If glass be used for a condenser, it will not suffer so great a degree of condensation; but the experiment will be more entertaining, since the subject may be viewed in the condensed air.

CONDITION, in the civil law, a clause of obligation stipulated as an article of a treaty or a contract; or in a donation of a testament, legacy, &c. in which last case a donee does not lose his donative if it be charged with any dishonest or impossible conditions.

CONDITIONAL, something not absolute, but subject to conditions.

CONDITIONAL Conjunctions, in grammar, are those which serve to make propositions conditional; as *if, unless, provided, &c.*

CONDITIONAL Propositions, in logic, such as consist of two parts connected together by a conditional particle.

CONDITIONAL Syllogism, a syllogism where the major is a conditional proposition. Thus,

If there is a God, he ought to be worshipped.

But there is a God;

Therefore he ought to be worshipped.

CONDIVICNUM, (anc. geog.), the capital of the Namnetes, in Armorica. Now Nants in Brittany, on the Loire, from its name *Civitas Namnetum*. W. Long. 1. 30. Lat. 47. 15

CONDOM, a town of Gascony in France, capital of the Condomois, with a bishop's see. It is but a poor place, and the trade is very small. It is seated on the river Gelisse, in E. Long. 0. 22. N. Lat. 44.

CONDOR, or **CONTOR**, in ornithology. See **VULTUR**.

VOL. V,

CONDORMIENTES, in church-history, religious sectaries, who take their name from lying all together, men and women, young and old. They arose in the 13th century, near Cologne; where they are said to have worshipped an image of Lucifer, and to have received answers and oracles from him.

CONDRIEU, a town of Lyonnais in France, remarkable for its excellent wines. It is seated at the foot of hill near the river Rhone, E. Long. 4. 33. N. Lat. 45. 28.

CONDRIUSII, (anc. geog.), a people of Belgica, originally Germans, dwelling about the Maese. Their country is now called *Condrotz*, in the bishopric of Liege, between Luxemburg and the Maese.

CONDUCTOR, in surgery, an instrument which serves to conduct the knife in the operation of cutting for the stone, and in laying up sinuses and fistulas.

CONDUCTORS, in electrical experiments, are those bodies that receive and communicate electricity; and those that repel it are called *non-conductors*. See **ELECTRICITY**.

CONDUIT, a canal or pipe for the conveyance of water, or other fluid.

There are several subterraneous conduits through which the waters pass that form springs. Artificial conduits for water are made of lead, stone, cast-iron, potter's earth, timber, &c.

CONDYLOID and **CORONOID** processes. See **ANATOMY**, n^o 26.

CONDYLOMA, in medicine, a tubercle, or calous eminence, which arises in the folds of the anus, or rather a swelling or hardening of the wrinkles of that part.

CONDYLUS, a name given by anatomists to a knot in any of the joints, formed by the epiphysis of a bone.

CONE, in geometry, a solid figure, having a circle for its base, and its top terminated in a point or vertex. See **CONIC SECTIONS**.

Melting Cone, in chemistry, is a hollow cone formed of copper or brass, with a handle, and with a flat bottom adjoining to the apex of the cone, upon which it is intended to rest. Its use is to receive a mass of one or more metals melted together, and cast into it. This mass, when cold, may be easily shook out of the vessel, from its figure. Also, if a melted mass consisting of two or more metals, or other substances not combined together, be poured into this vessel, the conical figure facilitates the separation of these substances according to their respective densities. The cone ought to be well heated before the melted mass is thrown into it; that it may not contain any moisture, which would occasion a dangerous explosion. It ought also to be greased internally with tallow, to prevent the adhesion of the fluid matter.

Cone of Rays, in optics, includes all the several rays which fall from any radiant point upon the surface of a glass.

CONE, in botany. See **CONUS**.

CONESSI, a sort of bark of a tree, which grows on the Coromandel coast in the East Indies. It is recommended in a letter to Dr Monro, in the Medical Essays, as a specific in diarrhoeas. It is to be finely pulverized, and made into an electuary with syrup of oranges. The bark should be fresh, and the electua-

Confarre-
ation
|
Confession.

ry new made every day, or second day, otherwise it loses its austere but grateful bitterness on the palate, and its proper effects on the intestines.

CONFARREATION, a ceremony among the ancient Romans, used in the marriage of persons whose children were destined for the honour of the priest-hood.

Confarreation was the most sacred of the three modes of contracting marriage among that people; and consisted, according to Servius, in this, that the *pontifex maximus* and *flamen dialis* joined and contracted the man and woman, by making them eat of the same cake of salted bread; whence the term, *far* signifying *meal* or *flour*.

Ulpian says, it consisted in the offering up of some pure wheaten bread; rehearsing, withal, a certain formula, in presence of ten witnesses. Dionysius Halicarnassensis adds, that the husband and wife did eat of the same wheaten bread, and threw part on the victims.

CONFECTIO, in pharmacy, signifies, in general, any thing prepared with sugar: in particular it imports something preserved, especially dry substances. It also signifies a liquid or soft electuary, of which there are various sorts directed in dispensatories. See **PHARMACY**.

CONFECTOR, among the ancient Romans, a sort of gladiator, hired to fight in the amphitheatre against beasts: thence also denominated *bestiarius*.

The *confectores* were thus called à *conficiendis bestiis*, from their dispatching and killing beasts.

The Greeks called them *παρὰβόλοι*, q. d. *daring, rash, desperate*; whence the Latins borrowed the appellations *parabolani* and *parabolarii*. The Christians were sometimes condemned to this sort of combat.

CONFECTS, a denomination given to fruits, flowers, herbs, roots, &c. when boiled or prepared with sugar or honey, to dispose them to keep, and render them more agreeable to the taste.

CONFEDERACY, in law, is when two or more persons combine to do any damage to another, or to commit any unlawful act. Confederacy is punishable, though nothing be put in execution; but then it must have these four incidents: 1. That it be declared by some matter of prosecution, as by making of bonds or promises to one another; 2. That it be malicious, as for unjust revenge; 3. That it be false, *i. e.* against the innocent; and, lastly, That it be out of court, voluntary.

CONFERVA, in botany: A genus belonging to the cryptogamia class of plants: and in the natural method ranking under the 57th order, *Algæ*. The tubercles are of different sizes, on capillary, very long fibres. There are 21 species, most of them growing on stones in slow streams, on the sides of cisterns, or in ponds.

CONFESSION, in a civil sense, a declaration or acknowledgement of some truth, though against the interest of the party who makes it; whether it be in a court of justice or out of it. It is a maxim, that in civil matters, the confession is never to be divided, but always taken entire. A criminal is never condemned on his simple confession, without other collateral proofs: nor is a voluntary extrajudicial confession admitted as any proof. A person is not admitted to accuse himself, according to that rule in law, *Non auditur perire volens*. See **ARRAIGNMENT**.

CONFESSION, among divines, the verbal acknowledgement which a Christian makes of his sins.

Among the Jews it was the custom, on the annual feast of expiation, for the high-priest to make confession of sins to God in the name of the whole people: besides this general confession, the Jews were enjoined, if their sins were a breach of the first table of the law, to make confession of them to God; but violations of the second table were to be acknowledged to their brethren. The confession of the primitive Christians were all voluntary, and not imposed on them by any laws of the church; yet private confession was not only allowed, but encouraged.

The Romish church requires confession not only as a duty, but has advanced it to the dignity of a sacrament: this confession is made to the priest, and is private and auricular; and the priest is not to reveal them under pain of the highest punishment.

CONFESSION of Faith, a list of the several articles of belief in any church.

CONFESSIO, or **CONFESSIO**, a place in churches under the great altar, where the bodies of deceased saints, martyrs, and confessors, were deposited.

This word is also used by the Romanists for a desk in the church where the confessor takes the confessions of the penitents.

CONFESSOR, a Christian who has made a solemn and resolute profession of the faith, and has endured torments in its defence. A mere saint is called a confessor, to distinguish him from the roll of dignified saints: such as apostles, martyrs, &c. In ecclesiastical history, we frequently find the word confessors used for martyrs: in after-times, it was confined to those who, after having been tormented by the tyrants, were permitted to live and die in peace. And at last it was also used for those who, after having lived a good life, died under an opinion of sanctity. According to St Cyprian, he who presented himself to torture, or even to martyrdom, without being called to it, was not called a *confessor* but a *professor*: and if any out of a want of courage abandoned his country, and became a voluntary exile for the sake of the faith, he was called *ex-terris*.

CONFESSOR is also a priest, in the Romish church, who has a power to hear sinners in the sacrament of penance, and to give them absolution. The church calls him in Latin *confessarius*, to distinguish him from confessor, which is a name consecrated to saints. The confessors of the kings of France, from the time of Henry IV. have been constantly Jesuits: before him the Dominicans and Cordeliers shared the office between them. The confessors of the house of Austria have also, ordinarily, been Dominicans and Cordeliers; but the latter emperors have all taken Jesuits.

CONFIGURATION, the outward figure which bounds bodies, and gives them their external appearance: being that which, in a great measure, constitutes the specific difference between bodies.

CONFIRMATION, in a general sense, the act of ratifying or rendering a title, claim, report, or the like more sure and indisputable.

CONFIRMATION, in law, a conveyance of an estate, or right in *esse*, from one man to another, whereby a voidable estate is made sure and unavoidable, or a particular estate is increased, or a possession made perfect.

Confession
|
Confirmation.

Confirma-
tion,
Conflagra-
tion.

CONFIRMATION, in theology, the ceremony of laying on of hands, for the conveyance of the Holy Ghost.

The antiquity of this ceremony is, by all ancient writers, carried as high as the apostles, and founded upon their example and practice. In the primitive church, it used to be given to Christians immediately after baptism, if the bishop happened to be present at the solemnity. Among the Greeks, and throughout the East, it still accompanies baptism: but the Romanists make it a distinct independent sacrament. Seven years is the stated time for confirmation: however, they are sometimes confirmed before, and sometimes after, that age. The person to be confirmed has a god-father and god-mother appointed him, as in baptism. The order of confirmation in the church of England, does not determine the precise age of the persons to be confirmed.

CONFISCATION, in law, the adjudication of goods or effects to the public treasury; as the bodies and effects of criminals, traitors, &c.

CONFLAGRATION, the general burning of a city, or other considerable place.

This word is commonly applied to that grand period or catastrophe of our world, when the face of nature is to be changed by fire, as formerly it was by water. The ancient Pythagoreans, Platonists, Epicureans, and Stoics, appear to have had a notion of the conflagration: though whence they should derive it, unless from the sacred books, is difficult to conceive; except, perhaps, from the Phœnicians, who themselves had it from the Jews. Seneca says expressly, *Tempus advenerit quo sidera sideribus incurrent, & omni flagrante materia uno igne, quicquid nunc ex deposito lucet, ardebit.* This general dissolution the Stoics call *καταστροφή, ecpyrosis*. Mention of the conflagration is also made in the books of the Sybils, Sophocles, Hytaspes, Ovid, Lucan, &c. Dr Burnet, after F. Tachard and others, relates that the Siamese believe that the earth will at last be parched up with heat; the mountains melted down; the earth's whole surface reduced to a level, and then consumed with fire. And the Bramins of Siam do not only hold that the world shall be destroyed by fire; but also that a new earth shall be made out of the cinders of the old.

Various are the sentiments of authors on the subject of the conflagration; the cause whence it is to arise, and the effects it is to produce. Divines ordinarily account for it metaphysically; and will have it take its rise from a miracle, as a fire from heaven. Philosophers contend for its being produced from natural causes; and will have it effected according to the laws of mechanics. Some think an eruption of the central fire sufficient for the purpose; and add, that this may be occasioned several ways, viz. either by having its intension increased; which again, may be effected either by being driven into less space by the encroachments of the superficial cold, or by an increase of the inflammability of the fuel whereon it is fed; or by having the resistance of the imprisoning earth weakened; which may happen, either from the diminution of its matter, by the consumption of its central parts, or by weakening the cohesion of the constituent parts of the mass by the excess of the defect of moisture. Others look for the cause of the conflagration in the atmosphere; and suppose, that some of the

meteors there engendered in unusual quantities, and exploded with unusual vehemence, from the concurrence of various circumstances, may effect it, without seeking any further. The astrologers account for it from a conjunction of all the planets in the sign Cancer; as the deluge, say they, was occasioned by their conjunction in Capricorn. Lastly, others have recourse to a still more effectual and flaming machine, and conclude the world is to undergo its conflagration from the near approach of a comet in its return from the sun.

CONFLUENT, among physicians, &c. an appellation given to that kind of SMALL-POX wherein the pustules run into each other.

CONFLUENTES (anc. geog.), a place at the confluence of the Rhine and Moselle, supposed to be one of the 50 forts erected by Drusus on the Rhine, in Gallia Belgica: Now *Coblentz*, a town of Triers. E. Long. 7. 15. Lat. 50. 30.

CONFORMATION, the particular consistence and texture of the parts of any body, and their disposition to compose a whole.

CONFORMATION, in medicine, that make and construction of the human body which is peculiar to every individual. Hence, a *mala conformatio* signifies some fault in the first rudiments; whereby a person comes into the world crooked, or with some of the viscera or cavities unduly framed or proportioned. Many are subject to incurable asthmas, from a too small capacity of the thorax, and the like vitious conformations.

CONFORMITY, in the schools, is the congruency, or relation of agreement between one thing and another; as between the measure and the thing measured, the object and the understanding, the thing and the division thereof, &c.

CONFRONTATION, the act of bringing two persons in presence of each other, to discover the truth of some fact which they relate differently.

The word is chiefly used in criminal matters; where the witnesses are confronted with the accused, the accused with one another, or the witnesses with one another.

CONFUCIUS, a Chinese philosopher, who lived about 500 years before our Saviour's birth, in the kingdom of Lu, now called the province of *Xantung*. His wit and judgment got him a reputation from his very youth: and being a mandarin, and employed in the government of the kingdom of Lu, his profound knowledge of morals and politics made him be greatly admired. Notwithstanding his care, his prince's court was much disordered; and Confucius finding the king would not listen to his advice, quitted the court, and taught moral philosophy with such applausé that he soon had above 3000 scholars, whereof 72 surpassed the rest in learning and virtue, for whom the Chinese have still a particular veneration. He divided his doctrine into four parts, and his scholars into four classes: the first order was of those who studied to acquire virtue; the 2d, those who learned the art of reasoning well; the 3d studied the government of the state and the duty of magistrates; the 4th were wholly taken up in noble discourses of all that concerned morals. In spite of all his pains to establish pure morality and religion, he was nevertheless the innocent cause of their corruption. It is said, that when

Confluent
Confucius.

Confusion. he was complimented upon the excellency of his philosophy, he replied, that he fell greatly short of the perfect degree of virtue; but that in the west the most holy was to be found. This made a strong impression on the learned; and in the 66th year after Christ's birth, the emperor Mon-ti sent ambassadors toward the west to seek this holy man. They stopped at an island near the Red Sea, and found a famous idol named Fohi, representing a philosopher that lived 500 years before Confucius. They carried this idol back with them, with instructions concerning the worship rendered to it; and so introduced a superstition that abolished in several places the maxims of Confucius. His tomb is in the academy where he taught, near the town Xio-fu, upon the banks of the river Xu. This philosopher has been in great veneration in China above 2000 years; and is still so esteemed, that each town has a palace consecrated to his memory. There was one of his descendants who was very considerable in the kingdom in 1646, whom Xanchi king of Tartary, who then conquered China, received with a great deal of honour. All those of his family are mandarins by birth; and have a privilege common with the princes of the blood, not to pay any tribute.

CONFUSION, in a general sense, is opposed to order, in a perturbation whereof confusion consists; *e. gr.* when things prior in nature do not precede, or posterior do not follow, &c.

In a logical sense, confusion is opposed to distinctness or perspicuity; and may happen either in words, as when misconstrued or misapplied; or in ideas, as when the idea of any thing presents something along with it, which does not properly belong to that thing. See IDEA and NOTION.

In a physical sense, confusion is a sort of union or mixture by mere contiguity. Such is that between fluids of contrary nature, as oil and vinegar, &c.

CONFUSION, in Scots law, is a method of suspending and extinguishing obligations. See LAW, Part III. N^o clxxvi. 8.

CONFUSION of Tongues, in the history of mankind, is a memorable event, which happened in the one hundred and first year according to the Hebrew chronology, and the four hundred and first year by the Samaritan, after the flood, at the overthrow of Babel; and which was providentially brought about in order to facilitate the dispersion of mankind and the population of the earth. Until this period there had been one common language, which formed a bond of union that prevented the separation of mankind into distinct nations; and some have supposed, that the tower of Babel was erected as a kind of fortress, by which the people intended to defend themselves against that separation which Noah had projected.

There has been a considerable difference of opinion as to the nature of this confusion, and the manner in which it was effected. Some learned men, prepossessed with the notion that all the different idioms now in the world did at first arise from one original language to which they may be reduced, and that the variety among them is no more than must naturally have happened in a long course of time by the mere separation of the builders of Babel, have maintained, that there were no new languages formed at the confusion; but that this event was accomplished by creating a misun-

derstanding and variance among the builders without any immediate influence on their language. But this opinion, advanced by Le Clerc, &c. seems to be directly contrary to the obvious meaning of the word *שפה*, *shapha*, "lip," used by the sacred historian. Others have imagined, that this was brought about by a temporary confusion of their speech, or rather of their apprehensions, causing them, whilst they continued together and spoke the same language, to understand the words differently. Scaliger is of this opinion. Others, again, account for this event by the privation of all language, and by supposing that mankind were under a necessity of associating together, and of imposing new names on things by common consent. Another opinion ascribes the confusion to such an indistinct remembrance of the original language which they spoke before, as made them speak it very differently; so that by the various inflections, terminations, and pronunciations of divers dialects, they could no more understand one another, than they who understand Latin can understand those who speak French, Italian, or Spanish, though all these languages arise out of it. This opinion is adopted by Caufabon, and by Bishop Patrick in his Commentary *in loc.* and is certainly much more probable than either of the former. And Mr Shuckford maintains, that the confusion arose from small beginnings, by the invention of new words in either of the three families of Shem, Ham, and Japhet, which might contribute to separate them from one another; and that in each family new differences of speech might gradually arise, so that each of these families went on to divide and subdivide among themselves. Others again, as Mr Jos. Mede and Dr Wotton, &c. not satisfied with either of the foregoing methods of accounting for the diversity of languages among mankind, have recourse to an extraordinary interposition of divine power, by which new languages were framed and communicated to different families by a supernatural infusion or inspiration; which languages have been the roots and originals from which the several dialects that are, or have been, or will be spoken, as long as this earth shall last, have arisen, and to which they may with ease be reduced. As to the number of languages thus introduced, many opinions have been adopted. If there were no more than there were nations or heads of nations, then the number would be seven for Japhet, four for Ham, and five for Shem; but if there were as many as there were families, which is the more probable opinion, their number cannot be certainly assigned. However, the Hebrews fancy they were 70, because the descendants from the sons of Noah, enumerated Genesis x. were just so many. Allowing, then, the languages of the chief families to have been fundamentally different from each other, the sub-languages and dialects within each branch would probably have had a mutual affinity, greater or less as they settled nearer or farther from each other. But whichever of these hypotheses is adopted, the primary object of the confusion at Babel was the separation and dispersion of mankind.

Dr Bryant, in the third volume of his *Analysis of Ancient Mythology*, has advanced a singular hypothesis, both with respect to the confusion of tongues and the dispersion. He supposes that the confusion of language was local and partial, and limited to Babel only.

Confutation || **Congelation.**
 By כל-ר-ארע, Gen. xi. 1. and 8, which our translators render *the whole earth*, he understands *every region*; and by the same words in ver. 9. *the whole region* or province. This confusion was occasioned, as he supposes, by a labial failure; so that the people could not articulate. Thus their speech was confounded, but not altered; for, as soon as they separated, they recovered their true tenor of pronunciation, and the language of the earth continued for some ages nearly the same. The interviews between the Hebrews and other nations, recorded in Scripture, were conducted without an interpreter; and he farther observes, that the various languages which subsist at this day retain sufficient relation to show, that they were once dialects from the same matrix, and that their variety was the effect of time. See DISPERSION.

CONFUTATION, in rhetoric, &c. a part of an oration, wherein the orator seconds his own arguments and strengthens his cause, by refelling and destroying the opposite arguments of the antagonist. This is done by denying what is apparently false, by detecting some flaw in the reasoning of the adverse party, by granting their argument, and showing its invalidity, or retorting it upon the adversary.

CONGE, in the French law, a licence, or permission, granted by a superior to an inferior, which gives him a dispensation from some duty to which he was before obliged. A woman cannot obligate herself without the *conge* or licence of her husband; a monk cannot go out of his convent, without the *conge* of his superiors.

CONGE' d'Elire, in ecclesiastical policy, the king's permission royal to a dean and chapter in the time of a vacancy, to choose a bishop; or to an abbey, or priory, of his own foundation, to choose their abbot or prior.

The king of England, as sovereign patron of all archbishoprics, bishoprics, and other ecclesiastical benefices, had of ancient time free appointment of all ecclesiastical dignities, whensoever they chanced to be void; investing them first *per baculum & annulum*, and afterwards by his letters-patent; and in course of time he made the election over to others, under certain forms and limitations, as that they should at every vacation, before they choose, demand the king's *congé d'elire*, and after the election crave his royal assent, &c.

CONGE', in architecture, a mould in form of a quarter round, or a cavetto, which serves to separate two members from one another; such as that which joins the shaft of the column to the cincture, called also *apophyge*.

CONGES are also rings or ferrels formerly used in the extremities of wooden pillars, to keep them from splitting, afterwards imitated in stone-work.

CONGELATION, signifies the passing of any body from a fluid to a solid state: so that the term is thus applicable to metals when they resume their solid form after being heated, to water when it freezes, to wax, spermaceti, &c. when they become solid after having been rendered fluid by heat; and in general to all processes, where the whole substance of the fluid is converted into solid: but it differs from crystallization; because in the latter process, though the salt passes from a fluid to a solid state, a considerable

¹
 Differs from crystallization.

quantity of liquid is always left, so that the term *congelation* is never applied in this case.

The process of congelation in all cases depends upon, or at least is accompanied with, the emission of heat, as has been evinced by experiments made not only in water, but on spermaceti, wax, &c. for in all of these, tho' the thermometer immersed in them while fluid continued to descend gradually till a certain period, yet it was as constantly observed to remain stationary, or even to ascend while the congelation went on. The principle on which the phenomenon depends is thus ascertained; but why this heat should be emitted, is a question which has not yet been thoroughly investigated. Some conjectures relative to this are indeed mentioned in the article CHEMISTRY, when treating of elementary fire, though experiments are still to be wished for on the subject.

Congelation.
²
 Is always attended with an emission of heat.

It is not known whether all kinds of fluids are naturally capable of congelation or not; though we are certain that there are very great differences among them in this respect. The most difficult of all those of which the congelation has been actually ascertained is quicksilver. This was long thought capable of resisting any degree of cold whatever; and it is only within a few years that its congelation by artificial means was known, and still more lately that some climates were found to be so severe as to congeal this fluid by the cold of the atmosphere.

³
 Congelation of quicksilver.

The congelation of quicksilver was first ascertained by M. Joseph Adam Braun professor of philosophy at Peterburg. He had been employed in making thermometrical experiments, not with a view to make the discovery he actually did, but to see how many degrees of cold he could produce. An excellent opportunity for this occurred on the 14th of December 1759, when the mercury stood naturally at -34, which is now known to be only five or six degrees above its point of congelation. Mr Braun having determined to avail himself of this great degree of natural cold, prepared a freezing mixture of aquafortis and pounded ice, by means of which his thermometer was reduced to -69. Part of the quicksilver had now really congealed; yet so far was M. Braun from entertaining any suspicion of the truth, that he had almost desisted from further attempts, being satisfied with having so far exceeded all the philosophers who went before him. Animated, however, by the hopes of producing a still greater degree of cold, he renewed the experiment; but having expended all his pounded ice, he was obliged to substitute snow in its place. With this fresh mixture the mercury sunk to -100, 240, and 352°. He then supposed that the thermometer was broken; but on taking it out to observe whether it was so or not, he found the quicksilver fixed, and continuing so for 12 minutes. On repeating the same experiment with another thermometer which had been graduated no lower than -220, all the mercury sunk into the ball, and became solid as before, not beginning to reascend till after a still longer interval of time. Hence the professor concluded that the quicksilver was really frozen, and prepared for making a decisive experiment. This was accomplished on the 25th of the same month, and the bulb of the thermometer broken as soon as the metal was congealed. The mercury was now converted

⁴
 Experiments of Mr Braun.

ed

Congela-
tion.

ed into a solid and shining metallic mass, which extended under the strokes of a pestle, in hardness rather inferior to lead, and yielding a dull sound like that metal. Professor *Æpinus* made similar experiments at the same time, employing both thermometers and tubes of a larger bore; in which last he remarked, that the quicksilver fell sensibly on being frozen, assuming a concave surface, and likewise that the congealed pieces sunk in fluid mercury.

The fact being thus established, and fluidy no longer to be considered as an essential property of quicksilver, Mr *Braun* communicated an account of his experiments to the Petersburg Academy, on the 6th of September 1760; of which a large extract was inserted in the *Philosophical Transactions*, vol. lii. p. 156. Five years afterwards he published another treatise on the same subject, under the title of *Supplements to his former dissertation*. In these he declared, that, since his former publication, he had never suffered any winter to elapse without repeating the experiment of congealing quicksilver, and never failed of success when the natural cold was of a sufficient strength for the purpose. This degree of natural cold he supposes to be -10 of Fahrenheit, though some commencement of the congelation might be perceived when the temperature of the air was as high as $+2$. The results of all his experiments were, that with the abovementioned frigorific mixtures, and once with rectified spirits and snow, when the natural cold was at -28° , he congealed the quicksilver, and discovered that it is a real metal which melts with a very small degree of heat. Not perceiving, however, the necessary consequence of its great contraction in freezing, he, in this work, as well as in the former, confounded its point of congelation with that of its greatest contraction in freezing, and thus marked the former a great deal too low; though the point of congelation was very uncertain according to him, various difficulties having occurred to his attempts of finding the greatest point of contraction while freezing.

5
Of Mr Blumenbach.

The experiments of M. *Braun* were not repeated by any person till the year 1774, when Mr *John Frederic Blumenbach*, then a student of physic at *Gottingen*, performed them to more advantage than it appears M. *Braun* had ever done. He was encouraged to make the attempt by the excessive cold of the winter that year. "I put (says he), at five in the evening of January 11th, three drachms of quicksilver into a small sugar-glass, and covered it with a mixture of snow and Egyptian sal-ammoniac. This mixture was put loose into the glass, so that the quicksilver lay perfectly free, being only covered with it as by pieces of ice: the whole, together with the glass, weighed somewhat above an ounce. It was hung out at a window in such a position as to expose it freely to the northwest; and two drachms more of sal-ammoniac mixed with the snow on which it stood. The snow and sal-ammoniac, in the open air soon froze into a mass like ice: no sensible change, however, appeared in the quicksilver that evening: but at one in the morning it was found frozen solid. It had divided into two large and four smaller pieces: one of the former was hemispherical, the other cylindrical, each seemingly rather above a drachm in weight: the four small bits might amount to half a scruple. They were all with their flat side frozen hard to the glass, and no

where immediately touched by the mixture; their colour was a dull pale white with a bluish cast, like zinc, very different from the natural appearance of quicksilver. Next morning about seven o'clock I found that the larger hemisphere began to melt, perhaps because it was most exposed to the air, and not so near as the others to the sal ammoniac mixture which lay beneath. In this state it resembled an amalgam, sinking to that side on which the glass was inclined; but without quitting the surface of the glass, to which it was yet firmly congealed: the five other pieces had not yet undergone any alteration, but remained frozen hard. Toward eight o'clock the cylindrical piece began to soften in the same manner, and the other four soon followed. About eight they fell from the surface of the glass, and divided into many fluid shining globules, which were soon lost in the interstices of the frozen mixture, and reunited in part at the bottom, being now exactly like common quicksilver." At the time this experiment was made, the thermometer stood at -10° in the open air.

Congela-
tion.

The circumstances attending this experiment are still unaccountable; for, in the first place, the natural cold was scarcely sufficient, along with that of the artificial mixture, which produces 32° more, to have congealed the quicksilver; which yet appears to have been very effectually done by the length of time it continued solid. 2. It is not easy to account for the length of time required for congealing the quicksilver in this experiment, since other frigorific mixtures begin to act almost immediately; and, 3. There was not at last even the appearance of action, which consists in a solution of the snow, and not in its freezing into a mass. "The whole experiment (says Dr *Blagden* *) remains involved in such obscurity, that some persons have supposed the quicksilver itself was not frozen, but only covered over with ice; to which opinion, however, there are great objections. It is worthy of remark, that *Gottingen*, though situated in the same latitude as *London*, and enjoying a temperate climate in general, becomes subject at times to a great severity of cold. This of 11th of January 1774 is one instance; I find others there where the thermometer sunk to -12° , -16° , or -19° ; and at *Cattlenburg*, a small town about two German miles distant, to -30° . By watching such extraordinary occasions, experiments on the freezing of quicksilver might easily be performed in many places, where the possibility of them is at present little suspected. The cold observed at *Glasgow* in 1780 would have been fully sufficient for that purpose."

6
Remarks
on this ex-
periment.

In consequence of the publication of Mr *Braun's* Experiments, the Royal Society desired their late secretary Dr *Maty* to make the necessary application to the *Hudson's-bay* company, in order to repeat the experiment in that country. Mr *Hutchins*, who was then at *London*, and going out with a commission as governor of *Albany Fort*, offered to undertake the experiments, and executed them very completely, freezing quicksilver twice in the months of January and February 1775. The account of his success was read before the Royal Society at the commencement of the severest winter that had been known for many years in Europe; and at this time the experiment was repeated by two gentlemen of different countries. One was Dr *Lambert Bicker*, secretary to the *Batavian* society at *Rotterdam*; who on the 28th of January 1776, at

Bicker, &c.

eight

Congela-
tion.

eight in the morning, made an experiment to try how low he could bring the thermometer by artificial cold, the temperature of the atmosphere being then $+2^{\circ}$. He could not, however, bring it lower than -94° , at which point it stood immoveable: and on breaking the thermometer, part of the quicksilver was found to have lost its fluidity, and was thickened to the consistence of an amalgam. It fell out of the tube in little bits, which bore to be flattened by pressure, without running into globules like the inner fluid part. The experiment was repeated next day, when the thermometer stood at $+8^{\circ}$, but the mercury would not then descend below -80° ; and as the thermometer was not broken, it could not be known whether the mercury had congealed or not. All that could be inferred from these experiments therefore was, that the congealing point of mercury was not below -94° of Fahrenheit's thermometer. The other who attempted the congelation of this fluid was the late Dr Anthony Fothergill; but it could not be determined whether he succeeded or not. An account of his experiment is inserted in the Philosophical Transactions, Vol. lxvi.

8
Point of
congelation
determined by
Mr Hutchins.

No other attempts were made to congeal quicksilver until the year 1781, when Mr Hutchins resumed the subject with great success, inasmuch that from his experiment the freezing point of mercury is now almost as well settled as that of water. Preceding philosophers, indeed, had not been altogether inattentive to this subject. Professor Braun himself had taken great pains to investigate it: but for want of paying the requisite attention to the difference betwixt the contraction of the fluid, mercury by cold and that of the congealing metal by freezing, he could determine nothing certain concerning it. Others declared it as their opinion, that nothing certain could be determined by merely freezing mercury in a thermometer filled with that fluid. Mr Cavendish and Dr Black first suggested the proper method of obviating the difficulties on this subject. Dr Black, in a letter to Mr Hutchins, dated October 5. 1779, gave the following directions for making the experiment with accuracy: "Provide a few wide and short tubes of thin glass, sealed at one end and open at the other; the wideness of these tubes may be from half to three quarters of an inch, and the length of them about three inches. Put an inch or an inch and a half depth of mercury into one of these tubes, and plunging the bulb of the thermometer into the mercury, set the tube with the mercury and the thermometer in it into a freezing mixture, which should be made for this purpose in a common tumbler or water-glass: and, *N. B.* in making a freezing mixture with snow and spirit of nitre, the quantity of the acid should never be so great as to dissolve the whole of the snow, but only enough to reduce it to the consistence of panada. When the mercury in the wide tube is thus set in the freezing mixture, it must be stirred gently and frequently with the bulb of the thermometer; and if the cold be sufficiently strong, it will congeal by becoming thick and *broasy* like an amalgam. As soon as this is observed, the thermometer should be examined without lifting it out of the congealing mercury; and I have no doubt that in every experiment thus made with the same mercury, the instrument will always

9
Dr Black's
directions
for making
the experi-
ment.

point to the same degree, provided it has been made and graduated with accuracy."

The apparatus recommended by Mr Cavendish, and which Mr Hutchins made use of, consisted of a small mercurial thermometer, the bulb of which reached about $1\frac{1}{4}$ inches below the scale, and was inclosed in a glass cylinder swelled at the bottom into a ball, which when used was filled with quicksilver, so that the bulb of the thermometer was entirely covered with it. If this cylinder be immersed in a freezing mixture till great part of the quicksilver in it is frozen, it is evident that the degree shown at that time by the inclosed thermometer is the precise point at which mercury freezes; for as in this case the ball of the thermometer must be surrounded for some time with quicksilver, part of which is actually frozen, it seems impossible that the thermometer should be sensibly above that point; and while any of the quicksilver in the cylinder remains fluid, it is impossible that it should sink sensibly below it. The diameter of the bulb of the thermometer was rather less than a quarter of an inch, that of the swelled part of the cylinder two-thirds; and as it was easy to keep the thermometer constantly in the middle of the cylinder, the thickness of quicksilver betwixt it and the glass could never be much less than the sixth part of an inch. The bulb of the thermometer was purposely made as small as it conveniently could, in order to leave a sufficient space between it and the cylinder, without making the swelled part larger than necessary, which would have caused more difficulty in freezing the mercury in it.

The first experiment with this apparatus was made on the 15th of December 1781; the thermometer had stood the evening before at -18° . A bottle of spiritus nitri fortis was put on the house-top, in order to cool it to the same temperature. The thermometers made use of had been hung up in the open air for three weeks to compare their scales. On the morning of the experiment they were about 23° below 0.—in making it, the thermometer of the apparatus was suspended in the bulb of the cylinder by means of some red worsted wound about the upper part of its stem, to a sufficient thickness to fill the upper part of its orifice; and a space of near half an inch was left empty between the quicksilver and worsted.

The apparatus was placed in the open air, on the top of the fort, with only a few deer skins sewed together for a shelter; the snow lay 18 inches deep on the works, and the apparatus was stuck into the snow in order to bring it the sooner to the temperature of the air. The instruments were afterwards placed in three fresh freezing mixtures, in hopes of being able by their means to produce a greater degree of cold, but without effect; nor was any greater cold produced by adding more spirit of nitre. The mercury, however was very completely frozen, that in the thermometer descending to 448° . On plunging the mercury into the freezing mixture, it descended in less than one minute to 40° below 0.

The second experiment was made the day following; and the same quantity of quicksilver employed that had been used in the former. As too small a quantity of the freezing mixture, however, had been originally made, it was necessary to add more during

periments.

Congelation.

the operation of congelation; by which means the spirit of nitre, in pouring it upon the snow, sometimes touched the bulb of the thermometer, and instantly raised it much higher; nor did the mercury ever descend below 206°, which was not half so far as it had done the day before, though the temperature of the atmosphere had been this day at - 43° before the commencement of the operation. That in the apparatus, however sunk to - 95°. The apparatus was taken out of the mixture for half a minute, in order to examine whether the mercury was perfectly congealed or not, and during that time it showed no sign of liquefaction.

The third experiment was made the same day, and with the freezing mixture used in the last. By it the point of congelation was determined to be not below 40°.

The fourth experiment was made January 7th 1782; and in it he observed, the the mercury in the apparatus thermometer, after standing at 42 and 41½ for a considerable time fell to 77, not gradually, but at once as a weight falls.

In the fifth experiment the weather was excessively severe, so that it ought to have frozen the metal in the open air; but this did not then happen.

At the time of making the sixth experiment, the quicksilver in the open air stood at 44 below 0; and Mr Hutchins resolved to make use of this opportunity to observe how far it was possible to make it descend by means of cold, observing the degrees at the same time with a spirit thermometer made by Nairne and Brout, with which he had been furnished by the royal society in 1774. In this, however, he did not succeed; for the mercury never fell below 438, nor the standard 48. It stood at 27½ at the beginning of the experiment. The reason of this was supposed to be, that the atmosphere was too cold for making this kind of experiments, by reason of its freezing the thread of quicksilver in the stem of the thermometer, so that it became incapable of contraction along with that in the bulb. In other experiments, though the metal in the bulb became solid, yet that in the stem always remained fluid; and thus was enabled to subside to a great degree by the diminution of bulk in the solid mercury. That this was really the case, appeared from the quicksilver falling at once from - 86 to - 434, when the cold of the freezing mixture diminished, and the temperature of the air becoming about the same time somewhat milder, melted the congealed part in the stem, which thus had liberty to descend to that point.

In this experiment, also, the mixtures were made in double quantity to those of the former: these being only in common tumblers, but the mixtures for this experiment in pint basons. It was observed that they liquefied faster than in other experiments. He had usually made them of the consistence of pap; but though he added snow at different times, it had very little effect in augmenting the cold, but rather decreased it. The congealed pieces of metal fell to the bottom as might naturally have been expected from its great contraction in becoming solid.

From this experiment Mr Hutchins concluded, that the nearer the temperature of the atmosphere approached to the congealing point of mercury (so that

a great degree of cold might be communicated to the bulb of a thermometer, and yet the quicksilver in the tube remain fluid), he might make the experiment of ascertaining the greatest contraction of mercury to more advantage. With this view, he made another experiment, when the temperature of some of his thermometers stood as low as - 37°; and after an hour's attendance he perceived the mercury had fallen to 1367; but the thermometer unluckily was broken, and its bulb thrown away with the mixture. Professor Braun had likewise observed, that his thermometers were always broken when the mercury descended below 600.

The eighth experiment was made with a view to try whether quicksilver would congeal when in contact with the freezing mixture. For this purpose, he did not use the apparatus provided for other experiments, but filled a gallipot made of flint stone (as being thinner than the common sort), containing about an ounce, half full of quicksilver, into which he inserted a mercurial thermometer, employing another as an index. Thus he hoped to determine exactly when the quicksilver was congealed, as he had free access to it at all times, which was not the case when it was inclosed in the cylindrical glass, the worsted wound round the tube of the thermometer to exclude the air being equally effectual in excluding any instrument from being introduced to touch the quicksilver. He then made a kind of skewer, with a flat blunt point, of dried cedar wood, on account of its lightness, which he found would remain in the gelatinous freezing mixture at any depth he chose; but, when inserted into the quicksilver, the great difference betwixt the specific gravity of it and that ponderous fluid, made it always rebound upward; and by the degree of resistance, he could always know whether it proceeded from fluid or solid metal. At this time, however, the experiment did not succeed; but, at another trial, having employed about ¾ths of a pound of metal, and let it remain a considerable time immersed in the same mixture which had just now been supposed to fail, he found that part of it was congealed, and, on pouring off the fluid part, no less than two-thirds remained fixed at the bottom.

The last experiment which has been published concerning the congelation of quicksilver by means of dish's snow is that of Mr Cavendish, and of which he gives an account in the Phil. Transact. Vol. lxxiii. p. 325. Here, speaking of the cold of freezing mixtures, he says, "There is the utmost reason to think that Mr Hutchins would have obtained a greater degree of cold by using a weaker nitrous acid than he did. I found (says he) by adding snow gradually to some of this acid, that the addition of a small quantity produced heat instead of cold; and it was not until so much was added as to increase the heat from 28 to 51°, that the addition of more snow began to produce cold; the quantity of snow required for this purpose being pretty exactly one quarter of the weight of the spirit of nitre, and the heat of the snow, and air of the room, as well as of the acid, being 28°. The reason of this is, that a great deal of heat is produced by mixing water with spirit of nitre; and the stronger the spirit is, the greater is the heat produced. Now it appears from this experiment, that before the acid was diluted,

Heat sometimes produced by adding snow to spirit of nitre.

Congela-
tion.

luted, the heat produced by its union with the water formed from the melting snow, was greater than the cold produced by the same; and it was not until it was diluted by the addition of one quarter of its weight of that substance, that the cold, generated by the latter cause, began to exceed the heat generated by the former. From what has been said, it is evident, that a freezing mixture made with undiluted acid will not begin to generate cold until so much snow is dissolved as to increase its heat from 28 to 51°; so that no greater cold will be produced than would be obtained by mixing the diluted acid heated to 51° with snow of the heat of 28°. This method of adding snow gradually is much the best way I know of finding what strength it ought to be of, in order to produce the greatest effect possible. By means of this acid diluted in the abovementioned proportion, I froze quicksilver in the thermometer called G (A) by Mr Hutchins, on the 26th of February 1782. I did not indeed break the thermometer to examine the state of the quicksilver therein; for, as it sunk to -110, it certainly must have been in part frozen; but immediately took it out, and put the spirit thermometer in its room, in order to find the cold of the mixture. It sunk only to -30°; but by making allowance of the spirit in the tube being not so cold as that in the ball, it appears, that if it had not been for this cause, it would have sunk to -35° (B); which is 6° below the point of freezing, and is within one degree of as great a cold as that produced by Mr Hutchins.

“ In this experiment the thermometer G sunk very rapidly; and, as far as I could perceive, without stopping at any intermediate point till it came to the abovementioned degree of -110°, where it stuck. The materials used in making the mixture were previously cooled, by means of salt and snow, to near nothing; the temperature of the air was between 20° and 25°; the quantity of acid used was 4½ oz.; and the glass in which the mixture was made, was surrounded with wool, and placed in a wooden box, to prevent its losing its cold so fast as it would otherwise have done. Some weeks before this I made a freezing mixture with some spirit of nitre much stronger than that used in the foregoing experiment, though not quite so strong as the undiluted acid, in which the cold was less intense by 4½°. It is true the temper of the air was much less cold, namely 35°, but the spirit of nitre was at least as cold, and the snow not much less so.

15
Of the cold
produced
by oil of vi-
triol and
snow.

“ The cold produced by mixing oil of vitriol, properly diluted with snow, is not so great as that produced by spirit of nitre, though it does not differ from it by so much as 8°; for a freezing mixture, prepared with diluted oil of vitriol, whose specific gravity, at 60° of heat, was 1,5642, sunk in the thermometer G to -37°, the experiment being tried at the same time, and with the same precautions, as the foregoing. It was previously found, by adding snow gradually to some of this acid, as was done by the nitrous acid, that it was a little, but not much stronger, than it ought to be, in order to produce the greatest effect.”

VOL. V.

The experiment made by Mr Walker, in which he congealed quicksilver by means of spirit of nitre and Glauber's salt, without any snow, concludes the history of the artificial congelation of mercury. See the article COLD. It now remains that we say something of the congelation of it by the natural cold of the atmosphere.

Congela-
tion.

Dr Blagden, from whose paper in the Philosophical Transactions, vol. lxxiii. this account is taken, observes, that it was not till near the year 1730 that thermometers were made with any degree of accuracy; and in four or five years after this, the first observations were made which prove the freezing of quicksilver. On the accession of the Empress Anne Ivanouna to the throne of Russia, three professors of the Imperial academy were chosen to explore and describe the different parts of her Asiatic dominions, and to inquire into the communication betwixt Asia and America. These were Dr John George Gmelin, in the department of natural history and chemistry; M. Gerard Frederic Muller, as general historiographer; and M. Louis de l'Isle de la Croyere, for the department of astronomy; draughtsmen and other proper assistants being appointed to attend them. They departed from Petersburg in 1733; and such as survived did not return till ten years after. The thermometrical observations were communicated by Professor Gmelin, who first published them in his Flora Sibirica, and afterwards more fully in the Journal of his Travels. An abstract of them was likewise inserted in the Petersburg Commentaries for the years 1756 and 1765, taken, after the professor's death, from his original dispatches in possession of the imperial academy.

16
Congela-
tion of
quicksilver
by natural
cold.

In the winter of 1734 and 1735, Mr Gmelin being at Yeneseisk in 58½° N. Lat. and 92° E. Long. from Greenwich, first observed such a descent of the mercury, as we know must have been attended with congelation. “ Here (says he) we first experienced the truth of what various travellers have related with respect to the extreme cold of Siberia; for, about the middle of December, such severe weather set in, as we were sure had never been known in our time at Petersburg. The air seemed as if it were frozen, with the appearance of a fog, which did not suffer the smoke to ascend as it issued from the chimnies. Birds fell down out of the air as dead; and froze immediately, unless they were brought into a warm room. Whenever the door was opened, a fog suddenly formed round it. During the day, short as it was, parhelia and haloes round the sun were frequently seen; and in the night mock moons, and haloes about the moon. Finally, our thermometer, not subject to the same deception as the senses, left us no doubt of the excessive cold; for the quicksilver in it was reduced, on the 5th of January O. S. to -120° of Fahrenheit's scale, lower than it had ever hitherto been observed in nature.”

17
Excessive
cold of Si-
beria.

The next instance of congelation happened at Yakutsk, in N. Lat. 62. and E. Long. 130. The weather here was unusually mild for the climate, yet the

R r

ther-

(A) This was a small mercurial thermometer, made by Nairne and Blount, on an ivory scale, divided at every five degrees, and reaching from 215° above to 250° below the cypher.

(B) This is to be understood of a spirit thermometer, whose -29° = 40° of Fahrenheit's mercurial.

Congela-
tion.

thermometer fell to -72° ; and one person informed the professor by a note, that the mercury in his barometer was frozen. He hastened immediately to his house to behold such a surprising phenomenon; but though he was witness to the fact, the prejudice he entertained against the possibility of the congelation, would not allow him to believe it. "Not feeling, (says he), by the way, the same effects of cold as I had experienced at other times in less distances, I began, before my arrival, to entertain suspicions about the congelation of his quicksilver. In fact, I saw that it did not continue in one column, but was divided in different places as into little cylinders, which appeared frozen; and, in some of these divisions between the quicksilver, I perceived like the appearance of frozen moisture. It immediately occurred to me, that the mercury might have been cleaned with vinegar and salt, and not sufficiently dried. The person acknowledged it had been purified in that manner. The same quicksilver, taken out of the barometer, and well dried, would not freeze again, though exposed to a much greater degree of cold, as shown by the thermometer."

Another set of observations, in the course of which the mercury frequently congealed, were made by Professor Gmelin at Kirenga fort, in $57\frac{1}{2}^{\circ}$ N. Lat. 108° E. Long.; his thermometer, at different times, standing at -108° , -86° , -100° , -113° , and many other intermediate degrees. This happened in the winter of 1737 and 1738. On the 27th of November, after the thermometer had been standing for two days at -46° , he found it sunk at noon to 108° . Suspecting some mistake, after he had noted down the observation, he instantly ran back, and found it at 102° ; but ascending with such rapidity, that in the space of half an hour it had risen to -19° . This phenomenon, which appeared so surprising, undoubtedly depended on the expansion of the mercury frozen in the bulb of the thermometer, and which now melting, forced upwards the small thread in the stem.

A similar appearance was observed at the same fort a few days after; and on the 29th of December, O. S. he found the mercury, which had been standing at -40° in the morning, sunk to -100° at four in the afternoon. At this time, he says, he "saw some air in the thermometer separating the quicksilver for the space of about six degrees." He had taken notice of a similar appearance the preceding evening, excepting that the *air*, as he supposed it to be, was not then collected into one place, but lay scattered in several.

These appearances undoubtedly proceeded from a congelation of the mercury, though the prejudice entertained against the possibility of this phenomenon would not allow the professor even to inquire into it at all. Several other observations were made; some of which were lost, and the rest contain no farther information.

The second instance where a natural congelation of mercury has certainly been observed, is recorded in the transactions of the Royal Academy of Sciences at Stockholm. The weather, in January 1760, was remarkably cold in Lapland; so that, on the 5th of that month, the thermometers fell to -76° , -128° , or lower; on the 23d and following days they fell to -58° , -79° , -92° , and below -238° entirely into the ball. This was observed at Tornea, Sombio, Ja-

kasiersf, and Utsioki, four places in Lapland, situated between the 65th and 78th degrees of N. Lat. and the 21st and 28th of E. Long. The person who observed them was M. Andrew Hellant, who makes the following remarks, of themselves sufficient to show that the quicksilver was frozen. "During the cold weather at Sombio (says he), as it was clear sun-shine, though scarcely the whole body of the sun appeared above the low woods that covered our horizon, I took a thermometer which was hanging before in the shade, and exposed it to the rising sun about eleven in the forenoon, to see whether, when that luminary was so low, it would have any effect upon the instrument. But to my great surprise, upon looking at it about noon, I found that the mercury had entirely subsided into the ball, though it was standing as high as -61° at 11 o'clock, and the scale reached down to 258° below 0." On bringing the instrument near a fire, it presently rose to its usual height; and the reason of its subsiding before was its being somewhat warmed by the rays of the sun; which, feeble as they were, had yet sufficient power to melt the small thread of congealed mercury in the stem of the thermometer, and allow it to subside along with the rest. Mr Hellant, however, so little understood the reason of this phenomenon, that he frequently attempted to repeat it by bringing the thermometer near a fire, when the cold was only a few degrees below the freezing point of water, but could never succeed until it fell to -58° , or lower, that is, until the cold was sufficiently intense to congeal the metal. The only seeming difficulty in his whole account, is, that when the mercury had subsided entirely into the ball of the thermometer, a vacuum or empty spot appeared, which run round the cavity like an air bubble, on turning the instrument: but this proceeded from a partial liquefaction of the mercury, which must necessarily melt first on the outside, and thus exhibit the appearance just mentioned.

The most remarkable congelation of mercury, which has ever yet been observed, was that related by Dr Peter Simon Pallas, who had been sent by the Empress of Russia, with some other gentlemen, on an expedition similar to that of Dr Gmelin. He did not, however, spend the winters in which he was in Siberia in the coldest parts of the country; that is about the middle of the northern part. Twice indeed he resided at Krasnoyarsk, in N. Lat. 56° , E. Long. 93° ; where, in the year 1772, he had an opportunity of observing the phenomenon we speak of. "The winter (says he) set in early this year, and was felt with uncommon severity in December. On the 6th and 7th of that month happened the greatest cold I have ever experienced in Siberia; the air was calm at the time, and seemingly thickened; so that, though the sky was in other respects clear, the sun appeared as through a fog. I had only one small thermometer left, in which the scale went no lower than -7° ; and on the 6th in the morning, I remarked that the quicksilver in it sunk into the ball, except some small columns which stuck fast in the tube.—When the ball of the thermometer, as it hung in the open air, was warmed by being touched with the finger, the quicksilver rose; and it could plainly be seen, that the solid columns stuck and resisted a good while, and were at length pushed upward with a sort of violence. In the mean

Remark-
able experi-
ments of
Dr Pallas.

time

Congela-
tion.

time I placed upon the gallery, on the north side of my house, about a quarter of a pound of clean and dry quicksilver in an open bowl. Within an hour I found the edges and surface of it frozen solid, and some minutes afterwards the whole was condensed by the natural cold into a soft mass very much like tin. While the inner part was still fluid, the frozen surface exhibited a great variety of branched wrinkles; but in general it remained pretty smooth in freezing, as did also a larger quantity which I afterwards exposed to the cold. The congealed mercury was more flexible than lead; but on being bent short, it was found more brittle than tin; and when hammered out thin, it seemed somewhat granulated. If the hammer had not been perfectly cooled, the quicksilver melted away under it in drops; and the same thing happened when the metal was touched with the finger, by which also the finger was immediately benumbed. In our warm room it thawed on its surface gradually, by drops, like wax on the fire, and did not melt all at once. When the frozen mass was broken to pieces in the cold, the fragments adhered to each other and to the bowl on which they lay. Although the frost seemed to abate a little towards night, yet the congealed quicksilver remained unaltered, and the experiment with the thermometer could still be repeated. On the 7th of December, I had an opportunity of making the same observations all day; but some hours after sunset, a northwest wind sprung up, which raised the thermometer to -46° , when the mass of quicksilver began to melt.

19
Von Elter-
lein's expe-
riment.

In the beginning of the year 1780, M. Von Elterlein, of Vytegra, a town of Russia, in Lat. 61° . E Long. 36° . froze quicksilver by natural cold; of which he gives the following account. "On the 4th of January 1780, the cold having increased to -34° that evening at Vytegra, I exposed to the open air three ounces of very pure quicksilver in a china tea-cup, covered with paper, pierced full of holes. Next day, at eight in the morning, I found it solid, and looking like a piece of cast lead, with a considerable depression in the middle. On attempting to loosen it in the cup, my knife raised shavings from it as if it had been lead, which remained sticking up; and at length the metal separated from the bottom of the cup in one mass. I then took it in my hand to try if it would bend: it was still like glue, and broke into two pieces; but my fingers immediately lost all feeling, and could scarcely be restored in an hour and an half by rubbing with snow. At eight o'clock a thermometer, made by Mr Lexmann of the Academy, stood at -57° ; by half after nine it was risen to -40° ; and then the two pieces of mercury which lay in the cup had lost so much of their hardness, that they could no longer be broken, or cut into shavings, but resembled a thick amalgam, which though it became fluid when pressed by the fingers, immediately afterwards resumed the consistence of pap. With the thermometer at -39° , the quicksilver became fluid. The cold was never less on the 5th than -28° , and by nine in the evening it had increased again to -33° .

An instance of the natural congelation of quicksilver also occurred in Jemtland, one of the provinces of Sweden, on the 1st of January 1782; and, lastly, on the 26th of the same month, Mr Hutchins observed the same effect of the cold at Hudson's bay. "The

subject of this curious phenomenon (says he), was quicksilver put into a common two-ounce vial, and corked. The vial was about a third part full, and had constantly been standing by the thermometer for a month past. At eight o'clock this morning I observed it was frozen rather more than a quarter of an inch thick round the sides and bottom of the vial, the middle part continuing fluid. As this was a certain method of finding the point of congelation, I introduced a mercurial and a spirit thermometer into the fluid part, after breaking off the top of the vial, and they rose directly and became stationary; the former 40° or $40\frac{1}{2}^{\circ}$, the latter at $29\frac{3}{4}^{\circ}$, both below the cypher. Having taken these out, I put in two others, a mercurial one formerly described, and a spirit thermometer; the former of which became stationary at 40° and the latter at 30° . I then decanted the fluid quicksilver, to examine the internal surface of the frozen metal, which proved very uneven, with many radii going across; some of which resembled pin-heads, Urgent business called me away an hour. On my return I found a small portion only had liquefied in my absence. I then broke the vial entirely, and with a hammer repeatedly struck the quicksilver. It beat out flat, yielded a deadish sound, and became fluid in less than a minute afterwards.---It may be worth remarking, that the quicksilver in one of the thermometers, which had sunk to very near 500, and was then at 444, very readily run up and down the tube by elevating either end of the instrument."

These are all the well authenticated accounts of the congelation of mercury by the natural cold of the atmosphere. Some others have been published; but being either less important, or not so well authenticated, we forbear to mention them. A very considerable confirmation is obtained from the above history, of the theory of congelation delivered by Dr Black, and which is fully explained under the article CHEMISTRY. On Mr Hutchin's experiments, and on congelation in general, Mr Cavendish makes many valuable remarks; the substance of which is as follows.

"If a vessel of water, with a thermometer in it, be exposed to the cold, the thermometer will sink several degrees below the freezing point, especially if the water be covered up so as to be defended from the wind, and care taken not to agitate it; and then on dropping in a bit of ice, or on mere agitation, spiculæ of ice shoot suddenly through the water, and the inclosed thermometer rises quickly to the freezing point, where it remains stationary." In a note he says, that though in conformity to the common opinion he has allowed that "mere agitation may set the water a freezing, yet some experiments lately made by Dr Blagden seem to show, that it has not much, if any, effect of that kind, otherwise than by bringing the water in contact with some substance colder than itself. Though in general also the ice shoots rapidly, and the inclosed thermometer rises very quick; yet he once observed it to rise very slowly, taking up not less than half a minute, before it ascended to the freezing point; but in this experiment the water was cooled not more than one or two degrees below freezing; and it should seem, that the more the water is cooled below the freezing point, the more rapidly the ice shoots and the inclosed thermometer rises."

dish's re-
marks on
congelation.

Congela-
tion.

Mr Cavendish then observes, "that from the foregoing experiments we learn that water is capable of being cooled considerably below the freezing point, without any congelation taking place; and that, as soon as by any means a small part of it is made to freeze, the ice spreads rapidly through the whole of the water. The cause of this rise of the thermometer is, that all, or almost all bodies, by changing from a fluid to a solid state, or from the state of an elastic to that of an unelastic fluid, generate heat; and that cold is produced by the contrary process. Thus all the circumstances of the phenomenon may be perfectly well explained: for, as soon as any part of the water freezes, heat will be generated thereby in consequence of the abovementioned law, so that the new formed ice and remaining water will be warmed, and must continue to receive heat by the freezing of fresh portions of water, till it is heated exactly to the freezing point, unless the water could become quite solid before a sufficient quantity of heat was generated to raise it to that point, which is not the case: and it is evident, that it cannot be heated above the freezing point; for as soon as it comes thereto, no more water will freeze, and consequently no more heat will be generated.--- The reason why the ice spreads all over the water, instead of forming a solid lump in one part, is, that, as soon as any small portion of ice is formed, the water in contact with it will be so much warmed as to be prevented from freezing, but the water at a little distance from it will still be below the freezing point, and will consequently begin to freeze.

"Were it not for this generation of heat, the whole of any quantity of water would freeze as soon as the process of congelation began; and in like manner the cold is generated by the melting of ice; which is the cause of the long time required to thaw ice and snow. It was formerly found that, by adding snow to warm water, and stirring it about until all was melted, the water was as much cooled as it would have been by the addition of the same quantity of water rather more than 150° degrees colder than the snow; or, in other words, somewhat more than 150° of cold are generated by the thawing of the snow; and there is great reason to believe that just as much heat is produced by the freezing of water. The cold generated in the experiment just mentioned was the same whether ice or snow was used.

22
On metals
when be-
ginning to
turn solid.

"A thermometer kept in melted tin or lead till they become solid, remains perfectly stationary from the time the metal begins to harden round the sides of the pot till it is entirely solid; but it cannot be perceived at all to sink below that point, and rise up to it when the metal begins to harden. It is not unlikely, however, that the great difference of heat between the air and melted metal might prevent this effect from taking place; so that though it was not perceived in these experiments, it is not unlikely that those metals, as well as water and quicksilver, may bear being cool-

ed a little below the freezing or hardening point (for the hardening of melted metals, and freezing of water, seems exactly the same process), without beginning to lose their fluidity."

Congela-
tion.

"The experiments of Mr Hutchins prove, that quicksilver contracts or diminishes in bulk by freezing; and that the very low degrees to which the thermometers have been made to sink, is owing to this contraction, and not to the cold having been in any degree equal to that shown by the thermometer. In the fourth experiment, one of the thermometers sunk to 450°, though it appeared, by the spirit thermometers that the cold of the mixture was not more than five or six degrees below the point of freezing quicksilver. In the first experiment also, it sunk to 448, at a time when the cold of the mixture was only 2½ below that point: so that it appears, that the contraction of quicksilver by freezing, must be at least equal to its expansion by 404 degrees of heat. (A) This however, is not the whole contraction that it suffers; for it appears by an extract from a meteorological journal kept by Mr Hutchins at Albany fort, that his thermometer once sunk to 490° below 0; though it was known by a spirit thermometer, that the cold scarcely exceeded the point of freezing quicksilver. There are two experiments also of Professor Braun, in which the thermometer sunk to 544 and 556° below nothing; which is the greatest descent he ever observed without the ball being cracked. It is not indeed known how cold his mixtures were; but from Mr Hutchin's experiments, there is great reason to think they could not be many degrees below 40°. If so, the contraction which quicksilver suffers in freezing, is not much less than its expansion by 500° or 510° of heat, that, is almost ¼ of its whole bulk; and in all probability is never much more than that, though it is probable that this contraction is not always determinate: for a considerable variation may frequently be observed in the specific gravity of the same piece of metal cast different times over; and almost all cast metals become heavier by hammering. Mr Cavendish observed, that on casting the same piece of tin three times over, its density varied from 7.252 to 7.294, though there was great reason to think that no hollows were left in it, and that only a small part of this difference could proceed from the error of the experiment. This variation of density is as much as is produced in quicksilver by an alteration of 66° of heat; and it is not unlikely, that the descent of a thermometer, on account of the contraction of the quicksilver in its ball by freezing, may vary as much in different trials, though the whole mass of quicksilver is frozen without any vacuities.

23
Variation
of the den-
sity of me-
tals by fre-
quent cast-
ing.

"The cold produced by mixing spirit of nitre with snow is entirely owing to the melting of the snow. Now, in all probability, there is a certain degree of cold in which the spirit of nitre, so far from dissolving snow, will yield part of its own water, and suf-

24
Offreezing
mixtures.

(A) "The numbers here given are those shown by the thermometer without any correction; but if a proper allowance is made for the error of that instrument, it will appear, that the true contraction was 25° less than here set down; and from the manner in which thermometers have been usually adjusted, it is likely that in the 5th experiment of Mr Hutchins, as well as in those of Professor Braun, the true contraction might equally fall short of that by observation."

Congela-
tion.

suffer that to freeze, as is the case with solutions of common salt; so that if the cold of the materials before mixing is equal to this, no additional cold can be produced. If the cold of the materials is less, some increase of cold will be produced; but the total cold will be less than in the former case, since the additional cold cannot be generated without some of the snow being dissolved, and thereby weakening the acid, and making it less able to dissolve more snow; but yet the less the cold of the materials is, the greater will be the additional cold produced. This is conformable to Mr Hutchins's experiments; for, in the fifth experiment, in which the cold of the materials was -40° , the additional cold produced was only 5° . In the first experiment, in which the cold of the materials was only -23° , an addition of at least 19° of cold was obtained; and by mixing some of the same spirit of nitre with snow in this climate, when the heat of the materials was $+26^{\circ}$, Mr Cavendish was able to sink the thermometer to -29° , so that an addition of 55 degrees of cold was produced.

"It is remarkable, that in none of Mr Hutchins's experiments the cold of the mixture was more than 6° of the spirit thermometer below the freezing point of quicksilver, which is so little, that it might incline one to think that the spirit of nitre used by him was weak. This, however, was not the case; as its specific gravity at 58° of heat was 1,4923. It was able to dissolve $\frac{1}{1.42}$ its weight of marble, and contained

very little mixture of the vitriolic or marine acid: as well as could be judged from an examination of it, it was as little phlogisticated as acid of that strength usually is."

25
Congela-
tion of oil
of vitriol.

Acids, especially those of the mineral kind, powerfully resist congelation. There is, however, a peculiarity with regard to that of vitriol. Mr Chaptal, a foreign chemist, observed that it condensed by the cold of the atmosphere, and the crystals began to melt only at $+70^{\circ}$ of his thermometer; which, if Reaumur's, corresponds to about 47° of Fahrenheit. The crystals were unctuous from the melting acid, and they felt warmer than the neighbouring bodies: the form was that of a prism of six sides, flattened and terminated by a pyramid of six sides, but the pyramid appeared on one end only; on the other, the crystal was lost in the general mass. The pyramid resulted from an assemblage of six isosceles triangles: the oil when the crystal was melted was of a yellowish black; on redistilling it in a proper apparatus, no peculiar gas came over. M. Chaptal repeated his experiments with the highly concentrated acid, but found that it did not freeze; that the density of the acid which he thought froze most easily was to the oil, of the usual strength for sale, as from 63 and 65 to 66; and the necessary degree of cold about 19 of Fahrenheit. Oil of vitriol once melted will not crystallize again with the same degree of cold.

M. Moré, a considerable manufacturer of oil of vitriol at Hadimont near Vervier, in the duchy of Limbourg in Germany, attributes this congelation to the addition of nitrous air. The acid of vitriol is usually separated from sulphur by burning it in close vessels; and the air is supplied by adding to the sulphur a little nitre. He found, that by mixing the acid, ca-

pable of being congealed, with water, or employing it for other purposes, orange-coloured fumes, and the smell of the true nitrous acid, were very evident. When this gas was destroyed, no degree of cold would congeal the acid, whatever was its degree of concentration; and the congelation was generally observed immediately after the process by which the acid was obtained.

Mr Macquer relates, in the second edition of his Chemical Dictionary, article *Vitriolic Acid*, that the Duke d'Ayen had observed the congelation of concentrated vitriolic acid, which had been exposed to a cold expressed by 13 or 14 degrees below 0 on Reaumur's thermometer; but that mixtures, consisting of one part of the abovementioned concentrated acid, with two or more parts of water, could not be frozen by the cold to which he exposed them, till he had diluted the acid so much that its density was to that of water as 104 to 96; in which latter case of congelation it is probable that the water only was frozen, as is the case in dilute solutions of salts. Similar experiments were made by M. de Morveau, and with equal success. Having produced an intense cold by pouring spirit of nitre on pounded ice, he congealed a part of some vitriolic acid which had been previously concentrated; but he observed, that though a very intense cold had been made use of to congeal the acid at first, it nevertheless remained congealed in much smaller degrees of cold, and that it thawed very slowly. This coincides with the observations of M. Chaptal; though the latter observes, that there is some difference between strong oil of vitriol lowered with water, and that produced of a given strength by rectification. The latter always has some colour; and it will not dissolve indigo in such a manner as to carry the colour into the stuff, though the stronger oil, diluted to the same degree, succeeds very well. Some observations were also made by Mr M'Nab at Hudson's Bay, an account of which is given in the Phil. Trans. for 1786 by Mr Cavendish, at whose desire they had been made. From them it appears, that a vitriolic acid, whose specific gravity was to that of water as 1843 to 1000, froze when exposed to a cold of -15° of Fahrenheit's scale; that another more dilute vitriolic acid, consisting of 629 parts of the former concentrated acid, and 351 parts of water, congealed in a temperature of -36 ; and that, when farther diluted, it was capable of sustaining a much greater degree of cold without freezing at all. In these experiments, as well as in those of Mr Morveau, it appeared that the whole of the acid did not congeal, but that part of it retained its fluidity; and on examining the strength of that which remained fluid, Mr Cavendish found that there was very little difference between it and the other; whence he was led to suppose, that the reason of this congelation does not arise from any difference in strength, but on some less obvious quality, and such as constitutes the difference between common and icy oil of vitriol.

In all the experiments hitherto made, however, Mr Cavendish had found some uncertainty in determining the point of easiest freezing; neither could he determine whether the cold necessary for congelation does not increase without any limitation in proportion to the strength of the acid. A new set of experiments were

Congela-
tion.

Congela-
tion.20
Mr Kier's
experi-
ments.

were therefore made by Mr Kier to determine this point. He had observed, after a severe frost at the end of the year 1774 and beginning of 1785, that some vitriolic acid, contained in a corked phial, had congealed, while other bottles containing the same, some stronger and some weaker, retained their fluidity. As the congelation was naturally imputed to the extremity of the cold, he was afterwards surpris'd to find, when the frost ceased, that the acid remained congealed for many days, when the temperature of the atmosphere was sometimes above 40° of Fahrenheit; and when the congealed acid was brought into a warm room on purpose to thaw it, a thermometer placed in contact with it during its thawing continued stationary at 45°. Hence he concluded, that the freezing and thawing point of this acid was nearly at 45°; and accordingly, on exposing the liquor which had been thawed to the air at the temperature of 30°, the congelation again took place in a few hours. From the circumstance of other parcels of the same acid, but of different strengths, remaining fluid, though they had been exposed to a much greater degree of cold, he was led to believe that there must be some certain strength at which the acid is more disposed to congeal than at any other. The specific gravity of the acid which had frozen was to that of water nearly as 1800 to 1000, and that of the stronger acid which had not frozen was as 1846 to 1000, which is the common density of that usually sold in England; and there was not the least difference, excepting in point of strength, between the acid which had frozen and that which had not; Mr Kier having taken the acid some weeks before with his own hands from the bottle which contained the latter, and diluted it with water, till it became of the specific gravity of 1800.

To render the experiment complete, Mr Keir immersed several acids of different strengths in melting snow, instead of exposing them to the air; the temperature of which was variable, whereas that of melting snow was certain and invariable. Those which would not freeze in melting snow were afterwards immersed in a mixture of common salt, snow, and water; the temperature of which, though not so constant and determinate as that of melting snow, generally remained for several hours at 18°, and was sometimes several degrees lower. The intention of adding water to the snow and salt was to lessen the intensity of the cold of this mixture, and to render it more permanent than if the snow and salt alone were mixed. The acids which had frozen in melting snow were five in number; which being thawed and brought to the temperature of 60°, were found on examination to have the following specific gravities, viz. 1786, 1784, 1780, 1778, 1775. Those which had not congealed with the melting snow, but which did so with the mixture of snow, salt, and water, were found, when brought to the temperature of 60°, to be of the following specific gravities, viz. 1814, 1810, 1804, 1794, 1790, 1770, 1759, 1750. Those which remained, and would freeze neither in melting snow nor in the mixture of snow, salt, and water, were of the gravities 1846, 1839, 1815, 1745, 1720, 1700, 1610, 1551. From the first of these it appears, that the medium density of the acids which froze with the na-

tural cold was 1780; and from the second, that at the densities of 1790 and 1770 the acid had been incapable of freezing with that degree of cold. Hence it follows, that 1780 is nearly the degree of strength of easiest freezing, and that an increase or diminution of that density equal to $\frac{1}{10}$ th of the whole, renders the acid incapable of freezing with the cold of melting snow, though this cold is something above the freezing point of the most congealable acid. From the second it appears, that by applying a more intense cold, viz. that produced by a mixture of snow, salt, and water, the limits of the densities of acids capable of congelation were extended to about $\frac{2}{10}$ th above or below the point of easiest freezing: and there seems little reason to doubt, that, by greater augmentations of cold, these limits may be further extended; but in what ratio these augmentations and extensions proceed, cannot be determined without many observations made in different temperatures.

“ But (says Mr Keir) though it is probable that the most concentrated acids may be frozen, provided the cold be sufficiently intense, yet there seems reason to believe, that some of the congelations which have been observed in highly concentrated acids, have been effected in consequence of the density of these acids being reduced nearly to the point of easy freezing by their having absorbed moisture from the air: for the Duke d'Ayen and M. de Morveau exposed their acids to the air in cups or open vessels; and the latter even acquaints us, that on examining the specific gravity of the acid which had frozen, he found it to that of water as 129 to 74; which density being less than that of easiest freezing, proves that the acid he employed, and which he had previously concentrated, had been actually weakened during the experiment. I have several times exposed concentrated oil of vitriol in open vessels in frosty weather; and I have sometimes, but not always, observed a congelation to take place. Upon separating the congealed part, and on examining the specific gravity of the latter after it had thawed, I found that it had been reduced to the point of easiest freezing. When the congealed acid was kept longer exposed it gradually thawed, even when the cold of the air increased; the reason of which is not to be imputed to the heat produced by the moisture of the air mixing with the acid, but principally to the diminution below the point of easiest freezing, which was occasioned by the continued absorption of moisture from the air, and which rendered the acid incapable of continuing frozen without a great increase of cold,

“ It appears, then, that the concentration of M. de Morveau's acid, at the time of its congelation, from which circumstance Mr Cavendish infers generally that the vitriolic acid freezes more easily as it is more dense, is not a true premise; and that therefore the inference, though justly deduced, is invalid. On the contrary, there seems every reason to believe, that as the density of the acids increases beyond the point of easiest freezing, the facility of the congelation diminishes; at least to as great density as we have ever been able to obtain the vitriolic acid: for if it were possible to divest it entirely of water, it would probably assume a solid form in any temperature of the air.

Congela-
tion.

“ The

Congela-
tion.

“ The crystallization of the vitriolic acid is more or less distinct, according to the slowness of the formation of the crystals and other favourable circumstances. Sometimes they are very large, distinctly shaped, and hard. Their shape is like those of the common mineral alkali and selenite spar, but with angles different in dimensions from either of these. They are solid, consisting of ten faces; of which the two largest are equal, parallel, and opposite to each other; and are oblique-angled parallelograms or rhomboids, whose angles are, as near as could be measured, of 105 and 75 degrees. Between these two rhomboidal faces are placed eight of the form of trapeziums; and thus each crystal may be supposed to be compounded of two equal and similar frustums of pyramids joined together by their rhomboidal bases. They always sunk in the fluid acid to the bottom of the vessel, which showed that their density was increased by congelation. It was attempted to determine their specific gravity by adding to this fluid some concentrated acid, which should make them float in the liquor, the examination of whose specific gravity should ascertain that of the floating crystals; but they were found to sink even in the most concentrated acid, and were consequently denser. Some of the congealable acid previously brought to the freezing temperature was then poured into a graduated narrow cylindrical glass, up to a certain mark, which indicated a space equal to that occupied by 200 grains of water. The glass was placed in a mixture of snow, salt, and water; and when the acid was frozen, a mark was made on the part of the glass to which it had sunk. Having thawed the acid and emptied the glass, it was filled with water to the mark to which it had sunk by freezing; and it was then found that 15 grains more of water were required to raise it to the mark expressing 200 grains; which shows, that the diminution of bulk sustained by the acid in freezing

had been equal to $\frac{1}{13.3}$ of the whole. Computing from

this datum, we should estimate the specific gravity of the congealed acid to have been 1924; but as it evidently contained a great number of bubbles, its real specific gravity must have been considerably greater than the above calculation, and cannot easily be determined on account of these bubbles. By way of comparison, Mr Keir observed the alteration of bulk which water contained in the same cylindrical vessel would suffer by freezing; and found that its expansion was equal to about $\frac{1}{10}$ th of its bulk. The water had been previously boiled, but nevertheless contained a great number of air bubbles; so that in this respect there is a considerable difference between the congelations of water and the vitriolic acid; though perhaps it may arise principally from the bubbles of elastic fluid being in greater proportion in the one than the other.

“ Greater cold is produced by mixing snow or pounded ice with the congealed than with the fluid vitriolic acid, though the quantity is not yet determined. The greatest cold produced by Mr M'Nab at Hudson's Bay, was effected by mixing snow with a vitriolic acid which had been previously congealed; and to this circumstance Mr Cavendish imputes the intensity of the cold, as the liquefaction both of the acid and the snow had concurred in producing the

same effect; while in mixing fluid acids with snow, the thawing of the snow is probably the only productive cause.

“ To compare the times requisite for the liquefaction of ice and of congealed oil of vitriol, two equal and similar glasses were filled, one with the congealable vitriolic acid, the other with water; and after having immersed them in a freezing mixture till both were congealed and reduced to the temperature of 28°, the glasses were withdrawn, wiped dry, and placed in a room where the thermometer stood at 62°. The ice thawed in 40 minutes, and the acid in 95; at the end of which time the thermometer, which stood near the glasses, had risen to 64°. Hence it appears that the congealed acid requires more than twice the time for its liquefaction that ice does, though it cannot thence be fairly inferred, that the cold generated by the liquefaction of the ice and of congealed acid are in the above proportions of the times, from the following considerations, *viz.* that as, during the liquefaction of the ice, its temperature remains stationary at 32°, and during the liquefaction of the acid, its temperature remains about 44 or 45°, it appears, that the ice being considerably colder than the acid, will take the heat from the contiguous air much faster. By this experiment, however, we know that a considerable quantity of cold is generated by the liquefaction of the acid; and hence it appears probable, that in producing cold artificially, by mixing snow with acids in very cold temperatures, it would probably be useful to employ a vitriolic acid of the proper density for congelation, and to freeze it previously to its mixture with snow. It must not, however, be imagined, that the cold generated by the mixture of these two frozen substances is nearly equal to the sums of the colds generated by the separate liquefactions of the congealed acid and ice, when singly exposed to a thawing temperature; for the mixture resulting from the liquefaction, consisting of the vitriolic acid and the water of the snow, appears from the generation of heat which occurs from the mixture of these ingredients in a fluid state, to be subject to different laws than those which rule either of the ingredients separately.

“ The vitriolic acid, like water and other fluids, is capable of retaining its fluidity when cooled considerably below its freezing point. A phial containing some congealable vitriolic acid being placed in a mixture of salt, snow, and water, a thermometer was soon afterwards immersed in it while the acid was yet fluid, on which it quickly sunk from 50 to 29°. On moving the thermometer in the fluid, to make it acquire the exact temperature, the mercury was observed suddenly to rise; and on looking at the acid, numberless small crystals were observed floating in it, which had been suddenly formed. The degree to which the mercury then rose was 46 $\frac{1}{2}$ °; and at another time, while the acid was freezing, it stood at 45°.”

From these experiments our author infers, “ 1. That the vitriolic acid has a point of easiest freezing, and that this is when its specific gravity is to that of water as 1780 to 1000. 2. That the greater or less disposition to congelation does not depend on any other circumstance than the strength of the acid. 3. That the freezing and thawing degree of the most congealable acid is about 45° of Fahrenheit's scale. It is,

however,

Congela-
tion.

Congela-
tion
||
Congeries.

however, to be observed, that this degree is inferred from the temperature indicated by the thermometers immersed in the freezing and thawing acids; but the congelation of the fluid acid could never be accomplished without exposing it to a greater degree of cold, either by exposing it to the air in frosty weather or to the cold of melting snow. 4. Like water, this acid possesses the property of retaining its fluidity when cooled several degrees below the freezing point; and of rising suddenly to it when its congelation is promoted by agitation, or by contact even with a warmer thermometer. 5. That, like water and other congelable fluids, the vitriolic acid generates cold by its liquefaction, and heat during its congelation, though the quantity of this heat and cold remains to be determined by future experiments. 6. That the acid, by congelation, when the circumstances for distinct crystallization are favourable, assumes a regular crystalline form, a considerable solidity and hardness, and a density much greater than it possessed in its fluid state."

Besides this species of congelation, the vitriolic acid is subject to another, probably the same described by Basil Valentine and some of the older chemists. This is effected in the ordinary temperature of the air, even in summer; and, according to Mr Keir*, is peculiar to that species of oil of vitriol which is distilled from green vitriol, and which is possessed of a smoking quality in a high degree; "for not only the authors (says Mr Keir), by whom this congelation has been observed, have given this description of the acid employed, but also the late experiments of Mr Dollfus, seem to show that this smoking quality is essential to the phenomenon: for neither the acid obtained from vitriol, when deprived by rectification of its smoking quality, nor the English oil of vitriol, which is known to be obtained by burning sulphur, and which does not smoke, were found by his trials to be susceptible of this species of congelation. It may, however, be worth the attention of those chemists who have an opportunity of seeing this *icy oil of vitriol*, as it is called, to observe more accurately than has yet been done, the freezing temperature and the density of the congelable acids; and to examine whether the density of this smoking acid also is connected with the glacial property. It seems also further deserving of investigation, whether there be not some analogy between the congelation of the smoking oil of vitriol and the very curious crystallization which Dr Priestley observed in a concentrated vitriolic acid saturated with nitrous acid vapours; and whether this smoking quality does not proceed from some marine or other volatile acid, which may be contained in the martial vitriol whence the vitriolic acid is obtained."

Mr Keir also observes, that M. Cornatter has effected the crystallization of vitriolic acid, by distilling it with nitrous acid and charcoal; and we can add from our own experience, that a crystallization instantly takes place on allowing the fumes of the nitrous and vitriolic acids to mix together; and this, whether the former be procured from martial vitriol or sulphur, and whether it be in a phlogisticated state or not, concentration in both acids is here the only requisite.

CONGER, in zoology. See MURENA.

CONGERIES, a Latin word, sometimes used in

our language for a collection or heap of several particles or bodies united into one mass or aggregate.

CONGESTION, in medicine, a mass or collection of humours, crowded together and hardened in any part of the body, and there forming a preternatural tumor.

Congestion is effected by little and little: in which it differs from *defuccion*, which is more sudden.

CONGIARIUM, CONGIARY, among medalists, a gift or donative represented on a medal. The word comes from the Latin *congius*; because the first presents made to the people of Rome consisted in wine and oil, which were measured out to them in *congii*. The congiary was properly a present made by the emperors to the people of Rome. Those made to the soldiers were not called *congiaries* but *donatives*. The legend on medals representing *congiaries*, is, *Congiarium* or *Liberalitas*. Tiberius gave a congiary of three hundred pieces of money to each citizen: Caligula twice gave three hundred sesterces a head: Nero, whose congiaries are the first that we find represented on medals, gave four hundred.

CONGIUS, a liquid measure of the ancient Romans, containing the eighth part of the amphora, or the fourth of the urna, or six sextarii. The congius in English measure contains 2,070,676 solid inches; that is seven pints, 4,942 solid inches.

CONGLOBATE GLAND. See ANATOMY.

CONGLOMERATE GLAND. *Ibid.*

CONGLOMERATE Flowers, are those growing on a branching foot-stalk, to which they are irregularly but closely connected. This mode of inflorescence, as Linnæus terms it, is opposed to that in which the flowers are irregularly and loosely supported on their foot-stalks, hence termed a *diffuse panicle**. The term is exemplified in several of the grasses, particularly in some species of the *poa*, fescue grass, and *agrostis*.

CONGLUTINATION, the gluing or fastening any two bodies together by the intromission of a third, whose parts are unctuous and tenacious, in the nature of glue. See GLUE.

CONGO, a kingdom of Africa, bounded on the north by the river Zair, or Zarah, which divides it from Loanga; on the south by the river Danda, which separates it from Angola; on the east by the kingdoms of Fungono and Metamba, and the burnt mountains of the sun, those of chrysal or salt-petre and silver, or (according to Anthony Cavazzi, a late traveller into those parts) by the mountains of Boanza, Bembela, and the great mountain of Chilandia or Aquilonda; and on the west by that part of the Atlantic ocean called the Ethiopic sea, or the sea of Congo. According to these limits, Congo Proper extends about three degrees from north to south; lying between 6° and 9° S. Lat.; but widens in its breadth inland, by the course of the river Zair, which runs winding above two degrees more to the north. Its length from east to west is very uncertain, as no observations have been taken of the exact situation of those mountains which bound it.

The history of this kingdom affords but few interesting particulars. Before its discovery by the Portuguese, the history is altogether uncertain and fabulous, as the inhabitants were totally unacquainted with

Congestion

Extent.

2
History uncertain and fabulous.

Congo. letters and learning. So little were they acquainted with chronology, that it is said they did not even distinguish between day and night; much less could they compute their time by moons or years; and therefore could remember past transactions only by saying they happened in such a king's reign.

³
The country discovered by the Portuguese.

The country was discovered by the Portuguese in 1484. The discoverer was named Diego Cam, an expert and bold sailor. He was very well received by the natives, and sent some of his men with presents to the king; but they being detained by unexpected accidents beyond the promised time of their return, Cam was obliged to sail away without them, and took with him four young Congoese, as hostages for the safety of his countrymen. These he taught the Portuguese language, in which they made such progress that king John was highly pleased, and sent them back next year to Congo with rich presents; charging them to exhort their monarch, in his name, to become a convert to the Christian religion, and to permit it to be propagated through his dominions. A firm alliance was concluded between the two monarchs, which continues to this day, though not without some interruptions, to which the Portuguese themselves have given occasion more than the natives.

⁴
Cavazzi's account of Congo.

Any particular account we have of this kingdom, rests almost entirely on the credit of Anthony Cavazzi, the traveller abovementioned. He was a capuchin-friar, a native of the duchy of Modena, and was sent missionary into those parts *de propaganda fide*, in the year 1654, and arrived at Congo the same year. During his stay there, his zeal to make converts made him travel through all these different kingdoms; and the credit he gained, as well as the great employments he was intrusted with, gave him an opportunity of informing himself of every thing relating to them with great exactness. The extent and situation, however, he could not possibly ascertain, for want of instruments, nor hath this defect been since supplied. According to him, the dominions of Congo extended a great deal further eastward and southward before the introduction of Christianity than afterwards; a great number of the states that were under the Congoese monarchs, either as subjects, or tributary, having withdrawn their allegiance out of dislike to them on that account. Not content with opposing the officers and troops that came annually to raise the tribute imposed by the king, they made such frequent and powerful incursions into his dominions, that they obliged him to draw his forces nearer the centre of Congo to prevent an invasion; by which means the kingdom, from an extent of 600 leagues, was reduced to less than one half.

⁵
Extent lessened since the introduction of Christianity.

⁶
Account of the climate and seasons.

Congo Proper being situated within the torrid zone, is liable to excessive heats: as it lies on the southern side of the equinoctial, the seasons are of course opposite to ours. They reckon only two principal seasons, the summer and winter; the former begins in October, and continues till February or March; during which time the sun's rays dart with such force, that the atmosphere appears to an European to be in a flame. The excessive heat, however, is mitigated by the equal length of the days and nights, as well as by the winds, breezes, rains, and dews. The winter takes up the other part of the year; and is said by the natives to

be proportionally cold, though to an European it would appear hot. These two seasons they divide into six lesser ones, *viz.* Massanza, Neasu, Ecundi, Quitombo, Quibiso, and Quibangala.

Congo.

Massanza begins with the month of October, which is the beginning of their spring. The rains begin to fall at that time, and continue during the next two, and sometimes three, months. When they do so, the low lands are commonly overflowed by the extraordinary floods, and all their corn carried off. A disaster of this kind is commonly followed by a famine; for the lazy inhabitants take no care to lay up any provisions, although such misfortunes happen very frequently. This first season they reckon commences at the time the plants begin to spring.

The second season, Neasu, begins about the end of January, when the produce of their lands has arrived at its full height, and wants but a few days of being ripened for harvest. This first crop is no sooner gathered in, than they sow their fields afresh, their land commonly yielding them two harvests.

The third and fourth seasons, called *Ecundi* and *Quitombo*, are frequently blended together towards the middle of March, when the more gentle rains begin to fall, and continue to do so till the month of May. These two seasons are distinguished by the greater or lesser quantity of rain that falls during that interval. During the rest of the time, the air is either very clear, hot, and dry; or the clouds being overcharged with electric matter, burst out into the most terrible thunders and lightnings, without yielding the least drop of rain, though they seem loaded with it.

The two last, *viz.* the *Quibiso* and *Quibangala*, make up their short winter, which consists not in frost or snow, but in dry, blasting winds, which strip the earth of all its verdure, till the next Massanza begins to restore them to their former bloom.

They now divide their year into twelve lunar months, and begin it in September. They have also weeks consisting of four days only, the last of which is their sabbath; and on it they religiously abstain from every kind of work. This practice, the compilers of the Universal History conjecture to have arisen from the extreme laziness for which this people, and indeed all the African nations, are so remarkable. To this shameful indolence also is to be ascribed the little produce they reap from their lands, while the Portuguese settled among them, who are at more pains in the cultivation of theirs, enjoy all manner of plenty. The natives, however, had rather run the risk of the most terrible famines, than be at the tenth part of the labour they see the Portuguese take. They seem to think it below them to use any other exercises than those of dancing, leaping, hunting, shooting, &c.; the rest of their time they spend in smoking, and downright idleness, committing the laborious part of their household affairs to their slaves, or, in want of them, to their wives. Nothing is more common than to see these poor creatures toiling in the fields and woods with a child tied to their backs, and fainting under their excessive labour and heavy burdens, or (which is still worse) hunger and thirst. What is yet more surprisngly shameful is, that though they have plenty of domestic animals which they might easily make use of for cultivating their grounds, and for other laborious

⁷
Natives excessively indolent.

Congo. ous services, and though they see the Portuguese do it every day to great advantage; yet they will rather see their tender females sink under their toil and labour, than be at the trouble of breeding up any of these useful creatures to their assistance.

8 Vegetables produced in Congo. The ground produces variety of grain, but no corn or rice except what is cultivated by the Portuguese. Their maize, or Indian wheat, grows very strong, and is well laden. This, being well ground, they make into bread, or boil with water into a kind of pap. Of this they have four kinds; one of which resembling what we call French wheat, is produced in plenty, and makes some amends for the want of industry in the people. They cultivate also a variety of the pease and bean kind: but what they chiefly live upon, as most suitable to their lazy disposition, is a kind of nut, like our filberds, which fall to the ground of themselves, and are to be found every where; every nut that falls to the ground producing a new shrub next year. They have scarcely any fruit-trees but what have been brought thither by the Portuguese. They have various sorts of palm-trees, useful both by their fruit, leaves, and their juice, which is easily converted into wine; also by affording a kind of oil with which they dress their victuals, though the Europeans use it only to burn in their lamps. They have also a vast number of plants and shrubs, which it would be impossible to describe or enumerate. Wheat is the only thing that the ground will not produce. It pushes forth, indeed, the straw and the ear; the former of which grows high enough, we are told, to hide a man on horseback, but the latter is empty, without one grain fit for use. Father Labat, however, who had lived a considerable time in some of the American islands, where he had observed the same thing, tells us, that he had the curiosity to examine those ears more carefully and had found some few grains; and that, having sowed them afresh, they produced very long ears, full of large heavy grain. Whence he conjectures, that if the Portuguese had tried the same experiment in their African settlements, it might perhaps have been attended with the same success.

9 Hazardous travelling. In the low lands the grass grows so high, rank, and thick, that it becomes one of the most dangerous receptacles for wild beasts, serpents, and other venomous insects: on this account travelling is exceedingly hazardous, as they have few beaten roads in the whole country, and travellers are obliged to march over it through vast plains, in continual danger of being devoured or stung to death; to say nothing of the manifold diseases produced by the unwholesome dews with which the grass is covered during some part of the day. The only method of guarding against all these evils effectually, is by setting fire to the grass in the hot weather, when it is quite parched by the heat of the sun: but even this cannot be done without the greatest danger; because both the wild beasts and venomous reptiles, being roused out of their places of retirement, will fly furiously at those who happen to be in the way. In this case there is no possibility of escaping, but by climbing up the highest trees, or defending one's self by fire-arms or other weapons. In such emergencies, the natives have a much better chance than the Europeans; the former being able to climb trees with surprising swiftness;

while the latter must be assisted with rope-ladders, which they commonly cause their blacks to carry about with them, and to go up and fasten to one of the branches. Congo.

10 Great variety of flowers. The flowers are here exceedingly beautiful and numerous. Almost every field and grove yields a much nobler prospect than the European gardens can boast of, notwithstanding the pains bestowed on their cultivation. The flowers are remarkable, not only for the prodigious variety of their colours, but the vast quantity of heads which grow upon one stalk. In the day-time, indeed, they seem to have lost their natural fragrancy; that being in some measure exhaled by the heat of the sun: but this is amply compensated after its setting, and more especially a little before its rising, when their sweetness is again condensed, and revived by the coldness and dews of the night, after which they exhale their various refreshing scents in a much higher degree than ours. The lilies, which there grow naturally in the fields, valleys, and woods, excel those of our gardens, not only in their extreme whiteness, but much more in a delightful fragrancy, without offending the head, as the European lilies do by their faintish sweetness. The tulips which there grow wild, though generally called *Persic*, have something so surprisingly charming in the variety and combination of their colours, that they dazzle the eyes of an intense beholder: neither do their flowers grow singly as with us, but ten or twelve upon one stalk; and with this double advantage, that they diffuse a very reviving and agreeable sweetness, and continue much longer in their full bloom. Of the same nature are their tuberoses, hyacinths, and other native flowers; which spring up in vast groups of 100 and 200 from one root, though somewhat smaller than ours; some of them finely variegated, and all of them yielding an agreeable smell. The roses, jessamines, and other exotics brought thither from Europe or America, come up likewise in great perfection; but require a constant supply of water, and diligent attendance, to prevent them from degenerating. The American jessamine, in particular, instead of single flowers, will grow up by dozens in a bunch: some of them of an exquisite white, and others of the colour of the most vivid fire.

11 Animals of different kinds. A vast variety, of animals of different kinds are found in the kingdom of Congo; the chief of which are the elephant. This creature is mostly found in the province of Bamba, which abounds with woods, pasture, and plenty of water; the elephants delighting much to bathe themselves during the heat of the day. They commonly go in troops of an hundred or more; and some of them are of such a monstrous size, that we are told the print of their hoof hath measured four, nay seven, spans in diameter. From the hair of their tails, and that of some other animals, the natives, especially the women, weave themselves collars, bracelets, girdles, &c. with variety of devices and figures, which denote their quality; and are in such esteem, that the hair of two elephants tails is sufficient to buy a slave. The reason of this is, that the natives have not the art of taming them, but are obliged to send some of their bravest and stoutest men to hunt them in the woods; which is not done without great labour and danger, they being here exceedingly fierce. The most common way of hunting them

Cogno. them is by digging deep holes in the ground, the top of which they cover with branches and leaves, as is practised in most parts of Asia.

Lions, leopards, tigers, wolves, and other beasts of prey, abound here in great plenty, and do much damage. Here are also a vast variety of monkeys of all sizes and shapes. The zebra, well known for its extreme beauty and swiftness, is also met with in this country. They have also a variety of buffaloes and wild asses; but the *dante* seems to be an animal peculiar to this kingdom. It is shaped and coloured much like an ox, though not so large. Its skin is commonly bought by the Portuguese, and sent into Germany to be tanned and made into targets, which are then called *dantes*. The natives make use of their raw hide dried to make their shields; which are so tough that no arrow or dart can pierce them; and they are also large enough to cover the whole body. The creature is vastly swift; and when wounded, will follow the scent or smoke of the gunpowder with such fury, that the hunter is obliged to climb up a tree with all possible speed; and this retreat he always takes care to secure before he ventures to fire. The wounded beast finding its enemy out of its reach, stays for him at the foot of the tree, and will not stir from it; of which the hunter taking the advantage, dispatches it with repeated shots. The forests of Congo also swarm with wild dogs, who, like the wolves, prey upon the tame cattle, and are so fierce that they will attack armed men. Their teeth are exceeding keen and sharp; they never bark, but make a dreadful howling when famished or in pursuit of their prey.

12
Birds.

This country also abounds with all the different kinds of birds that are to be found in other warm climates. One sort, which they call *birds of music*, is greatly esteemed, insomuch that persons of the highest rank have from time immemorial taken the greatest delight in keeping them in cages and aviaries for the sake of their surprising melody. On the other hand, as the Congoese are superstitious to the last degree, there are several kinds of birds which they look upon as ominous, and are so terrified at the sight or hearing of them, that if they were going to enter upon ever so momentous an expedition, if they were met in council, or going to engage an enemy with ever so great an advantage, the flight or cry of such birds would throw them into a general panic, and disperse them in the utmost haste and confusion. The most dreadful of the ominous kind are the crows, ravens, bats, and owls. The great owl is the most terrible of all, and to him they give the name of *kariem pemba*, by which words they likewise denote the devil.

13
Ants very
dangerous.

Fish of different kinds abound on the coasts of Congo in great numbers; but the inland parts are infested with such numbers of serpents, scorpions, and other venomous insects as are perhaps sufficient to overbalance every natural advantage we have yet mentioned. The most pernicious and dangerous kind are the ants; of which they reckon no less than six several species of different colours and sizes; all of them formidable on account of their prodigious numbers, and the mischief they do not only to the fruits of the earth, but to men and beasts; whom they will surround in the night time, and devour even to the very bone. It is a common practice, we are told, to condemn persons guilty of

some atrocious crimes to be stripped naked, tied hand and foot, and thrown into a hole where these insects swarm; where they are sure to be devoured by them in less than 24 hours to the very bones. But criminals are not the only persons who are in danger from the jaws of these little devouring insects. People may be attacked by them, as we have already hinted, in the night time, and while they are sleeping in their beds. This obliges the natives to be careful where they lie down, and to kindle a small fire, or at least to have a circle of burning hot embers round their beds. This caution is still more necessary in the country villages and hamlets, where persons are otherwise in danger of being attacked by millions of them in the dead of the night. In such a case, the only expedient to save one's self is to jump up as soon as one feels the bite, to brush them off with all possible speed, and then at once to set the house on fire. The danger is still greater in travelling through the country where a person is often obliged to take up his lodging on the bare ground; and may be overtaken during the heat of the day with such profound sleep, as not to be wakened by these diminutive animals till they have made their way through the skin; and in such a case nothing will prevent their devouring a man alive, though there were ever so many hands to assist him. In such incredible quantities do these creatures abound, notwithstanding the great numbers of monkeys who are continually ferreting the ants out of their retreats, and feed upon them with the utmost avidity. This can only be ascribed to the natural laziness and indolence of the inhabitants; which is such, that they not only neglect to rid their lands of them by proper cultivation, but will suffer their houses, nay even their very churches, to be undermined by them. Another kind of these destructive vermin lie so thick upon the paths and highways, that a person cannot walk without treading upon, and having his legs and thighs almost devoured by them. A third sort of a white and red colour, but very small, will gnaw their way through the hardest wood, penetrate into a strong chest, and in a little while devour all the cloths, linen, and every thing that is in it. A fourth sort, small and black, leave a most intolerable stench upon every thing they touch or crawl over, whether cloths or household-stuff, which are not easily sweetened again; or if they pass over victuals, they are entirely spoiled. A fifth sort harbour chiefly on the leaves and branches of trees; and if a man chance to climb up thither to save himself from a wild beast, he is so tormented by them, that nothing but the fear of the jaws of the one could make him endure the stings of the other. A sixth sort is of the flying kind; and is probably one of the former kinds, that live wholly under ground, till nature furnishes them with wings. After this, they rise in such swarms as darken the air, and would make terrible havoc among all kinds of vegetables, did not the natives come out against them in whole companies, and by dint of flaps, and other flat weapons, knock them down by myriads, and then laying them in heaps, set fire to their wings, which half broils them for food. Amidst all this variety of pernicious insects, however, they have one species of a more friendly and profitable kind, *viz.* the industrious bee, which furnishes the inhabitants with honey and wax in such plenty, that there is

Cogno.

Congo. scarce a hollow tree, cleft of a rock, or chop of the earth, in which their combs are not found in great quantities.

14 Congo very populous With respect to the populousness of the kingdom of Congo, some authors, writing either from mere conjecture, or at best precarious inferences, have represented it as thinly peopled. The accounts of the missionaries and Portuguese, however, are directly opposite to these. They found the country for the most part covered with towns and villages, and these swarming with inhabitants; the cities well filled with people, particularly the metropolis, which is said to contain above 50,000 souls. The provinces, though not equally populous, yet in the whole make up such an amount, as plainly proves, that what is wanting in the one is amply made up by the other. We are told, that the duchy of Bamba is still able to raise 200,000 fighting men, and was formerly in a condition to raise double that number; and that the army of the king of Congo, in the year 1665, consisted of 900,000 fighting men, who were attended by an infinite number of women, children, and slaves. The numbers of the Congoese will appear the more credible, when we consider the extreme fecundity of their women, the hardiness with which they bring up their children, and the stoutness and healthiness of their men. In some villages, if the missionaries are to be credited, the number of children is so great, that a father will part with one or two, for any commodity he wants, or even for some trifling bawble he fancies; so that the number of slaves they sell abroad seldom amounts, *communibus annis*, to less than 15,000 or 16,000.

15 Congoese have a high opinion of themselves. There is scarce a nation on earth that have a higher opinion of themselves or their country, than the Congoese, or that is more hardened against all conviction to the contrary, from reason, experience, or the most impartial comparison with other countries in Europe or Asia. Indeed, it is impossible they should think otherwise, when it is one of the fundamentals of their belief, that the rest of the world was the work of angels, but that the kingdom of Congo, in its full and ancient extent, was the handywork of the Supreme Architect; and must of course have vast prerogatives and advantages over all others. When told of the magnificence of the European and Asiatic courts, their immense revenues, the grandeur of their palaces and edifices, the richness and happiness of their subjects, the great progress they have made in the arts and sciences, to which their country is wholly a stranger, they coolly answer, that all this comes vastly short of the dignity and splendor of the kings and kingdom of Congo; and that there can be but one Congo in the world, to the happiness of whose monarch and people all the rest were created to contribute, and to whose treasury the sea and rivers pay their constant tribute of 'zimbis (or shells, which are their current coin); whilst other princes must condescend to enrich themselves by digging through rocks and mountains, to come at the excrements of the earth, so they style gold and silver which are in such request among other nations. Accordingly, they imagine, that the nations which come to traffic with them, are forced to that servile employment by their poverty and the badness of their country, rather than induced to it by luxury or avarice; whilst they themselves can indulge their natural indo-

lence or sloth, though attended with the most pinching poverty, rather than disgrace the dignity of their blood by the least effort of industry, which, how laudable and beneficial soever, is looked upon by them as only a lesser degree of slavery. But though they generally esteem it so much below their dignity to apply to any useful work, they think it no disgrace to beg or steal. With respect to the first, they are said to be the most shameless and importunate beggars in the world. They will take no denial, spare no crouching, lying, prayers, to obtain what they want, nor curses and ill language when sent away without it. With regard to the last, they deem no theft unlawful or scandalous, except it be committed in a private manner, without the knowledge of the person wronged. It is esteemed a piece of bravery and gallantry to wrench any thing from another by violence; and this kind of theft is so common, not only among the vulgar, but also among the great ones, that they make no scruple, in their travels from place to place, to seize not only upon all the provisions they meet with in towns and villages, but upon every thing else that falls in their way. These violences oblige the poor people to conceal the few valuables they have, in some secret place out of the knowledge and reach of those harpies; and they think themselves well off if they can escape a severe bastonading, or other cruel usage frequently inflicted upon them, in order to make them discover the place of their concealment.

The complexion of the natives, both men and women, is black, though not in the same degree; some being of a much deeper black than others. Their hair is black and finely curled; some have it also of a dark sandy colour; their eyes are mostly of a fine lively black; but some are of a dark sea colour. They have neither flat noses nor thick lips like the Nubians and other negroes. Their stature is mostly of the middle size; and, excepting their black complexion, they much resemble the Portuguese. In their temper they are mistrustful, envious, jealous, and treacherous; and where they once take a distaste or affront, will spare no pains, nor stick at any means, however base, to be avenged of, and crush their enemy under their feet. There is no such thing among them as natural affection. A husband, if an heathen, may take as many wives as he pleases; and if a Christian, may have any number of concubines, whom he may divorce at pleasure, or even sell them though with child. So little regard have they for their children, that there is scarce one among them who will not sell a son or a daughter, or perhaps both, for a piece of cloth, a collar or girdle of coral or beads, and often for a bottle of wine or brandy.

The religion of the Congoese in many parts is downright idolatry, accompanied with the most ridiculous superstitions, and the most absurd and detestable rites invented by their gangas or priests; and even in those parts where Christianity is professed, it is so darkened by superstitions of one kind or other, that we may justly question whether the people are any gainers by the exchange.

The government of this kingdom is monarchical, and as despotic as any in Asia or Africa. The kings are the sole proprietors of all the lands within their dominions; and these they can dispose of to whom they

Government.

Congo, Congregation. they please, upon condition they pay a certain tribute out of them: upon failure of the payment of which, or any other neglect, they turn them out. Even the princes of the blood are subjected to the same law; so that there is no person of any rank or quality whatever that can bequeath a foot of land to his heirs or successors; and when these owners under the crown die, the lands immediately return to it again, whether they were in their possession, or had been left to ever so many tenants under them; so that it entirely depends on the prince whether these lands shall be continued in the same, or be disposed into other hands. The Portuguese, however, since their settling in these parts, have prevailed upon the monarchs to permit the heirs and successors to continue in the quiet possession of such lands, in order to avoid the confusions, or even rebellions, which the alienation and deprivation of them frequently occasioned, and to oblige the tenants of them to pay their tribute more exactly and readily than they did before.

20 Commerce. St Salvador is the chief place of traffic the Portuguese and other Europeans have in this country. There are thought to be about 4000 of them settled here, who trade with most parts of the kingdom. The chief commodities they bring thither are either the product of Brazil or European manufactures. The former consist chiefly of grains, fruits, plants, &c.; the latter of Turkey carpets, English cloth, and other stuffs; copper, brass vessels, some kinds of blue earthen-ware, rings, and ornaments of gold, silver, and other baser metals; coral, glass beads, bugles, and other trinkets; light stuffs made of cotton, woollen, and linen for cloathing; and a great variety of tools and other utensils. In return for these, they carry off a great number of slaves, amounting to 15,000 or 16,000 annually, as we have already observed. Formerly they used also to carry away elephants teeth, furs, and other commodities of the country; but these branches of commerce are now greatly decayed, and the slave-trade is what the Portuguese merchants principally depend on.

CONGO, a term applied to tea of the second quality.

CONGREGATION, an assembly of several ecclesiastics, united so as to constitute a body.

The term is principally used for assemblies of cardinals appointed by the pope, and distributed into several chambers, for the discharge of certain functions and jurisdictions, after the manner of our offices and courts. The first is the congregation of the holy office, or the inquisition: the second, that of jurisdiction over bishops and regulars: the third, that of councils; this has power to interpret the council of Trent: the fourth, that of customs, ceremonies, precedencies, canonizations, called *the congregation of rites*: the fifth, that of St Peter's fabric, which takes cognizance of all causes relating to piety and charity, part whereof is due to the church of St Peter: the sixth, that of waters, rivers, roads: the seventh, of fountains and streets: the eighth, that of the index, which examines the books to be printed or corrected: the ninth, that of the council of state, for the management of the territories belonging to the pope and church (see **CAMERLINGO**): the tenth, *de bono regimine*; of which two last the cardinal-nephew is chief; the eleventh,

that of money: the twelfth, that of bishops, wherein those who are to be promoted to bishoprics in Italy are examined; this is held before the pope: the thirteenth, that of consistorial matters; the chief whereof is the cardinal-dean: the fourteenth, a congregation for propagating the faith (see **COLLEGE**): and the fifteenth, that of ecclesiastical immunity, for settling suits against churchmen. There is also a congregation of alms, which takes care of every thing that relates to the subsistence of Rome and the state of the church.

CONGREGATION is also used for a company or society of religious cantoned out of this or that order; and making, as it were, an inferior order, or a subdivision of the order itself. Such are the congregations of the oratory, and those of Cluny, &c. among the Benedictines.

The word is also used for assemblies of pious persons in manner of fraternities, frequent among the Jesuits in honour of the Virgin, &c. It is likewise applied to the audience in a church, particularly as consisting of the inhabitants of the same parish.

CONGREGATIONALISTS, in church history, a sect of Protestants who reject all church government, except that of a single congregation under the direction of one pastor.

CONGRESS, in political affairs, an assembly of commissioners, envoys, deputies, &c. from several courts meeting to concert matters for their common good.

CONGRESS, in America, is the assembly of delegates from the United States. See **AMERICA**.

CONGRESS, in a judicial sense, the trial made by appointment of a judge before surgeons and matrons, in order to prove whether or no a man be impotent, before sentence is passed for the dissolution of a marriage solicited upon such a complaint.

Neither the civil nor canon law makes any mention of the trial of virility by congress. It had its origin in France from the boldness of a young fellow, who, in open court, having been hard pressed by his wife, demanded the congress. The judge, surpris'd with the novelty of the demand, found it could not be denied, as being the surest evidence that the case could admit of. In time it became a branch in the French jurisprudence, and was authorized by decreets and arrets. It obtained for about 120 years; and was annulled by an arret of parliament in 1677, as being found precarious; some having failed under the experiment out of mere modesty and shame, which is found to have the same effect with actual impotency.

CONGREVE (William), a younger brother of an ancient family in Staffordshire. His father was employed in the stewardship of the great estate of the Earl of Burlington in Ireland, where he resided many years; and our author was born there in 1672. Mr Congreve entered into the Middle-Temple when he came to England, and began to study the law; but his bias was toward polite literature and poetry. His first performance was a noval, intituled, *Incognita*, or *Love and Duty reconciled*. He soon after began his comedy of *the Old Bachelor*; which was the amusement of some leisure hours during a slow recovery from a fit of illness soon after his return to England; yet was in itself so perfect, that Mr Dryden, on its being shown to him, declared he had never in his life seen such a first play.

When

Congregation
||
Congreve.

Congreve. When brought on the stage in 1693, it met with such universal approbation, that Mr Congreve, though he was but 19 years old at the time of his writing it, became now considered as a prodigy to the declining stage, and a rising genius in dramatic poetry. The next year he produced the *Double Dealer*; which, for what reason is not obvious, did not meet with so much success as the former. The merit of his first play, however, had obtained him the favour and patronage of Lord Halifax, and some peculiar mark of distinction from Queen Mary; on whose death, which happened in the close of this year, he wrote a very elegant elegiac pastoral. In 1695, when Betterton opened the new house in Lincoln's-Inn Fields, Mr Congreve, joining with him, gave him his comedy of *Love for Love*, with which the company opened their campaign; and which met with such success, that they immediately offered the author a share in the management of the house, on condition of his furnishing them with one play yearly. This offer he accepted; but whether through indolence, or that correctness which he looked upon as necessary to his works, his *Mourning Bride* did not come out till 1697, nor his *Way of the World* till two years after that. The indifferent success this last mentioned play, though an exceeding good one, met with from the public, completed that disgust to the theatre, which a long contest with Jeremy Collier, who had attacked the immoralities of the English stage, and more especially some of his pieces, had begun, and he determined never more to write for the stage. However, though he quitted dramatic writing, he did not lay down the pen entirely; but occasionally wrote many little pieces both in prose and verse, all of which stand on the records of literary fame. It is very possible, however, that he might not so soon have given way to this disgust, had not the easiness of his circumstances rendered any subservience to the opinions and caprice of the town absolutely unnecessary to him. For his abilities having very early in life raised him to the acquaintance of the Earl of Halifax, who was then the Mæcenas of the age; that nobleman, desirous of raising so promising a genius above the necessity of too hasty productions, made him one of the commissioners for licensing hackney-coaches; or, according to Coxeter, a commissioner of the wine-licence. He soon after bestowed on him a place in the pipe-office; and not long after gave him a post in the customs worth 600 l. *per annum*. In the year 1718, he was appointed secretary of Jamaica; so that, with all together, his income towards the later part of his life was upwards of 1200 l. a-year.

The greatest part of the last 20 years of his life was spent in ease and retirement; and he either did not, or affected not to give himself any trouble about reputation. Yet some part of that conduct might proceed from a degree of pride; to which purpose, T. Cibber, in his lives of the poets, Vol. IV. p. 93. relates the following anecdote of him: "When the celebrated Voltaire was in England, he waited upon Mr Congreve, and passed some compliments upon the merit and reputation of his works. Congreve thanked him; but at the same time told that ingenious foreigner, that he did not choose to be considered as an author, but only as a private gentleman, and in that light expected to be visited. Voltaire answered, that

if he had never been any thing but a private gentleman, in all probability he had never been troubled with that visit." He observes, in his own account of the transaction, that he was not a little disgusted with so unseasonable a piece of vanity.

Towards the close of his life he was much afflicted with the gout; and making a tower to Bath for the benefit of the waters, was unfortunately overturned in his chariot; by which, it is supposed, he got some inward bruise, as he ever after complained of a pain in his side; and, on his return to London, continued gradually declining in his health, till the 19th of January 1729, when he died, aged 57; and, on the 26th following, was buried in Westminster Abbey, the pall being supported by persons of the first distinction.

CONGRUITY, a suitability or relation of agreement between things.

The terms *congruity* and *propriety* are not applicable to any single object: they imply a plurality, and obviously signify a particular relation between different objects. Thus we currently say, that a decent garb is suitable or proper for a judge; modest behaviour for a young woman; and a lofty style for an epic poem: and, on the other hand, that it is unsuitable or incongruous to see a little woman sunk into an overgrown farthingale, a coat richly embroidered covering coarse and dirty linen, a mean subject in an elevated style, an elevated subject in a mean style, a first minister darning his wife's stocking, or a reverend prelate in lawn sleeves dancing a hornpipe.

The perception we have of this relation, which seems peculiar to man, cannot proceed from any other cause, but from a *sense* of congruity or propriety; for, supposing us destitute of that sense, the terms would be to us unintelligible.

It is a matter of experience, that congruity or propriety, wherever perceived, is agreeable; and that incongruity or impropriety, wherever perceived, is disagreeable. The only difficulty is, to ascertain what are the particular objects that in conjunction suggest these relations; for there are many objects that do not: the sea, for example, viewed in conjunction with a picture, or a man viewed in conjunction with a mountain, suggest not either congruity or incongruity. It seems natural to infer, what will be found true by induction, that we never perceive congruity nor incongruity but among things that are connected together by some relation; such as a man and his actions, a principal and his accessories, a subject and its ornaments. We are indeed so framed by nature, as, among things so connected, to require a certain suitability or correspondence, termed *congruity* or *propriety*; and to be displeased when we find the opposite relation of *incongruity* or *impropriety*.

If things connected be the subject of congruity, it is reasonable before-hand to expect, that a degree of congruity should be required proportioned to the degree of the connection. And upon examination we find this to hold in fact: where the relation is intimate, as between a cause and its effect, a whole and its parts, we require the strictest congruity; but where the relation is slight, or accidental, as among things jumbled together in the same place, we require little or no congruity: the strictest propriety is required

Congruity. quired in behaviour and manner of living; because a man is connected with these by the relation of cause and effect: the relation between an edifice and the ground it stands upon, is of the most intimate kind; and therefore the situation of a great house ought to be lofty; its relation to neighbouring hills, rivers, planes, being that of propinquity only, demands but a small share of congruity: among members of the same club, the congruity ought to be considerable, as well as among things placed for show in the same niche: among passengers in a stage-coach, we require very little congruity: and less still at a public spectacle.

Congruity is so nearly allied to beauty, as commonly to be held a species of it; and yet they differ so essentially as never to coincide: beauty, like colour, is placed upon a single subject; congruity upon a plurality: further, a thing beautiful in itself, may, with relation to other things, produce the strongest sense of incongruity.

Congruity and propriety are commonly reckoned synonymous terms; but they are distinguishable; and the precise meaning of each must be ascertained. Congruity is the genus of which propriety is a species; for we call nothing *propriety*, but that congruity or suitability which ought to subsist between sensible beings and their thoughts, words, and actions.

In order to give a full view of these secondary relations, we shall trace them through some of the most considerable primary relations. The relation of a part to the whole, being extremely intimate, demands the utmost degree of congruity; even the slightest deviation is disgusting.

Examples of congruity and incongruity are furnished in plenty by the relation between a subject and its ornaments. A literary performance intended merely for amusement, is susceptible of much ornament, as well as a music-room or a play-house; for in gaiety, the mind hath a peculiar relish for show and decoration. The most gorgeous apparel, however improper in tragedy, is not unsuitable to opera-actors: the truth is, an opera, in its present form, is a mighty fine thing; but as it deviates from nature in its capital circumstances, we look not for nature nor propriety in those which are accessory. On the other hand, a serious and important subject admits not much ornament; nor a subject that of itself is extremely beautiful: and a subject that fills the mind with its loftiness and grandeur, appears best in a dress altogether plain.

To a person of a mean appearance, gorgeous apparel is unsuitable; which, besides the incongruity, has a bad effect; for by contrast it shows the meanness of appearance in the strongest light. Sweetness of look and manner, requires simplicity of dress, joined with the greatest elegance. A stately and majestic air requires sumptuous apparel, which ought not to be gaudy, nor crowded with little ornaments. A woman of consummate beauty can bear to be highly adorned, and yet shows best in a plain dress:

————— For loveliness
Needs not the foreign aid of ornament,
But is when unadorn'd, adorn'd the most.

Thomson's Autumn, 208.

Congruity regulates not only the quantity of ornament, but also the kind. The ornaments that em-

bellish a dancing-room ought to be all of them gay. Congruity. No picture is proper for a church but what has religion for its subject. All the ornaments upon a shield ought to relate to war; and Virgil, with great judgment, confines the carvings upon the shield of *Aeneas* to the military history of the Romans: but this beauty is overlooked by Homer; for the bulk of the sculpture upon the shield of Achilles, is of the arts of peace in general, and of joy and festivity in particular: the author of *Telemachus* betrays the same inattention, in describing the shield of that young hero.

In judging of propriety with regard to ornaments, we must attend, not only to the nature of the subject that is to be adorned, but also to the circumstances in which it is placed: the ornaments that are proper for a ball, will appear not altogether so decent at public worship; and the same person ought to dress differently for a marriage-feast and for a burial.

Nothing is more intimately related to a man, than his sentiments, words, and actions; and therefore we require here the strictest conformity. When we find what we thus require, we have a lively sense of propriety: when we find the contrary, our sense of impropriety is not less lively. Hence the universal distaste of affectation, which consists in making a show of greater delicacy and refinement than is suited either to the character or circumstance of the person.

Congruity and propriety, wherever perceived, appear agreeable; and every agreeable object produceth in the mind a pleasant emotion: incongruity and impropriety, on the other hand, are disagreeable; and of course produce painful emotions. These emotions, whether pleasant or painful, sometimes vanish without any consequence; but more frequently occasion other emotions, which we proceed to exemplify.

When any slight incongruity is perceived in an accidental combination of persons or things, as of passengers in a stage-coach, or of individuals dining at an ordinary; the painful emotion of incongruity, after a momentary existence, vanisheth without producing any effect. But this is not the case of propriety and impropriety: voluntary acts, whether words or deeds, are imputed to the author; when proper, we reward him with our esteem; when improper, we punish him with our contempt. Let us suppose, for example, a generous action suited to the character of the author, which raises in him and in every spectator the pleasant emotion of propriety: this emotion generates in the author both self esteem and joy; the former when he considers the relation to the action; and the latter when he considers the good opinion that others will entertain of him: the same emotion of propriety produceth in the spectators esteem for the author of the action; and when they think of themselves, it also produceth, by means of contrast, an emotion of humility. To discover the effects of an unsuitable action, we must invert each of these circumstances: the painful emotion of impropriety generates in the author of the action both humility and shame; the former when he considers his relation to the action, and the latter when he considers what others will think of him: the same emotion of impropriety produceth in the spectators contempt for the author of the action; and it also produceth, by means of contrast, when they think of them-

Congruity. themselves, an emotion of self-esteem. Here then are many different emotions, derived from the same action, considered in different views by different persons; a machine provided with many springs, and not a little complicated. Propriety of action, it would seem, is a chief favourite of nature, when such care and solicitude is bestowed upon it. It is not left to our own choice; but, like justice, is required at our hands; and, like justice, is enforced by natural rewards and punishments: a man cannot, with impunity, do any thing unbecoming or improper; he suffers the chastisement of contempt inflicted by others, and of shame inflicted by himself. An apparatus so complicated, and so singular, ought to rouse our attention: for nature doth nothing in vain; and we may conclude with great certainty, that this curious branch of the human constitution is intended for some valuable purpose.

A gross impropriety is punished with contempt and indignation, which are vented against the offender by corresponding external expressions: nor is even the slightest impropriety suffered to pass without some degree of contempt. But there are improprieties, of the slighter kind, that provoke laughter: of which we have examples without end, in the blunders and absurdities of our own species: such improprieties receive a different punishment, as will appear by what follows. The emotions of contempt and of laughter occasioned by an impropriety of this kind, uniting intimately in the mind of the spectator, are expressed externally by a peculiar sort of laugh, termed a *laugh of derision* or *scorn*. An impropriety that thus moves not only contempt, but laughter, is distinguished by the epithet of *ridiculous*; and a laugh of derision or scorn is the punishment provided for it by nature. Nor ought it to escape observation, that we are so fond of inflicting this punishment, as sometimes to exert it even against creatures of an inferior species: witness a turkey cock swelling with pride, and strutting with displayed feathers; a ridiculous object, which in a gay mood is apt to provoke a laugh of derision.

We must not expect, that these different improprieties are separated by distinct boundaries: for of improprieties, from the slightest to the most gross, from the most risible to the most serious, there are degrees without end. Hence it is, that in viewing some unbecoming actions, too risible for anger, and too serious for derision, the spectator feels a sort of mixt emotion, partaking both of derision and of anger; which accounts for an expression, common with respect to the impropriety of some actions, that we know not whether to laugh or be angry.

It cannot fail to be observed, that in the case of a risible impropriety, which is always slight, the contempt we have for the offender is extremely faint, tho' derision, its gratification, is extremely pleasant. This disproportion between a passion and its gratification, seems not conformable to the analogy of nature. In looking about for a solution, we must reflect upon what is laid down above, that an improper action not only moves our contempt for the author, but also, by means of contrast, swells the good opinion we have of ourselves. This contributes, more than any other article, to the pleasure we have in ridiculing follies and absurdities; and accordingly, it is well known, that they who put the greatest value upon themselves

are the most prone to laugh at others. Pride, which is a vivid passion, pleasant in itself, and not less so in its gratification, would singly be sufficient to account for the pleasure of ridicule, without borrowing any aid from contempt. Hence appears the reason of a noted observation, That we are the most disposed to ridicule the blunders and absurdities of others, when we are in high spirits; for in high spirits, self-conceit displays itself with more than ordinary vigour.

With regard to the final causes of congruity and impropriety; one, regarding congruity, is pretty obvious, that the sense of congruity, as one principle of the fine arts, contributes in a remarkable degree to our entertainment. Congruity, indeed, with respect to quantity, coincides with proportion: when the parts of a building are nicely adjusted to each other, it may be said indifferently, that it is agreeable by the congruity of its parts, or by the proportion of its parts. But propriety, which regards voluntary agents only, can never be the same with proportion: a very long nose is disproportioned, but cannot be termed *improper*. In some instances, it is true, impropriety coincides with disproportion in the same subject, but never in the same respect; for example, a very little man buckled to a long Toledo: considering the man and the sword with respect to size, we perceive a disproportion; considering the sword as the choice of the man, we perceive an impropriety.

The sense of impropriety with respect to mistakes, blunders, and absurdities, is happily contrived for the good of mankind. In the spectators, it is productive of mirth and laughter, excellent recreation in an interval from business. But this is a trifle in respect of what follows. It is painful to be the subject of ridicule; and to punish with ridicule the man who is guilty of an absurdity, tends to put him more upon his guard in time coming. Thus even the most innocent blunder is not committed with impunity; because, were errors licensed where they do no hurt, inattention would grow into a habit, and be the occasion of much hurt.

The final cause of propriety as to moral duties, is of all the most illustrious. To have a just notion of it, the moral duties that respect others must be distinguished from those that respect ourselves. Fidelity, gratitude, and the forbearing injury, are examples of the first sort; temperance, modesty, firmness of mind, are examples of the other: the former are made duties by the sense of justice; the latter by the sense of propriety. Here is a final cause of the sense of propriety, that must rouse our attention. It is undoubtedly the interest of every man, to suit his behaviour to the dignity of his nature, and to the station allotted him by Providence; for such rational conduct contributes in every respect to happiness, by preserving health, by procuring plenty, by gaining the esteem of others, and, which of all is the greatest blessing, by gaining a justly-founded self-esteem. But in a matter so essential to our well-being, even self-interest is not relied on: the powerful authority of duty is superadded to the motive of interest. The God of nature, in all things essential to our happiness, hath observed one uniform method: to keep us steady in our conduct, he hath fortified us with natural laws and principles, which prevent many aberrations, that would daily happen were we totally surrendered to so fallible a guide as human

Congruity. human reason. Propriety cannot rightly be considered in another light, than as the natural law that regulates our conduct with respect to ourselves; as justice is the natural law that regulates our conduct with respect to others. We call propriety a law, not less than justice; because both are equally rules of conduct that ought to be obeyed: propriety includes this obligation; for to say an action is proper, is, in other words, to say, that it *ought* to be performed; and to say it is improper, is, in other words, to say that it *ought* to be forborne. It is this very character of *ought* and *should* that makes justice a law to us; and the same character is applicable to propriety, though perhaps more faintly than to justice: but the difference is in degree only, not in kind; and we ought, without hesitation or reluctance, to submit equally to the government of both.

But it must, in the next place, be observed, that to the sense of propriety, as well as of justice, are annexed the sanctions of rewards and punishments; which evidently prove the one to be a law as well as the other. The satisfaction a man hath in doing his duty, joined with the esteem and good-will of others, is the reward that belongs to both equally. The punishments also, though not the same, are nearly allied; and differ in

degree more than in quality. Disobedience to the law of justice, is punished with remorse; disobedience to the law of propriety, with shame, which is remorse in a lower degree. Every transgression of the law of justice raises indignation in the beholder; and so doth every flagrant transgression of the law of propriety. Slighter improprieties receive a milder punishment: they are always rebuked with some degree of contempt, and frequently with derision. In general, it is true, that the rewards and punishments annexed to the sense of propriety, are slighter in degree than those annexed to the sense of justice: which is wisely ordered, because duty to others is still more essential to society than duty to ourselves; for society could not subsist a moment were individuals not protected from the headstrong and turbulent passion of their neighbours.

Congruity,
Coni.

CONI, a strong town of Italy in Piedmont, and capital of a territory of that name, with a good citadel. The town being divided into two factions, it surrendered to the French in 1641; but was restored to the Duke of Savoy soon after. It is seated at the confluence of the rivers Gresse and Sture. E. Long. 7. 29. N. Lat. 44. 23.

C O N I C S E C T I O N S

ARE curve lines formed by the intersections of a cone and plane.

If a cone be cut by a plane through the vertex, the section will be a triangle ABC, Plate CXLVI. fig. 1.

If a cone be cut by a plane parallel to its base, the section will be a circle. If it be cut by a plane DEF, fig. 1. in such a direction, that the side AC of a triangle passing through the vertex, and having its base BC perpendicular to EF, may be parallel to DP, the section is a parabola; if it be cut by a plane DR, fig. 2. meeting AC, the section is an ellipse; and if it be cut by a plane DMO, fig. 3. which should meet AC extended beyond A, it is an hyperbola.

If any line HG, fig. 1. be drawn in a parabola perpendicular to DP, the square of HG will be to the square of EP, as DG to DP; for let LHK be a section parallel to the base, and therefore a circle, the rectangle LGK will be equal to the square of HG, and the rectangle BPC equal to the square of EP; therefore these squares will be to each other as their rectangles; that is, as BP to LG, that is DP to DG.

SECT. I. *Description of Conic Sections on a Plane.*

1. P A R A B O L A.

“LET AB, fig. 4. be any right line, and C any point without it, and DKF a ruler, which let be placed in the same plane in which the right line and point are, in such a manner that one side of it, as DK, be applied to the right line AB, and the other side KF coincide with the point C; and at F, the extremity of the side KF, let be fixed one end of the thread FNC, whose length is equal to KF, and the other extremity of it at the point C, and let part of the thread, as FG, be brought close to the side KF by a small pin G; then let the square DKF be moved

VOL. V.

“from B towards A, so that all the while its side DK be applied close to the line BA, and in the meantime the thread being extended will always be applied to the side KF, being stopt from going from it by means of the small pin; and by the motion of the small pin N there will be described a certain curve, which is called a *semi-parabola*.

“And if the square be brought to its first given position, and in the same manner be moved along the line AB, from B towards H, the other semi-parabola will be described.”

The line AB is called the *directrix*; C, the focus; any line perpendicular to AB, a diameter; the point where it meets the curve, its vertex; and four times the distance of the vertex from the directrix, its latus rectum or parameter.

2. E L L I P S E.

“If any two points, as A and B, fig. 5. be taken in any plane, and in them are fixed the extremities of a thread, whose length is greater than the distance between the points, and the thread extended by means of a small pin C, and if the pin be moved round from any point until it return to the place from whence it began to move, the thread being extended during the whole time of the revolution, the figure which the small pin by this revolution describes is called an *ellipse*.”

The points AB are called the *foci*; D, the *centre*; EF, the *transverse axis*; GH, the *lesser axis*; and any other line passing through D, a *diameter*.

3. H Y P E R B O L A.

“If to the point A, fig. 6. in any plane, one end of the rule AB be placed, in such a manner, that about that point, as a centre, it may freely move;

T t

“and

“ and if to the other end B, of the rule AB, be fixed
 “ the extremity of the thread BDC, whose length is
 “ smaller than the rule AB, and the other end of the
 “ thread, being fixed in the point C, coinciding with
 “ the side of the rule AB, which is in the same plane
 “ with the given point A; and let part of the thread,
 “ as BD, be brought close to the side of the rule AB,
 “ by means of a small pin D; then let the rule be
 “ moved about the point A, from C towards T, the
 “ thread all the while being extended, and the re-
 “ maining part coinciding with the side of the rule
 “ being stopt from going from it by means of the
 “ small pin, and by the motion of the small pin D, a
 “ certain figure is described which is called the *semi-*
 “ *hyperbola.*”

The other semi-hyperbola is described in the same way, and the opposite HKF, by fixing the ruler to C, and the thread to A, and describing it in the same manner. A and C are called *foci*; the point G, which bisects AC, the centre; KE, the transverse axis; a line drawn through the centre meeting the hyperbolas, a transverse diameter; a line drawn through the centre, perpendicular to the transverse axis, and cut off by the circle MN, whose centre is E, and radius equal to CG, is called the *second axis*.

If a line be drawn through the vertex E, equal and parallel to the second axis GP and GO be joined, they are called *asymptotes*. Any line drawn through the centre, not meeting the hyperbolas, and equal in length to the part of a tangent parallel to it, and intercepted betwixt the asymptotes, is called a *second diameter*.

An ordinate to any section is a line bisected by a diameter and the abscissa, the part of the diameter cut off by the ordinate.

Conjugate diameters in the ellipse and hyperbola are such as mutually bisect lines parallel to the other; and a third proportional to two conjugate diameters is called the *latus rectum* of that diameter, which is the first in the proportion.

In the parabola, the lines drawn from any point to the focus are equal to perpendiculars to the directrix; being both equal to the part of the thread separated from the ruler.

In the ellipse, the two lines drawn from any point in the curve to the foci are equal to each other, being equal to the length of the thread; they are also equal to the transverse axis. In the hyperbola the difference of the lines drawn from any point to the foci is equal, being equal to the difference of the lengths of the ruler and thread, and is equal to the transverse axis.

From these fundamental properties all the others are derived.

The ellipse returns into itself. The parabola and hyperbola may be extended without limit.

Every line perpendicular to the directrix of a parabola meets it in one point, and falls afterwards within it; and every line drawn from the focus meets it in one point, and falls afterwards without it. And every line that passes through a parabola, not perpendicular to the directrix, will meet it again, but only once.

Every line passing through the centre of an ellipse is bisected by it; the transverse axis is the greatest of

all these lines; the lesser axis the least; and these nearer the transverse axis greater than those more remote.

In the hyperbola, every line passing through the centre, is bisected by the opposite hyperbola, and the transverse axis is the least of all these lines; also the second axis is the least of all the second diameters. Every line drawn from the centre within the angle contained by the asymptotes, meets at once, and falls afterwards within it; and every line drawn through the centre without that angle, never meets it; and a line which cuts one of the asymptotes, and cuts the other extended beyond the centre, will meet both the opposite hyperbolas in one point.

If a line GM, fig. 4. be drawn from a point in a parabola perpendicular to the axis, it will be an ordinate to the axis, and its square will be equal to the rectangle under the abscissa MI and latus rectum; for, because GMC is a right angle, GM^2 is equal to the difference of GC^2 and CM^2 ; but GC is equal to GE, which is equal to MB; therefore GM^2 is equal to $BM^2 - CM^2$; which, because CI and IB are equal, is (8 *Euc.* 2.) equal to four times the rectangle under MI and IB, or equal to the rectangle under MI and the latus rectum.

Hence it follows, that if different ordinates be drawn to the axis, their squares being each equal to the rectangle under the abscissa and latus rectum, will be to each other in the proportion of the abscissas, which is the same property as was shown before to take place in the parabola cut from the cone, and proves those curves to be the same.

This property is extended also to the ordinates of other diameters, whose squares are equal to the rectangle under the abscissas and parameters of their respective diameters.

In the ellipse, the square of the ordinate is to the rectangle under the segments of the diameter, as the square of the diameter parallel to the ordinate to the square of the diameter to which it is drawn, or as the first diameter to its latus rectum; that is, LK^2 fig. 5. is to EKF as EF^2 to GH^2 .

In the hyperbola, the square of the ordinate is to the rectangle contained under the segments of the diameters betwixt its vertices, as the square of the diameter parallel to the ordinate to the square of the diameter to which it is drawn, or as the first diameter to its latus rectum; that is, SX^2 is to EXK as MN^2 to KE^2 .

Or if an ordinate be drawn to a second diameter, its square will be to the sum of the squares of the second diameter, and of the line intercepted betwixt the ordinate and centre, in the same proportion: that is, RZ^2 fig. 6. is to ZG^2 added to GM^2 , as KE^2 to MN^2 . These are the most important properties of the conic sections; and, by means of these, it is demonstrated, that the figures are the same described on a plane as cut from the cone; which we have demonstrated in the case of the parabola.

SECT. II. Equations of the Conic Sections

ARE derived from the above properties. The equation of any curve, is an algebraic expression, which denotes the relation betwixt the ordinate and abscissa; the abscissa being equal to x , and the ordinate equal to y .

If

If p be the parameter of a parabola, then $y^2 = px$; which is an equation for all parabolas.

If a be the diameter of an ellipse, p its parameter; then $y^2 : ax - xx :: p : a$; and $y^2 = \frac{p}{a} \times ax - xx$; an equation for all ellipses.

If a be a transverse diameter of a hyperbola, p its parameter; then $y^2 : a x + xx :: p : a$, and $y^2 = \frac{p}{a} \times ax + xx$.

If a be a second diameter of an hyperbola, then $y^2 = aa + xx :: p : a$; and $y^2 = \frac{p}{a} \times aa + xx$; which are equations for all hyperbolas.

As all these equations are expressed by the second powers of x and y , all conic sections are curves of the second order; and conversely, the locus of every quadratic equation is a conic section, and is a parabola, ellipse, or hyperbola, according as the form of the equation corresponds with the above ones, or with some other deduced from lines drawn in a different manner with respect to the section.

Sect. III. *General Properties of Conic Sections.*

A tangent to a parabola bisects the angle contained by the lines drawn to the focus and directrix; in an ellipse and hyperbola, it bisects the angle contained by the lines drawn to the foci.

In all the sections, lines parallel to the tangent are ordinates to the diameter passing through the point of contact; and in the ellipse and hyperbola, the diameters parallel to the tangent, and those passing through the points of contact, are mutually conjugate to each other. If an ordinate be drawn from a point to a diameter, and a tangent from the same point which meets the diameter produced; in the parabola, the part of the diameter betwixt the ordinate and tangent will be bisected in the vertex; and in the ellipse and hyperbola, the semi-diameter will be a mean proportion betwixt the segments of the diameter betwixt the centre and ordinate, and betwixt the centre and tangent.

The parallelogram formed by tangents drawn thro' the vertices of any conjugate diameters, in the same ellipse or hyperbola, will be equal to each other.

SECT. IV. *Properties peculiar to the Hyperbola.*

As the hyperbola has some curious properties arising from its asymptotes, which appear at first view almost incredible, we shall briefly demonstrate them:

1. The hyperbola and its asymptotes never meet; if not, let them meet in S , fig. 6.; then by the property of the curve the rectangle KXE is to SX^2 as GE^2 to GM^2 or EP^2 ; that is, as GX^2 to SX^2 ; wherefore, KXE will be equal to the square of GX ; but the rectangle KXE , together with the square of GE , is also equal to the square of GX ; which is absurd.

2. If a line be drawn through a hyperbola parallel to its second axis, the rectangle, by the segments of that line, betwixt the point in the hyperbola and the asymptotes, will be equal to the square of the second axis.

For if SZ , fig. 6. be drawn perpendicular to the second axis, by the property of the curve, the square of

MG , that is, the square of PE is to the square of GE , as the squares ZG and the square of MG together, to the square of SZ or GX : and the squares of RX and GX are in the same proportion, because the triangles RXG , PEG are equiangular; therefore the squares ZG and MG are equal to the square of RX ; from which, taking the equal squares of SX and ZG , there remains the rectangle RSV , equal to the square of MG .

3. Hence, if right lines be drawn parallel to the second axis, cutting an hyperbola and its asymptotes, the rectangles contained betwixt the hyperbola and points where the lines cut the asymptotes will be equal to each other; for they are severally equal to the square of the second axis.

4. If from any points, d and S , in a hyperbola, there be drawn lines parallel to the asymptotes da SQ and Sb dc , the rectangle under da and dc will be equal to the rectangle under QS and Sb ; also the parallelograms da , Gc , and SQG , which are equiangular, and consequently proportional to the rectangles, are equal.

For draw YW RV parallel to the second axis, the rectangle Yd W is equal to the rectangle Rb V ; wherefore, WD is to SV as RS is to dY . But because the triangles RQS , AYD , and GSV cdW , are equiangular, Wd is to SV as cd to Sb , and RS is to DY as SQ to da ; wherefore, dc is to Sb as SQ to da : and the rectangle dc , da , is equal to the rectangle QS , Sb .

5. The asymptotes always approach nearer the hyperbola.

For, because the rectangle under SQ and Sb or QG , is equal to the rectangle under da and dc , or AG , and QG is greater than aG ; therefore ad is greater than QS .

9. The asymptotes come nearer the hyperbola than any assignable distance.

Let X be any small line. Take any point, as d , in the hyperbola, and draw da , dc , parallel to the asymptotes; and as X is to da , so let aG be to GQ . Draw QS parallel to ad , meeting the hyperbola in S , then QS will be equal to X . For the rectangle SQG will be equal to the rectangle daG ; and consequently SQ is to da as AG to GQ .

If any point be taken in the asymptote below Q , it can easily be shown that its distance is less than the line X .

SECT. V. *Areas contained by Conic Sections.*

THE area of a parabola is equal to $\frac{2}{3}$ the area of a circumscribed parallelogram.

The area of an ellipse is equal to the area of a circle whose diameter is a mean proportional betwixt its greater and lesser axes.

If two lines ad and QS , be drawn parallel to one of the asymptotes of an hyperbola, the space $aQSd$, bounded by these parallel lines, the asymptotes and the hyperbola will be equal to the logarithm of aQ , whose module is ad , supposing aG equal to unity.

SECT. VI. *Curvature of Conic Sections.*

THE curvature of any conic section, at the vertices of its axis is equal to the curvature of a circle whose diameter is equal to the parameter of its axis.

If a tangent be drawn from any other point of a conic section, the curvature of the section in that point will be equal to the curvature of a circle to which the same line is a tangent, and which cuts off from the diameter of the section, drawn through the point, a part equal to its parameter.

SECT. VII. *Uses of Conic Sections.*

ANY body, projected from the surface of the earth, describes a parabola, to which the direction wherein it is projected is a tangent: and the distance of the directrix is equal to the height from which a body must fall to acquire the velocity wherewith it is projected: hence the properties of the parabola are the foundation of gunnery.

All bodies acted on by a central force, which decreases as the square of the distances increases, and impressed with any projectile motion, making any angle with the direction of the central force, must describe conic sections, having the central force in one of the foci, and will describe parabolas, ellipses, and hyperbolas, according to the proportion betwixt the central and projectile force. This is proved by direct demonstration.

The great principle of gravitation acts in this manner; and all the heavenly bodies describe conic sections having the sun in one of the foci; the orbits of the planets are ellipses, whose transverse and lesser diameters are nearly equal: it is uncertain whether the comets describe ellipses with very unequal axes, and so return after a great number of years; or whether they describe parabolas and hyperbolas, in which case they will never return.

SECT. VIII. *Uses of Conic Sections in the Solution of Geometrical Problems.*

MANY problems can be solved by conic sections that cannot be solved by right lines and circles. The following theorems, which follow from the simpler properties of the sections, will give a specimen of this.

A point equally distant from a given point and a given line, is situated in a given parabola.

A point, the sum of whose distances from two given points is given, is situated in a given ellipse.

A point, the difference of whose distances from two given points is given, is situated in a given hyperbola.

C O N

Conichthy-
odontes ||
Conissalæ. CONICHTHYODONTES, or PLECTRONITÆ, in natural history, one of the three names the fossile teeth of fishes are known by.

CONIFERÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, containing the following genera, viz. cupressus, ephedra, equisetum, juniperus, pinus, taxus, thuja.

CONIFEROUS TREES, such as bear hard dry seed-vessels of a conical figure; consisting of several woody parts, being mostly scaly, adhering closely together, and separating when ripe.

CONIMBRICA (anc. geog.), a town of Lusitania, on the south side of the river Monda; from the ruins of which arose *Coimbra*, in its neighbourhood, a city of Portugal. W. Long. 9. 5. Lat. 40. 16.

CONINGSECK, a town of Suabia in Germany, and capital of a county of the same name. E. Long. 9. 23. N. Lat. 47. 50.

CONJOINT, in a general sense, signifies united or connected.

CONJOINT Degrees, in music, two notes which follow each other immediately in the order of the scale, as *ut* and *re*.

CONJOINT Tetrachords, two tetrachords, or fourths, where the same chord is the highest of one and the lowest of the other.

CONISSALÆ, in natural history, a class of fossils naturally and essentially compounded, not inflammable, nor soluble in water, found in detached masses, and formed of crystalline matter debased by earth.

Of this class there are two orders, and of each of these only one genus. Conissalæ of the first order are found in form of a naturally regular and uniform powder; all the genuine particles of which are nearly of one determinate shape, appearing regularly concreted, and not fragments of others once larger. Conissalæ of

C O N

the second order are found in form of a rude, irregular, and shapeless powder, the particles of which are never of any determinate figure, but seem broken fragments of once larger masses. Conjugate
||
Conium.

To the former genus belong the different kinds of sand; and to the latter the *saburræ*, or grits.

CONJUGATE DIAMETER, or *Axis*, of an *Ellipsis*, the shortest of the two diameters, or that bisecting the axis.

CONJUGATION, in grammar, a regular distribution of the several inflexions of verbs in their different voices, moods, tenses, numbers, and persons, so as to distinguish them from one another. See GRAMMAR and LANGUAGE.

CONIUM, HEMLOCK: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The partial involucre are halved, and mostly triphyllous; the fruit subglobose and quinque-friated, the striæ crenated on each side. The species are three; 1. The *maculatum*, or *greater hemlock*, grows naturally on the sides of banks and roads in many parts of Britain. It is a biennial plant which perishes after it has ripened its seeds. It hath a long taper root like a parsnip, but smaller. The stalk is smooth, spotted with purple, and rises from four to upwards of six feet high; branching out toward the top into several smaller stalks, garnished with decomposed leaves, whose lobes are cut at the top into three parts; these are of a lucid green, and have a disagreeable smell. The stalks are terminated by umbels of white flowers, each being composed of about ten rays or small umbels, and have a great number of flowers, which spread open, each sitting upon a distinct footstalk; the seeds are small and channelled, and like those of anniseed. It flowers in June, and the seeds ripen in autumn.

2. The

Conium
||
Conjura-
tion.

2. The *tenuifolium*, with striated seeds, differs from the first in having taller stalks, which are not so much spotted. The leaves are much narrower, and of a paler green; and this difference is constant. It is a biennial plant, and grows naturally in Germany. 3. The *africanum*, with prickly seeds, it a native of the Cape of Good Hope. The plant rarely grows above nine inches high: the lower leaves are divided like those of the small wild rue, and are of a greyish colour, those upon the stock are narrower, but of the same colour; these are terminated by umbels of white flowers, each of the larger umbels being composed of three small ones; the involucre hath three narrow leaves situated under the umbel. This flowers in July and ripens seed in autumn, soon after which the plants decay.

Medicinal Uses. The first species is sometimes applied externally, in a form of decoction, infusion, or poultice, as a discutient. These are apt to exco-riate, and their vapour is to some particularly disa-greeable and hurtful. The stalks are insignificant, and the roots very virulent. With regard to its vir-tue when taken internally, it has been generally ac-counted poisonous; which it doubtless is, in a high degree, when used in any considerable quantity. But Dr Stoerk has lately found, that in certain small doses it may be taken with great safety; and that, without at all disordering the constitution, or even producing any sensible operation, it sometimes proves a powerful resolvent in many obstinate disorders. In scirrhus, the internal and external use of hemlock has been found useful, but then mercury has been generally used at the same time. In open cancer, it often abates the pains, and is free from the constipating effects of opi-um. It is likewise used in scrophulous tumours and ul-cers, and in other ulcers that are only defined by the term ill-conditioned. It is also recommended by some in chin-cough, and various other diseases. Its com-mon, and perhaps best form, is that of the powdered leaves, in the dose at first of two or three grains a-day, which in some cases has been gradually increased to upwards of two ounces a-day, without producing gid-diness. An extract from the seeds is said to produce giddiness sooner than that from the leaves. Hence, while both the London and Edinburgh colleges have given a place to the succus spissatus cicutæ, into the pharmacopœia of the latter an extractum feminum ci-cutæ is also introduced.

CONJUNCT, in a general sense, signifies conjoin-ed, concurrent, or united.

CONJUNCT Rights, in Scots law. See LAW, Part III. n^o clxxx. 15, &c.

CONJUNCT, or *Confident Persons*, in Scots law. Ibid. n^o clxxxiii. 8.

CONJUNCTION, in astronomy, the meeting of two or more stars or planets in the same degree of the zodiac.

CONJUNCTION, in grammar, an indeclinable word or particle, which serves to join words and sentences together, and thereby shows their relation or depend-ence upon one another. See GRAMMAR.

CONJURATION, magic words, characters, or ce-remonies, whereby evil spirits, tempests, &c. are sup-posed to be raised, or driven away. The Romish priests pretend to expel devils, by preparing holy wa-

ter in a particular manner, and sprinkling it over the possessed, with a number of conjurations and exor-cisms.

Some authors make the difference between conju-ration and witchcraft to consist in this; that the for-mer effects its end by prayers and invocation of God's name, &c. to compel the devil to do what is desired, so that the conjurer is supposed to be at war with the devil, and that evil spirit to act merely out of con-straint: whereas the latter attains its end by an im-mediate application to the devil himself; and the de-vil's complaisance is supposed to be the consequence of some compact between them, so that the devil and the witch have a good understanding together. Both these, again, differ from enchanting and sorcery; in that these latter operate secretly and slowly by spells, charms, &c. without ever calling on the devil, or having any conference with him.

CONN See COND.

CONNAUGHT, one of the four provinces of Ire-land, bounded on the east by that of Leinster, on the west by the ocean, on the north and north-west by part of the ocean and province of Ulster, and on the south and east by Munster. It is about 130 miles in length, and 84 in breadth. It has no rivers of any great note besides the Shannon. It has several con-venient bays and creeks, and is fertile in many places. It had several dangerous bogs, over-run with woods, which are now in some measure cleared away. This province produces abundance of cattle, sheep, deer, hawks, and honey; but the inhabitants being lazy, it is the least cultivated of all the four provinces. It contains 1 archbishopric, 5 bishoprics, 6 counties, 7 market towns, 8 places of trade, 10 boroughs that send members to parliament, 47,256 houses, 24 old castles, besides fortresses that have been erected of late, and 330 parishes. The principal town is Galway.

CONNADUS, CEYLON SUMACH: A genus of the decandria order, belonging to the monodelphia class of plants; and in the natural method ranking with those of which the order is doubtful. The stigma is simple, the capsule bivalved, unilocular, and monospermous. There is but one species, viz. The monocarpus. This is a native of India, and rises with a ligneous stalk eight or ten feet high, which is hard, rigid, and co-vered with a black bark, and divides upward into two or three branches garnished with trifoliate leaves, ha-ving long footstalks placed alternate. It is propagated by cutting, and is to be treated in the same manner with other tender exotics.

CONNECTICUT, a large river which gives name to one of the five states of New England, (see the next article). It rises in a swamp on the height of land, in Lat. 45. 10. Long. 4. E. After a sleepy course of eight or ten miles, it tumbles over four separate falls, and turning west keeps close under the hills which form the northern boundary of the vale through which it runs. The Amonoosuck and Israel rivers, two principal branches of Connecti-cut river, fall into it from the east, between the lati-tudes 44° and 45°. Between the towns of Walpole on the east, and Westminster on the west, side of the river, are the great Falls. The whole river, compres-sed between two rocks scarcely 30 feet asunder, shoots with amazing rapidity into a broad basin below. Over these

cut.

Morse's
Geography.

Connecticut.

these falls, a bridge 160 feet in length, was built in 1734, under which the highest floods may pass without detriment. This is the first bridge that was ever erected over this noble river. Above Deerfield in Massachusetts it receives Deerfield river from the west, and Miller's river from the east, after which it turns westerly in a sinuous course to Fighting falls, and a little after tumbles over Deerfield falls, which are impassable by boats. At Windsor in Connecticut it receives Farmington river from the west; and at Hartford meets the tide. From Hartford it passes on in a crooked course, until it falls into Long Island sound, between Saybrook and Lyme.

The length of this river, in a straight line, is nearly 300 miles. Its general course is several degrees west of south. It is from 80 to 100 rods wide, 130 miles from its mouth. At its mouth is a bar of sand which considerably obstructs the navigation. Ten feet water at full tides is found on this bar, and the same depth to Middleton. The distance of the bar from this place, as the river runs, is 36 miles. Above Middleton are several shoals which stretch quite across the river. Only six feet water is found on the shoal at high tide, and here the tide ebbs and flows but about eight inches. About three miles below Middleton the river is contracted to about 40 rods in breadth by two high mountains. Almost every where else the banks are low, and spread into fine extensive meadows. In the spring floods, which generally happen in May, these meadows are covered with water. At Hartford the water sometimes rises 20 feet above the common surface of the river, and having all to pass through the abovementioned strait, it is sometimes two or three weeks before it returns to its usual bed. These floods add nothing to the depth of water on the bar at the mouth of the river; this bar lying too far off in the sound to be affected by them.

On this beautiful river, whose banks are settled almost to its source, are many pleasant, neat, well-built towns. On its western bank, from its mouth northward, are the towns of Saybrook, Haddam, Middleton, Weathersfield, Hartford, Windsor, and Suffield, in Connecticut; West Springfield, Northampton, Hatfield, and Deerfield, in Massachusetts; Guilford, Brattleborough, in which is Fort Dummer, Westminster, Windsor, Hartford, Fairlee, Newbury, Brunswick, and many others in Vermont. Crossing the river into New Hampshire, and travelling on the eastern bank, you pass through Woodbury nearly opposite to Brunswick, Northumberland, the Coos country, Lyman, Orford, Lyme, Hanover, in which is Dartmouth College, Lebanon, Cornish, Clermont, Charleston, or N^o 4, Chesterfield, and many others in New Hampshire, Sunderland, Hadley, Springfield, Long Meadow, in Massachusetts; and in Connecticut, Enfield, East Windsor, East Hartford, Glastenbury, East Haddam, and Lyme.

This river is navigable to Hartford, upwards of 50 miles from its mouth, and the produce of the country for 200 miles above is brought thither in boats. The boats which are used in this business are flat-bottomed, long, and narrow, for the convenience of going up stream, and of so light a make as to be portable in carts. They are taken out of the river at three different carrying places, all of which make 15 miles.

Sturgeon, salmon, and shad, are caught in plenty in their season, from the mouth of the river upwards, excepting sturgeon, which do not ascend the upper falls; besides a variety of small fish, such as pike, carp, perch, &c.

From this river are employed three brigs of 180 tons each, in the European trade; and about 60 sail from 60 to 150 tons, in the West India trade; besides a few fishermen, and 40 or 50 coasting vessels.

CONNECTICUT, one of the five states of New England in America, bounded on the north by Massachusetts; on the east by Rhode Island; on the south, by the sound, which divides it from Long Island; and on the west, by the state of New York.

The divisional line between Connecticut and Massachusetts, as settled in 1713, was found to be about 72 miles in length. The line dividing Connecticut from Rhode Island was settled in 1728, and found to be about 45 miles. The sea coast, from the mouth of Paukatuk river, which forms a part of the eastern boundary of Connecticut, in a direct southwestwardly line to the mouth of Byram river, is reckoned at about 90 miles. The line between Connecticut and New York runs from latitude 41. 0. to latitude 42. 2.; 72 miles. Connecticut contains about 4674 square miles; equal to about 2,960,000 acres.

This state is watered by several fine rivers, the principal of which are, *Connecticut*, described in the preceding article, Housatonic, and the Thames. One branch of the Housatonic rises in Lanestborough, the other in Windsor, both in Berkshire county in Massachusetts. It passes through a number of pleasant towns, and empties into the sound between Stratford and Milford. It is navigable 12 miles, to Derby. A bar of shells, at its mouth, obstructs its navigation for large vessels. In this river, between Salisbury and Canaan, is a cataract, where the water of the whole river, which is 150 yards wide, falls about sixty feet perpendicularly, in a perfectly white sheet. A copious mist arises, in which floating rainbows are seen in various places at the same time, exhibiting a scene exceedingly grand and beautiful.

The Thames empties in Long Island sound at New London. It is navigable 14 miles, to Norwich Landing. Here it loses its name, and branches into Shetucket on the east, and Norwich or Little river on the west. The city of Norwich stands on the tongue of land between these rivers. Little river, about a mile from its mouth, has a remarkable and very romantic cataract. A rock 10 or 12 feet in perpendicular height, extends quite across the channel of the river. Over this the whole river pitches, in one entire sheet, upon a bed of rocks below. Here the river is compressed into a very narrow channel between two craggy cliffs, one of which towers to a considerable height. The channel descends gradually, is very crooked, and covered with pointed rocks. Upon these the water swiftly tumbles, foaming with the most violent agitation, 15 or 20 rods, into a broad basin which spreads before it. At the bottom of the perpendicular falls, the rocks are curiously excavated by the constant pouring of the water. Some of the cavities, which are all of a circular form, are five or six feet deep. The smoothness of the water above its descent—the regularity and beauty of the perpendicular fall—the tremendous roughness

Rivers

Connecticut.

roughness of the other, and the craggy, towering cliff which impends the whole, present to the view of the spectator a scene indescribably delightful and majestic. On this river are some of the finest mill seats in New England, and those immediately below the falls, occupied by Lathrop's mills, are perhaps not exceeded by any in the world. Across the mouth of this river is a broad, commodious bridge, in the form of a wharf, built at a great expence.

Shetucket river, the other branch of the Thames, four miles from its mouth, receives Quinnabog, which has its source in Brimfield in Massachusetts; thence passing through Sturbridge and Dudley in Massachusetts, it crosses into Connecticut, and divides Pomfret from Killingly, Canterbury from Plainfield, and Lisbon from Preston, and then mingles with Shetucket. In passing through this hilly country, it tumbles over many falls, and affords a vast number of mill seats. The source of the Shetucket is not far from that of Quinnabog. It has the name of Willamantik while passing through Stafford, and between Tolland and Willington, Coventry and Mansfield. Below Windham it takes the name of Shetucket, and empties as above. These rivers are fed by numberless brooks from every part of the adjacent country. At the mouth of Shetucket is a bridge of timber 124 feet in length, supported at each end by pillars, and held up in the middle by braces on the top, in the nature of an arch.

2 Harbours.

The two principal harbours are at New London and New Haven. The former opens to the south. From the light-house, which stands at the mouth of the harbour, to the town, is about three miles; the breadth is three quarters of a mile, and in some places more. The harbour has from five to six fathoms water—a clear bottom—tough ooze, and as far as one mile above the town is entirely secure and commodious for large ships. New Haven harbour is greatly inferior to that of New London. It is a bay which sets up northerly from the sound about four miles. Its entrance is about half a mile wide. It has very good anchorage, and two and an half fathoms at low water, and three fathoms and four feet at common tides. The whole of the sea coast is indented with harbours, many of which are safe and commodious, but are not sufficiently used to merit a description.

3 Climate, soil, and productions.

Connecticut, though subject to the extremes of heat and cold in their seasons, and to frequent sudden changes, is very healthful. As many as one in 46 of the inhabitants of Connecticut, who were living in 1774, were upwards of 70 years old. From accurate calculation it is found, that about one in eight live to the age of 70 years and upwards; one in 13 to the age of 80 years, and one in about 30 to the age of 90.

In the maritime towns the weather is variable, according as the wind blows from the sea or land. As you advance into the country, the sea breezes have less effect upon the air, and consequently the weather is less variable. The shortest day is 8 hours and 58 minutes, and the longest 15 hours. The northwest winds, in the winter-season, are often extremely severe and piercing, occasioned by the great body of snow which lies concealed from the dissolving influence of the sun in the immense forests north and northwest. The

2

Connecticut.

clear and serene temperature of the sky, however, makes amends for the severity of the weather, and is favourable to health and longevity. Connecticut is generally broken land, made up of mountains, hills, and valleys; and is exceedingly well watered. Some small parts of it are thin and barren. It lies in the fifth and sixth northern climates, and has a strong fertile soil. Its principal productions are Indian corn, rye, wheat in many parts of the state, oats and barley, which are heavy and good, and of late buck-wheat—flax in large quantities—some hemp, potatoes of several kinds, pumpkins, turnips, peas, beans, &c. &c. fruits of all kinds, which are common to the climate. The soil is very well calculated for pasture and mowing, which enables the farmers to feed large numbers of neat cattle and horses. Actual calculation has evinced, that any given quantity of the best mowing land in Connecticut, produces about twice as much clear profit as the same quantity of the best wheat land in the state of New York. Many farmers, in the eastern part of the state, have lately found their advantage in raising mules, which are carried from the ports of Norwich and New London to the West India islands, and yield a handsome profit. The beef, pork, butter, and cheese of Connecticut, are equal to any in the world.

4 Trade.

The trade of Connecticut is principally with the West India islands, and is carried on in vessels from 60 to 140 tons. The exports consist of horses, mules, oxen, oak staves, hoops, pine boards, oak planks, beans, Indian corn, fish, beef, pork, &c. Horses, live cattle, and lumber, are permitted in the Dutch, Danish, and French ports. Beef and fish are liable to such heavy duties in the French islands, as that little profit arises to the merchant who sends them to their ports. Pork and flour are prohibited. As the ordinance making free ports in the French West India islands extends to all foreigners, the price of molasses and other articles, has been greatly enhanced by the English purchases for Canada and Nova Scotia; so that the trade of Connecticut with the French West India islands is not profitable. Cotton, cocoa, indigo and sugars, are not permitted to be brought away by Americans. The severity with which these prohibitory laws are administered is such, as that these articles cannot be smuggled.

Connecticut has a large number of coasting vessels employed in carrying the produce of the state to other states--- To Rhode Island, Massachusetts, and New Hampshire, they carry pork, wheat, corn, and rye. To North and South Carolinas and Georgia, butter, cheese, salted beef, cyder, apples, potatoes, hay, &c. and receive in return rice, indigo, and money. But as New York is nearer, and the state of the markets always well known, much of the produce of Connecticut, especially of the western parts, is carried there; particularly pot and pearl ashes, flax-seed, beef, pork, cheese, and butter, in large quantities. Most of the produce of Connecticut river, from the parts of Massachusetts, New Hampshire, and Vermont, as well as of Connecticut, which are adjacent, goes to the same market. Considerable quantities of the produce of the eastern parts of the state are marketed at Boston and Providence.

The value of the whole exported produce and commodities from this state, before the year 1774, was then estimated at about L.200,000 lawful money annually,

Connecticut.

nually. Since this time no accurate estimate has been made, so that it is impossible to tell whether the amount has since been increased or diminished.

In 1774, the number of shipping in Connecticut was 180; their tonage 10,317; seafaring men 1162; besides upwards of 20 sail of coasting vessels, which employed about 90 seamen. This state has not yet fully recovered the confusion in which it was involved by the late war; so that the number of shipping, &c. has not, at any period since 1774, been ascertained with accuracy. It is probable, however, considering the losses sustained by the war, the decay of the ship-building business, and the number of unfortunate shipwrecks, and losses by hurricanes in the West Indies, that the shipping and seamen are not now so numerous as in 1774.

5
Manufactures.

The number of shipping from the port of New London employed in 1788 in the European and West India trade, was four ships, one snow, 54 brigantines, 32 schooners, and 45 sloops. The number of horses and cattle exported from the district round New London, from the 10th of January 1787 to the 10th of January 1788, was 6917; besides jack-asses imported and exported, not included. From 1786 to 1787, the number was 6671; so that the last year exceeded the other 246. From March 1787 to January 1788, 1454 horses, 700 oxen, and 23 cows, were exported from the port of Middleton.

The farmers in Connecticut and their families are mostly clothed in plain, decent, homespun cloth. Their linens and woollens are manufactured in the family way; and although they are generally of a coarser kind, they are of a stronger texture, and much more durable than those imported from France and Great Britain. Many of their cloths are fine and handsome.

In New Haven is a linen manufactory which flourishes, and one for cotton is about to be established. In East Hartford is a glass-work, a snuff and powder mill, and an iron-work and slitting-mill. Iron works are established also at Salisbury, Norwich, and other parts of the state. At Stafford is a furnace at which is made large quantities of hollow ware and other ironmongery, sufficient to supply the whole state. Paper is manufactured at Norwich, Hartford, New Haven, and in Litchfield county. Nails of every size are made in almost every town and village in Connecticut; so that considerable quantities can be exported to the neighbouring states, and at a better rate than they can be had from Europe. Ironmongery, hats of the best kinds, candles, leather, shoes, and boots, are manufactured in this state. We must not omit to mention wooden dishes and other wooden ware, which are made in vast quantities in Suffield and some few other places, and sold in almost every part of the eastern states. Oil-mills, of a new and very ingenious construction, have been erected in several parts of the state.

It appears from experiments made formerly in this state, that a bushel of sun-flower seed yields a gallon of oil; and that an acre of ground planted with the seed at three feet a part, will yield between forty and fifty bushels of the seed. This oil is as mild as sweet oil, and is equally agreeable with sallads, and as a medicine. It may, moreover, be used with advantage in paints, varnishes, and ointments. From its being ma-

nufactured in our own country, it may always be procured and used in a fresh state. The oil is pressed from the seed in the same manner that cold drawn linseed oil is obtained from flax-seed, and with as little trouble. Sweet olive oil sells for six shillings a quart. Should the oil of the sun-flower sell for only two-thirds of that price, the produce of an acre of ground, supposing it to yield only 40 bushels of the seed, will be L. 32, a sum far beyond the product of an acre of ground in any kind of grain. The seed is raised with very little trouble, and grows in land of moderate fertility. It may be gathered and shelled, fit for the extraction of the oil, by women and children.

Connecticut is divided into eight counties, *viz.* Hartford, New Haven, New London, Fairfield, Windham, Litchfield, Middlesex, and Tolland. The counties are subdivided into upwards of 80 townships; each of which is a corporation, invested with power to hold lands, choose their own town-officers, to make prudential laws, the penalty of transgression not to exceed 20s. and to choose their own representatives to the general assembly. The townships are generally divided into two or more parishes, in each of which is one or more places for public worship.

Connecticut is the most populous, in proportion to its extent, of any of the thirteen states. It is laid out in small farms from 50 to 300 or 400 acres each, which are held by the farmers in fee simple; and are generally cultivated as well as the nature of the soil will admit. The state is chequered with innumerable roads or highways, crossing each other in every direction. A traveller in any of these roads, even in the most unsettled parts of the state, will seldom pass more than two or three miles without finding a house or cottage, and a farm under such improvements as to afford the necessaries for the support of a family. The whole state resembles a well-cultivated garden; which, with that degree of industry that is necessary to happiness, produces the necessaries and conveniences of life in great plenty.

In 1756, the number of inhabitants in Connecticut was 130,611; in 1774, there were 167,856 souls. In 18 years, the increase was 67,245; from 1774 to 1782, the increase was but 11,294 persons. This comparatively small increase of inhabitants may be satisfactorily accounted for from the destruction of the war, and the numerous emigrations to Vermont, the western parts of New Hampshire, and other states.

The inhabitants are almost entirely of English descent. There are no Dutch, French, or Germans, and very few Scotch or Irish people, in any part of New England.

In addition to what has been already said on these particulars under New England, it may be observed, that the people of Connecticut are remarkably fond of having all their disputes, even those of the most trivial kind, settled according to law. The prevalence of this litigious spirit affords employment and support for a numerous body of lawyers. The number of actions entered annually upon the several dockets in the state, justifies the above observations. That party spirit, however, which is the bane of political happiness, has not raged with such violence in this state as in Massachusetts and Rhode-Island. Public proceedings have been conducted, generally, and especially of late,

Connecticut.

6
Civil divisions and population.7
Character, manners, &c.

late, with much calmness and candour. The people are well informed in regard to their rights, and judicious in the methods they adopt to secure them.

The clergy, who are numerous, and, as a body, very respectable, have hitherto preserved a kind of aristocratical balance in the very democratical government of the state; which has happily operated as a check upon the overbearing spirit of republicanism. It has been lamented that the unhappy religious disputes which have too much prevailed among some of the clergy, and the too great attention that others have paid to their temporal concerns, to the neglect of their flocks, and an inattention to the qualifications of those who have been admitted to the sacred office, have, heretofore, considerably diminished their influence. It is a pleasing circumstance that the rage for theological disputation is abating; and greater strictness is observed in the admission of candidates to the ministry. Their influence is on the increase; and it is no doubt to be attributed, in part, to their increasing influence, that an evident reformation in the manners of the people of this state has taken place since the peace. In regard to learning and abilities, the clergy, at the present day, are equal to their predecessors at any former period.

8 Religion.

As to ecclesiastical government and discipline, each church is a separate jurisdiction, and claims authority to choose their own minister, to exercise government, and to enjoy gospel ordinances within itself. The churches, however, are not independent of each other; they are associated for mutual benefit and convenience. The associations have power to licence candidates for the ministry, to consult for the general welfare, and to recommend measures to be adopted by the churches, but have no authority to enforce them. When disputes arise in churches, councils are called, by the parties, to settle them; but their power is only advisory. There are as many associations in the state as there are counties; and they meet twice in a year. These are all combined in one general association, who meet annually.

All religions that are consistent with the peace of society are tolerated in Connecticut; and a spirit of liberality and catholicism is increasing. There are very few religious sects in this state; the bulk of the people are congregationalists. Besides these there are episcopalians and baptists; and formerly there was a society of Sandimanians at New-Haven; but they are now reduced to a very small number. The episcopalian churches are respectable, and are under the superintendance of a bishop. There were 29 congregations of the baptists in 1784. These congregations, with those in the neighbouring states, meet in associations, by delegation, annually.

9 Chief towns.

There are a great number of very pleasant towns, both maritime and inland, in Connecticut. It contains five incorporated towns or cities. Two of these, Hartford and New Haven, are the capitals of the state. The general assembly is holden at the former in May, and at the latter in October, annually. See HARTFORD and New-HAVEN.

10 Colleges, academies, and schools.

In no part of the world is the education of all ranks of people more attended to than in Connecticut. Almost every town in the state is divided into districts, and each district has a public school kept in it a greater

or less part of every year. Somewhat more than one third of the monies arising from a tax on the polls and rateable estate of the inhabitants, is appropriated to the support of schools, in the several towns, for the education of children and youth. The law directs that a grammar school shall be kept in every county town throughout the state.

There is a grammar school at Hartford, and another at New Haven, supported by a donation of governor Hopkins. This venerable and benevolent gentleman, in his last will, dated 1657, left in the hands of Theophilus Eaton, Esq; and three others, a legacy of L. 1324, "as an encouragement, in these foreign plantations, of breeding up hopeful youths both at the grammar school and college." In 1664, this legacy was equally divided between New Haven and Hartford; and grammar schools were erected, which have been supported ever since.

At Greenfield there is a respectable academy, under the care and instruction of the Rev. Dr Dwight. At Plainfield is another, under the care of the Rev. Mr Benedict. This academy has flourished for several years, and furnished a number of students for Yale and Dartmouth colleges. At Norwich and Windham, likewise, are academies furnished with able instructors; each of these academies have 60 or 70 scholars.

Yale College was founded in 1700, and remained at Killingworth until 1707—then at Saybrook until 1716, when it was removed and fixed at New Haven. See NEW HAVEN.

On the bank of Connecticut river, two miles from Middleton, is a lead mine, which was wrought during the war, at the expence of the state, and was productive. It is too expensive to work in time of peace. Copper mines have been discovered and opened in several parts of the state, but have proved unprofitable, and are much neglected. Iron mines are numerous and productive. Steel ore has been found in the mountains between Woodbury and New Milford. Tales of various kinds, white, brown, and chocolate coloured crystals, zink or spelter, a semimetal, and several other fossils and metals, have been found in Connecticut.

11 Mines, minerals, and fossils.

All freeholders in the state are required by law to give in lists of their polls and rateable estate, to persons appointed in the respective towns to receive them, on or before the 20th of August annually. These are valued according to law, arranged in proper order, and sent to the general assembly annually in May.

12 Mode of levying taxes.

The sum total of the list of the polls and rateable estate of the inhabitants of Connecticut, as brought into the general assembly in May 1787, were as follows:

Sum total of the single list	L. 1,484,901 6 4 $\frac{1}{4}$
Assessments,	- - - 47,790 2 9
One quarter of the fourfolds,	- - - 1,176 9 4

Total, - L. 1,533,867 18 5 $\frac{3}{4}$

On this sum taxes are levied, so much on the pound, according to the sum proposed to be raised. A tax of two-pence on the pound would raise L. 12,782, 4s.

The ordinary annual expences of government before the war amounted to near L. 4000 Sterling, exclusive of that which was appropriated to the support of schools. The expences have since increased.

Mineral
springs.14
Constitution and
courts of
justice.

At Stafford is a medicinal spring, which is said to be a sovereign remedy for scorbutic, cutaneous, and other disorders. At Guilford is a spring, whose water, it is said, when separated from the fountain, will evaporate even when put into a bottle and tightly corked.

It is difficult to say what is the constitution of this state. Contented with the form of government which originated from the charter of Charles II. granted in 1662, the people have not been disposed to run the hazard of framing a new constitution since the declaration of independence. They have tacitly adopted their old charter as the ground of civil government, so far as it is applicable to an independent people.

Agreeable to this charter, the supreme legislative authority of the state is vested in a governor, deputy-governor, twelve assistants or counsellors, and the representatives of the people, styled the *General Assembly*. The governor, deputy governor, and assistants, are annually chosen by the freemen in the month of May. The representatives (their number not to exceed two from each town) are chosen by the freemen twice a year, to attend the two annual sessions, on the second Thursdays of May and October. This assembly has power to erect judicatories, for the trial of causes civil and criminal, and to ordain and establish laws for settling the forms and ceremonies of government. By these laws the general assembly is divided into two branches, called the upper and lower houses. The upper house is composed of the governor, deputy-governor, and assistants; the lower house, of the representatives of the people. No law can pass without the concurrence of both houses. The judges of the superior court hold their offices during the pleasure of the general assembly. The judges of the county courts, and justices, are annually appointed. Sheriffs are appointed by the governor and council, without limitation of time. The governor is captain-general of the militia, the deputy-governor lieutenant-general. All other military offices are appointed by the assembly, and commissioned by the governor.

The mode of electing the governor, deputy governor, assistants, treasurer, and secretary, is as follows: The freemen in the several towns meet on the Monday next after the first Tuesday in April, annually, and give in their votes for the persons they choose for the said offices respectively, with their names written on a piece of paper, which are received and sealed up by a constable in open meeting, the votes for each office by themselves, with the name of the town and office written on the outside. These votes, thus sealed, are sent to the general assembly in May, and there counted by a committee from both houses. All freemen are eligible to any office in government. In choosing assistants, twenty persons are nominated, by the vote of each freeman, at the freemen's meeting for choosing representatives in September annually. These votes are sealed up, and sent to the general assembly in October, and are there counted by a committee of both houses, and the twenty persons who have the most votes stand in nomination; out of which number the twelve who have the greatest number of votes, given by the freemen at their meeting in April, are in May declared assistants in the manner above-mentioned. The qualifications of freemen are, maturity in years,

quiet and peaceable behaviour, a civil conversation, and freehold estate to the value of forty shillings *per annum*, or forty pounds personal estate in the list, certified by the select men of the town; it is necessary also that they take the oath of fidelity to the state. Their names are enrolled in the town clerk's office, and they continue freemen for life, unless disfranchised by sentence of the superior court, on conviction of misdemeanor.

The courts are as follows: The justices of the peace, of whom a number are annually appointed in each town by the general assembly, have authority to hear and determine civil actions, where the demand does not exceed four pounds. If the demand exceeds forty shillings, an appeal to the county is allowed. They have cognizance of small offences, and may punish by fine not exceeding forty shillings, or whipping not exceeding ten stripes, or sitting in the stocks. There are eight county courts in the state, held in the several counties by one judge and four justices of the quorum, who have jurisdiction of all criminal cases, arising within their respective counties, where the punishment does not extend to life, limb, or banishment. They have original jurisdiction of all civil actions which exceed the jurisdiction of a justice. Either party may appeal to the superior court, if the demand exceeds twenty pounds, except on bonds or notes vouched by two witnesses.

There are several courts of probate in each county, consisting of one judge. The peculiar province of this court is, the probate of wills, granting administration of intestate estates, ordering distribution of them, and appointing guardians for minors, &c. An appeal lies from any decree of this court to the superior court.

The superior court consists of five judges. It has authority in all criminal cases extending to life, limb, or banishment, and other high crimes and misdemeanors, to grant divorces, and to hear and determine all civil actions brought by appeal from the county courts, or the court of probate, and to correct the errors of all inferior courts. This is a circuit court, and has two stated sessions in each county annually. The superior and county courts try matters of fact by a jury, or without if the parties will agree.

There is a supreme court of errors, consisting of the deputy governor and the twelve assistants. Their sole business is to determine writs of error brought on judgments of the superior court, where the error complained of appears on the record. They have two stated sessions annually, *viz.* on the Tuesdays of the weeks preceding the stated sessions of the general assembly.

The county court is a court of chancery, empowered to hear and determine cases in equity, where the matter in demand does not exceed one hundred pounds. The superior court has cognizance of all cases where the demand exceeds that sum. Error may be brought from the county to the superior court, and from the superior court to the supreme court of errors, on judgment in cases of equity as well as of law.

The general assembly only have power to grant pardons and reprieves, to grant commissions of bankruptcy, or protect the persons and estates of unfortunate debtors.

Connecticut.

The

Connecticut.

The common law of England, so far as it is applicable to this country, is considered as the common law of this state. The reports of adjudication in the courts of king's bench, common pleas, and chancery, are read in the courts of this state as authorities; yet the judges do not consider them as conclusively binding, unless founded on solid reasons which will apply in this state, or sanctioned by concurrent adjudications of their own courts.

The feudal system of descents was never adopted in this state. All the real estate of intestates is divided equally among the children, males and females, except that the eldest son has a double portion. And all estates given in tail, must be given to some person then in being, or to their immediate issue, and shall become fee-simple estates to the issue of the first donee in tail. The widow of an intestate is intitled to a third part of the personal estate for ever, and to her dower, or third part of the houses and lands belonging to the intestate at the time of his death, during her life.

15
Practice of law.

The practice of law in this state has more simplicity, but less precision, than in England. Assistants and judges are empowered to issue writs through the state, and justices through their respective counties. In these writs, the substance of the complaints or the declarations must be contained; and if neither of the parties show good reason for delay, the causes are heard and determined the same term to which the writs are returnable. Few of the fictions of law, so common in the English practice, are known in this state. The plaintiff always has his election to attach or summon the defendant. Attornies are admitted and qualified by the county courts. Previous to their admission to the bar, they must study two years with a practising attorney in the state, if they have had a college education, and three years if they have not; their morals must be good, and their characters unblemished; and they must sustain an examination by the attorneys of the court of the county where they are admitted, and be by them recommended to the court. When admitted to the county court, they can practice, without other qualifications, in any court in the state. There are upon an average about thirteen attorneys to each county, one hundred and four in the state; a very great proportion for the real exigencies of the people. Yet from the litigious spirit of the citizens, the most of them find employment and support. There is no attorney general, but there is one attorney to the state in each county.

16
History.

The present territory of Connecticut, at the time of the first arrival of the English, was possessed by the Pequot, the Mohegan, Podunk, and many other smaller tribes of Indians.

The Pequots were numerous and warlike. Their country extended along the sea coast from Pankatuk to Connecticut river. About the year 1630, this powerful tribe extended their conquests over a considerable part of Connecticut, over all Long Island, and part of Narraganset. Sassacus, who was the grand monarch of the whole country, was king of this nation. The seat of his dominion was at New London; the ancient Indian name of which was Pequot.

The Mohegans were a numerous tribe, and their territory extensive. Their ancient claim, which was

surveyed and settled by commissioners from queen Anne in 1705, comprehended all New London county, except a narrow strip of about eight miles wide, on the sea coast, almost the whole of the county of Windham, and a part of the counties of Tolland and Hartford. Uncas, distinguished for his friendship to the English, was the Sachem of this tribe.

Connecticut.

The Podunks inhabited East Hartford, and the circumjacent country. The first Sachem of this tribe, of whom the English had any knowledge, was Tatanimoo. He was able to bring into the field more than 200 fighting men.

The first grant of Connecticut was made by the Plymouth council to the earl of Warwick, in 1630, and confirmed by his majesty in council the same year. This grant comprehended all that part of New England which lies west from Narragansett river, 120 miles on the sea coast, from thence, in latitude and breadth asof said, to the fourth sea. The year following, the earl assigned this grant to lord Say and Seal, lord Brook, and nine others.

No English settlements were attempted in Connecticut until the year 1633, when a number of Indian traders, having purchased of Zequasson and Natanawute, two principal Sachems, a tract of land at the mouth of Little river in Windsor, built a house and fortified it, and ever after maintained their right of soil upon the river.

The same year, a little before the arrival of the English, a company of Dutch traders came to Hartford, and built a house which they called the *Hirfe of Good Hope*, and erected a small fort, in which they planted two cannon. The remains of this settlement are still visible on the bank of Connecticut river. This was the only settlement of the Dutch in Connecticut in these ancient times. The Dutch, and after them the province of New York, for a long time claimed as far east as the western bank of Connecticut river. It belongs to the professed historian to prove or disprove the justice of this claim. Douglas says, "The partition line between New York and Connecticut, as established December 1, 1664, run from the mouth of Memorocok river, a little west from Byram river, N. N. W. and was the *ancient easterly limits of New York*, until November 23, 1683, when the line was run nearly the same as it is now settled." If Douglas is right, the New York claim could not have been well founded.

In 1634, Lord Say and Seal, &c. sent over a small number of men, who built a fort at Saybrook, and held a treaty with the Pequot Indians, who in a formal manner gave to the English their right to Connecticut river and the adjacent country.

In 1635, the Plymouth council granted to the Duke of Hamilton, all lands between Narragansett and Connecticut rivers, and back into the country as far as Massachusetts south line. This covered a part of the Earl of Warwick's patent, and occasioned some disputes in the colony. There were several attempts to revive the Hamilton claim, but were never prosecuted.

In October of this year, about sixty persons from Newtown, Dorchester, and Watertown, in Massachusetts, came and settled at Hartford, Wethersfield, and Windsor, in Connecticut; and the June following the

Connecticut.

famous Mr Hooker and his company came and settled at Hartford, and was a friend and father to the colony to the day of his death.

The first court held in Connecticut was at Hartford, April 26, 1636.

The year 1637 was distinguished by the war with the Pequots. This warlike nation had, for some time, been troublesome neighbours. They solicited the Narragansetts to join them in extirpating the English. They had surprised and killed several of the English upon Connecticut river. These threatening appearances and actual hostilities induced the three colonies of Massachusetts, Plymouth, and Connecticut, to combine their forces, to carry the war into their country, and to attempt the entire destruction of the whole tribe. Myantonomo, the Narragansett Sachem, and Uncas, Sachem of the Mohegans, sent to the English and offered their service to join with them against the Pequots. Forces were accordingly raised in all the colonies; but those of Connecticut, on account of their vicinity to the enemy, were first in action. Captain Mason, with 80 English and 100 Indians from Connecticut river, proceeded by water to the Narragansett's country, where 200 of that tribe joined him. On the 24th of May, they began their march for Saffacus fort on Pequot, now Thames river. They afterwards determined first to assault Mystic fort, which was situated between them and Pequot river. On the morning of the 26th of May the attack was made. The Indians, after a midnight revel, were buried in a deep sleep. At the moment of their approach the centinel happened to be gone into a wigwam to light his pipe. The barking of a dog gave the alarm. The Indians awoke, seized their arrows, and began their hideous yell. They were joined in their tremendous noise by the Indians in the English army, who were in the rear and afraid to approach. The battle was warm and bloody, and the victory complete. The fort was taken---about 70 wigwams burnt--- 50 or 60 of the Indians were killed---many were wounded and taken, and the rest escaped. Saffacus and his warriors at Pequot, struck with terror at the news of this defeat, demolished their principal fort, burnt their wigwams, and fled to the westward. Capt. Stoughton, with 160 men from Massachusetts, had by this time arrived at Saybrook. He with his forces joined Captain Mason and pursued the Indians, and overtook and surrounded them in a great swamp near Fairfield. A Sachem and ninety-nine women and children came out and delivered themselves up to their pursuers. Terms of peace were offered to the rest: but after a short parley they determined, that as they had lived they would die together. There were about 80 who made this resolution. Part of these escaped by means of the darkness of the night. The rest were either killed or taken. In this action the Indians had guns, which is the first account of their having used them. Saffacus fled to the Mohawks, by whom it is reported he was murdered; but it is more probable that he and his company incorporated with them. Many of the Indian captives were unjustifiably sent to Bermudas and sold for slaves. The Pequot tribe was wholly extinguished. This successful expedition struck the Indians that remained with such terror, as restrained them from open hostilities for near forty years after.

Connecticut.

The English thus obtained the country east of the Dutch settlements, by right of conquest. The pursuit of the Indians led to an acquaintance with the lands on the sea coast from Saybrook to Fairfield. It was reported to be a very fine country. This favourable report, induced Messrs Eaton and Hopkins, two very respectable London merchants, and Mr Davenport, a man of distinguished piety and abilities, with their company, who arrived this year (1637) from London, to think of this part of the country as the place of their settlement. Their friends in Massachusetts, sorry to part with so valuable a company, dissuaded them from their purpose. Influenced, however, by the promising prospects which the country afforded, and flattering themselves that they should be out of the jurisdiction of a general governor, with which the country was from time to time threatened, they determined to proceed. Accordingly, in March 1638, with the consent of their friends on Connecticut river, they settled at New Haven, and laid the foundation of a flourishing colony, of which Quinnipiack, now New Haven, was the chief town. The first public worship, in this new plantation, was attended on Lord's day, April 18, 1638, under a large spreading oak. The Rev. Mr Davenport preached from Matt. iii. 1. on the temptations of the wilderness. Both colonies, by voluntary compact, formed themselves into distinct commonwealths, and remained so until their union in 1665.

In 1639, the three towns on Connecticut river, already mentioned, finding themselves without the limits of any jurisdiction, formed themselves into a body politic, and agreed upon articles of civil government. These articles were the foundation of the Connecticut charter, which was granted in 1662. The substance of the articles, so far as they respect the holding of assemblies, the time and manner of electing magistrates and other civil officers (except that in the old confederation no person was to be chosen governor more than once in two years), and the extent of legislative powers, was transferred into, and established in said charter.

The first church was gathered in New Haven this year, and consisted of seven members. These were chosen by the settlers after Mr Davenport had preached from the words of Solomon, 'Wisdom had builded her house, she hath hewed out her seven pillars.' These men were indeed the pillars of the church, to whom the rest were added as they became qualified. They were also the court to try all civil actions.

The first settlers in New Haven had all things common; all purchases were made in the name and for the use of the whole plantation; and the lands were apportioned out to each family according to their number and original stock.

At their first election, in October 1639, Mr Theophilus Eaton was chosen governor for the first year. Their elections, by agreement, were to be annual; and the word of God their only rule in conducting the affairs of government in the plantation.

In 1643, the articles of confederation between the four New England colonies, mentioned under the article NEW ENGLAND, were unanimously adopted by the colonies of New Haven and Connecticut.

The English settlement on Delaware, which was under

Connecticut. under the jurisdiction of New Haven, was surprized by the Swedes, and the people put in irons, under a false pretence that they were entering into a conspiracy with the Indians to extirpate the Swedes.

The general court of New Haven, this year, established it as a fundamental article not to be disputed, That none be admitted as free burgesses but church members, and that none but such should vote at elections. They also ordained, That each town choose from among themselves judges (church members) to be a court, to have cognizance of all civil actions not exceeding twenty pounds; and of criminal causes, where the punishment was, sitting in the stocks, whipping, and fining not exceeding five pounds. There was liberty of appeal from this to the court of magistrates. The court of magistrates consisted of all the magistrates throughout the colony, who were to meet twice a-year at New-Haven, for the trial of all capital causes. Six made a quorum. The general court was to consist of the governor, deputy-governor, magistrates, and two representatives from each town. The annual election of officers of government was at this time established, and has ever since continued.

The unsettled state of the colony had hitherto prevented their establishing a code of laws. To supply this defect, the general court ordered, 'That the judicial laws of God, as they were delivered to Moses, and as they are a fence to the moral, being neither typical nor ceremonial, nor having any reference to Canaan, shall be accounted of moral equity and generally bind all offenders, and be rule to all the courts in this jurisdiction in their proceedings against offenders, until they be branched out into particulars hereafter.'

About this time a war broke out between the Mohegan and Narragansett Indians. A personal quarrel between Myantonomo, sachem of the Narragansetts, and Uncas sachem of the Mohegans, was the foundation of the war. Myantonomo raised an army of 900 warriors, and marched towards the Mohegan country. Uncas by his spies received timely notice of their approach. His seat of residence was in some part of Norwich. He quickly collected 600 of his bravest warriors, and told them, 'The Narragansetts must not come into our town; we must meet them.' They accordingly marched about three miles to a large plain, where the two armies met, and halted within bow-shot of each other. A parley was proposed by Uncas, and agreed to by Myantonomo. The sachems met, and Uncas addressed his enemy as follows. 'You have a great many brave men: so have I. You and I have quarrelled; but these warriors, what have they done? Shall they die to avenge a private quarrel between us? No. Come like a brave man, as you pretend to be, and let us fight. If you kill me, my men shall be yours; if I kill you, your men shall be mine.' Myantonomo replied: 'My men came to fight, and they shall fight.' Uncas, like an experienced warrior, aware of the result of the conference from the superior force of his enemy, had previously signified to his men, that if Myantonomo refused to fight him in single combat, he would immediately fall, which was to be the signal for them to begin the attack. As soon therefore as Myantonomo had finished his laconic speech, Uncas dropped: his men instantly obeyed the

signal, and poured in a shower of arrows upon the unsuspecting Narragansetts, and rushing on with their horrid yells and savage fierceness, put them to flight. Many were killed on the spot, the rest were closely pursued, and some were precipitately driven down craggy precipices, and dashed in pieces. At a place called, from this event, *Sachem's plain*, Uncas overtook and seized Myantonomo by the shoulder. They sat down together; and Uncas with a hoop called in his men, and the battle ceased. Doubtful what to do with the royal prisoner, Uncas and his warriors, in council, determined to carry him to the governor and council at Hartford, and be advised by them. Thither he was accordingly conducted. The governor having advised with his council, told Uncas, that the English were not then at war with the Narragansetts, and of course that it was not proper for them to intermeddle in the matter. Uncas was left to do with him as he pleased. Myantonomo was conducted back to the plain where he was taken, and put to death by Uncas himself. The tragic scene did not end with his death. Uncas, after the manner of the Indians, with his tomahawk cut off a large piece of flesh from the shoulder of his slaughtered enemy, broiled and eat it, saying, with an air of savage triumph, 'It is the sweetest meat I ever eat. It makes me have a stout heart.' His body was afterwards buried, and a pillar erected over it, the remains of which are visible to this day.

The Narragansetts were greatly enraged at the death of their prince, and resolved to take vengeance on the Mohegans. The united colonies interposed to prevent a war between them, but in vain. The Narragansetts resolutely declared, they would continue the war until they had Uncas's head. But as Uncas had ever been a friend to the English, they joined him against his enemies, and were victorious. Such, however, was the enmity of the Narragansetts to the English, that they afterwards sent some of their men to Uncas, with large presents, to induce him to join with them in a war with the colonies. Uncas replied, 'Go tell your king that I will go to Norwich, and advise with Major John Mason and Mr Pitch; if they tell me to join him and fight against the English, I will join him.' In the war that happened soon after, Uncas assisted the English, and the Narragansetts were subdued, and never after were formidable.

In consideration of the success and increase of the New England colonies, and that they had been of no charge to the nation, and in prospect of their being in future very serviceable to it, the English parliament, March 10, 1643, granted them an exemption from all customs, subsidies, and other duties, until further order.

In 1644, the Connecticut adventurers purchased of Mr Fenwick, agent for Lord Say and Seal, and Lord Brook, their right to the colony of Connecticut, for L. 1600.

The history of Connecticut is marked with traces of the same spirit which appears to be characteristic of the Massachusetts, in different stages of their history. Indeed, as Massachusetts was the stock whence Connecticut proceeded, this is to be expected.

The colonies of Connecticut and New Haven, from their first settlement, increased rapidly; tracts of land were

Connecticut.

Connecticut.

were purchased of the Indians, and new towns settled from Stamford to Stonington, and far back into the country, when, in 1661, Major John Mason, as agent for the colony, bought of the natives all lands which had not before been purchased by particular towns, and made a public surrender of them to the colony, in the presence of the general assembly. Having done these things, the colonies petitioned King Charles II. for a charter, and their petition was granted. His Majesty, on the 23d of April 1662, issued his letters patent under the great seal, ordaining that the colony of Connecticut should for ever hereafter be one body corporate and politic, in fact and in name, confirming to them their ancient grant and purchase, and fixing their boundaries as follows, viz. "All that part of his Majesty's dominions in New England, in America, bounded east by Narragansett river, commonly called *Narragansett bay*, where the river falleth into the sea; and on the north by the line of Massachusetts plantation, and on the south by the sea, and in longitude as the line of the Massachusetts colony, running from east to west, that is to say, from the said Narragansett bay on the east, to the south sea on the west part, with the islands thereunto belonging." This charter has ever since remained the basis of the government of Connecticut.

Such was the ignorance of the Europeans respecting the geography of America, when they first assumed the right of giving away lands which the God of nature had long before given to the Indians, that their patents extended they knew not where, many of them were of doubtful construction, and very often covered each other in part, and have produced innumerable disputes and mischiefs in the colonies, some of which are not settled to this day. Connecticut construed her charter literally, and passing over New York, which was then in possession of the subjects of a Christian prince, claimed, in latitude and breadth mentioned therein, to the South Sea. Accordingly purchases were made of the Indians, on the Delaware river, west of the western bounds of New York, and within the supposed limits of Connecticut charter, and settlements were made thereon by people from, and under the jurisdiction of, Connecticut. The charter of Pennsylvania, granted to William Penn, in 1681, covered these settlements. This laid the foundation for a dispute, which for a long time was maintained with warmth on both sides. The matter was at last submitted to gentlemen chosen for the purpose, who decided the dispute in favour of Pennsylvania. Many, however, still assert the justice of the Connecticut claim. The state of Connecticut has lately ceded to Congress all their lands west of Pennsylvania, except a reserve of 20 miles square. This cession Congress have accepted, and thereby indubitably established the right of Connecticut to the reserve.

The colony of New Haven, though unconnected with the colony of Connecticut, was comprehended within the limits of their charter, and, as they concluded, within their jurisdiction. But New Haven remonstrated against their claim, and refused to unite with them until they should hear from England. It was not until the year 1665, when it was believed that the king's commissioners had a design upon the New England Charters, that these two colonies

formed a union, which has ever since amicably subsisted between them.

In 1672, the laws of the colony were revised, and the general court ordered them to be printed; and also, that "every family should buy one of the law books; such as pay in silver, to have a book for 12d. such as pay in wheat, to pay a peck and half a book; and such as pay in pease, to pay 2s. a book, the pease at 3s. the bushel." Perhaps it is owing to this early and universal spread of law books, that the people of Connecticut are to this day so fond of the law. In 1750, the laws of Connecticut were again revised, and published in a small folio volume of 258 pages. Dr Douglas observes, that they were the most natural, equitable, plain, and concise code of laws for plantations hitherto extant." There has been a revision of them since the peace, in which they were greatly and very judiciously simplified.

The years 1675 and 1676 were distinguished by the wars with Philip and his Indians, and with the Narragansetts, by which the colony was thrown into great distress and confusion. The inroads of the enraged savages were marked with cruel murders, and with fire and devastation.

In 1684, the charter of Massachusetts bay and Plymouth were taken away, in consequence of Quo warrantos which had been issued against them. The charter of Connecticut would have shared the same fate, had it not been for ——— Wadsworth, Esq; who, having very artfully procured it when it was on the point of being delivered up, buried it under an oak tree in Hartford, where it remained until all danger was over, and then was dug up and reassumed.

Connecticut has ever made rapid advances in population. There have been more emigrations from this than from any of the other states, and yet it is at present full of inhabitants. This increase, under the divine benediction, may be ascribed to several causes. The bulk of the inhabitants are industrious, sagacious husbandmen. The farms furnish them with all the necessaries, most of the conveniences, and but few of the luxuries of life. They of course are generally temperate, and, if they choose, can subsist with as much independance as is consistent with happiness. The subsistence of the farmer is substantial, and does not depend on incidental circumstances, like that of most other professions. There is no necessity of serving an apprenticeship to the business, nor of a large stock of money to commence it to advantage. Farmers, who deal much in barter, have less need of money than any other class of people. The ease with which a comfortable subsistence is obtained, induces the husbandman to marry young. The cultivation of his farm makes him strong and healthful. He toils cheerfully through the day---eats the fruit of his own labour with a gladsome heart---at night devoutly thanks his bounteous God for his daily blessings---retires to rest, and his sleep is sweet. Such circumstances as these have greatly contributed to the amazing increase of inhabitants in this state.

Besides, the people live under a free government, and have no fear of a tyrant. There are no overgrown estates, with rich and ambitious landlords, to have an undue and pernicious influence in the election of civil officers. Property is equally enough divided, and must
continue

Connecticut.

Connecticut. continue to be so as long as estates descend as they now do. No person is prohibited from voting, or from being elected into office, on account of his poverty. He who has the most merit, not he who has the most money, is generally chosen into public office. As in instances of this, it is to be observed, that many of the citizens of Connecticut, from the humble walks of life have arisen to the first offices in the state, and filled them with dignity and reputation. That base business of electioneering, which is so directly calculated to introduce wicked and designing men into office, is yet but little known in Connecticut. A man who wishes to be chosen into office, acts wisely for that end, when he keeps his desires to himself.

Connor.

A thirst for learning prevails among all ranks of people in the state. More of the young men in Connecticut, in proportion to their numbers, receive a public education, than in any of the states. Dr Franklin and other literary characters have honoured this state by saying, that it is the *Athens of America*.

The revolution, which so essentially affected the governments of most of the colonies, produced no very perceptible alteration in the government of Connecticut. While under the jurisdiction of Great Britain, they elected their own governors, and all subordinate civil officers, and made their own laws in the same manner and with as little controul as they now do. Connecticut has ever been a republic, and perhaps as perfect and as happy a republic, as has ever existed. While other states, more monarchical in their government and manners, have been under a necessity of undertaking the difficult task of altering their old, or forming new constitutions, and of changing their monarchical for republican manners. Connecticut has uninterruptedly proceeded in her old track, both as to government and manners; and by these means has avoided those convulsions which have rent other states into violent parties.

CONNECTION, or CONNEXION, the relation or dependence of one thing upon another.

CONNECTION, or Continuity, in the drama, consists in the joining of the several scenes together.

The connection is said to be observed, when the scenes of an act succeed one another immediately, and are so joined as that the stage is never left empty.

CONNECTIVES, in grammar, one of the four species under which, according to Mr Harris, all words may be included. They are of two kinds; and as they connect sentences or words, are called by the different names of *conjunctions* and *prepositions*. See **GRAMMAR**.

CONNIVENT VALVES, in anatomy, those wrinkles, cellules, and vasculæ, which are found in the inside of the two intestines ilium and jejunum. See **ANATOMY**, n° 93. *et seq.*

CONNOISSEUR, a French term, of late used in English; it literally denotes a person well versed in any thing; being formed of the verb *connoître*, to know, understand." Hence it comes to be used in our language for a critic, or a person who is a thorough judge or master in any way, particularly in matters of painting and sculpture.

CONNOR (Bernard), a learned physician, was born in the county of Kerry, in Ireland, about the year 1666. Having determined to apply himself to the study

of physic, he went to France, and resided sometime in the university of Montpellier. Afterward he went to Paris; where he obtained great skill in medicine, anatomy, and chemistry. From thence he travelled to Venice, with the two sons of the high-chancellor of Poland; and then taking a tour through great part of Germany, went to Warsaw, where he was made physician to king John Sobieski. In 1695, he came to England, read a course of lectures in London and Oxford, and became member of the Royal Society and College of Physicians; afterwards, being invited to Cambridge, he read public lectures there, and made various experiments in chemistry. He has rendered himself memorable for a philosophical and medical treatise in Latin, entitled, *Evangelium Medici*, i. e. "the Physician's Gospel;" tending to explain the miracles performed by Christ as natural events, upon the principles of natural philosophy. He wrote also a history of Poland; and died in 1698, aged 22.

CONNOR, a city of Ireland, in the county of Antrim, and province of Ulster. W. Long. 6. 30. N. Lat. 54. 50.

CONOCARPUS, BUTTON-WOOD: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 48th order, *Aggregata*. The corolla is pentapetalous; the seeds naked, solitary, inferior; the flowers aggregatæ. There are two species, the erecta and procumbens, both natives of the West Indies. They rise to the height of about 16 feet, but are trees of no beauty, nor is the wood of them used for any mechanic purpose in the countries where they grow naturally. They are, however, preserved in some botanic gardens in Britain for the sake of variety.

CONOID, in geometry, a solid body, generated by the revolution of a conic section about its axis. See **CONIC Sections**.

CONOIDES, in anatomy, a gland found in the third ventricle of the brain, called *pinealis*, from its resemblance to a pine-apple. See **ANATOMY**, n° 132.

CONON, the renowned Athenian general and admiral, flourished 394 years before Christ. See **ATTICA**, n° 162, 163. After his defeat by Lyfander, he fled to Evagoras king of Cyprus: after which he put himself under the protection of Artaxerxes king of Persia; with whose army he delivered Athens from the oppression of strangers, and rebuilt its walls. In the 360th year of Rome, he beat the Lacedæmonians in a sea-fight near Cnidus upon the coast of Asia, deprived them of the sovereign rule they had on sea ever since the taking of Athens, and had some other considerable advantages over them: but falling into the hands of Teribazus a Persian, who envied his glory, he was put to death.

CONOPS, in zoology; a genus of insects belonging to the order diptera, the characters of which are: The rostrum is porrected, and jointed like a knee. The antennæ terminate by a flat and solid articulation, resembling the bowl of a spoon, with a lateral bristle, which when closely examined appears to be very hairy. Of this genus there are several species. 1. The calcitrans is to be found every where, especially in autumn, when it harasses the horses, and draws blood from them with its sting. 2. The macrocephala might at first sight be mistaken for a species of wasp.

Conner
||
Conops

Conovium wasp. It is smooth; the forepart of the head is lemon-colour, as are the poisers; the feet are dun-coloured. The thorax is variegated with black and reddish dun. The same takes place with respect to the segments of the abdomen; some of which are edged with lemon-colour, chiefly the second, and part of the third, towards the sides. The wings are brown, watered, and clouded. This beautiful conops is found in meadows. There are eleven or twelve other species.

CONOVIVM, (anc. geog.) a town of the Ordovices, in Britain. From its ruins arose, at the distance of four miles, *Aberconwey*, the mouth of the Conwey, in Caernarvonshire; and on the spot where *Conovium* stood is a hamlet, called *Carbean*, the old town, (Camden.)

CONQUEST, in civil jurisprudence, is the acquisition of property in common by a number of persons.

In some countries they confound acquisition with conquest; but according to the most general acceptation, acquisition is the gaining of unappropriated goods before the establishment of a community: whereas by the term *conquest*, is ordinarily intended whatever is acquired by a number of persons in community; or by some one for all the others.—As it is more especially in the union of persons by marriage, that a community of property takes place; so it is in reference to them that we frequently use the word *conquest*. There are nevertheless conquests also among other persons who are in a tacit community or society; such as obtain by particular local customs. According to this sense of the word, it has been contended by several, that William I. claimed Britain; that is, not by right of arms, but by right of conquest or conquest; under promise of succession made by Edward the Confessor, and a contract entered into by Harold to support his pretensions to that succession: and by old writers, *conquestus*, *acquisitio*, and *perquisitio*, are frequently used as synonymous terms.

CONQUEST, in the law of nations, as the acquisition of sovereignty by force of arms, by some foreign prince: who reduces the vanquished under his empire. The right of conquest is derived from the laws of war; and when a people is subjected, the conduct of the conqueror is regulated by four kinds of law. First, the law of nature, which dictates whatever tends to self-preservation; secondly, our reason, which teaches us to use others, as we would be treated ourselves; thirdly, the laws of political society, to which nature has not assigned any precise boundary; lastly, the law which is derived from the particular circumstances attending the conquest. Thus, a state conquered by another will be treated in one of the four methods following: Either the conqueror will continue it under its own laws, and will only claim the exercise of civil and ecclesiastical sovereignty: or he will impose a new form of government; or he will destroy the frame of their society, and incorporate the inhabitants with others: or he will exterminate them.

CONRAD II. elected emperor of Germany in 1004. He was obliged to take the field against most of the German dukes who had revolted from him; and he put Ernest duke of Suabia under the ban of the em-

pire. This being one of the earliest instances of such a proscription, the formula is inserted here for its singularity. “We declare thy wife a widow, thy children orphans; and we send thee, in the name of the devil, to the four corners of the world.” It was in the reign of this prince that the German fiefs became hereditary. He died in 1039.

CONRAD III. emperor of Germany in 1138. The duke of Bavaria opposed his election, and being put under the ban of the empire, and deprived of his duchy, he could not survive his disgrace. The margrave of Austria was ordered by the Emperor to take possession of Bavaria; but Welsti, uncle to the deceased duke, attacked him, and was defeated near the castle of Winzburg: the battle fought upon this occasion is famous in history, as having given rise to the party names of *Guelphs* and *Gibbelines*, afterwards assumed in Italy. The parole of the day with the Bavarians was *Welsti*, from the name of their general; that of the Imperialists *Werblingen*, from a small village where Frederic Duke of Suabia, their commander, had been nursed: by degrees these names served to distinguish the two parties: and the Italians, who could not accustom themselves to such rough words, formed from them their *Guelphs* and *Gibbelines*. He died in 1152.

CONRAD of Lichtenau, or Abbas Uspergensis, was author of an Universal Chronology from the creation to 1229, continued by an anonymous writer to Cha. V. He collected a fine library, and died about the year 1240.

CONRADIN, or **CONRAD**, junior, son of Conrad IV. was acknowledged Emperor by the Gibbelines, who received him in triumph at Rome: but Pope Alexander IV. had published a crusade against this orphan; and Urban VII. his successor, gave the empire to Charles of Anjou, brother to Louis IX. king of France; and the unfortunate youth, though powerfully supported even by the Turks, lost a battle, in which he was taken prisoner, and was beheaded by order of his base opponent, publicly at Naples in 1229, in the 18th year of his age. In him ended the race of the Dukes of Suabia, which had produced several kings and emperors.

CONSANGUINITY, or **KINDRED**, is defined by the writers on these subjects to be, *vinculum personarum ab eodem stipite descendendum*; the connection or relation of persons descended from the same stock or common ancestor.” This consanguinity is either lineal or collateral.

Lineal consanguinity is that which subsists between persons of whom one is descended in a direct line from the other, as between John Stiles (the *propositus* in the table of consanguinity) and his father, grandfather, great-grandfather, and so upwards in the direct ascending line; or between John Stiles and his son, grand-son, great grand-son, and so downwards in the direct descending line. Every generation, in this direct lineal consanguinity, constitutes a different degree, reckoning either upwards or downwards: the father of John Stiles is related to him in the first degree, and so likewise is his son; his grandfire and grandson, in the second; his great-grandfire and great-grandson in the third. This is the only natural way of reckoning

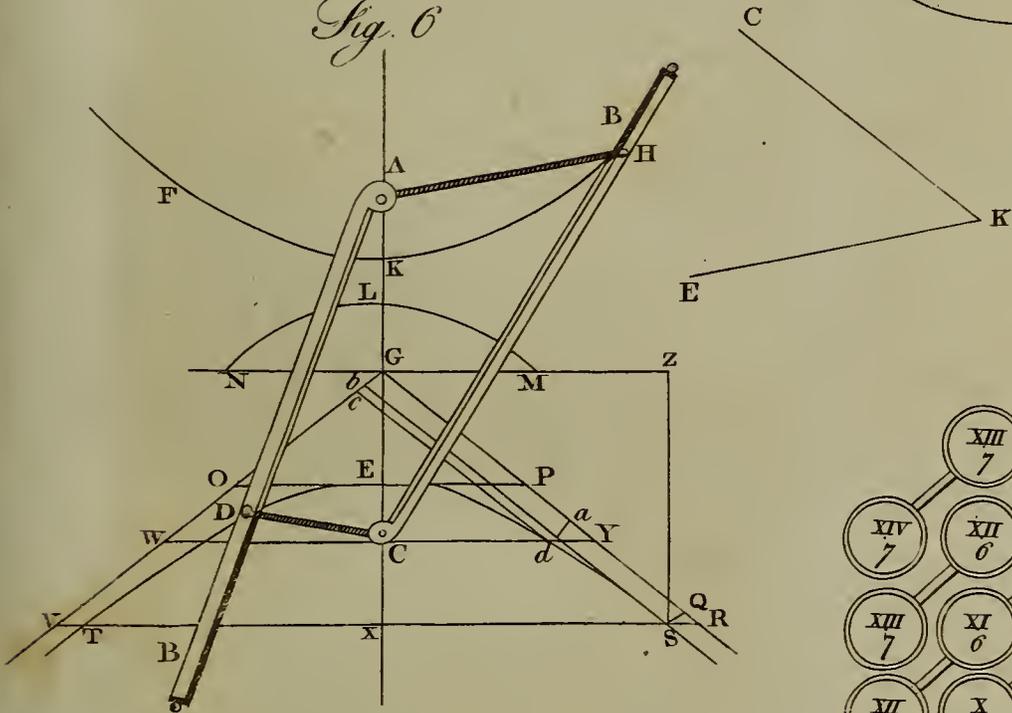

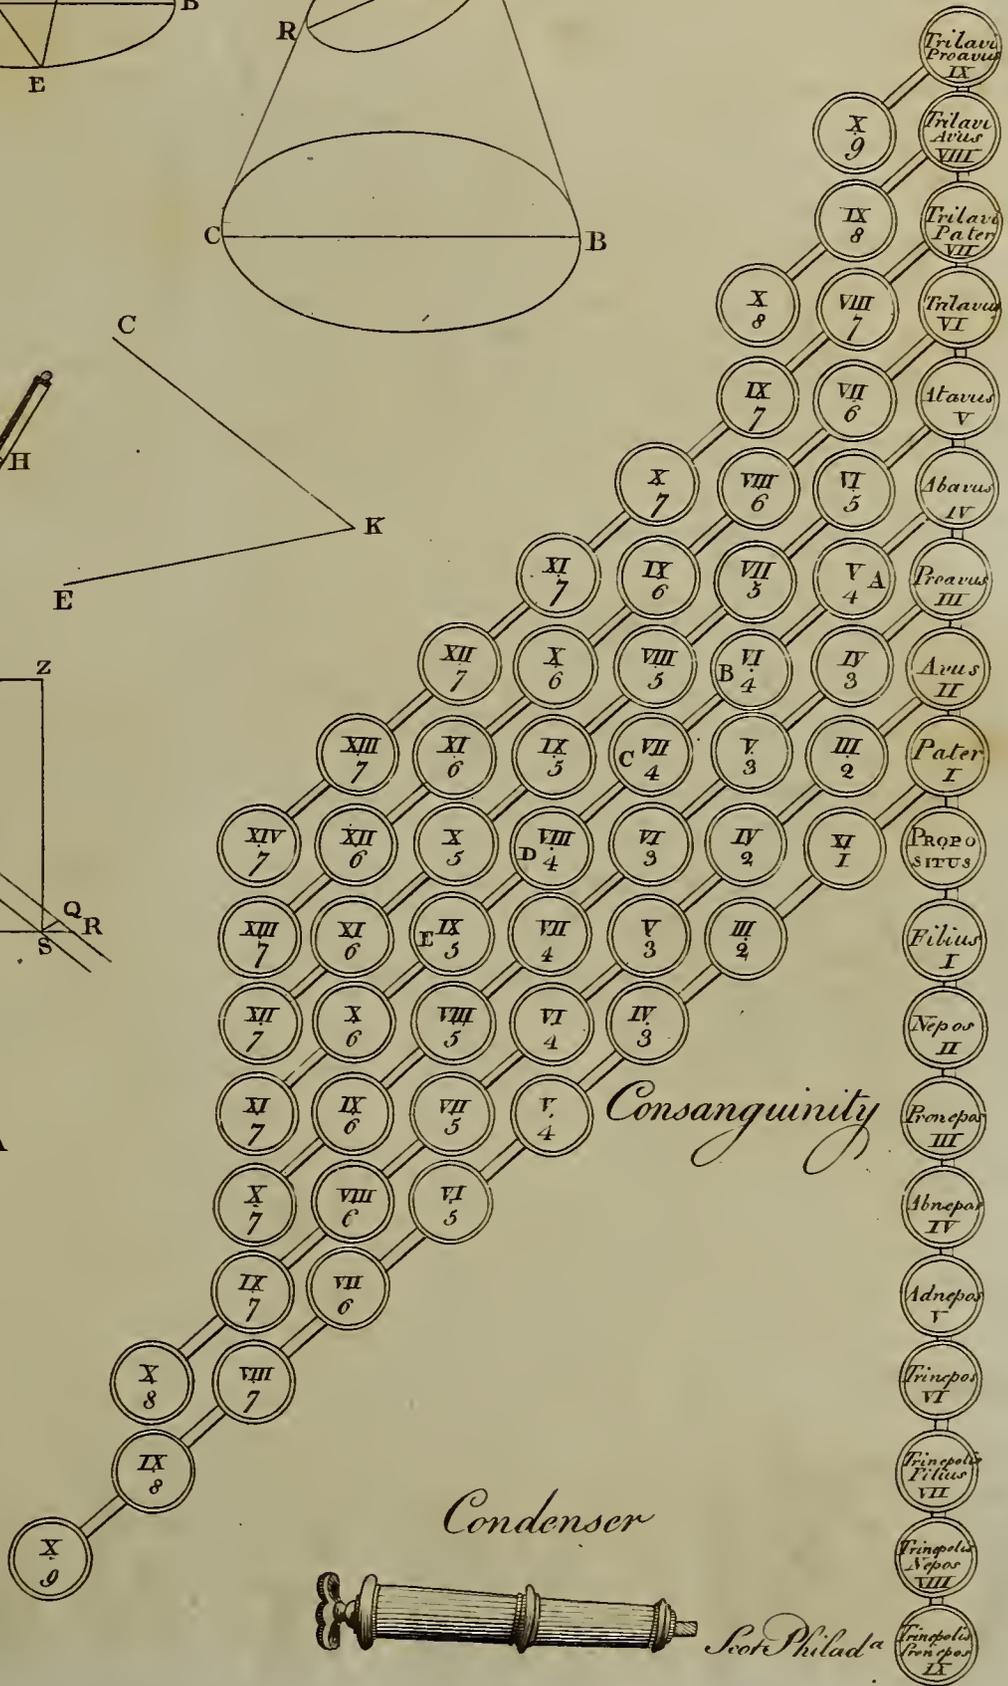

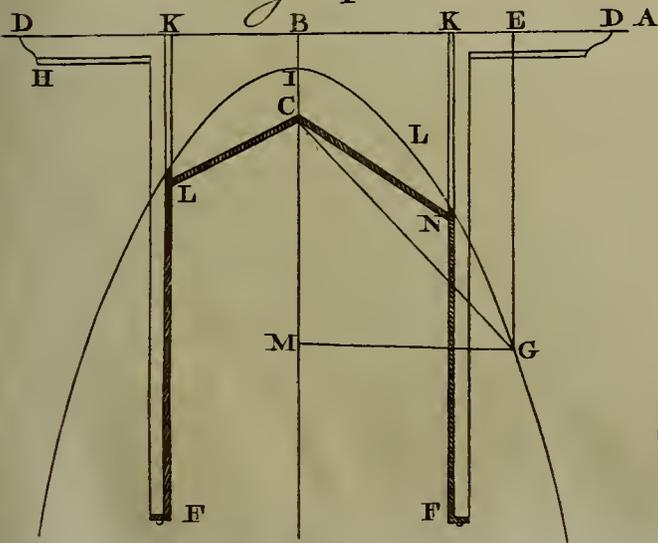

Fig. 4

Confanguinity. reckoning the degrees in the direct line; and therefore universally obtains, as well in the civil and canon, as in the common law.

The doctrine of lineal confanguinity is sufficiently plain and obvious; but it is, at the first view, astonishing to consider the number of lineal ancestors which every man has, within no very great number of degrees: and so many different bloods is a man said to contain in his veins, as he hath lineal ancestors. Of these he hath two in the first descending degree; his own parents: he hath four in the second; the parents of his father, and the parents of his mother: he hath eight in the third, the parents of his two grandfathers, and of his two grandmothers: and, by the same rule of progression, he hath 128 in the seventh; 1024 in the tenth; and at the 20th degree, or the distance of 20 generations, every man hath above a million of ancestors, as common arithmetic will demonstrate (A). This lineal confanguinity, we may observe, falls strictly within the definition of *vinculum personarum ab eodem stipite descendentium*; since lineal relations are such as descend one from the other, and both of course from the same common ancestor.

Collateral kindred answers to the same description: collateral relations agreeing with the lineal in this, that they descend from the same stock or ancestor; but differing in this, that they do not descend the one from the other. Collateral kinsmen, then, are such as lineally spring from one and the same ancestor, who is the *stirps*, or "root," the *stipes*, "trunk," or common stock, from whence these relations are branched out. As if John Stiles hath two sons, who have each a nu-

VOL. V.

merous issue: both these issues are lineally descended from John Stiles as their common ancestor; and they are collateral kinsmen to each other, because they are all descended from this common ancestor, and all have a portion of his blood in their veins, which denominates them *consanguineus*.

We must be careful to remember, that the very being of collateral confanguinity consists in this descent from one and the same common ancestor. Thus Titius and his brother are related; why? because both are derived from one father: Titius and his first cousin are related; why? because both descend from the same grandfather; and his second cousin's claim to confanguinity is this, that they are both derived from one and the same great-grandfather. In short, as many ancestors as a man has, so many common stocks he has from which collateral kinsmen may be derived. And as we are taught by holy writ, that there is one couple of common ancestors belonging to us all, from whom the whole race of mankind is descended, the obvious and undeniable consequence is, that all men are in some degree related to one another. For, indeed, if we only suppose each couple of our ancestors to have left, one with another, two children; and each of those children to have left, on an average, two more (and without such a supposition the human species must be daily diminishing); we shall find that all of us have now subsisting near 270 millions of kindred in the 15th degree, at the same distance from the several common ancestors as we ourselves are; besides those that are one or two degrees nearer to or farther from the common stock, who may amount to as many more.

X x

more.

(A) This will seem surprising to those who are unacquainted with the increasing power of progressive numbers; but it is palpably evident from the following table of a geometrical progression, in which the first term is 2, and the denominator also 2: or, to speak more intelligibly, it is evident, for that each of us has two ancestors in the first degree, the number of whom is doubled at every remove; because each of our ancestors has also two immediate ancestors of his own.

A shorter way of finding the number of ancestors at any even degree, is by squaring the number of ancestors at half that number of degrees. Thus, 16, the number ancestors at 4 degrees, is the square of 4, the number of ancestors at two; 256 is the square of 16, 65536 of 256; and the number of ancestors at 40 degrees would be the square of 1,048,576, or upwards of a million of millions.

Confanguinity. more (B). And if this calculation would appear incompatible with the number of inhabitants on the earth, it is because, by intermarriages among the several descendants from the same ancestor, a hundred or a thousand modes of consanguinity may be consolidated in one person; or he may be related to us a hundred or a thousand different ways.

The method of computing these degrees in the canon law, which we have adopted, is as follows. We begin at the common ancestor, and reckon downwards; and in whatsoever degree the two persons, or the most remote of them, is distant from the common ancestor, that is the degree in which they are related to each other. Thus, Titius and his brother are related in the first degree; for from the father to each of them is counted only one; Titius and his nephew are related in the second degree; for the nephew is two degrees removed from the common ancestor, viz. his own grandfather, the father of Titius: or (to give a more illustrious instance from the English annals) King Henry VII. who slew Richard III. in the battle of Bosworth, was related to that prince in the fifth degree. Let the *propositus*, therefore, in the table of consanguinity, represent King Richard III. and the class marked E, King Henry VII. Now their common stock

or ancestor was King Edward III. the *abavus* in the same table: from him to Edmund Duke of York, the *proavus* is one degree; to Richard Earl of Cambridge, the *avus*, two; to Richard Duke of York, the *pater*, three; to King Richard III. the *propositus*, four; and from King Edward III. to John of Gant (A) is one degree: to John Earl of Somersfet (B) two; to John Duke of Somersfet (C) three; to Margaret Countess of Richmond (D) four; to King Henry VII. (E) five. Which last-mentioned prince, being the farthest removed from the common stock, gives the denomination to the degree of kindred in the canon and municipal law. Though according to the computation of the civilians (who count upwards from either of the persons related, to the common stock, and then downwards again to the other; reckoning a degree for each person both ascending and descending) these two princes were related in the ninth degree: for from King Richard III. to Richard Duke of York is one degree; to Richard Earl of Cambridge two; to Edmund Duke of York three; to King Edward III. the common ancestor, four; to John of Gant five; to John Earl of Somersfet six; to John Duke of Somersfet seven; to Margaret Countess of Richmond eight; to King Henry VII. nine. See the Table of Consanguinity

(B) This will swell more considerably than the former calculation: for here, though the first term is but 1, the denominator is 4; that is, there is *one* kinsman (a brother) in the first degree, who makes, together with the *propositus*, the two descendants from the first couple of ancestors; and in every other degree, the number of kindred must be the *quadruple* of those in the degree which immediately precedes it. For since each couple of ancestors has two descendants who increase in a duplicate ratio, it will follow, that the ratio in which all the descendants increase downwards, must be double to that in which the ancestors increase upwards: but we have seen that the ancestors increase in a duplicate ratio: therefore the descendants must increase in a double duplicate; that is, in a quadruple ratio.

Collateral Degrees. Number of Kindred.

19	68719476736
20	274877906944

This calculation may also be formed by a more compendious process, viz. by squaring the couples, or half the number of ancestors, at any given degree; which will furnish us with the number of kindred we have in the same degree, at equal distance with ourselves from the common stock, besides those at unequal distances. Thus, in the tenth lineal degree, the number of ancestors is 1024; its half, or the couples, amount to 512; the number of kindred in the tenth collateral degree amounts therefore to 262144, or the square of 512. And if we will be at the trouble to recollect the state of the several families within our own knowledge, and observe how far they agree with this account; that is, whether, on an average, every man has not one brother or sister, four first-cousins, sixteen second-cousins, and so on; we shall find, that the present calculation is very far from being overcharged.

Confanguinity, Conscience. Confanguinity (Plate CXLVI), wherein all the degrees of collateral kindred to the *propofitus* are computed, as far as the tenth of the civilians and the seventh of the canonists inclusive; the former being distinguished by the numeral letters, the latter by the common ciphers.

CONSANGUINITY and *Affinity* (degrees of), forbidden in marriage. See MARRIAGE; and LAW, Part III. N^o clx. 4.

CONSANGUINITY and *Affinity*, an objection against a judge. See LAW, Part III. N^o clvi. 12. Against a witness, *ibid.* clxxxiv. 12.

CONSCIENCE, a secret testimony of the soul, whereby it gives its approbation to things that are naturally good, and condemns those that are evil. See *MORAL Philosophy*.

A man of integrity will never listen to any reason, or give way to any measure, or be misled by any inducement, against conscience.---The inhabitants of a great town offered Marshal de Turenne 100,000 crowns, upon condition he would take another road, and not march his troops their way. He answered them, "As your town is not on the road I intend to march, I cannot accept the money you offer me."---The Earl of Derby, in the reign of Edward III. making a descent in Guienne, carried by storm the town of Bergerac, and gave it up to be plundered. A Welch knight happened by chance to light upon the receiver's office. He found there such a quantity of money that he thought himself obliged to acquaint his general with it, imagining that so great a booty naturally belonged to him. But he was agreeably surpris'd when the earl told him, with a pleasant countenance, that he wish'd him joy of his good fortune; and that he did not make the keeping of his word to depend upon the great or little value of the thing he had promised. -- In the siege of Falisci by Camillus general of the Romans, the schoolmaster of the town, who had the children of the senators under his care, led them abroad under the pretext of recreation, and carried them to the Roman camp, saying to Camillus, that by this artifice he had delivered Falisci into his hands. Camillus abhorring this treachery, observed, "That there were laws for war as well as for peace; and that the Romans were taught to make war with integrity not less than with courage." He ordered the schoolmaster to be stripped, his hands to be bound behind his back, and to be delivered to the boys to be lash'd back into the town. The Falerians, formerly obstinate in resistance, struck with an act of justice so illustrious, delivered themselves up to the Romans; convinced that they would be far better to have the Romans for their allies than their enemies.

It is a saying, That no man ever offended his own conscience, but first or last it was revenged upon him. The power of conscience indeed has been remarked in all ages, and the examples of it upon record are innumerable. The following is related by Mr Fordyce, in his *Dialogues on Education* †, as a real occurrence which happened in a neighbouring state not many years ago. A jeweller, a man of good character and considerable wealth, having occasion in the way of his business to travel at some distance from the place of his abode, took along with him a servant, in order to take care of his portmanteau. He had with some

of his best jewels, and a large sum of money, to which his servant was likewise privy. The master having occasion to dismount on the road, the servant watching his opportunity, took a pistol from his master's saddle and shot him dead on the spot; then rifled him of his jewels and money, and hanging a large stone to his neck, he threw him into the nearest canal. With this booty he made off to a distant part of the country, where he had reason to believe that neither he nor his master were known. There he began to trade in a very low way at first, that his obscurity might screen him from observation, and in the course of a good many years seem'd to rise, by the natural progress of business into wealth and consideration; so that his good fortune appear'd at once the effect and reward of industry and virtue. Of these he counterfeited the appearance so well, that he grew into great credit, married into a good family, and by laying out his sudden stores discreetly, as he saw occasion, and joining to all an universal affability, he was admitted to a share of the government of the town, and rose from one post to another, till at length he was chosen chief magistrate. In this office he maintained a fair character, and continued to fill it with no small applause both as a governor and a judge; till one day as he sat on the bench with some of his brethren, a criminal was brought before him who was accused of murdering his master. The evidence came out full, the jury brought in their verdict that the prisoner was guilty, and the whole assembly waited the sentence of the president of the court (which he happen'd to be that day) with great suspense. Mean while he appear'd to be in unusual disorder and agitation of mind, and his colour chang'd often; at length he arose from his seat, and coming down from the bench, plac'd himself just by the unfortunate man at the bar. "You see before you (said he, addressing himself to those who had sat on the bench with him), a striking instance of the just awards of heaven, which this day, after 30 years concealment, presents to you a greater criminal than the man just now found guilty." Then he made an ample confession of his guilt, and of all its aggravations. "Nor can I feel (continued he) any relief from the agonies of an awakened conscience, but by requiring that justice be forthwith done against me in the most public and solemn manner." We may easily suppose the amazement of all the assembly, and especially of his fellow-judges. However, they proceeded, upon this confession, to pass sentence upon him, and he died, with all the symptoms of a penitent mind.

Courts of CONSCIENCE, are courts for recovery of small debts, constituted by act of parliament in London, Westminster, &c. and other populous and trading districts.

CONSCIOUSNESS. Metaphysicians, in lieu of the word *conscience*: which seems appropriated to theological or moral matters, ordinarily use that of *consciousness*; whereby they mean an inner sentiment of a thing, whereof one may have a clear and distinct notion. In this sense they say that we do not know our own soul, nor are assur'd of the existence of our own thoughts, otherwise than by self-consciousness. See METAPHYSICS.

CONSCRIPT, in Roman antiquity, an appellation given to the senators of Rome, who were call'd *conscript*

tion.
Consent.

script fathers, on account of their names being all entered in one register.

CONSECRATION, the act of devoting any thing to the service and worship of God. The Mosaical law ordained, that all the first born, both of man and beast, should be sanctified or consecrated to God. We find also, that Joshua consecrated the Gibeonites, as Solomon and David did the Nethinims, to the service of the temple; and that the Hebrews sometimes consecrated their fields and cattle to the Lord, after which they were no longer in their power.

Among the ancient Christians, the consecration of churches was performed with a great deal of pious solemnity. In what manner it was done for the three first ages, is uncertain; the authentic accounts reaching no higher than the fourth, when, in the peaceable reign of Constantine, churches were every where built, and dedicated with great solemnity. Some think the consecration consisted in setting up the sign of the cross, or in placing a communion-table in the church; and others, that no more was done than preaching a panegyric sermon in commemoration of the founder, and that then they proceeded to prayers, one of which was composed on purpose for the church to be consecrated. The Romanists have a great deal of pious foppery in the ceremonies of consecration; which they bestow on almost every thing, as bells, candles, books, water, oil, ashes, palms, swords, banners, pictures, crosses, agnus-dei's roses, childrens cloths, &c.

In England, churches have been always consecrated with particular ceremonies, the form of which was left to the discretion of the bishop. That observed by bishop Laud, in consecrating St Catherine Creed church, in London, gave great offence.

CONSECRATION is particularly used for the benediction of the elements in the eucharist.

CONSECRATION, among medalists, is the ceremony of the apotheosis of an emperor, or his translation into heaven and reception among the gods. On medals the consecration is thus represented: on one side is the emperor's head, crowned with laurel, sometimes veiled; and the inscription gives him the title of *divus*: on the reverse is a temple, a bustum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus: at other times the emperor is seen in the air, borne up by the eagle; the inscription always, *consecratio*. These are the usual symbols: yet on the reverse of that of Antoninus is the Antonine column. In the apotheosis of empresses, instead of an eagle there is a peacock. As to the honours rendered these princes after death, they were explained by the words *consecratio*, *pater*, *divus*, and *deus*. Sometimes around the temple or altar are put, *memoria felix*, or *memoria aeternæ*: for princesses, *aeternitas*, and *sideribus recepta*; on the side of the head, *dea*, or *œta*.

CONSENT, in a general sense, denotes much the same with **ASSENT**.

CONSENT of Parts, in the animal economy, an agreement or sympathy, whereby when one part is immediately affected, another at a distance becomes affected in the same manner.

This mutual accord or consent is supposed to be effected by the commerce of nerves, and their artificial distribution and ramification throughout the body. The effect is so sensible as even to come under the

physician's cognizance: thus, the stone in the bladder, by vellicating the fibres there, will pain and draw them so much into spasms, as to affect the coats of the bowels, in the same manner, by the intermediation of nervous threads, and make a colic there; and also extend their twitches sometimes as far as the stomach, and occasion grievous vomitings: the remedy, therefore, in such cases, is to regard the part originally affected, how remote and grievous soever may be the consequences and symptoms in other places.

The fifth conjugation of nerves branched to the parts of the eye, the ear, those of the mouth, cheeks, præcordia, and parts adjacent, &c. is supposed by naturalists to be the instrument of that particular and extraordinary consent between those parts. Hence it is, that a savoury thing seen or smelled excites the appetite, and affects the glands and parts of the mouth; and a shameful thing seen or heard affects the cheeks with blushes; on the contrary, if it please, it affects the præcordia, and excites the muscles of the mouth and face to laughter; if it grieve, it affects the glands of the eyes, so as to occasion tears, and the muscles of the face, putting them into an aspect of crying. Dr Willis, quoted by Mr Derham, imputes the pleasure of kissing, and its effects, to this pair of nerves; which being branched both to the lips and the genital parts, when the former are affected an irritation is occasioned in the latter. See **SYMPATHY**.

CONSENTES, the name which the Romans gave to the 12 superior gods, the *Dii majorum gentium*. The word signifies as much as *consentientes*; that is, who consented to the deliberations of Jupiter's council. They were twelve in number, whose name Ennius has briefly expressed in these lines,

*Juno, Vesta, Minerva, Ceres, Diana, Venus, Mars,
Mercurius, Jovi, Neptunus, Vulcanus, Apollo.*

CONSEQUENCE, in logic, the conclusion, or what results from reason or argument. See **CONCLUSION**.

The consequence is that other proposition in which the extremes or premises of a syllogism are joined, or separated; and is gained from what was asserted in the premises.

This word, in a more restrained sense, is used for the relation or connection between two propositions, whereof one is inferred from the other.

CONSEQUENT, something deduced or gathered from a former argumentation. But, in a more precise sense, it is used for the proposition which contains the conclusion, considered in itself, without any regard to the antecedent: in which sense the consequent may be true, though the consequence be false. See the preceding article.

CONSERVATOR, an officer ordained for the security and preservation of the privileges of some cities and communities, having a commission to judge of and determine the differences among them.

In most catholic universities there are two conservators; the conservator of royal privileges, or those granted by kings; and the conservator of apostolical privileges, or those granted by the pope. The first takes cognizance of personal and mixed causes between the regents, students, &c. and the latter of spiritual matters between ecclesiastics.

Anciently

Consentes
||
Conservator.

Conserva-
tor
||
Consign-
ment.

Anciently there were appointed conservators of treaties of peace between princes; which conservators became judges of the infractions made on a treaty, and were charged with procuring satisfaction to be made. These were usually the feudatories of the several powers. In lieu of conservators princes now have recourse to other indifferent princes to guarantee their treaties.

CONSERVATOR of Scots Privileges, at Campvere, is an officer belonging to the royal boroughs of Scotland, who takes care of the mercantile affairs of Scotland, agreeable to the staple contract between them and the States-General.

CONSERVATOR of the Peace, in the ancient English customs, was a person who had an especial charge, by virtue of his office, to see the king's peace kept. Till the erection of justices of the peace by king Edward III. there were several persons who by common law were interested in keeping the same: some having that charge as incident to other offices; and others simply, or of itself, called *custodes*, or *conservators of the peace*. The chamberlain of Chester is still a conservator in that county; and petty constables are, by the common law, conservators, &c. in the first sense, within their own jurisdiction: so are also the coroner and the sheriff within their own county. The king is the principal conservator of the peace within all his dominions: the lord chancellor, lord treasurer, lord high steward, lord marshal, lord high constable, all the justices of the court of king's bench, by their office, and the master of the rolls, by prescription, are general conservators of the peace through the whole kingdom, and may commit breakers of the peace, and bind them in recognisances to keep it.

CONSERVATOR of the Truce, and Safe Conducts, was an officer appointed in every sea-port, under the king's letters patent. His charge was to inquire of all offences committed against the king's truce, and safe conducts upon the main sea, out of the franchises of the cinque-ports, as the admirals were wont to do, and such other things as are declared *anno 3 Hen. V.* cap. 6.

CONSERVATORIOS, are musical schools established for the instruction of children in the profession of music. There are four of these at Venice, designed for the education of girls, and three at Naples, for the education of boys. It has been suggested that the operation of castration was performed in the conservatorios; but the practice is absolutely prohibited; and the young castrati are brought from Lucia in Puglia: but before the operation is performed, their voices are tried in a conservatorio. The scholars of the Venetian conservatorios have been chiefly celebrated for taste and neatness of execution; and those of Naples have had the reputation of being the first *contrapuntists*, or composers, in Europe.

CONSERVATORY, a term sometimes used for a green-house or ice-house.

CONSERVE, in pharmacy, a form of medicine contrived to preserve the flowers, herbs, roots, or fruits of several simples, as near as possible to what they are when fresh gathered. See *PHARMACY*.

CONSIGNMENT, in law, the depositing any sum of money, bills, papers, or commodities, in good hands; either by appointment of a court of justice, in

order to be delivered to the persons to whom they are adjudged; or voluntarily, in order to their being remitted to the persons they belong to, or sent to the places they are designed for.

CONSIGNMENT of Goods, in commerce, is the delivering or making them over to another: thus, goods are said to be consigned to a factor, when they are sent to him to be sold, &c.; or when a factor sends back goods to his principal, they are said to be consigned to him.

CONSISTENCE, in physics, that state of a body wherein its component particles are so connected or entangled among themselves, as not to separate or recede from each other. It differs from continuity in this, that it implies a regard to motion or rest, which continuity does not, it being sufficient to denominate a thing continuous that its parts are contiguous to each other.

CONSISTENTES, in church-history, a kind of penitents who were allowed to assist at prayers, but who could not be admitted to receive the sacrament.

CONSISTORY (*consistorium*), signifies as much as *pratorium*, a tribunal: it is commonly used for a council-house of ecclesiastical persons, or place of justice in the spiritual court; a session or assembly of prelates. And every archbishop and bishop of every diocese hath a consistory court held before his chancellor or commissary in his cathedral church, or other convenient place of his diocese, for ecclesiastical causes. The bishop's chancellor is the judge of this court, supposed to be skilled in the civil and canon law; and in places of the diocese far remote from the bishop's consistory, the bishop appoints a commissary to judge in all causes within a certain district, and a register to enter his decrees, &c.

CONSISTORY, at Rome, denotes the college of cardinals, or the pope's senate and council, before whom judiciary causes are pleaded. Du Cange derives the word from *consistorium*; i. e. *locus ubi consistitur*; used chiefly for a vestibule, gallery, or anti-chamber, where the courtiers wait for admission; and called *a consistente multitudine*.

The consistory is the first court, or tribunal of Rome: it never meets but when the pope pleases to convoke it: the pope presides in it in person, mounted on a magnificent throne, and habited in his *pontificalia*; on the right are the cardinal-bishops and priests, and on the left the cardinal deacons. The place where it is held, is a large hall in the apostolical palace, where princes and ambassadors of kings are received. The other prelates, prothonotaries, auditors of the rota and other officers, are seated on the steps of the throne: the courtiers sit on the ground; ambassadors on the right, and consistorial and fiscal advocates behind the cardinals.

Besides the public consistory, there is also a private one, held in a retired chamber, called the *chamber of papagay*; the pope's throne here being only raised two steps high. No body is here admitted but the cardinals whose opinions are collected, and called *sentences*. Here are first proposed and passed all bulls for bishoprics, abbeyes, &c. Hence bishoprics and abbeyes are said to be consistorial benefices; in regard, they must be proposed in the consistory, the anates be paid

Consign-
ment
||
Consistory.

Confistory to the pope, and his bulls taken. Anciently they were elective; but by the concordat, which abolishes elections, they are appointed to be collated by the pope alone, on the nomination of the prince.

Conspiracy.

CONSISTORY was also the name of a court under Constantine, where he sat in person, and heard causes: the members of this court were called *comites*.

CONSISTORY is also used among the reformed, for a council or assembly of ministers and elders, to regulate their affairs, discipline, &c.

CONSISTORY, or court Christian in the English laws, is a council of ecclesiastical persons, or the place of justice in an ecclesiastical or spiritual court. Every archbishop and bishop has a consistory-court, held before his chancellor or commissary, either in his cathedral, in some chapel, aisle, or portico, belonging thereto; or in some other convenient place of his diocese, for ecclesiastical causes. The spiritual court was anciently, in the time of the Saxons, joined with the county or hundred court; and the original of the consistory court, as divided from those courts, is found in a law of the conqueror, quoted by lord Coke. From this court there lies an appeal to the archbishop of each province respectively.

CONSOLATION, one of the places in rhetoric wherein the orator endeavours to abate and moderate the grief or concern of another.

CONSOLE, in architecture, an ornament cut upon the key of an arch, which has a projecture, and on occasion serves to support little corniches, figures, busts, and vases.

CONSOLIDATION, in law, the combining and uniting two benefices into one. The term is borrowed from the civil law; where it properly signifies an union of the possession, or occupation, with the property. Thus, if a man have by legacy *usum fructum fundi*, and afterwards buy the property, or fee-simple, of the heir; this is called a *consolidation*.

CONSOLIDATION, in medicine, the action of uniting broken bones, or the lips of wounds, by means of *consolidating remedies*, as they are called; which cleansing with a moderate heat and force, taking corruption out of the wounds, and preserving the temperature of the parts, cause the nourishment to be fitly applied to the part affected.

Among the many instances of the consolidating power of blood and raw flesh, we have a very remarkable one in Bartholine's Medical Observations. A man being condemned to have his nose cut off by the hand of the common executioner, the friends, who were to be present, provided a new loaf of warm bread, which was cut in the middle, and the nose received in it as it fell from the face: the nose was after this nicely placed on the face again; and, being sewed on, the whole in time consolidated, and left no other marks of the ignominy than the scar round the whole nose, and the traces of the stitches.

CONSONANCE, in music. See INTERVAL.

CONSONANT, a letter that cannot be sounded without some single or double vowel before or after it; as *b, c, d*, &c.

CONSORT, *Queen Consort*. See QUEEN.

CONSPIRACY, in law, signifies an agreement between two or more, falsely to indict, or procure to be indicted, an innocent person, of felony.

CONSPIRATORS are, by statute, defined to be such as bind themselves by oath, covenant, or other alliance, to assist one another falsely and maliciously to indict persons, or falsely to maintain pleas.

Conspirators, Constable.

Conspirators in treason, are those that plot against the king and the government.

CONSTABLE, according to some, is a Saxon word, compounded of *coning*, "king," and *staple*, which signifies the "stay or support of the king." But as we borrowed the name as well as the office of *Constable* from the French, Sir William Blackstone is rather inclined to deduce it, with Sir Henry Spelman and Dr Cowel, from that language; wherein it is plainly derived from the Latin *comes stabuli*, an officer well known in the empire; so called, because, like the great constable of France, as well as the lord high constable of England, he was to regulate all matters of chivalry, tilts, tournaments, and feats of arms, which were performed on horseback.—The

Lord High CONSTABLE of England is the seventh great officer of the crown; and he, with the earl marshal of England, were formerly judges of the court of chivalry, called in king Henry IV.'s time *Curia Militaris*, and now the court of honour. It is the fountain of the martial law, and anciently was held in the king's hall. The power of the lord high constable was formerly so great, and of which so improper a use was made, that so early as the 13th of king Richard II. a statute passed for regulating and abridging the same, together with the power of the earl marshal of England; and by this statute, no plea could be tried by them or their courts, that could be tried by the common law of the realm. The office of constable existed before the conquest. After the conquest, the office went with inheritance, and by the tenure of the manors of Harlefield, Newman, and Whitenhurst, in Gloucestershire, by grand serjeanty in the family of the Bohuns Earl of Hereford and Essex, and afterwards in line of Sefford as heirs-general to them; but in 1521, this great office became forfeited to the king in the person of Edward Stafford duke of Buckingham, who was that year attainted for high treason; and in consideration of its extensive power, dignity, and large authority, both in time of war and peace, it has never been granted to any person, otherwise than *hac vice*, and that to attend at a coronation, or trial by combat. In France, the same office was also suppressed about a century after by an edict of Louis XIII; though it has been exercised, in the command of the MARSHALS, by the first officer in the army.

Lord high constable of Scotland was an office of great antiquity and dignity. The first upon record is Hugo de Morvelle in the reign of David I. He had two grand prerogatives, viz. First, the keeping of the king's sword, which the king, at his promotion, when he swears fealty, delivers to him naked. Hence the badge of the constable is a naked sword.—Second, The absolute and unlimited command of the king's armies while in the field, in the absence of the king; but this command does not extend to castles and garrisons. He was likewise judge of all crimes committed within two leagues of the king's house, which precinct was called the *Chalmer of Peace*. Though his jurisdiction came at last to be exercised only as to crimes during the time of parliament, which some extended likewise

Constable. to all general conventions. This office was conferred heritably upon the noble family of Errol, by king Robert Bruce; and with them it still remains, being expressly reserved by the treaty of union.

Inferior CONSTABLES. From the great office of high constable is derived that inferior order, since called the *constables of hundreds and franchises*; these were first ordained in the 13th year of Edward I. by the statute of Winchester; which for the conservation of the peace, and view of armour, appointed that two constables should be chosen in every hundred and franchise. These are what are now called *constabularii capitales* or *high constables*; because continuance of time, and increase of people, &c. have occasioned others of like nature, but inferior authority, in every town, called *petty constables*, or *sub-constabularii*, first instituted about the reign of Edward III.

The former, or modern *high constables*, are appointed at the court-leets of the franchise or hundred over which they preside; or, in default of that, by the justices at their quarter-sessions; and are removeable by the same authority that appoints them. The *petty constables* have two offices united in them, the one ancient, and the other modern. Their ancient office is that of head-borough, tithing-man, or borsholder; who are as ancient as the time of king Alfred: their more modern office is that of constable merely; which was appointed so lately as the reign of Edward III. in order to assist the high-constable. And in general the ancient head-boroughs, tithing-men, and borsholders, were made use of to serve as petty constables; though not so generally, but that in many places they still continue distinct officers from the constables. They are all chosen by the jury at the court-leet; or if no court-leet be held, are appointed by two justices of the peace.

The general duty of all constables, both high and petty, as well as of the other officers, is to keep the king's peace in their several districts; and to that purpose they are armed with very large powers of arresting and imprisoning, of breaking open houses, and the like: of the extent of which powers, considering what manner of men are for the most part put upon these offices, it is perhaps very well that they are generally kept in ignorance. One of their principal duties arising from the statute of Winchester, which appoints them, is to keep watch and ward in their respective jurisdictions. Ward, guard, or *custodia*, is chiefly intended of the day-time, in order to apprehend rioters, and robbers on the highways; the manner of doing which is left to the discretion of the justices of the peace and the constable; the hundred being, however, liable for all the robberies committed therein by day-light, for having kept negligent guard. Watch is properly applicable to the night only, (being called among the Saxons *wach't* or *wachtu*); and it begins when ward ends, and ends when that begins: for, by the statute of Winchester, in walled towns the gates shall be closed from sun-setting to sun-rising; and watch shall be kept in every borough and town, especially in the summer season, to apprehend all rogues, vagabonds, and night-walkers, and make them give an account of themselves. The constable may appoint watchmen at his discretion, regulated by the custom of the place; and these, being his deputies, have, for the time being, the authority of their principal.

There are also constables denominated from particular places, as constable of the Tower, of Dover castle, of Windsor castle, of the castle of Caernarvon, and many other of the castles of Wales; whose office is the same with that of the castellani, or governors of castles.

CONSTABLES of London. The city of London is divided into 26 wards, and the wards into precincts, in each whereof is a constable. They are nominated by the inhabitants of each precinct on St Thomas's day, and confirmed, or otherwise, at the court of wardmote. After confirmation, they are sworn into their offices at a court of aldermen, on the next Monday after Twelfth day. Such as are chosen into the office, are obliged to place the king's arms, and the arms of the city, over their doors; and if they reside in alleys, at the ends of such alleys toward the streets, to signify that a constable lives there, and that they may be the more easily found when wanted.

CONSTABLES to Justices of the Peace, in Scotland, are the proper officers for executing their orders. They have powers to suppress tumults, and to apprehend delinquents and those who can give no good account of themselves, and carry them to the next justice.

CONSTANCE, a strong town of Germany, in the circle of Suabia, with a bishop's see, whose bishop is a prince of the empire. It has a handsome bridge, and several fine structures, as well sacred as profane. It carries on a great trade, and is well fortified; and though it pretends to be an imperial town, the Austrians keep a garrison here. It is famous for a council held here in 1514, when there were three popes; but they were all deposed, and Martin V. was elected in their room. The council caused Jerom of Prague to be burnt, though the emperor Sigismund had given him a safe conduct; in pursuance of this maxim, "that no faith is to be kept with heretics." They likewise condemned the doctrine of Wickliff, and ordered his bones to be burned 40 years after he was dead. However, the inhabitants now are Protestants. It is seated on a lake of the same name. E. Long. 9. 12. N. Lat. 47. 35.

CONSTANCE, a great lake of Germany, between Suabia and Swisserland. It is 30 miles in length, and 8 in breadth. It is crossed by the river Rhine; and there are several towns on its banks.

CONSTANCY, in a general sense, denotes immutability, or invariableness.—In ethics, or when applied to the human mind, the term implies resolution or steadiness, particularly under sufferings and the trials of adversity.

It was the saying of a heathen philosopher, That there cannot be imagined upon earth a spectacle more worthy the regard of the Creator intent on his works, than a brave man superior to his sufferings. Nothing indeed can be more noble or honourable than to have courage enough to execute the commands of reason and conscience; to maintain the dignity of our nature, and the station assigned us; and to be proof against poverty, pain, and death itself, so far as not to do any thing that is scandalous or sinful to avoid them. To be thus, is to be great above title and fortune. This argues the soul of an heavenly extraction, and is worthy the offspring of the Deity.

Of this virtue the following example, related in English

Constable. English history, is here selected, as superior perhaps, all circumstances considered, to any other upon record.

Sir William Askew of Kelfay, in Lincolnshire, had several daughters. His second, named *Anne*, had received a genteel education; which, with an agreeable figure and good understanding, rendered her a very proper person to be at the head of a family. Her father, regardless of his daughter's inclination and happiness, obliged her to marry a gentleman who had nothing to recommend him but his fortune, and who was a most bigoted Papist. No sooner was he convinced of his wife's regard for the doctrines of the reformation from popery, than, by the instigation of the priests, he violently drove her from his house, though she had born him two children, and her conduct was unexceptionable. Abandoned by her husband, she came up to London, in order to procure a divorce, and to make herself known to that part of the court who either professed or were favourers of protestantism: but as Henry VIII. with consent of parliament, had just enacted the law of the six articles, commonly called the *bloody statute*, she was cruelly betrayed by her own husband; and, upon his information, taken into custody, and examined concerning her faith. The act abovementioned denounced death against all those who should deny the doctrine of *transubstantiation*; or that the bread and wine made use of in the sacrament was not converted after consecration into the *real* body and blood of Christ; or, maintain the necessity of receiving the sacrament in both kinds; or affirm, that it was lawful for priests to marry; that the vows of celibacy might be broken; that private masses were of no avail; and that auricular confession to a priest was not necessary to salvation. Upon these articles she was examined by the inquisitor, a priest, the lord-mayor of London, and the bishop's chancellor; and to all their queries gave proper and pertinent answers; but not being such as they approved, she was sent back to prison, where she remained eleven days to ruminate alone on her alarming situation, and was denied the small consolation of a friendly visit. The king's council being at Greenwich, she was once more examined by chancellor Wriothesley, Gardiner bishop of Winchester, Dr Cox, and Dr Robinson; but not being able to convince her of her supposed errors, she was sent to the Tower. Mr Strype, from an authentic paper, gives us the following short account of her examination, which may not, perhaps, be unentertaining or useless to the reader: "Sir Martin Bowes (lord mayor) sitting with the council, as most meet for his wisdom, and seeing her stand upon life and death, I pray you, quoth he, my lords, give me leave to talk to this woman? Leave was granted. *Lord Mayor.* Thou foolish woman, sayest thou that the priest cannot make the holy body of Christ? *A. Askew.* I say so, my lord: for I have read that God made man; but that man made God I never read; nor I suppose ever shall read it. *Lord Mayor.* No! Though foolish woman, after the words of consecration, is it not the Lord's body? *A. Askew.* No: it is but consecrated bread, or sacramental bread. *Lord Mayor.* What if a mouse eat it after consecration; what shall become of this mouse? what sayest thou, thou foolish woman? *A. Askew.* What shall become of her, say you, my lord? *Lord Mayor.* I say, that the mouse is damned.

A. Askew. Alack, poor mouse!" Perceiving that some could not keep in their laughing, the council proceeded to the butchery and slaughter that they intended before they came there.—It was strongly suspected that Mrs Askew was favoured by some ladies of high rank; and that she carried on a religious correspondence with the queen. So that the chancellor Wriothesley, hoping that he might discover something that would afford matter of impeachment against that princess, the Earl of Hertford, or his Countess, who all favoured reformation, ordered her to be put to the rack: but her fortitude in suffering, and her resolution not to betray her friends, was proof against that diabolical invention. Not a groan, not a word, could be extorted from her. The chancellor, provoked with what he called her obstinacy, augmented her tortures with his own hands, and with unheard of violence: but her courage and constancy were invincible; and these barbarians gained nothing by their cruelties but everlasting disgrace and infamy. As soon as she was taken from the rack, she fainted away; but being recovered, she was condemned to the flames. Her bones were dislocated in such a manner, that they were forced to carry her in a chair to the place of execution. While she was at the stake, letters were brought her from the lord chancellor, offering her the king's pardon if she would recant. But she refused to look at them; telling the messenger, that "she came not thither to deny her Lord and Master." The same letters were also tendered to three other persons condemned to the same fate; and who, animated by her example, refused to accept them. Whereupon the lord-mayor commanded the fire to be kindled; and with savage ignorance cried out, *Fiat justitia*, "Let justice take its course." The faggots being lighted, she commended her soul, with the utmost composure, into the hands of her Maker; and, like the great founder of the religion she professed, expired, *praying for her murderers*, July 16, 1546, about the 25th year of her age.

CONSTANTIA, a district at the Cape of Good Hope, consisting of two farms, which produce the well-known wine so much prized in Europe, and known by the name of *Cape* or *Constantia* wine. This place is situated at the distance of a mile and a half from Alphen, in a bending formed by and nearly under the ridge of hills, which comes from Meuisenmountain, and just where it strikes off towards Houtbay. One of these farms is called Little Constantia. Here the white Constantia wine is made. The other produces the red. According to M. De la Cail's account, not more than 60 *figgars* of red, and 90 of the white Constantia wine are made, each *figgar* being reckoned at 600 French pints, or about 150 Swedish cans; so that the whole produce amounts to 22,500 cans. As the company are used to keep one third of this for themselves, the remainder is always bespoke by the Europeans long before it is made. At the Cape this wine is seldom seen at table, partly because it is dear, and partly because it is the produce of the country. The red Constantia wine sells for about 60 rixdollars the half awin; but the white is usually to be purchased at a more reasonable rate. The genuine Constantia wine is undeniably a very racy and delicate desert wine, and has something peculiarly agreeable in the flavour of it. That its superiority,

Constable,
Constantia.

Constantia periority, however, is not owing to any thing peculiar in the manner of preparing it, seems extremely probable; for then, without doubt, a great deal more of it would be made. In fact, Dr Sparmann informs us, that the genuine wine can only be produced by certain particular soils. The districts that lie next to these yield merely the common Cape wine, notwithstanding that they have been planted with vine-stocks taken from this, as well as with some brought from the banks of the Rhine, whence it is supposed that the true Constantia first originally comes; nay, even tho' all the vineyards about Constantia seem to have the same soil. We have instances at the Cape, as well as in Europe, that good grapes sometimes produce a bad wine; while, on the other hand, bad grapes will yield a good sort of wine: therefore, towards making wine of a certain quality, besides finer materials, there must be certain conditions and circumstances, which, by a diligent and rational investigation, might probably be explored to the great benefit of mankind.

Such as are apprized in what quantities Constantia wine is consumed in Europe, will perhaps think the above calculation of the produce too limited. This, however, Dr Sparmann assures us, is by no means the case; the overplus being the produce of avarice, which goaded on by the desire of gain, will always hit upon some method of satisfying the demands of luxury and sensuality. The votaries of these, accustomed to be put off with empty sounds, do not seldom drink with the highest relish an imaginary Constantia, with which, however, this liquor has nothing in common besides the mere name. It is therefore advisable, even at the Cape itself, to take care, that whilst one has a genuine sample given one to taste, one is not made to pay for a made-up red Constantia, which otherwise is in general sold for half the price. When a wine of this kind has been (as it usually is) meliorated by a voyage, and at the same time christened with the pompous name of genuine Constantia, of which it has indeed in some measure the flavour, it easily sells for such in Europe.

CONSTANTINA, a strong considerable town of Africa, in the kingdom of Algiers, and capital of a territory of the same name. It is the largest and strongest place in all the eastern parts; and it is seated on the top of a great rock. There is no way to it but by steps cut out of the rock; and the usual way of punishing criminals here is to throw them down the cliff. Here are a great many Roman antiquities, particularly a triumphal arch. E. Long. 7. 12. N. Lat. 36. 4.

CONSTANTINA, a town of Spain, in Andalusia, and capital of a small territory of the same name, with a castle seated on a mountain. W. Long. 5. 35. N. Lat. 37. 40.

CONSTANTINE, a kingdom of Barbary of that name in Africa. It is bounded on the north by the Mediterranean, on the east by the kingdom of Tunis, on the south by Bildulgerid, and on the west by the river Snfegmar, which separates it from the kingdom of Bugia. The country is the new Numidia of the ancients, and had its own king: but it is now a province to Algiers.

CONSTANTINE the Great, the first emperor of the

Romans who embraced Christianity. His father, Constantius Clorus, rendered himself famous by his victorious expeditions to Germany and Britain: upon the abdication of Dioclesian, he shared the Roman empire with Galerius Maximinus in 305; and was at that time at York, where he died in 306; having first caused his son Constantine the Great to be proclaimed emperor by his army, and by the English. Galerius at first refused to admit Constantine to his father's share in the imperial throne; but after having lost several battles he consented in 308. Maxentius, who succeeded Galerius opposed him; but was defeated, and drowned himself in the Tyber. The senate then declared Constantine *chief* or *first* Augustus, and Licinius his second associate in the empire, in 313. These princes published an edict, in their joint names, in favour of the Christians; but soon after Licinius, jealous of Constantine's renown, conceived an implacable hatred against him, and renewed the persecutions against the Christians. This brought on a rupture between the emperors; and a battle, in which Constantine was victorious. A short peace ensued: but Licinius having shamefully violated the treaty, the war was renewed; when Constantine, totally defeating him, he fled to Nicomedia, where he was taken prisoner and strangled in 323. Constantine, now become sole master of the western and eastern empires, immediately formed the plan of establishing Christianity as the religion of the state; for which purpose, he convoked several ecclesiastical councils: but finding he was likely to meet with great opposition from the Pagan interest at Rome, he conceived the design of founding a new city, to be the capital of his Christian empire; see **CONSTANTINOPLE**. The glory Constantine had acquire by establishing the Christian religion, was tarnished by the part he took in the persecutions carried on by the Arians, towards the close of his reign, against their Christian brethren who differed from them: seduced by Eusebius, of Nicomedia, he banished several eminent prelates: soon after which he died in 337, the 66th year of his age, and 31st of his reign.

As to the character of Constantine, he was chaste, pious, laborious, and indefatigable; a great general, successful in war, and deserving his success by his shining valour and by the brightness of his genius; a protector of arts, and an encourager of them by his beneficence. If we compare him with Augustus, we shall find that he ruined idolatry, by the same precautions and the same address that the other used to destroy liberty. Like Augustus, he laid the foundation of a new empire; but less skilful, and less polite, he could not give it the same stability: he weakened the body of the state by adding to it, in some measure, a second head in the foundation of Constantinople; and transporting the centre of motion and strength too near the eastern extremity, he left without heat, and almost without life, the western parts, which soon became a prey to the barbarians. The Pagans were too much his enemies to do him justice. Eutropius says, that in the former part of his reign he was equal to the most accomplished princes, and in the latter to the meanest. The younger Victor, who makes him to have reigned more than 21 years, pretends, that in the first 10 years he was a hero; in the 12 succeeding ones

Constantine.

Constantine,
Constantinople.

ones a robber; and in the rolast a spendthrift. It is easy to perceive, with respect to these two reproaches of Victor's, that the one relates to the riches which Constantine took from idolatry, and the other to those with which he loaded the church.

CONSTANTINE emperor of the East in 902, left the care of the empire to his wife Helena, who loaded the people with taxes, and sold all the offices in church and state to the highest bidders; while the emperor employed himself in reading, writing, and the fine arts, till he became as good an architect and painter as he was a bad prince: he wrote several biographical and geographical works, which would have done honour to his name, if he had not neglected his duty to compose them. He died in 960.

CONSTANTINE (Dracos), the son of Emmanuel Paleologus, was placed on the throne by sultan Amurath in 1448. But Mahomet II. his successor, resolving to dethrone him, laid siege to Constantinople by sea and land, and took it by assault in 1453, after it had held out 58 days. The unfortunate emperor seeing the Turks enter the breaches, threw himself into the midst of the enemy; and was cut to pieces; the children of the imperial house were massacred by the soldiers; and the women reserved to gratify the lust of the conqueror; and thus terminated the dynasty of the Constantines, 1123 years after its establishment at Constantinople.

CONSTANTINE (Robert), a learned physician born at Caen, taught polite literature in that city; and acquired great reputation by his skill in the Greek language, in history, and in medicine. He died in 1603, aged 103. He wrote a dictionary in Greek and Latin, and other works, which are esteemed.

1
Removing the imperial seat to this city the cause of the decline of the western empire.

CONSTANTINOPLE, the modern name of the city of BYZANTIUM in Thrace. It was enlarged and beautified by the Roman emperor Constantine the Great, in the year 330. At the same time he transferred thither the seat of the empire; and this removal is generally thought to have been one of the principal causes of the sudden decline of the western empire after this period.

2
Constantine defeats the Goths,

In the year 332, the Sarmatians implored Constantine's assistance against the Goths, who had made an irruption into their territories, and destroyed every thing with fire and sword. The emperor readily granted their request, and gained a complete victory. Near 100,000, of the enemy perished either in the battle, or after it with hunger and cold. In consequence of this overthrow, the Goths were obliged to sue for peace; but the ungrateful Sarmatians no sooner found themselves delivered from their enemies, than they turned their arms against their benefactor, and ravaged the provinces of Mæsia and Thrace. The emperor, receiving intelligence of this treachery, returned with incredible expedition, cut great numbers of them in pieces, and obliged the rest to submit to what terms he was pleased to impose.

3
And the Sarmatians

Constantine seems to have been a prince very highly respected, even by far distant nations. In 333, according to Eusebius, ambassadors arrived at Constantinople from the Blemyes, Indians, Ethiopians, and Persians, courting his friendship. They were received in a most obliging manner; and learning from the ambassadors of Sapor king of Persia, that there were great

4
Is highly respected.

numbers of Christians in their master's dominions, Constantine wrote a letter in their behalf to the Persian monarch.

Next year, the Sarmatians being again attacked by the Goths, found themselves obliged to set at liberty and arm their slaves against them. By this means they indeed overcame the Goths; but the victorious slaves turning their arms against their masters, drove them out of the country. This misfortune obliged them, to the number of 300,000, to apply for relief to the Roman emperor, who incorporated with his legions such as were capable of service; and gave settlements to the rest in Thrace, Scythia, Macedon, and Italy. This was the last remarkable action of Constantine the Great. He died on May 25, 337, having divided the empire among his children and nephews, in the following manner. Constantine, his eldest son, had Gaul, Spain, and Britain: Constantius, the second, had Asia, Syria, and Egypt: and Constans, the youngest, Illyricum, Italy, and Africa. To his nephew Dalmatius, he gave Thrace, Macedon, and Achaia; and to king Annibalianus, his other nephew, Armenia Minor, Pontus, Cappadocia, and the city of Cæsarea, which he desired might be the capital of his kingdom

After the death of Constantine, the army and senate proclaimed his three sons emperors, without taking any notice of his two nephews, who were soon after murdered, with Julius Constantius the late emperor's brother, and all their friends and adherents. Thus the family of Constantine was at once reduced to his three sons, and two nephews Gallus and Julian, the sons of Julius Constantius; and of these the former owed his life to a malady, from which no one thought he could recover; and the latter to his infancy, being then at most about seven years of age. The three brothers divided among themselves the dominions of the deceased princes; but did not long agree together. In 340, Constantine having in vain solicited Constans to yield part of Italy to him, raised a considerable army; and under pretence of marching to the assistance of his brother Constantius, who was then at war with the Persians, made himself master of several places in Italy. Hereupon Constans detached part of his army against him; and Constantine, being drawn into an ambuscade near Aquileia, was cut off with his whole forces. His body was thrown into the river Ansa; but being afterwards discovered, was sent to Constantinople, and interred there near the tomb of his father

By the defeat and death of his brother, Constans remained sole master of all the western part of the empire, in the quiet possession of which he continued till the year 350. This year, Magnentius, the son of one Magnus, a native of Germany, finding Constans despised by the army on account of his indolence and inactivity, resolved to murder him, and set up for himself. Having found means to gain over the chief officers of the army to his designs, he seized on the imperial palace at Autun, and distributed among the populace what sums he found there; which induced not only the city, but the neighbouring country, to espouse his cause. But Constans being informed of what had passed, and finding himself unable to resist the usurper, fled towards Spain. He was overtaken, however, by Gaiso, whom Magnentius had sent after him with a

Constantinus murdered. Thus Constantius acquired a right to the whole Roman empire; though one half of it was seized by Magnentius after the murder of Constantinus. The former had been engaged in a war with the Persians, in which little advantage was gained on either side; but the Persians now giving no more disturbance, the emperor marched against the usurpers in the west. Besides Magnentius, there were at this time two other pretenders to the western empire. Veteranio, general of the foot in Pannonia, had, on the first news of the death of Constantinus, caused himself to be proclaimed emperor by the legions under his command. He was a native of Upper Mæsia, and advanced in years when he usurped the sovereignty; but so illiterate, that he then first learned to read. The third pretender was Flavius Popilius Nepotianus, son of Eutropia the sister of Constantine the Great. Having assembled a company of gladiators and men of desperate fortunes, he assumed the purple on the 3d of June 350, and in that attire presented himself before the gates of Rome. The prefect Anicetus, who commanded there for Magnentius, sallied out against him with a body of Romans; who were soon driven back into the city. Soon after Nepotianus made himself master of the city itself, which he filled with blood and slaughter. Magnentius being informed of what had happened, sent against this new competitor his chief favourite and prime minister Marcellinus. Nepotianus received him with great resolution; a bloody battle ensued between the soldiers of Magnentius and the Romans who had espoused the cause of Nepotianus; but the latter being betrayed by a senator, named Heraclitus, his men were put to flight, and he himself killed, after having enjoyed the sovereignty only 28 days. Marcellinus ordered his head to be carried on the point of a lance through the principal streets of the city; put to death all those who had declared for him; and under pretence of preventing disturbances, commanded a general massacre of all the relations of Constantine. Soon after, Magnentius himself came to Rome to make the necessary preparations for resisting Constantius, who was exerting himself to the utmost in order to revenge the death of his brother. In the city he behaved most tyrannically, putting to death many persons of distinction, in order to seize their estates; and obliged the rest to contribute half of what they were worth towards the expence of the war. Having by this means raised great sums, he assembled a mighty army composed of Romans, Germans, Gauls, Franks, Britons, Spaniards, &c. At the same time, however, dreading the uncertain issues of war, he dispatched ambassadors to Constantius with proposals of accommodation. Constantius set out from Antioch about the beginning of autumn; and, passing through Constantinople, arrived at Heraclea, where he was met by the deputies from Magnentius, and others from Veteranio, who had agreed to support each other in case the emperor would hearken to no terms. The deputies of Magnentius proposed in his name a match between him and Constantia, or rather Constantina, the sister of Constantius, and widow of Annibalianus; offering, at the same time, to Constantius the sister of Magnentius.

17
Sends proposals of peace to Constantius.

At first the emperor would hearken to no terms; but afterwards, that he might not have to oppose two enemies at once, concluded a separate treaty with Veteranio, by which he agreed to take him for his partner in the empire. But when Veteranio ascended the tribunal along with Constantius, the soldiers pulled him down from thence, crying out, That they would acknowledge no other emperor than Constantius alone. On this Veteranio threw himself at the emperor's feet, and implored his mercy. Constantius received him with great kindness, and sent him to Prusia in Bithynia, where he allowed him a maintenance suitable to his quality.

Constantius, now master of all Illyricum, and of the army commanded by Veteranio, resolved to march against Magnentius without delay. In the mean time, however, on advice that the Persians were preparing to invade the eastern provinces, he married his sister Constantina to his cousin german Gallus; created him Cæsar on the 15th of March; and allotted him for his share not only all the East, but likewise Thrace and Constantinople. About the same time Magnentius gave the title of Cæsar to his brother Decentius, whom he dispatched into Gaul to defend that country against the barbarians who had invaded it; for Constantius had not only stirred up the Franks and Saxons to break into that province by promising to relinquish to them all the places they should conquer, but had sent them large supplies of men and arms for that purpose. On this encouragement the barbarians invaded Gaul with a mighty army, overthrew Decentius in a pitched battle, committed everywhere dreadful ravages, and reduced the country to a most deplorable situation. In the mean time Magnentius having assembled a numerous army, left Italy, and crossing the Alps, advanced into the plains of Pannonia, where Constantius, whose main strength consisted in cavalry, was waiting for him. Magnentius, hearing that his competitor was encamped at a small distance, invited him by a messenger to the extensive plains of *Sciscia* on the Save, there to decide which of them had the best title to the empire. This challenge was by Constantius received with great joy; but as his troops marched towards *Sciscia* in disorder, they fell into an ambuscade, and were put to flight with great slaughter. With this success, Magnentius was so elated, that he rejected all terms of peace which were now offered by Constantius; but after some time, a general engagement ensued at *Mursa*, in which Magnentius was entirely defeated, with the loss of 24,000 men. Constantius, though victor, is said to have lost 30,000, which seems improbable. All authors, however, agree, that the battle of *Mursa* proved fatal to the western empire, and greatly contributed to its speedy decline.

After his defeat at *Mursa*, Magnentius retired into Italy, where he recruited his shattered forces as well as he could. But the beginning of the following year 352, Constantius, having assembled his troops, surprised and took a strong castle on the Julian Alps, belonging to Magnentius, without the loss of a man. After this the emperor advanced in order to force the rest; upon which Magnentius was struck with such terror, that he immediately abandoned *Aquileia*, and ordered the troops that guarded the other passes of the Alps to

follow him. Thus Constantius entering Italy without opposition, made himself master of Aquileia. From thence he advanced to Pavia, where Magnentius gained a considerable advantage over him. Notwithstanding this loss, however, Constantius reduced the whole country bordering on the Po, and Magnentius's men deserted to him in whole troops, delivering up to him the places they had garrisoned; by which the tyrant was so disheartened, that he left Italy, and retired with all his forces into Gaul. Soon after this, Africa, Sicily, and Spain, declared for Constantius; upon which Magnentius sent a senator, and after him some bishops, to treat of a peace; but the emperor treated the senator as a spy, and sent back the bishops without any answer.—Magnentius now finding his affairs desperate, and that there were no hopes of pardon, recruited his army in the best manner he could, and dispatched an assassin into the East to murder Gallus Cæsar; hoping that his death would oblige the emperor to withdraw his forces from Gaul, and march in person to the defence of the Eastern provinces, which were threatened by the Persians. The assassin gained over some of Gallus's guards: but the plot being discovered before it could be put in execution, they were all seized and executed as traitors.

23 Magnentius attempts to get Gallus murdered.

24 Magnentius defeated a second time, kills all his family and himself.

In 353, the war against Magnentius was carried on with more vigour than ever, and at last happily ended by a battle fought in the Higher Dauphiny. Magnentius, being defeated, took shelter in Lyons; but the few soldiers who attended him, despairing of any further success, resolved to purchase the emperor's favour by delivering up to him his rival, the author of so calamitous a war. Accordingly they surrounded the house where he lodged; upon which the tyrant, in despair, slew with his own hand his mother, his brother Desiderius whom he had created Cæsar, and such of his friends and relations as were with him; and then, fixing his sword in a wall, threw himself upon it, in order, to avoid a more shameful death which he had reason to apprehend.

25 Constantius sole master of the empire.

After the death of Magnentius, his brother Decentius Cæsar, who was marching to his assistance, and had already reached Sens, finding himself surrounded on all sides by the emperor's forces, chose rather to strangle himself than fall alive into the hands of his enemies. Thus Constantius was left sole master of the Roman empire. His panegyrist tells us, that after his victory he behaved with the greatest humanity, forgiving and receiving into favour his greatest enemies; but other historians differ considerably from them, and tell us that Constantius now became haughty, imperious, and cruel, of which many instances are given.

26 Many grievous calamities.

This year the empire was subjected to very grievous calamities. Gaul was ravaged by the barbarians beyond the Rhine, and the disbanded troops of Magnentius. At Rome, the populace rose on account of a scarcity of provisions. In Asia, the Isaurian robbers over-ran Lycaonia and Pamphylia; and even laid siege to Seleucia, a city of great strength; which, however, they were not able to make themselves masters of. At the same time, the Saracens committed dreadful ravages in Mesopotamia; the Persians also invaded the province of Anthemusia on the Euphrates. But the Eastern provinces were not so much harassed by

the barbarians as by Gallus Cæsar himself, who ought to have protected them. That prince was naturally of a cruel, haughty, and tyrannical disposition; but being elated with his successes against the Persians, he at last behaved more like a tyrant and a madman than a governor. His natural cruelty is said to have been heightened by the instigations of his wife Constantina, who is by Ammianus styled the *Megara*, or "fury of her sex;" and he adds, that her ambition was equal to her cruelty. Thus all the provinces and cities in the East were filled with blood and slaughter. No man, however innocent, was sure to live or enjoy his estate a whole day; for Gallus's temper being equally suspicious and cruel, those who had any private enemies took care to accuse them of crimes against the state, and with Gallus it was the same thing to be accused and condemned. At last the emperor being informed from all quarters of the evil conduct of his brother-in-law, and being at the same time told that he aspired to the sovereignty, resolved upon his ruin. For this end he wrote letters to Gallus and Constantina, inviting them both into Italy. Though they had both sufficient reason to fear the worst, yet they durst not venture to disobey the emperor's express command. Constantina, who was well acquainted with her brother's temper, and hoped to pacify him by her artful insinuation, set out first, leaving Gallus at Antioch: but she had scarce entered the province of Bithynia, when she was seized with a fever which put an end to her life. Gallus now despairing of being able to appease his sovereign, thought of openly revolting; but most of his friends deserted him on account of his inconstant and cruel temper, so that he was at last obliged to submit to the pleasure of Constantius. He advanced, therefore, according to his orders; but at Petavium was arrested, and stripped of all the ensigns of his dignity. From thence he was carried to *Flanona*, now *Fianone* in Dalmatia; where he was examined by two of his most inveterate enemies. He confessed most of the crimes laid to his charge; but urged as an excuse the evil counsels of his wife Constantina. The emperor, provoked at this plea which reflected on his sister, and instigated by the enemies of Gallus, signed a warrant for his execution, which was performed accordingly.

27 Tyranny of Gallus.

28 He is put to death.

29 War with the Germans.

All this time the emperor had been engaged in a war with the Germans: he had marched against them in person; and though he gained no advantage, the barbarians thought proper to make peace with him. This, however, was but short-lived. No sooner was the Roman army withdrawn, than they began to make new inroads into the empire. Against them Constantius dispatched Arbetio with the flower of the army; but he fell into an ambuscade, and was put to flight with the loss of a great number of men. This loss, however, was soon retrieved by the valour of *Arintheus*, who became famous in the reign of Valens, and of two other officers, who falling upon the Germans, without waiting the orders of their general, put them to flight, and obliged them to leave the Roman territories.

The tranquillity of the empire, which ensued on this repulse of the Germans, was soon interrupted by a pretended conspiracy, by which in the end a true one was produced. Sylvanus, a leading man among the

Constantinopolitan history. ³⁰ Sylvanus betrayed by Arbetio. the Franks, commanded in Gaul, and had there performed great exploits against the barbarians. He had been raised to this post by Arbetio; but only with a design to remove him from the emperor's presence, in order to accomplish his ruin, which he did in the following manner: One *Dynamus*, keeper of the emperor's mules, leaving Gaul, begged of Sylvanus letters of recommendation to his friends at court; which being granted, the traitor erased all but the subscription. He then inserted directions to the friends of Sylvanus for the carrying on a conspiracy; and delivering these forged letters to the prefect Lampridius, they were by him showed to the emperor. Thus Sylvanus was forced to revolt, and cause himself to be proclaimed emperor by the troops under his command. In the mean time, however, *Dynamus* having thought proper to forge another letter, the fraud was discovered, and an enquiry set on foot, which brought to light the whole matter. Sylvanus was now declared innocent, and letters sent to him by the emperor confirming him in his post; but these were scarce gone, when certain news arrived at the court of Sylvanus having revolted, and caused himself to be proclaimed emperor. Constantius, thunderstruck at this news, dispatched against him *Urficius*, an officer of great integrity, as well as valour and experience in war; who forgetting his former character, pretended to be Sylvanus's friend, and thus found means to cut him off by treachery.

³¹ He is forced to revolt. ^[31] Is murdered. ³² Gaul ravaged by the barbarians. ³³ Julian created Cæsar. The barbarians, who had been hitherto kept quiet by the brave Sylvanus, no sooner heard of his death, than they broke into Gaul with greater fury than ever. They took and pillaged above forty cities, and among the rest Cologne, which they levelled with the ground. At the same time the *Quadi* and *Sarmatians* entering *Pannonia*, destroyed every thing with fire and sword. The *Persians* also, taking advantage of the absence of *Urficius*, over-ran, without opposition, *Armenia* and *Mesopotamia*; *Prosper* and *Mausonianus*, who had succeeded that brave commander in the government of the East, being more intent upon pillaging than defending the provinces committed to their care. Constantius, not thinking it advisable to leave Italy himself, resolved at last to raise his cousin Julian, the brother of *Gallus*, to the dignity of Cæsar. Julian seems to have been a man of very extraordinary talents; for though before this time he had been entirely buried in obscurity, and conversed only with books, no sooner was he put at the head of an army than he behaved with the same bravery, conduct, and experience, as if he had been all his life bred up to the art of war. He was appointed governor of Gaul; but before he set out, Constantius gave him in marriage his sister *Helena*, and made him many valuable presents. At the same time, however, the jealous emperor greatly limited his authority; gave him written instructions how to behave; ordered the generals who served under him to watch all his actions no less than those of the enemy; and strictly enjoined Julian himself not to give any largesses to the soldiery.

Julian set out from Milan on the 1st of December 355, the emperor himself accompanying him as far as Pavia, from whence he pursued his journey to the Alps, attended only by 360 soldiers. On his arrival at Turin he was first acquainted with the loss of Co-

logne, which had been kept concealed from the emperor. He arrived at Vienne before the end of the year, and was received by the people of that city and the neighbourhood with extraordinary joy. Constantinopolitan history.

³⁴ He sets out for Gaul. In 356, the barbarians besieged *Aulun*; to relieve which place, Julian marched with what forces he could raise. When he came there, he found the siege raised: on which he went in pursuit of the barbarians to Auxerre, crossing with no small danger thick woods and forests, from Auxerre to *Troies*. On his march he was surrounded on all sides by the barbarians, who moved about the country in great bodies; but he put them to flight with an handful of men, cut great numbers of them in pieces, and took some prisoners. From *Troies* he hastened to *Rheims*, where the main body of the army, commanded by *Marcellus*, waited his arrival. Leaving *Rheims*, he took his route towards *Decempagi*, now *Dieuze*, on the *Seille* in *Lorraine*, with a design to oppose the Germans who were busy in ravaging that province. But the enemy attacking his rear unexpectedly, would have cut off two legions, had not the rest of the army, alarmed at the sudden noise, turned back to their assistance. A few days afterwards he defeated the Germans, though with great loss to his own army; the victory, however, opened him a way to *Cologne*. This city he found abandoned by the barbarians. They had neglected to fortify it: but Julian commanded the ancient fortifications to be repaired with all possible expedition, and the houses to be rebuilt; after which he retired to *Sens*, and there took up his winter-quarters. This year also *Constantius* entered Germany on the side of *Rhætia*, laid waste the country far and wide; and obliged the barbarians to sue for peace, which was readily granted. The same year he enacted two laws; by one of which it was declared capital to sacrifice, or pay any kind of worship, to idols; the other, granting the effects of condemned persons to belong to their children and relations within the third degree, except in cases of magic and treason; but this last one he revoked two years after.

³⁵ Defeats the barbarians. ³⁶ Repairs the fortifications of Cologne. ³⁷ Idolatry declared capital by Constantius. In the beginning of the year 357, the barbarians besieged Julian a whole month in *Sens*; *Marcellus*, the commander in chief, never once offering to assist him. Julian, however, so valiantly defended himself with the few forces he had, that the barbarians at last retired. After this, *Constantius* declared Julian commander in chief of all the forces in Gaul; appointing under him one *Severus*, an officer of great experience, and of a quite different disposition from *Marcellus*. On his arrival in Gaul, Julian received him with great joy, raised new troops, and supplied them with arms which he luckily found in an old arsenal. The emperor, resolving at all events to put a stop to the terrible devastations committed by the barbarous nations, chiefly by the *Alemans*, wrote to Julian to march directly against them. At the same time he sent *Barbario*, who had been appointed general in place of *Sylvanus*, with a body of 25 or 30,000 men, out of Italy, in order to inclose the enemy between two armies. The *Leti*, however, a German nation, passing between the armies, advanced as far as *Lyons*, hoping to surprise that wealthy city; but meeting with a warmer reception than they expected, contented themselves with ravaging the country all round it. On the first notice

notice of this expedition, Julian detached strong parties to guard the passages through which he knew the barbarians must return. Thus they were all cut off except those who marched near the camp of Barbatio; who was so far from cutting off their retreat, that he complained by a letter to Constantius of some officers for attempting it. These officers, among whom was Valentinian, afterwards emperor of the West, were, by the orders of Constantius, cashiered for their disobedience. The other barbarians either fortified themselves in the countries which they had seized, stopping up all the avenues with huge trees, or took shelter in the islands formed by the Rhine. Julian resolved first to attack the latter; and with this view demanded some boats of Barbatio: but he, instead of complying with his just request, immediately burnt all his boats, as he did on another occasion the provisions which had been sent to both armies, after he had plentifully supplied his own. Julian, not in the least disheartened with this unaccountable conduct, persuaded some of the most resolute of his men to wade over to one of the islands. Here they killed all the Germans who had taken shelter in it. They then seized their boats, and pursued the slaughter in several other islands, till the enemy abandoned them all, and retired to their respective countries with their wives and what booty they could carry. On their departure, Barbatio attempted to lay a bridge of boats over the Rhine; but the enemy, apprised of his intention, threw a great number of huge trees into the river, which being carried by the stream against the boats, sunk several of them, and parted the rest. The Roman general then thought proper to retire; but the barbarians falling unexpectedly upon him in his retreat, cut great numbers of his men in pieces, took most of his baggage, laid waste the neighbouring country, and returned in triumph loaded with booty. Elated with this success, they assembled in great numbers under the command of *Chnodomarius*, a prince of great renown among them, and six other kings. They encamped in the neighbourhood of Straßbourg. Here they were encountered by Julian; who put them to flight, with the loss of 6 or 8000 of their men slain in the field, and a vastly greater number drowned in the river; while Julian himself lost only 243 private men and four tribunes. In this action *Chnodomarius* was taken, and sent to Rome, where he soon after died.

After the battle, Julian advanced with all his army to Mayence, where he built a bridge over the Rhine and entered Germany, having with difficulty prevailed upon his army to follow him. Here he ravaged the country till the time of the autumnal equinox, when being prevented by snow from advancing any further, he began to repair the fort of Trajan, by some supposed to be the castle of Cromburgh, about three or four leagues from Frankfort. The barbarians were now so much alarmed, that they sent deputies to treat of a peace; but this Julian refused to grant them upon any terms. He consented, however, to a truce for seven months, upon their promising to store with provisions the fort he was building in their country. This year Constantius made some remarkable laws. By one he punished with confiscation such as renounced the Christian for the Jewish religion; and by another, ad-

ressed to Felix bishop of Rome, he exempted all merchandizing ecclesiastics, with their wives, children, and domestics, from every imposition ordinary and extraordinary; supposing the gains they made to be applied by them to the relief of the poor.

In 358, as soon as the season was fit for action, Julian took the field against the Franks, with a design to conquer them before the truce he had concluded with the Alemans was expired. The Franks were at that time divided into several tribes, the most powerful of which were the Salii and Chamavi. The first of these sent deputies, intreating that he would suffer them to remain as friends to the empire in the country they possessed. But Julian, without paying any regard to this deputation, entered their country, and obliged them to submit; after which he allotted them lands in Gaul, incorporating great numbers of them into his cavalry. He next marched against the Chamavi, whom he defeated and obliged to retire beyond the Rhine. Afterwards he rebuilt three forts on the river Meuse, which had been destroyed by the barbarians; but wanting provisions in a country so often ravaged, he ordered 6 or 800 vessels to be built in Britain for the conveying corn from thence into Gaul. Julian continued in the country of the Chamavi till the expiration of his truce with the Alemans; and then laying a bridge of boats over the Rhine, he entered their country, putting all to fire and sword. At last two of their kings came in person to him to sue for peace: which Julian granted, upon their promising to set at liberty the captives they had taken; to supply a certain quantity of corn when required; and to furnish wood, iron, and carriages, for repairing the cities they had ruined. The prisoners whom he at this time released, amounted to upwards of 20,000.

Soon after the vernal equinox of this year 358, Constantius marched in person against the Quadi and Sarmatians, whose country lay beyond the Danube. Having crossed that river on a bridge of boats, he laid waste the territories of the Sarmatians; who thereupon came in great numbers, together with the Quadi, pretending to sue for peace. Their true design was to surprize the Romans; but the latter suspecting it, fell upon them sword in hand, and cut them all in pieces. This obliged the rest to sue for peace in good earnest, which was granted on the delivery of hostages. The emperor then marched against the *Limigantes*, that is, the slaves who, in 334, had driven the Sarmatians out of their country, and seized it for themselves.* They used the same artifice as the Sarmatians and Quadi had done, coming in great numbers under pretence of submitting, but prepared to fall upon him unexpectedly if opportunity offered. The emperor, observing their surlly looks, and distrusting them, caused his troops surround them insensibly while he was speaking. The *Limigantes* then displeased with the conditions he offered them, laid their hands on their swords: on which they were attacked by the Roman soldiers. Finding it impossible to make their escape, they made with great fury towards the tribunal, but were repulsed by the guards forming themselves into a wedge, and every one of them cut in pieces. After this, the emperor ravaged their country to such a degree, that they were in the end obliged to submit to the only condition he thought proper to allow them, which was to quit their

47
Haughty embassy from Sapor king of Persia.

This year is also remarkable for a very haughty embassy from Sapor king of Persia. The ambassador, named *Narfes*, brought a letter, in which the Persian monarch styled himself "king of kings, brother of the sun and moon," &c. He acquainted the emperor that he might lawfully insist on having all the countries beyond the river Strymon in Macedonia delivered up to him; but lest his demands should seem unreasonable, he would be contented with Armenia and Mesopotamia, which had been most unjustly taken from his grandfather *Narfes*. He added, that unless justice was done him, he was resolved to assert his right by force of arms. This letter was presented to Constantius wrapped up in a piece of white silk; but he, without entering into any negotiation with the ambassador, wrote a letter to Sapor, in which he told him, that as he had maintained the Roman dominions in their full extent, when he was possessed only of the East, he could not suffer them to be cartailed now when he was master of the whole empire. In a few days, however, he sent another letter with rich presents; being very desirous at least to put off the war till he had secured the northern provinces against the incursions of the barbarians, that he might then employ all the forces of the empire against so formidable an enemy. This embassy proved unsuccessful, as did also another which was sent soon after. The last ambassadors were imprisoned as spies, but afterwards dismissed unhurt. By a law of Constantius dated in 358, all magicians, augurs, astrologers, and pretenders to the art of divination, were declared enemies to mankind; and such of them as were found in the court either of the emperor or of Julian, he commanded to be put to the torture, and specified what torments they were to undergo.

49
Treachery of the Limigantes.

In 359 Julian continued his endeavours for relieving the province of Gaul, which had suffered so much from the incursions of the barbarians. He erected magazines in different places, visited the cities which had suffered most, and gave orders for repairing their walls and fortifications properly. He then crossed the Rhiue, and pursued the war in Germany with great success, insomuch that the barbarians submitted to such terms as he pleased to impose. In the mean time the emperor, having received intelligence that the Limigantes had quitted the country in which he had placed them, hastened to the banks of the Danube, in order to prevent their entering Pannonia. On his arrival he sent deputies, desiring to know what had induced them to abandon the country which had been allotted them. The Limigantes answered, in appearance with the greatest submission imaginable, that they were willing to live as true subjects of the empire in any other place; but that the country he had allotted them was quite uninhabitable, as they could demonstrate if they were but allowed to cross the river, and lay their complaints before him. This request was granted; but while he ascended his tribunal, the barbarians unexpectedly fell upon his guards sword in hand, killed several of them, and the emperor with difficulty saved himself by flight. The rest of the troops, however, soon took the alarm, and surrounding the Limigantes,

50
They are all cut off.

cut them all off to a man. This year Constantius instituted a court of inquisition against all those who consulted heathen oracles. Paulus Catena, a noted and cruel informer, was dispatched into the East to prosecute them; and Modestus, then count of the East, and equally remarkable for his cruelty, was appointed judge. His tribunal was erected at Scythopolis in Palestine; whither persons of both sexes, and of every rank and condition, were daily dragged in crowds from all parts, and either confined in dungeons, or torn in pieces in a most cruel and barbarous manner by racks, or publicly executed.

Constantinopolitan history.

51
The heathens cruelly persecuted.

In 359, Sapor king of Persia began hostilities, being encouraged thereto by the absence of Ursicinus, whom the emperor had recalled, and appointed in his room one Sabatianus, a person very unfit for such an office. During this campaign, however, he made very little progress; having only taken two Roman forts, and destroyed the city of Amida, the siege of which is said to have cost him 30,000 men. On the first news of the Persian invasion, Constantius had thought proper to send Ursicinus into the East; but his enemies prevented him from receiving the supplies necessary for carrying on the war, so that he found it impossible to take any effectual means for stopping the progress of the Persians. On his return, he was unexpectedly charged with the loss of Amida, and all the disasters that had happened during the campaign. Two judges were appointed to inquire into his conduct; but they, being creatures of his enemies, left the matter doubtful. On this Ursicinus was so much exasperated, that he appealed to the emperor, and in the heat of passion, let fall some unguarded expressions, which being immediately carried to the emperor, the general was deprived of all his employments.

52
The Persians begin hostilities.

Constantius resolved to march next year in person against the Persians; but in the mean time, dreading to encounter so formidable an enemy, he applied himself wholly to the assembling of a mighty army, by which he might be able fully to cope with them. For this purpose he wrote to Julian to send him part of his forces, without considering that by so doing he left the province of Gaul exposed to the ravages of the barbarians. Julian resolved immediately to comply with the emperor's orders; but at the same time to abdicate the dignity of Cæsar, that he might not be blamed for the loss of the province. Accordingly he suffered the best soldiers to be draughted out of his army. They were, however, very unwilling to leave him, and at last proclaimed him emperor. Whether this was done absolutely against Julian's consent or not is uncertain; but he wrote to the emperor, and persuaded the whole army also to send a letter along with his, in which they acquainted Constantius with what had happened, and entreated him to acknowledge Julian as his partner in the empire. But this was positively refused by Constantius, who began to prepare for war. Julian then, designing to be before-hand with the emperor, caused his troops take an oath of allegiance to himself, and with surprising expedition made himself master of the whole country of Illyricum, and the important pass separating that country from Thrace. Constantius was thunder-struck with this news; but hearing that the Persians had retired, he marched with

with all his forces against his competitor. On his arrival at Tarsus in Cilicia, he was seized with a feverish distemper, occasioned chiefly by the uneasiness and perplexity of his mind. He pursued his march, however, to Mopsucrene, a place on the borders of Cilicia, at the foot of Mount Taurus. Here he was obliged to stop by the violence of his disorder which increased every day, and at last carried him off on the 13th of November 361, in the 45th year of his age.

By the death of Constantius Julian now became master of the whole Roman empire without a rival. He had been educated in the Christian religion; but secretly apostatized from it long before, and as soon as he saw himself master of Illyricum openly avowed his apostasy, and caused the temples of the gods to be opened. When the messengers arrived at Naissus in Illyricum, where he then was, to acquaint him with his being sole master of the empire, they found him consulting the entrails of victims concerning the event of his journey. As the omens were uncertain, he was at that time very much embarrassed and perplexed; but the arrival of the messengers put an end to all his fears, and he immediately set out for Constantinople. At Heraclea he was met by almost all the inhabitants of this metropolis, into which he made his public entry on the 11th of December 361, being attended by the whole senate in a body, by all the magistrates, and by the nobility magnificently dressed, every one testifying the utmost joy at seeing such a promising young prince raised to the empire without bloodshed. He was again declared emperor by the senate of Constantinople; and as soon as that ceremony was over, he caused the obsequies of Constantius to be performed with great pomp.

The first care of Julian was to inquire into the conduct of the late emperor's ministers. Several of these having been found guilty of enormous crimes, were condemned and executed; particularly the noted informer Paulus Catena, and another named *Apodamus*, were sentenced to be burnt alive. Along with these, however, was put to death one Ursula, a man of unexceptionable character, and to whom Julian himself was highly indebted. He had been supplied with money by Ursula unknown to the emperor, at the time when he was sent into Gaul with the title of Cæsar, but without the money necessary for the support of that dignity. For what reason he was now put to death, historians do not acquaint us. Julian himself tells us, that he was executed without his knowledge.

The emperor next set about reforming the court. As the vast number of officers was in his time become an intolerable burden, he discharged all those whom he thought useless. He reduced, among the rest, the officers called *agentes in rebus*, from 10,000 to 17; and discharged thousands of cooks, barbers, &c. who by their large salaries drained the exchequer. The *curiosi*, whose office it was to inform the emperor of what had passed in the different provinces, were all discharged, and that employment entirely suppressed. Thus he was enabled to ease the people of the heavy taxes with which they were loaded: and this he did by abating a fifth part of all taxes and imposts throughout the kingdom.

As to religious matters, Julian, as before observed,

was a Pagan, and immediately on his accession to the throne, restored the heathen religion. He invited to court the philosophers, magicians, &c. From all parts; nevertheless he did not raise any persecution against the Christians. On the contrary, he recalled from banishment all the orthodox bishops who had been sent into exile during the former reign; but with a design, as is observed both by the Christian and Pagan writers, to raise disturbances and sow dissensions in the church.

As the Persians were now preparing to carry on the war with vigour, Julian found himself under a necessity of marching against them in person. But before he set out, he enriched the city of Constantinople with many valuable gifts. He formed a large harbour to shelter the ships from the south wind, built a magnificent porch leading to it, and in another porch a stately library, in which he lodged all his books. In the month of May, A. D. 362, he set out for Antioch; and on the first of January renewed in that city the sacrifices to Jupiter for the safety of the empire, which had been so long omitted. During his stay in this city, he continued his preparations for the Persian war, erecting magazines, making new levies, and above all consulting the oracles, aruspices, magicians, &c. The oracles of Delphi, Delos, and Dodona, assured him of victory. The aruspices, indeed, and most of his courtiers and officers, did all that lay in their power to divert him from his intended expedition; but the deceitful answers of the oracles and magicians, and the desire of adding the Persian monarch to the many kings he had already seen humbled at his feet, prevailed over all other considerations. Many nations sent deputies to him offering their assistance; but these offers he rejected, telling them that the Romans were to assist their allies, but stood in no need of any assistance from them. He likewise rejected, and in a very disobliging manner, the offers of the Saracens; answering them, when they complained of his stopping the pension paid them by other emperors, that a warlike prince had steel, but no gold; which they resenting, joined the Persians, and continued faithful to them to the last. However, he wrote to Arsaces king of Armenia, enjoining him to keep his troops in readiness to execute the orders he should soon transmit to him.

Having made the necessary preparations for so important an enterprise, Julian sent orders to his troops to cross the Euphrates, designing to enter the enemy's country before they had the least notice of his march; for which purpose he had placed guards on all the roads. From Antioch he proceeded to Litarba, a place about 15 leagues distant, which he reached the same day. From thence he went to Beræa, where he halted a day, and exhorted the council to restore the worship of the gods; but this exhortation, it seems, was complied with but by few. From Beræa he proceeded to Batnæ; and was better pleased with the inhabitants of the latter, because they had, before his arrival, restored the worship of the gods. There he offered sacrifices; and having immolated a great number of victims, he pursued the next day his journey to Hierapolis, the capital of the province of Euphratesiana, which he reached on the 9th of March. Here he lodged in the house of one for whom he had a particular esteem, chiefly because neither Constantius nor Gallus.

Constantinopolitan history.

Gallus, who had both lodged in his house, had been able to make him renounce the worship of his idols. As he entered this city, 50 of his soldiers were killed by the fall of a porch. He left Hierapolis on the 13th of March; and having passed the Euphrates on a bridge of boats, came to Batnæ a small city of Osrhoene, about 10 leagues from Hierapolis; and here 50 more of his soldiers were killed by the fall of a stack of straw. From Batnæ he proceeded to Carrhæ; where, in the famous temple of the moon, it is said, he sacrificed a woman to that planet.

62
Invades Persia.

While Julian continued in this city, he received advice that a party of the enemies horse had broke into the Roman territories. On this he resolved to leave an army in Mesopotamia, to guard the frontiers of the empire on that side, while he advanced on the other into the heart of the Persian dominions. This army consisted, according to some, of 20,000, according to others, of 30,000 chosen troops. It was commanded by Procopius, and Sebastian a famous manichean who had been governor of Egypt, and had persecuted there, with the utmost cruelty, the orthodox Christians. These two were to join, if possible, Arfaces king of Armenia, to lay waste the fruitful plains of Media, and meet the emperor in Assyria. To Arfaces Julian himself wrote, but in the most disobliging manner imaginable, threatening to treat him as a rebel if he did not execute, with the utmost punctuality, the orders given him; and at the conclusion told him, that the God he adored would not be able to screen him from his indignation.

There were two roads leading from Carrhæ to Persia; the one to the left by Nisibis; the other to the right through the province of Assyria, along the banks of the Euphrates. Julian chose the latter, but caused magazines to be erected on both roads; and, after having viewed his army, set out on the 25th of March. He passed the Abora, which separated the Roman and Persian dominions, near its conflux with the Euphrates; after which he broke down the bridge, that his troops might not be tempted to desert, seeing they could not return home. As he proceeded on his march, a soldier and two horses were struck dead by a flash of lightning; and a lion of an extraordinary size presenting himself to the army, was in a moment dispatched by the soldiers with a shower of darts. These omens occasioned great disputes between the philosophers and aruspices: the latter looking upon them as inauspicious, advised the emperor to return; but the former refuted their arguments with others more agreeable to Julian's temper.

63
Lays waste Assyria.

Having passed the Abora, Julian entered Assyria, which he found very populous, and abounding with all the necessaries of life: but he laid it waste far and near, destroying the magazines and provisions which he could not carry along with him; and thus he put it out of his power to return the same way he came; a step which was judged very impolitic. As he met with no army in the field to oppose him, he advanced to the walls of Ctesiphon, the metropolis of the Persian empire; having reduced all the strong holds that lay in his way. Here, having caused the canal to be cleared, which was formerly dug by Trajan between these two rivers, he conveyed his fleet from the former to the latter. On the banks of the Tigris he was op-

64
Advances to Ctesiphon.

posed by the enemy. But Julian passed that river in spite of their utmost efforts, and drove them into the city with the loss of a great number of their men, he himself, in the mean time, losing only 70 or 75.

Julian had now advanced so far into the enemy's country, that he found it necessary to think of a retreat, as it was impossible for him to winter in Persia. For this reason he made no attempt on Ctesiphon, but began to march back along the banks of the Tigris, soon after he had passed that river. In the mean time the king of Persia was assembling a formidable army, with a design to fall upon the Romans in their march; but being desirous of putting an end to so destructive a war, he sent very advantageous proposals of peace to Julian. These the Roman emperor very imprudently rejected; and soon after, deceived by treacherous guides, he quitted the river, and entered into an unknown country totally laid waste by the enemy, and where he was continually harassed, by strong parties, who in a manner surrounded his army, and attacked him sometimes in the front, and sometimes in the rear. A still worse step he was persuaded to take by the treacherous guides already mentioned; and this was to burn his fleet, lest it should fall into the hands of the enemy. As soon as the fleet was set on fire, the whole army cried out, that the emperor was betrayed, and that the guides were traitors employed by the enemy. Julian ordered them immediately to be put to the rack, upon which they confessed the treason; but it was too late. The fleet was already in flames; they could by no means be extinguished; and no part was saved except 12 vessels, which were designed to be made use of in the building of bridges, and for this purpose were conveyed over land in waggons.

The emperor thus finding himself in a strange country, and his army greatly dispirited, called a council of his chief officers, in which it was resolved to proceed to Corduene, which lay south of Armenia, and belonged to the Romans. With this view, they had not proceeded far when they were met by the king of Persia, at the head of a very numerous army, attended by his two sons, and all the principal nobility of the kingdom. Several sharp encounters happened, in which, though the Persians were always defeated, yet the Romans reaped no advantages from their victories, but were reduced to the last extremity for want of provisions. In one of these skirmishes, when the Romans were suddenly attacked, the emperor, eager to repulse the enemy, hastened to the field of battle without his armour, when he received a mortal wound by a dart, which, through his arm and side, pierced his very liver. Of this wound he died the same night, the 26th of June 363, in the 32d year of his age, after having reigned scarce 20 months from the time he became sole master of the Roman empire.

As Julian had declined naming any successor, the choice of a new emperor devolved on the army. They unanimously chose Jovian, a very able commander, whose father had lately resigned the post of *comes domesticorum*, in order to lead a retired life. The valour and experience of Jovian, however, were not sufficient to extricate the Roman army from the difficulties in which they had been plunged by the imprudence of his predecessor. The famine raged in the camp

camp to such a degree, that not a single man would have been left alive, had not the Persians unexpectedly sent proposals of peace. These were now received with the utmost joy. A peace was concluded for 30 years; the terms of which were, that Jovian should restore to the Persians the five provinces which had been taken from them in the reign of Dioclesian, with several castles, and the cities of Nisibis and Singara. After the conclusion of the treaty, Jovian pursued his march without molestation. When he arrived at Antioch, he revoked all the laws that had been made in the former reign against Christianity and in favour of paganism. He espoused also the cause of the orthodox Christians against the Arians; and recalled all those who had been formerly banished, particularly Athanasius, to whom he wrote a very obliging letter with his own hand. It is generally believed also that Athanasius, at the desire of Jovian, now composed the creed which still goes by his name, and is subscribed by all the bishops in Europe. But this emperor did not live to make any great alterations, or even to visit his capital as emperor; for in his way to Constantinople he was found dead in his bed, on the 16th or 17th of February 364, after he had lived 33 years, and reigned seven months and 40 days.

After the death of Jovian, Valentinian was chosen emperor. Immediately on his accession, the soldiers mutinied, and with great clamour required him to choose a partner in the sovereignty. Though he did not instantly comply with their demand, yet in a few days he chose his brother Valens for his partner; and, as the empire was threatened on all sides with an invasion of the barbarous nations, he thought proper to divide it. This famous partition was made at Mediana in Dacia; when Valens had for his share the whole of Asia, Egypt, and Thrace; and Valentinian all the West; that is, Illyricum, Italy, Gaul, Spain, Britain, and Africa.

After this partition, Valens returned to Constantinople, where the beginning of his reign was disturbed by the revolt of Procopius, a relation of Julian. On the death of that emperor, he had fled into Taurica Cheronesus for fear of Jovian; but not trusting the barbarians who inhabited that country, he returned in disguise into the Roman territories, where having gained over an eunuch of great wealth, by name *Eugenius*, lately disgraced by Valens, and some officers who commanded the troops sent against the Goths, he got himself proclaimed emperor. At first he was joined only by the lowest of the people, but at length he was acknowledged by the whole city of Constantinople. On the news of this revolt, Valens would have abdicated the sovereignty, had he not been prevented by the importunities of his friends. He therefore dispatched some troops against the usurper; but these were gained over, and Procopius continued for some time to gain ground. It is probable he would finally have succeeded, had he not become so much elated with this good fortune, that he grew tyrannical and insupportable to his own party. In consequence of his alteration in his disposition, he was first abandoned by some of his principal officers; and soon after defeated in battle, taken prisoner, and put to death.

This revolt produced a war betwixt Valens and the Goths. The latter, having been solicited by Proco-

pius, and sent 3000 men to his assistance. On hearing the news of the usurper's death, they marched back; but Valens detached against them a body of troops, who took them all prisoners notwithstanding the vigorous resistance they made. Athanaric, king of the Goths, expostulated on this proceeding with Valens; but that emperor proving obstinate, both parties prepared for war. In 367 and 369, Valens gained great advantages over his enemies; and obliged them to sue for peace, which was concluded upon terms very advantageous to the Romans. The rest of this reign contains nothing remarkable, except the cruelty with which Valens persecuted the orthodox clergy. The latter sent 80 of their number to him, in order to lay their complaints before him; but he, instead of giving them any relief, determined to put them all to death. But the person who was ordered to execute this sentence, fearing lest the public execution of so many ecclesiastics might raise disturbances, ordered them all to be put on board a ship, pretending that the emperor had ordered them only to be sent into banishment; but when the vessel was at some distance from land, the mariners set fire to it, and made their own escape in the boat. The ship was driven by a strong wind into an harbour, where it was consumed and all that were in it. A persecution was also commenced against magicians, or those who had books of magic in their custody. This occasioned the destruction of many innocent persons; for books of this kind were often conveyed into libraries unknown to the owners of them, and this was certainly followed by death and confiscation of goods. Hereupon persons of all ranks were seized with such terror that they burnt their libraries, lest books of magic should have been secretly conveyed in amongst the others. In 378, the Goths, whom Valens had admitted into Thrace, advanced from that province to Macedonia and Thessaly, where they committed dreadful ravages. They afterwards blocked up the city of Constantinople, plundered the suburbs, and at last totally defeated and killed the emperor himself. The day after the battle, hearing that an immense treasure was lodged in Adrianople, the barbarians laid siege to that place: but being quite strangers to the art of besieging towns, they were repulsed with great slaughter; upon which they dropped that enterprise, and returned before Constantinople. But here great numbers of them were cut in pieces by the Saracens, whom Maria their queen had sent to the assistance of the Romans; so that they were obliged to abandon this design likewise, and retire from the neighbourhood of that city.

By the death of Valens, the empire once more fell into the hands of a single person. This was Gratian, who had held the empire of the West after the death of Valentinian. He repulsed many barbarous nations who threatened the empire at that time with dissolution; but finding himself pressed on all sides, he soon resolved to take a colleague, in order to ease him of some part of the burden. Accordingly, on the 19th of January 379, he declared Theodosius his partner in the empire, and committed to his care all the provinces which had been governed by Valens.

Theodosius is greatly extolled by the historians of those ages on account of his extraordinary valour and piety; and for these qualifications has been honoured with

80 Gratian murdered by Maximus,

with the surname of *the Great*. From the many persecuting laws, however, made in his time, it would seem that his piety was at least very much misguided; and that if he was naturally of a human and compassionate disposition, superstition and passion had often totally obscured it. He certainly was a man of great conduct and experience in war, and indeed the present state of the empire called for an exertion of all his abilities. The provinces of Dacia, Thrace, and Illyricum, were already lost; the Goths, Taifali, Alans, and Huns, were masters of the greatest part of these provinces, and had ravaged and laid waste the rest. The Iberians, Armenians, and Persians, were likewise up in arms, and ready to take advantage of the distracted state of the empire. The few soldiers, who had survived the late defeat, kept within the strong holds of Thrace, without daring so much as to look abroad, much less face the victorious enemy, who moved about the country in great bodies. But notwithstanding this critical situation, the historians of those times give us no account of the transactions of the year 379. Many great battles indeed are said to have been fought, and as many victories obtained by Theodosius; but the accounts of these are so confused and contradictory, that no stress can be laid upon them.

In the month of February 380, Theodosius was seized with a dangerous malady, so that Gratian found himself obliged to carry on the war alone. This emperor, apprehending that the neighbouring barbarians might break into some of the provinces, concluded a peace with the Goths, which was confirmed by Theodosius on his recovery. The treaty was very advantageous to the barbarians; but they, disregarding all their engagements, no sooner heard that Gratian had left Illyricum, than they passed the Danube, and breaking into Thrace and Pannonia, advanced as far as Macedon, destroying all with fire and sword. Theodosius, however, drawing together his forces, marched against them; and, according to the most respectable authorities, gained a complete victory; though Zosimus relates, that he was utterly defeated.

The following year, Athanaric, the most powerful of all the Gothic princes, being driven out by a faction at home, recurred to Theodosius, by whom he was received with great tokens of friendship. The emperor himself went out to meet him, and attended him with his numerous retinue into the city. The Gothic prince died the same year; and Theodosius caused him to be buried after the Roman manner with such pomp and solemnity, that the Goths, who attended him in his flight, returned home with a resolution never to molest the Romans any more. Nay, out of gratitude to the emperor, they took upon them to guard the banks of the Danube, and prevent the empire from being invaded on that side.

In 383, one Maximus revolted against Gratian in Britain; and in the end, having got the unhappy emperor into his power, caused him to be put to death, and assumed the empire of the West himself. Gratian had divided his dominions with his brother Valentinian, whom he allowed to reign in Italy and West Illyricum, reserving the rest to himself. Maximus therefore, immediately after his usurpation, sent deputies to Theodosius, assuring him that he had no de-

signs on the dominions of Valentinian. As Theodosius at that time found himself in danger from the barbarians, he not only forbore to attack Maximus after this declaration, but even acknowledged him for his partner in the empire. It was not long, however, before the ambition of the usurper prompted him to break his promise. In 387, he passed the Alps on a sudden; and meeting with no opposition, marched to Milan where Valentinian usually resided. The young prince fled first to Aquileia; and from thence to Theifalonica, to implore the protection of Theodosius. The latter, in answer to Valentinian's letter, informed him, that he was not at all surpris'd at the progress Maximus had made, because the usurper had protected, and Valentinian had persecuted, the orthodox Christians. At last he prevailed on the young prince to renounce the Arian heresy which he had hitherto maintained; after which Theodosius promised to assist him with all the forces of the East. At first, however, he sent messengers to Maximus, earnestly exhorting him to restore the provinces he had taken from Valentinian, and content himself with Gaul, Spain, and Britain. But the usurper would hearken to no terms. This very year he besieged and took Aquileia, Quaderna, Bononia, Mutina, Rhegium, Placentia, and many other cities in Italy. The following year he was acknowledged in Rome, and in all the provinces of Africa. Theodosius, therefore, finding a war inevitable, spent the remaining months of this and the beginning of the following year in making the necessary preparations. His army consisted chiefly of Goths, Huns, Alans, and other barbarians, whom he was glad to take into the service in order to prevent their raising disturbances on the frontiers. He defeated Maximus in two battles, took him prisoner, and put him to death. The usurper had left his son Victor, whom he created Augustus, in Gaul, to awe the inhabitants in his absence. Against him the emperor dispatched Arbogastes, who took him prisoner after having dispersed the troops that attended him, and put him to death. The victory was used afterwards by Theodosius with great clemency and moderation.

In 389, Theodosius took a journey to Rome; and, according to Prudentius, at this time converted the senate and people from idolatry to Christianity. The next year was remarkable for the destruction of the celebrated temple of Serapis in Alexandria; which, according to the description of Ammianus Marcellinus, surpassed all others in the world, that of Jupiter Capitolinus alone excepted. The reason of its being now destroyed was as follows. Theophilus, bishop of Alexandria, having begged and obtained of the emperor an old temple, formerly consecrated to Bacchus, but then ruined and forsaken, with a design to convert it into a church, the workmen found among the rubbish several obscene figures, which the bishop, to ridicule the superstition of the Heathens, caused to be exposed to public view. This provoked the Pagans to such a degree, that they flew to arms; and falling unexpectedly upon the Christians, cut great numbers of them in pieces. The latter, however, soon took arms in their own defence; and being supported by the few soldiers who were quartered in the city, began to repel force by force. Thus a civil war was kindled and no day passed without some encounter. The Pa-

gans used to retire to the temple of Serapis: and thence falling out unexpectedly seized on such Christians as they met, and, dragging them into the temple, either forced them by the most exquisite torments to sacrifice to their idol, or, if they refused, racked them to death. As they soon expected to be attacked by the emperor's troops, they chose a philosopher named *Olympus* for their leader, with a design to defend themselves to the last extremity. The emperor, however, would not suffer any punishment to be indicted upon them for the lives of those they had taken away, but readily forgave them: however, he ordered all the temples of Alexandria to be immediately pulled down, and commanded the bishop to see his orders put in execution. The Pagans no sooner heard that the emperor was acquainted with their proceedings than they abandoned the temple, which was in a short time destroyed by Theophilus; nothing being left except the foundations, which could not be removed on account of the extraordinary weight and size of the stones. Not satisfied with the destruction of the Alexandrian temples, the zealous bishop encouraged the people to pull down all the other temples, oratories, chapels, and places set apart for the worship of the heathen gods throughout Egypt, and the statues of the gods themselves to be either burnt or melted down. Of the innumerable statues which at that time were to be found in Egypt, he is said to have spared but one, viz. that of an ape, in order to expose the Pagan religion to ridicule. On his return to Constantinople, Theodosius ordered such temples as were yet standing to be thrown down, and the Arians to be every where driven out of the cities.

85
Valentinian murdered by Arbogastes, who raises Eugenius to the empire.

In 392 Valentinian, emperor of the West, was treacherously murdered by Arbogastes his general; who, though he might afterwards have easily seized on the sovereignty himself, chose to confer it upon one Eugenius, and to reign in his name. This new usurper, though a Christian, was greatly favoured by the Pagans, who were well apprized that he only bore the title of emperor, while the whole power lodged in Arbogastes, who pretended to be greatly attached to their religion. The aruspices began to appear anew, and informed him that he was destined to the empire of the whole world; that he would soon gain a complete victory over Theodosius, who was as much hated as Eugenius was beloved by the gods, &c. But though Eugenius seemed to favour the Pagans, yet in the very beginning of his reign he wrote to St Ambrose. The holy man did not answer his letter till he was pressed by some friends to recommend them to the new prince; and then he wrote to this infamous usurper with all the respect due to an emperor. Soon after his accession to the empire, Eugenius sent deputies to Theodosius; and they are said to have been received by him in a very obliging manner. He did not, however, intend to enter into any alliance with this usurper, but immediately began his military preparations. In 394, he set out from Constantinople, and was at Adrianople on the 15th of June that year. He bent his march through Dacia, and the other provinces between Thrace and the Julian Alps, with a design to force the passes of these mountains, and break into Italy before the army of Eugenius was in a condition to oppose him. On his arrival at the Alps, he

found these passes guarded by Flavianus prefect of Italy, at the head of a considerable body of Roman troops. These were utterly defeated by Theodosius, who thereupon crossed the Alps and advanced into Italy. He was soon met by Eugenius; and a bloody battle ensued, without any decisive advantage on either side. The next day the emperor led his troops in person against the enemy, utterly defeated them, and took their camp. Eugenius was taken prisoner by his own men, and brought to Theodosius, who reproached him with the murder of Valentinian, with the calamities he had brought on the empire by his unjust usurpation, and with putting his confidence in Hercules, and not in the true God; for on his chief standard he had displayed the image of that fabulous hero. Eugenius begged earnestly for his life; but while he lay prostrate at the emperor's feet, his own soldiers cut off his head, and carrying it about on the point of a spear, showed it to those in the camp, who had not yet submitted to Theodosius. At this they were all thunderstruck; but being informed that Theodosius was ready to receive them into favour, they threw down their arms and submitted. After this, Arbogastes, despairing of pardon, fled to the mountains; but being informed that diligent search was made for him, he laid violent hands on himself. His children, and those of Eugenius, took sanctuary in churches; but the emperor not only pardoned, but took the opportunity of converting them to Christianity, restored to them their paternal estates, and raised them to considerable employments in the state. Soon after this, Theodosius appointed his son Honorius emperor of the West, assigning him for his share Italy, Gaul, Spain, Africa, and West Illyricum. The next year, as he prepared for his return to Constantinople, he was seized with a dropsy, owing to the great fatigues he had undergone during the war. As soon as he perceived himself to be in danger, he made his will; by which he bequeathed the empire of the East to Arcadius, and confirmed Honorius in the possession of the West. He likewise confirmed the pardon which he had granted to all those who had borne arms against him, and remitted a tribute which had proved very burdensome to the people; and charged his two sons to see these points of his will executed. He died at Milan on the 17th of January 395, in the 16th of his reign and 50th of his age.

Empire usurped by Basiliscus.

From the time of Theodosius to the time when the Roman empire in the West was totally destroyed by the Goths, we find but very little remarkable in the history of Constantinople. At this time the eastern empire was usurped by Basiliscus, who had driven out Zeno the lawful emperor; being assisted in his conspiracy by the empress Verina his sister. Zeno fled into Isauria, whither he was pursued by Illus and Trecondes, two of the usurper's generals; who having easily defeated the few troops he had with him, forced the unhappy prince to shut himself up in a castle, which they immediately invested. But in a short time Basiliscus having disoblinded the people by his cruelty, avarice, and other bad qualities, for which he was no less remarkable than his predecessor had been, his generals joined with Zeno, whom they restored to the throne. After his restoration, Zeno, having got Basiliscus into his power, confined him in a castle of Cappadocia together with his wife Zenonides, where they both perished

91
Great fire at Constantinople.

perished with hunger and cold. This happened in the year 467, after Basiliscus had reigned about 20 months. During the time of this usurpation a dreadful fire happened at Constantinople, which consumed great part of the city, with the library containing 120,000 volumes; among which were the works of Homer, written, as is said, on the great gut of a dragon 120 feet long.

The misfortunes which Zeno had undergone did not work any reformation upon him. He still continued the same vicious courses which had given occasion to the usurpation of Basiliscus. Other conspiracies were formed against him, but he had the good fortune to escape them. He engaged in a war with the Ostrogoths, in which he proved unsuccessful, and was obliged to yield the provinces of Lower Dacia and Mœlia to them. In a short time, however, Theodoric their king made an irruption into Thrace, and advanced within 15 miles of Constantinople, with a design to besiege that capital: but the following year, 485, they retired in order to attack Odoacer king of Italy; of which country Theodoric was proclaimed king in 493. The emperor Zeno died in the year 491, in the 65th year of his age, and 17th of his reign.

92
Decline of the Roman empire, to what owing.

The Roman empire had now for a long time been on the decline: the ancient valour and military discipline which had for such a long time rendered the Romans superior to other nations, had greatly degenerated; so that they were now by no means so powerful as formerly. The tumults and disorders which had happened in the empire from time to time by the many usurpations, had contributed also to weaken it very much. But what proved of the greatest detriment was the allowing vast swarms of barbarians to settle in the different provinces, and to serve in the Roman empire in separate and independent bodies. This had proved the immediate cause of the dissolution of the western empire; but as it affected the eastern parts less, the Constantinopolitan empire continued for upwards of 900 years after the western one was totally dissolved. The weak and imprudent administration of Zeno, and Anastasius who succeeded him, had reduced the eastern empire still more; and it might possibly have expired in a short time after the western one, had not the wise and vigorous conduct of Justin, and his partner Justinian, revived in some measure the ancient martial spirit which had originally raised the Roman empire to its highest pitch of grandeur.

93
It revives under Justin and Justinian.

Justin ascended the throne in 518. In 521 he engaged in a war with the Persians, who had all along been very formidable enemies to the Roman name. Against them he employed the famous Belisarius: but of him we hear nothing remarkable till after the accession of Justinian. This prince was the nephew of Justin, and was by him taken as his partner in the empire in 527; and the same year Justin died, in the 77th year of his age and 9th of his reign. Justinian being now sole master of the empire, bent his whole force against the Persians. The latter proved successful in the first engagement; but were soon after utterly defeated by Belisarius on the frontiers of Persia, and likewise by another general named *Dorotheus* in Armenia. The war continued with various success during the first five years of Justinian's reign. In the sixth year a peace was concluded upon the following

94
Justinian's war with the Persians.

terms: 1. That the Roman emperor should pay to Cosroes, the king of Persia, 1000 pounds weight of gold. 2. That both princes should restore the places they had taken during the wars. 3. That the commander of the Roman forces should no longer reside at Daras on the Persian frontiers, but at a place called *Constantina* in Mesopotamia, as he had formerly done. 4. That the Iberians, who had sided with the Romans, should be at liberty to return to their own country or stay at Constantinople. This peace, concluded in 532, was styled *eternal*; but in the event proved of very short duration.

Constantinopolitan history.

About this time happened at Constantinople the greatest tumult mentioned in history. It began among the different factions in the circus, but ended in an open rebellion. The multitude, highly dissatisfied with the conduct of John the *prefectus pratoris*, and of Trebonianus then questor, forced Hypatius, nephew to the emperor Anastasius, to accept the empire, and proclaimed him with great solemnity in the forum. As the two abovementioned ministers were greatly abhorred by the populace on account of their avarice, Justinian immediately discharged them, hoping by that means to appease the tumult: but this was so far from answering the purpose, that the multitude only grew the more outrageous upon it; and most of the senators joining them, the emperor was so much alarmed, that he had thoughts of abandoning the city and making his escape by sea. In this dilemma the empress Theodora encouraged and persuaded him rather to part with his life than the kingdom; and he at last resolved to defend himself to the utmost, with the few senators who had not yet abandoned him. In the mean time, the rebels having attempted in vain to force the gates of the palace, carried Hypatius in triumph to the circus; where, while he was beholding the sports from the imperial throne, amidst the shouts and acclamations of the people, Belisarius, who had been recalled from Persia, entered the city with a considerable body of troops. Being then apprised of the usurpation of Hypatius, he marched straight to the circus; fell sword in hand upon the disarmed multitude: and with the assistance of a band of Heruli, headed by Mundus governor of Illyricum, cut about 30,000 of them in pieces. Hypatius the usurper, and Pompeius another of the nephews of Anastasius, were taken prisoners and carried to the emperor, by whose orders they were both beheaded, and their bodies cast into the sea. Their estates were confiscated, and likewise the estates of such senators as had joined with them; but the emperor caused great part of their lands and effects to be afterwards restored, together with their honours and dignities, to their children.

95
Great tumult in Constantinople.

Justinian having now no other enemy to contend with, turned his arms against the Vandals in Africa, and the Goths in Italy; both which provinces he recovered out of the hands of the barbarians*. But before his general Belisarius had time to establish fully the Roman power in Italy, he was recalled in order to carry on the war against Cosroes king of Persia, who, in defiance of the treaty formerly concluded in 532, entered the Roman dominions at the head of a powerful army. The same year, however, a peace was concluded between the two nations upon the following conditions: 1. That the Romans should, with-

* See *Barbary and Goths*.

96
Another war with the Persians.

in

Constantinopolitan history.

in two months, pay to the Persian king 5000 pounds weight of gold, and an annual pension of 500. 2. That the Persians should relinquish all claim to the fortress of Daras, and maintain a body of troops to guard the Caspian gates, and prevent the barbarians from breaking into the empire. 3. That upon payment of the abovementioned sum, Cosroes should immediately withdraw his troops from the Roman dominions. The treaty being signed, and the stipulated sum paid, Cosroes began to march back again; but by the way plundered several cities as if the war had still continued. Hereupon Justinian resolved to pursue the war with the utmost vigour; and for that purpose dispatched Belisarius into the east. But soon after he was obliged to recall him in order to oppose the Goths who had gained great advantages in Italy after his departure. The Persian war was then carried on with indifferent success till the year 558, when a peace was concluded upon the emperor again paying an immense sum to the enemy. The same year the Huns, passing the Danube in the depth of winter, marched in two bodies directly for Constantinople; and laying waste the countries through which they passed, came, without meeting the least opposition, within 150 furlongs of the city. But Belisarius marching out against them with an handful of men, put them to flight; the emperor, however, to prevent them from invading the empire anew, agreed to pay them an annual tribute, upon their promising to defend the empire against all other barbarians, and to serve in the Roman armies when required. This was the last exploit performed by Belisarius, who on his return to Constantinople was disgraced, stripped of all his employments, and confined to his house, on pretence of a conspiracy against the emperor*. In the year 565 a real conspiracy was formed against Justinian, which he happily escaped, and the conspirators were executed; but the emperor did not long survive it, being carried off by a natural death in 566, in the 39th year of his reign.

97
Peace concluded.

* See Belisarius,

During the reign of Justinian, the majesty of the Roman empire seemed to revive. He recovered the provinces of Italy and Africa out of the hands of the barbarians, by whom they had been held for a number of years; but after his death they were soon lost, and the empire tended fast to dissolution. In 569 Italy was conquered by the Lombards, who held it for the space of 200 years. Some amends, however, was made for the loss by the acquisition of *Perfarmania*; the inhabitants of which, being persecuted by the Persians on account of the Christian religion which they professed, revolted to the Romans. This produced a war between the two nations, who continued to weaken each other, till at last the Persian monarchy was utterly overthrown, and that of the Romans greatly reduced by the Saracens†. These new enemies attacked the Romans in the year 632, and pursued their conquests with incredible rapidity. In the space of four years they reduced the provinces of Egypt, Syria, and Palestine. In 648 they were also masters of Mesopotamia, Phœnicia, Africa, Cyprus, Aradus, and Rhodes; and having defeated the Roman fleet, commanded by the emperor Constans in person, they concluded a peace on condition of keeping the vast extent of territory they had seized, and paying for it 7000 nummi a year.

98
Decline of the empire after Justinian.

† See Arabia.

An expedition against the Lombards was about this time undertaken, but with very little success, a body of 20,000 Romans being almost entirely cut off by one of the Lombard generals. In 671 the Saracens ravaged several provinces, made a descent in Sicily, took and plundered the city of Syracuse, and over-ran the whole island, destroying every thing with fire and sword. In like manner they laid waste Cilicia; and having passed the winter at Smyrna, they entered Thrace in the spring of the year 672, and laid siege to Constantinople itself. Here, however, they were repulsed with great loss: but next spring they renewed their attempt, in which they met with the same bad success; many of their ships being burnt by the *sea-fire*, as it was called, because it burnt under water: and in their return home their fleet was wrecked off the Scyllæan promontory. At last a peace was concluded for 30 years, on condition that the Saracens should retain all the provinces they had seized; and that they should pay to the emperor and his successors 3000 pounds weight of gold, 50 slaves, and as many choice horses.

Constantinopolitan history.

99
Unsuccessful expedition against the Lombards.

100
Constantinople besieged by the Saracens.

This peace was scarce concluded, when the empire was invaded by a new enemy, who proved very troublesome for a long time. These were the Bulgarians; who breaking into Thrace, defeated the Roman army sent against them, and ravaged the country far and wide. The emperor consented to pay them an annual pension, rather than continue a doubtful war; and allowed them to settle in Lower Mœsia, which from them was afterwards called *Bulgaria*. In 687, they were attacked by Justinian II. who entered their country without provocation, or regarding the treaties formerly concluded with them. But they falling suddenly upon him, drove him out of their country, and obliged him to restore the towns and captives he had taken. In 697, this emperor was deposed; and in his exile fled to Trebelis king of the Bulgarians, by whom he was kindly entertained, and by whose means he was restored to his throne; but soon forgetting this favour, he invaded the country of the Bulgarians, with a design to wrest from them those provinces which he had yielded to them. He was attended in this expedition by no better success than his ingratitude deserved, his army being utterly defeated, and he himself obliged to make his escape in a light vessel to Constantinople. The Bulgarians continued their inroads and ravages at different times, generally defeated the Romans who ventured to oppose them, till the year 800, the seventh of the reign of Nicephorus, when they surprised the city of Sardica, in Mœsia, and put the whole garrison, consisting of 6000 men, to the sword. The emperor marched against them with a considerable army: but the enemy retired at his approach; and he, instead of pursuing them, returned to Constantinople. Two years after, he entered Bulgaria at the head of a powerful army, destroying every thing with fire and sword. The king offered to conclude a peace with him upon honourable terms; but Nicephorus, rejecting his proposals, continued to waste the country, destroying the cities, and putting all the inhabitants, without distinction of sex or age, to the sword. The king was so much affected with these cruelties which were exercised on his subjects, that he sent a second embassy to Nicephorus, offering to conclude

101

a peace with him upon any terms, provided he would quit his country. But Nicephorus dismissing the ambassadors with scorn, the Bulgarian monarch attacked unexpectedly the Roman camp, forced it, and cut off almost the whole army, with the emperor himself, and a great number of patricians. His successor Michael likewise engaged in war with the Bulgarians; but being utterly defeated, he was so grieved that he resigned the empire. After this the Bulgarians continued to be very formidable enemies to the empire till the year 979, when they were attacked by Basilus II. The Bulgarians were at that time governed by a king named *Samuel*; who having ravaged the Roman territories, as was the common practice of his nation, Basilus sent against him one Nicephorus Uranus at the head of a powerful army. Uranus, leaving his baggage at Larissa, reached by long marches the Sperchius, and encamped with his whole army over against the enemy, who lay on the opposite bank. As the river was greatly swelled with the heavy rains that had lately fallen, Samuel, not imagining the Romans would attempt to pass it, suffered his troops to roam in large parties about the country in quest of booty. But Uranus having at length found out a place where the river was fordable, passed it in the dead of the night without being perceived. He then fell upon the Bulgarians who were left in the camp, and lay for the most part asleep: cut great numbers of them in pieces: took a great number of prisoners, with all their baggage; and made himself master of their camp. Samuel and his son were dangerously wounded; and would have been taken, had they not all that day concealed themselves among the dead. The next night they stole away to the mountains of *Ætola*, and from thence made their escape into Bulgaria. The following year the emperor entered Bulgaria at the head of a numerous and well-disciplined army; defeated Samuel in a pitched battle, and took several strong cities. The emperor himself, however, at last, narrowly escaped being cut off with his whole army; being unexpectedly attacked by the Bulgarians in a narrow pass. From this danger he was relieved by the arrival of Nicephorus Xiphias, governor of Philopolis, with a considerable body of troops; who falling upon the enemies rear, put them to flight. Basilus pursued them close; and having taken an incredible number of captives, caused their eyes to be pulled out, leaving to every hundred a guide with one eye, that he might conduct them to Samuel. This shocking spectacle so affected the unhappy king, that he fell into a deep swoon, and died two days after. The Roman emperor pursued his conquests, and in the space of two years made himself master of most of the enemies' strong holds. He defeated also the successor of Samuel in several engagements; and having at last killed him in battle, the Bulgarians submitted themselves without reserve. The vast treasures of their princes were by Basilus distributed among his soldiers by way of donative. Soon after, the widow of the late king, with her six daughters and three of her sons, surrendered themselves to the Roman emperor, by whom they were received with the utmost civility and respect. This obliging behaviour encouraged the three other sons of the late king, and most of the

princes of the blood, who had taken shelter in the mountains, to submit, and throw themselves on the emperor's mercy.

Ibatzes, however, a person nearly allied to the royal family, who had distinguished himself in a very eminent manner during the whole course of the war, refused to submit, and fled to a steep and craggy mountain, with a design to defend himself there to the last extremity. Basilus endeavoured to cause him submit by fair means, but he equally despised both threats and promises. At last Eustathius Daphnomelus, whom Basilus had lately appointed governor of Achridus, the chief city of Bulgaria, undertook to secure him by a most desperate and improbable scheme. Without communicating his design to any, he repaired, with two persons in whom he could confide, to the mountain on which Ibatzes had fortified himself. He hoped to pass undiscovered among the many strangers who flocked thither to celebrate the approaching feast of the Virgin Mary, for whom Ibatzes had a particular veneration. In this he found himself mistaken; for he was known by the guards, and carried before the prince. To him he pretended to have something of importance to communicate; but as soon as Ibatzes had retired with him into a remote place, Daphnomelus threw himself suddenly upon him, and with the assistance of the two men whom he had brought with him, pulled out both his eyes, and got safe to an abandoned castle on the top of the hill. Here they were immediately surrounded by the troops of Ibatzes; but Daphnomelus exhorting them now to submit to the emperor, by whom he assured them they would be well received, they congratulated Daphnomelus on his success, and suffered him to conduct the unhappy Ibatzes a prisoner to Basilus. The emperor was no less surprised than pleased at the success of this bold attempt; and rewarded Daphnomelus with the government of Dyrrhachium, and all the rich moveables of his prisoner. After this, having accomplished the entire reduction of Bulgaria, he returned to Constantinople with an incredible number of captives; where he was received by the senate and people with all possible demonstrations of joy.

All this time the Saracens had at intervals invaded the Roman dominions, and even attempted to make themselves masters of Constantinople. Their internal divisions, however, rendered them now much less formidable enemies than they had formerly been; so that some provinces were even recovered for a time out of their hands; though the weak and distracted state of the empire rendered it impossible to preserve such conquests. But in 1041, the empire was invaded by an enemy, not very powerful at that time indeed, but who by degrees gathered strength sufficient to overthrow both the Roman and Saracen empires. These were the Turks; who having quitted their ancient habitations in the neighbourhood of mount Caucasus, and passed the Caspian straits, settled in Armenia Major, about the year 844. There they continued an unknown and despicable people, till the intestine wars of the Saracens gave them an opportunity of aggrandizing themselves. About the year 1030, Mohammed the son of Sambrael sultan of Persia, not finding himself a match for Pifariss sultan of Babylon, with whom he was at war, had

recourse to the Turks, who sent him 3000 men under the command of one Tangrolipix, a leading man among them. By their assistance Mohammed defeated his adversary; but when the Turks desired leave to return home, he refused to part with them. Upon this they withdrew without his consent to a neighbouring desert; and being there joined by several discontented Persians, began to make frequent inroads into the sultan's territories. Against them Mohammed immediately dispatched an army of 20,000 men; who, being surpris'd in the night, were utterly defeated by Tangrolipix. The fame of this victory drew multitudes to him from all parts; so that in a short time Tangrolipix saw himself at the head of 50,000 men. Upon this Mohammed marched against them in person, but was thrown from his horse in the beginning of the engagement, and killed by the fall; upon which his men threw down their arms, and submitted to Tangrolipix.

112 They defeat the Romans.

After this victory the Turkish general made war upon the sultan of Babylon: whom he at length slew, and annexed his dominions to his own. He then sent his nephew, named *Cutlu-Moses*, against the Arabians; but by them he was defeated, and forced to fly towards Media. Through this province he was denied a passage by Stephen the Roman governor; upon which Cutlu-Moses was obliged to force a passage by encountering the Roman army. These he put to flight, took the governor himself prisoner, and without any further opposition reached the confines of Persia, where he sold Stephen for a slave. Returning from thence to Tangrolipix, he excused in the best manner he could, his defeat by the Arabians; but at the same time acquainted him with his victory over the Romans in Media, encouraging him to invade that fertile country, which he said might be easily conquered, as it was inhabited by none but *women*, meaning the Romans. At that time Tangrolipix did not hearken to his advice, but marched against the Arabians at the head of a numerous army. He was, however, attended with no better success than his nephew had been; and therefore began to reflect on what he had told him. Soon after he sent Asan his brother's son with an army of 20,000 men to reduce Media. Pursuant to his orders, the young prince entered that country, and committed every where dreadful ravages: but being in the end drawn into an ambush by the Roman generals, he was cut off with his whole army. Tangrolipix, no way discouraged by this misfortune, sent a new army into Media near 100,000 strong; who after having ravaged the country without opposition, laid siege to Artza a place of great trade, and therefore reckoned the most wealthy in those parts. Not being able to reduce it by any other means, they set it on fire; and thus in a short time it was utterly destroyed: the buildings being reduced to ashes, and 150,000 of the inhabitants perishing either by the flames or the sword. After this Abraham Halim, half brother to Tangrolipix, hearing that the Romans, reinforced with a body of troops under the command of Liparites governor of Iberia, had taken the field, marched against them, and offered them battle; which they not declining, the two armies engaged with incredible fury. The victory continued long doubtful; but at length inclined to the Romans; who nevertheless did not think pro-

per to pursue the fugitives, as their general Liparites was taken prisoner. The emperor, greatly concerned for the captivity of Liparites, dispatched ambassadors with rich presents, and a large sum of money to redeem him, and at the same time to conclude an alliance with Tangrolipix. The sultan received the presents; but generously returned them together with the money to Liparites, whom he set at liberty without any ransom: only requiring him, at his departure, never more to bear arms against the Turks. Not long after, Tangrolipix sent a person of great authority among the Turks, with the character of ambassador, to Constantinople; who having arrogantly exhorted the emperor to submit to his master, and acknowledge himself his tributary, was ignominiously driven out of the city,

Not long after, Tangrolipix sent a person of great authority among the Turks, with the character of ambassador, to Constantinople; who having arrogantly exhorted the emperor to submit to his master, and acknowledge himself his tributary, was ignominiously driven out of the city,

Tangrolipix, highly affronted at the reception his ambassador had met with, entered Iberia while the emperor Constantine Monomachus was engaged in a war with the Patzinacæ, a Scythian nation. Having ravaged that country, he returned from thence to Media and laid siege to Mantzichierta, a place defended by a numerous garrison, and fortified with a triple wall and deep ditches. However, as it was situated in an open plain country, he hoped to be master of it in a short time. But finding the besieged determined to defend themselves to the last extremity, he resolved to raise the siege, after he had continued it 30 days. One of his officers, however, named *Alcan*, prevailed on him to continue it but one day longer, and to commit the management of the attacks to him. This being granted, Alcan disposed his men with such skill, and so encouraged them by his example, that notwithstanding the vigorous opposition they met with, the place would have probably been taken, had not Alcan been slain as he was mounting the wall. The besieged, knowing him by the richness of his armour, drew him by the hair into the city, and cutting off his head threw it over the wall among the enemy: which so disheartened them, that they gave over the assault and retired. The next spring Tangrolipix returned, and ravaged Iberia with the utmost cruelty, sparing neither sex nor age. But on the approach of the Roman army he retired to Tauris, leaving 30,000 men behind him to infest the frontiers of the empire. This they did with great success, the borders being through the avarice of Monomachus unguarded. Till the time of this emperor, the provinces bordering on the countries of the barbarians had maintained, at their own charge, forces to defend them; and were on that account exempted from paying tribute: but as Monomachus exacted from them the same sums that were paid by others, they were no longer in a condition to defend themselves.

116 The Turks besiege Mantzichi-erta.

117 The siege raised.

118 The empress Eudocia forced that she will never marry.

In 1063 died the emperor Constantine Ducas, having left the empire to his three sons, Michael, Andronicus, and Constantine: but as they were all very young, he appointed the empress Eudocia regent during their minority, after having required of her an oath never to marry; which oath was with great solemnity lodged in the hands of the patriarch. He likewise obliged the senators solemnly to swear that they would acknowledge none for their sovereign but his three sons. No sooner, however, was he dead, than the Turks, hearing that the empire was governed by

Constantinopolitan history. a woman, broke into Mesopotamia, Cilicia, and Cappadocia, destroying all with fire and sword. The empress was no way in a condition to oppose them, the greater part of the army having been disbanded in her husband's life-time, and the troops that were still on foot being undisciplined, and altogether unfit for service. The concern which this gave the empress was aggravated by the seditious speeches of a discontented party at home, who repeated on all occasions that the present state of affairs required a man of courage and address at the helm, instead of a weak and helpless woman; and as they imagined the empress would never think of marrying, in consequence of the oath she had taken, they hoped by these speeches to induce the people to revolt, and choose a new emperor. This Eudocia was aware of; and therefore determined to prevent the evils that threatened herself and her family, by marrying some person of merit who was capable of defeating their enemies both at home and abroad. At this time one Romanus Diogenes, a person of a most beautiful aspect, extraordinary parts, and illustrious birth, being accused of aspiring to the empire, tried, and convicted, was brought forth to receive sentence of death. But the empress, touched with compassion at his appearance, gently upbraided him with his ambition, set him at liberty, and soon after appointed him commander in chief of all her forces. In this station he acquitted himself so well, that the empress resolved to marry him if she could but recover the writing in which her oath was contained out of the hands of the patriarch. In order to this, she applied to a favourite eunuch; who going to the patriarch, told him, that the empress was so taken with his nephew named *Bardas*, that she was determined to marry and raise him to the empire, provided the patriarch, absolved her from the oath she had taken, and convinced the senate of the lawfulness of her marriage. The patriarch, dazzled with the prospect of his nephew's promotion, readily undertook to perform both. He first obtained the consent of the senate by representing to them the dangerous state of the empire, and exclaiming against the rash oath which the jealousy of the late emperor had extorted from the empress. He then publicly discharged her from it; restored the writing to her; and exhorted her to marry some deserving object, who being entrusted with an absolute authority, might be capable of defending the empire. The empress, thus discharged from her oath, married a few days after Romanus Diogenes; who was thereupon proclaimed emperor, to the great disappointment of the patriarch.

119

She recovers the writing in which it was contained.

121
And marries Romanus Diogenes.

122
He passes over into Asia.

123
He defeats the Turks.

Romanus cut great numbers of them in pieces, and easily recovered the booty; after which he pursued his march to Aleppo, which he retook from them, together with Hierapolis, where he built a strong castle.

As he was returning to join the forces he had left behind him, he was met by a numerous body of Turks, who attempted to cut off his retreat. At first he pretended to decline an engagement through fear; but attacked them afterwards with such vigour when they least expected it, that he put them to flight at the first onset, and might have gained a complete victory had he thought proper to pursue them. After this, several towns submitted to him; but the season being now far spent, the emperor returned to Constantinople. The following year he passed over into Asia early in the spring; and being informed that the Turks had sacked the rich city of Iconium, besides gaining other considerable advantages, he marched in person against them. But the Turks, not thinking it advisable to wait his coming, retired in great haste. The Armenians, however, encouraged by the approach of the emperor's army, fell upon the enemy in the plains of Tarsus, put them to flight, and stripped them both of their baggage and the booty they had taken. The spring following the emperor once more entered Asia at the head of a considerable army which he had raised, and with incredible pains disciplined during the winter. When the two armies drew near to each other, Axan, the Turkish Sultan, and son of the famous Tangrolipix, sent proposals to Romanus for a lasting and honourable peace. These were imprudently rejected, and a desperate engagement ensued, when, in spite of the utmost efforts of the emperor, his army was routed, and he himself wounded and taken prisoner. When this news was brought to Axan, he could scarcely believe it; but being convinced by the appearance of the royal captive in his presence, he tenderly embraced him, and addressed him in an affectionate manner: "Grieve not (said he), most noble emperor, at your misfortune; for such is the chance of war, sometimes overwhelming one, and sometimes another: you shall have no occasion to complain of your captivity; for I will not use you as my prisoner, but as an emperor." The Turk was as good as his word. He lodged the emperor in a royal pavilion; assigned him attendants, with an equipage suitable to his quality; and discharged such prisoners as he desired. After he had for some days entertained his royal captive with extraordinary magnificence, a perpetual peace was concluded betwixt them, and the emperor dismissed with the greatest marks of honour imaginable. He then set out with the Turkish ambassador for Constantinople, where the peace was to be ratified; but by the way he was informed that Eudocia had been driven from the throne by John the brother of Constantine Ducas, and Pselus a leading man in the senate, who had confined her to a monastery, and proclaimed her eldest son, Michael Ducas, emperor. On this intelligence, Romanus retired to a strong castle near Theodosiopolis, where he hoped in a short time to be joined by great numbers of his friends and adherents. But in the mean time John, who had taken upon him to act as guardian to the young prince, dispatched Andronicus with a considerable army against him. Andronicus having easily

feated the small army which Romanus had with him, obliged him to fly to Adana a city in Cilicia, where he was closely besieged, and at last obliged to surrender. Andronicus carried his prisoner into Phrygia, where he fell dangerously ill, being as was suspected, secretly poisoned. But the poison being too slow in its operation, John ordered his eyes to be put out; which was done with such cruelty that he died soon after in the year 1067, having reigned three years and eight months.

Axan was no sooner informed of the tragical end of his friend and ally; than he resolved to invade the empire anew; and that not with a design only to plunder as formerly, but to conquer, and keep what he had once conquered. The emperor dispatched against him Isaac Comnenus, with a considerable army; but he was utterly defeated and taken prisoner by Axan. Another army was quickly sent off under the command of John Ducas the emperor's uncle. He gained at first some advantages, and would probably have put a stop to their conquests, had not one Rufelius, or Urselius, revolted with the troops he had under his command, caused himself to be proclaimed emperor, and reduced several cities in Phrygia and Cappadocia. Against him John marched with all his forces, suffering the Turks in the mean time to pursue their conquests: but coming to an engagement with the rebels, his army was entirely defeated and he himself taken prisoner. Notwithstanding this victory, Rufelius was so much alarmed at the progress of the Turks, that he not only released his prisoner, but joined with him against the common enemy, by whom they were both defeated and taken prisoners. Axan, however, was for some time prevented from pursuing his conquests by Cutlu-Moses, nephew to the late Tangrolipix. He had revolted against his uncle; but being defeated by him in a pitched battle, had taken refuge in Arabia, whence he now returned at the head of a considerable army, in order to dispute the sovereignty with Axan. But while the two armies were preparing to engage, the kalif of Babylon, who was still looked upon as the successor of the great prophet, interposed his authority. He represented the dangers of their intestine dissensions; and by his mediation, an agreement was at last concluded, on condition that Axan should enjoy undisturbed the monarchy lately left him by his father, and Cutlu-Moses should possess such provinces of the Roman empire as he or his sons should in process of time conquer.

After this agreement, both the Turkish princes turned their forces against the empire; and before the year 1077, made themselves masters of all Media, Lycaonia, Cappadocia, and Bithynia, fixing the capital city of their empire at Nice in the latter province. During all this time, the emperors of Constantinople, as well as their subjects, seemed to be in a manner infatuated. No notice was taken of the great progress made by these barbarians. The generals were ambitious only of seizing the tottering empire, which seemed ready to fall a prey to the Turks; and, after it was obtained, spent their time in oppressing their subjects, rather than in making any attempts to repulse the enemy.

At last Alexius Comnenus, having wrested the empire from Nicephoru Botoniates, in 1077, began to

prepare for opposing so formidable an enemy. But before he set out, as his soldiers had committed great outrages on his accession to the empire, he resolved to make confession of his sins, and do open penance for those he had suffered his army to commit. Accordingly he appeared in the attire of a penitent before the patriarch and several other ecclesiastics, acknowledged himself guilty of the many disorders that had been committed by his soldiers, and begged of the patriarch to impose upon him a penance suitable to the greatness of his crimes. The penance enjoined him and his adherents by the patriarch was to fast, lie upon the ground, and practise several other austerities for the space of 40 days. This command was religiously obeyed, and the emperor then began to prepare for war with so much vigour, that Solyman, the Turkish sultan, son and successor to Cultu-Moses, dispatched ambassadors to Alexius with proposals of peace. These were at first rejected; but the emperor was at last glad to accept them on certain advice, that Robert Guiscard, duke of Puglia and Calabria, was making great preparations against him in the West.

To this expedition, Robert was incited by Michael Ducas. That prince had been deposed by Nicephoru Botoniates, and towards the end of the usurper's reign fled into the West, where he was received by Robert, who was prevailed on to favour his cause. For this purpose, Robert made great Preparations; and these were continued even after the deposition of Botoniates. He sailed with all his forces from Brundisium; and landing at Buthrotum in Epirus, made himself master of that place, while his son Bohemond with part of the army reduced Aulon, a celebrated port and city in the country now called *Albania*. From thence they advanced to Dyrrhachium, which they invested both by sea and land; but met with a most vigorous opposition from George Paleologus, whom the emperor had entrusted with the defence of that important place. In spite of the utmost efforts of the enemy, this commander held out till the arrival of the Venetian fleet, by whom Robert's navy commanded by Bohemond was utterly defeated, the admiral himself having narrowly escaped being taken prisoner. After this victory, the Venetians landed without loss of time, and being joined by Paleologus's men, fell upon Robert's troops with such fury, that they destroyed their works, burnt their engines, and forced them back to their camp in great disorder. As the Venetians were now masters at sea, the besieged were supplied with plenty of provisions, while a famine began to rage in the camp of the enemy; and this calamity was soon followed by a plague, which in the space of three months is said to have destroyed ten thousand men. Notwithstanding all these disasters, however, Robert did not abandon the siege: having found means to supply his famished troops with provisions, he continued it with such vigour, that the courage of the besieged began at last to fail them; and Paleologus sent repeated messages to the emperor, acquainting him that he would be obliged to surrender unless very speedily assisted. On this Alexius marched in person to the relief of the city, but was defeated with great loss by Robert. The whole right wing of Alexius's army, finding themselves hard pressed by the enemy, fled to a church dedicated to St Michael, imagining they

The emperor himself with great difficulty made his escape, leaving the enemy masters of his camp and all his baggage. Soon after this defeat, the city surrendered ; and Alexius being destitute of resources for carrying on the war, seized on the wealth of churches and monasteries, which gave much offence to the clergy, and had like to have occasioned great disturbances in the Imperial city. At the same time, Alexius entering into an alliance with Henry emperor of Germany, persuaded him to invade the dominions of Robert in Italy. At first Henry met with great success ; but was soon overcome, and driven out of that country by Robert. Bohemond, in the mean time, reduced several places in Illyricum ; and, having defeated Alexius in two pitched battles, entered Thessaly, and sat down before Larissa. This place, being defended by an officer of great courage and experience in war, held out till the emperor came to its relief. Soon after his arrival he found means to draw a strong party of Bohemond's men into an ambuscade, and cut them off almost entirely. However, in the battle which was fought a few days after, Bohemond had the advantage ; but his troops mutinying and refusing to carry on the war, he was obliged to return to Italy. Alexius taking advantage of his absence, recovered several cities ; and being informed that Robert was making great preparations against him, he had recourse once more to the Venetians. By them he was assisted with a powerful fleet, which defeated that of Robert in two engagements ; but being soon after surprised by him, they were defeated with the loss of almost their whole navy. Robert is said to have used his victory with great barbarity, putting many of his prisoners to death with unheard-of torments. The Venetians equipped a second fleet ; and joining that of the emperor, fell unexpectedly upon Robert's navy, who were riding without the least apprehension in Buthrotum, sunk most of his ships, and took a great number of prisoners, his wife and younger sons having narrowly escaped falling into their hands. Robert made great preparations to revenge this defeat ; but was prevented by death from executing his designs : and, after his decease, his son Roger did not think proper to pursue so dangerous and expensive a war. He therefore recalled his troops, and the places which had been conquered by Robert and Bohemond submitted anew to the emperor.

136
The city surrenders.

137
The war ended by the death of Robert.

138
The Scythian war.

This war was scarce ended, when the Scythians passing the Danube laid waste great part of Thrace, committing every where the greatest barbarities. Against them the emperor dispatched an army under the command of Pacurianus and Branas. The latter insisted upon engaging the enemy contrary to the opinion of his colleague ; and his rashness caused the loss of the greater part of the army, who were cut off by the Scythians, together with the two generals. *Talicius*, an officer who had signalized himself on many occasions, was appointed to command the army in their room. He fell upon the enemy as they lay securely in the neighbourhood of Philippopolis, cut great numbers of them in pieces, and obliged the rest to retire in great confusion. The following spring, how-

ever, they returned in such numbers, that the emperor resolved to march against them in person. Accordingly he set out for Adrianople, and from thence to a place called *Lardea*. Here, contrary to the advice of his best officers, he ventured a battle ; in which he was utterly defeated with the loss of vast numbers of his men, he himself escaping with the utmost difficulty. The next year he was attended with no better success, his army being entirely defeated with the loss of his camp and baggage. In the year following, 1084, the emperor retrieved his credit ; and gave the Scythians such an overthrow, that very few escaped the general slaughter. Notwithstanding this disaster, however, they again invaded the empire in 1093 : To this they were encouraged by an impostor called *Leo*, who pretended to be the eldest son of Romanus Diogenes. The young prince had been slain in a battle with the Turks ; but as the Scythians only wanted a pretence to renew the war, they received the impostor with joy. By a stratagem, however, *Leo* was murdered ; and the Scythians being afterwards overthrown in three great battles, were obliged to submit on the emperor's own terms.

The Romans defeated.

140
They at last defeat the Scythians.

141
The Holy War.

Since the year 1083, the war had been carried on with the Turks with various success ; but now an association was formed in the West against these infidels, which threatened the utter ruin of the Turkish nation. This was occasioned by the superstition of the Christians, who thought it a meritorious action to venture their lives for the recovery of the Holy Land, possessed at that time by the Turks and Saracens. Had the western princes been properly assisted by the emperors of the East in this undertaking, the Turks had undoubtedly been unable to resist them ; but so far from this, the Latins were looked upon by them as no less enemies than the Turks ; and indeed whatever places they took from the infidels, they never thought of restoring to the emperors of Constantinople, to whom they originally belonged, but erected a number of small independent principalities ; which neither having sufficient strength to defend themselves, nor being properly supported by one another, soon became a prey to the Turks. In the year 1203, happened a dreadful fire at Constantinople, occasioned by some Latin soldiers. These had plundered a mosque, which the Turks residing in Constantinople had been suffered to build there. For this reason they were attacked by the infidels ; who being much superior to them in numbers, the Latins found themselves obliged to set fire to some houses, in order to make their escape with safety. The flame spreading in an instant from street to street, reduced in a short time great part of the city to ashes, with the capacious store-houses which had been built at a vast expence on the quay. The late emperor Isaac Angelus, who had been restored to his throne by the Latins, died soon after their departure from Constantinople, leaving his son Alexius sole master of the empire. The young prince, to discharge the large sums he had promised to the French and Venetians for their assistance, was obliged to lay heavy taxes on his subjects ; and this, with the great esteem and friendship showed to his deliverers, raised a general discontent among the people of Constantinople, who were sworn enemies to the Latins. This encouraged John Ducas, surnamed *Murtzuphlus*, from his joined

The city plundered by the Latins.

and thick eye-brows, to attempt the sovereignty. Unhappily he found means to put his treacherous designs in execution; and strangled the young prince with his own hands. After this he presented himself to the people; told them what he had done, which he pretended was in order to secure their liberties; and earnestly intreated them to choose an emperor who had courage enough to defend them against the Latins, that were ready to oppress and enslave them. On this he was instantly saluted emperor by the inconstant multitude; but this usurpation proved the ruin of the city. The Latins immediately resolved to revenge the death of the young prince; and, as they had been so often betrayed and retarded in their expeditions to the Holy Land by the emperors of Constantinople, to make themselves masters of that city, and seize the empire for themselves. In consequence of this resolution they mustered all their forces in Asia, and having crossed the straits, laid siege to Constantinople, by sea and land. The tyrant, who was a man of great courage and experience in war, made a vigorous defence. The Latins, however, after having battered the walls for several days together with an incredible number of engines, gave a general assault on the 8th of April 1204. The attack lasted from break of day till three in the afternoon, when they were forced to retire, after having lost some of their engines, and a great number of men. The assault was nevertheless renewed four days after; when, after a warm dispute, the French planted their standard on one of the towers; which the Venetians observing, they quickly made themselves masters of four other towers, where they likewise displayed their ensigns. In the mean time three of the gates being broke down by the battering rams, and those who had scaled the walls having killed the guards, and opened the gates between the towers they had taken, the whole army entered, and drew up in battle array between the walls. The Greeks fled up and down in the greatest confusion; and several parties were by the Latins dispatched to scour the streets, who put all they met to the sword, without distinction of age or condition. Night put a stop to the dreadful slaughter, when the princes founding the retreat, placed their men in different quarters of the city, with orders to be upon their guard, not doubting but they should be attacked early next morning. They were surpris'd, however, at that time by the entire submission of the Greeks; to whom they promised their lives, but at the same time, ordering them to retire to their houses, they gave up the city to be plundered by the soldiers for that day. They strictly enjoined their men to abstain from slaughter, to preserve the honour of the women, and to bring the whole booty into one place, that a just distribution might be made according to the rank and merit of each individual. The Greeks had undoubtedly concealed their most valuable effects during the night; many persons of the first rank had escaped, and carried along with them immense treasures; the soldiers had probably, as is usual in all such cases, reserved things of great value for themselves, notwithstanding all prohibitions to the contrary; and yet the booty, without the statues, pictures, and jewels, amounted to a sum almost incredible. As for Murtzuphlus, he made his escape in the night; embarking on a small vessel

with *Euphrosyne*, the wife of *Alexius Angelus* a late usurper, and her daughter *Eudoxia*, for whose sake he had abandoned his lawful wife.

Constantinopolitan history.

Constantinople continued subject to the Latins till the year 1261, when they were expelled by one *Alexius Strategopulus*. He was a person of an illustrious family; and, for his eminent services, distinguished with the title of *Cæsar*. He had been sent against *Alexius Angelus* despot of Epirus, who now attempted to recover some places in Thessaly and Greece from *Michael Paleologus*, one of the Greek emperors, that, since the capture of Constantinople, had kept their court at Nice; and to try whether he could on his march surpris'e the imperial city itself. *Alexius*, having passed these tracts encamped at a place called *Rhegium*, where he was informed by the natives that a strong body of the Latins had been sent to the siege of *Dapnusa*, that the garrison was in great want of provisions, and that it would be no difficult matter to surpris'e the city. Hereupon the Greek general resolved at all events to attempt it; in which he was encouraged by some of the inhabitants, who, coming privately to his camp, offered themselves to be his guides. He approached the walls in the dead of the night, which some of his men scaled without being observed; and, killing the centries whom they found asleep, opened one of the gates to the rest of the army. The Greeks rushing in, put all they met to the sword; and at the same time, to create more terror, set fire to the city in four different places. The Latins, concluding from thence that the enemy's forces were far more numerous than they really were, did not so much as attempt either to drive them out, or to extinguish the flames. In this general confusion, the emperor *Baldwin*, quitting the ensigns of majesty fled with *Justinian* the Latin patriarch, and some of his intimate friends, to the sea-side; and there, embarking on a small vessel, sailed first to Eubœa, and afterwards to Venice, leaving the Greeks in full possession of Constantinople. When news of this surpris'ing and altogether unexpected success of *Alexius* were first brought to *Paleologus*, he could scarce give credit to it; but receiving soon after letters from *Alexius* himself, with a particular account of so memorable an event, he ordered public thanks to be returned in all the churches, appeared in public in his imperial robes, attended by the nobility in their best apparel, and ordered couriers to be dispatched with the agreeable news into all parts of the empire.

Soon after having settled his affairs at Nice, he set out for Constantinople with the empress, his son *Andronicus*, the senate, and nobility, to take possession of the imperial city, and fix his residence in that place that had originally been designed for the seat of the eastern empire. Having passed the straits, he advanced to the *golden gate*, and continued some days without the walls, while the citizens were busied in making the necessary preparations to receive him with a magnificence suitable to the occasion. On the day appointed, the golden gate, which had been long shut up, was opened, and the emperor entering it amidst the repeated acclamations of the multitude, marched on foot to the great palace. He was preceded by the bishop of *Cyzicus*, who carried an image of the Virgin *Mary*, supposed to have been done by *St Luke*, and fol-

146
Entry of Michael Paleologus into the city.

Constantinopolitan history. followed by all the great officers, nobility, and chief citizens, pompously dressed. Public thanks were again returned in the church of St Sophia, at which the emperor assisted in person, with the clergy, the senate, and nobility. These exercises were succeeded by all sorts of rejoicings; after which the emperor carefully surveyed the imperial city. This survey greatly allayed his joy. He saw the stately palaces and other magnificent buildings of the Roman emperors lying in ruins; the many capacious buildings that had been erected by his predecessors, at an immense charge, destroyed by fire, and other unavoidable accidents of war; several streets abandoned by the inhabitants, and choaked up with rubbish, &c. These objects gave the emperor no small concern, and kindled in him a desire of restoring the city to its former lustre. In the mean time, looking upon Alexius as the restorer of his country, he caused him to be clad in magnificent robes; placed with his own hand a crown on his head; ordered him to be conducted through the city, as it were in triumph; decreed that for a whole year the name of Alexius should be joined in the public prayers with his own: and, to perpetuate the memory of so great and glorious an action, he commanded his statue to be erected on a stately pillar of marble before the church of the Apostles. His next care was to re-people the city, many Greek families having withdrawn from it while it was held by the Latins, and the Latins now preparing to return to their respective countries. The former were recalled home; and the latter, in regard of the great trade they carried on, were allowed many valuable privileges, which induced them not to remove. The Greeks were allowed to live in one of the most beautiful quarters of the city, to be governed by their own laws and magistrates, and to trade without paying customs or taxes of any kind. Great privileges were likewise granted to the natives of Venice and Pisa, which encouraged them to lay aside all thoughts of removing, and the trade they carried on proved afterwards highly advantageous to the state.

147 He resolves to restore it to its former grandeur. It was not long, however, before these regulations were altered. The emperor being soon after informed that Baldwin, lately expelled from Constantinople, had married his daughter to Charles king of Sicily, and given him, by way of dowry, the imperial city itself, he ordered the Genoese, who were become very numerous, to remove first to Heraclea, and afterwards to Galata, where they continued. As for the Pisans and Venetians, who were not so numerous and wealthy, they were allowed to continue in the city. Paleologus, though he had caused himself to be proclaimed emperor, and was possessed of absolute sovereignty, was as yet only guardian to the young emperor John Lascaris, then about 12 years of age. But having now settled the state, and having gained the affections both of natives and foreigners, he began to think of securing himself and his posterity in the full enjoyment of the empire; and for this reason cruelly ordered the eyes of the young prince to be put out, pretending that none but himself had any right to the city or empire of Constantinople, which he alone had recovered out of the hand of the Latins.

148 Great disturbances occasioned by the treachery of Paleologus. This piece of treachery and inhumanity involved him in great troubles. The patriarch immediately excom-

municated him; and he would in all probability have been driven from the throne by a combination of the western princes, had he not engaged pope Urban IV. to espouse his cause, by promising to submit himself and his dominions to the Latin Church. Thus, indeed, he diverted the present storm; but this proceeding caused the greatest disturbances, not only in Constantinople, but throughout the whole empire, nor was Paleologus able to reconcile his subjects to this union.

149 Union of the Greek and Latin churches. In 1283 Michael died, and was succeeded by his son Andronicus. His first step was to restore the ancient Greek ceremonies, thinking he could not begin his reign with a more popular act. But thus he involved himself in difficulties still greater than before. Though Michael had not been able fully to reconcile his Greek subjects to the Latin ceremonies, yet he had in some degree accomplished his purpose. The Latins had got a considerable footing in the city, and defended their ceremonies with great obstinacy; so that the empire was again thrown into a ferment by this imprudent step.

150 Dissolved. All this time the Turks had been continuing their encroachments on the empire, which had it not been for the crusades published against them by the Pope, they would in all probability have made themselves masters of before this time. They were now, however, very successfully opposed by Constantine the emperor's brother: but his valour rendered him suspected by the emperor; in consequence of which he was thrown into prison, along with several persons of great distinction. On the removal of this brave commander, the Turks, under the famous Othoman, made themselves masters of several places in Phrygia, Caria, and Bithynia; and, among the rest, of the city of Nice. To put a stop to their conquests, the emperor dispatched against them Philanthropenus and Libadarius, two officers of great experience in war. The former gained some advantages over the enemy; but being elated with his success, caused himself to be proclaimed emperor. This rebellion, however, was soon suppressed, Philanthropenus being betrayed by his own men: but the Turks taking advantage of these intestine commotions, not only extended their dominions in Asia, but conquered most of the islands in the Mediterranean; and being masters at sea, infested the coasts of the empire, to the utter ruin of trade and commerce.

151 War with the Turks. From this time the Roman empire tended fast to dissolution. After the revolt of Philanthropenus, the emperor could no longer trust his subjects, and therefore hired the Massagetes to assist him: but they, behaving in a careless manner, were first defeated by their enemies, and afterwards turned their arms against those they came to assist. He next applied to the Catalans, who behaved in the same manner; and having ravaged the few places left the emperor in Asia, returned into Europe, and called the Turks to their assistance.

152 Their first appearance in Europe. This happened in the year 1292, and was the first appearance of the Turks in Europe. This enterprize, however, was unsuccessful. Having loaded themselves with booty, they offered to depart quietly if they were allowed a safe passage, and ships to transport them to Asia. To this the emperor, willing to get rid of such troublesome guests, readily consented, and ordered the vessels

vessels to be got ready with all possible expedition. But the Greek officers observing the immense booty with which they were loaded, resolved to fall upon them in the night, and cut them all off at once. This scheme, however, was not managed with such secrecy but that the Turks had notice of it, and therefore prepared for their defence. They first surpris'd a strong castle in the neighbourhood, and then found means to acquaint their countrymen in Asia with their dangerous situation. Their brethren, enticed with the hopes of booty, were not long of coming to their assistance; and having crossed the Hellespont in great numbers, ravaged the adjacent country, making excursions to the very gates of Constantinople. At last the emperor determin'd to root them out; and accordingly march'd against them with all his forces, the country people flocking to him from all quarters. The Turks at first gave themselves over for lost; but finding the Greeks negligent of discipline, they attack'd their army unexpectedly, utterly defeated it, and made themselves masters of the camp. After this unexpected victory, they continued for two years to ravage Thrace in the most terrible manner. At last, however, they were defeated; and being afterwards shut up in the Chersonesus, they were all cut in pieces or taken.

153
They are all cut in pieces, or taken.

Soon after new commotions took place in this unhappy empire, of which the Turks did not fail to take the advantage. In 1327 they made themselves masters of most of the cities on the Mæander; and, among the rest, of the strong and important city of Prusa in Bithynia. The next year, however, Othoman, who may justly be styl'd the founder of the Turkish monarchy, being dead, the emperor laid hold of that opportunity to recover Nice, and some other important places, from the infidels. But these were lost the year following, together with Abydus and Nicomedia: and in 1330 a peace was concluded upon condition that they should keep all their conquests. This peace they observ'd no longer than serv'd their own purposes; for new commotions breaking out in the empire, they pursu'd their conquests, and by the year 1357 had reduced all Asia. They next pass'd the Hellespont under the conduct of Solyman the son, or as others will have it, the brother of Orchanes, the successor of Othoman, and seiz'd on a strong castle on the European side. Soon after the Turkish sultan died, and was succeeded by Amurath. He extend'd the conquests of his predecessors, and in a short time reduced all Thrace, making Adrianople the seat of his empire. Amurath was slain by treachery in a little time after, and was succeeded by his son Bajazet. This prince greatly enlarg'd his dominions by new conquests. In a short time he reduced the countries of Thessaly, Macedon, Phocis, Peloponnesus, Mysia, and Bulgaria, driving out the despots or petty princes who rul'd there. E-lated with his frequent victories, he began to look upon the Greek emperor, to whom nothing was now left but the city of Constantinople and the neighbouring country, as his vassal. Accordingly he sent him an arrogant and haughty message, commanding him to pay a yearly tribute, and send his son Manuel to attend him in his military expeditions. This demand the emperor was oblig'd to comply with, but died soon after in the year 1392.

154
Adrianople taken by the Turks.

Manuel no sooner heard of his father's death than

he hasten'd to Constantinople, without taking leave of the sultan, or acquainting him with the reasons of his sudden departure. At this Bajazet was so highly offended, that he pass'd with great expedition out of Bithynia into Thrace, ravaged the country adjoining to Constantinople, and at last invest'd the city itself both by sea and land. In this extremity Manuel had recourse to the western princes; who sent him an army of 130,000 men, under the command of Sigismund king of Hungary, and John count of Nevers. But though the western troops prov'd at first successful, they were in the end defeated with great slaughter by Bajazet, who then return'd to the siege with greater vigour than ever. As he found, however, that the citizens were determin'd to hold out to the last, he apply'd to John, the son of Manuel's elder brother, who had a better title to the crown than Manuel himself. With him he enter'd into a private agreement, by virtue of which Bajazet was to place John upon the throne of Constantinople; on the other hand, John was to deliver up the city to the Turks, and remove the imperial seat to Peloponnesus, which the sultan promis'd to relinquish to him and his posterity. At the same time he sent deputies to the inhabitants of Constantinople, offering to withdraw his army, and cease from further hostilities, provided they expell'd Manuel and plac'd John upon the throne. This proposal rent the city into two factions; but Manuel prevent'd the mischiefs which were ready to ensue, by a voluntary resignation, upon condition that he should be allowed to retire to whatever place he thought proper with his wife and children.

With this condition John readily comply'd; and Manuel having receiv'd him into the city, and conduct'd him to the palace, set sail for Venice. From thence he went to the courts of all the western princes to solicit their assistance against the Turks, whose power was grown formidable to all Europe. He was every where receiv'd with the greatest demonstrations of esteem, and promis'd large supplies; all Christendom being now alarm'd at the progress of the infidels.

In the mean time Bajazet did not fail to put John in mind of his promise; but the citizens refusing to comply with such a scandalous treaty, the siege was renew'd, and the city assaulted with more fury than ever. When it was already reduced to the last extremity, news were brought the sultan that Tamerlane, the victorious Tartar, having over-run all the East with incredible celerity, had now turn'd his arms against the Turks, and was preparing to break into Syria. Bajazet, alarm'd at the danger that threaten'd him, rais'd the siege in great haste, and advanced against Tamerlane with a very numerous and well-disciplin'd army; but the Tartar totally defeated and took him prisoner, after having cut most of his men in pieces: and thus Constantinople was preserv'd for the present.

But this relief was of short duration. In 1424 the city was again besieg'd by Amurath II. The inhabitants defend'd themselves with great bravery; but must in the end have submit't, had not the emperor prevail'd upon the prince of Caramania to countenance an impostor and pretender to the Turkish throne. This oblig'd Amurath to raise the siege, and march with all his forces against the usurper, whom he soon

reduced. Having then no other enemies to contend with, he entered Macedon at the head of a powerful army; and having ravaged the country far and near, he took and plundered Theſſalonica, as he did alſo moſt of the cities of Ætolia, Phocis, and Bœotia. From Greece he marched into Servia; which country he ſoon reduced. He next broke into the dominions of the king of Hungary, and beſieged the ſtrong city of Belgrade; but here he met with a vigorous repulſe, no fewer than 15,000 Turks being ſlain by the Chriſtians in one ſally, which obliged the ſultan to drop the enterprize and retire.

159
Success of John Hunniades against the Turks.

In his retreat he was attacked by the celebrated John Hunniades, who cut great numbers of his men in pieces, and obliged the reſt to fly with precipitation. Not long after he gained a ſtill more complete victory over the enemy in the plains of Tranſylvania, with the loſs of only 3000 of his own men, whereas 20,000 of the Turks were killed on the field of battle, and almoſt an equal number in the purſuit. Amurath, who was then at Adrianople, ſent an army into Tranſylvania far more numerous than the former; but they were attended with no better ſucceſs, being cut off almoſt to a man by the brave Hungarian. He gained ſeveral other victories no leſs remarkable; but was at laſt entirely defeated in 1448; and with this defeat ended all hopes of preſerving the Roman empire. The unhappy emperor was now obliged to pay an annual tribute of 300,000 aſpers to the ſultan; and to yield up to him ſome ſtrong holds which he ſtill held on the Euxine Sea. However, as he doubted not but Amurath would ſoon attempt to become maſter of the city itſelf, he renewed the union between the Greek and Latin churches, hoping that this would induce the weſtern princes to aſſiſt him in the defence of the city againſt the Turks. This union produced great diſturbances, which the emperor did not long ſurvive, but died in 1448, leaving the empire, now confined within the walls of Conſtantinople, to his brother Conſtantine.

160
He is at laſt defeated.

Amurath the Turkiſh ſultan died in 1450, and was ſucceeded by his ſon Mohammed. In the beginning of his reign he entered into an alliance with Conſtantine, and pretended a great deſire to live in friendſhip with him and the other Chriſtian princes; but no ſooner had he put an end to a war in which he was engaged with Ibrahim king of Caramania, than he built a ſtrong fort on the European ſide of the Boſphorus, oppoſite to another in Aſia; in both of which he placed ſtrong garrisons. Theſe two caſtles commanded the Straits; and the former being but five miles from the city, kept it in a manner blocked up. This ſoon produced a miſunderſtanding between him and the emperor, which ended in the ſiege of the city.

161
Constantinople beſieged by Mohammed.

The ſiege commenced on the ſixth of April 1453. Mohammed's numerous forces covering the plains before it on the land-ſide, and a fleet of 300 ſail blocking it up by ſea. The emperor, however, had taken care to ſecure the haven in which were three large ſhips, 20 ſmall ones, and a great number of galleys, by means of a chain drawn croſs the entrance. Mohammed began the ſiege by planting batteries as near the city as he could, and raiſing mounts in ſeveral places as high as the walls themſelves, whence the beſieged were inceſſantly galled with ſhowers of arrows.

Constantinopolitan history.

He had in his camp a piece of ordnance of prodigious ſize, which is ſaid to have carried a ball of 100 pounds weight, made of hard black ſtone brought from the Euxine Sea. With this vaſt piece the enemy made ſeveral breaches in the walls; which, however, were repaired with incredible expedition by the beſieged. But Mohammed, the better to carry on the ſiege, cauſed new levies to be made throughout his extenſive dominions, by which his army was ſoon increaſed to near 400,000 men; while the garrison conſiſted only of 9000 regular troops, viz. 6000 Greeks and 3000 Genoefe and Venetians. As the enemy continued to batter the walls day and night without intermiſſion, a great part of them was at laſt beaten down; but while the Turks were buſy in filling up the ditch, in order to give the aſſault, a new wall was built. This threw the tyrant into a prodigious rage, which was greatly heightened when he ſaw his whole fleet worſted by five ſhips, four of which were laden with corn from Peloponneſus, and the others with all manner of proviſions from the iſle of Chios. Theſe opened themſelves a way through the whole Turkiſh fleet; and, to the inexpressible joy of the Chriſtians; at laſt got ſafe into the harbour.

162
He conveys 80 galleys over land into the haven.

The Turks attempted ſeveral times to force the haven; but all their efforts proving ineffectual, Mohammed formed a deſign of conveying 80 galleys over land for the ſpace of eight miles into it. This he accompliſhed by means of certain engines, the contrivance of a renegado; and having then either taken or funk all the ſhips contained in it, he cauſed a bridge to be built over it with ſurpriſing expedition. By this means the city was laid open to an aſſault from that ſide likewiſe. The place was now aſſaulted on all ſides; and Conſtantine being well apprized that he could not long hold out againſt ſuch a mighty fleet and ſo numerous an army, ſent deputies to Mohammed, offering to acknowledge himſelf his vaſſal, by paying him yearly what tribute he ſhould think proper to impoſe, provided he raiſed the ſiege and withdrew. The tyrant answered that he was determiued at all events to become maſter of the city: but if the emperor delivered it up forthwith, he would yield up to him Peloponneſus, and other provinces to his brothers, which they ſhould enjoy peaceably as his friends and allies: but if he held out to the laſt extremity, and ſuffered it to be taken by aſſault, he would put him and the whole nobility to the ſword, abandon the city to be plundered by his ſoldiers, and carry the inhabitants into captivity.

163
A mutiny in the Turkiſh camp.

This condition was raſhly rejected by the emperor; who thereby involved himſelf and all his ſubjects in the moſt terrible calamity. The ſiege was renewed with more vigour than ever, and continued till the 25th of May; when a report being ſpread in the Turkiſh camp that a mighty army was advancing in full march to the relief of the city under the conduct of the celebrated John Hunniades, the common ſoldiers, ſeized with a panic, began to mutiny, and preſs Mohammed in a tumultuous manner to break up the ſiege. Nay, they openly threatened him with death, if he did not immediately abandon the enterprize and retire from before the city, which they deſpaired of being able to reduce before the arrival of the ſuppoſed ſuccours. Mohammed was upon the point of complying with their demand,

Constantinopolitan history.

mand, when he was advised by Zagan, a Turkish officer of great intrepidity, and an irreconcilable enemy to the Christian name, to give without loss of time a general assault. To this he said the soldiery, however mutinous, would not be averse, provided the sultan solemnly promised to abandon the city to be plundered by them. As such an advice best suited the humour of Mohammed, he readily embraced it; and caused a proclamation to be published throughout the camp, declaring, that he gave up to his soldiers all the wealth of that opulent city, requiring to himself only the empty houses.

The desire of plunder soon got the better of that fear which had seized the Turkish army, and they unanimously desired to be led on to the attack. Hereupon Constantine was summoned for the last time to deliver up the city, with a promise of his life and liberty; but to this he answered, that he was unalterably determined either to defend the city or to perish with it. The attack began at three in the morning on Tuesday the 29th of May; such troops were first employed as the sultan valued least, and designed them for no other purpose than to tire the Christians, who made a prodigious havock of that disorderly multitude. After the carnage had lasted some hours, the Janizaries and other fresh troops advanced in good order, and renewed the attack with incredible vigour. The Christians summoning all their courage and resolution, twice repulsed the enemy; but being in the end quite spent, they were no longer able to stand their ground; so that the enemy in several places broke into the city. In the mean time Justiniani, the commander of the Genoese and a select body of Greeks, having received two wounds, one in the thigh and the other in the hand, was so disheartened, that he caused himself to be conveyed to Galata, where he soon after died of grief. His men, disinayed at the sudden flight of their general, immediately quitted their posts and fled in the utmost confusion. However the emperor, attended with a few of the most resolute among the nobility, still kept his post, striving with unparalleled resolution to oppose the multitude of barbarians that now broke in from every quarter. But being in the end overpowered with numbers, and seeing all his friends lie dead on the ground, "What! (cried he aloud) is there no Christian left alive to strike off my head?" He had scarce uttered these words, when one of the enemy, not knowing him, gave him a deep cut across the face with his sabre; and at the same time, another coming behind him, with a blow on the back part of his head laid him dead on the ground. After the death of the emperor, the few Christians that were left alive betook themselves to flight; and the Turks, meeting with no further opposition, entered the city, which they filled with blood and slaughter. They gave no quarter, but put all they met to the sword, without distinction. Many thousands took refuge in the church of St Sophia, but they were all massacred in their asylum by the enraged barbarians; who, prompted by their natural cruelty, the desire of revenge, and love of booty, spared no place nor person. Most of the nobility were, by the sultan's orders, cut off, and the rest kept for purposes more grievous than death itself. Many of the inhabitants, among whom were some men of great learning, found

means to make their escape while the Turks were busied in plundering the city. These embarking on five ships then in the harbour, arrived safe in Italy; where, with the study of the Greek tongue, they revived the liberal sciences, which had long been neglected in the West. After the expiration of three days, Mohammed commanded his soldiers to forbear all further hostilities on pain of death; and then put an end to as cruel a pillage and massacre as any mentioned in history. The next day he made his public and triumphal entry into Constantinople, and chose it for the seat of the Turkish empire, which it has continued to be ever since.

This city is now called by the Turks *Islampol*, and by the Greeks *Islampoli* or *Stampoli*. It is seated at the eastern extremity of Romania, on a small neck of land which advances towards Natolia, from which it is separated by a channel of a mile in breadth. The sea of Marmora washes its walls on the south, and a gulph of the channel of Constantinople does the same on the north. It is delightfully situated between the Black Sea and the Archipelago, from whence it is supplied with all necessaries. The grand seignior's palace, called the *Seraglio*, is seated on the sea-side, and is surrounded with walls flanked with towers, and separated from the city by canals. It is said the harbour will easily hold 1200 ships. The number of houses must needs be prodigious, since one fire has burnt down 30,000 in a day, without greatly changing the aspect of the city. However, in general, they are but mean, especially on the outside, where there are few or no windows; and the streets being narrow, gives them a melancholy look. They reckon that there are 3770 streets, small and great, but they are seldom or never clean; and the people are infected with the plague almost every year. The inhabitants are half Turks, two-thirds of the other half Christians, and the rest Jews. Here are a great number of ancient monuments still remaining, and particularly the superb temple of Sophia, which is turned into a mosque, and far surpasses all the rest. The street called *Adrianople* is the longest and broadest in the city; and the bazars, or bezosteins, are the markets for selling all sorts of merchandize. The old and the new are pretty near each other: and are large square buildings, covered with domes, and supported by arches and pilasters. The new is the best, and contains all sorts of goods which are there exposed to sale. The market for slaves, of both sexes, is not far off; and the Jews are the principal merchants, who bring them here to be sold. There are a great number of young girls brought from Hungary, Greece, Candia, Russia, Mingrelia, and Georgia, for the service of the Turks, who generally buy them for their seraglios. The great square, near the mosque of sultan Bajazet, is the place for public diversions, where the jugglers and mountebanks play a great variety of tricks. The circumference of this city is by some said to be 15 miles, and by Mr Tournefort 23 miles; to which if we add the suburbs, it may be 34 miles in compass. The suburb called *Fera* is charmingly situated; and is the place where the ambassadors of England, France, Venice, and Holland, reside. This city is built in the form of a triangle; and as the ground rises gradually, there is a view of the whole town from the sea. The public buildings,

Constat
|
Constitu-
tion.

buildings, such as the palaces, the mosques, bagnios, and caravanaries for the entertainment of strangers, are many of them very magnificent. E. Long. 29. 20. N. Lat. 41. 4.

CONSTAT, in law, the name of a certificate which the clerk of the pipe and auditors of the exchequer make at the request of any person who intends to plead or move in that court for the discharge of any thing; and the effect of it is, the certifying what does *constare* upon record touching the matter in question.—A constat is held to be superior to a certificate; because this may err or fail in its contents; that cannot, as certifying nothing but what is evident upon record.

Also the exemplification under the great seal of the enrolment of any letters-patent is called a *constat*.

CONSTELLATION, in astronomy, a system of several stars that are seen in the heavens near to one another. Astronomers not only mark out the stars, but, that they may better bring them into order, they distinguish them by their situation and position in respect to each other; and therefore they distribute them into asterisms or constellations, allowing several stars to make up one constellation: and for the better distinguishing and observing them, they reduce the constellations to the forms of animals, as men, bulls, bears, &c.; or to the images of some things known, as of a crown, a harp, a balance, &c.; or give them the names of those whose memories, in consideration of some notable exploit, they had a mind to transmit to future ages.

The division of the stars by images and figures is of great antiquity, and seems to be as old as astronomy itself: for in the most ancient book of Job, Orion, Arcturus, and the Pleiades, are mentioned; and we meet with the names of many of the constellations in the writings of the first poets, Homer and Hesiod.

The ancients, in their division of the firmament, took in only so much as came under their notice, distributing it into 48 constellations; but the modern astronomers comprehend the whole starry firmament, dividing it into three regions. See *ASTRONOMY-Index*.

CONSTERNATION is defined by ethical writers to be an excess of horror, owing to the ill government of our admiration and fear: or such an immoderate degree of fear as confounds the faculties, and incapacitates a person for consultation and execution.

CONSTIPATION, in medicine, a hardness of the belly, with great costiveness. See *COSTIVENESS*.

CONSTITUENT PART, in physiology, an essential part in the composition of any thing, differing little from what is otherwise called *element* or *principle*.

CONSTITUTION, in matters of policy, signifies the form of government established in any country or kingdom.

CONSTITUTION also denotes an ordinance, decision, regulation, or law, made by authority of any superior, ecclesiastical or civil.

VOL. V.

Apostolical CONSTITUTIONS, a collection of regulations attributed to the apostles, and supposed to have been collected by St Clement, whose name they likewise bear.

Constitu-
tion.

It is the general opinion, however, that they are spurious, and that St Clement had no hand in them. They appeared first in the 4th age, but have been much changed and corrupted since that time. They are divided into eight books, consisting of a great number of rules and precepts, relating to the duties of Christians, and particularly the ceremonies and discipline of the church. Mr Whiston, in opposition to the general opinion, asserts them to be a part of the sacred writing, dictated by the apostles in their meetings, and written down from their own mouth by St Clement; and intended as a supplement to the New Testament, or rather as a system of Christian faith, and polity. The reason why the Constitutions are suspected by the orthodox, and perhaps the reason also why their genuineness is defended by Mr Whiston, is, that they seem to favour Arianism.

CONSTITUTION, in a physical sense, signifies the particular temperature of the body.

It is curious to observe, says Dr Percival, the revolution which hath taken place, within this century, in the constitutions of the inhabitants of Europe. Inflammatory diseases more rarely occur, and, in general, are much less rapid and violent in their progress than formerly (A); nor do they admit of the same antiphlogistic method of cure that was practised with success 100 years ago. The experienced Sydenham makes 40 ounces of blood the mean quantity to be drawn in the acute rheumatism; whereas this disease, as it now appears in the London hospitals, will not bear above half that evacuation. Vernal intermittents are frequently cured by a vomit and the bark, without venesection; which is a proof that at present they are accompanied with fewer symptoms of inflammation than they were wont to be. This advantageous change, however, is more than counterbalanced by the introduction of a numerous class of nervous ailments, in a great measure unknown to our ancestors; but which now prevail universally, and are complicated with almost every other distemper. The bodies of men are enfeebled and enervated; and it is not uncommon to observe very high degrees of irritability, under the external appearance of great strength and robustness. The hypochondria, palsies, cachexies, dropsies, and all those diseases which arise from laxity and debility, are in our days endemic every where; and the hysterics, which used to be peculiar to the women, as the name itself indicates, now attack both sexes indiscriminately. It is evident that so great a revolution could not be effected without a concurrence of many causes; but amongst these (according to Dr Percival), the present general use of tea* holds the first and principal rank. The second place may perhaps be allowed to excess in spirituous liquors. This pernicious custom, in many instances at least, owes its rise to the former, which,

* See *Tea*.

3 B

(A) The decrease in the violence of inflammatory diseases may perhaps in part be ascribed to the present improved method of treating them. Moderate evacuations, cool air, acedent diet, and the liberal use of saline and antimonial medicines, are better adapted to check the progress of fevers, than copious bleedings, stimulating purgatives, and profuse sweats excited by theriaca and mithridate.

Constrictor which, by the lowness and depression of spirits it occasions, renders it almost necessary to have recourse to something cordial and exhilarating. And hence proceed those odious and disgraceful habits of intemperance, with which many of the softer sex are now, alas! chargeable.

CONSTRUCTOR, an appellation given to several muscles, on account of their constringing or closing some of the orifices of the body.

CONSTRICION, in geometry, is the drawing such lines, such a figure, &c. as are previously necessary for making any demonstration appear more plain and undeniable.

CONSTRUCTION of Equations. See **EQUATIONS**.

CONSTRUCTION, in grammar; syntax, or the arranging and connecting the words of a sentence according to the rules of the language. See **GRAMMAR**, and **LANGUAGE**.

The construction is generally more simple, easy, and direct, in the modern tongues than in the ancient: we have very few of those inversions which occasion so much embarrassment and obscurity in the Latin; our thoughts are usually delivered in the same order wherein the imagination conceives them: the nominative case, for instance, always precedes the verb, and the verb goes before the oblique cases it governs.

The Greeks and Latins, M. St. Evremont observes, usually end their periods, where, in good sense and reason, they should have begun; and the elegance of their language consists, in some measure, in this capricious arrangement, or rather in this transposal and disorder of the words. See **LANGUAGE**.

CONSTRUCTION of Statutes, among lawyers. See **LAW**, Part II. n^o 49.

CONSUALIA, in antiquity, feasts which were held among the ancients, in honour of the god *Consus* i. e. Neptune; different from those other feasts of the same deity called *Neptunalia*. They were introduced with a magnificent cavalcade, or procession on horseback; because Neptune was reputed to have first taught men the use of horses; whence his surname of *Ἰππιος*, *Equestris*.

Evander is said to have first instituted this feast: it was re-established by Romulus, under the name of *Consus*; because it was some god under the denomination of *Consus*, that suggested to him the rape of the Sabines. It is said, that it was with a view to this rape that he made that establishment. This, however, is certain, that it was to this feast all his neighbours were invited; when, taking advantage of the solemnities and sacrifices, he seized the women. To draw the greater concourse of people, he gave out, that he had found an altar hid under ground, which he intended to consecrate, with sacrifices to the god to whom it had been originally erected. Those who take upon them to explain the mysteries of the heathen theology, say, that the altar hid under ground, is a symbol of the secret design of Romulus to seize his neighbours wives.

The consualia were of the number of feasts called sacred; as being consecrated to a divinity.—Originally they were not distinguished from those of the Circus: whence it is, that Valerius Maximus says, that the rape of the Sabines was effected at the games of the Circus.

Plutarch observes, that during the days of this solemnity, horses and asses were left at rest, and were dressed up with crowns, &c. on account of its being the feast of Neptuneus Equestris.—Festus says, the cavalcade was performed with mules; it being an opinion, that this was the first animal used to draw the car.

Servius gives us to understand, that the consualia fell on the 13th of August; Plutarch, in the life of Romulus, places them on the 18th, and the old Roman calendar on the 21st of that month.

CONSUBSTANTIAL, in theology, a term of like import with co-essential; denoting something of the same substance with another. The orthodox believe the Son of God to be consubstantial with the Father.

The term *ὁμοουσιος*, *consubstantial*, was first adopted by the fathers of the councils of Antioch and Nice, to express the orthodox doctrine the more precisely, and to serve as a barrier and precaution against the errors and subtleties of the Arians; who owned every thing excepting the consubstantiality.

The Arians allowed, that the word was God, as having been made God; but they denied that he was the same God, and of the same substance with the Father: accordingly they exerted themselves to the utmost to abolish the use of the word. The emperor Constantine used all his authority with the bishops to have it expunged out of the symbols; but it still maintained itself, and is at this day, as it was then, the distinguishing criterion between an Athanasian and an Arian.

Sandius will have it, that the word consubstantial was unknown till the time of the council of Nice; but it is certain it had been before proposed to the council of Antioch, wherein Paulus Samosatenus had been condemned; though it had there the fortune to be rejected. Curcellæus, on the other hand, maintains, that it was an innovation in doctrine in the council of Nice, to admit an expression, the use whereof had been abolished by the council of Antioch.

According to St Athanasius, the word consubstantial was only condemned in the council of Antioch, inasmuch as it implied the idea of a pre-existent matter, prior to the things formed thereof: now, in this sense, it is certain, the Father and the Son are not consubstantial, there having been no pre-existent matter.

CONSUBSTANTIATION, a tenet of the Lutheran church with regard to the manner of the change made in the bread and wine in the eucharist. The divines of that profession maintain, that after consecration, the body and blood of our Saviour are substantially present, together with the substance of the bread and wine, which is called consubstantiation, or impanation.

CONSUL, the chief magistrate of the Roman commonwealth, invested with regal authority for the space of one year. They were two in number, called consuls *a consulendo*, and annually chosen in the Campus Martius. The two first consuls were L. Jun. Brutus, and L. Tarquinius Collatinus, chosen in the year of Rome 244, after the expulsion of the Tarquins. In the first times of the republic the two consuls were always chosen from Patrician families or noblemen, but the people

Consubstantial
||
Consul.

Consul. ple obtained the privilege in the year of Rome 388, of electing one of the consuls from their own body, and sometimes both were plebeians. The first consul among the plebeians was L. Sextius. It was required that every candidate for the consulship should be 43 years of age, called *legitimum tempus*. He was always to appear at the election as a private man without a retinue, and it was requisite before he canvassed for the office to have discharged the functions of quæstor, edile, and prætor. Sometimes these qualifications were disregarded. Val. Corvinus was made a consul in his 23d year, and Scipio in his 24th. Young Marius, Pompey, and Augustus, were also under the proper age when they were invested with the office, and Pompey had never been quæstor or prætor. The power of the consuls was unbounded, and they knew no superior but the gods and the laws; but after the expiration of their office their conduct was minutely scrutinized by the people, and misbehaviour was often punished by the laws. The badge of their office was the *prætecta*, a robe fringed with purple, afterwards exchanged for the *toga picta* or *palmata*. They were preceded by 12 lictors carrying the *fascæ* or bundles of sticks, in the middle of which appeared an axe. The axe, as being the characteristic rather of tyranny than of freedom, was taken away from the *fascæ* by Valerius Poplicola, but it was restored by his successor. They took it by turns monthly to be preceded by the lictors while at Rome, lest the appearance of two persons with the badges of royal authority should raise apprehensions in the multitude. While one appeared publicly in state, only a crier walked before the other, and the lictors followed behind without the *fascæ*. Their authority was equal; yet the Valerian law gave the right of priority to the older, and the Julian law to him who had most children; and he was generally called *consul major* or *prior*. As their power was absolute, they presided over the senate, and could convene and dismiss it at pleasure. The senators were their counsellors; and among the Romans the manner of reckoning their years was by the name of the consuls, and by *M. Tull. Cicerone et L. Antonio Consulibus*, for instance, the year of Rome 689 was always understood. This custom lasted from the year of Rome 244 till the 1294, or 541st year of the Christian era. In public assemblies the consuls sat in ivory chairs, and held in their hand an ivory wand called *scipio eburneus*, which had an eagle on its top as a sign of dignity and power. When they had drawn by lot the provinces over which they were to preside during their consulship, they went to the capitol to offer their prayers to the gods, and intreat them to protect the republic; after this they departed from the city arrayed in their military dress and preceded by the lictors. Sometimes the provinces were assigned them without drawing by lot, by the will and appointment of the senators. At their departure they were provided by the state with whatever was requisite during their expedition. In their provinces they were both attended by the 12 lictors, and equally invested with regal authority. They were not permitted to return to Rome without the special command of the senate; and they always remained in the province till the arrival of their successor. At their return they harangued the people, and

solemnly protested that they had done nothing against the laws or interest of their country, but had faithfully and diligently endeavoured to promote the greatness and welfare of the state. No man could be consul two following years; yet this institution was sometimes broken, and we find Marius re-elected consul after the expiration of his office during the Cimbrian war. The office of consul, so dignified during the times of the commonwealth, became a mere title under the emperors, and retained nothing of its authority but the useless ensigns of original dignity. Even the duration of the office, which was originally annual, was reduced to two or three months by J. Cæsar; but they who were admitted on the first of January denominated the year, and were called *ordinarii*. Their successors during the year were distinguished by the name of *suffecti*. Tiberius and Claudius abridged the time of the consulship; and the emperor Commodus made no less than 25 consuls in one year. Constantine the Great renewed the original institution, and permitted them to be a whole year in office.

CONSUL, at present, is an officer established by virtue of a commission from a king or state, in all foreign countries of any considerable trade, to facilitate and dispatch business, and protect the merchants of the nation. The English consuls are to keep up a correspondence with the ministers of England residing in the courts whereon their consulate depends. They are to support the commerce and the interest of the nation; to dispose of the sums given and the presents made to the lords and principals of places, to obtain their protection, and prevent the insults of the natives on the merchants of the nation.

CONSUMMATION, the end, period, or completion of any work. Thus, we say, the *consummation* of all things, meaning the end of the world. By the incarnation, all the prophecies are said to be *consummated*. See PROPHECY, and ACCOMPLISHMENT.

CONSUMMATION of Marriage, denotes the last act of marriage, which makes its accomplishment; or the most intimate union between the married pair, &c.

CONSUMPTION, in medicine, a word of very extensive signification, implies all disorders that bring any decay or waste upon the constitution; but is most commonly used for the *phthisis pulmonalis*. See MEDICINE-Index.

CONSUMPTION, in farriery. See FARRIERY, § viii.

CONSUS, the pagan god of counsel. He had an altar under ground in the great circus at Rome, to show that counsel ought to be kept secret. See CONSUALIA.

CONTACT, is when one line, plane, or body, is made to touch another; and the parts that do thus touch are called the *points* or *places of contact*.

CONTAGION, in phytic, the communicating a disease from one body to another. In some diseases it is only effected by an immediate contact or touch, as the venom of the pox; in others it is conveyed by infected clothes, as the itch; and in others it is supposed to be transmitted through the air at a considerable distance, by means of steams or effluvia exspiring from the sick, as in the plague and other pestilential disorders, in which case the air is said to be contagious, though this has been disputed.

Contem-
plation
||
Continnence

CONTEMPLATION, an act of the mind, where-
by it applies itself to consider and reflect upon the
works of God, nature, &c.

CONTEMPORARY, or **COTEMPORARY**, a per-
son or thing that existed in the same age with another.
Thus, Socrates, Plato, and Aristophanes, were con-
temporaries.

CONTEMPT, in a general sense, the act of de-
spising, or the state of being despised.

CONTEMPT, in law, is a disobedience to the rules
and orders of a court, which hath power to punish such
offence; and as this is sometimes a greater, and some-
times a lesser offence, so it is punished with greater
or less punishment, by fine, and sometimes by impris-
onment.

CONTENT, in geometry, the area or quantity of
matter or space included in certain bounds.

CONTESSA, a port-town, of Turkey in Europe,
in the province of Macedonia, situated on a bay of the
Archipelago, about 200 miles west of Constantinople.
E. Long. 25. 0. N. Lat. 41. 0.

CONTEXT, among divines and critics, that part
of scripture or other writing which lies about the text,
before or after it, or both. To take the full and ge-
nune sense of the text, the context should be regard-
ed.

CONTEXTURE, a word frequently used in speak-
ing both of the works of nature and art; and denot-
ing the disposition and union of the constituent parts
with respect to one another.

CONTI, a town of Picardy in France, with the
title of a principality. It is seated on the river Seille,
in E. Long. 2. 17. N. Lat. 49. 54.

CONTIGUITY, in geometry, is when the surface
of one body touches that of another.

CONTIGUOUS, a relative term understood of
things disposed so near each other, that they join their
surfaces or touch. The houses in ancient Rome were
not contiguous as ours are, but all insulated.

CONTINENCE, in ethics, a moral virtue, by
which we resist concupiscence. It should seem that
there is this distinction between chastity and continence,
in that it requires no effort to be chaste, which results
from constitution; whereas continence appears to be
the consequence of a victory gained over ourselves.
The verb *continere*, in the Latin, signifies "to re-
strain." The term, however, is most usually applied
to men; as *chastity* is to women. See **CHASTITY**.

Continence is a virtue that makes but an inconsid-
erable figure in our days. However, we ought not to
lose our ideas of things, though we have debauched
our true relish in our practice: for, after all, solid vir-
tue will keep its place in the opinion of the wise and
sensible part of mankind. And though custom has
not made it so scandalous as it ought to be to insnare
innocent women, and triumph in the falsehood; such
actions as we shall relate must be accounted true gal-
lantry, and rise higher in our esteem the farther they
are removed from our imitation.

Livy, Val.
Maximus,
&c.

1. Scipio the Younger, when only 24 years of age,
was appointed by the Roman republic to the command
of the army against the Spaniards. His wisdom and
valour would have done honour to the most experienced
general. Determined to strike an important blow, he
formed a design of besieging Carthage, then the ca-

pital of the Carthaginian empire in Spain. His mea-
sures were so judiciously concerted, and with so much
courage and intrepidity pursued, both by sea and land,
that notwithstanding a bold and vigorous defence, the
capital was taken by storm. The plunder was im-
mense. Ten thousand free-men were made prisoners;
and above 300 more, of both sexes, were received as
hostages. One of the latter, a very ancient lady, the
wife of Mandonius, brother of Indibilis king of the
Ilergetes, watching her opportunity, came out of the
crowd, and, throwing herself at the conqueror's feet,
conjured him, with tears in her eyes, to recommend
to those who had the ladies in their keeping to have
regard to their sex and birth. Scipio, who did not
understand her meaning at first, assured her that he
had given orders that they should not want for any
thing. But the lady replied, "Those conveniences
are not what affect us. In the condition to which for-
tune hath reduced us, with what ought we not to be
contented? I have many other apprehensions, when I
consider, on one side, the licentiousness of war; and,
on the other, the youth and beauty of the princesses
which you see here before us; for as to me, my age
protects me from all fear in this respect." She had
with her the daughters of Indibilis, and several other
ladies of high rank, all in the flower of youth, who
considered her as their mother. Scipio then compre-
hending what the subject of her fear was, "My own
glory (says he), and that of the Roman people, are
concerned in not suffering that virtue, which ought
always to be respected wherever we find it, should be
exposed in my camp to a treatment unworthy of it.
But you give me a new motive for being more strict
in my care of it, in the virtuous solicitude you show
in thinking only of the preservation of your honour,
in the midst of so many other objects of fear." After
this conversation, he committed the care of the ladies
to some officers of experienced prudence, strictly com-
manding that they should treat them with all the re-
spect they could pay to the mothers, wives, and daugh-
ters, of their allies and particular friends. It was not
long before Scipio's integrity and virtue were put to the
trial. Being retired in his camp, some of his officers
brought him a young virgin of such exquisite beauty,
that she drew upon her the eyes and admiration of every
body. The young conqueror started from his seat
with confusion and surprize; and, like one thunder-
struck, seemed to be robbed of that presence of mind
and self-possession so necessary in a general, and for
which Scipio was remarkably famous. In a few mo-
ments, having rallied his straggling spirits, he inquired
of the beautiful captive, in the most civil and polite
manner, concerning her country, birth, and connec-
tions; and finding that she was betrothed to a Cetti-
berian prince named Allucius, he ordered both him
and the captive's parents to be sent for. The Spanish
prince no sooner appeared in his presence, than, even
before he spoke to the father and mother, he took him
aside; and, to remove the anxiety he might be in on
account of the young lady, he addressed him in these
words: "You and I are young, which admits of my
speaking to you with more liberty. Those who brought
me your future spouse, assured me, at the same time,
that you loved her with extreme tenderness: and her
beauty left me no room to doubt it. Upon which

Continnence

Continence reflecting, that if, like you, I had thought on making an engagement, and were not wholly engrossed with the affairs of my country, I should desire that so honourable and legitimate a passion should find favour, I think myself happy in the present conjuncture to do you this service. Though the fortune of war has made me your master, I desire to be your friend. Here is your wife: take her, and may the gods bless you with her. One thing, however, I would have you be fully assured of, that she has been amongst us as she would have been in the house of her father and mother. Far be it from Scipio to purchase a loose and momentary pleasure at the expence of virtue, honour, and the happiness of an honest man. No: I have kept her for you, in order to make you a present worthy of you and of me. The only gratitude I require of you for this inestimable gift is, that you would be a friend to the Roman people." Allucius's heart was too full to make him any answer: but throwing himself at the general's feet, he wept aloud. The captive lady fell into the same posture; and remained so, till the father burst out into the following words: "Oh! divine Scipio! the gods have given you more than human virtue! Oh! glorious leader! Oh! wondrous youth! does not that obliged virgin give you, while she prays to the gods for your prosperity, a capture above all the transports you could have reaped from the possession of her injured person?"

The relations of the young lady had brought with them a very considerable sum for her ransom: but when they saw that she was restored to them in so generous and godlike a manner, they intreated the conqueror, with great earnestness, to accept that sum as a present; and declared, by his complying, that new favour would complete their joy and gratitude. Scipio, not being able to resist such warm and earnest solicitations, told them that he accepted the gift, and ordered it to be laid at his feet: then addressing himself to Allucius, I add (says he) to the portion which you are to receive from your father-in-law this sum; which I desire you to accept as a marriage-present."

If we consider that Scipio was at this time in the prime of life, unmarried, and under no restraint, we cannot but acknowledge, that the conquest he made of himself was far more glorious than that of the Carthaginian empire: and though his treatment of this captive prince was not more delicate and generous than what might justly be expected from a person endowed with reason and reflection; yet considering how few there are in his circumstances who would have acted as he did, we cannot but applaud his conduct, and propose him as a suitable example to future ages. Nor was his virtue unrewarded. The young prince, charmed with the liberality and politeness of Scipio, went into his country to publish the praises of so generous a victor. He cried out, in the transports of his gratitude, "That there was come into Spain a young hero like the gods; who conquered all things less by the force of his arms than the charms of his virtue and the greatness of his beneficence." Upon this report all Celtiberia submitted to the Romans; and Allucius returned in a shout to Scipio, at the head of 1400 chosen horse, to facilitate his future conquests. To render the marks of his gratitude still more durable, Allucius caused the action we have just related to be

engraven on a silver shield, which he presented to Scipio; a present infinitely more estimable and glorious than all his treasures and triumphs. This buckler, which Scipio carried with him when he returned to Rome, was lost, in passing the Rhone, with part of the baggage. It continued in that river till the year 1665, when some fishermen found it. It is now in the king of France's cabinet.

2. The circumstance which raises Alexander the Great above many conquerors, and, as it were, above himself, is the use he made of his victory after the battle of Issus. This is the most beautiful incident in his life. It is the point of view in which it is his interest to be considered; and it is impossible for him not to appear truly great in that view. By the victory of Issus he became possessed of the whole Persian empire; not only Sygambis, Darius's mother, was his captive, but also his wife and daughters, princesses whose beauty was not to be equalled in all Asia. Alexander, like Scipio, was in the bloom of life, a conqueror, free, and not yet engaged in matrimony: nevertheless, his camp was to those princesses a sacred asylum, or rather a temple, in which their chastity was secured as under the guard of virtue itself; and so highly revered, that Darius, in his expiring moments, hearing the kind treatment they had met with, could not help lifting up his dying hands towards heaven, and wishing success to so wise and generous a conqueror, who could govern his passions at so critical a time. Plutarch informs us more particularly, that the princesses lived so retired in the camp, according to their own desire, that they were not seen by any person except their own attendants; nor did any other person dare to approach their apartments. After the first visit, which was a respectful and ceremonious one, Alexander, to avoid exposing himself to the dangers of human frailty, made a solemn resolution never to visit Darius's queen any more. He himself informs us of this memorable circumstance, in a letter written by him to Parmenio, in which he commanded him to put to death certain Macedonians who had forced the wives of some foreign soldiers. In this letter was the following paragraph: "For as to myself, it will be found that I neither saw nor would see the wife of Darius; and did not suffer any one to speak of her beauty before me."

3. Isocrates informs us, that Nicocles, king of Salamin, gloried in never having known any woman besides his wife; and was amazed that all other contracts of civil society would be treated with due regard, whilst that of marriage, the most sacred and inviolable of obligations, was broken through with impunity; and that men should not blush to commit an infidelity with respect to their wives, of which, should their wives be guilty, it would throw them in the utmost anguish and fury.

4. Henry VI. king of England, though unhappy in his family and government, was nevertheless possessed of many virtues. He was so remarkable for his chastity, that before his marriage he would not allow any lady of a suspicious character and ungarded conduct to frequent the court: and having observed one day some ladies with their bosoms uncovered, he turned away his eyes from the indecent object, and reprimanded them smartly in the simple dialect of the times; "Fy,

Plutarch:

Rafin.

Continnence "Fy, fy, (said he) for shame; forsooth ye be to blame."

Contingent

5. In the reign of king Charles II. when licentiousness was at its height in Britain, a yeoman of the guards refused the mistress of a king. The lady, who was dissatisfied with her noble lover, had fixed her eyes upon this man, and thought she had no more to do than speak her pleasure. He got out of her way. He refused to understand her; and when she pressed him further, he said, "I am married." The story reached the king, with all its circumstances: but they who expected an extravagant laugh upon the occasion were disappointed. He sent for the person: he found him a gentleman, though reduced to that mean station; and "Odds fish, man (says he), though I am not honest enough to be virtuous myself, I value them that are." He gave him an appointment, and respected him for life.

6. The extreme parts of Scotland, whose people are despised for their poverty, are honest in this respect to a wonder; and in the Swede's dominion, towards the pole, there is no name for adultery. They thought it an offence man could not commit against man; and have no word to express it in their language. The unpolished Lapland peasant, with these thoughts, is, as a human creature, much more respectable than the gay Briton, whose heart is stained with vices, and estranged from natural affection; and he is happier. The perfect confidence mutually reposed between him and the honest partner of his breast, entails a satisfaction even in the lowest poverty. It gilds the humble heart, and lights the cabin; their homely meal is a sacrifice of thanks, and every breath of smoke arises in incense. If hand be laid upon hand, it is sure affection; and if some infant plays about their knees, they look upon him and upon each other with a delight that greatness seldom knows, because it feels distrust.

CONTINENT, in general, an appellation given to things continued without interruption; in which sense we say, *continent fever*, &c.

CONTINENT, in geography, a great extent of land not interrupted by seas, in contradistinction to island and peninsula, &c. See GEOGRAPHY.—Sicily is said to have been anciently torn from the continent of Italy; and it is an old tradition, which some antiquaries still have a regard to, that Britain was formerly a part of the continent of France.

The world is usually divided into two great continents, the old and the new. Whether there exists in the *southern hemisphere* another continent, or the whole be only an immense watery region, is a question that for near three centuries has engaged the attention of the learned as well as the commercial world, and given rise to many interesting voyages and discoveries; concerning which, see the article *SOUTH SEA*.

CONTINGENT, something casual or unusual. Hence future contingent, denotes a conditional event which may or may not happen, according as circumstances fall out.

CONTINGENT, is also a term of relation for the quota that falls to any person upon a division. Thus each prince of Germany in time of war is to furnish so

many men, so much money, and munition, for his contingent.

CONTINUED, or CONTINUAL, in a general sense, means incessant, or proceeding without interruption.

CONTINUED *Fever*, is such a one as sometimes remits, but never intermits or goes entirely off till its period.

CONTINUED *Bass*, in music, thus called, says Rousseau, because it is continued through the whole piece. Its principal use, besides that of regulating the harmony, is to support the voice and preserve the tone. They pretend that it was one *Ludovico Viana*, of whom a treatise still remains, who towards the end of the last century first put the continued bass in practice.

CONTINUED *Proportion*, in arithmetic, is that where the consequent of the first ratio is the same with the antecedent of the second; as, 4 : 8 :: 8 : 16; in contradistinction to discrete proportion.

CONTINUITY, is defined by some schoolmen the immediate cohesion of parts in the same quantum; by others, a mode of body, whereby its extremities become one: and by others, a state of body resulting from the mutual implication of its parts. There are two kinds of continuity, mathematical and physical. The first is merely imaginary, since it supposes real or physical parts where there are none. The other, or physical continuity, is that state of two or more particles, in which their parts are so mutually implicated as to constitute one uninterrupted quantity or continuum.

CONTINUO, in music, signifies the thorough bass, as *basso continuo* is the continual or thorough bass, which is sometimes marked in music-books by the letters B. C.

CONTOBABBITES, a sect in the sixth century. Their first leader was Severus of Antioch; who was succeeded by John the grammarian surnamed Philoponus, and one Theodotius, whose followers were also called *Theodosians*. Part of them, who were willing to receive a book composed by Theodosius on the Trinity, made a separate body, and were called *Contobabbites*, from some place, which Nicephorus does not mention, but which must apparently have been the place where they held their assemblies. The Contobabbites allowed of no bishops; which is the only circumstance given us concerning them.

CONTOR, CONDOR, or CUNDUR, the American name of a species of VULTUR.

CONTORSION, in general, signifies the action of twisting or wresting a member of the body out of its natural situation. Rope dancers accustom themselves to contorsions of their limbs, from their youth, to render the fibres of their articulations lax, and supple to all kinds of postures.

CONORSION, in medicine, has many significations. 1. It denotes the iliac passion. 2. An incomplete dislocation, when a bone is in part, but not entirely, forced from its articulation. 3. A dislocation of the vertebræ of the back side-ways, or a crookedness of these vertebræ. And, 4. A disorder of the head, in which it is drawn towards one side, either by a spasmodic contraction of the muscles on the same side, or a palsy of the antagonist muscles on the other.

CONTORTÆ, the name of the 30th order in Linnaeus's

Continued
Contortæ.

Contour || **Contract.** *næus's* Fragments of a natural method, consisting of plants which have a single petal that is twisted or bent to one side. This order contains the following genera, viz. echites, cerbera, gardenia, genipa, microcnemum, nerium, periploca, rawolfia, tabernæmontana, vinca, apocynum, asclepias, comeraria, ceropegia, cynanchum, plumeria, stapelia.

CONTOUR, in painting, the outline, or that which defines a figure.

A great part of the skill of the painter lies in managing the contours well. Contour, with the Italian painters, signifies the lineaments of the face.

CONTOURNE, in heraldry, is used when a beast is represented standing or running with its face to the sinister side of the escutcheon, they being always supposed to look to the right, if not otherwise expressed.

CONTOURNIATED, a term among antiquaries applied to medals, the edges of which appear as if turned in a lath. This sort of work seems to have had its origin in Greece; and to have been designed to perpetuate the memories of great men, particularly those who had bore away the prize at the solemn games. Such are those remaining of Homer, Solon, Euclid, Pythagoras, Socrates, and several *athletæ*.

CONTRABAND, in commerce, a prohibited commodity, or merchandize bought or sold, imported or exported, in prejudice to the laws and ordinances of a state, or the public prohibitions of the sovereign. Contraband goods are not only liable to confiscation themselves, but also subject all other allowed merchandize found with them in the same box, bale, or parcel, together with the horses, waggons, &c. which conduct them. There are contrabands likewise, which, besides the forfeiture of the goods, are attended with several penalties and disabilities.

CONTRACT, in a general sense, a mutual consent of two or more parties, who voluntarily promise and oblige themselves to do something; pay a certain sum, or the like. All donations, exchanges, leases, &c. are so many different contracts.

CONTRACT is particularly used in common law, for an agreement or covenant between two, with a lawful consideration or cause. As, if I sell my horse for money; or covenant, in consideration of L. 20, to make you a lease of a farm; these are good contracts because there is *quid pro quo*.

Usurious CONTRACT, is a contract to pay more interest for money than the laws allow. See **USURY**.

Those contracts are said to be *null* which the law prohibits the making of; such are all contracts between persons incapable of contracting, as minors, religious, lunatics, wives without consent of their husbands, &c.

CONTRACT is also used for the instrument in writing, which serves as a proof of the consent granted, and the obligation passed between the parties.

Among the ancient Romans, contracts, and all voluntary acts, were written, either by the parties themselves, or by one of the witnesses, or by a domestic secretary of one of the parties, whom they called a *notary*, but who was no public person as among us.

The contract, when finished, was carried to the magistrate, who gave it a public authority by receiving it *inter acta*, into the number of acts under his ju-

isdiction; giving each of the parties a copy thereof, transcribed by his clerks or domestic registers, and sealed with his seal. Which practice passed into France, where it obtained a long time.

Contractile || **Contrast.**

CONTRACTILE FORCE, that property or power inherent in certain bodies, whereby, when extended, they are enabled to draw themselves up again to their former dimensions.

CONTRACTION, in physics, the diminishing the extent or dimensions of a body, or the causing its parts to approach nearer to each other; in which sense it stands opposed to dilatation or expansion.

CONTRACTION is frequently used, by anatomical writers, to express the shrinking up of a fibre, or an assemblage of fibres, when extended.

Convulsions and spasms proceed from a preternatural contraction of the fibres of the muscles of the part convulsed. On the contrary, paralytic disorders generally proceed from a too great laxness of the fibres of the parts affected; or from the want of that degree of contraction necessary to perform the natural motion or action of the part. In the first, therefore, the animal spirits are supposed to flow, either in too great a quantity, or irregularly; and, in the last, the animal spirits are either denied a free passage into the part affected, or the tension of the fibrillæ is supposed insufficient to promote the circulation.

CONTRACTION, in grammar, is the reducing of two syllables into one, as *can't* for *cannot*, *shouldest* for *shouldest*, &c.

CONTRADICTION, a species of direct opposition, wherein one thing is found diametrically opposite to another.

CONTRADICTORY PROPOSITIONS, are opposites, one of which imports a mere and naked denial of the other.

Seeming contradictories is when the members of a period quite disagree in appearance and sound, but perfectly agree and are consistent in sense: thus,

“Cowards die many times before their death:
“The valiant never taste of death but once.”

SHAKESPEARE.

CONTRAFISSURE, in surgery, a kind of fracture, or fissure, in the cranium, which sometimes happens on the side opposite to that which received the blow, or, at least, at some distance from it.

CONTRAINDICTION, in medicine, is an indication which forbids that to be done which the main scope of a disease points out.

Suppose, *e. gr.* in the cure of a disease a vomit were judged proper; if the patient be subject to a vomiting of blood, it is a sufficient contraindication as to its exhibition.

CONTRARIETY, an opposition between two things, which imports their being contrary to one another; and consists in this, that one of the terms implies a negation of the other, either mediately or immediately; so that contrariety may be said to be the contrast, or opposition of two things, one of which imports the absence of the other, as love and hatred.

CONTRAST; opposition or dissimilitude of figures, by which one contributes to the visibility or effect of the others. See **RESEMBLANCE**.

CONTRAST,

Contrast
|
Controller.

CONTRAST, in painting and sculpture, expresses an opposition or difference of position, attitude, &c. of two or more figures, contrived to make variety in a painting, &c. as where, in a groupe of three figures, one is shown before, another behind, and another sideways, they are said to be in contrast.

The contrast is not only to be observed in the position of several figures, but also in that of the several members of the same figure: thus, if the right arm advance farthest, the right leg is to be hindermost; if the eye be directed one way, the arm to go the contrary way, &c. The contrast must be pursued even in the drapery.

CONTRAST, in architecture, is to avoid the repetition of the same thing, in order to please by variety.

CONTRATE-WHEEL, in watch-work, that next to the crown, the teeth and hoop whereof lie contrary to those of the other wheels, from whence it takes its name. See *WATCH-Making*.

CONTRAVALLATION, or the *Line of CONTRAVALLATION*, in fortification, a trench guarded with a parapet, and usually cut round about a place by the besiegers, to secure themselves on that side, and to stop the sallies of the garrison. See *FORTIFICATION*.

CONTRAVENTION, in law, a man's failing to discharge his word, obligation, duty, or the laws or customs of the place.

CONTRAYERVA, in botany. See *DORSTENIA*.

CONTRE, in heraldry, an appellation given to several bearings, on account of their cutting the shield contrary and opposite ways: thus we meet with contre-bend, contre-chevron, contre-pale, &c. when there are two ordinaries of the same nature opposite to each other, so as colour may be opposed to metal, and metal to colour.

CONTRIBUTION, the payment of each person's quota of the part he is to bear in some imposition, or common expence. See *CONTINGENT*, &c.—Contributions are either involuntary, as those of taxes and imposts; or voluntary, as those of expences for carrying on some undertaking for the interest of the community.

CONTRIBUTIONS, in a military sense, are impositions paid by frontier countries to secure themselves from being plundered, and ruined by the enemy's army. The peasants till their ground under their faith of contributions, as securely as in time of profound peace.

CONTRITION, in theology, a sorrow for our sins, resulting from the reflection of having offended God, from the sole consideration of his goodness, without any regard to the punishment due to the trespass, and attended with a sincere resolution of reforming them. The word is derived from the Latin *conterere*, to break or bruise.

CONTROL, is properly a double register kept of acts, issues, &c. of the officers or commissioners in the revenue, army, &c. in order to perceive the true state thereof, and to certify the truth, and the due keeping of the acts subject to the enregisterment.

CONTROLLER an officer appointed to control or oversee the accounts of other officers; and on oc-

casion, to certify whether or no things have been controlled or examined.

In Britain there are several officers of this name: as controller of the king's house, controller of the navy, controller of the customs, controller of the mint, &c.

CONTROLLER of the Hanaper, an officer that attends the lord chancellor daily, in term and in seal-time, to take all things sealed in leathern bags from the clerks of the hanaper, and to take the number and effect thereof, and enter them in a book, with all the duties belonging to the king and other officers for the same, and so charge the clerk of the hanaper with them.

CONTROLLER of the Household, the second officer under the lord steward. The name of his office comes from the French word *contrerouler*. His office is to control the accounts and reckonings of the Green Cloth, of which board he is always a member. He carries, a white staff, and is always one of the privy-council. He has L. 107: 17: 6 a-year wages, and L. 1092: 2: 6 board-wages.

CONTROLLER of the Pipe, an officer of the exchequer, that makes out a summons twice every year, to levy the farms and debts of the pipe. See *PIPE* and *EX-CHEQUER*.

CONTROLLERS of the Pells, two officers of the exchequer, who are the chamberlain's clerks, and keep a control of the pell of receipts, and going out.

CONTUMACY, in law, a refusal to appear in court when legally summoned, or the disobedience to the rules and orders of a court having power to punish such offence.

CONTUSION, in medicine and surgery, any hurt of the body that is inflicted by a blunt instrument. See *SURGERY*.

CONVALLESCENCE, in medicine, the insensible recovery of health; or that state in which, after the cure of a disorder, the body which has been reduced, has not yet regained its vigour, but begins to resume its powers. Proper aliments conduce to the re-establishment of the languid faculties; but as the tone of the bowels is weakened, the digestive faculty is not equal to its office, which is shown by light sweats over the whole body; and the smallest excess in this respect is oftentimes the occasion of dangerous relapses. A person in this state is like a taper relumined, which the least degree of wind is sufficient to extinguish.

CONVALLARIA, or, *Lily of the VALLEY*, in botany, a genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under *Sarmentacea*, or 11th order. The corolla is sexfid; the berry spotted and trilocular. The species are eight, three of which are natives of Britain, *viz.* the maialis, or may-lily; the multiflora, or solomon's-seal; and the polygonatum, or sweet-smelling solomon's-seal. They are plants of considerable beauty, and may easily be propagated by their creeping roots.

CONVENARUM URBS, or *Lugdunum*, (anc. geog.) a town of the Convenae, a people of Gallia Narbonensis at the foot of the Pyrennees. Its origin was owing to the Sertorian war, Pompey compelling the robbers of the Pyrennees and fugitive slaves to settle

||
Convenarum.

Conventicle there, (Pliny). It stood near the head of the Garonne. Now St Bertrand, in Gascony. E. Long. 30', Lat. 43° 15'.

CONVENTICLE, a diminutive of convent; denoting, properly, a cabal, or secret assembly, of a part of the monks of a convent, to make a brigue or party in the election of an abbot. From the ill use of these assemblies, the word is come into disrepute; and now stands for any mischievous, seditious, or irregular assembly. F. Doucine observes, the occidentals always esteemed the fifth general council an unlawful conventicle.

The term conventicle is said, by some, to have been first applied in England to the schools of Wickliff, and has been since used to signify the religious assemblies of all in that country who do not conform to the established doctrines and worship of the church of England.

By 22 Car. II. cap. 1. it is enacted, That if any persons of the age of 16 years, subjects of this kingdom, shall be present at any conventicle, where there are five or more assembled, they shall be fined 5 s. for the first offence, and 10 s. for the second; and persons preaching incur a penalty of L. 20. Also suffering a meeting to be held in a house, &c. is liable to L. 20 penalty. Justices of peace have power to enter such houses, and seize persons assembled, &c. And if they neglect their duty, they shall forfeit L. 100. And if any constable, &c. know of such meetings, and do not inform a justice of peace, or chief magistrate, &c. he shall forfeit L. 5. But the 1st W. and M. cap 18. ordains, that protestant dissenters shall be exempt from penalties: though, if they meet in a house with the doors locked, barred, or bolted, such dissenters shall have no benefit from 1 W. and M. Officers of the government, &c. present at any conventicle, at which there shall be ten persons, if the royal family be not prayed for in express words, shall forfeit L. 40 and be disabled; (Stat. 10 Anne, cap. 2.)

CONVENTION, a treaty, contract, or agreement between two or more parties.

CONVENTION is also a name given in England to an extraordinary assembly of parliament, or the estates of the realm, held without the king's writ. Of this kind was the convention parliament which restored Charles II. This parliament met above a month before his return, and sat full seven months after his restoration, and enacted several laws still in force, which were confirmed by stat. 13 Car. II. c. 7. and c. 14. Such also was the convention of estates in 1688, who, upon the retreat of king James II. came to a conclusion that he had abdicated the throne, and that the right of succession devolved to king William and queen Mary; whereupon their assembly expired as a convention, and was converted into a parliament.

CONVENTION of Estates, in Scotland, was partly of the nature of a parliament; but differing in this, that the former could only lay on taxes, while parliament could both impose taxes and make laws.

CONVENTUAL, something belonging to a convent or monastery. See **MONASTERY**, and **COENOBITE**.

CONVENTUAL is particularly used for a religious who actually resides in a convent; in contradistinction to those who are only guests, or are entertained there,

VOL. V.

or in possession of benefices depending on the house. **Conventus** See **MONK**.

CONVENTUS JURIDICI, were courts of justice established in the Roman provinces; with a resort or extent of jurisdiction, circumscribed and confined within certain limits of district, whither all who were of the resort were to repair for justice. The unseasonable affectation of changing forms of war into forms of civil courts, proved the ruin of Varus and of three legions in Germany, (Florus). *Conventum agere*, is to hold a court of justice.

CONVERGING, or **CONVERGENT Lines**, in geometry, are such as continually approach nearer one another, or whose distances become still less and less. These are opposed to divergent lines, the distances of which become continually greater: those lines which converge one way, diverge the other.

CONVERGING Rays, in optics, those rays that, issuing from divers points of an object, incline towards another, till at last they meet and cross, and then become diverging rays.

CONVERSATION, or **DISCOURSE**, signifies an interlocution between two, or among more persons; with this distinction, that conversation is used for any general intercourse of sentiments whatever, whereas a discourse means a conversation limited to some particular subject.

There is no part, perhaps, of social life which affords more real satisfaction than those hours which one passes in rational and unreserved conversation. That conversation, however, may answer the ends for which it was designed, the parties who are to join in it must come together with a determined resolution to please, and to be pleased.

In the conduct of it, be not eager to interrupt others, or uneasy at being yourself interrupted; since you speak either to amuse or instruct the company, or to receive those benefits from it. Give all, therefore, leave to speak in turn. Hear with patience, and answer with precision. Inattention is ill manners; it shows contempt; and contempt is never forgiven.

Trouble not the company with your own private concerns, as you do not love to be troubled with those of others. Yours are as little to them as theirs are to you. You will need no other rule whereby to judge of this matter.

Contrive, but with dexterity and propriety, that each person may have an opportunity of discoursing on the subject with which he is best acquainted. He will be pleased, and you will be informed. By observing this rule, every one has it in his power to assist in rendering conversation agreeable; since, though he may not choose, or be qualified, to say much himself, he can propose questions to those who are able to answer them.

Avoid stories, unless short, pointed, and quite *a-propos*. He who deals in them, says Swift, must either have a very large stock, or a good memory, or must often change his company. Some have a set of them strung together like onions; they take possession of the conversation by an early introduction of one, and then you may have the whole rope; and there is an end of every thing else, perhaps, for that meeting, though you may have heard all twenty times before.

Talk often, but not long. The talent of haranguing

Conver-
sation
|
Convert.

ing private company is insupportable. Senators and barristers are apt to be guilty of this fault; and members who never harangue in the house, will often do it out of the house. If the majority of the company be naturally silent, or cautious, the conversation will flag, unless it be often renewed by one among them who can start new subjects. Forbear, however, if possible, to broach a second before the first is out, lest your stock should not last, and you should be obliged to come back to the old barrel. There are those who will repeatedly cross upon and break into the conversation with a fresh topic, till they have touched upon all, and exhausted none. Economy here is necessary for most people.

Laugh not at your own wit and humour; leave that to the company.

When the conversation is flowing in a serious and useful channel, never interrupt it by an ill-timed jest. The stream is scattered, and cannot be again collected.

Discourse not in a whisper, or half-voice, to your next neighbour. It is ill-breeding, and, in some degree, a fraud; conversation-stock being, as one has well observed, a joint and common property.

In reflections on absent people, go no farther than you would go if they were present. "I resolve (says bishop Beveridge) never to speak of man's virtues to his face, nor of his faults behind his back:" --- A golden rule! the observation of which would, at one stroke, banish flattery and defamation from the earth.

CONVERSE, in mathematics. One proposition is called the *converse* of another, when, after a conclusion is drawn from something supposed in the converse proposition, that conclusion is supposed; and then, that which in the other was supposed, is now drawn as a conclusion from it: thus, when two sides of a triangle are equal, the angles under these sides are equal; and, on the converse, if these angles are equal, the two sides are equal.

CONVERSION, in a moral sense, implies a repentance for a temper and conduct unworthy our nature, and unbecoming our obligations to its Author, and a resolution to act a wiser and a better part for the future.

CONVERSION, in war, a military motion, whereby the front of a battalion is turned where the flank was, in case the battalion is attacked in the flank.

CONVERSION of Equations, the same with reduction of equations by multiplication. See ALGEBRA.

CONVERT, a person who has undergone a conversion.

CONVERT is chiefly used in respect of changes from one religion, or religious sect, to another. Converts with relation to the religion turned to, are denominated *apostates* with regard to that they have relinquished.

The Jews formerly converted to Christianity in England, were called *converts*. Henry III. built them a house in London, and allowed them a competent subsistence for their lives; which house was called *domus conversorum*. But the number afterwards increasing, they grew a burden to the crown; upon which they were distributed among the monasteries: and after the expulsion of the Jews under Edward. III. the *domus conversorum* was given for keeping of the rolls.

CONVERTS, in a monastic sense, are lay-friars, or brothers, admitted for the service of the house: without orders, and not allowed to sing in the choir. Till the eleventh century, the word was used for persons who embraced the monkish life at the age of discretion; by which they were distinguished from those devoted in their childhood by their parents, called *oblats*. But in the eleventh century, when, they began to receive into monasteries illiterate persons, incapable of being clerks, and only destined for bodily labour, the signification of the word was necessarily changed. F. Mabillon observes, that it was John first abbot of Vallambrosa who first introduced these brother-converts, distinguished by their state from the monks of the choir, who were then either clerks or capable of becoming so.

CONVEX, an appellation given to the exterior surface of gibbous or globular bodies; in opposition to the hollow inner surface of such bodies, which is called *concave*: thus we say, a convex frieze, lens, mirror, superficies, &c.

CONVEXITY, the exterior surface of a convex, *i. e.* gibbous and globular thing; in opposition to concavity, or the inner surface, which is hollow or depressed. See CONCAVE.

The word is of a peculiar import in catoptrics and dioptrics; where it is applied to mirrors and lenses.

A convex mirror represents its images smaller than the objects; as a concave one represents them larger: a convex mirror reflects the rays from it, diverging; and therefore disperses and weakens their effect; as a concave one reflects them converging, so as they concur in a point, and have their effect increased: and by how much the mirror is a portion of a smaller sphere, by so much does it diminish the objects, and disperse the rays the more. See MIRROR.

A convex lens is either convex on both sides, called a *convexo-convex*; or it is plain on one side and convex on the other, called a *plano-convex*; or concave on one side and convex on the other, called a *convexo-concave*, or *concavo-convex*, as the one or the other surface prevails, *i. e.* as this or that is a portion of a smaller sphere. All convex lenses inflect the rays of light in their passage, *i. e.* send them out from their convex surface converging, so as that they concur in a point or focus. Hence all convex lenses magnify, *i. e.* represent their images larger than their objects; and this the more as they are portions of smaller spheres.

CONVEYANCE, in law, a deed or instrument that passes land, &c. from one person to another.

CONVICT, in common law, a person that is found guilty of an offence by the verdict of a jury. See the following article.

CONVICTION, in law. When a jury has given a verdict upon trial, finding the prisoner guilty, he is said to be *convicted* of the crime whereof he stands indicted. See TRIAL.

When the offender is thus convicted, there are two collateral circumstances that immediately arise. I. On a conviction in general for any felony, the reasonable expences of prosecution are by statute 25 Geo. II. c. 36. to be allowed the prosecutor out of the county-stock, if he petitions the judge for that purpose; and by statute 27. Geo. II. c. 3. poor persons, bound over

Converts
||
Conviction.

Conviction. to give evidence, are likewise intitled to be paid their charges, as well without conviction as with it. 2. On a conviction of larceny in particular, the prosecutor shall have restitution of his goods by virtue of the statute 21 Hen. VIII. c. 11. For by the common law there was no restitution of goods upon an indictment; because it is at the suit of the king only; and therefore the party was enforced to bring an appeal of robbery, in order to have his goods again. But, it being considered that the party prosecuting the offender by indictment, deserves to the full as much encouragement as he who prosecutes by appeal, this statute was made, which enacts, that if any person be convicted of larceny by the evidence of the party robbed, he shall have full restitution of his money, goods, and chattels, or the value of them out of the offender's goods, if he has any, by a writ to be granted by the justices. And the construction of this act having been in great measure conformable to the law of appeals, it has therefore in practice superseded the use of appeals of larceny. For instance, as formerly upon appeals, so now upon indictments of larceny, this writ of restitution shall reach the goods so stolen, notwithstanding the property of them is endeavoured to be altered by sale in market overt. And though this may seem somewhat hard upon the buyer, yet the rule of law is, that *spoliatus debet ante omnia restitui*, especially when he has used all the diligence in his power to convict the felon. And, since the case is reduced to this hard necessity, that either the owner or the buyer must suffer; the law prefers the right of the owner, who has done a meritorious act by pursuing a felon to condign punishment, to the right of the buyer, whose merit is only negative, that he has been guilty of no unfair transaction. And it is now usual for the court, upon the conviction of a felon, to order, without any writ, immediate restitution of such goods as are brought into court, to be made to the several prosecutors. Or else, secondly, without such writ of restitution, the party may peaceably retake his goods wherever he happens to find them, unless a new property be fairly acquired therein. Or, lastly, if the felon be convicted and pardoned, or be allowed his clergy, the party robbed may bring his action of trover against him for his goods, and recover a satisfaction in damages. But such action lies not before prosecution; for so felonies would be made up and healed: and also recaption is unlawful, if it be done with intention to smother and compound the larceny; it then becoming the heinous offence of *theft-bote*.

It is not uncommon, when a person is convicted of a misdemeanor, which principally and more immediately affects some individual, as a battery, imprisonment, or the like, for the court to permit the defendant to *speak with the prosecutor*, before any judgement is pronounced; and if the prosecutor declares himself satisfied, to inflict but a trivial punishment. This is done to reimburse the prosecutor his expences, and make him some private amends, without the trouble and circuitry of a civil action. But it is surely a dangerous practice: and, though it may be entrusted to the prudence and discretion of the judges in the superior courts of record, it ought never to be allowed in local or inferior jurisdictions, such as the quarter-sessions: where prosecutions for assaults are by

this means too frequently commenced rather for private lucre than for the great ends of public justice. Above all, it should never be suffered, where the testimony of the prosecutor himself is necessary to convict the defendant: for by this means the rules of evidence are entirely subverted; the prosecutor becomes in effect a plaintiff, and yet is suffered to bear witness for himself. Nay, even a voluntary forgiveness by the party injured, ought not, in true policy, to intercept the stroke of justice. "This (says an elegant writer who pleads with equal strength for the *certainty*, as for the lenity of punishment), may be an act of good nature and humanity, but is contrary to the good of the public. For although a private citizen may dispense with satisfaction for his private injury, he cannot remove the necessity of public example. The right of punishing belongs not to any one individual in particular, but to the society in general, or to the sovereign who represents that society; and a man may renounce his own portion of this right, but he cannot give up that of others."

CONVICTION, in theology, expresses the first degree of repentance, wherein the sinner becomes sensible of his guilt, of the evil nature of sin, and of the danger of his own ways.

CONVOCATION, an assembly of the clergy of England, by their representatives, to consult of ecclesiastical matters. It is held during the session of parliament, and consists of an upper and a lower house. In the upper sit the bishops, and in the lower the inferior clergy, who are represented by their proctors; consisting of all the deans and archdeacons, of one proctor for every chapter, and two for the clergy of every diocese, in all 143 divines; *viz.* 22 deans, 53 archdeacons, 24 prebendaries, and 44 proctors of the diocesan clergy. The lower house chooses its prolocutor; whose business it is to take care that the members attend, to collect their debates and votes, and to carry their resolutions to the upper house. The convocation is summoned by the king's writ, directed to the archbishop of each province, requiring him to summon all bishops, deans, archdeacons, &c.

The power of the convocation is limited by a statute of Henry VIII. They are not to make any canons or ecclesiastical laws without the king's licence; nor, when permitted to make any, can they put them in execution, but under several restrictions. They have the examining and censuring all heretical and schismatical books and persons, &c. but there lies an appeal to the king in chancery, or to his delegates! The clergy in convocation, and their servants, have the same privileges as members of parliament.

Since the year 1665, when the convocation of the clergy gave up the privilege of taxing themselves to the house of commons, they seldom have been allowed to do any business; and are generally prorogued from time to time till dissolved, a new one being generally called along with a new parliament. The only equivalent for giving up the privilege of taxing themselves, was their being allowed to vote at elections for members to the house of commons, which they had not before.

CONVOLUTION, a winding motion, proper to the trunks of some plants, as the convolvulus, or bindweed; the clasps of vines, bryony, &c.

Conviction
||
Convolution.

Convolvulus.

CONVOLVULUS, BIND-WEED: A genus of the pentandria order, belonging to the monogynia class of plants; and in the natural method ranking under the 29th order, *Campanaceæ*. The corolla is campanulate and plaited; there are two stigmata; the capsule is bilocular, and the cells are dispermous. Of this genus there is a great number of species, the most remarkable of which are the following.

1. The sepium, or large white bind-weed, is often a troublesome weed in gardens, when its roots are interwoven with those of trees and shrubs, or under hedges, as every small piece of root is apt to grow. It flourishes under moist hedges, and hath white or purplish blossoms. 2. The scammonia, or Syrian bind-weed, grows naturally in Syria. The roots are thick, run deep into the ground, and are covered with a dark bark. The branches extend on every side to the distance of 10 or 12 feet; they are slender, and trail on the ground, and are garnished with narrow, arrow-pointed leaves. The flowers are of a pale yellow, and come out from the side of the branches, two sitting upon each long footstalk: these are succeeded by roundish seed-vessels, having three cells filled with seeds. 3. The purpureus, or convolvulus major, is an annual plant growing naturally in Asia and America, but has been long cultivated in the British gardens. If these plants are properly supported, they will rise 10 or 12 feet high in warm summers. There are three or four lasting varieties: the most common hath a purple flower; the others have a white, a red, or a whitish-blue flower, which last hath white seeds. They flower in June, July, and August, and their seeds ripen in autumn. 4. The nil, or blue bind-weed, rises with a twining stalk 8 or 10 feet high, garnished with heart-shaped leaves, divided into three lobes, which end in sharp points. These are woolly, and stand upon long footstalks. The flowers also come out on long footstalks, each sustaining two flowers of a very deep blue colour, whence their name of anil or indigo. This is one of the most beautiful plants of the genus: it flowers all the latter part of the summer: and in good seasons the seeds ripen very well in the open air. 5. The battatas, or Spanish potatoes, hath esculent roots, which are annually imported from Spain and Portugal, where they are greatly cultivated for the table; but they are too tender to thrive in the open air in Britain. Their roots are like the common potato, but require much more room: for they send out many trailing stalks, which extend six or eight feet every way; and at their joints send out roots which in warm countries grow to be very large bulbs; so that from a single root planted 40 or 50 large potatoes are produced. 6. The canariensis, with soft woolly leaves, is a native of the Canaries; but hath long been preserved in the British gardens. It hath a strong fibrous root, from whence arise several twining woody stalks, which, where they have support, will grow more than 20 feet high, garnished with oblong heart-shaped leaves, which are soft and hairy. The flowers are produced from the wings of the leaves, several standing upon one footstalk. They are for the most part of a pale blue; but there is a variety with white flowers. They appear in June, July, and August, and sometimes ripen seeds there. 7. The tricolor, or convolvulus minor, is a native of Portugal; but hath long been

cultivated in the gardens of Britain. It is an annual plant, which hath several thick herbaceous stalks growing about two feet long, which do not twine like the other sorts, but decline toward the ground, upon which many of the lower branches lie prostrate; they are garnished with spear-shaped leaves, which sit close to the branches; the footstalks of the flowers come out just above the leaves of the same joint, and at the same side of the stalks. They are about two inches long, each sustaining one large open bell-shaped flower, which in some is of a fine blue colour with a white bottom; in others they are pure white, and some are beautifully variegated with both colours. The white flowers are succeeded by white seeds, and the blue by dark-coloured seeds; which difference is pretty constant. 8. The foldanella, or sea-bindweed, styled also *brassica marina*, grows naturally on the sea-beaches in many parts of England, but cannot be long preserved in gardens. It hath many small white stringy roots, which spread wide and send out several weak trailing branches. These twine about the neighbouring plants like those of the common bindweed, garnished with kidney-shaped leaves like those of the lesser celandine. The flowers are produced on the side of the branches at each joint. They are of a reddish purple colour, and appear in July. They are succeeded by round capsules, having three cells, each containing one black seed. 9. The tarpethum is a native of the island of Ceylon. This hath fleshy thick roots which spread far in the ground, and abound with a milky juice that flows out when the roots are broken or wounded, and soon hardens into a resinous substance when exposed to the sun and air. From the root shoot forth many twining branches, which twist about each other, or the neighbouring plants, like the common bindweed. They are garnished with heart-shaped leaves that are soft to the touch, like those of the marshmallow. The flowers are produced at the joints on the side of the stalks, several standing together on the same footstalk: they are white, and shaped like those of the common great bindweed, and are succeeded by round capsules, having three cells containing two seeds each. 10. The jalappa, or jalap, used in medicine, is a native of Haleppo in Spanish America, situated between La Vera Cruz and Mexico. It hath a large root of an oval form, which is full of a milky juice; from which come out many herbaceous twining stalks rising eight or ten feet high, garnished with variable leaves; some of them being heart-shaped, others angular, and some oblong and pointed. They are smooth, and stand upon long footstalks; the flowers are shaped like those of the common greater bindweed, each footstalk supporting only one flower.

Culture. The first and second sorts are propagated by seeds, which must be sown on a border of light earth. The second sort must have some tall stakes placed near them for their branches to twine about, otherwise they will spread on the ground and make a bad appearance. The third sort is annual, and must be propagated by seeds sown on a hot-bed in the spring, and towards the end of May they should be planted out in warm borders, and treated in the same manner with the former. The fourth species is sometimes propagated in Britain. The roots must be planted on a hot-bed in the spring; and if the plants

are

Convolvulus.

Convolvulus
||
Cook.

are covered in bad weather with glasses, they will produce flowers and some small bulbs from the joints of the stalks: but if they are exposed to the open air, they seldom grow to any size. The fifth is propagated by laying down the young shoots in the spring, which generally put out roots in three or four months: they may then be taken from the old plants, and each placed in a separate pot, which is to be set in the shade till they have taken new root; after which they may be placed with other hardy green-house plants till autumn, when they should be removed into the green-house, and afterwards treated in the same manner as myrtles and other green-house plants. The turpeth and jalap are too tender to live in Britain, unless they are constantly kept in a stove. The other species require no particular directions for their cultivation.

Uses. The root of the first sort is a very acrid purgative to the human race, but is eaten by hogs in large quantities without any detriment. The inspissated juice of the second species is used in medicine as a strong purgative; as are also the roots of the jalappa and turpethum. The soldanella has likewise been used with the same intention. Half an ounce of the juice, or a drachm of the powder, is an acrid purge. The leaves applied externally are said to diminish dropical swellings of the feet. See SCAMMONY, JALAP, and TURPETH.

CONVOY, in naval affairs, one or more ships of war, employed to accompany and protect merchant ships, and prevent their being insulted by pirates, or the enemies of the state in time of war.

CONVOY, in military matters, a body of men that guard any supply of men, money, ammunition, or provisions, conveyed by land into a town, army, or the like, in time of war.

CONUS, a CONE, in botany: a species of fruit or scaly seed-vessel, so termed by Tournefort and other botanists. Linnæus has substituted STROBILUS in its place.

CONVULSION, a preternatural and violent contraction of the membranous and muscular parts of the body. See (the *Index* subjoined to) MEDICINE.

CONWAY, a market-town of Caernarvonshire in North Wales, situated near the mouth of a river of the same name, 15 miles west of St Asaph. W. Long. 3. 50. N. Lat. 53. 20.

CONYZA, FLEABANE; a genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The pappus is simple, the calyx imbricated and roundish, the corollulæ of the radius trifid. There are 19 species, none of which merit any particular description.

CONZA, a town of the kingdom of Naples in Italy, situated on the farther principate, on the river Offanto, 50 miles south-east of the city of Naples. E. Long. 16. 0. N. Lat. 41. 0. It is the see of an archbishop.

COOK (Sir Anthony), descended from Sir Thomas Cook lord mayor of London, was born in 1506, and supposed to have been educated at Cambridge. He was so eminent for his learning, piety, and prudence, that the guardians of king Edward VI. appointed him

to be his chief instructor in learning, and to form his manners. He had four daughters; and being resolved to have sons by education, lest he should have none by birth, he taught his daughters those lessons by night that he had instilled into the prince by day: he was happy in his endeavours, as they proved learned in Greek and Latin, and equally distinguished by virtue, piety, and good fortune. Mildred was married to the great lord Burleigh; Ann to Sir Nicholas Bacon, lord keeper of the great seal; Elisabeth to Sir John Russel, son and heir of Francis earl of Bedford; and Catharine to Sr Henry Killigrew. He lived in exile during the Marian persecution; and returning on the accession of queen Elizabeth, spent the rest of his days in peace and honour, dying in 1576.

COOK (Captain James), one of the most celebrated navigators ever produced by Britain or any other country, was the son of James Cook, supposed to have been a native of the county of Northumberland. His station was no higher than that of a servant in husbandry, and he was married to a woman in his own sphere of life at Morton, a village in the North riding of Yorkshire. From this place they removed to another village, in the same riding named *Marton*, where Captain Cook was born on the 27th of October 1728. He was one of nine children, all of whom are now dead except a daughter, who married a fisherman of Redcar. He received the first rudiments of education from the schoolmistress of the village; and afterwards, on his father's removal to Great Ayton, he was put to a day school, at the expence of Mr Skottow, his father's employer, where he was instructed in writing and in a few of the first rules of arithmetic. Before the age of thirteen he was bound apprentice to Mr W. Sanderson, a haberdasher or shopkeeper at Straiths, about ten miles from Whitby: but some disagreement taking place between him and his master, he indulged his own inclination in binding himself apprentice to Messrs Walkers of Whitby, who had several vessels in the coal trade; and after serving a few years longer in the situation of a common sailer, he was at length raised to be mate of one of Mr Walker's ships. During all this period it is not recollected that he exhibited any thing peculiar either in his abilities or conduct.

Early in the year 1755, when hostilities broke out between France and England, Cook entered on board the *Eagle* of sixty guns, to which vessel Sir Hugh Palliser was soon after appointed, who soon distinguished him as an active and diligent seaman; and his promotion was forwarded by a letter of recommendation which was written by Mr Osbaldeston, member for Scarborough, at the request of several neighbours, in Mr Cook's favour. On the 15th of May 1759, he was appointed master of the *Mercury*, which soon after sailed to America, and joined the fleet under Sir Charles Saunders at the memorable siege of Quebec. His interest with the admiralty appears even then to have been very strong; for on Mr Osbaldeston's letter he was appointed master of the *Grampus* sloop; but the proper master having unexpectedly returned to her, the appointment did not take place. Four days after he was made master of the *Garland*; when upon inquiry it was found that he could not join her, as the vessel

Cook.

Cook.

vessel had already failed; and the next day, May 15th 1759, he was made master of the *Mercury*. On this occasion he was recommended by Captain Palliser to a difficult and dangerous service, *viz.* to take the soundings of the river St Lawrence, between the island of Orleans and the north shore, which he performed in the most complete manner; and soon afterwards he was employed to survey the most dangerous parts of the river below Quebec: these were his first efforts with the pencil. After this expedition he was appointed, on the 22d of September, master of the *Northumberland*, stationed at Halifax, where he first read Euclid, and applied to astronomy and other branches of science. In the year 1762 he was with the *Northumberland*, assisting at the recapture of Newfoundland; and in the latter end of the same year he returned to England, and married, at Barking in Essex, Miss Elizabeth Batts. Early in 1763, when admiral (then Captain) Greaves was appointed governor of Newfoundland, Mr Cook went out with him to survey the coasts of that island. At the end of the season he returned to England; but in the beginning of 1764, Sir Hugh Palliser being appointed governor of Newfoundland and Labradore, Mr Cook accompanied him in the same capacity of surveyor, and had the Grenville schooner to attend him on that business; in this situation he continued till 1767.

While Mr Cook remained on this station, he had an opportunity of exhibiting publicly a specimen of his progress in the study of astronomy, by a short paper printed in the 57th volume of the *Philosophical Transactions*, intitled "An observation of an eclipse of the sun at the island of Newfoundland, August 5, 1766, with the longitude of the place of observation deduced from it." Mr Cook's observation was made at one of the Burgeo islands near Cape Ray, in N. Lat. 47° 56' 19", and by the comparisons of it made by Mr Mitchel with an observation of Dr Hornsby at Oxford, it appeared to have been accurately done; and Mr Cook at that time obtained the character of an able astronomer.

In the mean time a spirit for geographical discoveries, which had gradually declined since the beginning of the 17th century, began to discover itself anew. Two voyages of this kind had been performed in the reign of George II. the one under Captain Middleton, the other by Captains Moore and Smyth, with a view to discover a northwest passage through Hudson's Bay to the East Indies. Two others, under Captains Byron, Wallis, and Carteret, had been undertaken soon after the conclusion of the peace in 1763 by order of his present Majesty; and before the return of these navigators, who were ordered to sail round the world, another voyage was resolved upon for astronomical purposes. It having been calculated that a transit of Venus over the sun's disk would happen in 1769, a long memorial to his Majesty was presented by the Royal Society; in which they set forth the great importance of making proper observations on this phenomenon, the regard that had been paid to it by the different courts of Europe, and intreating, among other things, that a vessel might be fitted out, at the expence of government, for conveying proper persons to some of the Friendly Islands, in order to make the necessary observations. This being complied with on the part of his Majesty,

Cook.

Alexander Dalrymple, Esq; an eminent member of the Royal Society, was appointed to take the command of the bark appropriated for the purpose. In the execution of the project, however, an unexpected difficulty occurred. Mr Dalrymple, sensible of the impossibility of guiding a vessel through unknown and dangerous seas without any proper command over the crew, demanded a brevet commission as captain of the vessel, in the same manner as had formerly been granted to Dr Halley in a voyage of discovery made by him. This commission Sir Edward Hawke absolutely refused to sign; declaring, when pressed upon the subject, that he would rather suffer his right hand to be cut off than trust any of his Majesty's ships to a person who had not been properly bred to the service: and in this proceeding he seemed to be justified by the mutinous behaviour of Dr Halley's crew; who, denying the legality of his authority over them, had involved him in a very disagreeable dispute, and which was attended with pernicious consequences. Mr Dalrymple, on the other hand, being equally determined in his refusal to proceed without the authority in question, there was a necessity for finding out some person of science who might also be free from the objection made by Sir Edward Hawke. Mr Cook therefore was proposed by Mr Stephens; and his recommendation being seconded by Sir Hugh Palliser, he was immediately appointed to direct the expedition; and on this occasion was promoted to the rank of lieutenant in his Majesty's service.

Mr Cook's commission as lieutenant was dated May 25, 1768; a vessel of 370 tons, named the *Endeavour*, was provided for him; and while the necessary preparations were making for the voyage, Captain Wallis returned. It having been recommended to this gentleman to fix upon a proper place for making the astronomical observations, he had accordingly chosen the island named by him *George's Island*, but since known by the name of *Otaheite*; judging also that Port Royal harbour in it would afford an eligible situation. This proposal being accepted, directions for the purpose were accordingly given to Mr Cook, with whom Mr Charles Green was joined in the astronomical part; the latter having been assistant to Dr Bradley in the Royal Observatory at Greenwich, and thus judged to be every way qualified for the office. The lieutenant was likewise accompanied by Mr Banks, now Sir Joseph Banks, Dr Solander, &c. The principal design of the voyage was, as has already been hinted, to make observations on the transit of Venus; but this being done, Mr Cook was directed to make further discoveries in the Pacific Ocean; and on the 30th of July 1768 he set sail on his expedition. An account of the voyage, and the discoveries made during the time of it, is given in the next article: here it is sufficient to observe, that throughout the whole Mr Cook approved himself an able seaman; and from his behaviour both to his own people and to the savage nations he occasionally met with, showed a most exact regard to the rules both of justice and humanity. On his first arrival at *Otaheite*, the following regulations were drawn up for his people, which he took care should be punctually obeyed: 1. To endeavour, by every fair means, to cultivate a friendship with the natives, and to treat them with all imaginable humanity. 2. A proper person or persons

Cook.

to be appointed to treat with the natives for provisions, fruits, &c. and no other person belonging to the ship to do so without leave. 3. Every person on shore to attend punctually to his duty, and to pay proper attention to his tools or arms; and if lost through negligence, to have the full value charged against his pay, with such farther punishment inflicted as occasion might require. 4. The same penalty to be inflicted on every one who should embezzle, trade with, or offer to trade with, any part of the ships stores; and, 5. No iron to be given in exchange for any thing but provisions. His rigid adherence to these rules was manifested in several instances, particularly by severely punishing the ship's butcher, who had threatened the life of a woman, wife to one of the chiefs of the island, for refusing a stone hatchet on the terms he proposed. On erecting their observatory, in order to go through the astronomical operations, an accident happened which had like to have disconcerted the whole scheme. This was the loss of their quadrant, which had been stolen by some of the natives; but, chiefly through the exertions of Mr Banks, it was recovered, and the observations made accordingly. Scarce was this accomplished, however, before another theft of the natives demanded the most serious consideration of the commander. Some of them taking advantage of the attention of the officers being otherwise engaged, took the opportunity of breaking into one of the store-rooms, and stealing from thence a bag of spike nails of no less than an hundred weight. This was a most important affair; for as those nails were of great estimation among the Indians, the possession of such quantity must undoubtedly have much lessened their value, and thus rendered provisions of every kind greatly dearer on the island than before. One of the thieves therefore being discovered, was punished with 200 lashes: notwithstanding which he obstinately refused to discover any of his accomplices. Repeated thefts committed afterwards required all the wisdom and resolution of Mr Cook to conduct himself in a proper manner. After due consideration, he judged it to be a matter of importance to put an end to these practices at once, by doing something which might engage the natives themselves to prevent them for their common interest. This, however, he was not at present able to accomplish; nor indeed did it seem possible to prevent them without using fire-arms, which from motives of humanity he still determined to avoid. At last, after a stay of three months, when preparing to take his leave, the most disagreeable adventure took place that he had hitherto met with. This was the desertion of two of his people, who having married young women of the country, determined to take up their residence in it. Mr Cook was now obliged to seize some of the chiefs, and to inform them that they could not obtain their liberty unless the deserters were recovered. This at last produced the desired effect; the deserters were given up, and Mr Cook set sail, along with Tupia (who had formerly been the prime minister to Oberea, a princess of the island) and a boy of 12 years of age, both of whom were desirous of accompanying him to England.

While Mr Cook proceeded to visit others of the South Sea Islands, Tupia occasionally served as an in-

terpreter. On his arrival in New Zealand, Mr Cook found the people extremely hostile and insolent. At their very first meeting, one of the natives having threatened to dart his lance into the boat, was shot dead. Another, having carried off Mr Green's hanger, was fired at with small shot, and upon his still refusing to restore it, was fired at with ball and killed. This, however, produced very little effect on the rest, who offered to make an attack upon them, till several muskets were fired with small shot, which wounded three or four more. Next day the commander, having determined to force some of the natives on board in order to conciliate their affections by kind treatment, directed his men to follow two canoes whom he perceived under way before him. One made her escape, but the other, not observing the boats in pursuit, was overtaken; on which the savages plied their oars so briskly, that the ship's boats were not able to keep up with them. Tupia, whose language the New Zealanders understood, called to them to return, with assurances that no hurt should be done them; but they continued their flight without minding him. A musket was then fired over their heads with a view to intimidate them, but upon this they prepared to fight; and on the coming up of the boats began the attack with so much vigour, that the lieutenant's people were obliged to fire upon them with ball, by which four out of seven that were in the boat were killed, and the other three jumped into the water, and were taken on board.

This part of Mr Cook's conduct seems inconsistent with that humanity for which he was in general so eminently distinguished; he was aware of the censure, and makes the following apology. "These people certainly did not deserve death for not choosing to confide in my promises, or not consenting to come on board my boat, even if they had apprehended no danger: but the nature of my service required me to obtain a knowledge of their country, which I could no otherwise obtain but by forcing into it in an hostile manner, or gaining admission through the confidence and good will of the people. I had already tried the power of presents without effect; and I was now prompted by my desire to avoid farther hostilities, to attempt to get some of them on board; the only method we had left of convincing them that we intended them no harm, and had it in our power to contribute to their gratification and convenience. Thus far my intentions certainly were not criminal; and tho' in the contest, which I had not the least reason to expect, our victory might have been complete without so great an expence of life; yet in such situations, when the command to fire has once been given, no man can pretend to restrain its excess, or prescribe its effect."

Notwithstanding the disaster just mentioned, to which the three New Zealanders, who were taken on board, had been witnesses, they were soon conciliated, and began to sing with a degree of taste that surpris'd the English gentlemen. They were boys, the oldest about 19 and the youngest about 11; but no kindness which could be shown them was in any degree effectual to bring about a reconciliation with the rest. On the contrary, having perceived the ship in some distress, they instantly showed a disposition to make an attack; and from this they were only prevented by

Cook.

the

Cook. the firing of a four-pounder charged with grape shot. Even this did not produce any permanent effect; another attack was determined upon, and would undoubtedly have been made, had not Tupia informed them, that if they persisted in the attempt, the arms of their adversaries, like thunder, would destroy every one of them. This was enforced by the fire of another four-pounder with grape shot, which spreading wide in the water, terrified them to such a degree that they began to paddle away as fast as possible. Notwithstanding this, however, some intercourse began to take place; but in every instance the New Zealanders manifested their hostility and treachery in such a manner as showed that they were not to be gained by fair means. At last an attempt to carry off Tayeto, Tupia's boy, rendered it absolutely necessary to fire upon them in order to rescue him from certain destruction, some of the savages having got him into a canoe, where they held him down by violence. In consequence of this one of the savages was killed on the spot, and several more wounded, by the discharge of muskets from the boats; Tayeto recovered his liberty, jumped into the water, and swam to the ship. Some partial intercourse again took place; but still it appeared that the innate rancour of these savages was neither to be subdued by fair means nor foul; and it was only by the powerful arguments of cannon and musketry that they could be kept from attempting to do mischief.

From the account of this voyage published by Dr Hawkefworth, indeed, it appears that a considerable number of savages perished in a manner similar to that above mentioned, and they seem to have manifested a more hostile behaviour than afterwards: on those melancholy occasions, however, it is observed to the honour of Mr Cook, that his humanity was eminently conspicuous beyond that of the common people, who all along showed as much inclination to destroy the Indians as a sportsman does to kill the game he pursues.

While Mr Cook coasted the islands of New Zealand, he was sometimes in the most imminent danger of being shipwrecked. In the latitude of 35° south, and in the midst of summer in that climate, he met with such a gale of wind as he scarce ever experienced before; so that he was no less than three weeks in getting ten leagues to the westward, and two more before he could get 30 leagues farther. Fortunately, however, they were all this time a considerable way from land, otherwise it is probable that the storm must have proved fatal.

Mr Cook having spent six months in circumnavigating and fully exploring the islands of New Zealand, he sailed from thence on the 31st of March 1770. It must be observed, however, that the extreme hostility manifested by the inhabitants in that part of the island where he first arrived, was not universally diffused, but that a friendly intercourse was for a long time maintained with those about Queen Charlotte's Sound. From New Zealand he proceeded to New Holland, and on the 28th of April came in sight of Botany Bay. Here all their endeavours to induce the natives to have any intercourse with them proved ineffectual, tho' happily there was no blood spilt in any quarrel.

During their navigation round New Holland, the

Cook. coasts of which are full of dangerous rocks and shoals, our navigators were brought into a more perilous situation than ever; and from which the escape was so extraordinary, that it deserves a particular relation. This happened on the 10th of June 1770, as they pursued their course from Trinity Bay, and nearly in the latitude assigned to the islands discovered by Quiros. At that time they had the advantage of a fine breeze and a clear moonlight; and in standing off from six till near nine o'clock, the ship had deepened her water from 14 to 21 fathoms; but while the navigators were at supper, it suddenly shoaled to 12, 10, and 8 fathoms, in the space of a few minutes. Every thing was then ready for putting the ship about, when they suddenly got into deep water again, and continued in 20 and 21 fathoms for some time, so that the gentlemen went to bed in perfect security. A little before eleven, however, the water shoaled at once from 20 to 17 fathoms; and before the lead could be heaved again, the ship struck, and remained immoveable, excepting as far as she was heaved up and down and dashed against the rocks by the surge. The alarm was now universal, and not indeed without the greatest reason. It appeared that the vessel had been lifted over the ledge of a rock, and lay in a hollow within it, where there were in some places from three to four fathoms water, and in others scarce as many feet: the sheathing boards were disjoined, and floating round the ship in great numbers; and at last the false keel also was destroyed, while the rock kept grating her bottom with such force as to be heard in the fore store-room. It was now necessary to lighten the ship as much as possible; and this was done with all expedition to the amount of more than 50 tons. In the morning of the 11th of June they discovered the land at about eight leagues distance, without any island between, on which they could have been sent ashore in the event of the ship going to pieces, that so they might have been carried to the main land by turns. To add to their distress, the ship drew so much water, that it could scarce be kept under by three pumps. Lastly, it appeared, that even the rising of the tide, on which they had ultimately depended for relief, was insufficient to answer the purpose, as the day-tide fell considerably short of that in the night-time. Having therefore lightened the ship still further, by throwing out every thing that could possibly be spared, they waited with patience for the next tide; when, after incredible exertion, the ship righted, and they got her over the ledge of the rock into deep water. By continual labour, however, the men were at last so much exhausted, that they could not stand to the pumps more than five or six minutes at a time; after which they threw themselves flat on the deck, though a stream of water between three and four inches deep ran over it; and in this situation they lay till others, exhausted as well as themselves, took their places, on which they started up again, and renewed their exertions. In this dreadful extremity Mr Monkhouse, a midshipman, proposed the expedient of fothering the ship, as it is called, by which means he said he had seen a merchant ship brought from Virginia to London after she had sprung a leak that admitted more than four feet water in an hour. The expedient being approved of, it was put into execution in the following manner. He

took

Cook. took a lower studding-sail, and having mixed a large quantity of oakum and wool together, stitched them down by handfuls as lightly as possible; the whole being afterwards spread over with the dung of the sheep and other filth. The sail was then hauled under the ship's bottom by means of ropes which kept it extended. When it came under the leak, the wool and oakum, with part of the sail, were forced inwards by the pressure of the water, which thus prevented its own ingress in such an effectual manner, that one pump, instead of three, was now sufficient to keep it under. Thus they got the ship into a convenient port on the coast of New Holland, where there was an opportunity of fully repairing her defects. Here they discovered that their preservation had not been owing entirely to the expedient abovementioned; for one of the holes was in a great measure filled up by a piece of rock which had broken off and stuck in it; and this hole was so large, that had it not been filled up in the manner just mentioned, they must undoubtedly have perished notwithstanding all the assistance that could have been derived from the pumps.

The dangers they sustained in navigating this coast were innumerable, inasmuch that for very near three months they were obliged to have a man constantly in the chains heaving the lead. They were always entangled among rocks and shoals, which could not have failed to destroy a less experienced navigator; and even Mr-Cook, with all his sagacity, could not sometimes have extricated himself, had it not been for the favourable interposition of some natural events, which no human penetration could foresee or have the least dependence upon. Of this we shall only give the following instance. Having at last, as they thought, got safely over the vast reefs of sunk rocks with which the coast of New Holland is surrounded, they flattered themselves that all danger was passed, and the vast swell of the water convinced them that they were now in the open ocean. The remembrance of former dangers, however, induced them frequently to take the precaution of sounding; notwithstanding which, in the latitude of about $14\frac{1}{2}^{\circ}$ S. they found themselves one morning only about a mile distant from the most hideous breakers, though the sea all around was unfathomable. Their situation was rendered the more dreadful by its being a dead calm, at the same time that they were carried towards the rock with such rapidity, that by the time they had got the ship's head turned by means of the boats, she was scarcely 100 yards distant from it. Their only resource then was to tow the ship, if possible, by means of the boats and pinnace, out of a situation so very perilous; but all their efforts would have been unsuccessful, had not a breeze of wind sprung up, which, though too light to have been noticed at any other time, was found to second their efforts so effectually, that the ship began to move perceptibly from the reef in an oblique direction: during the time that this breeze lasted, which was not more than ten minutes, they had made a considerable way. A dead calm succeeding, they began to lose ground, and in a little time were driven within 200 yards of the rocks: but fortunately the breeze returned, and lasted ten minutes more; during which time a small opening was perceived in the reef at the distance of about a quarter of a

Cook. mile. The mate being sent out to examine this opening, reported that it was not more than the length of the ship in breadth, but that there was smooth water within. On this it was determined to pass into it by all means. The attempt failed of success; as just when they had brought the ship with great labour to the mouth of the opening, they found a current setting out from it by reason of the tide now beginning to ebb. But though their hopes were disappointed in getting through the opening, they were, by the current setting out from it, driven in a very short time to the distance of a quarter of a mile from the rocks; and by dint of towing and other exertions, they were got by noon to the distance of two miles. This temporary deliverance, however, afforded but small prospect of being ultimately relieved. They had still no other expectation than of being forced back into their former situation by the return of the tide; but happily they now perceived another opening about a mile to the westward. Mr Hicks the lieutenant being sent to examine this opening, returned with an account of its being narrow and hazardous, but capable of being passed. To this place therefore the ship was directed by every possible means; and a light breeze happening to spring up, they fortunately reached it, and were instantly hurried through with great rapidity by the current of the returning tide; which, had it not been for this opening, would undoubtedly have dashed them to pieces against the rocks.

From the time they quitted the coast of New Holland till their arrival at Batavia in the island of Java, our navigators met with no other danger but what is common in sea-voyages. They were obliged to stay for some time at this place to repair their damages; and on viewing the condition of the ship, found they had more reason than ever to admire the manner in which they had been preserved. Both the false-keel and main-keel were greatly injured; great part of the sheathing was torn off; several of the planks were much damaged, and among these there were two, and half of another, which for six feet in length were not above the eighth part of an inch in thickness, besides being penetrated with worms quite to the timbers. Here the crew were excessively annoyed by sickness, which obliged them to remain much longer than they would otherwise have done: and it is worthy of notice, that every one of the crew was ill excepting the sail-maker, an old man between 70 and 80 years of age, and who was drunk every night. Poor Tupia, with his boy Tayetto, fell sacrifices to the unhealthiness of the climate, as well as the surgeon, three seamen, and Mr Green's servant. Nor did the evil stop here; for on their setting out from Batavia, the seeds of disease which had been received there broke out in the most violent and fatal manner, inasmuch that in the course of about six weeks there died one of Mr Banks's assistants, by name Mr Sporing, Mr Parkingson his natural history painter, Mr Green the astronomer, the boatswain, carpenter, and mate; Mr Monkhouse the midshipman, the corporal of the marines, two of the carpenter's crew, and nine seamen. Even the jolly old sail-maker could now hold out no longer; but whether his death might not in some measure be attributed to his being less plentifully supplied with liquors than formerly,

Cook.

formerly, might have deserved inquiry. These unfortunate events probably made a considerable impression on Mr Cook's mind; and perhaps induced him to direct his attention to those methods of preserving the health of seamen which he afterwards put in execution with so much success. After touching at St Helena, they continued their voyage for England, where they arrived on the 11th of June 1771; and on the 29th of August the same year, his Majesty testified his approbation of Mr Cook's conduct by appointing him a captain in the navy. On this occasion Mr Cook wished to have been advanced to the rank of post-captain, which, though not more profitable than the other, is more honourable; but this being inconsistent with the rules of preferment in the navy, the earl of Sandwich, at that time at the head of the admiralty, could not agree to it.

Captain Cook was not allowed to remain long inactive. The idea of a southern continent had long been entertained, and Mr Dalrymple had renewed the attention of the public towards the question, by his historical collection of voyages to the Pacific Ocean, published in two quarto volumes, one in 1770, the other in 1771. To determine the matter finally, Captain Cook was again sent out: and the object of this voyage was not merely to settle the question just mentioned, but to extend the geography of the globe to its utmost limits. That the undertaking might be carried on with the greater advantage, it was determined to employ two ships, on the choice and equipment of which the utmost attention was bestowed. The successful voyage which had already been made in the Endeavour, suggested the idea of that ship being a proper model for the two which were to be sent out; and the opinion of Lord Sandwich concurring with the general idea, two vessels, constructed by the same person who had built the Endeavour, were purchased for the voyage. These were about 14 or 16 months old at the time they were purchased; and in the opinion of Captain Cook, were as fit for the purpose as if they had been but newly built. The larger of the two, of 462 tons burden, was named the Resolution; the smaller, of 336 tons, had the name of the Adventure; the complement of men on board the former, of which Captain Cook was commander, being 112; on the latter, commanded by Mr Tobias Furneaux, 81. In their equipment, every article that could be supposed necessary, however much out of the common line, was procured, and every circumstance that could be supposed to contribute to the success of the voyage was attended to in the most scrupulous manner. Besides the usual stores and provisions, all of which were of the best kinds, the ships were furnished with malt, four-knot, salted cabbage, portable soup, salop, mustard, marmalade of carrots, beer, and inspissated wort. Mr Hodges, an excellent landscape painter, was engaged to make drawings and paintings of such objects as required them. Mr John Reinhold Forster, with his son, were both engaged, in order to explore and collect the natural history of the countries through which they passed; and lastly, that nothing might be wanting to render the voyage as complete as possible, Mr William Wales and Mr William Bayley were engaged by the board of longitude to make celestial observations. They were furnished with the

best instruments of every kind, and among the rest with four time-pieces; three constructed by Mr Arnold, and one by Mr Kendall on Mr Harrison's principles.

At Plymouth Captain Cook received his instructions; which were not only to sail round the globe, but to sail round it in high southern latitudes, and to make such traverses as might finally resolve the question concerning the southern continent. In pursuance of these instructions he set sail on the 13th of July 1772, and on the 29th of the same month reached the Madeiras. As he proceeded afterwards in his voyage, he made three punchcons of beer from the inspissated wort carried out along with him, and found it excellently to answer the purpose, provided the material could have been kept without fermentation in its inspissated state; but as this was found impossible, the expedient seems to have failed. In this voyage, however, the Captain used with the greatest success such methods as appeared likely to contribute to the preservation of the health of his men. In rainy weather, he took care that the ship should be aired and dried by means of fires made between the decks, the damp places were smoked, and the people were ordered to air their bedding, and wash and dry their clothes, whenever an opportunity offered. Thus he reached the Cape of Good Hope without having a single man sick. Having left it, and kept on his course to the southward, he soon began to meet with cold and stormy weather, by which he lost almost the whole of his live stock of sheep, hogs, and geese. The bad effects of this stormy weather upon the men were guarded against by an addition to their clothing, and giving them a dram on particular occasions. On the sixth of December, being in the latitude of $50^{\circ} 40'$, he fell in with islands of ice, and continued among them in various latitudes till the 17th of January 1773; when he set sail for New Zealand, which he reached on the 27th.

The reception of our navigator by the new Zealanders was now much more friendly than in the former voyage, so that there were no contests with the natives; nor did Captain Cook observe any one of those whom he had seen before, neither was there the smallest remembrance of former hostilities. Having staid in this country till the 7th of June, our navigators set sail for Otaheite; but during the voyage the crews of both ships were attacked by the scurvy. Those of the Adventure were in a very sickly state; the cook was dead, and 20 of her best men incapable of duty. On board the resolution matters were much better; and the only reason that could be conjectured for the difference was, that the people of the Adventure had been in an habit of body more inclined to the scurvy than those of the Resolution, and had eat fewer vegetables. Here it was observed, that the aversion of seamen to a change of diet is so great, that it can only be overcome by the steady and persevering example of a commander. While he remained at New Zealand, the Captain had discovered a tree which greatly resembled the American black spruce. Persuaded, therefore, that it would be attended with effects equally salutary on the health of the people, he employed them in brewing beer from it. This was done while they continued at Dusky bay, in order to supply the want of vegetables, which were not to be procured

Cook.

Cook. procured there ; but on removing to Queen Charlotte's Sound, they were more fortunate. Captain Cook himself went to look out for antiscorbutic vegetables ; and returned in a very short time with a boat-load of scurvy-grass, celery, &c. These were boiled with the peas and wheat ; and though some of the people disliked them at first, they soon became so sensible of their good effects, that they cheerfully followed the example of the rest ; and the freedom of the crew from the scurvy and other distempers was by every one attributed to the New Zealand spruce beer and vegetables. From this time forward the Captain had scarce occasion to give orders for gathering vegetables when they came to any land.

During this voyage Captain Cook experienced another narrow escape from shipwreck. Being becalmed at the distance of half a league from a reef of rocks near Osnaburg island, it was found necessary to order out the boats to tow off the ships ; but this was found impossible. The calm continuing, and the situation of our navigators becoming every moment more dangerous, the Captain attempted to get through an opening in the reef which he had judged practicable : but on approaching it, found that there was not sufficient depth of water ; at the same time that the draught of the tide through it forced the ship thither in a manner scarce to be resisted. One of the warping machines, with about 400 fathoms of rope, was then ordered out, but did not produce any effect. They were within two cables length of the breakers, and no bottom could be found for casting anchor. Having no other resource, however, they did drop an anchor ; but before it took hold, the Resolution was in less than three fathoms of water, and struck at every fall of the sea, which broke violently close under her stern, threatening destruction to every one on board. At last the tide ceasing to act in the same direction, the boats were ordered to try to tow off the vessel ; in which being assisted by the land-breeze, which fortunately sprung up at that instant, they with much labour succeeded.

Having spent a considerable time in the South Sea islands, Captain Cook returned to New Zealand, and from thence set sail for the southern part of the continent of America. Here he explored all the islands in the neighbourhood, and then returned to England, where he arrived in safety on the 30th of July 1774, having been absent three years and 18 days ; and in all that time lost only one man, who died of a consumption probably begun before he set out on the voyage.

The reception our navigator now met with was suited to his merit. He was immediately raised to the rank of post-captain, and soon after unanimously elected a member of the Royal Society ; from whom he received the prize of the gold medal for the best experimental paper that had appeared throughout the year. It was the custom of Sir John Pringle, at the delivery of this medal, annually to make an elaborate discourse, containing the history of that part of science for which the medal was given ; and as the subject of Captain Cook's paper (the means of preserving the health of seamen) was analogous to the profession of Sir John Pringle himself as a physician, he had the greater opportunity of displaying his eloquence on the occasion.

Cook. The speech he made was in the highest degree honourable to Captain Cook. He remarked, that the Society had never more meritoriously bestowed the medal than on the person who now received it. " If (says he) Rome decreed the civic crown to him who saved the life of a single citizen, what wreaths are due to the man who, having himself saved many, perpetuates in your Transactions the means by which Britain may now, on the most distant voyages, preserve numbers of her intrepid sons, her mariners ; who, braving every danger, have so liberally contributed to the fame, to the opulence, and to the maritime empire of the country ?" These honourable testimonies of the public regard, however, Captain Cook did not receive, being already embarked on another voyage, from which he never returned.

The third voyage of this celebrated navigator was not undertaken by any express command of his Majesty. Captain Cook had already done so much, that it was thought but reasonable he should now spend the remainder of his life in quiet ; and in order to enable him to do this in the more comfortable manner, besides his rank of post-captain in the navy, he was also made a captain in Greenwich. Still, however, there were some points in the science of geography which had very much engaged the attention of the public, and were indeed of such importance as to become a national concern. These were to discover the connection between Asia and America, and to determine whether there was not a possibility of shortening the passage to the East Indies by sailing round the northern parts of the continents of Europe and Asia. Many attempts, indeed, had already been made by various navigators of different nations ; but all of them had failed, and, what was worse, had left the point still undetermined. An act of parliament had been passed in 1745, by which a reward of L.20,000 was held out to the ships of any of his Majesty's subjects for accomplishing this important voyage, but without mentioning any thing of those belonging to his Majesty ; and this reward was further confined to the finding out of the north-west passage to the East Indies through Hudson's Bay. In the year 1776, however, both the errors just mentioned were corrected. It was now enacted, " That if any ship belonging to any of his Majesty's subjects, or to his Majesty, shall find out, and sail through, any passage by sea between the Atlantic and Pacific Oceans, in any direction or parallel of the northern hemisphere, to the northward of the 52d degree of northern latitude ; the owners of such ships, if belonging to any of his Majesty's subjects, or the commanders, officers, and seamen, of such ship belonging to his Majesty, shall receive, as a reward for such discovery, the sum of L.20,000.

It was not, as has already been hinted, now deemed proper to solicit Captain Cook to undergo fresh dangers by undertaking a voyage of this kind ; nevertheless, as he was universally looked upon to be the fittest person in the kingdom for the purpose, the eyes of every person were tacitly fixed upon him : he was consulted on every thing relating to it, and solicited to name the person whom he judged most proper to conduct it. To determine this point, Captain Cook, Sir Hugh Palliser, and Mr Stephens, were invited to the house of Lord Sandwich to dinner ; where, besides

Cook. the consideration of the proper officer for conducting the expedition, many things were said concerning the nature of the design. They enlarged upon its grandeur and dignity, its consequences to navigation and science, and the completeness it would give to the whole system of discoveries; until at last Captain Cook was so much inflamed by the representation of the importance of the voyage, that he started up, and declared that he would conduct it himself. This was what the parties present had desired, and probably expected; his offer was therefore instantly laid before the king, and Captain Cook appointed commander of the Expedition by the 10th of February 1776. At the same time it was agreed, that on his return from the voyage he should be restored to his place at Greenwich; and if no vacancy occurred during the interval, the officer who succeeded him was to resign in his favour. The instructions he now received were, that he should attempt the high latitudes between the continents of Asia and America, and if possible return to England along the northern coasts of Asia and Europe. This was most probably the result of the Captain's own deliberations, and what had been suggested by him to Lord Sandwich and other people in power. He was particularly desired to sail first into the Pacific Ocean thro' the chain of newly discovered islands which he had lately visited. After having crossed the equator, and passed into the northern parts of the ocean just mentioned, he was then to hold such a course as might tend to settle many interesting points of geography, and produce some intermediate discoveries, before he arrived at the main scene of operation. With regard to this principal object, he was ordered, immediately on his arrival on the coast of New Albion, to proceed northward as far as the latitude of 65 degrees, without losing any time in exploring creeks or rivers previous to his arrival in that latitude: and for his further encouragement, the act of 1745, offering a premium for the discovery of the passage, was amended in the manner above-mentioned. That nothing might be wanting which could promote the success of the grand expedition, Lieutenant Pickersgill was sent out, in 1776, with directions to explore the coasts of Baffin's Bay; and the next year Lieutenant Young was commissioned not only to examine the western parts of that bay, but to endeavour to find a passage on that side from the Atlantic to the Pacific Ocean. Nothing, however, was performed by either of these gentlemen which in the least could promote Captain Cook's success. Two vessels were provided as in the former voyage, viz. the *Resolution* and the *Discovery*; the command of the former being given to Captain Cook, and of the latter to Captain Charles Clerke. The only thing in which the appointment of the *Discovery* differed from that of the *Resolution* was, that the former had no marine officer on board. Every degree of attention was bestowed, as in the former voyage, upon the proper victualling and other necessaries for the two ships; and that the inhabitants of those countries which our navigator intended to visit might derive some permanent benefit from the intercourse they had with him, it was determined to send abroad a breed of domestic animals, and likewise a quantity of useful seeds, to be left in proper places. With this view, a bull, two cows with their calves, and several sheep, with hay and

Cook. corn for their subsistence, were taken on board; and it was likewise purposed to take in others at the Cape of Good Hope. A large assortment of iron tools and trinkets was also sent out; and, in short, every thing that could be judged proper either to conciliate the good will of the natives or to prove serviceable to them, was provided for the voyage, as well as every convenience for the ships companies. In the former voyage Captain Cook had brought along with him a native of one of the South Sea islands, named *Omai*, who resided in England during the interval between the second and third voyages, and was now happy at getting an opportunity of returning to his own country. Though he could by no means complain of the entertainment he had met with in England, the idea of returning home loaded with treasure, which might enable him to make a figure among his countrymen, soon overcame all uneasy sensations which the leaving of his English friends might excite. His majesty had taken care to furnish him with every thing that could possibly be of use when he came to his native country; and he had besides received several valuable presents from Lord Sandwich, Sir Joseph Banks, and several ladies and gentlemen of his acquaintance; so that nothing was omitted which could possibly be done to convey, by his means, to the inhabitants of the South Sea islands an idea of the British power and greatness.

Every thing being prepared for the voyage, our navigator set sail from the Nore on the 25th of June 1776; but by reason of some delay in receiving his instructions, did not leave Plymouth till the 12th of July. He had not been long at sea before he began his operations for preserving the health of his people; which were found equally efficacious in this as in the former voyage. Finding his stock of provender for the animals on board likely to run short, he touched at Teneriffe, in order to procure a supply, having judged that to be a more proper place than Madeira for the purpose. On sailing from thence he ran a great risk of running upon some sunk rocks on the island of Bonavista; but in this, as well as on other occasions of danger, he behaved with the same judgment, coolness, and presence of mind, that distinguished him throughout the whole course of his life. On the 12th of August he arrived before Port Praya, in one of the Cape de Verde islands named *St Jago*, but not finding it necessary to go in there, he continued his voyage to the southward. The weather now becoming gloomy and rainy, required a continuance of the methods he had already practised for preserving the health of his people; and, as formerly, they were attended with the greatest success. In this voyage, the effect of these precautions was the more remarkable, as at this time the seams of the vessel were opened to such a degree as to admit the rain, so that scarce any person on board could lie dry in his bed; and all the officers in the gun-room were driven out of their cabins by the water which came through the sides. Such was the humanity of the commander, however, that while the ships continued at sea, he would not trust the workmen over their sides to repair the defects, though caulkers were employed in the inside as soon as settled weather returned. On the 1st of September our navigators crossed the equator, and on the

Cook. the 18th of October anchored in Table Bay at the Cape of Good Hope. Here they met with a violent tempest, the effects of which were felt both on sea and land. It lasted three days, and the Resolution was the only ship in the bay that rode out the storm without dragging her anchors. On the shore the tents and observatory were destroyed, and the astronomical quadrant narrowly escaped irreparable damage. The Discovery, which had been some time later in sailing from England, was driven off the coast, and did not arrive till the 10th of November.

While they remained in this place, a disaster happened which threatened the loss of most of their live stock. The bull and two cows had been put ashore to graze among other cattle: but captain Cook had been advised to keep the sheep, 16 in number; near the tents, where they were penned in every night. Some dogs having got in among them in the night-time, killed four, and dispersed the rest. Six of them were recovered the next day, but the two rams and two of the finest ewes in the flock were missing. The captain applied to Baron Flettenburgh the governor; but all his endeavours were unsuccessful, until he employed some of the meanest and lowest of the people, fellows whose character was, that for a ducatoon they would cut their masters throat, burn the house over his head, and bury him and his whole family in ashes. This is mentioned as an instance how far the boasted policy of the Dutch government at the Cape of Good Hope falls short of its alledged perfection. After all, two of the finest ewes in the flock were missing, and never could be recovered. The captain, therefore, to repair the loss, and to make an addition to his original stock, purchased two young bulls, two stone horses, two mares, two heifers, two rams, several ewes and goats, with some rabbits and poultry; when, having finished all his business, he set sail on the 30th of November, though it was not till the 3d of December that he got clear of land. Soon after his putting to sea, he had the misfortune to lose several of the goats, especially the males, together with some sheep; and it was with the utmost difficulty that the rest of the cattle were preserved, by reason of the ship tossing and tumbling about in a very heavy sea. Having explored some desolate islands in the southern seas, Captain Cook set sail for New Zealand. During this part of the voyage, our navigators were involved in so thick a fog, that, according to the authors of Captain Cook's life, "they sailed 300 leagues *in the dark*." The first land they afterwards reached was New Holland; where, having remained till the 30th of January 1777, they set sail for New Zealand, and on the 12th of February they anchored in Queen Charlotte's Sound. Here the people were shy and timorous, on account of their having formerly destroyed 10 of Captain Furneaux's people who had been sent ashore to gather vegetables. The cause of the quarrel could not be known, as none of the party were left alive to tell the news. Lieutenant Burney, who went ashore in quest of them, found only some fragments of their bodies; from which it appeared that they had been killed and eaten by the savages. It was not the intention of Captain Cook, at this distance of time to resent the injury; he even refused to put to death a chief named *Kahoorā*, who as he was informed by the natives themselves had killed Mr Rowe the commander of the par-

ty. He was, however, particularly careful that no opportunity should now be given the savages of committing such an action with impunity; and with this view a boat was never sent on shore without being well armed, and the men under the command of such officers as could be depended upon. The New Zealanders were no sooner assured of Captain Cook's pacific disposition, than they threw aside their fears and suspicions, and entered into a commercial intercourse with the people. It would have been the less excusable in Captain Cook to have revenged at this time the massacre of Mr Rowe's party, as he was assured that the quarrel originated from some petty thefts of the savages, which were too hastily resented on the part of the British; and had it not been for this, no mischief would have happened.

On the 25th of February our navigator left New Zealand, taking with him, at the request of Omai two boys, the eldest about 18 and the youngest about 10. These were soon cured of their passion for travelling, being both violently sea-sick: but as it was then too late to repent, they expressed their grief in loud and almost continual lamentation; and this in a kind of song which seemed to consist of the praises of their native country, whence they were now to be separated for ever. By degrees, however, the sea-sickness abated, their lamentations became less frequent, and at last ceased entirely; their native country was forgotten, and they appeared to be as firmly attached to their new friends the English as if they had been born among them.

So much time was now spent in sailing up and down in the Pacific Ocean, where several new islands were discovered, that Captain Cook judged it impossible to accomplish any thing for this year in the high northern latitudes; for which reason he determined to bear away for the Friendly Islands, in order to supply himself with those necessaries which he had found impossible to be got at any of the islands which he had just discovered. In his run thither several new islands were visited; and in prosecuting these discoveries our navigator once more narrowly escaped being shipwrecked. The danger at this time arose from a low sandy island, which the Resolution was very near running upon. From this she was only saved by the circumstance of all the men having been accidentally called upon deck to put the vessel about, and most of them being at their stations when the danger was discovered. Soon after this both ships struck upon some sunk coral rocks, but happily were got off without damage.

After a stay of between two and three months, Captain Cook took leave of the Friendly Islands on the 13th of July 1777; and on the 12th of August reached Otaheite, where he introduced Omai to his country people, and whose reception by them is particularly related under the next article. Here the Captain found the people of Otaheite ready to engage in a war with those of Eimeo; but though strongly solicited by the former to assist them in an expedition against their enemies, he refused to take any concern in the affair, alleging, by a way of excuse, that the people of Eimeo had never offended him. This seemed to satisfy most of the chiefs: but one, named *Towha*, was so much displeased, that Captain Cook could never regain his favour. He even threatened, that as soon

Cook. soon as the Captain should be gone, he would make war upon Otoo, one of the princes of these islands whom he knew to be in strict friendship with him; but from this he was deterred by the Captain's threatening to return and chastise him if he made any such attempt. As a mark of Otoo's friendship, he gave our navigator a canoe, which he desired him to carry to the king of Britain, having nothing else, as he said, worth his acceptance.

From Otaheite Captain Cook proceeded to Eimeo where, on account of some thefts committed by the natives he was obliged to commence hostilities, by burning a number of their war canoes and even some houses. These transactions gave him much concern: and the more that he had been so much solicited to make war on these people by his friends at Otaheite, to whose entreaties he had refused to listen. From Eimeo he proceeded to Huaheine, where he saw Omai finally settled, and left with him the two New Zealand youths already mentioned. The youngest of these was so much attached to the English, that it was necessary to carry him out of the ship and put him ashore by force. During his stay on this island, the Captain was obliged to punish a thief with greater severity than he had ever done before, viz. by causing his head and beard to be shaved, and his ears cut off. Some other disagreeable transactions took place, particularly the desertion of two of his people, who were not recovered without the greatest difficulty. In the course of his exertions for their recovery, he found it necessary to detain the son, daughter, and son-in-law, of the chief of an island named Otaha. This had almost produced very serious consequences, the natives having formed a plot for carrying off Captain Cook himself, as well as Captain Clerke and Mr Gore. With regard to the commander, they were disappointed by his own caution and vigilance; but Messrs Clerke and Gore were in particular danger; and it was only owing to the circumstance of one of them having a pistol in his hand, as they walked together on shore, that they were not seized.

Having left the Society Islands, and discovered a new group, which, in honour of his patron the Earl of Sandwich, our commander named the *Sandwich Isles* he set out on the 2d of January 1778 on his voyage northward. In this he was very successful, ascertaining the vicinity of the continents of Asia and America, which had never been done, or but very imperfectly, before. From these desolate regions he returned to the island of Oonalashka; whence having refitted and taken in provisions, he returned to the southward, and on the 26th of November reached the Sandwich Islands, where he discovered a new one named *Mowee*, and on the 30th of the same month another of much larger extent, named *O-why-hee*. Seven weeks were spent in exploring the coasts of this island; and during all this time he continued to have the most friendly intercourse with the people, who however, appeared to be much more numerous and powerful than those of any island our navigators had yet touched at. Several of the chiefs and principal people had attached themselves greatly to the commander, and in general the people appeared to be much more honest in their dispositions than any whom he had ever visited. But by the time he had finished

Cook. his circumnavigation of the Island, and cast anchor in a bay called *Karakakooa*, matters were greatly altered. An Universal disposition to theft and plunder had now taken place; and in this it was evident that the common people were encouraged by their chiefs, who shared the booty with them. Still, however, no hostilities were commenced; the greatest honours were paid to the commander; and, on his going ashore he was received with ceremonies little short of adoration. A vast quantity of hogs and other provisions were procured for the ships; and on the 4th of February 1779, they left the island, not without most magnificent presents from the chiefs and such as they had never before received in any part of the world. Unluckily they met with a storm on the sixth and seventh of the same month; during which the *Resolution* sprung the head of her foremast in such a manner that they were obliged to return to *Karakakooa* bay to have it repaired. As they returned, Captain Cook had an opportunity of showing his humanity to the people by the relief he afforded to some of their canoes which had suffered in the storm. The same friendly intercourse which had formerly been held with the natives now commenced, and Captain Cook was treated with the usual honours; but on the 13th of this month it was unhappily broken off on the following account. One of the natives being detected in stealing the tongs from the armourer's forge in the *Discovery*, was dismissed with a pretty severe flogging; but this example was so far from being attended with any good effect, that in the afternoon another, having snatched up the tongs and a chissel, jumped over board with them and swam for the shore. The master and midshipman were instantly dispatched in pursuit of him; but he escaped on board a canoe, which paddled away so quickly that the cutter could not come near it. A chief named *Pareah*, who was at this time on board the *Resolution*, understanding what had happened, promised to go ashore and get back the stolen goods; but before this could be done the thief had made his escape into the country. Captain Cook, who was at that time ashore, had endeavoured to intercept the canoe when it landed, but was led out of the way by some of the natives who pretended to be his guides. The tongs and chissel, however, were brought back to the master as he advanced to the landing place; but he being now joined by some of the rest of the people in the pinnance could not be satisfied with the recovery of the stolen goods, but insisted upon having the thief, or the canoe which carried him, by way of reprisal. On his preparing to launch this last into the water, he was interrupted by *Pareah*, who insisted that it was his property, and that he should not take it away. As the officer paid no regard to his remonstrances, *Pareah*, who seems to have been a very strong man, seized him, pinioned his arms behind, and held him fast by the hair of the head. On this one of the sailors struck the chief with an oar, on which, quitting the officer, he instantly snatched the oar out of the man's hand, and broke it in two across his knee. The Indians then attacked the sailors with stones, and soon drove them to their boats, to which they were forced to swim, as they lay at some distance from the shore. The officers who could not swim retired to a small rock, where they were closely pursued by the Indians; and

Cook.

and here the master narrowly escaped with his life, till Pareah returned and obliged the Indians to give over their attacks. The gentlemen, sensible that Pareah's presence alone could protect them, entreated him to remain with them till they could be brought off in the boats. On his refusal, the master set out to the place where the observatories had been erected, for farther assistance; but Pareah, who met him, and suspected his errand, obliged him to return. In the mean time the multitude had begun to break in pieces the pinnace, after having taken every thing out of her that was loose: on the return of Pareah, however, they were again dispersed, and some of the oars restored, after which the gentlemen were glad to get off in safety. Before they reached the ship Pareah overtook them in a canoe, and delivered the midshipman's cap which had been taken from him in the scuffle; he also joined noses with them in token of friendship, and desired to know whether Captain Cook would kill him on account of what had happened. They assured him that he would not, and made signs of reconciliation on their part. On this he left them, and paddled over to the town of Kavaroah; and that was the last time that he was seen by the English. In the night-time the sentinels were much alarmed by shrill and melancholy sounds from the adjacent villages, which they took to be the lamentations of the women. Next day it was found that the large cutter of the Discovery had been carried off in the night-time; on which Captain Cook ordered the launch and small cutter to go under the command of the second lieutenant, and to ly off the east point of the bay in order to intercept all the canoes that might attempt to get out, and if necessary to fire upon them. The third lieutenant of the Resolution was dispatched to the western part of the bay on the same service; while the master was sent in pursuit of a large double canoe already under sail, and making the best of her way out of the harbour. He soon came up with her, and by firing a few shots, obliged her to run on shore, and the Indians to leave her. This was the canoe belonging to a chief named *Omea*, whose person was reckoned equally sacred with that of the king, and to the neglect of securing him we may attribute the succeeding disaster. Captain Cook now formed the resolution of going in person to seize the king himself in his capital of Kavaroah; and as there was reason to suppose that he had fled, it was his design to secure the large canoes, which on that account he caused to be hauled up on the beach. With this view he left the ship about seven o'clock in the morning of Sunday the 14th of February, being attended by the lieutenant of marines, a serjeant, corporal, and seven private men. The crew of the pinnace, under the command of Mr Roberts, were also armed; and as they rowed towards the shore, the captain ordered the launch to leave her station at the opposite point of the bay, in order to assist his own boat. Having landed with the mariners at the upper end of the town, the Indians flocked round him, and prostrated themselves before him. No sign of hostility, nor even much alarm, appeared; the king's sons waited on the commander as soon as he sent for them, and by their means he was introduced to the king, who readily consented to go on board; but in a little time the Indians began to arm

themselves with long spears, clubs, and daggers, and to put on thick mats which they use as defensive armour. This hostile appearance was greatly augmented by an unlucky piece of news which was just now brought by a canoe, *viz.* That one of the Indian chiefs had been killed by the people in the Discovery's boats. On this the women, who had hitherto sat on the beach conversing familiarly, and taking their breakfasts, removed, and a confused murmur ran through the crowd. An old priest now appeared with a cocoa-nut in his hand, which he held out as a present to Captain Cook, singing all the while, and making a most troublesome noise as if he meant to divert the attention of the Captain and his people from observing the motions of the Indians, who were now every where putting on their armour. Captain Cook beginning to think his situation dangerous, ordered the lieutenant of the marines to march towards the shore, as he himself did, having all the while hold of the king's hand, who very readily accompanied him. The Indians made a lane for them to pass; and as the distance they had to go was only about 50 or 60 yards, and the boats lay at no more than five or six yards distance from land, there was not the least apprehension of the catastrophe which ensued. The king's youngest son Keowa went on board the pinnace without the least hesitation, and the king was about to follow, when his wife threw her arms about his neck, and, with the assistance of two chiefs, forced him to sit down. The Captain might now have safely got aboard, but did not immediately relinquish the design of taking the king along with him. Finding at last, however, that this could not be accomplished without a great deal of bloodshed, he was on the point of giving orders for the people to reembark, when one of the Indians threw a stone at him. This insult was returned by the Captain, who had a double barrelled piece, by a discharge of small shot from one of the barrels. This had little effect, as the man had a thick mat before him; and as he now brandished his spear, the Captain knocked him down with his musket. The king's son, Keowa, still remained in the pinnace, and the detaining him would have been a great check upon the Indians; but unluckily Mr Roberts, who commanded the pinnace, set him ashore at his own request soon after the first fire. In the mean time another Indian was observed in the act of brandishing his spear at the commander; who thereupon was obliged to fire upon him in his own defence. Missing his aim, however, he killed one close by his side; upon which the serjeant observing that he had missed the man he aimed at, received orders to fire also, which he did, and killed him on the spot. This repressed the foremost of the Indians, and made them fall back in a body; but they were urged on again by these behind, and discharged a volley of stones among the marines, who immediately returned it by a general discharge of their muskets; and this was instantly followed by a fire from the boats. Captain Cook expressed his astonishment at their firing, waved his hand to them to cease, and called to the people in the boats to come nearer to receive the marines. This order was obeyed by Mr Roberts; but the lieutenant who commanded the launch, instead of coming nearer, put
off

Cook.

Cook. off to a greater distance: and by this preposterous conduct deprived the unfortunate commander of the only chance he had for his life: for now the Indians, exasperated by the fire of the marines, rushed in upon them and drove them into the water, leaving the Captain alone upon the rock. A fire indeed was kept up by both boats; but the one was too far off, and the other crowded with the marines, so that they could not direct their fire with proper effect. Captain Cook was then observed making for the pinnace, carrying his musket under his arm, and holding his other hand on the back-part of his head to guard it from the stones. An Indian was seen following him, but with marks of fear, as he stopped once or twice seemingly undetermined to proceed. At last he struck the Captain on the back of the head with a club, and then precipitately retreated. The latter staggered a few paces, and then fell on his hand and one knee, and dropped his musket. Before he could recover himself, another Indian stabbed him with a dagger in the neck, though still without putting an end to his life. He then fell into a pool of water knee-deep, where others crowded upon him; but still he struggled violently with them, got up his head, and looked towards the pinnace as if soliciting assistance. The boat was not above five or six yards distance; but such was the confused and crowded state of the crew, that no assistance could be given him. The Indians then got him under again, but in deeper water, though he still continued to struggle, and once more got his head up; but being quite spent, he turned towards the rock as if to support himself by it, when a savage struck him with a club, which probably put an end to his life, as he was never seen to struggle any more. The savages hauled his lifeless body up on the rocks, and used it in the most barbarous manner, snatching the daggers out of one another's hands, in order to have the pleasure of mangling it. If any thing could add to the misfortune of this celebrated navigator's death, it was, that even his mangled remains were not saved from the hands of the barbarians. The lieutenant already mentioned, who, by his removing to a distance when he ought to have come on shore, seemed to have been the occasion of his death, returned on board without making any attempt to recover his body; though it appeared from the testimonies of four or five midshipmen who arrived soon after at the fatal spot, that the beach was almost deserted by the Indians, they having at last yielded to the continual fire from the boats. The officer alleged in his own excuse for removing at first from the shore, that he mistook the signals; but be this as it will, the complaints against him were so many and so great, that Captain Clerke was obliged publicly to take notice of them, and to take the depositions of his accusers in writing.—These papers, however, were not found, and it is supposed that the Captain's bad state of health had induced him to destroy them. After all we are informed, that, in the opinion of Captain Philips, who commanded the marines, it is very doubtful whether any effectual relief could have been given to the commander, even if no mistake had been committed on the part of the lieutenant. The author of all the mischief was Pareaah, the chief already mentioned, who had employ-

ed people to steal the boat in the night-time. The king was entirely innocent both of the theft and the murder of Captain Cook; but the latter was perpetrated by some chiefs who were his near relations. The chief who first struck him with a club was named *Karimans raba*, and he who stabbed him with the dagger was called *Nooah*. The latter, Mr Samwell, from whose narrative this account is taken observes, was stout and tall, had a fierce look and demeanor, and united in his person the two properties of strength and agility more than he had ever observed in any other person.—Both of them were held in great estimation by their countrymen on account of the hand they had in his death.

By reason of the barbarous disposition of the Indians, it was found impossible to recover Captain Cook's body after the first opportunity already mentioned was lost. By dint of threats and negotiations, however, some of the principal parts were procured with great difficulty; by which means the navigators were enabled to perform the last offices to their much respected commander. These being put into a coffin, and the service read over them, were committed to the deep with the usual military honours on the 21st of February 1779. Soon after his death a letter was issued by M. de Sartine, secretary to the marine department of France, and sent to all the commanders of French ships, importing, that Captain Cook should be treated as the commander of a neutral and allied power; and that all captains of armed vessels who might meet with him, should make him acquainted with the king's orders, but at the same time let him know, that, on his part, he must refrain from hostilities. This humane and generous proceeding, with regard to France, originated from M. Turgot; but the thought seems first to have struck Dr Franklin. Thus much at least is certain, that the doctor, while ambassador from the United States, wrote a circular letter to the American naval commanders something to the purport of that already mentioned. The Spaniards, however, acted in a very different manner, having given orders to seize Captain Cook if an opportunity of doing it should occur, from a foolish idea that the knowledge of the western coast of America, or of a northern passage into the Pacific Ocean, might be attended with consequences prejudicial to their dominions in that quarter of the globe.

Captain Cook was a man of plain address and appearance, but well looked, and upwards of six feet high. His head was small, and he wore his hair, which was brown, tied behind. His face was full of expression; his nose exceedingly well shaped; his eyes, which were small and of a brown cast, were quick and piercing; his eye-brows prominent, which gave his countenance altogether an air of austerity. Notwithstanding this, it was impossible for any one to excel him in humanity, as is evident from the whole tenor of his behaviour both to his own people and the many savage nations with whom he had occasion to interfere. This amiable property discovered itself even in the final catastrophe of his life; his utmost care being directed to the preservation of his people, and the procuring them a safe retreat to their boats. And it can not be enough lamented, that he who took so much

Cook.

Cook.

care of others, should have perished in such a miserable manner for want of being properly supported by them. The perseverance with which he pursued every object which happened to be pointed out as his duty was unequalled. Nothing ever could divert him from what he had once undertaken; and he persevered in the midst of dangers and difficulties which would have disheartened persons of very considerable strength and firmness of mind. For this he was adapted by nature, having a strong constitution, inured to labour, and capable of undergoing the greatest hardships. His stomach bore without difficulty the coarsest and most ungrateful food; and he submitted to every kind of self-denial with the greatest indifference. To this strength of constitution he joined an invincible fortitude of mind, of which the circumnavigation of New Holland, and his voyage towards the South Pole, furnish innumerable instances. He was master of himself on every trying occasion; and the greater the emergency, the greater always appeared his calmness and recollection; so that in the most dangerous situations, after giving proper directions to his people, he could sleep soundly the hours that he had allotted to himself. That he possessed genius in an eminent degree cannot be questioned: his invention was ready, and capable not only of suggesting the most noble objects of pursuit, but the most proper methods of attaining them. His knowledge of his own profession was unequalled; and to this he added a very considerable proficiency in other sciences. In astronomy, he became so eminent, that he was at length enabled to take the lead in making the astronomical observations during the course of his voyages. In general learning he likewise attained to such a proficiency as to be able to express himself with clearness and propriety; and thus became respectable as the narrator, as well as the performer, of great actions. He was an excellent husband and father, sincere and steady in his friendship, and possessed of a general sobriety and virtue of character. In conversation he was unaffected and unassuming; rather backward in pushing discourse, but obliging and communicative to those who wished for information; and he was distinguished by a simplicity of manners almost universally the attendant of truly great men. With all these amiable qualities, the Captain was occasionally subject to an hastiness of temper, which has been set forth in its utmost extent, if not exaggerated by some, though but few, who are not his friends: but even these, as well as others, when taking a general view of his character, are obliged to acknowledge that he was undoubtedly one of the greatest men of his age.

Captain Cook is distinguished as an author by an account of his second voyage written by himself. His first voyage, as well as that of several other navigators, had been recorded by Dr Hawkesworth; but on the present occasion it was not judged necessary to have recourse to any other than the pen of the author himself; and his journal, with a few occasional alterations, and being divided into chapters, was sufficient for the purpose. The style is clear, natural, and manly; and it is not improbable that even a pen of more studied elegance could not have made it appear to more advantage. When it appeared, which was not till some time after the author had left England, the book was recommend-

VOL. V.

ed by the accuracy and excellency of its charts, and by a numerous collection of nine engravings done from the original drawings of Mr Hodges.

Cook.

We cannot conclude this article without taking some notice of the honours paid to our celebrated navigator after his death, both by his own countrymen and those of other nations. Perhaps indeed it may be said with justice, that foreigners hold his memory in an estimation unequalled even in England; a remarkable proof of which occurs in the eulogy upon him by Michael Angelo Gianetti, read in the Florentine academy on the 9th of June 1785, and published at Florence the same year. It is said also, that one of the French literary academies proposed a prize for the best eulogium on Captain Cook; and many poetical testimonies of his merit appeared in our own language. The Royal Society of London resolved to testify their respect for him by a medal, for which purpose a voluntary subscription was opened. A gold medal was given to such of the fellows as subscribed 20 guineas, and a silver one for those who subscribed smaller sums; and each of the other members received one of bronze. Those who subscribed 20 guineas were, Sir Joseph Banks, president, the Prince of Anspach, the Duke of Montague, Lord Mulgrave, and Messrs Cavendish, Peachy, Perrin, Poli, and Shuttleworth. Many designs were proposed on the occasion; but the following was that which was actually struck. On one side was the head of Captain Cook in profile, with this inscription round it, JAC. COOK OCEANI INVESTIGATOR ACCERRIMUS; and on the exergue, REG. SOC. LOND. SOCIO SUO. On the reverse is a representation of Britannia holding a globe, with this inscription round her, NIL INTENTATUM NOSTRI LIQUERE; and on the exergue, AUSPICIIS GEORGII III. One of the gold medals struck on this occasion was presented to the king, another to the queen, and a third to the prince of Wales. Another was sent to the French king on account of the protection he had granted to the ships; and a second to the empress of Russia, in whose dominions they had been treated with every expression of friendship and kindness. Both these great personages condescended to accept of the present with marks of satisfaction. The French king wrote a handsome letter to the Society, signed by himself, and undersigned by the Marquis de Vergennes; and the Empress of Russia commissioned Count Osterman to signify to Mr Fitzherbert the sense she had of the value of the present, and that she had caused it to be deposited in the museum of the Imperial Academy of Sciences. As a further testimony of the pleasure she derived from it, the empress presented to the Royal Society a large and beautiful gold medal, containing on one side the effigies of herself, and on the other a representation of the statue of Peter the Great. After the general assignment of the medals, which took place in 1784, there being a surplus of money still remaining, it was resolved by the president and council, that an additional number of medals should be thrown off, to be disposed of in presents to Mrs Cook, the Earl of Sandwich, Dr Benjamin Franklin, Dr Cooke provost of King's College Cambridge, and Mr Planta. At the same time it was agreed that Mr Aubert should be allowed to have a gold medal of Captain Cook on his

3 E

paying

Cook.

paying for the gold and the expence of striking it, in consideration of his intention to present it to the King of Poland.

During the two visits of the ships at Kamtschatka, Colonel Behn, the commandant of that province, had bestowed, in the most liberal manner, every kind of assistance which it was in his power to bestow; and such was the sense entertained by the lords of the admiralty of the kindness he had showed, that they determined to make him a present of a magnificent piece of plate, with an inscription expressive of his humane and generous conduct. The inscription was drawn up by Dr Cooke, and afterwards submitted to the opinion and correction of some gentlemen of the first eminence in classical taste.

Sir Hugh Palliser, who had all along displayed an uncommon respect and kindness for Captain Cook, likewise displayed his regard for his memory in a most eminent manner. On his estate in Buckinghamshire he constructed a small building with a pillar, containing the character of Captain Cook, which is given at the end of the introduction to the last voyage. This was drawn up by the Honourable Admiral Forbes, admiral of the fleet and general of the marines, to whom Captain Cook was known only by his merit and extraordinary actions.

Amidst all these expressions of unavailing praise, it was not forgotten to show some essential service to the widow and family of our celebrated navigator. A memorial for a pension of L 200 *per annum* was given in to the king from the commissioners of the admiralty, and signed by the Earl of Sandwich, Mr Butler, the Earl of Lisburne, Mr Penton, Lord Mulgrave, and Mr Mann. His majesty complied with the request of the memorial, and the grant was passed through the usual forms with all possible speed. By this L.200 *per annum* were settled on the widow during life; and L.25 a-year on each of her three sons. After her death the L.200 was to be divided between her children; a fourth was allotted to Captain King, and the remaining fourth to Mr Bligh and the representatives of Captain Clerke.

The last honour paid to the memory of Captain Cook was the granting a coat of arms to the family, which was done by patent on the 3d of September 1735; and of this we have the following description. Azure, between the two polar stars: Or, a sphere on the plane of the meridian, north pole elevated, circles of latitude for every ten degrees, and of longitude for every 15; showing the Pacific Ocean between 60° and 240° west, bounded on one side by America and on the other by Asia and New Holland; in memory of the discoveries made by him in that ocean, so very far beyond all former navigators. His track thereon is marked with red lines; and for crest, in a wreath of the colour is an arm imbowed, vested in the uniform of a captain of the Royal Navy. In the hand is the Union Jack, on a staff proper. The arm is encircled by a wreath of palm and laurel.

Cook's Discoveries. The number of countries discovered by Captain Cook, and which had never before been visited by any European, is very considerable; but it was a remarkable property of our celebrated navigator, that, wherever he touched, every thing relative to the place was determined with such accuracy

and precision, that all former accounts seemed to go for nothing, and the discovery to belong entirely to Captain Cook. Thus it was not unusual with him to make discoveries in places already well known; and thus his voyages have conveyed a vast fund of knowledge perfectly original. Though the accounts of the different places, therefore, at which he touched, are particularly given under their names in the order of the alphabet, we shall in this article endeavour to join the whole together in such a manner as to give the reader some idea of the benefit which has accrued to science from voyages attended not only with much expence and labour, but even with the loss of the celebrated navigator's life.

When he set out in the Endeavour in the year 1768, the first place touched at was Madeira. Here Mr Banks and Dr Solander, besides some additions to the science of botany, discovered undoubted marks of the island having a volcanic origin. On leaving this place they found it necessary to touch at Rio de Janeiro for provisions; and during the run thither the commander had an opportunity of determining the cause of the luminous appearance of the sea. On the 29th of October they observed that the water frequently emitted flashes like lightning, though much smaller; but such was their frequency, that eight or ten of them were visible almost at the same moment. This appearance they found, both at this time and afterwards, to arise from a small kind of animal with which the water abounded. While staying at Rio de Janeiro, a melancholy observation was made of the prodigious waste of human lives with which the working of the Portuguese gold mines was attended, no fewer than 40,000 negroes being annually imported for this purpose, none of whom, it seems, survive the labour of the year; and our navigator was informed, that in 1766 this number was so far short, that they were obliged to draught 20,000 more from the town of Rio itself. Proceeding from thence to the southern coasts of America, he had an opportunity of determining a question of great importance to navigation, viz. whether, in sailing to the Pacific Ocean, it is better to pass through the straits of Magellan, or to double Cape Horn and sail through those of Le Maire? From Captain Cook's voyage it appears, contrary to the opinion of former navigators, that the latter is the preferable passage. Through this he was only 33 days in coming round the land of Terra del Fuego from the east entrance of the strait of Le Maire till he had advanced about 12 degrees to the westward, and three and a half to the northward, of Magellan's straits. During all this time the ship scarcely received any damage, though if he had passed the other way he could not have accomplished his passage in less than three months, besides immense fatigue to his people and damage to the ship. In these stormy regions, however, he experienced the same inconveniences felt by other navigators; such a sea being met with off Cape Diego, that the ship frequently pitched her bowsprit under water. Here also the excessive cold and mutability of weather in these southern regions was experienced in such a manner as had nearly proved fatal to some of the gentlemen who sailed along with him. Dr Solander, Mr Banks, Mr Monkhouse the surgeon, and Mr Green the astronomer, with their attendants and servants, set out on a botani-

Cook's Discoveries.

1. Madeira, a volcanic island.

2. Luminous appearance of the sea occasioned by animals.

3. Vast number of negroes destroyed by the working the gold mines.

4. Best passage into the Pacific Ocean through the Straits le Maire.

5. Excessive storms and cold in the southern regions.

cal expedition while the ship lay at anchor in the bay of Good Success. It was then the middle of summer, and the morning on which they set out was as mild and warm as it usually is in the month of May in England: but having ascended a mountain for the purpose of botanizing, they were surpris'd by such storms of snow and hail that they could not get back that night. Dr Solander, who warn'd them of their danger, that people when about to perish with cold were seiz'd with a violent inclination to sleep, was the first who seem'd likely to fall a victim to it; and it was not in the power of his companions to keep him from sitting down for that purpose. He was awak'd in a few minutes; but during this short interval his feet had become so much diminished by the contraction of the vessels, that his shoes fell off from them when he was again made to rise. Even these dreary regions, however, are not without inhabitants, whom our voyagers justly concluded to be the lowest of the human species. Indeed, considering the little convenience they have, it is wonderful how they can resist the severity of the climate, for they are almost without clothing; they dwell in miserable hovels, which admit both the wind and snow or rain; and they have not any utensil for dressing their food. Nevertheless, these miserable creatures, as they appear'd to our navigators, seem'd to have no wish to possess more than they enjoy'd; and they were absolutely indifferent about every thing that was offer'd them, except large beads which they would take as ornaments. Hence Dr Hawkesworth, who wrote the account of the voyage, concludes, that these people may be on a level with ourselves with respect to the real happiness they enjoy.

On the 26th of January 1769 our navigators left Cape Horn; and from that time to the first of March, during which they run no less than 660 leagues, met with no current by which the ship was affect'd. Hence it is probable, that during all this time they had never been near any land, the currents of the ocean being usually met with in the neighbourhood of islands. Several islands, however, were discover'd before they reach'd Otaheite, on which they bestow'd the names of Lagoon Island, Thrum-cap, Bow Island, the Groups, Bird Island, and Chain island. All these seem'd to be inhabited, and were cover'd with a most delightful verdure; which appear'd to the greater advantage, as our navigators had for a long time seen no land but the dreary hills and wastes of Terra del Fuego. Having arriv'd at Otaheite, they set about observing the transit of Venus over the sun, which indeed was the main purpose for which the voyage had been undertaken. The anxiety which they underwent when the time of the expect'd phenomenon approach'd may easily be imagin'd, as the whole depend'd on the circumstance of a clear sky, which though more readily to be expect'd in that climate than one more to the northward, was still a matter of uncertainty. In consequence of some hints which had been given by the Earl of Morton, Captain Cook determin'd to send out two parties to different places to make the observations; by which means there would be a chance of success, even if those at Otaheite should fail. For this purpose he sent Mr Gore in the long boat to Eimeo, a neighbouring island, along with Mr Monkhouse, Mr Banks, and Mr Sporing, who were furnish'd with proper instruments by

Mr Green the astronomer. Messrs Hicks, Clerke, Pickersgill, and Saunders, were sent in the pinnace to a convenient spot to the eastward of the main observatory, where they were likewise order'd to make observations with such instruments as they had. The day on which the transit happen'd was the 3d of June 1769, when they had the satisfaction to see the sun rise without a cloud; and as the weather continu'd equally clear, throughout the day, there was the best opportunity of making the observations in a proper manner. All of them saw an atmosphere or dusky cloud round the planet, which disturb'd their observation, and probably caus'd them to differ from each other more considerably than they would otherwise have done. According to Mr Green, the times of ingress and egress of the planet were as follow:

	MORNING	h.	min.	sec.
First external contact,	-	9	25	42
First internal contract, or total immersion,	9	44	4	
AFTERNOON				
Second internal contact,	-	3	14	8
Second external contact, or end of the transit,	-	3	32	10

From these observations the latitude of the observatory was found to be 17° 29' 15" S. and the longitude 149° 32' 30" W. of Greenwich. Several curious remarks were made both on the country itself and on the inhabitants. Mr Banks, in an excursion up the country, discover'd many traces of volcanic fire; the stones, like those of Madeira, had evidently the appearance of being burnt, and the very clay on the hills had the same appearance. The natives, though addicted to thieving, appear'd in general harmless and friendly, and very ready to supply the ship with necessaries in exchange for such things as they want'd. The articles on which they set the greatest value were hatchets, axes, large nails, spikes, looking glasses, and beads. They were also fond of fine linen, whether white or printed; but an axe of the value of half a crown would buy more provisions than a piece of cloth of the value of 20 shillings. They are very fickle and inattentive; so that it was not possible to engage them to pay any regard to the worship of the Deity which they saw perform'd before them; nor would they attend to any explanation of it that was given them. They are not, however, destitute of a religion of their own; and are particularly careful of the repositories of the dead, which they will not allow to be violat'd on any account. Of this Captain Cook had an instance, when some of his people offer'd to take down an inclosure of one of these repositories. They were violently oppos'd by the natives, who sent a messenger to acquaint them they would never suffer any such thing; and the only insult that was ever offer'd to an Englishman by the people of this island was on a similar account. From Otaheite our navigators carried with them Tupia, formerly high-priest of the country and prime minister to Queen Oberea. From his practice it appear'd that the priests of Otaheite, as well as elsewhere, take care to place themselves a step nearer the Deity than the common people, and to use the deceptions too frequently put in practice by such mediators. While on board the Endeavour, he frequently pray'd to his god *Tane* for a wind; and according to

[8]
Otaheite a volcanic island.
9 Account of the natives.

Cook's
Discove-
ries.

his own account never failed of success. This, however, he took care to ensure; for he never began his prayers till he perceived the breeze already on the water, and so near that it must reach the ship before they could well be ended. It was observed likewise of the people of Otaheite, that they had their bards or minstrels, who went about the country with musical instruments. The band whom they saw at this time consisted of two players on flutes and three drummers; the latter accompanying the flutes with their voices. Their songs were made extempore, and the English themselves were generally the subject.

From Otaheite our navigators sailed towards a neighbouring island named *Tethuroa*; but finding it small, low, and without any settled inhabitants, the Captain chose rather to direct his course towards Huaheine and Ulietea, which he was informed were well inhabited. These had never been visited by any European ship; but the inhabitants, though peaceable and friendly, were very slow and cautious in trading, so that the Captain was obliged to bring out his hatchets to market; a commodity which he had hoped might have been concealed from those who had never seen an European ship before. On his arrival at Ulietea he found, by the discourse of Tupia, that the inhabitants of a neighbouring island named *Bolabola* were of such a martial disposition as to be the terror of those of Huaheine, Ulietea, and others, inasmuch that he apprehended great danger to our navigators should they touch at an island which the *Bolabola* men had lately conquered. This, however, had so little effect upon Captain Cook, that he not only landed on the island already mentioned, but took possession, in his Majesty's name, of *Bolabola* itself, together with Ulietea, Huaheine, and another named *Otaha*, which were all visible at once. During their stay here they paid a visit to Opoony, the formidable monarch of *Bolabola*; whom, to their surprise, they found a feeble wretch, withered and decrepid, half blind with age, and so stupid that he seemed scarce to be possessed of a common degree of understanding. About these islands they spent six weeks, bestowing upon them the name of the *Society Isles*, on account of their being so near to each other. They are six in number, Ulietea, Huaheine, *Bolabola*, *Otaha*, *Tubai*, and *Maurua*. The smaller ones in their neighbourhood are *Tethuroa*, *Eimeo*, *Tapoamanoa*, *Oatara*, *Opururu*, *Tamou*, *Toa-hoatu*, and *Whennuaia*.

Comet of
1769 ob-
served.

Leaving the *Society Islands*, which are situated between Lat. 16. 10. and 16. 55. S. and between 150. 57. and 152. W. from the meridian of Greenwich, they fell in with the island of *Oheteroa*, situated in S. Lat. 22. 27. and W. Long. 150. 47.; but this was found to be destitute of any harbour or safe anchorage, and the disposition of the inhabitants so hostile that they could not by any means be conciliated, so that no attempts were made to land. From *Tupia* Captain Cook learned that there were several islands in the neighbourhood, which our navigator conjectured to be *Boscawen* and *Keppel's Islands*, discovered by Captain Wallis; but without spending more time in exploring these, he set sail to the southward in search of a continent.

Our voyagers left *Oheteroa* on the 15th of August 1769, and on the 30th had a view of the comet which

appeared that year; its tail subtending on an angle of 42 degrees. This proved a new source of apprehension to *Tupia*, who instantly cried out, that as soon as it was seen at *Bolabola*, the people of that country would attack those of *Ulietea*, who would undoubtedly be obliged to fly with precipitation to the mountains to save their lives. On the 6th of October they discovered land, which from its size, and the enormous mountains observable on it, was supposed by the gentlemen on board to be part of *Terra Australis incognita*; but on farther examination it was found to be part of *New Zealand*. Here the inhabitants were found to speak a dialect of the language of *Otaheite*, so that they could understand *Tupia*, and he them; yet so extremely hostile were their dispositions, that not the smallest intercourse could be held with them; nor could any thing necessary for the ships be procured excepting wood: so that the name Captain Cook thought proper to bestow on this part of the country was *Poverty-Bay*. By the natives it is called *Taoneroa*, and lies in S. Lat. 38. 42. and W. Long. 181. 36. During the time of his stay in that part of the world the Captain circumnavigated almost the whole country of *New Zealand*, which he found to consist of two islands separated from each other by a narrow strait, which, from its discoverer, has obtained the name of *Cook's Strait*. In some places the disposition of the inhabitants was as favourable as could be wished; so that *Dr Solander*, *Mr Banks*, and other gentlemen, had an opportunity of exploring the country in some degree, with a view to discover its natural productions. In one of these excursions, as they passed through a valley, the hills on each side of which were very steep, they were suddenly struck with the sight of a very extraordinary natural curiosity. It was a rock perforated through its whole substance, so as to form a rude but stupendous arch or cavern, opening directly to the sea. This aperture was 75 feet long, 27 broad, and 45 in height, commanded a view of the bay and the hills on the other side, which were seen through it; and opening at once on the view, produced an effect far superior to any of the contrivances of art. On that part of the coast, which, from having observed a transit of *Mercury*, they named *Mercury Bay*, oysters were found in such plenty, that they might have loaded not only their boats but even their ship with them. They were about the same size with those met with in this country; and on account of their being found in such plenty, and likewise that the adjacent country abounds with conveniences, Captain Cook was at great pains to point out the situation of the place. By his observations, the latitude of *Mercury Bay* is 36° 48' 28" S.

Leaving this bay our commander proceeded to explore other parts of the country, which by their account seems to abound with rivers. Two large ones were met with in *Mercury Bay*; one of which, from the abundance of oysters found at its mouth, was called *Oyster river*; the other they named *Mangrove river*, from the number of mangrove trees growing there. A third, which they called *Thames*, was met with in that part called the *Bay of Islands*, up which they sailed 14 miles. Its banks were every where adorned with lofty trees, which they had likewise observed in other parts of the country. They were too heavy for masts,

mafts, but would make the fineft planks imaginable; and as they refembled the pitch pine, the timber of which is lightened by tapping, the carpenter was of opinion that they might thus be rendered more proper for mafts than any European timber. One of thefe trees meafured 19 feet 8 inches in circumference at the height of fix feet from the ground, and was no lefs than 89, with very little taper, to the branches, fo that the lieutenant fuppofed it muft contain 356 feet of folid timber. In Queen Charlotte's Sound, the country was little other than one vaft forest, with plenty of excellent water; and the coaft abounding with fifh. As the fhip lay at the diftance of only a quarter of a mile from the fhore, they were agreeably entertained with the finging of an infinite number of fmall birds, which formed a melody greatly fuperior to any thing they had ever heard before. The mufic of thefe little chorifters feemed to be like fmall bells, moft exquisitely tuned, though probably the diftance and intervention of the water had a confiderable effect in heightening it. They began to fing about two in the morning, and continued their fong till fun-rife, after which they were filent all the day, refembling in this refpect the nightingales of our own country.

17
General
description
of the coun-
try.

The time which Capt. Cook fpent in exploring the coasts of New Zealand was not lefs than fix months. By his refearches it was fhown to confift of two large iflands, the moft northerly of which is called *Eaheinomauwe*, and the moft fouterly *Tovy*, or *Tavai Poenannoo*; though it is not certain whether the whole fouterly ifland or only a part of it is comprehended under this name. This ifland feems to be barren and mountainous, but *Eaheinomauwe* has a much better appearance; and it was univerfally believed by the gentlemen on board, that all kinds of European grain, as well as garden plants and fruit, would flourifh in the greateft abundance and perfection; and from the vegetables found here it was concluded that the winters are not more fevere than thofe of England, and it was known by experience, that the fummer was not hotter, though the heat was more equal than in this country. Here are no quadrupeds except dogs and rats; and the latter are fo fcarce, that they efaped the notice of many on board. The birds are not numerous, and the gannet is the only one of the European kind that was obferved. The infefts are equally fcarce; but the fea makes abundant recompence for this fcarcity of land animals; every creek fwarms with fifh, equally delicious with thofe in this country. The forests are of vaft extent, and filled with excellent timber trees, the largeft, ftraighteft, and cleaneft that Mr Cook had ever feen. There is here one plant which answers the purpofes of both hemp and flax, and excels all other of the kind that has been met with in other parts of the world. If the fettling of New Zealand therefore fhould ever be deemed an object worthy of the attention of Great Britain, Captain Cook was of opinion, that the beft place for eftablifhing a colony would be either on the banks of the Thames or in the Bay of Iflands; each of thefe places having the advantage of an excellent harbour. Settlements might be extended, and a communication made with the inland parts of the country by means of the river; and veffels eafily conftituted of the excellent timber with which the country every where abounds.

18
Proper
place for
fettling a
colony
there.

The inhabitants of New Zealand are in a very barbarous ftate, and have a degree of ferocity unknown to the inhabitants of the South-Sea iflands, though they feem to have the fame origin. During their refidence there, our navigators had the moft convincing evidences of their being cannibals, and accuftomed to devour the bodies of their flain enemies. Notwithftanding thefe barbarous practices, however, they feemed to enjoy a ftate of uninterrupted health. In all the vifits made to their towns, none was ever perceived who had the leaft bodily complaint, not even the flighteft eruption on the fkin. This extraordinary degree of health was likewise manifefted by the eafe with which their wounds were healed without the fmalleft application, as well as by the number of old men with which the ifland abounded. Many of thefe, by the lofs of their hair and teeth, feemed to be extremely old, but none of them were decrepid; and though inferior in ftrength to the young men, they came not behind them in the leaft with regard to cheerfulness and vivacity. The univerfal and only drink of the New Zealanders is water.

Our navigator had now explored three-fourths of that part of the globe where the fouterly continent was fuppofed to lie, without being able to find it; and his voyage had demonftrated, that the lands feen by former navigators could not have been parts of fuch a continent, though, as he had never proceeded farther to the fouthward than 40 degrees, the arguments for it were not as yet entirely overthrown. Mr Cook, however, did not at this time proceed farther in the fearch of fuch a continent, but failed from New Zealand to the coasts of New Holland, where he anchored in Botany Bay on the 20th of April. Here he found a few favage inhabitants more barbarous and degenerate than any that had yet been obferved. Their language was harfh and diffonant, totally unintelligible even to Tupia; they appeared to have little curiofity, and fet no value upon any prefent that could be made them. The moft remarkable circumftance in this country feems to be its extreme fcarcity of water; not a fingle ftream of any confequence having ever been obferved by any navigator. Some were of opinion indeed, that Moreton's Bay, in S. Lat. 26. 56. and W. Long. 206. 28. opens into a river; though the only reafon they had for this opinion was, that the fea looked paler in that part than ufual, and the land at the bottom part of the bay could not be feen. At this time, however, the matter could not be determined by experiment, on account of the wind being contrary. The fcarcity of water here is the more furprifing, on account of the vaft extent of the country, and likewise its having abundance of tolerable high hills. In this ifland there were found many curious plants and animals; and it was found, that in feveral places the magnetical needle was affected to fuch a degree as to vary its pofition even to 30 degrees. At one time it varied no lefs than two points on being removed to the diftance of only 14 feet. Some of the loofe ftones being taken up and applied to the needle produced no effect; but Mr Cook was of opinion that the whole phenomenon was to be afcribed to iron ore in fome of the mountains, and of which traces had been already met with. This irregularity continued in fome degree even at fea; for when the fhip was clofe under Cape Upftart, the variation

ries.

ation of the needle in the evening of the 4th of June was 9. East, and next morning only 5. 35. ; and this was in like manner accounted for from iron ore, or some magnetical matter below the surface of the ground. The great island has many other small ones round it; several of which were visited by our navigators. One of them named *Eagle Island*, seemed to be inhabited by a monstrous kind of birds, the nest of one of which measured no less than 26 feet in circumference and two feet eight inches in height; and in the *Philosophical Transactions*, vol. xx. there is an account of one of these nests still larger; but the bird to which it belouged was not seen. That which our navigators saw was built of sticks, and lay upon the ground.

23
Vast extent
of the coun-
try.

The country which goes by the name of *New Holland* is by far the largest island in the world. Its eastern part, called *New South Wales*, now first explored by Captain Cook, extends upwards of 2000 miles in length, if the coast were reduced to a straight line. Though inhabited, as we have already said, by very barbarous savages, their number appears to bear no proportion to the extent of their territory. The intercourse they had with our navigators was so small, that they could pick up but a few words of their language. As a British settlement, however, is now made in that country, there is no doubt that much more exact and accurate accounts will soon be obtained than even the diligence and attention of Captain Cook could collect on such a transient visit.

24
Separated
by straits
from New
Guinea.

In this voyage our navigator, besides exploring the eastern part of the island, which had never been done before, discovered that it was separated from the island of New Guinea, to which it had formerly been thought to join. The two countries are separated by a strait to which the commander gave the name of *Endeavour Strait*. The north entrance of this lies in S. Lat. 10. 39. and W. Long. 218. 36. the passage is formed by the main land and a congeries of islands to the north, on which our navigator bestowed the name of *Prince of Wales's Islands*. These are very different both in height and extent; and the Captain was of opinion that several passages might be found out among them. On the coast of New Holland opposite to New Guinea are found cockles of an immense size; some of them being as much as two men could move, and containing 25 pounds of good meat. In these seas as well as on the coasts of Brazil, our navigators found the surface of the water covered with a kind of scum, called by the sailors *sea-spawn*. It was examined by Mr Banks and Dr Solander; but they could determine nothing farther than that it was of vegetable origin.

25

26
Unaccount-
able me-
thod of the
natives of
letting off
fires.

The natives of New Guinea were so hostile that no discoveries of any consequence could be made. They resembled the New Hollanders in stature, and having short cropped hair. Like them too they were absolutely naked, but somewhat less black and dirty. They had a surprising method of letting off a kind of fires, exactly resembling the flashes of fire-arms, but without any explosion. It was not known in what manner this was done, as they were never near enough to make a particular observation. Those who discharged them had a short piece of stick which they swung sideways from them, upon which there issued the fire and smoke just mentioned. This seems to have been in-

tended as a defiance; for they had no effect as offensive weapons, and others were armed with bows and arrows. The country appeared extremely pleasant and fertile. The place at which they touched lies in S. Lat. 6. 15,

As the condition of the *Endcavour* was now very much shattered by having sailed so long in these dangerous seas, the commander determined to make the best of his way for Batavia in order to refit. In this voyage he first passed two unknown islands without touching at either of them. They were supposed to belong to the *Aurora* islands; but if this be the case, the latter must be laid down at too great a distance from New Guinea. The *Weasel Isles*, laid down by former navigators at about 20, or 25 leagues from the coast of New Holland, were not seen; for which reason Mr Cook is of opinion that they are erroneously laid down.

Passing by the islands of Timor, Timor-Lavet, Rotta, and Seman, they next arrived at the island of Savu, where a settlement had lately been made by the Dutch. In this voyage they had the satisfaction of observing the *aurora australis*, which here seemed to differ in some respects from that in the northern hemisphere. It consisted of a dull reddish light extending about 20 degrees above the horizon; and though it varied at some times in extent, it was never less than eight or ten degrees. From this general mass of light there sometimes issued rays of a brighter colour, which vanished and were renewed like those of the *aurora borealis*, but without any of that tumultuous motion observed in the *aurora borealis*. The body of the light bore S. S. E. from the ship, and continued without any diminution of its brightness from 10 to 12 at night.

Cook's
Discove-
ries.

27
Aurora
Australis.

The middle part of the island of Savu lies in 10° 35' south, and 237° 30' west longitude, and afforded a most beautiful prospect from the ship. The people are remarkable for the purity of their morals, which are said to be irreproachable, even on the principles of Christianity. Though no man is allowed to have more than one wife, instances of illicit commerce betwixt the sexes, are scarce known among them. Instances of theft are likewise very rare; and so far are they from revenging a supposed injury by murder, that when any differences arise among them, they are immediately and implicitly referred to the determination of the king. They will not even make it the subject of private debate, lest they should be provoked to resentment and ill-nature; and the delicacy and cleanliness of their persons are said to be proportionable to the purity of their morals.

28
Excellent
character
of the inha-
bitants of
Savu.

On the arrival of the *Endeavour* at Batavia, our navigator had an opportunity of observing the good effects of the electrical chains applied to ships in securing them from the effects of lightning. A dreadful storm of thunder happened one evening, during which the main-mast of one of the Dutch East India-men was split and carried away close by the deck, the main top-mast, and top-gallant-mast being shivered to pieces. This ship lay so near the *Endcavour*, that the latter would probably have shared the same fate, had it not been for the conducting chain which fortunately was just put up. The explosion shook her like an earthquake, the chain at the same time appearing like

29
Good ef-
fects of the
electrical
chains in
preserving
from the
effects of
lightening.

Cook's Discoveries. a line of fire. The stroke seemed to have been directed to the Dutch vessel by an iron spindle at the mast head; which practice our commander discommends, but strongly advises the use of the electrical chain.

30
Death of Tupia. On their landing at Batavia, Tupia was confined by sickness, so that he appeared quite lifeless and dejected when put into the boat; but on his arrival at land recovered his spirits surprisingly. The scene, to him so new and extraordinary, seemed to produce an effect similar to what is ascribed to enchantment. His attention was particularly engaged by the various dresses of the people; and being informed that at Batavia every one appeared in the dress of his own country, he expressed a desire of likewise appearing in the garb of Otaheite. Having therefore been furnished with South Sea cloth from the ship, he equipped himself with great quickness and dexterity. After the first flow of spirits had subsided, however, he soon began to feel the fatal effects of the climate; and his boy Tayeto, whose spirits had been still more elevated on his arrival, was attacked with an inflammation of the lungs, and in a little time fell a victim to the disease. Tupia himself did not long survive him, and his death was not attributed entirely to the unwholesomeness of the climate. Having been accustomed from his infancy to subsist chiefly upon vegetable food, and particularly on ripe fruit, he had soon contracted the disorders incident to a sea-life, and could scarce have been expected to reach England, even if the unwholesome climate of Batavia had been out of the question.

The Endeavour left Batavia on the 27th of December 1770, and on the 5th of January 1771 reached Prince's Island. This place had been formerly much frequented by the India ships, but of late entirely deserted on account of the supposed bad quality of the water: but this our navigator has discovered to be a mistake; and that though the water near the sea is brackish, it may be had of excellent quality by going a little way up the country. He is of opinion that this island is a more proper place for ships to touch at than either North Island or New Bay, because neither of these can afford other refreshments which may be had at Prince's Island.

31
Prince's Island, a proper place for ships to touch at.

The rest of this voyage affords little interesting matter. The Cape of Good Hope, which was their next stage, has been so fully described by former navigators that there was little room for addition. At St Helena the commander made some remarks on the rigorous treatment of the slaves, which was represented as worse than that of the Dutch either at Batavia or the Cape of Good Hope. In the account of his second voyage, however, this accusation was retracted.

32
Second voyage.

Captain Cook's second voyage was undertaken in an especial manner to determine finally the question concerning the existence of a southern continent. It commenced in the year 1772; and, as in the former, he proceeded first to Madeira. From thence he proceeded to St Jago, one of the Cape de Verde Islands; where an opportunity was taken of delineating and giving such a description of Port Praya, and the supplies to be there obtained, as might be of use to future navigators. On the 8th of September he crossed the line in 8° west longitude, and had the satisfaction to meet with good weather, though he had been informed that

he had failed at an improper time of the year, in consequence of which he would probably be becalmed. From his account, however, it appears, that though in some years such weather may be expected, it is by no means universally the case. In this part of the ocean he had also an opportunity of observing the cause of the luminous property of sea-water, which in his former voyage had been attributed to insects. Mr Forster being of a different opinion, the matter was again particularly inquired into, but the result was entirely conformable to the former determination. Some buckets of water being drawn up from along side the ship, were found to be filled with those insects of a globular form, and about the size of a small pin's head. No life indeed could be perceived in them; but Mr Forster was thoroughly convinced of their being living animals when in their proper element.

Proceeding southward in quest of a continent, they fell in with Ice Islands in S. Lat. 50. 40. and two degrees of longitude east from the Cape of Good Hope. One of these was so much concealed by the haziness of the weather, that it could not be seen at the distance of more than a mile. Captain Cook judged it to be about 50 feet in height, and half a mile in circumference; its sides rising in a perpendicular direction, and the sea breaking against them with great violence. Two days after, they passed six others, some of which were two miles in circumference and 60 feet in height; yet such was the strength and violence of the waves that the sea broke quite over them. On the 14th they were stopped by a vast field of low ice, of which they could perceive no end. In different parts of this field there were seen islands or hills of ice like those already described, and some of the people imagined that they saw land over them; but upon a narrow examination this was found to be a mistake. On getting clear of the field of ice they again fell in with loose islands; and as it was a general opinion that these are only formed in bays and rivers, our navigators concluded that they could not be at a great distance from land. They were now in the latitude of 55° 40' south; and as they had sailed for more than 30 leagues along the edge of the ice without finding any opening, the Captain determined to run 30 or 40 leagues farther to the eastward, in hopes of then getting to the southward. If in this attempt he met with no land or other impediment, his design was to stretch behind the ice altogether, and thus determine the matter at once. In a short time, however, it became evident that the field of ice along which they had sailed so long did not join with any land; and the Captain now came to a resolution of running as far to the west as the meridian of Cape Circumcision. In the prosecution of this design he met with a very severe storm, which was rendered the more dangerous by the pieces of loose ice among which they were still entangled, and a vast field of which they could not perceive the boundaries, about three miles to the northward. Of this they could not get clear without receiving some severe strokes; and after all, when they arrived at the place where they ought to have found Cape Circumcision, it could not be discovered; so that the Captain concluded that what Bouvet took for land could have been nothing but ice.

During this run the fallacy of the general opinion had

35
Ice-islands.

Cook's Discoveries. 36
Ice not always found in the vicinity of land.

had been discovered, that the ice with which the polar regions abound has been formed in the vicinity of land. It was found likewise, that the water produced from the melting of ice, even though formed in the ocean, was perfectly sweet and well tasted. Of this circumstance the Captain took advantage to supply himself with water; and gave it as his opinion, that it was the most expeditious method of watering he had ever known. He had likewise an opportunity of detecting another popular error, *viz.* that penguins, albatrosses, and other birds of that kind, never go far from land. This indeed may be the case in open seas, but in such as are covered with ice it is very different; for they then inhabit the ice islands, and float out with them to sea at a great distance.

37
Irregularity of the magnetic needle.

When in the latitude of 49. 13. S. some signs of land were perceived; but as the wind did not admit of any search being made in the direction where it was supposed to lie, the Captain proceeded in his voyage to the eastward. A very remarkable alteration in the direction of the needle was now perceived, and which could not be supposed owing to the vicinity of any magnetic matter, as it happened while the ships were far out at sea. The circumstance was, that when the sun was on the starboard side of the ship the variation was least, but greatest when on the opposite side. An aurora australis was again observed, which broke out in spiral or circular rays, and had a beautiful appearance; but did not seem to have any particular direction, being conspicuous at various times in different parts of the heavens, and diffusing its light over the whole atmosphere.

38
Extreme cold of the southern seas.

The extreme cold and stormy weather which now began to take place, determined Captain Cook not to cross the antarctic circle a second time as he had once designed. His observations confirmed the accounts of former navigators, that the cold of the southern seas is much more intense than in equal latitudes in the northern hemisphere; but at the same time it showed that this cold cannot be owing to the vicinity of a continent, as had formerly been imagined. On the contrary, it was now determined beyond dispute, that if any such continent existed in the eastern part of the southern ocean, it must be confined within the latitude of 60 degrees. No farther discoveries therefore being practicable in higher latitudes, as the winter season was approaching, the commander steered for New Zealand, where he anchored in Dusky Bay on the 25th of March, having been at Sea 117 days without once coming in sight of land. Here the time was spent in

39
Farther account of New Zealand.

procuring proper refreshments for the people, and exploring the sea-coast and country for the benefit of future navigators. Nor was our commander unmindful of the inhabitants. Here he left the five geese which yet remained, choosing for them a place where there were no people at the time to disturb them; and as they had there great plenty of food, he had no doubt of their breeding, and in a short time spreading over the country. Some days after a piece of ground was cleared by setting fire to the topwood, after which it was dug up and sowed with garden seeds. Dusky Bay is situated in the western island of New Zealand, called *Tavaipoenammoo*, which as has already been said, is less fertile than the other. The inland part is full of rugged mountains of a vast height; but the sea-coast

is covered with trees, among which is the true spruce, which was found to be of great use. It was remarked that though a vast quantity of rain fell during the time of residence here, it was not attended with any bad effects on the health of the people; which furnishes an additional argument of the healthiness of the place. Dusky Bay is reckoned by Captain Cook to be the most proper place in New Zealand for the procuring of refreshments, though it is attended with some disagreeable circumstances, particularly being infested with great numbers of black sand-flies, which were troublesome to an extreme degree. The natives seen at Dusky Bay were apparently of the same race with those seen in other parts of the country, and led a wandering life, without any appearance of being united in the bonds of society or friendship.

From Dusky Bay the Captain proceeded to Queen Charlotte's Sound, where he met with the *Adventure*, which had been separated from the *Resolution* for above 14 weeks. In his passage thither he had an opportunity of observing six water-spouts, one of which passed within 50 yards of the *Resolution*. It has been a common opinion, that these meteors are dissipated by the firing of a gun, and the Captain was sorry he had not made the experiment; but he acknowledges, that though he had a gun ready for the purpose, and was near enough, his attention was so much engaged in viewing them, that he forgot to give the necessary orders.

Having planted another garden in this part of the country, and left two goats, two breeding sows and a boar, in as private a situation as possible, that they might be for some time out of the reach of the natives, the Captain set sail for Otaheite. During the long absence of the *Adventure*, Captain Furneaux had visited the coast of New Holland, and discovered that there was no probability of Van Dieman's land being separated from it by straits: he had likewise found additional proofs that the natives of New Zealand were accustomed to eat human flesh. Captain Cook also remarked with concern, that the morals of the New Zealanders were by no means mended by the visit he had formerly paid them. At that time he looked upon the women to be more chaste than those of most of the nations he had visited; but now they were ready to prostitute themselves for a spikenail, and the men to force them to such an infamous traffic, whether agreeable to the inclinations of the females or not.

In the run from New Zealand to Otaheite, our commander passed very near the situation assigned by Captain Carteret to Pitcairn's island, discovered by him in 1767, but without being able to find it, though a sight of it would have been useful for correcting its longitude as well as that of others in the neighbourhood; but there was not at present any time to spend in searching for it. Proceeding farther on his voyage, however, he fell in with a cluster of islands supposed to be the same discovered by M. Bougainville, and named by him the *Dangerous Archipelago*. To four of these Captain Cook gave the names of *Resolution*, *Doubtful*, *Furneaux*, and *Adventure Islands*. *Resolution* Island is situated in S. Lat. 17. 24. W. Long. 141. 39. *Doubtful* Island in S. Lat. 17. 20. W. Long. 141. 38. *Furneaux* Island in S. Lat. 17. 5. W. Long.

43 Mistake concerning the women of Otaheite corrected.

No discovery of any great consequence was made at the island of Otaheite or those in its neighbourhood, excepting that the Captain had an opportunity of correcting the opinion which till now had prevailed, of the excessive dissoluteness and immodesty of the women of Otaheite; and which had been enlarged upon by Dr Hawkesworth more than seemed to be consistent with decency. The charge, however, according to the accounts of this second voyage, is far from being indiscriminately true, even of the unmarried females of the lower class. Some additions were made to the knowledge of the geography of those islands; and from Haaheine Captain Furncaux took on board his ship one of the natives of Ulietea named *Omai*, afterwards so much spoke of in England. Captain Cook at first appeared dissatisfied with his choice of this youth, as being inferior in rank to many others, and having no particular advantage in shape, figure, or complexion; however he had afterwards reason to be better pleased. During the Captain's residence at Otaheite, he used his utmost endeavours to discover whether the venereal disease was endemic among them, or whether it had been imported by Europeans: but in this he could not meet with any perfectly satisfactory account; though it was universally agreed, that if it had been introduced by Europeans, it must have been by the French under M. Bougainville.

44 Harvey's Island discovered.

Captain Cook having left Ulietea on the 17th of September 1773, directed his course westward, with an inclination to the south. In this course he discovered land in S. Lat. 19. 8. and W. Long. 158. 54. to which he gave the name of *Harvey's Island*. From thence he proceeded to the island of Middleburg, where he was treated in the most hospitable manner possible. To such an excess did the people carry their generosity, that they seemed to be more fond of giving away their goods than of receiving any thing for them; insomuch that many, who had not an opportunity of coming near the boats, threw over the heads of others whole bales of cloth, and then retired without either waiting or asking for any thing in return. From Middleburg he proceeded to Amsterdam Island, where the beauty and cultivation of the island afforded the most enchanting prospect. There was not an inch of waste ground; the roads were no wider than what was absolutely necessary, and the fences not above four inches thick. Even this was not absolutely lost; for many of these contained useful trees or plants.

45 South Sea islands generally surrounded by coral rocks.

It is observable of the isles of Middleburg and Amsterdam, as well as of most others in the South Sea, that they are guarded from the waves by a reef of coral rocks which extend about one hundred fathoms from the shore. Thus they are effectually secured from the encroachments of the ocean; by which they would probably soon be swallowed up, as most of them are mere points in comparison of the vast quantity of water which surrounds them. Here he left a quantity of garden vegetable seeds and pulse, which it was not doubted would be taken care of by the industrious inhabitants. In the last mentioned islands our navigators found no animals but hogs and fowls; the former being of the same kind with those usually seen in the other islands in the South Sea, but the latter greatly

preferable, equalling those of Europe in their size, and even preferable in respect of the goodness of their flesh.

Cook's Discoveries.

On the 7th of October Captain Cook left the island of Amsterdam, with a design to pay another visit to New Zealand, in order to take in wood and water for his voyage in quest of a southern continent. The day after he left Amsterdam, he fell in with the island of Pilsart, formerly discovered by Tasman, and situated in S. Lat. 26', W. Long. 175° 59', 32 leagues distant from the east end of Middleburg. On his arrival at New Zealand, he exerted himself as much as possible to leave a proper assortment of vegetables and animals for the benefit of the inhabitants. One of the first things he did, therefore, was to make a present to a chief, who had come off in a canoe, of a quantity of the most useful garden seeds, such as cabbage, turnips, onions, carrots, parsnips, and yams; together with some wheat, French and kidney beans, and pease. With the same person he left also two boars, two sows, four hens, and two cocks. His present, however valuable in itself, seems to have been but indifferently received; for the chief was much better satisfied with a spikenail half the length of his arm than with all the rest; notwithstanding which, he promised to take care of the seeds, and not to kill any of the animals. On inquiring about those animals left in the country in the former part of his voyage, the Captain was informed, that the boar and one of the sows had been separated, but not killed. The other he saw in good condition, and very tame. The two goats, he was informed, had been killed by a native of the name of *Gaubiah*. The gardens had met with a better fate; all the articles being in a very flourishing condition, though left entirely to nature, excepting the potatoes. Captain Cook, however, still determined to supply these islanders with useful animals, put on shore a boar, a young sow, two cocks and two hens, which he made a present of to the adjacent inhabitants. Three other sows and a boar, with two cocks and hens, he ordered to be left in the country without the knowledge of the Indians. They were carried a little way into the woods, and there left with as much food as would serve them for 10 or 12 days, in order to prevent them from coming down to the coast in quest of it, and thus being discovered.

46 Another visit to New Zealand.

A second separation with the Adventure had now taken place; notwithstanding which, Captain Cook set out alone with his vessel in quest of a southern continent; and such was the confidence put in him by the sailors, that all of them expressed as much satisfaction and alacrity as if not only the Adventure, but ever so many ships had been in company.

47 Voyage in quest of a southern continent.

On the 26th of November the Captain set sail from New Zealand; and on the 12th of December began to fall in with the ice, but considerably farther to the southward than they had met with it in the former part of his voyage; being now in the latitude of 62° 10' S. and 172° W. Long. As they proceeded southward, the number of ice islands increased prodigiously; and in Lat. 67° 31' and W. Long. 142° 54', they all at once got in among such a cluster of these islands, that it became a matter of the utmost difficulty and danger to keep clear of them. Finding it impossible, therefore, to get any farther to the southward at present,

by ice.

the Captain determined to explore a considerable tract of sea to the north of his present situation, and then again to stand to the south. But in this he was still unsuccessful; no land being discovered either in sailing northward, eastward, westward, or southward; though he proceeded as far in the last direction as 71. 10. S. Lat. and 106. 54. W. It was now impossible to proceed; and the opinion of the Captain himself, as well as of most of the gentlemen on board, was, that the ice by which they were now stopped extended as far as the pole. As there was still room, however, in parts of the ocean entirely unexplored, for very large islands, our Commander determined not to abandon the pursuit in which he was engaged until there should not be any possibility of doing more; and besides the possibility of making new discoveries, he was conscious that many of the islands already discovered were so obscurely known, that it was of consequence to pay them a second visit. With this view he proposed to go in quest of Easter or Davis's Island; the situation of which was known with so little certainty, that none of the attempts lately made to discover it had been successful. He next intended to get within the tropic, and then to proceed to the west, touching at any islands he might meet with, and settling their situations, until he should arrive at Otaheite, where it was necessary for him to make some stay in order to look for the Adventure. It was part of his design also to run to the western as far as Terra Austral del Espiritu Sancto, discovered by Quiros, and which M. Bougainville had named *The Great Cyclades*. From this land he proposed to sail to the southward, and from thence to the east between the latitude of 50° and 60°. In the execution of this design, he determined if possible to reach Cape Horn during the ensuing November, when he would have the best part of the summer before him to explore the southern part of the Atlantic Ocean.

50
Visits Eas-
ter Island,

In pursuing his course to the northward, it had been part of his design to find out the land said to have been discovered by Juan Fernandez in about the latitude of 38°; but he was soon convinced, that if any such land existed, it could only be a very small island: but the prosecution of the design was for some little time interrupted by a violent bilious disorder by which the Captain was attacked. In this, when he began to recover, as there was no fresh meat on board, he was obliged to have recourse to dog's flesh; and a favourite animal belonging to Mr Forster was sacrificed on the occasion. The Captain was able to eat not only of the broth made of this, but likewise of the flesh, when his stomach could bear nothing else. On the 11th of March they arrived at Easter Island, before which time the Captain was tolerably recovered. Here they made but few discoveries farther than determining the situation of it to be in S. Lat. 27° 5' 30", and W. Long. 109° 46' 20". The island itself was found barren and desolate, having every appearance of being lately ruined by a volcanic eruption; without either wood, fuel, or fresh water worth taking on board. The inhabitants were few in number; and the women in very small proportion to the men, but remarkable for their lewdness. A number of gigantic statues were observed, which had also been taken notice of by Commodore

Roggewein, and the origin of which could not be accounted for.

On leaving Easter Island, Captain Cook was again attacked by his bilious disorder; but happily recovered before he reached the Marquesas, which they did on the 6th and 7th of April. One of these, being a new discovery, received the name of *Hood's Island*, from the young gentleman by whom it was first observed. These are five in number; situated between 9 and 10 degrees of south latitude, and between 128. 47. and 139. 12. of west longitude. They were discovered by Mendana a Spaniard; and their names are, La Magdalena, St Pedro, La Dominica, Santa Christina, and Hood's Island. The inhabitants are, without exception, the finest race of people in the South Sea, surpassing all others in that part of the world in the symmetry of their persons and regularity of their features. Their origin, however, from the affinity of language, was evidently the same with that of Otaheite. It was in St Christina that our commander anchored; and he has left particular directions for finding a particular cove in Resolution Bay in that island, which is the most convenient for procuring wood and water.

In the passage from the Marquesas to Otaheite, our navigators passed several low and small islands connected together by reefs of coral rocks. One of these, named by the inhabitants *Tiookea*, was visited by Lieutenant Cooper. It was discovered and visited by Captain Byron; and is situated in S. Lat. 27. 30. W. Long. 144. 56. The inhabitants are much darker in their complexions, and seem to be of a fiercer disposition than those of the neighbouring islands. They have the figure of a fish marked upon their bodies; a very proper emblem of their profession, deriving their subsistence almost entirely from the sea. Passing by St George's Islands, which had been also discovered and named by Captain Byron, our Commander now discovered four others, which he named *Palliser's Islands*. One of these is situated in S. Lat. 15. 26. and W. Long. 146. 20. another in S. Lat. 15. 27. and W. Long. 146. 3. They were inhabited by people resembling those of Tiookea, and like them were armed with long pikes. Here our navigator observed, that from W. Long. 138° to 148° or 150°, the sea is so full of small low islands, that one cannot proceed with too much caution.

On his arrival in Otaheite, provisions were met with in great plenty; and they were now very acceptable, by reason of the long time the ship had been at sea without obtaining any considerable supply. Two goats which had been given by Captain Furneaux to a chief named *Otoq*, appeared to be in a very promising situation. The female had brought forth two kids, which were almost large enough to propagate; and as she was again with kid, there was little doubt that the island would soon be stocked with these useful animals; though it was otherwise with the sheep, all of which had died except one. On this occasion, also, the Captain furnished the natives with cats, of which he gave away twenty; so that there was little danger of the stock of these animals decaying. During his residence at this time, he had an opportunity of making some computation of the number of inhabitants on the island, which he supposed to be no less than 200,000.

Cook's Discoveries. 55
Huahine, Ulietea, Howe Island, &c.

Huahine and Ulietea Islands were next visited, but without any remarkable occurrence. From the latter our Commander set sail on the 5th of June 1774; and next day came in sight of Howe Island, discovered by Captain Wallis, and situated in S. Lat. 16. 46. and W. Long. 154. 8. On the 16th a new island, named *Palmerstone Island*, was discovered in S. Lat. 18. 4. W. Long. 163. 10.; and, four days after, another was observed in S. Lat. 19. 1. W. Long. 169. 37. As it was evidently inhabited, the Captain determined to land; but found the people so extremely hostile, that no intercourse could be had; nay, he himself was in danger of losing his life by a lance thrown by one of the natives, which passed close over his shoulder. From the extreme hostility of the people of this island, it was named by Captain Cook *Savage Island*. It is of a round shape, pretty high, and has deep water close to the shore, but has no good harbour.

56
Rotterdam Island.

Passing by a number of small islands, Captain Cook next anchored at that of Anamocka or Rotterdam, discovered by Tasman. It is situated in 20. 15. S. Lat. and 174. 31. W. Long. Its form is triangular, each side extending about three and a half or four miles. From the north-west to the south it is encompassed by a number of small islands, sand banks, and breakers; of which no end can be seen from the island on the northern side, and may possibly be as far extended as Amsterdam or Tongataboo. While the Captain remained on this island, he learned the names of more than 20 of the adjacent isles, some of which were in sight between the north-west and north-east. Two of these, which lie more to the westward than the others, are named *Amattafoa* and *Oghao*. They are remarkable for their height; and from a great smoke visible about the middle of Amattafoa, it was supposed to have a volcano. The island of Rotterdam, Middleburg, or Eaowe, with Pilstart, form a group extending about three degrees of longitude and two of latitude. The whole group was named *The Friendly Isles* by Captain Cook, on account of the friendship which seemed to subsist among the inhabitants, and their courteous behaviour to strangers. The people of Rotterdam Island are similar to those of Amsterdam; but the island is not in such a state of high cultivation as Amsterdam, nor do its fruits come to such perfection. It is also inferior in the articles of cloth, matting, &c. which are accounted the wealth of these parts.

57
Supposed volcano.

58
New Hebrides visited.

From Rotterdam island our navigator continued his course to the westward, where he first discovered a small island in S. Lat. 19. 48. W. Long. 178. 2. It was named Turtle Island, from the great number of these animals found upon it. Sixteen days after he fell in with the cluster of islands named by M. Bougainville the *Great Cyclades*. The first island on which he landed was Mallicollo, where, though the people were at first very hostile, they were soon conciliated; and a friendly intercourse took place. The language of these people is considerably different from that of the other South-sea islands; they are diminutive in their persons, and of ugly features; their hair black or brown, short and curling, but less soft than that of the negroes. They had no name for a dog in their language, and had never seen the animal; so that they were extremely fond of a dog and bitch of which Captain Cook made them a present. The harbour in

this island, in which the ship came to anchor, was named Sandwich harbour, and lies on the north-east side in S. Lat. 16. 25. 20. E. Long 167. 57. 53. It is very commodious for the carrying on any operations at land, having a good depth of water, and many other advantages.

The next discovery was that of the Group named *Shepherd's Isles*, in honour of Dr Shepherd, Plumian professor of astronomy at Oxford. Numbers more were every day observed; of which one peaked rock, named the *Monument*, was uninhabited, being apparently inaccessible to any other creature but birds. Sandwich island is of considerable extent, and exhibits a most beautiful prospect. It is surrounded with other smaller islands, the principal of which were named Montague and Hinchinbrook. At Erromango they found the people hostile and treacherous; and from a skirmish they had with them near a promontory on the north-east point of the island, it was named *Traitor's Head*. Its situation is in S. Lat. 10. 47. E. Long. 169. 28.

From Erromango our navigator proceeded to Tanna, an island they had formerly discovered at a distance, and which is surrounded by some others, three of which are named *Inmer*, *Footoona* or *Erronan*, and *Anatom*. At Tanna they staid for some time, on account of their wanting some quantity of wood. A volcano was seen about the middle of this island, which burned with great violence, particularly in moist and wet weather; but notwithstanding the friendly terms on which they were with the natives, the latter would never allow them to approach this mountain. There were some spots on the sea coast which emitted an hot and sulphurous smoke; the people also expressed much uneasiness when these were approached or meddled with. The port which the ship entered in this island was named *Resolution harbour*, and is situated in S. Lat. 19. 32. 25. E. Long. 169. 44. 35. It is a small creek three quarters of a mile long, and about half as broad. It is extremely convenient, having plenty of wood and water close to the shore. Among the vegetable productions of this island, there is reason to suspect the nutmeg-tree to be one, a pigeon having been shot, in the craw of which was a wild nutmeg. The inhabitants are two distinct races of people, and speak two different languages; one that of the Friendly islands, the other peculiar to Tanna and those in the neighbourhood. The people are very expert in the use of their weapons; on which Mr Wales makes the following remarks: "I must confess I have often been led to think the feats which Homer represents his heroes as performing with their spears a little too much of the marvellous to be admitted in an heroic poem, I mean when confined within the strait stays of Aristotle; nay, even so great an advocate for him as Mr Pope acknowledges them to be surprising; but since I have seen what these people can do with their wooden spears, and them badly pointed, and not of an hard nature, I have not the least exception to any one passage in that great poet on this account. But if I see fewer exceptions, I can find infinitely more beauties in him, as he has, I think; scarcely any action, circumstance, or description of any kind whatever relating to a spear, which I have not seen and recognised among these people; as their whirling motion and whistling noise as they fly; their quivering.

quivering motion in the ground when they fall ; their meditating their aim when they were going to throw ; and their shaking them in their hands as they go along."

The Archipelago, in which Captain Cook had now remained a considerable time, is situated between 14. 29. and 20. 4. S. Lat. and between 166. 41. and 170. 21. E. Long. extending 125 leagues in the direction of N. N. W. $\frac{1}{2}$ W. and S. S. E. $\frac{1}{2}$ E. The principal islands are the Peak of the Etoile, Tierra del Espiritu Sauto, Mallicollo, St Bartholomew, the Isle of Lepers, Aurora, Whitsuntide Isle, Ambrym, Paomoo Apee, Three Hills, Sandwich, Erromango, Tanna, Immer, and Anatom. They were first discovered in 1606 by Quiros, who supposed them to be part of a southern continent ; nor were they visited from that time till the year 1768, when M. Bougainville bestowed upon them the name of the *Great Cyclades*, as already mentioned. This gentleman, however, besides landing in the Isle of Lepers, only discovered that the country was not connected, but consisted of islands. Captain Cook examined the whole in such an accurate manner, ascertaining the situation of many of the islands, and discovering such numbers of new ones, that he thought he had an undoubted right to impose a new name upon them ; and therefore called them the *New Hebrides*.

62
New Cale-
donia dis-
covered.

From the New Hebrides Captain Cook set sail for New Zealand, in order to prosecute his voyage in search of a southern continent, but in three days discovered a large island, which he named *New Caledonia*; and which, next to New Zealand, is the largest in the Pacific Ocean. It lies between 19. 39. and 22. 30. S. Lat. and between 163. 37. and 167. 14. E. Long. lying N. W. $\frac{1}{2}$ W. and S. E. $\frac{1}{2}$ E, extending about 87 leagues in that direction, though its breadth does not any where exceed 10 leagues. The natives are strong, active, well made, and seem to be a middle race between those of Tanna and the friendly Isles ; and the women were more chaste than those of the islands farther to the eastward. The island afforded a considerable variety of plants for the botanists, and some excellent timber of the species of the pitch-pine, for masts and spars. The wood is close-grained, white, and tough ; and very fit for the purpose. One of the small islands surrounding the large one was named the *Isle of Pines*, from the quantity of these trees found upon it ; and another, from the number and variety of plants it afforded, had the name of *Botany Island*. The coast, however, was so dangerous, that our navigator, having no more time to spare, was obliged to leave some part of it unexplored, though the extent was determined, as has been already related. Mr Forster was of opinion, that the language of this people is totally different from that of any of the other South Sea islands.

63
Norfolk
Island.

Proceeding from New Caledonia, our navigator next fell in with an island about five leagues in circumference, and of a good height, situated in S. Lat. 29. 2. 30. and E. Long. 168, 16. ; on which he bestowed the name of *Norfolk Island*. It was entirely uninhabited. Various trees and plants common at New Zealand were observed here, particularly the flax plant, which is more luxuriant in this island than in any part of New Zealand. The chief produce of this island is a kind of spruce pine, many of the trees of which are 10 or 12

feet in circumference. The palm-cabbage likewise abounds here ; and the coasts are well stocked with excellent fish. On the 18th of October they arrived at Queen Charlotte's Sound in New Zealand ; the situation of which was now ascertained by Mr Wales with the utmost accuracy, its latitude being found 41. 5. 56. $\frac{1}{2}$ S. and its longitude 174. 25. 7. $\frac{1}{2}$ E. On examining the gardens which had been made, it was found that they were in a thriving condition, though they had been entirely neglected by the natives. Some of the cocks and hens were supposed to be still in existence, as a new laid hen's egg was found, though none were seen.

On the 10th of November Captain Cook set sail from New Zealand in search of a southern continent ; but having traversed a vast extent of sea for 17 days, from S. Lat. 43. 0. to 55. 48. he gave up all thoughts of finding any more land in this part of the ocean, and therefore determined to steer directly for the west entrance of the straits of Magellan, with a design of coasting the southern part of Terra del Fuego quite round Cape Horn to Le Maire's Straits. As the world had hitherto received but very imperfect accounts of this coast, he thought a survey of it would be of more advantage to navigation and geography than any thing he could expect to meet with in a higher latitude. On the 17th of December he reached the coast of Terra del Fuego, and in three days more anchored in a place to which he gave the name of *Christmas Sound*. The land appeared desolate beyond any thing he had hitherto experienced. It seems to be entirely composed of rocky mountains without the least appearance of vegetation. These mountains terminate in horrid precipices, the craggy summits of which spire up to a vast height ; so that scarcely any thing in nature can have a more barren and savage aspect than the whole of the country. In the course of his voyage along this coast, he could not but observe, that at no time had he ever made one of such length where so little occurred of an interesting nature. Barren and dreary, however, as the coast was, it was not totally destitute of accommodations about Christmas Sound. Fresh water and wood for fuel were found about every harbour ; and the country every where abounds with fowl, particularly geese. A considerable number of plants were also found upon it, almost every species of which was new to the botanists. In passing by Cape Horn, it was wished to determine whether it belonged to the land of Terra del Fuego, or to a small island south from it ; but this was found impracticable on account of the foggy weather and dangerous sea. Its latitude was now determined to be 55. 58. S. and its longitude 67. 46. W. The coast appeared less dreary here than on the western side of Terra del Fuego ; for though the summits of some of the hills were rocky, the sides and valleys seemed covered with a green turf and wooded in tufts. In passing this cape a remark was made by the Captain, that if he were on a voyage round Cape Horn to the west, and not in want of wood or water, or any other thing which might make it necessary to put into port, he would sail a considerable way to the southward so as to be out of the reach of land altogether. By this method he would avoid the currents, whose force, he was of opinion, would be broken at

at 10 or 12 leagues distance from the shore, and farther off would be entirely destroyed. The extent of Terra del Fuego, and consequently of Magellan's Straits, was found to be less than what is commonly laid down in maps and charts, and the coast, in general, less dangerous than has been usually represented; though this must undoubtedly have been owing in a great measure to the weather, which happened to be remarkably temperate. In one of the small islands near Staten Land, and which, from their being discovered on new year's day, were called *New Year's Isles*, a remarkable harmony was observed among the animals of different species with which these desolate regions abound. The sea-lions occupy the greatest part of the sea-coast; the bears occupy the island; the shags are posted in the highest cliffs; the penguins in such places as have the best access to and from the sea; and the other birds choose more retired places. Occasionally, however, all these animals were seen to mix together like domestic cattle and poultry in a farm-yard, without one attempting to hurt the other in the least. Even the eagles and vultures were frequently observed sitting together on the hills among the shags, while none of the latter, either old or young, appeared to be disturbed at their presence. It is probable, therefore, that these birds of prey subsist by feeding on the carcases of the animals which die naturally or by various accidents, and which must be very numerous from the immense quantity existing on the island.

Farther dis-
coveries in
the south-
ern regions.

Our navigator now set out in quest of that extensive coast laid down in Mr Dalrymple's chart, and in which is marked the Gulph of St Sebastian; but when he came into the place where it is supposed to lie, neither land nor any certain signs of it could be met with. Some islands, however, were discovered, particularly Willis's island, in S. Lat. 54. 0. W. Long. 38. 23; another named *Bird Island* and *South Georgia*, situated between 53. 57. and 54. 57. S. Lat. and between 38. 13. and 35. 34. W. Long. All these were covered with snow and ice to a great height. Not a tree was to be seen, not even a shrub, nor were there any rivulets or streams of water; the only vegetables to be met with were a coarse strong bladed grass, wild burnet, and a kind of moss. A considerable quantity of seals and penguins were met with, whose flesh, though very coarse, was preferred by the ship's company, even by Captain Cook himself, to the salt provisions, which were now greatly decayed. The most southerly land discovered by our navigator was that on which he bestowed the name of *Southern Thule*, and which is situated in S. Lat. 59° 13' 30", W. Long. 27° 45'. This was still more desolate than South Georgia, being forsaken even by the seals and penguins which abounded on it. Not a single herb of any kind was seen upon it, but vast high and barren mountains, the tops of some of which reached above the clouds; and it may be remarked, that this seems to be the only part of the world hitherto discovered, entirely unfit for the support of animal life.

69
Of the
existence
of a south-
ern conti-
nent.

Southern Thule was discovered on the 31st of January 1775; and from this to the 6th of February several other lands were discovered, and named *Cape Bristol*, *Cape Montague*, *Saunders's Isle*, *Candlemas Isles*, and *Sandwich's Land*. With regard to this last, Captain

Cook was undetermined whether it was a group of islands or part of a continent lying near the pole, as after all his disappointments he still was inclined to think that such a continent has an existence, on account of the vast quantity of ice met with in the southern seas; and which from its great height appears to be formed in bays and gulphs of the land, and not in the ocean itself. The greatest part of this southern continent, however, if it has any existence, must be within the polar circle, where the sea is so incumbered with ice, that the land must be inaccessible. So great is the danger in navigating these southern seas, that Captain Cook asserts, on the most probable grounds in the world, that such lands as lie to the southward of his discoveries could not be explored; and that no man would ever venture farther than he had done. Thick fogs, snow-storms, intense cold, and every thing that can render navigation difficult or dangerous, must be encountered; all which difficulties are greatly heightened by the inexpressible horrid aspect of the country itself. It is a part of the world doomed by nature never once to feel the warmth of the sun's rays, but be buried in everlasting snow and ice. Whatever ports there may be on the coast, they are almost entirely covered with frozen snow of a vast thickness. If, however, any of them should be so far open as to invite a ship into it, she would run the risk of being fixed there forever, or of coming out in an ice island. To this it may be added, that the islands and floats on the coast, the great falls from the ice-cliffs in the port, or a sudden snow-storm, might be attended with equally fatal effects. For these reasons our commander determined to abandon the pursuit of a land whose existence was so equivocal, but whose utility, if it should be discovered, was certain. One thing only remained to complete what he wished to accomplish, and that was to determine the existence of Bouvet's land. In this inquiry he spent 16 days; but having run for 13 of these directly in the latitude assigned to that land, and found no appearance of it or of Cape Circumcision, he concluded that neither of them had any existence, but that the navigators had been deceived by the appearance of ice islands. Two days more were spent in quest of some land which had been observed more to the southward, but with the like bad success: after which our commander abandoned all farther thoughts of southern discoveries, and prepared for returning to England. On his way home, however, he determined to direct his course in such a manner as to fall in with the isles of Denia and Marseeven. These are laid down in Dr Halley's variation chart in the latitude of 41. $\frac{1}{2}$ S. and about 4. 0. E. from the meridian of the Cape of Good Hope. None of these islands could be found; and therefore our commander having very little time to spare either in searching for them or attempting to disprove their existence, made the best of his way to the Cape of Good Hope, and from thence to England. In his passage thither he visited the isles of St Helena, Ascension, and Fernando de Noronha. An experiment was made on the use of the still for procuring fresh water at sea; the result of which was, that though the invention was useful upon the whole, yet it would not by any means be advisable to trust entirely to it. Provided indeed that there was not a scarcity of fuel, and that the coppers were good,

as much might thus be procured as would support life; but that no efforts would be sufficient to procure the quantity necessary for the preservation of health, especially in hot climates. He was likewise convinced that nothing contributes more to the health of seamen than having plenty of fresh water. His last stage in this second voyage before his arrival in England was at Fayal, one of the Azores islands: and his only design in stopping here was to give Mr Wales an opportunity of finding the rate of the watches going, that so he might be enabled to find the longitude of these islands with the greater certainty.

73
Third voy-
age.

In our commander's third voyage he touched at the island of Teneriffe instead of Madeira, looking upon the former to be a better place for procuring refreshments; and was convinced of the justness of his conjecture by the facility with which provisions of all kinds were obtained. The air of the country is exceedingly healthy and proper for those subject to pulmonary complaints. This was accounted for by a gentleman of the place from the great height of the island, by which it was in the power of any person to change the temperature of the air as he pleased; and he expressed his surprize that physicians, instead of sending their patients to Nice or Lisbon, did not send them to Teneriffe.

74
Visits the
Isle of Te-
neriffe.

From the same gentlemen it was learned, that the tea-shrub grows in that island as a common weed, which is constantly exterminated in large quantities. The Spaniards, however, sometimes use it as tea, and ascribe to it all the qualities of that brought from the East Indies. They give it also the name of tea, and say that it was found in the country when the islands were first discovered. Another botanical curiosity is the fruit called the *impregnated lemon*, which is a perfect and distinct lemon inclosed within another, and differing from the outer only in being a little more globular.

ted lemon.

77
Prince Ed-
ward's
Islands dis-
covered.

From Teneriffe Captain Cook proceeded to the Cape of Good Hope, and from thence to the southward, where he fell in with two islands, the larger of which is about 15 leagues in circuit, and the smaller about nine; their distance from one another being about five leagues. The one of these islands lies in S. Lat. 45. 53. and E. Long. 37. 46; the other in S. Lat. 46. 4. E. Long. 38. 8. As the ships passed through between them, they could not discern either tree or shrub upon any of them even with the assistance of their best glasses. The shore seemed to be bold and rocky, their internal parts full of mountains, whose sides and summits were covered with snow. These two, with four others, which lie from 9 to 12 degrees of longitude more to the east, and nearly in the same latitude, had been discovered in the year 1772 by Captains Marion du Fresne and Crozet, two French navigators, in their passage from the Cape of Good Hope to the Philippines. As no names had been assigned to them in a chart of the Southern Ocean communicated to Captain Cook in 1775, the two larger ones were by him distinguished by the name of *Prince Edward's Islands*, in honour of his Majesty's fourth son: the other four, with a view to commemorate the discoveries, were called *Marion's* and *Crozet's Islands*.

78
Voyage in
quest of
Kergue-
len's land.

From these our commander steered to the southward in search of Kerguelen's land, which he had been instructed to touch at, in order to discover, if possible,

a good harbour there. In his passage to it several new islands were discovered; to one which Kerguelen had given the name of the *Island of Rendezvous*, Captain Cook, on account of its shape, changed it to that of *Bligh's Cap*. It is situated in S. Lat. 48. 29. E. Long. 68. 40. and is a high round rock, inaccessible to all creatures but birds. Next day he fell in with Kerguelen's land, at first thought to be a part of the southern continent, but afterwards found by Kerguelen himself to be an island. The extent of it, however, was not determined either by the French navigator or by Captain Cook. The former reckons it at 200 leagues in circumference, but Captain Cook estimates it at much less. Our navigator could not get any extensive view of it on account of the foggy weather; but as far as could be discovered, it was barren and desolate, inasmuch that there was neither food nor covering for cattle of any kind, so that they would inevitably perish if any were left. Even the sea-coasts were in a great measure destitute of fish; but the shore was covered with innumerable multitudes of seals, together with penguins and other birds; all of which were so void of fear, that any quantity whatever might be killed without any difficulty. Not a single tree nor shrub could be seen, nor a piece of drift wood on the shore; and herbage of every kind was likewise very scarce. A prodigious quantity of the sea-weed, called by Sir Joseph Banks *fucus giganteus*, was found in one of the bays. The whole variety of plants found in this island did not exceed 16 or 18 species. The harbour in which our navigator made his longest stay on this desolate coast was named *Port Palliser*, and is situated in S. Lat. 49. 3. E. Long. 69. 37. In this voyage our navigator undoubtedly displayed superior nautical abilities to those of M. Kerguelen, who in two voyages to the place had never been able to bring his ships to anchor on any part of the coast.

From Kerguelen's land our navigator proceeded to the coast of New Holland, where he now touched at the southern part called *Van Diemen's land*, where he anchored in Adventure Bay. Here they found plenty of wood and water, with abundance of grass, coarse indeed, where they went first ashore, but afterwards much finer and proper for the cattle. Here, as every where else, the latitudes and longitudes were settled with the greatest exactness. The bottom of Adventure Bay was found to lie in S. Lat. 43° 21' 6"; E. Long. 147° 29'. The inhabitants visited them in a friendly manner, but seemed as stupid and insensible as those they had formerly seen. They seemed to be totally ignorant of the use of iron, and set no value upon any thing in the ornamental way excepting beads; nor did they seem to be acquainted even with the use of fish hooks. Here they found the stories of the ancient fauns and satyrs living in hollow trees realized. Some huts covered with bark, and of a most wretched construction, were indeed found near the shore; but the most commodious habitations were afforded by the largest trees. These had their trunks hollowed out by fire to the height of six or seven feet; and there was room enough in one of them for three or four persons to sit round a hearth made of clay; and it may justly seem surprising, that notwithstanding the extreme violence offered to the vegetative powers of the

ries.

the tree by forming this habitation, it still continued to flourish in consequence of one side being left entire. The people, notwithstanding their extreme barbarity, were supposed to proceed from the same stock with those of the South Sea Islands. As in one of their visits the natives had seized upon two pigs which had been brought ashore, apparently with an intention to kill them, the commander determined to make them a present of these animals; though from their excessive stupidity and inattention there was no probability of their allowing them to propagate, if they had been put directly into their hands. To prevent this, Captain Cook ordered the two they had attempted to seize, being a boar and sow, to be carried about a mile within the head of the bay, and saw them left by the side of a fresh water rivulet. He was prevented from leaving any other species by a consideration of the barbarity of the inhabitants.

81
Visit to
New Zea-
land.

From New Holland our navigator proceeded to New Zealand, where he arrived on the 12th of February 1777, and anchored in Queen Charlotte's Sound. Here he was desirous of leaving a further supply of animals; but the inhabitants had hitherto shown such carelessness about those which had been left, that he durst not venture to leave any other than two goats, a male and a female with kid, and two hogs, a boar and sow. He was informed, however, that one chief had several cocks and hens in his possession, so that there was some probability of these animals being allowed to multiply; and as ten or a dozen hogs had at different times been left by Captain Cook, besides those put on shore by Captain Furneaux, it seems also to be likely that this race of creatures will increase either in a wild or domestic state, or both. The gardens had still been almost totally neglected, and some of them destroyed. Those which remained, however, produced cabbages, onions, leeks, purslains, radishes, and a few potatoes. These last had been brought from the Cape of Good Hope, and were so greatly meliorated by the change of soil, that with proper cultivation they seemed to bid fair for excelling those of most other countries.

82
Extraordi-
nary pre-
servation of
some of the
natives of
Otaheite.

Our navigator's next course was towards the Island of Otaheite; in the run to which he discovered the Island of Mangea, situated in S. Lat. 22. 57. E. Long. 301. 53. From thence he proceeded to Wa-teoa, where Omai, now on his way home, recognized three of his countrymen, natives of the Society Islands, who had arrived here by the following accident. About 12 years before, 20 of the natives of Otaheite had embarked in a canoe, in order to visit the neighbouring island of Ulietea. A violent storm arose, which drove them out of their course, and they suffered incredible hardships by famine and fatigue, so that the greatest part of them perished. Four men continued hanging by the side of the vessel for four days after it was overfet, when they were at last brought within sight of the people of this island. The latter immediately sent out their canoes, and brought them ashore, treating them afterwards with so much kindness, that the three who now survived expressed no desire of returning to their own country, though they had now an opportunity, but chose rather to remain where they were. This island is situated in S. Lat. 20. 1. E. Lon. 201. 45. and is about six leagues in circumference.

The inhabitants are said to be equally amiable in their persons and dispositions.

Visiting a small island named *Wennocca-ete*, or *Ota-kootaia*, situated in S. Lat. 19. 15. and E. Long. 201. 37. our commander found it without inhabitants, tho' there were undoubted marks of its being occasionally frequented. Harvey's Island, which in his former voyage had been destitute of inhabitants, was now found to be well peopled; but the inhabitants showed such an hostile disposition that no refreshments could be procured; for which reason it was determined to steer for the Friendly Islands, where there was a certainty of meeting with an abundant supply. In his way thither he touched at Palmerston Island, from a small isle near which a supply of 1200 cocoa nuts were obtained, besides abundance of fish and birds of various kinds. Had the island been capable of furnishing water, the Captain would have preferred it to any of the inhabited ones for the purpose of procuring refreshments, as they could be had in any quantity without molestation from the petulance of the inhabitants. As water at this time happened to be a scarce article, our navigator was obliged to supply himself from the showers which fell, and which afforded as much in an hour as he could procure by distillation in a month.

During the time of residence at the Friendly Islands our navigator visited one named *Hepace*, at which no European ship had ever touched before. Here he was entertained in a friendly manner, supplied with refreshments, and left some useful animals; great additions were made to the geography of these islands, and many curious remarks made on the inhabitants and natural products. It was observed by Mr Anderson, that the people had very proper notions of the immateriality and immortality of the human soul, and he thought himself authorized to assert, that they did not worship any part of the visible creation.

Passing by a small island named *Toobouai*, about five or six miles in extent, and situated in S. Lat. 23. 25. E. Long. 210. 37. our navigator now arrived at Otaheite. Here Omai met with his relations, some of whom received him with apparent indifference; but his meeting with an aunt and a sister was marked with expressions of the most tender regard. It was Huaheine, however, that was destined for the place of Omai's final residence, and thither the Captain repaired on purpose to settle him. The affair was conducted with great solemnity; and Omai brought with him a suitable assortment of presents to the chiefs, went through a great number of religious ceremonies, and made a speech, the subject of which had been dictated to him by Captain Cook. The result of the negotiation was, that a spot of ground was assigned him, extending about 200 yards along the shore of the harbour, with a proportionable part of an adjacent hill. The carpenters of both ships were then employed in constructing an house for him, in which he might secure his European commodities. At the same time a garden was made for his use, in which were planted thaddock, vines, pine-apples, melons, and several other garden vegetables. Here he met with a brother, sister, and sister-in-law, by whom he was very affectionately received; but it was discovered with concern, that none of his relations were able to protect him in case of any attack on his person

or property; so that there was too much reason to fear that he would be plundered immediately on the departure of the English. To prevent this, if possible, Captain Cook advised him to conciliate the favour and engage the patronage and protection of some of the most powerful chiefs by proper presents; at the same time that he himself took every opportunity of letting the inhabitants know that it was his intention to return to the island again, and if he did not find Omai in the same state of security in which he left him, those by whom he had been injured would certainly feel the weight of his resentment. About a fortnight after leaving Hoahene, the Captain had a message from Omai; in which he informed him that every thing went well, only that his goat had died in kidding, for which he desired another might be sent; and accompanied this request with another for two axes, which were sent along with a couple of kids, male and female. On taking this final leave of the Society Islands, Captain Cook observes, that it would have been far better for these poor people never to have known the superiority of the Europeans in such arts as render life comfortable, than after once being acquainted with it to be again abandoned to their original incapacity of improvement; as, if the intercourse between them and us should be wholly discontinued, they could not be restored to that happy state of mediocrity in which they were found. It seemed to him that it was become in a manner incumbent on the Europeans to visit these islands once in three or four years, in order to supply them with those conveniences of which they have taught them the use. It is indeed to be apprehended, that by the time the iron tools which were then among them are worn out, they will have forgot the use of their own; as in this last voyage it was observed that the use of their former tools was almost totally abolished.

86
Remarks
on the Soci-
ety Islands.

87
Christmas
Island dis-
covered.

Having left the Society Islands, Captain Cook now proceeded to the northward, crossing the equator on the 22d and 23d of December; and on the 24th discovered a low uninhabited island about 15 or 20 leagues in circumference. Here the longitude and latitude were exactly determined by means of an eclipse of the sun. The west side of it where the eclipse was observed, lies in N. Lat. 1. 59. E. Long. 202. 30. From the time of its discovery it obtained the name of *Christmas Island*. Plenty of turtle were found upon it, and the Captain caused the seeds of the cocoa-nut, yams, and melons, to be planted.

88
Sandwich
Isles.

Proceeding still to the northward, our navigator next fell in with five islands, to which he gave the general name of *Sandwich Isles*, in honour of his patron. Their names in the language of the country are Woa-hoo, Atooi, Oneheow, Oreehoua, and Tehoora. They are situated in the latitude of 21. 30. and 22. 15. North, and between 199. 20. and 201. 30. E. Long. The longitude was deduced from no fewer than 72 sets of lunar observations. The largest of these islands is Atooi, and does not in the least resemble the other islands of the South Sea formerly visited by our navigator, excepting only that it has hills near the centre, which slope gradually towards the sea-side. The only domestic animals found upon it were hogs, dogs, and fowls. Captain Cook designed to have made the inhabitants of this island a present of some

others; but being driven out of it by storms of weather, he was obliged to land them upon a smaller one named *Oneheow*. They were a he-goat with two females, and a boar and sow of the English breed, which is much superior to that of the South-Sea Islands. He left also the seeds of melons, pumpkins, and onions. The soil of this island seemed in general to be poor: it was observable that the ground was covered with shrubs and plants, some of which had a more delicious fragrance than had been experienced before. The inhabitants of these islands are much commended, notwithstanding the horrid custom of eating human flesh. In every thing manufactured by them there is an ingenuity and neatness in an uncommon degree; and the elegant form and polish of some of their fishing-hooks could not be exceeded by an European artist, even assisted by all his proper tools. From what was seen of their agriculture also, it appeared that they were by no means novices in that art, and that the quantity and goodness of their vegetable productions might with propriety be attributed as much to their skilful culture as to the fertility of the soil. The language of the Sandwich Isles is almost identically the same with that of Otaheite.

Proceeding farther to the northward, our navigators discovered the coast of New Albion on the 7th of March 1778. Its appearance was very different from that of the countries with which they had hitherto been conversant. The land was full of mountains, the tops of which were covered with snow; while the valleys between them, and the grounds on the sea-coast, high as well as low, were covered with trees, which formed a beautiful prospect as of one vast forest. The place where they landed was situated in N. Lat. 44. 33. E. Long. 235. 20. At first the natives seemed to prefer iron to every other article of commerce; but at last they showed such a predilection for brass, that scarcely a bit of it was left in the ships except what belonged to the necessary instruments. It was observed also, that these people were much more tenacious of their property than any of the savage nations that had hitherto been met with, inasmuch that they would part neither with wood, water, grass, nor the most trifling article, without a compensation, and were sometimes very unreasonable in their demands; with which, however, the Captain always complied as far as was in his power.

The place where the Resolution was now anchored was by our navigator called *St George's Sound*, but he afterwards understood that the natives gave it the name of *Nootka*. Its entrance is situated in the east corner of Hope Bay, in N. Lat. 49. 33. E. Long. 233. 12. The climate, as far as they had an opportunity of observing it, was much milder than that on the eastern coast of the American continent in the same parallel of latitude; and it was remarkable that the thermometer, even in the night, never fell lower than 42°, while in the day time it frequently rose to 60°. The trees met with here are chiefly the Canadian pine, white cypress, and some other kinds of pine. There seemed to be a scarcity of birds, which are much harassed by the natives, who ornament their clothes with the feathers, and use the flesh for food. The people are no strangers to the use of metals, having iron tools in general use among them; and Mr Gore procured two silver spoons of a construction similar to what may be observed in some Flemish

Flemish pictures, from a native who wore them round his neck as an ornament. It is most probable that these metals have been conveyed to them by the way of Hudson's Bay and Canada; nor is it improbable that some of them may have been introduced from the north-western parts of Mexico.

While Captain Cook sailed along this coast, he kept always at a distance from land when the wind blew strongly upon it; whence several large gaps were left unexplored, particularly between the latitudes of 50° and 55°. The exact situation of the supposed straits of Anian was not ascertained, though there is not the least doubt, that if he had lived to return by the same way in 1779, he would have examined every part with his usual accuracy. On departing from Nootka Sound, our navigator first fell in with an island in N. Lat. 59. 49. E. Long. 216. 58. to which he gave the name of *Kay's Island*. Several others were discovered in the neighbourhood; and the ship came to an anchor in an inlet named by the Captain *Prince William's Sound*. Here he had an opportunity of making several observations on the inhabitants, as well as on the nature of the country. From every thing relative to the former, it was concluded, that the inhabitants were of the same race with the Esquimaux or Greenlanders. The animals were much the same with those met with at Nootka, and a beautiful skin of one animal, which seemed to be peculiar to the place, was offered for sale. Mr Anderson was inclined to think that it was the same to which Mr Pennant has given the name of the *casan marmot*. The alcedo, or great king's fisher, was found here, having very fine and bright colours. The humming-bird also came frequently, and flew about the ship while at anchor; though it is scarce to be supposed that it can live throughout the winter on account of the extreme cold. The water-fowl were in considerable plenty; and there is a species of diver which seemed to be peculiar to the place. Almost the only kinds of fish met with in the place were torsk and halibut. The trees were chiefly the Canadian and spruce pine, some of which were of a considerable height and thickness. The Sound is judged by Captain Cook to occupy a degree and a half of latitude and two of longitude, exclusively of its arms and branches, which were not explored. There was every reason to believe that the inhabitants had never been visited by any European vessel before; but our navigator found them in possession not only of iron but of beads, which it is probable are conveyed to them across the continent from Hudson's Bay.

93
Prince
William's
Sound.

Soon after leaving Prince William's Sound, our navigators fell in with another inlet, which it was expected would lead either to the northern sea or to Hudson's or Baffin's bay; but upon examination it was found to end in a large river. This was traced for 210 miles from the mouth, as high as N. Lat. 61. 30. and promises to vie with the most considerable ones already known, as it lies open by means of its various branches to a very considerable inland communication. As no name was given by our commander to this river, it was ordered by Lord Sandwich to be named *Cook's River*. The inhabitants seemed to be of the same race with those of Prince William's Sound; and like them had glass beads and knives, they were also clothed in very fine furs; so that

VOL. V.

it seemed probable that a valuable fur-trade might be carried on from that country. Several attempts have accordingly been made from the British settlements in the East Indies to establish a traffic of that kind; but little benefit accrued from it except to the proprietors of the first vessel, her cargo having greatly lowered the price of that commodity in the Chinese market. It must be observed, that on the western side of the American continent, the only valuable skins met with are those of the sea-otter; those of the other animals, especially foxes and martins, being of an inferior quality to such as are met with in other parts.

Proceeding farther to the northward, our navigator now fell in with a race of people who had evidently been visited by the Russians, and seemed to have adopted from them some improvements in dress, &c. In the prosecution of this part of their voyage, it appeared that they had been providentially conveyed in the dark through a passage so dangerous, that our commander would not have ventured upon it in the day time. They were now got in among those islands which had lately been discovered by Captain Beering and other Russian navigators, and came to an anchor in a harbour of Oonalashka, situated in N. Lat. 52. 55. E. Long. 193. 30. Here it was remarked, that the inhabitants had as yet profited very little by their intercourse with the Russians; so that they did not even dress the fish they used for their food, but devoured them quite raw.

From Oonalashka our navigator proceeded again towards the continent, which he continued to trace as far as possible to the northward. In the latitude of 54. 48. E. Long. 195. 45. N. Lat. is a volcano of the shape of a perfect cone, having the crater at the very summit. On the coast farther to the north the soil appears very barren, producing neither tree nor shrub, though the lower grounds are not destitute of grass and some other plants. To a rocky point of considerable height, situated in N. Lat. 58. 42. E. Long. 197. 36. our commander gave the name of *Cape Newnham*.

Here Mr Anderson, the surgeon of the Resolution, died of a consumption under which he had laboured for more than twelve months. Soon after he had breathed his last, land being seen at a distance, it was named *Anderson's Island*; and on the 9th of August the ship anchored under a point of the continent, which he named *Cape Prince of Wales*. This is remarkable for being the most westerly point of the American continent hitherto known. It is situated in N. Lat. 65. 46. E. Long. 191. 45. It is only 39 miles distant from the eastern coast of Siberia; so that our commander had the pleasure of ascertaining the vicinity of the two continents to each other, which had only been imperfectly done by the Russian navigators. Setting sail from this point next day, he steered to the west and north, when he soon fell in with the country of the Tschutski, which had been explored by Beering in 1728. Here he had an opportunity of correcting M. Stœhlin's map, who had placed in these seas an imaginary island, on which he bestowed the name of *Alaschka*. Being convinced that the land he had now reached was part of the Asiatic continent, our commander directed his course eastward, in order to fall in with that of America; and on the 17th reached the latitude of 70. 33. and E. Long. 197. 41. Here they

Cook's
Discoveries.
99
The progress
northward
stopped
by ice.

they began to perceive that brightness in the horizon called by mariners the *blink of the ice*; and in 70. 41. they had got quite up to it, so that no farther progress could be made. Next day they made a shift to get as far as 70. 44; but the ice was now as compact as a wall, and about ten or twelve feet in height. Its surface was extremely rugged, and farther to the northward appeared much higher. Its surface was covered with pools of water; and great numbers of sea-lions lay upon it, whose flesh they were now glad to use as food. Our commander continued to traverse the Icy Sea till the 29th; but the obstructions becoming every day greater and greater, it was thought proper to give over all further attempts of finding a passage to Europe for that year. He did not, however, omit the investigation of the Asiatic and American coasts until he had fully ascertained the accuracy of Captain Bering's accounts as far as he went, and corrected the errors of M. Stæhlin. Great additions were thus made to the geographical knowledge of this part of the globe, and Mr Coxe observes, that "it reflects no small honour upon the British name, that their great navigator extended his discoveries much farther in one expedition, and at so great a distance from the point of his departure, than the Russians accomplished in a long series of years, and in parts belonging or contiguous to their own empire."

100
Arrival at
Oonalashka.

An end of this celebrated navigator's discoveries, however, was now at hand. From Bering's straits he sailed for Oonalashka, where he arrived on the 2d of October, and staid for some time in order to repair his ships. While the carpenters were employed in this work, one third of the people had permission to go on shore by turns, in order to gather berries, with which the island abounds, and which, though now beginning to decay, were of great service, in conjunction with the spruce-beer, to preserve the people from the scurvy. Such a quantity of fish was likewise procured, as not only served to supply the ships for the present, but likewise allowed a great number to be carried out to sea; so that hence a considerable saving was made of the provisions of the ships, which was an article of very considerable consequence. On the eighth of the month our commander received a very singular present from some persons unknown, by the hands of an Oonalashka man named *Derramoushk*. It consisted of a rye-loaf, or rather a salmon pye in the form of a loaf, and highly seasoned with pepper. This man had the like present for Captain Clerke, and each of them was accompanied with a note which none on board could understand: a few bottles of rum, with some wine and porter, were sent in exchange; it being supposed that such a present would be more acceptable than any other thing that could be spared. Corporal Lediard of the marines, an intelligent man, was at the same time directed to accompany *Derramoushk*, for the purpose of gaining a more satisfactory account of the country. On the tenth of the month he returned with three Russian seamen or furriers, who, with several others, resided at *Egoeshac*, where they had a dwelling house, some store-houses, and a sloop about 30 tons burden. One of these people was either master or mate of the vessel, and all of them were very sober and decent in their behaviour. The greatest difficul-

ty arose from the want of an interpreter; for which reason the conversation was carried on by signs. However, the Captain obtained a sight of two sea-charts, both of which he was allowed to copy. One of them included the sea of *Penshinsk*, part of the coast of Tartary down to the latitude of 41°; the Kurile Islands, and the peninsula of *Kamtschatka*. The other comprehended all the discoveries that had been made from the time of Captain Bering to the year 1777; but these were found to be very trifling. Indeed our navigator was assured by all the Russians whom he had occasion to see, that they knew of no other islands than those laid down in the charts just mentioned, and that none of them had ever seen any part of the American continent excepting what lies opposite to the country of the *Tschutki*. With regard to the natives of *Oonalashka*, they are to appearance the most inoffensive and peaceable people in the world, not to be in a state of civilization; though perhaps this may be owing in some measure to the connection they have long had with the Russians. From the affinity observed between the language of the *Esquimaux*, *Greenlanders*, and those of *Norton's Sound* in N. Lat. 64. 55. there is great reason to believe that all those nations are of the same extraction; and if that be the case, there is little reason to doubt that a communication by sea exists between the eastern and western sides of the American continent; which, however, may very probably be shut up by ice in the winter time, or even for the most part throughout the year.

The return of Captain Cook to the Sandwich Islands, with the lamentable catastrophe that ensued, have been already related under the former article. We shall now briefly enumerate the consequences of his discoveries with respect to the advancement of science. These are principally his having overthrown the hypothesis of a southern continent of immense extent, usually spoken of under the name of *Terra australis incognita*; his demonstration of the impracticability of a northern passage either by Asia or America to the East Indies; and his having established a sure method of preserving the health of seamen through the longest sea-voyages. It is remarked by the bishop of Carlisle, that one great advantage resulting from the late surveys of the globe, is the refutation of fanciful theories too likely to give birth to impracticable undertakings. The ingenious reveries of speculative philosophers will now be obliged to submit, perhaps with reluctance, to the sober dictates of truth and experience; nor is it only by discouraging future unprofitable searches that the late voyages are likely to be of service to mankind, but likewise by lessening the dangers and distresses formerly experienced in those seas which are within the actual line of commerce and navigation.

The interests of science, as well as of commerce, are highly indebted to the labours of our illustrious navigator. Before his time almost half the surface of the globe was involved in obscurity and confusion: but now such improvements have been made, that geography has assumed a new face, and become in a manner a new science; having attained such completeness as to leave only some less important parts to be explored by future voyagers. Other sciences besides geography

have been advanced at the same time. Nautical astronomy, which was in its infancy when the late voyages were undertaken, is now brought to much greater perfection; and, during Captain Cook's last expedition, many even of the petty officers could take the distance of the moon from the sun or from a star, the most delicate of all observations, with sufficient accuracy; and the officers of superior rank would have been ashamed to have it thought that they did not know how to observe for, and compute, the time at sea; a thing before hardly mentioned among seamen. It must, however, be remembered, that a great part of the merit in this respect is due to the board of longitude. In consequence of the attention of that board to the important object just mentioned, liberal rewards have been given to mathematicians for perfecting the lunar tables and facilitating calculations; and artists have been amply encouraged in the construction of watches, and other instruments better adapted to the purposes of navigation, than any that formerly existed.

A vast addition of knowledge has been gained with respect to the ebbing and flowing of the tides; the direction and force of the currents at sea; the nature of the polarity of the needle, and the cause of its variations. Natural knowledge has been increased by experiments on the effects of gravity in different and very distant places; and from Captain Cook's having penetrated so far into the southern regions, it is now ascertained, that the phenomenon usually called the *aurora borealis*, is not peculiar to high northern latitudes, but belongs equally to all cold climates, whether north or south.

No science, however, perhaps stands more indebted to these voyages than that of botany. At least 1200 new species of plants have been added to those formerly known; and every other department of natural history has received large additions. Besides all this, there have been a vast many opportunities of observing human nature in its different situations. The islands visited in the middle of the Pacific Ocean are inhabited by people, who, as far as could be observed, have continued unmixed with any different tribe since their first settlement. Hence a variety of important facts may be collected with respect to the attainments and deficiencies of the human race in an uncultivated state, and in certain periods of society. Even the curiosities brought from the newly discovered islands, and which enrich the British museum and the late Sir Ashton Lever's (now Mr Parkinson's) repository, may be considered as a valuable acquisition to Britain, and affording no small fund of instruction and entertainment.

There are few inquires more generally interesting than those which relate to the migrations of the various colonies by which the different parts of the earth have been peopled. It was known in general, that the Asiatic nation called the *Malayans* possessed in former times much the greatest trade of the Indies, and that their ships frequented not only all the coasts of Asia, but even those of Africa likewise, and particularly the large island of Madagascar; but that from Madagascar to the Marquesas and Easter Island, that is, nearly from the east side of Africa till we approach the west coast of America, a space including almost half the circumference of the globe, the same nation of the oriental world should have made their settle-

ments, and founded colonies throughout almost every intermediate stage of this immense tract, in islands at amazing distances from the mother-continent, is an historical fact that before Captain Cook's voyages could not be known, or at least but very imperfectly. This is proved, not only by a similarity of manners and customs, but likewise by the affinity of language; and the collections of words which have been made from all the widely-diffused islands and countries visited by Captain Cook, cannot fail to throw much light on the origin of nations, and the manner in which the earth was at first peopled.

Besides this, information has been derived concerning another family of the earth formerly very much unknown. This was the nation of the Esquimaux or Greenlanders, who had formerly been known to exist only on the north-eastern part of the American continent. From Captain Cook's accounts, however, it appears, that these people now inhabit also the coasts and islands on the west side of America opposite to Kamtschatka. From these accounts it appears also, that the people we speak of have extended their migrations to Norton Sound, Conalashka, and Prince William's Sound; that is, nearly to the distance of 1500 leagues from their stations in Greenland and the coast of Labrador. Nor does this curious fact rest merely on the evidence arising from the similitude of manners; for it stands confirmed by a table of words, exhibiting such an affinity of language as must remove every doubt from the mind of the most scrupulous inquirer.

From the full confirmation of the vicinity of the two great continents of Asia and America, it can no longer be supposed ridiculous to believe, that the latter received its inhabitants from the former; and by the facts recently discovered, a degree of further evidence is added to those which might formerly be derived from nature concerning the authenticity of the Mosaic accounts. It is not indeed to be doubted, that the inspired writings will stand the test of the most rigorous investigation; nor will it ever be found, that true philosophy and Divine Revelation can militate against each other. The rational friends of religion are so far from dreading the spirit of inquiry, that they wish for nothing more than a candid and impartial examination of the subject, according to all the lights which the improved reason and enlarged science of man can afford.

Another good effect of the voyage of Captain Cook is, that they have excited in other nations a zeal for similar undertakings. By order of the French government, Messrs de la Peyrouse and de Langle sailed from Brest in August 1785, in the frigates *Bouffole* and *Astroloobe*, on an enterprize, the purpose of which was to improve geography, astronomy, natural history, and philosophy, and to collect an account of the customs and manners of different nations. For the more effectual prosecution of the design, several gentlemen were appointed to go out upon the voyage, who were known to excel in different kinds of literature. The officers of the *Bouffole* were men of the best information and firmest resolution; and the crew contained a number of artificers in various branches of mechanics. Marine watches, &c. were provided, and M. Dagelet the astronomer was particularly directed to make observations with M. Condamine's invariable pendulum,

Cook's
Discove-
ries.

Cook's
Discoveries.

to determine the differences in gravity, and to ascertain the true proportion of the equatorial to the polar diameter of the earth. It has likewise been made evident, that notwithstanding all that has been done by Captain Cook, there is still room for a farther investigation of the geography of the northern parts of the world. The object accordingly was taken up by the Empress of Russia, who committed the care of the enterprise to Captain Billings an Englishman in her majesty's service. We shall only make one observation more concerning the benefits likely to accrue from the voyages of Captain Cook, and that is relative to the settlement in Botany Bay. Whatever may be supposed to accrue to the nation itself from this settlement, it must undoubtedly give the highest satisfaction to every friend to humanity to be informed, that thus a number of unhappy wretches will be effectually prevented from returning to their former scenes of temptation and guilt, which may open to them the means of industrious subsistence and moral reformation. If the settlement be conducted with wisdom and prudence, indeed it is hard to say what beneficial consequences may be derived from it, or to what height it may arise. Rome, the greatest empire the world ever saw, proceeded from an origin little, if at all, superior to Botany Bay. For an account of this settlement see the article *New-HOLLAND*.

One other object remains only farther to be considered with regard to these voyages, and that is the advantages which may result from them to the discovered people. Here, however, it may perhaps be difficult to settle matters with precision. From the preceding accounts, it must be evident that the intentions of Captain Cook were in the highest degree benevolent; and if at any time the people were the sufferers, it must have been through their own fault. In one instance indeed it might be otherwise, and that is with respect to the venereal disease. The evidence in this case cannot be altogether satisfactory. Mr Samwell, who succeeded Mr Anderson as surgeon of the Resolution, has endeavoured to show, that the natives of the lately explored parts of the world, and especially of the Sandwich islands, were not injured by the English; and it was the constant care and solicitude of Captain Cook to prevent any infection from being communicated to the people where he came. But whether he was universally successful in this respect or not, it is evident that the late voyages were undertaken with a view exceedingly different from those of former times. The horrid cruelties of the Spanish conquerors of America cannot be remembered without concern for the cause of religion and human nature; but to undertake expeditions with a design of civilizing the world, and meliorating its condition, is certainly a noble object. From the long continued intercourse betwixt Britain and the South Sea islands, there cannot be any doubt that some degree of knowledge must already have been communicated to them. Their stock of ideas must naturally be enlarged by the number of uncommon observations which have been presented to them, and new materials furnished for the exercise of their rational faculties. A considerable addition must be made to their immediate comfort and enjoyment by the introduction of useful animals and vegetables; and if the only benefit they should ever receive from Britain should be

the having obtained fresh means of subsistence, this of itself must be considered as a valuable acquisition. Greater consequences, however, may soon be expected. The connection formed with these people may be considered as the first step towards their improvement; and thus the blessings of civilization may be spread among the various tribes of Indians in the Pacific Ocean, which in time may prepare them for holding an honourable place among the nations of the earth.

As a supplement to this account of the discoveries made by Captain Cook himself, we shall here subjoin a narrative of the subsequent part of the voyage by Captains Clerke, &c. until the return of the ships to England. At the time of Captain Cook's death, the great point of a north-west passage remained in some measure to be still determined: for though, by the event of the former attempt, it had been rendered highly improbable that they should succeed in this, it was still resolved to try whether or not, at certain seasons of the year, the ice might not be more open than they had hitherto found it. The first object that naturally occurred, however, was the recovery of Captain Cook's body; for which Mr King was of opinion that some vigorous measure ought instantly to be pursued. His motives for this, besides the personal regard he had for the Captain, were to abate the confidence which must be supposed to ensue on the part of the natives, which would probably incline them to dangerous attempts; and this the more particularly, as they had hitherto discovered much less fear of the fire-arms than other savage nations were accustomed to do. Mr Samwell also takes notice of the intrepidity of the natives in this respect; but ascribes it, in the first instance, to ignorance of their effects; and in the next, to a notion, that as the effects of these arms were occasioned by fire, they might be counteracted by water. For this purpose they dipped their war mats in water; but finding themselves equally vulnerable after this method had been pursued, they became more timid and cautious.

As matters stood at present, there was even reason to dread the consequences of a general attack upon the ships; and therefore Mr King was the more confirmed in his opinion of the necessity of doing something to convince them of the prowess of their adversaries. In these apprehensions he was seconded by the opinion of the greater part of the officers on board; and nothing seemed more likely to encourage the islanders to make the attempt than an appearance of being inclined to an accommodation, which they would certainly attribute to weakness or fear. Captain Clerke, however, and those who were in favour of conciliatory measures, urged, that the mischief was already irreparable; that the natives, by reason of their former friendship, had a strong claim to the regard of the English; and that the more particularly, as the late calamitous accident did not appear to have taken its rise from any premeditated design: they urged also the ignorance of the king concerning the theft, and the mistake of the islanders who had armed themselves on a supposition that some attempt would be made to carry off the king. To all this was added, that the ships were in want of refreshments, particularly water; that the Resolution's foremast would require seven or eight days before it could be properly repaired; and as the spring was fast advancing, the speedy prosecution of the voyage to the northward

ries.

ought now to be the only object; that a vindictive contest with the natives might not only justify an imputation of needless cruelty, but would occasion great delay in the equipment of the ships.

In consequence of the prevalence of these sentiments lenient measures were adopted, though the behaviour of the natives continued to be very insolent. A great body still kept possession of the shore; many of whom came off in their canoes within pistol-shot of the ships, and provoking the people by every kind of insult and defiance. A train of negotiations for Captain Cook's body took place; in which the natives showed the most hostile and treacherous disposition, and, as afterwards appeared, had cut the flesh from the bones and burnt it. A piece of about ten pounds weight was brought by two natives at the hazard of their lives, who gave information that the rest had been burnt, and that the bones were in the possession of the king and some of the principal chiefs. Information was given, at the same time, that the chiefs were very desirous of war in order to revenge the death of their countrymen.

Thus it appeared that the pacific plan had answered no good purpose. No satisfactory answer had been given to the demands made of the bodies of the slain; nor was any progress made in the great work intended, viz, a reconciliation with the natives; they still remained on shore in an hostile posture, as if determined to oppose any endeavours that might be made by the people to land; at the same time that a landing was become absolutely necessary, in order to complete the stock of water. Had this spiritless conduct been persisted in, there is not the least doubt that neither this purpose nor any other could have been effected. The insolence of the natives became every day greater and greater; insomuch that one of them had the audacity to come within musket-shot of the Resolution, and, after throwing several stones, waved Captain Cook's hat over his head, while his countrymen on shore were exulting and encouraging his audacity. By this insult the people were so highly enraged, that, coming on the quarter-deck in a body, they begged that they might no longer be obliged to put up with such reiterated provocation, but might be allowed to make use of the first opportunity of revenging the death of their Captain. The necessity of more vigorous measures, therefore, being now apparent, a few discharges of the great guns, with the burning of a village and some other acts of severity, at last produced the mangled remains of Captain Cook. They were wrapped up in a bundle, in which were found both his hands entire, which were easily known by a scar in one of them dividing the fore-finger from the thumb the whole length of the metacarpal bone. Along with these was the skull, but with the scalp separated from it, and the bones of the face wanting; the scalp, with the ears adhering to it, and the hair cut short; the bones of both the arms, with the skin of the fore-arms hanging to them; the bones of the thighs and legs joined together, but without the feet. The ligaments of the joints were observed to be entire; the whole showing evident marks of having been in the fire, except the hands, which had the flesh remaining upon them, and were cut in several places and crammed with salt, most probably for the purpose of preserving them. The skull was not fractured; but the

106
His re-
mains at
last obtain-
ed.

scalp had a cut in the back part of it. The lower jaw and feet were wanting, having been seized by different chiefs.

Having accomplished the purposes of their stay in this place, Captain Clerke set sail from Karakakooa bay in O-why-hee towards Mowee, with a design to explore the coast of that island more fully than had been done, but were unable to accomplish their purpose: nor indeed was it in their power to accomplish any discovery of consequence among these islands. The only intelligence worth mentioning which they were able to procure was, that wars had ensued about the property of the goats which were left by Captain Cook on the island of Oneehow, as has been already mentioned, and that during the contest all these poor animals, who had already begun to multiply, were destroyed; so that the benevolent attempts of our illustrious navigator in favour of these islanders had proved abortive.

On quitting the island of Oneehow our navigators set sail for another named Mocoopapappa, which they were assured by the natives lay within five hours sailing of Tahoorā, a small island in the neighbourhood of Oneehow. In this they proved unsuccessful; on which it was determined to steer for the coast of Kamtschatka. In the passage thither they arrived at that place where de Gama is said to have discovered a great extent of land; but of this they could discover no appearance. This imaginary continent is said to have been discovered by a navigator called *John de Gama*, but who seems also to have been imaginary, as no person can find out either the country where he lived or the time when he made the discovery. We are informed by Muller, that the first account of it was published by Texeira in a chart in 1649, who places it between the latitude of 44 and 45 degrees, and about 160° E. Long. and calls it "land seen by John de Gama, in a voyage from China to New Spain." By the French geographers it is removed five degrees farther to the east. When they arrived at Kamtschatka they were entertained in the most hospitable manner, and furnished with every thing that could be procured in that desert and barren region. "In this wretched extremity of the earth (says the narrator of the voyage), beyond conception barbarous and inhospitable, out of the reach of civilization, bound and barricaded with ice, and covered with summer snow, we experienced the tenderest feelings of humanity, joined to a nobleness of mind and elevation of sentiment which would have done honour to any clime or nation." From Major Behm, in particular they received so many and so great obligations, that an handsome acknowledgement was made him by the Royal Society, as has been already observed. Even the sailors were so struck with his gratitude, that they voluntarily requested that their allowance of grog might be withheld, in order to compliment the garrison of Bolcheretsk with the spirits; saying, that they knew brandy was extremely scarce in that country, the soldiers on shore having offered four roubles a bottle for it. The officers, however, would not allow them to suffer by their generosity in this inclement country and season of the year (the month of March not being yet expired); but, in room of the small quantity of brandy which Major Behm consented to accept, substituted an equal quantity of rum.

ries.

It is worth observing, that the kindness with which the empress had ordered the British navigators to be treated in this part of her dominions were amply rewarded, even with no less than the addition of a new kingdom to the Russian empire, which hitherto her arms had not been able to subdue. Among the northern Asiatics none had been able to maintain their independence except the Tschutski, who inhabit the north-eastern extremity of the continent. No attempt to subdue these people had been made since the year 1750, when the Russian forces had at last been obliged to retreat, after having lost their commanding officer. The Russians afterwards removed their frontier fortrefs from the river Anadyr to the Ingiga, which runs into the northern extremity of the sea of Okotsk, and gives its name to a gulf to the west of the sea of Penhinsk. On the day that Captains Clerke and Gore arrived at Bolcharetsk, Major Behn received dispatches from this fort, acquainting him that a party of the Tschutski had been there with voluntary offers of friendship and a tribute. That on asking the reason of such an unexpected alteration in their sentiments they had acquainted his people, that two large Russian boats had visited them towards the end of the preceding summer; that they had been shown the greatest kindness by the people who were in them, and had entered into a league of amity with them; and that, in consequence of this, they came to the Russian fort in order to settle a treaty upon terms agreeable to both nations. This incident had occasioned much speculation, and could never have been understood without the assistance of those who were now present; the large *Russian boats* having been in truth no other than the *Resolution* and *Discovery*, under Captains Cook and Clerke.

press.

110
Vast quan-
tity of fish.

About the middle of May the snow began to melt very fast in this inhospitable region, and the ships being now on their passage northward, met with an excellent opportunity of supplying themselves with fish. The beach was cleared of ice on the 15th of the month; from which time vast quantities came in from every quarter. Major Behn had ordered all the Kamtschadales to employ themselves in the service of the English ships; so that often they found it impossible to take on board the quantities that were sent. They chiefly consisted of herrings, trout, flat fish, and cod. These fish were here found in such plenty, that once the people of the *Discovery* surrounded such an amazing quantity with the seine, that they were obliged to throw out a very considerable number, lest the net should have been broken to pieces; and the cargo was still so abundant, that, besides having a stock for immediate use, they filled as many casks as they could conveniently spare for salting; and after sending on board the *Resolution* a tolerable quantity for the same purpose, they left behind several bushels upon the beach.

111
Spirituos
liquors per-
nicious in
the sea-
scurvy.

While they remained in this country an opportunity offered of observing the pernicious effects of spirituous liquors in producing the sea-scurvy. All the Russian soldiers were in a greater or lesser degree afflicted with that disorder, some of them being in the last stage of it: and it was particularly observed that a serjeant, with whom the people had kept up a most friendly intercourse, had, *in the course of a few days*, brought upon himself the most alarming scorbutic

symptoms, by drinking too freely of the liquors with which he had been presented by the English. Captain Clerke soon relieved them, by putting them under the care of the surgeons of the ships, and supplying them with four-kroun and malt for sweet wort. In consequence of this a surprizing alteration was soon observed in the figures of most of them; and their speedy recovery was principally attributed to the sweet wort.

Cook's
Discove-
ries.

On the 12th of June they began to proceed northward along the coast of Kamtschatka, and three days after had an opportunity of observing an eruption of one of the volcanoes of that peninsula. On the 15th, before day light, they were surprized with a rumbling noise like distant thunder; and when the day appeared, found the decks and sides of the ships covered near an inch thick with fine dust like emery. The air was at the same time loaded and obscured with this substance; and in the neighbourhood of the volcano itself, it was so thick that the body of the hill could not be discovered. The explosions became more loud at 12 o'clock and during the afternoon, being succeeded by showers of cinders, generally of the size of pease, though some were as large as hazzle-nuts. Along with these there also fell some small stones which had undergone no alteration from the action of the fire. In the evening there were dreadful claps of thunder with bright flashes of lightning, which, with the darkness of the sky, and the sulphureous smell of the air, produced a most awful and tremendous effect. The ships were at this time about 24 miles distant from the volcano; and it appeared that the volcanic shower had been carried to a still greater distance, as they next day found the bottom of the sea to consist of such small stones as had fallen upon the decks of the ships. The mountain was still observed to be in a state of eruption on the 18th.

112
Eruption
of a vol-
cano.

For some time Captain Clerke kept the coast of Kamtschatka in view, with a design to make an accurate survey of it; but in this he was disappointed by foggy and squally weather; however, he determined the position of some remarkable promontories, and at last finding the season too far advanced to accomplish his design, set sail for Beering's Straits, chiefly with a view to ascertain the situation of the projecting points of the coast.

113
Voyage to
the north-
ward.

On the 3d of July our navigators came in sight of the island of St Lawrence, and another which was supposed to lie between it and Anderson's island. The latter being entirely unknown to Captain Clerke, he was inclined to have approached it, but was unable to effect his purpose. All these islands, as well as the coast of the Tschutski on the continent, were covered with snow, and had a dismal appearance.

In the preceding year Captain Cook had determined the situation of the Islands of St Diomedes to be in 65° 48' latitude; but now being somewhat at a loss to reconcile this with the position of the continent, they stood for some time over to the latter, till fully convinced of the accuracy of the former observations. At this time they approached within two or three leagues of the eastern cape of Asia, which is an elevated round head of land extending about five miles from north to south, and forms a peninsula connected with the continent by a narrow isthmus of low land. It has a bold shore, and three lofty detached spiral

Cook's Discoveries.

spiral rocks are seen off its northern part. It was still encompassed with ice, and is covered with snow. Here they found a strong current setting to the northward, which at noon had occasioned an error in the computation of the latitude of no less than 20 miles. A similar effect had been observed the preceding year in passing this strait. On steering to the north-east the weather cleared up, so that they had a view of the eastern cape of Asia, Cape Prince of Wales on the western coast of America, with a remarkable peaked hill on the latter, and the two islands of St Diomed lying between them. Here they met with great numbers of very small hawks, having a compressed bill rather large in proportion to the body; the colour dark brown, or rather black, the breast whitish, and towards the abdomen of a reddish hue.

114 Are stopped by the ice.

On the 6th of July at 12 o'clock, the ships were in N. Lat. 67. 0. E. Long. 191. 6. when having already passed many large pieces of ice, and observed that in several places it adhered to the continent of Asia, they were suddenly stopped about three in the afternoon by an extensive body, which stretched towards the west. By this their hopes of reaching any higher latitude than what had been attained last year were considerably diminished; but finding the course obstructed on the Asiatic side, they proceeded to the north-eastward, in order to explore the continent of America, between the latitude of 68° and 69°; which had last year been found impracticable on account of the foggy weather: but in this also they were partly disappointed; for on the 7th, about six in the morning, they met with another large body of ice stretching from north-west to south-east; but not long afterwards, the horizon becoming clear, they had a view of the American coast at the distance of about ten leagues, extending from north-east by east to east, and lying between N. Lat. 68° and 68° 20'. As the ice was not very high, the view extended a great way over it, so that they could perceive it exhibiting a compact solid surface, and apparently adhering to the land. Soon after the weather became hazy, so that they lost sight of the land; and it being impossible to get nearer, they continued to steer northward close by the side of the ice. This course was continued till next morning, during which time the ships passed some drift-wood; but the morning following, the wind shifting to the north, they were obliged to stand to the westward. At two in the afternoon they were again close to an immense expanse of ice; which from the mast-head seemed to consist of very large compact bodies, united towards the exterior edge, tho' in the interior parts some pieces floated in the water; it extended from west south-west to north-east by north. There was now a necessity for steering towards the south, as the strong northerly winds had drifted down such numbers of loose pieces, that they had encompassed the ships for some time, and it was impossible to avoid very severe strokes while sailing among them. Thus, however, they reached the latitude of 69. 12. and E. Long. 183. 5.; but having now sailed almost 40 leagues to the west along the edge of the ice without perceiving any opening, Captain Clerke determined to bear away south by east, the only quarter which was clear at present, and to wait till the season was somewhat farther advanced before any further attempts were made. The intermediate

time he proposed to employ in surveying the bay of St Lawrence, and the coast situated to the southward of it; as it must be a great satisfaction to have an harbour so near in case of the ships receiving any damage from the ice; and the Captain was also desirous of paying another visit to the Tschutski, especially in consequence of the accounts of them that had been given by Major Behm. In this navigation they killed several sea-horses, and had an opportunity of observing the strength of parental affection in those monstrous animals. On the approach of the boats towards the ice, all of them took their young ones under their fins, and attempted to make their escape with them into the sea. Some, whose cubs were killed or wounded, and left floating upon the surface of the water, rose again, and carried them down, sometimes just as they were on the point of being taken into the boat; and could be traced bearing them to a considerable distance through the water, which was stained with their blood. They were afterwards observed bringing them at intervals above the surface, and again plunging under its surface with an horrid bellowing; and one female, whose young one had been killed and taken on board, became so furious, that she struck her tusks through the bottom of the cutter.

Cook's Discoveries.

115 Remarkable affection of the sea-horses towards their young.

Our navigators still found themselves disappointed in their attempts. On approaching the coast of the Tschutski they met with a large and compact body of ice, extending to the north-east, south-west, and south-east, as far as the eye could reach; so that they were again obliged to sail back to the northward. Here also their course was soon stopped; for, on the 13th, being in N. Lat. 69. 37. and about the middle of the channel between the two continents, they once more fell in with a compact body of ice, of which they could perceive no limit. Captain Clerke therefore determined to make a final attempt on the coast of America, the passage northward having been found last year practicable much farther on than the Asiatic side. Thus they attained the latitude of 70. 8. at the distance, as was supposed, of 25 leagues from the coast of America; and some days after got about three minutes farther to the northward, about the distance of seven or eight leagues from the Icy Cape. This, however, was the utmost limit of the voyage to the north-east; and they were soon obliged to relinquish all hopes of proceeding farther on the American side. Another effort was still resolved on to try the practicability of a north-west passage; and for this purpose our navigators altered their direction on the 21st of July, passing through a great quantity of loose ice. About ten at night the main body was discovered at a very small distance, so that they were obliged to proceed to the southward. During this perilous navigation, the Discovery, after having almost got clear out from the ice, became so entangled by several large pieces, that her progress was stopped, and she immediately dropped to leeward, falling broadside foremost on the edge of a considerable body of ice, on which she struck with violence, there being an open sea to windward. At length the mass was either broken or moved so far, that the crew had an opportunity of making an effort to escape. But unluckily, before the ship gathered way sufficient to be under command, she fell to leeward a second time upon another

116 The ships finally stopped by ice.

117 Dangerous situation of the Discovery.

Cook's
Discove-
ries.

other piece of ice; and the swell rendering it unsafe to lie to windward, and finding no prospect of getting clear, they pushed into a small opening, and made the vessel fast to the ice with hooks. Here the Resolution for some time lost sight of her consort, which occasioned no small uneasiness in both vessels; but at length, on a change of wind, the Discovery, setting all her sails, forced a passage, though not without losing a considerable part of her sheathing, and becoming very leaky by reason of the blows she had received.

Thus the two vessels continued to make every effort to penetrate through the immense quantities of ice with which those seas are filled winter and summer, but without success. Captain Clerke therefore finding that it was impossible either to get to the northward, or even to reach the Asiatic continent, the ships being also greatly damaged, determined to proceed southward to the bay of Awatska, on the Kamtschadale coast, to refit, and afterwards take a survey of the coasts of Japan before the winter should set in.

118
Of the extent of the Asiatic continent to the northward.

During this navigation, two general conclusions were adopted relative to the extent of the Asiatic coast in opposition to the opinion of Mr Muller. One is, that the promontory, called the *East Cape*, is in reality the most easterly point of Asia; and that no part of that quarter of the globe extends farther than the longitude of $190^{\circ} 22'$ E. The other conclusion is, that the latitude of the most north-easterly point of Asia does not exceed 70° N. but is rather somewhat below it. As the present discoveries, however, were terminated on the Asiatic side in the 69th degree of latitude, the probable direction of the coast afterwards can only be conjectured. The only sources of knowledge in this case are the Russian charts and journals; and these in general are so defective and contradictory, that the particulars of their real discoveries can scarce be collected. Hence the Russian geographers are greatly divided in their opinions concerning the extent and figure of the peninsula of the Tschutski. Mr Muller, in a map published in 1754, supposes it to extend north-east as far as the latitude of 75° , and E. Long. 190° , ending in a round cape which he calls *Tschukotskoi Nofs*. To the southward of this cape he supposes the coast to form a bay to the west, bounded in the latitude of $67^{\circ} 18'$ by Serdze Kamen, the most northerly point observed by Beering in his expedition in 1728. A new form is given to the whole peninsula in a map published by the academy at Petersburg in 1776. Here its most north-easterly extremity is placed in N. Lat. 73° , E. Long. $178^{\circ} 30'$; and its most easterly point in N. Lat. 65° , E. Long. $189^{\circ} 30'$. All the other maps vary between these two situations; and the only thing in which all of them agree is the position of the east cape in N. Lat. 66° . The form of the coast, however, is very erroneous in the map published by the academy, and may be entirely disregarded. In Mr Muller's map, the northern part of the coast has some resemblance to that laid down in Captain Cook's and Clerke's survey, as far as the latter extends; only that Mr Muller does not make it trend sufficiently to the west, but supposes it to recede only five degrees of longitude between the latitudes of 66° and 69° ; whereas it really recedes almost ten.

We must next examine Mr Muller's authority for

supposing the coast to bend round to the north and north-east in such a manner as to form a large promontory.—Mr Coxe, whose accurate researches into this matter must give great weight to his opinion, thinks, that the extremity of the promontory was never doubled by any person except Deshneff and his party; who sailed, in the year 1648, from the river Kovyma, and are imagined to have got round to the river Anadyr. The account of this voyage, however, gives no geographical delineation of the coast, so that its figure must be determined by other circumstances; and from these it evidently appears, that the Tschukotskoi Nofs of Deshneff is in reality the East Cape of Captain Cook. Speaking of this Nofs, he says, that a person, with a favourable wind, may sail from the isthmus to the Anadyr in three days and three nights. This agrees entirely with the situation of the East Cape, which is about 120 leagues from the mouth of the river Anadyr; and there being no other isthmus to the north between that and the latitude of 69° , it seems evident, that by this description he certainly means either the East Cape or some other situated to the southward of it. In another place he says, that opposite to the isthmus there are two islands, upon which some of the Tschutski nation were observed, having pieces of the teeth of sea-horses fixed in their lips; and this exactly coincides with the two islands that lie to the south-east of the East Cape. Our navigators indeed did not observe any inhabitants upon these islands; but it is by no means improbable, that some of those from the American coast, whom the above description perfectly suits, might have accidentally been there at the time, and been mistaken for a tribe of Tschutski.

Other circumstances, though less decisive than those just mentioned, concur in the same proof. Deshneff says, that in sailing from the Kovyma to the Anadyr, a great promontory, which projects far into the sea, must be doubled; and that this promontory extends between north and north-east. From these expressions, perhaps, Mr Muller was induced to represent the country of the Tschutski in the form we find in his map; but if he had been acquainted with the position of the East Cape as determined by Captain Cook, and the striking agreement between that and the promontory or isthmus in the circumstances abovementioned, it is most probable that he would not have deemed these expressions of sufficient weight to authorize his extending the north-eastern extremity of Asia either as far to the north or to the east as he has done.

Another authority used by Mr Muller seems to have been the deposition of the Cossac Popoff, taken at the Anadirskoi Ostrog in 1711. Popoff was sent by land, in company with several others, to demand tribute of the independent Tschutski tribes, who inhabited the country about the Nofs. In the account of this journey, the distance betwixt Anadirsk and Tschukotskoi Nofs is represented as a journey of ten weeks with loaded rein-deer. From such a vague account, indeed, we can judge but very little; but as the distance between the East Cape and Anadirsk does not exceed 200 leagues, and consequently might be accomplished in the space abovementioned at the rate of 12 or 14 miles a-day, we cannot reckon Popoff's account of its situation inconsistent with the supposition of its being the East Cape. It may likewise be observed,

Cook's
Discove-
ries.

that

Cook's
Discove-
ries.

that Popoff's rout lay along the foot of a rock named *Matkol*, situated at the bottom of a spacious gulf, which Muller supposes to have been the bay he lays down between the latitudes of 66° and 72° ; and he accordingly places the rock *Matkol* in the centre of it: but it seems more probable, that it might be a part of the gulf of Anadyr, which they would undoubtedly pass in their journey towards the East Cape.

But what seems to put the matter beyond all doubt, and to prove that the cape which Popoff visited cannot be to the northward of 69° Lat. is that part of his deposition which relates to an island lying off the Nofs, from whence the opposite coast might be discerned; for as the opposite continents, in the latitude of 69° , diverge so far as to be upwards of 100 leagues distant, it is highly improbable that the Asiatic coast should again trend eastward in such a manner as to come almost in sight of that of America. As an additional proof of the position in question, we may observe, that the *Tschukotkoi Nofs* is constantly laid down as dividing the sea of *Kovyma* from that of Anadyr; which could not possibly be the case if any large cape had projected to the north-east in the higher latitudes.

The next question to be determined is, to what degree of latitude the northern coast of Asia extends before it inclines directly westward? Captain Cook was always strongly inclined to believe, that the northern coast of this continent, from the *Indigirka* eastward, has hitherto been usually laid down above two degrees to the northward of its true situation; for which reason, and on the authority of a map that was in his possession, as well as from intelligence received at *Oonalashka*, he placed the mouth of the *Kovyma* in the latitude of 68 degrees. Should he be right in his conjecture, it is probable that the coast of Asia does not any where extend beyond the latitude of 70 degrees before it trends to the west; and consequently our navigators must have been only one degree from its northern extremity. This seems to be confirmed by the silence of the Russian navigators concerning any extent of continent to the northward of *Shelatkoï Nofs*; nor do they mention any remarkable promontory, except the East Cape, between the Anadyr and the *Kovyma*. Another particular which *Deshneff* relates may perhaps be deemed a farther confirmation of this opinion, *viz.* that he met with no obstruction from ice in sailing round the north-eastern extremity of Asia; though he adds, that this sea is not at all times so free of it, which indeed appears evidently to be the case. That part of the continent which lies between Cape North and the mouth of the *Kovyma* is about 125 leagues in extent. A third part of this space, from *Kovyma* eastward, was explored in the year 1723 by *Feodot Amosoff*, who informed Mr Muller that its direction was easterly. Since that time it has been surveyed with some accuracy by *Shalauoff* whose chart makes it trend north-east-by-east as far as *Shelatkoï Nofs*, which he places at the distance of about 43 leagues east of the *Kovyma*. The space therefore between the Nofs and Cape North, somewhat more than 80 leagues, is the only part of the Russian dominions now remaining unexplored. But if the *Kovyma* be erroneously laid down in point of longitude as well as latitude, a supposition far from being improbable, the extent of the undiscovered coast will be con-

Vol. V.

siderably diminished. The following are the reasons why it may be supposed that the mouth of the *Kovyma* is placed too far to the westward in the Russian charts: 1. Because the accounts that have been given of the navigation of the Frozen Ocean from that river round the north-eastern extremity of Asia to the Gulf of Anadyr, do not agree with the supposed distance between those places. 2. Because the distance from the Anadyr to the *Kovyma* over land is by some Russian travellers represented as a journey of no very great length, and easily performed. 3. Because the coast from the *Shelatkoï Nofs* of *Shalauoff* appears to trend directly south-east towards the East Cape. From all which it may be inferred, with some degree of probability, that only 60 miles of the northern Asiatic coast remain to be explored.

With regard to a north-west passage from the At-
lantic into the Pacific Ocean, it is highly probable
that no such thing exists to the southward of the 56th
degree of latitude. If, in reality, it exists any where,
it must certainly be either through *Bassin's Bay*, or
by the north of *Greenland* in the western hemisphere,
or in the eastern through the frozen sea to the north
of *Siberia*; so that in whichever continent it is seated
the navigator must pass through *Beering's Straits*.
All that remains now to be considered therefore is,
the impracticability of penetrating into the Atlantic
Ocean through these straits. From the voyages of
our navigators it appears, that the sea to the northward
of *Beering's Straits* is more free from ice in August
than in July, and perhaps may be still more so in some
part of September. But after the autumnal equinox,
the length of the day diminishes so fast that no farther
thaw can be expected; and it would be unreasonable
to attribute so great an effect to the warmth of the
last fortnight of September as to imagine it capable of
dispersing the ice from the most northern parts of the
American coast. Even admitting this to be possible,
it must at least be allowed that it would be highly im-
prudent to endeavour to avoid the *Icy Cape*, by run-
ning to the known parts of *Bassin's Bay*, a distance of
about 1260 miles, in so short a time as that passage can
be supposed to be open. On the side of Asia there
appears still less probability of success, as appears from
the testimony of the Russian as well as the English na-
vigators. The voyage of *Deshneff* indeed proves the
possibility of circumnavigating the north-eastern ex-
tremity of Asia; but even this affords a very slender
foundation to hope for any great benefit, as no person
besides himself appears to have succeeded in the at-
tempt, though more than a century and an half has
now elapsed since the time of his voyage. But even
supposing that, in some very favourable season, this
cape might be doubled, still the Cape of *Taimura* re-
mains, extending as far as the 78th degree of latitude,
and round which none pretend ever to have sailed.

These arguments seem conclusive against any ex-
pectation of a north-west or north-east passage to the
East Indies, unless on the supposition of an open sea
very near the polar regions. The probability of get-
ting into the polar seas is considered under the article
POLE; and indeed from what has already been ad-
vanced must appear very little. Waving this subject
therefore at present, we shall return to the remarks
made by our navigators during their second voyage.

120
Remarks
during the
voyage of
Captain
Clerke to-
wards the
By Sea.

In this they did little more than confirm what had been observed during the first; for it never was in their power to approach the continent of Asia in any higher latitude than 67° , nor that of America in any part, excepting a few leagues, between 68° and $68^{\circ}20'$, which they had not seen before. In both years the ice was met with sooner on the Asiatic than the American coast; but in 1779 they met with it in lower latitudes than in 1778. As they proceeded northward, the ice was found universally more compact and solid, though they were ascertained at the same time that the greatest part of what they met with was moveable. Its height on a medium was estimated at eight or ten feet; though some of the highest might be about 16 or 18. The currents were generally at the rate of one mile in the hour, and more generally set from the south-west than from any other quarter. Their force, however, was so inconsiderable, whatever their direction might be, that no conclusion could possibly be drawn from them concerning the existence or non-existence of a northern passage. With regard to the temperature of the weather, July was found much colder than August. In the former, the thermometer was once at 28° , and very frequently at 30° ; whereas during the last year it was very uncommon in August to have it as low as the freezing point. High winds were experienced in both seasons, all of which blew from the south-west. The air was foggy whenever the weather became calm; but the fogs were observed to accompany southerly winds much more than others.

The straits, in the nearest approach of the continents to each other, in the latitude of 66° , are about 13 leagues over; beyond which they diverge to N. E. by E. and W. N. W.; so that in the latitude of 69° , their distance from each other is about 300 miles. A great resemblance is observed betwixt the continents on both sides of the straits. Both are destitute of wood; the shores are low, with mountains further inland, rising to a great height. The soundings in the mid-way between them were from 29 to 30 fathoms, gradually decreasing as either continent was approached; with this difference, however, that the water was somewhat shallower on the coast of America than that of Asia, at an equal distance from land. The bottom, towards the middle, was a soft slimy mud; and near either shore was a brownish sand intermixed with a few shells and small fragments of bones. There was but little tide or current, and what there was came from the west.

121
Death of
Captain
Clerke.
See Clerke.

Before the ships could reach the peninsula of Kamtschatka, Captain Clerke expired: in consequence of which the command devolved upon Mr King, Captain Gore being now the superior officer. On the return to Kamtschatka, Captain Clerke was buried in the spot on which a church was to be erected; it having been his own desire to be interred in the church.

122
Return to
Kamtschat-
ka, with a
description
of the Bay
of Awat-
ska.

By the time they arrived at this peninsula, the face of the country was greatly improved; the fields being covered with the most lively verdure, and every plant in the most flourishing state. The eruption of the volcano which they had observed on their last departure from Kamtschatka, had done little or no damage notwithstanding its violence. Several stones had fallen about the size of a goose's egg, but none larger. At this visit it was observed by our navigators, that the

complexions of the Russians seemed to be much more unhealthy and fallow than when they saw them formerly; and the Russians made the same observation upon the complexions of their guests. As no certain cause for this alteration could be perceived, the blame was by both parties laid on the verdure of the country; which, by contrasting itself with the colour of the people, made the latter appear to disadvantage.

Having repaired as well as they could the damages sustained by the ships among the ice, our navigators now began to proceed on their voyage southward; but the shattered condition of their vessels, with the little time they had now to spare on voyages of discovery, after having been so long at sea, now rendered them much less successful than formerly. Before leaving the peninsula, however, they took care to give such a description of the bay of Awatska as must be of great service to future navigators. This bay lies in $52. 51. N. Lat.$ and $158. 48. E. Long.$ in the bight of another bay formed by Cape Gavareca to the south, and Cheeponskoi Nofs to the north. The latter of these bears from the former N. E. by N. and is 32 leagues distant. From Cape Gavareca to the entrance of Awatska bay the coast takes a northerly direction, and extends about 11 leagues. It consists of a chain of ragged cliffs and rocks, and in many parts presents an appearance of bays or inlets; but on a nearer view, low grounds were perceived by which the headlands were connected. From the entrance of Awatska bay, Cheeponskoi Nofs bears E. N. E. distant 17 leagues. The shore on this side is flat and low, with hills behind gradually rising to a considerable height. The latitude of Cape Gavareca is $52. 21.$ By this remarkable difference of the land on both sides the Cape, navigators may be directed in their course towards it from the southward. When they approach it from the northward, Cheeponskoi Nofs becomes very conspicuous; it being a high projecting headland, and united to the continent by a large extent of level ground lower than the Nofs; and presents the same appearance whether viewed from the north or south. Should the weather happen to be sufficiently clear to admit a view of the mountains both on the sea coast and in the neighbourhood, the situation of Awatska bay may be known by the two high ones to the south of it. That nearest the bay is in the form of a sugar loaf, the other flat at top and not quite so high. Three very conspicuous mountains appear on the north side of the bay; of which that to the west appears to be the highest; the next, being a volcano, is readily known by the smoke which it emits; the third is the most northerly, and might properly be called a cluster of mountains as it presents several flat tops to view. When got within the capes, the entrance of the bay of Awatska to the north is pointed out by a lighthouse on a perpendicular head-land. Many sunken rocks lie to the eastward of this head land, stretching two or three miles into the sea; and which with a moderate sea or swell will always show themselves. A small round island lies four miles to the south of the entrance, principally composed of high pointed rocks, one of which is very remarkable. The entrance into the bay is at first about three miles wide, and one and an half in the narrowest part; the length is four miles in a north-west direction. Within the mouth is a noble

Cook's noble basin about 25 miles in circumference; in which are the harbours of Rakowera to the east, Tarcinska to the west, and St Peter and St Paul to the north.

123
Account of the voyage from the time of leaving Kamtschatka.

On leaving Kamtschatka, it was unanimously judged improper to make any attempt to navigate the seas between the continent of Asia and Japan. Instead of this, it was proposed to steer to the eastward of that island, and in the way thither to sail along the Kuriles; examining particularly those that are situated nearest to the northern coast of Japan, which are said to be considerable, and neither subject to the Russians nor Japanese. In case they should have the good fortune to meet with some secure and commodious harbours in any of these islands, it was supposed that they might prove of considerable importance, as convenient places of shelter for subsequent navigators, who might be employed in exploring the seas as the means of producing a commercial intercourse among the adjacent dominions of the two abovementioned empires. The next object was to take a survey of the coasts of the islands of Japan; after which they designed to sail for the coast of China as far north as possible, and then sail along it southward to Macao.

In pursuance of this plan, they sailed along the coast of Kamtschatka, till they came to the southern point called *Cape Lopatka*, whose situation they determined to be in Lat. 51. 0. E. Long. 156. 45. To the north-west they observed a very lofty mountain whose summit was lost in the clouds; and the same instant the first of the Kurile islands, named *Shoomska*, made its appearance in the direction of west, half south. The passage betwixt the southern extremity of Cape Lopatka and the island of *Shoomska*, though only one league in breadth, is extremely dangerous, both on account of the rapidity of the tides, and of the sunk rocks which lie off the Cape. In the course of this voyage, they had occasion to observe, that a violent swell from the north-east frequently took place, though the wind had been for some time in the western quarter; a circumstance for which they seem to have been altogether unable to account.

The tempestuous weather which now occurred, prevented any discoveries from being made among the Kurile isles; however, they again sailed over the space assigned to the land of De Gama, without being able to find it; and from comparing several accounts of the Russian navigators with one another, it was judged extremely probable, that the land of *Jeso*, so frequently laid down in former maps, is no other than the most southerly of the Kurile Isles. On coming in view of the coast of Japan, they had the mortification to find that they could not approach the land by reason of the tempestuous weather and bad state of the ships; the coasts of these islands being extremely dangerous. Passing from thence in quest of the *Bashee* Islands, they found amazing quantities of pumice-stone floating in the sea; so that they seemed inclined to believe, with Mr Muller, that if there had formerly been any part of the continent, or large island, called the *Layd of Jeso*, it must have disappeared in a volcanic convulsion; which also must have been the case with that called the *Company's Land* and *Staten Island*. Though they had not the good fortune to find the *Bashee* Islands, they discovered one in 24. 48. N. Lat. 141. 20. E. Long. which from its appearance, and the sulphureous smell

emitted by it, they named *Sulphur Island*. After this nothing remarkable occurred till their arrival at Canton in China, where having staid for some time in order to put their ships in repair, they at last set sail for Britain; but through stress of weather were driven as far north as Stromness in Orkney. From thence Captain Gore sent a dispatch to the Lords of the Admiralty to inform them of his arrival; and on the 4th of October 1780 the ships reached the Nore, after an absence of 4 years 2 months and 22 days.

COOKERY, the art of preparing and dressing viands for the table: An art, in its simplest and ordinary modes, sufficiently familiar to every housekeeper, and, in its luxurious refinements, too copiously detailed in manuals and directories published for the purpose to require any enlargement here, were it even a topic that at all deserved consideration in a work of this nature.

COOLERS, in medicine, those remedies which produce an immediate sense of cold, being such as have their parts in less motion than those of the organs of feeling; as fruits and all acid liquors. Or they are such as, by a particular viscosity or grossness of parts, give the animal fluids a greater consistency than they had before, and consequently retard their motion, having less of that intestine force on which their heat depends: of this sort are cucumbers and all substances producing viscosity.

COOM, a term applied to the soot that gathers over an oven's mouth; also for that black, greasy substance, which works out of the wheels of carriages.

COOMB, or COMB, of *Corn*, a dry measure containing 4 bushels, or half a quarter.

COOP, in husbandry, a tumbrel or cart inclosed with boards, and used to carry dung, grains, &c.

Coop is also the name of a pen, or enclosed place, where lambs, poultry, &c. are shut up in order to be fed.

COOPER, a tradesman who makes casks, tubs, and barrels, for holding liquors or other commodities. Every custom-house and excise office in Britain has an officer called *King's cooper*; and every ship of burden has a cooper on board.

COOPER (Anthony-Ashley), first earl of Shaftesbury, a most able statesman, was the son of Sir John Cooper, Bart. of Rockborn in Hampshire, and was born in 1621. He was elected member for Tewkesbury at 19 years of age, in the short parliament that met April 13. 1640. He seems to have been well affected to the king's service at the beginning of the civil wars; for he repaired to the king at Oxford with offers of assistance: but prince Maurice breaking articles to a town in Dorsetshire that he had got to receive him, furnished him with a pretence for going over to the parliament, from which he accepted a commission. When Richard Cromwell was deposed, and the Rump come again into power, they nominated Sir Anthony one of their council of state, and a commissioner for managing the army. At that very time he had engaged in a secret correspondence for restoring Charles II. and, upon the king's coming over, was sworn of his privy council. He was one of the commissioners for the trial of the regicides; was soon after made chancellor of the exchequer, then a commissioner of the treasury; in 1672 was created earl of Shaftesbury; and soon after was raised to the post of lord chancellor.

Cookery
||
Cooper.

Cooper. lor. He filled this office with great ability and integrity; and though the short time he was at the helm was in a tempestuous season, it is doing him justice to say, nothing could either distract or affright him. The great seal was taken from him in 1673, 12 months after his receiving it; but, though out of office, he still made a distinguished figure in parliament, for it was not in his nature to remain inactive. He drew upon himself the implacable hatred of the duke of York, by steadily promoting, if not originally inventing, the famous project of an exclusion-bill. When his enemies came into power, he found it necessary to consult his safety by retiring into Holland, where he died six weeks after his arrival, in 1683. While his great abilities are confessed by all, it has been his misfortune to have his history recorded by his enemies, who studied to render him odious. Butler has given a very severe character of him in his Hudibras.

COOPER (Anthony Ashley), earl of Shaftesbury, was son of Anthony earl of Shaftesbury, and grandson of Anthony first earl of Shaftesbury, lord high chancellor of England. He was born in 1671, at Exeter-house in London, where his grandfather lived, who from the time of his birth conceived so great an affection for him, that he undertook the care of his education; and he made so good a progress in learning, that he could read with ease both the Latin and Greek languages when only 11 years old. In 1683, his father carried him to the school at Winchester, where he was often insulted on his grandfather's account, whose memory was odious to the zealots for despotic power: he therefore prevailed with his father to consent to his desire of going abroad. After three years stay abroad, he returned to England in 1689, and was offered a seat in parliament in some of those boroughs where his family had an interest. But this offer he did not now accept, that he might not be interrupted in the course of his studies, which he prosecuted five years more with great vigour and success; till, on Sir John Trenchard's death, he was elected burghers for Poole. Soon after his coming into parliament, he had an opportunity given him of expressing that spirit of liberty by which he uniformly directed his conduct on all occasions. It was the bringing in and promoting "the act for regulating trials in cases of high treason." But the fatigues of attending the house of commons, in a few years so impaired his health, that he was obliged to decline coming again into parliament after the dissolution in 1693. He then went to Holland, where the conversation of Mr Bayle, Mr le Clerc, and several other learned and ingenious men, induced him to reside a twelvemonth. During this time, there was printed at London, in 8vo. an imperfect edition of Lord Ashley's Inquiry concerning Virtue. It had been surreptitiously taken from a rough draught, sketched when he was no more than 20 years of age. His lordship, who was greatly chagrined at this event, immediately brought up the impression before many books were sold, and set about completing the treatise, as it afterwards appeared in the second volume of the Characteristics. Soon after lord Ashley's return to England, he became, by the decease of his father, earl of Shaftesbury. But his own private affairs hindered him from attending the house of lords till the second year of his peerage, when he was very earnest

to support king William's measures, who was at that time projecting the grand alliance. So much was he in favour with king William, that he had the offer of secretary of state; but his declining constitution would not allow him to accept it. Though he was disabled from engaging in business, the king consulted him on matters of very high importance; and it is pretty well known that he had the greatest share in composing that celebrated last speech of king William, December 31. 1701. On Queen Anne's accession to the throne, he returned to his retired manner of life, being no longer advised with concerning the public; and was then removed from the vice-admiralty of Dorset, which had been in the family for three generations. In 1703, he made a second journey to Holland, and returned to England the year following. The French prophets, soon after this, having by their enthusiastic extravagancies made a great noise throughout the nation, and, among different opinions, some advising a prosecution, the lord Shaftesbury apprehended that such measures tended rather to inflame than to cure the disease. This was the origin of his Letter concerning Enthusiasm, which he sent to lord Somers, then president of the council; and which, being approved of by that nobleman and other gentlemen to whom it was shown, was published in 1708, tho' without the name of the author, or that of the person to whom it was addressed. His Moralist, a philosophical Rhapsody, being a recital of certain conversations on natural and moral subjects, appeared in Jan. 1709; and in the May following his *Sensus Communis*, an Essay upon the Freedom of Wit and Humour, in a letter to a Friend. It was in the same year that he entered into the marriage state with Mrs Jane Ewer, the youngest daughter of Thomas Ewer, Esq; of Lee in Hertfordshire. By this lady, to whom his lordship was related, he had an only son, Anthony the late Earl of Shaftesbury. In 1710, his Soliloquy, or Advice to an Author, was published at London in 8vo. While he was thus employing himself in literary composition, his health declined so fast, that it was recommended to him to seek assistance from a warmer climate. Accordingly, in July 1711, he set out for Naples, and pursuing his journey by way of France, was obliged to pass through the Duke of Berwick's army, which at that time lay encamped near the borders of Piedmont. Here he was entertained by that famous general in the most friendly manner, and every assistance was given him to conduct him in safety to the Duke of Savoy's dominions. Our noble author's removal to Italy was of no service to the re-establishment of his health; for after having resided at Naples about a year and a half, he departed this life on the 4th of February, O. S. 1712-13, in the 42d year of his age. The only pieces which he finished after he came to this city, were the Judgment of Hercules, and the Letter concerning Design, which last was added to that impression of the Characteristics which appeared in 1732. It was in 1711 that the first edition was published of all the Characteristics together, and in the order in which they now stand. But this publication not being entirely to his lordship's satisfaction, he chiefly employed the latter part of his life in preparing his writings for a more elegant edition; which was given to the world in 1713, soon after his decease. The several prints that were then first

Cooper. interspersed through the volumes were all invented by himself, and designed under his immediate inspection; and for this purpose he was at the pains of drawing up a most accurate set of instructions, the manuscript of which is still preserved in the family. That no mistakes might be committed, the Earl did not leave to any other hands so much as the drudgery of correcting the press. In the three volumes of the *Characteristics of Men, Manners, Opinions, and Times*, he completed the whole of his works which he intended for the public eye. Not long before his death he had formed a scheme of writing a discourse on painting, sculpture, and the other arts of design, which, if he had lived to have finished it, might have proved a very pleasing and useful work, as he had a fine taste in subjects of that kind: but his premature decease prevented his making any great progress in the undertaking. The Earl of Shaftesbury had an esteem for the works of the best English divines; one remarkable instance of which was displayed in his writing a Preface to a volume of Dr Whichcot's Sermons, published in 1698. Copies of these sermons had been taken in short-hand, as they were delivered from the pulpit; and the Earl had so high an opinion of them, that he not only introduced them to the world by his Preface, but had them printed under his own particular inspection. In his Letters to a Young Man at the University, he speaks of Bishop Burnet and Dr Hoadly in terms of great applause, and has done justice to the merits of Tillotson, Barrow, Chillingworth, and Hammond, as the chief pillars of the church against fanaticism. But whatever regard his lordship might have for some of the divines, it was to the writings of antiquity that his admiration was principally directed. These were the constant objects of his study, and from them he formed his system of philosophy, which was of the civil, social, and theistic kind.

Of Lord Shaftesbury's character as a writer, different representations have been given. As one of his greatest admirers may be mentioned Lord Monboddo; who, speaking of his Rhapsodist in particular, does not hesitate to pronounce it not only the best dialogue in English, out of all degree of comparison, but the sublimest philosophy; and if we will join with it the Inquiry, the completest system both of morality and theology that we have in our language, and, at the same time, of the greatest beauty and elegance for the style and composition.

Even several of the authors who have distinguished themselves by their direct opposition to many of the sentiments which occur in the *Characteristics*, have nevertheless mixed no small degree of applause with their censures. "I have again perused, with fresh pleasure and fresh concern (says Mr Balguy, in his Letter to a Deist), the volumes of *Characteristics*—I heartily wish the noble author had been as unprejudiced in writing as I was in reading. If he had, I am persuaded his readers would have found double pleasure and double instruction. It seems to me, that his lordship had little or no temptation to pursue any singularities of opinion by way of distinction. His fine genius would sufficiently have distinguished him from vulgar authors in the high road of truth and good sense; on which account his deviations seem the more to be lamented. The purity and politeness of his style, and the delicacy of his sentiments,

are and must be acknowledged by all readers of taste and sincerity. But nevertheless, as his beauties are not easy to be overlooked, so neither are his blemishes. His works appear to be stained with so many gross errors, and his fine thoughts are so often mingled with absurdities, that however we may be charmed with the one, we are forced to condemn the other." Mr Balguy hath farther observed, with regard to the Inquiry concerning Virtue, which is the immediate object of his animadversion, that though he cannot agree in every particular contained in it, he finds little more to do than to tell how much he admires it; and that he thinks it indeed, in the main, a performance so just and exact as to deserve higher praises than he is able to give it.

Dr Brown, in his Essay on the *Characteristics*, observes, that the Earl of Shaftesbury hath in that performance mingled beauties and blots, faults and excellencies, with a liberal and unsparing hand. At the same time, the Doctor applauds that generous spirit of freedom which shines throughout the whole. Another direct antagonist of the Earl of Shaftesbury, Dr Leland, has observed, that no impartial man will deny him the praise of a fine genius. "The quality of the writer (continues the Doctor), his lively and beautiful imagination, the delicacy of taste he hath shown in many instances, and the graces and embellishments of his style, though perhaps sometimes too affected, have procured him many admirers. To which may be added his refined sentiments on the beauty and excellency of virtue, and that he hath often spoken honourably of a just and good Providence, which ministers and governs the whole in the best manner; and hath strongly asserted, in opposition to Mr Hobbes, the natural difference between good and evil; and that man was originally formed for society, and the exercise of mutual kindness and benevolence; and not only so, but for religion and piety too. These things have very much prejudiced many persons in his favour, and prepared them for receiving, almost implicitly, whatever he hath advanced." Dr Johnson, as we are informed by Sir John Hawkings, bore no good-will to Lord Shaftesbury; "neither did he seem at all to relish the cant of the Shaftesburian school, nor inclined to admit the pretensions of those who professed it, to tastes and perceptions which are not common to all men; a taste in morals, in poetry, and prose writing, in painting, in sculpture, in music, in architecture, and in government! A taste that censured every production, and induced them to reprobate every effort of genius that fell short of their own capricious standard."

The grand point in which our noble author has rendered himself justly obnoxious to the friends of religion, is his having interspersed through the *Characteristics* a number of insinuations that appear to be unfavourable to the cause of revelation. There have not, however, been wanting many among his admirers, who have thought that he ought not to be reckoned among the deistical writers. The author of *Animadversions upon Dr Brown's three Essays on the Characteristics* observes, that it is "imprudent, to say no worse, in some sincere advocates for Christianity, to reject the friendly advice and assistance of so masterly a writer as the Lord Shaftesbury, and to give him up to the deists as a patron of infidelity." But it is matter of fact, and not considerations of prudence or imprudence, that

Cooper. must determine the question. In support of his Lordship's having been a believer in our holy religion, may be alleged, his Preface to Whichcot's Sermons, and his Letters to a Student at the University: in both which works he constantly expresses himself in such language as seems to indicate that he was really a Christian. And with regard to the Letters it may be remarked, that they were written in 1707, 1708, and 1709, not many years before his lordship's death. Nevertheless, there are in the Characteristics so many sceptical passages, that he must be considered as having been a doubter at least, if not an absolute disbeliever, with respect to revelation. But if he must be ranked amongst the deists, we agree with the observation of one of his biographers, that he is a very different deist from numbers who have appeared in that character; his general principles being much less exceptionable.

The style of Lord Shaftesbury's compositions is also a point upon which various and contradictory sentiments have been entertained. But for the fullest and most judicious criticism that has appeared upon that subject, we may refer the reader to Dr Blair's Lectures on Rhetoric and Belles Lettres, Vol. I. p. 192, 193, 207, 208, 234, 263, and 396—398.

COOPER (Samuel), a very eminent English miniature painter, born in 1609, and bred under the care of his uncle John Hoskins. He derived, however, his principle excellence from a study of the works of Van Dyck, in whose time he lived; inasmuch that he was commonly styled "Van Dyck in little." His pencil was chiefly confined to the head, in which, with all its dependencies, especially the hair, he was inimitable; but if he descended lower, his incorrectness was notorious. He died in 1672; and his pieces are universally admired all over Europe, selling for incredible prices.—He had a brother, Alexander, likewise a good miniature painter, who became limner to Christina queen of Sweden.

COOPER (Thomas), a pious and learned prelate in the reign of queen Elizabeth, was born at Oxford about the year 1517. He was educated in the school adjoining to Magdalene college, of which he was a choirister; where also, in 1539, he was elected probationer, and fellow in the following year. About the year 1546, quitting his fellowship, he applied himself to the study of physic, in 1556 took the degree of bachelor in that faculty, and practised as physician at Oxford. Being inclined to the Protestant religion, probably this was only a prudent suspension of his final intentions during the Popish reign of queen Mary: for, on the accession of Elizabeth, he resumed the study of divinity; became a celebrated preacher, was made dean of Christchurch and vice chancellor of the university, having accumulated the degrees of bachelor and doctor in divinity. In 1569 he was made dean of Gloucester; and, the year following, bishop of Lincoln: whence, in 1584, he was translated to the see of Winchester; in which city he died on the 29th of April 1594, and was buried in the cathedral there, on the south side of the choir. The several writers who have mentioned Dr Cooper, unanimously give him the character of an eloquent preacher, a learned divine, and a good man. He had the misfortune while at Oxford to marry a lady whose gallantries became notorious: nevertheless he would not be divorced from her; knowing that he

could not live without a wife, he did not choose "to charge his conscience with the scandal of a second marriage."—He wrote, 1. The Epitome of Chronicles from the 17th year after Christ to 1540, and thence after to 1560. 2. Thesaurus linguæ Romanæ et Britannicæ. This dictionary, which is an improvement upon Elyot's, was much admired by queen Elizabeth, who thence forward determined to promote the author. 3. A brief exposition of such chapters of the Old Testament as usually are read in the church, at common prayer, on Sundays throughout the year. 4. An admonition to the people of England. 5. Sermons.

COOPER (John-Gilbert), a polite writer of the present age, was born in 1723; and was descended from an ancient family in the county of Nottingham, whose fortune was injured in the last century by their attachment to the principles of monarchy. He resided at Thurgarton priory in Nottinghamshire, which was granted by King Henry VIII. to William Cooper, one of his ancestors. This mansion Mr Cooper inherited from his father, who in 1739 was high-sheriff of the county; and transmitted it to his son, who filled the same respectable office in 1783. After passing through Westminster school under Dr John Nicoll, along with the late Lord Albemarle, Lord Buckinghamshire, Major Johnson, Mr George Ashby, and many other eminent and ingenious men, he became in 1743 a Fellow-Commoner of Trinity-college, Cambridge, and resided there two or three years; but quitted the university on his marriage with Susanna the daughter of William Wrighte, Esq; son to the Lord Keeper of that name, and Recorder of Leicester 1729—1763. In the year 1745 he commenced author by the publication of The Power of Harmony, a poem in 4to; and in 1746 and 1747 he produced several Essays and Poems under the signature of Philalethes, in a periodical work called The Museum, published by Mr Dodsley. In the same year he came forward as an author, with his name, by a work which received much assistance from his friend the Reverend John Jackson of Leicester, who communicated several learned notes, in which he contrived to manifest his dislike to his formidable antagonist Mr Warburton. It was intitled The Life of Socrates, collected from the Memorabilia of Xenophon and the Dialogues of Plato, and illustrated farther by Aristotle, Diodorus Siculus, Cicero, Proclus, Apuleius, Maximus Tyrius, Boëthius, Diogenes Laërtius, Aulus Gellius, and others, 1749, 8vo. In this work Mr Cooper gave evident marks of superior genius; warm, impetuous, and impatient of restraint. In 1754, Mr Cooper published his Letters on Taste, 8vo; an elegant little volume, on which no small share of his reputation is founded; and in 1755, The Tomb of Shakespeare, a Vision, 4to; a decent performance, but in which there is more of wit and application than of nature or genius. In 1756 he assisted Mr Moore, by writing some numbers of The World; and attempted to rouse the indignation of his countrymen against the Hessians, at that juncture brought over to defend the nation, in a poem called The Genius of Britain, addressed to Mr Pitt. In 1758, he published Epistles to the Great, from Aristippus in Retirement, 4to; and The Call of Aristippus, Epistle IV. to Mark Akenfide, M. D. Also, A Father's Advice to his Son, in 4to.

In

Co-ordi-
nate
||
Copaiba.

In the Annual Register of the same year is his Translation of An Epistle from the King of Prussia to Monsieur Voltaire. In 1759, he published *Ver Vert*; or, the Nunnery Parrot; an Heroic Poem, in four cantos; inscribed to the Abbess of D***; translated from the French of Monsieur Gresset, 4to; reprinted in the first volume of Dilly's Repository, 1777; and, in 1764, Poems on several Subjects, by the Author of the Life of Socrates; with a prefatory Advertisement by Mr Doddsley. In this little volume were included all the separate poetical pieces which have been already mentioned, excepting *Ver Vert*, which is a sprightly composition. Mr Cooper died at his father's house in May-Fair, after a long and excruciating illness arising from the stone, April 14. 1769.

CO-ORDINATE, something of equal order, rank, or degree, with another.

COOT, in ornithology. See FULICA.

COOTWICH (John), doctor of laws, was born at Utrecht, and spent great part of his life in travelling. He published in Latin, in 1619, an account of his journey from Jerusalem and from Syria; which is very scarce and in high esteem. Time of his death uncertain.

COPAIBA, or *Balsam of COPAIBA*, a liquid resinous juice, flowing from incisions made in the trunk of the *copaifera* balsamum. See the following article. This juice is clear and transparent, of a whitish or pale yellowish colour, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker: when long kept, it becomes nearly as thick as honey, retaining its clearness; but has not been observed to grow dry or solid, as most of the other resinous juices do. We sometimes meet with a thick sort of balsam of *copaiba*, which is not at all transparent, or much less so than the foregoing, and generally has a portion of turbid watery liquor at the bottom. This sort is probably either adulterated by the mixture of other substances, or has been extracted by coction from the bark and branches of the tree: its smell and taste are much less pleasant than those of the genuine balsam. Pure balsam of *copaiba* dissolves entirely in rectified spirit, especially if the menstruum be previously alkalized: the solution has a very fragrant smell. Distilled with water, it yields a large quantity of a limpid essential oil; and in a strong heat, without addition, a blue oil.

The balsam of *copaiba* is an useful corroborating detergent medicine, accompanied with a degree of irritation. It strengthens the nervous system, tends to loosen the belly, in large doses proves purgative, promotes urine, and cleanses and heals exulcerations in the urinary passages, which it is supposed to perform more effectually than any of the other balsams. Fuller observes, that it gives the urine an intensely bitter taste, but not a violet smell as the turpentine do.

This balsam has been principally celebrated in gleet and the fluor albus, and externally as a vulnerary. The author abovementioned recommends it likewise in dysenteries, in scorbutic cachexies, in diseases of the breast and lungs, and in an acrimonious or putrescent state of the juices: he says, he has known very dangerous coughs, which manifestly threatened a consumption, cured by the use of this balsam alone; and that, notwithstanding its being hot and bitter, it has good

effects even in hectic cases. Most physicians seem now, however, to consider balsams and resins too stimulant to be ventured on in phthisical affections.

The dose of this medicine rarely exceeds 20 or 30 drops, though some direct 60 or more. It may be conveniently taken in the form of *elæosaccharum*, or in that of an emulsion, into which it may be reduced by triturating it with almonds, or rather with a thick mucilage of gum-arabic, till they are well incorporated, and then gradually adding a proper quantity of water.

COPAIFERA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under those of which the order is doubtful. There is no calyx; there are four petals; the legumen ovate; one seed with an arillus or coat resembling a berry. We know but of one species, the *balsamum*, being that which yields the *copaiba* balsam mentioned in the preceding article. This tree grows near a village called *Ayapel*, in the province of Antiochi, in the Spanish West Indies about ten days journey from Carthagen. There are great numbers of these trees in the woods about this village, which grow to the height of 50 or 60 feet. Some of these trees do not yield any of the balsam; those which do, are distinguished by a ridge which runs along their trunks. These trees are wounded in the centre, and they place calabash shells, or some other vessels, to the wounded part to receive the balsam, which will all flow out in a short time. One of these trees will yield five or six gallons of balsam: but tho' they will thrive well after being tapped, yet they never afford any more balsam.

COPAL, improperly called *gum copal*, is a gum of the resinous kind brought from New Spain, being the concrete juice of a tree * which grows in these parts. * *Rhus Copallinum*. It comes to us in irregular masses, some of which are transparent, and of different shades as to colour, from a light yellow to a deep brown. Some pieces are whitish and semitransparent. To the smell it is more agreeable than frankincense: but hath neither the solubility in water common to gums, nor in spirit of wine common to resins, at least in any considerable degree. By these properties it resembles amber; which has induced some to think it a mineral bitumen resembling that substance. In distillation it yields an oil, which like mineral petrolea is indissoluble in spirit of wine. Copal itself is soluble in the essential oils, particularly in that of lavender, but not easily in the expressed ones. It may, however, be dissolved in linseed oil by digestion, with a heat very little less than is sufficient to boil or decompose the oil. This solution, diluted with spirit of turpentine, forms a beautiful transparent varnish, which when properly applied, and slowly dried, is very hard and durable. This varnish is applied to snuff-boxes, tea-boards, and other utensils. It preserves and gives lustre to paintings, and greatly restores the decayed colours of old pictures, by filling up the cracks and rendering the surfaces capable of reflecting light more uniformly.

COPARCENARY, the share or quota of a coparcener.

COPARCENERS, (from *con* and *particeps*, "partner;"), or PARCENERS; such as have equal portions in the inheritance of their ancestor.

Copaifera
||
Coparceners.

Cope
||
Copenha-
gen.

Coparceners are so either by law or custom. Coparceners by law, are the issue female; which, in default of a male heir, come equally to the lands of their ancestor. Coparceners by custom, are those who, by some peculiar custom of the country, challenge equal parts in such lands; as in Kent, by the custom of gavelkind. The crown of England is not subject to coparcenary.

COPE, an ecclesiastical ornament, usually worn by chanters and subchanters, when they officiate in solemnity. It reaches from the shoulders to the feet. The ancients called it *pluviale*.—The word is also used for the roof or covering of a house, &c.

COPE is also the name of an ancient custom or tribute due to the king or lord of the soil, out of the lead-mines in some part of Derbyshire, England; of which Manlove saith thus:

Egrefs and regrefs to the king's highway,
The miners have; and *lot* and *cope* they pay:
The thirteenth dish of ore within their mine,
To the lord, for *lot*, they pay at measuring time;
Sixpence a load for *cope* the lord demands,
And that is paid to the *burghmaster's* hands.

This word by doomday-book, as Mr Hagar hath interpreted it, signifies a hill: and *cope* is taken for the supreme cover, as the *cope of heaven*.

COPEL. See CUPEL.

COPENHAGEN, the capital of the kingdom of Denmark, situated on the eastern shore of the island of Zealand, upon a fine bay of the Baltic sea, not far from the strait called the *Sound*. E. Long. 13. 0. N. Lat. 55. 30.

The precise date of the foundation of this city is disputed; but the most probable account is, that it took its rise from a castle built on the spot in the year 1168, as a protection against the pirates which at that time swarmed in the Baltic. The conveniency of the situation, and the security afforded by the castle, soon induced a number of the inhabitants of Zealand to resort thither: but it was not distinguished by the royal residence until 1443, during the reign of Christopher of Bavaria; since which period it has been gradually enlarged and beautified, and is become the capital of Denmark.

Copenhagen is the best built city of the north; for although Petersburgh excels it in superb edifices, yet, as it contains no wooden houses, it does not display that striking contrast of meanness and magnificence, but in general exhibits a more equable and uniform appearance. The town is surrounded towards the land with regular ramparts and bastions, a broad ditch full of water, and a few outworks: its circumference measures between four and five miles. The streets are well paved, with a foot-way on each side, but too narrow and inconvenient for general use. The greatest part of the buildings are of brick; and a few are of free-stone brought from Germany. The houses of the nobility are in general splendid, and constructed in the Italian style of architecture: the palace, which was erected by Christian VI. is a large pile of building; the front is of stone, and the wings of brick stuccoed; the suite of apartments is princely; but the external appearance is more grand than elegant.

The busy spirit of commerce is visible in this city, which contains about 80,000 inhabitants. The haven is always crowded with merchant ships; and the streets are intersected by broad canals, which bring the mer-

chandize close to the warehouses that line the quays. This city owes its principal beauty to a dreadful fire in 1728, that destroyed five churches and 67 streets, which have been since rebuilt in the modern style. The new part of the town, raised by the late King Frederic V. is extremely beautiful, scarcely inferior to Bath. It consists of an octagon, containing four uniform and elegant buildings of hewn stone, and of four broad streets leading to it in opposite directions. In the middle of the area stands an equestrian statue of Frederic V. in bronze, as big as life, which cost 80,000l. The Royal Museum, or Cabinet of Rarities, merits the attention of travellers. This collection, which was begun by Frederic III. is deposited in eight apartments, and ranged in the following order: animals, shells, minerals, paintings, antiquities, medals, dresses, arms and implements of the Laplanders.

Part of Copenhagen, which is called *Christianstadsen*, is built upon the Isle of Amak, which generally attracts the curiosity of foreigners; (see AMAK). From this place, to which the main city is joined by a bridge, the markets are supplied with fowl, beef, mutton, venison, corn, and culinary vegetables, which are produced here in the greatest abundance.

COPERNICAN, in general, something belonging to COPERNICUS. Hence,

COPERNICAN System or Hypothesis, that system of the world, wherein the sun is supposed to rest in the centre, and the planets, with the earth, to move in ellipses round him. See COPERNICUS.

COPERNICUS (Nicolaus), an eminent astronomer, was born at Thoru in Prussia, Jan. 10. 1472. He was taught the Latin and Greek languages at home; and afterwards sent to Cracovia, where he studied philosophy and physic. His genius in the mean time was naturally turned to mathematics, which he pursued through all its various branches. He set out for Italy when he was 23 years of age; but staid at Bononia some time, for the sake of being with the celebrated astronomer of that place, Dominicus Maria; whose conversation, however, and company, he affected, not so much as a learner, as an assistant to him in making his observations. From thence he passed to Rome, where he was no sooner arrived than he was considered as not inferior to the famous Regiomontanus; and acquired in short so great a reputation, that he was chosen professor of mathematics, which he taught for a long time with great applause. He also made some astronomical observations there about the year 1500. Returning to his own country some years after, he began to apply his vast knowledge in mathematics to correct the system of astronomy which then prevailed. He set himself to collect all the books which had been written by philosophers and astronomers, and to examine all the various hypotheses they had invented for the solution of the celestial phenomena; to try if a more symmetrical order and constitution of the parts of the world could not be discovered, and a more just and exquisite harmony in its motions established, than what the astronomers of these times so easily admitted. But of all their hypotheses none pleased him so well as the Pythagorean, which made the sun to be the centre of the system, and supposed the earth to move not only round the sun, but round its own axis also. He thought he discerned much beautiful

Coperni-
can,
Coperni-
cus.

Copernicus, beautiful order and proportion in this; and that all that embarrassment and perplexity from epicycles and excentrics, which attended the Ptolemaic hypothesis, would here be entirely removed.

This system, then, he began to consider, and to write upon, when he was about 35 years of age. He employed himself in contemplating the phenomena carefully; in making mathematical calculations; in examining the observations of the ancients, and in making new ones of his own; and after more than 20 years chiefly spent in this manner, he brought his scheme to perfection, and established that system of the world which goes by his name, and is now universally received, (see ASTRONOMY, n° 22.) His system, however, was then looked upon as a most dangerous heresy: for which he was thrown into prison by Pope Urban VIII. and not suffered to come out till he had recanted his opinion; that is, till he had renounced the testimony of his senses. He died the 24th of May 1543, in the 70th year of his age.

This extraordinary man had been made canon of Worms by his mother's brother, Lucas Wazelrodus, who was bishop of that place. He was not only the greatest of astronomers, but a perfect master of the Greek and Latin tongues; to all which he joined the greatest piety and innocence of manners.

COPERNICUS, the name of an astronomical instrument invented by Mr Whiston, to exhibit the motion and phenomena of the planets, both primary and secondary. It is built upon the Copernican system, and for that reason called by his name.

COPHTI, COPHTS, or COPTI, a name given to the Christians of Egypt, who are of the sect of Jacobites.

The critics are extremely divided about the origin and orthography of the word; some write it Cophti, others Cophtites, Cophtitæ, Copts, &c. Scaliger derives the name from Coptos, an anciently celebrated town of Egypt, the metropolis of the Thebaid. Kircher refutes this opinion, and maintains, that the word originally signifies "cut" and "circumscribed;" and was given these people by the Mahometans, by way of reproach, because of their practice of circumcising: but P. Sollier, another Jesuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the word from Αἰγυπτῶν, the ancient name of Egypt, by retrenching the first syllable: but this opinion, too, P. Sollier disputes. John de Leo and others say, that the Egyptians anciently called their country *Elchibth*, or *Cibth*, from Cibth their first king, whence Cophtite, &c. others say from Cobtim second king of Egypt. Vansleb derives the word Copht from Copt son of Misraim, grandson of Noah. All these etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called *Cophti*; whereas, in effect, none but the Christians, and among those none but the Jacobites, bear the name, the Melchites not being comprehended under it. Hence he chooses to derive the word from the name *Jacobite*, retrenching the first syllable; whence, Cobite, Cobeia, Copta, and Cophta.

The Cophts have a patriarch who resides at Cairo, but he takes his title from Alexandria; he has no archbishop under him, but 11 or 12 bishops. The rest of the clergy, whether secular or regular, is com-

posed of the orders of St Anthony, St Paul, and St Macarius, who have each their monasteries. Besides the orders of priests, deacons, and subdeacons, the Cophts have likewise archimandrites, the dignity whereof they confer with all the prayers and ceremonies of a strict ordination. This makes a considerable difference among the priests; and besides the rank and authority it gives them with regard to the religious, it comprehends the degree and functions of arch-priests. By a custom of 600 years standing, if a priest elected bishop be not already archimandrite, that dignity must be conferred on him before episcopal ordination. The second person among the clergy, after the patriarch, is the titular patriarch of Jerusalem, who also resides at Cairo, because of the few Cophts at Jerusalem; he is, in effect, little more than the bishop of Cairo: only he goes to Jerusalem every Easter, and visits some other places in Palestine near Egypt, which own his jurisdiction. To him belongs the government of the Cophtic church, during the vacancy of the patriarchal see.

To be elected patriarch, it is necessary the person have lived all his life in continence: it is he confers the bishoprics. To be elected bishop, the person must be in the celibate; or, if he have been married, it must not be above once. The priests and inferior ministers are allowed to be married before ordination; but are not obliged to it, as Ludolphus erroneously observes. They have a great number of deacons, and even confer the dignity frequently on children. None but the lowest rank among the people commence ecclesiastics; whence arises the excessive ignorance found among them: yet the respect of the laity towards the clergy is very extraordinary. Their office is longer than the Roman office, and never changes in any thing: they have three liturgies, which they vary occasionally.

The monastic life is in great esteem among the Cophts: to be admitted into it, there is always required the consent of the bishop. The religious Cophts make a vow of perpetual chastity; renounce the world, and live with great austerity in deserts: they are obliged to sleep in their clothes and their girdle, on a mat stretched on the ground; and to prostrate themselves every evening, 150 times, with their face and breast on the ground. They are all, both men and women, of the lowest class of the people; and live on alms. The nunneries are properly hospitals; and few enter but widows reduced to beggary.

F. Roderic reduces the errors and opinions of the Cophts to the following heads: 1. That they put away their wives, and espouse others while the first are living. 2. That they have seven sacraments; viz. baptism, the eucharist, confirmation, ordination, faith, fasting, and prayer. 3. That they deny the Holy Spirit to proceed from the Son. 4. That they only allow of three œcumenical councils; that of Nice, Constantinople, and Ephesus. 5. That they only allow of one nature, will, and operation, in Jesus Christ, after the union of the humanity with the divinity. For their errors in discipline, they may be reduced, 1. To the practice of circumcising their children before baptism, which has obtained among them from the 12th century. 2. To their ordaining deacons at five years of age.

Cophiti,
Cophitic.

3. To their allowing of marriage in the second degree.
4. To their forbearing to eat blood: to which some add their belief of a baptism by fire, which they confer by applying a hot iron to their forehead or checks. —Others palliate these errors, and show that many of them are rather abuses of particular persons than doctrines of the sect. This seems to be the case with regard to their polygamy, eating of blood, marrying in the second degree, and the baptism of fire: for circumcision, it is not practised as a ceremony of religion, nor as of any divine appointment, but merely as a custom which they derive from the Ishmaelites; and which, perhaps, may have had its origin from a view to health and decency in those hot countries.

The Cophts, at different times, have made several re-unions with the Latins; but always in appearance only, and under some necessity of their affairs. In the time of Pope Paul IV. a Syrian was dispatched to Rome from the Patriarch of Alexandria, with letters to that pope; wherein he acknowledged his authority, and promised obedience; desiring a person might be dispatched to Alexandria, to treat about a re-union of his church to that of Rome: pursuant to which, Pius IV. successor to Paul, chose F. Roderic, a Jesuit, whom he dispatched in 1561, in quality of apostolical nuncio. But the Jesuit, upon a conference with two Cophts deputed for that purpose by the patriarch, was made to know, that the titles of father of fathers, pastor of pastors, and master of all churches, which the patriarch had bestowed on the pope in his letters, were no more than mere matters of civility and compliment; and that it was in this manner the patriarch used to write to his friends: they added, that since the council of Chalcedon, and the establishment of several patriarchs independent of one another, each was chief and master of his own church. This was the answer the patriarch gave the pope, after he had received a sum of money remitted to him from Rome, by the hands of the Venetian consul.

COPHTIC, or COPTIC, the language of the Cophts, the ancient language of the Egyptians, mixed with a great deal of Greek, the characters it is written in being all Greek. It has a form and construction peculiar to itself: it has no inflections of the nouns or verbs; but expresses number, case, gender, person, mood, tense, and possessive pronouns, by letters and particles prefixed.

F. Kircher is the first who published a grammar and vocabulary of the Cophtic. There is not known any book extant in the Cophtic, except translations of the Holy Scriptures, or of ecclesiastical offices; or others that have relation thereto, as dictionaries, &c.

The ancient Cophtic is now no longer found but in books; the language now used throughout the country is Arabic. The old Cophtic, which Kircher maintains to be a mother-tongue, and independent of all others, had been much altered by the Greek: for besides that it has borrowed all its characters from the Greek, with a very little variation, a great number of the words are pure Greek. Vossius, indeed, asserts, that there was no Cophtic language till after Egypt became subject to the Arabs. The language, according to him, is a mixture of Greek and Arabic: the very name thereof not being in the world till after the Arabs

were masters of the country. But this, M. Simon observes, proves nothing; except that what was anciently called *Egyptian*, has since by the Arabs been called *Cophtic*, by a corruption of speech. There are, it is true, Arabic words in the Cophtic; yet this by no means proves but that there was a language before that time, either Cophtic or Egyptian. Pietro de la Valle observes, that the Cophts have entirely lost their ancient tongue; that it is now no longer understood among them; that they have nothing extant therein but some sacred books; and that they still say masses in it.

All their other books have been translated into Arabic, which is their vulgar tongue; and this has occasioned the originals to be lost: it is added, that they rehearse the epistles and gospels in the mass twice; once in Arabic and once in Cophtic. Indeed, if we believe F. Vansleb, the Cophts say the mass in Arabic, all but the epistles and gospels, which they rehearse both in that and Cophtic.

COPHTIC Bible. See BIBLE.

COPHTIC Liturgies are three; one attributed to Basil, another to St Gregory, and the third to Cyril: they are translated into Arabic for the use of the priests and people.

COPIATA, under the western empire, a grave-digger. In the first ages of the church there were clerks destined for this employment. In the year 357, Constantine made a law in favour of the priests *copiatæ*, i. e. of those who had the care of interments; whereby he exempts them from the lustral contribution which all other traders paid. It was under him also that they first began to be called *copiatæ*, q. d. clerks destined for bodily labour, from *κοπεω*, or *κοπω*, *sciindo*, *caedo*, *ferio*, "I cut, beat," &c. Before that time they were called *decani* and *lecticarii*; perhaps because they were divided by decads or tens, each whereof had a bier or litter for the carriage of the dead bodies. Their place among the clerks was the next in order before the chantors.

COPING of a wall, the top or cover of a wall, made sloping to carry off the water.

COPING over, in carpentry, a sort of hanging over, not square to its upright, but bevelling on its under side till it end in an edge.

COPIST, in diplomatic science, signifies a transcriber or copier of deeds, books, &c.

COPPA, in law, a cop or cock of grass, hay, or corn, divided into titheable portions; as the tenth cock, &c. This word in strictness denotes the gathering or laying up the corn in cops or heaps, as the method is for barley or oats, &c. not bound up, that it may be the more fairly and justly tithed: and in Kent in England they still retain the word, a *cop* or *cap* of hay, straw, &c.

COPPEL. See CUPEL.

COPPER, the finest of the imperfect metals, called by the alchemists *Venus*, on account of its facility of uniting with a great number of different metallic substances. Its colour, when pure, is pale red, and its specific gravity from 8.7 to 9.3, which depends not only on its degree of purity, but also on its condensation by hammering. The specific gravity of Japan copper is to water as 9000 to 1000; but that of the Swedish kinds only 8784 or 8843.---The colour, when

Cophitic
|
Copper.

Copper. when clean, is very brilliant, but it is extremely liable to tarnish. It has a disagreeable smell, very perceptible on friction or on being heated: its taste is stiptic and nauseous, but less perceptible than that of iron. Its tenacity, ductility, and hardness, are very considerable, and its elasticity superior to that of any other metal except steel. From this last quality masses of the metal emit a loud and lasting sound when struck; and this more especially when cast into a proper form, viz. such an one as may make the metal vibrate in the most simple manner possible. Thus, if cast into the hollow form of a bell, without any cracks or imperfections, an uniform tone will be produced by it; or at least the tones produced by a stroke will consist of a single predominant one, and of others that have an agreement with it. When broken by often bending backward and forward, it appears internally of a dull red colour without any brightness, and of a fine granulated texture; not ill resembling, as Cramer observes, some kinds of earthen ware. It continues malleable in a red heat, and in this state extends much more easily than when cold; but has not that valuable quality of iron, by which two pieces cohere together when heated to a great degree. In a heat far below ignition, the surface of a piece of polished copper becomes covered with various ranges of prismatic colours; the red of each order being nearest to the end which has been most heated. Reduced to a fine powder, or even to filings, and thrown across a flame, it produces blue or green colours, whence its use in fireworks. It requires a fierce heat to melt it; less, according to Mr Wedgewood, than gold or silver*, but more according to some other metallurgists.—It is remarkably impatient of moisture when in a state of fusion, and the contact even of a very small quantity of water will cause a vast mass of melted metal to be thrown about with incredible violence, to the imminent danger not only of the bystanders but even of the strongest furnaces and buildings. Effects of this kind are said to have been produced by so slight a cause as the workman spitting in a furnace full of melted copper.

Copper is found in the bowels of the earth in the following states.

¹ Native copper. I. Native copper, having the red colour, the malleability, and all the other properties of the metal. It is distinguished, says Mr Fourcroy, into two kinds; copper of the first formation, and copper of the second formation or cementation. The copper of the first formation is dispersed in laminæ or fibres, in gangue almost always quartzose; some of its crystals resemble a kind of vegetation, but other specimens are in masses or grains. Copper of cementation is commonly in grains or superficial laminæ, on stones or on iron: this last appears to have been deposited in waters containing virriol of copper which has been precipitated by iron. Native copper is found in many places of Europe; particularly in various parts of Scotland, England, and Wales; at St Bell in Lyons; at Norberg in Sweden, and Newfol in Hungary. It is also to be met with in several parts of America.—Mr Kirwan says, it is met with either of its own peculiar colour or blackish or grey; and that either in grains or in large shapeless solid lumps; in a foliated, capillary, or arborescent form, or crystallized in quadrangular pyramids, in or on clay, chistus, quartz, fluors

zcolytes, &c. He accounts for its origin by supposing it to have been originally precipitated by iron from waters which held it in solution, which is the purest sort: but in many cases it could not have been produced in that manner; and then this sort is never very pure, but mixed with gold, silver, or iron, or with sulphur; which last combination is called *black copper*.

Native copper is found in very considerable quantities at Cape Lizard in Cornwall: it is formed into threads or branches, and lies in veins of some thickness, contained in blackish serpentine mixed with brownish red, and covered externally with a greenish nephrites, partly adherent to it and partly loose. Native copper, in large lumps, has also been found in the same rocks: but a more considerable quantity is found at Huel Virgin in the same county. Here it shoots into various branches and in various directions: the pieces seem to be formed of small rhomboidal crystals interspersed with quartz, the impressions of which are to be seen in the copper itself; from whence we might conclude that the quartz existed before the metal. Some of these lumps of native copper have been found in this spot that weighed from 20 to 30 pounds; and in the month of March 1785 there were no less than 28 millions of pounds of rich copper ore extracted from this mine. At a place called *Catar-rach*, contiguous to Huel Virgin, some crystallized native copper has been found, with the transparent vitreous copper ore, to be afterwards mentioned, crystallized in octahedrons of a ruby colour; though the latter now begins to be very scarce. Near this place also a compact native copper is found in lumps of a spherical form; the copper either still in its metallic form, or beginning to be transformed into red copper-glass, imbedded in decayed granite. Native copper of a tender and moss-like form, united to vitreous ruby copper ore, crystallized in rhombs, is found in the clefts of the mountains composed of killas, near Pol-dry.—An indurated iron-clay has lately been found under the surface of the sea in the Faro isles, in which there is scattered a zeolite with native copper.

II. Mineralized by fixed air; of which there are several varieties. 1. Red copper, or hepatic ore of copper. This is known by its red dusky colour, similar to that of the scales beat off from copper by hammering. It is seldom met with, and then is generally mixed with native copper and mountain green. Sometimes it is crystallized in octahedrons or silky fibres, and is called *flowers of copper*. Mr Kirwan says, that it is sometimes met with in a loose form, and generally called *copper ochre*; but is usually of a moderate hardness, though brittle; sometimes crystallized and transparent, either in a capillary form, or in cubes, prisms, or pyramids; it effervesces with acids, and is found in Scotland, England, and Germany. According to Mr Fontana, 100 parts of it contain 73 of copper, 26 of fixed air, and one of water. Mr Kirwan distinguishes the hepatic ore as being of a brown colour. It "contains a variable proportion of iron or pyrites, and sometimes sulphurated copper; and hence affords from 20 to 50 per cent. of copper. It is often *iridescent*" (we suppose showing the colours of the rainbow). 2. Earthy copper, mountain-green, green chrysocholla or malachite. The last, according to Mr Kirwan, looks like

Copper.

* See *Chemistry*, n^o 104.

² Where found.

³ Different ores mineralized with fixed air.

Copper. green jasper, but less hard, and does not strike fire with steel, is of a radiated or equable texture, generally of an oval form, and the size of an egg, but sometimes forming capillary filaments. Mutchenbrook fixes its specific gravity from 3.5 to 3.994. It is sometimes mixed with calcareous earth and gypsum. According to Mr Fontana, 100 parts of the purest sort contain 75 of copper and 25 of aerial acid and water. Mountain green is generally found in a loose and friable state, rarely crystallized and indurated, often mixed with calcareous earth, iron, and some arsenic. An hundred parts of the purest kind contain 72 of copper, 22 of aerial acid, and 6 of water.

4
Mountain
green.

A compact green copper ore, like malachite, mixed with grey copper ore, and likewise green velvet-like copper in the form of bunches, are found at Huel Virgin in Cornwall. At Carrarach, in the same county, is found also an amorphous green copper ore, on a decayed granite; and at St Menan, the same is found stratified betwixt quartz, and covered with a brownish iron. Cronstedt informs us, that both the green and blue colours of copper ores depend on a menstruum, and therefore may be often edulcorated or washed away. In Saalfeld they find also a sort of green, somewhat indurated, calcareous substance, containing copper: this, when broken, looks fat, and somewhat shining; but, upon the whole, it resembles a jasper. It is there very improperly called a *green copper glass-ore*. Good copper is made of it; and, with a phlogistic substance, without being ustulated, it forms a kind of bell-metal fit for being employed for that purpose.

5
Malachite.

The malachite, according to Mr Fourcroy, is frequently found in Siberia, composing beds, some of which represent nipples of various magnitudes. Some specimens are composed of needles, converging towards a common centre. The grain of malachite is sufficiently hard to take a fine polish, and is therefore formed into toys of different kinds; but as it is frequently porous and full of unequal cavities, the solid pieces of a certain size are reckoned valuable. The strata in which it is found are often of different shades of green. The mountain green is a true ochre of copper, of a more or less deep green, not heavy, and unequally distributed on its gangue: it appears to be combined with the crctaceous acid. There are two varieties besides the malachite, *viz.* the simple mountain green, and that which is crystallized, or the silky copper ore of China. It is common in the Hartz, and likewise in China. It is very pure, and crystallized in long silky bundles of considerable solidity. To these three states, says Mr Fourcroy, we may add a beautiful green sand, brought by M. Dombey from Peru, which appears to be a calx of this metal mixed with sand, and containing a small quantity of muriatic acid.

6
Mountain
blue, or
blue chry-
focolla.

3. The third variety of this species is the mountain blue, or blue chryfocolla. This, according to M. Fourcroy, is a calx of copper of a deep blue colour, sometimes regularly formed in rhomboidal prismatic crystals of a fine blue, in which case it is called azure of copper. "All these calces of copper (says he) appear to have been precipitated from vitriolic solutions of copper, by the intermedium of calcareous earths through which the waters have transfused. M. Sage considers these blue copper ores as combinations

of copper with the volatile alkali; from which he affirms that they differ only in their degree of solubility; he likewise thinks that the malachites is produced from this blue, which he calls transparent azure copper ore; but most mineralogists are of a different opinion." Mr Kirwan tells us, that 100 parts of this ore contain about 69 of copper, 29 of aerial acid, and 2 of water. Mr Morveau, in the Memoirs of the Academy of Dijon for 1782, has shown that the calces of copper ore determined to a blue rather than a green colour, by a greater proportion of phlogiston.

Copper.

III. Cupreous stones. These are the *turquoise* and *lapis armenus*. The former of these is improperly called a stone, being the tooth of an animal penetrated by the blue calx of copper. It loses its colour when heated; is opaque, of a lamellar texture, and susceptible of a fine polish; its specific gravity from 2.5 to 2.908; some are of a deep blue, some more white, and become deeper when heated. They are found in Persia and in Languedoc in France; the copper may be extracted from them by distilled vinegar. Reaumur informs us, Mem. Par. 1715, that nitrous acid will not dissolve the Persian turquoise, though it will that of France. The lapis armenus has calcareous earth or gypsum for its base; whence it sometimes effervesces with acids and sometimes not. It is used in painting, when ground to a fine powder, under the name of BICE. To these Mr Fourcroy adds "copper mineralized by the muriatic acid and united to clay." This ore has been confounded with talc; and it was exposed to sale at Paris, in the year 1784, under the name of green mica. It consists of small beautifully green crystals, or small brilliant scales. It was discovered by Mr Forster in the mines of John Georgenstadt; the green cupreous sand of Peru already mentioned, perhaps belongs to the same class.

7
Turquoise
and lapis
armenus.

IV. Copper mineralized by sulphur, with scarce any iron, improperly called vitreous copper ore. This is of a deep violet grey, greenish brown, or liver colour; melting with a very gentle heat, ponderous, sometimes flexible, and always yielding to the knife. When broken it appears of a bright golden colour. It is sometimes found out in shapeless masses, sometimes regularly crystallized; is much more fusible than pure copper, and has a specific gravity from 4.81 to 5.338. It is found in mines of other copper ores, in limestone, spar, quartz, mica, and clay: it is the richest of all the copper ores; affording from 80 to 90 *per cent.* of copper, 10 or 12 of sulphur, and a small proportion of iron.

8
Copper mi-
neralized
by sulphur.

V. Copper mineralized by sulphur with a large proportion of iron, azure copper ore; does not differ from the preceding but in the quantity of iron it contains, which sometimes amounts to 50 *per cent.* It yields 50 or 60 pounds of copper *per* hundred, the rest being sulphur. The less iron this ore contains, the richer it is in copper; and it has by many been confounded with indurated mountain blue.

9
With a
large pro-
portion of
iron.

VI. Copper mineralized by sulphur, with much iron, the yellow copper ore, or yellow pyrites. The colour of this is yellow, or yellow mixed with red or green, or variegated like a pigeon's neck; it is inferior in hardness to the other pyrites, not readily giving fire with steel as they do. It is sometimes found crystallized, and sometimes in shapeless masses; its specific gravity

10
Yellow
copper ore,
or yellow
pyrites.

Copper. gravity is about 4.16. It occurs both in separate masses and embodied in stones, being the most common of all the copper ores. The crystallized kind affords least metal, containing only from 4 to 8 *per cent.* the remainder being chiefly iron. It is generally reddish, and is in fact only a martial pyrites with a small portion of copper; the greenish yellow contains most sulphur, and from 15 to 20 *per cent.* of copper; the pure yellow contains most copper, viz. from 20 to 30 *per cent.* "The cupreous pyrites (says M. Fourcroy) often present very brilliant blue or violet colours at their surface, which are produced by the decomposition of their principles: they are then called *chatoyant* ores of copper, or ores resembling the peacock's tail: they commonly contain a large quantity of sulphur, a small quantity of iron, and are not rich in copper; such are the ores of Derbyshire in England, some of those of St Bell in Lyons, and many ores of Alsatia, such as those of Caulenbach and Feldens."

^{II} Arsenical or grey copper ore. VII. Copper united to sulphur, arsenic, iron, and a small quantity of silver. This is called arsenical or grey copper ore, and is of a white, grey, or brown colour; of moderate hardness, very brittle, sometimes crystallized, and often of an indeterminate figure. It is very difficult of fusion, and more ponderous than the former. It contains from 35 to 60 *per cent.* of copper; the brown is the richest in copper; the white or grey contains most arsenic; and if the silver it contains exceed 1 or 2 *per cent.* it is called grey silver ore. It is found embodied in all sorts of stones, and mixed with other copper ores, as well as with the ores of other metals.

A great variety of sulphurated copper ores is to be met with in the mines of Cornwall, viz. a whitish-grey ore crystallized in small triangular and quadrangular pyramids, with truncated points, is found along with the solid copper ore at Poldice and Dolcoth; but the richest are the solid grey ones found in various places; some of which may be cut with a knife like the soft vitreous silver ore. The most remarkable of the yellow ores is the stalaetical ore, of an hemispherical form, called *run-yellow-copper*, often variegated with different colours. A compact red glassy copper ore, covered with mountain green, or green copper, and with calciform copper of a vermilion red colour, is found in crystallized quartz, mixed with tender green mica. We also meet with an *olive-green-coloured* copper ore which is arsenical, and crystallized into tender spiculæ of about three lines long, standing up straight, either single or fasciculated, or radiated, found on the granitical mountain at Carrarach. These crystals melt before the blow-pipe with an arsenical smoke, and afterwards melt, forming a button of a grey colour, which, on being melted again with borax, soon produces a very pure copper. Another kind of arsenical cupreous crystals are likewise met with in the form of green cubes run together, with smooth and shining surfaces, upon grey copper ore, in a mass of crystallized compact quartz, with various crystals in itself; and greatly resembling small cubes of fluor.

¹² Brown or blende copper ore. VIII. Copper mineralized by sulphur and arsenic with zinc and iron; brown or blende copper-ore. Mr Monnet found this ore only at Catherineberg in Bohemia; it is brown, granulated, and very hard, and contains from 18 to 30 *per cent.* of copper.

This kind of ore may be analysed in the liquid way by solution in nitrous acid, and precipitation of the copper by iron. The iron and zinc are precipitated by the Prussian alkali; the precipitate is then calcined and redissolved in nitrous acid, and the solution evaporated to dryness. The iron being thus dephlogisticated, becomes insoluble in the nitrous acid, but the calx of zinc is redissolved, and again precipitated by the Prussian alkali. An hundred grains of this precipitate are equivalent to 20 of zinc in its metallic state; and 100 grains of dephlogisticated iron are equivalent to 75 $\frac{1}{2}$ of iron in its metallic state.

¹³ Slaty copper ore. IX. Argillaceous schistose, or slaty copper ore, seems to consist of the vitreous copper ore intimately combined with schistus, and not barely dispersed through it in visible particles: it is of a brown or black colour, lamellar texture, and very heavy; affording from 6 to 10 *per cent.* of copper, and is of difficult fusion, unless limestone be added. It contains a little bitumen, calcareous earth, and iron.

¹⁴ Bituminous ore. X. Bituminous copper ore is a kind of pitcoal found in Sweden. It burns with little or no flame, but leaves ashes from which copper is extracted.

¹⁵ Black copper ore. XI. Black copper ore, of the colour of pitch. Mr Gellert denominates it copper ore, in scoriæ: it is a residuum of the decomposition of the yellow and grey copper ores which contain neither sulphur nor arsenic, and approaches to the state of malachite; it has a black shining appearance like pitch.

¹⁶ Antimonial ore. XII. Copper united to sulphur and arsenic containing antimony, or antimonial copper ore, is mentioned by Mr Sage in his Elements of Mineralogy. It is grey, and bright in its fracture like antimony, and contains from 14 to 20 *per cent.* of metal.

XIII. Copper dissolved by the vitriolic acid. In the year 1673, Dr Brown visited a famous copper-mine at Hern-grundt, about seven English miles from Newfol in the Upper Hungary; and he informs us, that there he saw two springs, called the *Old* and *New Ziment*, which turned iron to copper, as it is vulgarly said. But the case is, that the iron is dissolved by the vitriolic acid of this spring-water, and the copper is precipitated in its metallic form in the place of the iron. It has been the custom in Germany for some centuries to collect the copper contained in these waters, by filling with them some pits made purposely for this operation. Old iron is thrown in, and being dissolved by the acid, is suspended in the Water, whilst the copper is precipitated: the mud being raked out, is melted afterwards in a furnace, and a very fine copper is produced: from 100 tons of iron, 84 and sometimes 90 tons of fine copper is thus produced.

But although this method of obtaining copper has been long practised in Germany, yet it is but of late years, says Bishop Watson (p. 238. of the first volume of his Essays), that any successful attempts of this kind have been made either in England or Ireland. In this last, at least, it was quite owing to an accident. There are the very celebrated copper-mines at Arklow, in the county of Wicklow in Ireland; and from these mines issues a great quantity of water, strongly impregnated with vitriol of copper. One of the workmen having accidentally left an iron shovel in this water, he found it some weeks after so incrustated with a coat of

Copper. of copper, that it was thought to be changed into copper.

The proprietors of the mines in pursuance of this hint, made proper pits and receptacles for the water; and have obtained, by means of soft iron bars put into them, such quantities of copper, that these streams are now of as much consequence as the mines themselves. One ton of iron produces near two tons of copper mud; and each ton of mud produces, when melted, 16 hundred weight of copper, which sells for L. 10 Sterling a ton more than the copper which is fluxed from the ore.

There is in the isle of Anglesey, on the coast of North Wales, a mountain called *Paris*, which abounds in copper-ore, the bed of ore being above 40 feet in thickness. The lessees of this mine annually raise from six to seven thousand tons of merchantable ore, and daily employ above 40 furnaces in smelting it. This ore contains a great quantity of sulphur, which must be separated by roasting before it can be fluxed into copper. The phlogiston, with part of the vitriolic acid, is dispersed into the air by the force of the fire; another part of the acid attacks and dissolves such a quantity of the copper, that the water in which the roasted ore is washed (by means of old iron immersed in it according to the German method) produces great quantities of fine copper, so that the proprietors have there obtained in one year near 100 tons of the copper precipitated from this water.

If this water was afterwards evaporated, it would yield green vitriol or vitriolated iron, at nearly the rate of 200 tons of vitriol for each hundred ton of iron at least; which, at the rate of L. 3 Sterling *per* ton, might perhaps produce very good profit to the undertakers, if any should settle such a manufacture there.

Besides the celebrated copper-mines at Arklow in the county of Wicklow in Ireland, there are no less than seventeen different places in Britain in which copper-mines are found, as mentioned by Dr Campbell in the 2d vol. p. 44. of his *Political Survey of Britain*. These are Cardiganshire, Cheshire, Cornwall, Cumberland, Derbyshire, Devonshire, Lancashire, Isle of Man, Northumberland, Shropshire, Somersetshire, Staffordshire, Yorkshire, Wales, Warwickshire, Westmoreland, and North Britain: some that are worked at this time give such large products of this metal, that the opening more copper-mines in the island would probably affect the copper-trade of Europe in a very considerable manner. The Eston mine, in the estate of the Duke of Devonshire, on the frontiers of Derbyshire, but properly situated in the county of Staffordshire, produces at least 300 tons of copper *per annum*. That of the mountain called *Paris*, in the island of Anglesey, whose bed of ore is about 40 feet in thickness, produces about 1500 tons of copper in the year; and the copper-mines of Cornwall produce no less than 4000 tons in the same period. Mr Jars, who visited these mines in the year 1770, found, upon calculation, that the annual produce of these mines amounted to L. 140,000 Sterling; and M. H. Klaproth, in his *Observations on the Fossils of Cornwall*, just published (in 1787), asserts that this account is not an exaggerated one.

Copper is purified with less difficulty than iron; and

its goodness is judged of by the bright redness of its colour.

The impurity of copper proceeds from the mixture of heterogeneous substances that are alloyed with it, on account of being naturally contained in the copper-ores. Iron and arsenic are the chief of these natural mixtures. The copper-ores of variegated colours, the white copper-ores, and generally those mineralized by sulphur, contain a greater proportion of iron; whilst the blue and green copper-ores commonly produce a purer metal, being free, for the most part, of any considerable ferruginous mixture. The great aim, therefore, of the metallurgist must be directed to separate these mixtures from the copper, beginning by the proper examination of the ore, and by ascertaining the proportion of sulphur that may be required to scorify the quantity of iron there contained. The ore should always be roasted by a slow fire, in a close furnace, which contributes the best towards scorifying the ferruginous and heterogeneous mixtures; and the same operation must be repeated after the second and third fusion of the metal, till its grain becomes of an homogeneous fine texture. The mixture of sulphureous pyrites in the fusion of the metal contributes towards obtaining this object; if their quality be chosen according to the quantity of sulphur wanting. But in the second, third, and following operations, only pure sulphur should be added, to scorify the remainder of the iron that is still intermixed with the copper. This should be done when the metal is already well fused; covering it immediately with a proper quantity of charcoal, and separating the scoria or dross formed on the surface of the fused metal.

The copper extracted from those mines Near Newfol, in Upper Hungary, is said to be usually melted 14 times before it is fit for use. These are the greatest copper mines in all Hungary. There are, however, other mines, whose copper requires far less fusions to be well purified. The above was the process of Mr Delius, director of the mines of Bannat near Temeswar in Hungary, proposed by him to the imperial board of the Austrian mines.

Pure copper allowed to cool slowly will form itself into regular crystallizations, which the Abbe Mongaz describes as quadrangular pyramids, sometimes solid, and sometimes composed of other similar small pyramids laterally adhering. When heated it becomes coloured on its surface, nearly in the same manner as steel; the colours are blue, yellow, and lastly violet; it does not melt but by a violent white heat, though much inferior to that which melts iron. When in a state of fusion it appears covered with a green flame, which the filings of the metal likewise produce when projected through flame; and hence are used in fireworks, as has been already remarked. The crystallization of the metal abovementioned is best perceived by suffering the metal to cool slowly; and after the surface is become congealed, the fluid portion being poured off, the remaining solid part is found to be crystallized in pyramids, which are more regular and large in proportion as the fusion has been more complete and cooling more gradual. The pyramids, according to Foureroy, are quadrangular, and appear to be formed of a great number of octahedrons inserted into one another.

of the crys-
tals.

Copper. another. When heated with excess of air, this metal burns at its surface, and is converted into a calx of a dark red colour, in proportion as it absorbs the base of the dephlogisticated part of the atmosphere. The calx may be easily obtained by heating a ball of copper red-hot, the form of which causes the calx to scale off; and the same effect takes place when red-hot copper is quenched in cold water; the separation of the calx being promoted by the sudden contraction of the metal. This calx is called the scales of copper, and may be further calcined till it becomes of a deep brown;

20
How the calx is obtained.

21
The scoriæ partly reduced without addition.

22
Copper rusts by exposure to the air, but without any corrosion of its internal parts.

25
Of the tinning of copper.

after which, by violent heat, it may be melted into a blackish or deep reddish brown mass. The scoriæ may partly be reduced without any additional phlogiston; for the founders, who buy them of the copperfiniths, take no other trouble with them than that of throwing them into large crucibles on the melted copper, with which they incorporate by fusion; and the same method is made use of to melt the filings. The calx of copper appears to possess some saline properties, but its nature has not yet been ascertained.

Copper calcines when exposed to the air, and is converted into a green rust or calx, which is in some degree soluble in water, and communicates a taste as well as pernicious qualities to it. It is remarkable, however, that this rust does not corrode the internal parts like that of iron, but is confined to the surface; and thus, instead of destroying, contributes, for a long time at least, to the preservation of the metal. This is particularly observable in the antique medals and statues, which are very well preserved under a covering of rust. The antiquarians call this crust *patina*, and put a high value upon the pieces of antiquity covered with it; but the Italians and others have got a method of imitating this crust, and thus there is great danger of being deceived.

Copper, when taken into the human body, acts as a violent emetic, and has been generally accounted poisonous, though lately received with some applause into the materia medica as a tonic. The pernicious qualities, however, and very disagreeable taste which it certainly communicates on some occasions, render it highly necessary to observe some cautions in the use of this metal, of which so many kitchen utensils are made. Besides an exact attention to cleanliness, it is altogether improper to let any fluid remain in a copper vessel till it be cold; for copper is much more calcinable in the cold than when heated. Mr Fourcroy explains this by supposing the calcination to be produced by water in a state of extreme division: as long, therefore, as the fluid is boiling and the vessel hot, the aqueous vapour does not adhere to its surface; but when the vessel is cold, the drops of water which adhere to its sides calcine it, and reduce it to a green calx. The air and the cretaceous acid (fixed air,) he says, also contribute greatly to this calcination: for by distilling the rust of copper fixed air has been obtained.

In order to prevent the pernicious effects of copper, the vessels made of it are usually covered with tin in the inside. To tin copper-vessels, they are first scraped clean and bright; after which they are rubbed with sal ammoniac to clean them more perfectly. They are then heated and sprinkled with powdered resin, which prevents the surface of the copper from being calcined; after which the melted tin is poured on and spread a-

bout. It is, however, justly complained, that the tinning of copper-vessels is not sufficient to defend them from the action of the air, moisture, and saline substances: because these vessels, even when well tinned, are observed to be subject to rust. This might possibly be remedied by a thicker covering of tin; and a manufacture of this kind was some time ago established at Edinburgh, though it does not appear to have much attracted the notice of the public; which, however, is no objection to the usefulness of the invention. The method employed was to make the surface of the copper very rough, with a machine contrived for that purpose, and the tin put upon it in this situation; after which the copper was hammered smooth as before. Mr Fourcroy objects to this thicker covering of tin, that there "is reason to fear that a degree of heat superior to that of boiling water, to which these vessels are often exposed, would melt the tin and leave the surface of the copper uncovered." This objection is surely void of foundation: for as long as there remains any liquid in the vessel, the tin will not melt though the heat were applied to it directly without any intervention of copper; and if a dry heat were applied, a thin covering of tin would be still less able to resist it than a thick one. Our author, however, observes, that to prevent this accident the tin may be alloyed with iron, silver, or platina, to diminish its fusibility, and render it capable of being applied in thicker strata on the copper. Alloys of this kind, he tells us, are already used in several manufactures.

The very small quantity of tin required to cover the surface of the copper is surprising; a vessel of 9 inches in diameter and $3\frac{1}{4}$ inches in depth, being found to gain no more than 21 grains by this operation. This small quantity is nevertheless sufficient to prevent the dangers which might arise from the use of copper-vessels, provided care be taken not to allow substances capable of dissolving the tin to remain too long in them; but more especially that the tin be frequently renewed, as the friction, heat, and action of spoons, with which the included substances are stirred, very soon destroy it. There is likewise another cause of apprehension, according to our author, viz. that the tin is often alloyed with lead, even to the quantity of one-fourth of its weight; in which case the latter may exert its mischievous influence, especially as it is known that lead is easily soluble in fatty substances. To prevent this sophistication, he is of opinion that government should take sufficient care that the braziers be not deceived in the tin they purchase, and that they may not employ any but the Malacca or Banca tin, in the state it is received from the East Indies, without having been alloyed or melted by the pewterers. A better method, however, seems to be that proposed by M. Folie of Rouen, to use vessels of forged iron covered over on the inside with zinc, which, he says, have already been used with advantage by certain persons; and it were to be wished that its use might become more general.

Copper is also used in mixture with other metals, particularly tin and zinc, in enamel-painting, dyeing, &c. Mixed with tin in considerable quantity, it produces BELL-METAL; with a smaller proportion BRONZE; with zinc it forms BRASS, PINCHBECK, or SIMILOR, MANHEIM GOLD, &c. according to the proportion; it being

Copper.

26
Very small quantity of tin required for this purpose.

27
Best kind of tin ought to be employed.

28
Zinc recommended instead of tin.

29
Various mixtures of copper with other metals.

Copperas being always observable, that the compounds most nearly resembling gold in colour have the least ductility and are most brittle. See these articles, and CHEMISTRY-
 Index.

30
 Of its effects as a poison.

With regard to the poisonous qualities of copper when taken into the body, much less danger seems to arise than from those of arsenic, on account of its easy solubility; nor indeed have we met with any well authenticated instance of a person who has died in consequence of swallowing even verdigrise itself. In one case, where an unlucky boy had swallowed some bits of this substance thrown out of a chemist's laboratory, the symptoms were only violent sickness and vomiting, from which he recovered by drinking warm water largely; and probably nothing else would be requisite in any case, though Mr Fourcroy advises *emetics*, abundance of water, liver of sulphur, alkalis, &c. The use of emetics in such a case, however, seems altogether superfluous; since verdigrise, in the quantity of a grain or a grain and a half, has been ordered by some medical writers in the case of poison swallowed otherwise, as the emetic most quick in its operation that could be thought of.

COPPERAS, a name given to the factitious green vitriol. See CHEMISTRY-*Index*.

COPPERPLATE. See ENGRAVING.

COPPICE, or COPSE, a little wood, consisting of under-woods, or such as may be raised either by sowing or planting.

COPTOS (anc. geog.), a famous trading town of the Thebais, inhabited by Egyptians and Arabs, some distance from the Nile; others place it in a small island in the Nile, on which, however, it had a port. Here Isis, on hearing of the death of Osiris, cut one of her locks and put on mourning; and hence the name *Coptos*, signifying privation. A proof this of the antiquity of the place. And for this reason the Isiaci, or priests of Isis, were bald, according to Juvenal.

COPULATION, the act of generation, or the congress of the male and female, otherwise called *coition*. See GENERATION.

COPY, in a law sense, a transcript of a writing or instrument, made for the use and satisfaction of some of the parties concerned, or in order to preserve the memory thereof.

COPY is also used for an imitation of any original work; particularly a painting, draught, figure, &c.

COPY, among printers, denotes the manuscript or original of a book given to print from.

Copi-Hold, a tenure for which a tenant has nothing to show but the copy of the rolls made by the steward of the lord's court.

It is called a base tenure; because the tenant holds the land at the will of the lord. However, it is not simply at the will of the lord, but according to the custom of the manor by which such estate is descendible, and the tenant's heirs may inherit it; and a copy-holder, so long as he does his services, and does not break the custom, cannot be ejected by the lord; and if he be, he shall have trespass against him. See the articles TENURE and VILLENAGE.

Copy-Holder, one who is admitted tenant of lands or tenements within a manor, which time out of mind, by use and custom of the manor, have been demisable, and demised to such as will take them in fee-simple

or fee-tail, for life, years, or at will, according to the custom of the manor by copy of court-roll; but is generally where the tenant has such estate either in fee or for three lives.

Copr-Right, the right which an author may be supposed to have in his own original literary compositions; so that no other person, without his leave, may publish or make profit of the copies. When a man by the exertion of his rational powers has produced an original work, he has clearly a right to dispose of that identical work, as he pleases; and any attempt to take it from him, or vary the disposition he has made of it, is an invasion of his right of property. Now the identity of a literary composition consists intirely in the sentiment and the language; the same conceptions, clothed in the same words, must necessarily be the same composition: and whatever method be taken of conveying that composition to the ear, or to the eye of another, by recital, by writing, or by printing, in any number of copies, or at any period of time, it is always the identical work of the author which is so conveyed; and no other man (it hath been thought) can have a right to convey or transfer it without his consent, either tacitly or expressly given. This consent may perhaps be tacitly given when an author permits his work to be published without any reserve of right, and without stamping on it any marks of ownership: it is then a present to the public, like the building of a church, or the laying out a new highway: but in case of a bargain for a single impression, or a total sale or gift of the copy-right; in the one case the reversion hath been thought to continue in the original proprietor; in the other the whole property, with its exclusive rights, to be perpetually transferred to the grantee. On the other hand, it is urged, that though the exclusive right of the manuscript and all which it contains, belongs undoubtedly to the owner before it is printed or published; yet from the instant of publication, the exclusive right of an author or his assigns to the sole communication of his ideas immediately vanishes and evaporates; as being a right of too subtle and unsubstantial a nature to become the subject of property at the common law, and only capable of being guarded by positive statute and special provisions of the magistrate.

The Roman law adjudged, that if one man wrote any thing, though ever so elegantly, on the paper or parchment of another, the writing should belong to the original owner of the materials on which it was written: meaning certainly nothing more thereby than the mere mechanical operation of writing, for which it directed the scribe to receive a satisfaction; especially as, in works of genius and invention, such as a picture painted on another man's canvas, the same law gave the canvas to the painter. We find no other mention in the law of any property in the works of the understanding, though the sale of literary copies, for the purposes of recital or multiplication, is certainly as ancient as the times of Terence, Martial, and Statius. Neither in Britain hath there been (till very lately) any final determination upon the right of authors at the common law. It was determined in the case *Miller v. Taylor* in *B. R. Pasch. 9 Geo. III. 1769*, that an exclusive copy-right

Coques
||
Cor-meille.

in authors subsisted by the common law. But afterwards, in the case of *Donaldson v. Becket*, before the house of lords, which was finally determined 22d February 1774, it was held that no copy-right subsists in authors, after the expiration of the several terms created by the statute 8 Ann c. 19. This statute declares, that the author and his assigns shall have the whole liberty of printing and reprinting his works for the term of 14 years, and no longer; and also protects that property by additional penalties and forfeitures; directing farther, that if at the end of that term the author himself be living, the right shall then return to him for another term of the same duration.—Copy Right in this Country is put on a similar footing, by Act of Congress of May 31, 1790.

COQUES (Genzalo), an esteemed painter of portraits and conversations, was born at Antwerp in 1618, and was a disciple of the old David Ryckaert; under whose direction he applied himself diligently to cultivate those promising talents which he possessed; not only by practising the best rules administered to him by his instructor, but also by studying nature with singular attention.—He was a great admirer of Vandyck; and fixing on the manner of that great artist as his model, had the happiness of so far succeeding, that next to him he was esteemed equal to any other painter of his time.—In the school of Ryckaert he had been accustomed to paint conversations, and he frequently composed subjects of fancy like Teniers, Ostade, and his master; and by that habit, he introduced a very agreeable style of portrait painting, in a kind of historical conversations, which seemed much more acceptable to persons of taste than the general manner of painting portraits, and procured him great reputation and riches. In that way he composed several fine pictures for king Charles I. and likewise several for the archduke Leopold, and the prince of Orange; which latter prince, as a mark of respect, presented Coques with a rich gold chain, and a gold medal on which the bust of that prince was impressed. He died in 1684.—He had an excellent pencil; his portraits were well designed, with easy natural attitudes; he disposed the figures in his composition so as to avoid confusion or embarrassment; he gave an extraordinary clearness of colour to his heads and hands; and his touch was free, firm, and broad, a circumstance very uncommon in works of a small size.

COQUIMBO, a port-town of Chili, in South America, situated at the mouth of a river of the same name, which discharges itself into the Pacific ocean. W. Long. 75. 10. S. Lat. 30. 0.

COR CAROLI, in astronomy, an extraconstellated star in the northern hemisphere, situated between the *coma Berenices*, and *ursa major*; so called by Dr Halley in honour of king Charles.

COR *Hydræ*, a fixed star of the first magnitude, in the constellation of hydra.

COR *Leonis*, in astronomy, a fixed star of the first magnitude, in the constellation Leo.

COR-meille, a noted plant, common in the Highlands of Scotland. Its roots dried are the support of the highlanders in long journeys, amidst the barren hills destitute of supports of life; and a small quantity, like the alimentary powders, will for a long time re-

pel the attacks of hunger. Infused in liquor it is an agreeable beverage, and like the *Nepenthe* of the Greeks, exhilarates the mind. From the similitude of found in the name, it seems to be the same with chara, the root discovered by the soldiers of Cæsar at Dyrrhachium, which steeped in milk was such a relief to the famished army. Or we may reasonably believe it to have been the Caledonian food described by Dio, of which the quantity of a bean would prevent both hunger and thirst: and this, says the historian, they have ready for all occasions.

CORACIAS, the ROLLER, in ornithology; a genus of birds of the order of picæ, the characters of which are: The bill is straight, bending towards the tip, with the edges cultrated: the nostrils are narrow and naked; the legs for the most part short; the toes placed three before and one behind, and divided to their origin. This genus is not confined to one spot of the globe, as one or other of the different species may be met with in all the four quarters of it.

1. The garrula, or garrulous roller, is about the size of a jay; the bill black, and at the base beset with bristles, but do not cover the nostrils: the head, neck, breast, and belly, are of a light bluish green; back and scapulars, reddish brown; coverts on the ridge of the wing rich blue, beneath them pale green; upper part and tips of the quills dusky; the lower parts of a fine deep blue; rump, of this last colour: tail forked, of a light blue; the outer feather tipped with black above, and beneath with deep blue, as is the case with such part of the quill feathers as is black above; the other tail feathers are dull green: the legs are short, and of a dirty yellow. Mr Pennant observes that these birds are frequent in several parts of Europe, in most parts of which it is a bird of passage. Mention is made of them in Sweden and Denmark on the one hand, and as far as Africa on the other; not that they are found in all the parts between, nor in the same plenty. Willoughby tells us, that in Germany, Sicily, and Malta, they are so common as to be sold in the markets, and in poulterers shops. Adanson says, that it "comes to reside for some months of the summer in the southern parts of Europe, and goes back to spend the remainder of the year in Senegal," having shot one on board the ship, on its passage, in April. Frisch observes, that it makes its nest in woods, where there is birch; that it does not come to its colour till the second year; flies in troops in autumn; often seen in tilled grounds, with rooks and other birds, searching for worms, small seeds, and roots. Its flesh tastes like that of a turtle. It is said also sometimes to make the nest in holes in the ground, in one of which nests two eggs were found. The nest is generally filthy, from the young evacuating their excrements therein; whence by some it was said to make the nest of excrements. We are told in the British Zoology, that it has been twice shot in England, and is remarkable for making a chattering noise, whence its name.

2. The blue-striped roller is in length eight inches; the bill three quarters of an inch long, bent at the tip, and of a black colour: the irides are red: the general colour of the plumage deep blue-black, dashed with streaks of greenish blue: the tail and legs are black. It inhabits New Caledonia.

3 K

3. The

Coracias.

Caraco
Corallina.

3. The Chinese roller is of the size of a jay: The bill and irides are red: the head, hind part of the neck, back, rump, and upper tail coverts, are green: through the eyes on each side is a black stripe: the under parts of the body, from chin to vent, are yellowish white, tinged with green; but the thighs are grey: the wing coverts are olive brown; quills the same, with a mixture of chestnut in some; and others, nearest the body, tipped with white: the tail is five inches in length, and wedge-shaped, the outer feathers shortening by degrees like that of a magpie; all of them are more or less green, verging to black near the ends; the tips of all are white: the legs and claws are of a pale red, and longer than in other rollers. It inhabits China, and is called at Canton *Sau-ta-hoang*. It is not very common.

There are 13 other species enumerated by ornithologists; though many of them doubtful, and supposed to be only varieties.

CORACO-BRACHIALIS, in anatomy, the name of a muscle in the arm, serving to raise it upwards.

CORACOIDES, in anatomy, a small sharp process of the scapula. See ANATOMY, n^o 47.

CORACOMANTES, in antiquity, persons who foretold events from their observations on crows.

CORALLINA, or CORAL, in zoology, a genus belonging to the order of vermes zoophyta. The trunk is radicated, jointed, and calcareous. The species are eight, distinguished by the form of their branches, and are found in the ocean adhering to stones, bones, shells, &c. The corals were formerly believed to be vegetable substances hardened by the air; but are now known to be composed of congeries of animals, which are even endued with the faculty of moving spontaneously.

The islands in the South-sea are mostly coral rocks covered over with earth. The little creatures, which have scarce sensation enough to distinguish them from plants, build up a rocky structure from the bottom of that sea, too deep to be measured by human art, till it reaches the surface. Some of these coralline islands appear to be of a much older date than others; particularly the Friendly islands: and it is probable that as these submarine works are continually going on, new islands may by that means frequently be produced.

M. de Peyssonnel of Marseilles, in consequence of a series of experiments and observations from about the year 1720 to 1750, seems to have been the first who threw a proper light upon the nature and production of coral and similar marine substances. Those bodies, which the count de Marfigli imagined to be flowers, this ingenious naturalist discovered to be insects inhabiting the coral; for upon taking branches of it out of the water, the flowers, which proceeded from a number of white points answering to the holes that pierced the bark, and the radiation of which resembled the flower of the olive-tree, entered into the bark and disappeared; but upon being again restored to the water, they were some hours after perceptible. These flowers spread on white paper lost their transparency, and became red as they dried. The holes in the bark correspond to small cavities upon the substance of the coral; and when the bark is removed, there may be seen an infinite quantity of little tubes connecting the bark with the inner substance, besides a great number

of small glands adhering to them; and from these tubes and glands the milky juice of coral issues forth: the holes in the bark are the openings through which the insects that form these substances for their habitation come forth; and those cavities which are partly in the bark and partly in the substance, are the cells which they inhabit. The organs of the animal are contained in the tubes, and the glandules are the extremities of its feet, and the milky liquor is the blood and juice of the animal, which are more or less abundant in proportion to its health and vigour. When the insects are dead, they corrupt, and communicate to the water the smell of putrid fish. This juice or liquor runs along the furrows perceived upon the proper substance or body of coral, and stopping by little and little becomes fixed and hard, and is changed into stone: and being stopped in the bark, causes the coral to increase proportionably and in every direction. In forming coral, and other marine productions of this class, the animal labours like those of the testaceous kind, each according to his species; and their productions vary according to their several forms, magnitudes, and colours.

The coral insect, or polype, M. Peyssonnel observes, expands itself in water, and contracts itself in air, or when it is touched with the hand in water, or acid liquors are poured upon it: and he actually saw these insects move their claws or legs, and expand themselves, when the sea-water containing coral was placed near the fire, and keep them in their expanded state when separated from the coral in boiling water. Broken branches of coral have been observed to fasten themselves to other branches, and have continued to grow; and this is the case when they are connected with detached pieces of rock and other substances, from which no nourishment could be derived. The coral insects in their cells, not having been injured, continue their operations; and as they draw no nourishment from the stone of the coral, they are able to increase in a detached and separate state. Coral was found to be equally red in the sea as out of it; and it was more shining when just taken out of the water than even when it is polished; and the bark by being dried becomes somewhat pale. M. Peyssonnel found that it grows in different directions, sometimes perpendicularly downwards, sometimes horizontally, and sometimes upwards; and in the caverns of the sea, open to every exposure.

This system was little regarded, though first communicated to the Academy of Sciences at Paris in 1727, till Mr Trembley's discovery of the fresh-water polype; but since that time it has been confirmed by the observations of M. Bernard de Jussieu on the sea-coasts of Normandy, and those of M. de Reaumur near Rochelle. M. Donati of Turin has also adopted the same hypothesis, viz. that coral is a mass of animals of the polype kind; and instead of representing the polype beds and cells which they contain as the work of polypes, he thinks it more just to say, that coral and other coralline bodies have the same relation to the polypes united to them, that there is between the shell of a snail and the snail itself, or the bones of an animal and the animal itself.

The same system has also been excellently illustrated and established by Mr Ellis, in answer to the objections

Corallina.

Corallina, tions of Dr Baister of Zealand, and Dr Pallas of Berlin, who still refer corallines to the vegetable kingdom.

There are properly but three kinds of coral; red, white, and black: the black is the rarest, and most esteemed; but the red was formerly used in medicine. It must be chosen thick, smooth, and shining, and of a beautiful red, not covered with any tartareous matter. However, this substance is now scarce ever prescribed by any intelligent practitioner.

When coral is newly taken up out of the sea, the small protuberances on its surface are soft, and yield, on being pressed, a milky juice which effervesces with acids. The cortical part with which the coral is all over covered is not near so compact as the internal, and may easily be taken off whilst fresh; and from this part it is usually freed before it comes to the market. The greatest coral trade is in Genoa and Leghorn. The small sprigs unfit for ornamental uses are in the shops levigated into a subtile powder; which, however, has no medicinal virtues superior to the common testacea. Coral is not unfrequently imitated by artificial compositions, some of which are made to resemble it exactly; but the abuse may be discovered by fire, the counterfeit not affording the alkaline earth which is afforded by the genuine coral. The colouring ingredients in the artificial coral are cinnabar and minium, both of which are easily discovered. The natural coral seems to receive its colour from iron; for spirit of vitriol acquires from it a ferruginous taste; and on calcining the coral, some particles are found among the ashes that are attracted by the magnet. Sixteen ounces of coral, according to Neumann, when distilled in an open fire, yield about six scruples and an half of volatile alkaline spirit, with two or three grains of an empyreumatic oil: from the caput mortuum calcined, five scruples and a half of fixed salt may be extracted. In former times, many extraordinary virtues were expected from this substance, on account of its fine red colour; and therefore a great number of methods were tried to extract this colour by means of spirit of wine. None of these, however, succeeded. A red colour was indeed sometimes obtained, but it turned out the same whether any coral was used in the operation or not. In some of these processes, however, the coral loses its colour. One method of making the tincture is by dissolving a pound of sugar in a little water, and then adding half a pound of wax. A pound of coral boiled in this mixture loses its redness, but is found to be unaltered in other respects. In order to prepare the tincture, the wax and sugar must be dissolved in spirit of wine.

CORAL FISHERY. Red coral is found in the Mediterranean, on the shores of Provence, from Cape de la Couronne to that of St Tropez; about the isles of Majorca and Minorca; on the south of Sicily; on the coasts of Africa; and, lastly, in the Ethiopic ocean, about cape Negro. The divers say, that the little branches are found only in the caverns whose situation is parallel to the earth's surface, and open to the south. The manner of fishing being nearly the same where ever coral is found, it will suffice to instance the method used at the bastion of France, under the direction of the company established at Marseilles for that fishery. Seven or eight men go in a boat commanded by the

patron or proprietor; and when the net is thrown by the caster, the rest work the vessel, and help to draw the net in. The net is composed of two rafters of wood tied cross-wise, with leads fixed to them: to these they fasten a quantity of hemp twisted loosely round, and intermingled with some large netting. This instrument is let down where they think there is coral, and pulled up again when the coral is strongly intangled in the hemp and netting. For this purpose, six boats are sometimes required; and if in hauling in, the rope happens to break, the fishermen run the hazard of being lost. Before the fishers go to sea, they agree for the price of the coral, which is sometimes more, sometimes less, a pound; and they engage, on pain of corporal punishment, that neither they nor their crew shall embezzle any, but deliver the whole to the proprietors. When the fishery is ended, which amounts one year with another to twenty-five quintals for each boat, it is divided into thirteen parts; of which the proprietor hath four, the casters two, and the other six men one each, the thirteenth belongs to the company for payment of the boat furnished them.

CORAL-STONE, a name for a kind of red and white agate which breaks in veins, and is found in Italy and some parts of Saxony. That of Rochlitz in Saxony is the most celebrated, and is found in globules which have a kind of crust about them.

CORALLINES, in natural history, were formerly reckoned a genus of plants, and Mr Tournefort enumerates 36 species of them; but in the Linnæan system they belong to the class of zoophytes, and are defined by modern naturalists to be submarine plant-like bodies, that consist of many slender finely divided and jointed branches, resembling some species of moss; or animals growing in the form of plants, having their stems fixed to other bodies: these stems are composed of capillary tubes, whose extremities pass through a calcareous crust, and open into pores on the surface. The branches are often jointed, and always subdivided into smaller branches, which are either loose and unconnected, or joined as if they were glued together. They are distinguished from plants by their texture and hardness: they also yield in distillation a considerable quantity of volatile salt; and their smell, in burning, resembles that of burnt horns and other animal substances. Many of the corallines seem to consist of a single tube, containing a single parent animal. Every branch emitted contains an offspring of this parent dependant upon it, and yet capable of producing its like in the emission of a new branch. Others consist of many such tubes united, rising up together, and encircling the deserted tubes of their progenitors, whose exuviae become the substratum of a rising generation. Mr Ellis distributes corallines into the *vesiculated*, *tubular*, *celliferous*, and *articulated* kinds.

Vesiculated corallines are distinguished by their horny hollow ramifications: most of them are furnished with little denticles on their branches, like leaves on mosses; and at certain seasons of the year they are furnished with small bodies like bladders, proceeding from their stems and branches, and differing in form according to the different species. Their colour, when dry, is of a yellowish or pale brown, and their nature is elastic. They are found adhering to rocks, shells, and fucuses,

Corallines. *fucuses*, by small root-like tubes: they recover their form in water, after having been dried; and when put into vinegar, they cause no effervescence. See Plate CXLVII. fig. 1. where *a* represents the sea-tamarisk in its natural size, and *A* in which the denticles are magnified. Fig. 2. *b*, *B*, is the sea-cypress; fig. 3. *c d*, *CD*, the small climbing coralline with well shaped cups.

Tabular corallines are composed of a number of simple tubes, growing up nearly together; or of such branched ones as have neither denticles nor vesicles. These are horny and elastic like the former, and recover their original form in water. Some of them appear wrinkled like the wind-pipe, and others like the intestines of small animals. See fig. 4, *E*.

Celliferous corallines are those which appear, when magnified, to be fine thin cells, the habitations of small animals connected together, and disposed in a variety of elegant forms like branches. These effervesce with acids. See fig. 5, *F f*, with part (*GH*) magnified.

Articulated corallines consist of short pieces of a stony or cretaceous brittle matter, whose surface is covered with pores or cells, which are joined by a tough, membranous, flexile substance, composed of many small tubes of the like nature compacted together. The stony part is soluble in vinegar, and the other part remains entire. *a*, *A*, (fig. 6.) is the coralline of the shops. It is fixed to rocks and shells by stony joints, which, as they rise, are united to others by extremely fine and slender tubes: These may be discovered by a good eye, or a common magnifier. As the stems extend themselves, they become pennated by side-branches which come out opposite to each other, and are jointed in the same manner: the joints of this species are like the upper part of an inverted cone, but a little compressed: The whole surface is covered over with very minute circular-shaped cells like pores; see *B*, and *B 1*, where they are higher magnified. *B 2*, shows a cross section highly magnified. If a branch of this coralline is put into vinegar, these cells are dissolved with the whole cretaceous surface; instead of which there appear rows of minute ramifications, which seem to have communicated with each of these cells. Upon some specimens of this coralline, we may observe little small figures like seed-vessels, with which the branches frequently terminate: They are also found on the sides, as may be seen at *A*, where they are magnified.—When a branch is rendered soft by being steeped in vinegar, there may be squeezed out from the little knobs at the ends and sides, small twisted figures, like those at *A 1*, which are magnified higher at *A 2*.—We frequently find this coralline of different colours, as red, green, ash, and white; but all of it, by being exposed to the sun and air on the shore, becomes white.

The ancients have said great things of the virtues of the common coralline. Dioscorides prescribes it for mitigating the pain of the gout, and for preventing stagnations of the humours in any part; he says nothing of its virtues against worms, which are what we alone esteem it for. We give it in powder from 10 grains to a scruple or half a dram twice a day in these cases, and that with a considerable good effect.

Besides the above, Mr Ellis enumerates other genera of marine productions; as the keratophyta, eschara, sponges, and alcyonium; all which are the nests or matrices of sea-animals. See POLYPE. The last class of marine bodies is formed like funguses of various figures, and with different sorts of covering: some having a gritty, and some a callous skin, with a spongy substance in the inside: other species are of a fleshy substance.

CORALLODENDRON, in botany. See ERYTHRINA.

CORALLOIDES (FRUTICES.) See ESCHARA and KERATOPHYTA.

CORAM (Captain Thomas), an English gentleman remarkably distinguished by his humanity, was born about the year 1668, and spent the early part of his life in the station of master of a vessel trading to the colonies. Afterwards residing in the eastern part of the metropolis, among seafaring people, where business often obliged him to come early into the city and return late, he frequently saw young children exposed in the streets through the indigence or cruelty of their parents. This excited his compassion, and induced him to project the foundation of an hospital for foundlings. In this humane design he laboured with indefatigable diligence for seventeen years; and by his application procured a number of the nobility and gentry to patronize and carry the scheme into execution, and at length obtained the royal charter for it. He was also highly instrumental in promoting the trade of America, by procuring a bounty upon naval stores imported from the colonies. He was likewise eminently concerned in setting on foot the colonies of Georgia and Nova Scotia. His last charitable design, in which he lived to make some progress, was a scheme for uniting the North American Indians more closely to the British interest, by an establishment for the education of Indian girls. In short, he spent the greatest part of life in labouring for the public, and experienced a fate too common in those who devote their talents to such laudable purposes; being at last indebted for subsistence to the voluntary subscriptions of some public-spirited persons, at the head of whom was the late Frederic Prince of Wales. Captain Coran died in 1751: and was interred, at his own desire, in a vault under the chapel of the Foundling Hospital.

CORAN, or ALCORAN. See ALCORAN.

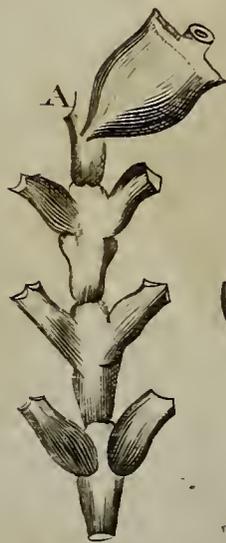

CORAX, in ornithology, the trivial name of a species of CORVUS.

CORANICH, among the Scotch and Irish, the custom of singing at funerals, anciently prevalent in those countries, and still practised in several parts. Of this custom Mr Pennant gives the following account. "I had not the fortune to be present at any in North Britain: but formerly assisted at one in the south of Ireland, where it was performed in the fulness of horror. The cries are called by the Irish the *uloghne* and *hullulu*; two words very expressive of the sound uttered on these occasions; and being of Celtic stock, etymologists would swear to be the origin of the *ολοληγον* of the Greeks and *ululatus* of the Latins. Virgil is very fond of using the last whenever any of his females are distressed; as are others of the Roman poets, and generally on occasions similar to this. It was my fortune

Coranich ||
Corbel. to arrive at a certain town in Kerry at the time that a person of some distinction departed this life : my curiosity led me to the house, where the funeral seemed conducted in the purest classical form.

*Quodcumque aspiceret luctus, gemitusque sonabant,
Formaque non taciti funeris intus erat.*

In short, the *conclamatio* was set up by the friends in the same manner as Virgil describes that consequential of Dido's death ;

*Lamentis, gemitibusque, & femineo ululatu
Tecta fremunt.*

Immediately after this followed another ceremony, fully described by Camden in his account of the manners of the ancient Irish ; the earnest expostulations and reproaches given to the deceased for quitting this world, where she enjoyed so many blessings, so good a husband, and such fine children. This custom is also of great antiquity, for Euryalus's mother makes the same address to her dead son.

*Tunc illa fenestra
Sera mea requirit ? potuisti relinquere solam,
Grudelis ?*

But when the time approached for carrying out the corps, the cry was redoubled,

Tremulis ululatus aëtera complent ;

a numerous band of females waiting in the outer court to attend the hearse, and to pay in chorus the last tribute of their voices. The habit of this sorrowing train, and the neglect of their persons, were admirably suited to the occasion ; their robes were black and flowing, resembling the ancient Palla ; their feet naked, the hair long and dishevelled : I might truly say,

*Ut qui conducti plorant in funera, sicunt
Et faciunt prope plura dolentibus exanimo.*

The corpse was carried slowly along the verge of a most beautiful lake, the ululatus was continued, and the whole procession ended among the venerable ruins of an old abbey."

CORBAN, in Jewish antiquity, were those offerings which had life, in opposition to the *minchab*, or those which had not. It is derived from the word *karab*, which signifies "to approach ;" because the victims were brought to the door of the tabernacle. The corban were always looked upon as the most sacred offerings. The Jews are reproached with defeating, by means of the corban, the precept of the fifth commandment, which enjoins the respect due to parents. For when a child had no mind to relieve the wants of his father or mother, he would say to them, "It is a gift (*corban*) by whatsoever thou mightest be profited by me ;" *i. e.* "I have devoted that to God which you ask of me, and it is no longer mine to give."

CORBAN is also a ceremony which the Mahometans perform at the foot of mount Arrarat in Arabia, near Mecca. It consists in killing a great number of sheep, and distributing them among the poor.

CORBEILS, in fortification, little baskets, about a foot and a half high, eight inches wide at the bottom and twelve at the top ; which being filled with earth, are frequently set one against another upon the parapet or elsewhere ; leaving certain port-holes, from whence to fire upon the enemy under covert without being seen by them.

CORBEL, in architecture, the representation of a

basket, sometimes seen on the heads of carytides. The word is also used for the vase, or tambour, of the Corinthian column ; so called from its resemblance of a basket, or because it was first formed on the model of a basket.

CORBEL, or *Corbil*, is also used, in building, for a short piece of timber placed in a wall, with its end sticking out six or eight inches, as occasion serves, in manner of a shouldering-piece. The under part of the end thus sticking out is sometimes cut into the form of a boulder ; sometimes of an ogee, and sometimes of a face, &c. according to the workman's fancy, the upper side being plain and flat.

CORBEL is also used by some architects for a niche or hollow left in walls for images, figures, or statues to stand in.

CORBET (Richard), bishop of Norwich, and an eminent poet, was born at Ewell in Surry, toward the latter end of the 16th century ; and educated at Oxford, where he was esteemed one of the most celebrated wits of the university. Entering into holy orders, he became a popular preacher, and was made chaplain to King James I. : when, after several preferments in the church, he was, in 1629, made bishop of Oxford ; and, in 1632, was translated to the see of Norwich. He was very hospitable, and always a generous encourager of public designs. He died in 1635. There have been several editions of his poems published under the title of *Poemata Stromata*.

CORBEY, a town of Picardy in France, with a famous abbey of Benedictine monks. It is seated on the river Somme, 10 miles east of Amiens, and 75 north of Paris. E. Long. 2. 35. N. Lat. 49. 55.

CORCELET, in natural history, that part of the fly-class which is analogous in its situation to the breast in other animals. Many have called it the breast in these also, but improperly ; because the breast of other animals is the place of the lungs and trachea, but these organs are in the fly-class distributed through the whole body. The wings are affixed to this part of the fly-class ; and there are some distinctions of great consequence in regard to the arrangement and distribution of those animals into genera. Some flies have a double corcelet, or one divided into two parts ; and this is the case of the fly produced from the formica leo, which therefore does not carry its only distinction in the figure of its antennæ. One pair of the legs of this fly are attached to the first or anterior corcelet, which is also capable of moving on the other.

The corcelets of some flies are also much more elevated than those of others ; and in some this elevation is carried so far, that the head is forced by it to be bent downward, and the creature is plainly made hump-backed by it. The great kind, and the *tipulæ*, furnish instances of this elevated and hump-backed corcelet.

A series of flies of two wings are known by a very particular armament which they carry on the corcelet, usually called their *breast*. This consists of two long, slender, sharp-pointed prickles, which are immoveable in their insertions, and seem meant as offensive or defensive weapons ; but in what manner they are used it is not easily to be determined.

All these flies are produced from long water-worms with

Corbei
||
Corcelet.

Corcelet with open and funnel-fashioned tails, or furnished with their aperture for respiration at the hinder extremity. There are three known species of this sort of fly, with armed corcelets, which differ much in size, but are all produced of worms of this kind. The largest of these flies are produced from the largest and longest worm, and are something longer than the bee. The smallest are produced of worms very small and slender, and are themselves extremely minute: and the third kind is of a middle size between these, and produced from a proportionably smaller worm than that of the first, and proportionably larger than that of the second species.

All these species have their wings but little distinguishable at their first production from the shell; they appear indeed only like two slender filaments laid across their bodies: but they quickly show, that in this state they were only very nicely folded together; and soon expand, and show their full extent and proportion.

When first produced from the shell, these flies are of a pale green colour. The under part of their belly in many continues green, but in the greater number it becomes of a pale dead brown. Some of them have the outside of their bodies of a deep brown, approaching to black, with lines of a dead brown between the commissures of the rings. The back of some others has only a blackish brown band, which runs straight down from the corcelet to the end of the body, the whole body beside being of a dead brown. The corcelet in these flies is brown, and the prickles are yellowish near their insertions, but nearly black at their points. They have three of the small glossy eyes disposed in the shape of a triangle on the back part of their head; and their reticular eyes are brown, and at some distance from one another.

CORCHORUS, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 37th order, *Columnææ*. The corolla is pentapetalous; the calyx pentaphyllous and deciduous; and the capsule many-valved and many-celled.

There are eight species; of which the most remarkable is the olitorius, an annual, and a native of Asia, Africa, and America. It rises with a round, striated, upright, branched stalk, to near two feet, which is furnished with leaves differing in shape; some being oval, some cut off straight at their base, and others almost heart-shaped. They are of a deep green colour, and have a few teeth on the margins of their base, that end in bristly, reflexed, purplish filaments. The flowers come out at the sides of the branches opposite to the leaves. They stand singly on very short peduncles; are composed of five small yellow petals, and a great number of stamina surrounding an oblong germen, which becomes a long, rough, sharp-pointed capsule, opening in four parts, each filled with greenish angular seeds.—This plant is sown by the Jews about Aleppo, and is therefore called *Jews mallow*. The leaves are a favourite salad among these people, and they boil and eat them with their meat.

CORCULUM, a diminutive from *cor*, “the heart,” little heart; the essence of a seed, and principle of life of the future plant, attached to and contained within the lobes. It consists of two parts, termed by Linnæus *PLUMULA* and *ROSTELLUM*. The former is the *radicula* of Grew and other naturalists. The

corculum is in fact the embryo of the future vegetable; and is attached by two trunks of vessels to the lobes at their union. The first of its two parts mounts upward, and becomes the trunk. The other strikes into the ground, and is the rudiment of the root. The lobes and heart of the seed are distinctly visible in the bean, and other seeds of that class, especially after remaining some time in water or earth.

The principle of life is seated either at the summit or base of the seed. From this circumstance are constructed the two first classes in Cæsalpinus’s method, containing trees and shrubs only.

CORCYRA (anc. geog.), an island in the Ionian Sea, opposite to Thesprotia, a district of Epirus, called *Scheria* and *Phaacia* by Homer. In Callimachus it is called *Drepane*; its most ancient name, according to the Scholiast, from the curvity of its figure. Famous for the shipwreck of Ulysses and the gardens of Alcinous. Now *Corfu*.

CORCYRA, a cognominal town of the island; formerly powerful, and capable of coping with mighty states; situated about the middle of the east side of the island, called *The Town of the Phœacians* by Homer. Now *Corfu*, from the *Κορυφα* of the middle age, the name of the citadel. It was a colony of Corinthians; *Corcyraei*, the people. E. Long 19. 43. Lat. 39. 50.

CORCYRA Nigra, an island in the Adriatic, on the coast of Dalmatia (Pliny); called *Melana* by the Greeks, to distinguish it from the island in the Ionian Sea. The epithet *Nigra* was added, from its woods of tall trees with which it is almost covered. Now *Curzola*.

CORD, or **CHORD**, an assemblage of several threads of hemp, cabled or twisted together by means of a wheel. See **CORDAGE**. The word comes from the Greek *χορδή*, which properly signifies an intestine or gut, of which chords may be made. See **CHORD**.

Magical CHORD, an instrument in great use among the Laplanders, and by them supposed to be endued with a number of virtues. It is a cord or rope with three knots tied in it. They use many magical rites and ceremonies in the tying of this cord; and, when thus prepared, it is supposed to have power over the winds; and they will sell, by means of it, a good wind, or at least the promise of one, to a ship. If they untie only one of these knots, a moderate gale succeeds; if two, it is much stronger; and if three, a storm is sure to follow.

CORD of Wood, a certain quantity of wood for burning, so called because formerly measured with a chord. The dimensions of a statute cord of wood are eight feet long, four feet high, and four feet broad.

CORD-Wood, is new wood, and such as, when brought by water, comes on board a vessel, in opposition to that which is floated.

CORDAGE, a term used in general for all sorts of cord, whether small, middling, or great. See **ROPE**.

The naval cordage of the earlier ages was in all probability only thongs of leather. These primitive ropes were retained by the Caledonians in the third century. The nations to the north of the Baltic had them in the ninth or tenth centuries: and the inhabitants of the western isles of Scotland make use of them at present; cutting the skin of a seal, or the raw and salted hide of a cow, into long pieces, and fastening the plough to their horses with them, or even twisting them into strong ropes of 20 or 30 fathoms length.

But

Corcyra
||
Cercage.

Cordage ||
Cordelier. But these, in the south of Britain, and on the continent, were early superseded by the use of iron chains. The very maritime and commercial nation of the Veneti, that were so intimately connected with the Belgæ of Britain, used iron chains for their cables in the days of Cæsar. But in the more distant and refined countries of the south, both thongs and these had long given place to the use of vegetable threads, and the arts of combining them into strength. In this manner the Greeks appear to have used the common rushes of their country, and the Carthaginians the spartum or broom of Spain. And as all the cordage of the Romans was made of these materials at their last descent on Britain, so the art of manufacturing them would necessarily be introduced with the Roman settlements among the Britons. Under the direction of Roman artists their thongs of leather would naturally be laid aside; and the junci, or rushes of the plains, worked up into cordage. And what remarkably coincides with this opinion is, that the remains of old cables and ropes are still distinguished among the British sailors by name of *old junk*.

The nations of Roman Britain, and the tribes of Caedonia and Ireland, had inherited, from their earliest ancestors, many of the ruder arts of navigation. Their ships were large open boats, framed of light timbers ribbed with hurdles and lined with hides. These were furnished with masts and sails. The latter were formed of hides, as the tackle was of thongs. They were actually of hides among the Veneti as late as the days of Cæsar; and they were never furled, but only bound to the mast. But these slight sea-boats and their rude furniture, would soon be dismissed by the provincials for the more substantial vessels and more artificial sails of the Romans. The Roman sails, which were composed of flax in the days of Agricola, were afterwards made of hemp; and our own are therefore denominated *cannabis* or *canvas* by our mariners at present. And about the same period assuredly did the junk of the British cordage give way to the same materials; the use of hempen ropes upon land, and of hempen nets for hunting, being very common among the Romans in the first century.

CORDATED, an appellation frequently given by naturalists to things somewhat resembling a heart.

CORDED, in heraldry. A cross corded, some authors take for a cross wound or wrenched about with cords: others, with more probability, take it for a cross made of two pieces of cord.

CORDELERAS, mountains of South America, otherwise called **ANDES**.

CORDELIER, a Franciscan, or religious of the order of St Francis. The Cordeliers are clothed in thick grey cloth, with a little cowl, a chaperon, and cloak, of the same; having a girdle of rope or cord tied with three knots: whence the name.—They are otherwise called *Minor Friars*, their original name. The denomination *Cordelier* is said to have been first given them in the war of St Louis against the infidels; wherein the Friars Minor having repulsed the barbarians, and that king having inquired their name, it was answered, they were people *cordeliez*, “tied with ropes.” The Cordeliers are to a man professed Scotists.

CORDEMOI (Géral de), a learned philosopher and historian, born at Paris, made himself known to M. Bossuet, who placed him about the dauphin in the quality of reader. He instructed that young prince with great assiduity; and in 1675 was received into the French academy. He wrote a general history of France during the first races of the French kings, in 2 vols; and six discourses on the Distinction between Body and Soul, which were printed together in 1702 quarto. He died in 1684. M. Cordenoi followed the principles of Descartes.

CORDIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 41st order, *Asperifoliae*. The corolla is funnel-shaped; the style dichotomous or divided into two threads, and each of these divided into other two.

There are five species, of which the principal are the myxa and sebestena. 1. The myxa, or Assyrian plum, grows wild in Assyria and Egypt, and also on the coast of Malabar. It rises to the height of a middling plum-tree; and its branches are furnished with oval, woolly leaves, standing without order. The flowers are produced in bunches; are white, and consist of one tubular petal, and a like calyx, nearly of an equal length, and both are cut into five parts at their brims. In their centre are five very small stamina, and one slender style crowned with an obtuse stigma. The germen is roundish, and swells to a plum of the same form, and about the size of a damson, of a dark brown colour, a sweet taste, and very glutinous. These plums were formerly kept in the shops; and were accounted good for obviating acrimony, and thereby stopping defluxions of rheum upon the lungs: but at present they are little used for these purposes. In some parts of Turkey they cultivate this tree in great abundance, not only for the sake of the fruit to eat, but to make birdlime of, which is a vast article of trade in a town called *Seid*.—2. The sebestena, or rough-leaved sebesten, grows naturally in both the Indies, and sends forth several shrubby stalks eight or ten feet high. The young leaves are serrated, but the full grown ones are not. They are of an oblong-oval form, rough, of a deep green on the upper side, and stand alternately on short footstalks. The flowers terminate the branches in large clusters, are nearly of the shape and colour of those of the marvel of Peru, and make a most beautiful appearance. Each has five stamina and one bifid style. The plums are much of the shape of those of the myxa, and are eaten in the same manner. The fruit of this tree is less valuable than the wood, a small piece of which thrown upon a clear fire will perfume a room with a most agreeable odour.

CORDIAL, in medicine, whatever raises the spirits, and gives them a sudden strength and cheerfulness; as wine, spirits, the effluvia of flowers, fruit, and many other substances.

CORDON, in fortification, a row of stones, made round on the outside, and set between the wall of the fortress which lies aslope, and the parapet which stands perpendicular, after such a manner, that this difference may not be offensive to the eye; whence the cordons serve only as an ornament, ranging round about the place,

Cordemoi
||
Cordon.

Corduba, place, being only used in fortifications of stone-work ;
Cordoua. for in those made with earth the void space is filled up with pointed stakes.

CORDUBA (anc. geog.), an illustrious city of Bætica, on the right or north side of the Bætis. Built by Marcellus, according to Strabo; but which Marcellus, is not so clear. It was the first colony sent into those parts by the Romans; and surnamed *Patricia*, because at first inhabited by principal men, both of the Romans and natives. It is mentioned by Sil. Italicus in the second Punic war; and hence it is probable the first Marcellus was the founder, and not the Marcellus engaged in the civil war between Cæsar and Pompey. It was famous for the birth of the two Senecas and of Lucan (Martial), and for its rich produce in oil (Status, Martial). Still retaining its name a little altered. W. Long. 5. Lat. 37. 45.

CORDOUA, or CORDOVA, a city of Andalusia in Spain, situated on the river Guadalquivir, in a very extensive plain. The circumference is large; but it is not peopled in proportion to its extent, for there are a great many orchards and gardens within the walls. There are many superb structures, palaces, churches, and religious houses; particularly the cathedral, which is very magnificent: it was formerly a mosque when the Moors possessed the town; for which reason it still retains the name of *Mezquita*, which has the same meaning. This cathedral is very rich in plate, four of the silver candlesticks cost L. 850 a-piece. The revenue of the see amounts to L. 3500 *per annum*; but as the bishops cannot devise by will, all they die possessed of escheats to the crown. The square called the *Plaza Major* is surrounded with very fine houses, under which are piazzas. The trade is flourishing on account of the river; and consists of wine, silk, and Cordovian leather. In the neighbourhood of this place are a vast number of orange and lemon trees, which renders their fruits exceeding cheap. The best horses in Spain come from hence.

Cordova was the ancient *Corduba* mentioned in the preceding article. After the fall of the Roman empire, it was subjected to the dominion of the Goths; but in the eighth century it was raised by the Moorish princes to a state of splendor unequalled in any other part of the world. In the year 755, Abdoulrahman, only heir-male of the Ommiad line, having passed over from Africa at the head of a few desperate followers, found means to raise a rebellion in Spain; when, after a battle fought on the banks of the Guadalquivir, in which he overthrew the lieutenant of the Abassid Caliph of Damascus, he became king of all the Moorish possessions in the south of Spain, and in 759 fixed his royal residence at Cordova. Then began those flourishing ages of Arabian gallantry and magnificence which rendered the Moors of Spain superior to all their cotemporaries in arts and arms, and made Cordova one of the most splendid cities of the world. Agriculture and commerce prospered under the happy sway of this hero; and the face of the country was changed from a scene of desolation, which the long wars and harsh government of the viceroys had brought on, into a most populous flourishing state, exceeding in riches, number of inhabitants, activity, and industry, any prior or subsequent era of the Spanish history. He added new fortifications to the town, built himself a

magnificent palace with delicious gardens, laid causeways through the marshes, made excellent roads to open ready communication between the great towns, and in 786 began the great mosque, which he did not live to finish.

During the course of two centuries, this court continued to be the resort of all professors of the polite arts, and of such as valued themselves upon their military and knightly accomplishments; while the rest of Europe was buried in ignorance, debased by brutality of manners, or distracted by superstitious disputes. England, weakened by its heptarchy, was too inconsiderable even to be mentioned in the political history of the times: France, though it had a gleam of reputation under Charlemagne, was still a barbarous unpolished nation: and Italy was in utter confusion; the frequent revolutions and change of masters rendering it impossible for learning, or any thing good, to acquire a permanent footing in so unstable a soil: Greece, though still in possession of the arts and luxury of ancient Rome, had lost all vigour, and seemed absorbed in the most futile of all pursuits; *viz.* that of scholastic argument and religious subtilties.

The residence of the Ommiad Caliphs was long conspicuous for its supreme magnificence, and the crowds of learned men who were allured to it by the protection offered by its sovereigns, the beauty of the country, the wholesomeness of the climate, and the variety of pleasures that returned incessantly in one enchanting round.

Cordova became the centre of politeness, industry, and genius. Tilts and tournaments, with other costly shows, were long the darling pastimes of a wealthy happy people; and this was the only kingdom in the west where geometry, astronomy, and physic, were regularly studied and practised. Music was no less honoured; for we find, that in 844 a famous musician called *Ali Zeriab* came to settle at Cordova, and formed several pupils, who were supposed to equal the most celebrated performers that were ever known even in the East. That architecture was greatly encouraged, we need no other proof than the great and expensive fabrics undertaken and completed by many of these Spanish monarchs. Whatever faults may be justly condemned in their manner by the connoisseur, accustomed to the chaste noble graces of the Grecian proportions, certainly nobody can behold what remains of these Moorish edifices, without being strongly impressed with a high idea of the genius of the artists, as well as the grandeur of the prince who carried their plans into execution.

The sultans not only gave the most distinguished protection to arts and sciences, and to the persons learned in any of them, but were themselves eminently versed in various branches of knowledge. Alkehem II. collected so immense a quantity of manuscripts, that before the end of his reign the royal library contained no less than 600,000 volumes, of which the very catalogue filled 40 huge folios. The university of Cordova was founded by him, and under such favourable auspices rose to the highest pitch of celebrity.

Abdoulrahman was succeeded by his son Hissem, whose passion for glory and architecture was not in the least inferior to that of his father. He put the finishing hand to the mosque, which the plunder of the southern

Cordoua southern provinces of France enabled him to complete in the course of a few years. The bridge over the Guadalquivir was a work of Hisslem's after his own plan.

Alkahem succeeded Hisslem.

Abdoulrahman II. was also passionately fond of building. He was the first that brought the supplies of water to Cordova by means of leaden pipes laid upon aqueducts of stone. The quantity was so considerable, that every part of the palace, the mosques, baths, squares, and public edifices, had all of them their fountains constantly playing. A great many of these works still subsist. He paved the whole city, and erected several mosques.

After him reigned Mahomet Almandar, Abdallah, and Abdoulrahman III. who surpassed all his predecessors in splendor, riches, and expence. His subjects vied with each other in profusion and magnificence. This monarch was succeeded by his son Alkahem II. who left a minor to succeed him, and the kingdom to be governed by a famous visir, Mahomet Abenamir, surnamed *Almanzor*, or "the defender," from his great victories and wise conduct. His descendents inherited from him the visirship, and a power as absolute as if they had been caliphs, until the weakness of the sovereigns encouraged, and the insolence of the ministers provoked, the grandees to disturb the state with their jealousies and dissensions. These broils occasioned such a series of civil wars and anarchy, as overthrew the throne of Cordova and destroyed the whole race of Abdoulrahman. Thus the glorious edifice, founded by the valour and prudence of that conqueror, and cemented by similar virtues in many of his successors, sunk into nothing as soon as the sceptre devolved upon weak enervated princes, whose indolence and incapacity transferred the management of every thing to a visir. Many petty kingdoms sprang up out of the ruins of this mighty empire; and the Christians soon found opportunities of destroying, by separate attacks, that tremendous power, which when united had proved an overmatch for their utmost force.

New CORDOVA, a considerable town of South America, in the province of Tucuman, with a bishop's see, 175 miles from St Jago. W. Long. 62. 5. S. Lat. 32. 10.

CORDUAN, a famous pharos or light-house of France, in Guienne, at the mouth of the river Girond. The architecture is extremely fine; and is placed there to hinder vessels from running on the sand banks at the mouth of the river. W. Long. 1. 9. N. Lat. 45. 36.

CORDUS (Valerius), a learned botanist, was the son of Ericius Cordus, a physician and poet of Germany. Having learnt the languages, he applied himself to the study of botany; in the prosecution of which, he examined the mountains of Germany, and travelled into Italy; but being wounded in the leg by the kick of a horse, died at Rome in 1544. He wrote Remarks on Dioscorides, and other works.

CORDWAINERS, or **CORDINERS**, the term whereby the statutes denominate *shoemakers*. The word is formed from the French *cordonnier*, which Menage derives from *cordouan*, a kind of leather brought from Cordoua, whereof they formerly made the upper-

leathers of their shoes. Others derive it from *corde*, "rope," because anciently shoes were made of cords; as they still are in some parts of Spain, under the name of *alpargates*. But the former etymology is better warranted: for, in effect, the French workmen who prepare the corduas are still called *cordouanniers*.

In Paris they have two pious societies under the titles of *freres cordonniers*, "brothers shoemakers," established by authority towards the middle of the 17th century; the one under the protection of St Crispin*, the other of St Crispianus, two saints who had formerly honoured the profession. They live in community, and under fixed statutes and officers; by which they are directed both in their spiritual and secular concerns. The produce of their shoes goes into a common stock, to furnish necessaries for their support; the rest to be distributed among the poor.

COREA, a peninsula lying to the north-east of China, between 99 and 109 degrees of E. Long. and between 32 and 46 N. Lat. It is divided into eight provinces, which contain 40 cities of the 1st rank, 51 of the 2d, and 70 of the 3d. The capital of the whole is Hanching, where the king resides. The Jesuits say, the people are well made, of a sweet and tractable disposition, and fond of learning, music, and dancing, and in general resemble the Chinese. Their houses are mean, being covered with thatch; and they have no beds but lie on the floor. They have little silk, and therefore make use of linen-cloth in its room. Their trade consists in white paper, pencils, gingfeng, gold, silver, iron, yellow varnish, fowls whose tails are three feet long, horses no more than three feet in height, sable-skins, castor, and mineral salt. In general it is a fertile country, though abounding in mountains. It is tributary to China.

Mr Grosier relates an observation concerning the natural history of Corea, which, in his opinion, furnishes a new proof of the revolutions which the surface of our globe has undergone. An ancient Chinese book asserts, that the city where Kipe, the king of Corea, established his court, was built in a place which forms at present a part of the territories of *Yong-ping-fou*, a city of the first class in the province of Petcheli. "If this (says he) be admitted as a fact, we may from thence conclude that these territories formerly belonged to Corea; and that the gulf of Lax-tong, which at present separates this kingdom from the province of Petcheli, did not then exist, and that it has been formed since; for it is not probable that a sovereign would have fixed his residence without the boundaries of his kingdom, or in a place where he was separated from it by a wide and extensive sea. This conjecture is confirmed by certain facts admitted by the Chinese. Thus when *Yu*, surnamed the *Great*, undertook to drain and carry off the waters which had inundated the low grounds of several provinces, he began by the river Hoang-ho, the overflowing of which caused the greatest devastation. He went in search of its source to the bosom of Tartary, from whence he directed its course across the provinces of Chan-si, Chen-si, Honan, and Petcheli. Towards its mouth, in order to weaken the rapidity of its waters, he divided them into nine channels, through which he caused this river discharge itself into the eastern sea

Corea.

near the mountain of *Kie-che-chan*, which then formed a promontory. Since that time to the present, that is about 3950 years, the river Hoang-ho has departed so much from its ancient course, that its mouth at present is about six degrees farther south. We must also remark, that the mountain *Kie-che-chan*, which was formerly united to the main land of *Yong-ping-fou*, stands at present in the sea at the distance of about 50 leagues to the south of that city. If the sea has been able to cover with its waters that extent of territory which at present forms part of the gulph of *Lea-tong*, may we not be allowed to suppose that like inundations may have formed successively the whole of that gulph, the ancient existence of which seems so ill to agree with the residence of the kings of Corea in the territories of *Yong-ping-fou*? It is true, the Chinese history makes no mention of so considerable a physical revolution; but it is equally silent with regard to the 500 *lys* (50 leagues) extent of ground which is at present covered by the sea beyond the mountains of *Kie-che-chan*. Besides, of all the changes which the surface of our globe experiences, those only are mentioned in history which happen suddenly, and which consequently make more impression on the minds of men.

Corea chiefly produces wheat, rice, and ginseng, with a kind of palm-tree, which yields a gum capable of producing a yellow varnish little inferior to gilding. Hence also are exported castor and sable skins; also gold, silver, iron, and fossil salt; a kind of small brushes for painting, made of the hair of a wolf's tail, are likewise manufactured here, which are exported to China and highly esteemed there. The sea-coasts abound in fish, and great numbers of whales are found there every year towards the north-east. Several of these, it is said, have in their bodies the harpoons of the French and Dutch, from whom they have escaped in the northern extremities of Europe; which seems to indicate a passage from the European into the Asiatic seas round the continents of Europe and Asia.

A considerable quantity of the paper of Corea is annually imported into China; indeed the tribute due to the emperor is partly paid with it every year. It is made of cotton, and is as strong as cloth, being written upon with a small hair-brush or pencil; but must be done over with alum-water before it can be written upon in the European manner. It is not purchased by the Chinese for writing, but for filling up the squares of their fash-windows; because, when oiled, it resists the wind and rain better than that of China. It is used likewise as wrapping paper; and is serviceable to the taylor, who rub it between their hands until it becomes as soft and flexible as the finest cotton cloth, instead of which it is often employed in lining clothes. It has also this singular property, that if it be too thick for the purpose intended, it may be easily split into two or three-leaves, each of which are even stronger than the best paper of China.

The Coreans are well made, ingenious, brave, and tractable; are fond of dancing, and show great docility in acquiring the sciences, to which they apply with great ardour and honour in a particular manner. The northern Coreans are larger sized and more robust than those of the south; have a taste for arms,

and become excellent foldiers. Their arms are cross-bows and long sabres. Men of learning are distinguished from other classes of people by two plumes of feathers in their caps; and when merchants present the Coreans with any books for sale, they dress themselves in their richest attire, and burn perfumes before they treat concerning the price.

The Coreans mourn three years, as in China, for a father or mother: but the time of mourning for a brother is confined to three months. Their dead are not interred until three years after their decease: and when the ceremony of interment is performed, they place around the tomb the clothes, chariot, and horses of the deceased, with whatever else he showed the greatest fondness for while alive; all which they leave to be carried off by the assistants. Their houses, as in China, consist only of one story, and are very ill built; in the country being composed of earth, and in cities generally of brick, but all thatched with straw: the walls of their cities are constructed after the Chinese manner, with square turrets, battlements and arched gates. Their writing, dress, religious ceremonies, and creed, as well as the greater part of their customs, are borrowed from the Chinese. Their women, however, are less confined, and have the liberty of appearing in public with the other sex, for which they are often ridiculed by their neighbours. They differ from the Chinese also in their ceremonies of marriage, and in the manner of contracting it; the parties in this country taking the liberty to choose for themselves, without consulting the inclination of their parents, or suffering them to throw any obstacles in their way.

COREIA, in antiquity, a festival in honour of Proserpine, named *Core*, *Kopp*, which in the Molossian dialect signifies a beautiful woman.

CORELLI (Arcangelo), the famous Italian musician and composer, a native of Fusignano, in the territory of Bologna, was born in 1653. He entertained an early propensity to the violin; and as he advanced in years, laboured incessantly in the practice of that instrument. About the year 1672, his curiosity led him to visit Paris, probably with a view to attend the improvements which were making in music under the influence of cardinal Mazarine, and in consequence of the establishment of a royal academy: but notwithstanding the character which he brought with him, he was driven back to Rome by Lully, whose jealous temper could not brook so formidable a rival as this illustrious Italian. In the year 1680 he visited Germany, and met with a reception suitable to his merit from most of the German princes, particularly the elector of Bavaria; in whose service he was retained and continued for some time. After about five years stay abroad, he returned again to Rome, and there pursued his studies with great assiduity.

The proficiency of Corelli on his favourite instrument the violin was so great, that the fame of it reached throughout Europe. The style of his performance was learned, elegant, and pathetic; and his tone firm and even. (Mr Geminiani, who was well acquainted with, and had studied it, was used to resemble it to a sweet trumpet. A person who had heard him perform says, that, whilst he was playing on the violin, it was usual for his countenance to be distorted, his eyes

Corea.

|| Corelli.

Corelli. eyes to become as red as fire, and his eye-balls to roll as in an agony.

Corelli was highly favoured by that great patron of poetry and music, cardinal Ottoboni. Crescembini says, that he regulated the musical academy held at the palace of his eminence every Monday afternoon. Here it was that Mr Handel became acquainted with him; and in this academy a serenata of Mr Handel, entitled, *Il Trionfo del Tempo*, was performed, the overture to which was in a style so new and singular, that Corelli was confounded in his first attempt to play it.

During the residence of Corelli at Rome, besides those of his own country, many persons were ambitious of becoming his disciples, and learning the practice on the violin from the greatest master of that instrument the world had then heard of. Of these it is said the late lord Edgecumbe was one; and that the fine mezzotinto print of Corelli by Smith was scraped from a picture painted by Mr Hugh Howard at Rome for that nobleman.

Corelli died at Rome in 1713; and was buried in the church of the Rotunda, otherwise called the Pantheon, in the first chapel, on the left hand of the entrance. Over the place of his interment is a sepulchral monument to his honour, with a marble bust thereon, erected at the expence of Philip-William, count palatine of the Rhine, under the care and direction of cardinal Ottoboni.

For many years after his decease, this excellent musician was commemorated by a solemn musical performance in the Pantheon, on the anniversary of his death. In the year 1730 an eminent master, now living, was present at that solemnity, who relates that at it the third and eighth of his concertos were performed by a numerous band, among whom were many who had been the pupils of the author. He adds, that these two pieces were performed in a slow, distinct, and firm manner, without graces, and just as they are wrote; and from hence concludes, that this was the manner in which they were played by the author himself.

He died possessed of about 6000 l. sterling. He was a passionate admirer of pictures, and lived in an uninterrupted friendship with Carlo Cignani and Carlo Maret: these two eminent painters were rivals for his favour; and for a series of years presented him at times with pictures, as well of other masters as of their own painting. The consequence was, that Corelli became possessed of a large and valuable collection of original paintings; all which, together with the sum above-mentioned, he bequeathed to his dear friend and patron cardinal Ottoboni, who, reserving the pictures to himself, generously distributed the rest of the effects among the relations of the testator.

Corelli is said to have been remarkable for the mildness of his temper and the modesty of his deportment: nevertheless, he was not insensible of the respect due to his skill and exquisite performance. Cibber, in the Apology for his Life, p. 340. relates, that when he was playing a solo at cardinal Ottoboni's, he discovered the cardinal and another person engaged in discourse, upon which he laid down his instrument; and being asked the reason, gave for answer, that he feared the music interrupted their conversation.

The compositions of Corelli are celebrated for the harmony resulting from the union of all the parts; but the fineness of the airs is another distinguishing characteristic of them: the allemand in the 12th solo is as remarkable for spirit and force, as that in the 11th is for its enchanting delicacy: his jigs are in a style peculiarly his own; and that in the 5th solo was never equalled. In the gavot movements in the 2d and 4th operas, the melody is distributed with great judgment among the several parts. In his minutes alone he seems to fail; Bononcini, Mr Handel, and Giuseppe Martini, have excelled him in this kind of airs.

It is said there is in every nation a style both in speaking and writing, which never becomes obsolete; a certain mode of phraseology, so consonant and congenial to the analogy and principles of its respective language, as to remain settled and unaltered. This, but with much greater latitude, may be said of music, and accordingly it may be observed of the compositions of Corelli, not only that they are equally intelligible to the learned and unlearned, but that the impressions made by them have been found to be as durable in general. His music is the language of nature; and, for a series of years, all that heard it became sensible of its effects: of this there cannot be a stronger proof than that, amidst all the innovations which the love of change had introduced, it continued to be performed, and was heard with delight in churches, in theatres, at public solemnities and festivities, in all the cities of Europe for near 40 years. Men remembered, and would refer to passages in it as to a classic author; and even at this day, the masters of the science do not hesitate to pronounce of the compositions of Corelli, that, of fine harmony and elegant modulation, they are the most perfect exemplars.

COREOPSIS, TICKSEEDED SUNFLOWER: A genus of the polygamia frustanea order, belonging to the syn-genesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is paleaceous; the pappus two-horned; the calyx erect and polyphyllous, surrounded with patent radiated leaflets at the base. There are 11 species, most of them herbaceous perennials. They are very flowery, and rise from three to eight feet stature; terminated by clusters of compound radiated flowers of a yellow colour. They have all perennial fibrous roots, and annual stalks, which rise in the spring, flower from July to October, and decay to the root in November. The flowers are all shaped like sun-flowers, but smaller, and are very ornamental. They are easily propagated by slipping or dividing the roots in autumn, when the stalks decay; planting the slips at once where they are to remain; after which they will require no farther trouble than to be kept free from weeds, and have the decayed stalks cut annually in autumn.

CORFE-CASTLE, a borough-town in Dorsetshire in England. It takes its name from a strong castle, belonging to the crown, that stood there, but is now ruined. It sends two members to parliament. W. Long. 2. 8. N. Lat. 50. 33.

CORFU, an island in the Ionian sea, at the mouth of the gulph of Venice, formerly called *Corcyra* and *Phœacia*, famous for the gardens of Alciraus. It belongs

Corelli
|
Corfu.

Corfu. longs at present to the Venetians; and forms the bulwark of Christendom against the Turks, who have often attempted to reduce it, but without success. It is well fortified, and has 50 castles; and the number of the inhabitants is said to be about 50,000. The inhabitants are of the Greek church; and the Venetians send them a governor and magistrates, which are changed every two years. The soil is very fruitful, and produces a great deal of wine, olives, and several other fruits, particularly figs, which are exceedingly good. The chief city is likewise called *Corfu*; see the following article.

CORFU, a city of the island of that name, belonging to the Venetians. It is a large place, strongly fortified and defended by a garrison of about 10,000 men; which, however, in the opinion of a late traveller, do not appear adequate to the extent of the fortifications. A number of very excellent brass and iron cannon are mounted on the different forts, which, he observes, are so divided, that it would take treble the number of their garrison to defend them. However, the republic of Venice is generally at peace with the different European nations, and the ancient power of the Turks being much decayed, they have little to apprehend; tho' to prevent any sudden surprise, the Venetians keep a formidable squadron in the harbour of Corfu, and the works have been much improved by Major General Paterfon.—In the late war they had with the Turks, this town was attacked by an army of 80,000 men, and attempted to be stormed several times by the enemy; but the garrison, which consisted of 12,000 men under the command of Count Schulenburg, made so brave and gallant a defence, that they always repulsed them, and obliged them to raise the siege, and abandon the place with considerable loss. For this piece of service the republic has caused a magnificent statue to be erected in memory of the Count, with an elegant Latin inscription, setting forth the many eminent services of his military achievements. The circumference of the city is about four miles; the number of inhabitants on the whole island are computed at about 50,000, the greatest part of whom are Greeks.

This island is the residence of the governor-general, whose jurisdiction extends over all the islands subject to the republic of Venice, in the Levant seas, and is considered as one of the greatest honours they can confer on a subject. He is always a nobleman of the first rank, and has his appointment for three years only, in which time he makes a tolerable addition to his fortune, and on his return to Venice is generally advanced to the honours of the senate. In the city are many handsome Greek churches, the principal of which is that of St Speridione, or the cathedral: It is embellished with some excellent paintings, and most superbly ornamented. The body of the saint from whom it was named, is preserved entire in a rich shrine within the church. The Greeks are most of them such fanatics as to be continually offering their devotions at this shrine, believing that through the intercession of the saint they will obtain all their wants; and that by offerings of money their sins will be forgiven them; by which means the church has amassed an immense treasure. The relic of the saint is deposited in a silver coffin, richly decorated with precious stones. It is in an amazing state of preservation; he having died in

the island of Cyprus upwards of 700 years ago; and after remaining 400 years there, was transported to this place. Besides the grand fleet, the Venetians have another of galleys, that are manned by convicts whose crimes are not of such a nature as to merit death. The chief diversions of this place in the winter are operas; they have always a company of comedians for the season from Naples. In the summer they pass their time in walking upon the ramparts: few except the governor and great officers of state are permitted to keep carriages. The Corfu people perfectly resemble the Zanteots in their manners (see ZANTE); though it must be observed in praise of the former, that assassinations are uncommon among them, their laws being too severe to permit such practices with impunity. E. Long. 19. 48. N. Lat. 39. 50.

CORIA, a town of Spain, in the kingdom of Leon and province of Estremadura, towards the confines of Portugal, with a bishop's see. It is seated on a little river called *Alagon*, in a very fertile plain. There is nothing remarkable but the cathedral church, except at a little distance a river without a bridge, and a bridge without a river. This was caused by an earthquake, which turned the river another way. W. Long. 6. 46. N. Lat. 39. 59.

CORIANDRUM, CORIANDER: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellata*. The corolla is radiated; the petals inflexed-emarginated; the involucre universal and monophyllous; the partial involucre halved; the fruit spherical. There are only two species, both of them herbaceous annuals, the leaves of which are useful for the kitchen, and the seeds for medicine. Both species have divided small leaves, somewhat resembling parsley: but there is but one species generally cultivated; namely, the *sativum*. This hath a small fibrous white root, crowned by many parted leaves, having broadish segments; and in the centre an upright, round, branchy stalk, two feet high, having all the branches terminated by umbels of flowers, which are succeeded by globular fruit. It is propagated by seed, which when a good crop is wanted, ought to be sown in March, either in drills a foot asunder, or by broadcast, and then raked in. When the plants are an inch or two high, they should be hoed to six or eight inches distance. The seeds when fresh have a strong disagreeable smell, which improves by drying, and becomes sufficiently grateful: they are recommended as carminative and stomachic. They are also much used by the brewers both in England and Holland, to give a flavour to their strongest beer. The ancients had a notion, that the juice of coriander would deprive people of their senses, and even of life. The leaves are sometimes used for culinary purposes in soups, and as an ingredient in salads; but as they are of a ferid smell, they are held in no great esteem in this country.

CORIARIA, the *Tanner's* or *myrtle-leaved* SUMACH: A genus of the decandria order, belonging to the dioecia class of plants; and in the natural method ranking under the 54th order, *Miscellanea*. The male calyx is pentaphyllous; the corolla pentapetalous, very like the calyx, and united with it; the antheræ bipartite. The female calyx is pentaphyllous; the corolla like that of the male; the styles five, seeds five, covered

Coria
||
Coriaria.

Coridor
||
Corinth.

ed with a like number of succulent petals, forming altogether the resemblance of a berry. There are two species, the *myrtifolia* and the *fœmina*. They are both natives of the south of France, but the former is most commonly cultivated in Britain. It is a pretty ornamental plant, with a shrubby pithy brown stem, closely branching from the bottom, and forms a bushy head three or four feet over, thickly garnished with oblong, pointed, bright green leaves, having small spikes of whitish flowers at the ends of the branches. It is easily propagated by suckers from the root, which it affords plentifully, and may be taken off with fibres every autumn or winter. It may also be propagated by layers in autumn, which will take root in a year. It is much used in the south of France, where it naturally grows, for tanning of leather, whence its name of *tanner's sumach*. It also dyes a beautiful black colour. The berries are dangerous, and when eaten generally occasion vertigoes and epilepsies. The old leaves have the same effect upon cattle that eat them, but the young leaves are innocent.

CORIDOR, or CORRIDOR, in fortification, a road or way along the edge of the ditch, without-side: encompassing the whole fortification. The word comes from the Italian *coridore*, or the Spanish *coridor*.

It is also called the *covert-way*; because covered with a glacis, or esplanade, serving it as a parapet. The coridor is about 20 yards broad.

CORIDOR is also used in architecture, for a gallery or long aisle around a building, leading to several chambers at a distance from each other, sometimes wholly inclosed, and sometimes open on one side.

CORINNA, a Grecian lady, celebrated for her beauty and poetic talents, was born at Theffu a city of Bœotio, and was the disciple of Myrtis another Grecian lady. Her verses were so esteemed by the Greeks that they gave her the name of the *lyric muse*. She lived in the time of Pindar, about 495 years before Christ; and is said to have gained the prize of lyric poetry from that Poet: but Pausanias observes that her beauty made the judges partial.

CORINTH, a celebrated city of antiquity, for some time the most illustrious of all the Greek cities. It is said to have been founded 1514 years before Christ, by Sisyphus the son of Eolus, and grandfather of Ulysses. Various reasons are given for its name, but most authors derive it from *Corinthus* the son of Pelops. It was situated in the south part of the Isthmus which joins the Peloponnesus, now the Morea, to the continent. It consisted of a citadel built upon an eminence, and thence named *Acrocorinthus*; besides which it had two maritime towns subject to it, named *Lecheum* and *Genchrea*. The whole state extended scarce half a degree in length or breadth; but so advantageously were the abovementioned ports situated, that they might have gained the Corinthians a superiority, if not a command, over all Greece, had not their advantageous situation inclined them to commerce rather than war. For their citadel was almost impregnable; and, commanding both the Ionian and Ægean seas, they could easily cut off all communication from one half of Greece with the other; for which reason this city was called one of the fetters of Greece.

But as the genius of the Corinthians led them to commerce rather than martial exploits, their city became the finest in all Greece. It was adorned with the most sumptuous buildings, as temples, palaces, theatres, porticoes, &c. all of them enriched with a beautiful kind of columns, which from the city were called *Corinthian*. But though the Corinthians seldom or never engaged in a war with a view of enlarging, but rather of defending, their little state, they did not forget to cultivate a good discipline both in time of peace and of war. Hence many brave and experienced generals have been furnished by Corinth to the other Grecian cities, and it was not uncommon for the latter to prefer a Corinthian general to any of their own.

This city continued to preserve its liberty till the year before Christ 146, when it was pillaged and burnt by the Romans. It was at that time the strongest place in the world; but the inhabitants were so disheartened by a preceding defeat, and the death of their general, that they had not presence of mind enough even to shut their gates. The Roman consul, Mummius, was so much surpris'd at this, that at first he could scarce believe it; but afterwards fearing an ambuscade, he advanced with all possible caution. As he met with no resistance, his soldiers had nothing to do but destroy the few inhabitants who had not fled, and plunder the city. Such of the men as had staid, were all put to the sword, and the women were sold for slaves. After this the city was ransacked by the greedy soldiers, and the spoils of it are said to have been immense. There were more vessels of all sorts of metal, more fine pictures, and statues done by the greatest masters in Corinth, than in any other city in the world. All the princes of Europe and Asia, who had any taste in painting and sculpture, furnished themselves here with their richest moveables: here were cast the finest statues for temples and palaces, and all the liberal arts brought to their greatest perfection. Many inestimable pieces of the most famous painters and statuaries fell into the hands of the ignorant soldiers, who either destroyed them or parted with them for a trifle. Polybius the historian was an eye-witness to this barbarism of the Romans. He had the mortification to see two of them playing at dice on a famous picture of Aristides, which was accounted one of the wonders of the world. The piece was a Bacchus, so exquisitely done, that it was proverbially said of any extraordinary performance, "It is as well done as the *Bacchus of Aristides*." This masterly piece of painting, however, the soldiers willingly exchanged for a more convenient table to play upon: but when the spoils of Corinth were put up to sale, Attalus king of Pergamus offered for it 600,000 sesterces, near L. 5000 sterling. Mummius was surpris'd at such a high price offered for a picture, and imagined there must be some magical virtue in it. He therefore interposed his authority, and carried it to Rome, notwithstanding the complaints of Attalus. Here this famous picture was lodged in the temple of Ceres, where it was at last destroyed by fire, together with the temple. Another extraordinary instance of the stupidity of Mummius is, that when the pictures were put on board the transports, he told the masters of the vessels very seriously, that if any of the things were either

Corinth.

Corinth. either lost or spoiled, he would oblige them to find others at their own cost; as if any other pieces could have supplied the loss of those inestimable originals, done by the greatest masters in Greece. When the city was thoroughly pillaged, fire was set to all the corners of it at the same time. The flames grew more violent as they drew near the centre, and at last uniting there made one prodigious conflagration. At this time the famous metalline mixture is said to have been made, which could never afterwards be imitated by art. The gold, silver, and brats, which the Corinthians had concealed, were melted, and ran down the streets in streams, and when the flames were extinguished, a new metal was found, composed of several different ones, and greatly esteemed in after ages.

The town lay desolate until Julius Cæsar settled there a Roman colony; when, in moving the rubbish and digging, many vases were found of brass or earth finely embossed. The price given for these curiosities excited industry in the new inhabitants. They left no burying-place unexamined; and Rome, it is said, was filled with the furniture of the sepulchres of Corinth.

Strabo was at Corinth soon after its restoration by the Romans. He describes the site as follows. "A lofty mountain, in perpendicular height as much as three stadia and a half (near half a mile), the ascent 30 stadia (3¼ miles), ends in a pointed summit called *Acrocorinthus*. Of this the portion to the north is the most steep; beneath which lies the city on a level area, at the foot of the *Acrocorinthus*. The circuit of the city alone has been 40 stadia (5 miles), and as much of it as was unsheltered by the mountain has been walled about. Within the inclosure was comprehended also the *Acrocorinthus*, where the mountain was capable of receiving a wall; and as we ascended, the vestiges were plain; so that the whole circumference exceeded 85 stadia (near 11 miles). On the other sides the mountain is less steep, but rises very high, and is visible all around. Upon the summit is a small temple of Venus; and below it the spring *Pirene*, which does not overflow, but is always full of pellucid and potable water. They say it unites with some other hidden veins, and forms the spring at the mountain foot, running into the city, and affording a sufficient supply for the use of the inhabitants. In the city is plenty of wells, and in the *Acrocorinthus*, as they say, for we did not see any. There they relate the winged horse *Pegasus* was taken as he was drinking, by *Bellerophon*. Below *Pirene* is the *Sisyphæum*, some temple or palace of white stone, the remains not inconsiderable. From the summit is beheld to the north *Parnassus* and *Helicon*, lofty mountains covered with snow; and below both, to the west, the *Crisean* gulph bounded by *Phocis*, by *Bœotia* and the *Megaris*, and by *Corinthia* and *Sicyonia* opposite to *Phocis*. Beyond all these are the mountains called the *Oncian*, stretching as far as *Bœotia* and *Cithæron* from the *Scironian* rocks on the road to *Attica*." Strabo saw likewise *Cleonæ* from thence. *Cenchreæ* was then a village. *Lechæum* had some inhabitants.

New Corinth had flourished 217 years when it was visited by *Pausanias*. It had then a few antiquities, many temples and statues, especially about the *Agora* or market place, and several baths. The emperor *Hadrian* introduced water from a famous spring at

Corinth. *Stymphalus* in *Arcadia*; and it had various fountains alike copious and ornamental. The stream of one issued from a dolphin, on which was a brazen *Neptune*; of another, from the hoof of *Pegasus*, on whom *Bellerophon* was mounted. On the right hand, coming along the road leading from the market-place toward *Sicyon*, was the *Odæum* and the theatre, by which was a temple of *Minerva*. The old *Gymnasium* was at a distance. Going from the market-place toward *Lechæum* was a gate, on which were placed *Phæton* and the *Sun* in gilded chariots. *Pirene* entered a fountain of white marble, from which the current passed in an open channel. They supposed the metal called *Corinthian brass* to have been immersed while red hot in this water. On the way up to the *Acrocorinthus* were temples, statues, and altars; and the gate next *Tenca*, a village with a temple of *Apollo* sixty stadia, or seven miles and a half distant, on the road to *Mycenæ*. At *Lechæum* was a temple and a brazen image of *Neptune*. At *Cenchreæ* were temples; and by the way from the city a grove of cypresses-trees, sepulchres, and monuments. Opposite was the *Bath of Helen*, water tepid and salt, flowing plentifully from a rock into the sea. *Mummius* had ruined the theatre of *Corinth*, and the munificence of the great Athenian *Atticus Herodes* was displayed in an edifice with a roof inferior to few of the most celebrated structures in Greece.

The Roman colony was reserved to suffer the same calamity as the Greek city, and from a conqueror more terrible than *Mummius*, *Alaric* the savage destroyer of *Athens* and universal *Greece*. In a country harassed with frequent wars, as the *Peloponnesus* has since been, the *Acrocorinthus* was a post too consequential to be neglected. It was besieged and taken in 1459 by *Mahomet II.*; the despots or lords of the *Morea*, brothers of the Greek emperor who was killed in defending *Constantinople*, refusing payment of the arrears of the tribute, which had been imposed by *Sultan Morat*, in 1447. The country became subject to the *Turks*, except such maritime places as were in the possession of the *Venetians*; and many of the principal inhabitants were carried away to *Constantinople*. *Corinth*, with the *Morea*, was yielded to the republic at the conclusion of the war in 1698, and again by it to the *Turks* in 1715.

Corinth retains its old name, and is of considerable extent, standing on high ground, beneath the *Acrocorinthus*, with an easy descent toward the gulph of *Lepanto*; the houses scattered or in parcels, except in the *Bazar* or market-place. *Cypresses*, among which tower the domes of mosques, with corn-fields, and gardens of lemon and orange-trees, are interspersed. The air is reputed bad in summer, and in autumn exceedingly unhealthy. *Wheler* relates, that from the top of the *Acrocorinthus* or *Citadel*, he enjoyed one of the most agreeable prospects which this world can afford. He guessed the walls to be about two miles in compass, inclosing mosques, with houses and churches mostly in ruins. An hour was consumed in going up on horseback. It was a mile to the foot of the hill, and from thence the way was very steep, with many traverses. The families living below were much infested by corsairs, and on every alarm flocked up to the castle.

According to Dr Chandler, Corinth has preserved but few monuments of its Greek or Roman citizens. The chief remains, he informs us, are at the south-west corner of the town, and above the bazar or market; 11 columns supporting their architraves, of the Doric order, fluted, and wanting in height near half the common proportion to the diameter. Within them, toward the western end, is one taller, though not entire, which it is likely contributed to sustain the roof. They have been found to be stone, not marble; and appear brown, perhaps from a crust formed on the outside. The ruin he judges to be of very remote antiquity, and a portion of a fabric erected not only before the Greek city was destroyed, but before the Doric order had attained to maturity. He suspects it to have been the Sisyphæum mentioned by Strabo. North of the Bazar stands a large mass of brick-work, a remnant, it may be conjectured, of a bath or of the Gymnasium.

The inhabitants are most of them Christians of the Greek church, who are allowed liberty of conscience by the Turks. E. Long. 28. 13. N. Lat. 38. 14.

CORINTH, (the isthmus of), in the Morea, is a neck of land which joins the Morea to Greece, and reaches from the gulph of Lepanto to that of Egina. Julius Cæsar, Caligula, and Nero, attempted to cut a channel through it, but in vain; and they therefore afterwards built a wall across it, which they called *Hexamilium*, because it was six miles in length. This was demolished by Amurat II. and afterwards rebuilt by the Venetians, but was levelled a second time by Mahomet II.

CORINTHIAN, in general, denotes something belonging to Corinth: thus we say, Corinthian brass, Corinthian order, &c.

CORINTHIAN Brass. See BRASS and CORINTH.

CORINTHIAN Order, in architecture, the fourth order of architecture, according to Scamozzi; but Mr Le Clerc makes it the fifth, being the most noble and delicate of all the other five. See ARCHITECTURE, n^o 47.

CORIO (Bernardine), an historian, born of an illustrious family at Milan, in the year 1460. He was secretary of state to that duchy; and the Duke of Lavis Storza appointed him to write the history of Milan. He died in 1500. The best edition of his history is that of 1503, in folio. It is printed in Italian, and is very scarce.

CORIOLANUS (C. Marcius), a famous Roman captain, took Corioli a town of the Volsci, whence he had his surname: at last, disgusting the people, he was banished Rome by the tribune Decius. He went to the Volsci, and, persuading them to take up arms against the Romans, they encamped within four miles of the city. He would not listen to proposals of peace till he was prevailed upon by his wife Veturia, and his mother Volumnia, who were followed by all the Roman ladies in tears. He was put to death by the Volsci as a traitor that had made them quit their conquest: upon which the Roman ladies went into mourning; and in the same place where his blood was spilled there was a temple consecrated to Feminine Virtue.

CORIS, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the

natural method ranking with those of which the order is doubtful. The corolla is monopetalous and irregular; the calyx prickly; the capsule quinquevalved superior. There is only one species, viz. the monspeliensis, or blue maritime coris. There are two varieties of this plant, one with a red, and the other with a white flower; but these are only accidental, and arise from the same seeds. They grow wild about Montpellier, and in most places in the south of France: they seldom grow above six inches high, and spread near the surface of the ground like heath; and in June, when they are full of flowers, make a very pretty appearance. They may be propagated by sowing their seeds in a bed of fresh earth, and afterwards removing the young plants, some into pots, and others into a warm border. They generally bear our winter colds well enough, but severe frosts will sometimes destroy them; for which reason it is proper to keep some of them in pots, which should be put under a hot-bed frame in winter. As they seldom produce good seeds in this country, they may, in want of these, be propagated by slips and cuttings, which will take root if planted on a very gentle hot-bed, shaded from the sun, and duly watered.

CORIS is also used in the East-Indies for a kind of shells which pass for money.

CORISPERMUM, TICKSEED: A genus of the digynia order, belonging to the monandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx; two petals, and one oval naked seed. There are two species; but none of them are remarkable for their beauty or any other quality.

CORITANI, (anc. geog.) a people of Britain, occupying widely the inland parts, as Northampton, Leicester, Rutland, Lincoln, Nottingham, and Derby shires; (Camden).

CORK, the bark of a tree of the same name, a species of *Quercus*. See *QUERCUS*.

To take off the bark they make an incision from the top to the bottom of the tree, and at each extremity another round the tree, perpendicular to the first. When stripped from the tree, which does not therefore die, the bark is piled up in a pond or ditch, and loaded with heavy stones to flatten it, and reduce it into tables: hence it is taken to be dried; and when sufficiently dry, put in bales for carriage. If care be not taken to strip the bark, it splits and peels off itself; being pushed up by another bark formed underneath.

The bark of cork, as well as the acorn, are of some use in medicine; being both reputed astringents, after being burnt and powdered when used externally; but the chief employ of the former is, to put in shoes, slippers, &c. and to stop bottles. The Spaniards burn it to make that kind of light black we call *Spanish black*, used by painters. Cups made of cork, are said by some to be good for hysterical persons to drink out of. The Egyptians made coffins of cork; which being lined with a resinous composition, preserved dead bodies uncorrupted. The Spaniards line stone-walls with it, which not only renders them very warm, but corrects the moisture of the air.

Fossil-CORK, a name given to a kind of stone. It seems to be a species of amianthus, consisting of flexi-

ble.

Cork.

ble fibres loosely interwoven, and somewhat resembling vegetable cork. It is the lightest of all stones; by fire it is fusible, and forms a black glass. It possesses the general qualities of amianthus. See that article.

CORK, in Latin *comitatus Corcagiensis*, a county of the province of Munster in Ireland. It is the most populous and considerable county of the kingdom next to that of Dublin; containing near a million of acres, and being divided into 15 baronies. It is bounded on the north-east by the county of Waterford; on the west by Kerry; by Limerick on the north; and by the sea on the south and south-east. Including Desmond it is 85 miles in length and 50 in breadth; but is very unequal both ways. Though a considerable part of the country is boggy, mountainous, and barren; yet by the industry of the inhabitants it is pretty well cultivated and improved, and contains several good towns and harbours.

CORK, a city of Ireland, and capital of the county of that name. It is an episcopal see; and is the largest and most populous of any in the kingdom, Dublin alone excepted. It is situated on the river Lee, 15 miles from its mouth. It is a place of great trade, the harbour here being one of the finest in the world. Though smaller vessels can come up to the key, yet the larger generally ride at a place called *Passage*. This city, together with its liberties, makes a county. It was built, or rather fortified, by the Danes, in the ninth century. The greatest part of it stands on a marshy island surrounded by the river Lee, which also runs through the city, and divides it into several canals. On this account some have thought the air very moist and unwholesome. Complaints have also been made against the water as impure; but, from comparing the bills of mortality with those of other cities, it appears that the city of Cork is far from being unhealthy. This hath been accounted for from the influx of the tide, by which a stagnation of air is prevented. The first charter of Cork was bestowed by Henry III. and afterwards ratified by Edward I. Edward II. and Edward III. Edward IV. granted a new charter; and the city received many favours from the succeeding monarchs. King James I. gave the citizens a new and ample charter; and king Charles I. what is called the Great Charter, by which, among others, a clause in king James's charter was enforced, making this city a county of itself. The see of Cork is reputed worth L. 2700 a-year. The chapter consists of a dean, chanter, chancellor, treasurer, archdeacon, and twelve prebendaries. The church is dedicated to St Barr or Finbarr; and the diocese is divided into five deaneries. There is very little to be found in ancient writers concerning the foundation of the Cathedral of Cork; yet it is generally ascribed to St Barr in the seventh century. Many of its bishops have been great benefactors to it. Through length of time, the church became quite ruinous; but it hath lately been completely rebuilt, and is now an elegant modern structure. To defray the expence, the parliament laid a tax on all coals consumed in the city of Cork. The deanery is reputed to be worth L. 400 a-year.

Cork is much improved and enlarged, several broad streets have been lately added, by filling up the canals that formerly ran through them, and are now built up with elegant houses; the parade is very spacious,

Cork.

and is adorned with an equestrian statue of king George II. It hath the largest export in the kingdom, particularly of beef, hides, tallow, butter, fish, and other provisions. It is partly situated on several islands, formed by the river Lee, which are banked and quayed in, somewhat like the towns in Holland; and partly on rising grounds, on the north and south sides of the river. The earl of Marlborough besieged and took it from king James's army in 1690; when the duke of Grafton, who served as a volunteer, was slain in an attack. It contains about 8600 houses, and upwards of 70,000 inhabitants. It hath twelve companies of foot quartered in the barracks. Besides a stately cathedral, built from the foundation, between 1725 and 1735, by the produce of a duty upon coals, as above noticed, it is adorned with several handsome parish churches. It has also an elegant exchange for the merchants, a new and beautiful custom-house, a town-hall, several fine hospitals, and various other public structures. The city possesses an annual revenue of about 1300l. out of which the mayor enjoys for his salary and the support of his dignity 500l. The wealth and grandure of Cork arise from its capacious and commodious haven, where almost any number of ships may lie with ease and safety. According to some accounts, when there has been no war, 1200 vessels have resorted hither in a year. Ships from England, bound to all parts of the West Indies, take in here a great part of their provisions; and on the same account the haven of Cork is visited by those also of most other nations. The slaughtering season continues from the month of August to the latter end of January; in which space it has been computed, that they kill and cure seldom fewer than 100,000 head of black cattle. The rest of their exports consist of butter, candles, hides, raw and tanned, linen cloth, pork, calves, lambs, and rabbit-skins, tallow, wool for England, linen and woollen yarn, and worsted. The merchants of Cork carry on a very extensive trade to almost all parts of the known world; so that their commerce is annually increasing. The produce of the customs some years since exceeded 60,000l. and the number of ships that they employ is double to what it was forty years ago. The only thing that seemed to be wanting to the security of the port of Cork was supplied in the earl of Chesterfield's memorable administration, by building a fort on the great island, to command the entrance of the haven. The outlets of Cork are cheerful and pleasant. The country around the city, on both sides of the river, is hilly and picturesque; and the harbour called the *Cove*, is one of the best in the world; the entrance is safe, and the whole navy of England might ride in it, secure from every wind that blows. Ships of burden, however, are obliged to unload at *Passage*, five miles and a half from Cork, the channel not admitting vessels of above 150 tons.

CORK Jacket, or *Waistcoat*, is an invention of one Mr Dubourg, a gentleman very fond of swimming, but subject to the cramp, which led him to consider of some method by which he might enjoy his favourite diversion with safety. The waistcoat is composed of four pieces of cork, two for the breasts and two for the back; each pretty near in length and breadth to the quarters of a waistcoat without flaps; the

Cormandel the whole is covered with coarse canvas, with two holes to put the arms through: there is a space left between the two back-pieces, and the same betwixt each back and breast-piece, that they may fit the easier to the body. Thus the waistcoat is only open before, and may be fastened on the wearer with strings, or, if it should be thought more secure, with buckles and leather straps. This waistcoat does not weigh above 12 ounces, and may be made up for about 5 or 6 shillings expence. Mr Dubourg tried his waistcoat in the Thames, and found that it not only supported him on the water, but that two men could not sink him, tho' they used their utmost efforts for that purpose. If those who use the sea occasionally, and especially those who are obliged to be almost constantly there, were to have those waistcoats, it would be next to impossible that they should be drowned. It would also be of vast service to those that, for the sake of health, bathe in the sea; and even the most delicate and timorous young lady might by the help of one of these jackets venture into a rough sea. See *AIR-Jacket*, and *BAMBOO-Habit*.

CORMANDEL. See **COROMANDEL**.

COR-MASS, the name of a grand procession, said to have been established at Dunkirk during the dominion of Charles V. and renewed on St John's day, the twenty-fourth of June. After the celebration of high mass, the procession, consisting of the several tradesmen of the town, begins. Each person has a burning taper of wax in his hand; and after each company comes a pageant, followed by the patron-faint, usually of solid silver, richly wrought and adorned. The companies are followed by music; and after the musicians, the friars in the habits of their order, the secular priests, and then the abbot magnificently adorned and preceded by the host. Machines likewise of various fantastical forms and devices, and as variously accoutred, form a part of the show on this occasion: which is described as one of the most superb and magnificent in the world, by an eye-witness, in 1735.

CORMORANT, a corruption of corvorant, in ornithology. See **PELICANUS**.

CORN, in country affairs, the grain or seeds of plants separated from the spica or ear, and used for making bread.

There are several species, of corn, such as wheat, rye, and barley, millet and rice, oats, maize and lentils, pease, and a number of other kinds; each of which has its usefulness and propriety.

Europe, in every part of it; Egypt, and some of the cantons of Africa, particularly the coasts of Barbary; and some parts of America cultivated by the Europeans, particularly New England, New France, and Acadia; are the places which produce corn. Other countries have maize and rice in lieu of it; and some parts of America, both in the islands and continents, simple roots, such as potatoes and manioc.—Egypt was anciently the most fertile of all other countries in corn; as appears both from sacred and profane history. It furnished a good part of the people subject to the Roman empire, and was called the *dry nurse of Rome and Italy*. Britain, France, and Poland, seem now in the place of Egypt, and with their superabundances support a good part of Europe.

For the first discovery and culture of corn, authors

are much divided: the common opinion is, that in the first ages men lived on the spontaneous fruits of the earth; as acorns, and the nut or mast produced by the beech; which, they say, took its name *fagus*, from the Greek *φαγω*, *I eat*. It is added, that they had not either the use of corn, nor the art of preparing or making it eatable.

Ceres has the credit of being the first that showed the use of corn, on which account she was placed among the gods; others give the honour to Triptolemus; others share it between the two, making Ceres the first discoverer, and Triptolemus the first planter and cultivator of corn. Diodorus Siculus ascribes the whole to Isis; on which Polydore Virgil observes, he does not differ from the rest; Isis and Ceres being, in reality, the same. The Athenians pretend it was among them the art began; and the Cretans or Candiots, Sicilians, and Egyptians, lay claim to the same. Some think the title of the Sicilians best supported, that being the country of Ceres: and authors add, she did not teach the secret to the Athenians, till she had first instructed her own countrymen. Others say, Ceres passed first into Attica, thence into Crete, and, last of all, into Sicily: many of the learned, however, maintain it was in Egypt the art of cultivating corn first began; and it is certain there was corn in Egypt and the East long before the time of Ceres.

Corn is very different from fruits, with respect to the manner of its preservation; and is capable of being preserved in public granaries for pressing occasions, and of being kept for several centuries.—A little time after the siege of Mentz, under Henry II. of France, in the year 1578, the duc d'Espemon laid up vast stores of corn in the citadel; which was preserved in good plight to the year 1707, when the French king and his retinue passing that way, eat bread baked thereof.

The chief thing that contributes to the preservation of corn is, a crust which forms on its surface, by the germination of the grain next underneath, to the thickness of an inch and a half. On that at Mentz people walked, without it giving the least way. At Sedan was a granary cut in a rock, wherein a heap of corn was preserved a hundred and ten years: it was covered with a crust a foot thick.

For the preservation of corn, the first method is to let it remain in the spike; the expedient that was for conveying it to the islands and provinces of America. The inhabitants of those countries save it in the ear, and raise it to maturity by that precaution: but this method of preserving it is attended with several inconveniencies in Britain; corn is apt to rot or sprout, if any the least moisture is in the heap; the rats likewise infest it, and the want of straw also obliges us to separate the grain from the ear. The second is to turn out and winnow it frequently; or to pour it through a trough or mill-hopper, from one floor to another; being thus moved and aired every 15 days, for the first 6 months, it will require less labour for the future, if lodged in a dry place; but if through neglect, mites should be allowed to slide into the heap, they will soon reduce the corn to a heap of dust: this must be avoided by moving the corn anew, and rubbing the places adjacent with oils and herbs, whose strong odour may chase them away; for which garlic and dwarf-elder

Corn
||
Cornarius.

are very effectual: they may likewise be exposed to the open sun, which immediately kills them. When the corn has been preserved from all impurities for the space of two years, and has exhales all its fires, it may be kept for 50 or even 100 years, by lodging it in pits covered with strong planks, closely joined together: but the safer way is to cover the heap with quick-lime, which should be dissolved by sprinkling it over with a small quantity of water; this causes the grains to shoot to the depth of two or three fingers; and incloses them within an incrustation, as above-mentioned, through which neither air nor insects can penetrate.

Indian Corn or maize. See ZEA.

Corn-Butterfly, method of destroying it. See AGRICULTURE, n^o 80.

Corn-Crake. See RALLUS.

Corn-Mill, a water-engine for grinding of corn. See MECHANICS.

CORNS, in surgery, hard excrescences, consisting of indurations of the skin arising on the toes, and sometimes on the sides of the feet, where they are much exposed to the pressure of the shoes. By degrees they press themselves farther down between the muscular fibres on these parts, and by their irritation occasion extreme pain. Many cures have been prescribed, but the total removal of them is always found to be attended with great difficulty. It has been recommended to soften them with plasters, and then to pull them up by the roots, to apply caustic, &c. A piece of raw beef laid on by way of plaster, and frequently shifted, is also said to be effectual; but the best cure is to bathe them frequently in warm water, and pare away as much as possible of the indurated skin without drawing blood.

CORN, in farriery. See FARRIERY.

CORNAGE, an ancient tenure, the service whereof was to blow a horn when any invasion of the Scots was perceived. This tenure was very frequent in the northern counties near the Picts wall; but by stat. 12. Car. II. all tenures are converted into free and common socage.—An old rental calls cornage, *newtgeldt*, q. d. *neat-geld*. Lord Coke says, in old books it is called *horngeld*.

CORNARISTS, in ecclesiastical history, the disciples of Theodore Cornhert, an enthusiastic secretary of the states of Holland. He wrote at the same time against the Catholics, Lutherans, and Calvinists. He maintained that every religious communion needed reformation; but he added, that no person had a right to engage in accomplishing it, without a mission supported by miracles. He was also of opinion, that a person might be a good Christian without being a member of any visible church.

CORNARIUS, or HAGUENBOT, (John), a celebrated German physician, born at Zwickow in Saxony. His preceptor made him change his name of Haguenbot to that of Cornarius, under which he is most known. At 20 years of age he taught grammar, and explained the Greek and Latin poets and orators to his scholars; and at 23 was licentiate in medicine. He found fault with most of the remedies provided by the apothecaries; and observing, that the greatest part of the physicians taught their pupils only what is to be found in Avicenna, Rasis, and the other Arabian

physicians, he carefully sought for the writings of the best physicians of Greece, and employed about 15 years in translating them into Latin, especially the works of Hippocrates, Aetius, Eginetes, and a part of those of Galen. Meanwhile he practised physic with reputation at Zwickow, Francfort, Marburg, Nordhausen, and Gena, where he died of an apoplexy in 1558, aged 58. He also wrote some medicinal treatises; published editions of some poems of the ancients on medicine and botany; and translated some of the works of the fathers, particularly those of Basil, and a part of those of Epiphanius.

CORNARO (Lewis), a Venetian of noble extraction, memorable for having lived healthful and active to above 100 years of age by a rigid course of temperance. By the ill conduct of some of his relations he was deprived of the dignity of a noble Venetian; and seeing himself excluded from all employments under the republic, he settled at Padua. In his youth he was of a weak constitution; and by irregular indulgence reduced himself, at about 40 years of age, to the brink of the grave, under a complication of disorders; at which extremity he was told that he had no other chance for his life, but by becoming sober and temperate. Being wise enough to adopt this wholesome council, he reduced himself to a regimen of which there are very few examples. He allowed himself no more than 12 ounces of food and 14 ounces of liquor each day; which became so habitual to him, that when he was above 70 years of age, the experiment of adding two ounces to each by the advice of his friends, had like to have proved fatal to him. At 83, he wrote a treatise which has been translated into English, and often printed, intitled, *Sure and certain Methods of attaining a Long and Healthful Life*; in which he relates his own story, and extols temperance to a degree of enthusiasm. At length, the yolk of an egg became sufficient for a meal, and sometimes for two, until he died with much ease and composure in 1566. The writer of the Spectator, n^o 195. confirms the fact from the authority of the Venetian ambassador at that time, who was a descendant of the Cornaro family.

CORNAVII (Ptolemy), a people of Britain, beginning in the very heart of the island, and extending to Chester. Now *Warwick, Worcester, Salop, Stafford shires, and Cheshire* (Camden).

CORNEA TUNICA, in anatomy, the second coat of the eye; so called from its substance resembling the horn of a lantern, in Latin *cornu*. See ANATOMY, n^o 142.

CORNEILLE (Peter), a celebrated French poet, was born at Rouen in the year 1606. He was brought up to the bar, which he attended for some little time; but formed with a genius too elevated for such a profession, and having no turn for business, he soon deserted it. An affair of gallantry occasioned his writing his first piece, intitled *Melite*; which had prodigious success. Encouraged by the applause of the public, he wrote the *Cid*, and the other tragedies that have immortalized his name. In his dramatic works he discovers a majesty, a strength and elevation of genius, scarce to be found in any other of the French poets; and, like the immortal Shakespeare, seems better acquainted with nature than with the rules of critics. Corneille was received into the French academy

Cornaro
||
Corneille.

Cornacille
I
Cornelia. demy in 1647, and died dean of that academy in 1684, aged 73. Besides his dramatic pieces, he wrote a translation, in French verse, of the "Imitation of Jesus Christ," &c. The best edition of his works is that of 1682, in 4 vols 12mo.

CORNEILLE (Thomas), brother of the former, was a member of the French academy and of that of inscriptions. He discovered in his youth a great inclination to poetry; and at length published several dramatic pieces in 5 vols 12mo, some of which were applauded by the public, and acted with success. He also wrote, 1. A translation of Ovid's *Metamorphoses*, and of some of Ovid's *Epistles*; 2. *Remarks on Vauglas*; 3. A *Dictionary of Arts*, 2 vols folio; and, 4. An universal, geographical, and historical *Dictionary*, in 3 vols folio.

CORNEILLE (Michael), a celebrated painter, was born at Paris in the year 1642; and was instructed by his father, who was himself a painter of great merit. Having gained a prize at the academy, young Corneille obtained a pension from Louis XIV.; and was sent to Rome, where that prince had founded a school for young artists of genius. Having studied there some time, he gave up his pension, and applied to the antique with great care. He is said to have equalled Carache in drawing, but in colouring he was deficient. Upon his return from Rome, he was chosen professor in the academy of Paris; and was employed by the above prince in all the great works he was carrying on at Versailles and Trianon, where are still to be seen some noble efforts of his genius.

CORNEL-TREE, in botany. See CORNUS.

CORNELIA, daughter of Scipio Africanus, was the mother of Tiberius and Caius Gracchus. She was courted by a king, but she preferred being the wife of a Roman citizen to that of a monarch. Her virtues have been deservedly commended, as well as the wholesome principles she inculcated in her two sons. When a Campanian lady made once a show of her jewels at Cornelia's house, and entreated her to favour her with a sight of her own, Cornelia produced her two sons, saying, "These are the only jewels of which I can boast."

CORNELIA *Lex, de civitate*, was enacted, in the year of Rome 670, by L. Corn. Sylla. It confirmed the Sulpician law, and required that the citizens of the eight newly elected tribes should be divided among the 35 ancient tribes.—Another, *de judiciis*, in 673, by the same. It ordained, that the prætor should always observe the same invariable method in judicial proceedings, and that the process should not depend upon his will.—Another, *de sumptibus*, by the same. It limited the expences which generally attended funerals.—Another, *de religione*, by the same, in 677. It restored to the college of priests the privilege of choosing the priests, which by the Domitian law had been lodged in the hands of the people.—Another, *de municipiis*, by the same; which revoked all the privileges which had been some time before granted to the several towns that had assisted Marius and Cinna in the civil wars.—Another, *de magistratibus*, by the same; which gave the power of bearing honours, and being promoted before the legal age, to those who had followed the interest of Sylla; while the sons and partizans of his

enemies, who had been proscribed, were deprived of the privilege of standing for any office in the state.—Another, *de magistratibus*, by the same, in 673. It ordained, that no person should exercise the same office within ten years distance, or be invested with two different magistracies in one year.—Another, *de magistratibus*, by the same, in 673. It divested the tribunes of the privilege of making laws, interfering, holding assemblies, and receiving appeals. All such as had been tribunes were incapable of holding any other office in the state by that law.—Another, *de majestate*, by the same in 670. It made it treason to lend an army out of a province, or engage in a war without orders, to influence the soldiers to spare or ransom a captive general of the enemy, to pardon the leaders of robbers or pirates, or for the absence of a Roman citizen to a foreign court without previous leave. The punishment was *aqua & ignis interdictio*.—Another by the same. It gave the power to a man accused of murder, either by poison, weapons, or false accusations, and the setting fire to buildings, to choose whether the jury that tried him should give their verdict *clam* or *palam*, *viva voce* or by ballot. Another by the same; which made it *aqua & ignis interdictio* to such as were guilty of forgery, concealing and altering of wills, corruption, false accusations, and the debasing or counterfeiting of the public coin. All such as were accessory to this offence were deemed as guilty as the offender.—Another, *de pecuniis repetundis*; by which a man convicted of peculation or extortion in the provinces was condemned to suffer the *aqua & ignis interdictio*.—Another by the same; which gave the power to such as were sent into the provinces with any government, of retaining their command and appointment without a renewal of it by the senate, as was before observed.—Another by the same; which ordained, that the lands of proscribed persons should be common, especially those about Volaterræ and Fesulæ in Etruria, which Sylla divided among his soldiers.—Another by C. Cornelius tribune of the people, in 686. It ordained, that no person should be exempted from any law according to the general custom, unless 200 senators were present in the senate; and no person thus exempted could hinder the bill of his exemption from being carried to the people for their concurrence.—Another by Naffica, in 582, to make war against Perseus, son of Philip king of Macedonia, if he did not give proper satisfaction to the Roman people.

CORNELIAN. See CARNELIAN.

CORNER, in a general sense, the same with ANGLE.

CORNET, in the military art of the ancients, an instrument much in the nature of a trumpet; which when it only sounded, the ensigns were to march alone without the soldiers; whereas, when the trumpet only sounded, the soldiers were to move without the ensigns. The cornets and buccinæ sounded the charge and retreat; and the cornets and trumpets sounded during the course of the battle. See Plate CL.

CORNET, in modern military œconomy, denotes an officer in the cavalry who bears the ensign or colours of a troop.

The cornet is the third officer in the company, and commands in the absence of the captain and lieutenant.

Corneus He takes his title from his ensign, which is square; and is supposed to be called by that name from *cornu*, because placed on the wings, which form a kind of points or horns of the army.—Others derive the name from *coronet*; alleging, that it was the ancient custom for these officers to wear coronets or garlands on their heads.

||
Cornucopia.

CORNEUS, the name by which Linnæus calls a kind of tin-ore, found in black columns, with irregular sides, and terminating in prisms.

CORNICHE, **CORNISH**, or **CORNICE**, in architecture, the uppermost member of the entablature of a column as that which crowns the order. See **ARCHITECTURE**, Chap. I. and the Plates.

CORNICHE, is also used, in general, for all little projections in masonry or joinery, even where there are no columns, as the corniche of a chimney, beaufet, &c.

CORNICHE-Ring, a piece of ordnance, is that next from the muzzle-ring, backward.

CORNICULARIUS, in antiquity, an officer in the Roman army, whose business was to aid and assist the military tribune in quality of a lieutenant.

The *cornicularii* went the rounds in lieu of the tribune, visited the watch, and were nearly what the aids major are in the French army.

The denomination *cornicularius* was given them from a little horn, called *corniculum*, which they used in giving orders to the soldiers: though Salmastius derives it from *corniculum*, the crest of an head-piece; it being an observation of Pliny, that they wore iron or brass horns on their helmets; and that these were called *cornicula*.

In the *Notitia Imperii* we find a kind of secretary or register of the same name. His business was to attend the judge, and enter down his sentences and decisions. The critics derive the word, in this sense, from *corniculum*, a little horn to put ink in.

CORNICULUM (anc. geog.), a town of the Sabines, to the east of Crustumerium, towards the Anio. It was burnt down by Tarquin; but restored again, after the expulsion of the kings, (Florus). Now in ruins, called *il Monte Gennaro*, (Holstenius).

CORNISH DIAMOND, a name given by many people to the crystals found in digging the mines of tin in Cornwall. See **CORNWAL**, p. 462. col. 2.

CORNIX, in ornithology, the trivial name of a species of **CORVUS**.

CORNU. See **HORN**.

CORNU Ammonis, in natural history, fossile shells, called also *serpent-stones*, or *snake-stones*.

They are found of all sizes, from the breadth of a sixpence, to more than two feet in diameter; some of them rounded, others greatly compressed, and lodged in different strata of stones and clays; some again are smooth, and others ridged in different manners, their striæ and ridges being either straight, irregularly crooked, or undulated. See **SNAKE-Stone**.

CORNU Cervi. See **HARTSHORN**.

CORNUCOPIA, among the ancient poets, a horn out of which proceeded plenty of all things; by a particular privilege which Jupiter granted his nurse, supposed to be the goat Amalthea. The fable is thus interrupted: That in Lybia there is a little territory shaped not unlike a bullock's horn, exceeding fertile,

given by king Ammon to his daughter Amalthea, whom the poets feign to have been Jupiter's nurse.

In architecture and sculpture, the cornucopia, or horn of plenty, is represented under the figure of a large horn, out of which issue fruits, flowers, &c. On medals, F. Joubert observes, the cornucopia is given to all deities.

CORNUCOPIÆ, in botany: A genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The involucre is monophyllous, funnel-shaped, crenated, and multiflorous; the calyx bivalved; corolla one valved.

CORNUS, **CORNEL-TREE**, **CORNELIAN CHERRY**, or **DOG-WOOD**: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The involucre is most frequently tetraphyllous; the petals above the receptacle of the fruit four; the fruit itself a bilocular kernel.

Species. Of this genus there are five species; the most remarkable are the following. 1. The mas, or cornelian cherry-tree, hath an upright tree-stem, rising 20 feet high, branching, and forming a large head, garnished with oblong leaves, and small umbels of yellowish-green flowers at the sides and ends of the branches, appearing early in the spring, and succeeded by small, red, cherry-like, eatable, acid, fruit. 2. The sanguinea, bloody-berry, or common dogwood: hath an upright tree-stem, branching 10 or 12 feet high, having blood-red shoots, garnished with oblong pointed nervous leaves two inches long; and all the branches terminated by umbellate white flowers succeeded by black berries: of this there is a kind with variegated leaves. 3. The florida, or Virginian dogwood, hath a tree-stem branching 12 or 15 feet high, and fine red shoots garnished with large heart-shaped leaves; and the branches terminated by umbellate white flowers, having a large involucre succeeded by dark red berries. Of this species there are several varieties, chiefly distinguished by the colour of their berries, which are red, white, or blue.

Culture. All the species may be propagated by seeds, which ought to be sown in autumn, otherwise they will lie a year in the ground. When the plants come up, they should be duly watered in dry weather, and kept clean from weeds. The following autumn they may be transplanted into the nursery; and having remained there two or three years, they may then be removed to the places where they are to remain. They may also be propagated by suckers, of which they produce great plenty, or by laying down the young branches.

CORNUTIA, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personatæ*. The calyx is quinque-dentated; the stamina larger than the corolla; the style very long; the berry monospermous. There is but one species, *viz.* the pyramidata, with a blue pyramidal flower, and hoary leaves. It grows plentifully in several of the islands of the West Indies, also at Campeachy, and at La Vera Cruz. It rises to the height of 10 or 12 feet, with rude branches, the leaves being placed opposite. The flowers are produced in spikes at the

Cornucopia
||
Cornutia.

Cornwal. end of the branches, and are of a fine blue colour. They usually appear in autumn, and will sometimes remain in beauty for two months or more. It is propagated either by seeds or cuttings, and makes a fine appearance in the stove; but is too tender to bear the open air in this country.

CORNWAL, the most westerly county of England, bounded by the English channel on the south, St George's channel on the west, the Bristol channel on the north, and on the east by the river Tamar, which separates it from Devonshire. Its name is supposed by some to be compounded of *caru*, signifying "a rock" in the British language, and *Gauls*, or *Wauls*, the name the Saxons gave to the Britons. Others, however, think it is derived from the Latin *cornu*, or the British *keru*, "a horn;" on account of its running out into the sea somewhat in the form of a horn. Hither the ancient Britons (as well as in Wales) retired on the intrusion of the Saxons, where they opposed their further conquests. In this part of the island they formed a kingdom that existed for many years after, under different princes, amongst whom were Ambrosius Aurelius, and the justly celebrated Arthur; nor were they subdued till the middle the 7th century, from which time Cornwall was considered as subject to the West Saxon kings, who begun their sovereignty in 519, and continued it till 823, under 18 sovereigns, the last of whom was the great Egbert, who subdued all the others; and by uniting them, formed the kingdom of England, when this country was included in the county of Devon, then the 9th division; and that accounts for Alfred's not mentioning Cornwall, which on forming the circuits after the Norman conquest, is included in the western circuit. In 1337, Edward III. erected it into a dukedom, and invested with it *Edward the Black Prince*. But this, according to the express words of the grant, is limited to the first-born son and heir, on which account Richard II. was created duke of Cornwall by charter. So was Henry V. by his father Henry IV. Henry IV. delivered the duchy to his son prince Edward, and Edward IV. created his son Edward V. duke of Cornwall, as did Henry VII. his son, afterwards Henry VIII. upon the death of his elder brother Arthur. James I. created his son Henry duke of Cornwall, which title on his decease came to his brother Charles. The eldest sons of succeeding kings have enjoyed this title by inheritance. These not only appoint the sheriff, but all writs, deeds, &c. are in their name, and not in the king's; and they have also peculiar royalties and prerogative distinct from the crown, for which they appoint the officers. This county is 80 miles long, 40 broad, and 250 in circumference; containing 960,000 acres, and 126,000 inhabitants. It is divided into 9 hundreds; has 27 market towns, *viz.* Launceston, Truro, Falmouth, Helston, Saltash, Bodmyn, St Ives, Tregony, Camelford, Fowey, St Germans, Penryn, Callington, St Austle, East Looe, Padstow, St Colomb, Penfance, Grampond, Leskard, Lestwithiel, St Mawes, St Michael, Newport, Market Jew, Stratton, and Redruth; 1230 villages, 161 parishes, 89 vicarages, provides 640 men to the militia, and pays 8 parts of the land-tax. Its chief rivers are the Tamer, Fale, Cober, Looe, Camel, Fowe, Haile, Lemara, Kense,

and Aire. Its principal capes or head-lands are the Land's-end, the Lizard, Cape Cornwall, Deadman's-head, Rame-head, &c. and a cluster of islands, 145 in number, called the *Scilly Isles*, supposed formerly to have been joined to the main land, though now 30 miles distant; abounding with antiquities, particularly druidical.

As Cornwall is surrounded by the sea on all sides except the east, its climate is somewhat different from that of the other parts of Britain. The reasons of this difference will be easily understood from what is observed concerning the climate of America. The summers in Cornwall are less hot, and the winters less cold than in other parts of England, and the spring and harvest are observed to be more backward. High and sudden winds are also more common in this than in other counties of England. The county is rocky and mountainous; but the mountains are rich in metals, especially tin and copper. The valleys are very pleasant and fertile, yielding great plenty both of corn and pasture. The lands near the sea-coast are manured and fertilized with sea-weed, and a kind of sand formed by the particles of broken shells as they are dashed against each other by the sea. Cattle of all sorts are smaller here than in the other counties of England; and the wool of the sheep, which are mostly without horns, is very fine, and the flesh, both of them and of the black cattle, extremely delicate. The county is well supplied with fish from the sea and the many rivers with which it is watered. The most noted of the sea-fish is the pilchard; of which prodigious quantities are caught from July to November, and exported to different parts, especially to Spain. It is said that a million have been sometimes taken at a single draught. The natives are remarkable for their strength and activity, as well as their dexterity in wrestling, in which exercise the Cornish hug is highly extolled.

This county abounds in mines of different metals and semimetals; but the principal produce is tin. The Phenicians early visited these coasts for this article, some think 400 or 450 years before Christ; and the mines continued to be wrought with various success at different periods. In the time of king John they appear to have yielded no great emolument; the right of working them being wholly in the king as earl of Cornwall, and the mines farmed by the Jews for 100 marks; and according to this proportion the 10th of it, L. 6. 12s. 4d. is at this day paid by the crown to the bishop of Exeter. In the time of Richard king of the Romans and earl of Cornwall, the tin-mines were immensely rich, the Jews being farmed out to him by his brother Henry III. what interest they had was at his disposal. The Spanish tin-mines being stopped by the Moors, and none discovered in Germany, the Malabar coast, or the Spanish West Indies, Cornwall and its earls had all the trade of Europe for it. The Jews being banished the kingdom, 18 Edw. I. they were again neglected till the gentlemen of Blackmore, lords of seven tithings best stored at that time with tin, obtained of Edmund earl of Cornwall, son of Richard king of the Romans, a charter under his own seal, with more explicit grants of privileges, courts, pleas, parliaments, and the toll-tin or $\frac{1}{7}$ th of all the tin raised. At this time too the right of bounding or dividing

Cornwal.

Cornwal. dividing tin-grounds into separate partitions for the encouragement of searching for it seems to have been first appointed, or at least adjusted. This charter was confirmed 33 Edward I. and the Cornish separated from the Devonshire tanners. Their laws, particularly recited in Plowden's Commentaries, p. 237, were further explained, 50 Edw. III. confirmed and enlarged by parliament, 8 Rich. II. 3 Ed. IV. 1 Ed. VI. 1 and 2 P. and M. and 2 Eliz. and the whole society divided into four parts under one general warden, to do justice in law and equity, from whose sentence lies an appeal to the duke of Cornwall in council, or for want of a duke of Cornwall to the crown. The lord-warden appoints a vice-warden to determine all stannary disputes every month: he also constitutes four stewards, one for each of the precincts before mentioned, who hold their courts every three weeks, and decide by juries of six persons, with an appeal reserved to the vice-warden, lord warden, and lord of the prince's council. In difficult cases the lord-warden, by commission, issues his precept to the four principal towns of the stannary districts, who each choose six members, and these twenty-four stannators constitute the parliament of tanners. Each stannator chooses an assistant, making a kind of standing council in a different apartment to give information to the prince. Whatever is enacted by the body of tanners must be signed by the stannators, the lord-warden, or his deputy, and by the duke or the king, and thenceforward has with regard to tin affairs all the authority of an act of the whole legislature. Five towns are appointed in the most convenient parts of the country for the tanners to bring their tin to every quarter of a year. These are Leskard, Lestwithiel, Truro, Helston, and Pensance, the last added by Charles II. for the conveniency of the western tanners. In the time of Henry VIII. there were but two coinages, at Midsummer and Michaelmas: two more at Christmas and Lady-day were added, for which the tanners pay an acknowledgement called *Post groats*, or 4 *d.* for every hundred of white tin then coined. The officers appointed by the duke assay it; and if well purified stamp it by a hammer with the duchy seal, the arms of Richard earl of Cornwall, a lion rampant G. crowned O. within a bordure of bezants S.; and this is a permission to the coiner to sell, and is called *coining the tin*. Every hundred of white tin so coined pays to the duke 4s. The tin of the whole county, which, in Carew's time, in the last century, amounted to 30 or 40,000 l. yearly, has for 24 years last past amounted one year with another to L. 180,000 or 190,000 sterling. Of this the duke of Cornwall receives for his 4s. duty on every hundred of white tin above L. 10,000 yearly: the bounders or proprietors of the soil about $\frac{1}{4}$ th at a medium clear, or about L. 30,000 yearly; the remainder goes to the adventures in the mine, who are at all the charge of working. Tin is found collected and fixed in lodes and floors, or in grains and bunches in the natural rock, or loose and detached in single separate stones called *shodes* or *streams*, or in a continued course of such stones called the *beuheyl* or *living stream*, or in an arenaceous pulverized state. It is most easily discovered by tracing the lodes by the scattered fragments of them called *shodes*, by leave of the lord of the soil or the bounder. The tin being divided among the lords and

Cornwal. adventurers, is stamped and worked at the mill; and being thus dressed is carried under the name of *black tin* to the melting-house, where it is melted by Welsh pit-coal, and poured into blocks of 320lb. weight, and carried to the coinage town. Mundic, a scarce metal or mineral ore, of a white, brassy, or brown colour, is found in large quantities, intermixed with tin, copper, and lead, and sometimes by itself. Iron ore is found in Cornwall, but the working it does not answer. There is no richer copper, nor a greater variety any where than in this county. Silver, if really found here in the reigns of Edward I. and II. has been rarely found since, nor do the lead-mines answer. Very late discoveries have proved that Cornwall has more gold than was formerly imagined. What is called the *Cornish diamond* is a figured crystal generally hexagonal and pyramidal, or columnar, or both, of a fine clear water, and of all the bastard diamonds in Britain esteemed the best, and some of different colours, black, yellow, &c. The clearer these are, the better they will bear engraving for seals.

In privileges and language Cornwall seems to be another kingdom. By 21 Elizabeth it was ordered that all duty on Cornish cloth exported should be remitted to every Englishman within the duchy of Cornwall. This was first granted by the black prince, in consideration of their paying 4s. for the coinage of every hundred of tin: whereas Devonshire pays no more than 8d. They have also by grant from Richard earl of Cornwall, confirmed 45 Henry III. freedom to take sand out of the sea and carry it through the country for manure; whereupon in the following reign, on an inquisition made, we find a complaint that Saltash had lately taken 12s. yearly for each barge that carried sand up the Tamar; whereas nothing ought to be demanded. They still continue this ancient method of improving their land, carrying it ten miles up into the country, and great part of the way on horses backs. Mr Ray supposes the virtue of this sand depends chiefly on the salt mixed with it, which is so copious that in many places salt is boiled up out of a lixivium made of the sea sand; and the reason why sand when it has lain long in the sun and wind proves less enriching and useful is, that the dews and rain evaporate great part of its salt. They had likewise a privilege of trading to all parts of the world, granted them by Charles I. in recompence of their loyalty.

The number of boroughs in this small county was surprisngly increased by Edward VI. who added seven to the original six, Mary two, Elizabeth six, making in all 21, sending 40 members besides the county two. Eight of these boroughs had an immediate or remote connection with the demesne lands of the duchy; the rest belonged to religious houses, or powerful families, or were old boroughs, which had legal immunities granted to them by their princes or lords.

The Cornish language is a dialect of that which till the Saxons came in was common to all Britain, and more anciently to Ireland and Gaul; but the inhabitants of the island being dispersed before those conquests, and driven into Wales and Cornwall, and thence into Bretagne, the same language, for want of frequent intercourse, became differently pronounced and written, and in different degrees mixed with different

Corody
||
Coroman-
del.

ferent languages. Hence came the Welsh, the Cornish, and the Armoric dialects, whose radicals are so much alike that they are known and admitted by the inhabitants of either country; but the grammar so varied that they cannot converse. The Cornish is reckoned the most pleasing of the three. It was spoken so generally down to the reign of Henry VIII. that Dr John Moreman, vicar of Mynhinnet, is said to have been the first who taught his parishioners the Lord's prayer, the creed, and ten commandments in English, and at the Reformation the natives desired the service in English. The older people in some parishes retained their original language to the middle of the last century: and the last sermon was preached in it in 1673. When Mr Ray was there, 1662, he could find but one person who could write this language; and it is now so nearly extinct, that Mr Barrington, in 1768, could only find one old woman who could scold in it, and she is since dead.

CORODY. See REVENUE.

COROLLA, among botanists, the most conspicuous part of a flower, surrounding the organs of generation, and composed of one or more flower-leaves, most commonly called *petals* to distinguish them from the leaves of the plant; according as there is one, two, or three of these petals, the corolla is said to be monopetalous, dipetalous, tripetalous, &c.

COROLLARY is a consequence drawn from something already advanced or demonstrated: thus, it being demonstrated that a triangle which has two equal sides, has also two angles equal: this corollary will follow, that a triangle which has three sides equal, has also its three angles equal.

COROLLISTÆ, a name by which Linnæus distinguishes those systematic botanists who have arranged vegetables from the regularity, figure, number, and other circumstances, of the petals, or beautiful coloured leaves of the flower. The best systems of this kind are those of Rivinus and Tournefort. The former proceeds upon the regularity and number of the petals; the latter, with much more certainty, on their regularity and figure.

COROLLULA, a term used by botanists to express the little partial flowers which make up the compound ones.

COROMANDEL, the eastern coast of the peninsula on this side the Ganges in Asia. It is bounded on the north by Golconda, on the east by the bay of Bengal, on the south by Madura, and on the west by Bijnagar. This coast so much resembles that of Orixá, that the Abbé Raynal chooses to consider them as one, and gives to both the general name of *Coromandel*. Here an excessive heat reigns from the beginning of May to the end of October. It begins at nine in the morning, and continues till nine in the evening. During the night it is allayed by a sea-breeze from the south-east; and most commonly this refreshing gale begins at three in the afternoon. The air is less inflamed during the rest of the year, though in all seasons it is very hot. It rains almost continually during the months of November and December. This immense tract is covered with a parched sand for the extent of two miles, and sometimes only one mile along the coast.

This country was at first neglected by the Europe-

ans for many reasons. It was separated by inaccessible mountains from Malabar, where their bold adventurers endeavoured to settle themselves. Spices and aromatics, which were the principal objects of their attention, were not to be found there. In short, civil dissensions had banished from it tranquillity, security, and industry. At that period the empire of Bijnagar, to which this vast country was subject, was falling to ruin. The governments of Visapour, the Carnatic, Golconda, and Orixá, threw off their dependence, and assumed the title of kings. Those of Madura, Tanjore, Myfore, Gingi, and some others, likewise usurped the sovereign authority, though they retained their ancient title of *Naick*. This revolution had just happened when the Europeans appeared on the coast of Coromandel. The foreign trade was at that time inconsiderable; it consisted only of diamonds from Golconda, which were carried to Calicut and Surat, and from thence to Ormus or Suez, whence they were circulated through all Europe and Asia. Masulipatan, the richest and most populous city of these countries, was the only market that was known for linens; they were purchased at a great fair annually holden there by the Arabian and Malayan vessels that frequented that bay, and by caravans arrived from distant parts. The linens were exported to the same places with the diamonds. The fondness for the manufactures of Coromandel which began to prevail here, inspired all the European nations trading to the Indian seas with the resolution of forming settlements there. They were not discouraged either by the difficulty of conveying goods from the inland parts of the country, where there was no navigable river; by the total want of harbours, where the sea at one season of the year is not navigable; by the barrenness of the coasts, for the most part uncultivated and uninhabited; nor by the tyranny and fluctuating state of the government. They thought that silver would be industriously sought after; that Pegu would furnish timber for building, and Bengal corn for subsistence; that a prosperous voyage of nine months would be more than sufficient to complete their loadings; and that by fortifying themselves they should be secure against the attacks of the weak tyrants that oppressed these countries.

The first European colonies were established near the shore. Some of them obtained a settlement by force; most of them were formed with the consent of the sovereigns; and all were confined to a very narrow tract of land. The boundaries of each were marked out by a hedge of thorny plants, which was their only defence. In process of time fortifications were raised; and the security derived from them, added to the lenity of the government, soon increased the number of colonists. The splendor and independence of these settlements several times raised the jealousy of the princes in whose dominions they were formed; but their attempts to demolish them proved abortive. Each colony increased in prosperity in proportion to the riches and the wisdom of the nation that founded it. None of the companies that exercised an exclusive privilege beyond the Cape of Good Hope had any concern in the trade of diamonds. This was always left to private merchants, and by degrees fell entirely into the hands of the English, or the Jews and

Coroman-
del.

Coroman-
del.

and Armenians that lived under their protection. At present this grand object of luxury and industry is much reduced. The revolutions that have happened in Indostan have prevented people from resorting to these rich mines; and the anarchy in which this unhappy country is plunged, leaves no room to hope that they will be again attended to. The whole of the commercial operations on the coast of Coromandel is confined to the purchase of cottons. The manufacturing of the white cottons bought there, differs so little from the British, that it would be neither interesting nor instructive to enter into a minute description of it. The process used in making their printed cottons, which was at first servilely followed in Europe, has since been rendered more simple, and brought to greater perfection by the manufacturers. The painted cottons which are bought there, have not yet been attempted to be imitated. Nature has not given to Europeans the wild fruits and drugs necessary for the composition of those bright and indelible colours which constitute the principal merit of the Indian manufactures; nor has she furnished them with the waters that serve to fix them. The Indians do not universally observe the same method in painting their cottons; either because there are some niceties peculiar to certain provinces, or because different soils produce different drugs for the same uses. We should tire the patience of our readers were we to trace the slow and painful progress of the Indians in the art of painting their cottons. It is natural to believe that they owe it to length of time, rather than to the fertility of their genius. What seems to authorize this conjecture is, that they have stopped in their improvements, and have not advanced a single step in the arts for many ages; whereas the Europeans have proceeded with amazing rapidity. From the rapid advances of the arts in the United States we may soon expect to see that branch flourish in this country. Indeed, were we to consider only the want of invention in the Indian, we should be tempted to believe, that, from time immemorial, they have received the arts they cultivate from some more industrious nation; but when it is remembered that these arts have a peculiar dependence on the materials, gums, colours, and productions of India, we cannot but be convinced that they are natives of that country. It may appear somewhat surprising that cottons painted with all sorts of colours should be sold at so moderate a price, that they are almost as cheap as those that have only two or three. But it must be observed, that the merchants of the country sell to all the companies a large quantity of cottons at a time; and that the demand for cottons painted with various colours makes but a small article in their assortments, as they are not much esteemed in Europe.

Though cottons of all sorts are in some degree manufactured through the whole country of Indostan, which extends from Cape Comorin to the banks of the Ganges; it is observable, that the fine sorts are made in the eastern part, the common ones in the centre, and the coarse ones in the most western parts. Manufactures are established in the European colonies, and upon the coast: they are more frequent at the distance of five or six leagues from the sea, where cotton is more cultivated, and provisions are cheaper. The purchases made there are carried 30 or 40 leagues

farther in the country. The Indian merchants settled in the European factories have always the management of this business. The quantity and quality of the goods wanted are settled with these people: the price is fixed according to the patterns: and at the time a contract is made, a third or a fourth part of the money agreed on is advanced. This arrangement is owing to the necessity these merchants themselves are under of advancing money to the workmen by the partners or agents who are dispersed through the whole country: of keeping a watchful eye upon them for fear of losing what they have advanced; and of gradually lessening the sum, by calling for the cottons as fast as they are worked off. Without these precautions, nothing could be depended on in an oppressive government, where the weaver cannot work on his own account, either because his circumstances will not permit, or because he dares not venture to discover them for fear of exactions. The companies that have either success or good management, constantly keep the stock for one year in advance in their settlements. By this method they are sure of having the quantity of goods they have occasion for, and of the quality they choose, at the most convenient time; not to mention that their workmen, and their merchants, who are kept in constant employment, never leave them. Such nations as want money and credit cannot begin their mercantile operations till the arrival of their ships. They have only five or six months at most to execute the orders sent from Europe. The goods are manufactured and examined in haste; and they are even obliged to take such as are known to be bad, and would be rejected at any other time. The necessity they are under of completing their cargoes, and fitting out their vessels before hurricanes come on, leaves no room for nicety of inspection. It would be a mistake to imagine that the country agents could be prevailed upon to order goods to be made on their account, in hopes of selling them with a reasonable advantage to the company with whom they are engaged. For, besides that the generality of them are not rich enough to embark in so large an undertaking, they would not be certain of finding their account in it. If the company that employ them should be hindered by unforeseen accidents from sending the usual number of ships, these merchants would have no vent for their commodities. The Indians, the form of whose dress requires different breadths and lengths from those of the cottons fabricated for our use, would not purchase them; and the other European companies would be provided, or certain of being provided with whatever the extent of their trade required, and their money enabled them to purchase. The plan of procuring loans, which was contrived to remedy this inconvenience, never has, nor can be useful. It has been a custom, time immemorial, in Indostan, for every citizen who borrows money, to give a written instrument to his creditor. This deed is of no force in a court of judicature, unless it is signed by three witnesses, and bears the day of the month and the year when it was made, with the rate of interest agreed upon by the parties. If the borrower fails to fulfil his engagements, he may be arrested by the lender himself. He is never imprisoned, because there is no fear of his making his escape. He would

Coroman-
del.

Coroman-
del,
Corona.

not even eat, without obtaining leave of his creditor. The Indians make a three-fold division of interest: one kind they call *vice*; another neither *vice* nor *virtue*; and a third, they say, is *virtue*. The first is four *per cent.* a month; the second two; and the third one. The last is, in their opinion, an act of beneficence that only belongs to the most heroic minds. Yet, though the Europeans, who are forced to borrow, meet with this treatment, it is plain they cannot avail themselves of the indulgence without being involved in ruin.

The foreign trade of Coromandel is not in the hands of the natives. In the western part, indeed, there are Mohammedans known by the name of *Chalias*, who, at Naour and Porto-Nuovo, send out ships to Acken, Merguy, Siam, and the eastern coast. Besides vessels of considerable burden employed in these voyages, they have smaller embarkations for the coasting trade for Ceylon and the pearl fishery. The Indians of Maffulipatan turn their attention another way. They import from Bengal white calicoes, which they dye or print, and sell them again at the places from whence they had them, at 35 or 40 *per cent.* advantage. Excepting these transactions, which are of very little consequence, the whole trade is vested in the Europeans, who have no partners but a few Banians and Armenians settled in their colonies. The quantity of calicoes exported from Coromandel to the different ports of India, may be computed at 3500 bales. Of these the French carry 800 to Malabar, Mocha, and the isle of France; the English, 1200 to Bombay, Malabar, Sumatra, and the Philippine Islands; and the Dutch 1500 to their different settlements. Except 500 bales destined for Manila, each of the value of 100 guineas, the others are of such an ordinary kind that they do not exceed 30 guineas at prime cost; so that the whole number of bales do not amount to more than about L. 150,000.

Coromandel furnishes Europe with 9500 bales: 800 of which are brought by the Danes, 2500 by the French, 3000 by the English, and 3200 by the Dutch. A considerable part of these calicoes are dyed blue, or striped blue and red for the African trade. The others are fine muslins, printed calicoes, and handkerchiefs from Maffulipatan, or Paliacate. It is proved by experience that each of these bales costs only about L. 42 Sterling; consequently they ought to bring in to the manufactory where they are wrought near L. 360,000. The payments are not entirely made in specie, either in Europe or Asia; we give in exchange, cloths, iron, lead, copper, coral, and some other articles of less value. On the other hand, Asia pays with spices, pepper, rice, sugar, corn, and dates. All these articles taken together may amount to about L. 210,000; and from this calculation it follows, that Coromandel receives annually from Europe about L. 300,000 in money. The British, who have acquired the same superiority on this coast that they have elsewhere, have formed on it several settlements.

CORONA, among anatomists, denotes that edge of the glans penis where the preputium begins.

CORONA, or *Halo*, in optics, a luminous circle, surrounding the sun, the moon, the planets, or fixed stars. Sometimes these circles are white, and sometimes coloured, like the rainbow. Sometimes one only is vi-

sible, and sometimes several concentric coronas make their appearance at the same time. Those which have been seen about Sirius and Jupiter were never more than three, four, or five degrees in diameter; those which surround the moon are, also, sometimes no more than three or five degrees; but these, as well as those which surround the sun, are of very different magnitudes, *viz.* of 12° 0', 22° 35', 30° 0', 38° 0', 41° 2', 45° 0', 46° 24', 47° 0', and 90°, or even larger than this. Their diameters also sometimes vary during the time of observation, and the breadths both of the coloured and white circles are very different, *viz.* of 2, 4, or 7 degrees.

The colours of these coronas are more dilute than those of the rainbow; and they are in a different order, according to their size. In those which Newton observed in 1692, they were in the following order, reckoning from the inside. In the innermost were blue, white, and red; in the middle were purple, blue, green, yellow, and pale red; in the outermost, pale blue and pale red. Mr Huygens observed red next the sun, and a pale blue outwards. Sometimes they are red on the inside and white on the outside. M. Weidler observed one that was yellow on the inside and white on the outside. In France, one was observed in 1683, the middle of which was white; after which followed a border of red; next to it was blue, then green, and the outermost circle was a bright red. In 1728, one was seen of a pale red outwardly, then followed yellow, and then green, terminated by a white.

These coronas are very frequent. In Holland, M. Muschenbroeck says, 50 may be seen in the day-time, almost every year; but they are difficult to be observed, except the eye be so situated, that not the body of the sun, but only the neighbouring parts of the heavens can be seen. Mr Middleton says, that this phenomenon is very frequent in North America; for that there is generally one or two about the sun every week, and as many about the moon every month. Halos round the sun are very frequent in Russia. M. Æpinus says, that from the 23d of April 1758, to the 20th of September, he himself had observed no less than 26, and that he has sometimes seen twice as many in the same space of time.

Coronas may be produced by placing a lighted candle in the midst of steam in cold weather. Also, if glass windows be breathed upon, and the flame of a candle be placed some feet from it, while the spectator is also at the distance of some feet from another part of a window, the flame will be surrounded with a coloured halo. And if a candle be placed behind a glass receiver, when air is admitted into the vacuum within it, at a certain degree of density, the vapour with which it is loaded will make a coloured halo round the flame. This was observed by Otto Guericke. In December 1756, M. Muschenbroeck observed, that when the glass windows of his room were covered with a thin plate of ice on the inside, the moon appearing through it was surrounded with a large and variously coloured halo; and, opening the window; he found that it arose entirely from that thin plate of ice, for none was seen except through it.

Similar, in some respects, to the halo, was the remarkable

Corona.

Corona. markable appearance which M. Bouguer describes, as observed by himself and his companions on the top of Mount Pichinea, in the Cordilleras. When the sun was just rising behind them, so as to appear white, each of them saw his own shadow projected upon it, and no other. The distance was such, that all the parts of the shadow were easily distinguishable, as the arms, the leg, and the head; but what surprised them most was, that the head was adorned with a kind of glory, consisting of three or four small concentric crowns, of a very lively colour, each exhibiting all the varieties of the primary rainbow, and having the circle of red on the outside. The intervals between these circles continued equal, though the diameters of them all were constantly changing. The last of them was very faint, and at a considerable distance was another great white circle, which surrounded the whole. As near as M. Bouguer could compute, the diameter of the first of these circles was about $5\frac{1}{2}$ degrees, that of the second 11, that of the third 17, and so on; but the diameter of the white circle was about 76 degrees. This phenomenon never appeared but in a cloud consisting of frozen particles, and never in drops of rain like the rainbow. When the sun was not in the horizon, only part of the white circle was visible, as M. Bouguer frequently observed afterwards.

Similar also to this curious appearance was one that was observed by Dr M'Fait in Scotland. This gentleman observed a rainbow round his shadow in the mist, when he was upon an eminence above it. In this situation the whole country round seemed, as it were, buried under a vast deluge, and nothing but the tops of distant hills appeared here and there above the flood; so that a man would think of diving down into it with a kind of horror. In those upper regions the air, he says, is at that time very pure and agreeable to breathe in. At another time he observed a double range of colours round his shadow in these circumstances. The colours of the outermost range were broad and very distinct, and every where about two feet distant from the shadow. Then there was a darkish interval, and after that another narrower range of colours, closely surrounding the shadow, which was very much contracted. This person seems to think that these ranges of colours are caused by the inflection of the rays of light, the same that occasioned the ring of light which surrounds the shadows of all bodies, observed by M. Maraldi, and this author*.

* *Edin. Essays*, Vol. i. p. 198.

But the prodigious variety with which these appearances are exhibited seems to show that many of them do not result from the general laws of reflexion, refraction, or inflection, belonging to transparent substances of a large mass; but upon the alternate reflexion and transmission of the different kinds of rays, peculiar to substances reduced to the form of thin plates, or consisting of separate and very minute parts. But where the dimensions of the coronas are pretty constant, as in the usual and larger halo, which is about half the diameter of the rainbow, they may, perhaps, be explained on the general principles of refraction only.

Descartes observes, that the halo never appears when it rains: from which he concludes that this phenomenon is occasioned by the refraction of light in the round particles of ice, which are then floating in the atmosphere; and though these particles are flat when

they fall to the ground, he thought they must be protuberant in the middle, before their descent; and according to this protuberancy he imagined that the diameter of the halo would vary.—In treating of meteors, Gassendi supposed that a halo is the same thing with the rainbow, the rays of light being in both cases twice refracted and once reflected within each drop of rain or vapour, and that all the difference there is between them arises from their different situation with respect to the observer. For, whereas, when the sun is behind the spectator, and consequently the rainbow before him, his eye is in the centre of the circle; when he views the halo, with his face towards the sun, his eye is in the circumference of the circle; so that according to the known principles of geometry, the angle under which the object appears in this case, must be just half of what it is in the other. Though this writer says a great deal upon the subject, and endeavours to give reasons why the colours of the halo are in a different order to those of the rainbow, he does not describe the progress of the rays of light from the sun to the eye of the spectator when a halo is formed by them, and he gives no figures to explain his ideas.

Dechales, also, endeavours to show that the generation of the halo is similar to that of the rainbow. If, says he, a sphere of glass or crystal, AB, (n^o 1.) full of water, he placed in the beams of the sun shining from C, there will not only be two circles of coloured light on the side next the sun, and which constitute the two rainbows; but there will also be another on the part opposite to the sun, the rays belonging to which meeting at E, afterwards diverge, and form the coloured circle G, as will be visible, if the light that is transmitted through the globe be received on a piece of white paper. The colours also will appear to an eye placed in any part of the surface of the cone FEG. Measuring the angle FEH, he found it to be 23 degrees. They were only the extreme rays of this cone that were coloured like those of the rainbow. Plate CL.

This experiment he thought sufficiently illustrated the generation of the halo; so that whenever the texture of the clouds is such, as not entirely to intercept the rays of the sun or moon, and yet have some degree of density, there will always be an halo round them, the colours of the rainbow appearing in those drops which are 23 degrees distant from the sun or moon. If the sun be at A, and the spectator in B, the halo will be the circle DFE, DBE being 46 degrees, or twice 23.

The reason why the colours of the halo are more dilute than those of the rainbow, he says, is owing principally to their being formed not in large drops of rain, but in very small vapour; for if the drops of water were large, the cloud would be so thick, that the rays of the sun could not be regularly transmitted through them; and, on the other hand, he had observed, that when the rainbow is formed by very thin vapours, the colours hardly appear. As for those circles of colours which are sometimes seen round candles, it was his opinion that they are owing to nothing but moisture on the eye of the observer; for that he could never produce this appearance by means of vapour only, if he wiped his eyes carefully; and he had observed that such circles are visible to some persons and

Corona. and not to others, and to the same persons at one time and not another.

The most considerable of all the theories respecting halos, and that which has met with most favourable and the longest reception, is that of Mr Huygens. Sir Isaac Newton mentions it with respect, and Dr Smith, in his Complete System of Optics, does not so much as hint at any other. The occasion of M. Huygens publishing his thoughts on this subject, was the appearance of a halo at Paris, on the 12th of May 1667, of which he gave an account in a paper read at the Royal Academy in that city, which was afterwards translated, and published in the English Philosophical Transactions, and which may be seen in Lowthorp's Abridgement, Vol. II. p. 189. But this article contains nothing more than the heads of a discourse, which he afterwards composed, but never quite finished, on this subject; and which has been translated, with some additions, by Dr Smith, from whom the following account is chiefly extracted.

Our philosopher had been first engaged to think particularly upon this subject, by the appearance of five suns at Warsaw, in 1658; presently after which, he says, he hit upon the true cause of halos, and not long after of that of mock suns also.

To prepare the way for the following observations, it must be remarked, that if we can conceive any kind of bodies in the atmosphere, which, according to the known laws of optics, will, either by means of reflection or refraction, produce the appearance in question, when nothing else can be found that will do it, we must acquiesce in the hypothesis, and suppose such bodies to exist, even though we cannot give a satisfactory account of their generation. Now, two such bodies are assumed by Mr Huygens; one of them a round ball, opaque in the centre, but covered with a transparent shell; and the other is a cylinder, of a similar composition. By the help of the former he endeavours to account for halos, and by the latter for those appearances which are called mock suns. Those bodies which Mr Huygens requires, in order to explain these phenomena, are not, however, a mere assumption; for some such, though of a larger size than his purpose requires, have been actually found, consisting of snow within and ice without. They are particularly mentioned by Descartes.

The balls with the opaque kernel, which he supposed to have been the cause of them, he imagines not to exceed the size of a turnip-seed; but, in order to illustrate this hypothesis, he gives a figure of one, of a larger size, in ABCDEF, (n^o 3.) representing the kernel of snow in the middle of it. If the rays of light, coming from GH, fall upon the side AD, it is manifest they will be so refracted at A and D, as to bend inwards; and many of them will strike upon the kernel EF. Others, however, as GA and HD, will only touch the sides of the kernel; and being again refracted at B and C, will emerge in the lines BK, CK, crossing each other in the point K, whose nearest distance from the globule is somewhat less than its apparent diameter. If, therefore, BK and CK be produced towards M and L, (n^o 4.) it is evident that no light can reach the eye placed within the angle LKM, but may fall upon it when placed out of that angle, or rather the cone represented by it.

For the same reason, every other of these globules will have a shadow behind it, in which the light of the sun will not be perceived. If the eye be at N, and that be conceived to be the vertex of a cone, the sides of which NR, NQ, are parallel to the sides of the former cone KL, KM, it is evident that none of the globules within the cone QNR can send any rays of the sun to the eye at N. But any other globule out of this cone, as X, may send those rays, which are more refracted than XZ, to the eye; so that this will appear enlightened, while those within the cone will appear obscure. It is evident from this, that a certain area, or space, quite round the sun, must appear dark; and that the space next to this area will appear luminous, and more so in those parts that are nearest to the obscure area; because, he says, it may easily be demonstrated, that those globules which are nearest to the cone QNR exhibit the largest image of the sun. It is plain, also, that a corona ought to be produced in the same manner whatever be the sun's altitude, because of the spherical figure of the globules.

To verify this hypothesis, our philosopher advises us to expose to the sun a thin glass bubble, filled with water, and, having some opaque substance in the centre of it; and he says we shall find, that we shall not be able to see the sun through it, unless at a certain distance from a place opposite to the centre of it; but as soon as we do perceive the light; the image of the sun will immediately appear the brightest, and coloured red, for the same reason as in the rainbow.

These coronas, he says, often appear about the moon; but the colours are so weak as to appear only white. Such white coronas he had also seen about the sun, when the space within them appeared scarce darker than that without. This he supposes to happen where there are but few of those globules in the atmosphere; for the more plentiful they are, the more lively the colours of the halo appear; at the same time also the area within the corona will be the darker. The apparent diameter of the corona, which is generally about 45 degrees, depends upon the size of the dark kernel; for the larger it is with respect to the whole globule, the larger will be the dark cone behind it.

The globules that form these halos, Mr Huygens supposes to have consisted of soft snow, and to have been rounded by continual agitation in the air, and thawed on their outsides by the heat of the sun.

To make the diameter of the halo 45 degrees, he demonstrates that the semidiameter of the globule must be to the semidiameter of the kernel of snow very nearly as 1000 to 480; and that to make a corona of 100 degrees, it must be as 1000 to 680.

Mr Weidler, in his Commentary on parhelia, published at Wirtemburgh in 1733, observes that it is very improbable that such globules as Mr Huygens's hypothesis requires, with nuclei of such precise proportion, should exist; and if there were such bodies, he thinks they would be too small to produce the effects ascribed to them. Besides, he observes that appearances exactly similar to halos are not uncommon, where fluid vapours alone are concerned; as when a candle is placed behind the steam of boiling water in frosty weather, or in the midst of the vapour issuing

Corona.

copiously from a bath, or behind a receiver when the air is so much rarefied as to be incapable of supporting the water it contains. The rays of the sun twice reflected and twice refracted within small drops of water are sufficient, he says, without any opaque kernel, to produce all the appearances of the halos that have the red light towards the sun, as may be proved by experiment. That the diameter of the halos is generally half of that of the rainbow, he accounts for as Cassendi did before him.

M. Marriotte accounts for the formation of the small coronas by the transmission of light through aqueous vapours, where it suffers two refractions, without any intermediate reflection. He shows that light which comes to the eye, after being refracted in this manner, will be chiefly that which falls upon the drop nearly perpendicular; because more rays fall upon any given quantity of surface in that situation, fewer of them are reflected with small degrees of obliquity, and they are not so much scattered after refraction. The red will always be uttermost in these coronas, as consisting of rays which suffer the least refraction. And whereas he had seen, when the clouds were driven briskly by the wind, halos round the moon, varying frequently in their diameter, being sometimes of two, sometimes of three, and sometimes of four degrees; sometimes also being coloured, sometimes only white, and sometimes disappearing entirely; he concluded that all these variations arose from the different thickness of the clouds, through which sometimes more and sometimes less light was transmitted. He supposed, also, that the light which formed them might sometimes be reflected, and at other times refracted. As to those coronas which consist of two orders of colours, he imagined that they were produced by small pieces of snow, which when they begin to dissolve, form figures which are a little convex towards their extremities. Sometimes, also, the snow will be melted in different shapes; and in this case, the colours of several halos will be intermixed and confused; and such, he says, he had sometimes observed round the sun.

M. Marriotte then proceeds to explain the larger coronas, namely those that are about 45 degrees in diameter, and for this purpose he has recourse to equiangular prisms of ice, in a certain position with respect to the sun; and he takes pains to trace the progress of the rays of light for this purpose: but this hypothesis is very improbable. In some cases he thought that these large coronas were caused by hail-stones, of a pyramidal figure; because after two or three of them had been seen about the sun, there fell the same day several such pyramidal hail-stones. M. Mariotte explains parhelia by the help of the same suppositions. See PARHELIA.

Sir Isaac Newton does not appear to have given any particular attention to the subject of halos, but he has hinted at his sentiments concerning them occasionally; by which we perceive that he considered the larger and less variable appearances of this kind as produced according to the common laws of refraction, but that the less and more variable appearances depend upon the same cause with the colours of thin plates.

He concludes his explication of the rainbow with

the following observation on halos and parhelia. "The light which comes through drops of rain by two refractions, without any reflection, ought to appear the strongest at the distance of about 26 degrees from the sun, and to decay gradually both ways as the distance from him increases. And the same is to be understood of light transmitted through spherical hail-stones: and if the hail be a little flatted, as it often is, the transmitted light may be so strong, at a little less distance than that of 26 degrees, as to form a halo about the sun or moon; which halo, as often as the hail-stones are duly figured, may be coloured, and then it must be red within by the least refrangible rays, and blue without by the most refrangible ones; especially if the hail-stones have opaque globules of snow in their centres to intercept the light within the halo, as Mr Huygens has observed, and make the inside of it more distinctly defined than it would otherwise be. For such hail-stones, though spherical, by terminating the light by the snow, may make a halo red within, and colourless without, and darker within the red than without, as halos use to be. For of those rays which pass close by the snow, the red-making ones will be the least refracted, and so come to the eye in the straightest lines."

Some farther thoughts of Sir Isaac Newton's on the subject of halos we find subjoined to the account of his experiments on the colours of thick plates of glass, which he conceived to be similar to those which are exhibited by thin ones. "As light reflected by a lens quick-silvered on the back side makes the rings of the colours above described, so (he says) it ought to make the like ring in passing through a drop of water. At the first reflexion of the rays within the drop, some colours ought to be transmitted, as in the case of a lens, and others to be reflected back to the eye. For instance, if the diameter of a small drop or globule of water be about the 500th part of an inch, so that a red-making ray, in passing through the middle of this globule, has 250 fits of easy transmission within the globule, and all the red-making rays which are at a certain distance from this middle ray round about it have 249 fits within the globule, and all the like rays at a certain farther distance round about it have 248 fits, and all those at a certain farther distance 247 fits, and so on, these concentric circles of rays, after their transmission, falling on a white paper, will make concentric rings of red upon the paper: supposing the light which passes through one single globule strong enough to be sensible, and in like manner the rays of other colours will make rings of other colours. Suppose now that in a fair day the sun should shine through a thin cloud of such globules of water or hail, and that the globules are all of the same size, the sun seen through this cloud ought to appear surrounded with the like concentric rings of colours, and the diameter of the first ring of red should be $7\frac{1}{2}$ degrees, that of the second $10\frac{1}{4}$, that of the third $12^{\circ} 33'$, and according as the globules of water are bigger or less, the ring should be less or bigger."

This curious theory our author informs us was confirmed by an observation which he made in 1692. He saw by reflexion, in a vessel of stagnating water, three halos, crowns, or rings of colours about the sun, like three little rainbows concentric to his body. The colours

Corona. lours of the first, or innermost crown, were blue next the sun, red without, and white in the middle, between the blue and red. Those of the second crown were purple and blue within, and pale red without, and green in the middle. And those of the third were pale blue within, and pale red without. These crowns inclosed one another immediately, so that their colours proceeded in this continual order from the sun outward; blue, white, red; purple, blue, green, pale yellow, and red; pale blue, pale red. The diameter of the second crown, measured from the middle of the yellow and red on one side of the sun, to the middle of the same colour on the other side, was $9\frac{1}{2}$ degrees or thereabouts. The diameters of the first and third he had not time to measure; but that of the first seemed to be about five or six degrees, and that of the third about twelve. The like crowns appear sometimes about the moon: for in the beginning of the year 1664, on February 19th at night, he saw two such crowns about her. The diameter of the first, or innermost, was about three degrees, and that of the second about five degrees and a half. Next about the moon was a circle of white; and next about that the inner crown, which was of a bluish green within, next the white, and of a yellow and red without; and next about these colours were blue and green on the inside of the outer crown, and red on the outside of it.

At the same time there appeared a halo at the distance of about $22^{\circ} 35'$ from the centre of the moon. It was elliptical; and its long diameter was perpendicular to the horizon, verging below farthest from the moon. He was told that the moon has sometimes three or more concentric crowns of colours encompassing one another next about her body. The more equal the globules of water or ice are to one another, the more crowns of colours will appear, and the colours will be the more lively. The halo, at the distance of $22\frac{1}{2}$ degrees from the moon, is of another sort. By its being oval, and more remote from the moon below than above, he concludes that it was made by refraction in some kind of hail or snow floating in the air in an horizontal posture, the refracting angle being about 50 or 60 degrees. Dr Smith, however, makes it sufficiently evident, that the reason why this halo appeared oval, and more remote from the moon towards the horizon, is a deception of sight, and the same with that which makes the moon appear larger in the horizon.

Dr Kotelnihow, having, like Dr Halley, made very accurate observations to determine the number of possible rainbows, considers the coloured halo which appears about a candle as the same thing with one of these bows which is formed near the body of the sun, but which is not visible on account of his excessive splendor.

Lastly, M. Muschenbroeck concludes his account of coronas with observing, that some density of vapour, or some thickness of the plates of ice, divides the light in its transmission through the small globules of water, or their interstices, into its separate colours: but what that density was, or what was the size of the particles which composed the vapour, he could not pretend to determine.

CORONA, among botanists, the names given by some to the circumference or margin of a radiated compound flower. It corresponds to the radius of Linnæus; and is exemplified in the flat, tongue-shaped petals which occupy the margin of the daisy or sunflower.

CORONA Australis, or *Meridionalis*, Southern Crown, a constellation of the southern hemisphere, whose stars in Ptolemy's catalogue are 13, in the British catalogue 12.

CORONA Borealis, the Northern Crown, or Garland, in astronomy, a constellation of the northern hemisphere, whose stars in Ptolemy's catalogue are eight, in Tycho's as many, and in Mr Flamsteed's 21.

CORONA Imperialis, in conchyology, a name given by some authors to a kind of voluta, differing from the other shells of that family, by having its head ornamented with a number of points, forming a sort of crown. See VOLUTA.

CORONAL, in anatomy, the first future of the skull. See ANATOMY, n° 13.

CORONALE os, the same with the os frontis. See ANATOMY, n° 12.

CORONARY VESSELS, in anatomy, certain vessels which furnish the substance of the heart with blood.

CORONARY Arteries, are two arteries springing out of the aorta, before it leaves the pericardium. See ANATOMY, n° 122, and 123.

CORONARY Vein, a vein diffused over the exterior surface of the heart. See ANATOMY, n° 122.

Stomachic CORONARY, a vein inserted into the trunk of the splenic vein, which, by uniting with the mesenteric, forms the vena porta. See ANATOMY, n° 123.

CORONARIÆ, in botany, the 10th order of plants in Linnæus's Fragments of a natural method. Under this name, instead of the more obvious one *libaseæ*, Linnæus collects a great number of genera, most of which furnish very beautiful garden-flowers, viz. albaica, cyanella, fritillaria, helonias, hyacinthus, hypoxis, lilium, melanthium, ornithogalum, scilla, tulipa, agave, aletris, aloe, anthericum, alphodelus, bromelia, burmannia, hemerocallis, polianthes, tillandsia, veratrum, yucca.

CORONATION, the ceremony of investing with a crown, particularly applied to the crowning of kings, upon their succeeding to the sovereignty. See KING.

CORONÆ (anc. geog.), a town of Bœotia, near mount Helicon, and the lake Copais, situated on an eminence; famous for the defeat of the Athenians and Bœotians by Agésilas.—Another Coronæ of Thessaly, having Narthacium to the east, and Lamia near the Sperchius, to the north, (Ptolemy).

CORONE (anc. geog.), a town of Messenia, situated on the sea giving name to the Sinus Coronæus, (Pliny), now *Golfo di Coron*. Pausanias takes it to be the *Aepea* of Homer; but Strabo *Thuria*, and Pliny *Pedafus*, now *Coron*, in the territory of Belvidere, in the Morea. E. Long. 22. Lat. 36. 30.

CORONELLI (Vincent), a famous geographer, born at Venice. His skill in the mathematics having brought him to the knowledge of the count d'Estrees, his eminence employed him in making globes for Louis XIV. With this view Coronelli spent some
time

Coronæ,
||
Coronelli.

Coroner. time at Paris; and left a great number of globes there, which are esteemed. In 1685, he was made cosmographer to the republic of Venice: and four years after, public professor of geography. He founded an academy of cosmography at Venice; and died in that city in 1718. He published above 400 geographical charts, an abridgement of cosmography, several books on geography, and other works.

CORONER (*coronator*), an ancient officer in England, so called because he hath principally to do with pleas of the crown, or such wherein the king is more immediately concerned. And in this light, the lord chief justice of the king's bench is the principal coroner in the kingdom; and may, if he pleases, exercise the jurisdiction of a coroner in any part of the realm. But there are also particular coroners for every county of England; usually four, but sometimes six, and sometimes fewer. This officer is of equal authority with the sheriff; and was ordained, together with him, to keep the peace when the earls gave up the wardship of the county.

He is chosen by all the freeholders of the county court; and by the statute of Westminster 1. it was enacted, that none but lawful and discreet knights should be chosen: but it seems now sufficient if a man have lands enough to be made a knight, whether he be really knighted or not: for the coroner ought to have an estate sufficient to maintain the dignity of his office, and answer any fines that may be made upon him for his misbehaviour; and, if he hath not enough to answer, his fine shall be levied on the county, as a punishment for electing an insufficient officer. Now, indeed, through the culpable neglect of gentlemen of property, this office has been suffered to fall into disrepute, and get into low and indigent hands; so that although formerly no coroners would be paid for serving their country, and they were by the aforesaid statute of Westminster 1. expressly forbidden to take a reward under pain of great forfeiture to the king; yet for many years past they have only desired to be chosen for the sake of their perquisites; being allowed fees for their attendance by statute 3 Hen. VII. c. 1. which Sir Edward Coke complains of heavily, though since his time those fees have been much enlarged.

The coroner is chosen for life; but may be removed, either by being made sheriff or chosen verderor, which are offices incompatible with the other; and by the statute 25 Geo. II. c. 29. extortion, neglect, or misbehaviour, are also made causes of removal.

The office and power of a coroner are also, like those of the sheriff, either judicial or ministerial; but principally judicial. This is in great measure ascertained by statute 4 Edw. I. *De officio coronatoris*; and consists, first, in inquiring, when any person is slain, or dies suddenly, or in prison, concerning the manner of his death. And this must be *super visum corporis*; for if the body is not found, the coroner cannot sit. He must also sit at the very place where the death happened. And his inquiry is made by a jury from four, five or six of the neighbouring towns, over whom he is to preside. If any be found guilty by this inquest of murder, he is to commit to prison for farther trial, and is also to enquire concerning their lands, goods, and chattels, which are forfeited thereby; but whe-

ther it be murder or not, he must inquire whether any deodand has accrued to the king, or the lord of the franchise, by this death; and must certify the whole of this inquisition to the court of king's-bench, or the next assizes. Another branch of his office is to inquire concerning shipwrecks; and certify whether wreck or not, and who is in possession of the goods. Concerning treasure-trove, he is also to inquire concerning the finders, and where it is, and whether any one be suspected of having found and concealed a treasure; "and that may well be perceived (saith the old statute of Edw. I.), where one liveth riotously, haunting taverns, and hath done so of long time;" whereupon he might be attached and held to bail upon this suspicion only.

The ministerial office of the coroner is only as the sheriff's substitute. For when just exception can be taken to the sheriff, for suspicion of partiality (as that he is interested in the suit, or of kindred to either plaintiff or defendant), the process must then be awarded to the coroner, instead of the sheriff, for execution of the king's writs.

CORONET. See CROWN.

CORONET, or cornet, of a horse, the lowest part of the pasteru, which runs round the coffin, and is distinguished by the hair joining and covering the upper part of the hoof.

CORONILLA, *jointed podded COLUTEA*: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionacea*. The calyx is bilabiate, with two segments above coalited; the vexillum scarce any longer than the alæ; the legumen much contracted between the seeds. To this genus Linnæus also joins the emerus, or scorpion senna; though Mr Miller makes it a distinct species. There are 11 species, all of them plants of considerable beauty, with very bright yellow flowers. All of them, however, are rather too tender for this climate, except the emerus. This species rises with a shrubby stem, branching numerously six or eight feet high, closely garnished with winged leaves of three pair of lobes, terminated by an odd one; and, at the sides of the branches, numerous long flower-stalks, each supporting two or three large yellow flowers of the papilionaceous kind, succeeded by longish pods; it is easily propagated by seeds, and likewise by layers or cuttings. The leaves of this plant are esteemed laxative, and used as a substitute for common senna in some parts of Europe. A dye is procured by fermentation from the leaves, like that of indigo.

CORONOID, and **CONDYLOID**, processes. See ANATOMY, n° 26.

CORPORA CAVERNOSA, in anatomy, two spongy bodies, called also *corpora nervosa* and *corpus spongiosum*. See ANATOMY, p. 738, col. 2.

CORPORA PYRAMIDALIA, are two protuberances of the under part of the *cerebellum*, about an inch long; so called from their resemblance to a pyramid. See ANATOMY, n° 134.

CORPORA STRIATA. See ANATOMY, p. 758, col. 1.

CORPORAL, an inferior officer under a sergeant, in a company of foot, who has charge over one of the divisions, places and relieves sentinels, and keeps good order in the corps de garde: he also receives the word from the inferior rounds, which passes by his corps

Coronet,
||
Corporal.

Corporal, corps de garde. This officer carries a fusce, and is commonly an old soldier: there are generally three corporals in each company.

CORPORAL of a Ship of War, an officer under the master at arms, employed to teach the officers the exercise of small arms, or of musketry; to attend at the gang-way, on entering ports, and observe that no spirituous liquors are brought into the ship, unless by express leave from the officers. He is also to extinguish the fire and candles at eight o'clock in winter and nine in summer, when the evening gun is fired; and to walk frequently down in the lower decks in his watch, to see that there are no lights but such as are under the charge of proper centinels.

CORPORAL (Corporale), is also an ancient church-term, signifying the sacred linen spread under the chalice in the eucharist and mass, to receive the fragments of the bread, if any chance to fall. Some say, it was pope Eusebius who first enjoined the use of the corporal; others ascribe it to St Silvester. It was the custom to carry corporals, with some solemnity, to fires, and to heave them against the flames, in order to extinguish them. Phillip de Comines says, the pope made Louis XI. a present of the corporale, whereon my lord St Peter sung mass.

CORPORATION, a body politic or incorporate, so called, because the persons or members are joined into one body, and are qualified to take, grant, &c.

Of corporations there is a great variety subsisting, for the advancement of religion, of learning, and of commerce; in order to preserve entire and for ever those rights and immunities, which, if they were granted only to those individuals of which the body corporate is composed, would upon their death be utterly lost and extinct. To show the advantages of these incorporations, let us consider the case of a college in either of the universities, founded *ad studendum et orandum*, for the encouragement and support of religion and learning. If this was a mere voluntary assembly, the individuals which compose it might indeed read, pray, study, and perform scholastic exercises together, so long as they could agree to do so: but they could neither frame, nor receive, any laws or rules of their conduct; none at least which would have any binding force, for want of a coercive power to create a sufficient obligation. Neither could they be capable of retaining any privileges or immunities: for, if such privileges be attacked, which of all this unconnected assembly has the right or ability to defend them? And, when they are dispersed by death or otherwise, how shall they transfer these advantages to another set of students, equally unconnected as themselves? So also, with regard to holding estates or other property, if land be granted for the purposes of religion or learning to 20 individuals not incorporated, there is no legal way of continuing the property to any other persons for the same purposes, but by endless conveyances from one to the other, as often as the hands are changed. But when they are consolidated and united into a corporation, they and their successors are then considered as one person in law: as one person, they have one will, which is collected from the sense of the majority of the individuals: this one will may establish rules and orders for the regulation of the whole, which are a sort of mu-

nicipal laws of this little republic; or rules and statutes may be prescribed to it at its creation, which are then in the place of natural laws: the privileges and immunities, the estates and possessions, of the corporation, when once vested in them, will be for ever vested, without any new conveyance to new successions; for all the individual members that have existed from the foundation to the present time, or that shall ever hereafter exist, are but one person in law, a person that never dies: in like manner as the river Thames is still the same river, though the parts which compose it are changing every instant.

The honour of originally inventing these political constitutions entirely belongs to the Romans. They were introduced, as Plutarch says, by Numa; who finding, upon his accession, the city torn to pieces by the two rival factions of Sabines and Romans, thought it a prudent and politic measure to subdivide these two into many smaller ones, by instituting separate societies of every manual trade and profession. They were afterwards much considered by the civil law, in which they were called *universitates*, as forming one whole out of many individuals; or *collegia*, from being gathered together: they were adopted also by the canon law, for the maintenance of ecclesiastical discipline; and from them the spiritual corporations are derived. But our laws have considerably refined and improved upon the invention, according to the usual genius of the English nation: particularly with regard to sole corporations, consisting of one person only, of which the Roman lawyers had no notion; their maxim being that "tres faciunt collegium:" though they held, that if a corporation, originally consisting of three persons, be reduced to one, "si universitas ad unum redit," it may still subsist as a corporation, "et stet nomen universitatis."

As to the several sorts of corporations, the first division of them is into *aggregate* and *sole*. Corporations aggregate consist of many persons united together into one society, and are kept up by a perpetual succession of members, so as to continue for ever: of which kind are the mayor and commonalty of a city, the head and fellows of a college, the dean and chapter of a cathedral church. Corporations sole consist of one person only and his successors, in some particular station, who are incorporated by law, in order to give them some legal capacities and advantages, particularly that of perpetuity, which in their natural persons they could not have had. In this sense the king is a sole corporation: so is a bishop: so are some deans and prebendaries, distinct from their several chapters: and so is every parson and vicar. And the necessity, or at least, use of this institution will be very apparent, if we consider the case of a parson of a church. At the original endowment of parish-churches, the freehold of the church, the church-yard, the parsonage-house, the glebe, and the tithes of the parish, were vested in the then parson by the bounty of the donor, as a temporal recompence to him for his spiritual care of the inhabitants, and with intent that the same emoluments should ever afterwards continue as a recompence for the same care. But how was this to be effected? The freehold was vested in the parson; and, if we suppose it vested in his natural capacity, on his death it might descend to his heir, and would be liable to his debts and incumbrances;

Corporation.
Blackst.
Comment.

Corpora-
tion.Blackst.
Comment.

branches: or at best the heir might be compellable, at some trouble and expence, to convey these rights to the succeeding incumbent. The law therefore has wisely ordained, that the parson, *quatenus* parson, shall never die, any more than the king; by making him and his successors a corporation. By which means all the original rights of the parsonage are preserved entire to the successor: for the present incumbent, and his predecessor who lived seven centuries ago, are in law one and the same person; and what was given to the one was given to the other also.

Another division of corporations, either sole or aggregate, is into *ecclesiastical* and *lay*. Ecclesiastical corporations are where the members that compose it are entirely spiritual persons; such as bishops; certain deans and prebendaries; all archdeacons, parsons, and vicars; which are sole corporations: deans and chapters at present, and formerly prior and convent, abbot and monks, and the like, bodies aggregate. These are erected for the furtherance of religion, and perpetuating the rights of the church.—Lay corporations are of two sorts, *civil* and *eleemosynary*. The civil are such as are erected for a variety of temporal purposes. The king, for instance, is made a corporation to prevent in general the possibility of an *interregnum* or vacancy of the throne, and to preserve the possessions of the crown entire; for, immediately upon the demise of one king, his successor is in full possession of the regal rights and dignity. Other lay corporations are erected for the good government of a town or particular district, as a mayor and commonalty, bailiff and burgesses, or the like: some for the advancement and regulation of manufactures and commerce; as the trading companies of London and other towns: and some for the better carrying on of divers special purposes; as church-wardens, for conservation of the goods of the parish; the college of physicians and company of surgeons in London, for the improvement of the medical science; the royal society for the advancement of natural knowledge; and the society of antiquarians for promoting the study of antiquities. The eleemosynary sort are such as are constituted for the perpetual distribution of the free alms, or bounty, of the founder of them to such persons as he has directed. Of this kind are all hospitals for the maintenance of the poor, sick, and impotent; and all colleges, both *in* universities and *out* of them: which colleges are founded for two purposes: 1. For the promotion of piety and learning by proper regulations and ordinances. 2. For imparting assistance to the members of those bodies, in order to enable them to prosecute their devotion and studies with greater ease and assiduity. And all these eleemosynary corporations are, strictly speaking, lay, and not ecclesiastical, even though composed of ecclesiastical persons, and although they in some things partake of the nature, privileges, and restrictions of ecclesiastical bodies.

Having thus marshalled the several species of corporations, let us next proceed to consider, 1. How corporations in general may be created. 2. What are their powers, capacities, and incapacities. And, 3. How they may be dissolved.

I. Corporations, by the civil law, seem to have been created by the mere act and voluntary associa-

tion of members; provided such convention was not contrary to law, for then it was *illicitum collegium*. It does not appear that the prince's consent was necessary to be actually given to the foundation of them; but merely that the original founders of these voluntary and friendly societies (for they were little more than such) should not establish any meetings in opposition to the laws of the state.

But in England the king's consent is absolutely necessary to the erection of any corporation, either impliedly or expressly given. The king's implied consent is to be found in corporations which exist by force of the common law, to which former kings are supposed to have given their concurrence; common law being nothing else but custom, arising from the universal agreement of the whole community. Of this sort are the king himself, all bishops, parsons, vicars, church-wardens, and some others; who by common law have ever been held (as far as our books can show us) to have been corporations, *virtute officii*: and this incorporation is so inseparably annexed to their offices, that we cannot frame a complete legal idea of any of these persons, but we must also have an idea of a corporation, capable to transmit his rights to his successors, at the same time. Another method of implication, whereby the king's consent is presumed, is as to all corporations by prescription, such as the city of London and many others, which have existed as corporations, time whereof the memory of man runneth out to the contrary; and therefore are looked upon in law to be well created. For though the members thereof can show no legal charter of incorporation, yet in cases of such high antiquity the law presumes there once was one; and that by the variety of accidents, which a length of time may produce, the charter is lost or destroyed. The methods by which the king's consent is expressly given, are either by act of parliament or charter. By act of parliament, of which the royal assent is a necessary ingredient, corporations may undoubtedly be created: but it is observable, that most of those statutes, which are usually cited as having created corporations, do either confirm such as have been before created by the king; as in the case of the college of physicians, erected by charter 10 Hen. VIII. which charter was afterwards confirmed in parliament; or, they permit the king to erect a corporation *in futuro* with such and such powers; as in the case of the bank of England, and the society of the British fishery. So that the immediate creative act is usually performed by the king alone, in virtue of his royal prerogative.

All the other methods therefore whereby corporations, exist, by common law, by prescription and by act of parliament, are for the most part reducible to this of the king's letters patent, or charter of incorporation. The king's creation may be performed by the words *creamus, erigimus, fundamus, incorporamus*, or the like. Nay it is held, that if the king grants to a set of men to have *gildam mercatorum*, "a mercantile meeting or assembly," this is alone sufficient to incorporate and establish them for ever.

The king (it is said) may grant to a subject the power of creating corporations, though the contrary was formerly held: that is, he may permit the sub-

Corpora-
tion.Blackst.
Comment.

Corpora- tion. Blackst. Comment. ject to name the persons and powers of the corporation at his pleasure, but it is really the king that erects, and the subject is but the instrument; for though none but the king can make a corporation, yet *qui facit per alium, facit per se*. In this manner the chancellor of the university of Oxford has power by charter to erect corporations; and has actually often exerted it in the erection of several matriculated companies, now subsisting, of tradesmen subservient to the students.

When a corporation is erected, a name must be given to it; and by that name alone it must sue and be sued, and do all legal acts.

II. After a corporation is so formed and named, it acquires many powers and rights, which we are next to consider. Some of these are necessarily and inseparably incident to every corporation; which incidents, as soon as a corporation is duly erected, are tacitly annexed of course. As, 1. To have perpetual succession. This is the very end of its incorporation: for there cannot be a succession for ever without an incorporation; and therefore all aggregate corporations have a power necessarily implied of electing members in the room of such as go off. 2. To sue or be sued, implead or be impleaded, grant or receive, by its corporate name, and do all other acts as natural persons may. 3. To purchase lands, and hold them, for the benefit of themselves and their successors: which two are consequential to the former. 4. To have a common seal. For a corporation, being an invisible body, cannot manifest its intentions by any personal act or oral discourse: it otherwise acts and speaks only by its common seal. For though the particular members may express their private consents to any act, by words, or signing their names, yet this does not bind the corporation; it is the fixing of the seal, and that only, which unites the several assents of the individuals who compose the community, and makes one joint assent of the whole. 5. To make by-laws or private statutes for the better government of the corporation; which are binding upon themselves, unless contrary to the laws of the land, and then they are void. But no trading company is with us allowed to make by-laws which may affect the king's prerogative or the common profit of the people, under penalty of L. 40, unless they be approved by the chancellor, treasurer, and chief justices, or the judges of assize in their circuits: and even though they be so approved, still, if contrary to law, they are void. These five powers are inseparably incident to every corporation, at least to every corporation aggregate: for two of them, though they may be practised, yet are very unnecessary to a corporation sole; viz. to have a corporate seal to testify his sole assent, and to make statutes for the regulation of his own conduct.

Corporations have a capacity to purchase lands for themselves and successors; but they are excepted out of the statute of wills; so that no devise of lands to a corporation by will is good; except for charitable uses, by statute 43 Eliz. c. 4. which exception is again greatly narrowed by the statute 9 Geo. II. c. 36. And also, by a great variety of statutes, their privilege even of purchasing from any living grantor is much abridged; so that now a corporation, either ecclesiastical or lay, must have a licence from the king to purchase, before they can exert that capacity which is vested in them

VOL. V.

by the common law: nor is even this in all cases sufficient. These statutes are generally called the statutes of *mortmain*. See MORTMAIN.

The general duties of all bodies politic, considered in their corporate capacity, may, like those of natural persons, be reduced to this single one; that of acting up to the end or design, whatever it be, for which they were created by their founder.

III. How corporations may be dissolved. Any particular member may be disfranchised, or lose his place in the corporation, by acting contrary to the laws of the society, or the laws of the land: or he may resign it by his own voluntary act. But the body politic may also itself be dissolved in several ways; which dissolution is the civil death of the corporation: and in this case their lands and tenements shall revert to the person, or his heirs, who granted them to the corporation: for the law doth annex a condition to every such grant, that if the corporation be dissolved, the grantor shall have the lands again, because the cause of the grant faileth. The grant is indeed only during the life of the corporation; which may endure for ever; but when that life is determined by the dissolution of the body politic, the grantor takes it back by reversion, as in the case of every other grant for life. The debts of a corporation, either to or from it, are totally extinguished by its dissolution; so that the members thereof cannot recover, or be charged with them, in their natural capacities: agreeable to that maxim of the civil law, *Si quid universitati debetur, singulis non debetur; nec, quod debet universitas, singuli debent*.

A corporation may be dissolved, 1. By act of parliament, which is boundless in its operations. 2. By the natural death of all its members, in cases of an aggregate corporation. 3. By surrender of its franchises into the hands of the king, which is a kind of suicide. 4. By forfeiture of its charter, through negligence or abuse of its franchises; in which case the law judges that the body politic has broken the condition upon which it was incorporated, and thereupon the incorporation is void. And the regular course is to bring an information in nature of a writ of *quo warranto*, to inquire by what warrant the members now exercise their corporate power, having forfeited it by such and such proceedings. The exertion of this act of law, for the purposes of the state, in the reigns of king Charles and king James II. particularly by seizing the charter of the city of London, gave great and just offence; though perhaps, in strictness of law, the proceedings in most of them were sufficiently regular: but the judgment against that of London was reversed by act of parliament after the revolution; and by the same statute it is enacted, that the franchises of the city of London shall never more be forfeited for any cause whatsoever. And because by the common law corporations were dissolved, in case the mayor or head-officer was not duly elected on the day appointed in the charter or established by prescription, it is now provided, that for the future no corporation shall be dissolved upon that account; and ample directions are given for appointing a new officer, in case there be no election, or a void one, made upon the charter or prescriptive day.

CORPORATION ACT, is that which prevents any person from

Corporeal from being legally elected into any office relating to the government of any city or corporation, unless within a twelvemonth before he has received the sacrament of the Lord's supper, according to the rites of the church of England; and which enjoins him to take the oaths of allegiance and supremacy when he takes the oath of office; otherwise his election is void.

CORPOREAL, those qualities which denominate a body. See **INCORPOREAL**.

CORPOREITY, the quality of that which is corporeal, or his body; or that which constitutes or denominates it such.—The corporeity of God was the capital error of the Anthropomorphites. Some authors reproach Tertullian with admitting a corporeity in the Deity: but it is manifest, by *body* he means no more than *substance*.—The Mahometans reproach the Samaritans at this day, with a belief of the corporeity of God. Many of the ancients believed the corporeity of angels.

CORPSE, a dead body.

If any one, in taking up a dead body, steals the shroud, or other apparel, it will be felony. Stealing only the corpse itself is not felony; but it is punishable as a misdemeanor by indictment at common law.

CORPS, in architecture, is a term borrowed from the French, signifying any part that projects or advances beyond the naked of a wall; and which serves as a ground for some decoration or the like.

CORPS de Bataille, is the main body of an army drawn up for battle.

CORPS de Garde, a post in an army, sometimes under covert, sometimes in the open air, to receive a body of soldiery, who are relieved from time to time, and are to watch in their turns, for the security of a quarter, a camp, station, &c.—The word is also used for the men who watch therein. It is usual to have, beside the great, a little corps de garde, at a good distance before the lines; to be the more readily advertised of the approach of the enemy.

CORPULENCY, the state of a person too much loaded with flesh or fat.

Corpulency is the occasion of various diseases, and particularly the apoplexy. It was held infamous among the ancient Lacedæmonians.

Sennertus mentions a man that weighed 600 pounds, and a maid 36 years of age who weighed 450. Bright of Malden, who died at the age of 29 years in 1750, weighed 616 pounds. Chiapin Vitelli, Marquis of Cerrona, a noted Spanish general in his time, from an excessive corpulency, is said to have reduced himself, by drinking of vinegar, to such a degree of leanness, that he could fold his skin several times round him.

Castile soap, in the form of a bolus, an electuary, pills, or dissolved in a gill or more soft water, from one to four drachms, taken at bed-time, is strongly recommended with a view of reducing corpulency, in a discourse on its nature, causes, and cure, by Malcolm Fleming, M. D. Lond. 1760. See **MEDICINE-Index**.

CORPUS, in anatomy, is applied to several parts of the animal structure: as *corpus colosum*, *corpus cavernosum*, &c. See **ANATOMY**, p. 739, and p. 740.

CORPUS is also used in matters of learning, for several works of the same nature collected and bound together.

Gratian made a collection of the canons of the church, called *corpus canonum*. The *corpus* of the civil law is composed of the digest, code, and institutes. We have also a *corpus* of the Greek poets; and another of the Latin poets.

CORPUS Christi, a festival of the church of England, kept on the next Thursday after Trinity-sunday, instituted in honour of the eucharist; to which also one of the colleges in Oxford is dedicated.

CORPUSCLE, in Physics, a minute particle, or physical atom, being such as a natural body is made up of. By this word is not meant the elementary particles, nor the hypostatical principles of chemists; but such particles, whether of a simple or compound nature, whose parts will not be dissolved nor dissipated by ordinary degrees of heat.

CORPUSCULAR PHILOSOPHY, that way of philosophizing which endeavours to explain things, and to account for the phenomena of nature, by the motion, figure, rest, position, &c. of the corpuscles, or the minute particles of matter.

Mr Boyle sums up the chief principles of the corpuscular hypothesis, which now flourishes under the mechanical philosophy in these particulars:

1. They suppose that there is but one catholic or universal matter, which is an extended, impenetrable, and divisible substance, common to all bodies; and capable of all forms.
2. That this matter, in order to form the vast variety of natural bodies, must have motion in some or all its assignable parts; and that this motion was given to matter by God the Creator of all things, and has all manner of directions and tendencies.
3. Matter must also be actually divided into parts, and each of these primitive particles, fragments, or atoms of matter, must have its proper magnitude or size, as also its peculiar figure or shape.
4. They suppose also, that these differently sized and shaped particles may have as different orders and positions, whereof great variety may arise in the composition of bodies.

CORRADINI DE SEZZA (Peter Marcellinus), a learned civilian and cardinal, born at Sezza, in 1658, acquired the esteem and confidence of Clement XI, and died at Rome in 1743. He was the author of a learned and curious work entitled "*Verus Latium profanum & sacrum*," 2 vols folio; and a history of Sezza, in 4to.

CORRADO (Sebastian), an Italian grammarian of the 16th century, taught the Greek and Latin tongues at Reggio, where he formed an academy of polite literature; and at length removed to Bologna, in order to be professor of those languages. He wrote several works, the most esteemed of which are, "*Questura in qua Ciceronis Vita refertur*," an excellent performance; and, "*de Linguâ Latinâ*." He died in 1556.

CORRECTION, in printing, the act of retrenching the faults in a work; or the reading which the corrector gives the first proofs, to point out and amend the faults, to be rectified by the compositor.

The corrections are placed on the margin of each page, right against the line where the faults are found. There are different characters used to express different corrections, as *D* or *d*, *dele*, for any thing to be effaced or left out. When any thing is to be inserted,

Corpus
||
Correc-
tion.

Corrector the place is marked in the line with a caret \wedge , and the insertion added in the margin. When a word, syllable, &c. is to be altered, it is erased out of the proof, and that to be put in its room written in the margin; always observing, if there be several mistakes in the same line, that the corrections in the margin be separated by little bars, or strokes, |. If a space be omitted, its place is marked with a caret, and the margin with \times . If a space be wrong placed, as in the middle of a word, the two parts are connected with a curve, and the same character put in the margin. If a letter be inverted, it is expressed on the margin with γ . If any thing be transposed, it is marked thus: *The shortest [are the] follies [best]; for the shortest follies are the best;* and in the margin is added *tr.* in a circle. If Roman characters are to be changed for Italic, or *vice versa*, a line is drawn under them thus, and *Roman* or *Italic* added in the margin; if to capitals, a double line. If a word or sentence is entirely omitted, the place is marked with a caret, and in the margin is inserted the word *out*. If the letters of a word stand too far asunder, a line is drawn under them, and in the margin is put a crooked line or hook, thus \smile .

CORRECTOR, in general, denotes something that mends the faults or bad qualities of others.

CORRECTOR of the Staple in Britain, a clerk belonging to the staple, whose business is to write down and record the bargains that merchants make there.

CORRECTOR, in medicine or pharmacy, an ingredient in a composition, which guards against or abates the force of another.

CORREGIDOR, the name of an officer of justice in Spain, and countries subject to the Spanish government. He is the chief judge of a town or province.

CORREGGIO. See ALLEGRI.

CORRELATIVE, something opposed to another in a certain relation. Thus, father and son are correlatives. Light and darkness, motion and rest, are correlative and opposite terms.

CORRIGIOLA, in botany: A genus of the trigynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 54th order, *Miscellanea*. The calyx is pentaphyllous; the petals five; and one three-cornered seed.

CORROBORANTS, or **CORROBORATIVE Medicines**. See STRENGTHENERS.

CORROSION, in a general sense, the action of gnawing away, by degrees, the continuity of the parts of bodies.

CORROSION, in chemistry, an action of bodies, by means of proper menstrua, that produces new combinations, and a change of their form, without converting them to fluidity.

CORROSIVE SUBLIMATE MERCURY. See CHEMISTRY-Index.

CORRUGATOR MUSCLE. See ANATOMY, *Table of the Muscles*.

CORROSIVES, in surgery, are medicines which corrode whatever part of the body they are applied to: such are burnt alum, white precipitate of mercury, white vitriol, red precipitate of mercury, butter of antimony, lapis infernalis, &c.

CORRUPTICOLÆ, a sect who rose out of the Monophysites in Egypt about the year 519, under their chief Severus, the pretended patriarch of Alexandria. Corrupticolæ, Corruption.

Their distinguishing doctrine, whence they derived their name, was, that the body of Jesus Christ was *corruptible*; that the fathers had owned it; and that to deny it was to deny the truth of our Saviour's passion.

On the other hand, Julian of Halicarnassus, another Eutychian, a refugee, as well as Severus, in Alexandria, maintained that the body of Jesus Christ had been always incorruptible; that to say it was corruptible, was to make a distinction between Jesus Christ and the Word, and by consequence to make two natures in Jesus Christ.

The people of Alexandria were divided between the two opinions; and the partisans of Severus were called *corrupticolæ*, q. d. worshippers of something *corruptible*: sometimes they were denominated *corruptibles*; and the adherents of Julian *incorruptibles* or *phantasiastæ*. The clergy and secular powers favoured the first; the monks and the people the latter.

CORRUPTION, the destruction, extinction, or at least cessation for a time, of the proper mode of existence of any natural body. See PUTREFACTION.

CORRUPTION of Blood, in law, one of the consequences of an attainder; and is both upwards and downwards; so that an attainted person can neither inherit lands or other hereditaments from his ancestors, nor retain those he is already in possession of, nor transmit them by descent to any heir; but the same shall escheat to the lord of the fee, subject to the king's superior right of forfeiture; and the person attainted shall also obstruct all descents to his posterity, wherever they are obliged to derive a title through him to a remoter ancestor. See ATTAINDER.

This is one of those notions which our laws have adopted from the feudal constitutions, at the time of the Norman conquest; as appears from its being unknown in those tenures which are indisputably Saxon, or Gavel kind: wherein, though by treason, according to the ancient Saxon laws, the land is forfeited to the king, yet no corruption of blood, no impediment of descents, ensues; and on judgment of mere felony, no escheat accrues to the lord. But, by the law of England, derived as above, a man's blood is so universally corrupted by attainder, that his sons can neither inherit to him nor to any other ancestor, at least on the part of their attainted father. Blackf. Comment.

This corruption of blood cannot be absolutely removed but by authority of parliament. The king may excuse the public punishment of an offender; but cannot abolish the private right which has accrued, or may accrue, to individuals as a consequence of the criminal's attainder. He may remit a forfeiture in which the interest of the crown is alone concerned: but he cannot wipe away the corruption of blood; for therein a third person hath an interest, the lord who claims by escheat. If therefore a man hath a son, and is attainted, and afterwards pardoned by the king; this son can never inherit to his father, or father's ancestors; because his paternal blood, being once thoroughly corrupted by his father's attainder, must continue so: but if the son had been born after the pardon, he

Corfair
||
Corfica.

might inherit; because, by the pardon, the father is made a new man, and may convey new inheritable blood to his after-born children.

This corruption of blood, thus arising from feudal principles, but perhaps extended farther than even these principles will warrant, has been long looked upon as a peculiar hardship: because the oppressive parts of the feudal tenures, being now in general abolished, it seems unreasonable to reserve one of their most inequitable consequences; namely, that the children should not only be reduced to present poverty (which, however severe, is sufficiently justified upon reasons of public policy), but also be laid under future difficulties of inheritance, on account of the guilt of their ancestors. And therefore in most (if not all) of the new felonies treated by Parliament since the reign of Henry VIII. it is declared that they shall not extend to any corruption of blood: and by the statute 7 Anne c. 21. (the operation of which is postponed by the statute 17 Geo. II. c. 39.) it is enacted, that, after the death of the late pretender and his sons, no attainder for treason shall extend to the disinheriting any heir, nor the prejudice of any person, other than the offender himself: which provisions have indeed carried the remedy farther than was required by the hardship above complained of; which is only the future obstruction of descents, where the pedigree happens to be deduced through the blood of an attainted ancestor.

CORSAIR, a pirate or person who scours the seas, especially the Mediterranean, with a vessel armed for war, without commission from any prince or power, to plunder merchant-vessels. The word comes from the Italian *corsare*, of *corso*, or *à corsibus*, by reason of their courses, or excursions.—The name is commonly given to the piratical cruisers of Barbary, who had their rise about the beginning of the 16th century.

A *corfair* is distinguished from a *privateer* in this, that the latter does it under a commission, and only attacks the vessels of those at war with the state whence his commission is derived. The punishment of a *corfair* is to be hanged, without remission; whereas *privateers* are to be treated as prisoners of war. All *corfair* vessels are good prizes.

CORSELET, a little cuirass; or, according to others, an armour or coat made to cover the whole body, anciently worn by the pike-men, usually placed in the front and flanks of the battle, for the better resisting the enemy's assaults, and guarding the soldiers placed behind them.

CORSICA, (anc. geog.) an island situated in that part of the Mediterranean anciently called the *Sea of Liguria*, in length from north to south 150 miles, and where broadest 50, (Pliny). The ancient inhabitants were the Phocenses, (Herodotus); from which they removed to Massilia. To them succeeded the Ligurians and Hispani, as appears from the similitude of rites and customs: afterwards two Roman colonies, one by Marius, the other by Sylla. To the south it is separated from Sardinia by a narrow strait called *ταφρος*, or *Fossa*, (Pliny); sixty stadia or about seven miles in breadth, (Strabo). It was famous for its barren rocks, its woods, and its honey; which last was reckoned noxious, from the great plenty of yew-trees, ac-

ording to Diodorus Siculus and Virgil. *Corfi* was the name of the people, (Livy); *Cyrnaeus*, the epithet, (Virgil).—The island still retains its ancient name *Corfica*; situated between 8 and 10 degrees of east longitude, and between 41 and 43 degrees of north latitude. It was formerly subject to Genoa; though the natives for many years disputed their right. The island is now in the hands of the French; and have lately, in consequence of the revolution in France, been admitted to a participation of all the rights and privileges of free citizens.

CORSNED, or MORSEL of EXECRATION, a species of trial or purgation* anciently in use in Britain, and which probably arose from an abuse of revelation in the dark ages of superstition. It consisted of a piece of cheese or bread, about an ounce in weight, which was consecrated with a form of exorcism; desiring of the Almighty that it might cause convulsions and paleness, and find no passage if the man was really guilty; but might turn to health and nourishment if he was innocent; as the water of jealousy among the Jews was, by God's especial appointment, to cause the belly to swell, and the thigh to rot, if the woman was guilty of adultery. This *corsned* was then given to the suspected person, who at the same time also received the holy sacrament: if indeed the *corsned* was not, as some have suspected, the sacramental bread itself; till the subsequent invention of transubstantiation preserved it from profane uses with a more profound respect than formerly. Our historians assure us, that Godwin, Earl of Kent, in the reign of King Edward the Confessor, abjuring the death of the king's brother, at last appealed to his *corsned*, "*per buccellam deglutendam abjuravit*," which stuck in his throat and killed him. This custom has been long since gradually abolished, though the remembrance of it still subsists in certain phrases of abjuration retained among the common people; as, "I will take the sacrament upon it; May this morsel be my last;" and the like.

CORT (Cornelius), a celebrated engraver, was born at Hoorn in Holland in 1536. After having learned the first principles of drawing and engraving, he went to Italy to complete his studies, and visited all the places famous for the works of the great masters. At Venice he was courteously received by Titian; and engraved several plates from the pictures of that admirable painter. He at last settled at Rome, where he died 1578, aged 42. According to Bafan, he was "the best engraver with the burin or graver only that Holland ever produced. We find in his prints," adds he, "correctness of drawing, and an exquisite taste." He praises also the taste and lightness of touch with which he engraved landscapes, and that without the assistance of the point. It is no small honour to this artist, that Agostino Carracci was his scholar, and imitated his style of engraving rather than that of any other master. His engravings are very numerous (151 according to Abbé Marolles), and by no means uncommon.

CORTES of SPAIN, a term purely Spanish, signifying the *courts*, i. e. the states, or assembly of the states, at Madrid.

CORTES, or CORTEZ, (Ferdinand), a Spanish general, famous for the conquest of Mexico, and other victories

Corfned
||
Cortes.

Cortusa.

vicinities over the natives of South America; but infamous for the cruelties he committed upon the vanquished, without regard to rank, age, or sex. It probably was on this account he was but coolly received on his return to Europe by his royal master Charles le Quint: it is even asserted that the emperor asked him who he was? to which Cortez replied; "I am the man who have given you more provinces than your ancestors have left you towns." Died in 1554, aged 63. See MEXICO.

CORTEX, in botany; the rind or coarse outer bark of plants. The organization of the outer and inner barks, which differ principally in the fineness of their texture, is particularly explained under the article PLANTS.

Wounds of the bark, and its separations from the wood, whether naturally or artificially made, are easily cured, and made to unite again by proper care. If sections be made in the rinds of the ash and sycamore of a square figure, three sides cut, and the fourth uncut, and the whole be afterwards bound round with a pack-thread, it will all unite again, only leaving a scar in each of the three sides where it was cut. If several parts of the bark of either of these trees be cut off, and entirely separated from the tree; some shallower, leaving a part of the bark on, and others deeper, to the wood itself; these pieces being again put into their places, and bound on with pack-thread, will not indeed unite, but a fresh bark will grow in their places, and thrust them away: but if they be first carefully laid on in the exact direction in which they originally grew, and then the whole part beyond the wound on every side covered with a large plaster of diachylon, or the like; and this bound over with pack-thread to keep all firmly in their places, the pieces of bark, whether cut off shallower or deep down to the very wood of the tree, will firmly unite themselves to the places where they originally grew. This cure will be performed in about three weeks: but the outer rind of the separated pieces will not be plump, but somewhat shrivelled; the edges also will recede somewhat from their original place; so that there remains a sort of scar all round. These experiments are best made in the spring season; for in the autumn and winter, the sap arising but weakly, the parts that should unite wither before that is brought about. The success of these experiments has made some think that the whole branch of a tree separated and bound on again might unite with the rest. But the experiments that have been made in the most favourable manner for such a trial have all proved vain, the branch cut off withering always in a few days, however well united and carefully kept on.

CORTEX Peruvianus. See CINCHONA.

CORTEX Winteranus. See WINTERA.

CORTONA (Pietro da). See BERRETINI.

CORTONA, a very ancient town of Italy, mentioned by many of the Roman historians. It was originally called *Corton*, and lay to the northward of the lake Thrasymenus. It still retains the name of Cortona. E. Long. 13. 0. N. Lat. 43. 15.

CORTONESE (Pietro Palo). See GOBBO.

CORTUSA, BEAR'S-EAR SANICLE: A genus of the monogynia order, belonging to the pentandria class of

plants, and in the natural method ranking under the 21st order, *Precia*. The corolla is wheel-shaped, with its throat like an elevated ring; the capsule unilocular, oval, and quinquevalved at the top. There are two species, both of them very low, flowery, herbaceous perennials, crowned by umbels of monopetalous, wheel-shaped flowers, of a fine red colour. They are natives of mountainous rocky parts abroad, so must have a dry lean soil; or they may be kept in pots of dry sandy earth placed in the shade, and in summer must be duly watered; and their propagation here is by slipping the roots in October.

CORRUNNA, or GROVNE, a port-town of Galicia in Spain, situated on a fine bay of the Atlantic ocean, about 32 miles north of Compostella: W. Long. 9. 0. and N. Lat. 43. 0.

CORUS, OMER, HOMER, or CHOMER, in the Jewish antiquities, a measure containing 10 baths or 75 gallons and 5 pints, as a measure of things liquid, and 32 pecks and 1 pint, as a measure for things dry. The *corus* or *omer* was most commonly a measure for things dry; and the greatest that was used among the Jews. It contained, according to the rabbins 10 ephahs or 30 sata or seahs. *Corus* is the most usual term in the historical writers, and *omer* or *chomer* among the prophets.

CORUS is also used in some of the old writers for eight bushels or a quarter; *decem coros tritici, sive decem quarteria*.

CORUSCATION, a glittering or gleam of light issuing from any thing. It is chiefly used for a flash of lightning darting from the clouds in time of thunder.

There is a method of producing artificial coruscations or sparkling fiery meteors, which will be visible not only in the dark but at noon-day, and that from two liquors actually cold. The method is this. Fifteen grains of solid phosphorus are to be melted in about a drachm of water; when this is cold, pour upon it about two ounces of oil of vitriol; let these be shaken together, and they will at first heat, and afterwards they will throw up fiery balls in great number, which will adhere like so many stars to the sides of the glass, and continue burning a considerable time; after this, if a small quantity of oil of turpentine is poured in without shaking the vial, the mixture will of itself take fire, and burn very furiously. The vessel should be large and open at the top.

Artificial coruscations may also be produced by means of oil of vitriol and iron, in the following manner. Take a glass body capable of holding three quarts; put into this three ounces of oil of vitriol and twelve ounces of water; then warming the mixture a little, throw in, at several times, two ounces, or more, of clean iron filings: upon this an ebullition and white vapours will arise: then present a lighted candle to the mouth of the vessel, and the vapour will take fire, and afford a bright fulmination or flash like lightning. Applying the candle in this manner several times, the effect will always be the same; and sometimes the fire will fill the whole body of the glass, and even circulate to the bottom of the liquor; at others, it will only reach a little way down its neck. The great caution to be used in making this experiment is

Corunna
||
Coruscation.

the

Corvorant,
Corvus. the making the vapour of a proper heat: for if too cold, few vapours will arise; and if made too hot, they will arise too fast, and will only take fire in the neck of the glass, without any remarkable corrosion.

CORVORANT, formerly written **CORMORANT**.
See **PELICANUS**.

CORVUS, the **RAVEN** or **CROW** kind, in ornithology; a genus of birds of the order of *picæ*, the distinguishing characteristics of which are these: The beak is convex and cultrated; the nostrils are covered with bristly feathers; the tongue is forked and cartilaginous; and the feet are of the walking-kind. The species are 19. The most remarkable are:

1. The **corax**, or raven of English authors, weighs three pounds, and is about two feet two inches in length; the colour is black, finely glossed with a rich blue; the belly excepted, which is of a dusky colour. They are very docile, birds, and may be trained up to fowling like hawks; to fetch and carry like spaniels; they may be taught to speak like parrots; and, what is most extraordinary of all, they may be taught to imitate the human voice in singing. They have a great propensity to pilfer, often hiding things of value to the great loss of the owner, without use to themselves. They frequent the neighbourhood of great towns, where they are useful in devouring the carcases and filth which would otherwise prove a nuisance. They, however, also destroy many living animals; such as rabbits, young ducks, and chickens, and not unfrequently lambs which have been dropped in a weak state. In clear weather they fly in pairs to a great height, making a deep loud noise, different from the common croaking. Their scent is remarkably good; and they are very long lived. The quills of ravens sell for 12 s. *per* hundred, being of great use in tuning the lower notes of an harpsichord when the wires are set at a considerable distance from the sticks.—The raven makes its nest early in the spring, laying 5 or 6 eggs, of a pale bluish-green colour spotted with brown. With us it builds in trees; but in Greenland and Iceland makes its nest in the holes of rocks, composing it of roots and twigs, together with the bones they have picked, and lining it with hair, moss, &c. The flesh of these birds, rank and unfavoury as we may well suppose it, is eaten in Greenland by many of the natives, who also use the skins as a warm under-covering.

2. The **corone**, or carrion-crow, in the form of its body agrees with the raven; also in its food, which is carrion and other filth. It will also eat grain and insects; and like the raven will pick out the eyes: for which reason it was formerly distinguished from the rook, which feeds entirely on grain and insects, by the name of the *gor* or *gor-crow*. Virgil says that its croaking forebodes rain:

Tum cornix plena pluviam vocat improba voce.

It was also thought a bird of bad omen, especially if it happened to be seen on the left hand:

Sæpe sinistra cava prædixit ab ilice cornix.

England breeds more of this kind of birds than any other country in Europe. In the 24th of Henry VIII. they were grown so numerous, and thought to be so prejudicial to the farmer, that they were considered as an evil worthy of parliamentary redress; an act was passed for their destruction, in which rooks and

choughs were included. Every hamlet was to provide crow-nets for ten years; and all the inhabitants were obliged at certain times to assemble during that space to consult of the proper means for extirpating them. But though the crow abounds thus in Britain, it is so rare in Sweden, that Linnæus speaks of it only as a bird that he once knew killed there. It lays the same number of eggs as the raven, and of the same colour: immediately after deserting their young they go in pairs. Both these birds are often found white or pied; an accident that befalls black birds more frequently than any others. Mr Pennant says, he has observed one entirely of a pale brown colour, not only in its plumage, but even in its bill and feet. The crow weighs about 20 ounces. Its length is 18 inches; its breadth two feet two inches.

Concerning these birds, we have the following curious anecdote in Mr Edward's natural history*. "The reverend Mr Robinson rector of Ousby in Westmoreland and Cumberland, says, 'that birds are natural planters of all sorts of wood and trees. They disseminate the kernels upon the earth, which like nurseries brings them forth till they grow up to their natural strength and perfection.' He says, 'About 25 years ago, coming from Rosecastle early in the morning, I observed a great number of crows very busy at their work upon a declining ground of a mossy surface: I went out of my way on purpose to view their labour, and I found they were planting a grove of oaks. The manner of their planting was thus: they first made little holes in the earth with their bills, going about and about till the hole was deep enough; and then they dropped in the acorn, and covered it with earth and moss. The season was at the latter end of autumn when all seeds are full ripe.' Mr Robinson seems to think that Providence had given the crows this instinct solely for the propagation of trees; but I imagine it was given them principally for their own preservation, by hiding provision in time of plenty, in order to supply them in a time of scarcity: for it is observed in tame pies and daws kept about houses, that they will hide their meat when they have plenty of it, and fetch it from their hiding-places when they want. So that such an instinct in these birds may answer a double purpose; both their own support in times of need, and the propagation of the trees they plant: for wherever they hide a great number of nuts or grain in the earth, we cannot suppose they find them all again; but that as many will remain in the plot of ground they make use of, as can well grow by one another."

3. The **frugilegus**, or rook, is the **corvus** of Virgil; no other species of this kind being gregarious.

E. pastu decedens agmine magno

Corvorum increpuit densis exercitus alis:

A very natural description of the evening return of these birds to their nests.

The rook differs not greatly in its form from the carrion crow: the most remarkable difference is in the nostrils and root of the bill; which parts in the crow are well clothed with feathers, but in the rook are bare, or covered only with some bristly hairs. This arises from its thrusting the bill into the earth continually, after the various worms and crucæ of insects, on which it feeds; for it does not live on carrion, like the

Corvus.

the last species and ravens. Besides insects, it also feeds on all sorts of grain, to some inconvenience perhaps to the husbandman, but no doubt doubly repaid by the good done him in extirpating the maggot of the chaferbeetle, which in some seasons destroys whole crops of corn by feeding on the roots. The rook is a gregarious bird, sometimes being seen in immense flocks, so as to almost darken the air. These flights they regularly perform morning and evening, except in breeding-time, when the daily attendance of both male and female is required for the use of incubation, or feeding the young; for it is observed that they do both by turns. As these birds are apt to form themselves into societies, such places as they frequent during the breeding-time are called *rookeries*; and they generally choose a large clump of the tallest trees for this purpose; but make so great a litter, and such a perpetual chatter, that nothing but habit and a length of time can reconcile one to the noise. The eggs are like those of crows, but less, and the spots larger. They begin to build in March, and after the breeding-season forsake their nest trees, going to roost else where, but have been observed to return to them in August: in October they repair their nests. In Britain they remain the whole year; yet we are told that both in France and Silesia they are birds of passage. Whether they migrate or not in Sweden, we are not told; but Linnæus talks of their building there. The young birds are accounted good eating, especially if skinned and put in a pie.

4. The cornix, or royston crow, petty much resembles the rook, feeding on insects, and flying together in great flocks. In England it is a bird of passage, visiting that kingdom in the beginning of winter, and leaving it with the woodcocks. In the maritime parts they feed on crabs and shell-fish. They are very common in Scotland: in many parts of the Highlands, and in all the Hebrides, Orknies, and Shetland, it is the only species of genuine crow; the carrion and rook being unknown there. It breeds and continues in those parts the whole year round. In the Highlands, they breed indifferently in all kinds of trees: lay six eggs: have a shriller note than the common crows; are much more mischievous; pick out the eyes of lambs, and even of horses when engaged in bogs. They are, therefore, in many places proscribed, and rewards given for killing them. For want of other food these birds will eat cran-berries or other mountain berries.

5. The dauricus, or white-breasted crow is in length about 12 inches; the bill is black; the head and throat are black, glossed with blue; the neck and breast white; the rest of the body, wings, and tail, blue black; the legs of a lead-colour; the claws black. The specimen figured by Buffon came from Senegal; but it is by no means confined to that quarter. Pallas describes the same species, which he says come early in the spring in great flights from China, and the southern Monguls country, into the parts about the lake Baikal, but most frequent about the towns and villages on the river Lena, in which part the jackdaws and Royston crows are very seldom seen. It is said they are likewise found in vast numbers in the island of Johann, where they live chiefly on insects and fruits, and make their nests in trees.

6. The monedula, or jack-daw, weighs nine ounces; the length thirteen inches, the breadth twenty-eight. The head is large in proportion to its body; which, Mr Willoughby says, argues him to be ingenious and crafty. The irides are white: the breast and belly are of a dusky hue inclining to ash-colour: the rest of the plumage is black, slightly glossed with blue: the claws are very strong and hooked. It is a docile and loquacious bird. Jack-daws breed in steeples, old castles, and in high rocks, laying five or six eggs. Sometimes they have been known to breed in hollow-trees near a rookery, and join those birds in their foraging parties. In some parts of Hampshire, they make their nests in rabbit holes; they also build in the interstices between the upright and transverse stones of Stonehenge; a proof of the prodigious height of that stupendous antiquity, for their nests are placed beyond the reach of the shepherd boys, who are always idling about this spot. They are gregarious birds; and feed on insects, grain, and seeds.—These birds are frequently brought up tame: they have a practice of hiding that part of their food which they cannot eat; and often, along with it, they secret small valuables, thereby sometimes occasioning injurious suspicions of theft in servants or others not guilty.

7. The glandarius, or jay, is one of the most beautiful of British birds. The weight is between six and seven ounces: the length 13 inches. The forehead is white streaked with black; the head is covered with very long feathers, which it can erect at pleasure into the form of a crest: the whole neck, back, breast, and belly, are of a faint purple dashed with grey; the covert-feathers of the wings are of the same colour. The first quill-feather is black; the exterior webs of the nine next are ash-coloured; the interior webs dusky; the six next are black, but the lower sides of their exterior webs are white tinged with blue; the two next wholly black; the last of a fine bay colour tipped with black. The lesser coverts are of a light bay: the greater covert-feathers most beautifully barred with a lively blue, black, and white: the rest are black: the rump is white. The tail consists of twelve black feathers. The feet are of a pale brown; the claws large and hooked.—Jays build chiefly in woods, making their nest of sticks, fibres of roots, and tender twigs; and lay five or six eggs, of the size of a pigeon's, cinerous olive, marked with pale brown. The young keep with the old ones till the next pairing time in spring; when they choose each his mate to produce their future progeny. In general they feed on acorns, nuts, seeds, and fruits of all kinds; but will sometimes destroy young chickens and eggs, and will also take away birds that have been caught in a trap or entangled with birdlime. They are often kept in cages, and will talk pretty well; but then lose all their beauty so conspicuous in the wild state.

8. The caryocatactes, or nut-cracker, is somewhat less than the jack-daw: the bill is strong, straight, and black: the colour of the whole head and neck, breast and body, of a rusty brown: the crown of the head and rump are plain; the other parts marked with triangular white spots: the wings are black; the coverts spotted in the same manner as the body: the tail is rounded at the end, black tipped with white: the vent-feathers

Corvus.

Plate
CXLIX.

Corvus.

feathers are white; the legs dusky. We find these birds scattered in many parts of Europe, but no where so plenty as in Germany; they are found also in Sweden and Denmark, where they frequent the mountainous parts. Sometimes they come in vast flocks into France, especially Burgundy. They visit England very seldom; are also found in North America, but not near the sea-coasts. One has been brought from Kamtschatka by the late voyagers.—In manners this bird is said to resemble the jay, laying up a store of acorns and nuts. In some parts it keeps chiefly in the pine forests, on the kernels of which it then feeds; but is said frequently to pierce the trees like the woodpecker, for which the bill seems not unapt. It makes its nests in holes of trees. Klein mentions two varieties, one smaller than the other; the largest, he says, breaks the nuts to pieces, and the other pierces them. Both feed at times on wild berries and insects.

9. The pica, or magpie, is in length above 18 inches, and weighs 8 or 9 ounces. The bill is black: the irides are hazel; the scapulars, and all the under parts from the breast, are white; the rest of the plumage, wings, and tail, black, glossed with green, purple, and blue, in different lights: the eleven first quills are white in the middle on the inner web, lessening by degrees as they advance inwards: the tail is very cuneiform, the two middle feathers being near 11 inches in length, and the utmost only 5 inches and a half: the legs are black. We can form no judgement of the beauties of this bird, from those dirty mutilated specimens which we see exposed daily in a wicker cage at every stall. It is only in a state of nature that they can be found; and whoever views them in this state, will do so with astonishment: for though the colours, at a distant view, seem to be mere black and white, yet the splendor that meets in every new situation the eye of the beholder, will oblige him to own that there is not a more beautiful bird in Britain. In these parts it is every where common. Mr Latham has been able to trace this bird no farther south than Italy on the European continent; and to the north, Sweden, and Denmark. Forster met with it at Madeira; and it is also seen in America, but not common, and is a bird of passage in those parts. At Hudson's Bay it is called by the Indians *Oue-ta-kee-aske*; which signifies *Heart-Bird*; but for what reason does not appear. In manners it approaches to the crow, feeding almost on every thing in turn, both animal and vegetable; and like that will kill young ducks and chickens, and suck the eggs. It builds its nest with art, making a thorny cover at top, leaving a hole on the side for admittance: lays six or seven pale greenish eggs, thickly spotted with black. It is a crafty bird in every state, and if brought up young, becomes exceedingly familiar, and will talk a great many sentences as well as imitate every noise within hearing, like a parrot, but not near so plain.

10. The graculus, or red-legged crow, is but thinly scattered over the northern world: no mention is made of it by any of the Faunists; nor do we find it in other parts of Europe except Britain and the Alps. It is produced in the island of Canadia in Asia; and it visits Egypt towards the end of the inundations of the Nile. Except in Egypt, it affects mountainous and rocky

places; builds its nest in high cliffs or ruined towers; and lays four or five eggs, white spotted with a dirty yellow. It feeds on insects, and also on new-sown corn. They commonly fly high, make a shriller noise than the jack-daw, and may be taught to speak. It is a very tender bird, and unable to bear very severe weather; is of an elegant, slender-make; active, restless, and thieving; much taken with glitter, and so meddling as not to be trusted where things of consequence lie. It is very apt to catch up bits of lighted sticks; so that there are instances of houses being set on fire by its means; on which account Cambden calls it *incendiaria avis*. It is found in Cornwall, Flintshire, Caernarvonshire, and Anglesea, in the rocky cliffs along the shores. It is also found in Scotland as far as Strathnavern, and in some of the Hebrides. Its colour is wholly black, beautifully glossed over with blue and purple: the legs and bill are of a bright orange colour inclining to red: the tongue is almost as long as the bill, and a little cloven: the claws are large, hooked, and black.

11. The cristatus, or blue jay, is much smaller than the common jay. The bill is black and above an inch long: the head is crested and blue: a streak of the sides of the head and throat are of a bluish white, and there is a spot of the same over the eye: hind part of the neck and back is blue; the wings and tail are the same; all the feathers of the last, except the two middle ones, tipped with white; the feathers of both it and the wings elegantly barred with black, and the greater coverts and second quills tipped with white: the breast is of a blossom colour; the belly and under tail-coverts white: the legs are dusky brown: the tail is nearly as long as the rest of the bird. The colours of the female are less bright than those of the male—This species is said to be peculiar to North America, but not seen farther north than the town of Albany. It builds in swags, and has a soft delicate note. Its food is hazel-nuts, chestnuts, and such like, which it breaks by placing between the feet, and pecking with the bill till the shell gives way. It is also very fond of maize; and being a gregarious bird, often unites into flocks of 20,000 at least, which alighting on a field of 10 or 12 acres soon lay waste the whole: hence it is reckoned the most destructive bird in this country. They will often take up with snails and vermin thro' necessity, but not while any thing they like better is to be got at. They are not accounted good to eat.

12. The canadensis is in length 9 inches, and weighs two ounces. The bill is blackish, and not quite an inch long: the irides are black: the forehead and throat are of a dirty yellowish white; the hind-head and sides of blackish brown: the upper parts of the body are brown; beneath pale ash, palest on the breast: the quills and tail are brown, tipped with white: tail is a little wedged: the legs and claws are blackish. These birds inhabit Canada; and are frequent near Hudson's Bay, where they are called *Whiskijohn* and *Whiskijack*. They breed early in the spring; build in pine-trees; and have two, rarely three, young at a time. The eggs are blue. They are not gregarious. Their food is black moss, worms, and flesh. They are very bold pilfering birds, stealing from the traveller even salt meat, and devouring often the bait from the traps set for

for the martins, as soon as the persons who set them turn their backs. They lay up stores for winter; at which time they are seldom seen unless near habitations. They do not bear confinement well. What natural note they have, we are not told; but they are said to act the mocking bird, in imitating that of others.—There are near 30 other species.

CORVUS (*Raven*), in astronomy, a constellation of the southern hemisphere; whose stars in Ptolemy's Catalogue are 7; in Tycho's as many; in the Britannic Catalogue 9.

CORVUS, in Roman antiquity, a military engine, or rather gallery, moveable at pleasure by means of pulleys; chiefly used in boarding the enemy's ships to cover the men. The construction of the corvus was as follows: They erected on the prow of their vessels a round piece of timber of about a foot and an half diameter, and about 12 feet long: on the top of which they had a block or pulley. Round this piece of timber they laid a stage or platform of boards, four feet broad, and about 18 feet long, which was well framed and fastened with iron. The entrance was long-ways, and it moved about on the abovementioned upright piece of timber as on a spindle, and could be hoisted up within six feet of the top: about this was a sort of parapet knee-high, which was defended with upright bars of iron sharpened at the end, and towards the top there was a ring, by the help of which and a pulley or tackle, they raised or lowered the engine at pleasure. With this moveable gallery they boarded the enemy's vessels (when they did not oppose side to side), sometimes on their bow, and sometimes on their stern, as occasion best served. When they had grappled the enemy with these iron spikes, if they happened to swing broadside to broadside, then they entered from all parts; but in case they attacked them on the bow, they entered two and two by the help of this machine, the foremost defending the foreparts, and those that followed the flanks keeping the bows of their bucklers level with the top of the parapet.

CORYATE (Thomas), a very extraordinary personage, who seems to have made himself famous by his whimsical extravagancies, was the son of a clergyman, and born at Oldcombe in Somersethire in 1577. He acquired Greek and Latin at Oxford; and going to London, was received into the household of Henry prince of Wales. If Coryate was not over witty himself, he got acquainted with the wits of that time, and served to exercise their abilities, having more learning than judgment. He was a great peripatetic: for, in 1608, he took a long journey on foot; and after he returned, published his travels under the following strange title, *Crudities hastily gobbled up in five months Travels in France, Savoy, Italy, Rhetia, Helvetia, some parts of High Germany, and the Netherlands*, Lond. 1611, 4to. In 1612 he set out again with a resolution to spend ten years in travelling: he went first to Constantinople; and after travelling over a great part of the East, died of a flux at Surat in the East Indies. Some of the accounts of his peregrination are to be found in Purchas's Pilgrimages.

CORYBANTES, in antiquity, priests of Cybele, who danced and capered to the sound of flutes and drums. See CROTALUM.

Catullus, in his poem called *Atys*, gives a beautiful

V. VOL.

description of them, representing them as madmen. Accordingly Maximus Tyrius says, that those possessed with the spirit of Corybantes, as soon as they heard the sound of a flute, were seized with an enthusiasm, and lost the use of their reason. And hence the Greeks use the word *κορυβαντιν*, to *corobantize*, to signify a person's being transported or possessed with a devil. See ENTHUSIASM.

Some say that the Corybantes were all eunuchs; and that it is on this account Catullus, in his *Atys*, always uses feminine epithets and relatives in speaking of them.

Diodorus Siculus remarks, that Corybas, son of Jason and Cybele, passing into Phrygia with his uncle Dardanus, there instituted the worship of the mother of the gods, and gave his own name to the priests. Strabo relates it as the opinion of some, that the Corybantes were children of Jupiter and Caliope, and the same with the *Cabiri*. Others say the word had its origin from this, that the Corybantes always walked dancing (if the expression may be allowed) or tossing the head, *κορυπαντες βαλλειν*.

CORYBANTICA, a festival held in Crete, in memory of the Corybantes, who educated Jupiter when he was concealed in that island from his father Saturn, who would have devoured him.

CORYCEUM, in antiquity, that part of the gymnasium where people undressed. It was otherwise called *apodyterion*.

CORYCOMACHIA, among the ancients, was a sort of exercise in which they pushed forwards a ball, suspended from the ceiling, and at its return either caught it with their hands, or suffered it to meet their body. Oribasius informs us it was recommended for extenuating too gross bodies.

CORYDALES, in botany, an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus, containing the following genera, *viz.* epimedium, hypecoum, leontice, melianthus, pinguicula, and utricularia.

CORYDALIS, in botany. See FUMARIA.

CORYLUS, the HAZLE: A genus of the polyandria order, belonging to the monœcia class of plants; and in the natural method ranking under the 50th order, *Amentacea*. The male calyx is monophyllous, scale-like, trifid, and uniflorous; there is no corolla; the stamina eight in number: The female calyx diphyllous and lacerated; no corolla; two styles; and an egg-shaped nut. Mr Miller reckons three species, though other botanists make only two. They are all of the large shrub kind, hardy and deciduous; and have several varieties valuable for their nuts, as also for their variety in large wildernesses and shrubby works. They will prosper in almost any soil or situation, and turn out to good account when growing in coppices to cut as underwood, and as poles for various uses, as hoops, spars, hurdles, handles to husbandry implements, walking sticks, fishing rods, &c. for which purposes they may be cut every 5th, 7th, or 8th year, according to the purposes for which they are designed. The best method of propagating them is by layers, though they may also be raised from the nuts.

The kernels of the fruit have a mild, farinaceous, oily taste, agreeable to most palates. Squirrels and mice are fond of them, as well as some birds, such as jays, nutcrackers, &c. A kind of chocolate has been

Corypha.

prepared for them, and there are instances of their having been formed into bread. The oil expressed from them is little inferior to the oil of almonds; and is used by painters, and by chemists, for receiving and retaining odours. The charcoal made of the wood is used by painters in drawing. Some of the Highlanders, where superstition is not totally subdued, look upon the tree itself as unlucky; but are glad to get two of the nuts naturally conjoined, which is a good omen. These they call *cno chòmblaich*, and carry them as an efficacious charm against witchcraft.

Evelyn tells us, that no plant is more proper for thickening of copses than the hazle, for which he directs the following expeditious method. Take a pole of hazle (ash or poplar may also be used), of 20 or 30 feet in length, the head a little lopped into the ground, giving it a chop near the ground to make it succumb; this fastened to the earth with a hook or two, and covered with some fresh mould at a competent depth, (as gardeners lay their carnations), will produce a great number of suckers, and thicken and furnish a copse speedily.

CORYMBIFERÆ, in botany, the name of an order or division of the compound flowers adopted by Linnæus after Ray and Vaillant, in the former editions of his *Fragments of a Natural Method*. This title in the later editions is changed for *Discoidea*, another name borrowed from Ray's *Method*, but used in a somewhat different sense.

CORYMBIUM, in antiquity, an ornament of hair worn by the women. Its form was that of a corymbus.

CORYMBIUM, in botany: A genus of the monogamia order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The calyx is diphylous, uniflorous, and prismatical; the corolla monopetalous and regular; there is one woolly seed below each floret.

CORYMBUS, properly signifies a cluster of ivy berries. Among botanists, it is a mode of flowering in which the lesser or partial flower-stalks are produced along the common stalk on both sides; and, though of unequal lengths, rise to the same height, so as to form a flat and even surface at the top. See BOTANY, n° 273.

CORYNOCARPUS, in botany: A genus of the monogynia order, belonging to the pentandria class of plants. The calyx is a pentaphyllous perianthium; the corolla consists of five roundish, erect, and hollow petals; the stamina five subulated filaments arising from the base of the petals; the antheræ are erect and oblong; the pericarpium a monospermous, turbinat-clavated nut.

CORYPHA, MOUNTAIN PALM, or *Umbrella Tree*, in botany: A genus of the order of *Palmeæ*, belonging to the monœcia class of plants. The corolla is tripetalous; the stamina six, with one pistil; the fruit a monospermous plum. There is only one species, the *umbracula*, a native of the West Indies, where it is called *codda-pana*. It rises to a considerable height, and produces at the top many large palmated, plaited leaves, the lobes of which are very long, and are placed regularly round the end of a long spiny footstalk, in a manner representing a large umbrella. The flowers are produced on a branched spadix, from a compound

spatha or sheath: they are hermaphrodite, and each consists of one petal, divided into three oval parts, and contains six awl-shaped stamina, surrounding a short slender style, crowned with a simple stigma. The germen is nearly round, and becomes a large globular fruit of one cell, including a large round stone. These plums having a pleasant flavour are held in esteem by the Indians.

CORYPHÆNA, in ichthyology a genus belonging to the order of thoracici. The head is declined and truncated; the branchiostege membrane has six rays; and the back-fin runs the whole length of the back. There are twelve species, most of them natives of foreign seas. The most remarkable are the blue and parrot fishes, described by Mr Catesby.—The head of the first is of an odd structure, resembling that of the spermaceti whale: the mouth is small, each mandible armed with a single row of even teeth, so closely joined that they seem entire bones; the iris of the eye is red. On the back is a long pliant fin, somewhat indented on the edge; behind the gills are two fins, one under the abdomen and another behind the anus. The tail is forked; and the whole fish entirely blue. They are taken on the coasts of the Bahama Islands, and in most of the seas between the tropics.—The parrot-fish hath a large mouth, paved as it were with blunt teeth, closely connected, after the manner of the *lupus marinus*. The body is covered with large green scales; the eyes are red and yellow; the upper part of the head brown, the lower part and the gills blue, bordered with a dusky red: a streak of red extends from the throat behind the gills, at the upper end of which is a bright yellow spot. The fins are five in number, one extending almost the length of the back, of a bay or cinnamon colour; there are two behind the gills, blended with black, green and purplish colours, with the upper edge verged with blue; under the abdomen is another red fin verged with blue; under the anus extends another long narrow green fin, with a list of red through the middle of it: at the basis of the tail on each side is a large yellow spot. The tail is large, forked, and green, with a curved red line running through the middle parallel to the curve, and ending in two points. The fish is more esteemed for beauty than the delicacy of its taste. They are taken on the coasts of Hispaniola, Cuba, and the Bahama Islands.

CORYPHÆUS, in the ancient tragedy, was the chief or leader of the company that composed the chorus: (See CHORUS).—The word is formed from the Greek *κορυφή*, “tip of the head.” The coryphæus spoke for all the rest, whenever the chorus took part in the action, in quality of a person of the drama, during the course of the acts. Hence coryphæus had passed into a general name for the chief or principal of any company, corporation, sect, opinion, &c. Thus Eustacius of Antioch is called the *coryphæus* of the council of Nice; and Cicero calls Zeno the *coryphæus* of the stoics.

CORYZA, in medicine, a catarrh of the nose. See MEDICINE-Index.

CORZOLA, or CURSCOLA, an island in the gulph of Venice, divided from Ragusa in Dalmatia by a narrow strait. E. Long. 18. o. N. Lat. 42. 35.

COS, or Coos, (anc. geog.), a noble island on the coast

Coryphæna
||
Cos.

Cos ||
Coenage. coast of Caria, in the Hither Asia, fifteen miles to the west of Halicarnassus, a hundred in compass, called *Meropis*; and hence Thucydides joins both names together, *Cos Meropis*: it had a cognominal town *Cos*, but originally called *Alypalaea*, mentioned by Homer; with a port locked or walled round, (Scylax, Mela). The island was fruitful, and yielded a generous wine, (Strabo). It boasted of Hippocrates and Apelles; each at the head of his several profession. It was the country of Philetas, an excellent elegiac poet, who flourished in the time of Philip and Alexander; the preceptor of Ptolemy Philadelphus: so thin and light that he was obliged to wear lead to prevent the being blown away by a puff of wind (Aelian, Athenæus): much commended by Propertius. The *vestes Coas*, made of silk, were famous for their fineness and colour, (Horace, Propertius, Tibullus). In the suburbs of Cos stood the temple of Æsculapius, a noble structure, and extremely rich.

COS, the **W H E T S T O N E**, in natural history, a genus of vitrescent stones, consisting of fragments of an indeterminate figure, sub-opaque, and granulated.

Of this genus there are several species, some consisting of rougher, and others of smoother, or even of altogether impalpable particles; and used not only for whet-stones, but also for mill-stones, and other the like purposes.

COS TURCICA, *Turky-stone*, a species of stones of the garnet kind, belonging to the siliceous class. It is of a dull white, and often of an unequal colour; some parts appearing more compact than others. Its specific gravity is 2598: it strikes fire with steel, and effervesces with acids. Mr Kirwan found that 100 parts of it contain 25 of mild calcareous earth, and no iron. Cronstedt is of opinion that there are probably two sorts of stones known by this name, as that described by Wallerius neither gives fire with steel nor effervesces with acids. It is used as a whet-stone; and those of the finest grain are the best hones for the most delicate cutting tools, and even for razors, lancets, &c.

COSCINOMANCY, the art of divination, by means of a sieve. The word comes from *κοσκινον*, *cibrum*, "a sieve;" and *μαντια*, *divination*. The sieve being suspended, after rehearsing a formula of words, it is taken between two fingers only; and the names of the parties suspected repeated: he at whose name the sieve turns, trembles, or shakes, is reputed guilty of the evil in question.

This must be a very ancient practice: Theocritus, in his third Idyllion, mentions a woman very skilful in it. It was sometimes also practised by suspending the sieve by a thread, or fixing it to the points of a pair of sheers, giving it room to turn, and naming, as before, the parties suspected; in which last manner *coscinomancy* is still practised in some parts of England. It appears from Theocritus, that it was not only used to find out persons unknown, but also to discover the secrets of those that were known.

CO-SECANT, in geometry, the secant of an arch which is the complement of another to 90°. See **G E O M E T R Y**.

COSENAGE, in law, a writ that lies where the trefail, that is, the tritavus, the father of the befail, or great grandfather, being seized in fee at his death of

certain lands or tenements, dies; a stranger enters, and abates; then shall his heir have this writ of cose-nage; the form of which see in Fitzb. Nat. Br. fol. 221.

COSENING, in law, an offence whereby any thing is done deceitfully, in or out of contracts, which cannot be fitly termed by any especial name. In the civil law it is called *stellionatus*. See **STELLIONATE**.

COSENZA, the capital of the Hither Calabria, in the kingdom of Naples. E. Long. 16. 35. N. Lat. 39. 15. It is an archbishop's see.

COSHERING, in the feudal customs, a kind of right of the lords to lie and feast themselves and their followers at their tenants houses. The word *coshering* may perhaps be derived from the old English word *coshe*, a cot or cottage.

CO-SINE, in trigonometry, the sine of an arch which is the complement of another to 90°. See **G E O M E T R Y**.

COSMETIC, in physic, any medicine or preparation which renders the skin soft and white, or helps to beautify and improve the complexion; as lip-salves, cold creams, cerufs, &c.

COSMICAL, a term in astronomy, expressing one of the poetical risings of a star: thus a star is said to rise cosmically when it rises with the sun, or with that point of the ecliptic in which the sun is at that time: and the cosmical setting is when a star sets in the west at the same time that the sun rises in the east.

COSMOGONY, in physics, signifies the science of the formation of the universe. It is formed of *κοσμος*, *the world*, and *γενομια*, *I am born*.

In our conjectures about the formation of the world there are two principles which we ought never to lose sight of. 1. That of *creation*; for certainly matter could not give itself existence, it must have received it. 2. That of a *Supreme Intelligence* directing this creation, and the arrangement of the parts of matter, in consequence of which this world was formed. See **C R E A T I O N** and **E A R T H**.

COSMOGRAPHY, the description of the world; or the art which teaches the construction, figure, disposition, and relation of all the parts of the world, with the manner of representing them on a plane. The word comes from *κοσμος*, *world*, and *γραφω*, *I describe*.

Cosmography consists chiefly of two parts. *Astronomy*, which shows the structure of the heavens, and the disposition of the stars; and *Geography*, which shows those of the earth.

COSMOLABE (from *κοσμος*, *world*, and *λαμβάνω*, *I take*), an ancient mathematical instrument, serving to measure distances, both in the heavens and on earth. The *cosmolabe* is in great measure the same with the *astrolabe*. It is also called *pentacosm*, or the *universal instrument*, by L. Morgard, in a treatise written expressly upon it, printed in 1612.

COSMOLOGY (from *κοσμος*, *world*, and *λογος*, *discourse*), the science of the world in general. This Wolfius calls *general*, or *transcendental cosmology*, and has written a treatise on the subject, wherein he endeavours to explain how the world arises from simple substances, and treats of the general principles of the modifications of material things, of the elements of bodies, of the laws of motion, of the perfection of the world, and of the order and course of nature.

COSMOPOLITE, or **COSMOPOLITAN**, a term

Cosening
 ||
 Cosmopo-
 lite.

Cossacks. sometimes used to signify a person who has no fixed living or place of abode, or a man who is a stranger nowhere. The word comes from the Greek *κοσμος*, "world," and *πολις*, "city."—One of the ancient philosophers being interrogated what countryman he was? answered, he was a *cosmopolite*, i. e. an inhabitant or citizen of the world.

COSSACKS, a name given to the people inhabiting the banks of the rivers Dnieper and Don, near the Black Sea and borders of Turkey. The word implies irregular troops of horse. These people are divided into European and Asiatic Cossacks. The first consist of the Zaporog, who dwell below the cataract of the Dnieper, some on the side next to Russia, and others on the opposite side of that river; the Lower and Upper Cossacks; the Bielogorod Cossacks; and a part of the Don Cossacks. The Asiatic Cossacks are composed of the rest of the Don Cossacks, the Grebin Cossacks, the Yaik Cossacks, and the Western Calmuks, who retiring from those that inhabited the south borders of Siberia under Yaiuki Can, settled upon the Wolga, and are dependent upon Russia.

The Cossacks were known by that name ever since the 948th year of Christ. They dwelt upon mount Caucasus, in the place now called *Cabardy*; and were reduced to the Russian dominion by prince Mstislav in the year 1021. Many Russians, Poles, and others, who could not live at home, have, at different times, been admitted among the Cossacks; but the latter, abstracted from these fugitives, must have been an ancient and well governed nation.

Towards the beginning of the 16th century, the Zaporog Cossacks fixed their habitations on the spacious plains that extend along the banks of the Dnieper. They had undergone considerable hardships from the incursions of the Tartars, for which they afterwards found means to avenge themselves in an ample manner. The Poles being sensible how serviceable the Cossacks might be in defending them from the ravages of the Tartars, and even of the Russians, proposed to them terms of alliance. In 1562, they solemnly took them under their protection, and engaged to pay them an annual subsidy; in return for which, the Cossacks were to keep on foot a sufficient body of troops for the defence of the Polish dominions. With a view to bind them still more strongly by ties of interest, the Poles gave them the whole country between the rivers Dnieper and Neister, and the borders of Tartary. The Cossacks applied themselves with great industry to the cultivation of this fertile spot; so that in a short time it was interspersed with large towns and handsome villages. Besides they continually harassed the Turks, and did them great damage by their incursions; and in order to prevent the latter from pursuing them, or making reprisals, they possessed themselves of several small islands in the Dnieper, where they kept their magazines, &c. The hettman, or general of the Cossacks, was not in the least subordinate to the field-marshal of Poland; but acted in concert with him as an ally, and not as a subject of that republic. But this alliance, though of such manifest advantage to both parties, was not of long duration. The Poles, seeing the vast improvements made by the Cossacks in the country they had given up to them, became envious of them, and actually made an attempt

to bring them into subjection, as we have seen in the history of Poland. In 1648 the Cossacks gained great advantages over them, and next year came to an accommodation, in which they not only preserved their old immunities, but obtained additional privileges. The result of all was, that these Cossacks remained under the protection of Russia; and as their former country was entirely laid waste in the late wars, they settled in the Russian Ukraine, upon receiving formal assurances from the court of Russia, that no alteration should be made in their political constitution, and that no taxes whatever should be laid upon them. The Cossacks, on the other hand, were always to keep in readiness a good body of troops for the service of Russia: but in the year 1708 Mazceppa, their hettman or chief, went over from the Russians to the Swedes; upon which Peter I. resolved to prevent such revolts for the future. To this end, after the battle of Pultowa, he sent a strong detachment into the abovementioned little islands in the Dnieper, whether the Cossacks had fled, with their wives and children, and all their effects; and ordered them all to be put to the sword without distinction, and the plunder to be divided among his soldiers. He likewise sent a great number of men into their country, and caused several thousands of the Cossacks to be carried to the coasts of the Baltic, where they were put to all sorts of hard labour; by which means he in a manner extirpated the whole nation.

What distinguishes the Zaporog Cossacks from all other people is, that they never suffer any women in their settlements, as the Amazons are said not to have suffered any men among them. The women of these Cossacks live in other islands of the Dnieper. They never marry, nor have any family: all their male children are enrolled as soldiers, and the females are left with their mothers. The brother often has children by his sister, and the father by his daughter. They know no laws but those which custom has introduced, founded on their natural wants; though they have among them some priests of the Greek persuasion. They serve in the armies as irregulars; and woe to those who fall into their hands.

The country of these Cossacks, who are an assemblage of ancient Roxelans, Sarmatians, and Tartars, is called the *Ocraine* or *Ukraine*. It lies upon the borders of Russia and Poland, Little Tartary, and Turkey, and was anciently a part of Scythia. By virtue of the last treaty settled between Russia and Poland, in 1693, the latter remains in possession of all that part of the Ukraine which is situated on the west side of the Dnieper, and is now but poorly cultivated. That on the east side, inhabited by the Cossacks, is in a much better condition, and extends about two hundred and sixty miles in length, and as many in breadth. It is one continued fertile plain, watered by a great number of fine rivers, diversified with pleasant woods, and yields such plenty of all sorts of grain, pulse, tobacco, honey, and wax, as to supply a great part of the Russian empire with those commodities. Its pastures are exceeding rich, and its cattle very large; but the inhabitants are greatly plagued by locusts, which infest this fine country. The houses in the Ukraine are, like those of the Russians, mostly built with timber.

The

Cossacks.

The Cossacks are tall and well made, generally hawk-nosed, and of a good mien. They are hardly, vigorous, brave, and extremely jealous of what is most valuable in life, their liberty: nickle and wavering, but sociable, cheerful, and sprightly. They are a very powerful people, and their forces consist wholly of cavalry. Their dialect is a compound of the Polish and Russian language; but the latter is the most predominant. They were formerly Pagans or Mahometans; but upon their entering into the Polish service, they were baptized Christians of the Romish communion; and now that they belong to Russia, they profess themselves members of the Greek church.

Each of their towns, with the district belonging to it, is governed by an officer called *ottomann* or *at-tamann*.

The Don-Cossacks, so called from their residence upon the banks of the river Don, greatly resemble those already described. In the year 1559, when the czar Iwan Basilowitz was emperor of Russia, they voluntarily put themselves under his protection, and are at this time on a pretty equal footing with the other Russian subjects. They have several towns and villages upon the banks of the Don; but are prevented from extending themselves farther up the country, by the scarcity of fresh water and wood in many places. Their chief support is grazing and agriculture, and occasionally robbing and plundering, for which they want neither capacity nor inclination. Every town is governed by a magistrate called *tamann*; and the *tamanns*, with their towns, are under the jurisdiction of two *ottomanns*, who reside at Tsherkasky. The troops of these Cossacks likewise consist entirely of cavalry. In this country all the towns and villages are fortified and encompassed with palisades, to defend them against the incursions of the Calmucs and Kuban Tartars, with whom they are continually at war. The Cossacks, in general, are of great service to garrison towns by way of defence, or to pursue an enemy; but are not so good at regular attacks.

The Sietsh Cossacks, who are also called *Haidamacks*, have their particular hettman. They inhabit the Russian, Polish, and Turkish dominions, along the banks of the Dnieper.

The Yaik Cossacks dwell on the the south side of the river Yaik; and upon the success of the Russian arms in the kingdom of Astracan, voluntarily submitted to them. In stature they greatly resemble the other Cossacks; though by their boorish manner of living, and intermarriages with the Tartars, they have not the shape and air peculiar to the rest of their countrymen. Their natural dispositions and customs are, however, nearly the same. Husbandry, fishing, and feeding of cattle, are their principal employments; and, like the other tribes, they let slip no opportunity of making depredations on their neighbours. Their continual wars with the Kara-Kalpaes and the Kasatshaia-Horda oblige them to keep their towns and villages in a state of defence. They are indeed subject to Russian waiwodes, to whom they pay an annual tribute in corn, wax, honey, and cattle; but they have also their particular chiefs, who govern them according to their ancient customs. Though the generality of the Yaik Cossacks profess the Greek religion, yet a great many relics of Mahometanism and Paganism are still found

among them. Being naturally bold and hardy, they make excellent soldiers; and they are not so turbulent as the other Cossacks. They live entirely at peace with the Calmucs and their other neighbours, and even maintain a commercial intercourse with them.

COSE DE GENISTE, an order of knighthood instituted in 1234. by Louis IX. at his marriage with Margaret of Provence. The motto on the collar of this order was, *exaltat humilis*.

COSSET, among farmers, a colt, calf, or lamb, brought up by hand without the dam.

COSTA (Christopher), a celebrated botanist of the 16th century, was born in Africa, of a Portuguese father, and went into Asia to perfect himself in the knowledge of simples, where he was taken prisoner, but found means to make his escape, and after several voyages, practised physic at Bourgos. He wrote, 1. A Treatise on Indian Drugs and Medicines. 2. His Voyages to the Indies. 3. A book in praise of Women; and other works.

COSTAL, an appellation given by anatomists to several parts belonging to the fides: thus we meet with costal muscles, vertebræ, &c.

COSTANZO (Angelo di), an Italian historian and poet, lord of Catalupo, was born in 1507, of a noble and ancient family of Naples, and died about 1591. He wrote, 1. A History of Naples, from 1250 to 1489; the best edition of which is that of Aquila, in 1582, in folio, very scarce. 2. Italian Poems, which are esteemed, and have had several editions.

COSTA-RICCA, a province of North America in New Spain and in the audience of Guatemala, bounded on the north-east by the northern ocean, on the south-west by the south sea, on the north-west by Nicaragua, and on the south-east by Veragua. The soil is not very fertile, though there is plenty of cattle. Carthage is the capital town.

COSTARD (George), a clergyman of the church of England, and author of several learned works was born about the year 1710. He was educated at Wadham College, Oxford; and took the degree of M. A. in 1733. The first ecclesiastical situation in which he was placed was that of curate of Islip in Oxfordshire. In 1747 he published in 8vo, Some observations tending to illustrate the Book of Job. In 1750 he published Two Dissertations: I. On the meaning of the Word *Kesitah*, mentioned in Job, chap. xlii. ver. 11. II. on the Signification of the Word *Hermes*. In 1752 he published, in 8vo, at Oxford, *Dissertationes II. Critico-Sacræ, quarum prima explicatur, Ezek. xiii. 18. Altera vero, 2 Reg. x. 22.* In 1755 he wrote a letter to Dr Birch, which is preserved in the British Museum, respecting the meaning of the phrase *sphæra barbarica*. Some time after this he undertook to publish a second edition of Dr Hyde's *Historia Religionis veterum Persarum, eorumque Magorum*; and which was accordingly printed, under his inspection, and with his corrections, at the Clarendon Press at Oxford, in 4to, in 1760. Mr Costard's extensive learning having now recommended him to the notice of Lord Chancellor Northington, he obtained, by the favour of that nobleman, in June 1764, the vicarage of Twickenham in Middlesex; in which situation he continued till his death. In 1767 he published, in one volume quarto, *The History of Astronomy, with its application to Geography, History, and chronology*;

Coffard.

Costiveness occasionally exemplified by the Globes. This work was chiefly intended for the use of students, and contains a full and distinct view of the several improvements made in geography and astronomy. Mr Costard has shown, "by a gradual deduction, at what time, and by whom, the principal discoveries have been made in geography and astronomy; how each discovery has paved the way to what followed; and by what easy steps, through the revolution of so many ages, these very useful sciences have advanced towards their present state of perfection." In 1778 he published, in 8vo, A Letter to Nathaniel Brassey Halhead, Esq; containing some Remarks on his Preface to the Code of Gentoo Laws. This appears to have been the last of his publications. It contains some criticisms which were intended to invalidate the opinion which Mr Halhead had conceived concerning the great antiquity of the Gentoo laws; and some arguments against a notion which had been adopted by several writers, drawn from the observation of natural phenomena, that the world is far more ancient than it is represented to be by the Hebrew chronology. Mr Costard died on the 10th of January 1782. He was a man of uncommon learning, and eminently skilled in Grecian and oriental literature. His private character was amiable, and he was much respected in the neighbourhood in which he lived for his humanity and benevolence.—Besides the works already mentioned, he wrote some others; and was also the author of learned papers, inserted in the Philosophical Transactions, on astronomical and chronological subjects.

COSTIVENESS, a preternatural detention of the feces, with an unusual dryness and hardness thereof, and thence a suppression of their evacuation. See (the *Index* subjoined to) **MEDICINE**.

COSTMARY, the English name of a species of tansy. See **TANACETUM**.

COSTS, in law, imply the expences of a suit recovered by the plaintiff, together with damages. Costs were not allowed by the common law, the amercement of the vanquished party being his only punishment; but they are given by statute*. Costs are allowed in chancery for failing to make answer to a bill exhibited, or making an insufficient answer: and if a first answer be certified by a master to be insufficient, the defendant is to pay 40s.; 3l. for a second insufficient answer; 4l. for a third, &c. But if the answer be reported good, the plaintiff shall pay the defendant 40s. costs.

COSTUME, a rule or precept in painting, by which the artist is enjoined to make every person and thing sustain its proper character, and not only observe the story, but the circumstances, the scene of action, the country or place, and take care that the habits, arms, manners, proportions, and the like, exactly correspond.

COSTUS, in botany: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the eighth order *Scitamineæ*. The corolla is interior, inflated, and ringent, with the under lip trifid. There is but one species, *viz.* the arabicus, a native of the Indies. The root was formerly in some esteem as an attenuant, and serviceable in venereal complaints; but it is now rarely prescribed or met with in the shops.

COTA (Rodriguez), a Spanish poet in the 16th century, was the author of the *Tragi-comedia de Galisto y Melibea*, which has been translated into Latin by Gaspar Barthius, and into French by James de Lavaradin. The Spaniards set a great value on this performance.

CO-TANGENT, the tangent of an arch which is the complement of another to 90°. See **GEOMETRY**.

COTBUS, a town of Germany in Lower Luface. It is a strong important place, and has been subject to the king of Prussia ever since the year 1645. It is seated on the river Spree, 60 miles south-by-east of Berlin, and 55 south-east of Wirtemberg. Here are a great number of French Protestants, who have introduced manufactures; and this place is noted for excellent beer, pitch, and the cultivation of flax. E. Long. 15. 29. N. Lat. 51. 40.

COTE, a term used in coursing, to express the advantage one greyhound has over another when he runs by the side of it, and putting before it, gives the hare a turn. See **COURSING**.

COTE-Carc, a kind of refuse wool, so clung or clotted together that it cannot be pulled asunder. By 13 Rich. II. stat. 1. c. 9. it is provided, that neither denizen or foreigner make any other refuse of wools but cote-gare and villein. So the printed statute has it; but in the parliament-roll of that year it is *cod-land* and *villein*. *Cot*, or *cote*, signifies as much as cottage in many places, and was so used by the Saxons according to Verstegan.

COTELERIUS (John-Baptist), fellow of the Sorbonne, and king's Greek professor, was born at Nismes in Languedoc in 1627. He made a collection of the fathers who lived in the apostolic age, which he published at Paris in two volumes folio in 1672; all reviewed and corrected from several MSS. with a Latin translation and notes. He also published *Monumenta Ecclesie Græcæ*, in 3 vols; being a collection of Greek tracts out of the king's and M. Colbert's libraries, and which had never been published before: to these he added a Latin translation and notes. He intended a farther prosecution of this work; but his intense studies broke his constitution, and deprived him of life in 1686. Besides his great skill in languages and ecclesiastical antiquities, Cotelerius was remarkable for his probity and candour.

COTERELLUS. *Cotarius*, and *coterellus*, according to Spelman and Du Fresne, are servile tenants; but in Doomsday and other ancient MSS. there appears a distinction, as well in their tenure and quality as in their name: for the cotarius hath a free soccage tenure, and paid a stated firm or rent in provisions or money, with some occasional customary services; whereas the coterellus seems to have held in mere villenage, and his person, issue, and goods, were disposable at the pleasure of the lord.

COTERIE, a term adopted from the French trading associations or partnerships, where each person advances his quota of stock and receives his proportion of gain; and which retains its original meaning when applied to little assemblies or companies associated for mirth and good humour, where each one furnishes his quota of pleasantry. Here they coin new words not understood elsewhere, but which it becomes fashionable for others to use; and they are thought ridiculous who

Cott.

COTES (Roger), an excellent mathematician of the 18th century. He early discovered an inclination to the mathematics; and at 17 years of age was admitted a pensioner of Trinity College, Cambridge. In 1706 he was appointed professor of astronomy in the professorship founded by Dr Plume archdeacon of Rochester, being chosen the first in that chair for his great merit and learning. In the year 1713, at the request of Dr Richard Bentley, he published at Cambridge, in 4to, a second edition of Sir Isaac Newton's *Principia*, with all the improvements which the author had annexed thereto; to which he prefixed an excellent Preface. He prepared several useful books for the public; and wrote A Description of the great Meteor which appeared on the 6th of March 1716, published in the Philosophical Transactions. He lived but a little while to carry on the discourses for which he was eminently qualified; dying in the prime of his age in 1716, to the great regret of all the lovers of the sciences.

COTESWOLD, several sheep-cotes, and sheep feeding on hills. It comes from the Saxon *cote*, i. e. *casa*, "a cottage," and *wold*, "a place where there is no wood."

COTHURNUS, **BUSKIN**, a very high shoe or patten raised on soles of cork, worn by the ancient actors in tragedy to make them appear taller and more like the heroes they represented; most of whom were supposed to be giants. It covered the greatest part of the leg, and was tied beneath the knee. Æschylus is said to have invented the cothurnus. See **BUSKIN**.

COTICE, or **COTISE'**, in heraldry, is the fourth part of the bend; which with us is seldom or ever borne but in couples, with a bend between them: whence probably the name; from the French *cote*, "side;" they being borne, as it were, a-side of the bend.—A bend thus bordered is said to be *cotised*, *cotice*. He bears sable on a bend cotised argent three cinquefoils.

COTILLON, the name of a well-known brisk dance, in which eight persons are employed. The term is French, and signifies an under-petticoat.

COTRONE, a town in the Hither Calabria, standing on the site of the ancient Croton, though not occupying the same extent of Ground: (See **CROTON**). It is fortified with single walls, and a castle erected by Charles V. Its private buildings are poor and sordid, the streets dismal and narrow. Cheese and corn are the principal commodities. For the stowage of corn, there are ranges of granaries in the suburbs; and the annual export is about 200,000 tomoti. The cheese is tolerably good; but has a great deal of that hot acrid taste so common to all cheese made with goats milk. The wine is not unpleasant, and appears susceptible of improvement by better management in the making and keeping.

COTT, a particular sort of bed-frame, suspended from the beams of a ship for the officers to sleep in between the decks. This contrivance is much more convenient at sea than either the hammocks or fixed cabins: being a large piece of canvas sewed into the form of a chest, about six feet long, one foot deep, and from two to three feet wide. It is extended by a

square wooden frame with a canvas bottom, equal to its length and breadth, to retain it in an horizontal position.

Cottage,
Cotton.

COTTAGE, **COTTAGIUM**, is properly a little house for habitation without lands belonging to it; stat. 4 Edw. I. But by a later statute, 31 Eliz. c. 7. no man may build a cottage unless he lay four acres of land thereto; except it be in market-towns or cities, or within a mile of the sea, or for the habitation of labourers in mines, sailors, foresters, shepherds, &c. and cottages erected by order of justices of peace for poor impotent people are excepted out of the statute. The four acres of land to make it a cottage within the law are to be freehold, and land of inheritance; and four acres holden by copy, or for life or lives, or for any number of years, will not be sufficient to make a lawful cottage.

COTTON, in commerce, a soft downy substance found on the gossypium, or cotton-tree. See **GOSYPIUM**.

Cotton is separated from the seeds of the plant by a mill, and then spun and prepared for all sorts of fine work, as stockings, waistcoats, quilts, tapestry, curtains, &c. With it they likewise make muslin; and sometimes is mixed with wool, sometimes with silk, and even with gold itself.

The finest sort comes from Bengal and the coast of Coromandel,

Cotton makes a very considerable article in commerce, and is distinguished into cotton-wool and cotton-thread. The first is brought mostly from Cyprus, St John d'Arce, and Smyrna: the most esteemed is white, long, and soft. Those who buy it in bales should see that it has not been wet, moisture being very prejudicial to it.

Of cotton-thread, that of Damas, called *cotton d'ounce*, and that of Jerusalem, called *bazas*, are the most esteemed; as also that of the West India islands. It is to be chosen white, fine, very dry, and evenly spun. The other cotton-threads are the half bazas, the rames, the beledin, and gondezel; the payas and montafiri, the genequins, the baquins, the josselaffars, of which there are two sorts. Those of India, known by the name of Tutucorin, Java, Bengal, and Surat, are of four or five sorts, distinguished by the letters A, B, C, &c. They are sold in bags, with a deduction of one pound and a half on each of those of Tutucorin, which are the dearest, and two pounds on each bag of the other sorts. For those of Fielebas, Smyrna, Aleppo, and Jerusalem, the deduction at Amsterdam is eight in the hundred for the tare, and two in the hundred for weight, and on the value one *per cent.* for prompt payment.

Cotton of Siam, is a kind of silky cotton in the Antilles, so called because the grain was brought from Siam. It is of an extraordinary fineness, even surpassing silk in softness. They make hose of it there preferable to silk ones for their lustre and beauty. They sell from 10 to 12 and 15 crowns a pair, but there are very few made unless for curiosity.

The manner of packing Cotton as practised in the Antilles. The bags are made of coarse cloth, of which they take three ells and a half each; the breadth is one ell three inches. When the bag has been well soaked in water, they hang it up, extending the mouth

of:

Cotton. of it to cross pieces of timber nailed to posts fixed in the ground seven or eight feet high. He who packs it goes into the bag, which is six feet nine inches deep, or thereabouts, and presses down the cotton, which another hands him, with hands and feet: observing to tread it equally every where, and putting in but little at a time. The best time of packing is in rainy moist weather, provided the cotton be under cover. The bag should contain from 300 to 320 pounds. The tare abated in the Antilles is three in the hundred. Cotton being a production applicable to a great variety of manufactures, it cannot be too much cultivated in our own plantations that will admit of it.

Cotton-Spinning, the art or process of reducing cotton-wool into yarn or thread.

The most simple method for this purpose, and the only one in use for a long time in Britain, was by the hand upon the well-known domestic machine called a *one-thread-wheel*. But as the demand for cotton-goods began to increase, other inventions were thought of for expediting this part of the manufacture. About 50 years ago, one Paul and others of London contrived an engine for a more easy and expeditious method of spinning cotton, and for which they obtained a patent; but the undertaking did not prove successful. Some years thereafter, various machines were constructed by different persons for facilitating the spinning of cotton; but without producing any very material or lasting advantage. At length, about the year 1757, Mr James Hargrave, a weaver in the neighbourhood of Blackburn in Lancashire, constructed a machine by which a great number of threads (from 20 to 80) might be spun at once, and for which he obtained his Majesty's letters-patent. This machine is called a *Jenny*, and is the best contrivance for spinning *wool* or *shute* that has hitherto appeared. It is now commonly constructed for 84 threads; and with it one person can spin 100 English hanks in the day, each hank containing 840 yards.

Carding of cotton, as a preparation for spinning, used formerly to be performed by the hand, with a single pair of cards, upon the knee: but this being a tedious method, ill suited to the rapid operations of the new spinning machines, other methods were contrived for affording a quicker and more adequate supply. The first improvement for this purpose was likewise made by Mr Hargrave; and consisted in applying two or three cards to the same board, and fixing them to a stool or stock; whence they obtained the name of *stock-cards*. With these, one woman could perform two or three times as much work as she could do before in the common way. A still more expeditious method of carding, however, by what are commonly called *cylinder-cards*, was soon afterwards invented, and is that which is now most commonly practised: but as several persons lay claim to this invention, it is not easy to determine to whom in particular the merit of it is due.

The next and most capital improvements which this branch of manufacture received were from Mr Arkwright, a native of Lancashire, now Sir Richard Arkwright of Cromford in Derbyshire. He first brought forward his new method of spinning cotton in 1768, for which he obtained a patent in 1769; he afterwards, in 1775, obtained a patent for engines which

he had constructed to prepare the materials for spinning: though one of these patents, being challenged at law, was set aside some years before it expired.

The result of Mr Arkwright's different inventions and improvements is a combination of machinery, by which cotton is *carded*, *roved*, and *spun*, with the utmost exactness and equality; and such a degree of perfection attained in spinning *warp*, as is not to be equalled in any other part of the world. To these improvements Britain is entirely indebted for the great extent of its cotton manufactures; large buildings having been erected for that branch both in England and Scotland, many of which contain several thousands of spindles, each driven by one or more large water-wheels; and some of such extent as to spin at the rate of one thousand yards of twist or warp yarn in the minute.

Other machines have been invented at different times, and a variety of improvements made by different mechanics and manufacturers; one of which in particular we must not omit to mention. It is called a *Mule* being a kind of mixture of machinery between the *warp*-machine of Mr Arkwright and the *woof*-machine or hand-jenny of Mr Hargrave, and was also invented in Lancashire. This machine bids fair to be of a great use in spinning cotton yarn for muslins to a degree of fineness never before known in Britain, being nearly equal in quality to those usually brought from India.

Cotton Mills, are large buildings with peculiar machinery for carding, roving, and spinning cotton: (see the preceding article.)—These were entirely unknown in Britain before the different inventions and improvements of Messrs Arkwright and Hargrave; since which time great numbers have been erected in England, and several in Scotland.

The first erections of the kind were by Messrs Arkwright and Hargrave, both in the town of Nottingham, and both nearly at the same time. The Engines were then driven by horses: but since that time they have been chiefly erected upon water-falls in different parts of the country; particularly the warp machines, which are better adapted for being driven by water than any other. The most extensive of these is in the village and neighbourhood of Cromford in Derbyshire, and under the immediate inspection of Sir Richard Arkwright. The first that was erected in Scotland was for Mr Peter Brotherston, under the inspection and direction of Mr John Hackett from Nottingham; and is in the neighbourhood of Pennycuik near Edinburgh. Since which time several have been erected in the neighbourhood of Glasgow, Paisley, Lanark, Perth, &c.

General State of the Cotton Manufactory. The facilities which the manufacturers of Great Britain had suddenly acquired, and the immense capitals which they have so recently laid out in expensive machinery and other heavy establishments for carrying on the cotton trade, are unparalleled in the annals of the world. Above one hundred and forty cotton-mills are now built in Great Britain, of which nearly two-thirds have been erected within these seven years. Besides these, there are above 20,500 hand-mills or jennies for spinning the shute for the twisted yarn spun by the water-mills.

Above a million of money was, within this time, sunk

Cotton. sunk in mills, hand engines, and other machines, including the grounds and necessary buildings.

Expence of water-mills, - L. 715,000 0 0
Ditto of hand-jennies, houses, buildings, and auxiliary machinery, supposed at least, - 285,000 0 0

Total, - L. 1,000,000 0 0

A power had been also created of working nearly two millions of spindles; and men, women, and children were trained to this business, capable of carrying the cotton manufacture almost to any extent. In 1787, the power of spindles capable of being worked was estimated as follows:

In the water-mills, - - 286,000
In the jennies, - - - 1,665,100

Total spindles, 1,951,100

In the branches applicable to muslin and callico, it was calculated that employment was given to 100,000 men and women, and at least 60,000 children; many of the latter having been taken from different parishes and hospitals in Great Britain.

The quantity of the raw material of cotton wool consumed in this manufacture, which did not amount to 6,000,000lb. in 1781, and was only about 11,000,000lb. six years ago, had amounted in the year 1787 to the enormous height of 22,000,000lb. and upwards; and the astonishing rapidity of this increase is in some measure to be attributed to the extension of these branches to the goods of India, particularly the callicoes and muslins.

British callicoes were first made in Lancashire about the year 1772, but the progress was slow till within these last 12 years. The quantity manufactured has since extended from about 50,000 to 1,000,000 of pieces made in the course of a single year.

British muslins were not successfully introduced until the year 1731, and were carried to no great extent until 1785, after which period the progress during two years became rapid beyond all example. The acquisition of cotton wool of a superior quality from Demerara and the Brazils, and the improvements made in the spinning fine yarns upon the mule jennies, had given a spring to this branch of the cotton manufactory, which extended it beyond what it was possible to have conceived. Above half a million pieces of muslin of different kinds, including shawls and handkerchiefs, were computed to be annually made in Great Britain; while the quantity not only increased daily with the new accession of powers that were bursting forth upon the country, but the quality was exceedingly improved; and since a yearly supply of about 300 bales of East Indian cotton has been obtained by the way of Ostend, yarns have been spun, and muslins have been wove, equal to any from India. Nothing, therefore, but a fine raw material appeared wanting to enable the British manufacturer to carry this branch to the greatest extent; and, of all others, it is that species of cotton goods which deserves most to be encouraged, because of the immense return it makes for labour more than any other branch of the cotton manufactory. East India cotton wool has been spun into one pound of yarn worth five guineas; and when wove into muslin, and afterwards ornamented by children in the tambour, has

VOL. V.

extended to the value of L. 15; yielding a return of 5,900 per cent. on the raw material.

But the state of the raw materials, and the progressive and astonishing increase of this manufacture, will be best explained by what follows:

	Cotton Wool used in the Maufacture.	Supposed Value when manufactured.
1781,	lb. 5,101,920	L. 2,000,000
1782,	11,206,810	3,900,000
1783,	9,546,179	3,200,000
1784,	11,280,238	3,950,000
1785,	17,992,838	6,000,000
1786,	19,151,867	6,500,000
1787,	22,600,000	7,500,000

Such was the progress of the British cotton manufactory till 1787; when, with establishments and mechanical powers capable of bringing forward immense quantities of goods into the consumption, this manufacture was checked by a great and sudden reduction of the prices of East India goods of the same species, which were sold above 20 per cent. on an average under the lowest prices at which the British manufacturer can afford to sell without loss.

This conduct in the East India Company quickly operated to the great prejudice of the British manufactures; and there is no saying how far these might be reduced, should that company be allowed to press goods upon the market at prices which have no relation to the original cost, and under circumstances where the just laws of competition cannot operate, and where every idea of protecting-duties is annihilated in the effect of the general system.

It is believed, however, that the home-manufacture of this article, in all its different branches, has of late revived, and is likely to be carried on with greater advantage to the manufacturer than ever it was before.

Lavender COTTON. See SANTOLINA.

Philosophic COTTON, a name given to the flowers of zinc, on account of their white colour and resemblance to cotton.

Flax made to resemble COTTON. See FLAX.

Silk COTTON. See BOMBAX.

COTTON-Weed. See GNAPHALIUM.

COTTON (Sir Robert), a most eminent English antiquarian, descended from an ancient family, was born in 1570. In his 18th year he began to collect ancient records, charters, and other MSS. Camden, Selden, and Speed, acknowledged their obligations to him in their respective works. He was highly distinguished by queen Elizabeth, and by James I. who created him a baronet. He wrote many things himself; but our principal obligations to him are for his valuable library, consisting of curious manuscripts, &c. which he was forty years in collecting. At his death in 1621, he left the property of it to his family, though designed for public use. A large accession was made to this library by private benefactions before the death of the founder, and afterwards by the purchases of his heirs, and donations of others, who added to it a great number of books, chiefly relating to the history and antiquities of the British nation. An act of parliament was obtained, at the request of Sir John Cotton, in 1700, for preserving it after his decease, under the above denomination, for public use. It is now fixed in the British Museum. For statutes relating

Cotton to it, see 12 and 13 W. III. c. 5. and 5 Anne, cap. 30.

COTTON (Charles), a burlesque poet, was descended of a good family, and lived in the reigns of Charles II. and James II. His most celebrated piece is *Scarronides*, or *Travestie* of the first and fourth books of the *Æneid*. But though, from the title, one would be apt to imagine it an imitation of Scarron's famous *Travestie* of the same author, yet, upon examination, it would be found greatly to excel not only that, but every other attempt of the same kind that hath been hitherto made in any language. He has also translated several of Lucian's dialogues, in the same manner, under the title of *the Scoffer Scoff'd*;—and written another poem of a more serious kind, entitled *the Wonders of the Peak*. The exact period of either Mr Cotton's birth or his death, is no-where recorded; but it is probable the latter happened about the time of the revolution. Neither is it better known what his circumstances were with respect to fortune; they appear, however, to have been easy, if one may judge from the turn of his writings, which is such as seems scarcely possible for any one to indulge whose mind was not perfectly at ease. Yet there is one anecdote told of him, which seems to show that his vein of humour could not restrain itself on any consideration, viz. that in consequence of a single couplet in his *Virgil Travestie*, wherein he has made mention of a peculiar kind of ruff worn by a grandmother of his who lived in the Peak, he lost an estate of L. 400 *per annum*; the old lady, whose humour and testy disposition he could by no means have been a stranger to, being never able to forgive the liberty he had taken with her; and having her fortune wholly at her disposal, although she had before made him her sole heir, altered her will, and gave it away to an absolute stranger.

COTTUS, or **BULL-HEAD**, in ichthyology, a genus belonging to the order of thoracici. The head is broader than the body, and the gill-membrane has six rays. There are six species; the most remarkable are,

1. The gobio, or river-bull head, is very common in all our clear brooks: it lies almost always at the bottom, either on the gravel or under a stone: it deposits its spawn in a hole which it forms among the gravel, and quits it with great reluctance. It feeds on water insects. This fish seldom exceeds the length of three inches and an half: the head is large, broad, flat, and thin at its circumference, being well adapted for insinuating itself under stones: on the middle part of the covers of the gills is a small crooked spine turning inwards. The eyes are very small: the irides yellow: the body grows slender towards the tail, and is very smooth. The colour of this fish is as disagreeable as its form, being dusky, mixed with a dirty yellow; the belly is whitish. The taste, however, is excellent.

2. The cataphraetus, armed bull-head, or *pogge*, is very common on most of the British coasts. It seldom exceeds five inches and an half in length; and even seldom arrives at that size. The head is large, bony, and very rugged: the end of the nose is armed with four short upright spines: on the throat are a number of short white beards: the body is octogoeal, and co-

vered with a number of strong bony crusts, divided into several compartments, the ends of which project into a sharp point, and form several echinated lines along the back and sides from the head to the tail.

3. The scorpius, or father-lasher, is not uncommon on the rocky coasts of Britain; it lurks under stones, and will take a bait. It seldom exceeds 8 or 9 inches in length. The head is large, and has a most formidable appearance, being armed with vast spines, which it can oppose to any enemy that attacks it, by swelling out its cheeks and gill-covers to a large size. The nose and space contiguous to the eyes are furnished with short sharp spines; the covers of the gills are terminated by exceeding long ones, which are both strong and very sharp pointed. The mouth is large; the jaws covered with very small teeth; the roof of the mouth is furnished with a triangular spot of very minute teeth. This species is very frequent in the Newfoundland seas, where it is called *scolping*: it is also as common on the coast of Greenland, in deep water near the shore. It is a principal food of the natives, and the soup made of it is said to be agreeable as well as wholesome.

COTULA, **MAY-WEED**: A genus of the polygama superflua order, belonging to the syngenesia class of plants. The receptacle is almost naked; the pappus marginated; the florets of the disc quadrifid; of the radius frequently none. There are six species, all of them herbaceous annuals, rising six or eight inches high, and adorned with yellow flowers. There are none of them natives of Britain, and most of them require artificial heat.

COTULA, or *Cotyla* a liquid measure in use among the ancients.

Fannius says, the cotyla was the same thing with the hemina, which was half a sextary.

*At cotylas, quas si placeat, dixisse licebit
Heminas recepit geminas extarias unus.*

Chorier observes, that the cotyla was used as a dry measure as well as a liquid one; from the authority of Thucydides, who in one place mentions two cotylæ of wine, and in another two cotylæ of bread.

COTURNIX, in ornithology. See **TETRAO**.

COTYLEDON, **NAVEL-WORT**; a genus of the pentagynia order, belonging to the decandria class of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is quinquesfid; the corolla monopetalous: there are five nectariferous scales at the base of the germen, and five capsules. There are eight species, most of them hardy succulent perennials; though some require to be kept in a stove, as being natives of warm climates. They rise from half a foot to a yard and an half high, and are adorned with yellow flowers growing in umbels. They are easily propagated either by seed or cuttings of their branches.

COTYLEDONES, in anatomy, are certain glandular bodies, adhering to the chorion of some animals.

COTYLEDONES, in botany, the perishable porous side-lobes of the seed, which involve, and for some time furnish nourishment to the embryo plant. See **BOTANY**, p. 435.

COTYTTO, the goddess of all debauchery. Her festivals called *Cotyttia* were celebrated by the Athenians, Corinthians, Thracians, &c. during the night. Her priests were called *bapta*, and nothing but debauchery

Cotula
||
Cotytto.

Couch
I
Covenant.

chery and wantonness prevailed at the celebration. A festival of the same name was observed in Sicily, where the votaries of the goddesses carried about boughs hung with cakes and fruit, which it was lawful for any person to pluck off. It was a capital punishment to reveal whatever was seen or done at these sacred festivals. It cost Eupolis his life for an unseasonable reflection upon them. The goddesses Corytto is supposed to be the same as Proserpine.

COUCH, in painting, denotes a lay, or impression of colour, whether in oil or water, wherewith the painter covers his canvas, wall, wainscot, or other matter to be painted.

The word is also used for a lay or impression on any thing, to make it firm and consistent, or to screen it from the weather.

Paintings are covered with a couch of varnish; a canvas to be painted must first have two couches of size, before the colours be laid; two or three couches of white lead are laid on wood, before the couch of gold be applied: the leather-gilders lay a couch of water and whites of eggs on the leather, before they apply the gold or silver leaf.

The gold wire drawers also use the word *couch* for the gold or silver leaf wherewith they cover the mass to be gilded or silvered, before they draw it through the iron that is to give it its proper thickness.

The gilders use couch for the quantity of gold or silver leaves applied on the metals in gilding or silvering. Each couch of gold is but one leaf, or two at most, and each of silver three to gild: if the gilding be hatched, there are required from eight to twelve couches; and only three or four if it be without hatching. To silver there are required from four to ten couches, according to the beauty of the work.

COUCH-Grass, in botany. See TRITICUM.

COUCHANT, in heraldry, is understood of a lion, or other beast, when lying down, but with his head raised; which distinguishes the posture of couchant from dormant, wherein he is supposed quite stretched out and asleep.

COUCHÉ, in heraldry, denotes any thing lying along: thus, chevron-couché, is a chevron lying sideways, with the two ends on each side of the shield, which should properly rest on the base.

COUCHER, or COURCHER, in English statutes, is used for a factor, or one that continues in some place or country for traffic; as formerly in Gascoign, for the buying of wines. Anno 37. Edw. III. c. 16.

COUCHER is also used for the general book in which any religious house or corporation register their particular acts. Anno 3 and 4. Edw. VI. c. 10.

COUCHING of a CATARACT, in surgery. See SURGERY-Index.

COVE, a small creek or bay, where boats and small vessels may ride at anchor, sheltered from the wind and sea.

COVENANT, in law, is the consent and agreement of two or more persons to do, or not to do, some act, or thing, contracted between them. Also it is the declaration the parties make, that they will stand to such agreement, relating to lands or other things; and is created by deed in writing, sealed and executed by the parties, otherwise it may be implied in the contract as incident thereto. And if the persons do

not perform their covenants, a writ or action of covenant is the remedy to recover damages for the breach of them. Covenant
Coventry.

COVENANT, in ecclesiastical history, denotes a contract or convention agreed to by the Scotch in the year 1638, for maintaining their religion free from innovation. In 1581, the general assembly of Scotland drew up a confession of faith, or national covenant, condemning episcopal government, under the name of *hierarchy*, which was signed by James I. and which he enjoined on all his subjects. It was again subscribed in 1590 and 1596. The subscription was renewed in 1638, and the subscribers engaged by oath to maintain religion in the same state as it was in 1580, and to reject all innovations introduced since that time. This oath annexed to the confession of faith received the name of the *covenant*; as those who subscribed it were called *covenanters*.

COVENANT, in theology, is much used in connection with other terms; as, 1. *The Covenant of Grace* is that which is made between God and those who believe the gospel, whereby they declare their subjection to him, and he declares his acceptance of them and favour to them. The gospel is sometimes denominated a *covenant of grace*, in opposition to the Mosaic law. 2. *Covenant of Redemption* denotes, a mutual stipulation, tacit or express, between Christ and the Father, relating to the redemption of sinners by him, previous to any act on Christ's part under the character of Mediator. 3. *Covenant of Works* signifies, in the language of some divines, any covenant whereby God requires perfect obedience from his creatures, in such a manner as to make no express provision for the pardon of offences to be committed against the precepts of it, on the repentance of such supposed offenders, but pronounces a sentence of death upon them; such, they say, was the covenant made with Adam in a state of innocence, and that made with Israel at Mount Sinai.

Solemn League and COVENANT, was established in the year 1643, and formed a bond of union between Scotland and England. It was sworn and subscribed by many in both nations; who hereby solemnly abjured popery and prelacy, and combined together for their mutual defence. It was approved by the parliament and assembly at Westminster, and ratified by the general assembly of Scotland in 1645. King Charles II. disapproved of it when he surrendered himself to the Scots army in 1646: but in 1650 he declared his approbation both of this and the national covenant by a solemn oath; and in August of the same year, made a farther declaration at Dunfermline to the same purpose, which was also renewed on occasion of his coronation at Scone in 1651. The covenant was ratified by parliament in this year, and the subscription of it required by every member, without which the constitution of the parliament was declared null and void. It produced a series of distractions in the subsequent history of that country, and was voted illegal by parliament, and provision made against it. Stat. 14. Car. II. c. 4.

Ark of the COVENANT, in Jewish antiquity. See ARK.

COVENTRY, a town of Warwickshire, in England, situated in W. Long. 1. 26. N. Lat. 52. 25. It is an ancient place, and is supposed to derive its name

Coventry. from a convent formerly situated here. Leofric, earl of Mercia, who rebuilt the religious house after it had been destroyed by the Danes, and was lord of the place about the year 1040, is said, upon some provocation, to have loaded them with heavy taxes. Being importuned by his lady, Godiva, to remit them, he consented, upon condition that she should ride naked through the town, which he little imagined she would ever comply with. But he found himself mistaken: for she accepted the offer, and rode through the town with her long hair scattered all over her body; having first enjoined the citizens not to venture, on pain of death, to look out as she passed. It is said, however, that a certain taylor could not help peeping; and to this day there is an effigy of him at the window whence he looked. To commemorate this extraordinary transaction, and out of respect to the memory of their patroness, the citizens make a procession every year, with the figure of a naked woman on horseback. After Leofric's death, the earls of Chester became lords of the city, and granted it many privileges. At length it was annexed to the earldom of Cornwall; and growing considerable, had divers immunities and privileges conferred upon it by several kings; particularly that of a mayor and two bailiffs by Edward III.; and Henry VI. made it, in conjunction with some other towns and villages, a distinct county, independent of the county of Warwick. But afterwards Edward IV. for their disloyalty, deprived them of their liberties, which were not restored till they had paid a fine of 500 merks. By a charter from James I. an alderman is allotted to each ward, with the powers of the justices of the peace within the city and its liberties. The walls were ordered to be demolished at the restoration; and now nothing remains of them but the gates, which are very lofty. Coventry is noted for the two parliaments which were held in it; the one called the parliament of *Dunces*, and the other of *Devils*. The former was so called on account of the exclusion of the lawyers; and the attainders of the duke of York, the earls of Salisbury, Warwick, and March, procured the other the epithet of *Devils*. The town-house of Coventry is much admired for its painted windows representing several kings and others that have been benefactors to the city. The chief manufactures carried on here are temmies and ribbands.

Coventry sends two members to parliament, and gives title of earl to an ancient family of the same name.—Coventry is a bishop's see. The bishopric is said to have been founded by Oswy king of Mercia, in the year 656 or 657; and although it hath a double name, yet, like Bath and Wells, it is a single diocese. It was so extremely wealthy, that king Offa, by the favour of pope Adrian, constituted it an archiepiscopal see; but this title was laid aside on the death of that king. In 1075, Peter, the 34th bishop, removed the see to Chester. In 1102, Robert de Limsey, his immediate successor, removed it to Coventry; and Hugo Novant, the 41st bishop, removed it back to Litchfield, but with great opposition from the monks of Coventry. The dispute was finally settled in a manner nearly similar to that which is mentioned between Bath and Wells. Here it was agreed that the bishop should be styled from both places, and that Coventry should have the precedence; that they should choose the bi-

shop alternately; and that they should both make one chapter to the bishop, in which the prior of Coventry should be the chief man. Matters continued thus till the Reformation, when the priory of Coventry being dissolved by king Henry VIII. the style of the bishop continued as before. But an act of parliament passed 33d of king Henry VIII. to make the dean and chapter of Litchfield one sole chapter to the bishop. This see hath given three saints to the church, and to the nation, one lord chancellor, three lord treasurers, three presidents of Wales, one chancellor to the university of Cambridge, and one master of the Wardrobe. The old church built by king Oswy being taken down by Roger de Clinton, the 37th bishop, he built the beautiful fabric that now stands in 1148, and dedicated it to the Virgin Mary and St Chad. During the grand rebellion, the church suffered much; but, soon after the Restoration, it was repaired and beautified. This diocese contains the whole counties of Stafford and Derby (except two parishes of the former), the largest part of Warwickshire, and near only one half of Shropshire, in which are 555 parishes, of which 250 are impropriate. It hath four archdeacons, viz. Stafford, Derby, Coventry, and Shrewsbury. It is valued in the king's books at L. 559 : 18 : 2³, and is computed to be worth annually L. 2800. The clergy's tenth is L. 590 : 16 : 11⁷. To this cathedral belong a bishop, a dean, a precentor, a chancellor, a treasurer, four archdeacons, twenty-seven prebendaries, five priest vicars, seven lay clerks, or singing men, eight choristers, and other under officers and servants.

CO-VERSED SINE, in geometry, the remaining part of the diameter of a circle, after the versed sine is taken from it. See GEOMETRY.

COVERT, in law.—*Feme Covert* denotes a woman married, and so covered by, or under the protection of, her husband.

COVERT-way, or CORRIDOR, in fortification, a space of ground, level with the field on the edge of the ditch, three or four fathoms broad, ranging quite round the half moons and other works towards the country. It has a parapet raised on a level, together with its banquets and glacis. See FORTIFICATION.

COVERTURE, in law, is applied to the state and condition of a married woman, who is under the power of her husband, and therefore called *femme covert*.

COUGH, in medicine. See (*Index* subjoined to) MEDICINE.

COUGH, in farriery. See FARRIERY, § vi.

COUCH, called the husk, is a disease to which young bullocks are subject. In this disorder the wind-pipe and its branches are loaded with small taper worms. Farmers count the disease incurable; but fumigations with mercurials, as cinnabar, or with fœtids, as tobacco, might prove serviceable.

COUHAGE, or STINKING-BEANS; a kind of kidney-beans imported from the East Indies, where they are used as a cure for the dropsy. The down growing on the outside of the pod is so pointed as, like a nettle, to sting the flesh, though not with so painful a sensation. This, by a corruption of the word, is called *cowitch*. The plant is a species of *DOLICHOS*.

COVIN, a deceitful compact or agreement between two or more to deceive or prejudice a third person;

As,

Co-versed
||
Covin.

Coving
|
Council.

Council

As, if a tenant for life conspire with another, that this other shall recover the land which the tenant holds, in prejudice of him in reversion. Dr Skinner takes the word to be a corruption of the Latin *conventum*, and therefore writes it *coven*. See CONSPIRACY.

COVING, in building, is when houses are built projecting over the ground plot, and the turned projection arched with timber, lathed and plastered.

COVINUS, among the ancients, a kind of chariot, in which the Gauls and Britons used to fight in battles.

COUL, or COWL. See COWL.

COULTER, in husbandry, and iron-instrument, fixed in the beam of a plough, and serving to cut the edge of each furrow. See AGRICULTURE.

COUNCIL, or COUNSEL, in a general sense, an assembly of divers considerable persons to concert measures relative to the state.

In Britain, the law, in order to assist the king in the discharge of his duties, the maintenance of his dignity, and the exertion of his prerogative, hath assigned him a diversity of councils to advise with.

1. The first of these is the high court of parliament. See PARLIAMENT.

2. The peers of the realm are by their birth hereditary counsellors of the crown; and may be called together by the king, to impart their advice in all matters of importance to the realm, either in time of parliament, or, which hath been their principal use, when there is no parliament in being. Accordingly, Bracton, speaking of the nobility of his time, says, they might properly be called "consules a consulendo; reges enim tales sibi associant ad consulendum." And in the law-books it is laid down, that the peers are created for two reasons: 1. *Ad consulendum*, 2. *Ad defendendum, regem*: for which reasons the law gives them certain great and high privileges; such as freedom from arrests, &c. even when no parliament is sitting; because the law intends, that they are always assisting the king with their counsel for the common-wealth, or keeping the realm in safety by their prowess and valour.

Instances of conventions of the peers, to advise the king have been in former times very frequent; though now fallen into disuse, by reason of the more regular meetings of parliament. Sir Edward Coke gives us an extract of a record, 5 Henry IV. concerning an exchange of lands between the king and the earl of Northumberland, wherein the value of each was agreed to be settled by advice of parliament (if any should be called before the feast of St Lucia), or otherwise by advice of the grand council of peers, which the king promises to assemble before the said feast, in case no parliament shall be called. Many other instances of this kind of meeting are to be found under the ancient kings: though the formal method of convoking them had been so long left off, that when king Charles I. in 1640, issued out writs under the great seal, to call a council of all the peers of England, to meet and attend his majesty at York, previous to the meeting of the long parliament, the earl of Clarendon mentions it as a new invention, not before heard of; that is, as he explains himself, so old, that it had not been practised in some hundreds of years. But though there had not for so long before been an instance, nor has there been any since, of assembling them in so solemn a manner,

Blackst.
Comment.

yet in cases of emergency, princes have at several times thought proper to call for, and consult as many of the nobility as could easily be brought together: as was particularly the case with king James II. after the landing of the prince of Orange; and with the prince of Orange himself, before he called the convention parliament which afterwards called him to the throne.

Besides this general meeting, it is usually looked upon to be the right of each particular peer of the realm, to demand an audience of the king, and to lay before him with decency and respect such matters as he shall judge of importance to the public weal. And therefore, in the reign of Edward II. it was made an article of impeachment in parliament against the two Hugh Spencers, father and son, for which they were banished the kingdom, "that they by their evil covin would not suffer the great men of the realm, the king's good counsellors, to speak with the king, or to come near him; but only in presence and hearing of said Hugh the father and Hugh the son, or one of them, and at their will, and according to such things as pleased them."

3. A third council belonging to the king, are, according to Sir Edward Coke, his judges of the courts of law, for law-matters. And this appears frequently in the English statutes, particularly 14 Edward III. c. 5. and in other books of law. So that when the king's council is mentioned generally, it must be defined, particularized, and understood, *secundum subjectam materiam*; "according to the subject matter:" and if the subject be of a legal nature, then by the king's council is understood his council for matters of law; namely, his judges. Therefore, when by statute 16 Richard II. c. 5. it was made a high offence to import into England any papal bulls, or other processes from Rome; and it was enacted, that the offenders should be attached by their bodies, and brought before the king and his council to answer for such offence; here, by the expression of king's council, were understood the king's judges of his courts of justice, the subject-matter being legal: this being the general way of interpreting the word *council*.

4. But the principal council belonging to the king is his *privy council*, which is generally, by way of eminence, called *the Council*. For an account of its constitution and powers, see the article *PRIVY-COUNCIL*.

Aulic COUNCIL. See AULIC.

Common COUNCIL, in the city of London, is a court wherein are made all bye-laws which bind the citizens. It consists, like the parliament, of two houses; an upper composed of the lord mayor and aldermen; and a lower, of a number of common-council men, chosen by the several wards, as representatives of the body of the citizens.

COUNCIL of War, an assembly of the principal officers of an army or fleet, occasionally called by the general or admiral to concert measures for their conduct with regard to sieges, retreats, engagements, &c.

COUNCIL, in church history, an assembly of prelates and doctors, met for the regulating matters relating to the doctrine or discipline of the church.

National COUNCIL, is an assembly of prelates of a nation under their primate or patriarch.

Oecumenical or General COUNCIL, is an assembly which represents

Council.
Counsel.

represents the whole body of the universal church. The Romanists reckon eighteen of them; Bullinger, in his treatise de Conciliis, six; Dr Prideaux, seven; and bishop Beveridge has increased the number to eight, which, he says, are all the general councils which have ever been held since the time of the first Christian emperor. They are as follows: 1. The council of Nice, held in the reign of Constantine the Great, on account of the heresy of Arius. 2. The council of Constantinople, called under the reign and by the command of Theodosius the Great, for much the same end that the former council was summoned. 3. The council of Ephesus, convened by Theodosius the younger at the suit of Nestorius. 4. The council of Calcedon, held in the reign of Martianus, which approved of the Eutychian heresy. 5. The second council of Constantinople, assembled by the emperor Justinian, condemned the three chapters taken out of the book of Theodorus of Mopsuestia, having first decided that it was lawful to anathematize the dead. Some authors tell us, that they likewise condemned the several errors of Origen about the Trinity, the plurality of worlds, and pre-existence of souls. 6. The third council of Constantinople, held by the command of Constantius Pogonatus the emperor, in which they received the definitions of the five first general councils, and particularly that against Origen and Theodorus of Mopsuestia. 7. The second Nicene council. 8. The fourth council of Constantinople, assembled when Louis II. was emperor of the West. The regulations which they made are contained in twenty-seven canons, the heads of which are set down by M. du Pin, to whom the reader is referred.

COUNSEL, in a general sense, signifies advice or instruction how to behave in any difficult matter.

COUNSEL, or *Advocates*, in English courts of law, are of two species or degrees; BARRISTERS and SERJEANTS. See these articles; also ADVOCATE.

From both these degrees some are usually selected to be his majesty's counsel, learned in the law; the two principal of whom are called his *attorney-general*, and *solicitor-general*. The first king's counsel, under the degree of serjeant, was Sir Francis Bacon, who was made so *honoris causa*, without either patent or fee: so that the first of the modern order (who are now the sworn servants of the crown, with a standing salary) seems to have been Sir Francis North, afterwards lord keeper of the Great Seal to King Charles II. These king's counsel answer, in some degree, to the advocates of the revenue, *advocati fisci*, among the Romans. For they must not be employed in any cause against the crown without special license: in which restriction they agree with the advocates of the fisc: but, in the imperial law, the prohibition was carried still farther, and perhaps was more for the dignity of the sovereign; for, excepting some peculiar causes, the fiscal advocates were not permitted to be at all concerned in private suits between subject and subject. A custom has of late years prevailed of granting letters patent of precedence to such barristers as the crown thinks proper to honour with that mark of distinction: whereby they are intitled to such rank and precedence as are assigned in their respective patents; sometimes next after the king's attorney-general, but usually next after his majesty's counsel next being. These, as well as the queen's attorney and solicitor-general, rank promiscu-

Blackl.
Comment.

ously with the king's counsel; and, together with them, sit within the bar of their respective courts: but receive no salaries, and are not sworn; and therefore are at liberty to be retained in causes against the crown. And all other serjeants and barristers indiscriminately, (except in the court of common-pleas, where only serjeants are admitted), may take upon them the protection and defence of any suitors, whether plaintiff or defendant; who are therefore called their *clients*; like the dependents on the ancient Roman orators. These indeed practised *gratis*, for honour merely, or at most for the sake of gaining influence: and so likewise it is established with us, that a counsel can maintain no action for his fees; which are given, not as *locatio vel conductio*, but as *quiddam honorarium*; not as a salary or hire, but as a mere gratuity, which a counsellor cannot demand without doing wrong to his reputation; as is also laid down with regard to advocates in the civil law, whose *honorarium* was directed, by a decree of the senate, not to exceed in any case 10,000 sesterces, or about L. 80 of English money. And in order to encourage due freedom of speech in the lawful defence of their clients, and at the same time to check the unseemly licentiousness of prostitute and illiberal men (a few of whom may sometimes insinuate themselves even into the most honourable professions), it hath been holden that a counsel is not answerable for any matter by him spoken, relative to the cause in hand, and suggested in the client's instructions; altho' it should reflect upon the reputation of another, and even prove absolutely groundless; but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured. And counsel guilty of deceit and collusion are punishable by the statute Westm. 1. § Edw. 1. c. 28. with imprisonment for a year and a day, and perpetual silence in the courts: a punishment still sometimes inflicted for gross misdemeanours in practice.

COUNSELLOR, in general, a person who advises another: thus we say, a counsellor at law, a privy counsellor, &c.

COUNSELLOR at Law, a person retained by a client to plead his cause in a public court of judicature. See ADVOCATE, BARRISTER, COUNSEL, and SERJEANT.

Privy-COUNSELLOR. See PRIVY-COUNCIL.

COUNT, (COMES), a nobleman who possesses a domain erected into a county. See VISCOUNT.

English and Scottish counts we distinguish by the title of *earls*; foreign ones still retain their proper name. The dignity of a count is a medium between that of a duke and a baron—According to the modern use, most plenipotentiaries and ambassadors assume the title of counts, though they have no county; as the count d'Avaux, &c.

Anciently, all generals, counsellors, judges, and secretaries of cities under Charlemagne, were called *counts*; the distinguishing character of a duke and count being this, that the latter had but one town under him but the former several.

A count has a right to bear on his arms a coronet, adorned with three precious stones, and surmounted with three large pearls, whereof those in the middle and extremities of the coronet advance above the rest.

Counsel
||
Count.

Count.

Counts were originally lords of the court, or of the emperor's retinue, and had their name *comites*, à *comitando*, or à *commendo*: hence those who were always in the palace, or at the emperor's side, were called *counts palatine*, or *comites à latere*. See PALATINE.

In the times of the commonwealth, *comites* among the Romans was a general name for all those who accompanied the proconsuls and proprætors into the provinces, there to serve the commonwealth; as the tribunes, præfects, scribes, &c.

Under the emperors, *comites* were the officers of the palace. The origin of what we now call *counts* seems owing to Augustus, who took several senators to be his *comites*, as Dion observes, *i. e.* to accompany him in his voyages and travels, and to assist him in the hearing of causes; which were thus judged with the same authority as in full senate. Gallienus seems to have abolished this council, by forbidding the senators being found in the armies: and none of his successors re-established it.

These counsellors of the emperor were really counts, *comites*, *i. e.* companions of the prince; and they sometimes took the title thereof, but always with the addition of the emperor's name whom they accompanied; so that it was rather a mark of their office than a title of dignity.—Constantine was the first who converted it into a dignity; and under him it was that the name was first given absolutely. The name once established, was in a little time indifferently conferred, not only on those who followed the court, and accompanied the emperor, but also on most kinds of officers; a long list whereof is given us by Du Cange.

Eusebius tells us that Constantine divided the counts into three classes; the first bore the title of *illustres*; the second that of *clarissimi*, and afterwards *spectabiles*; the third were called *perfectissimi*. Of the two first classes was the senate composed; those of the third had no place in the senate, but enjoyed several other of the privileges of senators.

There were counts who served on land, others at sea; some in a civil, some in a religious, and some in a legal capacity: as *comes ararii*, *comes sacrarum largitionum*, *comes sacri consistorii*, *comes curiæ*, *comes capellæ*, *comes archiatrorum*, *comes commerciorum*, *comes vestiarius*, *comes horreorum*, *comes opsoniorum* or *annonæ*, *comes domesticorum*, *comes equorum*, *regiorum* or *comes stabuli*, *comes domorum*, *comes excubitorum*, *comes notariorum*, *comes legum* or *professor in jure*, *comes limitum* or *marcarum*, *comes portus Romæ*, *comes patrimonii*, &c.

The Franks, Germans, &c. passing into Gaul and Germany, did not abolish the form of the Roman government; and as the governors of cities and provinces were called *counts*, *comites*, and *dukes*, *duces*, they continued to be called so. They commanded in time of war; and in time of peace they administered justice. Thus, in the time of Charlemagne, counts were the ordinary judges and governors of the cities.

These counts of cities were beneath the dukes and counts who presided over provinces; the first being constituted in the particular cities under the jurisdiction of the latter. The counts of provinces were in nothing inferior to dukes, who themselves were only governors of provinces. Under the last of the second race of French kings they got their dignity rendered hereditary, and even usurped the sovereignty when

Hugh Capet came to the crown: his authority was not sufficient to oppose their encroachments: and hence it is they date the privilege of wearing coronets in their arms; they assumed it then, as enjoying the rights of sovereigns in their particular districts or counties. But, by degrees, most of the counties became re-united to the crown.

The quality of count is now become very different from what it was anciently; being now no more than a title, which a king grants upon erecting a territory into a county, with a reserve of jurisdiction and sovereignty to himself. At first there was no clause in the patent of erection, intimating the reversion of the county to the crown in default of heirs male; but Charles IX. to prevent their being too numerous, ordained that duchies and counties, in default of heirs male, should return to the crown.

The point of precedence between counts and marquises has been formerly much controverted: the reason was, that there are counts who are peers of France, but no marquises: but the point is now given up, and marquises take place; though anciently, when counts were governors of provinces, they were on a level even with dukes.

William the Conqueror, as is observed by Camden, gave the dignity of counts in fee to his nobles; annexing it to this or that county or province, and allotting for their maintenance a certain proportion of money, arising from the prince's profits in the pleadings and forfeitures of the provinces. To this purpose he quotes an ancient record, thus: Hen. II. *Rex Angliæ his verbis comitem creavit; sciatis nos fecisse Hugonem Bigot comitem de Norf. &c. de tertio denarii de Norwich & Norfolk, sicut aliquis comes Angliæ, &c.*

The Germans call a count, *graaf*, or *graff*; which, according to a modern critic, properly signifies *judge*; and is derived from *gradio* or *graffio*, of γράφω, *I write*. They have several kinds of these counts or graffs; as landgraves, marchgraves, burg-graves, and palgrave, or counts palatine. These last are of two kinds; the former are of the number of princes, and have the investiture of a palatinate; the others have only the title of *count palatine* without the investiture of any palatinate. Some assert, that by publicly professing the imperial laws for twenty years, the person acquires the dignity of a count palatine; and there are instances of professors in law who have assumed the title accordingly: but there are others who question this right.

COUNT, in law, denotes the original declaration in a real action; as the declaration is in a personal one: the libellus of the civilians answers to both.—Yet, count and declaration are sometimes confounded, and used for each other; as, count in debt, count in appeal, &c.

COUNT-Wheel, in the striking part of a clock, a wheel which moves round once in 12 or 24 hours. It is sometimes called the *locking-wheel*. See CLOCK-Making.

COUNTER, a term which enters into the composition of diverse words of our language, and generally implies opposition; but when applied to deeds, means an exact copy kept of the contrary party, and sometimes signed by both parties.

COUNTER-Changed, in heraldry, the intermixture, or opposition of any metal with a colour.

Count.

Counter.

Counter
||
Counter-
poise.

COUNTER-Flory, in heraldry, is said of a tressure whose flower-de-luce are opposite to others. See HERALDRY.

COUNTER-Drawing, in painting, is the copying a design, or painting, by means of a fine lincn-cloth, an oiled paper, or other transparent matter, where the strokes appearing through are followed with a pencil, with or without colour. Sometimes it is done on glass, and with frames or nets divided into squares with silk or with thread, and also by means of instruments invented for the purpose, as the parallelogram.

COUNTER-Ermine, in heraldry, is the contrary of ermine, being a black field with white spots.

COUNTERFEITS, in law, are persons that obtain any money or goods by counterfeit letters or false tokens, who being convicted before justices of assize or of the peace, &c. are to suffer such punishment as shall be thought fit to be inflicted under death, as imprisonments, pillory, &c.

COUNTER-FOIL, or **COUNTER-STOCK**, in the exchequer, that part of an ally which is kept by an officer of the court.

COUNTER-Guard, in fortification, is a work raised before the point of a bastion, consisting of two long faces parallel to the faces of the bastion, making a salient angle: they are sometimes of other shapes, or otherwise situated.

COUNTER-Light, or *Counter-jour*, a light opposite to any thing, which makes it appear to disadvantage. A single counter-light is sufficient to take away all the beauty of a fine painting.

COUNTER-March, in military affairs, a change of the face or wings of a battalion, by which means those that were in the front come to be in the rear. It also signifies returning, or marching back again.

COUNTER-Mine, in war, a well and gallery drove and sunk till it meet the enemy's mine to prevent its effect.

COUNTER-Paled, in heraldry, is when the escutcheon is divided into twelve pales parted per fesse, the two colours being counter-changed; so that the upper are of one colour and the lower of another.

COUNTER-Part, in music, denotes one part to be applied to another. Thus the bass is said to be a counter-part to the treble.

COUNTER-Passant, in heraldry, is when two lions are in a coat of arms, and the one seems to go quite the contrary way from the other.

COUNTER-Point, in music: a term derived from the Latin preposition *contra* and the verb *pungere*; because the musical characters by which the notes in each part are signified are placed in such a manner each with respect to each as to show how the parts answer one another. See COMPOSITION.

COUNTER-Pointed (*Contre-pointé*), in heraldry, is when two chevrons in one escutcheon meet in the points, the one rising as usual from the base, and the other inverted falling from the chief; so that they are counter to one another in the points. They may also be counter-pointed when they are founded upon the sides of the shield, and the points meet that way, called *counter-pointed in fesse*.

COUNTERPOISE, in the manege, is the liberty of the action and seat of a horse-man; so that in all the motions made by the horse, he does not incline his

body more to one side than to the other, but continues in the middle of the saddle, being equally on his stirrups, in order to give the horse the proper and reasonable aids.

COUNTER-POTENT (*Contre potencé*), in heraldry, is reckoned a fur as well as vair and ermine; but composed of such pieces as represent the tops of crutches, called in French *potences*, and in old English *potents*.

COUNTER-Proof, in rolling-press printing, a print taken off from another fresh printed; which by being passed through the press, gives the figure of the former, but inverted. To counter-prove, is also to pass a design in black lead, or red chalk, through the press, after having moistened with a sponge both that and the paper on which the counter-proof is to be taken.

COUNTER-Quartered (*contre-ecartelé*), in heraldry, denotes the escutcheon, after being quartered, to have each quarter again divided into two.

COUNTER-Saliant, is when two beasts are borne in a coat leaping from each other directly the contrary way.

COUNTER-Scarp, in fortification, is properly the exterior talus or slope of the ditch; but it is often taken for the covered-way and the glacis. In this sense we say, the enemy have lodged themselves on the counter-scarp. Angle of the counter-scarp, is that made by two sides of the counter-scarp meeting before the middle of the curtain.

COUNTER-Signing, the signing the writing of a superior in quality of secretary. Thus charters are signed by the king, and counter-signed by a secretary of state, or lord chancellor.

COUNTER-Time, in the manege, is the defence or resistance of a horse that interrupts his cadence, and the measure of his manege, occasioned either by a bad horseman or by the malice of the horse.

COUNTER, is also the name of a counting-board in a shop, and of a piece of metal with a stamp on it, used in playing at cards.

COUNTER of a Horse, that part of a horse's forehead which lies between the shoulders and under the neck.

COUNTER in a Ship, are two. 1. The hollow arching from the gallery to the lower part of the straight piece of the stern is called the *upper-counter*. 2. The lower counter is between the transom and the lower part of the gallery.

COUNTER, is also the name of two prisons in the city of London, viz. the Poultry and Woodstreet.

COUNTORS, **CONTOURS**, or **COUNTERS**, has been used for serjeants at law, retained to defend a cause, or to speak for their client in any court of law.

It is of those Chancer speaks;

—A sheriff had he been, and a contour,

Was no where such a worthy vavafour.

They were anciently called *serjeant contours*.

COUNTRIES, among the miners, a term or appellation they give to their works under ground.

COUNTRY, among geographers, is used indifferently to denote either a kingdom, province, or lesser district. But its most frequent use is in contradistinction to town.

COUNTRY-Dance is of English origin, though now transplanted into almost all the countries and courts of

unter
|
Country.

County. Europe. There is no established rule for the composition of tunes to this dance, because there is in music no kind of time whatever which may not be measured by the motions common in dancing; and there are few song tunes of any note within the last century, that have not been applied to country-dances.

COUNTY, in geography, originally signified the territory of a count or earl, but now it is used in the same sense with shire; the one word coming from the French, the other from the Saxon.—In this view, a county is a circuit or portion of the realm: into fifty-two of which, the whole of England and Wales, is divided for its better government and the more easy administration of justice.

For the execution of the laws in the several counties, excepting Cumberland, Westmoreland, and Durham, every Michaelmas term officers are appointed, under the denomination of *sheriffs*. Other officers of the several counties, are, a lord lieutenant, who has the command of the militia of the county; custodes rotulorum, justices of peace, bailiffs, high-constable, and coroner.

Of the fifty-two counties, there are three of special note, which are therefore termed *counties palatine*, as Lancaster, Chester, and Durham. See PALATINE.

COUNTY-Corporate, is a title given to several cities, or ancient boroughs on which English monarchs have thought fit to bestow extraordinary privileges; annexing to them a particular territory, land, or jurisdiction; and making them counties of themselves, to be governed by their own sheriffs and magistrates.

COUNTY-Court, in English law, a court incident to the jurisdiction of the sheriff. It is not a court of record, but may hold pleas of debt or damages under the value of 40s. Over some of which causes these inferior courts have, by the express words of the statute of Gloucester, a jurisdiction totally exclusive of the king's superior courts. For in order to be intitled to sue an action of trespass for goods before the king's justiciars, the plaintiff is directed to make affidavit that the cause of action does really and *bonæ fide* amount to 40s. which affidavit is now unaccountably refused, except in the court of exchequer. The statute also 43 Eliz. c. 6. which gives the judges in many personal actions, where the jury assess less damages than 40s. a power to certify the same and abridge the plaintiff of his full costs, was also meant to prevent vexation by litigious plaintiffs; who, for purposes of mere oppression, might be inclinable to institute such suits in the superior courts for injuries of a trifling value. The county-court may also hold plea of many real actions, and of all personal actions to any amount, by virtue of a special writ called *justicies*; which is a writ empowering the sheriff for the sake of dispatch to do the same justice in his county-court, as might otherwise be had at Westminster. The freeholders of the county are the real judges in this court, and the sheriff is the ministerial officer. The great conflux of freeholders, which are supposed always to attend at the county-court (which Spelman calls *forum plebeia justitiæ et theatrum comitivæ potestatis*), is the reason why all acts of parliament at the end of every session were wont to be there published by the sheriff; why all outlawries of absconding offenders are there proclaimed; and why all popular elections which the

VOL. V.

freeholders are to make, as formerly of sheriffs and conservators of the peace, and still of coroners, verderors, and knights of the shire, must ever be made *in pleno comitatu*, or in full county-court. By the statute 2 Edw. VI. c. 25. no county-court shall be adjourned longer than for one month, consisting of 29 days. And this was also the ancient usage, as appears from the laws of king Edward the elder: *prepositus* (that is, the sheriff) *ad quartam circiter septimanam frequentem populi concionem celebrato; cuique jus dicitur; litesque singulas dirimito*. In those times the county court was a court of great dignity and splendour, the bishop and the ealdorman (or earl), with the principal men of the shire, sitting therein to administer justice both in lay and ecclesiastical causes. But its dignity was much impaired, when the bishop was prohibited, and the earl neglected to attend it. And, in modern times, as proceedings are removeable from hence into the king's superior courts, by writ of *pone* or *recordare*, in the same manner as from hundred-courts and courts-baron; and as the same writ of false judgment may be had, in nature of a writ of error, this has occasioned the same disuse of bringing actions therein.

COUPAR, the name of a town in Scotland, capital of the county of Fife, situated about 10 miles west of St Andrew's: W. Long. 2. 40. N. Lat. 56. 20.—*Coupar* is also the name of a village in the shire of Angus, inhabited chiefly by weavers in the linen trade.

COUPED, in heraldry, is used to express the head, or any limb, of an animal, cut off from the trunk, smooth; distinguishing it from that which is called *erased*, that is, forcibly torn off, and therefore is ragged and uneven.

COUPED, is also used to signify such crosses, bars, bends, chevrons, &c. as do not touch the sides of the escutcheon, but are, as it were, cut off from them.

COUPEE, a motion in dancing, wherein one leg is a little bent, and suspended from the ground; and with the other a motion is made forwards.

The word in the original French signifies a *cut*.

COUPLE-CROSS, in heraldry, the fourth part of a chevron, never borne but in pairs, except there be a chevron between them, saith Guillim, though Bloom gives an instance to the contrary.

COUPLET, a division of a hymn, ode, song, &c. wherein an equal number, or equal measure, of verses, is found in each part; which divisions, in odes, are called *strophes*.—Couplet, by an abuse of the word, is frequently made to signify a couple of verses.

COURAGE, in ethics, is that quality of the mind, derived either from constitution or principle, or both, that enables men to encounter difficulties and dangers. See FORTITUDE.

COURANT, a French term synonymous with *current*, and properly signifies running. See CURRENT.

COURANT, is also a term in music and dancing; being used to express both the tune or air and the dance. With regard to the first, *courant*, or *currant*, is a piece of music in triple time: the air of the courant is ordinarily noted in triples of minims; the parts to be repeated twice. It begins and ends when he who beats the measure falls his hand; in contradistinction from the saraband, which ordinarily ends when the hand is raised. With regard to dancing, the courant was long the most common of all the dances practised

Coupar
Courant.

Courap
|
Courayer.

in England: it consists, essentially, of a time, a step, a balance, and a coupee; though it also admits of other motions. Formerly they leaped their steps; in which point, the courant differed from the low dance and pavades. There are simple courants and figured courants, all danced by two persons.

COURAP, the modern name for a distemper very common in Java and other parts of the East-Indies. It is a sort of herpes or itch on the arm-pits, groins, breast, and face: the itching is almost perpetual; and the scratching is followed by great pain and a discharge of matter, which makes the linen stick so to the skin as not easily to be separated without tearing off the crust. *Courap* is a general name for any sort of itch; but this distemper is thus called by way of eminence. It is so contagious that few escape it. For the cure, gentle and repeated purging is used, and externally the sublimate in a small quantity is a good topic.

COURAYER (PETER FRANCIS), a Roman Catholic clergyman, distinguished by great moderation, charity, and temper, concerning religious affairs, as well as by learning, was born at Vernon in Normandy, 1681. While canon regular and librarian of the abbey of St Genevieve at Paris, he applied to archbishop Wake for the resolution of some doubts, concerning the episcopal succession in England, and the validity of their ordinations: he was encouraged to this by the friendly correspondence which had passed between the archbishop and M. du Pin of the Sorbonne. The archbishop sent him exact copies of the proper records; and on these he built his "Defence of English Ordinations," which was published in Holland, 1727. This exposing him to a prosecution in his own country, he took refuge in England; where he was well received, and presented the same year by the university of Oxford with a doctor's degree. As it is somewhat uncommon for a Roman Catholic clergyman to be admitted to degrees in divinity by Protestant universities; the curious may be gratified with a sight of the diploma, and the doctor's letter of thanks, in "The present State of the Republic of Letters, for June 1728. In 1736, he translated into French, and published, "Father Paul's History of the Council of Trent," in 2 vols. folio, and dedicated it to queen Caroline; who augmented to 200 l. a pension of 100 l. a-year, which he had obtained before from the court. The learned Jer. Markland, in a letter to his friend Bowyer, September 1746, says, "Mr Clarke has given me F. Courayer's translation of the History of the Council of Trent; with whose preface I am so greatly pleased, that if he be no more a Papist in other tenets than he is in those he mentions (which are many, and of the most distinguished class), I dare say there are very few considerate Protestants who are not as good Catholics as he is." His works are many, and all in French: he translated Sleidan's "History of the Reformation." He died in 1776, after two days illness, at the age of 95; and was buried in the cloister of Westminster-abbey. In his will, dated Feb. 3d 1774, he declares, that he "dies a member of the Catholic church, but without approving of many of the opinions and superstitions which have been introduced into the Romish church, and taught in their schools and seminaries; and which they have insisted on as articles

of faith, though to him they appear to be not only not founded in truth, but also to be highly improbable." And his practice was conformable to this declaration; for at London he constantly went to mass, and at Ealing in the country, whither he often retired, as constantly attended the service of the parish church; declaring at all times, that he "had great satisfaction in the prayers of the church of England."

COURBARIL. See HYMENEAE.

COURIER, or CURRIER, (from the French *courir*, "to run,") a messenger sent post, or express, to carry dispatches.

Antiquity, too, had its couriers. We meet with two kinds: 1. Those who ran on foot, called by the Greeks *hemerodromi*, q. d. "couriers of a day." Pliny, Corn. Nepos, and Cæsar, mention some of these who would run 20, 30, 36, and in the circus even 40 leagues per day. 2. Riding couriers (*cursores equitantes*), who changed horses, as the modern couriers do.

Xenophon attributes the first couriers to Cyrus. Herodotus says, they were very ordinary among the Persians, and that there was nothing in the world more swift than these kind of messengers. "That prince (says Xenophon) examined how far a horse would go in a day; and built stables, at such distances from each other, where he lodged horses, and persons to take care of them, and at each place kept a person always ready to take the packet, mount a fresh horse, and forward it to the next stage: and thus quite through his empire."

But it does not appear that either the Greeks or Romans had any regular fixed couriers till the time of Augustus: under that prince they travelled in cars; though it appears from Socrates they afterwards went on horseback. Under the western empire, they were called *viatores*; and under that of Constantinople, *cursores*; whence the modern name. See POST.

COURLAND, a duchy situated between E. Long. 21. 26. and between N. Lat. 56. 30. and 57. 30. It is bounded by the river Dwina, which divides it from Livonia, on the north; by Lithuania, on the east; by Samogitia, on the south; and by the Baltic sea on the west; being 130 miles long and 30 broad. This duchy was formerly independent, and elected their own duke; but is now subject to Russia.

COURSE (*route*), in navigation, the angle contained between the nearest meridian and that point of the compass upon which a ship sails in any particular direction.

COURSE, in architecture, denotes a continued range of stones, level, or of the same height, throughout the whole length of the building; and not interrupted by any aperture. It forms a parapet to the intermediate space between the body of the building and the wings.

COURSE of Plinths, is the continuity of a plinth of stone or plaster in the face of a building; to mark the separation of the stories.

COURSE is also used for the time ordinarily spent in learning the principles of a science, or the usual points and questions therein. Thus, a student is said to have finished his course in the humanity, in philosophy, &c.

COURSE.

Courbaril.
|
Course.

Courfe
||
Courſing.

COURSE is alſo uſed for the elements of an art exhibited and explained, either in writing or by actual experiment. Hence our courſes of philoſophy, anatomy, chemiſtry, mathematics, &c. probably ſo called as going throughout or running the whole length or courſe of the art, &c.

COURSES, a name by which the principal fails of a ſhip are diſtinguiſhed, viz. the main-fail, the fore-fail, and the mizen: the mizen-stay-fail and fore-fail are alſo ſometimes comprehended in this denomination; as are the main-stay-fails of all brigs and ſchooners. See **SAIL**.

COURSING, among ſportſmen. There are three ſeveral ſorts of courſes with gre-hounds: 1. At the hare; 2. At the fox; and, 3. At the deer.

For the *deer*, there are two ſorts of courſes; the one in the paddock, the other either in the foreſt or the purlicu. For the paddock courſe, there muſt be the gre-hound and the terrier, and the mongrel gre-hound, whoſe buſineſs it is to drive away the deer before the gre-hounds are ſlipped; a brace or a leaſh are the uſual number ſlipped at a time, ſeldom at the utmoſt more than two brace. In courſing the deer in the foreſt or purlicu, there are two ways in uſe: the one is courſing from wood to wood; and the other, upon the lawns cloſe by the keeper's lodge. In the courſing from wood to wood, the way is to throw in ſome young hounds into the wood to bring out the deer, and if any deer come out that is not weighty, or a deer or antler which is buck, ſore, or ſorrel, then you are not to ſlip your gre-hounds, which are held at the end of the wood, where the keepers, who can gueſs very well on theſe occaſions, expect that the deer will come out. If a proper deer come out, and it is ſuſpected that the brace or leaſh of gre-hounds ſlipped after him will not be able to kill him, it is proper to way-lay him with a couple of freſh gre-hounds.

The courſing upon the lawn is the moſt agreeable of all other ways. When the keeper has notice of this, he will lodge a deer for the courſe; and then, by coming under the wind, the gre-hound may be brought near enough to be ſlipped for a fair courſe.

The beſt method of courſing the *hare*, is to go out and find a hare ſitting; which is eaſily done in the ſummer, by walking acroſs the lands, either ſtubble, fallow, or corn grounds, and caſting the eye up and down; for in ſummer they frequent thoſe places for fear of the ticks, which are common in the woods at that ſeaſon; and in autumn the rains falling from the trees offend them. The reſt of the year there is more trouble required; as the buſhes and thickets muſt be beat to rouse them, and oftentimes they will lie ſo cloſe, that they will not ſtir till the pole almoſt touches them: the ſportſmen are always pleaſed with this, as it promiſes a good courſe. If a hare lies near any cloſe or covert, and with her head that way, it is always to be expected that ſhe will take to that immediately on being put up; all the company are therefore to ride up and put themſelves between her and the covert before ſhe is put up, that ſhe may take the other way, and run upon open ground. When a hare is put up, it is always proper to give her ground, or *law*, as it is called; that is, to let her run 12 ſcore yards, or thereabouts, before the gre-hounds are ſlip-

ped at her; otherwiſe ſhe is killed too ſoon, the greater part of the ſport is thrown away, and the pleaſure of obſerving the ſeveral turnings and windings that the creature will make to get away is all loſt. A good ſportſman had rather ſee a hare ſave herſelf after a fair courſe, than ſee her murdered by the gre-hounds as ſoon as ſhe is up.

In courſing the *fox*, no other art is required, than ſtanding cloſe, and in a clear wind, on the outside of ſome grove where it is expected he will come out; and when he is come out, he muſt have head enough allowed him, otherwiſe he will return back to the covert. The ſloweſt gre-hound will be able to overtake him, after all the odds of diſtance neceſſary; and the only danger is the ſpoiling the dog by the fox, which too frequently happens. For this reaſon, no gre-hound of any value ſhould be run at this courſe; but the ſtrong, hard, bitter dogs, that will ſeize any thing.

The laws of courſing eſtabliſhed by the duke of Norfolk, and other ſportſmen of the kingdom of England, are theſe:

1. He that is choſen ſewterer or letter-looſe of the dogs, ſhall receive the gre-hounds matched to run together into his leaſh as ſoon as he comes into the field; he is to march next to the hare-finder, or him who is to ſtart the hare, until he come to the form; and no horſeman or footman is to go before or ſide-ways, but all ſtraight behind, for the ſpace of about 40 yards.
2. A Hare ought never to be courſed with more than a brace of gre-hounds.
3. The hare-finder is to give the hare three ſohoes before he puts her up from her form or ſet, to the end that the dogs may be prepared and attend her ſtarting.
4. If there be not a particular danger of loſing the hare, ſhe ſhould have about twelve ſcore yards law.
5. The dog that gives the firſt turn, if after that there be neither cote, ſlip, nor wrench, wins the wager.
6. A go-by, or bearing the hare, is accounted equivalent to two turns.
7. If neither dog turns the hare, he that leads to the laſt covert wins.
8. If any dog turns the hare, ſerves himſelf, and turns her again, it is as much as a cote, and a cote is eſtimated as much as two turns.
9. If all the courſe be equal, he that bears the hare ſhall win; and if he be not borne, the courſe ſhall then be judged *dead*.
10. If a dog take a fall in his courſe, and yet perform his part, he may challenge the advantage of a turn more than he gave.
11. If a dog turn the hare, ſerve himſelf, and give divers cotes, and yet in the end ſhall ſtand ſtill in the field, the other dog, if he turns home to the covert, although he gives no other, ſhall be adjudged to win the wager.
12. If by miſfortune a dog be rid over in the courſe, that courſe ſhall be adjudged void, and he that did the miſchief is to make reparation to the owner.
13. If a dog gives the firſt and laſt turn, and there be no other advantage betwixt them, he that gives the odd turn wins.
14. A cote is when a gre-hound goes end ways by the ſide of his fellow, and gives the hare a turn.
15. A cote ſerves for two turns, and two trippings or jerkings for a cote; and if the hare turns not quite about, ſhe only *wrencheth*, in the ſportſman's phraſe.
16. If there be no cotes given by either of the gre-hounds, but one ſerves the other at turning, then he that gives the moſt turns wins the wager.
- 17.

Court. Sometimes a hare does not turn, but wrenches ; for she does not turn except she turns as it were round. In these cases, two wrenches stand for one turn. 18. He that comes in first at the death of the hare takes her up, and saves her from breaking ; he cherishes the dogs, and cleanses their mouths from the wool ; he is adjudged to have the hare for his pains. 19. Finally, those who are judges of the leath, must give their judgment before they depart out of the field, or else it is not to stand as valid.

COURT, an appendage to a house or habitation ; consisting of a piece of ground inclosed with walls, but open upwards.

COURT is also used for the palace or place where a king or sovereign prince resides.

*Blackst.
Comment.*

COURT, in a law sense is defined to be a place wherein justice is judicially administered. And as, by our excellent constitution, the sole executive power of the laws is invested in the person of the king, it will follow that all courts of justice, which are the medium by which he administers the laws, are derived from the power of the crown. For whether created by act of parliament or letters patent, or subsisting by prescription (the only methods by which any court of judicature can exist), the king's consent in the two former is expressly, and in the latter impliedly, given. In all these courts, the king is supposed in contemplation of law to be always present ; but as that is in fact impossible, he is there represented by his judges, whose power is only an emanation of the royal prerogative.

For the more speedy, universal, and impartial administration of justice between subject and subject, the law hath appointed a prodigious variety of courts, some with a more limited, others with a more extensive jurisdiction : some constituted to inquire only, others to hear and determine : some to determine in the first instance, others upon appeal and by way of review. See **LAW**, n^o xcvi. xcix. c. cxli. clvi. clvii. clviii. and the respective articles in the order of the alphabet. One distinction may be here mentioned, that runs throughout them all ; viz, that some of them are courts of record, others not of record. A court of record is that where the acts and judicial proceedings are enrolled in parchment for a perpetual memorial and testimony : which rolls are called the *records of the courts*, and are of such high and supereminent authority, that their truth is not to be called in question. For it is a settled rule and maxim, that nothing shall be averred against a record, nor shall any plea, or even proof, be admitted to the contrary. And if the existence of a record be denied, it shall be tried by nothing but itself ; that is, upon bare inspection whether there be any such record or no ; else there would be no end of disputes. But if there appear any mistake of the clerk in making up such record, the court will direct him to amend it. All courts of record are the king's courts, in right of his crown and royal dignity, and therefore no other court hath authority to fine or imprison ; so that the very erection of a new jurisdiction with power of fine or imprisonment, makes it instantly a court of record.—A court not of record is the court of a private man ; whom the law will not intrust with any discretionary power over the fortune or liberty of his fellow-subjects. Such are the courts

Court. baron incident to every manor, and other inferior jurisdictions : where the proceedings are not enrolled or recorded ; but as well their existence as the truth of the matters therein contained shall, if disputed, be tried and determined by a jury. These courts can hold no plea of matters cognizable by the common law, unless under the value of 40s. ; nor of any forcible injury whatsoever, nor having any process to arrest the person of the defendant.

In every court there must be at least three constituent parts, the *actor*, *reus*, and *judex* : the *actor*, or plaintiff, who complains of an injury done ; the *reus*, or defendant, who is called upon to make satisfaction for it ; and the *judex*, or judicial power, which is to examine the truth of the fact, to determine the law arising upon that fact, and, if any injury appears to have been done, to ascertain and by its officers to apply the remedy. It is also usual in the superior courts to have attorneys, and advocates or counsel, as assistants. See **ATTORNEY** and **COUNSEL**.

COURT-Baron, in English law, a court incident to every manor in the kingdom, to be holden by the steward within the said manor. This court-baron is of two natures ; the one is a customary-court appertaining entirely to the copyholders, in which their estates are transferred by surrender and admittance, and other matters transacted relative to their tenures only. The other is a court of common law, and it is the court of the *barons*, by which name the freeholders were sometimes anciently called : for that it is held before the freeholders who owe suit and service to the manor, the steward being rather the registrar than the judge. These courts, though in their nature distinct, are equally confounded together. The court we are now considering, viz. the freeholder's court, was composed of the lord's tenants, who were the *pares* of each other, and were bound by their feudal tenure to assist their lord in the dispensation of domestic justice. This was formerly held every three weeks ; and its most important business is to determine, by writ of right, all controversies relating to the right of lands within the manor. It may also hold plea of any personal actions, of a debt, trespass on the case, or the like, where the debt or damages do not amount to 40s. Which is the same sum, or three marks, that bounded the jurisdiction of the ancient Gothic courts in their lowest instance, or *fiending courts*, so called because four were instituted within every superior district or hundred. But the proceedings on a writ of right may be removed into the county-court by a precept from the sheriff called a *tolt*, *quia tollit atque eximit causam e curia baronum*. And the proceedings in all other actions may be removed into the superior courts by the king's writs of *pone*, or *accedas ad curiam*, according to the nature of the suit. After judgment given, a writ also of *false judgment* lies to the courts at Westminster to rehear and review the cause, and not a writ of *error* ; for this is not a court of record : and therefore, in some of these writs of removal, the first direction given is to cause the plaint to be recorded, *recordari facias loquelam*.

COURT-Martial, a court appointed for the punishing offences in officers, soldiers, and sailors, the powers of which are regulated by the mutiny-bill.

For other courts, see **ADMIRALTY**, **ARCHES**, **BENCH**, **COUNTY**,

Courtesy || **Coutances.**
 COUNTY, COMMON-*Pleas*, CHANCERY, ECCLESIASTICAL, DUCHY, FACULTY, REQUESTS, HUSTINGS, CHIVALRY, FOREST, STANNARY, STAR-*Chamber*, PREROGATIVE, UNIVERSITY, LEGATE, LEET, MAYOR, PIEPOUDRE, &c.

COURTESY, or **CURTESY**, of *England*; a certain tenure whereby a man marrying an heiress seized of lands of fee simple, or fee-tail general, or seized as heir of the tail special, and getteth a child by her that cometh alive into the world, though both it and his wife die forthwith; yet, if she were in possession, he shall keep the land during his life, and is called *tenant per legem Angliæ*, "or tenant by the courtesy of England;" because this privilege is not allowed in any country except Scotland, where it is called *curialitas Scotiae*.

COURTESAN, a woman who prostitutes herself for hire, especially to people of superior rank. Lais, the famous Theban courtesan, stands on record for requiring no less than 10,000 crowns for a single night. Of all places in the world, Venice is that where courtesans abound the most. It is now 300 years since the senate, which had expelled them, was obliged to recall them; in order to provide for the security of women of honour, and to keep the nobles employed lest they should turn their heads to make innovations in the state.

COURTRAY, a town of the Austrian Netherlands, situated on the river Lys, about 23 miles south-west of Ghent, and 14 east of Ypres. E. Long. 3. 10. N. Lat. 50. 48.

COUSIN, a term of relation between the children of brothers and sisters, who in the first generation are called *cousin-germans*, in the second generation *second-cousins*, &c. If sprung from the relations of the father's side, they are denominated *paternal* cousins; if on the mother's, *maternal*.

The word is ordinarily derived from *consanguineus*; though Menage brings it from *congenius*, or *congenus*, q. d. *ex eodem genere*.

In the primitive times, it was allowed cousin-germans to marry, to prevent their making alliances in heathen families: but Theodosius the Great prohibited it, under pain of death; on pretence that they were, in some sort, brothers and sisters with regard to each other.

COUSIN (John), a celebrated French painter, who excelled in painting on glass. His picture of the Last Judgment, in the vestry of the Minims of the Wood of Vincennes, is much admired. He was also a good sculptor. He wrote several works on geometry and perspective; and died after the year 1689.

COUSU, in heraldry, signifies a piece of another colour or metal placed in the ordinary, as if it were sewed on, as the word imports. This is generally of colour upon colour, or metal upon metal, contrary to the general rule of heraldry.

COUTANCES, a port town of Normandy, and capital of Coutantin, in W. Long. 1. 32. Lat. 49. 10. This town, anciently called *Constantia* or *Cosedia*, is pleasantly situated among meadows and rivulets about six miles distant from the sea. By the remains of a Roman aqueduct, and other ancient ruins, it appears to be a place of great antiquity. It is the see of a bishop suffragan of Rome; and has a magnificent cathe-

dral, esteemed one of the finest pieces of Gothic architecture in Europe. The trade of this town is very inconsiderable, and the fortifications are quite demolished. They have several religious houses, and two parochial churches.

COUTHUTLAUGH, from the Saxon *couth*, "knowing," and *utlaugh*, "outlaw;" he that wittingly receives a man outlawed, and cherishes or conceals him: for which offence he was in ancient times subject to the same punishment with the outlaw himself.

COVERT, in heraldry, denotes something like a piece of hanging, or a pavilion falling over the top of a chief or other ordinary, so as not to hide, but only to be a covering to it.

COW, in zoology. See **BOS**.

Cow-Burner. See **BUPRESTIS**.

Sea-Cow, in zoology. See **TRICHECUS**.

Cow-Itch, or *Couhage*, in botany. See **COUHAGE**, and **DOLICHOS**.

Cow's-Lip, in botany. See **PRIMULA**.

COWARD, in heraldry, a term given to a lion borne in an escutcheon with his tail doubled, or turned in between his legs.

COWEL (Dr John), a learned and eminent civilian, born about the year 1554. In 1607 he compiled a *Law Dictionary*, which gave great offence to Sir Edward Coke and the common lawyers: so that they first accused him to James I. as asserting that the king's prerogative was in some cases limited; and when they failed in that attempt, they complained of him to the house of commons, as a betrayer of the rights of the people, by asserting that the king was not bound by the laws; for which he was committed to custody and his book publicly burnt. He also published *Institutiones Juris Anglicani*, in the manner of Justinian's Institutes; and died of the operation for the stone, in 1611.

COWES, a town and harbour on the north-east coast of the Isle of Wight, in Hampshire. It has no market, but is the best place for trade in the whole island; but as it lies low, the air is accounted unhealthy. It is eight miles south-east of Portsmouth. W. Long. 1. 25. N. Lat. 50. 45.

COWL, or **COUL**, a sort of monkish habit worn by the Bernardines and Benedictines. The word is formed from *cucullus*, by confounding the two first syllables into one, as being the same twice repeated.—There are two kinds of cowls: the one white, very large, worn in ceremony, and when they assist at the office; the other black, worn on ordinary occasions in the streets, &c.

F. Mabillon maintains the coul to be the same thing in its origin with the scapular. The author of the apology of the Emperor Henry IV. distinguishes the forms of cowls: the one a gown reaching to the feet, having sleeves, and a capuchin, used in ceremonies; the other a kind of hood to work in, called also a *scapular*, because it only covers the head and shoulders.

COWLEY (Abraham), an eminent poet, was born at London 1618. His father who was a grocer, dying before he was born, his mother procured him to be admitted a king's scholar at Westminster. His first inclination to poetry arose on his lighting on Spencer's *Fairy Queen*, when he was but just able to read: and this inclination so far

Couthut-
laugh
|
Cowley.

Cowley. far improved in him, that at 13 he began to write several poems; a collection of which was published in 1613, when he was but 15. He has been represented as possessed of so bad a memory that his teachers could never bring him to retain the ordinary rules of grammar. But the fact was, as Dr Johnson notices, not that he could not learn or retain the rules; but that being able to perform his exercises without them, he spared himself the labour. In 1636 he was elected a scholar of Trinity College, Cambridge, and removed to that university. Here he went through all his exercises with a remarkable degree of reputation: and at the same time must have pursued his poetical turn with great eagerness, as it appears that the greatest part of his poems were written before he left that university. He had taken his degree of Master of Arts before 1643, when, in consequence of the turbulence of the times, he, among others, was ejected from the college: whereupon, retiring to Oxford, he entered himself of St John's college: and that very year, under the denomination of a *scholar of Oxford*, published a satire called the Puritan and the Papist. It is apparent, however, that he did not remain very long at Oxford: for his zeal to the royal cause engaging him in the service of the king, who was very sensible of his abilities, and by whom he was frequently employed, he attended his majesty in many of his journeys and expeditions, and gained not only that prince's esteem, but that of many other great personages, and in particular of Lord Falkland, one of the principal secretaries of state.

During the heat of the civil war, he was settled in the Earl of St Alban's family; and when the queen-mother was obliged to retire into France, he accompanied her thither, laboured strenuously in the affairs of the royal family, undertook several very dangerous journeys on their account, and was the principal instrument in maintaining an epistolary correspondence between the king and queen, whose letters he cyphered and decyphered with his own hand. His poems intitled *The Mistress*, were published at London in 1647: and his comedy called *The Guardian*, afterwards altered and published under the title of *Cutter of Coleman-street*, in 1650. In 1656 it was thought proper by those on whom Mr Cowley depended that he should come over into England, and, under pretence of privacy and retirement, should give notice of the posture of affairs in that nation. Upon his return he published a new edition of his poems, consisting of four parts; viz. I. *Miscellanies*. II. *The Mistress*, or *Several Copies of Love-Verses*. III. *Pindarique Odes*, written in imitation of the style and manner of Pindar. IV. *Davidis*, a sacred Poem of the troubles of David, in four books.

Soon after his arrival, however, he was seized, in the search after another gentleman of considerable note in the king's party; but although it was through mistake that he was taken, yet when the republicans found all their attempts of every kind to bring him over to their party proved ineffectual, he was committed to a severe confinement, and it was even with considerable difficulty that he obtained his liberty; when venturing back to France, he remained there, in his former situation, till near the time of the king's re-

turn. During his stay in England he wrote his *Two Books of Plants*, published first in 1662; to which he afterwards added four books more; and all six, together with his other Latin poems, were printed at London in 1678. It appears by Mr Wood's *Fasti Oxonienses*, that our poet was created doctor of physic at Oxford, December 2. 1657.

Soon after the restoration he became possessed of a very competent estate, through the favour of his principal friends the duke of Buckingham and the earl of St Alban's; and being now upwards of 40 years of age, he took up a resolution to pass the remainder of a life which had been a scene of tempest and tumult, in that situation which had ever been the object of his wishes, a studious retirement. His eagerness to get out of the bustle of a court and city made him less careful than he might have been in the choice of a healthful habitation in the country; by which means he found his solitude from the very beginning suit less with the constitution of his body than with his mind. His first rural residence was at Barn Elms, a place which, lying low, and being near a large river, was subject to a variety of breezes from land and water, and liable in the winter-time to great inconvenience from the dampness of the soil. The consequence of this Mr Cowley too soon experienced, by being seized with a dangerous and lingering fever. On his recovery from this he removed to Chertsey, a situation not much more healthy, where he had not been long before he was seized with another consuming disease. Having languished under this for some months, he at length got the better of it, and seemed pretty well recovered from the bad symptoms; when one day in the heat of summer 1667, staying too long in the fields to give some directions to his labourers, he caught a most violent cold, which was attended with a defluxion and stoppage in his breast; and for want of timely care, by treating it as a common cold, and refusing advice till it was past remedy, he departed this life on the 28th of July in that year, being the 49th of his age; and, on the 3d of August following, he was interred in Westminster-abbey, near the ashes of Chaucer and his beloved Spencer. He was a man of a very amiable character, as well as an admirable genius. King Charles II. on the news of his death, declared "that Mr Cowley had not left a better man behind him in England." A monument was erected to his memory by George Villiers duke of Buckingham in 1675.

Besides the works already mentioned, Mr Cowley wrote, among other things, *A proposition for the Advancement of Experimental Philosophy*; *A Discourse by way of Vision concerning the Government of Oliver Cromwell*; and *Several Discourses by way of Essays in prose and verse*. Mr Cowley had designed also a *Discourse concerning Style*, and a *Review of the Principles of the Primitive Christian Church*, but was prevented by death. A spurious piece, intitled *The Iron Age*, was published under Mr Cowley's name during his absence; and, in Mr Dryden's *Miscellany Poems*, we find *A Poem on the Civil War*, said to be written by our author, but not extant in any edition of his works. An edition of his works was published by Dr Spratt, afterwards bishop of Rochester, who also prefixed to it an account of the author's

Cowley. thor's life. The reverend editor mentions, as very excellent of their kind, Mr Cowley's Letters to his Friends; none of which, however, were published.

The moral character of Mr Cowley appears, from every account of it, to have been very excellent. "He is presented by Dr Spratt (says Dr Johnson) as the most amiable of mankind: and this posthumous praise may be safely credited, as it has never been contradicted by envy or by faction.

As a poet, his merits have been variously estimated, Lord Clarendon has said he made a flight above all men; Addison, in his account of the English poets, that he improved upon the Theban bard; the duke of Buckingham upon his tomb-stone, that he was the English Pindar, the Horace, the Virgil, the delight, the glory of his times. And with respect to the harshness of his number, the eloquent spratt tells us, that if his verses in some places seem not as soft and flowing as one would have them, it was his choice and not his fault.

"Such (says Mr Knox) is the applause lavished on a writer who is now seldom read. That he could ever be esteemed as a Pindaric poet, is a curious literary phenomenon. He totally mistook his own genius when he thought of imitating Pindar. He totally mistook the genius of Pindar, when he thought his own incoherent sentiments and numbers bore the least resemblance to the wild yet regular sublimity of the Theban. He neglected even those forms, the strophe, antistrophe, and epode, which even imitative dullness can copy. Sublime imagery, vehement pathos, poetic fire, which constitute the essence of the Pindaric ode are incompatible with witty conceits, accurate antitheses, and vulgar expression. All these imply the coolness of deliberate composition, or the meanness of a little mind; both of them most repugnant to the truly Pindaric, in which all is rapturous and noble. Wit of any kind would be improperly displayed in such composition; but to increase the absurdity, the wit of Cowley is often false. That he had a taste for Latin poetry, and wrote in it with elegance, the well known epitaph on himself, upon his retirement, and an admirable imitation of Horace, are full proofs. But surely his rhetorical biographer makes use of the figure hyperbole, when he affirms that Cowley has excelled the Romans themselves. He was inferior to many a writer of less fame in the *Musa Anglicana*. But still he had great merit; and I must confess I have read his Latin verses with more pleasure than any of his English can afford." *Essays*, vol. ii. p. 363—365.

To Cowley's compositions in prose Mr Knox hath paid a very honourable testimony. He says, that in this department he is an elegant, a pleasing, a judicious writer; and that it is to be much lamented that he did not devote a greater part of his time to a kind of writing which appeared natural to him, and in which he excelled.

Dr Joseph Warton observes, that it is no caricature of Cowley to represent him as being possessed of a strained affectation of striving to be witty upon all occasions. "It is painful (adds this excellent critic) to censure a writer of so amiable a mind, such integrity of manners, and such a sweetness of temper. His fancy was brilliant, strong, and sprightly; but his taste

false and unclassical, even though he had much learning."

Dr Beattie has characterised Cowley in the following terms. "I know not whether any nation ever produced a more singular genius than Cowley. He abounds in tender thoughts, beautiful lines, and emphatical expressions. His wit is inexhaustible, and his learning extensive; but his taste is generally barbarous, and seems to have been formed upon such models as Donne, Martial, and the worst parts of Ovid: nor is it possible to read his longer poems with pleasure, while we retain any relish for the simplicity of ancient composition. If this author's ideas had been fewer, his conceits would have been less frequent; so that in one respect learning may be said to have hurt his genius. Yet it does not appear that Greek and Latin did him any harm; for his imitations of Anacreon are almost the only parts of him that are now remembered or read. His Davideis, and his translations of Pindar, are destitute of harmony, simplicity, and every other classical grace."

But the works of this celebrated poet have been nowhere so amply criticised as in his Life by Dr Johnson. After a particular examination of the different pieces, the Doctor, in taking a general review of Cowley's poetry, observes, That "he wrote with abundant fertility, but negligent or unskilful selection; with much thought, but with little imagery; that he is never pathetic, and rarely sublime, but always either ingenious or learned, either acute or profound." Of his prose he speaks with great approbation. "No author (says he) ever kept his verse and his prose at a greater distance from each other. His thoughts are natural, and his style has a smooth and placid equability, which has never yet obtained its due commendation. Nothing is far-fought or hard-laboured; but all is easy without feebleness, and familiar without grossness." Upon the whole, he concludes as follows: "It may be affirmed, without any encomiastic fervour, that he brought to his poetic labours a mind replete with learning, and that his passages are embellished with all the ornaments which books could supply; that he was the first who imparted to English numbers the enthusiasm of the greater ode and the gaiety of the less; that he was qualified for sprightly sallies and for lofty flights; that he was among those who freed translation from servility, and, instead of following his author at a distance, walked by his side; and that if he left versification yet improvable, he left likewise from time to time such specimens of excellence as enabled succeeding poets to improve it."

So many of Cowley's productions being now esteemed scarcely worthy of a perusal, while others of them are distinguished by their beauty, Dr Hurd (the present bishop of Worcester) thought proper to make a selection of them, which he published in 1772, under the title of Select Works of Mr Abraham Cowley, in two volumes; with a Preface and Notes by the Editor.

COX (Richard), a learned prelate, and principal pillar of the Reformation, was born at Whaddon in Buckinghamshire, of low parentage, in the year 1499. From Eaton school he obtained a scholarship in King's-college in Cambridge, of which he became a fellow in

Cowley,
Cox.

Cox. 1519: he was thence invited to Oxford by Cardinal Wolsey, and was there made one of the junior canons of Cardinal College. In 1525 he was incorporated bachelor; and the following year took the degree of master of arts in the same university. In this situation he became remarkable for his learning and poetical abilities; but his attachment to the opinions of Luther rendered him hateful to his superiors, who stripped him of his preferment, and threw him into prison on a suspicion of heresy. Being, however, soon released, he was chosen master of Eaton school, which flourished remarkably under his care. In 1537 he commenced doctor of divinity at Cambridge; in 1540 was made archdeacon of Ely; and the following year prebendary of that cathedral, on its being new founded by king Henry VIII. In 1546 he was made dean of Christ-church, Oxford. By the recommendation of Archbishop Cranmer and bishop Goodrich, to the latter of whom he had been chaplain, he not only obtained the above preferments, but was chosen preceptor to Prince Edward; on whose accession to the throne he became a favourite at court, was sworn of the privy council, and made king's almoner. In 1547 he was elected chancellor of Oxford; in 1548 canon of Windsor; and the next year dean of Westminster. About this time he was appointed one of the commissioners to visit the university of Oxford; in which office his zeal for reformation was so excessive, that he destroyed a number of curious and valuable books, for no better reason than because they were written by Roman Catholics. On the accession of Queen Mary he was stripped of all his preferments and committed to the Marshalsea. He was, however, soon released, and immediately left the kingdom. Having resided some time at Strasburgh with his intimate friend Peter Martyr, on the death of Queen Mary he returned to England, and, with other divines, was appointed to revise the liturgy. He often preached before the queen; and in 1559 was preferred to the see of Ely, which he continued to enjoy upwards of 21 years. He was, however, no favourite with the queen: the reason assigned for which was, his zealous opposition to her retaining the crucifix and wax-candles on the altar of the royal chapel; also his strenuous defence of the marriage of the clergy, which her majesty always disapproved. He died on the 22d of July 1581, aged 81. He was a man of considerable learning, a zealous and rigid bulwark of the church of England, and an implacable enemy both to Papists and Puritans. In a letter to Archbishop Parker, he advises him to proceed vigorously in reclaiming or *punishing* the Puritans, and not to be discouraged at the frown of those court-favourites who protected them; assuring him that he might expect the blessing of God on his *pious* labours to free the church from their dangerous attempts, and to establish uniformity.—This zealous reformer we find had not totally lost sight of the popish text, *compel them to come in*: but a stronger proof of his implacability and self-importance appears in his letter to the lord treasurer Burleigh, in which he warmly expostulates with the council for interposing in behalf of the Puritans, or meddling in affairs of the church, admonishing them to keep their own sphere. Such language from a bishop would make a modern privy council stare. His works are, 1. Two Latin Orations on the Dispute

between Dr Tresham and Peter Martyr, Lond. 1549, 4to. 2. Liturgy of the Church of England: in compiling, and afterwards correcting which, he was principally concerned. 3. The Lord's Prayer in verse, commonly printed at the end of David's Psalms by Sternhold and Hopkins. 4. Translation of the four Gospels, the Acts of the Apostles, and the Epistle to the Romans, in the new translation of the Bible in the reign of Queen Elizabeth. 5. Resolutions of some questions concerning the Sacrament, in the Collections of records at the end of Burnet's History of the Reformation. 6. Several Letters to the Queen and others, published in Strype's Annals of the Reformation. He is also said to have been concerned in the declaration concerning the divine institution of bishops, and to have assisted Lilye in his Grammar.

COXWOLD, a town in the North riding of Yorkshire, 14 miles north of York. W. Long. 1. 10. N. Lat. 54. 16.

COYPEL (Anthony), an excellent French painter, born at Paris in 1661. Noel Coypel, his father being chosen by M. Colbert to be director of the academy at Rome, he took his son with him into Italy, where Anthony Coypel formed himself on the works of the greatest masters, and on his return to France was made first painter to the duke of Orleans. That prince employed him in painting the grand gallery of the royal palace, and allowed him a pension. In 1714, he was director of the Academy of Painting and Sculpture. In 1715, he was made first painter to the French king, and was ennobled on account of his merit. He died in 1722. M. Coypel, his son also excelled in the same art.

COZENING; tricking, or defrauding. In law it denotes an offence where any thing is done deceitfully, whether belonging to contracts or not, which cannot be properly termed by any special name.

COZUMEL, an island near the western coast of Jucatan, where Cortez landed and refreshed his troops before entering upon the conquest of Mexico. W. Long. 89. 0. and N. Lat. 13. 0.

CRAB, in zoology. See **CANCER**.

CRAB's Claws, in the materia medica, are the tips of the claws of the common crab broken off at the verge of the back part, so much of the extremity of the claws only being allowed to be used in medicine as is tinged with this colour. The blackness, however, is only superficial; they are of a greyish white within, and when levigated furnish a tolerable white powder.

Crab's claws are of the number of the alkaline absorbents, but they are superior to the generality of them in some degree, as they are found on a chemical analysis to contain a volatile urinous salt.

CRAB's Eyes, in pharmacy, are a strong concretion in the head of the cray-fish. They are rounded on one side, and depressed and sinuated on the other, considerably heavy, moderately hard, and without smell. We have them from Holland, Muscovy, Poland, Denmark, Sweden, and many other places.

Crab's eyes are much used both in the shop-medicines and extemporaneous prescriptions, being accounted not only absorbent and drying, but also discussive and diuretic.

CRAB-Lice, a troublesome kind of vermin, which
stick

Crab,
Cracatoa. stick so fast with their claws to the skin as to render it difficult to dislodge them. Being viewed with a glass they nearly resemble the small crab-fish; whence they obtained their popular name. They are also called *pluctula*, *morpiones*, *petola*, and *peffolata*: they usually infest the arm-pits and *pudenda*. They will be quickly destroyed, and drop off dead, upon the application of a rag wet with the milk of sublimate. This sort of vermin is reckoned to prognosticate speedy mortality to those whom they abandon without being removed by medicine.

CRAB, a sort of wooden pillar, whose lower end, being let down through a ship's decks, rests upon a socket like the capstern; and having in its upper end three or four holes, at different heights, through the middle of it, one above another, into which long bars are thrust, whose length is nearly equal to the breadth of the deck. It is employed to wind in the cable, or to purchase any other weighty matter which requires a great mechanical power. This differs from a capstern, as not being furnished with a *drum-head*, and by having the bars to go entirely through it, reaching from one side of the deck to the other; whereas those of the capstern, which are superior in number, reach only about eight inches or a foot into the drum-head, according to the size thereof. This machine is represented in Plate CXXVII. n^o 4. See also CAPSTERN.

CRAB-YAWS, a name in Jamaica for a kind of ulcer on the soles of the feet, with hard callous lips, so hard that it is difficult to cut them. The *ungt. cerul. fort.* is their cure.

CRACATOA, the most southerly of a cluster of islands lying in the entrance of the straits of Sunda in the East Indies. Its whole circumference does not exceed nine miles; and off its north-eastern extremity is a small island forming a road, in which Captain Cook anchored when visiting this island on his last voyage. On the southern part of the small island is a reef of rocks, within which is a tolerable shelter against all northerly winds, there being 27 fathoms water in the mid-channel, and 18 near the reef. Between the two islands there is a narrow passage for boats. The shore that constitutes the west side of the road runs in a north-westerly direction, having a bank of coral running into the sea for a little way, so that it is difficult for boats to land except at the time of high water; but the anchoring ground is very good and free from rocks. In the inland parts the ground is elevated, rising on all sides gradually from the sea, and is entirely covered with wood, excepting a few spots which are cleared by the inhabitants for sowing rice. The climate is reckoned very healthy in comparison with the neighbouring countries, but is very thinly inhabited. There are abundance of turtle on the coral reefs, but other refreshments are scarce, and sold at an exorbitant price. Water is not plentiful: Captain Cook was obliged to supply himself from a small spring opposite to the southern extremity of the small island abovementioned. To the southward is a hot spring, whose waters are used as a bath by the inhabitants. The road where the Resolution anchored lies in S. Lat. 8. 6. and by observation, in 105. 36. E. Long. by the time-keeper in 104. 48. The variation of the compass one degree W. On the full and

change days it is high water at seven o'clock in the morning, and the tide rises three feet two inches perpendicular. Crackow.

CRACKOW, a city of Poland, situated in a palatinate of the same name, E. Long. 20. 16. N. Lat. 50. 8. It was formerly the capital of Poland, where the kings were elected and crowned, and was once almost the centre of the Polish dominions, but is now a frontier town; a proof how much the power of this republic has been contracted.

Crackow stands in an extensive plain, watered by the Vistula, which is broad but shallow: the city and its suburbs occupy a vast track of ground, but are so badly peopled, that they scarcely contain 16,000 inhabitants. The great square in the middle of the town is very spacious, and has several well-built houses, once richly furnished and well inhabited, but most of them now either untenanted or in a state of melancholy decay. Many of the streets are broad and handsome; but almost every building bears the most striking marks of ruined grandeur; the churches alone seem to have preserved their original splendor. The devastation of this unfortunate town was begun by the Swedes at the commencement of the present century, when it was besieged and taken by Charles XII. but the mischiefs it suffered from that ravager of the north were far less destructive than those it experienced during the late dreadful commotions, when it underwent repeated sieges, and was alternately in possession of the Russians and Confederates. The effects of cannon, grape, and musket shot, are still discernible on the walls and houses. In a word, Crackow exhibits the remains of ancient magnificence, and looks like a great capital in ruins: from the number of fallen and falling houses one would imagine it had lately been sacked, and that the enemy had left it only yesterday. The town is surrounded with high walls of brick, strengthened by round and square towers of whimsical shapes, in the ancient style of fortification: these walls were built by Venceslaus king of Bohemia during the short period in which he reigned over Poland.

The university of Crackow was formerly, and not unjustly, called the mother of Polish literature, as it principally supplied the other seminaries with professors and men of learning; but its lustre has been greatly obscured by the removal of the royal residence to Warsaw, and still more by the late intestine convulsions. In this city the art of printing was first introduced into Poland by Haller; and one of the earliest books was the Constitutions and Statutes compiled by Casimir the Great, and afterwards augmented by his successors. The characters are Gothic, the same which were universally used at the invention of printing: the great initial letters are wanting, which shows that they were probably painted and afterwards worn away. The year in which this compilation was printed is not positively known; but its publication was certainly anterior to 1496, as it does not contain the statutes passed by John Albert in that year. The most flourishing period of the university was under Sigismund Augustus in the 16th century, when several of the German reformers fled from the persecutions of the emperor Charles V. and found an asylum in this city. They gave to the world several versions of the sacred writings,

Crackow. tings, and other theological publications, which diffused the reformed religion over great part of Poland. The protection which Sigismund Augustus afforded to men of learning of all denominations, and the universal toleration which he extended to every sect of Christians, created a suspicion that he was secretly inclined to the new church; and it was even reported that he intended to renounce the catholic faith, and publicly profess the reformed religion.

Towards the southern part of the town, near the Vistula, rises a small eminence or rock, upon the top of which is built the palace, surrounded with brick walls and old towers, which form a kind of citadel to the town. This palace owes its origin to Ladislaus Jaghelon; but little of the ancient structure now appears, as the greatest part was demolished by Charles XII. in 1702, when he entered this town in triumph after the battle of Clisso. It has been since repaired: the remains of the old palace consist of a few apartments, which are left in their ancient state as they existed in the last century. This palace was formerly the residence of the kings of Poland, who, from the time of Ladislaus Loketec, have been crowned at Crackow. The Polish and German historians differ concerning the time when the title of king was first claimed by the sovereigns of this country; but the most probable account is, according to Mr. Coxe, that in 1295 Premislaus assumed the regal title, and was inaugurated at Gnesna by the archbishop of that diocese. He was succeeded by Ladislaus Loketec, who offending the Poles by his capricious and tyrannical conduct, was deposed before he was crowned; and Venceslaus king of Bohemia, who had married Richsa daughter of Premislaus, being elected in his stead, was in 1300 consecrated at Gnesna. Ladislaus, after flying from his country and undergoing a series of calamitous adventures, was at length brought to a sense of his misconduct. Having regained the affection of his subjects, he was restored, in the lifetime of Venceslaus, to part of his dominions; and he recovered them all upon the demise of that monarch in the year 1305: he governed, however, for some years without the title of king; but at length in 1320 was crowned at Crackow, to which place he transferred the ceremony of the coronation; and afterwards enacted, that for the future his successors should be inaugurated in the cathedral of this city.

Since that period all the sovereigns have been consecrated at Crackow, excepting the present king. Previous to his election a decree was issued by the diet of convocation, that the coronation should be solemnised for this turn at Warsaw, without prejudice in future to the ancient right of Crackow; a proviso calculated to satisfy the populace, but which will not probably prevent any future sovereign from being crowned at Warsaw, now become the capital of Poland and the residence of its kings. The diadem and other regalia used at the coronation are still kept in the palace of Crackow, under so many keys, and with such care, that it was impossible to obtain a sight of them.

Adjoining to the palace stands the cathedral, also within the walls of the citadel. Here all the sovereigns, from the time of Ladislaus Loketec, have been interred, a few only excepted, viz. Louis and Ladislaus III. who were kings of Hungary as well as of Poland, and whose bodies were deposited in Hungary;

Alexander, who died and was buried at Vilna; Henry of Valois, interred in France; and the late monarch Augustus III. The sepulchres of the kings of Poland are not distinguished by any peculiar magnificence: their figures are carved in marble of no extraordinary workmanship, and some are without inscriptions.

The bishop of Crackow is the first in the kingdom, duke of Saveria, and very often a cardinal. His revenues are larger than those of his metropolitan the archbishop of Gnesna, and are computed to amount to 40,000 dollars *per annum*.

CRADLE, a well known machine in which infants are rocked to sleep.

It denotes also that part of the stock of a cross-bow where the bullet is put.

CRADLE, in surgery, a case in which a broken leg is laid after being set.

CRADLE, in engraving, is the name of an instrument used in scraping mezzotintos and preparing the plate. It is formed of steel, resembling a chisel with one sloping side, upon which are cut hollow lines very near each other, and at equal distances. The acting part of this tool is made circular, and the corners are rounded. After being properly tempered, it must be sharpened on the whetstone. There are various sizes of this instrument.

CRADLE, among shipwrights, a frame placed under the bottom of a ship, in order to conduct her smoothly and steadily into the water when she is going to be launched; at which time it supports her weight while she slides down the descent or sloping passage called *the ways*, which are for this purpose daubed with soap and tallow. See Plate CL.

CRAFT, a general name for all sorts of vessels employed to load or discharge merchant ships, or to carry alongside or return the stores of men of war. Such are lighters, hoys, barges, prames, &c. See those articles.

CRAKE, or **CORN-CRAKE**. See **RALLUS**.

CRAIL, or **CAREIL**, a parliament town of Scotland, situated on the sea-coast of the county of Fife, about seven miles south-east of St Andrew's. W. Long. 2. 20. and N. Lat. 56. 17.

CRAMBE, **SEA-CABBAGE**, **SEA-BEACH KALE**, or **SEA-COLEWORT**, in botany: A genus of the siliquosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, *Siliquosæ*. The four longer filaments are forked at top, with an anthera only on one point of each; the fruit a dry, globose, and deciduous berry. There are three species, all of them herbaceous esculents with perennial roots, producing annually large leaves resembling those of cabbage spreading on the ground, with strong flower-stalks and yellowish flowers. Only one of the species is a native of Britain. It grows wild on the shores of many of the maritime counties of England, but is cultivated in many gardens as a choice esculent; and the young robust shoots of its leaves and flower-stalks, as they issue forth from the earth after the manner of asparagus shoots, are then in the greatest perfection for use. At this period they appear white as if blanched, and when boiled eat exceeding sweet and tender. Its principal season for use is in April and May. This plant may also be employed in the pleasure-ground as a flowering perennial, for the stalks

Cradle
|
Crambe.

Crameria stalks divided into fine branchy heads of flowers. It is propagated by seeds sown in any common light earth in autumn or spring, where the plants are to remain, which, when two years old, will produce shoots fit for use, will multiply exceedingly by the roots, and continue for many years.

CRAMERIA, in botany, a genus of the monogynia order, belonging to the tetrandria class of plants. There is no calyx; the corolla has four petals; the superior nectary is trifid, the inferior biphyllous; the fruit is a dry, monospermous, and echinated berry.

CRAMOND, **OVER** and **NETHER**, two villages about four miles west of Edinburgh; of which only the last deserves notice, as having been once a famous naval station of the Romans. It is situated at the influx of the river Almon into the Forth. Three Roman roads meet at this place, which was called by them *Alaterra*, and whither they brought their grain for the support of their troops. The village contains about 300 inhabitants. Here are the remains of a bath and sudatory; and many altars, medals, &c. have been dug up.

CRAMP, a kind of numbness or convulsion, occasioned by a thick viscid vapour entering the membranes of the muscles, which contracts or extends the neck, arms, legs, &c. with a violent but transitory pain; being usually driven off with friction alone. The word comes from the German *krampfe*, which signifies the same.

A glass of tar water, to be drank night and morning, has been recommended; and a rod of brimstone, when held in the hand has given present relief.

CRAMP-Fish, or *Torpedo*. See **RAJA**.

CRAMP-Iron, or *Cramps*, a piece of iron bent at each end, which serves to fasten together pieces of wood, stones, or other things.

CRAMPONEE, in heraldry, an epithet given to a cross which has at each end a cramp or square piece coming from it; that from the arm in chief towards the sinister angle, that from the arm on that side downwards, that from the arm in base towards the dexter side, and that from the dexter arm upwards.

CRANAGE, the liberty of using a crane at a wharf, and also the money paid for drawing up wares out of a ship, &c. with a crane.

CRANE, in ornithology. See **ARDEA**.

CRANE, in mechanics, a machine used in building for raising large stones and other weights. See **MECHANICS**.

CRANE'S-Bill, in botany. See **GERANIUM**.

CRANE-Fly, in zoology, a species of **TIPULA**.

CRANGANOR, a Dutch factory on the Malabar coast in the East Indies, seated in E. Long. 75. 5. N. Lat. 10. 0. See **COCHIN**.

CRANIOLARIA, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personata*. The calyx of the flower is double, the under one tetraphyllous, the upper one a monophyllous spathe; the tube of the corolla very long; the capsule almost the same with that of the *martynia*; which see. There are two species, both natives of hot climates, and neither of them possessed of any remarkable property.

CRANIUM, in anatomy, an assemblage of several bones which cover and enclose the brain and cerebel-

lum, popularly called the *skull*. See **ANATOMY**, n^o 11. The word comes from the Greek *κρανιον*, of *κρηνη*, *galea*, "helmet;" because it serves to defend the brain like a head-piece. Pezron, again, derives *κρανιον* from the Celtic *cran*, because of its roundness.

CRANK, a contrivance in machines in manner of an elbow, only of a square form, projecting out from an axis or spindle; and serving, by its rotation, to raise and fall the pistons of engines for raising water or the like.

CRANK, in sea-language. A ship is said to be *crank-sided*, when, for want of a sufficient quantity of ballast or cargo, she cannot bear her sails, or can bear but small sail, for fear of oversetting.—She is said to be *crank by the ground*, when her floor is so narrow that she cannot be brought on ground without danger.

CRANK is also an iron brace which supports the lanterns on the poop-quarters, &c.

CRANMER (Thomas), a celebrated archbishop, reformer, and martyr, was the son of Thomas Cranmer, Esq; of Ailaston in Nottinghamshire, where our author was born in 1489. At the age of 14, he was admitted a student of Jesus' College, Cambridge, of which he afterwards became fellow; but marrying the relation of an inn-keeper's wife, he lost his fellowship and quitted the college. On the death of his wife he was re-admitted fellow of Jesus' College. In 1523 he took the degree of doctor of divinity, and was made theological lecturer and examiner. The plague being at Cambridge, he retired to the house of a relation at Walsham Abbey, where, meeting with Fox the king's almoner, and Gardiner the secretary, he gave his opinion concerning King Henry's marriage with Catharine much to the satisfaction of his majesty. This opinion was, that instead of disputing about the validity of the King's marriage with Catharine, they should reduce the matter to this simple question, "Whether a man may marry his brother's wife or no?" When the King was told of it, he said, "This fellow has got the right sow by the ear." He then sent for him to court, made him one of his chaplains, and ordered him to write a vindication of the divorce in agitation. This book having quieted the tender conscience of the King, he was desirous that all Europe should be convinced of the illegality of his marriage with Queen Catharine; and for that purpose sent Cranmer to France, Italy, and Germany, to dispute the matter with the divines of those countries. At Nuremberg Cranmer married a second wife. Being returned to England, in March 1533 he was consecrated archbishop of Canterbury; in May following he pronounced the sentence of divorce between the King and Queen; and soon after married the amorous monarch to Ann Boleyn. Being now at the head of the church, he exerted himself in the business of the Reformation. The Bible was translated into English, and monasteries dissolved principally by his means.

In 1536 the royal conscience again required the assistance of our archbishop: in this year he divorced the King from Ann Boleyn. In 1537 he visited his diocese, and endeavoured to abolish the superstitious observation of holidays. In 1539 he and some of the bishops fell under the King's displeasure, because they could not be brought to give their consent in parliament that the monasteries should be suppressed for the King's sole use.

Cranmer

use. He also strenuously opposed the act for the six articles in the house of lords, speaking three days against it; and upon the passing of that statute sent away his wife into Germany. In 1540 he was one of the commissioners for inspecting into matters of religion, and explaining some of its chief doctrines. The result of their commission was the book intitled *A necessary Erudition of any Christian Man*. After Lord Cromwell's death (in whose behalf he had written to the King), he retired and lived in great privacy, meddling not at all with state affairs. In 1541 he gave orders, pursuant to the King's directions, for taking away superstitious shrines; and, exchanging Bishopsbourn for Bekefbourn, united the latter to his diocese. In 1542 he procured the "Act for the advancement of true religion and the abolishment of the contrary," which moderated the rigour of the six articles. But the year following, some enemies preferring accusations against him, he had like to have been ruined, had not the King interposed in his behalf. His majesty continued afterwards to protect him from his enemies; and at his death appointed him one of the executors of his will, and one of the regents of the kingdom. In 1546 he crowned young Edward, during whose short reign he promoted the reformation to the utmost of his power; and was particularly instrumental in composing, correcting, and establishing the liturgy by act of parliament. He had also a share in compiling the thirty-nine articles of religion.

In 1553 he opposed the new settlement of the crown upon Lady Jane Gray, and would no way be concerned in that affair (though at last, through many importunities, he was prevailed upon to set his hand to it): neither would he join in any of Dudley's ambitious projects. Upon Queen Mary's accession to the throne, he was committed to the Tower; partly for setting his hand to the instrument of Lady Jane's succession, and partly for the public offer he had made a little before of justifying openly the religious proceedings of the late king. Some of his friends, foreseeing the storm that was likely to fall upon him, advised him to fly, but he absolutely refused. In the ensuing parliament on November the 3d, he was attainted, and at Guildhall found guilty of high treason; whereupon the fruits of his archbishopric were sequestered. In April 1554, he and Ridley and Latimer were removed to Oxford, in order for a public disputation with the Papists; which was accordingly held there towards the middle of the month, with great noise, triumph, and impudent confidence on the Papists side, and with as much gravity, learning, modesty, and convincing sufficiency on the side of the Protestant bishops. The 20th of April, two days after the end of these disputations, Cranmer and the two others were brought before the commissioners, and asked, Whether they would subscribe (to Popery)? which they unanimously refusing, were condemned as heretics. From this sentence the archbishop appealed to the just judgment of the Almighty; and wrote to the council, giving them an account of the disputation, and desiring the Queen's pardon for his treason, which it seems was not yet remitted. By the convocation which met this year, his Defence of the true and catholic Doctrine of the Sacrament of the Body and Blood of our Saviour Christ was ordered to be burnt. Some of his friends petitioned the Queen in his behalf;

putting her in mind how he had once preserved her in her father's time by his earnest intercessions with him for her, so that she had reason to believe he loved her, and would speak the truth to her more than all the rest of the clergy. All endeavours in his behalf, however, were ineffectual; and the Archbishop being degraded and most ignominiously treated, was at last flattered and terrified into an insincere recantation and renunciation of the Protestant faith. But this triumph was not sufficient to gratify the pious vengeance of the Romish Mary. On the 24th of Feb. 1556, a writ was signed for the burning of Cranmer; and on the 24th March, which was the fatal day, he was brought to St Mary's church, Cambridge, and placed on a kind of stage over against the pulpit, where Dr Cole provost of Eton was appointed to preach a sermon on the occasion. While Cole was haranguing, the unfortunate Cranmer expressed great inward confusion; often lifting up his hands and eyes to heaven, and frequently pouring out floods of tears. At the end of the sermon, when Cole desired him to make an open profession of his faith, as he had promised him he would, he first prayed in the most fervent manner; then made an exhortation to the people present, not to set their minds upon the world, to obey the King and Queen, to love each other, and to be charitable. After this he made a confession of his faith, beginning with the creed, and concluding with these words: "And I believe every word and sentence taught by our Saviour Jesus Christ, his apostles, and prophets, in the Old and New Testament.—And now (added he) I come to the great thing that so much troubleth my conscience more than any thing I ever did or said in my whole life; and that is the setting abroad a writing contrary to the truth, which I here now renounce as things written with my hand contrary to the truth which I thought in my heart; and written for fear of death, and to save my life if it might be: that is, all such bills and papers which I have written or signed with my hand since my degradation, wherein I have written many things untrue. And forasmuch as my hand offended, writing contrary to my heart, my hand shall first be punished; for, may I come to the fire, it shall be first burned. As for the pope, I refuse him, as Christ's enemy and antichrist, with all his false doctrine. And as for the sacrament, I believe as I have taught in my book against the Bishop of Winchester." Thunderstruck as it were with this unexpected declaration, the enraged Popish crowd admonished him not to dissemble. "Ah! (replied he with tears), since I lived hitherto, I have been a hater of falsehood and a lover of simplicity, and never before this time have I dissembled." Whereupon they pulled him off the stage with the utmost fury, and hurried him to the place of his martyrdom over against Baliol College; where he put off his clothes in haste, and standing in his shirt, and without shoes, was fastened with a chain to the stake. Some pressing him to agree to his former recantation, he answered, showing his hand, "This is the hand that wrote it, and therefore it shall first suffer punishment." Fire being applied to him, he stretched out his right hand into the flame, and held it there unmoved (except that once with it he wiped his face) till it was consumed; crying with a loud voice, "This hand hath offended;" and often repeating, "This unwor-

Cranmer.

thy

Cranmer. thy right hand." At last, the fire getting up, he soon expired, never stirring or crying out all the while; only keeping his eyes fixed to heaven; and repeating more than once, "Lord Jesus receive my spirit." Such was the end of the renowned Thomas Cranmer, in the 67th year of his age.

It was noticed above, that after the passing of the act for the six articles, Archbishop Cranmer sent his wife into Germany. But she afterwards returned again to England; and Mr. Strype informs us, that "in the time of King Edward, when the marriage of the clergy was allowed, he brought her forth, and lived openly with her." Mr. Gilpin says, "he left behind him a widow and children; but as he always kept his family in obscurity for prudential reasons, we know little about them. They had been kindly provided for by Henry VIII; who, without any solicitation from the Primate himself, gave him a considerable grant from the Abbey of Walbeck in Nottinghamshire, which his family enjoyed after his decease. King Edward made some addition to his private fortune; and his heirs were restored in blood by an act of parliament in the reign of Elizabeth."

Archbishop Cranmer wrote a great number of books: many of them he published himself; and many of them still remain in MSS. viz. two folio volumes in the king's library, several letters in the Cotton collection, &c.

Mr. Gilpin remarks, That "the character of the Archbishop hath been equally the subject of exaggerated praise and of undeserved censure. The most indefensible parts of the Archbishop's character are the readiness with which he sometimes concurred in the unjustifiable proceedings of Henry VIII. and the instances wherein he showed himself to be actuated by intolerant principles.

"He first recommended himself to Henry by the zeal which he displayed in promoting the king's divorce from queen Catharine. As to this, it may be allowed, that Dr. Cranmer might think the marriage wrong: but though it possibly might be a point of conscience with the King, it could however be none with him; and there was manifestly a difference between advising not to do a thing, and advising to undo it when already done, at least in a matter of so disputable a nature. On the other hand, to repudiate a woman with whom the King had cohabited near 20 years as his wife, and to illegitimate a daughter, bred up in the highest expectations, and now marriageable, were acts of such cruelty, that it seems to indicate a want of feeling to be in any degree necessary to them. To this may be added, that the notoriety of the King's passion for Ann Boleyn, which all men believed to be, if not the first mover, at least the principal spring of his pretended scruples, threw a very indelicate imputation on all who had any concern in the affair. No serious churchman, one would imagine, could be fond of the idea of administering to the King's passions. It is with concern, therefore, that we see a man of Dr Cranmer's integrity and simplicity of manners acting so much out of character as to compound an affair of this kind, if not with his conscience, at least with all delicacy of sentiment; and to parade through Europe, in the quality of an ambassador, defending every where the King's *pious intentions*. But the cause (continues

Mr. Gilpin) animated him. With the illegality of the King's marriage, he endeavoured virtually to establish the insufficiency of the pope's dispensation; and the latter was an argument so near his heart, that it seems to have added merit to the former. We cannot indeed account for his embarking so zealously in this business without supposing his principal motive was to free his country from the tyranny of Rome, to which this step very evidently led. So desirable an end would in some degree, he might imagine, sanctify the means.

Of two of the instances of persecution in which Archbishop Cranmer was concerned, Mr Gilpin gives the following account. "Joan Bocker and George Paris were accused, though at different times; one for denying the humanity of Christ, the other for denying his divinity. They were both tried and condemned to the stake; and the Archbishop not only consented to these acts of blood, but even persuaded the aversion of the young King into compliance. "Your majesty must distinguish (said he, informing his royal pupil's conscience) between common opinions and such as are the essential articles of faith. These latter we must on no account suffer to be opposed." Mr Gilpin justly observes, that "nothing even plausible can be suggested in defence of the Archbishop on this occasion, except only that the spirit of Popery was not yet wholly repressed." These instances of injustice and barbarity were indeed totally indefensible, and a great disgrace to Cranmer and to all who were concerned in them. It does not appear that he endeavoured to promote the death of Lambert; but, as Mr Gilpin observes, it were to be wished he had rid his hands of the disputation likewise. The public disputation, in which Cranmer bore some part, proved the means of bringing Lambert to the stake.

One of the most honourable transactions of Archbishop Cranmer's life, was the firm stand that he made against the act of the six articles. This act was so strongly supported by the King, that even the Protestants in parliament made little opposition to it. But Cranmer opposed it with great zeal and steadiness. "The good Archbishop (says Mr Gilpin) never appeared in a more truly christian light than on this occasion. In the midst of so general a defection (for there were numbers in the house who had hitherto shown great forwardness in reformation) he alone made a stand. Three days he maintained his ground, and baffled the arguments of all opposers. But argument was not their weapon, and the Archbishop saw himself obliged to sink under superior power. Henry ordered him to leave the house. The Primate refused: 'It was God's business (he said), and not man's.' And when he could do no more, he boldly entered his protest. Such an instance of fortitude is sufficient to wipe off many of those courtly stains which have fastened on his memory."

His behaviour in the case of the Duke of Norfolk was also entitled to great commendation. "The last act of this reign (says Mr Gilpin) was an act of blood, and gave the Archbishop a noble opportunity of showing how well he had learned that great Christian lesson of forgiving an enemy. Almost without the shadow of justice, Henry had given directions to have the Duke of Norfolk attainted by an act of parliament. The King's mandate stood in lieu of guilt, and the bill passed

Cranmer.

Cranmer. passed the house with great ease. No man, except the Bishop of Winchester, had been so great an enemy to the Archbishop as the Duke of Norfolk. He had always thwarted the Primate's measures, and oftener than once had practised against his life. How many would have seen with secret pleasure the workings of Providence against so rancorous an enemy; satisfied in having themselves no hand in his unjust fate! But the Archbishop saw the affair in another light: He saw it with horror; and although the King had in a particular manner interested himself in this business, the Primate opposed the bill with all his might; and when his opposition was vain, he left the house with indignation, and retired to Croydon."

He was indeed remarkable for the placability of his temper, and for showing kindness to those by whom he had been greatly injured. Hence it is mentioned in Shakespeare's Henry VIII. as a common saying concerning him:

—————"Do my Lord of Canterbury
But one shrewd turn, and he's your friend for ever."

Archbishop Cranmer was a great friend and patron of learned foreigners who had been persecuted for their attachment to the principles of the Reformation. Mr Gilpin says, "the suffering professors of Protestantism, who were scattered in great numbers about the various countries of Europe, were always sure of an asylum with him. His palace at Lambeth might be called a seminary of learned men; the greater part of whom persecution had driven from home. Here, among other celebrated reformers, Martyr, Bucer, Ales, Phage, found sanctuary. Martyr, Bucer, and Phage were liberally pensioned by the Archbishop till he could otherwise provide for them. It was his wish to fix them in the two universities, where he hoped their great knowledge and spirit of inquiry would forward his designs of restoring learning; and he at length obtained professorships for them all. Bucer and Phage were settled at Cambridge; where they only showed what might have been expected from them, both dying within a few months after their arrival. But at Oxford Martyr acted a very conspicuous part, and contributed to introduce among the students there a very liberal mode of thinking.

Of the learning of Archbishop Cranmer, Mr Gilpin remarks, that "it was chiefly confined to his profession." He had applied himself in Cambridge to the study of the Greek and Hebrew languages; which, though esteemed at that time as the mark of heresy, appeared to him the only sources of attaining a critical knowledge of the Scriptures. He had so accurately studied canon law, that he was esteemed the best canonist in England; and his reading in theology was so extensive, and his collections from the fathers so very voluminous, that there were few points in which he was not actually informed, and in which he could not give the opinions of the several ages of the church from the times of the Apostles. He was a sensible writer, rather nervous than elegant. His writings were entirely confined to the great controversy which then subsisted, and contain the whole sum of the theological learning of those times. His library was filled with a very noble collection of books, and was open to all men of letters.

Mr Gilpin, after remarking that Archbishop Cran-

mer preached often wherever he visited, says, "In his sermons to the people he was very plain and instructive; insisting chiefly on the essentials of Christianity. The subjects of his sermons, for the most part, were from whence salvation is to be fetched, and on whom the confidence of man ought to lean. They insisted much on the doctrines of faith and works; and taught what the fruits of faith were, and what place was to be given to works: they instructed men in the duties they owed their neighbour, and that every one was our neighbour to whom we might any way do good; they declared what men ought to think of themselves after they had done all; and, lastly, what promises Christ hath made, and who they are to whom he will make them good. Thus he brought in the true preaching of the Gospel, altogether different from the ordinary way of preaching in those days; which was to treat concerning saints, to tell legendary tales of them, and to report miracles wrought for the confirmation of transubstantiation and other Popish corruptions. And such a heat of conviction accompanied his sermons, that the people departed from them with minds possessed of a great hatred of vice, and burning with a desire of virtue."

He was a great economist of his time. Mr Gilpin says, "he rose commonly at five o'clock, and continued in his study till nine. These early hours, he would say, were the only hours he could call his own. After breakfast he generally spent the remainder of the morning either in public or private business. His chapel-hour was eleven, and his dinner-hour twelve. After dinner he spent an hour either in conversation with his friends, in playing at chess, or in, what he liked better, overlooking a chess-board. He then retired again to his study till his chapel-bell rang at five. After prayers, he generally walked till six, which was in those times the hour of supper. His evening meal was sparing. Often he ate nothing; and when that was the case, it was his usual custom, as he sat down to table, to draw on a pair of gloves; which was as much as to say, that his hands had nothing to do. After supper, he spent an hour in walking and another in his study, retiring to his bedchamber about nine. This was his usual mode of living when he was most vacant, but very often his afternoons as well as his mornings were engaged in business. He generally, however, contrived, if possible, even in the busiest day, to devote some proportion of his time to his books besides the morning. And Mr Fox tells us, he always accustomed himself to read and write in a standing posture; esteeming constant sitting very pernicious to a studious man."

Mr Gilpin also observes, "that he was a very amiable master in his family, and admirably preserved the difficult medium between indulgence and restraint. He had, according to the custom of the times, a very numerous retinue, among whom the most exact order was observed. Every week the steward of his household held a kind of court in the great hall of his palace; in which all family affairs were settled, servants wages were paid, complaints were heard, and faults examined. Delinquents were publicly rebuked, and after the third admonition discharged. His hospitality and charities were great and noble; equal to his station, greater often than his abilities. A plentiful

Cranney
||
Crape.

ful table was among the virtues of those days. His was always beautifully covered. In an upper room was spread his own, where he seldom wanted company of the first distinction. Here a great many learned foreigners were daily entertained, and partook of his bounty. In his great hall a long table was plentifully covered every day for guests and strangers of a lower rank; at the upper end of which were three smaller tables, designed for his own officers and inferior gentlemen. Among the other instances of the Archbishop's charity, we have one recorded which was truly noble. After the destruction of monasteries, and before hospitals were erected, the nation saw no species of greater misery than that of wounded and disbanded soldiers. For the use of such miserable objects as were landed on the southern coasts of the island, the Archbishop fitted up his manor-house of Beckesburn in Kent. He formed it indeed into a complete hospital; appointing a physician, a surgeon, nurses, and every thing proper, as well for food as physic. Nor did his charity stop here. Each man, on his recovery, was furnished with money to carry him home, in proportion to the distance of his abode."

To conclude with the character given by Mr Hume: "Archbishop Cranmer was undoubtedly a man of merit; possessed of learning and capacity; and adorned with candour, sincerity, and beneficence, and all those virtues which were fitted to render him useful and amiable in society. His moral qualities procured him universal respect; and the courage of his martyrdom, though he fell short of the rigid inflexibility observed in many, made him the hero of the Protestant party."

CRANNY, in glass-making, an iron instrument wherewith the necks of glasses are formed.

CRANTARA, among the antient Britons, was a sort of military signal used for collecting the distant and scattered warriors to the standard of their chief. A prince having immediate occasion for the assistance of his followers to repel some sudden invasion or engage in some expedition, besides striking the shield and sounding the horn to give warning to those who were within hearing, he sent the crantara, or a stick burnt at the end and dipped in the blood of a goat, by a swift messenger, to the nearest hamlet, where he delivered it without saying one word but the name of the place of rendezvous. This crantara, which was well understood to denounce destruction by fire and sword to all who did not obey this summons, was carried with great rapidity from village to village; and the prince in a little time found himself surrounded by all his warriors ready to obey his commands.

CRANTOR, a Greek philosopher and poet, was born at Solos in Cilicia. He left his native country where he was admired; went to Athens, and there studied with Polemon under Xenocrates. He was considered as one of the chief supporters of the Platonic sect; and was the first who wrote commentaries upon Plato's works. He flourished 270 years before Christ.

CRAPE, a light transparent stuff, in manner of gauze; made of raw silk gummed and twisted on the mill; woven without crossing, and much used in mourning.

Crapes are either craped, *i. e.* crisped, or smooth; the first double, expressing a closer mourning; the

latter single, used for that less deep. Note, White is reserved for young people, or those devoted to virginity. The silk destined for the first is more twisted than that for the second; it being the greater or less degree of twisting, especially of the wrap, which produces the crisping given when taken out of the loom, steeped in clear water, and rubbed with a piece of wax for the purpose.

Crapes are all dyed raw. The invention of this stuff came originally from Bologna: but the chief manufacture of it is said to be at Lyons.

History tells us, that St Bathilda, queen of France, made fine crape (*crepa*) of gold and silver, to lay over the body of St Eloy. The Bollandists own they cannot find what this *crepa* was. Binet says, it was a frame to cover the body of the saint: but others, with reason, take it to be a transparent stuff, through which the body might be seen; and that this was the *crepa* whence our word crape was formed.

CRAPULA, among physicians; a term for SURFEIT.

CRASHAW (Richard), who was in his lifetime honoured with the friendship of Cowley, and since his death by the praise of Mr Pope, who condescended both to read his poems and to borrow from them; was the son of William Crashaw, an eminent divine, and educated at the Charter-house near London. He was then sent to Pembroke hall in Cambridge, and was afterwards of Peter-house, where he was fellow; in both which colleges he was distinguished for his Latin and English poetry. Afterwards he was ejected from his fellowship, together with many others, for denying the covenant in the time of the rebellion; and he changed his religion, being by catholic artifices perverted to the church of Rome; not converted, but rather, as Pope says, *outwitted*. He went to Paris, in hopes of recommending himself to some preferment there; but being a mere scholar, was incapable of executing the new plan he had formed. There he fell into great distress, which Cowley the poet hearing of in 1646, very kindly sought him out, gave him all the assistance he could, and at last got him recommended to Henrietta Maria queen of England, then residing at Paris. Obtaining from her letters of recommendation, he travelled into Italy; and by virtue of those letters became secretary to a cardinal at Rome, and at last one of the canons or chaplains of the rich church of our lady at Loretto, some miles distance from thence, where he died and was buried about 1650. Before he left England he wrote certain poems, entitled, *Steps to the Temple*; "because (says Wood) he led his life in the temple of God, in St Mary's church near to his college. There, as we learn from the preface to these poems, he lodged under Tertullian's roof of angels. There he made his nest more gladly than David's swallow near the house of God: where, like a primitive saint, he offered more prayers in the night than others usually offer in the day. There he penned the said poems called *Steps to the Temple for happy Souls to climb to Heaven by*. To the said Steps are joined other poems called *The Delights of the Muses*, wherein are several Latin poems; which, though of a mere human mixture, yet they are sweet as they are innocent. He hath also written *Carmen Deo nostro*, being hymns and other sacred poems, addressed to the counts of Denbigh. He was excellent in five languages besides

Crapula,
Crashaw,

Cræsis
||
Cræffus.

besides his mother tongue, namely, Hebrew, Greek, Latin, Italian, and Spanish.

CRASIS (from *κρασιμι*, *to mix*), the temper of the blood peculiar to every constitution.

CRASIS, in grammar, is a figure whereby two different letters are either contracted into one long letter or a diphthong. Such, *e. g.* is *οφισ* for *οφιας*; *αληθη* for *αληθεια*, &c. *τυχης*, for *τυχους*, &c. where *i* and *α* are contracted into *i*; *ε* and *α* into *η*; *ε* and *ο* into *ω*.

CRASSAMENTUM, in physic, the thick red or fibrous part of the blood, otherwise called *crutor*, in contradistinction to the serum or aqueous part.

CRASSULA, LESSER ORPHINE, OR LIVE-EVER: A genus of the pentagynia order, belonging to the pentrandria class of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is pentaphyllous; the petals five, with five nectariferous scales at the base of the germen, and five capsules. Their are 17 species, all of them natives of warm climates. Several of them are cultivated in this country, but require the assistance of artificial heat for their preservation. They rise from one foot to six or eight in height, and are ornamented with oblong, thick, succulent leaves, and funnel shaped pentapetalous flowers of a scarlet, white, or greenish colour. They are propagated by off-sets or cuttings; and must be potted in light sandy compost, retained in a sunny part of the green-house all winter, and very sparingly watered. In summer they may be placed in the full air in a sheltered place, and in dry weather watered twice a week.

CRASSUS (M. Licinius), a celebrated Roman, furnamed *Rich* on account of his opulence. At first he was very circumscribed in his circumstances, but by educating slaves and selling them at a high price he soon enriched himself. The cruelties of Cinna obliged him to leave Rome, and he retired to Spain, where he remained concealed for 8 months. After Cinna's death he passed into Africa, and thence to Italy, where he served Sylla and ingratiated himself in his favour. When the Gladiators with Spartacus at their head had spread an universal alarm in Italy and defeated some of the Roman generals, Crassus was sent against them. A battle was fought, in which Crassus slaughtered 12,000 of the slaves, and by this decisive blow soon put an end to the war, and was honoured with an *ovatio* at his return. He was soon after made consul with Pompey in the year of Rome 682, and in this high office he displayed his opulence by entertaining the populace at 10,000 tables. He was afterwards Censor, and formed the first triumvirate with Pompey and Cæsar. As his love of riches was more predominant than that of glory, Crassus never imitated the ambitious conduct of his colleagues, but was satisfied with the province of Syria, which seemed to promise an inexhaustible source of wealth. With hopes of enlarging his possessions he set off from Rome, though the omens proved unfavourable, and every thing seemed to threaten his ruin. He crossed the Euphrates, and forgetful of the rich cities of Babylon and Selenicia, he hastened to make himself master of Parthia. He was betrayed in his march by the delay of Artavades, king of Armenia, and the perfidy of Ariannes. He was met in a large plain by Sirena the general of the forces of Orodes king of Parthia, and a battle was

fought in which 20,000 Romans were killed and 10,000 taken prisoners. The darkness of the night favoured the escape of the rest; and Crassus, forced by the mutiny and turbulence of his soldiers, and the treachery of his guides, trusted himself to the general of the enemy on pretence of proposing terms of accommodation, and he was killed. His head was cut off and sent to Orodes, who poured melted gold down his throat, and insulted his misfortunes. Though he has been called avaricious, yet he showed himself always ready of lending money to his friends without interest. He was fond of philosophy, and his knowledge of history was great and extensive.

CRATÆGUS, WILD-SERVICE TREE, HAWTHORN, &c.: A genus of the digynia order, belonging to the icofandria class of plants; and in the natural method ranking under the 36th order, *Pomaceæ*. The calyx is quinquefid; the petals five; the berry inferior, dispermous. There are ten species, all of the tree and shrub kind, hardy and deciduous. Those most valuable for economical and ornamental purposes in gardening are the following.

1. The oxycanthus, hawthorn, or white-thorn, grows naturally all over Europe. In the state in which we are used to observe it, it is nothing better than a tall, uncouth, irregular shrub; but trained up as a standard, it swells to a large timber size, with a tall stem and a full spreading head. The standard hawthorn, whether we view its flowers in the spring, its foliage in the summer, or its fruit in the autumn and winter, is one of the most ornamental plants, standing singly, that can be scattered over a park or lawn. Its uses will be explained under the article *HEDGES*.

In order to propagate a quantity of quick, one method is generally practised; namely, first burying the haws, and taking them up to sow the October following; though, says Hanbury; there is another way more preferable; namely, to prepare the beds and sow the haws soon after they are gathered. Whoever pursues the former method, having gathered what quantity of haws will answer his purpose, should in some bye-corner of the kitchen-garden or nursery dig an hole or pit capacious enough to receive them; some of the earth which came out of the hole, after the haws are put in it, should be laid upon them; and being thus carefully covered down, they may remain there till October. Then, having ground well dug, and cleared of the roots of all troublesome weeds, and the mould being fit for working, the beds should be made for the haws. Four feet is a very good width for these beds, as they may be easily reached over to be weeded; and if the alleys between be each one foot and a half wide, they will be of a good size. The beds being marked out with a line, sufficient mould must be raked out to cover the haws an inch and an half deep. This being done, and the bottom of the beds being made level and even, the haws should be sown, and afterwards gently tapped down with the back of the spade; and then the fine mould, which had been raked out of the beds, must be thrown over them, covering them an inch and an half deep. In the spring the plants will come up, and in the summer following should be kept clear of weeds; though it does sometimes happen, that few of them will appear till the second spring after sowing. Sometimes the
young

Cratægus. young plants are planted out from the seed-beds at one, two, or three years old; but the best plants are obtained by transplanting them into fresh mould the first or second year, letting them remain in the nursery two or three years longer. The practice of the London nurserymen is this: The strongest of the seed-bed plants having been drawn at two or three years old for sale, they clear the beds entirely by drawing the remaining weak underling plants, and transplanting them into fresh beds in this manner, which they call *bedding them*: The ground having been trenched, and the tips of the plants, as well as the lower fibres of their roots having been taken off with a sharp knife, they strain a line along one side of the bed; and by chopping with a spade by the side of the line, leave a cleft or drill of a depth proportioned to the length of the plants to be laid in; and drawing the loose mould somewhat towards them, leave the side of the drill next to the line with a smooth polished face. Against this face the plants are set up, leaning towards the line, about three inches asunder, leaving their heads about an inch above the mould, and placing their roots at such a depth as to bury their stems from two to three inches deeper than they stood in the seed-bed. The loose mould being returned and pressed gently to the roots with the foot, the line is removed, and another row planted in the same manner about a foot from the first.

The common hawthorn sports in the following varieties; The large scarlet hawthorn; the yellow hawthorn; the white hawthorn; the maple-leaved hawthorn; the double-blossomed hawthorn: the Glastonbury thorn. The large scarlet hawthorn is no more than a beautiful variety of the common haw. It is exceedingly large, oblong, perfectly smooth, and of a bright scarlet; and from the additional splendor it acquires by the berries, it is propagated to cause variety in plantations for observation and pleasure. Yellow haw is a most exquisite plant. The buds at their first coming out in the spring are of a fine yellow, and the fruit is of the colour of gold. The tree is a great bearer, and retains its fruit all winter, causing a delightful effect in plantations of any kind. It is a native of Virginia, is greatly admired, and no collection of hardy trees should be without it. White haw is but a paltry tree compared with the former. It hardly ever grows to the height of the common hawthorn, is an indifferent bearer, and the fruit is small and a very bad white. Maple-leaved hawthorn will grow to be near twenty feet high, and has very few thorns. The leaves are larger than the common hawthorn, resemble those of the maple, and are of a whitish-green colour. The flowers are produced in large bunches in June, and are succeeded by remarkable fruit, of a shining red, which looks beautiful in the winter. Double-blossomed hawthorn produces a full flower, and is one of the sweetest ornaments in the spring. Nature seems to have peculiarly designed this sort for the pleasure-garden; for though it be the common hawthorn only with the flowers doubled, yet it may be kept down to what size the owner pleases; so that it is not only suitable for wilderness-quarters, shrubberies, and the like, but is also useful for small gardens, where a tree or two only are admitted. These beautiful double flowers come out

VOL. V.

in large bunches in May, and the tree is so good a bearer that it will often appear covered with them. Their colour at their first appearance is a delicate white: They afterwards die to a faint red colour, and are frequently succeeded by small imperfect fruit. Glastonbury thorn differs in no respect from the common hawthorn, only that it sometimes flowers in the winter. It is said to have originally been the staff of Joseph of Arimathea, that noble counsellor who buried Christ. He, according to the tradition of the abbey of Glastonbury, attended by eleven companions, came over into Britain, and founded, in honour of the Blessed Virgin, the first Christian church in that isle. As a proof of his mission, he is said to have stuck his staff into the ground, which immediately shot forth and bloomed. This tree is said to have blossomed on Christmas-day ever since, and is universally distinguished by the name of the *Glastonbury thorn*. Hanbury says, I have many plants that were originally propagated from this thorn: and they often flower in the winter, but there is no exact time of their flowering; for in fine seasons they will sometimes be in blow before Christmas, sometimes they afford their blossoms in February, and sometimes it so happens that they will be out on Christmas day.

Cratægus.

2. The azarolus, or azarole thorn, is a native of Italy and the south of France. It will grow to be fifteen or sixteen feet high. The leaves are large, nearly trifid, serrated and obtuse. The flowers are large, come out in May, and in the different varieties are succeeded by fruit of different size, shape, and relish. The principal varieties of this species are: The azarole with strong thorns; the azarole with no thorns; the jagged leaved azarole; the oriental medlar.

3. The *aria theophrasti*, called the *white leaf-tree*, is a native of most of the cold countries of Europe. It will grow to be more than twenty feet high. This tree is engaging at all times of the year, and catches the attention even in the winter; for then we see it stand, though naked of leaves, with a fine strait stem, with smooth branches, spotted with white, at the end of which are the buds, swelled for the next year's shoot, giving the tree a bold and fine appearance. In the spring the leaves come out of course, and look delightfully, having their upper surface green and the lower white. Their figure is oval; they are unequally serrated, about three inches long, and half as wide. Several strong nerves run from the mid-rib to the border, and they are placed alternately on the branches which appear as if powdered with the finest meal. The flowers are produced at the end of the branches in May; they are white, grow in large bunches, having mealy footstalks; and are succeeded by red berries, which will be ripe in autumn.

5. The *terminalis*, wild service, or maple-leaved service, is a large growing tree, native of England, Germany, Switzerland, and Burgundy. It will arrive to near fifty feet, and is worth propagating for the sake of the timber, which is very white and hard. This tree grows naturally in several woods in England; and it is the fruit of this species that is tied in bunches and exposed for sale in the autumn: It is gathered in the woods, and by some persons is much liked. The leaves in some degree resemble those of the maple-tree in shape; their upper surface is a fine green, their under

Cratægus. der hoary; and they grow alternately on the branches. The flowers come out in May, exhibiting themselves in large clusters at the ends of the branches: They are white, and are succeeded by the aforefaid eatable fruit, which when ripe is of a brown colour, and about the size of a large haw.

5. The coccinea, or Virginian azarole, is a native of Virginia and Canada. It will grow to be near twenty feet high. The stem is robust, and covered with a light-coloured bark. The branches are produced without order, are of a dark brown colour, and possessed of a few sharp thorns. The leaves are spear-shaped, oval, smooth, and serrated; of a thickish consistence, and often remain on the tree the greatest part of the winter. Each separate flower is large; but as few of them grow together, the umbels they form are rather small. They come out in May, and are succeeded by large dark-red-coloured fruit, which ripens late in the autumn. The varieties of this species are: The pear-leaved thorn; the plum-leaved thorn with very long strong spines and large fruit; the plum-leaved thorn with short spines and small fruit.

6. The crus galli, or cockspur thorn, is a native of Virginia and Canada, and grows to about twenty feet high. It rises with an upright stem, irregularly sending forth branches, which are smooth, and of a brownish colour, spotted thinly with small white spots. It is armed with thorns that resemble the spurs of cocks, which gained it the appellation of cockspur thorn. In winter the leaf-buds appear large, turgid, and have a bold and pleasant look among others of different appearances. In summer this tree is very delightful. The leaves are oval, angular, serrated, smooth, and bend backwards. They are about four inches long, and three and a half broad; have five or six pair of strong nerves running from the mid rib to the border; and die to a brownish-red colour in the autumn. The flowers are produced in very large umbels, making a noble show in May; and are succeeded by large fruit of a bright red colour, which have a good effect in the winter. The principal varieties of this species are: The cockspur hawthorn with many thorns; the cockspur hawthorn with no thorns; the cockspur with eatable fruit, "The latter was sent me (says Hanbury) from America with that name, and I have raised some trees of the seed; but they have not yet produced any fruit, so that I cannot pretend to say how far it may be desirable; though I have been informed it is relished in America by some of the inhabitants there."

7. The tomentosa, gooseberry-leaved Virginia hawthorn, grows to about seven or eight feet high. The branches are slender, and closely set with sharp thorns. The leaves are cuneiform, oval, serrated, and hairy underneath. The flowers are small, and of a white colour: They are produced from the sides of the branches about the end of May; and are succeeded by yellow fruit, which ripens late in autumn. There is a variety of this called the *Carolina Hawthorn*, which has longer and whiter leaves, larger flowers and fruit, and no thorns.

8. The viridis, or green-leaved Virginia hawthorn, has the stem and branches altogether destitute of thorns. The leaves are lanceolate, oval, nearly trilobate, serrated, smooth, and green on both sides. The flowers are white, moderately large, come out the end of May,

and are succeeded by a roundish fruit, which will be ripe late in the autumn.

The respective species are all propagated by sowing of the seeds; and the varieties are continued by budding them upon stocks of the white thorn. This latter method is generally practised for all the sorts; though when good seeds can be procured, the largest and most beautiful plants are raised that way. 1. In order to raise them from seeds, let these be sown soon after they are ripe, in beds of fresh, light, rich earth. Let alleys be left between the beds, for the convenience of weeding, and let the seeds be covered over with fine mould about an inch deep. The summer following the beds must be kept clean of weeds, and probably some few plants will appear: But this is not common in any of the sorts; for they generally lie till the second spring after sowing before they come up. At the time they make their appearance they must be watered if the weather proves dry; and this should be occasionally repeated all summer. They should also be constantly kept clean from weeds; and in the autumn the strongest may be drawn out, and set in the nursery-ground, a foot asunder, in rows that are two feet distant from each other; while the weakest may remain until another year. During the time they are in the nursery, the ground between the rows should be dug every winter, and the weeds constantly hoed down in the summer; and this is all the trouble they will require until they are planted out for good, which may be in two, three, or more years, at the pleasure of the owner, or according to the purposes for which they are wanted. 2. These trees are easily propagated by budding also; they will all readily take on one another; but the usual stocks are those of the common hawthorn. In order to have these the best for the purpose, the haws should be got from the largest trees, such as have the fewest thorns and largest leaves. After they are come up, and have stood one year in the seed-bed, the strongest should be planted out in the nursery, a foot asunder and two feet distant in the rows; and the second summer after many of them will be fit for working. The end of July is the best time for this business; and cloudy weather, night and morning, are always preferable to the heat of the day. Having worked all the different sorts into these stocks, they may be let alone until the latter end of September, when the bass matting should be taken off. In the winter the ground between the rows should be dug, and in the spring the stock should be headed about half a foot above the bud. The young shoots the stocks will always attempt to put out, should be as constantly rubbed off; for these would in proportion starve the bud and stop its progress. With this care several of the sorts have been known to shoot six feet by the autumn; and as they will be liable to be blown out of their sockets by the high winds which often happen in the summer, they should be slightly tied to the top of the stock that is left on for the purpose, and this will help to preserve them.

CRATCHES, in the manege, a swelling on the pastern, under the fetlock, and sometimes under the hoof; for which reason it is distinguished into the sinew cratches, which affect the sinew, and those upon the coronet, called *quitter-bones*.

CRATER, *Cyp*, in astronomy, a constellation of

Cratægus.
||
Crater.

Crater
||
Cratippus.

of the southern hemisphere; whose stars, in Ptolemy's Catalogue, are seven; in Tycho's, eight; in Hevelius's, ten; in the Britannic Catalogue, thirty-one.

CRATER is also used to signify the mouth or opening of a volcano or burning mountain, from whence the fire is discharged. See VOLCANO.

CRATES, of Thebes, a famous philosopher, was the disciple of Diogenes the Cynic. It is said that he threw all his money into the sea, that he might the more freely apply himself to the study of philosophy. Others assert that he placed it in another person's hands, with orders to give it to his children if they should happen to be fools: For (said Crates), if they should be philosophers, they will have no need of it: in which case it was to be given to the people. He flourished about 328 years before Christ.

He ought not to be confounded with Crates, a famous academic philosopher, the disciple and friend of Polemon. This last Crates had Arcefilaus and other celebrated philosophers for his disciples; and flourished about 300 years before Christ.

CRATEVA, the GARLIC PEAR: A genus of the monogynia order, belonging to the dodecandria class of plants; and in the natural method ranking under the 25th order, *Putamineæ*. The corolla is tetrapetalous; the calyx quadrifid; the berry inferior dispermous. There are two species, both of them natives of several parts of India. They are both of the tree kind; and are chiefly distinguished by their fruit. The tapia, or garlic pear, has a smooth round fruit about the size of an orange, with a hard brown shell or cover, which incloses a mealy pulp, filled with kidney-shaped seeds. It hath a strong smell of garlic, and communicates the same to such animals as feed upon it. The tender buds from the young branches being bruised and applied to the naked skin, will blister as effectually as cantharides. It rises to the height of about 30 feet. The other grows to the size of a very large tree, with trifoliate leaves, sawed on the edges. The flowers have the smell of roses, and are succeeded by an oblong fruit of the size of an apple, covered with a very hard bony shell, and containing a soft fleshy pulp, having the taste of quinces. From the flowers of this plant is obtained by distillation a water highly odoriferous and cordial. The pulpy part of the fruit is prepared into various kinds of marmalades, which are exceedingly agreeable to the taste, and are much used by the grandees in those countries where the trees are native: they are also reckoned serviceable in dysenteries. Both species may be propagated in Britain by seeds. These are to be sown upon a hot-bed in the spring; and when the plants come up, they are to be treated in the manner directed for the ANNONA.

CRATINUS, an ancient comic poet, of whom we should scarcely have known any thing, had not Quintilian, Horacé, and Persius, mentioned him, Eupolis, and Aristophanes, as the great masters of what we call the ancient comedy. It is gathered that he died in the 87th Olympiad. Suidas tells us that he wrote 21 plays, and that he was splendid and bright in his characters.

CRATIPPUS, a celebrated peripatetic philosopher, was a native of Mitylene, where he taught philosophy; but at length went to Athens, where Brutus and the son of Cicero were his disciples. Pompey

went to see him after the battle of Pharsalia, and proposed to him his difficulties in relation to the belief of a Providence; when Cratippus comforted him, and by forcible arguments answered his objections. He wrote some pieces about divination: and is supposed to be the same with him whom Tertullian, in his book *De Anima*, has ranked among the writers upon dreams.

CRATO, a small town of Portugal, in the province of Alentejo, with a rich priory. It is the chief commandery which the knights of Malta have in Portugal. W. Long. 8. 12 N. Lat. 38. 50.

CRAVAN, a town of France, in Burgundy, remarkable for its good wine, and for a battle fought there between the English and French. It is seated near the confluence of the rivers Cure and Yonne. E. Long. 3. 30. N. Lat. 47. 42.

CRAVEN, or CRAVENT, a word of reproach, used in trials by battel. See BATTLE.

CRAX; in ornithology, the curassou, a genus of birds belonging to the order of gallinæ. The base of the beak of each mandible is covered with wax; and the feathers of the head are curled. There are five species, viz. 1. The alecator, or Indian hen of Sloane, is about the size of a small turkey. It is black, with a white belly. A yellow wax covers about one half of each mandible; the tongue is entire; the temples are bare and black; the tail is roundish and consists of 14 prime feathers; the legs are strong, and of a dusky brown colour. They are frequent at Guiana; and are called *powese* by the natives from their cry, which is somewhat similar; are pretty numerous in the woods, and make no small part of the food of the planters, being supplied therewith by the Indian hunters; and their flesh is reckoned delicate, much like that of a turkey. They are easily brought up tame, and are frequently found in the Dutch settlements of Berbice, Essequebo, and Demerary. They are called at Brasé by the name of *curasso*. It is found in the warm parts of America. 2. The rubra, or Peruvian hen, is red, with a bluish head: it is a native of Peru. These birds are natives of Mexico and Peru. They feed on fruits, and perch at nights on trees: the flesh is white; and esteemed very good food. They are frequently kept tame in the menageries in England, and readily mix with other poultry, feeding on bread and grain; but that climate is not near warm enough for their nature, they not being able to bear the dampness of the grass of the meadows, which renders them subject to have their toes rot off. They will often live in this state some time; and in one instance which Mr Latham saw, the whole of one foot was gone, and but part of one toe left on the other, before the creature died. 3. The mitu, or Brazilian pheasant is black, with a dusky belly, and red wax: it is a native of Guinea and Brazil. 4. The globicera, has a yellow protuberance between the nostrils, and is of a bluish black colour: it is likewise a native of Brazil. 5. The pauxi, or Meixcan pheasant of Brissonius, is of a bluish colour, with blue wax, and the tip of the tail and belly white: it is a native of Mexico.

CRAY-FISH, or CRAW-FISH. See CANCER.

The flesh of cray-fish is cooling, moistening, and adapted to nourish such as labour under atrophies. There are various methods of preparing these animals; they may be either boiled or fried, and then taken out

Crato
||
Cray-fish.

Plate CLI.

Cray-fish,
Crayon.

of their shells, and made up in a variety of dishes: but no parts of them are eatable except their claws and tails. Preparations and broths of cray-fish are celebrated not only for a palatable aliment, but also for answering some medicinal intentions, as being of a moistening quality, and sheathing up and correcting acrimony. The broth is prepared of four or five craw-fish, which having their heads cut off, and their intestines extracted, are to be bruised and boiled in the broth of flesh or poultry, until they become sufficiently red; after which the liquor is to be strained off and seasoned, as the case may require. This broth may be rendered still more medicinal by the addition of herbs, snails, or other substances; according to the intention of the physician. Their flesh is accounted best in the summer months.

The delicate flavour of these fish depends, in a great measure on their food. When they have well-tasted food, their flesh preserves the relish of it: but when they feed on other things, they are often rendered of no value, by the flavour communicated to their flesh by them. There are great quantities of these fish in the river Obra, on the borders of Silesia; but the people find them scarce eatable, because of a bitter aromatic flavour, very disagreeable in food. It has been since observed, that the *calamus aromaticus* grows in vast abundance on the banks of that river, and that these creatures feed very greedily upon its roots. These have a very remarkable bitterness mixed with their aromatic flavour, while fresh, which goes off very much in the drying; and on comparing the taste of these roots with that of the cray-fish, there remains no doubt of the one being owing to the other.

They abound in the river Don in Muscovy, where they are laid in heaps to putrefy; after which the stones called *crab's eyes* are picked out. These animals are very greedy of flesh, and flock in great numbers about carcases thrown into the water where they are, and never leave it while any remains. They also feed on dead frogs when they come into their way. In Swisserland there are some cray-fish which are red while they are alive, and others bluish. Some kinds of them also will never become red, even by boiling, but continue blackish.

The cray-fish discharges itself of its stomach, and, as M. Geoffroy thinks, of its intestines too. These, as they putrefy and dissolve, serve for food to the animal; during the time of the reformation, the old stomach seems to be the first food the new one digests. It is only at this time that the stones are found called *crab's eyes*; they begin to be formed when the old stomach is destroyed, and are afterwards wrapped up in the new one, where they decrease by degrees till they entirely disappear.

CRAYER (Casper de), was born at Antwerp in 1585, and was a disciple of Raphael Coxis, the son of that Coxis who had studied under Raphael; but he soon showed such proofs of genius, and of an elevated capacity, that he far surpassed his master, and therefore quitted him. Afterwards he made judicious observations on the particular excellencies of the most renowned masters to which he had any access; and taking nature for his constant director and guide, he formed for himself a manner that was exceedingly pleasing. The first work which established him in the favour of the court at Brussels, was a portrait of Cardinal Fer-

dinand, brother to the King of Spain, which he painted at full length, and as large as life. In that picture he succeeded so happily, that it was sent to Madrid, and received there with such concurrent approbation of the king and the whole court, that it laid the foundation of the fame and fortune of Crayer. For the king, as an acknowledgment of the painter's merit, sent him a gold chain with a medal; and added, as a farther instance of his favour, an appointment for a considerable pension. But nothing places the talents of Crayer in a stronger light, than the testimony of so excellent an artist as Rubens. That great man went to Antwerp particularly to visit Crayer, and to see his work; and after examining attentively a picture of his painting, in the refectory of the abbey of Affeghem, he publicly declared that no painter could surpass Crayer. Nor was this master less distinguished by Vandyck, who always expressed a real esteem and friendship for him, and painted his portrait. He had somewhat less fire in his compositions than Rubens, but his design is frequently more correct. His composition generally consisted of a small number of figures; and with discreet judgment, he avoided the encumbering his design with superfluous particulars, or loading his subject with any thing that seemed not to contribute to its elegance or probability. He grouped his figures with singular skill, and his expressions have all the truth of nature. There is a remarkable variety in his draperies, and an equal degree of simplicity in their folds; and as to his colouring, it is admirable. Of all his cotemporary painters, he was accounted to approach nearest to Vandyck, not only in history but in portrait. He principally painted religious subjects, and was continually at work, and although he lived to a great age, yet his temperance and constant regularity preserved to him the full use of all his faculties; and to the last month of his life his pencil retained the same force and freedom which it possessed in his most vigorous time. The subject of that picture which was so honoured by the approbation of Rubens is the Centurian alighting from his horse to prostrate himself at the feet of our Saviour. It is a capital design of Crayer; and although it consists of a great number of figures, the harmony and union are well preserved.

CRAYON, a general name for all coloured stones, earths, or other minerals and substances, used in designing or painting in pastel; whether they have been beaten and reduced to a paste, or are used in their primitive consistence, after sawing or cutting them into long narrow slips. In this last manner are red crayons made of blood-stone or red chalk; black ones, of charcoal and black lead. Crayons of all other colours are compositions of earths reduced to paste.

CRAYON Painting. Whether the painter works with oil-colours, water-colours, or crayons, the grand object of his pursuit is still the same: a just imitation of nature. But each species has its peculiar rules and methods. Painting with crayons requires in many respects a treatment different from painting in oil-colours; because all colours used dry are in their nature of a much warmer complexion than when wet with oils, &c. For this reason, in order to produce a rich picture, a much greater portion of what painters term *cooling tints* must be applied in crayon-painting than would be judicious to use in oils. Without any danger of a mistake, it is to be supposed, the not be-

Caryer,
Crayon.

Crayon. being acquainted with this observation is one great cause why so many oil-painters have no better success when they attempt crayon-painting. On the contrary, crayon-painters being so much used to those tints which are of a cold nature when used wet, are apt to introduce them too much when they paint with oils, which is seldom productive of a good effect.

We shall now endeavour to give the student some directions towards the attainment of excellence in this art.

Of the Application of the Crayons, with some previous Dispositions. The student must provide himself with some strong blue paper, the thicker the better, if the grain is not too coarse or knotty, though it is almost impossible to get any entirely free from knots. The knots should be levelled with a penknife or razor, otherwise they will be exceedingly troublesome. After this is done, the paper must be pasted very smooth on a linen cloth, previously strained on a deal frame, the size according to the artist's pleasure: on this the picture is to be executed; but it is most eligible not to paste the paper on till the whole subject is first dead-coloured. The method of doing this is very easy, by laying the paper with the dead-colour on its face, upon a smooth board or table, when, by means of a brush, the backside of the paper must be covered with paste; the frame, with the strained cloth, must then be laid on the pasted side of the paper; after which turn the painted side uppermost, and lay a piece of clean paper upon it, to prevent smearing it: this being done, it may be stroaked gently over with the hand; by which means all the air between the cloth and the paper will be forced out.

When the paste is perfectly dry, the student may proceed with the painting. The advantages arising from pasting the paper on the frame according to this method, after the picture is begun, are very great, as the crayons will adhere much better than any other way; which will enable the student to finish the picture with a firmer body of colour and greater lustre.

When the painters want to make a very correct copy of a picture, they generally make use of tiffany or black gauze, strained tight on a frame, which they lay flat on the subject to be imitated, and with a piece of sketching chalk trace all the outlines on the tiffany. They then lay the canvas to be painted on flat upon the floor, placing the tiffany with the chalked lines upon it, and with an handkerchief brush the whole over: this presents the exact outlines of the picture on the canvas. The crayon-painter may also make use of this method when the subject of his imitation is in oils; but in copying a crayon-picture, he must have recourse to the following method, on account of the glass.

The picture being placed upon the easel, let the outlines be drawn on the glass with a small camel's hair pencil dipped in lake, ground thin with oils, which must be done with great exactness. After this is accomplished, take a sheet of paper of the same size and place it on the glass, stroking over all the lines with the hand, by which means the colour will adhere to the paper, which must be pierced with pin-holes pretty close to each other. The paper intended to be used for the painting must next be laid upon a table, and the pierced paper placed upon it; then with some fine-pounded charcoal, tied up in a piece of lawn, rub over the pierced lines, which will give an exact outline; but great care must be taken not to brush this

off till the whole is drawn over with sketching chalk, which is a composition made of whiting and tobacco-pipe clay, rolled like the crayons, and pointed at each end.

When a student paints immediately from the life, it will be most prudent to make a correct drawing of the outlines on another paper, the size of the picture he is going to paint, which he may trace by the preceding method, because erroneous strokes of the sketching chalk (which are not to be avoided without great expertness) will prevent the crayons from adhering to the paper, owing to a certain greasy quality in the composition.

The student will find the sitting posture, with the box of crayons in his lap, the most convenient method for him to paint. The part of the picture he is immediately painting should be rather below his face; for, if it is placed too high, the arm will be fatigued. Let the windows of the room where he paints be darkened, at least to the height of six feet from the ground; and the subject to be painted should be situated in such a manner, that the light may fall with every advantage on the face, avoiding too much shadow, which seldom has a good effect in portrait-painting, especially if the face he paints from has any degree of delicacy.

Before he begins to paint, let him be attentive to his subject, and appropriate the action or attitude proper to the age of the subject: if a child, let it be childish; if a young lady, express more vivacity than in the majestic beauty of a middle-aged woman, who also should not be expressed with the same gravity as a person far advanced in years. Let the embellishments of the picture, and introduction of birds, animals, &c. be regulated by the rules of propriety and consistency.

The features of the face being correctly drawn with chalks, let the student take a crayon of pure carmine, and carefully draw the nostril and edge of the nose next the shadow; then, with the faintest carmine tint, lay in the highest light upon the nose and forehead, which must be executed broad. He is then to proceed gradually with the second tint, and the succeeding ones, till he arrives at the shadows, which must be covered brilliant, enriched with much lake, carmine, and deep green. This method will at first offensively strike the eye, from its crude appearance; but in the finishing, it will be a good foundation to produce a pleasing effect, colours being much more easily sullied when too bright, than when the first colouring is dull, to raise the picture into a brilliant state. The several pearly tints discernible in fine complexions must be imitated with blue verditer and white, which answers to the ultramarine tints used in oils. But if the parts of the face where these tints appear are in shadow, the crayons composed of black and white must be substituted in their place.

Though all the face when first coloured should be laid in as brilliant as possible, yet each part should be kept in its proper tone; by which means the roundness of the face will be preserved.

Let the student be careful when he begins the eyes to draw them with a crayon inclined to the carmine tint, of whatever colour the irises are; he must lay them in brilliant, and at first not loaded with colour, but executed lightly: no notice is to be taken of the pupil yet. The student must let the light of the

eye

Crayon.

Crayon. eye incline very much to the blue cast, cautiously avoiding a staring white appearance, (which, when once introduced, is seldom overcome), preserving a broad shadow thrown on its upper part, by the eye-lash. A black and heavy teint is also to be avoided in the eye-brows; it is therefore best to execute them like a broad glowing shadow at first, on which, in the finishing, the hairs of the brow are to be painted; by which method of proceeding, the former teints will show themselves through, and produce the most pleasing effect.

The student should begin the lips with pure carmine and lake, and in the shadow use some carmine and black; the strong vermilion teints should be laid on afterwards. He must beware of executing them with stiff, harsh lines, gently intermixing each with the neighbouring colours, making the shadow beneath broad, and enriched with brilliant crayons. He must form the corner of the mouth with carmine, brown ochre, and greens, variously intermixed. If the hair is dark, he should preserve much of the lake and deep carmine teints therein; this may easily be overpowered by the warmer hair teints, which, as observed in painting the eye-brows, will produce a richer effect when the picture is finished; on the contrary, if this method is unknown or neglected, a poverty of colouring will be discernible.

After the student has covered over, or as artists term it, has dead-coloured the head, he is to sweeten the whole together, by rubbing it over with his finger, beginning at the strongest light upon the forehead, passing his finger very lightly, and uniting it with the next teint, which he must continue till the whole is sweetened together, often wiping his finger on a towel to prevent the colours being sullied. He must be cautious not to smooth or sweeten his picture too often, because it will give rise to a thin and scanty effect, and have more the appearance of a drawing than a solid painting; as nothing but a body of rich colours can constitute a rich effect. To avoid this (as the student finds it necessary to sweeten with the finger), he must commonly replenish the picture with more crayon.

When the head is brought to some degree of forwardness, let the back-ground be laid in, which must be treated in a different manner, covering it as thin as possible, and rubbing it into the paper with a leather stump. Near the face the paper should be almost free from colour, for this will do great service to the head, and by its thinness give both a soft and solid appearance. In the back ground also, no crayon that has whitening in its composition should be used, but chiefly such as are the most brilliant and the least adulterated. The ground being painted thin next the hair, will give the student an opportunity of painting the edges of the hair over in a light and free manner when he gives the finishing touches.

The student having proceeded thus far, the face, hair, and back-ground being entirely covered, he must carefully view the whole at some distance, remarking in what respect it is out of keeping, that is, what parts are too light and what too dark, being particularly attentive to the white or chalky appearances, which must be subdued with lake and carmine. The above method being properly put into execution, will produce

the appearance of a painting, principally composed of three colours, viz. carmine, black, and white, which is the best preparation a painter can make for the producing a fine crayon picture. Crayon.

The next step is, to complete the back-ground and the hair, as the dust, in painting these, will fall on the face, and would much injure it if that was completed first. From thence proceed to the forehead, finishing downward till the whole picture is completed.

In painting over the forehead the last time, begin the highest light with the most faint vermilion teint, in the same place where the faint carmine was first laid, keeping it broad in the same manner. In the next shade succeeding the lightest, the student must work in some light blue teints, composed of verditer and white, intermixing with them some of the deeper vermilion teints, sweetening them together with great caution, insensibly melting them into one another, increasing the proportion of each colour as his judgment shall direct. Some brilliant yellows may be used, but sparingly; and towards the roots of the hair, strong verditer teints, intermixed with greens, will be of singular service. Cooling crayons, composed of black and white, should succeed these and melt into the hair. Beneath the eyes, the sweet pearly teints are to be preserved, composed of verditer and white, and under the nose, and on the temples, the same may be used; beneath the lips, teints of this kind also are proper, mixing them with the light greens and some vermilion.

In finishing the cheeks, let the pure lake clear them from any dust contracted from the other crayons; then with the lake may be intermixed the bright vermilion; and last of all (if the subject should require it), a few touches of the orange-coloured crayon, but with extreme caution; after, sweeten that part with the finger as little as possible, for fear of producing a heavy disagreeable effect on the cheeks: as the beauty of a crayon-picture consists in one colour showing itself through, or rather between, another: this the student cannot too often remark, it being the only method of imitating beautiful complexions.

The eye is the most difficult feature to execute in crayons, as every part must be expressed with the utmost nicety, to appear finished; at the same time that the painter must preserve its breadth and solidity while he is particularizing the parts. To accomplish this, it will be a good general rule for the student to use his crayon in sweetening as much, and his finger as little, as possible. When he wants a point to touch a small part with, he may break off a little of his crayon against the box, which will produce a corner fit to work with in the minutest parts. If the eye-lashes are dark, he must use some of the carmine and brown ochre, and the crayon of carmine and black; and with these he may also touch the iris of the eye (if brown or hazel), making a broad shadow, caused by the eye-lash. Red teints of vermilion, carmine, and lake, will execute the corners of the eye properly; but if the eye-lids are too red, they will have a disagreeable sore appearance. The pupil of the eye must be made of pure lamp-black: between this and the lower part of the iris, the light will catch very strong, but it must not be made too sudden, but be gently diffused round the pupil

Crayon. pil till it is lost in shade. When the eye-balls are sufficiently prepared, the shining speck must be made with a pure white crayon, which should be first broken to a point, and then laid on firm; but as it is possible they may be defective in neatness, they should be corrected with a pin, taking off the redundant parts, by which means they may be formed as neat as can be required.

The difficulty, with respect to the nose, is to preserve the lines properly determined, and at the same time so artfully blended into the cheek, as to express its projection, and yet no real line to be perceptible upon a close examination; in some circumstances it should be quite blended with the cheek, which appears behind it, and determined entirely with a slight touch of red chalk. The shadow caused by the nose is generally the darkest in the whole face, partaking of no reflection from its surrounding parts. Carmine and brown ochre, carmine and black, and such brilliant crayons, will compose it best.

The student having before prepared the lips with the strongest lake and carmine, &c. must with these colours make them completely correct; and when finishing, introduce the strong vermilions, but with great caution, as they are extremely predominant. This, if properly touched, will give the lips an appearance equal, if not superior, to those executed in oils, notwithstanding the seeming superiority the latter has, by means of glazing (A), of which the former is entirely destitute.

When the student paints the neck, he should avoid expressing the muscles too strong in the stem, nor should the bones appear too evident on the chest, as both have an unpleasing effect, denoting a violent agitation of the body; a circumstance seldom necessary to express in portrait-painting. The most necessary part to be expressed, and which should ever be observed, (even in the most delicate subjects), is a strong marking just above the place where the collar bones unite; and if the head is much thrown over the shoulders, some notice should be taken of the large muscle that rises from behind the ear, and is inserted into the pit between the collar bones. All inferior muscles should be, in general, quite avoided. The student will find this caution necessary, as most subjects, especially thin persons, have the muscles of the neck much more evident than would be judicious to imitate. As few necks are too long, it may be necessary to give some addition to the stem, a fault on the other side being quite unpardonable, nothing being more ungraceful than a short neck. In colouring the neck, let the student preserve the stem of a pearly hue, and the light not so strong as on the chest. If any part of the breast appears, its transparency must also be expressed by pearly tints; but the upper part of the chest should be coloured with beautiful vermilions delicately blended with the other.

Of the Drapery. Dark blue, purple, black, pink, and all kinds of red draperies also, should be first tinged with carmine, which will render the colours much more brilliant than any other method; over this should

be laid on the paper the middle tint (a medium between the light and dark tints, or which the drapery is to be painted), except the dark masses of shadow, which should be laid on at first as deep as possible; these, sweetened with the finger, being destitute of the smaller folds, will exhibit a matterly breadth, which the lesser folds, when added, ought by no means to destroy. With the light and dark tints, the smaller parts are next to be made with freedom, executing as much with the crayon, and as little with the finger as possible; in each fold touching the last stroke with the crayon, which stroke the finger must never touch. In the case of reflections, the simple touch of the crayon will be too harsh, therefore fingering will be necessary afterwards, as reflected lights are always more gentle than those which are direct. With respect to reflections in general, they must always partake of the same colour as the object reflecting, but in the case of single figures, it may be useful to make some particular observations.

In a blue drapery, let the reflections be of a greenish cast; in green draperies, make them of a yellow tint; in yellow, of an orange; in orange, reflect a reddish cast; in all reds, something of their own nature, but inclined to the yellow: black should have a reddish reflection; the reflection of a reddish tint will also present purples to the best advantage.

Of whatever colour the drapery is, the reflection on the face must partake thereof, otherwise the picture, like paintings on glass, will have but a gaudy effect.

Linen, lace, fur, &c. should be touched spiritedly with the crayon, fingering very little, except the latter; and the last touches, even of this, like all other parts, should be executed by the crayon, without sweetening with the finger.

The methods above recommended have been practised by the most celebrated crayon-painters, whose works have been held in public estimation; but the knowledge of, and ability to execute, each separate part with brilliancy and truth, will be found very insufficient to constitute a complete painter, without his judgment enables him to unite them with each other, by correctness of drawing, propriety of light and shadow, and harmony of colouring. In order to accomplish this, the student should carefully avoid finishing one part in particular, till he has properly considered the connection it is to have with the rest. The neglect of this is the principal reason why the performances of indifferent painters are so destitute of what is termed breadth, so conspicuously beautiful in the works of great masters. It must be granted that this observation relates more particularly to large compositions, where a diversity of figures requires such a judicious disposition, that each may assist in the combination of a kind of universal harmony; yet, even in portrait-painting, the student should be particularly attentive to observe this idea of breadth, if he is desirous of acquiring that importance and dignity which constitutes excellence in painting.

Of the Materials. The perfection of the crayons consists,

(A) The method with which painters in oils express transparency in the lips is, by painting them first with light vermilion tints, and, when dry, touching them over with pure lake.

Crayon. sits, in a great measure, in their softness; for it is impossible to execute a brilliant picture with them if they are otherwise; on which account great care should be observed in the preparing them, to prevent their being hard. In all compositions, flake-white and white-lead should be wholly rejected, because the slightest touch with either of these will unavoidably turn black.

The usual objection to crayon-paintings is, that they are subject to change; but whenever this happens, it is entirely owing to an injudicious use of the abovementioned whites, which will stand only in oils. To obviate the bad effects arising from the use of such crayons, let the student make use of common whiting prepared in the following manner.

Take a large vessel of water, put the whiting into it, and mix them well together; let this stand about half a minute, then pour off the top into another vessel, and throw the gritty sediment away; let what is prepared rest about a minute, and then pour it off as before, which will purify the whiting and render it free from all dirt and grittiness. When this is done, let the whiting settle, and then pour the water from it; after which, lay it on the chalk to dry, and keep it for use, either for white crayons, or the purpose of preparing tints with other colours, for with this all other tints may be safely prepared. If the student chooses to make crayons of the whiting immediately after it is washed, it is not necessary to dry it on the chalk, for it may be mixed instantly with any other colour, which will save considerable trouble. All colours of a heavy or gritty nature, especially blue verditer, must be purified by washing after this method.

The student must be provided with a large, flexible pallet-knife, a large stone and muller to levigate the colours, two or three large pieces of chalk to absorb the moisture from the colours after they are levigated, a piece of flat glass to prevent the moisture from being absorbed too much, till the colours are rolled into form, and vessels for water, spirits, &c. as necessity and convenience shall direct.

I. REDS. It is rather difficult to procure either good carmine or good lake. Good carmine is inclined to the vermilion tint, and good lake to the carmine tint. The carmine crayons are prepared in the following manner.

1. Carmine. As their texture is inclinable to hardness, instead of grinding and rolling them, take a sufficient quantity of carmine, lay it upon the grinding-stone, mix it with a levigating knife with spirits of wine till it becomes smooth and even. The chalk-stone being ready, lay the colour upon it to absorb the spirit; but be careful that it is laid on in a proper shape for painting. If it is levigated too thin, the crayons will be too flat; and if too thick, it will occasion a waste of colour, by their adhering to the pallet-knife; but practice will render the proper degree of consistency familiar. The simple colour being prepared, the next step is to compose the different tints by a mixture with whiting; the proportion to be observed consisting of 20 gradations to one, which may be clearly understood by the following directions. Take some of the simple colour, and levigate it with spirits of wine, adding about one part of washed whiting to three parts of carmine, of which, when properly incorporated, make

two parcels. The next gradation should be composed of equal quantities of carmine and whiting, of which four crayons may be made. The third composition should have one fourth carmine and three fourths whiting; of this make six crayons, which will be a good proportion with the rest. The last tint should be made of whiting, very faintly tinged with carmine, of which make about eight crayons, which will complete the abovementioned proportion. As these compound tints are levigated, they are to be laid immediately upon the chalk, that the moisture may be absorbed to the proper degree of dryness for forming into crayons, which may be known by its losing the greater part of its adhesive quality when taken into the hand: if the consistency is found to be right, it may be then laid upon the glass, which having no pores will prevent the moisture from becoming too dry before it is convenient to form it into crayons, otherwise the crayons would be full of cracks and very brittle, which will be a great inconvenience when they are used in painting.

2. Lake. This is a colour very apt to be hard; to prevent which the student must observe the following particulars. Take about half the quantity of lake intended for the crayons and grind it very fine with spirits of wine; let it dry, and then pulverize it, which is easily done if the lake is good; then take the other half, and grind it with spirits, after which mix it with the pulverized lake, and lay it out directly in crayons on the chalk. This colour will not bear rolling. The simple colour being thus prepared, proceed with the compound crayons as directed before, and in the same degrees of gradation as the carmine tints.

3. Vermilion. The best is inclined to the carmine tint. Nothing is required to prepare this colour more than to mix it on the stone with soft water or spirits, after which it may be rolled into crayons. The different tints are produced by a mixture of the simple colour with whiting, according to the proportions already given.

II. BLUES. 1. Prussian blue is a colour very apt to bind, and is rendered soft with more difficulty than carmine and lake. The same method of preparation is to be followed with this as directed with respect to lake, only it is necessary to grind a larger quantity of the pure colour, as it is chiefly used for painting draperies. The different tints may be made according to necessity, or the fancy of the painter. 2. Blue-verditer is a colour naturally gritty, and therefore it is necessary to wash it well. Its particles are so coarse as to require some binding matter to unite them, otherwise the crayons will never adhere together. To accomplish this, take a quantity sufficient to form two or three crayons, to which add a piece of slacked plaster of Paris about the size of a pea; mix these well together, and form the crayons upon the chalk. This blue is extremely brilliant, and will be of great use in heightening draperies, &c. The tints must be formed with whiting as directed in the former instances, and are highly serviceable for painting flesh, to produce those pearly tints so beautiful in crayon-pictures. It is not necessary to mix the compounds with spirits, as clear water will be sufficient.

III. GREENS. Brilliant-greens are produced with great difficulty. In Switzerland, they have a method of

Crayon. of making them far superior to ours. We usually take yellow ochre, and after grinding it with spirits, mix it with the powder of Prussian blue, then temper it with a knife, and lay the crayons on the chalk, without rolling them. Instead of this, some use king's yellow mixed with Prussian blue, and others brown ochre and Prussian blue. The crayons made of the two last may be rolled. Various tints may be produced by these colours, according to fancy or necessity; some to partake more of the blue, and others of the yellow.

IV. **YELLOWS.** 1. King's-yellow is the most useful and the most brilliant, levigated with spirits of wine, and compose the different tints as before directed. Yellow ochre and Naples yellow ground with spirits will make useful crayons. 2. Orange is produced with king's-yellow and vermilion ground together with spirits, and the tints formed as in other cases, but no great quantity of them is required.

V. **BROWNS.** 1. Cullen's-earth is a fine dark brown. After six or eight of the simple crayons are prepared, several rich compound tints may be produced from it, by a mixture with carmine, in various degrees. Black, carmine, and this colour, mixed together, make useful tints for painting hair; several gradations may be produced from each of these by a mixture with whiting. Roman or brown ochre is an excellent colour, either single or compounded with carmine. Whiting tinged in several degrees with either of these, will prove very serviceable in painting. 2. Umber may be treated in just the same manner, only it is necessary to levigate it with spirit of wine.

VI. **PURPLES.** Prussian blue ground with spirits and mixed with pulverized lake, will produce a good purple. Carmine thus mixed with Prussian blue, will produce a purple something different from the former. Various tints may be made from either of these compounds by a mixture with whiting.

VII. **BLACK.** 1. Lamp-black is the only black that can be used with safety, as all others are subject to mildew: but as good lamp-black is very scarce the student will, perhaps, find it most expedient to make it himself; the process of which is as follows: Provide a tin cone, fix it over a lamp at such a height that the flame may just reach the cone for the foot to gather within it. When a sufficient quantity is collected, take it out, and burn all the grease from it in a crucible. It must then be ground with spirits, and laid on the chalk to absorb the moisture. Various grey tints may be formed from this by a mixture with whiting, as mentioned in former instances.— 2. Vermilion mixed with carmine: this is a composition of great use, and tints made from this with whiting will be found to be very serviceable. 3. Carmine and black is another good compound, of which five or six gradations should be made, some partaking more of the black, and others having the carmine most predominant, besides several tints by a mixture with whiting. 4. Vermilion and black is also a very useful compound, from which several different tints should be made. 5. Prussian blue and black is another good compound, and will be found of singular service in painting draperies.

It is impossible to lay down rules for the forming

every tint necessary in composing a set of crayons, there being many accidental compositions, entirely dependent on fancy and opinion. The student should make it a rule to save the leavings of his colours: for of these he may form various tints, which will occasionally be useful.

Of rolling the crayons, and disposing them for painting. The different compositions of colours must be cut into a proper magnitude, after they are prepared, in order to be rolled into pastils, for the convenience of using them. Each crayon should be formed in the left hand with the ball of the right, first formed cylindrically, and then tapered at each end. If the composition is too dry, dip the finger in water; if too wet, the composition must be laid upon the chalk again to absorb more of the moisture. The crayons should be rolled as quick as possible; and when finished, must be laid upon the chalk again, to absorb all remaining moisture. After the gradation of tints from one colour are formed, the stone should be well scraped and cleaned with water before it is used for another colour.

When the set of crayons is completed according to the rules prescribed, they should be arranged in classes for the convenience of painting with them. Some thin drawers, divided into a number of partitions, is the most convenient method of disposing them properly. The crayons should be deposited according to the several gradations of light. The bottom of the partitions must be covered with bran, as a bed for the colours; because it not only preserves them clean, but prevents their breaking.

The box made use of when the student paints, should be about a foot square, with nine partitions. In the upper corner, on the left hand (supposing the box to be in the lap when he paints), let him place the black and grey crayons, those being the most seldom used; in the second partition, the blues; in the third, the greens and browns; in the first partition on the left hand of the second row, the carmines, lakes, vermilions, and all deep reds; the yellows and orange in the middle, and the pearly tints next; and as these last are of a very delicate nature, they must be kept very clean, that the gradations of colour may be easily distinguished: in the lowest row, let the first partition contain a piece of fine lining rag to wipe the crayons with while they are using; the second, all the pure lake and vermilion tints; and the other partition may contain those tints which, from their complex nature, cannot be classed with any of the former.

CRAZE-MILL, or *CRAZING-Mill*, a mill in all respects like a grist-mill to grind corn, and is so called by the tin-miners, who use it to grind their tin, which is yet too great, after trampling.

CREAM, a general name applicable to all substances that separate from a liquor, and are collected upon its surface: but is more particularly applied to the following.

CREAM of Lime, is that part of the lime which had been dissolved in the water in its caustic state, but having again attracted some fixed air from the atmosphere, becomes incapable of solution, and therefore separates from the water in the mild state of chalk or limestone.

CREAM of Milk, generally called simple cream, is the most

Crayon

Creation.

* See *But-
ter, Milk,
and Cheese.*

most oily part of the milk ; which being naturally only mixed, and not dissolved in the rest, soon separates from them, as being specifically lighter : after which it collects on the surface ; from which it is generally skimmed, to complete the disengagement of the oily from the caseous and ferous parts that is to make butter*. Cream of milk is not only an agreeable aliment when recent, but is also useful in medicine as a lenient, when applied to tetter and crysipelas attended with pain and proceeding from an acrid humour.

CREAM of Tartar. See CHEMISTRY, n° 886.

CREAT, in the manege, an usher to a riding master ; or a gentleman bred in the academy, with intent to make himself capable of teaching the art of riding the great horse.

CREATION, in its primary import, seems to signify the bringing into being something which did not before exist. The term is therefore most generally applied to the original production of the materials whereof the visible world is composed. It is also, however, used in a secondary or subordinate sense, to denote those subsequent operations of the Deity upon the matter so produced, by which the whole system of nature and all the primitive genera of things received their form, qualities, and laws.

There is no subject concerning which there have been more disputes than this of creation. It is certain that none of the ancient philosophers had the smallest idea of its being possible to produce a substance out of nothing, or that even the power of the Deity himself could work without any materials to work upon. Hence some of them, among whom was Aristotle, asserted that the world was eternal both as to its matter and form. Others, though they believed that the gods had given the world its form, yet imagined the materials whereof it is composed to have been eternal. Indeed the opinions of the ancients, who had not had the benefit of revelation, were on this head so confused and contradictory, that nothing of any consequence can be deduced from them. The freethinkers of our own and of former ages have denied the possibility of creation, as being a contradiction to reason ; and of consequence have taken the opportunity from thence to discredit revelation. On the other hand, many defenders of the sacred writings have asserted, that creation out of nothing, so far from being a contradiction to reason, is not only probable, but demonstrably certain. Nay, some have gone so far as to say, that from the very inspection of the visible system of nature, we are able to infer that it was once in a state of non-existence. It would be impossible for us, however, to enter into the multiplicity of arguments used on both sides ; nor can we pretend to settle it, as the subject is confessedly above human comprehension.

I
What
works of
creation
God is
known to
have per-
formed.

As to the works of creation which the Deity is known to us to have performed ; all other beings, beside himself, are his creatures. Men and other animals that inhabit the earth and the seas, all the immense varieties of herbs and plants of which the vegetable kingdom consists ; the globe of the earth, and the expanse of the ocean ; these we know to have been produced by his power. Besides the terrestrial world which we inhabit, we see many other material bodies disposed around it in the wide extent of space. The moon, which is in a particular manner connected with

our earth, and even dependent upon it ; the sun, and the other planets with their satellites, which, like the earth, circulate round the sun, and appear to derive from him light and heat ; those bodies which we call fixed stars, and consider as illuminating and cherishing with heat each its peculiar system of planets ; and the comets which at certain periods surprize us with their appearance, and the nature of whose connection with the general system of nature, or with any particular system of planets, we cannot pretend to have fully discovered ;—these are so many more of the Deity's works, from the contemplation of which we cannot but conceive the most awful ideas of his creative power.

Matter, however, whatever the varieties of form under which it is made to appear, the relative disposition of its parts, or the motions communicated to it, is but an inferior part of the works of creation. We believe ourselves to be animated with a much higher principle than brute matter ; in viewing the manners and economy of the lower animals, we can scarce avoid acknowledging even them to consist of something more than various modifications of matter and motion : The other planetary bodies which seem to be in circumstances nearly analogous to those of our earth, are surely, as well as it, destined for the habitations of rational, intelligent beings. The existence of intelligences of an higher order than man, though infinitely below the Deity, appears extremely probable :—Of those spiritual beings called Angels we have express intimation in scripture ; (see the article ANGELS.) Such are our notions concerning the existence of beings essentially distinct from matter, and in their nature far superior to it : these, too, must be the creatures of the Deity, and of his works of creation the noblest part. But the limits of creation we must not pretend to define. How far the regions of space extend, or how they are filled, we know not. How the planetary worlds, the sun and the fixed stars, are occupied, we do not pretend to have ascertained. We are even ignorant how wide a diversity of forms, what an infinity of living animated beings may inhabit our own globe. So confined is our knowledge of creation ; yet so grand, so awful, that part which our narrow understandings can comprehend !

Concerning the periods of time at which the Deity executed his several works of creation, it cannot be pretended that mankind have had opportunities of receiving very particular information. From viewing the phenomena of nature, and considering the general laws by which they are regulated, we cannot draw any conclusive or even plausible inference with respect to the precise period at which the universe must have begun to exist. We know not, nor can we hope to ascertain, whether the different systems of planets circulating round our sun and the other fixed stars, were all created at one period, or each at a different period. We cannot even determine, from any thing that appears on the face of nature, whether our earth was not created at a later period than any of her fellow planets which revolve round the same sun. Astronomers are, from time to time, making new discoveries in the heavens ; and it is impossible to say whether some of these successive discoveries may not be owing to successive creations.

Philosophers have, indeed, formed some curious conjectures

Creation.

2
The periods
of time at
which God
executed
his works
of creation.

Creation. conjectures concerning the antiquity of the earth, from the appearances of its surface, and from the nature and disposition of its interior strata. The beds of lava in the neighbourhood of volcanoes have afforded ground for some calculations, which, though they do not fix the period of the earth's origin, are yet thought to prove that period to have been much more remote than the earliest age of sacred or profane history. * In the neighbourhood of mount *Ætna*, or on the sides of that extensive mountain, there are beds of lava covered over with a considerable thickness of earth: and at least another, again, which though known from ancient monuments and historical records to have issued from the volcano at least 2000 years ago, is still almost entirely destitute of soil and vegetation: in one place a pit has been cut through seven different strata of lava; and these have been found separated from each other by almost as many thick beds of rich earth. Now, from the fact, that a stratum of lava 2000 years old is yet scantily covered with earth, it has been inferred by the ingenious canon *Recupero*, who has laboured 30 years on the natural history of mount *Ætna*, that the lowest of these strata which have been found divided by so many beds of earth, must have been emitted from the volcanic crater at least 14000 years ago; and consequently that the age of the earth, whatever it may exceed this term of years, cannot possibly be less. Other facts of a similar nature likewise concur to justify this conjecture.

* *Brydone's*
Tour thro'
Sicily and
Malta.

But all these facts are as nothing in comparison with the long series which would be requisite to establish such a conjecture as an incontrovertible truth. And, besides, any evidence which they can be supposed to afford, may be very easily explained away. The bed of lava which in the course of 2000 years has scarce acquired a covering of earth, is confessed to stand in a situation in which it is exposed to the spray of the sea, and to all the violence of winds and rains. In such a situation, it cannot be thought that a thick bed of earth could, in any length of time, be formed on it: we might as well expect depth of soil and vigorous vegetation on the craggy cliffs of hills. In crevices here and there over it in which the earth has been retained, there is a depth of soil which supports large trees. This fact, therefore, admits of no such inference as that which *Recupero* has pretended to deduce from it. The local circumstances, again, of the seven strata that have been pierced through, are very different. They are situated at *Jaci Reale*, in a situation where showers of ashes from the volcano must frequently fall; and where whatever falls must be naturally retained and accumulated:—so that seven beds of earth might be formed on these seven strata of lava much sooner than one thin layer could be formed on the stratum abovementioned. In other places, some of which are within the influence of the same awful volcano, and some adjacent to that of *Vesuvius*, soil is known to have accumulated on lava with the help of showers of ashes from the volcanoes, with sufficient rapidity to justify this supposition concerning the coverings of the strata at *Jaci Reale*. From the observation of these phenomena of volcanoes, therefore, no facts have been gained that can help us to determine with any certainty the earth's age. And so wide is the variety of circumstances to be here taken into ac-

Creation. count, that it cannot be hoped that this *desideratum* will be ever supplied from this quarter. See further the article *EARTH*: n^o 177 and 178.

But by examining the composition and arrangement of the interior strata of the globe, and by viewing the general appearance of its surface, the ingenuity of philosophers has, with better hopes, sought to guess at the length of time during which it must have existed. Observing the exuviae of sea and land animals deposited at profound depths under ground, and accompanied with vegetable bodies in a good state of preservation, as well as with oleaginous and bituminous substances which have in all probability been formed from vegetable bodies; and remarking at the same time with what confusion the other materials, composing the crust of this terrestrial ball, are, in various instances, not arranged, but cast together; they have concluded that the earth must have existed for many an age before the earliest events recorded in sacred or profane history, and must have undergone many a revolution, before it settled in its present state. Such at least are the ideas which *Buffon* and *M. de Luc*, and also *Dr Hutton* †, seem desirous to im-

† *Ed. Phil.*

vol. i.

press us with concerning its changes and antiquity.—It will be only doing justice to these philosophers to acknowledge, that they have collected, with amazing industry, almost every fact in the natural history of the earth that can serve to give plausibility to their conjectures. But still their facts, besides the inconsistency of many of them, are by far too scanty to warrant the conclusions which they have pretended to deduce from them. See the article *EARTH*.

The voice of profane history is far from being decisive concerning the age of the world; nor is it to be expected that it should. When the earth first arose into existence, we can be at no loss to conceive that mankind were not spectators of the event: and we may naturally imagine that the first human beings who occupied it, would be too much busied in furnishing themselves with the immediate necessaries and the conveniences of life, to think of curious researches into its origin, or even their own. Profane history is not, however, without accounts of the age of the earth and the origin of human society; but those accounts are various and contradictory.—*Plato* in his dialogue intitled *Critias*, mentions his celebrated *Atantis* to have been buried in the ocean about 9000 years before the age in which he wrote. He asserts it to have been well known to the Egyptian priests and to the cotemporary inhabitants of *Atica*. The learned world, indeed, generally agree in regarding his accounts of that island as a fiction, which the author himself did not design to be understood in any other light: some, however, are more credulous, and others go so far as acknowledge doubts: and, if the existence of such an island, at a period so distant, be admitted as a fact worthy of any credit, the age of the world may be reckoned as at least considerably more than 12,000 years. The pretensions of the Chinese represent the world as some hundreds of thousands of years older: and we are also told * that the astronomical records of the ancient Chaldeans carried back the origin of society to a very remote period; no less than 472,000 years. The Egyptian priests reckoned between *Menes* and *Sethon* 341 generations †. But these accounts

Creation. are so discordant, and so slenderly supported by evidence, that we cannot hesitate to reject them all as false; the fables of historians scarce merit so much attention as the hypotheses of philosophers.

⁴
The era of
the creation
as stated in
profane
history.

When from profane we turn to sacred history, we may reasonably expect more accurate and more credible information concerning the antiquity of the globe. As the authenticity of the Holy Scriptures is so incontrovertibly established, wherever they afford evidence concerning any fact, that evidence must be regarded as decisive. A fact so important as the present may be thought highly worthy of a place in them. Unfortunately, however, even the sacred writings do not fix the era of the creation with sufficient accuracy; they leave us, in some measure, at a loss whether to extend what they say concerning that era to the whole contents of created space, or to confine it to our earth and its inhabitants: different copies give different dates; and even in the same copy, different parts relating the same events, either disagree or do not speak decisively with regard to the length of the time in which they passed.—In the beginning of the sixth chapter of the first book of Kings, the time which elapsed between the departure of the children of Israel from Egypt, and the period at which Solomon laid the foundation of his temple, is said to have been 480 years: And in the book of Judges again, the age of all the patriarchs amounts to 592 years. † The Hebrew copy of the bible, which we Christians for good reasons consider as the most authentic, dates the creation of the world 3944 years before the Christian era. The Samaritan bible, again, fixes the era of the creation 4305 years before the birth of Christ. And the Greek translation, known by the name of the *Septuagint* version of the bible, gives 5270 as the number of the years which intervened between those two periods. As many other different calculations of the years contained in the same intermediate space of time, might be formed upon other dates in the sacred volume, differing in the different copies. By comparing the various dates in the sacred writings, examining how these have come to disagree and to be diversified in different copies, endeavouring to reconcile the most authentic profane with sacred chronology, and picking out deficiency of dates and evidence with conjecture; some ingenious men have formed schemes of chronology, plausible indeed, but not supported by sufficient authorities, which they would gladly persuade us to receive in preference to any of those abovementioned. Usher makes out from the Hebrew bible 4004 years, as the term between the creation and the birth of Christ; Josephus, according to Dr Wills and Mr Whiston, makes it 4658 years; and M. Pezron, with the help of the *Septuagint*, extends it to 5872 years. Usher's system is the most generally received.

But though these different systems of chronology are so inconsistent and so slenderly supported, yet the differences among them are so inconsiderable in comparison with those which arise before us when we contemplate the chronology of the Chinese, the Chaldeans, and the Egyptians, and they agree so well with the general information of authentic history and with the appearances of nature and of society, that

they may be considered as nearly fixing the true period of the creation of the earth.

Profane history cannot be expected to contain an account of the first events which passed after the creation of the substances of which the universe consists. The conjectures of ancient philosophers on this subject cannot merit attention; for vague tradition, and the appearances of nature, the only data on which they could proceed in forming their conjectures, could admit of no fair inductions concerning those events; and besides, instead of listening to tradition, or examining the appearances of nature, they generally consulted imagination, and imagination alone, on such occasions. Here, therefore, we have nothing to hope but from the sacred writings. From them we may expect historical information, not to be obtained from any other source. What they communicate is communicated on divine authority; and it is only on such authority we can receive any accounts concerning the creation.

A few hints in the book of Job, afford the earliest information to be found in the scriptures concerning the creation of the world. "Where wast thou when I laid the foundations of the earth, when the morning stars sang together, and all the sons of God shouted for joy *?" "Behold, he put no trust in his servants, and his angels he charged with folly †." "And unto man, (or to Adam), he said, Behold, the fear of the Lord is wisdom, and to depart from evil is understanding ‡." These passages rather hint at than relate facts. But it has been inferred from them, that there were stars in the firmament, and angels in heaven, before the formation of our globe; that angels as well as man have fallen; and that other injunctions, besides that of abstaining from the forbidden fruit, were laid on Adam when he was first placed in Paradise ||. If the interpretation be admitted as just, the first of these facts may be considered as forming, as it were, a point with which our knowledge of the works of the Deity commences: the period of time at which the second event took place is not specified; and the precept to Adam must no doubt have been uttered after he was formed and inspired with intelligence. Yet with regard to the first of the above quotations from the book of Job, the only one that is of importance to us at present it must be acknowledged, that it has been differently understood. The morning stars might sing together, and the sons of God shout for joy, on account both of their own creation and of the creation of the earth at one time; and yet Job, having been himself made a conscious being at a much later period, not be able to tell where he was at that era of exulting gratitude and congratulation.

Moses relates that * "in the beginning God created the heavens and the earth. And the earth (continues he) was without form and void; and darkness was upon the face of the deep: and the spirit of God moved upon the face of the waters. And God said, Let there be light, and there was light. And God saw the light, that it was good: and God divided the light from the darkness. And God called the light day, and the darkness he called night: and the evening and the morning were the first day." During five succeeding days the work of creation was carried on. On the

Mosaic account
of the creation.

* Gen. i. 1.

† *Universal
Hist.* vol. i.
Preface.

Creation. the second day, a firmament was made to separate the waters, and that firmament called *heaven*: on the third day, the waters were collected into seas, and the land from which the waters retired caused to produce grass and trees and other plants: on the fourth day, lights were made to appear in the firmament: to enlighten the earth, to divide the day from the night, and to distinguish time into seasons and years: on the fifth day, the seas were peopled with whales and other fishes, and the air with fowls: on the sixth day, the earth was furnished with reptiles and quadrupeds of all kinds; and on the same day, the first human pair, the progenitors of all the human race, were created in God's own image.

a crust of earth; nor does he inform us that the scenery of nature was not diversified by hills and vales. Besides, the author of this theory has, without any evidence, supposed matter to have been originally under the influence of laws very different from those by which it is at present regulated. Oil, indeed, while fluid, floats above water: but in a concrete state, it sinks in water like other solid bodies. If reduced into that state by combination with terrene matters, sufficient to render the mixture proper for the nourishment and production of vegetables; its specific gravity will be still greater, and it will consequently sink so much the sooner. How a concrete substance, consisting of earth and oil, could float on water, appears an inexplicable enigma. But we need not here take farther pains in combating and triumphing over this theory, which has long since fallen and sunk to its grave.

Creation.

8
Difficulties occurring in the above account.

Some difficulties occur in comparing this account of the creation with the laws which appear at present to regulate the system of nature. We find it hard to conceive how the earth, while yet a stranger to the influence of the sun, could experience the vicissitude of day and night; and are astonished at the rapidity with which trees and herbage first overspread its surface. The condition of matter when the earth was without form and void, and the operation of the spirit of God on the face of the waters, are equally mysterious.

Mr Whiston treats both the scriptures and the laws of nature with greater reverence. Yet he certainly involves himself in no trifling difficulties in attempting to solve those which Moses presents. He supposes the sun, moon, and stars to be all more ancient than the earth. The chaos from which the earth was formed, he represents as having been originally the atmosphere of a comet. The six days of the creation he would persuade us to believe equal to six of our years: for he is of opinion, that the earth did not revolve daily round its axis, but only annually round its orbit, till after the fall of man.

11

Mr Whiston's theory.

9
Attempts to solve those difficulties. Dr Burnet's theory.

Some ingenious men have eagerly laboured to remove these difficulties. Among these is Dr Burnet, whose theory of the earth has now been long considered as fanciful and ill-founded. He supposes all the celestial bodies, even the sun and all the other planets of the solar system, to have existed long before the earth. The chaos on which the spirit of God moved, consisted, according to him, of the first principles from which all terrestrial bodies have been formed. When those laws by which the material world is regulated first began to operate on the mass, he supposes that its grosser and heavier parts would sink towards the centre, and there form a solid ball. Around this solid ball two species of particles would still float together in confusion. Of these he thinks one, being more volatile, would by degrees make its escape from the other, would leave it still recumbent on the solid centre, and spread around it in an atmosphere. The middle stratum he composes of aqueous and oleaginous fluids; and he makes no doubt, that after the air had made its escape, the levity of the oleaginous fluids would enable them to rise above the aqueous, and dispose themselves next the surface of the liquid mass. On them he supposes the impure atmosphere to have then deposited a quantity of terrene particles, sufficient to form, by intermixture with the oils, a thick crust of rich earth for the production of plants and herbage, and to afford an habitation to animals. This delicate shell he was careful not to furrow with seas or load with mountains; either of these would have reduced all to confusion. Such is *his* earth; and after moulding it with so much ingenuity, and into so happy a form, he contents himself, without venturing to use the same freedoms with the remaining part of Moses's account of the creation.

On the first day or year, therefore, the more ponderous parts of the chaos were according to this theory conglomerated into an orb of earth, the chinks and interstices over that orb filled up with water, and the exterior part or atmosphere rarefied, so as to admit some faint glimmering of the rays of the sun.

On the second day, the atmosphere was diffused to its due extent around the earth, and reduced to a degree of rarity and purity which rendered it still more suitable for the transmission of light; the earth was still more consolidated; and the waters being almost entirely excluded from the interstices which they before occupied, were partly spread over the surface of the earth, and partly raised in vapour into the atmosphere or firmament.

On the third day, the earth's surface became so irregular, in one place rising into hills, in another sinking into vales, as to cause the waters, which were before equally diffused, to collect into seas and lakes, leaving large tracts of ground unoccupied. And no sooner was a part of the earth's surface left bare by the waters, than the general influence of the sun produced on it a rich covering of herbage, and all the different species of vegetables.

On the fourth day, the earth was rendered subject to the regular influence of the sun, moon, and stars.

On the fifth day or year, things were so far advanced, that fishes and fowls were now produced from the waters.

On the sixth day was the earth furnished with animals; and the lord of all the other animals, man, was now created.

Such is Mr Whiston's account of the phenomena of the Mosaic creation. But he likewise assumes much more than can be reasonably granted. The atmosphere

12
Objections to Mr Whiston's theory.

10
Objections to Dr Burnet's theory.

But Moses affords nothing that can be with any propriety used in the foundation of such a theory: he tells not whether the chaos consisted of those terrene, and aqueous, and oleaginous, and aerial particles which Dr Burnet finds in it; he confines not the seas within

Creation. Sphere of a comet could not well be the primitive chaos; it is not an obscure, but a pellucid fluid; and its exterior strata, if of the same nature with the matter of our earth, must be scorified by its near approaches to the sun. Had the earth not begun to move round its axis till after the work of creation was completed, the immoderate degrees of heat and cold which its different parts would have alternately felt, would in all probability have proved fatal to both plants and animals. Even the most artful interpretation of Moses's words cannot represent him as meaning to inform us that the sun and moon were created at different periods. But philosophy will scarce permit us to imagine that the moon was formed before the earth. And therefore we cannot upon good grounds agree with Mr Whiston, that the creation of the earth was later than that of the other bodies of the solar system.

¹³
M. de Luc's
theory and
objections.

Among others who have endeavoured to explain the original formation of the earth, and the changes which it has undergone, is M. de Luc. This cosmologist, like Mr Whiston, thinks that the days of the creation were much longer periods of time than our present days. He seems to think that the earth had existed long before the Mosaic creation; but began at that era to experience new changes, and to be regulated by new laws; that all the different events described by Moses in his history of the creation, actually took place in the order in which he relates them; but that Moses's days are indefinite spaces of time, which must have been very long, but of which we cannot hope to ascertain the precise length. These are ingenious conjectures; but they do not appear necessary, nor are they justified by facts. For a fuller and more close investigation of this part of the subject, we must refer to the article EARTH: and shall now close the present article with a short explanation of what appears to us the most natural way of understanding Moses's account of the creation.

* *Univ. Hist.*
vol. i. p. 25.

It has been conjectured*, with great probability, that the creation of which Moses is the historian, was neither confined to the earth alone, nor extended to the whole universe. The relation which all the planets of the solar system bear to the same illuminating body countenances the conjecture, that they, together with the luminary by which they are enlightened, were all created at one period: but it would perhaps be to conceive too meanly of the benevolence, wisdom, and active power of the Deity to suppose that before that period these had never been exerted in any work of creation. Yet even here we have not demonstrative evidence.

On the supposition that the whole solar system was created at once, which has at least the merit of doing no violence to the narrative of Moses, the creation of the sun and the other planets may be understood to have been carried on at the same time with the creation of the earth. In that case, even in the course of the first day, though not longer than our present days, those bodies might be reduced to such order, and their relative motions so far established, as to begin the distinction between light and darkness, day and night.

On the second day, we may naturally understand from Moses's narrative, that the atmosphere was purified, and the specific gravities of aqueous vapour and

atmospheric air so adjusted, as to render the latter capable of supporting the former.

On the third day the waters were first collected into lakes and seas: but in what manner, we cannot well determine. Some call in the operation of earthquakes; others tell us, that when the earth was first formed, the exterior strata were, at different parts over its surface, of different specific gravities; and that the more ponderous parts now sunk nearer the common centre, while the lighter parts still remaining equally remote from it as before, formed islands, continents, hills, and mountains. But these are mere fancies; and we have not facts to offer in their stead. On the latter part of this day vegetables were caused to spring up over the earth. Their growth must have been much more rapid than we ever behold it now: but by what particular act of supernatural power that might be effected, we should in vain inquire.

On the fourth day the sun, moon, and stars, were made to appear. But according to the conjecture which we have mentioned as plausible, though without ascribing to it the evidence of certain truth, those heavenly bodies are to be considered as having been created before this day. But they might now begin to exert their full influence on the earth in the same manner as they have since continued to do.

The creation of the inanimate world was now finished, and the earth prepared for the reception of animals. On the fifth day, therefore, were the living inhabitants of the air and the waters created.

On the sixth day the inferior animals inhabiting the earth were first created; and after that, the whole work was crowned by the creation of a male and female of the human species. To the account of the creation of the animals, nothing certain can be added in explanation of Moses's narrative. No more but one pair of the human species were at first created: the same oeconomy might possibly be observed in the creation of the inferior animals.

CREBILLON (Prosper Joliot de), a French writer of tragedy, and usually ranked after Corneille and Racine, was born at Dijon in 1674. He was originally destined to the profession of the law, and placed at Paris with that view; but the impetuosity of his passions rendering him unfit for business, he was urged by some friends, who discerned very well his natural turn, to attempt dramatic compositions. He complied, but not till after many refusals; and gave at length a tragedy, which met with great success. He then marched on in the career he had begun, but was checked by a fit of love for an apothecary's daughter; which fit of love ended in marriage. His father, doubly enraged at his son for thus surrendering himself to the two demons of love and poetry, disinherited him; but falling sick some years after, in 1707, he re-established him in all his rights, and died. Crebillon was, however, little better for his acquisitions, the greatest part being probably wasted before they came; and thus, though high in fame and at the prime of life, he still continued poor. He lost his wife in 1711, and fortune long frowned upon him, till at last he obtained a place in the French academy, and the employment of censor of the police. He was afterwards in good circumstances, and happy to the end of his life, which was a very long one; for he did not die

Creation,
Crebillon.

Crecy
||
Credit.

die till 1762, aged 88. He was much regretted and lamented, as old as he was; being a very worthy man, and possessed of many and great virtues. He was of a temperament extremely robust, without which he could not have held out so long; for he eat prodigiously, and continued to the last so to do. He slept little, and lay as hard as if upon the floor; not from any pious principle of mortifying, but because he liked it. He was always surrounded with about 30 dogs and cats; and used to smook a good deal of tobacco, to keep his room sweet against their exhalations. Whenever he was ill, he used to manage himself according to his own fancy and feelings; for he always made a jest of physic and physicians. He was a dealer in *bons mots*. Being asked one day in full company, which of his works he thought the best? "I don't know (says he) which is my best production; but this (pointing to his son) is certainly my worst."

CRECY, CRESCY, or CRESSY. See CRESSY.

CREDENTIALS, letters of recommendation and power, especially such as are given to ambassadors or public ministers, by the prince or state that sends them to foreign courts.

CREDIBILITY, a species of evidence, less indeed than absolute certainty or demonstration, but greater than mere possibility: it is nearly allied to probability, and seems to be a mean between possibility and demonstration.

CREDIT, in commerce, a mutual trust or loan of merchandize or money, on the reputation of the probity and solvability of a dealer.

Credit is either public or private. Every trader ought to have some estate, stock, or portion of his own, sufficient to carry on the traffic he is engaged in: they should also keep their dealings within the extent of their capital, so that no disappointment in their returns may incapacitate them from supporting their credit. Yet traders of worth and judgment may sometimes lie under the necessity of borrowing money for carrying on their business to the best advantage; but then the borrower ought to be so just to his own reputation and to his creditors, as to be well assured that he has sufficient effects within his power to pay off his obligations in due time. But if a trader should borrow money to the extent of his credit, and launch out into trade so as to employ it with the same freedom as if it was his own proper stock, such a way of management is very precarious, and may be attended with dangerous consequences. Merchants ought never to purchase their goods for exportation upon long credit, with intent to discharge the debt by the return of the same goods; for this has an injurious influence on trade several ways: and if any merchant has occasion to make use of his credit, it should always be for the borrowing of money, but never for the buying of goods; nor is the large credit given to wholesale traders a prudential or justifiable practice in trade.

The public credit of a nation is said to run high when the commodities of that nation find a ready vent, are sold at a good price, and when dealers may be safely trusted with them: also when lands and houses find ready purchasers; when money is to be borrowed at a low interest: when people think it safe and advantageous to venture large stocks in trade; and when notes, mortgages, &c. will pass for money.

Letters of CREDIT, are those given to persons in whom a merchant, &c. can trust, to take money of his correspondent abroad, in case he happens to need it.

Credit
||
Creech.

CREDIT is also used for the currency which papers or bills have in the public or among dealers. In this sense credit is said to rise, when, in negotiating the shares of the company, they are received and sold at prices above *par*, or the standard of their first creation. Discredit is opposed to credit, and is used where money, bills, &c. fall below *par*.

CREDIT was also anciently a right which lords had over their vassals; consisting in this, that during a certain time they might oblige them to lend them money. In this sense, the Duke of Brittany had credit during fifteen days on his own subjects, and those of the bishop of Nantes; and the bishop had the same credit or right among his subjects and those of that prince.

CREDITON, a market-town in Devonshire, considerable for a good woollen manufactory: it is situated about 9 miles north-west of Exeter, in W. Long. 3. 50. and N. Lat. 50. 50.

CREDITOR, a person to whom any sum of money is due, either by obligation, promise, or otherwise. See DEBT.

CREDULITY denotes a weakness of mind, by reason of which a person yields his assent to propositions or facts, before he has considered their evidence.

CREECH (Thomas), eminent for his translations of ancient authors both in prose and verse, was son of Thomas Creech, and born near Sherborne in Dorsetshire in 1659. He was educated in grammar learning under Mr Curganven of Sherborne, to whom he afterwards dedicated a translation of one of Theocritus's Idylliums; and entered a commoner of Wadham college in Oxford in 1675. Wood tells us that his father was a gentleman; but Giles Jacob says, in his Lives and characters of English Poets, that his parents circumstances not being sufficient to afford him a liberal education, his disposition and capacity for learning raised him up a patron in Colonel Strangeways, whose generosity supplied that defect. Be that as it will, Creech distinguished himself much, and was accounted a good philosopher and poet, and a diligent student. June 13. 1683. he took the degree of master of arts, and not long after was elected probationer fellow of All-souls college; to which, Jacob observes, the great reputation acquired by his translation of Lucretius recommended him. Wood tells us, that upon this occasion he gave singular proofs of his classical learning and philosophy before his examiners. He also took the degree of B. D. on the 13th of March 1696. He now began to be well known by the works he published; but Father Niceron observes, that they were of no great advantage to his fortune, since his circumstances were always indifferent. In 1699, having taken holy orders, he was presented by his college to the living of Welwyn in Hertfordshire; but this he had not long enjoyed before he put an end to his own life. The motives of this fatal catastrophe have been variously represented. The author of the *Nouvelles de la Republique des Lettres* informs us, that in the year 1700 Mr Creech fell in love with a woman who treated him with

Creed
||
Creep.

with great neglect, though she was complaisant enough to several others. This affront he could not bear, and resolved not to survive it. Whereupon he shut himself up in his study, where he hanged himself about the end of June 1700, and was found in that circumstance three days after. The Poetical Register says nothing of the particular manner of his death, but only that he unfortunately made away with himself in the year 1701; and ascribes this fatal catastrophe of Mr Creech's life to the moroseness of his temper, which made him less esteemed than his great merit deserved, and engaged him in frequent animosities and disputes upon that account. But from an original letter of Arthur Charlett, preserved in the Bodleian library, it has lately been discovered, that this unhappy event was owing to a very different cause. There was a fellow collegian of whom Creech frequently borrowed money; but repeating his applications too often, he met one day with such a cold reception, that he retired in a fit of gloomy disgust, and in three days was found hanging in his study. Creech's principal performances are, 1. A Translation of Lucretius. 2. A Translation of Horace; in which, however, he has omitted some few odes. 3. The Idylliums of Theocritus, with Rapin's Discourse of Pastorals. 4. A translation of Manilius's Astronomicum. Besides translations of several parts of Virgil, Ovid, and Plutarch; printed in different collections.

CREED, a brief summary of the articles of a Christian's belief.

The most ancient form of creeds is that which goes under the name of the apostolic creed: besides this, there are several other ancient forms and scattered remains of creeds to be met with in the primitive records of the church. The first is the form of apostolical doctrine, collected by Origen; the second is a fragment of a creed preserved by Tertullian; the third remains of a creed is in the works of Cyprian; the fourth, a creed composed by Gregory Thaumaturgus, for the use of his own church; the fifth, the creed of Lucian the martyr; the sixth, the creed of the apostolical constitutions. Besides these scattered remains of the ancient creeds, there are extant some perfect forms, as those of Jerusalem, Cesarea, Antioch, &c.

The most universal creeds are, the APOSTOLICAL, the ATHANASIAN, and the NICENE creeds. See these articles.

These three creeds are used in the public offices of the church of England; and subscription to them is required of the clergy, and of dissenting teachers properly qualified by the toleration act, as the eighth article declares that they may be proved by the surest testimonies of scripture.

CREEK, a part of a haven, where any thing is landed from the sea. So many landing-places as there are in a harbour or port, so many creeks there are. It is also said to be a shore or bank whereon the water beats, running in a small channel from any part of the sea; from the Latin *crepido*. This word is used in the stat. 4 Hen. IV. c. 20. and 5 Eliz. c. 5.

CREENGLES. See CRINGLE.

CREEPER, in ornithology. See CERTIA.

CREEPER, in naval affairs, an instrument of iron resembling a grappling, having a *shank*, and four hooks or claws. It is used to throw into the bottom of any

river or harbour, with a rope fastened to it, to hook and draw up any thing from the bottom which may have been lost. See Plate CL.

CRELLIUS (John), a famous Socinian, born in 1590, in a village near Noremberg. In 1612 he went into Poland, where the Unitarians had a school, in which he became professor of divinity, and minister at Crackow, where he died in 1632, aged 42. He was the author, 1. Of a famous Treatise against the Mystery of the Trinity; 2. Commentaries on a part of the New Testament; and other works. All of them are scarce.

CREMA, a city and bishop's see of Italy, capital of a district of the Milanese, called from it *Cremusco*: it stands almost in the middle between Milan and Mantua, in E. Long. 10. 15. and N. Lat. 45. 20.

CREMASTER, in anatomy, the name of a muscle of the testicle, of which there is one on each side. See ANATOMY, *Table of the Muscles*.

CREMATION is sometimes used for burning, particularly when applied to the ancient custom of burning the dead. This custom is well known to have prevailed among most eastern nations, and continued with their descendants after they had peopled the different parts of Europe. Hence we find it prevailing in Greece, Italy, Gaul, Britain, Germany, Sweden, Norway, and Denmark, till Christianity abolished it.

CREMONA (anc. geog.), a Roman colony, with municipal rights, settled beyond the Po, below the confluence of the Addua, on the report of Hannibal's march into Italy (Polybius): a town at this day still maintaining its name and flourishing state. It was an opulent and mercantile city; but suffered greatly in the civil wars of Augustus (Virgil). In the war with Vitellius, it was destroyed by the partizans of Vespasian; but was soon after rebuilt by the munificence of the citizens and exhortations of Vespasian, (Tacitus). Now capital of the Cremonese, in the duchy of Milan. E. Long. 10. 30. Lat. 45.

CRENATED, in botany. See BOTANY-Index.

CRENELLE, or IMBATTLED, in heraldry, is used when any honourable ordinary is drawn, like the battlements on a wall to defend men from the enemies shot. This attribute belongs to the arms of such as have defended castles for their prince or country, or of such as are skilled in architecture.

CRENOPHYLAX, in antiquity, a magistrate of Athens, who had the inspection of fountains.

CREODIBA, in the customs of the middle age, a robbery and murder committed in a wood, where the body of the person killed was burnt in order to prevent any discovery of the crime. The word, says Wendelinus, is compounded of *cruy* and *diven*, that is, "wood-robbers."

CREOLES, a name given to the families descended from the Spaniards who first settled at Mexico in America. These are much more numerous than the Spaniards properly so called, and the Mulattoes, which two other species of inhabitants they distinguish; and are excluded from all considerable employments.

CREON, king of Corinth, was son of Sisyphus. He promised his daughter Glauce to Jason, who had repudiated Medea. To revenge the success of her rival, Medea sent her for a present a gown covered with poison. Glauce put it on, and was seized with sudden pains.

Crellius

Creon.

Creon
|
Crepitation.

Her body took fire, and she expired in the greatest torments. The house also was consumed by the fire, and Creon and his family shared Glauce's fate.

CREON, son of Menœtius, was father of Jocasta, the wife and mother of Oedipus. At the death of Laius, who had married Jocasta, Creon ascended the vacant throne of Thebes. As the ravages of the Sphynx were intolerable, Creon offered his crown and daughter in marriage to him who could explain the enigmas which the monster proposed. Oedipus was happy in his explanations, and he ascended the throne of Thebes and married Jocasta without knowing that she was his mother, and by her he had two sons, Polynices and Eteocles. These two sons mutually agreed after their father's death to reign in the kingdom each a year alternately. Eteocles first ascended the throne by right of seniority; but when he was once in power he refused to resign at the appointed time, and his brother led against him an army of Argives to support his right. The war was decided by a single combat between the two brothers. They both killed one another, and Creon ascended the throne till Leodamus the son of Eteocles should be of a sufficient age to assume the reins of government. In his regal capacity he commanded that the Argives, and more particularly Polynices, who was the cause of all the bloodshed, should remain unburied. If this was in any manner disobeyed, the offenders were to be buried alive. Antigone the sister of Polynices transgressed, and was accordingly punished. Hæmon the son of Creon, who was passionately fond of Antigone, killed himself on her grave, when his father refused to grant her pardon. Creon was afterwards killed by Theseus, who had made war with him because he refused burial to the Argives.

CREPANCE, in the manege, a chop or cratch in a horse's leg, given by the sponges of the shoes of one of the hinder feet crossing and striking against the other hinder foot. This cratch degenerates into an ulcer.

CREPIDÆ, among the Romans, a kind of slippers or shoes, which were always worn with the *pallium*, as the *calcei* were with the *toga*.

CREPIS, HAWK-WEED: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is naked; the calyx calyculated with deciduous scales; the pappus feathery and stalked. There are 14 species, most of them herbaceous annuals, rising to the height of a foot or a foot and an half; and having their branches terminated by ligulated compound red and yellow flowers. These are very large, and consist of many flat florets spread over one another imbricatum, and when fully blown appear as if radiated. They are very conspicuous and beautiful: and appear in June, July, and August. They are succeeded by plenty of seed, which, if permitted to scatter on the ground, will produce a number of young plants without further trouble.

CREPITATION, that noise which some salts make over the fire in calcination, called also *detonation*.

CREPITATION is also used in surgery, for the noise made by the ends or pieces of bones, when the sur-

geon moves a limb to assure himself by his ear of the existence of a fracture.

CREPUNDIA, in antiquity, a term used to express such things as were exposed along with children, as rings, jewels, &c. serving as tokens whereby they afterwards might be known.

CREPUSCULUM, in astronomy, twilight; the time from the first dawn or appearance of the morning to the rising of the sun; and again, between the setting of the sun and the last remains of day.

Papias derives the word from *creperus*; which, he says, anciently signified *uncertain, doubtful*, q. d. *a dubious light*. The crepusculum is usually computed to begin and end when the sun is about 18 degrees below the horizon; for then the stars of the sixth magnitude disappear in the morning, and appear in the evening. It is of longer duration in the solstices than in the equinoxes, and longer in an oblique than in a right sphere.

The crepuscula are occasioned by the sun's rays refracted in our atmosphere, and reflected from the particles thereof to the eye. See TWILIGHT.

CRESCENT, the new moon, which, as it begins to recede from the sun, shows a little rim of light, terminating in points or horns, which are still increasing till it become full and round in the opposition. The word is formed from *creresco*, "I grow."

The term is also used for the same figure of the moon in its wane or decrease, but improperly; because the points or horns are then turned towards the west, whereas they look to the east in the just crescent.

CRESCENT, in heraldry, is a bearing in form of a half moon. The Ottomans bear sinople, a crescent montant, argent.

The crescent is frequently used as a difference in coat-armour, to distinguish it for that of a second brother or junior family.

The figure of the crescent is the Turkish symbol; or rather is that of the city Byzantium, which bore this device from all antiquity; as appears from medals struck in honour of Augustus, Trajan, &c.

The crescent is sometimes montant, i. e. its points look towards the top of the chief, which is its most ordinary representation; whence some contend, that the crescent, absolutely so called, implies that situation; though other authors blazon it montant, when the horns are towards the dexter-side of the escutcheon, in which position others call it *incroissant*.

Crescents are said to be *adossed*, when their backs or thickest parts are turned towards each other; their points looking to the sides of the shield. *Crescent inverted*, is that whose points look towards the bottom: *turned crescents*, are placed like those adossed; the difference is, that all their points look to the dexter-side of the shield: *conturned crescents*, on the contrary, look to the sinister side: *affronted* or *appointed crescents*, are contrary to the adossed, the points looking towards each other.

CRESCENT is also the name of a military order, instituted by Renatus of Anjou, King of Sicily, &c. in 1448; so called from the badge or symbol thereof, a crescent of gold enamelled. What gave occasion to this establishment was, that Renatus took for his device a crescent, with the word *loz*, "praise," which, in

Crependia
|
Crescent.

Crescentia, the style of rebus, makes *loz in crescent*, q. d. by *advancing in virtue, one merits praise*.
Crescimbeni.

CRESCENTIA, the CALABASH-TREE: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 25th order, *Putaminea*. The calyx is bipartite and equal; the corolla gibbous; the berry pedicellated or stalked, unilocular, and polyspermous; the seeds bilocular. There are two species.

1. The *cujete*, with oblong narrow leaves and a large oval fruit, is a native of Jamaica and the Leeward Islands. It hath a thick trunk covered with a whitish bark, which rises from 20 to 30 feet high, and at the top divides into many branches, forming a large and regular head, garnished with leaves, which come out irregularly, sometimes single; at other times many arise out of the same knot: the flowers are produced from the sides of the large branches, and sometimes from the trunk, standing upon long footstalks. They have but one petal, which is irregular; and they are of a greenish yellow colour, striped and spotted with brown. These are succeeded by very large fruit, generally spherical, sometimes oval; and at other times they have a contracted neck like a bottle; and are so large, that when the pulp and seeds are cleaned out, the shells will contain three pints or two quarts of liquid. The fruit is covered externally with a thin skin of a greenish-yellow colour when ripe. When this is peeled off, there appears a hard ligneous shell, inclosing a pale yellowish soft pulp of a tart unfavoury flavour, surrounding a great number of flat heart-shaped seeds. 2. The *latifolia*, or broad-leaved calabash, seldom rises more than 15 or 20 feet high, with an upright trunk, covered with a white smooth bark, sending out many lateral branches at the top, garnished with leaves three inches in length, and one and a quarter broad, ranged alternately. The flowers come out as in the former species; but are smaller, and of a deeper yellow colour. The fruit of this sort is sometimes round, sometimes oval, but of very unequal sizes. Both these species are easily propagated by seeds; but the plants are too tender to live in Britain, unless they are constantly kept in a stove.

The shells of calabashes are made use of for various purposes. At Barbadoes, besides drinking-cups and punch-bowls, there are made of them spoons, dishes, and other utensils for the slaves. Some of these shells are so large, as to be capable of holding 15 pints of water. The pulp is seldom eaten, except by cattle in the time of drought. The wood, which is hard and smooth, is made into stools, chairs, and other furniture.

CRESCIMBENI (John Maria), an Italian, was born at Macerata in Ancona, 1663. His talents for poetry and eloquence developed themselves early. His verses at first had too much pomp and point; but residing in Rome, and reading the best Italian poets, brought him back to nature. He not only reformed himself, but undertook to reform bad taste in general. From this motive he projected the establishment of a new academy, under the name of *Arcadia*; the members of which at first did not exceed 14, but afterwards increased much. They called themselves the shepherds of Arcadia, and each took the name of some shepherd and some place in that ancient kingdom. The founder of this society was appointed the director of it in 1690, and held this honourable post 38 years;

namely, to the year of his death, which happened in 1728. Among a great number of works, in verse and prose, the principal is, *An History of the Italian Poetry*, very much esteemed, and reprinted, 1731, at Venice, in six volumes 4to. This history is accompanied with a commentary, containing anecdotes of Italian poets. He published also an *History of the Academy of Arcadia*, together with the *Lives of the most illustrious Arcadians*: and many other works.

CRESCY, or **CRESSY**. See **CRESSY**.

CRESS, **WATER-CRESS**, or **CRESESSES**, in botany. See **SISYMBRIUM**.

Indian CRESS. See **TROPÆOLUM**.

CRESSY, a port town of Picardy in France, about 44 miles south of Calais, and 27 north-west of Abbeville, remarkable on account of the victory obtained there over the French by Edward III. of England, in the year 1346. E. Long. 2. 0. N. Lat. 50. 20.

Edward having encountered and overcome many difficulties in his expedition, was at last so closely followed and harassed by the French army, commanded by the King of France in person, that he determined to make a stand at this place, and to give his pursuers a check. For this purpose he chose his ground with great judgment, on the gentle declivity of a hill, with a thick wood in his rear. He ordered deep entrenchments to be made on each flank, and waited with firmness the approach of his enemies. The King of France, dreading nothing so much as the escape of the English, began the march of his great army from Abbeville early in the morning, August 26. and continued it several hours with great eagerness, till he received intelligence that the English had halted at Cressy, and were prepared to give him battle. He was advised at the same time not to engage that day, when his troops were much fatigued with their march, and in great disorder; and he was disposed to have taken this advice. But the discipline of these times was so imperfect, that the orders given for halting were not obeyed; and one corps of this mighty host impelling another, they continued advancing till they came into the presence of their enemies in much confusion.

Edward had employed the forenoon of this important day in drawing up his army in the most excellent order, in three lines. The first line, which consisted of 800 men at arms, 4000 English archers, and 600 Welsh foot, was commanded by his young, amiable, and heroic son, the Prince of Wales, assisted by the Earls of Warwick and Oxford, and several other noblemen. The second line, composed of 800 men at arms, 4000 halbardiers, and 2400 archers, was led by the Earls of Arundel and Northampton; the last line, or body of reserve, in which were 700 men at arms, 5300 billmen, and 6000 archers, was ranged along the summit of the hill, and conducted by the King in person, attended by the Lords Moubray, Mortimer, and others. When the army was completely formed, Edward rode along the lines, and by his words and looks inspired his troops with the most ardent courage and strongest hopes of victory. He then commanded the cavalry to dismount, and the whole army to sit down upon the grass, in their ranks, and refresh themselves with meat, drink, and rest. As soon as the French army came in view, they sprung from the ground, full of strength and spirit, and stood ready to receive them.

The King of France, assisted by the Kings of Bohemia

Cressy
||
Cressy.

Henry's
History,
Vol. IV.
p. 178.

Cressy. hemia and Majorca, the Dukes of Lorraine and Savoy, and several other sovereign princes, with the flower of the French nobility, laboured to restore some degree of order to his prodigious army, and drew it up also in three lines, but very indistinctly formed. The first line was commanded in chief by the King of Bohemia; the second by the Earl of Alençon, the King of France's brother; and the third by Philip in person; and each of these lines contained a greater number of troops than the whole English army.

The battle of Cressy was begun about three o'clock in the afternoon, August 26. by a great body of Genoese cross-bowmen, in the French service, who let fly their quarrels at too great a distance to do any execution, and were presently routed by a shower of arrows from the English archers. The Earl of Alençon, after trampling to death many of the flying Genoese, advanced to the charge, and made a furious attack on that corps commanded by the Prince of Wales. The Earls of Arundel and Northampton advanced with the second line to sustain the Prince, and Alençon was supported by as many troops as could crowd to his assistance. Here the battle raged for some time with uncommon fury; and the Earl of Warwick, anxious for the fate of the day and the safety of the Prince, sent a messenger to the King, intreating him to advance with the third line. Edward, who had taken his stand on a wind-mill on the top of the hill, from whence he had a full view of both armies, asked the messenger, if his son was unhorsed, or wounded, or killed? and being answered, that the Prince was unhurt, and performed prodigies of valour, "Go then," said he, "and tell my son and his brave companions, that I will not deprive them of any part of the glory of their victory." This flattering message being made known, inspired the Prince and his troops with redoubled ardour; and the king of Bohemia, the Earl of Alençon, and many other great men, being slain, the whole first and second lines of the French army were put to flight. Philip, undismayed at the slaughter of his troops, and the fall of so many princes, advanced to the charge with the line under his immediate command. But this body soon shared the same fate with the other two; and Philip, after having been unhorsed, and wounded in the neck and thigh, was carried off the field by John de Hainault, and fled with no more than five knights and about 60 soldiers in his company, of all his mighty army, which at the beginning of the battle consisted of more than 120,000 men. Such was the famous victory of Cressy, the greatest ever gained by any King of England. After the battle, the King flew into the arms of the Prince of Wales, and grasping him to his bosom, cried in an ecstasy of joy, "My dear son, you have this day showed yourself worthy of the knight-hood which you lately received, and of the crown for which you have so bravely fought; persevere in your honourable course." The Prince, as modest as he was brave, sunk down on his knees, his face covered with blushes, and begged his father's blessing. Edward continued with his army at Cressy three days, employed in numbering and burying the dead. The French had left on this bloody scene the King of Bohemia, 11 other princes, 80 bannerets, 1200 knights, 1500 gentlemen, 4000 men of arms, and 30,000 other soldiers.

CREST, in armoury, denotes the uppermost part of an armoury; or that part rising over the cask or helmet.—Next to the mantle, says Guillim, the crest or cognizance claims the highest place, being seated on the most eminent part of the helmet; yet so as to admit an interposition of some escrol, wreath, chapeau, crown, &c.

The ancient warriors wore crests to strike terror in their enemies, as the sight of the spoils of animals they had killed; or to give them the more formidable mien, by making them appear taller, &c.

In the ancient tournaments, the cavaliers had plumes of feathers, especially those of ostriches and herons, for their crests; these tufts they called *plumarts*; and were placed in tubes, on the tops of high caps or bonnets. Some had their crests of leather; others of parchment, pasteboard, &c. painted or varnished, to keep out the weather; others of steel, wood, &c. on which were sometimes represented a member or ordinary of the coat; as, an eagle, fleur-de-lys, &c. but never any of those called *honourable ordinaries*, as pale, fesse, &c. The crests were changeable at pleasure; being reputed no other than as an arbitrary device or ornament.

Herodotus attributes the rise of crests to the Carians, who first bore feathers on their casks, and painted figures on their bucklers; whence the Persians called them *cocks*.

The crest is esteemed a greater mark of nobility than the armoury, as being borne at tournaments; to which none were admitted till they had given proof of their nobility. Sometimes it serves to distinguish the several branches of a family. It has also served, on occasion, as the distinguishing badge of factions. Sometimes the crest is taken from the device; but more usually it is formed of some piece of the arms: thus, the emperor's crest is an eagle; that of Castile, a castle, &c. Families that exchange arms, as the houses of Brunswick and Cologne have done, do not change their crests; the first still retain the horse, and the latter the mermaid.

CREST, in heraldry, the figure placed above the helmet in an achievement. See HERALDRY.

CREST-fallen, a fault of an horse, when the upper part of his neck, called the *crest*, hangs to one side: this they cure by placing it upright, clipping away the spare skin, and applying plasters to keep it in a proper position.

CRETA, or CHALK, in natural history. See CHALK.

CRETE, one of the largest islands in the Mediterranean, lying between 22 and 27 degrees of east longitude, and between 35 and 36 degrees of north latitude. According to Strabo, this island is 287 miles in length; and according to Pliny, 270; and according to Scylax, 312. As to its breadth, it is not, as Pliny observes, above 55 miles where widest; whence it was styled, as Stephanus observes, the *Long Island*. It has the Archipelago to the north, the African sea to the south, the Carpathian sea to the east, and the Ionian to the west. Anciently it was known by the names of *Aeria*, *Chthonia*, *Idæa*, *Curete*, *Macaris*, &c. but its most common name was that of *Crete*.

The Cretan mythologists, quoted by Diodorus Siculus, relate that the first inhabitants of the Island were the Dactyli, Idæi, who dwelt around mount Ida; they

Crete
||
Crete.

Crete.

they were regarded as magicians, because they possessed a variety of knowledge, and were particularly skilled in religious mysteries. Orpheus, who distinguished himself so highly in poetry and music, was their disciple. They discovered the use of fire, iron, and brass, and invented the art of working these metals in Berecynthius, a mountain near Aptera. Those invaluable discoveries procured them divine honours. One of them, named Hercules, rendered himself famous by his courage and great exploits. He instituted the Olympic games: though posterity, by a mistake arising from his bearing the same name, have ascribed that institution to the son of Alcmena; who, indeed, trode in the steps of his predecessor, and raised himself also to immortality.

The Daetyli Idæi were the ancestors of the Curetes. These last, at first inhabited the forests and caves of the mountains. Afterwards they entered into domestic life, and contributed, by their institutions, to the civilization of mankind. They taught men to collect flocks of sheep, to tame the ferocity of wild animals for domestic purposes, and to invite bees into hives, that they might rattle them of the fruit of their labours. They first prompted men to the chase, and taught the use of the bow. They were the inventors of swords and of military dances. The noise which they made, by dancing in armour, hindered Saturn from hearing the cries of Jupiter, whose education Rhea had entrusted to them. With the assistance of the nymphs, they brought up that god in a cave in mount Ida, feeding him with the milk of the goat Amalthea, and with honey.

To this period mythology assigns the origin of the Titans; their abode near Gnosus, where stood the palace of Rhea; their travels over the whole earth; their war against Ammon, and his defence by Bacchus; the nuptials of Jupiter and Juno, celebrated nigh the river Therenus in Crete; the gods, goddesses, and heroes who descended from them.

The most illustrious of those heroes were Minos and Rhadamanthus. They are said to have been the sons of Jupiter and Europa, who was conveyed into the island on a bull. Minos becoming king, built several cities; the most considerable of which are—Gnosus, on that side of the island which faces Asia, Phæstus on the southern shore, and Cydon on the western, facing Peloponnesus. He gave to his subjects a code of admirable laws, which he pretended to have received from his father Jupiter in the grotto of mount Ida.

Rhadamanthus distinguished himself by the impartiality of his judgments, and by the inflexible severity with which he inflicted punishment on the impious and wicked. His empire extended over the chief isles of the Archipelago, and the inhabitants of the adjacent coasts of Asia submitted to him on account of his high reputation for probity and justice. Mythologists have constituted him judge in the regions below, to determine the future state of the righteous and the wicked. They have conferred on him the same honours which were bestowed on Minos, the justest of kings.

Thus far have been followed the Cretan traditions as they are related by Diodorus; but historians differ about the truth of them. There are a variety of opinions concerning the first inhabitants of Crete. Stra-

bo, who has discussed them with great erudition, says, after several pages on the subject, "I am not fond of fables; yet I have detailed these at some length, because they are connected with theology. Every discourse concerning the gods should examine the religious opinions of antiquity, and distinguish them from fable. The ancients were pleased to conceal their knowledge of nature under a veil. It is now impossible to unfold the meaning of their enigmas. But by exposing to light the numerous allegories which they have left us, and by examining attentively their mutual relations and differences, genius may perhaps be able to unfold the truths which are couched under them."

But leaving mythology for the more certain records and monuments of history, we find that Crete received its name from Crés, the first of its monarchs. He was author of several useful inventions, which contributed to the happiness of his subjects. Prompted by gratitude, they endeavoured to perpetuate the memory of his favours, and to immortalize his name, by naming the island after him.

In order to distinguish the true Cretans from strangers, they were named *Eteocretes*. A number of colonies, from different parts of Greece, settled in the island. The agreeableness of the climate, and the fertility of the soil, invited them to fix their habitation there. The Lacedæmonians, Argives, and Athenians, were the principal people who sent colonies into Crete. This is what makes Homer say, "Crete is an extensive island in the midst of the stormy main. The soil is rich and fertile. It contains an immense number of inhabitants. It is adorned with an hundred cities. Its inhabitants speak in various languages. We find there Achæans, valiant Eteocretes, Cydonians, Dorians, and godlike Pelasgians." The Eteocretes inhabited the southern division of the island; they built there the city of Præsus, and erected a temple to Dictæan Jove.

Crés was not the only monarch who reigned in the island of Crete. He had a series of successors. But history affords little information concerning them: only the names of a few of them are preserved, and a small number of events which happened under the reign of some others,—but blended and disfigured with an intermixture of fable. Among those monarchs we find two Jupiters, and two of the name of Minos. However, most writers confound them, and ascribe to one those transactions and exploits which should be shared between the two.

This remark chiefly regards Minos, who was esteemed the wisest legislator of antiquity. The office assigned him in the regions below, is a clear and certain proof of his having gained an exalted reputation by his justice. Greece, says Plato, has with great propriety adopted the laws of Crete; for they are founded on the solid basis of reason and equity, and have a natural tendency to render the people, who live in subjection to them, opulent and happy. One of those laws forbade "the Cretans ever to carry their festivity so far as to intoxicate themselves with wine." The following was very suitable to repress the presumptuous ardour of youth, "Let young people not canvass the laws with an indiscreet curiosity; let them not examine whether the lawgiver has done right or wrong in promulgating them; but let them join un-

nanimously

Crete.

Crete. nimously in declaring them good, since they proceed from the gods. If any of the old men perceive something in them meriting amendment, let him mention it to the magistrate, or discuss it with his equals, but never in the presence of the young people." That excellent code was engraven on tables of brass; and Talos, chief minister to Minos, visited all the towns and cities in the island, three times a-year, to observe in what manner the laws were executed and obeyed. The king of Crete, well knowing that the marvellous is necessary to command the belief and enforce the obedience of the people, pretended that he had received those laws from his father Jupiter, in the grotto of mount Ida. In the same manner, Lycurgus, before promulgating his laws, repaired to Delphos, and gave out they had received the sanction of Apollo. A like reason induced Numa to pretend to an intimacy with the nymph Egeria, and Mahomet to ascribe his doctrines and institutions to the revelation of the angel Gabriel.

In contradiction to this account, others of the ancients describe Minos as a prince impotently abandoned to the fury of his passions, and a barbarous conqueror. Falling passionately in love with the nymph Diotynna, who refused to gratify his wishes, he pursued her to the brink of the shore, and forced her to plunge into the sea, where she was saved by some fishermen, who received her in their nets. He was the first of the Greeks who appeared in the Mediterranean at the head of a naval armament. He conquered the Cyclades, expelled the Carians, established Cretan colonies in those islands, and committed the government of them to his son.

Being informed, while he was at Paros, that his son Androgeus was slain at Athens, he declared war against Egeus, and imposed on him a disgraceful tribute; from the payment of which Theseus delivered his country. He took arms against Nisus, king of Megara, made him prisoner by the treachery of his daughter Scylla, and put him to death, together with Megarus, the son of Hippomanes, who had brought some forces to his assistance. Dædalus, who had by some means incurred his displeasure, despairing of pardon from so severe and inflexible a prince, employed the resources of his inventive genius, in order to escape from his power. He fled to Sicily, gained the protection of King Cocalus, and obtained an asylum in his court. Valerius Flaccus has described his flight in a very lively and picturesque manner. "Thus Dædalus, with the wings of a bird, ascended from mount Ida. Beside him flew the comrade of his flight, with shorter wings. They appeared like a cloud rising in the air. Minos, seeing his vengeance thus eluded, glowed with impotent rage. In vain he followed with his eyes the secure flight of his enemies through the wide expanse of heaven. His guards returned to Gortynia with their quivers filled with arrows." The Cretan monarch did not, however, give up his prey. He equipped a fleet, pursued the fugitive to Sicily, and fell before the walls of Camicum.

It is plain, that those actions cannot agree to the character of that just monarch, whose merits raised him to the office of determining, in the regions below, the unalterable fate of the righteous and the wicked. We may, therefore, reasonably conclude,

Crete. that Minos the legislature is a different person from the conqueror; that it was the former who gained a lasting reputation by his wisdom and justice; and the latter who subdu'd most of the islands of the Archipelago, but being enslaved by his passions, tarnished his glory by his cruelty and merciless thirst for vengeance.

The last king of Crete was Idomeneus. This prince, accompanied by Merion, conducted 24 ships to the assistance of Agamemnon. Homer informs us of the illustrious exploits by which he signalized himself before the walls of Troy. At his departure, he committed the government of his kingdom to Leucus his adopted son, promising him the hand of his daughter Clithera if he governed wisely in his absence. That ambitious young man soon forgot the favours which had been so lavishly bestowed on him. Gaining a number of partisans, he in a short time aspired to the immediate possession of the crown. His impatience would not wait till he should obtain it lawfully by marriage. Flattering himself, from the long absence of the king, that he was perhaps fallen before Troy, he determined to mount the throne. Mida, wife to Idomeneus, and the princess Clithera, were an obstacle to his wishes. But ambition knows no restraint, and tramples under foot the most sacred obligations. The base wretch having seduced the people from their allegiance, and captivated the affections of the nobles, sacrificed those unfortunate victims in the temple. When Idomeneus, crowned with laurels, landed on the coast of Crete, Leucus, who had now firmly established his power, attacked him with an armed force, and obliged him to reembark. A different account is also given of the banishment of Idomeneus. Servius says, that he had vowed, in a storm, to sacrifice to the gods the first person that his eyes should behold on the Cretan shore; that his son having met him first after his arrival, he fulfilled his vow, by sacrificing him; and that the island, being soon after depopulated by pestilence, the inhabitants looked upon that affliction as the effect of divine vengeance, and expelled the parricide; who retiring to Italy, founded Salernum, on the Messapian coast. But that opinion appears entirely groundless. History mentions no son of Idomeneus. If he had a son of his own blood, why did he adopt Leucus? Why did he entrust to him the government of the island, when he promised him his daughter in marriage? The more probable opinion is, that the plague was introduced into the island by his ships, when he returned from the siege of Troy, as Herodotus asserts; and that Leucus artfully made use of that pretext to expel his lawful sovereign from the island. But it appears that the usurper did not long enjoy the fruit of his crimes. Soon after the departure of Idomeneus, monarchy was abolished, and the government of Crete became republican. The republic of Crete has been celebrated by the panegyric of Plato, served Lycurgus as a model for that which he established in Lacedæmon, and was beheld by all Greece with respect and admiration. Strabo has thought it not unworthy of its pencil, and has consecrated the leading features of its constitution to lasting fame in his immortal work. It was indeed a system of legislature, whose direct tendency was to call forth the buds of virtue in the heart of infancy; to open and expand them

Crete. them in youth ; to inspire man, as he reached maturity, with the love of his country, of glory, and of liberty ; and to comfort and support the infirmities of age with the respect and esteem due to the experience and wisdom of that period of life. It laboured to form affectionate friends, patriotic citizens, and worthy magistrates. It made no use, however, of a multitude of acts and statutes to produce those inestimable advantages. They flowed all from one source ; the public education of youth, judiciously directed. The virtuous examples set before youth in the course of that education, the illustrious deeds which were recited to them with high applause, the honours conferred on valour and on noble actions, the opprobrium invariably cast on vice ; these were the only means which the Cretan lawgiver made use of to form a warlike, humane, and virtuous nation.

The Cretan government, soon after the expulsion of Idomeneus, became aristocratical. The power was divided between the nobles and the people. Yet as the chief employments were occupied by the nobles, they directed the administration of affairs. Ten magistrates were annually elected, by a majority of voices in the national assembly. These were named *Cosmoi*, and their public office and character were the same with those of the Ephori at Sparta. They were the generals of the republic in time of war, and directed all affairs of any importance. They had the right of choosing certain old men for counsellors. Those old men, to the number of twenty-eight, composed the Cretan senate. They were chosen from among such as had discharged the office of *Cosmoi*, or had distinguished themselves by extraordinary merit and blameless probity. Those senators continued in office during life, possessed a weighty influence, and were consulted in every affair of any importance. This body was a barrier opposed by the wisdom of the legislator against the ambition of the ten chief rulers. He had imposed another restraint on their power, by limiting the period of their administration to one year. His foresight went still farther. The suffrages of the people might be obtained by bribery or personal influence, and of consequence their choice might sometimes fall on a man unworthy of so honourable an office. When that happened, he who had been undeservedly advanced to the dignity of *Cosmos* was degraded, either in a national assembly, or simply by the voices of his colleagues. This, doubtless, is what Plato alludes to, when he says, "Neither the commonwealth, which approaches too near to a monarchical constitution, nor that which affects a licentious liberty, is founded on the solid basis of a just medium between anarchy and despotism. O Cretans ! O Lacedæmonians ! by establishing yours on firmer foundations, you have avoided those fatal extremes."

Such were the distribution of power and the administration of public affairs in the Cretan government. Its simplicity was admirable. A people who were blessed with the sacred enjoyment of liberty, but possessed not sufficient knowledge and discernment to direct themselves, elected magistrates, to whom they delegated their authority. Those magistrates, thus arrayed with sovereign power, chose senators to assist and direct their deliberations. These counsellors

could neither enact or decide of themselves : but they held their office for life ; and that circumstance contributed to strengthen their influence and to increase their experience. The magistrates were animated by the most powerful motives to distinguish themselves when in office, by unwearied activity in the public service. On one side, they were restrained by the fear of degradation ; on the other, actuated by the hope of becoming one day members of the national council.

Yet let us enquire what means the Cretan lawgiver used to form virtuous citizens. All the Cretans were subjected to the power of their magistrates ; and divided into two classes, the adults and the youth. Men arrived at maturity were admitted into the first. The second consisted of all the young men who were not below the age of seventeen. The society of adults eat together in public halls. Their rulers, magistrates, poor and rich, seated together, partook, without distinction, of the same simple fare. A large bowl, filled with wine and water, which went round the company from one to another, was the only drink that they were allowed. None but the old men had a right to call for more wine. Doubtless, that people, so celebrated for wisdom, were not strangers to the power of beauty ; for a woman was appointed to preside at each table. She openly distributed the most exquisite meats to those who had distinguished themselves by their valour or wisdom. That judicious preference was so far from exciting envy or jealousy, that it only prompted every person to deserve it by brave and prudent conduct. Near where the citizens sat, two tables were laid, which they named *Hospital* ; all strangers and travellers were entertained at these : and there was also a particular house set apart by the public, in which they might spend the night.

To supply the public expences, every citizen was obliged to bring a tenth part of this annual income into the treasury. The chief magistrates were to take care that every person contributed his proportion. In Crete, says Aristotle, one part of the fruits of the earth, of the produce of the flocks, of the revenues of the state, and of the taxes and customs, is sacred to the gods : the other is distributed among the members of the community ; so that men, women, and children, all subsist at the public expence.

After dinner, the magistrates and senators usually spent some time in deliberating on the affairs of the state ; they next recounted the noble deeds which had been done in war, celebrated the courage of their most distinguished warriors, and animated the youth to heroic valour. Those assemblies were the first school of the youth. At the age of seven, the boy was permitted to handle the bow ;—from that time he was admitted into the society of the adults, where he continued till the age of seventeen. There, sitting on the ground, and clothed in a plain and coarse dress, he served the old men, and listened, with respectful silence, to their advices. His young heart was inflamed with the recital of noble deeds in arms, and glowed with ardour to imitate them. He acquired habits of sobriety and temperance. And being constantly witness of illustrious examples of moderation, wisdom, and patriotism ; the seeds of virtue were thus sown

Crete. fown and fostered in his heart before he attained the use of reason.

He was early accustomed to arms and to fatigue, that he might learn to endure excessive heat or cold, to clamber and leap among hills and precipices, and to bear manfully the blows and wounds which he might receive amid the gymnastic exercises or in battle. His education was not confined to the gymnastic exercises; he was also taught to sing the laws, which were written in verse, with a certain species of melody; in order that the charms of music might dispose him to learn them with more pleasure, and might impress them more deeply on his heart, and that, if he should ever transgress them, he might not have the excuse of ignorance to offer. He next learned hymns in honour of the gods, and poems composed in praise of heroes. When he reached his seventeenth year, he retired from the society of the adults, and became a member of that of the young men.

Here his education was still carried on. He exercised himself in hunting, wrestling, and fighting with his companions. The lyre played tunes of martial music; and he learned to follow exactly the sounds and measure of the musician. Those sports and exercises were sometimes attended with danger; because arms of steel were sometimes used in them. One dance, in which the youth aspired most ardently to excel, was the Pyrrhic, originally invented in Crete. The performers in that dance were arrayed in complete armour:—they wore a light short coat, which did not fall below the knee, and was bound with a girdle going twice round the waist; on their feet and legs were buskins; above these they bore their arms,—and performed various military evolutions to the sound of musical instruments. “The Lacedemonians and Cretans,” (says Libanius), “cultivated dancing with amazing ardour; they considered, that their laws had directed them to practise it for the most important purposes; and it was scarce less dishonourable for a Lacedemonian or Cretan to neglect the military dances, than to desert his post in battle.”

Those Cretans who were opulent and high-born, were permitted to form societies of young men of their own age. They often strove, with emulation, who should form the most numerous one. The father of the young man who formed one of those societies, usually presided in it. He had a right to educate those warlike youth, to exercise them in running and in hunting, to confer rewards and inflict punishments.

Friendship was in high estimation among the Cretans; but, says Strabo, the manner in which they conducted the intercourse of friendship was pretty extraordinary. Instead of mild persuasion, they made use of violence, to gain the objects of their affections. He who conceived an affection for a young man of his own age, and wished to attach him to himself by indissoluble bonds, formed a scheme for carrying him off by violence. Three days before putting it into execution, he communicated it to his comrades. They could not then interfere to prevent it; because if they had, they would have appeared to think the young man unworthy of such an excessive attachment. At the appointed day they assembled to protect their companion. If the ravisher appeared to them not unworthy of the object of his affection, they made, at first, a faint resistance in obedience to the law—but,

at last, joyfully favoured his enterprise; if, on the other hand, they thought him unworthy of the object of his choice, they made such resistance as to prevent him from executing his design. The feigned resistance continued till the ravisher had conducted his friend into the hall of that society to which he belonged. They did not regard him who possessed superior beauty and gracefulness of person as the most amiable; but him who had most distinguished himself by his modesty and valour.

The ravisher loaded his young friend with favours, and conducted him wherever he desired: they were accompanied by those who had favoured the rape: he carried him from feast to feast, procured him the pleasures of the chase and good cheer; and after using all possible means to gain his heart for the course of two months, brought him back to the city, and was obliged to give him up to his parents. But first he presented him with a suit of armour, an ox, and a drinking-cup; which were the usual and legal presents on such occasions. Sometimes his generosity went still farther; and he made more expensive presents; to defray the expence of which his comrades contributed. The young man sacrificed the ox to Jupiter, and gave an entertainment to those who had assisted when he was carried off. He then declared his sentiments concerning a connection with his ravisher, and told whether or not it was agreeable to him. If he had reason to complain of the treatment which he had received, the law allowed him to forsake a friend so unworthy of the name, and to demand his punishment.

It would have been disgraceful, adds Strabo, to a young man, who was handsome and well-born, to be rejected by his friends on account of the depravity of his manners. Those who had been carried off received public honours. Theirs were the first places in the halls and at the race. They were permitted to wear, during the rest of life, those ornaments which they owed to the tenderness of friendship; and that mark of distinction testified to all who saw them, that they had been the objects of some fond attachment.

When the youth had finished their exercises, and attained the legal age, they became members of the class of adults; being then considered as men, they were permitted to vote in the national assemblies, and were entitled to stand candidates for any public office. They were then obliged to marry; but did not take home their wives till such time as they were capable of managing their domestic concerns.

“The legislator (says Strabo) had considered liberty as the greatest blessing that citizens can enjoy. Liberty alone can secure the property of the citizens of any state. Slavery either robs them of it, or renders it precarious. The first care of nations should therefore be to preserve their liberty. Concord strengthens and supports her empire; she flourishes wherever the seeds of dissension are extinguished. Almost all those hostilities which prevail among nations or individuals spring either from an inordinate desire of wealth or the love of luxury. Introduce, instead of those baneful principles, frugality, moderation, and equality of conditions; you will thus banish envy, hatred, injustice, and haughty disdain.” This was what the Cretan lawgiver happily effected. And the community, which was regulated by his wise institutions rose to glory, opulence, and power; and was honoured

Crete.

nquered with the panegyrics of the most celebrated philosophers of Greece: but the highest honour it ever obtained, was that of serving Lycurgus as a model for the admirable form of government which he established at Sparta.

The republic of Crete continued to flourish till the age of Julius Cæsar. No other state has enjoyed so long a period of strength and grandeur. The legislature, regarding liberty as the only sure basis of a nation's happiness, had instituted a system of laws, the natural tendency of which was, to inspire men with an ardent passion for liberty, and with such virtue and valour as are necessary to support and defend it. All the citizens were soldiers; all of them were skilled in the art of war. The valiant youth of other nations resorted to Crete, to learn the exercises, manœuvres, and evolutions, of the military art. "Philopœmen (says Plutarch) being impatient of indolence, and eager to acquire skill in arms, embarked for Crete. After spending a considerable time in the noblest exercises among that brave people, who were skilled in the art of war, and accustomed to an austere and temperate life, he returned to the Achæans. The knowledge which he had acquired made him so eminent among them, that he was immediately appointed general of their cavalry."

On the other hand, the legislator, being persuaded that conquests are generally unjust and criminal, that they often exhaust the strength of the victorious nation, and almost always corrupt its manners, endeavoured to preserve the Cretans from the ambition of conquest. The fertility of the island abundantly supplied their wants. They needed not that commerce should introduce among them the riches of foreign countries, along with which luxury and her train of attendant vices would also be introduced; and he knew how to inspire them with an indifference for such acquisitions without expressly forbidding them. The gymnastic exercises, which occupied the leisure of the gallant youths; the pleasures of the chase; the ardour of friendship; the public shows, at which all the different orders of the community, both men and women, used to assemble; the love of equality, order, and their country, with which he inflamed every breast; the wise institutions, which united a whole nation so closely that they composed but one family;—all these ties attached the Cretans to their native island: and finding at home that happiness which was the object of their wishes, they never thought of wandering abroad in search of an imaginary glory, or of extending their empire over other nations. Therefore, from the period at which that state assumed a republican form till the time when they were attacked by the arms of Rome, the nation was not once known to send an hostile force into the territories of any of their neighbours. This instance of moderation is unparalleled in history; no other nation can divide the glory of it with the Cretans. Individuals indeed might leave their country to engage in foreign armies. Those princes and states who knew their valour and skill in archery eagerly sought to take them into their pay; all the neighbouring monarchs were desirous of having in their armies a body of Cretan archers. Over the whole world none were more celebrated than they for bending the bow. "The arrows of Gortynia (says Claudian)

aimed from a trusty bow, are sure to wound, nor ever miss the destined mark."

Crete.

Though the multitude of independent cities which flourished in Crete did not unite their arms to subjugate the neighbouring islands, and drench them with the blood of their inhabitants, yet they were not so wise as to live in peace among themselves. Discord often stalked among them with her flaming torch. The most powerful wished to enslave the rest. Sometimes Gnôsfus and Gortynia marched with social banners against their neighbours, levelled their fortresses, and subjected them to their power; at other times they attacked each other with hostile violence, and saw their bravest youth perish amid the horrors of civil war. Lyctos and Cydon opposed an invincible barrier to their ambition, and preserved their own liberty. The last of these cities had acquired such strength and influence, that she held the balance between the rival powers of the island. Those wars destroyed a number of the cities, and drenched the native country of Jupiter with blood.

To what source must we attribute those intestine dissensions? One part of the island was occupied by the Eteocretes, the original inhabitants; the rest was peopled with colonies from Athens, Sparta, Argos, and Samos. Perhaps the ancient grudges which had subsisted among those strangers, being still unextinguished in their breasts, were easily rekindled by accident or circumstances, and inflamed with new fury. We may also suppose, that the most powerful among them, exulting in their superiority, would endeavour to take advantage of the weakness of the rest, and disregard all laws but those of force; besides, the glowing ardour of the youth, trained to military exercises, was ever ready to fly to arms. Such, probably, were the causes which fomented discord and hostility among a people living under the same religion, customs, and laws. Whatever these might be, the Cretans, being persuaded that the firm union of their soldiers was essential to victory, arrayed the bravest youths of the army in splendid robes, and caused them to sacrifice to friendship before engaging in battle. In some countries it would be very proper to oblige the generals, on such occasions, to sacrifice to concord. If such a sacrifice were performed with sincerity, it might preserve their glory unstained, and prevent such deluges of blood from being wasted without producing any advantages to the state.

Their passion for war did not extinguish in the breasts of the Cretans that exquisite sensibility which is the mother and nurse of the fine arts. "The Cretans (says Sozomen) gave an illustrious proof of their munificence to genius, by making Homer a present of a thousand pieces of silver; and to perpetuate the memory of this act of generosity, they recorded it by an inscription on a public column." In Crete, adds Ptolemy, men are still more desirous of cultivating their understandings than of exercising their bodily powers. Often when dissensions arose, the voice of wisdom and the charms of poetry recalled them to reason and harmony. Thales of Gortynia, the preceptor of Lycurgus, was one of their most celebrated philosophers. Being both a poet and legislator, he made an happy use of his abilities and knowledge to extinguish among his countrymen the kindling sparks of discord. "His poems were moral discourses in verse, which recalled

the

Crete. the people to concord and submission to the laws. Using a regular measure, he recommended the austerity of his subject by the insinuating and powerful charm of sentiment. So powerful were the effects of his verses, which addressed at once the ears, the heart, and the understanding of his hearers, that their rage was gradually softened. Next, opening their hearts to the love of peace, the advantages of which he described in glowing colours, they forgot their intestine dissensions, and ranged themselves around the standard of concord." That sage is said to have invented tunes for the military dances and for the Cretan Pyrrhic. Men who felt so strongly the influence of poetry and music could scarcely be enemies to pleasure. Accordingly they had a custom of distinguishing their fortunate days with white flint stones, their unfortunate days with black. At the end of the year they counted the number of their white stones, and reckoned that they had lived only so many days as were distinguished for having been fortunate. They did not think mere existence, without the enjoyment of pleasure, worthy of the name of *life*. For this reason, they caused to be inscribed on their tombs: "He lived so many days; he continued in existence so long."

A passion for glory is easily awaked in a feeling and generous breast. The Cretans eagerly repaired to the famous solemnities of Greece, and were often crowned at the Olympic, Nemæan, and Pythian games: others of them were favourites of the muses, and versified the predictions of prophets, or celebrated the glorious deeds of their heroes. Several of them distinguished themselves by historical compositions. At the most ancient games, a prize is said to have been bestowed on the poet who sung the noblest hymn in honour of Apollo: Chrysothemis of Crete sung and gained the prize.

The ravages of time have deprived us of almost all their works; and if Pindar had not preserved the memory of some of their crowns, we should not know even the names of the conquerors who wore them. The temple of Dianna at Ephesus, built by the Cretan Ctesipon and his son Metagenes, was not proof against the frantic hand of the incendiary. Those ingenious architects had built it on the principles of the Ionic order: to the costliness of the materials, the elegance of the architecture, the symmetry of the parts, and the majesty and perfection of the whole, they had added solidity and strength, without which the rest must have been of small value. Their names have descended to posterity, but the pillars of that monument which has perpetuated their memory have been dispersed or destroyed. Scarce a vestige remains of that building which was esteemed one of the seven wonders of the world.

Nations are effaced from the earth like the monuments of their power, and after the revolution of several ages we can scarce trace in their posterity any remains of their ancient character. Some of them exist longer, others shorter; but we may almost always calculate the period of their duration by the excellence of their laws, and the fidelity with which they support and obey them. The republic of Crete, being established on a solid basis, knew no foreign master for a period of ten centuries. She bravely repelled the attacks of those princes who attempted to enslave her. At length the time arrived when the warlike and victorious Ro-

mans aspired to the empire of the world, and would suffer none but their subjects or slaves to inhabit within the reach of their arms. Florus does not scruple to acknowledge, that the Romans had no other motives for invading Crete but the ambitious desire of subduing the renowned native country of Jupiter. "If any persons wish to know the reasons which induced us to attack Crete (says he), the true reason was our desire to subdue so celebrated an island. The Cretans had appeared to favour Mithridates, and the Romans thought proper to declare war against them on that pretext. Mark Antony, father of the triumvir, attacked them with strong hopes of success; but was severely punished for his presumption and imprudence. The Cretans took a great part of his fleet, hung up his soldiers and sailors on the masts amid the sails and cordage, and returned in triumph into their harbours."

The Romans never forgot nor forgave a defeat. As soon as the Macedonian war was brought to an happy conclusion, they again took arms against the Cretans to revenge their ignominy and loss. Quintus Metellus was sent to Crete with a powerful armament. He met with an obstinate and vigorous resistance. Parnarus and Lathenes, two experienced leaders, collecting a body of 20,000 young warriors, all eager for battle, and of determined courage, employed their arms and arrows successfully against the Romans, and protracted the fate of Crete for three years. These conquerors could not make themselves masters of the island before destroying its bravest warriors. They lost a great number of troops, and bought a bloody victory at the price of many a danger and much fatigue. However, their usual good fortune at length prevailed. The first care of the conqueror was to abolish the laws of Minos, and to establish in their room those of Numa. Strabo, that enlightened philosopher, complains of this act of severity; and informs us, that in his days the original laws of Crete were no longer in force, because the Romans compelled the conquered provinces to adopt their civil code. To secure themselves still more fully in the possession of the island, they sent a powerful colony to Gnoſſus.

From that era to the present time, that is, for a period of 1900 years, the Cretans have no longer formed a separate nation, nor made any figure among the states and kingdoms of the world: their noble and ingenuous manners, their arts and sciences, their valour and their virtues, are no more. They have lost these with the loss of liberty. So true is it that man is born for himself; and that, when deprived of that aid which Nature has designed to strengthen and support his weakness, the flame of genius and the ardent glow of valour are extinguished in his breast; he becomes incapable of vigorous resolution, and sinks below the natural virtue and dignity of the species.

The island of Crete, joined with the small kingdom of Cyrene, on the Lybian coast, formed a Roman province. It was at first governed by a proconsul; a questor and an assistant were afterwards sent there; at last, as Suetonius informs us, it was put under the government of a consul. This island was one of the first places in the world that were favoured with the light of the gospel. St Paul introduced the Christian faith into Crete: and his disciple Titus, whom he left there

Crete
||
Creux.

to cherish and cultivate the precious plant, became the first bishop of the island. In the reign of the emperor Leo, it had twelve bishops, who were all subject to the patriarch of Constantinople. Constantine separated Crete from Cyrene in the new division which he made of the provinces of the empire. Leaving three sons, Constantius, Constantine, and Constans, he assigned Thrace and the eastern provinces to the first; to the second, the empire of the West; the island of Crete, Africa, and Illyria, to the third.

When Michael Balbus sat on the throne of Constantinople, the rebellion of Thomas, which lasted three years, caused him to neglect the other parts of the empire. The Agarenians (a people of Arabia), who had conquered the finest provinces of Spain, seized that opportunity. They fitted out a considerable fleet, plundered the Cyclades, attacked the island of Crete, and made themselves masters of it without opposition. In order to secure their conquest, they built a fortress which they named *Khandak*, "intrenchment." From that citadel the barbarians made inroads into the interior parts of the island, carrying havoc and devastation wherever they appeared. By repeated attacks, they subdued all the cities in Crete except Cydon. Michael made some ineffectual efforts to expel them from Crete. The emperor Basilus, the Macedonian, was not more successful. They defeated him in a bloody battle; but being vanquished by one of his generals, they were subjected to the payment of an annual tribute. At the end of ten years, the Arabians refused the tribute. It was reserved for Nicephorus Phocas, who was afterwards emperor, to deliver this fine island from the yoke of the infidels. He landed on the island with a numerous army, boldly attacked them, and routed them in various engagements. The Saracens, no longer daring to meet so formidable a general in the field, fled for protection to their fortresses. Phocas being plentifully supplied with all the warlike machines necessary for a siege, levelled their walls, and alarmed their hearts with terror. He took their cities and fortresses, and drove them into *Khandak* their metropolis and last resource. In the course of nine months he subdued the whole island, took their king Curup and his lieutenant Aremas prisoners, and reunited to the empire a province which had been 127 years in the hands of the infidels. It remained under the dominion of the Romans till the time when Baldwin Count of Flanders, being raised to the throne, liberally rewarded the services of Boniface Marquis of Montserrat, by making him king of Thessalonica, and adding the island of Crete to his kingdom. That lord, being more covetous of gold than glory, sold it to the Venetians in the year 1194; under whom it assumed the name of **CANDIA**. See the sequel of its history under that article.

CRETIO, in antiquity a certain number of days allowed the heir to consider whether he would act as heir to the deceased or not; after which time, if he did not act, he was excluded from the estate.

CREUX, a term in sculpture, much used by the French; though not yet, that we know of, naturalized among us: but the want of a word of equal import in English, as it has frequently put us under a necessity of using this in the course of the present

work; so it pleads strongly for its admission into our language.

Creux originally signifies a *hollow, cavity, or pit*, out of which something has been scooped or dug; hence it is used to denote that kind of sculpture and graving where the lines and figures are cut and formed within the face or plane of the plate or matter engraven on. In which sense it stands opposed to *relievo*: where the lines and figures are embossed, and appear prominent above the face of the matter.

CREW, the company of sailors belonging to a ship, boat, or other vessel.

The sailors that are to work and manage a ship are regulated by the number of lasts it may carry; each last making two ton. The crew of a Dutch ship, from 40 to 50 lasts, is seven sailors and a swabber; from 50 to 60 lasts, the crew consists of eight men and a swabber; and thus increases at the rate of one man for every ten lasts; so that a ship of 100 lasts has 12 men, &c. English and French crews are usually stronger than Dutch; but always in about the same proportion. In a ship of war there are several particular crews, or gangs, as the boatswains crew, the carpenter's crew, the gunner's crew, &c.

CREVIER (**JOHN BAPTIST LEWIS**), a Parisian, was trained under the celebrated Rollin, and afterwards became professor of rhetoric. Upon the death of his master, in 1741, he took upon him to finish his Roman History. He published other works, and was greatly serviceable to the cause of virtue and religion as well as letters. His death happened, 1765, in a very advanced age. Besides the continuation just mentioned, he published, 1. An edition of *Livius, cum Notis*, in 6 vols 4to, 1748; and afterwards another edition, better adapted to the use of his pupils, in 6 vols. small 8vo. 2. *La Histoire des Empereurs de Romains Jusqu'à Constantin*, 1749, 12 tom. 12mo. 3. *Histoire de l'Université de Paris*, 7 tom. 12mo. 4. *Rhetorique Française*, a just and useful work. 5. *Observations sur l'Esprit des Loix*. Here he ventured out of his depth; he should have kept within the precincts of the belles lettres.

CREUSA, in fabulous history, daughter of Creon king of Corinth. As she was going to marry Jason, who had divorced Medea, she put on a poisoned garment, which immediately set her body on fire, and she expired, in the most excruciating torments. She had received this gown as a gift from Medea, who wished to take that revenge upon the infidelity of Jason. Some call her *Glauce*. (*Ovid. de Art. Am. l. v. 335.*) A daughter of Priam, king of Troy by Hecuba. She married Æneas, by whom she had, among other children, Ascanius. When Troy was taken, she fled in the night with her husband; but they were separated in the midst of the confusion and tumult, and Æneas could not recover her, nor hear where she was. Some say that Cybele saved her, and carried her to her temple, of which she became priestess. *Paus. l. 10. c. 26.—Virg. Æn. 2. v. 562.*

CREX, in ornithology, a species of **RALLUS**.

CRIB, the rack or manger of a stable, or the stall or cabin of an ox. It is also used for any small habitation, as a cottage, &c.

CRIB, in the English salt-works, a name given to a sort of case used in some places instead of the *drab*, to put

Crew
||
Crib.

Cribbage put the falt into as it is taken out of the boiling pan.

Crichton. CRIBBAGE, a game at cards, to be learnt only by practice.

CRIBRATION, in pharmacy, the passing any substance through a sieve or searce, in order to separate the finer particles from the grosser.

CRIBROSUM OS, in anatomy, called also *os ethmoides*. See *Anatomy*, n^o 17.

CRICELASIA, the driving a ring or hoop. Driving a hoop was one of the ancient gymnastics: this hoop was as high as the breast of the person who used it. It was commended for rendering the limbs pliable, and for strengthening the nerves.

CRICETUS, in zoology. See *Mus*.

CRICHTON (James), a Scots gentleman, who lived in the 16th century, and who, on account of his extraordinary endowments both of body and mind, obtained the appellation of "the admirable Crichton;" by which title he has continued to be distinguished down to the present day. The time of this celebrated person's birth is said, by the generality of writers, to have been in 1551; but, according to Lord Buchan*, it appears, from several circumstances, that he was born in the month of August 1560. There is a difference likewise between the Earl of Buchan and other biographers, with regard to the family of Crichton, and the rank and situation of his father. The common accounts assert, that James Crichton's father was Robert Crichton of Clanie, in the county of Perth; and that this Robert Crichton commanded Queen Mary's army at the battle of Langside in the year 1568. But from the Earl of Buchan we learn, that this gentleman was of Elliock in the same county, and that he was lord advocate of Scotland in queen Mary's reign from 1561 to 1573; part of which time he held that office in conjunction with Spens of Condie. The mother of James Crichton was Elizabeth Stuart, the only daughter of Sir James Stuart of Beath, who was a descendant of Robert duke of Albany, the third son of king Robert the second, by Elizabeth Muir or More, as she is commonly called. It is hence evident, that when the admirable Crichton boasted (as he did abroad), that he was sprung from Scottish kings, he said nothing but what was agreeable to truth.

James Crichton is said to have received his grammatical education at Perth, and to have studied philosophy in the university of St Andrew. His tutor in that university was Mr John Rutherford, a professor at that time famous for his learning, and who distinguished himself by writing four books on Aristotle's logic and a commentary on his poetics. According to Aldus Manutius, who calls Crichton first cousin to the king, he was also instructed, along with his majesty, by Buchanau, Hepburn, and Robertson, as well as by Rutherford; and he had scarcely arrived to the 20th year of his age, when he had run through the whole circle of the sciences, and could speak and write to perfection in ten different languages. Nor was this all; for he had likewise improved himself to the highest degree in riding, dancing, and singing, and in playing upon all sorts of instruments.

Crichton, being thus accomplished, went abroad upon his travels, and is said to have gone to Paris; of his transactions at which place the following account

is given. He caused six placards to be fixed on all the gates of the schools, halls, and colleges belonging to the university, and on all the pillars and posts before the houses of the most renowned men for literature in the city, inviting all those who were well versed in any art or science, to dispute with him in the college of Navarre, that day six weeks, by nine of the clock in the morning, where he would attend them, and be ready to answer to whatever should be proposed to him in any art or science, and in any of these 12 languages, Hebrew, Syriac, Arabic, Greek, Latin, Spanish, French, Italian, English, Dutch, Flemish, and Sclavonian; and this either in verse or prose at the discretion of the disputant. During this whole time, instead of closely applying to his studies, he regarded nothing but hunting, hawking, tilting, vaulting, riding of a well-managed horse, tossing the pike, handling the musket, and other military feats; or else he employed himself in domestic games, such as balls, concerts of music vocal and instrumental; cards, dice, tennis, and the like diversions of youth. This conduct so provoked the students of the university, that, beneath the placard which was fixed on the Navarre gate, they caused the following words to be written: "If you would meet with this monster of perfection, to make search for him either in the tavern or bawdy-house, is the readiest way to find him." Nevertheless, when the day appointed arrived, Crichton appeared in the college of Navarre, and acquitted himself beyond expression in the disputation, which lasted from nine o'clock in the morning till six at night. At length, the president, after extolling him highly for the many rare and excellent endowments which God and nature had bestowed upon him, rose from his chair, and, accompanied by four of the most eminent professors of the university, gave him a diamond ring, and a purse full of gold, as a testimony of their love and favour. The whole ended with the repeated acclamations and huzzas of the spectators: and henceforward our young disputant was called, "the admirable Crichton." It is added, that he was so little fatigued with the dispute, that he went on the very next day to the Louvre, where he had a match of tilting (an exercise then in much request), and in the presence of some of the princes of the court of France, and a great many ladies, carried away the ring 15 times successively.

About two years after this we find him at Rome, where he affixed a placard upon all the eminent places of the city, in the following terms: *Nos Jacobus Crichtonus Scotus, cuicumque rei propositæ ex improvise respondimus*. In a city which abounded in wit, this bold challenge, to answer to any question that could be proposed to him without his being previously advertised of it, could not escape the ridicule of a pasquinade. It is said, however, that being nowise discouraged, he appeared at the time and place appointed; and that, in the presence of the pope, many cardinals, bishops, doctors of divinity, and professors in all the sciences, he displayed such wonderful proofs of his universal knowledge, that he excited no less surprize than he had done at Paris. Bocalini, who was then at Rome, gives something of a different relation of the matter. According to this author, the pasquinade against Crichton, which was to the following effect, "And he that will see it let him go to

Crichton.

* MS. Memoir read to the Society of Antiquaries at Edinburgh.

Crichton. *the sign of the Falcon and it shall be shown,*" made such an impression upon him, that he left a place where he had been so grossly affronted as to be put upon a level with jugglers and mountebanks.

From Rome he went to Venice: where he contracted an intimate friendship with Aldus Manutius, Laurentius Massa, Speron Speronius, Johannes Donatus, and various other learned persons, to whom he presented several poems in commendation of the city and university. At length he was introduced to the Doge and Senate, in whose presence he made a speech, which was accompanied with such beauty of eloquence, and such grace of person and manner, that he received the thanks of that illustrious body, and nothing was talked of through the whole city but this *rara in terris axis*, this prodigy of nature. He held, likewise, disputations on the subjects of theology, philosophy, and mathematics, before the most eminent professors, and large multitudes of people. His reputation was so great, that the desire of seeing and hearing him brought together a vast concourse of persons from different quarters to Venice. It may be collected from Manutius, that the time in which Crichton exhibited these demonstrations of his abilities was in the year 1580.

During his residence at Venice, he fell into a bad state of health, which continued for the space of four months. However, before he was perfectly recovered, he went, by the advice of his friends, to Padua, the university of which city was at that time in great reputation. The next day after his arrival, there was a meeting of all the learned men of the place, at the house of Jacobus Aloysius Cornelius; when Crichton opened the assembly with an extemporary poem in praise of the city, the university, and the company who had honoured him with their presence. After this, he disputed for six hours with the most celebrated professors on various subjects of learning; and he exposed, in particular, the errors of Aristotle and his commentators, with so much solidity and acuteness, and at the same time with so much modesty, that he excited universal admiration. In conclusion, he delivered extempore an oration in praise of ignorance, which was conducted with such ingenuity and elegance, that his hearers were astonished. The exhibition of Crichton's talents was on the 14th of March 1581. Soon after he appointed a day for another disputation to be held at the palace of the bishop of Padua; not for the purpose of affording higher proofs of his abilities, for that could not possibly be done, but in compliance with the earnest solicitations of some persons who were not present at the former assembly. However, several circumstances occurred which prevented this meeting from taking place. Such is the account of Manutius: but Imperialis relates, that he was informed by his father, who was present upon the occasion, that Crichton was opposed by Archangelus Mercenarius, a famous philosopher; and that he acquitted himself so well as to obtain the approbation of a very honourable company, and even of his antagonist himself.

Amidst the discourses which were occasioned by our young Scotsman's exploits, and the high applauses that were bestowed upon his genius and attainments, some persons there were who endeavoured to detract from his merit. For ever, therefore, to confound these in-

vidious impugners of his talents, he caused a paper to be fixed on the gates of St. John and St. Paul's church, wherein he offered to prove before the university, that the errors of Aristotle, and of all his followers, were almost innumerable; and that the latter had failed both in explaining their master's meaning, and in treating on theological subjects. He promised likewise to refute the dreams of certain mathematical professors; to dispute in all the sciences; and to answer to whatever should be proposed to him or objected against him. All this he engaged to do, either in the common logical way or by numbers and mathematical figures, or in 100 sorts of verses, at the pleasure of his opponents. According to Manutius, Crichton sustained this contest, without fatigue, for three days; during which time he supported his credit, and maintained his propositions, with such spirit and energy, that, from an unusual concourse of people, he obtained acclamations and praises, than which none more magnificent were ever heard by men.

From Padua, Crichton set out for Mantua; where there happened to be at the time a gladiator, who had foiled, in his travels, the most famous fencers in Europe, and had lately killed three who had entered the lists with him in this city. The duke of Mantua was much grieved at having granted this man his protection, as he found it to be attended with such fatal consequences. Crichton, being informed of his Highness's concern, offered his service, not only to drive the murderer from Mantua, but from Italy, and to fight him for 1500 pistoles. Though the duke was unwilling to expose such an accomplished gentleman to so great a hazard; yet, relying upon the report he had heard of his warlike achievements, he agreed to the proposal; and the time and place being appointed, the whole court attended to behold the performance. At the beginning of the combat Crichton stood only upon his defence; while the Italian made his attack with such eagerness and fury, that having over-acted himself, he began to grow weary. Crichton now seized the opportunity of attacking his antagonist in return; which he did with so much dexterity and vigour, that he ran him through the body in three different places, of which wounds he immediately died. The acclamations of the spectators were loud and extraordinary upon this occasion; and it was acknowledged by all of them, that they had never seen Art grace Nature, or Nature second the precepts of Art, in so lively a manner as they had beheld these two things accomplished on that day. To crown the glory of the action, Crichton bestowed the prize of his victory upon the widows of the three persons who had lost their lives in fighting with the gladiator.

It is asserted, that in consequence of this and his other wonderful performances, the duke of Mantua made choice of him for preceptor to his son Vincentio di Gonzaga, who is represented as being of a riotous temper and a dissolute life. The appointment was highly pleasing to the court. Crichton, to testify his gratitude to his friends and benefactors, and to contribute to their diversion framed, we are told, a comedy, wherein he exposed and ridiculed all the weaknesses and failures of the several employments in which men are engaged. This composition was regarded as one of the most ingenious satires that ever was made upon mankind. But the most

Crichton: most astonishing part of the story is, that Crichton sustained 15 characters in the representation of his own play. Among the rest, he acted the divine, the philosopher, the lawyer, the mathematician, the physician, and the soldier, with such inimitable grace, that every time he appeared upon the theatre he seemed to be a different person.

From being the principal actor in a comedy, Crichton soon became the subject of a dreadful tragedy. One night, during the time of carnival, as he was walking along the streets of Mantua, and playing upon his guitar, he was attacked by half a dozen people in masks. The assailants found that they had no ordinary person to deal with, for they were not able to maintain their ground against him. In the issue, the leader of the company being disarmed, pulled off his mask, and begged his life, telling him that he was the prince his pupil. Crichton immediately fell upon his knees, and expressed his concern for his mistake; alleging, that what he had done was only in his own defence, and that if Gonzaga had any design upon his life, he might always be master of it. Then taking his own sword by the point, he presented it to the prince, who immediately received it, and was so irritated by the affront which he thought he had sustained in being foiled with all his attendants, that he instantly ran Crichton through the heart.

Various have been the conjectures concerning the motives which could induce Vincentio di Gonzaga to be guilty of so ungenerous and brutal an action. Some have ascribed it to jealousy, asserting that he suspected Crichton to be more in favour than himself with a lady whom he passionately loved; and Sir Thomas Urquhart has told a story upon this head which is extravagant and ridiculous in the highest degree. Others, with greater probability, represent the whole transaction as the result of a drunken frolic; and it is uncertain, according to Imperialis, whether the meeting of the prince and Crichton was by accident or design. However, it is agreed on all hands that Crichton lost his life in this rencounter. The time of his decease is said, by the generality of his biographers, to have been in the beginning of July 1583; but Lord Buchan fixes it to the same month in the preceding year. There is a difference, likewise, with regard to the period of life at which Crichton died. The common accounts declare that he was killed in the 32d year of his age: but Imperialis asserts that he was only in his 22d when that calamitous event took place; and this fact is confirmed by Lord Buchan.

Crichton's tragical end excited a very great and general lamentation. If Sir Thomas Urquhart is to be credited, the whole court of Mantua went three quarters of a year into mourning for him; the epitaphs and elegies that were composed upon his death and stuck upon his hearse, would exceed, if collected, the bulk of Homer's works; and, for a long time afterwards, his picture was to be seen in most of the bed-chambers and galleries of the Italian nobility, representing him on horseback, with a lance in the one hand and a book in the other. The same author tells us, that Crichton gained the esteem of kings and princes, by his magnanimity and knowledge; of noblemen and gentlemen, by his courtliness and breeding; of knights, by his honourable deportment and

pregnancy of wit; of the rich, by his affability and good fellowship; of the poor, by his munificence and liberality; of the old, by his constancy and wisdom; of the young, by his mirth and gallantry; of the learned, by his universal knowledge; of the soldiers, by his undaunted valour and courage; of the merchants and artificers, by his upright dealing and honesty; and of the fair sex, by his beauty and handsomeness, in which respect he was a masterpiece of nature.

Joannes Imperialis, in his life of Crichton, says, That he was the wonder of the last age, the prodigious production of nature; the glory and ornament of Parnassus, in a stupendous and unusual manner; and that, in the judgment of the learned world, he was the phoenix of literature, and rather a shining particle of the Divine Mind and Majesty than a model of what could be attained by human industry. The same author, after highly celebrating the beauty of his person, asserts, that his extraordinary eloquence and his admirable knowledge of things testified that he possessed a strength of genius wholly divine. "What (adds this writer) can more exceed our comprehension, than that Crichton, in the 21st year of his age, should be master of ten different languages, and perfectly well versed in philosophy, mathematics, theology, polite literature, and all other sciences? Besides, was it ever heard in the whole compass of the globe, that to these extraordinary endowments of the mind should be added a singular skill in fencing, dancing, singing, riding, and in every exercise of the gymnastic art?" Nay, Imperialis, in his account of Crichton's death, declares, that the report of so sad a catastrophe was spread to the remotest parts of the earth; that it disturbed universal nature; and that in her grief for the loss of the wonder she had produced, she threatened never more to confer such honour upon mankind. Compared with these extravagancies, the assertion of Bayle that Crichton was one of the greatest prodigies of wit that ever lived, and the testimony of Fœlix Astolfus concerning his wonderful memory, may be considered as modest encomiums.

Such are the accounts which, by a succession of writers, and particularly since the time of Mackenzie, have been given of the admirable Crichton. These accounts are indeed so wonderful that many persons have been disposed to consider them as in a great measure, if not entirely, fabulous. We shall therefore subjoin from the *Biographia Britannica* the following observations of Dr Kippis, with a view to ascertain what portion of faith is due to the different parts of the preceding narrative, or at least to assist the reader in forming a proper judgment concerning them.

The Doctor begins with observing, "That no credit can be granted to any facts which depend upon the sole authority of Sir Thomas Urquhart. Mr Pennant indeed speaks of him with approbation; and Dr Samuel Johnson laid a stress on his veracity, in the account of Crichton which he dictated to Dr Hawksworth, and is inserted in the 81st number of the *Adventurer*; of which account it may be observed, that it is only an elegant summary of the life written by Mackenzie. But with all deference to these respectable names, I must declare my full persuasion that Sir Thomas Urquhart is an author whose testimony to facts is totally unworthy

Crichton. thy of regard ; and it is surprizing that a perusal of his works does not strike every mind with this conviction. His productions are so inexpressibly absurd and extravagant, that the only rational judgment which can be pronounced concerning him is, that he was little, if at all, better than a madman. To the character of his having been a madman must be added that of his being a liar. Severe as this term may be thought, I apprehend that a diligent examination of the treatise which contains the memorials concerning Crichton would show that it is strictly true. But of his total disregard to truth there is incontestable evidence in another work of his, intituled, *The true Pedigree and Lineal Descent of the most ancient and honourable Family of the Urquhart's in the House of Cromarty, from the Creation of the World until the year of God 1652.* In this work it is almost incredible what a number of falsities he has invented, both with respect to names and facts. Perhaps a more flagrant instance of imposture and fiction was never exhibited ; and the absurdity of the whole pedigree is beyond the power of words to express. It can only be felt by those who have perused the tract itself. Such a man therefore can justly be intituled to no degree of credit, especially when he has a purpose to serve, as was the case with Sir Thomas Urquhart. His design was to exalt his own family and his own nation at any rate. With respect to his own nation, there was no occasion for having recourse to fiction, in order to display the lustre of Scotland, in the eminent men whom it has produced in arms and literature. The pencil of truth alone would have been amply sufficient for the purpose.

“ So far therefore as Sir Thomas Urquhart's authority is concerned, the wonderful exhibitions of Crichton at Paris, his triumph at Rome, his combat with the gladiator, his writing an Italian comedy, his sustaining fifteen characters in the representation of that comedy, the extraordinary story of the amour which is described as the cause of his death, the nine months mourning for him at Mantua, and the poems hung round his hearse to the quantity of Homer's works, must be regarded as in the highest degree doubtful, or rather absolutely false. I cannot forbear mentioning two circumstances, which show how much Sir Thomas Urquhart was destitute of prudence, as well as of scrupulosity, in his violations of truth. He says that the duke of Mantua was pleased to confer upon the young lady that was Crichton's mistress and future wife, a pension of five hundred ducats a year ; and that

the prince also bestowed as much upon her during all the days of his life, “ which was (adds Sir Thomas) but short ; for he did not long enjoy himself after the cross fate of so miserable an accident. Now it is well known that Vincenzo di Gonzaga succeeded his father in the dukedom of Mantua in 1587, and that he did not die till the year 1612 ; which was almost, if not entirely, thirty years after Crichton's decease. The other instance of the imprudence of Sir Thomas Urquhart in the contrivance of his fictions, occurs at the conclusion of his narrative, where he asserts that the verity of the story which he hath related concerning the incomparable Crichton, ‘ may be certified by two thousand men yet living who have known him.’ *Two thousand men yet living!* that is, in 1652, sixty-nine or seventy years after Crichton's death, for such was the time of Sir Thomas's publication. Our author would have been sadly puzzled to collect together these two thousand living witnesses who could certify the verity of his story.

“ With regard, however, to the account which is given of the prodigious exertions of Crichton, both corporal and mental, at Paris, Mackenzie imagines that he has found a full confirmation of them in a passage produced by him from the *Disquisitiones* of Stephen Pasquier, and which he considers as the testimony of an eye-witness. But the whole of what has been built upon it by Mackenzie and succeeding biographers, is founded on a mistake. In the quotation from the *Disquisitiones*, the name of Crichton is not mentioned, and the author doth not appear to have been personally present at the exhibitions of the extraordinary youth there described. The expressions which are supposed to carry that meaning may well be referred not to the writer himself, but to his countrymen the French, before whom the young man is said to have displayed his surprizing talents. But the discussion of this point is totally needless, because the passage in question is not an original authority. The book intituled *Stephani Paschieri Disquisitiones*, is only an abridgment in Latin of Pasquier's *Des Recherches de la France*. Now in this last work there is indeed an account of a wonderful youth, such as is related in Mackenzie's quotation, and from which that passage was formed. But this wonderful youth, whoever he might be, was not the admirable Crichton : for Pasquier, who does not tell his name, expressly says that he appeared in the year 1445 (A). The evidence, therefore, produced by Mackenzie falls entirely to the ground.

(A) This matter has lately been set in a clear light by a learned and judicious writer in the Edinburgh Magazine for May 1787, whose letter is as follows.

“ S I R,

“ We are informed by Sir John Hawkins, that Dr Johnson dictated from memory that account of the person vulgarly named *the Admirable Crichton*, which is to be found in one of the papers of the Adventurer.

“ That account is plainly an abridgment of the Life of Crichton by Dr George Mackenzie. Dr Mackenzie supposes that Pasquier, the French lawyer and antiquary, was an eye witness of the feats performed in arts as well as in arms by Crichton. This is one of the grossest errors in biography which has occurred to me in the course of my reading : and it is an error which I perceive is gaining ground daily, and bids fair in a short time to be received as an indisputable truth.

“ The error seems to have arisen from the following circumstance : Dr Mackenzie had never read the original work of Pasquier intituled *Recherches de la France* ; what he quotes concerning *the wonderful young man* is

Crichton. ground. Indeed, if the story of Crichton's exploits at Paris had been true, no man was more likely to be acquainted with them than Stephen Pasquier, who lived at that time, and who would be fond enough of recording transactions so extraordinary. It may farther be observed, that Thuanus, who was likewise a contemporary, and who in his own life is very particular in what relates to learned men, makes no mention of Crichton. The only authority for his having ever resided in France at all (Sir Thomas Urquhart excepted) is that of Dr John Johnson, who says *Gallia pectus excolit*. But this amounts to no proof of the truth of the transactions related by Urquhart. The whole which can be deduced from it is, that Crichton, in the course of his travels, might make some stay in France for the purpose of improvement. Even this, however, doth not agree with the narration of Imperialis, who informs us, that when troubles arose in Scotland on account of religion, and queen Mary fell into so many calamities, Crichton was sent by his father directly from that country to Venice as a place of security.

“ It is acknowledged by Sir John Hawkins, that Sir Thomas Urquhart has produced no authorities in support of his surprising narrations. But this defect, Sir John thinks, is supplied in the life of Crichton which is given in Mr Pennant's Tour. I am under the necessity of saying, that this is by no means the case. The article in Pennant was not drawn up by that ingenious and learned gentleman, but is the transcript of a pamphlet, that was printed some years ago at Aberdeen; and which pamphlet is nothing more than a republication, with a few verbal alterations, of the Life of Crichton written by Mackenzie. It doth not, therefore, furnish a single additional testimony in confirmation of Sir Thomas Urquhart's stories, excepting in the mistaken instance from Pasquier. In other respects it only borrows facts from Sir Thomas Urquhart, without establishing them upon fresh proofs. It is observable, that the earlier biographers of Crichton had no knowledge of most of the transactions enlarged

upon by this extravagant writer; for if they had known them, they would have been eagerly disposed to relate them, and to do it with every circumstance of exaggeration. How much this was the character of Thomas Dempster, with regard to his own countrymen, is sufficiently understood, and hath frequently been remarked; and yet his account of Crichton is uncommonly modest, compared with those of succeeding authors. The extravagance of Imperialis in respect to Crichton has already appeared. There seems indeed to have been an universal tendency in the writers of this young Scotsman's life to produce wonder and astonishment. Mackenzie remarks, that Imperialis could not but know the truth of all, or at least of most of, the things he has related concerning Crichton, since he lived upon the places in which they were transacted, and had them from an eye and ear-witness, even his own father. It is, however, to be remembered, that Imperialis's *Museum Historicum* was not published till 1640, nearly sixty years after the events recorded by him happened; to which may be added, that the information he derived from his father was probably very imperfect. Imperialis the elder was not born till 1568, and consequently was only thirteen years old when Crichton displayed his talents at Padua. What real dependence, therefore, could there be on the accuracy of the account given by a youth of that age? He could only relate, and perhaps from inadequate intelligence, the things which were talked of when he was a boy. Besides, his authority is appealed to for no more than a single fact, and that a doubtful one, since it does not accord with Manutius's narrative: and who ever heard of the famous philosopher Arcangelus Mercenarius?

“ The truth of the matter is, that, some slight circumstances excepted, neither Dempster nor Imperialis have produced any evidences of Crichton's extraordinary abilities besides those which are recorded by the younger Aldus Manutius. He therefore is to be regarded as the only living authority upon the subject.”

is taken from a Latin abridgement of that work; he refers to *Steph. Pasch.* Disquis. lib. v. cap. 23. and he gives his quotation in Latin; indeed it does not appear that Dr Mackenzie had ever heard of the original work. Now Pasquier, instead of saying that he was an eye-witness of the wonders exhibited by Crichton, says, in the most unequivocal terms, that what he relates was taken ‘ from a manuscript which was occasionally used by him,’ (*d'un livre écrit à la main dont je m'aide selon les occurrences*). And he adds, ‘ I will represent the story in its own simple garb, without any artificial colouring, so that my readers may be the more inclined to give credit to it.’ (*vous représentant cette histoire en sa simplicité sans y apporter aucun fard pour ce que vous y adjousteres plus de foy*). He then transcribes the narrative from the MS. which places the appearance of this phenomenon in the year 1445, a full century before the birth of our Crichton. See *Recherches de la France*; lib. vi. c. 38, 39.

“ Dr Mackenzie, although he had not read the original of Pasquier, appears to have read an author who quotes the same story: ‘ The learned M. du Launoy (says he), in his History of the College of Navarre, finding the history of this dispute recorded in a MS. History of the College of Navarre, and the like account of a Spaniard in Trithemius, confounds the two together, and robs our author of the glory of this action, and places it in the year 1445; whereas it should be in the year 1571.’ This charge of robbery is singular enough.

“ Let me only add, that Pasquier transcribes some verses written by George Chastelain, a French poet in the reign of Charles VII. king of France, which allude to the same story; and that Pasquier himself was born at Paris in 1528, passed his life in that city, and was an eminent lawyer and pleader in 1571; so that it is impossible the feats of Crichton, had they been really performed at Paris, could have been unknown to him, and most improbable that, knowing them, he would have omitted to mention them; for, in the same lib. iv. c. 39. he is at pains to produce examples of great proficiency, displayed by men in a much humbler rank of life than that of philosophers and public disputants. I am, &c.”

Crichton. jeft. Manutius was contemporary with Crichton; he was clofely connected with him in friendship; and he relates feveral things on his own perfonal knowledge. He is a pofitive and undoubted witness with refpect to our young Scotfman's intellectual and literary exertions at Venice and Padua; and from him it is that our account of them is given above. Nevertheless, even Aldus Manutius is to be read with fome degree of caution. Dedications are apt to affume the ftyle of exaggeration, and this is the cafe with Manutius's dedication of the *Paradoxa Ciceronis* to Crichton. In addition to the general language of fuch addreffes, he might be carried too far by his affection for his friend, which appears to have been very great: nor was the younger Aldus eminent for ftadinefs and confiftency of character. It is even faid that by his imprudencies he fell into contempt and mifery. But independently of any confiderations of this kind, it may be obferved, that Manutius's narrative, previously to Crichton's arrival at Venice, could not be derived from perfonal knowledge. For that part of it (which is fufficiently erroneous) he was probably indebted to Crichton himfelf. Neither does he appear to have been an eye-witness of the whole of the difputations which were held at Padua; for fpeaking of his young friend's praife of ignorance, he relates, that thofe who were prefent told him afterwards how much they were ftruck with that oration. However, at the other difputation, which lafted three days, Manutius feems certainly to have attended; for he concludes his accounts of it with faying, that he was not only the advifer but the fpectator of Crichton's wonderful contefts. It is evident, however, from the dedication, that his extraordinary abilities were not univerfally acknowledged and admired. Some there were who detracted from them, and were difpleafed with Manutius for fo warmly fupporting his reputation.

“As to the real caufe and manner of our young Scotfman's death, both of them ftill remain in fome degree of obfcurety. That he was killed in a rencounter at the carnival at Mantua, is teftified by too many authors to be reasonably doubted. But whether there was that particular malignity on the part of Vincenzo di Gonzago, which is commonly afcribed to him, may be confidered as uncertain.

“One important method yet remains by which we may be enabled to form a judgment of Crichton's genius, and that is from a perufal of the four poems of his which are ftill preferved. It is, however, to be feared, that thefe will not exhibit him in a very high point of view. Some fancy, perhaps, may be thought to be difplayed in the longeft of his poems, which was written on occafion of his approach to the city of Venice. He there represents a Naiad as rifing up before him; and, by the order of the Mufes and of Minerva, directing him how to proceed. But this is a fentiment which fo eafily prefents itfelf to a claffical reader, that it can fcarcely be confidered as deferving the name of a poetical invention. The three other poems of Crichton have ftill lefts to recommend them. Indeed his verfes will not ftand the teft of a rigid examination even with regard to quantity.

“What then is the opinion which on the whole we are to form of the admirable Crichton? It is evident that he was a youth of fuch lively parts as excited

great prefent admiration, and high expectations with regard to his future attainments. He appears to have had a fine perfon, to have been adroit in his bodily exercifes, to have poffeffed a peculiar facility in learning languages, to have enjoyed a remarkably quick and retentive memory, and to have excelled in a power of declamation, a fluency of fpeech, and a readinefs of reply. His knowledge, likewise, was probably very uncommon for his years; and this, in conjunction with his other qualities, enabled him to fhine in public difputation. But whether his knowledge and learning were accurate or profound, may juftly be queftioned; and it may equally be doubted whether he would have arifen to any extraordinary degree of eminence in the literary world. It will always be reflected upon with regret, that his early and untimely death prevented this matter from being brought to the teft of experiment.”

From the portraits which remain of Crichton, it appears that in his face and form he was beautiful and elegant, and that his body and limbs, though not muscular or athletic, were well proportioned, and fitted for feats of agility. The following catalogue of Crichton's works is given by Dempfter: 1. *Oda ad Laurentium Maffum plures.* 2. *Laudes Patavinae, Carmen extempore effufum, cum in Jacobi Moyfii Cornelii domo experimentum ingenii coram tota Academia frequentia, non sine multorum ftupore, faceret.* 3. *Ignorantionis Laudatio, extemporale Thema ibidem redditum, poft sex horarum difputationes, ut praefentes fomnia potius fovere quam rem fe veram videre affirmarint, ait Manutius.* 4. *De appulfu fuo Venetias.* 5. *Oda ad Aldum Manutium.* 6. *Epiftolae ad Diverfos.* 7. *Praefationes folemnes in omnes Scientias facras et prophanas.* 8. *Judicium de Philofophis.* 9. *Errores Aristotelis.* 10. *Arma an Literae praeflant, Controversia oratoria.* 11. *Refutatio Mathematicorum.* 12. A Comedy in the Italian language.

CRICK, among farriers, is when a horfe cannot turn his neck any manner of way, but holds it fore right, infomuch that he cannot take his meat from the ground without great pain.

CRICKET, in zoology. See GRYLLUS.

CRICKET is alfo the name of an exercife or game, with bats and a ball.

Mole CRICKET. See GRYLLOTALPA.

CRICKLADE, a borough-town of Wiltfhire, fituated on the river Ifis, about 26 miles fouth-weft of Oxford. It fends two members to parliament. W. Long. 1. 55. N. Lat. 51. 35.

CRICOARYTANOIDÆUS, in anatomy, a name given to two mufcles of the larynx. See ANATOMY, n^o 116.

CRICOIDES, in anatomy, a cartilage of the larynx, called alfo the *annular cartilage*. It occupies the loweft part by way of bafe to the reft of the cartilages, and to the lower part of it the afpera arteria adheres. See ANATOMY, *Table of the mufcles*.

CRICOTHYROIDÆUS, in anatomy, one of the five proper mufcles of the larynx. *Ibid.*

CRIM-TARTARS, a people of Afa, fo called becaufe they originally came from Crimea. They rove from place to place in fearch of paftures, their houfes being drawn on carts. There are a great number of them about Aftarchan, to which place they flock in the winter-time; but they are not permitted to enter the city: for this reafon, they erect huts up and
down

Crichton
||

tars.

Crime,
Crime and
Punish-
ment.

down in the open fields; which are made either of bull-rushes or reeds, being about 12 feet in diameter, of a round form, and with a hole at the top to let out the smoke. Their fuel is turf or cow-dung; and, when the weather is very cold, they cover the hut with a coarse cloth, and sometimes pass several days without stirring out. They are generally of small stature, with large faces, little eyes, and of an olive complexion. The men are generally so wrinkled in their faces, that they look like old women. Their common food is fish dried in the sun, which serves them instead of bread; and they eat the flesh of horses as well as camels. Their drink is water and milk, especially mares milk, which they carry about in nasty leathern-bags. Their garments are of coarse grey cloth, with a loose mantle made of a black sheep's skin, and a cap of the same. The women are clothed in white linen, with which likewise they dress their heads, hanging a great many Muscovian pence about them; and there is likewise a hole left to stick feathers in. As for their religion, they are a sort of Mahometans; but do not coop up their women like the Turks.

CRIM-TARTARY, or *Crimea*. See CRIMEA.

CRIME and PUNISHMENT. The discussion and admeasurement of crimes and punishments forms in every country the code of criminal law; or, as it is more usually denominated in England, the doctrine of the *pleas of the crown*: so called, because the king, in whom centres the majesty of the whole community, is supposed by the law to be the person injured by every infraction of the public rights belonging to that community; and is therefore in all cases the proper prosecutor for every public offence.

The knowledge of this branch of jurisprudence, which teaches the nature, extent, and degrees of every crime, and adjusts to it its adequate and necessary penalty, is of the utmost importance to every individual in the state. For no rank or elevation in life, no uprightness of heart, no prudence or circumspection of conduct, should tempt a man to conclude, that he may not at some time or other be deeply interested in these researches. The infirmities of the best among us, the vices and ungovernable passions of others, the instability of all human affairs, and the numberless unforeseen events which the compass of a day may bring forth, will teach us (upon a moment's reflection), that to know with precision what the laws of our country have forbidden, and the deplorable consequences to which a wilful disobedience may expose us, is a matter of universal concern.

In proportion to the importance of the criminal law, ought also to be the care and attention of the legislature in properly forming and enforcing it. It should be founded upon principles that are permanent, uniform, and universal; and always conformable to the dictates of truth and justice, the feelings of humanity, and the indelible rights of mankind: though it sometimes (provided there be no transgression of these eternal boundaries) may be modified, narrowed, or enlarged, according to the local or occasional necessities of the state which it is meant to govern. And yet, either from a want of attention to these principles in the first concoction of the laws, and adopting in their stead the impetuous dictates of avarice, ambi-

tion, and revenge; from retaining the discordant political regulations, which successive conquerors or factions have established, in the various revolutions of government; from giving a lasting efficacy to sanctions that were intended to be temporary, and made (as lord Bacon expresses it) merely upon the spur of the occasion; or from, lastly, too hastily employing such means as are greatly disproportionate to their end, in order to check the progress of some very prevalent offence; from some, or from all, of these causes it hath happened, that the criminal law is in every country of Europe more rude and imperfect than the civil. We shall not here enter into any minute enquiries concerning the local constitutions of other nations; the inhumanity and mistaken policy of which have been sufficiently pointed out by ingenious writers of their own*. But even in Great Britain, where the crown-law is with justice supposed to be more nearly advanced to perfection; where crimes are more accurately defined, and penalties less uncertain and arbitrary; where all accusations are public, and trials in the face of the world; where torture is unknown, and every delinquent is judged by such of his equals, against whom he can form no exception, nor even a personal dislike;—even there we shall occasionally find room to remark some particulars that seem to want revision and amendment. These have chiefly arisen from too scrupulous an adherence to some rules of the ancient common law, where the reasons have ceased upon which those rules were founded; from not repealing such of the old penal laws as are either obsolete or absurd; and from too little care and attention in framing and passing new ones. The enacting of penalties to which a whole nation shall be subject, ought not to be left, as a matter of indifference, to the passions or interests of a few, who upon temporary motives may prefer or support such a bill; but be calmly and maturely considered by persons who know what provisions the laws have already made to remedy the mischief complained of, who can from experience foresee the probable consequences of those which are now proposed, and who will judge without passion or prejudice how adequate they are to the evil. It is never usual in the house of peers even to read a private bill which may affect the property of an individual, without first referring it to some of the learned judges, and hearing their report thereon. And surely equal precaution is necessary, when laws are to be established, which may affect the property, the liberty, and perhaps even the lives, of thousands. Had such a reference taken place, it is impossible that in the 18th century it could ever have been made a capital crime, to break down (however maliciously) the mound of a fishpond, whereby any fish shall escape; or to cut down a cherry-tree in an orchard. Were even a committee appointed but once in an hundred years to revise the criminal law, it could not have continued to this hour a felony without benefit of clergy, to be seen for one month in the company of persons who call themselves or are called *Egyptians*.

It is true, that these outrageous penalties, being seldom or never inflicted, are hardly known to be the law by the public; but that rather aggravates the mischief, by laying a snare for the unwary. Yet they cannot but occur to the observation of any one, who

Comment.

Crime and
Punish-
ment.

hath undertaking the task of examining the great outlines of our law, and tracing them up to their principles, and it is the duty of such a one to hint them with decency to those whose abilities and stations enable them to apply the remedy. Proceed we now to consider (in the first place) the general nature of crimes.

I. A crime, or misdemeanour, is an act committed, or omitted, in violation of a public law, either forbidding or commanding it. This general definition comprehends both crimes and misdemeanours; which, properly speaking, are mere synonymous terms: though in common usage, the word "crimes" is made to denote such offences as are of a deeper and more atrocious dye; while smaller faults, and omissions of less consequence, are comprized under the gentler name of "misdemeanours" only.

The distinction of public wrongs from private, of crimes and misdemeanours from civil injuries, seems principally to consist in this: that private wrongs, or civil injuries, are an infringement or privation of the civil rights which belong to individuals, considered merely as individuals; public wrongs, or crimes and misdemeanours, are a breach and violation of the public rights and duties, due to the whole community, considered as a community, in its social aggregate capacity. As if I detain a field from another man, to which the law has given him a right, this is a civil injury, and not a crime; for here only the right of an individual is concerned, and it is immaterial to the public which of us is in possession of the land: but treason, murder, and robbery, are properly ranked among crimes; since, besides the injury done to individuals, they strike at the very being of society; which cannot possibly subsist, where actions of this sort are suffered to escape with impunity.

In all cases the crime includes an injury: every public offence is also a private wrong, and somewhat more; it affects the individual, and it likewise affects the community. Thus treason in imagining the king's death, involves in it conspiracy against an individual, which is also a civil injury: but as this species of treason in its consequences principally tends to the dissolution of government, and the destruction thereby of the order and peace of society, this denominates it a crime of the highest magnitude. Murder is an injury to the life of an individual; but the law of society considers principally the loss which the state sustains by being deprived of a member, and the pernicious example thereby set, for others to do the like. Robbery may be considered in the same view: it is an injury to private property; but, were that all, a civil satisfaction in damages might atone for it; the public mischief is the thing, for the prevention of which our laws have made it a capital offence. In these gross and atrocious injuries the private wrong is swallowed up in the public: we seldom hear any mention made of satisfaction to the individual; the satisfaction to the community being so very great. And indeed, as the public crime is not otherwise avenged than by forfeiture of life and property, it is impossible afterwards to make any reparation for the private wrong; which can only be had from the body or goods of the aggressor. But there are crimes of an inferior nature, in which the public punishment is not so severe, but it

affords room for a private compensation also: and herein the distinction of crimes from civil injuries is very apparent. For instance; in the case of battery, or beating another, the aggressor may be indicted for this at the suit of the king, for disturbing the public peace, and be punished criminally by fine and imprisonment: and the party beaten may also have his private remedy by action of trespass for the injury, which he in particular sustains, and recover a civil satisfaction in damages. So also, in case of a public nuisance, as digging a ditch across a highway, this is punishable by indictment, as a common offence to the whole kingdom, and all his majesty's subjects: but if any individual sustains any special damage thereby, as laming his horse, breaking his carriage, or the like, the offender may be compelled to make ample satisfaction, as well for the private injury as for the public wrong.

II. The nature of crimes and misdemeanours in general being thus ascertained and distinguished, we proceed in the next place to consider the general nature of punishments: Which are evils or inconveniences consequent upon crimes and misdemeanours; being devised, denounced, and inflicted by human laws, in consequence of disobedience or misbehaviour in those, to regulate whose conduct such laws were respectively made. And herein we will briefly consider the *power*, the *end*, and the *measure*, of human punishment.

1. As to the *power* of human punishment, or the right of the temporal legislator to inflict discretionary penalties for crimes and misdemeanours. It is clear, *Blackf. Comment.* that the right of punishing crimes against the law of nature, as murder and the like, is in a state of mere nature, vested in every individual. For it must be vested in somebody; otherwise the laws of nature would be vain and fruitless, if none were empowered to put them in execution: and if that power is vested in any one, it must also be vested in all mankind; since all are by nature equal. Whereof the first murderer Cain was so sensible, that we find him expressing his apprehensions, that whoever should find him would slay him. In a state of society this right is transferred from individuals to the sovereign power; whereby men are prevented from being judges in their own causes, which is one of the evils that civil government was intended to remedy. Whatever power therefore individuals had of punishing offences against the law of nature, that is now vested in the magistrate alone; who bears the sword of justice by the consent of the whole community. And to this precedent natural power of individuals must be referred that right, which some have argued to belong to every state (though, in fact, never exercised by any), of punishing not only their own subjects, but also foreign embassadors, even with death itself; in case they have offended, not indeed against the municipal laws of the country, but against the divine laws of nature, and become liable thereby to forfeit their lives for their guilt.

As to offences merely against the laws of society, which are only *mala prohibita*, and not *mala in se*; the temporal magistrate is also empowered to inflict coercive penalties for such transgression: and this by the consent of individuals; who, in forming societies did,

Crime and
Punish-
ment.

Crime and
Punish-
ment.

did either tacitly or expressly invest the sovereign power with a right of making laws, and of enforcing obedience to them when made, by exercising, upon their non-observance, severities adequate to the evil. The lawfulness therefore of punishing such criminals is founded upon this principle, that the law by which they suffer was made by their own consent; it is a part of the original contract into which they entered, when first they engaged in society; it was calculated for, and has long contributed to, their own security.

This right therefore, being thus conferred by universal consent, gives to the state exactly the same power, and no more, over all its members, as each individual member had naturally over himself or others. Which has occasioned some to doubt, how far a human legislature ought to inflict capital punishments for positive offences: offences against the municipal law only, and not against the law of nature; since no individual has, naturally, a power of inflicting death upon himself or others for actions in themselves indifferent. With regard to offences *mala in se*, capital punishments are in some instances inflicted by the immediate command of God himself to all mankind; as, in the case of murder, by the precept delivered to Noah their common ancestor and representative. "Who so sheddeth man's blood, by man shall his blood be shed." In other instances they are inflicted after the example of the Creator, in his positive code of laws for the regulation of the Jewish republic; as in the case of the crime against nature. But they are sometimes inflicted without such express warrant or example, at the will and discretion of the human legislature: as for forgery, for theft, and sometimes for offences of a lighter kind. This practice is thus justified by that great and good man Sir Matthew Hale: "When offences grow enormous, frequent, and dangerous to a kingdom or state, destructive or highly pernicious to civil societies, and to the great security and danger of the kingdom or its inhabitants, severe punishment and even death itself is necessary to be annexed to laws in many cases by the prudence of lawgivers." It is therefore the enormity, or dangerous tendency, of the crime, that alone can warrant any earthly legislature in putting him to death that commits it. It is not its frequency only, or the difficulty of otherwise preventing it, that will excuse our attempting to prevent it by a wanton effusion of human blood. For though the end of punishment is to deter men from offending, it never can follow from thence, that it is lawful to deter them at any rate and by any means; since there may be unlawful methods of enforcing obedience even to the justest laws. Every humane legislator will be therefore extremely cautious of establishing laws that inflict the penalty of death, especially for slight offences, or such as are merely positive. He will expect a better reason for his so doing, than that loose one which generally is given; that it is found by former experience that no lighter penalty will be effectual. For is it found upon farther experience, that capital punishments are more effectual? Was the vast territory of all the Russias worse regulated under the late empress Elizabeth, than under her more sanguinary predecessors? Is it now under Catherine II. less civilized, less social, less secure? And yet we are assured, that neither of these

illustrious princesses have, throughout their whole administration, inflicted the penalty of death: and the latter has, upon full persuasion of its being useless, may even pernicious, given orders for abolishing it entirely throughout her extensive dominions. But indeed, were capital punishments proved by experience to be a sure and effectual remedy, that would not prove the necessity (upon which the justice and propriety depend) of inflicting them upon all occasions when other expedients fail. It is feared this reasoning would extend a great deal too far. For instance, the damage done to our public roads by loaded waggons is universally allowed, and many laws have been made to prevent it, none of which have hitherto proved effectual. But it does not therefore follow, that it would be just for the legislature to inflict death upon every obstinate carrier, who defeats or eludes the provisions of former statutes. Where the evil to be prevented is not adequate to the violence of the preventive, a sovereign that thinks seriously can never justify such a law to the dictates of conscience and humanity. To shed the blood of our fellow-creature is a matter that requires the greatest deliberation, and the fullest conviction of our own authority: for life is the immediate gift of God to man; which neither he can resign, nor can it be taken from him, unless by the command or permission of him who gave it, either expressly revealed, or collected from the laws of nature or society by clear and indisputable demonstration.

We would not be understood to deny the right of the legislature in any country to enforce its own laws by the death of the transgressor, though persons of some abilities have doubted it; but only to suggest a few hints for the consideration of such as are, or may hereafter become, legislators. When a question arises, whether death may be lawfully inflicted for this or that transgression, the wisdom of the laws must decide it: and to this public judgment or decision all private judgments must submit; else there is an end of the first principle of all society and government. The guilt of blood, if any, must lie at their doors, who misinterpret the extent of their warrant; and not at the doors of the subject, who is bound to receive the interpretations that are given by the sovereign power.

2. As to the end, or final cause, of human punishments. This is not by way of atonement or expiation for the crime committed; for that must be left to the just determination of the Supreme Being: but as a precaution against future offences of the same kind. This is effected three ways: either by the amendment of the offender himself; for which purpose all corporeal punishments, fines, and temporary exile or imprisonment, are inflicted: or, by deterring others by the dread of his example from offending in the like way, "*ut pœna* (as Tully expresses it) *ad paucos, metus ad omnes, perveniat*"; which gives rise to all ignominious punishments, and to such executions of justice as are open and public: or, lastly, by depriving the party injuring of the power to do future mischief; which is effected by either putting him to death, or condemning him to perpetual confinement, slavery, or exile. The same one end, of preventing future crimes, is endeavoured to be answered by each of these three species of punishment. The public gains

Crime and
Punish-
ment.

Crime and
Punish-
ment.

equal security, whether the offender himself be amended by wholesome correction, or whether he be disabled from doing any farther harm: and if the penalty fails of both these effects, as it may do, still the terror of his example remains as a warning to other citizens. The method, however, of inflicting punishment ought always to be proportioned to the particular purpose it is meant to serve, and by no means to exceed it: therefore the pains of death, and perpetual disability by exile, slavery, or imprisonment, ought never to be inflicted, but when the offender appears incorrigible: which may be collected either from a repetition of minuter offences; or from the perpetration of some one crime of deep malignity, which of itself demonstrates a disposition without hope or probability of amendment: and in such cases it would be cruelty to the public to defer the punishment of such a criminal till he had an opportunity of repeating perhaps the worst of villainies.

3. As to the *measure* of human punishments. From what has been observed in the former articles we may collect, that the quantity of punishment can never be absolutely determined by any standing invariable rule: but it must be left to the arbitration of the legislature to inflict such penalties as are warranted by the laws of nature and society, and such as appear to be the best calculated to answer the end of precaution against future offences.

Hence it will be evident, that what some have so highly extolled for its equity, the *lex talionis* or "law of retaliation," can never be in all cases an adequate or permanent rule of punishment. In some cases indeed it seems to be dictated by natural reason; as in the case of conspiracies to do an injury, or false accusations of the innocent; to which we may add that law of the Jews and Egyptians, mentioned by Josephus and Diodorus Siculus, that whoever without sufficient cause was found with any mortal poison in his custody, should himself be obliged to take it. But, in general, the difference of persons, place, time, provocation, or other circumstances, may enhance or mitigate the offence; and in such cases retaliation can never be a proper measure of justice. If a nobleman strikes a peasant, all mankind will see, that if a court of justice awards a return of the blow, it is more than a just compensation. On the other hand, retaliation may sometimes be too easy a sentence; as, if a man maliciously should put out the remaining eye of him who had lost one before, it is too slight a punishment for the maimer to lose only one of his: and therefore the law of the Locrians, which demanded an eye for an eye, was in this instance judiciously altered; by decreeing, in imitation of Solon's laws, that he who struck out the eye of a one-eyed man, should lose both his own in return. Besides, there are very many crimes, that will in no shape admit of these penalties, without manifest absurdity and wickedness. Theft cannot be punished by theft, defamation by defamation, forgery by forgery, adultery by adultery, and the like. And we may add, that those instances, wherein retaliation appears to be used, even by the divine authority, do not really proceed upon the rule of exact retribution, by doing to the criminal the same hurt he has done to his neighbour, and no more; but this correspondence between the crime and punishment is barely a conse-

quence from some other principle. Death is ordered to be punished with death; not because one is equivalent to the other, for that would be expiation, and not punishment. Nor is death always an equivalent for death: the execution of a needy decrepid assassin is a poor satisfaction for the death of a nobleman in the bloom of his youth, and full enjoyment of his friends, his honours, and his fortune. But the reason upon which this sentence is grounded seems to be, that this is the highest penalty that man can inflict, and tends most to the security of the world: by removing one murderer from the earth, and setting a dreadful example to deter others: so that even this grand instance proceeds upon other principles than those of retaliation. And truly, if any measure of punishment is to be taken from the damage sustained by the sufferer, the punishment ought rather to exceed than equal the injury; since it seems contrary to reason and equity, that the guilty (if convicted) should suffer no more than the innocent has done before him: especially as the suffering of the innocent is past and irrevocable, that of the guilty is future, contingent, and liable to be escaped or evaded. With regard indeed to crimes that are incomplete, which consist merely in the intention, and are not yet carried into act, as conspiracies and the like; the innocent has a chance to frustrate or avoid the villainy, as the conspirator has also a chance to escape his punishment: and this may be one reason why the *lex talionis* is more proper to be inflicted, if at all, for crimes that consist in intention than for such as are carried into act. It seems indeed consonant to natural reason, and has therefore been adopted as a maxim by several theoretical writers, that the punishment due to the crime of which one falsely accuses another should be inflicted on the perjured informer. Accordingly, when it was once attempted to introduce into England the law of retaliation, it was intended as a punishment for such only as preferred malicious accusations against others; it being enacted by statute 37 Edw. III. c. 18. that such as preferred any suggestions to the king's great council should put in sureties of taliation; that is, to incur the same pain that the other should have had, in case the suggestion were found untrue. But, after one year's experience, this punishment of taliation was rejected, and imprisonment adopted in its stead.

But though from what has been said it appears, that there cannot be any regular determinate method of rating the quantity of punishments for crimes, by any one uniform rule; but they must be referred to the will and discretion of the legislative power: yet there are some general principles, drawn from the nature and circumstances of the crime, that may be of some assistance in allotting it an adequate punishment.

As, first, with regard to the object of it: for the greater and more exalted the object of an injury is, the more care should be taken to prevent that injury, and of course under this aggravation the punishment should be more severe. Therefore treason in conspiring the king's death is (in Britain) punished with greater rigour than even actually killing any private subject. And yet, generally, a design to transgress is not so flagrant an enormity as the actual completion of that design. For evil, the nearer we approach it, is the more disagreeable and shocking;

Crime and
Punish-
ment.

Crime and
Punish-
ment.

so that it requires more obstinacy in wickedness to perpetrate an unlawful action, than barely to entertain the thought of it: and it is an encouragement to repentance and remorse, even till the last stage of any crime, that it never is too late to retract; and that if a man stops even here, it is better for him than if he proceeds: for which reasons an attempt to rob, to ravish, or to kill, is far less penal than the actual robbery, rape, or murder. But in the case of a treasonable conspiracy, the object whereof is the king's majesty, the bare intention will deserve the highest degree of severity; not because the intention is equivalent to the act itself; but because the greatest rigour is no more than adequate to a treasonable purpose of the heart, and there is no greater left to inflict upon the actual execution itself.

Again: The violence of passion, or temptation, may sometimes alleviate a crime: as theft, in case of hunger, is far more worthy of compassion, than when committed through avarice, or to supply one in luxurious excesses. To kill a man upon sudden and violent resentment is less penal than upon cool deliberate malice. The age, education, and character, of the offender; the repetition (or otherwise) of the offence; the time, the place, the company wherein it was committed; all these, and a thousand other incidents, may aggravate or extenuate the crime (A).

Farther: As punishments are chiefly intended for the prevention of future crimes, it is but reasonable that among crimes of different natures those should be most severely punished, which are the most destructive of the public safety and happiness; and, among crimes of an equal malignity, those which a man has the most frequent and easy opportunities of committing, which cannot be so easily guarded against as others, and which therefore the offender has the strongest inducement to commit: according to what Cicero observes, *Ea sunt animadvertenda peccata maxime, quæ difficillime præcaventur*. Hence it is, that for a servant to rob his master is in more cases capital than for a stranger. If a servant kills his master, it is a species of treason; in another it is only murder. To steal a handkerchief, or other trifle of above the value of twelvepence, privately from one's person, is made capital; but to carry off a load of corn from an open field, though of fifty times greater value, is punished with transportation only. And in the island of Man this rule was formerly carried so far, that to take away an horse or an ox was there no felony, but a trespass, because of the difficulty in that little territory to conceal them or carry them off: but to steal a pig or a fowl, which is easily done, was a capital misdemeanour, and the offender was punished with death.

Lastly, as a conclusion to the whole, we may observe, that punishments of unreasonable severity, especially when indiscriminately inflicted, have less effect in preventing crimes, and amending the manners of a people, than such as are more merciful in general, yet properly intermixed with due distinctions of severity.

Crime and
Punish-
ment.

It is the sentiment of an ingenious writer, who seems to have well studied the springs of human action, that crimes are more effectually prevented by the certainty than by the severity of punishment, for the excessive severity of laws (says Montesquieu) hinders their execution. When the punishment surpasses all measure, the public will frequently prefer impunity to it. Thus also the statute 1 Mar. st. 1. c. 1. recites in its preamble, "that the state of every king consists more assuredly in the love of the subject towards their prince, than in the dread of laws made with rigorous pains; and that laws made for the preservation of the commonwealth without great penalties, are more often obeyed and kept than laws made with extreme punishments." Happy had it been for the nation if the subsequent practice of that deluded prince in matters of religion, had been correspondent to these sentiments of herself and parliament in matters of state and government! We may further observe, that sanguinary laws are a bad symptom of the distemper of any state, or at least of its weak constitution. The laws of the Roman kings, and the twelve tables of the *deceveiri*, were full of cruel punishments: the Porcian law, which exempted all citizens from sentence of death, silently abrogated them all. In this period the republic flourished; under the emperors severe punishments were revived, and then the empire fell.

It is, moreover, absurd and impolitic to apply the same punishment to crimes of different malignity. A multitude of sanguinary laws (besides the doubt that may be entertained concerning the right of making them) do likewise prove a manifest defect either in the wisdom of the legislative, or the strength of the executive, power. It is a kind of quackery in government, and argues a want of solid skill, to apply the same universal remedy, the *ultimum supplicium*, to every case of difficulty. It is, it must be owned, much easier to extirpate than to amend mankind; yet that magistrate must be esteemed both a weak and a cruel surgeon, who cuts off every limb which through ignorance or indolence he will not attempt to cure. It has been therefore ingeniously proposed, that in every state a scale of crimes should be formed, with a corresponding scale of punishments, descending from the greatest to the least. But if that be too romantic an idea, yet at least a wise legislator will mark the principal divisions, and not assign penalties of the first degree to offences of an inferior rank. Where men see no distinction made in the nature and gradations of punishment, the generality will be led to conclude there is no distinction in the guilt. Thus in France the punishment of robbery, either with or without murder, is the same: hence it is, that though perhaps they are therefore subject to fewer robberies, yet they never rob but they also murder. In China murderers are cut to pieces, and robbers not: hence in that country they never murder on the highway, though they often rob. And in Britain, besides the additional terrors of a speedy execution, and a subsequent exposure or dissection, robbers

(A) Thus Demosthenes (in his oration against Midias) finely works up the aggravations of the insults he had received. "I was abused (says he) by my enemy, in cold blood, out of malice, not by heat of wine, in the morning, publicly, before strangers as well as citizens; and that in the temple, whither the duty of my office called me."

Crime and Punishment. robbers have a hope of transportation, which seldom is extended to murderers. This has the same effect here as in China, in preventing frequent assassination and slaughter.

Yet though in this instance we may glory in the wisdom of our law, we shall find it more difficult to justify the frequency of capital punishment to be found therein; inflicted (perhaps inattentively) by a multitude of successive independent statutes, upon crimes very different in their natures. It is a melancholy truth, that among the variety of actions which men are daily liable to commit, no less than 160 have been declared by act of parliament to be felonies without benefit of clergy; or, in other words, to be worthy of instant death. So dreadful a list, instead of diminishing, increases the number of offenders. The injured, through compassion, will often forbear to prosecute; juries, through compassion, will sometimes forget their oaths, and either acquit the guilty or mitigate the nature of the offence; and judges, through compassion, will respite one half of the convicts, and recommend them to the royal mercy. Among so many chances of escaping, the needy and hardened offender overlooks the multitude that suffer: he boldly engages in some desperate attempt to relieve his wants or supply his vices; and if unexpectedly the hand of justice overtakes him, he deems himself peculiarly unfortunate in falling at last a sacrifice to those laws which long impunity has taught him to contemn.

As to the trials and mode of punishment, See *ARRAIGNMENT*; *TRIAL*, and the references therefrom; *CONVICTION*; *JUDGMENT*; *ATTAINDER*; *CORRUPTION of Blood*; *FORFEITURE*; *EXECUTION*; the several *Crimes* under their respective names; and *LAW*, Part II. cxxii. *et seq.* and Part III. clxxxvi.

Persons capable or incapable of committing CRIMES; or (which is all one) of suffering the censures of the law upon the commission of forbidden acts.

All the several pleas and excuses which protect the committer of a forbidden act from the punishment which is otherwise annexed thereto, may be reduced to this single consideration, the want or defect of *will*. An involuntary act, as it has no claim to merit, so neither can it induce any guilt: the concurrence of the will, when it has its choice either to do or to avoid the fact in question, being the only thing that renders human actions either praiseworthy or culpable. Indeed, to make a complete crime, cognizable by human laws, there must be both a will and an act. For though, *in foro conscientiae*, a fixed design or will to do an unlawful act is almost as heinous as the commission of it; yet as no temporal tribunal can search the heart, or fathom the intentions of the mind, otherwise than as they are demonstrated by outward actions, it therefore cannot punish for what it cannot know. For which reason, in all temporal jurisdiction, an *overt* act, or some open evidence of an intended crime, is necessary in order to demonstrate the depravity of the will, before the man is liable to punishment. And as a vitious will without a vitious act is no civil crime; so, on the other hand, an unwarrantable act without a vitious will is no crime at all. So that to constitute a crime against human laws, there must be, first, a vitious will; and, secondly, an unlawful act consequent upon such vitious will.

Now there are three cases in which the will does not join with the act: 1. When there is a defect of understanding. For where there is no discernment, there is no choice; and where there is no choice, there can be no act of the will, which is nothing else but a determination of one's choice to do or to abstain from a particular action: he, therefore, that has no understanding, can have no will to guide his conduct. 2. Where there is understanding and will sufficient residing in the party, but not called forth and exerted at the time of the action done; which is the case of all offences committed by chance or ignorance. Here the will sits neuter, and neither concurs with the act nor disagrees to it. 3. Where the action is constrained by some outward force and violence. Here the will counteracts the deed; and is so far from concurring with, that it loaths and disagrees to what the man is obliged to perform. Infancy, idiocy, lunacy, and intoxication, fall under the first class; misfortune and ignorance may be referred to the second; and compulsion or necessity may properly rank in the third. See *INFANCY*, *IDIOCY*, *DRUNKENNESS*, *MISFORTUNE*, *IGNORANCE*, *NECESSITY*.

CRIMEA, or *CRIM TARTARY*, anciently the *Chersonesus Taurica*, a peninsula situated directly to the south of St Petersburg, between the 51st and 55th degrees of latitude, and in 46 of longitude. Its southern and western coasts lie in the Euxine, its northern and eastern in the Rotten Sea and the Palus Mæotis. It is joined, however, to the continent on the north by a small neck of land not more than six miles broad. This peninsula has been known more than 3000 years since the first naval expedition of the Argonauts; a story, though mixed with fable, yet well founded in its principal facts. The mountainous parts were inhabited by the Tauri, probably a colony of Scythians; and its coasts on the west, the east, and the south, by Greeks. The Scythians were driven out by Mithridates; the Greeks by the Sarmatians; and these again by the Alani and Goths, a northern hord of Scythians. The Hungarians, the Cossacks, and Tartars, succeeded in their turn; while the Genoese, in the 12th century, held a temporary and precarious possession of the sea-ports, which they were obliged to yield to the Turks in 1475. At the peace of 1774, the Tartars of the Crimea were declared independent; and in 1783, this peninsula was united to the Russian empire.

From the abovementioned isthmus, on which is built the fortrefs of Or-kapi or Perekop, to the first rising of the hill at Karasubasar, the country is one continued flat; elevating itself, by an easy gradation, to the summit of the hill, which forms the south side of the peninsula and the shore of the Euxine Sea. The surface of the soil is almost all of one kind, a reddish-grey loam; on digging, you find it more or less mixed with a black earth, and the hills abound with marle. The whole flat, from Perekop to the river Salgir, which may be an extent of 80 miles, is full of salt marshes and lakes; from whence the neighbouring Russian governments, as well as the Crim itself, Anatolia, and Bessarabia, are supplied with salt. The most remarkable of these lakes are five in number: Koslof and Keffa; so called after the towns near which they lie, are very large; the Tussa, about 15 versts from Perekop, on the road from Keffa; the Red Lake,

Crimea. not far from the last mentioned; and the Black Lake. Besides these, there are many other swamps and lakes, from whence the inhabitants get salt for their own consumption.

The greatest part of the peninsula is so level that a man may travel over the half of it without meeting with a river, or even the smallest brook. The inhabitants of the villages, therefore, make a pit in the yard of every house for receiving the rain or the water that runs from the hills. The whole tract is bare of every kind of tree. Not a bush or bramble is to be seen, and the herbage is extremely scanty. This, however, does not proceed so much from the unfruitfulness of the place, as from the vast herds of cattle which rove the whole year long from place to place; by which means all the grass in spring, summer, or autumn, no sooner appears through the long drought which succeeds the rainy season, but it is immediately devoured or trodden down. The universal prevalence of this custom of keeping cattle to wander up and down, joined to the slothfulness of the Tartars, with their inaptitude and aversion to agriculture, is the reason of the total neglect of that science here. Otherwise, were the land divided into portions and properly managed, there would be a sufficiency for the cattle, and the rest would be fruitful in corn and grain. By this means alone the Crim would become a fertile country, and no natural defect would be found in opposition to the welfare of its inhabitants. The truth of this is well known by their neighbours; where, of a hundred Tartars, one perhaps follows husbandry, who finds it to answer to so much profit, that he has not only enough for his own use, but wherewith to sell to the ninety-nine.

This peninsula, which is indeed but a little district, yet, from the many advantages conferred upon it by nature, may be esteemed peculiarly rich, is divided into the hilly country and the flat. The latter, which extends from Perekop to Koflof and the river Bulganak, to Karafubasar, Keffa, and Yenicali, is strewn here and there with little Tartar villages, maintained by cattle and the produce of the salt lakes. The highlands, or hilly country, form the southern part of the Crim, along the straight coast of the Black Sea, and stretching westward, in a right line from Keffa, to the vicinity of Belbek. These hills are composed of layers of chalk; which, in the headlands and promontories, is soft, but more inland quite hard. The strata of the highest hills are like those of the promontories, and take a direction from north to south. These qualities of the strata prevail not throughout the whole hills, but only in the large and lofty ones; such as the two that rise near Karafubasar, and one very high by Achmetfched, which bears the name of Aktau. The other smaller hills lie scattered and dispersed, but take the names of the greater ones, to which they seem to belong; as the great ridge of Caucasus does, which extends beyond the Donau, through Bulgaria, and are named *Palkans*.

All accounts agree in this, that nature has favoured these highland countries with great advantages, and blessed them with abundance of all things. A number of springs that flow from the mountains form the two considerable rivers Salgir and Karafu, which run into the Rotten Sea. The former, which takes its rise from a cavern in a high hill near Achmetfched, falls

straight into the plain below, and waters a great part of the Crim; the other, commencing behind Karafubasar, falls likewise into the plain, and mingles with the Salgir. There are many other little rivers and streams, which run eastward, and either join the two forementioned, or fall immediately into the Rotten Sea. All the streams, for the whole length of the hills, which begin at Keffa, and proceed in a chain of the same height, flow to the north or the north-east, excepting the one behind Achmetfched, where the great mountain Aktau is, which falls on the other side: this river, rising on the northern side of this mountain, flows, as was before observed, towards the north-east, to the Salgir and the Rotten Sea; as likewise those which spring on the western side, take their course westward to the Bulganak, and thence straight to the Black Sea; which also receives all the other little rivers that arise from these hills, as the Amma, the Katscha, the Belbek, the Kafulkioi, &c.

The mountains are well covered with woods fit for the purpose of ship-building, and contain plenty of wild beasts. The valleys consist of fine arable land; on the sides of the hills grow corn and vines in great abundance, and the earth is rich in mines. But these mountaineers are as careless and negligent as the inhabitants of the deserts; slighting all these advantages; and, like their brethren of the lowlands, are sufficiently happy if they are in possession of a fat sheep and as much bread as serves them to eat.

About 20 years ago this peninsula was uncommonly full of inhabitants and wealth. They reckoned at that time at least 1200 villages; but, from the late troubles in the Crim, it has lost more than a third part of its inhabitants; and now, wherever we turn, we meet with the ruins of large villages and dwellings. The people were composed of various nations, who lived together under the Tartars in the most unbounded freedom; but in the late Turkish war they either put themselves under the Russian government, and were transferred to that empire, or fled to Abcasia and the Tschirkassian hills.

The houses in the towns, as well as the villages, are for the most part of square timbers, having the interstices filled with brick work, if the possessor can afford it, and those of the poorer sort with turf. The chinks and crannies are made tight with clay, and then plastered within and without. The covering is commonly either of brick or of turfs. Only the medfcheds, minarets, and baths, are of stone, and a few extremely handsome of marble. They have chimnies in the chambers, at which they likewise dress their victuals; but stoves in the Russian manner none. In extreme frosts a great iron pan of charcoal is brought into the room, for making it comfortable. Their custom is, to sit upon low sofas, with Turkish coverings and cushions, or upon a clay seat, somewhat raised above the earth, and spread with a carpet. In these rooms are cupboards and chests, often covered with cushions, to serve as seats; in which they keep their gold, silver, and valuables. Such are the inner apartments or harems, in which the women generally live; the others are not so fine. These contain only a sofa, or a bank of clay covered with a carpet, as in the chimney rooms.

The rich Tartars, and their nobility or marzas (excepting

Crimea.

cepting only such as are about the person of the khan), commonly dwell all the year round in the country, coming only to town when they have business there. There are but few towns in the Crim, at least in comparison of its former population. The Krimskoi Tartars have no tribunal of justice, controversies and quarrels being seldom heard of among them; and if a dispute should arise, it is immediately settled by an appeal to the Koran. Little differences in the villages inevitably happening about property, or other matters not taken notice of in that code, are amicably adjusted by the eldersmen or abefes; but in the towns all weighty concerns, excepting the single case of murder or homicide, are brought before the kaimakan or commandant, who settles them absolutely without appeal.

The residence of the khans of the Crimea was formerly Bachtshifarai, in which city they held their seat for upwards of 200 years. They went thither from Eski-Crim, or Old Crim, the capital city of the Genoese, upon Bengli Ghireikhan's plundering the seaports, and driving all the Genoese from their stations. Before Eski-Crim, and indeed upon the first coming of the Tartars into this peninsula, the sovereign residence was at Koslof; but here they remained not long. Under the late khan Shagin Ghirei it was held at Keffa, the ancient Theodosia; which is 10 miles distant from Eski-Crim, said to be the Cimmericum of the ancients.

The principal cities or towns of the Crimea are: 1. *Bachtshi-Sarai*, an extensive and wealthy city, lying in a vale between two high mountains, and surrounded by a number of gardens. From this circumstance it has its name; *bachtshi* signifying in the Tartarian language "a garden," and *sarai* "a palace." It formerly contained 3000 houses, and many sumptuous medsheds. The palace of the khans, with its gardens and ponds, were much improved under the government of Khan Kerim Girei, under whose government the last Turkish war took its rise. In this palace is the burial place of all the khans of Crimea, wherein all the khans that have reigned here lie interred. The fine Krimskoi vines, with their large clusters of grapes, grow in great plenty all about this town, and a profusion of other delicious fruits, from whence the neighbouring parts of Russia are supplied. 2. *Keffa*, the present residence of the khans, stands on the shore of a large harbour in the Black Sea. Its site is on the declivity of a long ridge of mountains; and is mantled by a stone wall, fortified by several towers, and encompassed by a deep ditch. On both sides of the city formerly stood castles, and in the middle of them a lofty turret for the purpose of giving signals by fire. Before the wall were wide extended suburbs; containing, among other considerable buildings, medsheds, churches for the Greek and Armenian worship; of all which now only the vestiges remain. The castles and towers lie also in ruins; and not one third part of the houses of the city itself are now remaining, and those chiefly built of materials taken from the aforesaid ruins. They formerly reckoned Keffa to contain 4000 houses, including the suburbs, with a number of medsheds and Christian churches; but this number has been much diminished by the last Turkish war. The present inhabitants consist mostly of Tartars; who carry on a trade by no means inconsiderable, in commodities brought

from Turkey. The late khan, an intelligent and enlightened personage, made this city the place of his residence, and brought hither the mint from Bachtshifarai, built himself a palace, and erected a divan, which assembled three times a-week, and the fourth time was held in the palace of the khan, in which he always personally assisted. Here is also a custom-house, the management of which is farmed out. 3. *Karafubasar*, likewise a very rich city in former times, stands at the beginning of the mountains, about half-way between Keffa and Bachtshifarai. It is a large trading town; contains a considerable number of dwelling-houses and medsheds, but the greatest part of them in decay, and many fine gardens. This place is the most famous in all the Crim for its trade in horses, and has a market once a-week for that article of traffic; to which are likewise brought great numbers of buffaloes, oxen, cows, camels, and sheep, for sale. Near this city flows one of the principal rivers of the Crim, called the *Karafu*, that is, the Black Water. Of this river they have an opinion in Russia, that one part of it flows upwards for several versts together. But this is in some sort true, not only of the Karafu, but of all the rivers of the Crim that have a strong current. The Tartars, who dwell either in the valleys or on the sides of the mountains (frequently without considering whether the place is supplied with water or not), dig canals either from the source of the next river, or from that part of it which lies nearest to their particular habitation, about an arshine in breadth, for their gardens and domestic use. From these they cut smaller ones through the villages, to supply them with water, and not unfrequently to drive a mill. These canals appear, to the imagination of the common people, to run in a contrary direction to the current of the river; and in fact these canals do lie, in many places for a verst in length, some fathoms higher than the level of the stream from whence they are supplied. 4. *Achmetsted*, a pretty large city not far from Bachtshifarai; now made the capital of all the Crimea by the regulations of Prince Potemkin in the summer of 1785. 5. *Koslof*, formerly a very considerable trading town, lies on the western side of the peninsula, in a bay of the Black Sea; which, as well as the found at Keffa, might rather be called a road than a haven. This was the first town the Tartars possessed themselves of on their first entrance into the Crim, and established a customhouse therein, after the example of the Genoese, which is now farmed out.

The other remarkable places are, *Sudak*, which is built on the hills upon the shore of the Black Sea, at the south side of the peninsula, and is famous for its excellent wine, resembling Champagne both in colour and strength; *Alushti*, on the same side, among the hills on the sea-shore; *Baluklava*, where there is a fine harbour, and perhaps the only one on the Black Sea, containing ample room for a very good fleet; *Inkerman* may be noticed for its commodious though not very large haven, called *Achtiar*; and *Mangup*, the old Chersonesus: which were all formerly very flourishing towns; but are now either in ruins, or dwindled into small villages.

All these places, so long as the Genoese remained masters of the Crim, were well fortified; but the Tartars, in taking them, demolished all the works. While they

Crimea.

Crimea they were under the Turks, they left the fortresses of
 || Keffa, Kertsch, and Koslof, and built the fort Arabat
 Crinum. on the neck of land between the sea of Azof (or Palus
 Mæotus) and the Rotten Sea, where Perekop also is.

In *Arabat* are but few houses; but here the warlike
 stores of the khans were kept.—*Perekop*, called by the
 Turks *Or-kapi*, is a fortress of moderate strength;
 standing about the middle of the neck of land that
 joins the peninsula with the continent. This isthmus,
 which is at least six miles broad, is cut through with a
 wide and deep ditch lined with stone, and reaches from
 the Black to the Rotten Sea. This was formerly kept
 without water, but now is filled from both seas. On
 the Crimean side a high wall of earth runs the whole
 length of it, straight from one sea to the other. The
 people pass over the ditch by means of a drawbridge, and
 through the wall by a gateway. The walls of the for-
 tress are some fathoms from the road-side; of which
 the ruins are only now discernible, namely, large brick
 houses, with a number of bomb-shells and cannon-balls
 about them, which were formerly kept in the fortresses.
 At least two miles from this is the pretty populous but
 miserable place, which was probably the town to which
 this fort belonged. Near the gate is a custom-house,
 where all imports and exports pay duty.

This peninsula was formerly extremely populous; the
 number of its inhabitants, in Tartars, Turks, Greeks,
 Armenians, Jews, and others, amounted to above
 200,000 men. Since that, however, the greatest part
 of the Christians have betaken themselves to the other
 parts of the Russian empire, particularly the govern-
 ment of Azof; and many other inhabitants, particu-
 larly Tartars, have gone to Taman and Abchasia; so
 that the present population of the Crim cannot now be
 reckoned at more than 70,000 men at most.

The Crim was heretofore divided into 24 kaduliks
 or districts, namely, Yenikali, Kertsch, Arabat, Ef-
 ki-krim, Keffa, Karasubasar, Sudak, Achmetsched,
 Yalof, Bachtschifarai, Balaklava, Mangup, Inkerman,
 Koslof, Or, Mansur, Tarkan, Sivaseh, Tschongar,
 Sarubulat, Barun, Argun, Sidschugut, and Schirin.
 Several of these districts are named after the town or
 village wherein the murza, their governor, dwells;
 and many of them are at present in a state of total de-
 cay.

CRIMEN FALSI. See *FALSI Crimen*.

CRIMSON, one of the seven red colours of the
 dyers. See *DYEING*.

CRINGLE, a small hole made in the bolt-rope of
 a sail, by intertwisting one of the divisions of a rope,
 called a *strand*, alternately round itself and through
 the *strands* of the bolt-rope, till it becomes threefold,
 and assumes the shape of a wreath or ring. The use
 of the cringle is generally to contain the end of some
 rope, which is fastened thereto for the purpose of
 drawing up the sail to its yard, or of extending the
 skirts by the means of *bridles*, to stand upon a side
 wind. The word seems to be derived from *krinchelen*
 (Belg.) "to run into twists."

CRINUM, ASPHODEL-LILY: A genus of the mo-
 nogynia order, belonging to the hexandria class of
 plants; and in the natural method ranking under the
 9th order, *Spathaceæ*. The corolla is funnel-shaped,
 monopetalous, and sexpartite, with three alternate seg-
 ments having hooked appendages; the germen is co-

vered in the bottom of the corolla, the stamina stand-
 ing asunder. They are very beautiful green-house
 plants, rising two or three feet high, each of them
 crowned by a large umbellate cluster of a spathaceous,
 monopetalous, long funnel-shaped flowers, blue, white,
 or striped, having a very fragrant smell. They are pro-
 pagated by off-sets.

CRISIS, in medicine, is used in different senses, both
 by the ancient and modern physicians. With some it
 means frequently no more than the excretion of any
 noxious substance from the body. Others take the
 word for a secretion of the noxious humours made in
 a fever. Others use it for the critical motion itself;
 and Galen defines a crisis in fevers, a sudden and in-
 stantaneous change, either for the better or the worse,
 productive of recovery or death.

CRISPIN and CRISPIANUS, two legendary saints,
 whose festival, as marked in the calendar, is on the
 25th of October. According to the legend, they
 were brethren, born at Rome; from whence they tra-
 velled to Soissons in France, about the year 303, to
 propagate the Christian religion; and because they
 would not be chargeable to others for their mainte-
 nance, they exercised the trade of shoemakers; but
 the governor of the town discovering them to be Chri-
 stians, ordered them to be beheaded. From which
 time the shoemakers made choice of them for their
 tutelary saints.

CRISTÆ, in surgery, a term for certain excres-
 cences about the anus and pudenda. See *MEDICINE-
 Index*.

CRISTA GALLI, in anatomy, an eminence in the
 middle of the *os ethmoides*, advancing within the cavity
 of the cranium; and to which is fastened that part of
 the dura mater which divides the brain, called, *fals*.
 It has its name from its figure, which resembles that
 of a cock's comb. In adults, this process appears of
 a piece with the *septum narium*.

CRITERION, or CRITERIUM, a standard by
 which propositions and opinions are compared, in or-
 der to discover their truth or falsehood.

CRITHE, in surgery, commonly called the *flye*, is
 a sort of tubercle that grows on the eye-lids. When
 small, it is seated on the edge of the eye-lid; but when
 large, it spreads further. When they do not suppu-
 rate, they become wens. They are apt to disappear
 and return. If there is inflammation, endeavour to
 suppurate it with the white-bread poultice: if it is
 hard, destroy it with a mixture of equal parts of hog's
 lard and quicksilver. If the lower eye lid is affected,
 the tumor is more frequently on its inside; and then
 it is best to dissect it, or to make way for it outwardly
 by applying a caustic on the skin just upon it.

CRITHMUM, SAMPHIRE: A genus of the digy-
 nia order, belonging to the pentandria class of plants;
 and in the natural method ranking under the 45th or-
 der, *Umbellatæ*. The fruit is oval and compressed, the
 florets equal. There are two species, the principal of
 which is the maritimum, or common maritime sam-
 phire. It hath a fibrous penetrating root; thick suc-
 culent, branchy stalks rising two feet high; winged
 fleshy leaves, consisting of many small spear-shaped
 lobes; with round yellow flowers growing in umbels.
 It is produced naturally on the sea-coasts among the
 gravel and rocks. Its leaves are an excellent pickle

Critho-
mancy
||
Criticism.

used for sauces, and are by many eaten raw in salads. It is of a saltish relish, palatable, and comfortable to the stomach. It is not very easily preserved in gardens. It must be sown on gravelly or rocky ground, half an inch deep; in which situation the plants will come up, and last some years. The leaves of this plant are said also to be aperient and diuretic.

CRITHOMANCY, a kind of divination, performed by considering the dough or matter of the cakes offered in sacrifice, and the meal strewed over the victims to be killed. Hence, in regard they ordinarily used barley-meal in these ceremonies, this kind of divination was called *crithomancy*, from *κριθον*, *barley*, and *μαντεια*, *divination*.

CRITHAS, one of the 30 tyrants set over Athens by the Spartans. He was eloquent and well bred, but of dangerous principles. He cruelly persecuted his enemies and put them to death. He was killed about 400 years before the Augustan age, in a battle against those citizens whom his oppression had banished. He had been among the disciples of Socrates, and had written elegies and other compositions, of which some fragments remain.

CRITICAL DAYS and SYMPTOMS, among physicians, are certain days and symptoms in the course of acute diseases, which indicate the patient's state, and determine him either to recover or grow worse. See *MEDICINE-Index*.

CRITICISM, the art of judging with propriety concerning any object or combination of objects. But, in a more limited sense, the science of criticism is confined to the fine arts. The principles of the fine arts are best unfolded by studying the sensitive part of our nature, and by learning what objects are naturally agreeable and what are naturally disagreeable. The man who aspires to be a critic in these arts, must pierce still deeper: he must clearly perceive what objects are lofty, what low, what are proper or improper, what are manly, and what are mean or trivial. Hence a foundation for judging of taste, and for reasoning upon it: where it is conformable to principles, we can pronounce with certainty that it is correct; otherwise, that it is incorrect, and perhaps whimsical. Thus the fine arts, like morals, become a rational science; and, like morals, may be cultivated to a high degree of refinement.

Manifold are the advantages of criticism, when thus studied as a rational science. In the first place, a thorough acquaintance with the principles of the fine arts redoubles the entertainment these arts afford. To the man who resigns himself entirely to sentiment or feeling, without interposing any sort of judgement, poetry, music, painting, are mere pastime; in the prime of life, indeed, they are delightful, being supported by the force of novelty and the heat of imagination: but they lose their relish gradually with their novelty; and are generally neglected in the maturity of life, which disposes to more serious and more important occupations. To those who deal in criticism as a regular science, governed by just principles, and giving scope to judgment as well as to fancy, the fine arts are a favourite entertainment; and in old age maintain that relish which they produce in the morning of life.

In the next place, a philosophical inquiry into the

principles of the fine arts, inures the reflecting mind to the most enticing sort of logic: the practice of reasoning upon subjects so agreeable tends to a habit; and a habit strengthening the reasoning faculties, prepares the mind for entering into subjects more difficult and abstract. To have, in this respect, a just conception of the importance of criticism, we need but reflect upon the common method of education; which, after some years spent in acquiring languages, hurries us, without the least preparatory discipline, into the most profound philosophy: a more effectual method to alienate the tender mind from abstract science, is beyond the reach of invention: and accordingly, with respect to such speculations, the bulk of our youth contract a sort of hobgoblin terror, which is seldom, if ever, subdued. Those who apply to the arts are trained in a very different manner: they are led, step by step, from the easier parts of the operation to what are more difficult; and are not permitted to make a new motion till they be perfected in those which regularly precede it. The science of criticism appears then to be a middle link, connecting the different parts of education into a regular chain. This science furnisheth an inviting opportunity to exercise the judgment: we delight to reason upon subjects that are equally pleasant and familiar; we proceed gradually from the simpler to the more involved cases: and in a due course of discipline, custom, which improves all our faculties, bestows acuteness upon those of reason, sufficient to unravel all the intricacies of philosophy.

Nor ought it to be overlooked, that the reasonings employed upon the fine arts are of the same kind with those which regulate our conduct. Mathematical and metaphysical reasonings have no tendency to improve social intercourse; nor are they applicable to the common affairs of life: but a just taste in the fine arts, derived from rational principles, furnishes elegant subjects for conversation, and prepares us finely for acting in the social state with dignity and propriety.

The science of rational criticism tends to improve the heart not less than the understanding. It tends, in the first place, to moderate the selfish affections: by sweetening and harmonizing the temper, it is a strong antidote to the turbulence of passion and violence of pursuit; it procures to a man so much mental enjoyment, that, in order to be occupied, he is not tempted in youth to precipitate into hunting, gaming, drinking; nor in middle-age, to deliver himself over to ambition; nor in old age to avarice. Pride and envy, two disgusting passions, find in the constitution no enemy more formidable than a delicate and discerning taste: the man upon whom nature and culture have bestowed this blessing, feels great delight in the virtuous dispositions and actions of others: he loves to cherish them, and to publish them to the world: faults and failings, it is true, are to him not less obvious; but these he avoids, or removes out of sight, because they give him pain. On the other hand, a man void of taste, upon whom the most striking beauties make but a faint impression, has no joy but in gratifying his pride or envy by the discovery of errors and blemishes. In a word, there may be other passions, which, for a season, disturb the peace of society more than those mentioned; but no other passion is so unwearied an antagonist

Criticism.

Criticism
||
Crizzel-
ling.

gonist to the sweets of social intercourse: these passions, tending assiduously to their gratification, put a man perpetually in opposition to others; and dispose him more to relish bad than good qualities, even in a companion. How different that disposition of mind, where every virtue in a companion or neighbour, is, by refinement of taste, set in its strongest light; and defects or blemishes, natural to all, are suppressed, or kept out of view!

In the next place, delicacy of taste tends not less to invigorate the social affections than to moderate those that are selfish. To be convinced of this tendency, we need only reflect, that delicacy of taste necessarily heightens our sensibility of pain and pleasure, and of course our sympathy, which is the capital branch of every social passion. Sympathy, in particular, invites a communication of joys and sorrows, hopes and fears: such exercise, soothing and satisfactory in itself, is necessarily productive of mutual good-will and affection.

One other advantage of rational criticism is referred to the last place, being of all the most important; which is, that it is a great support to morality. No occupation attaches a man more to his duty than that of cultivating a taste in the fine arts: a just relish of what is beautiful, proper, elegant, and ornamental, in writing or painting, in architecture or gardening, is a fine preparation for the same just relish of these qualities in character and behaviour. To the man who has acquired a taste so acute and accomplished, every action wrong or improper must be highly disgusting: if, in any instance, the overbearing power of passion sway him from his duty, he returns to it upon the first reflection, with redoubled resolution never to be swayed a second time: he has now an additional motive to virtue, a conviction derived from experience, that happiness depends on regularity and order, and that a disregard to justice or propriety never fails to be punished with shame and remorse.

For the rules of criticism applicable to the fine arts, and derived from human nature, see ARCHITECTURE, BEAUTY, CONGRUITY, COMPARISON, GRANDEUR, &c.

CRITO, an Athenian philosopher, flourished 400 years before Christ. He was one of the most zealous disciples of Socrates, and supplied him with whatever he wanted. He had several scholars who proved great men, and he composed some dialogues which are lost.

CRITOLAUS, a citizen of Tegea in Arcadia. He with two brothers fought against the three sons of Demostratus of Pheneus, to put an end to a long war between their respective nations. The brothers of Critolaus were both killed, and he alone remained to withstand his three bold antagonists. He conquered them; and when at his return his sister deplored the death of one of his antagonists, to whom she was betrothed, he killed her in a fit of resentment. The offence deserved capital punishment; but he was pardoned on account of the services he had rendered his country. He was afterwards general of the Achæans; and it is said that he poisoned himself because he had been conquered at Thermopylæ by the Romans, about 146 years before the Augustan age.

CRIZZELLING, in the glass trade, a kind of roughness arising on the surface of some kinds of glass.

This was the fault of a peculiar sort of glass made in Oxfordshire and some other places, of black flints, a crystallized sand, and a large quantity of nitre, tartar, and borax. The glass thus made is very beautiful, but from the too great quantities of the salt in the mixture, is subject to crizzel; that is, the salts in the mixture, from their too great proportion, are subject, either from the adventitious nitre of the air from without, or from warm liquors put in them, to be either increased in quantity or dissolved, and thereby induce a scabrities or roughness, irrecoverably clouding the transparency of the glass. This is what was called *crizzelling*; but by using an Italian white pebble, and abating the proportions of the salts, the manufacture is now carried on with advantage, and the glass made with these salts is whiter than the finest Venetian, and is subject to no faults.

CROATIA, a part of the ancient Illyricum, is bounded on the east by Sclavonia and Bosnia, on the south and south-west by Morlachia, and on the north by the Drave, which separates it from a part of Sclavonia. It is about 80 miles in length and 70 in breadth, and was once divided between the Hungarians and Turks; but now the greatest part of it is subject to the house of Austria. The Croats derive their origin from the Sclavi; and their language is a dialect of the Sclavonian, approaching very near to that of the Poles. The country is divided into two parts, viz. that under, and that beyond the Save. In the late wars between the empress queen and the king of Prussia, no less than 50,000 men were raised out of this small territory. Both horse and foot are good soldiers, especially the former. The soil, where cultivated, is fruitful in wine and oil, &c. but being a frontier country, and much exposed to inroads, it is not so well cultivated as otherwise it might be.

CROCODILE, in zoology. See LACERTA.

Fossile CROCODILE, one of the greatest curiosities in the fossile world which the late ages have produced. It is the skeleton of a large crocodile; almost entire, found at a great depth under ground, bedded in stone. This was in the possession of Linkius, who wrote many pieces of natural history, and particularly an accurate description of this curious fossile. It was found in the side of a large mountain in the midland part of Germany, and in a stratum of black fossile stone, somewhat like the common slate, but of a coarser texture, the same with that in which the fossile fish in many parts of the world are found. This skeleton had the back and ribs very plain, and was of a much deeper black than the rest of the stone; as is also the case in the fossile fishes which are preserved in this manner. The part of the stone where the head lay was not found; this being broken off just at the shoulders, but that irregularly; so that, in one place, a part of the back of the head was visible in its natural form. The two shoulder-bones were very fair, and three of the feet were well preserved; the legs were of their natural shape and size, and the feet preserved even to the extremities of the five toes of each.

CROCODILE (*crocodilus*), in rhetoric, a captious and sophistical kind of argumentation, contrived to seduce the unwary, and draw them speciously into a snare. It has its name crocodile from the following occasion, invented by the poets. A poor woman, begging a cro-

Croatia,
Crocodile.

Crocus.

codile that had caught her son walking by the river-side to spare and restore him, was answered, that he would restore him, provided she should give a true answer to a question he should propose: the question was, Will I restore thy son or not? To this the poor woman, suspecting a deceit, sorrowfully answered, Thou wilt not: and demanded to have him restored, because she had answered truly. Thou liest, says the crocodile; for if I restore him, thou hast not answered truly: I cannot therefore restore him without making thy answer false. Under this head may be reduced the propositions called *mentientes* or *insolubiles*; which destroy themselves. Such is that of the Cretan poet: *Omnes ad unam Cretenses semper mentiuntur*: "All the Cretans, to a man, always lie." Either, then, the poet lies when he asserts that the Cretans all lie, or the Cretans do not all lie.

CROCUS, SAFFRON: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the 6th order, *Enfata*. The corolla is sexpartite and equal; the stigmata convoluted or rolled spirally inwards. Modern botanists allow only one species of this genus, which, however, comprehends many beautiful varieties. This hath a small roundish, brown, bulbous root, compressed at the bottom. Directly from the root issue many long narrow leaves, of a deep green colour; and amidst them the flowers all protruded from a thin univalvular radical spathe; the tube of the flower is long, standing on the root, and serving as a footstalk to the limb or upper part, which is erect, six-parted, widens gradually upward, and grows from about three to five or six inches high. The varieties of this species may be divided into two classes, the autumnal and spring flowering.

The varieties of the first are the *crocus officinalis*, or saffron of the shops; for the properties of which, and its cultivation for sale, see the article **SAFFRON**. This hath a long-tubed bluish purple flower, with three stigmata of a fine golden colour. Other varieties are the autumnal small blue crocus; deep blue, sky-blue, whitish blue, many flowered whitish blue, purple, large rush leaved purple, autumnal white crocus, and autumnal yellow crocus. The varieties of the vernal crocus are, the small and large, and golden yellow crocuses, and the yellow black-striped, the yellow purple-striped and double cloth of gold ones; the white, white purple-striped, white purple bottom, white black-striped, whitish cream coloured, whitish ash coloured, little narrow-leaved white, and white blue-striped crocuses. Besides these there are a great many others of a blue and purple colour finely variegated.

The autumnal crocuses flower about the beginning of October, but never ripen their seeds in Britain. They are very beautiful if sown in patches in the front of borders, or in beds by themselves, and very proper ornaments for gardens of every extent, as coming up at a time when most other flowers are on the decay. They grow freely in any kind of soil, and may be propagated by off-sets. The vernal kinds flower in February, March, and April. They also are very ornamental, and are so hardy that they will grow almost any where. They are propagated by seeds, which the plants produce in plenty.

CROCUS, in chemistry, denotes any metal calcined to a red or deep yellow colour.

CROCUS Metallorum, an emetic preparation of antimony and nitre. See **CHEMISTRY-Index**.

CRÆSUS, the last king of Lydia, remarkable for his riches, his conquests, his temporary prosperity, and the sad reverse of his fortune. He subdued the Phrygians, Mysians, Paphlagonians, Thracians, and Carians; amassed together immense riches; and became one of the most powerful and magnificent princes in the world. He drew the learned to his court, and took a pleasure in conversing with them. Thales of Miletus, Pittacus of Mitylene, Bias of Prienè, Cleobulus of Lindus, and most of the other "wise men," as they are emphatically styled, who lived in that age, as well as Æsop the fabulist, and the elegant Greek poets of the times, were bountifully received at the court of Cræsus. There is still on record a memorable conversation between that prince and Solon, which seemed to predict the subsequent events of his reign, and which had a late but important influence on the character and fortune of the Lydian king. Cræsus having entertained his Athenian guest, according to the ancient fashion, for several days, before he asked him any questions, ostentatiously showed him the magnificence of his palace, and particularly the riches of his treasury. After all had been displayed to the best advantage, the king complimented Solon upon his curiosity and love of knowledge; and asked him, as a man who had seen many countries, and reflected with much judgment upon what he had seen, Whom of all men he esteemed most happy? By the particular occasion, as well as the triumphant air with which the question was proposed, the king made it evident that he expected flattery rather than information. But Solon's character had not been enervated by the debilitating air of a court; and he replied with a manly freedom, "Tellus, the Athenian." Cræsus, who had scarcely learned to distinguish, even in imagination, between wealth and happiness, inquired with a tone of surprise, why this preference to Tellus? "Tellus," rejoined Solon, "was not conspicuous for his riches or his grandeur, being only a simple citizen of Athens; but he was descended from parents who deserved the first honours of the republic. He was equally fortunate in his children, who obtained universal esteem by their probity, patriotism, and every useful quality of the mind or body: and as to himself, he died fighting gallantly in the service of his country, which his valour rendered victorious in a doubtful combat; on which account the Athenians buried him on the spot where he fell, and distinguished him by every honour which public gratitude can confer on illustrious merit."

Cræsus had little encouragement, after this answer, to ask Solon, in the second place, Whom, next to Tellus, he deemed most happy? Such, however, is the illusion of vanity, that he still ventured to make this demand; and still, as we are informed by the most circumstantial of historians, entertained hopes of being favourably answered. But Solon replied with the same freedom as before, "The brothers Cleobis and Biton; two youths of Argos, whose strength and address were crowned with repeated victory at the Olympic games; who deserved the affection of their parents, the gratitude of their country, the admiration of Greece; and

Crocus,
Cræsus.

who,

Cræsus. who, having ended their lives with peculiar facility, were commemorated by the most signal monuments of immortal fame." "And is the happiness of a king, then," said Cræsus, "so little regarded, O Grecian stranger! that you prefer to it the mean condition of an Athenian or Argive citizen?" The reply of Solon sufficiently justified his reputation for wisdom. "The life of man," said he, "consists of 70 years, which make 25,550 days; an immense number: yet in the longest life, the events of any one day will not be found exactly alike to those of another. The affairs of men are liable to perpetual vicissitudes: the Divinity who presides over our fate is envious of too much prosperity; and all human life, if not condemned to calamity, is at least liable to accident. Whoever has uninterruptedly enjoyed a prosperous tide of success may justly be called *fortunate*: but he cannot before his death be intitled to the epithet of *happy*."

The events which soon followed this conversation, prove how little satisfaction is derived from the possession of a throne. Victorious in war, unrivalled in wealth, supreme in power, Cræsus felt and acknowledged his unhappiness. The warmest affections of his soul centered in his son Atys, a youth of the most promising hopes, who had often fought and conquered by his side. The strength of his attachment was accompanied with an excess of paternal care, and the anxiety of his waking hours disturbed the tranquillity of his rest. He dreamed that his beloved son was slain by a dart; and the solicitude with which he watched his safety, preventing the youth from his usual occupations and amusements, and thereby rendering him too eager to enjoy them, most probably exposed him to the much dreaded misfortune. Reluctantly permitted to engage in a party of hunting, the juvenile ardour of Atys, increased by the impatience of long restraint, made him neglect the precautions necessary in that manly amusement. He was slain by a dart aimed at a wild boar of a monstrous size, which had long spread terror over the country of the Mysians. The weapon came from the hand of Adrastus, a Phrygian prince and fugitive, whom Cræsus had purified from the involuntary guilt of a brother's blood, and long distinguished by peculiar marks of bounty. To the grateful protection of the Phrygian, Cræsus recommended, at parting, the safety of his beloved son. A mournful procession of Lydians brought to Sardis the dead body of Atys. The ill-fated murderer followed behind. When they approached the royal presence, Adrastus stepped forward, and intreated Cræsus to put him to death; thinking life no longer to be endured after killing, first his own brother, and then the son of his benefactor. But the Lydian king, notwithstanding the excess of his affliction, acknowledged the innocence of Adrastus, and the power of fate. "Stranger your action is blameless, being committed without design. I know that my son was destined to a premature death." Adrastus, though pardoned by Cræsus, could not pardon himself. When the mourners were removed, he privately returned, and perished by his own hand on the tomb of Atys.

Two years Cræsus remained disconsolate for the loss of his son; and might have continued to indulge his unavailing affliction during the remainder of life, had not the growing greatness of Persia, which threatened

the safety of his dominions, roused him from his dream of misery. (See LYDIA.)—He marched against Cyrus with a great army, but was defeated; and retreating to his capital Sardis, was there besieged. The city was taken by assault; and as a Persian soldier was going to kill Cræsus, that prince's only surviving son, who had hitherto been dumb, terrified at his danger, cried, *Stop, soldier, and touch not Cræsus*. But though delivered by this extraordinary accident from the blind rage of the soldier, he seemed to be reserved for a harder fate. Dragged into the presence of his conqueror, he was loaded with irons; and the stern, unrelenting Cyrus, of whose humane temper of mind we have so beautiful, but so flattering, a picture in the philosophical romance of Xenophon, ordered him, with the melancholy train of his Lydian attendants, to be committed to the flames. An immense pile of wood and other combustibles were erected in the most spacious part of the city. The miserable victims, bound hand and foot, were placed on the top of the pyre. Cyrus, surrounded by his generals, witnessed the dreadful spectacle, either from an abominable principle of superstition if he had bound himself by a vow to sacrifice Cræsus, as the first fruits of his Lydian victory, or from a motive of curiosity, equally cruel and impious, to try whether Cræsus, who had so magnificently adorned the temples and enriched the ministers of the gods, would be helped in time of need by the miraculous interposition of his much honoured protectors. Mean while the unfortunate Lydian, oppressed and confounded by the intolerable weight of his present calamity compared with the security and splendor of his former state, recollected his memorable conversation with the Athenian sage, and uttered with a deep groan the name of *Solon*. Cyrus asked by an interpreter, "Whose name he invoked?" "*Him*," replied Cræsus, emboldened by the prospect of certain death, "whose words ought ever to speak to the heart of kings." This reply not being satisfactory, he was commanded to explain at full length the subject of his thoughts. Accordingly he related the important discourse which had passed between himself and the Athenian, of which it was the great moral, That no man could be called happy till his death.

The words of a dying man are fitted to make a strong impression on the heart. Those of Cræsus deeply affected the mind of Cyrus. The Persian considered the speech of Solon as addressed to himself. He repented of his intended cruelty towards an unfortunate prince, who had formerly enjoyed all the pomp of prosperity: and dreading the concealed vengeance that might lurk in the bosom of fate, gave orders that the pyre should be extinguished. But the workmen who had been employed to prepare it, had performed their task with so much care, that the order could not speedily be obeyed. At that moment, Cræsus calling on Apollo, whose favourite shrine of Delphi had experienced his generous munificence, and whose perfidious oracle had made him so ungrateful a return; the god, it is said, sent a plentiful shower to extinguish the pyre. This event, which saved the life, and which sufficiently attested the piety of Cræsus, strongly recommended him to the credulity of his conqueror. It seemed impossible to pay too much respect to a man who was evidently the favourite of heaven. Cyrus gave orders that

Crœsus
Croifade.

that he should be feated by his fide, and thenceforth treated as a king; a revolution of fortune equally sudden and unexpected. But the mind of Crœsus had undergone a still more important revolution; for, tutored in the useful school of adverfity, he learned to think with patience and to act with prudence, to govern his own paffions by the dictates of reafon, and to repay by wholefome advice the generous behaviour of his Perfian mafter.

The first advantage which he derived from the change in Cyrus's difpofition towards him, was the permiffion of fending his fetters to the temple of Delphian Appollo, whole flattering oracles had encouraged him to wage war with the Perfians. "Behold," were his meffengers inftructed to fay, "the trophies of our promifed fuccefs! behold the monuments of the unerring veracity of the god!" The Pythia heard their reproach with a fmile of contemptuous indignation, and answered it with that folemn gravity which fhe was fo carefully taught to affume: "The gods themfelves cannot avoid their *own* deftiny, much lefs avert, however they may retard, the determined fates of men. Crœsus has fuffered, and juftly fuffered, for the crime of his anceftor Gyges; who, entrusted as chief of the guards, with the perfon of Candaules, the laft king of the race of Hercules, was feduc'd by an impious woman to murder his mafter, to defile his bed, and to ufurp his royal dignity. For this complicated guilt of Gyges the miffortunes of Crœsus have atoned; but know that through the favour of Appollo, thefe miffortunes have happened three years later than the fates ordained." The Pythia then proceeded to explain her answers concerning the event of the war againft Cyrus, and proved, to the conviction of the Lydians, that her words, if properly underftood, portended the deftruction, not of the Perfian, but of the Lydian empire. Crœsus heard with refignation the report of his meffengers, and acknowledged the juftice of the Delphian oracle, which maintained and increafed the luftre of its ancient fame. This fallen monarch furvived Cyrus. The manner of his death is not known.

CROFT, a little clofe adjoining to a dwelling-houfe, and inclofed for pafture or arable land, or any other purpofe.—in fome ancient deeds, *crufia* occurs as the Latin word for a "croft;" but *cum toftis & croftis* is more frequent. Croft is tranflated in Abbo Floriacenfis, by *prædium* a "farm."

CROISADE, or CRUSADE, a name given to the expeditions of the Chriftians againft the infidels for the conqueft of Paleftine

Thefe expeditions commenced in the year 1096. The foundation of them was a fuperftitious veneration for thofe places where our Saviour performed his miracles, and accomplifhed the work of man's redemption. Jerufalem had been taken, and Paleftine conquered, by Omar the fucceffor of Abu Becr,* who fucceeded Mahomet himfelf. This proved a confiderable interruption to the pilgrims, who flocked from all quarters to perform their devotions at the holy fepulchre. They had, however, ftill been allowed this liberty, on paying a fmall tribute to the Saracen caliphs, who were not much inclined to moleft them. But, in 1065, this city changed its mafters. The Turks took it from the Saracens; and being much more fierce and barbarous than the former, the pil-

grims now found they could no longer perform their devotions with the fame fafety they did before. An opinion was about this time alfo prevalent in Europe, which made thefe pilgrimages much more frequent than formerly. It was fomehow or other imagined, that the thoufand years mentioned in the 20th chapter of the Revelations were fulfilled; that Chrift was foon to make his appearance in Paleftine, to judge the world; and confequently that journeys to that country were in the higheft degree meritorious, and even abfolutely neceffary. The multitudes of pilgrims which now flocked to Paleftine meeting with a very rough reception from the Turks, filled all Europe with complaints againft thofe infidels who profaned the holy city by their prefence, and derided the facred myfteries of Chriftianity even in the place where they were fulfilled. Pope Gregory VII. had formed a defign of uniting all the princes of Chriftendom againft the Mahometans; but his exorbitant encroachments upon the civil power of princes had created him fo many enemies, and rendered his fchemes fo fufpicious, that he was not able to make great progrefs in this undertaking. The work was referved for a meaner inftrument.

Peter, commonly called the *hermit*, a native of Amiens in Picardy, had made the pilgrimage to Jerufalem; and being deeply affected with the dangers to which that act of piety now expofed the pilgrims, as well as with the oppreffion under which the eastern Chriftians now laboured, formed the bold, and, in all appearance, impracticable defign of leading into Asia, from the fartheft extremities of the Weft, armies fufficient to fubdue thofe potent and warlike nations that now held the Holy Land in flavery. He propofed his fcheme to Martin II. who then filled the papal chair; but he, though fenfible enough of the advantages which muft accrue to himfelf from fuch an undertaking, refolved not to interpoze his authority till he faw a greater probability of fuccefs. He fummoned, at Placentia, a council confifting of 4000 ecclefiaftics and 30,000 feculars. As no hall could be found large enough to contain fuch a multitude, the afsembly was held in a plain. Here the Pope himfelf, as well as Peter, harangued the people, representing the difmal fituation of their brethren in the Eaft, and the indignity offered to the Chriftian name in allowing the holy city to remain in the hands of the infidels. Thefe fpeeches were fo agreeable to thofe who heard them, that the whole multitude fuddenly and violently declared for the war, and folemnly devoted themfelves to perform this fervice, which they believed to be fo meritorious in the fight of God.

But though Italy feemed to have embraced the defign with ardour, Martin yet thought it neceffary, in order to ensure perfect fuccefs, to engage the greater and more warlike nations in the fame enterprize. Having therefore exhorted Peter to vifit the chief cities and fovereigns of Chriftendom, he fummoned another council at Clermont in Auvergne. The fame of this great and pious defign being now univerfally diffufed, procured the attendance of the greateft prelates, nobles, and princes; and when the Pope and the hermit renewed their pathetic exhortations, the whole afsembly, as if impelled by an immediate infpiration, exclaimed with one voice, "It is the will of God! it is the will

Croifade.

* See Arabia, n^o 76.

Croifade. of God!" These words were deemed so memorable, and so much the effect of a divine impulse, that they were employed as the signal of rendezvous and battle in all future exploits of these adventurers. Men of all ranks now flew to arms with the utmost ardour, and a cross was affixed to their right shoulder by all who enlisted in this holy enterprize.

At this time Europe was sunk in the most profound ignorance and superstition. The ecclesiastics had gained the greatest ascendant over the human mind; and the people, who committed the most horrid crimes and disorders, knew of no other expiation than the observances imposed on them by their spiritual pastors.

But amidst the abject superstition which now prevailed, the military spirit had also universally diffused itself; and, though not supported by art or discipline, was become the general passion of the nations governed by the feudal law. All the great lords possessed the right of peace and war. They were engaged in continual hostilities with one another: the open country was become a scene of outrage and disorder: the cities, still mean and poor, were neither guarded by walls nor protected by privileges. Every man was obliged to depend for safety on his own force, or his private alliances; and valour was the only excellence which was held in esteem, or gave one man the pre-eminence above another. When all the particular superstitions, therefore, were here united in one great object, the ardour for private hostilities took the same direction; "and all Europe (as the princess Anna Comnena expresses herself), torn from its foundations, seemed ready to precipitate itself in one united body upon Asia."

All orders of men, now deeming the croifades the only road to heaven, were impatient to open the way with their swords to the holy city. Nobles, artisans, peasants, even priests, inrolled their names; and to decline this service was branded with the reproach of impiety or cowardice. The nobles who enlisted themselves were moved, by the romantic spirit of the age, to hope for opulent establishments in the East, the chief seat of arts and commerce at that time. In pursuit of these chimerical projects, they sold at the lowest price their ancient castles and inheritances, which had now lost all value in their eyes. The infirm and aged contributed to the expedition by presents and money; and many of them, not satisfied with this, attended it in person, being determined, if possible, to breath their last in sight of that city where their Saviour had died for them. Women themselves, concealing their sex under the disguise of armour, attended the camp; and commonly forgot their duty still more, by prostituting themselves to the army. The greatest criminals were forward in a service which they considered as an expiation for all crimes; and the most enormous disorders were, during the course of these expeditions, committed by men inured to wickedness, encouraged by example, and impelled by necessity. The multitude of adventurers soon became so great, that their more sagacious leaders became apprehensive lest the greatness of the armament would be the cause of its own disappointment. For this reason they permitted an undisciplined multitude, computed at 300,000 men, to go before them under the command of Peter

the hermit, and Gautier or Walter, surnamed the *moneyless*, from his being a soldier of fortune. These took the road towards Constantinople through Hungary and Bulgaria; and, trusting that heaven, by supernatural assistance, would supply all their necessities, they made no provision for subsistence in their march. They soon found themselves obliged to obtain by plunder what they vainly expected from miracles; and the enraged inhabitants of the countries through which they passed, attacked the disorderly multitude, and slaughtered them without resistance. The more disciplined armies followed after; and, passing the straits at Constantinople, they were mustered in the plains of Asia, and amounted in the whole to 700,000 men.

This rage for conquering the Holy Land did not cease with this expedition. It continued for very near two centuries, and eight different croifades were set on foot, one after another. The first was in the year 1096, as already observed. The princes engaged in it were, Hugo, count of Vermandois, brother to Philip I. king of France; Robert, duke of Normandy; Robert earl of Flanders; Raimond, earl of Toulouse and St Giles; Godfrey of Bouillon, duke of Lorraine, with his brothers Baldwin and Eustace; Stephen, earl of Chartres and Biois; Hugo, count of St Paul; with a great number of other lords. The general rendezvous was at Constantinople. In this expedition, the famous Godfrey besieged and took the city of Nice. The city of Jerusalem was taken by the confederated army, and Godfrey chosen king. The Christians gained the famous battle of Ascalon against the sultan of Egypt; which put an end to the first croifade.

The second croifade, in the year 1144, was headed by the emperor Conrad III. and Louis VII. king of France. The emperor's army was either destroyed by the enemy, or perished through the treachery of Manuel the Greek emperor; and the second army, through the unfaithfulness of the Christians of Syria, was forced to break up the siege of Damascus.

The third croifade, in the year 1188, immediately followed the taking of Jerusalem by Saladin the sultan of Egypt. The princes engaged in this expedition were, the emperor Frederic Barbarossa; Frederic duke of Suabia, his second son; Leopold duke of Austria; Berthold duke of Moravia; Herman marquis of Baden; the counts of Nassau, Thuringia, Miffen, and Holland; and above 60 other princes of the empire; with the bishops of Besançon, Cambray, Munster, Osnaburg, Miffen, Passau, Wisburg, and several others. In this expedition, the emperor Frederic defeated the sultan of Iconium: his son Frederic, joined by Gny Lusignan king of Jerusalem, in vain endeavoured to take Acre or Ptolemais. During which transactions, Philip Augustus king of France, and Richard II. king of England, joined the croifade; by which means the Christian army consisted of 200,000 fighting men: but great disputes happening between the kings of France and England, the former quitted the Holy Land, and Richard concluded a peace with Saladin.

The fourth croifade was undertaken, in the year 1202, by the emperor Henry VI. after Saladin's death. In this expedition the Christians gained several battles

against

Croifade.

Croifade. against the infidels, took a great many towns, and were in the way of success, when the death of the emperor obliged them to quit the Holy Land, and return into Germany.

The fifth croifade was published, by order of pope Innocent III. in 1198. Those engaged in it made fruitless efforts for the recovery of the Holy Land: for, though John de Neule, who commanded the fleet equipped in Flanders, arrived at Ptolemais a little after Simon of Montfort, Renard of Dampierre, and others; yet the plague destroying many of them, and the rest either returning or engaging in the petty quarrels of the Christian princes, there was nothing done; so that the foldan of Aleppo easily defeated their troops in 1204.

The sixth croifade began in 1228; in which the Christians took the town of Damietta, but were forced to surrender it again. The next year the emperor Frederic made peace with the foldan for 10 years. About 1240, Richard earl of Cornwall, and brother to Henry III. king of England, arrived in Palestine at the head of the English croifade; but finding it most advantageous to conclude a peace, he embarked, and steered towards Italy. In 1244, the Karasians being driven out of Persia by the Tartars, broke into Palestine, and gave the Christians a general defeat near Gaza.

The seventh croifade was headed by St Lewis, in the year 1249, who took the town of Damietta; but a sickness happening in the Christian army, the king endeavoured a retreat; in which being pursued by the infidels, most of his army were miserably butchered, and himself and the nobility taken prisoners. Then a truce was agreed upon for 10 years, and the king and lords set at liberty.

The eight croifade, in 1270, was headed by the same prince, who made himself master of the port and castle of Carthage in Africa; but dying in a short time, he left his army in a very ill condition. Soon after, the king of Sicily coming up with a good fleet, and joining Philip the Bold, son and successor of Lewis the king of Tunis, after several engagements with the Christians, in which he was always worsted, desired peace, which was granted upon conditions advantageous to the Christians; after which both princes embarked for their own kingdoms. Prince Edward of England, who arrived at Tunis at the time of this treaty, sailed towards Ptolemais, where he landed with a small body of 300 English and French, and hindered Bendocdar from laying siege to Ptolemais: but being obliged to quit the Holy Land to take possession of the crown of England, this croifade ended without contributing any thing to the recovery of the Holy land. In 1291, the town of Acre, or Ptolemais, was taken and plundered by the foldan of Egypt, and the Christians quite driven out of Syria. There has been no croifade since that time, though several popes have attempted to stir up the Christians to such an undertaking; particularly Nicholas IV. in 1292. and Clement V. in 1311.

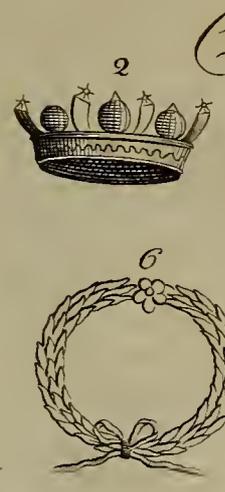

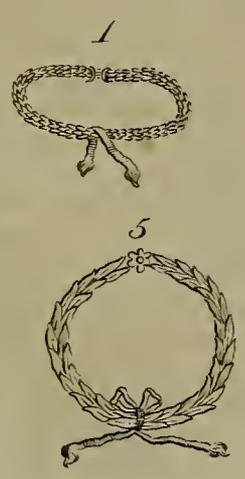

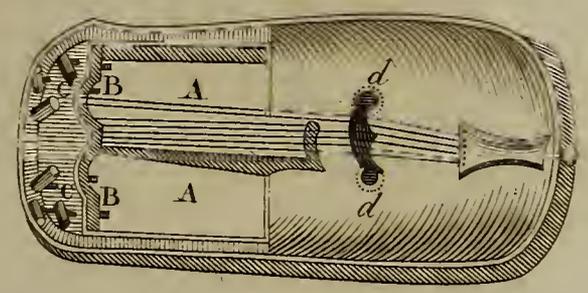

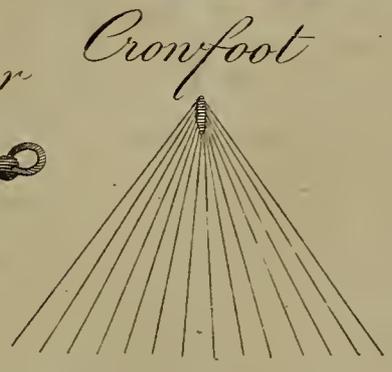

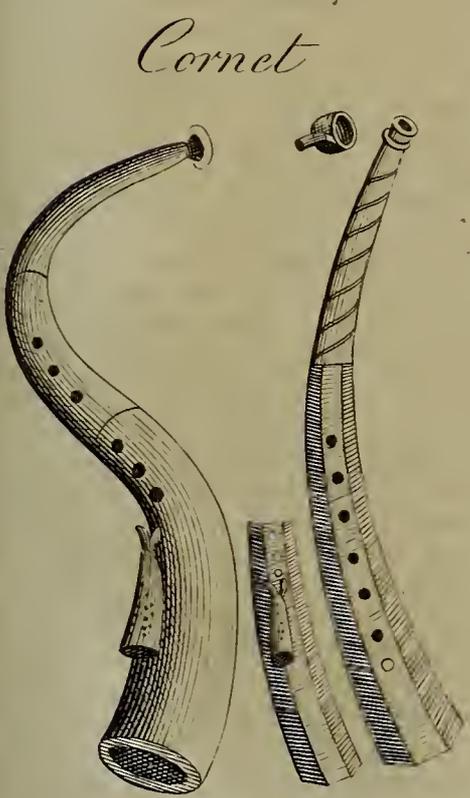

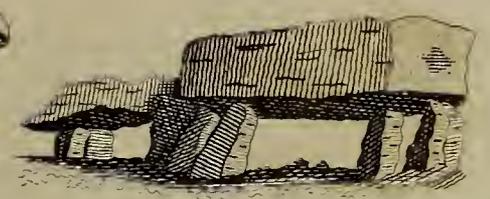

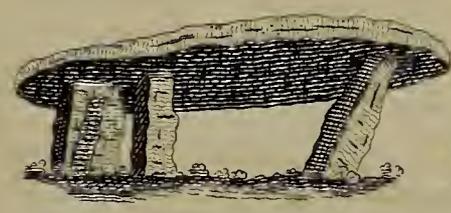

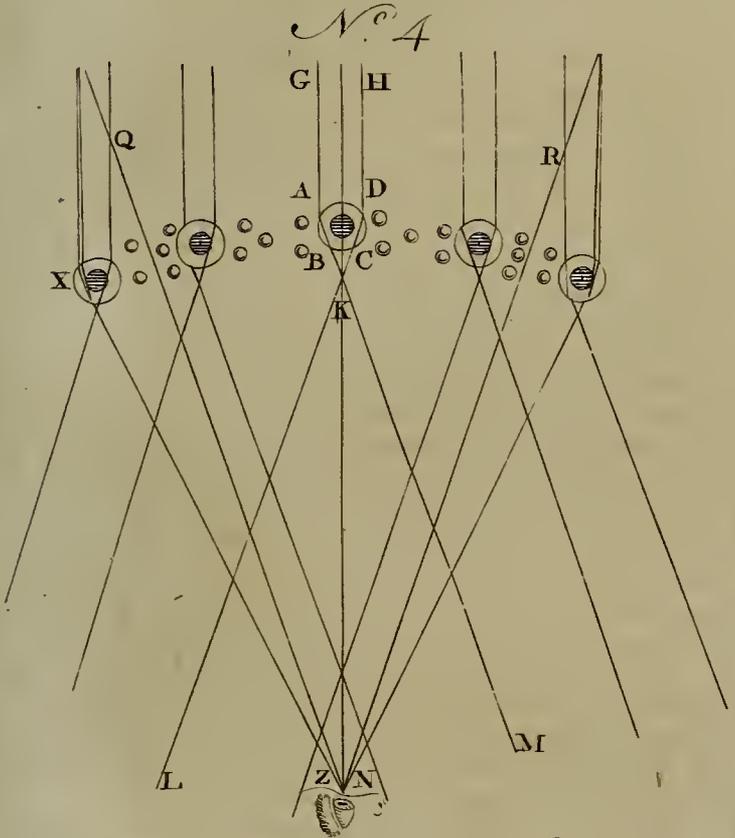

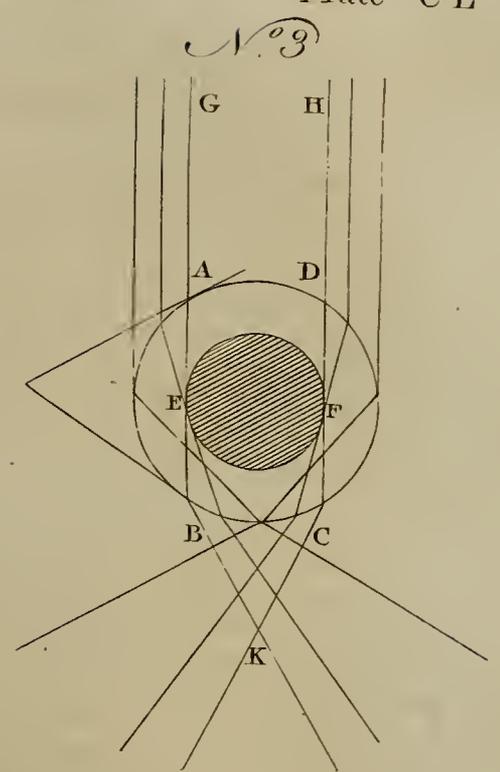

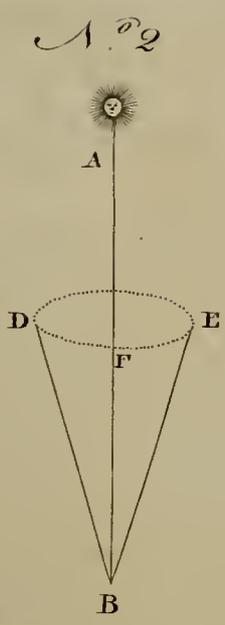

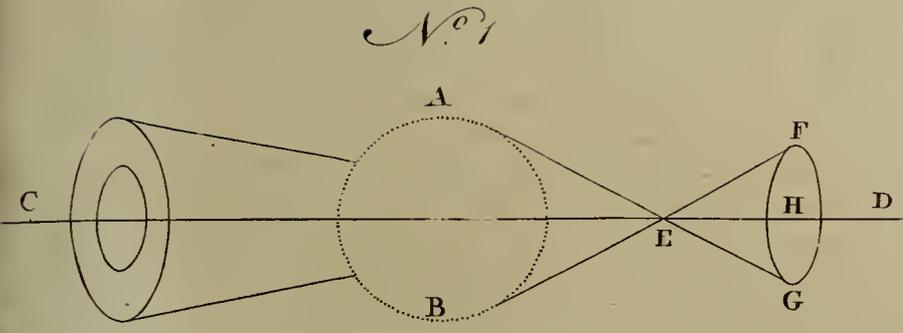

Though these croifades were effects of the most absurd superstition, they tended greatly to promote the good of Europe. Multitudes indeed were destroyed. M. Voltaire computes the people who perished in the different expeditions at upwards of two millions. Many there were, however, who returned; and these, ha-

ving conversed so long with people who lived in a much more magnificent way than themselves, began to entertain some taste for a refined and polished way of life. Thus the barbarism in which Europe had been so long immersed, began to wear off soon after this time. The princes also who remained at home, found means to avail themselves of the frenzy of the people. By the absence of such numbers of restless and martial adventurers, peace was established in their dominions. They also took the opportunity of annexing to their crown many considerable fiefs, either by purchase, or by the extinction of the heirs: and thus the mischiefs which must always attend feudal governments were considerably lessened.

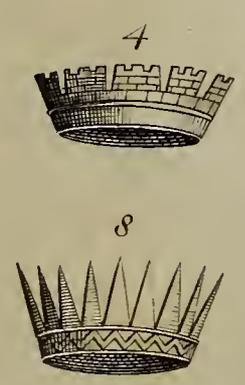

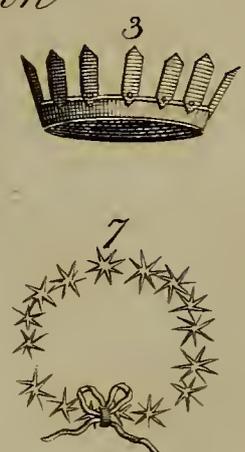

With regard to the bad success of the croifaders, it was scarce possible that any other thing could happen them. The emperors of Constantinople, instead of assisting, did all in their power to disconcert their schemes. They were jealous, and not without reason, of such an inundation of barbarians. Yet, had they considered their true interest, they would rather have assisted them, or at least stood neuter, than entered into alliances with the Turks. They followed the latter method, however, and were often of very great disservice to the western adventurers, which at last occasioned the loss of their city.* But the worst enemies the croifaders had, were their own internal feuds and dissensions. They neither could agree while marching together in armies with a view to conquest, nor could they unite their conquests under one government after they had made them. They set up three small states, one at Jerusalem, another at Antioch, and another at Edessa. These states, instead of assisting, made war upon each other, and on the Greek emperors; and thus became an easy prey to the common enemy. The horrid cruelties they committed also were such as must have inspired the Turks with the most invincible hatred against them, and made them resist with the greatest obstinacy. They were such as could have been committed only by barbarians inflamed with religious enthusiasm. When Jerusalem was taken, not only the numerous garrison were put to the sword, but the inhabitants were massacred without mercy and without distinction. No age nor sex was spared, not even sucking children. According to Voltaire, some Christians, who had been suffered by the Turks to live in that city, led the conquerors into the most private caves where women had concealed themselves with their children, and not one of them was suffered to escape. What eminently shows the enthusiasm by which these conquerors were animated, is their behaviour after this terrible slaughter. They marched over heaps of dead bodies towards the holy sepulchre; and while their hands were yet polluted with the blood of so many innocent persons, sung anthems to the common Saviour of mankind. Nay, so far did their religious enthusiasm overcome their fury, that these ferocious conquerors now burst into tears. If the absurdity and wickedness of this conduct can be exceeded by any thing, it must be by what follows. In the year 1204, the frenzy of croifading seized the children, who are ever ready to imitate what they see their parents engage themselves in. Their childish folly was encouraged by the monks and schoolmasters; and thousands of those innocents were conducted from

Croifade.

 them to the Turks, and the rest perished miserably.

CROISES, or CROIZES, in English antiquity, pilgrims bound for the Holy Land, or such as have been there; so called from a badge they wore in imitation of a cross. The knights of St John of Jerusalem, created for the defence and protection of pilgrims, were particularly called *croises*.

CROISIERS, a religious order founded in honour of the invention or discovery of the cross by the empress Helena. They are dispersed in several parts of Europe, particularly in the Low Countries, France, and Bohemia, those in Italy being at present suppressed. These religious follow the rule of St Augustine. They had in England the name of *crouched friars*.

CROIX (FRANCIS PETIS DE LA), secretary and interpreter to the king of France in the Turkish and Arabic languages, died November 4th 1695, in his 73d year; after having executed this employment for the space of 44 years. And it appears, that he executed it with as much integrity as abilities: for, when the Algerines sought for peace of Louis XIV. conditions were offered, by which they were required to reimburse to this monarch 600,000 franks. The terms being thought exorbitant, they had recourse to stratagem: and they offered a large sum to La Croix, who was the interpreter of all that passed, if he would put into the treaty "crowns of Tripoli," instead of "French crowns:" which would have made to the Algerines a difference of more than 100,000 livres. But the integrity of the interpreter triumphed over the temptation; which however was the greater, as it was next to impossible he should be discovered. Besides the Turkish and the Arabic, the Persian and the Tartarian, he also understood the Ethiopian and Armenian languages. He is well known to the learned world by many works. He translated the "History of France" into the Turkish language. He digested the three volumes of "Voyages into the East Indies" of M. Thevenot. He made an accurate catalogue of all the Turkish and Persian books which are in the king's library. He composed two complete Dictionaries for the French and Turkish languages; and, when he was dying, he was about to present the world with the history of Genghiscan. He undertook this history by the order of M. Colbert: for this minister, altogether intent upon aggrandizing his master, was accustomed every week to call together, either in the king's library or his own, certain of the learned, whom, according as they excelled in their several departments in literature, he constantly set to work. This history, which cost La Croix more than ten years labour, is useful, not only to the learned who are curious to know past events, or to geographers who had hitherto been greatly ignorant of Grand Tartary, but likewise to all who trade to China, Persia, or other eastern parts of the world. There is a good map of northern Asia drawn by M. de l'Isle, accompanying the work; which M. Petis de la Croix, the author's son, not only revised, but, to render it more curious, added to it an abridgement of the lives of all those authors from whom it was extracted. It was translated into English, and published at London, 1722, 8vo.

VOL. V.

CROMARTY, the capital of the shire of Cromarty, in Scotland, with an excellent and safe harbour capable of containing the greatest fleets. W. Long. Cromarty
 3. 40. N. Lat. 57. 54. Cromwell.

CROMLECH, in British antiquities, are huge, broad, flat stones, raised upon other stones set up on end for that purpose. They are common in ANGLESEY; under which article a very large one is described. See Plate CL.

These monuments are spoken of largely by Mr Rowland, by Dr Borlase, and by Wormius, under the name of *Ara* or altar. Mr Rowland, however, is divided in his opinion: for he partly inclines to the notion of their having been altars, partly to their having been sepulchres; he supposes them to have been originally tombs, but that in after times sacrifices were performed upon them to the heroes deposited within. Mr Keiller preserves an account of King Harold having been interred beneath a tomb of this kind in Denmark, and Mr Wright discovered in Ireland a skeleton deposited under one of them. The great similarity of the monuments throughout the north, Mr Pennant observes, evinces the same religion to have been spread in every part, perhaps with some slight deviations. Many of these monuments are both British and Danish; for we find them where the Danes never penetrated.

The cromlech, or cromleh, chiefly differs from the *Kist-vaen*, in not being closed up at the end and sides, that is, in not so much partaking of the chest-like figure; it is also generally of larger dimensions, and sometimes consists of a greater number of stones: the terms *cromlech* and *kist-vaen* are however indiscriminately used for the same monument. The term *cromlech* is by some derived from the Armoric word *crom*, "crooked or bowing," and *leh* "stone," alluding to the reverence which persons paid to them by bowing. Rowland derives it from the Hebrew words *carem-luach*, signifying a devoted or consecrated stone." They are called by the vulgar *coetne Arthor*, or *Arthur's quoits*, it being a custom in Wales as well as Cornwall to ascribe all great or wonderful objects to prince Arthur, the hero of those countries.

CROMWELL (Thomas), earl of Essex, was the son of a blacksmith at Putney, and born in 1498. Without a liberal education, but endowed with a strong natural genius, he considered travelling as a proper means of improving his understanding; and to this early token of his sound judgment he stood indebted for the high rank and distinguished honours he afterwards enjoyed. He became by degrees the confidential favourite and prime minister of Henry VIII.; and from the moment he acquired any authority in the cabinet, he employed it in promoting the reformation, to his zeal for which he became a victim; for, the more firmly to secure the Protestant cause, he contrived to marry the king to Ann of Cleves, whose friends were all Lutherans. Unfortunately Henry took a disgust to this lady, which brought on Cromwell's ruin: the king, with his usual cruelty and caprice, taking this opportunity to sacrifice this minister to the Roman Catholic party, to whom he seemed desirous of reconciling himself as soon as he had Catharine Howard in view. Cromwell was a great politician, and a good man; but like most statesmen, was guilty of great errors. In his zeal for the new reli-

4 B

gion,

Cromwell. gion, he had introduced the unjustifiable mode of attainting in cases of treason and heresy; and his enemies, who were numerous (consisting of two classes, the ancient nobility and gentry, who were enraged to see the highest honours bestowed on a man of his mean extraction, and the Roman Catholics, who detested him) having preferred many complaints against him, availed themselves of his own law. He was attainted of treason and heresy, convicted unheard, and beheaded in 1540. He was the chief instrument of the suppression of the abbey and monasteries, and of the destruction of images and relics; to him also we are indebted for the institution of parish registers of births, marriages, and burials.

CROMWELL (Oliver), styled *Lord Protector* of the commonwealth of England, one of the most extraordinary personages mentioned in history, was the son of Mr Robert Cromwell of Hinchinbrooke in the county of Huntingdon. His ancestors were of very honourable extraction: but no ways related to Thomas Cromwell earl of Essex, the prime minister and favourite of Henry VIII. He was born in the parish of St John, Huntingdon, where his father mostly lived, on the 24th or 25th of April 1599, and educated at the free-school of that town. Little is known concerning him in his younger years, or indeed concerning his behaviour in private life. It is, however, related by authors of unsuspected veracity, that when at school he gave many signs of a very turbulent and restless disposition. He is also said from his early years to have been subject to the hypochondriac disorder, and to many deceptions of the imagination. He had a very remarkable one while at school. It happened in the day time, when he was lying melancholy upon his back in bed. A spectre, as he thought, approached him, and told him that he should be the greatest man in the kingdom. His father, being informed of this, was very angry, and desired his master to correct him severely. This, however, produced no effect. Oliver persisted in the truth of his story and would sometimes mention it, though his uncle told him that it was too traitorous to be repeated."— From this school Oliver was removed to Sidney-college in Cambridge, where he was admitted in 1616. His progress in his studies is uncertain; but he spent much time in playing at foot-ball, cricket, and other robust exercises, at which he was very expert. His father dying after he had been about two years at college, Cromwell returned home; but the irregularity of his life, gave such offence to his mother, that, by the advice of some friends, she sent him to London, and placed him in Lincoln's-inn. This expedient by no means answered the purpose; her son gave himself up to gaming, wine, and women, so that he quickly dissipated all that was left him by his father. This dissipation, however, could be but of very short continuance; for he was married before he was 21 years of age, to Elizabeth daughter of Sir James Bouchier of Essex. Soon after his marriage he returned to the country, where he led a very grave and sober life. This sudden reformation has been ascribed to his falling in with the Puritans; but it is certain, that Mr Cromwell continued then, and for some time after, a zealous member of the church of England, and formed a close friendship with several eminent divines.

He continued at Huntingdon where he settled after Cromwell. his marriage, till an estate of between L. 400 and L. 500 *per annum* devolved to him by the death of his uncle Sir Thomas Stuart. This induced him to remove to the isle of Ely where the estate lay, and here he embraced the puritanical doctrines. He was elected a member of the third parliament of Charles I. which met on the 20th of January 1628; and was a member of the committee for religion, where he distinguished himself by his zeal against popery. After the dissolution of that parliament, he returned again into the country, where he continued to express much concern for religion, to keep company with silenced ministers, and to invite them often to lectures and sermons at his house. Thus he brought his affairs again into a very indifferent situation; so that, by way of repairing the breaches he made in his fortune, he took a farm at St Ives, which he kept five years. But this scheme succeeded so ill, that he was obliged to give it up; and at last, chagrined with his disappointments, and made uneasy by the treatment his party at that time received, he formed a design of going over to New-England. In this, however, he was disappointed; the king issued out a proclamation against all such emigrations, and Cromwell was obliged to remain in England against his will.

In 1638, Cromwell had first an opportunity of getting himself publicly taken notice of. The earl of Bedford, and some other persons of high rank, who had estates in the fen country, were very desirous of having it better drained; and though one project of this sort had failed, they set on foot another, got it countenanced by royal authority, and settled a part of the profits upon the crown. This, though really intended for a public benefit, was opposed as injurious to private property: and at the head of the opposers was Mr Oliver Cromwell, who had considerable influence in these parts. The vigour he showed on this occasion recommended him to his friend and relation Mr Hampden; who afterwards characterized him in parliament, as a person capable of contriving and conducting great designs. But for all this he was not very successful in his opposition; and as his private affairs were still declining, he was in very necessitous circumstances at the approach of the long parliament. In this critical situation he got himself elected member of parliament, in the following manner. In the puritanical meetings which he constantly frequented, Oliver had most eminently distinguished himself by his *gifts* of praying, preaching, and expounding. At one of these meetings, he met with one Richard Tims, a tradesman of Cambridge. This man was so much taken with Oliver, that he took it into his head to attempt getting him chosen burgess for the approaching parliament. Being himself one of the common-council, Tims imagined this design might be brought about; and with this view went to Mr Wildbore a relation of Cromwell's, to whom he communicated his intention. Wildbore agreed as to the fitness of the person; but told him the design was impracticable, because Oliver was not a freeman. Tims next addressed one Evert on the same subject, who also made the same objection. He recollected, however, that the mayor had a freedom to bestow, and a scheme was immediately laid for securing this freedom to Cromwell. On application

Cromwell. plication to the mayor, however, he told them that the freedom was already disposed of to another; but this objection being obviated by promising that person a freedom from the town, the mayor being informed that Cromwell was a man of great fortune, signified his intention of bestowing the freedom upon him. Our hero, being informed of the good offices of his friends, made his appearance in the court dressed in scarlet richly laced with gold, and having provided plenty of claret and sweatmeats, they were so freely circulated among the corporation, that Mr Mayor's freeman was unanimously declared to be a very civil worthy gentleman. When the election came on, the mayor discovered his mistake, but it was now too late; the party among the burgesses was strong enough to choose him, and accordingly did so at the election next year.

When Cromwell first came into parliament, he affected great plainness, and even carelessness, in his dress. His attention to farming had entirely rusticated him, so that he made a very uncouth appearance. "Who (says Dr South) that had beheld such a bankrupt, beggarly fellow, as Cromwell, first entering the parliament house, with a thread-bare torn coat and greasy hat, and perhaps neither of them paid for, could have suspected, that, in the space of so few years, he should, by the murder of one king, and the banishment of another, ascend the throne, be invested with the royal robes, and want nothing of the state of a king but the changing his hat into a crown?" Cromwell was very active in promoting the famous *Remonstrance**; which in reality laid the foundation of the civil war. He declared afterwards to Lord Falkland, that if the remonstrance had not been carried, he designed to have converted the small remains of his estate into ready money the next day, and to have left the kingdom by the first opportunity. His firmness on this occasion so effectually recommended him to Hampden, Pym, and the other leaders of the popular party, that they took him into all their councils; and here he acquired that clear insight into things, and that knowledge of men, of which he afterwards made such prodigious use. His exploits during the civil war, his murder of the king, and usurpation of the kingdom, are related under the article BRITAIN, n^o 139—188.

With regard to the character of Cromwell, Mr Hume expresses himself as follows: "The writers attached to this wonderful person make his character, with regard to abilities, bear the air of the most extravagant panegyric: his enemies form such a representation of his moral qualities as resembles the most virulent invective. Both of them, it must be confessed, are supported by such striking circumstances in his fortune and conduct, as bestow on their representation a great air of probability. 'What can be more extraordinary (it is said), than that a person of private birth and education, no fortune, no eminent qualities of body, which have sometimes, nor shining qualities of mind, which have often, raised men to the highest dignities, should have the courage to attempt, and the abilities to execute, so great a design as the subverting one of the most ancient as well as best established monarchies in the world? That he should have the power and boldness to put his prince and

master to an open and infamous death? Should banish that numerous and strongly allied family? Cover all these temerities under a seeming obedience to a parliament, in whose service he pretended to be retained? Trample too upon that parliament in their turn, and scornfully expel them as soon as they gave him ground of dissatisfaction? Erect in their place the dominion of the faints, and give reality to the most visionary idea which the heated imagination of any fanatic was ever able to entertain? Suppress again that monster in its infancy, and openly set himself up above all things that ever were called *sovereign* in England? Overcome first all his enemies by arms, and all his friends afterwards by artifice? Serve all parties patiently for a while, and afterwards command them victoriously at last? Over-run each corner of the three nations, and subdue with equal facility both the riches of the south, and the poverty of the north? Be feared and courted by all princes, and adopted a brother to the gods of the earth? Call together parliaments with a word of his pen, and scatter them again by the breath of his mouth? Reduce to subjection a warlike and discontented nation by means of a mutinous army? Command a mutinous army by means of seditious and factious officers? Be humbly and daily petitioned, that he would be pleased, at the rate of millions a-year, to be hired as master of those who had formerly hired him for their servant? Have the estates and lives of three nations as much at his disposal as was once the little inheritance of his father, and be as noble and liberal in the spending of them? And, lastly, (for there is no end of enumerating every particular of his glory), with one word bequeath all this power and splendor to his posterity? Die possessed of peace at home, and triumph abroad? Be buried among kings, and with more than regal solemnity? And leave a name behind him not to be extinguished but with the whole world; which, as it was too little for his praise, so it might have been for his conquests, if the short line of his mortal life could have stretched out to the extent of his immortal designs?"

"My intention is not to disfigure this picture drawn by so masterly a hand: I shall only endeavour to remove from it somewhat of the marvellous: a circumstance which, on all occasions, gives much ground for doubt and suspicion. It seems to me that the circumstance of Cromwell's life in which his abilities are principally discovered, is his rising, from a private station, in opposition to so many rivals, so much advanced before him, to a high command and authority in the army. His great courage, his signal military talents, his eminent dexterity and address, were all requisite for this important acquisition. Yet will not this promotion appear the effect of supernatural abilities, when we consider that Fairfax himself, a private gentleman, who had not the advantage of a seat in parliament, had, through the same steps, attained even to a superior rank; and, if endued with common capacity and penetration, had been able to retain it. To incite such an army to rebellion against the parliament, required no uncommon art or industry: to have kept them in obedience had been the more difficult enterprize. When the breach was once formed between the military and civil powers, a supreme and absolute authority, from that moment, is devolved on

* See *Bri-*
tain, n^o 107.

Cromwell. the general; and if he is afterwards pleased to employ artifice or policy, it may be regarded on most occasions as great condescension, if not as superfluous caution. That Cromwell was ever able really to blind or over-reach either the king or the republicans, does not appear: as they possessed no means of resisting the force under his command, they were glad to temporize with him; and, by seeming to be deceived, to wait for an opportunity of freeing themselves from his dominion. If he seduced the military fanatics, it is to be considered, that their interest and his evidently concurred; that their ignorance and low education exposed them to the grossest imposition; and that he himself was at bottom as frantic an enthusiast as the worst of them; and, in order to obtain their confidence, needed but to display those vulgar and ridiculous habits which he had early acquired, and on which he set so high a value. An army is so forcible, and at the same time so coarse a weapon, that any hand which wields it, may, without much dexterity, perform any operation, and attain any ascendant in human society.

“ The domestic administration of Cromwell, though it discovers great ability, was conducted without any plan either of liberty or arbitrary power: perhaps his difficult situation admitted of neither. His foreign enterprises, though full of intrepidity, were pernicious to the national interest; and seem more the result of impetuous fury or narrow prejudices, than of cool foresight and deliberation. An eminent personage, however, he was in many respects, and even a superior genius; but unequal and irregular in his operations: and, though not defective in any talent except that of elocution, the abilities which in him were most admirable, and which contributed most to his marvellous success, were the magnanimous resolution of his enterprises, and his peculiar dexterity in discovering the characters and practising on the weaknesses of mankind.

“ If we survey the moral character of Cromwell, with that indulgence which is due to the blindness and infirmities of the human species, we shall not be inclined to load his memory with such violent reproaches as those which his enemies usually throw upon it. Amidst the passions and prejudices of that time, that he should prefer the parliamentary to the royal cause, will not appear extraordinary; since even at present many men of sense and knowledge are disposed to think, that the question, with regard to the justice of the quarrel, may be regarded as doubtful and ambiguous. The murder of the king, the most atrocious of all his actions, was to him covered under a mighty cloud of republican and fanatical illusions; and it is not impossible but he might believe it, as many others did, the most meritorious action which he could perform. His subsequent usurpation was the effect of necessity, as well as of ambition; nor is it easy to see how the various factions could at that time have been restrained without a mixture of military and arbitrary authority. The private deportment of Cromwell as a son, a husband, a father, a friend, is exposed to no considerable censure, if it does not rather merit praise. And, upon the whole, his character does not appear more extraordinary and unusual by the mixture of so much absurdity with so much penetration, than by his temper-

ing such violent ambition and such enraged fanaticism Cromwell. with so much regard to justice and humanity.”

That Cromwell continued a most complete and bigotted enthusiast to the very last, appears from his behaviour in his last sickness. His disease, which at first was a kind of slow fever, brought on by the cares and anxiety of his mind, soon degenerated into a tertian ague. For about a week the disorder continued without any dangerous symptoms, inasmuch that every other day he walked abroad; but one day after dinner his five physicians coming to wait upon him, one of them having felt his pulse, said that it intermitted. At this Cromwell was surprised, turned pale, fell into a cold sweat, and, when he was almost fainting, ordered himself to be carried to bed; where, by the assistance of cordials, being brought a little to himself, he made his will with respect to his private affairs. The next morning when one of his physicians came to visit him, Cromwell asked him, why he looked so sad? and when answer was made, that so it became every one who had the weighty charge of his life and health upon him, “ Ye physicians (says Cromwell), think I shall die: I tell you I shall not die this bout, I am sure of it. Do not you think (said he to the physician, looking more attentively at him), do not think that I am mad: I speak the words of truth upon surer grounds than your Hippocrates or Galen can furnish you with. God Almighty himself hath given that answer, not to my prayers alone, but also to the prayers of those who entertain a stricter commerce and greater interest with him. Go on cheerfully, banishing all sadness from your looks; and deal with me as you would do with a fervent man. Ye may have a skill in the nature of things; yet nature can do more than all physicians put together, and God is far more above nature.” As this physician was coming out of the chamber, he accidentally met with another, to whom he expressed his fear that the protector was turning light-headed. But the other informed him that the chaplains, being dispersed the preceding night into different parts of the house, had prayed for the protector's recovery, and unanimously received for answer that he should recover. Nay, to such a degree of madness did they at last arrive, that, a public fast being kept at Hampton-court, they did not so much pray to God for the protector's health, as return thanks for the undoubted pledges they had of his recovery. On this account, though the physicians perceived his distemper increasing every hour, they took no notice of his danger, till it became necessary for him to appoint a successor while he had any breath remaining. But being then in a lethargic fit, he answered from the purpose; upon which he was again asked whether he did not name his eldest son Richard? and to this question he answered. Yes. Being then asked where his will was which he had formerly made concerning the heirs of the kingdom; he sent to look for it in his closet and other places, but in vain; for somebody had either stole it, or he himself had burnt it. Soon after, he expired, on the 3d of September 1658, aged somewhat more than 59 years and four months. This day of September he had always reckoned to be the most fortunate for him in the whole year. A violent tempest, which immediately succeeded his death, served as a subject of discourse to the vulgar. His partizans, as well as his opponents, were

Cromwell. were fond of remarking this event: and each of them endeavoured, by forced inferences, to interpret it as best suited their particular prejudices.

It has been imagined by some, that Oliver Cromwell was poisoned; but for this there seems to be no reasonable foundation. His body was opened by Dr Bates. He found the brain somewhat overcharged with blood, and the lungs a little inflamed; but what he reckoned to have been the principal cause of his disorder was a total degeneracy of the substance of the spleen into a matter resembling the lees of oil. This, he thought, also accounted for the hypochondriac dispositions to which Cromwell had from his infancy been subject. Though the bowels were taken out, and the body filled with spices wrapped in a fourfold cere-cloth, put first into a coffin of lead, and then into one of wood, yet the corruption was so great that the humour wrought itself through the whole, and there was a necessity of interring the body before the solemnity of the funeral. A very pompous funeral was ordered at the public expence, and performed from Somerset-house, with a splendor not only equal but superior to that bestowed upon crowned heads. Some have related that his body was deposited in Naseby-field: others, that it was wrapped in lead, and sunk in the deepest part of the Thames, to prevent any insult that might afterwards be offered to it. But it seems beyond doubt that his body was interred at Westminster; as we are informed, that on the order to disinter him after the restoration, his corpse was found in a vault in the middle aisle of Henry VII.'s chapel. In the inside of the coffin, and on the breast of the corpse, was laid a copper plate finely gilt, inclosed in a thin case of lead. On one side of this plate were engraven the arms of England impaled with those of Oliver, and on the reverse the following legend: *Oliverius Protector Reipublicæ Angliæ, Scotiæ, et Hiberniæ, natus 25 Aprilis 1599, inauguratus 16 Decembris 1653, mortuus 3 Septembris ann. 1658, hic situs est.*

Cromwell was of a robust frame of body, and of a manly, though not agreeable aspect. His nose being remarkably red and shining, was often made the subject of ridicule. He left only two sons, Richard and Henry; and three daughters; one married to General Fleetwood, another to Lord Fauconberg, and a third to Lord Rich. His mother lived till after he was protector; and contrary to her orders he buried her with great pomp in Westminster Abbey. She could not be persuaded that ever his power or his person was in safety. At every noise she heard she would exclaim that her son was murdered; and was never satisfied that he was alive if she did not receive frequent visits from him. She was a decent woman; and by her frugality and industry had raised and educated a numerous family upon a small fortune. She had even been obliged to set up a brewery at Huntingdon, which she managed to good advantage. Hence Cromwell, in the invectives of that age, is often stigmatized with the name of brewer. Ludlow, by way of insult, mentions the great accession which he would receive to his royal revenues upon his mother's death, who possessed a jointure of 60 pounds a-year upon his estate. She was of a good family, of the name of Stuart; and is by some supposed to have been remotely allied to the royal family.

CROMWELL (Richard), eldest son of Oliver Cromwell, was by his father appointed successor to the protectorship, but very soon deposed by the army*. They discharged his debts, took all the household stuff, plate, &c. gave him a protection for six months, and so he retired. He was by no means qualified to support the station gained by the aspiring talents of his father. He was of a moderate temper, and untainted with that fanatical spirit which his father had so successfully cultivated. On the restoration he went abroad; but returned in 1680 under the assumed name of Clark, and settled at Cheshunt in Hertfordshire, where he lived privately, and died in 1712, aged 86.

CRONENBURG, a town of Germany, in the circle of the upper Rhine, and in the landgravate of Hesse Cassel, with a strong castle. It is seated at the foot of a high mountain, on a fertile soil, and is surrounded with a double wall. E. Long. 8. 15. N. Lat. 50. 15.

CRONENBURG, a strong fortress of Denmark, in the isle of Zealand, at the entrance of the Sound, where the Danes take toll of such ships as are bound for the Baltic. It was very richly furnished, but pillaged by the Swedes in 1658, who took away the furniture, among which were some statues of massy silver. It is built upon piles. E. Long. 12. 50. N. Lat. 56. 0.

CRONIUS, in chronology, the ancient name of the Athenian month Hecatombæon; which was the first of their year, and answered to the latter part of our June and beginning of July.—There were feasts called *Croniones* celebrated at Athens in this month, in honour of Saturn, answering to the Saturnalia of the Romans.

CRONSLLOT. See CRONSTADT.

CRONSTADT, a sea-port town of Russia, where the greatest part of the navy is situated. It stands upon the island of Retufari, in the Gulf of Finland; and was founded by Peter I. as being provided with the safest harbour in these parts, and as forming a strong bulwark by sea for the defence of the new metropolis. The only passage by which ships of burden can approach Petersburg lies on the south side of Retufari, through a narrow channel; one side whereof is commanded by Cronstadt, and the opposite by Cronslot and the citadel. Cronslot, which stands upon a small island of sand, is a circular wooden building, and surrounded with fortifications of wood that jut into the water. It contains a garrison of 100 men. The citadel is another small wooden fortress, constructed also upon an adjacent sand-bank, and capable of holding about 30 soldiers. All large vessels must sail between Cronstadt and these two fortresses exposed to the fire of the opposite batteries; for the other parts of the gulf are only from one to eleven feet in depth. All these fortifications were, at the time of their construction, esteemed places of considerable strength; but now they derive their consequence more from their past importance than from any resistance they could make against the attack of a powerful fleet.

Cronstadt is built upon the south-eastern extremity of the island, and is defended towards the sea by wooden piers projecting into the water, and towards the land by ramparts and bastions. It is a very straggling place; and occupies, like all the Russian towns, a larger space of ground than the number of habitations,

Crofs.

tions seem to require; the houses are mostly of wood, excepting a few fronting the harbour, which are of brick stuccoed white. Among the latter are the imperial hospital for sailors, the barracks, and the academy for marines and officers of the navy. That seminary usually contains between three and four hundred cadets, who are clothed, maintained, and taught at the expence of the crown. They are admitted at the age of five, and are suffered to remain until they reach their seventeenth year. They learn accounts, mathematics, drawing, fortification, and navigation; and have masters in the French, German, English, and Swedish languages. They are trained to naval affairs, and make an annual cruise in the Baltic as far as Revel.—Cronstadt has a separate haven appropriated to the men of war, and another to merchant ships. Close to the haven for merchant ships is a canal and several dry docks, begun in 1719 by Peter I. for the purpose of refitting the men of war. This useful work was neglected under his successors, and was not completed until the reign of his daughter Elizabeth. It has been still further beautified and improved by the present empress; and is now applied for building as well as careening ships of the line. At the extremity of these docks is a great reservoir, 568 feet in length, which contains water sufficient, and half the quantity over, to supply all the docks; which is pumped into it by means of a fire engine, the diameter of whose cylinder is six feet. The length of this work, from the beginning of the canal to the end of the last dock, is 4221 feet. The sides of the docks are faced with stone, and the bottom is paved with granite. They are 40 feet deep and 150 broad; and are capable of containing nine men of war upon the stocks.

CRONSTAT, a town of Transylvania, near the frontiers of Moldavia, subject to the house of Austria. E. Long. 25. 0. N. Lat. 47. 0.

CROP, the highest part or end of any thing cut off. It is particularly used for the corn gathered off a field in harvest. See AGRICULTURE, Part II.

CROSIER, or CROZIER, a shepherd's crook; a symbol of pastoral authority, consisting of a gold or silver staff, crooked at the top, carried occasionally before bishops and abbots, and held in the hand when they give the solemn benedictions. The custom of bearing a pastoral staff before bishops is very ancient, as appears from the life of St Cæsarea of Arles, who lived about the year 500. Among the Greeks none but the patriarchs had a right to the crosier. The crosiers were at first no more than simple wooden staves in form of a T, used to rest and lean upon. By degrees they were made longer; and at length arrived to the form we now see them of. Regular abbots are allowed to officiate with a mitre and crosier.

CROSIER, in astronomy, four stars in the southern hemisphere, in the form of a cross, serving those who sail in south latitudes to find the antarctic pole.

CROSLET, in heraldry, is when a cross is crossed again at a small distance from each of the ends. Upton says it is not so often borne by itself in arms as other crosses are, but often in diminutives, that is, in small crosslets scattered about the field. See HERALDRY.

CROSS, a gibbet made with two pieces of wood placed crosswise, whether they cross with right angles

at the top like a T, or in the middle of their length like an X. The cross to which our Saviour was fastened, and on which he died, was of the former kind; being thus represented by old monuments, coins, and crosses; and St Jerom compares it to a bird flying, a man swimming, or praying with his arms extended. The punishment of the cross was common among the Syrians, Egyptians, Persians, Africans, Greeks, Romans, and Jews.

The death of the cross was the most dreadful of all others, both for the shame and pain of it; and so scandalous, that it was inflicted as the last mark of detestation upon the vilest of people. It was the punishment of robbers and murderers, provided that they were slaves too; but otherwise, if they were free, and had the privileges of the city of Rome, this was then thought a prostitution of that honour, and too infamous a punishment for such a one, let his crimes be what they would.

The Mosaic law ordained, that the persons executed should not be left upon the tree after sun-set, because he that is hanged in this manner is accursed of God. Dent. xxi. 22. The Jews believe, that the souls of those who remain upon the gibbet, and without burial, enjoy no peace, and receive no benefit from the prayers of other people; but wander up and down till their bodies are buried: which agrees with the notions that the Greeks and Romans had of this matter, as may be seen in *Hom. II. 4.* and *Virg. Æneid. 6.*

The form of a cross being such as has been already described, the body of the criminal was fastened to the upright piece by nailing the feet to it, and on the other transverse piece generally by nailing the hands on each side. Now, because these parts of the body, being the instruments of action and motion, are provided by nature with a much greater quantity of nerves than others have occasion for; and because all sensation is performed by the spirit contained in these nerves; it will follow, as Stanhope observes, that wherever they abound, the sense of pain must needs in proportion be more quick and tender.

The Jews confess, that indeed they crucified people in their nation, but deny that they inflicted this punishment upon any one alive. They first put them to death, and then fastened them to the cross either by the hands or neck. But there are indisputable proofs of their crucifying men frequently alive. The worshippers of Baal-peor and the king of Ai were hung up alive; as were also the descendants of Saul, who were put into the hands of the Gibeonites, 2 Sam. xxi. 9.

Before crucifixion the criminal was generally scourged with cords: sometimes little bones, or pieces of bones, were tied to these scourges, so that the condemned person might suffer more severely. It was also a custom, that he who was to be crucified should bear his own cross to the place of execution. After this manner we find Christ was compelled to bear his own cross; and as he sunk under the burden, Simon the Cyrenian was constrained to bear it after him and with him. But whereas it is generally supposed that our Lord bore the whole cross, *i. e.* the long and transverse part both, this seems to be a thing impossible; and therefore Lipsius (in his treatise *De Supplicio Crucis*) has set the matter in a true light, when he tells us that

Jesus

Cross.

Cros.

Jesus only carried the transverse beam; because the long beam, or the body of the cross, was either fixed in the ground before, or made ready to be set up as soon as the prisoner came: and from hence he observes, that painters are very much mistaken in their description of our Saviour carrying the whole cross.

There were several ways of crucifying; sometimes the criminal was fastened with cords to a tree, sometimes he was crucified with his head downwards. This way St Peter chose out of respect to his master Jesus Christ, not thinking himself worthy to be crucified like him; though the common way of crucifying was by fastening the criminal with nails, one through each hand, and one through both feet, or one through each of them: for this was not always performed in the same manner; the ancients sometimes representing Jesus Christ crucified with four nails, and sometimes with three. The criminal was fixed to the cross quite naked; and in all probability the Saviour of the world was not used with any greater tenderness than others upon whom this punishment was inflicted. The soldiers divided his cloths among them, and cast lots for his tunic, which is an under garment worn over the flesh like a shirt.

The text of the Gospel shows clearly, that Jesus Christ was fastened to the cross with nails; and the Psalmist (xxxii. 17.) had foretold long before, that they should pierce his hands and his feet: but there are great disputes concerning the number of these nails. The Greeks represent our Saviour as fastened to the cross with four nails; in which particular Gregory of Tours agrees with them, one at each hand and foot. But several are of opinion, that our Saviour's hands and feet were pierced with three nails only, viz. one at each hand, and one through both his feet: and the custom of the Latins is rather for this last opinion; for the generality of the old crucifixes made in the Latin church have only three nails. Nonnus thinks that our Saviour's arms were besides bound fast to the cross with chains; and St Hilary speaks of the cords wherewith he was tied to it.

Sometimes they who were fastened upon the cross lived a good while in that condition. St Andrew is believed to have continued three days alive upon it. Eusebius speaks of certain martyrs in Egypt who were kept upon the cross till they were starved to death. Pilate was amazed at Jesus Christ's dying so soon; because naturally he must have lived longer, if it had not been in his power to have laid down his life and to take it up again. The thighs of the two thieves who were crucified together with our Saviour were broken in order to hasten their death, that their bodies might not remain upon the cross on the Sabbath day (John xix. 31, 32, 33.), and to comply with the law of Moses, which forbids the bodies to be left there after sun-set. But among other nations they were suffered to remain upon the cross a long time. Sometimes they were devoured alive by birds and beasts of prey. Guards were appointed to observe that none of their friends or relations should take them down and bury them. The story of the Ephesian matron and the soldier who was set to guard the cross, is very well known. The Roman soldiers who had crucified Jesus Christ and the two thieves continued near the crosses till the bodies were taken down and buried.

Crosses were usually, in former times, erected on

the tops of houses, by which tenants pretended to claim the privileges of the Templars Hospitallers, to defend themselves against their rightful lords. This was condemned by the statute Wil. II. c. 37. It was usual also, in those days, to set up crosses in places where the corpse of any of the nobility rested as it was carried to be buried, that a *transseuntibus pro ejus animo deprecetur*. Crosses, &c. are forbidden, to be brought into England by 13 Eliz. c. 2. on pain of a *præmunire*, &c.

Invention of the Cross, an ancient feast, solemnized on the 3d of May, in memory of St Helena's (the mother of Constantine) finding the true cross of Christ deep in the ground on mount Calvary; where she erected a church for the preservation of part of it: the rest being brought to Rome and repositied in the church of the Holy Cross of Jerusalem.

Theodoret mentions the finding of three crosses; that of Jesus Christ and those of the two thieves; and that they distinguished between them by means of a sick woman, who was immediately healed by touching the true cross. The place is said to have been pointed out to her by St Quiriacus, then a Jew, afterwards converted and canonized.

Exaltation of the Cross, an ancient feast, held on the 14th of September, in memory of this, that Heraclitus restored to mount Calvary the true cross in 642, which had been carried off 14 years before by Cosroes, king of Persia, upon his taking Jerusalem from the emperor Phocas.

The adoration of the cross appears to have been practised in the ancient church; inasmuch as the Heathens, particularly Julian, reproach the primitive Christians with it. And we do not find that their apologists disclaimed the charge. Mornay, indeed, asserted, that this had been done by St Cyril, but could not support his allegation at the conference of Fontainebleau. St Helena is said to have reduced the adoration of the cross to its just principle, since she adored in the wood, not the wood itself, which had been direct idolatry and Heathenism, but him who had been nailed to this wood. With such modifications some Protestants have been induced to admit the adoration of the cross. John Hufs allowed of the phrase, provided it were expressly added, that the adoration was relative to the person of Christ. But however Roman Catholics may seem to triumph by virtue of such distinction and mitigations, it is well known they have no great place in their own practice. Imbert, the good prior of Gascony, was severely prosecuted in 1683 for telling the people, that in the ceremony of adoring the cross, practised in that church on Good Friday, they were not to adore the wood, but Christ, who was crucified on it. The curate of the parish told them the contrary; it was the wood! the wood! they were to adore. Imbert replied, it was Christ, not the wood: for which he was cited before the archbishop of Bourdeaux, suspended from his functions, and even threatened with chains and perpetual imprisonment. It little availed him to cite the bishop of Meaux's distinction; it was answered, that the church allowed it not.

Cross-Bearer (*port-croix*, *cruciger*), in the Romish church, the chaplain of an archbishop or a primate, who bears a cross before him on solemn occasions.

The pope has the cross borne before him every where; a patriarch any where out of Rome; and pri-

Cros.

mates,

Cros.

mates, metropolitans, and those who have a right to the pallium, throughout their respective jurisdictions.

Gregory XI. forbade all patriarchs and prelates to have it borne in presence of cardinals. A prelate bears a single cross, a patriarch a double cross, and the pope a triple one on their arms.

Cross-Bearers also denote certain officers in the inquisition, who make a vow before the inquisitors or their vicars to defend the Catholic faith, though with the loss of fortune and life. Their business is to provide the inquisitors with necessaries. They were formerly of great use: but in process of time some of their constitutions were changed, and they were called of the penance of St Dominic.

Pectoral Cross, is a cross of gold or silver, or other precious materials, often enriched with diamonds, which the bishops, archbishops, &c. and regular abbesses, wear hanging from the neck.

Order of the Cross, or *Croisade*, an order of ladies instituted in 1668 by the empress Eleonora de Gonzaga, wife of the emperor Leopold; on occasion of the miraculous recovery of a little golden cross, wherein were inclosed two pieces of the true cross, out of the ashes of part of the palace. It seems the fire had burnt the case wherein it was inclosed, and melted the crystal, yet the wood remained untouched.

Maids of the Cross, a community of young women instituted in 1265 at Roye in Picardy, and since dispersed to Paris and other towns. They instruct young persons of their own sex. Some take the three vows of poverty, chastity, and obedience, others retain their liberty. They are under the direction of a superior.

Cross, in heraldry, is defined by Guillim, an ordinary composed of fourfold lines: whereof two are perpendicular, and the other two transverse; for so we must conceive of them, though they be not drawn throughout, but meet by couples, in four right angles, near the fesspoint of the escutcheon. See *HERALDRY*.

This bearing was first bestowed on such as had performed, or at least undertaken, some service for Christ, and the Christian profession; and is held by divers the most honourable charge in all heraldry. What brought it into such frequent use, was the ancient expeditions into the Holy Land; and the holy war pilgrims, after their pilgrimage, taking the cross for their cognizance; and the ensign of that war being the cross. In those wars, says Mackenzy, the Scots carried St Andrew's cross; the French a cross argent; the English a cross or; the Germans, sable; the Italians, azure; the Spaniards, gules.

St George's Cross, or the red cross, in a field argent, is now the standard of England; that saint being the reputed patron of that nation.

Nor is it only in crosses that the variety is so great; the like is found in many other bearings, and particularly in lions, and the parts of them; whereof Colombier gives us no less than 96 varieties. Leigh mentions but 46 several crosses; Sylvanus Morgan, 26; Upton, 30; Johannes de Bado Aureo, 12; and so others, whom it is needless to mention. Upton owns he dares not presume to ascertain all the various crosses used in arms, for that they are at present almost innumerable; and therefore he only takes notice of such as he had seen used in his own time.

Cros.

Cross, in mining, two nicks cut in the superficies of the earth, thus +, which the miners make when they take the ground to dig for ore. This cross gives the miners three days liberty to make and to set on stones. As many of these crosses as the miner makes, so many mears of ground he may have in the vein, provided he set on stones within three days after making his cross or crosses. But if he make but one cross, and a stander-by makes the second, and a stranger makes the third, every one is served with the next mear, according as they have first or last, sooner or later, made their cross or crosses upon the ground.

Cross, in coins, a name given to the right side or face, the other being called the *pile* or *reverse*. It has been a common error, that the reverse was meant by the cross; because at this time in Britain, it is marked with figures disposed in that form; but the stamping the head of the prince in Britain on the right side of the coin, was preceded by a general custom of striking on that part the figure of a cross; while the other, called the *pile*, contained the arms, or some other device.

Cross, instead of a signature to a deed, &c. is derived from the Saxon practice of affixing the sign of the cross, whether they could write or not.

Cross-Bar Shot, a bullet with an iron bar passing through it, and standing six or eight inches out at both sides. It is used at sea for destroying the enemy's rigging.

Cross-Bill, in ornithology. See *LOXIA*.

Cross-Bill, in chancery, is an original bill, by which the defendant prays relief against the plaintiff.

Cross-Bows. See *BOWS* and *ARCHERY*.

Cross-grained Stuff, in joinery. Wood is said to be cross-grained, when a bough or branch has shot out of it; for the grain of the branch shooting forward, runs athwart that of the trunk.

In wood well grown this defect is scarce perceivable; except in working; but in deal-boards these boughs make knots. If the bough grew up with the young trunk, instead of a knot is found a curling in the stuff, very sensible under the plane.

Cross-Jack, pronounced *cro-jeck*, a sail extended on the lower yard of the mizen-mast, which is hence called the *cross-jack yard*. This sail, however, has generally been found of little service, and is therefore very seldom used.

Cross-Piece, a rail of timber extended over the windlass of a merchant-ship from the knight-heads to the belfry. It is stuck full of wooden pins, which are used to fasten the running rigging as occasion requires. See *WINDLASS*.

Cross-Tining, in husbandry, a method of harrowing land, consisting in drawing the harrow up the interval it went down before, and down that which it was drawn up.

Cross-Trees, certain pieces of timber, supported by the cheeks and trestle-trees, at the upper ends of the lower masts, athwart which they are laid to sustain the frame of the top.

Cross-Tree Yard, is a yard standing square, just under the mizen-top, and to it the mizen-top is fastened below. See *Cross-Jack*.

Cross-Wort, in botany. See *VALENTIA*.

Ordeal of the Cross, a species of trial frequently practised in the days of superstition. See *ORDEAL*.

CROSS.

Cross
||
Crotalum.

CROSS, an English artist, famous only for copying, in the reigns of Charles I. and Charles II. Of this talent there is a story current, more to the credit of his skill than of his probity. He is said to have been employed by Charles I. to copy the celebrated Madona of Raphael in St Mark's church at Venice; and that, having obtained leave of the state for that purpose, he executed his piece so well as to bring away the original and leave his copy in the place of it. The deception was not detected until it was too late to recover the loss; and this piece was bought in Oliver's time by the Spanish ambassador for his master, who placed it in the Escorial.

CROSSEN, a handsome town of Silesia in Germany, and capital of a principality of the same name. It is situated at the confluence of the rivers Bobar and Oder, in a fertile country abounding in wine and fruits. There is a bridge over the Oder which is fortified. E. Long. 15. 20. N. Lat. 52. 5.

CROSSOSTYLUS, in botany: A genus of the polyandria order belonging to the monadelphia class of plants. The calyx is a quadrangular, quadrifid, turbinated perianthium: the corolla consists of four elliptical petals; the stamina are 20 filiform filaments, almost the length of the calyx; the antheræ small and roundish; the pericarpium an hemispherical, unilocular berry, with many striæ on its upper part; the seeds numerous and roundish.

CROTALARIA, **RATTLE-WORT**: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The legumen is turgid, inflated, and pedicellated; the filaments are coalited with a fissure on the back. There are 11 species, all of them natives of warm climates. They rise from 18 inches to 5 feet in height, and are adorned with flowers of a blue or yellow colour. The most remarkable species is the *retusa*, with simple oblong wedged leaves. It is a native of the island of Ceylon and some other parts of the East Indies. The flowers are yellow, the pods smooth, cylindrical, inflated, and placed horizontally: they are filled with seeds, which, when dried, and shaken by the slightest wind, emit a rattling noise: and this, by the rude inhabitants of the countries where the plant is native, is attributed to the devil, who is thought to deliver his oracles in this whimsical manner.

CROTALO, an instrument of military music, like that described in the next article. The Turks are the first, among the moderns, who introduced the use of it for their troops. It is now common in Flanders and Florence, and other territories on the continent. It has only one tone; but its effect in marking time may be distinctly heard through the noise of forty drums. This is the same instrument with the ancient cymbalum.

CROTALUM, an ancient kind of castagnetta, or musical instrument, found on medals, in the hands of the priests of Cybele. The crotalum differed from the sistrum; though authors frequently confound the two. It consisted of two little brass plates or rods, which were shaken in the hand, and in striking against each other made a noise.

It was sometimes also made of a reed split length-

wise; one part whereof they struck against the other; and as this made a noise somewhat like that of a crane's bill, they called that bird *crotalifria*, a player on the crotala; and Aristophanes calls a great talker a *crotalum*.

Clemens Alexandrinus attributes the invention to the Sicilians; and forbids the use thereof to the Christians, because of the indecent motions and gestures that accompany it.

CROTALUS, or **RATTLE-SNAKE**, in zoology, a genus belonging to the order of amphibia serpentes; the characters of which are these: the belly is furnished with scuta, and the tail has both scuta and scales; but the principal characteristic of this genus is the rattle at the end of the tail. The rattles consist of several articulated crustaceous, or rather horny, bags, which make a considerable rattling noise when the creature moves, and serves to warn people of their approach. There are five species; and the bite of every one of them is so highly poisonous, that it generally kills in a short time. Of these we have no account that can be depended upon, except that given by Mr Catesby of the horridus, or American rattle-snake. This grows sometimes to the length of 8 feet, and weighs between 8 and 9 pounds. The colour of the head is brown; the eye red; the upper part of the body of a yellowish-brown colour, transversely marked with irregular broad black lists. The rattle is of a brown colour, composed of several horny, membranous, cells, of an undulated pyramidal figure. These are articulated within one another in such a manner that the point of the first cell reaches as far as the basis of the protuberant ring of the third, and so on; which articulation, being very loose, gives liberty to the parts of the cells that are inclosed within the outward rings to strike against the sides of them, and so to cause the rattling noise which is heard when the snake shakes its tail. This is the most inactive and slow moving of all the snakes, and is never the aggressor except in what it preys upon. The above gentleman is of opinion that no remedy is yet discovered for the bite of this animal. He had frequently access to see Indians bit by it; and always thought that those who recovered were cured more through the force of nature, or by reason of the slightness of the bite, than by the remedies used. He tells us that the Indians know their destiny the moment they are bit; and if the bite happens to be on any of the large veins, they apply no remedies, as knowing them to be entirely useless. He believes the reports of the fascinating power of this serpent, though he never had an opportunity of seeing it. See the article **POISON** and **SERPENT**.

CROTALYSTRÆ, in antiquity, a kind of morrice dancers, admitted to entertainments, in order to divert the company with their dancing and playing on an instrument called *crotalum*, whence they had their name.

CROTCHET, in music, one of the notes or characters of time, equal to half a minim, and double of a quaver.

CROTCHETS are also marks or characters, serving to inclose a word or sentence which is distinguished from the rest, being generally in this form [] .

CROTO, or **ΚΡΟΤΟΝ**, (anc. geog.), a noble city of the Brutii, built by the Achæans; an hundred and

Crotalus

CXLIX.

Croto. fifty stadia to the north of Lacinium, and in the neighbourhood of Metapontum. It was twelve miles in compass before the arrival of Pyrrhus into Italy; but after the desolation produced by that war, scarce half of it was inhabited. The citadel on one side hung over the sea, on the other towards the land. It was naturally strong from its situation, but afterwards walled round; on which side it was taken by Dionysius by stratagem, by means of the rocks behind it.

Pythagoras, after his long peregrinations in search of knowledge, fixed his residence in this place, which some authors think his native one, at least that of his parents, supposing him to have been born in the isle of Samos, and not at some town of that name in Italy. This incomparable sage spent the latter part of his life in training up disciples to the rigid exercise of sublime and moral virtue, and instructing the Crotonites in the true arts of government, such as alone can insure happiness, glory, and independence.

Under the influence of this philosophy, the Crotonites inured their bodies to frugality and hardships, and their minds to self-denial and patriotic disinterestedness. Their virtues were the admiration of Greece, where it was a current proverb, that the last of the Crotonites was the first of the Greeks. In one Olympiad, seven of the victors in the games were citizens of Croton; and the name of Milo is almost as famous as that of Hercules. The vigour of the men and beauty of the women were ascribed to the climate, which was believed to be endowed with qualities peculiarly favourable to the human system. Their physicians were in high repute; and among these, Alcmeon and Democides rendered themselves most conspicuous. Alcmeon was the first who dared to amputate a limb, in order to save the life of a patient; and also the first writer who thought of inculcating moral precepts under the amusing cloak of apologues. This invention is more commonly attributed to Æsop, as he was remarkably ingenious in this species of composition. Democides was famous for his attachment to his native soil. Though caressed and enriched by the king of Persia, whose queen he had snatched from the jaws of death, he abandoned wealth and honours, and by a stratagem escaped to the humble comforts of a private life at Croton.—The Pythagoreans are said to have discovered that disposition of the solar system, which, with some modifications, has been revived by Copernicus, and is now universally received, as being most agreeable to nature and experiment. Theano, the wife of Pythagoras, and many other women, emulated the virtues of their husbands.

In those fortunate days the state of Croton was most flourishing. Its walls inclosed a circumference of 12 miles. Of all the colonies sent out from Greece, this alone furnished succour to the mother-country when invaded by the Persians. By its avenging arms the Sybarites were punished for their shameful degeneracy; but victory proved fatal to the conquerors, for riches, and all their pernicious attendants, insinuated themselves into Croton, and soon contaminated the purity of its principles. Indeed, the very constitution of human nature militates against any long continuance in such rigid practices of virtue; and therefore it is no wonder if the Crotonites fell by degrees

into the irregularities they once abhorred. Not long after, the Locrians, who were less corrupted, defeated them on the banks of the Sagra, and reduced the republic to distress and penury. This restored the remaining Crotonites to their pristine vigour of mind, and enabled them to make a brave, though unsuccessful, resistance, when attacked by Dionysius of Syracuse. They suffered much in the war with Pyrrhus, and, by repeated misfortunes, decreased in strength and numbers, from age to age, down to that of Hannibal, when they could not muster 20,000 inhabitants. This small population being incapable of manning the extensive works erected in the days of prosperity, Croton was taken by the Carthaginians, and its citizens transported to Locri. The Romans sent a colony hither 200 years before Christ. In the Gothic war, this city rendered itself conspicuous by its fidelity to Justinian, and Totila besieged it long in vain.

CROTON, WILD RICINUS: A genus of the adelphia order, belonging to the monœcia class of plants; and in the natural method ranking under the 38th order, *Tricocca*. The male calyx is cylindrical and quinque-lobed, the corolla is pentapetalous; the stamina from 10 to 15. The female calyx is polyphyllous; no corolla; three bifid styles; the capsule trilocular; one seed. There are 21 species; of which the most remarkable are, 1. The tinctorium, or plant from which the French turnsole is made. This grows naturally in the south of France: it is an annual plant, rising about 9 inches high, with an herbaceous branching stalk, garnished with irregular or rhomboidal figured leaves, which are near two inches long and an inch and a quarter wide in their widest part. These stand upon slender footstalks near four inches long. The flowers are produced in short spikes from the sides of the stalks, at the end of the branches; the upper part of the spike is composed of male flowers, having many stamina which coalesce at the bottom; the lower part hath female flowers, which have each a roundish, three-cornered, germen; these afterwards become a roundish capsule with three lobes, having three cells, each including one roundish seed. This flowers in July; but unless the plants are brought forward on a hot-bed, they do not ripen seeds in Britain. From this plant is made the turnsole used for colouring wines and jellies. It is made of the juice which is lodged between the empalement and the seeds; which, if rubbed on cloths, at first appears of a lively green, but afterwards changes to a bluish purple colour. If these cloths are put into water, and afterwards wrung, they will dye the water to a claret colour. The rags thus dyed are exported to Britain, and sold in the druggists shops under the name of *turnsole*. 2. The sebifera, or tallow-tree, with rhomboidal egg-shaped leaves, pointed, smooth and very entire. It is about the height of a cherry-tree; its leaves in form of a heart, of a deep, shining, red colour, and its bark very smooth. Its fruit is enclosed in a kind of pod, or cover, like a chestnut, and consists of three round white grains, of the size and form of a small nut, each having its peculiar capsula, and within that a little stone. This stone is encompassed with a white pulp, which has all the properties of true tallow, as to consistence, colour, and even smell: and accordingly the

Croton.

Croton
||
Crotophaga.

Chinese make their candles of it; which would doubtless be as good as those in Europe, if they knew how to purify their vegetable tallow as well as we do our animal kind, and to make their wicks as well. 4. The aromaticum, with heart-shaped serrated leaves, and an arborescent stem. The bark of this tree is the same as the cascarilla and eleutheria; though these have been considered by some as distinct barks, and sold in the shops as different productions. It is a hot, acrid, aromatic bitter, resembling in appearance the Peruvian bark, but it is more bitter and pungent, though not so rough and astringent. It was first introduced into Europe about the end of the last century, and seems first to have been used in Germany, where it is still in very high esteem. There it is frequently employed against common intermittent fevers, in preference to the Peruvian bark, as being less subject to some inconveniences, which the latter on account of its great astringency is apt to occasion. It is also said to have been employed with great success in some very dangerous epidemic fevers attended with petechiæ, and it is frequently employed with advantage in flatulent colics, internal hemorrhagies, dysenteries, diarrhœas, and similar disorders. In Britain it has been used by some practitioners, particularly by the late Dr Keir of London, who was of opinion that it was by no means employed so generally as it deserved to be. Its virtues are partially extracted by water, and totally by rectified spirit, but it is most effectual when given in substance. 4. The cascarilla, described by Linnæus as producing the officinal bark of that name, is, according to Dr Wright †, the wild rosemary shrub of Jamaica, the bark of which has none of the sensible qualities of the true cascarilla or eleutheria above described.

CROTONA, a town of Italy, in the kingdom of Naples, seated on the gulph of Taranto, with a bishop's see and a citadel. E. Long. 17. 27. N. Lat. 39. 10.

CROTOPHAGA, in ornithology, a genus of birds belonging to the order of picæ; the characters of which are: The bill is thin, compressed, greatly arched, half oval, and cultrated at top; the nostrils are round; the tongue flat, and pointed at the end; the tail consists of ten feathers; and the toes are placed two and two. The most remarkable species is the ani, which is about the size of a blackbird: the colour of the whole bird is black, in some parts glossed with purple, and about the neck faintly tinged with green on the margins: the base of the bill is furnished with black bristles, which turn forwards: the eye-lids have long hairs like eye-lashes: the tail is six inches long, and much emeated; and the legs are black. This species is found in Jamaica, St Domingo, and other islands in the West Indies; also at Cayenne and other parts of South America. Contrary to all other birds, they have the singularity of many laying in the same nest; to make which, they all unite in concert, and after laying their eggs, sit on them close to each other in order to hatch them, each unanimously striving to do the best for the general good; and when the young are hatched, the parents, without reserve, do the best to feed the whole flock. Still a greater singularity occurs, which is, that as soon as each female lays her eggs she covers them with leaves, doing the same thing whenever she is obliged to leave the

nest for food: this might be necessary in a cold climate; but why it should be wanted in a hot one seems not clear, especially as it has not been observed in other birds. It generally has two broods in a year, except accidents happen; in which case it has been known to make three nests. The eggs are about the size of those of a pigeon, of a sea-green colour, spotted at the ends. Their food is various; worms, insects, fruits, and grain, according to the season. There is a variety called the greater ani, which is about the size of a jay, differing no otherwise from the former but in size. They ought, however, to be considered as two distinct species: for they never mix together; though each have the same manners, with this difference only, that the smaller frequent the open savannas, the larger only the salt-marshes near the sea-coasts. It is said that they are easily made tame, and will learn to talk like parrots. The male and female are both alike. Both species are easy to be shot, not being so wild as many other birds; but are known to chatter much on the sight of a man, though they do not fly to a great distance; hence are not well relished by sportsmen, as, like the jays in England, they are the occasion of hindering his sport in respect to other game, without making him amends in their own flesh, which is never sought after for food, being rank and unfavoury.

CROTOY, a town of France, in Picardy, and in Ponthieu. The fortifications are demolished. It is seated at the mouth of the river Somme. E. Long. 1. 45. N. Lat. 50. 15.

CROUCHED FRIARS. See CROISIERS.

CROUP, in medicine. See MEDICINE-Index.

CROUP of a Horse, in the manege, the extremity of the reins above the hips.

CROUPADE, in the manege, a leap, in which the horse pulls up his hind legs, as if he drew them up to his belly.

CROUTE, SOUR CROUTE, or KROUTE. As this preparation of cabbage has been found of sovereign efficacy as a preservative in long voyages from the sea-scurvy, it may not be unacceptable to give a concise account of the process for making it, according to the information communicated by an ingenious German gentleman.

The soundest and most solid cabbages are selected for this use, and cut very small, commonly with an instrument made for this purpose, not unlike the plain which is used in this country for slicing cucumbers. A knife is used when the preparation is made with greater nicety. The cabbage thus minced is put into a barrel in layers, hand high, and over each is strewed a handful of salt and carraway seeds; in this manner it is rammed down with a rammer *stratum super stratum*, till the barrel be full; when a cover is put over it and pressed down with a heavy weight. After standing some time in this state it begins to ferment; and it is not till the fermentation has entirely subsided that the head is fitted to it, and the barrel is finally shut up and preserved for use. There is not a drop of vinegar employed in this preparation. The Germans write this preparation in the following manner; *Sauer kraut*, or *sauer kohl*; that is, in their language, "sour herb, or sour cabbage."

CROUSAZ (John Peter de), a learned philosopher and

Plate CLI.

Crow,
Crowd,

and mathematician, was born in 1663; having made great progress in the mathematics and the philosophy of Des Cartes, he travelled to Geneva, Holland, and France; was successively professor in several universities; and at length was chosen governor to Prince Frederic of Hesse-Cassel, nephew to the king of Sweden. He wrote many works; the most esteemed of which are, 1. His Logic, the best edition of which is that of 1741, in 6 vols 8vo. 2. A Treatise on Beauty. 3. A Treatise on the Education of Children, 2 vols 12mo. 4. Several Treatises on Philosophical and Mathematical Subjects, &c. He died at Laufanne in 1748.

CROW, in ornithology. See **CORVUS**.

CROW, in mechanics, a kind of iron lever, with a claw at one end and a sharp point at the other; used for heaving or purchasing great weights.

CROW'S BILL, among surgeons, a kind of forceps for drawing bullets and other foreign bodies out of wounds.

CROW'S FEET, in the military art, machines of iron, having four points, each about three or four inches long, so made, that whatever way they fall there is still a point up: they are thrown upon breaches, or in passes where the enemy's cavalry are to march, proving very troublesome, by running into the horse's feet and laming them.

CROW-FOOT, on ship-board, a complication of small cords spreading out from a long block, like the smaller parts which extend from the back bone of a herring (Plate CL.). It is used to suspend the awnings; or to keep the top-fails from striking violently, and fretting against the tops.

CROW-NET, is an invention for catching wild-fowl in the winter season, and may be used in the day-time. This net is made of double thread, or fine pack thread; the meshes should be two inches wide, the length about ten yards, and the depth three; it must be verged on the side with good strong cord, and stretched out very stiff on long poles prepared for that purpose. When you are come to the place where you would spread your net, open it, and lay it out at its full length and breadth; then fasten the lower end of the net all along the ground, so as only to move it up and down; the upper end of the net must stand extended on the long cord; the further end thereof being staked first to the earth by a strong cord about five yards distant from the net. Place this cord in an even line with the lower edge of the net. The other end must be at least 25 yards distant to reach into some natural or artificial shelter, by the means of which you may lie concealed from the fowl, otherwise no good success can be expected. The net must be placed in such exact order that it may give way to play on the fowl on the least pull of the cord, which must be done smartly, lest the fowl should prove too quick for you. This net may be used for pigeons, crows, or other birds, on corn-fields newly sown; as also in stubble-fields, provided the stubble conceals the net from the birds.

CROWD, in a general sense, signifies a number of people assembled in a place scarce big enough to hold them all.

To CROWD, in the sea-language, is to carry an extraordinary force of sail upon a ship, in order to ac-

celerate her course on some important occasion; as in pursuit of, or flight from, an enemy; to escape any immediate danger, &c.

Crowland,
Crown.

CROWLAND, a town in Lincolnshire, seated in the fens, in a dirty soil, and had formerly an abbey of very great note. There is no coming at it but by narrow causeways, which will not admit a cart. It has three streets. Separated from each other by water courses, whose banks are supported by piles, and set with willow trees. Their chief trade is in fish and fowl, which are in great plenty in the adjacent pools and marshes. W. Long. O. 10. N. Lat. 52. 40.

CROWN, an ornament worn on the head by kings, sovereign princes, and noblemen, as a mark of their dignity.

In scripture there is frequent mention of crowns, and the use of them seems to have been very common among the Hebrews. The high priest, wore a crown, which was a fillet of gold placed upon the forehead, and tied with a ribbon of hyacinth colour, or azure blue. It seems also as if private priests, and even common Israelites, wore also a sort of crown, since God commands Ezekiel not to take off his crown, nor assume the marks of one in mourning. This crown was no more than a ribbon or fillet, with which the Jews and several people in the east girt their heads. And indeed the first crowns were no more than a bandelet drawn round the head, and tied behind, as we still see it represented on medals round the heads of Jupiter, the Ptolemies, and kings of Syria. Afterwards they consisted of two bandelets; by degrees they took branches of trees of divers kinds; at length they added flowers, insomuch that Claudius Saturninus says, there was not any plant whereof crowns had not been made. The woods and groves were searched to find different crowns for the several deities; and they were used not only on the statues and images of the gods, by the priests in sacrificing, and by kings and emperors, but also on altars, temples, doors of houses, sacred vessels, victims, ships, &c.

The Roman emperors had four kinds of crowns, still seen on medals, viz. a crown of laurel, a radial or radiating crown, a crown adorned with pearls and precious stones, and the fourth a kind of bonnet or cap, something like the mortar.

The Romans had also various kinds of crowns, which they distributed as rewards of military achievements; as, 1. The oval crown, made of myrtle, and bestowed upon generals, who were intitled to the honours of the lesser triumph, called *ovation*. 2. The naval or rostral crown, composed of a circle of gold, with ornaments representing beaks of ships, and given to the captain who first grappled, or the soldier who first boarded, an enemy's ship. 3. The crown called in Latin *vallarum*, or *castrumensis*, a circle of gold raised with jewels or palifades: the reward of him who first forced the enemy's entrenchments. 4. The mural crown, a circle of gold indented and embattled: given to him who first mounted the wall of a besieged place, and there lodged a standard. 5. The civic crown, made of the branch of a green oak, and given him who had saved the life of a citizen. 6. The triumphal crown, consisting at first of wreaths of laurel, but afterwards made of gold; proper to such generals

Crown. as had the honour of a triumph. 7. The crown called *obsidionatis*, or *graminea*, made of grafs growing on the place; the reward of a general who had delivered a Roman army from a siege. 8. The radial crown, given to princes at their translation among the gods. We meet also with the *corona aurea*, often bestowed on soldiers, without any other additional term; athletic crowns, and crowns of laurel, destined to crown victors at the public games, poets, orators, &c. All these crowns were marks of nobility to the wearers; and upon competitions with rivals for rank and dignities, often determined the preference in their favour. See Plate CL. For an account of modern crowns, see HERALDRY.

CROWN is also used to signify the possessions and dignity of a king. The crown of England, according to Sir William Blackstone, is, by common law and constitutional custom, hereditary; and this in a manner peculiar to itself: but the right of inheritance may from time to time be changed or limited by act of parliament, under which limitations the crown still continues hereditary. See SUCCESSION.

Pleas of the CROWN. See PLEAS.

CROWN, in commerce, is a general name for coins, both foreign and domestic, of or near the value of five shillings Sterling. In its limited sense, crown is only applicable to that popular English coin which bears the name, and which is equivalent to sixty English pence or five shillings, or to six livres French money. But, in its extensive sense, it takes in several others, as the French *ecu*, which we call the French crown, struck in 1641 for sixty sols, or three livres; also the *patagon*, *dollar*, *ducatoon*, *rix-dollar*, and *piastre* or piece of eight.

CROWN, in an ecclesiastical sense, is used for the clerical tonsure; which is the mark or character of the Romish ecclesiastics. This is a little circle of hair shaved off from the crown of the head; more or less broad, according to the quality of the orders received: That of a mere clerk is the smallest; that of priests and monks the largest. The clerical crown was anciently a round list of hair, shaved off around the head, representing a real crown: this is easily observable in several ancient statues, &c. The religious of St Dominic and St Francis still retain it.

CROWN, among jewellers, the upper work of the rose diamond, which all centres in the point at the top, and is bounded by the horizontal ribs.

CROWN-Office, in England, an office belonging to the king's bench court, of which the king's coroner or attorney is commonly master. In this office, the attorney-general and clerk of the crown severally exhibit informations for crimes and misdemeanours at common law, as in the case of batteries, conspiracies, libelling, &c. on which the offender is liable to pay a fine to the king.

CROWN-Glass, denotes the finest sort of window-glass. See GLASS.

CROWN-Scabs, in farriery. See there, § xxxvi. 2.

CROWN-Wheel of a Watch, the upper wheel next the balance, which by its motion drives the balance, and in royal pendulums is called the *swing-wheel*.

CROWN Imperial, in botany. See FRITILLARIA.

CROWN-Work, in fortification, is an out-work running into the field; designed to keep off the enemy,

gain some hill or advantageous post, and cover the other works of the place. The crown-work consists of two demi-battions at the extremes, and an entire bastion in the middle, with curtains.

CROWNE (John), a celebrated dramatic writer, born in Nova Scotia, where his father was a minister. Being impatient of the gloomy restraint of that country, he went to England, where he was reduced to enter into the service of an old lady; of which he was soon as weary as he had been of America. He then had recourse to his pen, which quickly procured him favour at court; but this kind of subsistence proving precarious, he ventured to solicit Charles II. for some establishment. Charles promised to provide for him, but insisted first on having another comedy; and suggested to him the plan of a Spanish play, from which Crowne produced the comedy of *Sir Courtly Nice*: but the sudden death of the king on the last day of the rehearsal, plunged him at once from his pleasing expectations into disappointment and distress, and left him no resource but his wits. He died some time about the year 1703; and left behind him 17 tragedies and comedies, some of which are acted with great success. His chief excellency lay in comedy; yet his tragedies are far from being contemptible. His plots are for the most part his own invention; his characters are in general strongly coloured and highly finished; and his dialogue lively and spirited, attentively diversified, and well adapted to the several speakers. So that on the whole he may assuredly be allowed to stand at least in the third rank of our dramatic writers.

CROWNING, in architecture, is understood, in the general, of any thing that terminates or finishes a member or decoration. Thus, a cornice, a pediment, &c. are called *crownings*. Thus also the abacus is said to crown the capital; and thus any member or moulding is said to be crowned when it has a fillet over it; and a niche is crowned when it is covered with a capital.

CROWNING, in sea language, denotes the finishing part of a knot made at the end of a rope. It is performed by interweaving the ends of the different strands artfully amongst each other, so as that they may not become loosened or untwisted. They are useful in all kinds of stoppers.

CROWTH, or CRUTH. See CRUTH.

CROXAL (Samuel), an ingenious English divine, who in his youth wrote the celebrated poem intitled *The Fair Circassian*. He had the livings of Hampton in Middlesex; and the united parishes of St Mary Somerset, and St Mary Mounthaw, in London; both which he held till his death in 1751. He published many other poems and translations, with an entire English edition of Esop's Fables. In consequence of his attachment to Whig principles, he enjoyed some other preferments, and was chaplain in ordinary to George II.

CROYDON, a town in Surry in England. Its situation is low, near the spring-head of the river Wandel, and it is in a manner surrounded with hills. It is pretty large, and is chiefly noted for being the seat of the archbishop of Canterbury. It has a large handsome church, an hospital, and a free school. W. Long. o. 5. N. Lat. 51. 22.

Crowne
||
Croydon.

Crucial
|
Crumentata.

CRUCIAL INCISION, in surgery, an incision made in the form of a cross.

CRUCIANELLA, PETTY MADDER: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, *Stellatae*. The corolla is monopetalous and funnel-shaped, with the tube filiform and the limb unguiculated, or having an inflexed segment on the top of each segment; the calyx is diphyllous, and there are two linear seeds. There are five species, natives of the southern parts of Europe; but none of them possessed of any remarkable quality.

CRUCIBLE, a chemical vessel made of earth, and so tempered and backed as to endure the greatest fire. They are used to melt metals, and to flux minerals, ores, &c. See *CHEMISTRY-Index*.

CRUCIFIX, a cross upon which the body of Christ is fastened in effigy, used by the Roman Catholics to excite in their minds a strong idea of our Saviour's passion.

They esteem it an essential circumstance of the religious worship performed at the altar; and on Good Friday they perform the ceremony of adoring it, which is done in these words, *O crux ave, spes unica*; "Hail, thou cross, our only hope." The officiating priest uncovers the crucifix, elevates it with both his hands, and says, *Ecce lignum crucis*; "Behold the wood of the cross." The people answer, *in quo salus mundi pependit*; "on which the Saviour of the world suffered death." Then the whole congregation bow with great reverence, and devoutly kiss the holy wood.

CRUCIFIXION, a capital punishment by nailing the criminal to a cross. See *Cross*.

CRUCIFORM, in general, something disposed cross-ways; but more especially used by botanists, for flowers consisting of four petals disposed in the form of a cross.

CRUCITA, in botany, a genus of the digynia order, belonging to the tetrandria class of plants, and in the natural method ranking with those the order of which is doubtful. The interior calyx is tetraphyllous, the exterior calyx triphyllous; there is no corolla, and only one seed.

CRUDE, an epithet given to something that has not passed the fire or had a proper degree of coction.

CRUDITY, among physicians, is applied to undigested substances in the stomach; to humours in the body which are unconcocted, and not prepared for ex-pulsion; and to the excrements.

CRUISE, from the German *kruifs*, "across," signifies to cross to and fro, to sail up and down within a certain space of the sea, called the *cruising* latitude, in quest of vessels, or fleets of an enemy, &c.

CRUISERS, in the British navy, are small men of war made use of to and fro in the channel, and elsewhere, to secure the merchant ships and vessels from the enemy's small frigates and privateers. They are generally such as sail well, and are commonly well manned: and indeed the safety of the trade in the channel, and up and down the soundings, and other places, absolutely requires the constant keeping out such ships at sea.

CRUMENTATA, among zoologists, animals fur-

nished with a pouch or bag, wherein to receive their young in time of danger; as the opossum. See *DELPHIS*.

CRUOR, sometimes signifies the blood in general; sometimes only the venous blood; and sometimes extravasated or coagulated blood; but is most frequently used for the red globules of the blood, in contradistinction to the limpid or serous part.

CRUPPER, in the manege, the buttocks of a horse, the rump; also a thong of leather put under a horse's tail, and drawn up by thongs to the buckle behind the saddle, so as to keep him from casting the saddle forwards on his neck.

CRURÆUS, or **CRUREUS**, *Musculus*, in anatomy, a fleshy mass, covering almost all the fore-side of the os femoris, between the two vasti, which likewise cover the edges of this muscle on each side. See *ANATOMY, Table of the Muscles*.

CRURAL, in anatomy, an epithet given to the artery which conveys the blood to the crura or legs, and to the vein by which this blood returns towards the heart. See *ANATOMY, p. 751*.

CRUS, in anatomy, all that part of the body contained between the buttocks and the toes.

CRUSADO, in commerce, a Portuguese coin, struck under Alphonfus V. about the year 1457, at the time when pope Calixtus sent thither the bull for a croisade against the infidels. This coin has a cross on one side, and the arms of Portugal on the other.

CRUSCA, an Italian term signifying *bran*, is in use amongst us to denote that celebrated academy called *della Crusca*, established at Florence for purifying and perfecting the Tuscan language. See *ACADEMY, n° 11*. The academy took its name from its office, and the end proposed by it; which is, to refine the language, and as it were to separate the bran from it. Accordingly, its device is a sieve; and its motto, *Il piu bel fior ne coglie*; that is, "It gathers the finest flour thereof." In the hall or apartment where the academy meets, M. Moneonis informs us, that every thing bears an allusion to the name and device: the seats are in form of a baker's basket; their backs like a shovel for moving of corn; the cushions of grey fatin, in form of sacks or wallets; and the branches where the lights are placed resembling sacks. The vocabulary *Della Crusca* is an excellent Italian dictionary, composed by this academy.

CRUSTA LACTEA, in medicine, the same with *ACHOR*.

CRUSTACEOUS FISH, in natural history, are those covered with shells, consisting of several pieces or scales; as those of crabs, lobsters, &c.

These are usually softer than the shells of the testaceous kind, which consist of a single piece, and generally much thicker and stronger than the former; such as those of the oyster, scallop, cockle, &c.

Dr Woodward observes, in his *Natural History*, that of all the shells found in beds of all the different matters dug out of the earth, there are scarce any of the crustaceous kind: the reason he gives for it is, that these being much lighter than the rest, must have floated on the surface at the time of the deluge, when all the strata were formed; and there have corrupted and perished.

Cruor
||
Crustaceous.

Cruth
|
Crypta.

CRUTH, or CROWTH, a kind of musical instrument formerly in use among the common people in Wales. It is of the fidicinal kind, somewhat resembling a violin, 22 inches in length, and an inch and an half in thickness. It has six strings supported by a bridge, and is played on with a bow: the bridge differs from that of a violin, in that it is flat and not convex on the top; a circumstance from which it is to be inferred, that the strings are to be struck at the same time, so as to afford a succession of concords. The bridge is not placed at right angles with the sides of the instrument, but in an oblique direction; and, which is further to be remarked, one of the feet of the bridge goes through one of the sound-holes, which are circular, and rests on the inside of the back; the other foot, which is proportionably shorter, resting on the belly before the other sound-hole. Of the strings, the four first are conducted from the bridge down the finger-board, as in a common violin; but the fifth and sixth, which are about an inch longer than the others, leave the small end of the neck about an inch to the right. The whole six are wound up either by wooden pegs in the form of the letter T, or by iron pins, which are turned with a wrest like those of a harp or spinnet. Of the tuning, it is to be remarked, that the fifth and sixth strings are the unison and octave of G; the fourth and fifth, the same of C; and the second and first, the same of D; so that the second pair of strings are a fourth, and the third a fifth, to the first. See Plate CL.

Concerning the antiquity of this instrument, there is but little written evidence to carry it further back than the time of Leland; nevertheless the opinion of its high antiquity is so strong among the inhabitants of the country where it was used, as to afford a probable ground of conjecture, that the cruth might be the prototype of the whole fidicinal species of musical instruments. Another evidence of its antiquity, but which tends also to prove that it was not peculiar to Wales, arises from a discovery lately made and communicated to the society of antiquarians, respecting the abbey-church of Melrose in Scotland, supposed to have been built about the time of Edward II. It seems that among the outside ornaments of that church there is the representation of a cruth, very little different from the description above given. The instrument is now disused, in so much that Sir John Hawkins, from whom we extract, tells us, that there is but one person in the whole principality of North Wales that can play upon it; and as he was at that time near 60 years of age, the succession of performers is probably near an end.

CRUX, or St CROIX, one of the Caribbee islands, situated about 60 miles south-east of Porto-Rico, and subject to Denmark. From being a perfect desert, it has begun to flourish exceedingly, being made a free port, and receiving great encouragement from government. W. Long. 64. o. N. Lat. 17. 30.

CRYMODES, among physicians, a kind of fever attended with a shivering cold, and inflammation of the internal parts of the body.

CRYPTA, a subterraneous cell or vault, especially under a church, for the interment of particular families or persons. S. Ciampini, describing the outside of the Vatican, speaks of the *cryptæ* of St Andrew, St Paul,

&c. The word is formed of *κρυπτω*, *abscondo*, "I hide;" whence *κρυπτην*, *crypta*.

Vitruvius uses the word *crypta* for a part of a building, answering nearly to our cellar; Juvenal for a *cloaca*. Hence *crypto-porticus*, a subterraneous place arched or vaulted; used as an under-work or passage in old walls. The same is also used for the decoration at the entry of a grotto.

CRYPTA is also used by some of our ancient writers for a chapel or oratory under-ground.

CRYPTÆ, in anatomy, a name given by Ruysch to glands situated on the back of the tongue, and to glands of the intestines.

CRYPTOGAMIA, (from *κρυπτος*, *occultus*, "concealed," and *γαμος*, *nuptia*, "nuptials"), the 24th class in the Linnæan system, comprehending those plants whose fructification is concealed, either through minuteness, or within the fruit. See BOTANY, the *Scheme* and *Explanation*, Vol. III. p. 430.

CRYPTOGRAPHY, the art of writing in cipher, or with sympathetic ink. See CIPHER and INK.

CRYSTAL, a species of stones of the quartz kind, belonging to the siliceous class. It always appears, when there has been no interruption to its crystallization, in hexagonal prisms pointed at both ends. It is found of different kinds and colours. 1. Opaque or semitransparent, and white or of a milk colour. 2. Opaque and red, or of a cornelian colour, from Oran in Barbary. 3. Opaque and black, from the same place. 4. Clear. The specific gravity of these kinds of crystals is from 2650 to 2700. Professor Bergman extracted from them about six parts of argilla and one of calcareous earth per hundred weight; but Mr Gerard found some so pure as to contain neither. 5. Clear and blackish brown, the smoky topaz, or *rauch topaz* of the Germans. It is found at Egan in Norway, and at Lovisa in Finland. These crystals are said to become clear by boiling them in tallow. 6. Clear and yellow; found in Bohemia, and sold instead of topazes. 7. Clear and violet-coloured; the amethyst, from Saxony, Bohemia, and Daunemore in Upland. The most transparent of these are called false diamonds. Bristol, Kerry stones, Alençon diamonds, &c. 8. Colourless rock-crystal, properly so called, found in Bohemia, the province of Jemtland; and many other places. 9. Pyramidal crystal with one or two points. These have no prismatic shape, but either stand upon a base in cavities of quartz-veins, have only a single pyramid, and are of various colours; or they lie in a clayey earth, and have both pyramids, but no prism. They are found at Blackenburgh upon the Hartz, and at Morferosh in the Silverland in Transylvania.

The coloured transparent crystals derive their tinge from an exceedingly small portion of metallic calces, but lose them entirely when strongly heated. They are called *false gems*; viz. the red from Oran in Barbary, false rubies; the yellow from Saxony, false topazes; the green from Dauphiny, very rare, false emeralds or prasēs; the violet from Vil in Catalonia, false amethysts; the blue from Puy in Valay in France, false sapphires. There are likewise opal or rainbow crystals, the various colours of which are thrown out in zones across the surface. They make a very fine appearance, though they never shine like the oriental opal.

Crypta
|
Crystal.

Crystal.

M. Fourcroy makes a remarkable difference between the crystals and quartz, by affirming that the former are unalterable in the fire, in which they neither lose their hardness, transparency, nor colour, while the quartz loses the same qualities, and is reduced by it to a white and opaque earth. He classes the rock-crystals,

I. According to their form, *viz.* 1. Insulated hexagonal crystals ending in pyramids of six faces, which have a double refraction, or show two images of the same object when looked through. 2. Hexagonal crystals united, having one or two points. 3. Tetraedral, dodcaedral, flatted crystals; and which, though hexagonal, have nevertheless their planes irregular. 4. Crystals in large masses, from the island of Madagascar, which have a simple refraction.

II. With regard to their colour, as being either diaphanous, reddish, smoky, or blackish.

III. With regard to accidental changes, some are hollow; some contain water within one or more cavities; some are cased one within the other; some are of a round form, as the pebbles of the Rhine; some have a crust of metallic calces or of a pyrites; some are found crystallized in the inside of a cavity; while some seem to contain amianthus or asbestus; and others contain shirls. The same author reckons among crystals the oriental topaz, the hyacinth, the oriental sapphire, and the amethyst. Mr Daubenton has always looked upon this last as a quartz of a crystal.

When the rock-crystals are semitransparent or intermixed with opaque veins, they are called by the Swedish lapidaries *milk-crystals*. When they are found in the form of round pebbles, which is occasioned by their being tossed about and rubbed against one another by floods or by the sea, they are called by the English lapidaries *pebble crystals*. They come from the Indies, Siberia, and other places.

According to Bomare, the rock-crystals are generally formed upon or among quartz, which shows their great affinity, and are to be found in all parts of the world. The greatest quantity of them is brought from Mount Saint Gothard in Switzerland. Large pieces of these, weighing from 5 to 800 pounds, were found there at Grimselberg; another of about 1200 pounds weight was found some years ago at Fribach in the Wallais; and a piece six feet long, four wide, and equally thick, was found in the island of Madagascar, where these natural productions are of the most extraordinary size and perfection.

In the imperial collection at Vienna, there is a pyramidal crystal vase two ells in height, cut wholly out of one piece. It is usual with the largest crystals of the German mountains to be full of cracks and flaws, and to be so constructed internally as to show all the prismatic colours; but the abovementioned ones were quite free from these blemishes, and resembled columns of the purest glass, only much clearer than any glass can be made. Crystal is also found in many parts of Britain and Ireland. About Bristol it is found of an amethystine tinge. In Silesia and Bohemia in Germany it is found stained with the colours of the ruby, sapphire, emerald, and topaz; in which case jewellers take great advantage of it, selling it under the name of *accidental sapphire*.

The orders of pure crystal are three: The first is

2

Crystal.

perfect columnar crystals, with double pyramids, composed of 18 planes, in an hexangular column, terminated by an hexangular pyramid at each end: the second order is that of perfect crystals, with double pyramids, without a column, composed either of 12 or of 16 planes, in two hexangular pyramids, joined closely base to base, without the intervention of any column: the third order is that of imperfect crystals, with single pyramids, composed either of 12 or 10 planes, in an hexangular or pentangular column, affixed irregularly at one end to some solid body, and terminated at the other by an hexangular or pentangular pyramid.

These are all the general forms into which crystal, when pure, is found concreted: but under these there are almost infinite varieties in the number of angles, and the length, thickness, and other accidents of the columns and pyramids.

When crystal is blended with metalline particles at the time of its formation, it assumes a variety of figures wholly different from these, constituting a fourth order under the name of *metalline crystals*: when that metal is lead, the crystal assumes the form of a cube; when it is tin, of a quadrilateral pyramid, with a broad base; when iron, the crystal is found concreted in rhomboidal figures: these crystals are very common about mines; but the common spars, which are liable to be influenced in the same manner by the metals, and to appear in the very same form, are to be carefully distinguished from them. There is one very easy test for this purpose, which is, that all spars are subject to be dissolved by aquafortis, and effervesce violently only on its touching them: but it has no such effects on crystal.

The pebble-crystal is common enough in all parts of the world; but that which is formed of hexangular columns, affixed to a solid base at one end, and terminated by a hexangular column at the other, is infinitely more so: this is what we call *sprig* or *rock crystal*, and is the species described by most authors under the name of *crystal of the shops*, or that kept for medicinal uses.

With regard to the formation of crystals, it is certain that they must have been once in a soft state, since some are found to have water in their cavities. Professor Bergman obtained 13 regular formed crystals, by suffering the powder of quartz to remain in a vessel with fluor acid for two years. These were about the size of small peas, and were less hard than quartz. Mr Magellan informs us, that he received from Mr Achard two crystals, one of the sparry kind, and the other as hard and transparent as rock-crystal. The first he procured by means of calcareous earth, and the latter from the earth of alum, both dissolved in water impregnated with fixed air, the water filtrating very slowly through a porous bottom of baked clay. The apparatus is described by the author in the *Journal de Physique* for January 1773: but though the process was attempted by Mr Magellan, and afterwards a second time by Mr Achard himself, neither of them were able to succeed. Mr Morveau, however, in the first volume of the Dijon Memoirs for 1785, asserts that he has produced a very small artificial crystal; and gives the proper method for succeeding in the process.

In

Crystal.

In the natural way many of the more compound fossile bodies are formed chiefly either of crystal, or of spar, a body in many things resembling it. The original formation and coalescence of those bodies of which spar is the basis, we know, may have been but of yesterday, since we have evident proofs that spar is concreting to this day, and that sparry bodies are forming every moment. This is evident from the sparry stalactiæ in the arches of modern buildings, particularly in one so lately built as the new bridge at Westminster; the roofs of the arches of which were filled with these spars within a year after they were built. It is also demonstrable that the spars are not formed of matter exuding from the stone, since brick arches abound equally with them; and the brick vault which supports part of the grand terrace at London, was some time ago so full of them that there was not room to walk. These observations sufficiently demonstrate the growth of spar; but the vegetation of crystal remained dubious till Dr Hill showed by some experiments that *crystal*, as well as spar, is dissolved in every kind of water, even such as appears to be most pure and clear. This is also probable from an observation of Neumann's, who tells us, that he has seen leaves, stalks of plants, hay, straw, hogs bristles, &c. inclosed in sprigs of crystal. From the regular forms in which these natural crystals are found, the regular arrangement of salts into different figures takes the name of *crystallization*, and both are probably owing to the same cause*. Henckel gives us a remarkable account of the formation of crystal out of human urine. He once filled a large round glass-vessel half way up with the recent urine of a young lad, and tying a bladder over the mouth of the vessel, set it in a stove for four years together, never stirring it during that whole time. At the end of this time he found a number of small white stones growing to the inside of the glass; they were of the size of an oat-seed, of a prismatic figure, and tolerably pellucid: they stuck so fast to the sides of the glass that they could not be washed off by the shaking about of the urine; and when taken out had no saline taste, and were not soluble even in hot water.

* See Crystallization.

Crystal is frequently cut; and lustres, vases, and toys, are made of it as of other beautiful stones. For this purpose it is to be chosen perfectly clear and transparent. It is to be tried by aquafortis, or by drawing it along a pane of glass. The genuine crystal will not be affected by the acid, and will cut glass almost like a diamond. When any piece of workmanship of natural crystal is become foul and dark, the following method is to be used for recovering its brightness without hurting the polish. Mix together six parts of common water and one part of brandy; boil these over a brisk fire, and let the crystal be kept in it in a boiling state, a quarter of an hour; then take it out and rub it carefully over with a brush dipped in the same liquor; after this it is to be wiped with a napkin, and by that means its surface will be perfectly cleaned, and rendered as bright as at first, without any injury to the points of the cutting or the polish of the planes or faces, which would probably have happened had the cleaning been attempted by mere rubbing with a cloth.

Natural crystal may be reduced by calcination into

VOL. V.

a state proper for making glass with alkaline salts, and thus becomes a very valuable frit. The method of doing it is as follows; calcine natural crystal in a crucible; when it is red-hot, throw it into cold water. Repeat this eight times, covering the crucible that no dust or ashes may get in among the crystal. Dry this calcined mass, and reduce it to an impalpable powder.

Colouring CRYSTAL, for the imitation of gems. See DOUBLET.

CRYSTAL, is also used for a factitious body, cast in glass-houses, called *crystal-glass*; being in fact no more than glass carried, in the composition and manufacture, to a greater perfection than the common glass.

The best kind of glass-crystal is that called *Venice-crystal*, made at Moran near Venice. See GLASS.

Iceland or Iceland CRYSTAL, a transparent fissile stone, brought from Iceland, soft as talc, clear as rock-crystal, and without colour: remarkable for its unusual refractions.

It is there found in great abundance all over the country, but is particularly plentiful in a mountain, not far from the bay of Røezfiord, where the finest and most pellucid pieces are found on digging. The mountain lies in 65 degrees latitude, and has its whole outside made up of it; but though this makes a very bright and glittering appearance, it is not so fine as that which lies at a little depth, and is met with on opening the surface. This is generally taken up out of the earth in masses a foot long, and its corners very frequently are terminated in these large masses, by a sort of crystals, very different in figure and qualities from the rest of the mass. The stone itself is of a parallelopiped figure; but these excrescences are either single pyramids, affixed to columns like common crystal, or double pyramids with or without columns between. The stone itself is soft; these are hard, and cut glass: the stone calcines to lime in the fire; these run into glass: in short, the stone itself is true spar, and these are true crystal. Beside these, there sometimes grows out of the ends of the larger masses a pure fine asbestos. This likewise is the case sometimes in the spar found about Barege in France, and shows how nearly together the formation of bodies, wholly different from one another, may happen. The general figure of the stone is parallelopiped; or, as some express it, rhomboide; and it retains this not only while whole, but also when broken to pieces. Every fragment it naturally falls into, though ever so small, being truly of the shape. But it is remarkable, that in some places of this mountain, the same sort of matter is found in form of triangular pyramids, all which have the same property of the double refraction with the parallelopipeds of the same substance; so that the original error of supposing its qualities owing to its shape, is refuted by this, as well as by the trials made with other pellucid bodies of the same figure, which do not show this remarkable property.

The Iceland crystal is electrical, and when rubbed will draw up straws, feathers, and other light substances, in the same manner that amber does.

The vast masses of white spar which are found in the lead mines of Derbyshire, though they are not externally of the parallelopiped figure of the Iceland crystal, nor have any thing of its brightness or transparency

Crystal.

Crystal. in the general lump; yet when they are broken they separate into rhomboidal fragments, and some of these are found to be tolerably pellucid: all those which are so have the property of the Iceland crystal; and being laid upon paper, where a black line is drawn, they all show that line double in the same manner as the real Iceland crystal does.

Iceland crystal bears a red heat without losing its transparency; and in a very intense heat calcines without fusion: steeped a day or two in water, it loses its natural polish. It is very soft and easily scratched with the point of a pin; it will not give fire on being struck against steel; and ferments and is perfectly dissolved in aquafortis. It is found in Iceland, from whence it has its name; and in France, Germany, and many other places. In England fragments of other spars are very often mistaken for it, many of them having in some degree the same property. It has none of the distinguishing characters of crystal; and is plainly a genus of spars, called from their figure *parallelopipedia*, which, as well as some other bodies of a different genus, have the same properties. Bartholine, Huygens, and Sir Isaac Newton, have described the body at large, but have accounted it either a crystal or a talc; errors which could not have happened, had the criterions of fossils been at that time fixed; since Sir Isaac Newton has recorded its property of making an ebullition with aquafortis, which alone must prove that it is neither talc nor crystal, both those bodies being wholly unaffected by that menstruum. It is always found in form of an oblique parallelopiped, with six sides, and is found of various sizes, from a quarter of an inch to three inches or more in diameter. It is pellucid, and not much less bright than the purest crystal, and its planes are all tolerably smooth, though when nicely viewed they are found to be waved with crooked lines made by the edges of imperfect plates. What appears very singular in the structure of this body is, that all the surfaces are placed in the same manner, and consequently it will split off into thin plates, either horizontally or perpendicularly; but this is found, on a microscopic examination, to be owing to the regularity of figure, smoothness of surface, and nice joining of the several small parallelopiped concretions, of which the whole is composed, and to the same cause is probably owing its remarkable property in refraction.

The phenomena of this stone are very remarkable, were first suggested by Bartholine, and have been examined with great accuracy by M. Huygens and Sir Isaac Newton.

1. Whereas in other pellucid bodies there is only one refraction, in this there are two; so that objects viewed through it appear double.

2. Whereas in other transparent bodies, a ray falling perpendicularly on the surface, passes straight through, without suffering any refraction; and an oblique ray is always divided; in Iceland crystal, every ray, whether perpendicular or oblique, becomes divided into two, by means of the double refraction. One of these refractions is, according to the ordinary rule, the sine of incidence out of air into crystal, being to the sine of refraction as five to three; but the other is perfectly new. The like double refraction is also observed in crystal of the rock, though much less sensibly. When an incident ray is thus divided, and each moiety ar-

ives at the farther surface, that refracted in the first surface after the usual manner, is refracted entirely after the usual manner at the second; and that refracted in the unusual manner in the first is entirely refracted after the like manner in the second; so that each emerges out of the second surface parallel to the first incident ray. Again, if two pieces of this crystal be placed over each other, so that the surfaces of the one be parallel to the corresponding ones of the other; the rays refracted in the usual manner in the first surface of the first, are refracted after the usual manner in all the other surfaces; and the same uniformity appears in the rays refracted after the unusual manner; and this in any inclination of the surfaces, provided their planes of perpendicular refraction be parallel.

From these phenomena Sir Isaac Newton infers, that there is an original difference in the rays of light; by means whereof some are here constantly refracted after the usual manner; and others in the unusual manner. Were not the difference original, and did it arise from any new modifications impressed on the rays at their first refraction, it would be altered by new modifications in the three following ones: whereas, in fact, it suffers no alteration at all. Again, he hence takes occasion to suspect, that the rays of light have several sides, endued with several original properties: for it appears from the circumstances, that these are not two sorts of rays differing in their nature from each other, one constantly, and in all positions, refracted in the usual, and the other in the unusual manner; the difference in the experiment mentioned being only in the position of the sides of the rays to the plane of perpendicular refraction. For one and the same ray is refracted sometimes after the usual, and sometimes after the unusual manner, according to the position of its sides to the crystal: the refraction being alike in both, when the sides of the rays are posited the same way to both, but different when different. Every ray therefore may be considered as having four sides or quarters; two of which, opposite to each other, dispose the ray to be refracted after the unusual manner; and the other two in the usual. These dispositions, being in the rays before their incidence on the second, third, and fourth surfaces, and suffering no alterations; for what appears in their passage through them must be original and connate.

Father Beccaria corrects the observations of Huygens and Newton concerning the refraction of rock or mountain crystal. The double refraction of the latter happens when a ray passes through two sides that are inclined to each other, and consequently issues coloured; whereas that of the Iceland crystal is made by the passage of a ray through two parallel sides, and therefore it issues colourless. He suggests, that there may be other substances in which there is a manifold refraction. Gravesande had a prism of Brasil pebble, which had a double refraction at each angle, but of a different kind from one another. Mr B. Martin prepared several prisms of Iceland crystal, which exhibited not only a double but a multiple refraction. A single prism produced a six-fold refraction; and by combining several prisms, a number of refractions was obtained equal to the product of those of the single prisms; *i. e.* a prism which afforded two images applied to one of six, produced a prism of twelve images, &c. He farther

Crystalline ther observes, with respect to Iceland crystal, that tho' the sides of its plane of perpendicular refraction be parallel to one another, a beam of light transmitted thro' them will not be colourless; in which property it differs from all other known substances.

CRYSTALLINE, in general, something composed of, or resembling, crystal. See **CRYSTAL**.

CRYSTALLINE Heavens, in ancient astronomy, two spheres, imagined between the primum mobile and the firmament, in the Ptolemaic system, which supposes the heavens solid, and only susceptible of a single motion. See **ASTRONOMY**, n^o 247.

CRYSTALLINE Humour. See **ANATOMY**, p. 767.

CRYSTALLINÆ, or **CRYSTALLINES**, in medicine, are pustules filled with water, and so called on account of their transparency. They are one of the worst symptoms attendant on a gonorrhœa. They are lodged on the prepuce, without pain; and though caused by coition, have nothing of infection attending them. The cause is supposed to be a contusion of the lymphatic vessels in the part affected. Dr Cockburn, who hath described this case, recommends for the cure a mixture of three parts of lime-water and two of rectified spirit of wine, to be used warm, as a lotion, three times a-day.

CRYSTALLIZATION, in general signifies the natural formation of any substance into a regular figure, resembling that of a crystal. Hence the phrases of crystallized ores, crystallized salts, &c. and even the basaltic rocks are now generally reckoned to be effects of this operation: (See **BASALTES** and **VOLCANO**). The term, however, is most commonly applied to bodies of the saline kind, and their separation in regular figures from the water, or fluid in which they are dissolved, is called their *crystallization* *. The word *crystallization* is never applied to the freezing of water, or to the consolidation of metals after they have been melted; though it might certainly be applied with as much justice to these substances as to any others; for all of them concrete into a certain regular form, from which they never deviate, unless disturbed. When water freezes slowly, it always forms regular crystals of ice, which are constantly of the same form. They are long, needle-like masses, flattened on one side, and joined together in such a manner that the smaller are inserted into the sides of the greater: and thus these compound crystals have the appearance of feathers, or branches of trees with leaves. The most remarkable circumstance attending this crystallization is, that the angle formed by the insertion of the smaller pieces into the larger, is either 60 or 120 degrees. The figures assumed by metals of different kinds have not been so exactly investigated, except in the regulus of antimony, which is observed always to take a stellated form. Experience also shows, that all kinds of earths, or other mineral matters, are capable of assuming a crystalline form, and may easily be made to do so by taking away part of the water which dissolves them.

Different salts assume different figures in crystallization, and are thus most easily distinguished from one another. The methods of reducing them into this form, for sale, are mentioned under the article **CHEMISTRY**, n^o 573. But besides the large crystals produced in this way, each salt is capable of assuming a

very different appearance of the crystalline kind, when only a single drop of the saline solution is made use of, and the crystallization viewed through a microscope. For our knowledge of this species of crystallization we are indebted to Mr Henry Baker, who was presented with a gold medal for the discovery, in the year 1744. These microscopical crystals he distinguishes from the large ones by the name of *configurations*; but this term seems inaccurate, and the distinction may well enough be preserved by calling the large ones the *common*, and the small ones the *microscopical*, crystals of the salt. His method of making these observations he gives in the following words:

“ I dissolve the subject, to be examined, in no larger a quantity of rain or river water than I am certain it is sufficient to saturate. If it is a body easily dissolvable I make use of cold water; otherwise I make the water warm, hot, or even boiling, according as I find it necessary. After it is perfectly dissolved, I let it rest for some hours, till, if overcharged, the redundant saline particles may be precipitated and settle to the bottom, or shoot into crystals; by which means I am most likely to have a solution of the same strength at one time as at another; that is, a solution fully charged with as much as it can hold up, and no more; and by these precautions the configurations appear alike, how often soever tried: whereas, if the water be less saturated, the proportions at different times will be subject to more uncertainty; and if it be examined before such separation and precipitation of the redundant salts, little more will be seen than a confused mass of crystals.

“ The solution being thus prepared, I take up a drop of it with a goose quill cut in fashion of a scoop, and place it on a flat slip of glass of about three quarters of an inch in width, and between three and four inches long, spreading it on the glass with the quill, in either a round or an oval figure, till it appears a quarter of an inch, or more, in diameter, and so shallow as to rise very little above the surface of the glass. When it is so disposed, I hold it as level as I can over the clear part of a fire that is not too fierce, or over the flame of a candle, at a distance proportionable to the heat it requires (which experience only can direct), and watch it very carefully till I discover the saline particles beginning to gather and look white, or of some other colour, at the extremities of the edges. Then (having adjusted the microscope before-hand for its reception, armed with the fourth glass, which is the fittest for most of those experiments), I place it under my eye, and bring it exactly to the focus of the magnifier; and, after running over the whole drop, I fix my attention on that side where I observe any increase or pushing forwards of crystalline matter from the circumference towards the centre.

“ This motion is extremely slow at the beginning, unless the drop has been overheated, but quickens as the water evaporates; and, in many kinds, towards the conclusion, produces configurations with a swiftness inconceivable, composed of an infinity of parts, which are adjusted to each other with an elegance, regularity, and order, beyond what the exactest pencil in the world, guided by the ruler and compasses, can ever equal, or the most luxuriant imagination fancy.

Crystallization.

Microscopical crystals discovered by Mr Baker.

His method of procuring them.

* See Chemistry-Index.

I Similarity between congelation and crystallization.

Crystalliza-
tion.

“ When this action once begins, the eye cannot be taken off, even for a moment, without losing something worth observation: for the figures alter every instant till the whole process is over; and, in many sorts, after all seems at an end, new forms arise different entirely from any that appeared before, and which probably are owing to some small quantity of salt of another kind, which the other separates from, and leaves to act after itself has done: and in some subjects, three or four different sorts are observable, few or none of them being simple and homogeneous.

“ When the configurations are fully formed, and all the water evaporated, most kinds of them are soon destroyed again by the moisture or action of the air upon them; their points and angles lose their sharpness, become uneven and defaced, and moulder, as it were, away. But some few are permanent, and being inclosed between glasses, may be preserved months, or even years, entertaining objects for the microscope.

“ It happens oftentimes that a drop of saline solution can hardly be spread on the slip of glass, by reason of the glass's smoothness, but breaks into little globules, as it would do if the surface were greasy: this was very troublesome, till I found a way of preventing it, by rubbing the broken drop with my finger over the glass, so as to leave the surface smeared with it; on which smeared place, when dry, another drop of the solution may be spread very easily in what form one pleases.

“ It likewise sometimes happens, that when a heated drop is placed properly enough for examination, the observer finds he can distinguish nothing: which is owing to saline steams that, rising from the drop, cover and obscure the object-glass, and therefore must immediately be wiped away with a soft cloth or leather.

“ In all examinations by the microscope of saline solutions, even though made in the day-time, I always employ the light of a candle, and advise every observer to do so likewise: for the configurations being exceedingly transparent, are rendered much more distinguishable by the brown light a candle affords, than by the more white and transparent day-light; and besides, either by moving the candle or turning the microscope, such light may be varied or directed just as the object requires.”

4
Description
of the mi-
croscopical
crystals of
various
salts.

In this manner were produced the beautiful crystallizations represented Plate CLII. They are vastly different from such crystals of the same salts as are obtained by the common processes; but Mr Baker assures us they are no less constant and invariable than they, and that he has repeated the experiments a great number of times with the same success.

Fig. 1. shows the microscopical crystals of *nitre* or *salt-petre*. These shoot from the edges, with very little heat, into flatish figures of various lengths, exceedingly transparent, and with straight and parallel sides. They are shown in their different degrees of progression at the letters *a, b, c, d, e*; where *a* represents how they first begin. After numbers of these are formed, they will often dissolve under the eye, and disappear entirely; but if one waits a little, new shoots will push out, and the process go on afresh. These first figures sometimes enlarge only without altering

their shapes, and sometimes form in such sort as the drop represents; but if the heat has been too great, they shoot hastily into ramifications very numerous and beautiful, but very difficult to be drawn; and which Mr Baker therefore did not attempt. There seems all the while a violent agitation in the fluid, and most commonly, towards the conclusion, a few octaedra (composed of eight triangular planes, or two quadrangular pyramids, joined base to base) make their appearance.

2. *Blue vitriol*, produces crystals round the edges, very short at the beginning, but increasing gradually, as represented at the figures 1, 2, 3, which denote their difference of form, and the progress of their growth. These crystalline shoots are solid, regular, transparent, and reflect the light very beautifully from their polished sides and angles. As the watery part evaporates, numbers of long slender bodies like hairs are seen here and there, some lying side by side, or crossing each other as at 4, others forming star-like figures with many radiations (5, 5). This salt shoots but slowly, and therefore requires patience. At last the true crystals begin to appear commonly in the middle of the drop, and are very prettily branched, as at 6.

3. *Distilled verdigris*, dissolved as above directed, and immediately applied to the microscope, shows abundance of the regular figures, 1, 2, 3, 4, 5, 6, 7: but if the solution is suffered to stand for a few hours, and a drop of it is then heated over the fire on a slip of glass, till it begins to concret about the sides, and then examined, sharp-pointed, solid, figures, bisected by a line cut through the middle, from which they are cut away toward the edges, begin to appear, and shooting forwards (1, 1, 1). These figures are often striated very prettily from the middle line to the edges obliquely (2, 2); and frequently they arise in clusters; and shooting from a centre (3, 3). These figures are a long time in growing; and whilst they are doing so, regular crystals appear forming in several parts of the drop, of the most lovely emerald colour, and reflecting the light from their sides and angles, which are most exactly disposed, and finely polished. No crystals are formed in the middle till the water is nearly evaporated; and then they begin to form hastily, for which reason they must be carefully attended. Their common figures resembles two long // crossing each other in an angle of about 60°, and shooting branches every way: each of which again protrudes other branches from one and sometimes from both, its sides; making together an appearance like four leaves of fern conjoined by their stalks (5, 5). Separate clusters of the same sharp pointed figures, as those at the edges of the drop, are also formed in the middle of it (6). Sometimes also they put on another form like the leaves of dandelion (7). Very beautiful figures are likewise produced by a kind of combination of sharp points and branches (8, 8). All these crystals are of a most beautiful green colour, but deeper or lighter according to the time of their production. The deepest are constantly produced first, and the paler ones afterwards. Towards the end of the process some circular figures are formed, extremely thin, and so slightly tinged, with green lines radiating from a centre, as to be almost colourless (9, 9). When all
seems

Crystalliza-
tion.

CrySTALLIZA-
tion. seems in a manner over, bundles of hair-like bodies appear frequently scattered here and there throughout the drop, like those of blue vitriol already described.

4. *Alum.* The microscopical crystals of this salt prove more or less perfect according to the strength of the solution and the degree of heat employed in making the experiment. The solution of alum, however saturated with the salt, will not be found overstrong after standing some days; for in that time many crystals will have formed in it. This separation will often leave the remainder too weak for the purpose; but by holding the vial over, or near the fire, the crystals will again dissolve. After it has stood about half an hour it may then be used. The drop put on the glass and properly heated, exhibits commonly at first a dark cloud which appears in motion somewhere near the edge, and runs pretty swiftly both to the right and left, until it is either stopped by the intervention of regular crystals, or else it proceeds both ways at once, till having surrounded the whole drop, the two ends rush together, and join into one (*a, a*). This cloudy part, which seems to be violently agitated while it is running round, appears on a strict examination to consist of salts, shot into long and very slender lines, much finer than the smallest hair, crossing each other at right angles. As they go along, rows of solid crystals are produced from their internal edges. These are composed of many oblique plain sides (*b, b*), and which have all a tendency towards the figures of the regular crystals to be described presently. But it frequently happens, that, in some parts of the drop, many minute and circular figures are seen, rising at some little distances from the edge, which enlarging themselves continually, appear at last of a star-like form (*c, c*). The crystals in the middle seldom appear till the fluid seems almost wholly evaporated; when, on a sudden, many straight lines appear pushing forwards, whose sides or edges are jagged, and from which other similar straight and jagged lines shoot out at right angles with the first. These again have other small ones of the same kind shooting out likewise from themselves, and compose altogether a most beautiful and elegant configuration (*D*). Each of these lines increasing in breadth towards its end, appears somewhat club-headed (*e, e, e*). Sometimes, instead of sending branches from their sides, many of these lines rise parallel to each other, resembling a kind of pallisade, and having numberless minute transverse lines running between them (*F*). But the most wonderful part of all, though not producible without an exact degree of heat and right management, is the dark ground work (*G*). It consists of an infinity of parallel lines, having others crossing them at right angles, and producing a variety scarce conceivable from lines disposed in no other manner: the direction of the lines (which are exquisitely straight and delicate) being so frequently and differently changed, that one would think it the result of long study and contrivance. During the time this ground work is framing, certain lucid points present themselves to view most commonly on one side. These grow continually larger, with radiations from a centre, and become star-like figures as before mentioned. Some of them send out long tails, which give them the appearance of comets: and at the end of all, a dark lineation in various directions darts frequently through,

and occupies all or most of the spaces between them, making thereby no ill representation, when viewed by candle-light, of a dark sky, illuminated with stars and comets. The regular crystals are often formed in the same drop with the others (*f*).

5. *Borax.* If a drop of solution of borax is held too long over the fire, it hardens on the slip of glass in such a manner that no crystals can appear. The best method is to give it a brisk heat for about a second, and then applying it to the microscope, the crystals will quickly form themselves as represented in the figure.

6. *Sal ammoniac* begins with shooting from the edges great numbers of sharp, but thick and broad, spiculæ; from whose sides are protruded, as they rise, many others of the same shape, but very short; parallel to each other, but perpendicular to their main stem (*1*). These spiculæ arrange themselves in all directions; but for the most part obliquely to the plane from whence they rise, and many are frequently seen parallel to one another (*1, 1*). As they continue to push forwards, which they do without increasing much in breadth, some shoot from them the small spiculæ only (*2*); others divide in a singular manner by the splitting of the stem (*3*); and others branch out into smaller ramifications (*4*). Before the middle of the drop begins to shoot, several exceedingly minute bodies may be discerned at the bottom of the fluid. These in a little while rise to the top, and soon distinguish their shape as at (*5*). Their growth is very quick, and for some time pretty equal; but at last some branch gets the better of the rest, and forms the figure (*6*). The other branches enlarge but little after this, all the attraction seeming to be lodged in that one that first began to lengthen; and from this, more branches being protruded, and they again protruding others, the whole appears as at (*8*). It is not uncommon to see in the middle of the drop some crystals, where, instead of the straight stems above described, there is formed a kind of zig-zag, with spiculæ like those in the other figures (*7*).

7. *Salt of Lead, or saccharum saturni.* A little of this salt dissolved in hot water, which it immediately renders milky, after standing a quarter of an hour to subside, is in a fit condition for an examination by the microscope. A drop of it then applied on a slip of glass, and held over the fire to put the particles in action, will be seen forming round the edge a pretty even and regular border of a clear and transparent film or glewy substance (*aaaa*); which if too sudden and violent a heat be given, runs over the whole area of the drop, and hardens so on the glass as not to be got off without great difficulty. But if a moderate warmth be made use of, which likewise must not be too long continued, this border proceeds only a little way into the drop, with a kind of radiated figure composed of fine lines, or rather bundles of lines, beginning from the centres in the interior edge of the border, and spreading out at nearly equal distances from each other every way, towards the exterior (*bbbb*). From the same centres are produced afterwards a radiation inwards, composed of parallelograms of different lengths and breadths; from one, and sometimes both the angles of these, are frequently seen shootings so exceedingly slender, that they are

Crystallization.

perhaps the best possible representations of a mathematical line. The extremities of the parallelograms are generally cast off at right angles; but they are sometimes also seen oblique (*cccc*). Centres with the like radii issuing from them, and some of the glutinous matter for their root, are sometimes formed in the drop, entirely detached from the edges; and in these it is very frequent to find a kind of secondary radii proceeding from some of the primary ones; and others from them again to a great number of gradations, forming thereby a very pretty figure (*D*).

8. *Salt of Tin*, produces at the edges of the drop a number of octaedra, partly transparent, standing on long necks, at small distances from each other, with angular shoots between them (*aa*). At the same time, solid and regular opaque cubes will be seen forming themselves in other parts of the drop (*bb*). In the middle of the same drop, and in several other parts of it, very different figures will also be formed; particularly great numbers of flat, thin, transparent, hexangular bodies (*ccc*); some among which are thicker (*e*), and a few appear more solid, and with six sloping sides rising to a point, as if cut and polished (*d*). The figure (*f*) is composed of two high pyramids united at their base. Some in this kind of form are found truncated at one of their ends, and others at both. Several of the hexagonal bodies may be observed with sloping sides, forming a smooth, triangular, rising plane, whose angles point to three intermediate sides of the hexagon (*g*).

9. *Epsom Salt*, begins to shoot from the edge in jagged figures (*a*). From other parts differently figured crystals extend themselves towards the middle, some of which have fine lines proceeding from both sides of a main stem, in an oblique direction; those on one side shooting upwards in an angle of about 60°, and those on the other downwards in the same obliquity (*cf*). Others produce jags from their sides nearly perpendicular to the main stem, thereby forming figures that resemble some species of the polipody (*e*); but in others the jags are shorter (*d*). Now and then one of the main stems continues shooting to a considerable length, without any branchings from the sides; but at last sends out two branches from its extremity (*g*). Sometimes a figure is produced having many fine and minute lines radiating from a centre (*b*). The last shootings in the middle of the drop (*b*) are not unlike the frame-work of the flooring or roofing of a house, but with the angles oblique: and sometimes a form of another kind presents itself (*i*).

10. *Scarborough Salt*, begins to shoot from the edges: first of all in portions of quadrilateral figures, much resembling those of common salt; but two of their angles, instead of 90°, are about 100°. They shoot in great numbers round the borders of the drop, having their sides as nearly parallel to one another as the figure of the drop will allow: some proceed but a little way, others farther, before they renew the shoot (*aa*). In some places they appear more pointed and longer (*b*); and sometimes, instead of the diagonal, one of the sides is seen towards the edge, and the other shooting into the middle (*c*). The middle crystals (*d e f*) seem to be of the vitriolic kind.

11. *Glauber's Salt*, produces ramifications from the side of the drop, like the growth of minute plants, but

extremely transparent and elegant (*e*). Some of them, however, begin to shoot from a centre at some distance from the edge, and protrude branches from that centre in a contrary direction (*b*). Sometimes they shoot from one, and sometimes from more sides of the central point in different varieties (*d*). Other figures are produced from different parts of the edge of the drop (*a, f, e*); but the most remarkable and beautiful crystallization forms last of all near the middle of the drop. It is composed of a number of lines proceeding from one another at right angles with transparent spaces and divisions running between them, appearing altogether like streets, alleys, and squares, (*g g*). When this crystallization begins, it forms with great rapidity, affording the observer a very agreeable entertainment: but its beauty is of very short duration: in a few moments it dissolves and vanishes like melted ice, which renders the drawing of it very difficult.

12. *Salt of Jesuits bark*. The few shootings which the salt produces at the edge of the drop are of no regular figure (*a*). The whole area becomes quickly filled with great numbers of rhombi, of different sizes, extremely thin and transparent (*b*). Some of these enlarge greatly and acquire a considerable thickness, forming themselves into solids of many sides, (*c, c*). Near the conclusion some crystals of sea-salt are formed (*dd*), and likewise a few odd triangular figures (*e*).

13. *Salt of Liquorice*, begins shooting from the edge with a sort of rhombic spiculæ (*a*). Some four-branched figures like those of vitriol commonly appear, but moulder away before their ramifications are completed, leaving only their stamina behind (*bb*). The middle of the drop is usually overspread with great numbers of parallelograms, some exceedingly transparent, being mere planes; having sometimes one, sometimes more, of the angles canted in such a manner as to produce pentagonal, hexagonal, and other figures. Others have much thickness, and form parallelopipeds or prisms (*c*). Some of the plane figures now and then protrude an irregular kind of shooting which appears very pretty (*d*).

14. *Salt of Wormwood*. The first shootings of this salt from the edges of the drop appear of a considerable thickness in proportion to their length: their sides are deeply and sharply jagged or indented, being made up of many somewhat obtuse angles, and their ends pointed with angles of the same kind (*a*). But other shoots frequently branch out from these original ones, and they again send forth others, making altogether a very pretty appearance (*bb*). The crystals of this salt are very different from each other, consisting of squares, rhombi, parallelograms, &c. (*c*).

15. *Salt of Tobacco*. If a moderate degree of heat is given to a solution of this salt its first shootings will be from the edges of the drop, in slender tapering figures, ending with very sharp points, but at considerable distances from one another. Along with these are formed other crystals, nearly of the same kind, but entirely detached, and farther within the drop, having the thicker ends towards the centre of the drop, and the sharp points turned towards its edge (*a*). When a little more heat has been given, other spiculæ are produced from the edge, whose ends spread on either side, and then terminate in a point; and

Crystallization.

Crystallization. and which have all along their sides triangular pointed crystals, placed alternately so as to represent a zig-zag, with a line drawn through its middle (*b*). The regular crystals are produced in the middle of the drop, and are either hexagons or rhombi (*c*). When the moisture is nearly exhale, there are sometimes seen to shoot from, or rather under the spiculæ, upon the plane of the glass, a representation of leaves very small at their first appearance, but gradually increasing (*d*). A violent agitation may be discovered in the fluid by the first magnifier during the whole process: but especially at the beginning, and extremely minute crystals rising from the bottom.

16. *Salt of Hartshorn.* On the application of a very small degree of heat, salt of hartshorn shoots near the edges of the drop into solid figures somewhat resembling razors or lancets, where the blade turns into the handle by a clasp (*d*). The crystals of this salt are produced with great velocity, and are somewhat opaque, shooting from the edges of the drop, on both sides a main stem, and with a kind of regularity, rugged branches like those of some sorts of coral (*a a*). But sometimes, instead of these branches, sharp spiculæ, some plain, and others jagged, are protruded to a considerable depth on one side only (*b*). As the fluid exhales, some one of the branching figures generally extends to a great length, producing on one side shoots that are rugged and irregular, and on the other curious regular branches resembling those of some plant (*c*).

17. *Salt of Urine,* shoots from the edges of the drop in long parallelograms like nitre (*a a*). But in other places, along the sides of the drop solid angles are formed, that seem to be the rudiments of common salt (*b*). Some of the parallelograms increase much in size, and spread themselves in the middle, so as to change their first figure, and become three or four times bigger than the rest: and these have a dividing line that runs through their whole length from end to end, whence issue other short lines at small distances, opposite to one another; all pointing with the same degree of obliquity towards the base (*c c*). Among these enlarged figures, some few shoot still forward and tapering towards a point, but, before they form one, swell again, and begin as it were anew; and thus they proceed several times before their figure is quite finished (*a a*). The figures 1, 2, 3, 4, 5, 6, are the regular crystals of this salt when it is allowed to dissolve in the air, and no heat at all is given.

18. *Rheum,* or the clear liquor which distills from the nostrils when people catch cold, is strongly saturated with salt. A drop of it on a slip of glass will soon crystallize in a beautiful manner, either with or without heat; but if heated to about the warmth of the blood, and when viewed through the microscope, many lucid points will be seen rising and increasing gradually, till their form is shown to be quadrangular, with two transparent diagonals crossing each other (*d d*). These diagonals shoot soon after far beyond the square, protruding other lines at right angles from their sides; and thus they go on to form the most elegant and beautiful crystals (*b b, c c*). When a drop of rheum is set to crystallize without any heat, instead of branched crystals over the whole area, such are formed only in the middle; but, about the edges, plant-like figures are

produced shooting several stems from one point, and resembling a kind of sea-moss (*E*).

19. *Camphire,* though insoluble in water, dissolves very readily in spirit of wine. A drop of this solution spread upon a slip of glass crystallizes instantly in the beautiful manner represented in the figure.

20. *Manna* easily dissolves in water, and a drop of the solution is a very pretty object. Its first shootings are radiations from points at the very edge of the drop: the radiating lines seem opaque, but are very slender (*a a a*). Amongst these arise many minute transparent columns, whose ends grow wider gradually as they extend in length, and terminate at last with some degree of obliquity (*b*). Some few figures radiating from a centre every way, and circumscribed by an outline, are produced within the drop (*d d*). But the most surprising and elegant configuration is composed of many clusters of radiations shooting one from another over great part of the drop, and making all together a figure not unlike a certain very beautiful sea-plant (*C*).

The phenomena of crystallization have much engaged the attention of modern chemists, and a vast number of experiments has been made with a view to determine exactly the different figures assumed by salts in passing from a fluid to a solid form. It does not, however, appear, from all that has yet been done, that any certain rule can be laid down in these cases, as the figure of saline crystals may be varied by the slightest circumstances. Thus, sal ammoniac, when prepared by a mixture of pure volatile alkali with spirit of salt, shoots into crystals resembling feathers; but if, instead of a pure alkali, we make use of one just distilled from bones, and containing a great quantity of animal oil, we shall, after some crystallizations of the feathery kind, obtain the very same salt in the form of cubes.

Such salts as are sublimeable crystallize not only in the aqueous way by solution and evaporation, but also by sublimation; and the difference betwixt the figures of these crystals is often very remarkable. Thus sal ammoniac by sublimation never exhibits any appearance of feathery crystals, but always forms cubes or parallelepipeds. This method of crystallizing salts by sublimation has not as yet been investigated by chemists: nor indeed does the subject seem capable of investigation without much trouble; as the least augmentation of the heat beyond the proper degree would make the crystals run into a solid cake, while a diminution of it would cause them fall into powder. In aqueous solutions, too, the circumstances which determine the shapes of the crystals are innumerable; and the degrees of heat, the quantity of salt contained in the liquor, nay, the quantity of liquor itself, and the various constitutions of the atmosphere at the time of crystallization, often occasion such differences as seem quite unaccountable and surprising.

Mr Bergman has given a dissertation on the various forms of crystals; which, he observes, always resemble geometrical figures more or less regular. Their variety at first appears infinite; but by a careful examination it will be found, that a great number of crystals, seemingly very different from each other, may be produced by the combination of a small number of original figures, which therefore he thinks may be called *primitive*. On this principle he explains the formation

Crystallization.

5
Excessive
variety in
the forms
of crystals.

6
Mr Bergman's
account of
their formation.

of

CrySTALLIZATION. of the crystalline gems as well as salts; and the results of his observations are as follow.

I. One of the primitive forms is that named by our author *spathaceous*; and these, he says, properly agglutinated, may form the great variety of dissimilar bodies found among crystals.

7
Of the
schoerlaceous crystal.
In the calcareous spar we find a combination of rhombi, whose obtuse angles contain $101\frac{1}{2}$ degrees, and the acute $78\frac{1}{2}$. By a combination of these is formed the calcareous spar, which appears in the form of a tessera or oblique parallelopiped; but by other combinations of the same planes, crystals apparently of the most opposite forms may be generated. Thus, for the formation of an hexaedral prism, consisting of six equal and similar parallelograms terminating at both ends in three rhombi which form a solid angle, we have only to suppose a continual addition of rhombi equal, similar, and parallel to the oblique parallelopiped or crystal of the calcareous spar. Thus, suppose the figure ABCDE (fig. 1.) to represent a nucleus of the kind just mentioned, the axis of which passes through the two opposite angles BE; it is evident, that by a continual application of rhombi, such as FG, HI, &c. to both sides of the axis, we shall at last produce the figure AB, fig. 2. and which represents the hexaedral prism required. This kind of crystal, our author tells us, belongs chiefly to the stones called *schoerls*, and is therefore called the *schoerlaceous* form. It belongs likewise to some others of the calcareous tribe.

Plate
CL.III.
8
Garnet crystal.
From the schoerlaceous crystal that of the garnet is easily produced by a stoppage of the accumulation of the planes as soon as the sides of the prism have acquired a rhomboidal figure. Thus a complete dodecahedron is formed, which is always the figure of the garnet when perfect.

9
Hyacinth.
The figure of the garnet is easily changed into another, frequently assumed by the hyacinth, by the regular application of equal and similar rhombi to each of the solid angles, which angles are formed by four planes. The garnet, when complete, has six angles composed of four planes, and eight with three. The formation of this kind of crystal will be understood from an inspection of fig. 3. In this operation the four rhombi are changed into an equal number of oblong hexagons; L H A B into L H h a b B: and so of the other rhombi represented by the different letters of the figure.

10
Pyramidal crystals.
In some cases the original planes decrease according to a certain law; and this, from whatever cause it may arise, must necessarily change the appearance of the terminating planes, and occasionally either augment or diminish their number. Thus, instead of a prism, we shall have a double pyramid, one tending upwards and other downwards, as will be easily understood from what has been already said. This is the form assumed by the calcareous crystals commonly called *pig-tooth* by the miners.

If the decreasing series of rhombi is stopped before they vanish ultimately in a point, the formation of truncated pyramids, of which many examples are to be met with in the mineral kingdom, must necessarily take place. In cases of this kind, it is easy to see why the pyramids, if struck in one direction, will break over smoothly and easily, but not in another.

It is not uncommon to find the original crystals themselves imperfect; in which case the large crystals, formed by combining them together, must deviate more or less from the perfect form. Thus, let A B C D E F G (fig. 4.) represent the three rhombi which constitute the apex of a perfect schoerlaceous crystal; and let us next suppose the rhombus A G truncated in the direction of the line *ab*, C G along *cd*, and E G along *ef*. Thus, the regular hexagonal figure of the prism A B C D E F will be changed into an irregular one *abcdDefF*, consisting of nine unequal sides, whose apex is composed of three irregular pentagons, *abBGF*, *cdDCB*, and *efFGD*. The rough tourmalins of Tyrol and Ceylon particularly assume this form, though it sometimes belongs to bodies both of the calcareous and schoerlaceous kind.

11
Triangular crystals.
Triangular crystals may be supposed to arise from those of the pentagonal kind; it being obvious, that the periphery of a pentagon, as *abBGF*, approaches more nearly to a triangle in proportion as the distance between *ab* and B F grows less: and when these distances vanish entirely, a triangular prism is formed, terminated by three triangles: if the cutting line *ab* approach still nearer to the centre G, the form still remains the same.

12
Varieties of the garnet crystal.
Let us now suppose, that the garnet crystal, whose shape is represented fig. 5. instead of complete rhombi, has others accumulated about its axis, whose three external angles are truncated; or, which is the same thing, if the longitudinal margins of the prism be cut by planes parallel to the axis, crystals will be formed, whose shape is represented by the small letters in the figure. Calcareous crystals are sometimes found of this shape; but generally so low, that *e* nearly coincides with *a*, *c* with *d*, &c. and hence the pentagon *abcde* becomes almost of a triangular figure, which has been attributed to these crystals by some authors who did not understand their true origin. The pyritaceous crystals sometimes afford instances of this kind complete. Sometimes the garnet consists of 24 sides, by having all the margins truncated; a change which may easily be understood from what has been already mentioned. If the intersection *cd* of the planes *ec* and *cr* fall without the plane B G, a figure of a very different kind will be generated.

13
Cruciform hyacinthine crystal.
Sometimes the hyacinthine crystal assumes the cruciform appearance A B C D E F G H I K L M, fig. 6. Here the apex is at C, the figure A B C *bca* being all in the same inclined plane, which is the case with the other three homologous figures. Now, in order to investigate the formation of these crystals, let us suppose the rhombi CO, CP, and CQ, to be completed, which to an eye placed in the high axis C, will appear like as many squares situated in the subjacent plane. Thus we may understand the formation of the crystals of granite as well as of the hyacinth. The former may be supposed a quadrangular prism composed of four rhombi, touching one another only at their apices, and terminated at each end by four rhombi meeting at the apex. When this form is a little protracted, or augmented by applying to the apices, similar and equal planes, it becomes that of the hyacinth; whence the granite crystal may be called the rudiment of the hyacinth also. The variety here mentioned

Crystallization. mentioned, of hyacinthine crystals, is met with in the Hartz mines. Mr Ehrhart says, that they are of a siliceous, and not of a calcareous, nature.

15
Other varieties of the forms of crystals.

If planes similar to one another, but dissimilar to the fundamental ones, be added, a vast variety of shapes may be produced, of which it is needless to give more examples at present. Our author appeals to experience for the truth of it; and asserts, that the loose texture of calcareous crystals will clearly show their construction, if carefully and completely broken. The harder crystals can scarcely be broken in such a manner as to show their structure; but the schoerls discover it very plainly, and even the garnets show themselves to be composed of laminæ.

“ Finally (says Mr Bergman), we may add one particular observation concerning prismatic and hexagonal calcareous crystals truncated perpendicularly; such sometimes occur, and they cannot derive their origin, in the manner above described, from the spathaceous particles, and by no other way can hexagonal prisms be generated. What, then, is the cause which destroys their apices? I confess this to be a question which I am wholly unable to answer, unless we may assume an accumulation of planes more and more deficient around the axis. We may from hence conclude, that something unusual occurs; as the truncated extremity is opaque, while the rest of the prism is transparent; but the upper hexagonal section is smooth and polished.”

On the whole, our author observes, that the greatest varieties may occur in the figures of crystals, though all of them may be generated from those of the spathaceous form, and the substance of all may be ultimately the same; whence we should be induced to put but little confidence in the figure. “ If, then, (says he), this test, which undoubtedly is the most remarkable so far as externals reach, is of so little use, of what value can the others be? and with what success can we hope to form a system of mineralogy upon such distinctions? External criteria should certainly not be neglected, but he who trusts implicitly to them deceives himself.”

16
Of the minute constituent parts of crystals.

II. From a consideration of the larger lamellæ of which crystals are composed, our author naturally proceeds to an investigation of their smaller constituent parts. Here he is of opinion, that the different external appearance of all crystals is owing to varieties in their mechanical elements. A question, however, occurs, Whether those very minute molecules, which may, as it were, be called the *stamina* of crystals, be naturally possessed of a determinate angular figure, or whether they acquire it by crystallization? In answer to this, he mentions the following facts, which he has had an opportunity of observing himself.

1. “ If the small particles which separate from lime-water, when exposed to the air, be inspected with a microscope, they will be found spathaceous.

2. “ The greater spathous tessellæ, when accurately examined, are frequently found with striæ running diagonally, such as often appear in saline crystals, by which their internal structure is discovered.

3. “ The cubes of common salt not only exhibit diagonal striæ, but frequently, upon each side, show squares parallel to the external surface, and gradually decreasing inwards (fig. 7.), by which we discover their internal structure: for every cube is composed of

Crystallization. six quadrangular hollow pyramids, joined by their apices and external surfaces; each of these tiled up by others similar, but gradually decreasing, completes the form. By a due degree of evaporation, it is no difficult matter to obtain these pyramids separate and distinct, as in fig. 8. or six of such, either hollow, or more or less solid, joined round a centre. This is the whole course of the operation from beginning to end. This takes place in the salited vegetable alkali, or *sal digestivus Sylvii*; in the crystallized luna cornea; the galena or sulphurated lead; and quadrangular nitre, which is of the spathaceous form, produces a similar congeries of pyramids, and these almost equally distinct with the preceding cubic crystals. A solution of alum, upon evaporation, generally produces solid octædra; but sometimes also it exhibits hollow pyramids, and upon such of them as are complete, the junctures are very distinctly marked by conspicuous lines.

4. “ Sometimes, too, other salts indicate the same construction by visible diagonals. Fig. 9. represents a section of the hexagonal prism formed by Rochelle salt. The arrangement of the internal particles of this salt cannot be known when the crystal is complete: but when it is formed on the bottom of the vessel, as represented fig. 10. the lower side cannot be perfect; and this parallelogram exhibits two diagonals distinctly, as represented fig. 11. This is likewise the case with the salt extracted from human urine, called *microcosmic salt*. Besides, we should observe of the vertical triangles, that they are alternately transparent and opaque in pairs; which plainly points out a difference in the situation of their elements. Some crystals of nitre are also marked with diagonals; a circumstance which in others is generally concealed by the close connection of the particles.

5. “ If we examine the hollow pyramid of common salt farther, we shall find it composed of four triangles, and each of these formed of threads parallel to the base; which threads, upon accurate examination, are found to be nothing else than a series of small cubes: Therefore, although the above circumstances seem plainly to point out the formation of all crystals from the union and cohesion of pyramids, whose sides, being different in form and magnitude, occasion the differences of forms; it yet remains uncertain whether the same internal structure takes place in those whose minuteness renders them totally invisible; and whether the primary stamina possess a determinate figure, or are composed by the union of many shapeless particles. We have long known, that the smallest concretions which are visible by a microscope possess a determined figure: but these are compounds. In the mean time, until this veil be removed in some measure at least, we cannot avoid comparing the process of crystallization with the congelation of water.

“ While the watery particles are concreting, they exert a double tendency; by one of which they are formed into spiculæ, by the other these spiculæ are ranged in such a manner with respect to one another as to form angles of 60 degrees: from hence the varieties observed in the particles of snow may be easily explained. The most simple figure is that where six equal radii diverge from a centre in the angle above-mentioned, as in fig. 12. The same angle will be preserved if the extremities of these be joined by right lines; which will also be the case, if each of the tri-

CrySTALLIZATION. angles thus formed be filled with right lines parallel to the base, as in fig. 13.

“ Let us now suppose the particles which are employed in crystallization endowed with a tendency to form spiculæ, and these spiculæ with a tendency to arrange themselves at equal angles of inclination, and we shall have both the triangles and the pyramids composed of them, even although the primary stamina had not a determined figure. As the angles of inclination vary, the triangles and pyramids will also vary; and hence the different forms of crystals will be produced, which may to a certain degree be investigated geometrically, the angles being given.

17
Different ways in which they may be produced.

III. Mr Bergman now considers the various ways in which crystals may be produced; which are, 1. By water; 2. By a liquefying heat; 3. By a volatilizing heat.

1. The most common method of obtaining crystals is by means of water; as by this medium saline substances are very readily taken up, and appear again in a solid form when the liquid is properly diminished by evaporation. It is not only when dissolved in water that they acquire determinate forms; this happens also when they are sufficiently attenuated and mixed with it; for substances not soluble in water will remain suspended in it, when, by sufficient division, they have acquired as much surface as makes them approach the specific gravity of the fluid; and it seems very probable, that many of the earths met with in the mineral kingdom, which have a regular form, have coalesced in this way. We must, however, carefully distinguish between mechanical mixture and true solution, even though both should agree in weight. When solid bodies are mechanically mixed with water, they will remain at the bottom of the vessel if laid there in powder, unless diffused by agitation; but soluble substances totally and spontaneously distribute themselves through the menstruum even without any agitation, though this certainly accelerates the solution.

2. Another method of obtaining crystals is by fusion and slow cooling. Thus sulphur, when melted and cooled, shoots into long striæ, acquiring at the same time an electrical property: bismuth, zinc, and regulus of antimony, acquire a tessellated appearance; nay, the last of these, when set to cool in a conical mould, becomes stellated, not only on the upper surface or basis of the mass, but along the whole axis. Glass also, when melted and slowly cooled, will sometimes shoot into beautiful crystals. Our author mentions his having sometimes seen the scoria of furnaces, where iron had been melted with the addition of calcareous earth, of a regular prismatic figure; and when crude iron has been melted with lime, he has sometimes also found complete octaedra in the scoria. In large metallic masses, however, the under parts are generally so much pressed by the weight of those above, that they show no signs of crystallization, though beautiful crystals are often formed on the surface of gold, silver, iron, &c.

3. The particles of bodies volatilized by heat, if during cooling they are sufficiently at liberty, often obey the laws of attraction, and form crystals. To this class we may refer those which are condensed from the vapours of regulus of antimony, called the *flores argentine*. The galena which is frequently interspersed among the copper-ore at Fahlen sends forth a vapour which condenses on the upper strata, forming hollow

pyramids, which are the bases of the cubes of galena, entirely similar to those which compose common salt. In the heaps of arsenical ore exposed to the fire at Loefa, our author has collected very beautiful crystals, of white, yellow, and red colours, partly tetrahedral and partly octahedral. Some of these exhibit hollow pyramids, whose sides consist of threads parallel to the base, and exactly similar to those formed in the moist way. These crystals, when complete, frequently show the junctures of the pyramids very distinctly by straight lines; and by careful examination, we may be able to trace the whole process through its various steps, from the very beginning to the end of the operation.

Prisms of any kind may be formed by the apices of proper pyramids meeting together in a certain number round the same point. The apex may also be formed by a single pyramid, having its vertical angle turned outward. Thus, by adding to the cube ABCD the quadrangular pyramids ABE DCF, we shall have a four-sided prism (fig. 16.); and thus, though very seldom, common salt sometimes acquires an apex. If we apply to one or both of the apices of the octaedron ACBD, fig. 17. a hollow pyramid *adb*, similar and equal to the fundamental figure, we will have a prism of the same kind: alum, however, has never been observed of a prismatic form by our author, though sometimes consisting of octaedra imperfectly joined together, as in fig. 18. Four sided pyramids may be composed of four tetrahedra, and consequently 24 of the same may make up a cube; “ and (says our author) it has also a double apex of 32. Thus we have a new construction, which undoubtedly sometimes takes place; for, as I have already said, arsenical crystals sometimes take the tetrahedral, sometimes the octahedral, form, which may therefore easily be mutually exchanged.

“ It is with less facility that hexagonal prisms are formed of such pyramids as have the same number of sides, unless tetrahedra be admitted. In fig. 19. four hexagonal and six tetragonal pyramids meet; the former are easily resolved into six and the latter into four tetrahedra (fig. 20.); 48 of which consequently make up the whole mass, supposing this to be the method followed by nature. I have no doubt that this construction is probable on many accounts; for it requires only the most simple elements, and such as are conformable to the figures of all crystals. That tetrahedra adapted to this purpose have sometimes dissimilar and unequal sides, makes not against the supposition: but what is most to the purpose is, that sometimes such tetrahedra are employed without the smallest doubt. All these circumstances are of no small weight; but as long as no traces of tetrahedra are to be found among the pyramids of common salt, the laws of sound reasoning forbid us to draw any general conclusion. I am perfectly certain that nature does frequently employ pyramids in this operation; it remains for future experiments to determine whether this be always the case.”

IV. We come now to consider the ultimate cause of crystallization, concerning which there have been many different theories. Some have been of opinion that there cannot be any crystallization without a saline principle in some degree existing in the crystallizing substance. This opinion, however, is opposed by Mr Bergman on the following grounds:

1. He supposes crystallization to be an effect of attraction;

CrySTALLIZATION.

18
Formation of prisms of various kinds.

19
Different theories of crystallization.

Crystallization. traction; consequently, as all other matters as well as salts are subject to the laws of that attraction, we cannot consider the regular and symmetrical form in which they arrange themselves as peculiar to saline bodies; and hence crystals are also produced by such methods as will sufficiently attenuate and disengage the integrant parts from each other.

2. The more simple that any saline body is, and the more free from any kind of heterogeneous matter, the more difficult it is to reduce it into a crystalline form. Thus the pure acids and caustic alkali cannot be made to assume the form of crystals without the greatest difficulty.

3. The similarity of forms in crystals, Mr Bergman observes, "does not depend upon the acid; as the prismatic and quadrangular nitre are formed from the same acid, though joined indeed to different alkalies. Neither is the basis sufficient to determine the figure; for the vegetable, as well as the mineral alkali, when saturated with marine acid, will produce cubical crystals. The external appearance, therefore, depends on the menstruum and the base jointly. We are not, however, to imagine from thence that there is present a neutral or middle salt whenever the figure of such a one is discoverable; for not the smallest particle of alum is found in nickel or lead when united with nitrous acid, though both these compounds yield octaedra crystals." Here we may again remark, that the figure of crystals depends upon circumstances altogether unknown, of which Dr Eason, in a paper on this subject in the Manchester Transactions, gives a remarkable instance in gypsum, which is known to be a combination of the vitriolic acid with a calcareous basis; yet this compound is found naturally crystallized in five ways, so very different from each other, that mineralogists have distinguished them by five distinct names, viz. Lapis specularis. 2. Striated gypsum. 3. Gypseous alabaster. 4. Selenites properly so called. 5. A gypseous spar frequently adhering to the veins of ore in mountains. All of these, when chemically examined, exhibit precisely the same phenomena, and are really nothing but different crystallizations of the same compound salt.

4. Mr Bergman likewise observes, that there is a great variety in the forms of crystals, though the matter remains the same; of which examples have been given in the calcareous crystals, and in the different kinds of gypsum just mentioned. Among the pyrites also we meet with cubes striated in a very singular manner; the lines of one side being perpendicular to those which distinguish the different sides, as represented fig. 14.; but among these there are likewise tetraedra, octaedra, dodecaedra, and icosaedra, to be met with.

5. A great number of crystals are either totally destitute of any saline matter, or possess it in such a small degree that no experiments hitherto tried have been able to discover the smallest sensible traces of it. Thus mica sometimes shoots into hexangular prisms composed of parallel lamellæ, the elementary spiculæ of which are disposed as in fig. 15.; gems, schoerls, granites, and other earthy bodies, are frequently found figured, though no saline matter can be discovered by analysis; and the same holds good of gold, silver, lead, tin, bismuth, and zinc, united with mercury, all of which regular forms, according to the quantity of the mercury.

"If we have recourse (concludes Mr Bergman) to

the supposition of an hidden saline substance which cannot be discovered by art, it must surely be unreasonable to attribute to such a principle so great a power as that of arranging the particles in the order necessary for crystallization; a cause, beyond question, unequal to the magnitude of the effect: for how is it possible that a saline matter, the presence of the smallest atom of which cannot be discovered by the most delicate tests, shall in pure water have yet power to effect the icy crystallization with such force as to overcome the strongest obstacles? How can a saline matter, which by no test can be discovered, have power, in an amalgam of gold, to arrange the ponderous particles of both metals in a particular manner? What salt is able to form the stellated regulus of antimony? What the hexagonal lamellæ of mica?"

On this subject we may remark, that whether we affirm or deny a saline principle to be the cause of crystallization, the ultimate power by which it is effected must be equally unknown. A saline principle can make other bodies crystallize along with it only by virtue of the disposition it has of itself to assume a crystalline appearance; and we must therefore seek for the cause of this crystallization of the salt, as well as of the substance with which it is mixed. Mr Bergman, as well as others, have endeavoured to account for this on the principle of attraction; but with little success. Sir Isaac Newton supposes the particles of salt to be diffused through the solvent fluid at equal distances from each other; on which account he concludes that they must come together in regular figures. Mr Bergman considers the particles which form saline substances as endowed with a twofold tendency: one to arrange themselves in spiculæ, the other for the spiculæ to arrange themselves at certain angles of inclination; and as these angles vary, different forms of crystals must be produced. Both these effects, he thinks, may be owing to the same cause, viz. a mutual attraction between the particles; which, according to the various shapes and particular figures of the atoms, at one time arranges them in the form of spiculæ, and again connects the spiculæ already formed under different angles of inclination.

This seems to be much the same with what other chemists understand by the *polarity* of the saline particles, by which they are arranged in certain directions. All this, however, is totally insufficient to explain the phenomenon. If, according to Sir Isaac Newton's supposition, the particles were brought together by a general attraction, after being placed at equal distances by the solvent for some time, we must expect to find all kinds of salts crystallized in the same manner, or rather running into one solid lump. The arrangement of the particles, or their tendency to arrangement, assigned by Mr Bergman as a cause, is only explaining the phenomenon by itself; for it is the *cause* of this tendency which is the point in question. Now, that the attraction of the saline particles to each other cannot be the cause of crystalline arrangements, is evident from the following considerations: 1. The crystals of every kind of salt contain water as an essential part of their composition; and if deprived of this, they lose their crystalline form entirely, and fall into powder. It is plain, therefore, that the saline particles attract not only one another, but some part of

Crystallization.

20
All of them
insufficient.

CrySTALLI-
zation
Ctesibius.

the water which dissolves them; whence it seems probable that the processes of crystallization and vegetation are analogous to each other. This is likewise confirmed by the many curious vegetations of salts known by the name of *efflorescences*. These cannot be owing merely to attraction; because they frequently protrude from a large saline mass, in which they ought rather to be detained by the attraction of the rest. Thus, if a quantity of the residuum of Glauber's spirit of nitre distilled with a large proportion of vitriolic acid, be exposed to a moist air, beautiful ramifications somewhat resembling shrubs will sometimes shoot out to the length of more than an inch. This surely cannot be the effect of attraction; but rather of some repulsive power by which the particles of the large mass at first tend to separate from one another †. 2. Attraction, in such a manner as would dispose the particles into certain determinate forms, cannot take place where they are all homogeneous, which must be the case with metals; all of which are capable of forming crystals when slowly cooled; such crystallizations, therefore, must be produced by some other power.

† See *Efflorescence*.

Mr Bergman considers the congelation of water as a species of crystallization; and in order to prove the similitude, he takes notice, that it is by means of the matter of heat that this element becomes fluid. He observes likewise, that salts, in the act of crystallizing, part with heat as water does in the act of being converted into ice. It would seem, therefore, that the particles were arranged in certain forms by the action of the heat when passing from a latent to a sensible state. From a late experiment, it would seem that the electric fluid was principally concerned. This was first discovered by Lichtenberg, and consists only in sprinkling powdered rosin upon an electrophorus, which in certain circumstances arranges itself into stars with radii similar to those of the crystals of snow. See ELECTRICITY.

CRYSTALS, in chemistry, salts or other matters shot or congealed in the manner of crystal. See CHEMISTRY-Index; and CRYSTALLIZATION.

CTESIAS, a native of Cnidos, who accompanied Cyrus the son of Darius in his expedition against his brother Artaxerxes; by whom he was taken prisoner. But curing Artaxerxes of a wound he received in the battle, he became a great favourite at the court of Persia, where he continued practising physic for 17 years, and was employed in several negotiations. He wrote the History of Persia in 23 books, and a History of the Indies: but these works are now lost, and all we have remaining of them is an abridgement compiled by Photius. The most judicious among the ancients looked upon Ctesias as a fabulous writer; yet several of the ancient historians and modern Christian writers have adopted in part his chronology of the Assyrian kings.

CTESIBIUS, a mathematician of Alexandria, about 120 years before Christ. He was the first who invented the pump. He also invented a clepsydra, or a water clock. This invention of measuring time by water was wonderful and ingenious. Water was let drop upon wheels which it turned: the wheels communicated their regular motion to a small wooden image, which by a gradual rise pointed with a stick to

the proper hours and months, which were engraved on a column near the machine. This artful invention gave rise to many improvements; and the modern manner of measuring time with an hour-glass is in imitation of the clepsydra of Ctesibius.

CTESIPHON, a celebrated Greek architect, who gave the designs for the famous temple of Ephesus, and invented a machine for bringing thither the columns to be used in that noble structure. He flourished 544 B. C.

CTESIPHON (anc. geog.), a large village, or rather a fine city, of Chalonitis, the most southern province of Assyria. It was situated on the left or east side of the Tigris, opposite to Seleucia on this side; and built by the Parthians, to rival Seleucia. Here the kings of Parthia passed the winter (Strabo); as they did the summer at Ecbatana.

CTESIPHON was also the name of several noted persons of antiquity. 1. An Athenian, who advised his fellow citizens to crown publicly Demosthenes with a golden crown for his probity and virtue. This was opposed by the orator Æschines, the rival of Demosthenes, who accused Ctesiphon of seditious views. Demosthenes undertook the defence of his friend, in a celebrated oration still extant, and Æschines was banished. 2. A Greek architect, who made the plan of Diana's temple at Ephesus. 3. An elegiac poet, whom king Attalus set over his possessions in Æolia. 4. A Greek historian, who wrote an history of Bœotia.

CUB, a bear's whelp. Among hunters, a fox and marten of the first year are also called *cubs*. See URSUS.

CUBA, a large and very important island in the West Indies, belonging to Spain. On the east side it begins at 20. 20. N. Lat. touches the tropic of Cancer on the north, and extends from 74. to 85. 15. W. Long. It lies 60 miles to the west of Hispaniola, 25 leagues north of Jamaica, 100 miles to the east of Jucatan, and as many to the south of Cape Florida; and commands the entrance of the gulphs both of Mexico and Florida, as also the windward passages. By this situation it may be called the *key* of the West Indies. It was discovered by Columbus in 1492, who gave it the name of Ferdinando, in honour of king Ferdinand of Spain; but it quickly after recovered its ancient name of *Cuba*. The natives did not regard Columbus with a very favourable eye at his landing; and the weather proving very tempestuous, he soon left this island, and sailed to *Hayta*, now called *Hispaniola*, where he was better received. The Spaniards, however, soon became masters of it. By the year 1511 it was totally conquered; and in that time they had destroyed, according to their own accounts, several millions of people. But the possession of Cuba was far from answering the expectations of the Spanish adventurers, whose avarice could be satiated with nothing but gold. These monsters finding that there was gold upon the island, concluded that it must come from mines; and therefore tortured the few inhabitants they had left, in order to extort from them a discovery of the places where these mines lay. The miseries endured by these poor creatures were such that they almost unanimously resolved to put an end to their own lives; but were prevented by one of the

Ctesiphon
Cuba.

Cuba. the Spanish tyrants called *Vasco Perceellos*. This wretch threatened to hang himself along with them, that he might have the pleasure, as he said, of tormenting them in the next world worse than he had done in this; and so much were they afraid of the Spaniards, that this threat diverted these poor savages from their desperate resolution. In 1511, the town of Havannah was built, now the principal place on the island. The houses were at first built only of wood; and the town itself was for a long time so inconsiderable, that in 1536 it was taken by a French pirate, who obliged the inhabitants to pay 700 ducats to save it from being burnt. The very day after the pirate's departure, three Spanish ships arrived from Mexico, and having unloaded their cargoes, sailed in pursuit of the pirate ship. But such was the cowardice of the officers, that the pirate took all the three ships, and returning to the Havannah, obliged the inhabitants to pay 700 ducats more. To prevent misfortunes of this kind, the inhabitants built their houses of stone; and the place has since been strongly fortified. See HAVANNAH.

According to the Abbé Raynal, the Spanish settlement at Cuba is very important, on three accounts: 1. The produce of the country, which is considerable. 2. As being the staple of a great trade; and, 3. As being the key to the West Indies. The principal produce of this island is cotton. The commodity, however, through neglect, is now become so scarce, that sometimes several years pass without any of it being brought into Europe. In place of cotton, coffee has been cultivated: but, by a similar negligence, that is produced in no great quantity; the whole produce not exceeding 30 or 35 thousand weight, one-third of which is exported to Vera Cruz, and the rest to Madrid. The cultivation of coffee naturally leads to that of sugar; and this, which is the most valuable production of America, would of itself be sufficient to give Cuba that state of prosperity for which it seems designed by nature. Although the surface of the island is in general uneven and mountainous, yet it has plains sufficiently extensive, and well enough watered, to supply the consumption of the greatest part of Europe with sugar. The incredible fertility of its new lands, if properly managed, would enable it to surpass every other nation, however they may have now got the start of it: yet such is the indolence of the Spaniards, that to this day they have but few plantations, where, with the finest canes, they make but a small quantity of coarse sugar at a great expence. This serves partly for the Mexican market, and partly for the mother-country; while the indolent inhabitants are content to import sugar for themselves at the expence of near 220,000 l. annually. It has been expected with probability, that the tobacco imported from Cuba would compensate this loss; for after furnishing Mexico and Peru, there was sufficient, with the little brought from Caracca and Buenos Ayres, to supply all Spain. But this trade too has declined through the negligence of the court of Madrid, in not gratifying the general taste for tobacco from the Havannah. The Spanish colonies have an universal trade in skins; and Cuba supplies annually about 10 or 12 thousand. The number might easily be increased in a country abounding with wild cattle where some gentlemen possess large

tracts of ground, that for want of population can scarce be applied to any other purpose than that of breeding cattle. The hundredth part of this island is not yet cleared. The true plantations are all confined to the beautiful plains of the Havannah, and even those are not what they might be. All these plantations together may employ about 25,000 male and female slaves. The number of whites, mestees, mulattoes, and free negroes, upon the whole island, amounts to about 30,000. The food of these different species consists of excellent pork, very bad beef, and cassava bread. The colony would be more flourishing, if its productions had not been made the property of a company, whose exclusive privilege operates as a constant and invariable principle of discouragement. If any thing could supply the want of an open trade, and atone for the grievances occasioned by this monopoly at Cuba, it would be the advantage which this island has for such a long time enjoyed, in being the rendezvous of almost all the Spanish vessels that sail to the new world. This practice commenced almost with the colony itself. Ponce de Leon having made an attempt upon Florida in 1512, became acquainted with the new canal of Bahama. It was immediately discovered that this was the best route the ships bound from Mexico to Europe could possibly take; and to this the wealth of the island is principally, if not altogether owing.

CUBE, in geometry, a solid body consisting of six equal sides. See GEOMETRY.

CUBE-Root of any Number or Quantity, is such a number or quantity, which, if multiplied into itself, and then again the product thence arising by that number or quantity, being the cube-root, this last product shall be equal to the number or quantity whereof it is the cube-root; as 2 is the cube-root of 8: because two times 2 is 4, and two times 4 is 8; and $a+b$ is the cube-root of $a^3 + 3aab + 3abb + b^3$. See ALGEBRA.

CUBEBS, in the materia medica, a small dried fruit resembling a grain of pepper, but often somewhat longer, brought into Europe from the island of Java. In aromatic warmth and pungency, they are far inferior to pepper,

CUBIC EQUATION. See ALGEBRA.

CUBIDIA, a genus of spars. The word is derived from *κύβη*, "a die;" and is given them from their being of the shape of a common die, or of a cubic figure. These bodies owe this shape to an admixture of lead, and there are only two known species of the genus. 1. A colourless crystalline one, with thin flakes, found in the lead-mines of Yorkshire, and some other parts of Britain; and, 2. A milky white one with thicker crusts. This is found in the lead mines of Derbyshire and Yorkshire, but is usually small, and is not found plentifully.

CUBIT, in the mensuration of the ancients, a long measure, equal to the length of a mans's arm, from the elbow to the tip of the fingers.

Dr Arbuthnot makes the English cubit equal to 18 inches; the Roman cubit equal to 1 foot 5.406 inches; and the cubit of the scripture equal to 1 foot 9.888 inches.

CUBITÆUS MUSCLES, the name of two muscles of the hand. See ANATOMY, *Table of the Muscles*.

CUBITUS, in anatomy, a bone of the arm, reaching

Cube
||
Cubitus.

Cuboides ||
Cucubalus. ing from the elbow to the wrist; otherwise called *ulna* or the *greater fossile*. Some use the word for all that part of the arm between the elbow and the wrist; including the *ulna* or *cubitus*, properly so called, and the *radius*.

CUBOIDES, or *Os CUBIFORME*, in anatomy, the seventh bone of the foot; so called from its being in form of a cube or die.

CUCKING-STOOL, an engine invented for punishing scolds and unquiet women, by ducking them in water; called in ancient times a *tumbrel*, and sometimes a *trebuchet*. In *Domesday*, it is called *cathedra stercoris*: and it was in use even in the Saxons time, by whom it was described to be *cathedra in qua rixosæ mulieres sedentes aquis demergebantur*. It was anciently also a punishment inflicted upon brewers and bakers transgressing the laws; who were thereupon in such a stool immersed over head and ears in *stercore*, some stinking water. Some think it a corruption from *ducking-stool*; others from *choaking stool*, *quia hoc modo demersæ aquis fere suffocantur*. See GASTIGATORY.

CUCKOW, in ornithology. See CUCULUS.

Cuckow-Spit, the same with froth-Spit. See FROTH-Spit, and CICADA.

CUCUBALUS, BERRY-BEARING CHICKWEED: A genus of the trigynia order, belonging to the decandria class of plants, and in the natural method ranking under the 22d order, *Garyophillei*. The calyx is inflated; the petals five, unguiculated without a nectariferous corona at the throat; the capsule is trilocular. There are 13 species, the most remarkable of which are,

1. The beken, Swedish lychnis, or gumspungar, is a native of several parts of Europe. The empalement of its flower is curiously wrought like a network, and is of a purplish colour. The leaves have somewhat of the flavour of pease, and proved of great use to the inhabitants of Minorca in 1625, when a swarm of locusts had destroyed the harvest. The Gothlanders apply the leaves to erysipelatous eruptions. Horses, cows, sheep, and goats, eat this plant.

2. The noctiflora, or night-flowering lychnis, grows naturally in Spain and Italy. It is a perennial plant, rising with an upright branching stalk, a foot and an half high, garnished with very narrow leaves, placed opposite. The upper part of the stalk branches very much; the flowers stand upon long naked footstalks, each supporting three or four flowers which have long tubes with striped empalements: the petals are large, deeply divided at top, and of a pale bluish colour. The flowers are closed all the day; but when the sun leaves them, they expand, and then emit a very agreeable scent. It may be propagated by seeds sown in the spring on a bed of light earth; and when the plants are fit to remove, they should be planted in a nursery bed at about four inches distance, where they may remain till autumn. They may then be planted in the borders where they are to remain, and will flower the following year.

3. The otites, or catch fly, is a native of Britain, and other European countries. It hath a thick, fleshy perennial root, which strikes deep into the ground

from whence rises a jointed stalk three or four feet high. At the joints there exudes a viscous clammy juice, that sticks to the fingers when handled; and the small insects which settle upon those parts of the stalks are thereby so fastened that they cannot get off. The flowers are small, and of a greenish colour. The plant is propagated by seeds. Cucullus.

CUCULUS, the Cuckow, in ornithology, a genus Pate CLI. belonging to the order of picæ: the characters of which are: The bill is smooth, and more or less bending; the nostrils are bounded by a small rim; the tongue is short and pointed; the feet and toes formed for climbing. The most remarkable species are:

1. The canorus, or common cuckow, weighs about five ounces; and is in length 14 inches, in breadth 25. The bill is black, and about two thirds of an inch in length. The head, hind part of the neck, coverts of the wings and rump, are of a dove colour; darker on the head and paler on the rump. The throat and upper part of the neck, are of a pale grey; the breast and belly white, crossed elegantly with undulated lines of black. The tail consists of ten feathers of unequal lengths; the two middle tail-feathers are black tipped with white; the others are marked with white spots on each side their shafts. The legs are short; and the toes disposed two-backwards and two forwards, like those of the wood-pecker, though it is never observed to run up the sides of trees. The female differs in some respects. The neck before and behind is of a brownish-red; the tail barred with the same colour and black, and spotted on each side the shaft with white. The young birds are brown mixed with black, and in that state have been described by some authors as old ones.

“This bird appears in our country early in the spring, and makes the shortest stay with us of any bird of passage. It is compelled here, as Mr Stillingfleet observes, by that constitution of the air which causes the fig-tree put forth its fruit; though it has been supposed that some of these birds do not quit this island during the winter; but that they seek shelter in hollow trees and lie torpid, unless animated by unusually warm weather.” Mr Pennant gives two instances of their being heard in February; one in 1771, in the end of that month; the other in 1769, on the 4th day; but after that they were heard no more, being probably chilled again into torpidity. There is a remarkable coincidence between the song of these birds and the mackarels continuing in full roe; that is, from about the middle of April to the latter end of June. The cuckow is silent for some time after his arrival; his note is a call to love, and used only by the male, who sits perched generally on some dead tree or bare bough, and repeats his song, which he loses as soon as the amorous season is over. His note is so uniform, that his name in all languages seems to have been derived from it; and in all countries it is used in the same reproachful sense:

The plain-song cuckow grey,
Whose note full many a man doth mark,
And dares not answer nay. Shakespeare.

The reproach seems to arise from the cuckow's making use of the bed or nest of another to deposit its eggs in, leaving the care of its young to an improper parent;

Cuculus. parent; but Juvenal with more justice gives the infamy to the bird in whose nest the supposititious eggs were laid:

Tu tibi nunc corruca places.

† Part II.
art. 14.

On the natural history of this singular bird, we have a very curious paper by Mr Jenner, published in the Philosophical Transactions for 1738†. The first appearance of cuckows in Britain, as already observed, is about the middle of April; (the 17th according to Mr Jenner, whose observations were made in Gloucestershire). The song of the male, which is well known, soon proclaims its arrival. The song of the female (if the peculiar notes of which it is composed may be so called) is widely different, and has been so little attended to, that perhaps few are acquainted with it: the cry of the dab-chick bears some resemblance to it.

Unlike the generality of birds, cuckows do not pair. When a female appears on the wing, she is often attended by two or three males, who seem to be earnestly contending for her favours. From the time of her appearance till after the middle of summer the nests of the birds selected to receive her eggs are to be found in great abundance; but, like the other migrating birds, she does not begin to lay till some weeks after her arrival.

It is on all hands allowed, that the cuckow does not hatch its own eggs; for which different reasons have been given, as will be afterwards noticed. The hedge-sparrow, the water-wagtail, the tit-lark, the redbreast, the yellow hammer, the green linnnet, or the whinchat, is generally the nurse of the young cuckow: but Buffon enumerates 20 sorts of nests at least in which they have deposited their eggs. It may be supposed, that the female cuckow lays her egg in the absence of the bird in whose nest she intends to deposit; as it has been known, that on sight of one of these a redbreast and its mate jointly attacked her on approaching the nest, putting her to flight; and so effectually drove her away, that she did not dare to return. Among the birds abovementioned, it generally, according to Mr Jenner's observations, selects the three first, but shows a much greater partiality to the hedge-sparrow. This last commonly takes up four or five days in laying her eggs. During this time (generally after she has laid one or two) the cuckow contrives to deposit her egg among the rest, leaving the future care of it entirely to the hedge-sparrow. This intrusion often occasions some discomposure; for the old hedge-sparrow at intervals, whilst she is sitting, not unfrequently throws out some of her own eggs, and sometimes injures them in such a way that they become addle; so that it more frequently happens that only two or three hedge-sparrows eggs are hatched with the cuckow's than otherwise. But whether this be the case or not, she sits the same length of time as if no foreign egg had been introduced, the cuckow's egg requiring no longer incubation than her own.

* The young cuckow is commonly hatched first.

When the hedge-sparrow has sat her usual time, and disengaged the young cuckow and some of her own offspring from the shell*, her own young ones, and any of her eggs that remain unhatched, are soon turned out, the young cuckow remaining possessor of the nest, and sole object of her future care. The young birds are not previously killed, nor are the eggs

demolished; but all are left to perish together, either entangled about the bush which contains the nest, or lying on the ground under it.

“ The early fate of the young hedge-sparrows (Mr Jenner observes) is a circumstance that has been noticed by others, but attributed to wrong causes. A variety of conjectures have been formed upon it. Some have supposed the parent cuckow the author of their destruction; while others, as erroneously, have pronounced them smothered by the disproportionate size of their fellow-nestling. Now the cuckow's egg being not much larger than the hedge-sparrow's (as I shall more fully point out hereafter), it necessarily follows, that at first there can be no great difference in the size of the birds just burst from the shell. Of the fallacy of the former assertion also I was some years ago convinced, by having found that many cuckows eggs were hatched in the nests of other birds after the old cuckow had disappeared, and by seeing the same fate than attend the nestling sparrows as during the appearance of the old cuckows in the country. But before I proceed to the facts relating to the death of the young sparrows, it will be proper to lay before you some examples of the incubation of the egg, and the rearing of the young cuckow; since even the well-known fact, that this business is intrusted to the care of other birds, has been controverted by an author who has lately written on this subject †; and since, as it is a fact so much out of the ordinary course of nature, it may still probably be disbelieved by others.

Cuculus.

“ *Example 1.* The titlark is frequently selected by the cuckow to take charge of its young one; but as it is a bird less familiar than many that I have mentioned, its nest is not so often discovered. I have, nevertheless, had several cuckows eggs brought to me that were found in titlarks nests, and had one opportunity of seeing the young cuckow in the nest of this bird. I saw the old bird feed it repeatedly; and, to satisfy myself that they were really titlarks, shot them both, and found them to be so.

“ *Example 2.* A cuckow laid her egg in a water-wagtail's nest in the thatch of an old cottage. The wagtail sat her usual time, and then hatched all the eggs but one; which, with all the young ones except the cuckow, was turned out of the nest. The young birds, consisting of five, were found upon the rafter that projected from under the thatch, and with them was the egg not in the least injured. On examining the egg, I found the young wagtail it contained quite perfect, and just in such a state as birds are when ready to be disengaged from the shell. The cuckow was reared by the wagtails till it was nearly capable of flying, when it was killed by an accident.

“ *Example 3.* A hedge-sparrow built her nest in a hawthorn bush in a timber yard. After she had laid two eggs, a cuckow dropped in a third. The sparrow continued laying as if nothing had happened, till she had laid five, her usual number, and then sat.

“ June 20. 1736. On inspecting the nest, I found that the bird had hatched this morning, and that every thing but the young cuckow was thrown out. Under the nest I found one of the young hedge-sparrows dead, and one egg by the side of the nest entangled with the coarse woody materials that formed its outside covering. On examining the egg, I found one end of the shell

† The Hon.
Daines
Barrington.

Cuculus. shell a little cracked, and could see that the sparrow it contained was yet alive. It was then restored to the nest, but in a few minutes was thrown out. The egg being again suspended by the outside of the nest, was saved a second time from breaking. To see what would happen if the cuckow was removed, I took out the cuckow, and placed the egg containing the hedge-sparrow in the nest in its stead. The old birds, during this time, flew about the spot, showing signs of great anxiety; but when I withdrew, they quickly came to the nest again. On looking into it in a quarter of an hour afterwards, I found the young one completely hatched, warm, and lively. The hedge-sparrows were suffered to remain undisturbed with their new charge for three hours (during which time they paid every attention to it), when the cuckow was again put into the nest. The old sparrows had been so much disturbed by these intrusions, that for some time they showed an unwillingness to come to it. However, at length they came; and on examining the nest again in a few minutes, I found the young sparrow was tumbled out. It was a second time restored, but again experienced the same fate.

“ From these experiments, and supposing, from the feeble appearance of the young cuckow just disengaged from the shell, that it was utterly incapable of displacing either the egg or the young sparrows, I was induced to believe that the old sparrows were the only agents in this seeming unnatural business. But I afterwards clearly perceived the cause of this strange phenomenon, by discovering the young cuckow in the act of displacing its fellow-nestlings, as the following relation will fully evince.

“ June 18. 1787, I examined the nest of a hedge-sparrow, which then contained a cuckow's and three hedge-sparrow's eggs. On inspecting it the day following, I found the bird had hatched, but that the nest now contained only a young cuckow and one young hedge-sparrow. The nest was placed so near the extremity of a hedge, that I could distinctly see what was going forward in it; and, to my astonishment, saw the young cuckow, though so newly hatched, in the act of turning out the young hedge-sparrow.

“ The mode of accomplishing this was very curious. The little animal, with the assistance of its rump and wings, contrived to get the bird upon its back; and making a lodgement for the burden by elevating its elbows, clambered backward with it up the side of the nest till it reached the top; where resting for a moment, it threw off its load with a jerk, and quite disengaged it from the nest. It remained in this situation a short time, feeling about with the extremities of its wings, as if to be convinced whether the business was properly executed, and then dropped into the nest again. With these (the extremities of its wings) I have often seen it examine, as it were, an egg and nestling before it began its operations; and the nice sensibility which these parts appeared to possess, seemed sufficiently to compensate the want of sight, which as yet it was destitute of. I afterwards put in an egg; and this, by a similar process, was conveyed to the edge of the nest and thrown out. These experiments I have since repeated several times in different nests, and have always found the young cuckow disposed to act in the same manner. In climbing up the nest, it

sometimes drops its burthen, and thus is foiled in its endeavours; but, after a little respite, the work is resumed, and goes on almost incessantly till it is effected. It is wonderful to see the extraordinary exertions of the young cuckow, when it is two or three days old, if a bird be put into the nest with it that is too weighty for it to lift out. In this state it seems ever restless and uneasy. But this disposition for turning out its companions begins to decline from the time it is two or three till it is about twelve days old; when, as far as I have hitherto seen, it ceases. Indeed, the disposition for throwing out the egg appears to cease a few days sooner; for I have frequently seen the young cuckow, after it had been hatched nine or ten days, remove a nestling that had been placed in the nest with it, when it suffered an egg, put there at the same time, to remain unmolested. The singularity of its shape is well adapted to these purposes; for, different from other newly-hatched birds, its back, from the scapulæ downwards, is very broad, with a considerable depression in the middle. This depression seems formed by nature for the design of giving a more secure lodgement to the egg of the hedge-sparrow or its young one when the young cuckow is employed in removing either of them from the nest. When it is about 12 days old, this cavity is quite filled up, and then the back assumes the shape of nestling birds in general.

“ Having found that the old hedge-sparrow commonly throws out some of her own eggs after her nest has received the cuckow's, and not knowing how she might treat her young ones if the young cuckow was deprived of the power of dispossessing them of the nest, I made the following experiment.

“ July 9. A young cuckow, that had been hatched by a hedge-sparrow about four hours, was confined in the nest in such a manner that it could not possibly turn out the young hedge-sparrows which were hatched at the same time, though it was almost incessantly making attempts to effect it. The consequence was, the old birds fed the whole alike, and appeared in every respect to pay the same attention to their own young as to the young cuckow, until the 13th, when the nest was unfortunately plundered.

“ The smallness of the cuckow's egg, in proportion to the size of the bird, is a circumstance that hitherto, I believe, has escaped the notice of the ornithologist. So great is the disproportion, that it is in general smaller than that of the house-sparrow; whereas the difference in the size of the birds is nearly as five to one. I have used the term *in general*, because eggs produced at different times by the same bird vary very much in size. I have found a cuckow's egg so light that it weighed only 43 grains, and one so heavy that it weighed 55 grains. The colour of the cuckow's eggs is extremely variable. Some, both in ground and penciling, very much resemble the house-sparrow's; some are indistinctly covered with bran-coloured spots; and others are marked with lines of black, resembling, in some measure, the eggs of the yellow-hammer.

“ The circumstance of the young cuckow's being destined by nature to throw out the young hedge-sparrows, seems to account for the parent cuckow's dropping her egg in the nests of birds so small as those I have particularised. If she were to do this in the nest of a bird which produced a large egg, and consequently,

Cuculus. quently a large nestling, the young cuckow would probably find an insurmountable difficulty in solely possessing the nest, as its exertions would be unequal to the labour of turning out the young birds. Besides though many of the larger birds might have fed the nestling cuckow very properly had it been committed to their charge, yet they could not have suffered their own young to have been sacrificed for the accommodation of the cuckow in such great number as the smaller ones, which are so much more abundant; for though it would be a vain attempt to calculate the numbers of nestlings destroyed by means of the cuckow, yet the slightest observation would be sufficient to convince us that they must be very large."

Here Mr Jenner remarks, that though nature permits the young cuckow to make this great waste, yet the animals thus destroyed are not thrown away or rendered useless. At the season when this happens, great numbers of tender quadrupeds and reptiles are seeking provision; and if they find the callow nestlings which have fallen victims to the young cuckow, they are furnished with food well adapted to their peculiar state.

It appears a little extraordinary, that two cuckows eggs should ever be deposited in the same nest, as the young one produced from one of them must inevitably perish; yet two instances of this kind fell under our author's observation, one of which he thus relates: "June 27. 1787. Two cuckows and a hedge-sparrow were hatched in the same nest this morning; one hedge-sparrow's egg remained unhatched. In a few hours after, a contest began between the cuckows for the possession of the nest, which continued undetermined till the next afternoon, when one of them, which was somewhat superior in size, turned out the other, together with the young hedge-sparrow and the unhatched egg. This contest was very remarkable. The combatants alternately appeared to have the advantage, as each carried the other several times nearly to the top of the nest, and then sunk down again, oppressed by the weight of its burden; till at length, after various efforts, the strongest prevailed, and was afterwards brought up by the hedge-sparrows."

But the principal circumstance that has agitated the mind of the naturalist respecting the cuckow is, Why, like other birds, it should not build a nest, incubate its eggs, and rear its own young?

There is no apparent reason, Mr Jenner thinks, why this bird, in common with others, should not perform all these several offices; for it is in every respect perfectly formed for collecting materials and building a nest. Neither its external shape nor internal structure prevent it from incubation; nor is it by any means incapacitated from bringing food to its young. It would be needless to enumerate the various opinions of authors on this subject from Aristotle to the present time. Those of the ancients appear to be either visionary or erroneous; and the attempts of the moderns towards its investigation have been confined within very narrow limits: for they have gone but little further in their researches than to examine the constitution and structure of the bird; and having found it possessed of a capacious stomach with a thin external covering, concluded that the pressure upon this part, in a sitting posture, prevented incubation. They have

not considered that many of the birds which incubate have stomachs analogous to those of cuckows. The stomach of the owl, for example, is proportionably capacious, and is almost as thinly covered with external integuments. Nor have they considered, that the stomachs of the nestlings are always much distended with food; and that this very part, during the whole time of their confinement to the nest, supports in a great degree the weight of the whole body: whereas, in a sitting-bird, it is not nearly so much pressed upon, for the breast in that case fills up chiefly the cavity of the nest; for which purpose, from its natural convexity, it is admirably well fitted.

These observations may be sufficient to show, that the cuckow is not rendered incapable of sitting through any peculiarity either in the situation or formation of the stomach; yet, as a proof still more decisive, our observer adduces the following fact.

"In the summer of the year 1786, I saw, in the nest of a hedge-sparrow, a cuckow, which, from its size and plumage, appeared to be nearly a fortnight old. On lifting it up in the nest, I observed two hedge-sparrows eggs under it. At first I supposed them part of the number which had been sat upon by the hedge-sparrow with the cuckow's egg, and that they had become addle, as birds frequently suffer such eggs to remain in their nests with their young; but on breaking one of them I found it contained a living foetus: so that of course these eggs must have been laid several days after the cuckow was hatched; as the latter now completely filled up the nest, and was by this peculiar incident performing the part of a sitting-bird. At this time I was unacquainted with the fact, that the young cuckow turned out the eggs of the hedge-sparrow; but it is reasonable to conclude, that it had lost the disposition for doing this when these eggs were deposited in the nest.

"Having under my inspection, in another hedge-sparrow's nest, a young cuckow about the same size as the former, I procured two wagtails eggs which had been sat upon a few days, and had them immediately conveyed to the spot, and placed under the cuckow. On the ninth day after the eggs had been in this situation, the person appointed to superintend the nest (as it was some distance from the place of my residence) came to inform me that the wagtails were hatched. On going to the place, and examining the nest, I found nothing in it but the cuckow and the shells of the wagtail's eggs. The fact, therefore, of the birds being hatched, I do not give you as coming immediately under my own eye, but the testimony of the person appointed to watch the nest was corroborated by that of another witness."

In considering to what causes may be attributed the singularities of the cuckow, Mr Jenner suggests the following as the most probable: "*The short residence this bird is allowed to make in the country where it is destined to propagate its species; and the call that nature has upon it, during that short residence, to produce a numerous progeny.* The cuckow's first appearance here is about the middle of April, commonly on the 17th. Its egg is not ready for incubation till some weeks after its arrival, seldom before the middle of May. A fortnight is taken up by the sitting-bird in hatching the egg. The young bird generally continues three weeks

Cuculus.

in the nest before it flies, and the foster-parents feed it more than five weeks after this period; so that if a cuckow should be ready with an egg much sooner than the time pointed out, not a single nestling, even one of the earliest, would be fit to provide for itself before its parent would be instinctively directed to seek a new residence, and be thus compelled to abandon its young one; for old cuckows take their final leave of this country the first week in July.

“Had nature allowed the cuckow to have staid here as long as some other migrating birds, which produce a single set of young ones (as the swift or nightingale, for example), and had allowed her to have reared as large a number as any bird is capable of bringing up at one time, these might not have been sufficient to have answered her purpose; but by sending the cuckow from one nest to another, she is reduced to the same state as the bird whose nest we daily rob of an egg, in which case the stimulus for incubation is suspended. Of this we have a familiar example in the common domestic fowl. That the cuckow actually lays a great number of eggs, dissection seems to prove very decisively. Upon a comparison I had an opportunity of making between the ovarium, or *racemus vitellorum*, of a female cuckow, killed just as she had begun to lay, and of a pullet killed in the same state, no essential difference appeared. The uterus of each contained an egg perfectly formed and ready for exclusion; and the ovarium exhibited a large cluster of eggs, gradually advanced from a very diminutive size to the greatest the yolk acquires before it is received into the oviduct. The appearance of one killed on the third of July was very different. In this I could distinctly trace a great number of the membranes which had discharged yolks into the oviduct; and one of them appeared as if it had parted with a yolk the preceding day. The ovarium still exhibited a cluster of enlarged eggs, but the most forward of them was scarcely larger than a mustard-feed.

“I would not be understood to advance, that every egg which swells in the ovarium at the approach or commencement of the propagating season is brought to perfection: but it appears clearly, that a bird, in obedience to the dictates of her own will, or to some hidden cause in the animal economy, can either retard or bring forward her eggs. Besides the example of the common fowl above alluded to, many others occur. If we destroy the nest of a blackbird, a robin, or almost any small bird, in the spring, when she has laid her usual number of eggs, it is well known to every one who has paid any attention to inquiries of this kind, in how short a space of time she will produce a fresh set. Now, had the bird been suffered to have proceeded without interruption in her natural course, the eggs would have been hatched, and the young ones brought to a state capable of providing for themselves, before she would have been induced to make another nest, and excited to produce another set of eggs from the ovarium. If the bird had been destroyed at the time she was sitting on her first laying of eggs, dissection would have shown the ovarium containing a great number in an enlarged state, and advancing in the usual progressive order. Hence it plainly appears, that birds can keep back or bring forward (under certain limitations) their eggs at any

Cuculus.

time during the season appointed for them to lay; but the cuckow, not being subject to the common interruptions, goes on laying, from the time she begins till the eve of her departure from Britain; for although old cuckows in general take their leave the first week in July (and I never could see one after the 5th day of that month, though I conceive it possible that here and there a straggling cuckow may be seen after this time); yet I have known an instance of an egg's being hatched in the nest of an hedge-sparrow so late as the 15th. And a farther proof of their continuing to lay till the time of their leaving us may, I think, be fairly deduced from the appearances on dissection of the female cuckow above mentioned, killed on the 3d of July.”

Among the many peculiarities of the young cuckow, there is one that shows itself very early. Long before it leaves the nest, it frequently, when irritated, assumes the manner of a bird of prey, looks ferocious, throws itself back, and pecks at any thing presented to it with great vehemence, often at the same time making a cuckling noise like a young hawk. Hence probably the vulgar opinion, that this bird changes into a hawk and devours its nurse on quitting its nest; whence the French proverb, *Ingrat comme un coucou*. Sometimes, when disturbed in a smaller degree, it makes a kind of hissing noise, accompanied with a heaving motion of the whole body.

The growth of the young cuckow is uncommonly rapid. Its chirp is plaintive, like that of the hedge-sparrow; but the sound is not acquired from the foster-parent, as it is the same whether it be reared by the hedge-sparrow or any other bird. It never acquires the adult note during its stay in Britain.

The stomachs of young cuckows contain a great variety of food. On dissecting one that was brought up by wagtails, and sed by them at the time it was shot (though it was nearly of the size and fullness of plumage of the parent-bird), Mr Jenner found in its stomach the following substances: Flies and beetles of various kinds; small snails with their shells unbroken; grasshoppers; caterpillars; part of a horse-bean; a vegetable substance, resembling bits of tough grafs rolled into a ball; and the seeds of a vegetable that resembled those of the goose-grafs. In the stomach of one fed by hedge-sparrows, the contents were almost entirely vegetable; such as wheat, small vetches, &c. “But this (says our author) was the only instance of the kind I had ever seen, as these birds in general feed the young cuckow with scarcely any thing but animal food. However, it served to clear up a point which before had somewhat puzzled me; for having found the cuckow's egg in the nest of a green linnet, which begins very early to feed its young with vegetable food, I was apprehensive, till I saw this fact, that this bird would have been an unfit foster-parent for the young cuckow.

“The tit-lark, I observe, feeds it principally with grasshoppers.

“But the most singular substance, so often met with in the stomachs of young cuckows, is a ball of hair curiously wound up. I have found it of various sizes, from that of a pea to that of a small nutmeg. It seems to be composed chiefly of horse hairs; and from the resemblance it bears to the inside covering of the nest,

Cuculus. nest, I conceive the bird swallows it while a nestling. In the stomachs of old cuckows are often seen masses of hair; but these had evidently once formed a part of the hairy caterpillar, which the cuckow often takes for its food."

There seems to be no precise time fixed for the departure of young cuckows. Mr Jenner believes they go off in succession, probably as soon as they are capable of taking care of themselves; for although they stay in Britain till they become nearly equal in size and growth of plumage to the old cuckow, yet in this very state the fostering care of the hedge-sparrow is not withdrawn from them. "I have frequently (says he) seen the young cuckow of such a size that the hedge-sparrow has perched on its back, or half-expanded wing, in order to gain sufficient elevation to put the food into its mouth. At this advanced stage, I believe that young cuckows procure some food for themselves; like the young rook, for instance, which in part feeds itself, and is partly fed by the old ones, till the approach of the pairing season. If they did not go off in succession, it is probable we should see them in large numbers by the middle of August; for as they are to be found in great plenty when in a nestling state, they must now appear very numerous, since all of them must have quitted the nest before this time. But this is not the case; for they are not more numerous at any season than the parent-birds are in the months of May and June.

The same instinctive impulse which directs the cuckow to deposit her eggs in the nests of other birds, directs her young one to throw out the eggs and young of the owner of the nest. The scheme of nature would be incomplete without it; for it would be extremely difficult, if not impossible, for the little birds destined to find succour for the cuckow, to find also for their own young ones after a certain period; nor would there be room for the whole to inhabit the nest."

It is supposed, that there are more male cuckows than females; since two are often seen in dispute where a third has been in sight; which, no doubt, was of the opposite sex. Mr Pennant observed, that five male birds were caught in a trap in one season; and Mr Latham says, that "out of at least half a dozen that I have attended to, my chance has never directed me to a female; and it is to be wished, that future observers may determine whether our observations have rise only in chance, or are founded on the general circumstance." He believes that the male birds are more liable to be shot, their note directing the gunner where to take aim, while the female is secured by her silence.

Cuckows may be, and often are, brought up tame, so as to become familiar. They will eat in this state bread and milk, fruits, insects, eggs, and flesh either cooked or raw; but in a state of nature, I believe, chiefly live on caterpillars; which, in a few I have observed were all of the smooth kind; others have found vegetable matter, beetles, and small stones. When fat, they are said to be as good eating as a land rail. The French and Italians eat them to this day. The ancient Romans admired them greatly as food; Pliny says that there is no bird which can be compared to them for delicacy.

In migrating, the major part of these birds are supposed to go into Africa, since they are observed to visit

the island of Malta twice in a year, in their passage backwards and forwards, as is supposed, to that part of the world. They are well known also at Aleppo. To the north, it is said to be common in Sweden; but not to appear so early by a month as in Britain. Russia is not destitute of this bird; and Mr Latham has seen a specimen brought from Kamtschatka, now in the possession of Sir Joseph Banks.

2. The *Americanus*, or cuckow of Carolina. It is about the size of a blackbird, the upper mandible of the bill black, the lower yellow; the large wing-feathers are reddish; the rest of the wing, and all the upper part of the body, head and neck, is of an ash-colour; all the under part of the body, from the bill to the tail, white; the tail long and narrow, composed of six long and four shorter feathers; their legs short and strong. Their note is very different from the cuckow of Britain, and not so remarkable to be taken notice of. It is a solitary bird, frequenting the darkest recesses of woods and shady thickets. They retire on the approach of winter.

3. The indicator, or honey-guide, is a native of Africa. The following description is given of it by Dr Sparrman in the Philosophical Transactions for 1777. "This curious species of cuckow is found at a considerable distance from the Cape of Good Hope, in the interior parts of Africa, being entirely unknown at that settlement. The first place I heard of it was in a wood called the *Groot-vaader's Bosch*, "the Grand-father's Wood," situated in a desert near the river which the Hottentots call *T'kaut'kai*. The Dutch settlers thereabouts have given this bird the name of *honiguyzer*, or "honey-guide," from its quality of discovering wild honey to travellers. Its colour has nothing striking or beautiful. Its size is considerably smaller than that of the cuckow in Europe; but in return, the instinct which prompts it to seek its food in a singular manner is truly admirable. Not only the Dutch and Hottentots, but likewise a species of quadruped named *ratel* (probably a new species of badger), are frequently conducted to wild bee-hives by this bird, which, as it were, pilots them to the very spot. The honey being its favourite food, its own interest prompts it to be instrumental in robbing the hive, as some scraps are commonly left for its support. The morning and evening are its times of feeding, and it is then heard calling in a shrill tone, *cherr, cherr*; which the honey-hunters carefully attend to as the summons to the chase. From time to time they answer with a soft whistle; which the bird hearing, always continues its note. As soon as they are in sight of each other, the bird gradually flutters toward the place where the hive is situated, continually repeating its former call of *cherr, cherr*: nay, if it should happen to have gained a considerable way before the men (who may easily be hindered in the pursuit by bushes, rivers, or the like), it returns to them again, and redoubles its note, as it were to reproach them with their inactivity. At last the bird is observed to hover for a few moments over a certain spot, and then silently retiring to a neighbouring bush or resting-place, the hunters are sure of finding the bees nest in that identical spot; whether it be in a tree or in the crevice of a rock, or (as is most commonly the case) in the earth. Whilst the hunters are busy in taking the honey, the bird is

*Cuculus.*Plate
CLIV.

Cuculus. seen looking on attentively to what is going forward, and waiting for its share of the spoil. The bee-hunters never fail to leave a small portion for their conductor; but commonly take care not to leave so much as would satisfy its hunger. The bird's appetite being whetted by this parsimony, it is obliged to commit a second treason by discovering another bee's nest, in hopes of a better salary. It is further observed, that the nearer the bird approaches the hidden hive, the more frequently it repeats its call, and seems the more impatient. I have had frequent opportunities of seeing this bird, and have been witness to the destruction of several republics of bees by means of its treachery. I had, however, but two opportunities of shooting it, which I did to the great indignation of my Hottentots. It is about seven inches in length, and is of a rusty brown colour on the back, with a white breast and belly." A nest which was shown to Dr Sparrman for that of this bird, was composed of slender filaments of bark, woven together in the form of a bottle; the neck and opening hung downwards, and a string, in an arched shape, was suspended across the opening fastened by the two ends, perhaps for the bird to perch on.

4. The Cape cuckow (*Buff.*), is a trifle smaller than ours: the bill a deep brown; the upper part of the body greenish brown: throat, cheeks, fore part of the neck, and upper wing coverts, of a deep rufous colour: tail feathers rufous, but paler, tipped with white; the breast, and all the under parts of the body white, crossed with lines of black: the legs reddish brown. It inhabits the Cape of Good Hope; and is most likely the same bird which is called *Edolio*, from its pronouncing that word frequently in a low melancholy tone.—Voyagers also mention another cuckow, which is common to Loango in Africa. It is bigger than ours, but of the same colour; and repeats the word *cuckow* like that bird, but in different inflexion of voice. It is said that the male and female together go through the whole eight notes of the gamut; the male, beginning by itself, sounds the three first, after which he is accompanied by the female through the rest of the octave.

5. The honoratus, or sacred cuckow, is somewhat less than our cuckow: the general colour is blackish ash on the upper parts, marked with two spots of white on each feather; beneath white, transversely spotted with ash colour: the quills are cinereous, transversely spotted with white: the tail is much cuneated, five inches and a half long, and of the same colour as the quills; the outer feather only three inches long: the legs and claws are of a pale ash colour. This species inhabits Malabar, here the natives hold it sacred. It feeds on reptiles, which, perhaps may be such as are the most noxious; if so, this seeming superstition may have rise from a more reasonable foundation than many others of the like sort.

6. The shining cuckow is the size of a small thrush: the bill is bluish: the upper part of the body green, with a rich gilded gloss, the under parts are white, transversely waved with green gold: the under tail coverts almost white; the quills and tail dusky-brown; the legs are bluish. This inhabits New Zealand, where it is called *Poopo-awwro*. See Plate CLI.

7. The vetula is a trifle bigger than a blackbird: the bill above an inch and a half long: the upper

mandible black; the lower whitish: crown of the head brown, the feathers of it soft and silky: the upper parts of the body and the quills cinereous olive: throat and fore part of the neck whitish; the rest of the under parts rufous: the tail is much cuneated; the two middle feathers cinereous olive, the others dusky black tipped with white; the outer feather very short: legs blue-black. This species inhabits Jamaica, where it is frequent in the woods and hedges all the year round. It feeds on seeds, small worms, and caterpillars, and is very tame. This bird has the name *tacco* from its cry, which is like that word; the first syllable of this is pronounced hardly, the other following in a full octave lower than the first. It has also another cry like *qua, qua, qua*; but that only when alarmed by an enemy. Besides insects, it will also eat lizards, small snakes, frogs, young rats, and sometimes even small birds. The snakes they swallow head foremost, letting the tail hang out of the mouth till the fore-parts are digested. This bird, it is most likely, might be easily tamed, as it is so gentle as to suffer the negro children to catch it with their hands. Its gait is that of leaping, like a magpie; being frequently seen on the ground; and its flight but short, chiefly from bush to bush. At the time when other birds breed, they likewise retire into the woods, but their nests have never yet been found; from which one should be inclined to think, that they were indebted to other birds for the rearing their young in the manner of the common cuckow. It has the name of *rain-bird*, as it is said to make the greatest noise before rain. Common all the year at Jamaica. In another species or variety, common in Jamaica, the feathers on the throat appear like a downy beard, whence probably the name of *old-man rain-bird*, given it there and by Ray, Sloane, &c.

8. The *nævius*, spotted cuckow, or rail-bird, is about the size of a fieldfare: the bill three quarters of an inch; the upper mandible black on the top, and rufous on the sides; the under wholly rufous: the general colour of the plumage is rufous in two shades; the under parts rufous white: the feathers on the crown are of a deep brown, and pretty long, with rufous tips and some of them margined with rufous: the hind part of the neck is a rufous grey; down the shafts deep brown: back and rump the same; each feather tipped with a rufous spot: on each feather of the throat and neck is a transverse brownish line near the end: the under tail coverts are rufous: the quills are grey brown, edged with rufous, and a spot of the same at the tips: the tail is near six inches long, much cuneated; the outer feathers only half the length of the middle ones; colour of it the same as the quills; some of the upper coverts reach to near two-thirds of the length of the tail: the legs are ash-colour; the claws greyish brown. It inhabits Cayenne.—Buffon mentions a variety of this by the name of *rail-bird*. It is much the same in size, but has less rufous, being grey in the place of that colour: the side tail-feathers have white tips: the throat is pale grey; under the body white; the tail a trifle longer than in the other. Whether a variety or different sex, is not known. This is common at Cayenne and Guiana; and is seen often perched upon gates and rails, whence its name; and when in this situation continually moves its tail. These

Cucumber, are not very wild birds, yet do not form themselves into troops, although numbers are often found in the same district: nor do they frequent the thick woods like many of the genus.

9. The cayanus, or Cayenne cuckoo, is the size of a blackbird: the bill is grey brown, above an inch long, and a little bent at the tip: the plumage on the upper parts of the body is purplish chestnut; beneath, the same, but paler: the quills are the same as the upper parts, tipped with brown: the tail is the same; near the end black, and tipped with white; it is much cuneated, and above ten inches long: the legs and claws are grey brown. This inhabits Cayenne, where it goes by the name of *piaye*, or *devil*. The natives give it that name as a bird of ill omen. The flesh they will not touch; and indeed not without reason, as it is very bad and lean. It is a very tame species, suffering itself to be almost touched by the hand before it offers to escape. Its flight is almost like that of a king's fisher; frequents the borders of rivers, on the low branches; feeds on insects; often wags its tail on changing place.

There are 37 other species, which inhabit different parts of the globe, and are principally distinguished by the shape of the tail and variations in colour.

CUCUMBER, in botany. See CUCUMIS.

CUCUMIS, the CUCUMBER: A genus of the syngenesia order, belonging to the monœcia class of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The male calyx is quinque-dentated, the corolla quinquepartite; the filaments three. The female calyx is quinque-dentated, the corolla quinquepartite, the pistil trifid; the sides of the apple sharp pointed. In this genus Linnæus includes also the MELON; (see that article). There are 11 species, of which the following are the most remarkable.

1. The sativa, or common cucumber, hath roots composed of numerous, long, slender, white fibres; long slender stalks, very branchy at their joints, trailing on the ground, or climbing by their clasps, adorned at every joint by large angular leaves on long erect footstalks, with numerous and monopetalous bell-shaped flowers of a yellow colour, succeeded by oblong rough fruit. The varieties of this kind are, (1.) The common rough green prickly cucumber; a middle-sized fruit, about six or seven inches long, having a dark-green rough rind, closely set with very small prickles; the plant is of the hardiest sort, but does not show its fruit early. (2.) The short green prickly cucumber is about three or four inches long; the rind rather smooth, and set with small black prickles. It is valuable chiefly for being one of the earliest and hardiest sorts. (3.) The long green prickly cucumber, grows from six to nine inches in length, and is rather thinly set with prickles. And as there is an early and late cucumber, it is considerably the best variety for the main crops, both in the frames and hand-glasses, as well as in the open ground for pricklers. Of this there is another variety with white fruit. (4.) The early green cluster cucumber is a shortish fruit, remarkable for growing in clusters, and appearing early. (5.) The long smooth green Turkey cucumber, is a smooth green-rinded fruit, growing from 10 to 15 inches in length, without prickles. The plants are strong growers, with very large leaves. (6.) The long smooth

white Turkey cucumber, is a smooth rinded fruit, from 10 to 15 inches long, without prickles. (7.) The large smooth green Roman cucumber is a very large and long smooth green fruit produced from a strong growing plant. (8.) The long white prickly Dutch cucumber, is a white fruit 8 or 10 inches long, set with small black prickles; the plants are but bad bearers in Britain.

2. The chata, or round-leaved Egyptian cucumber. According to Mr Hasselquist, this grows in the fertile earth near Cairo after the inundation of the Nile, and not in any other place in Egypt, nor does it grow in any other soil. It ripens with the water-melons. The fruit is a little watery; the flesh almost of the same substance with the melons; it tastes somewhat sweet and cool; but is far from being as cool as the water-melons. This the grandees and Europeans in Egypt eat as the most pleasant fruit they find, and that from which they have the least to apprehend. It is the most excellent fruit of this tribe of any yet known.

The four first varieties of the cucumis sativa are those chiefly cultivated in Britain. They are raised at three different seasons of the year: 1. on hot-beds, for early fruit; 2. under bell, or hand-glasses, for the middle crop; 3. on the common ground, which is for a late crop, or to pickle. The cucumbers which are ripe before April are unwholesome; being raised wholly by the heat of the dung without the assistance of the sun. Those raised in April are good, and are raised in the following manner.

Towards the latter end of January, a quantity of fresh horse-dung must be procured with the litter among it; and a small proportion of sea-coal ashes should be added to it. In four or five days the dung will begin to heat; at which time a little of it may be drawn flat on the outside, and covered with two inches thickness of good earth: this must be covered with a bell-glass; and after two days, when the earth is warm, the seeds must be sown on it, covered with a quarter of an inch of fresh earth, and the glass then set on again. The glass must be covered with a mat at night, and in four days the young plants will appear. When these are seen, the rest of the dung must be made up into a bed for one or more lights. This must be three feet thick, beat close together, and covered three inches deep with fine fresh earth; the frame must then be put on, and covered at night, or in bad weather, with mats. When the earth is hot enough, the young plants from under the bell must be removed into it, and set two inches distance. The glasses must be now and then a little raised, to give air to the plants, and turned often, to prevent the wet from the steam of the dung from dropping down upon them. The plants must be watered at proper times; and the water used for this purpose must be set on the dung till it becomes as warm as the air in the frame: and as the young plants increase in bulk, they must be earthed up, which will give them great additional strength. If the bed is not hot enough, some fresh litter should be laid round its sides: and if too hot, some holes should be bored into several parts of it with a flake, which will let out the heat; and when the bed is thus brought to a proper coolness, the holes are to be stopped up again with fresh dung. When these plants begin to shoot their third or rough leaf,

Cucumis. leaf, another bed must be prepared for them like the first; and when it is properly warm through the earth, the plants of the other bed must be taken up, and planted in this, in which there must be a hole in the middle of each light, about a foot deep, and nine inches over, filled with light and fine fresh earth laid hollow in form of a basin: in each of these holes there must be set four plants: these must be, for two or three days, shaded from the sun, that they may take firm root; after which they must have all the sun they can, and now and then a little fresh air, as the weather will permit. When the plants are four or five inches high, they must be gently pegged down towards the earth, in directions as different from one another as may be; and the branches afterwards produced should be treated in the same manner. In a month after this the flowers will appear, and soon after the rudiments of the fruit. The glasses should now be carefully covered at night; and in the day-time the whole plants should be gently sprinkled with water. These will produce fruit till about midsummer; at which time the second crop will come in to supply their place: these are to be raised in the same manner as the early crop, only they do not require so much care and trouble. This second crop should be sown in the end of March or beginning of April. The season for sowing the cucumbers of the last crop, and for pickling, is towards the latter end of May, when the weather is settled: these are sown in holes dug to a little depth, and filled up with fine earth, so as to be left in the form of a basin; eight or nine seeds being put into one hole. These will come up in five or six days; and till they are a week old, are in great danger from the sparrows. After this they require only to be kept clear of weeds, and watered now and then. There should be only five plants left at first in each hole; and when they are grown a little farther up, the worst of these is to be pulled up, that there may finally remain only four. The plants of this crop will begin to produce fruit in July.

The cucumber is taken in great cities by the lower people as nourishment; but by the better sort is chiefly used as a refrigerant, or condiment, to accompany animal food. They have a bland insipid juice, without acidity or sweetness, approaching, as appears by their ripening, to a farinaceous matter. When used green they have no nourishment, so they are only to be used in the summer season and by the sedentary. Although cucumbers are neither sweet nor acid, yet they are considerably acescent, and so produce flatulency, cholera, diarrhoea, &c. Their coldness and flatulency may be likewise in part attributed to the firmness of their texture. They have been discharged with little change from the stomach, after being detained there for 48 hours. By this means, therefore, their acidity is greatly increased. Hence oil and pepper, the condiments commonly employed, are very useful to check their fermentation. We have lately used another condiment, *viz.* the skin, which is bitter, and may therefore supply the place of aromatics; but should only be used when young.

Besides the above-mentioned species which are proper for the table, this genus affords also two articles for the materia medica.

1. The elaterium of the shops, is the inspissated fæcula of the juice of a kind of wild cucumber, called also the ass's cucumber. It comes to this country from Spain and the southern parts of France, where the plant is very common. It is brought to us in small flat whitish lumps or cakes that are dry, and break easily between the fingers. It is of an acrid, bitter, and nauseous taste, and has a strong offensive smell when newly made: but these, as well as its other qualities, it loses after being kept some time. Elaterium is a very violent purge and vomit, and is now very seldom used. The plant is commonly called spitting cucumber, from its casting out its seeds with great violence, together with the viscid juice in which they are lodged, if touched when ripe; from this circumstance it has obtained the appellation of *noli me tangere*, or "touch me not."

2. The colocynthis, the colocynth, coloquintida, or bitter apple of the shops, is brought to us from Aleppo and the island of Crete. The leaves of the plant are large, placed alternate, almost round, and stand upon footstalks four inches long. The flowers are white; and are succeeded by a fruit of the gourd kind, of the size of a large apple, and which is yellow when ripe. The shelly or husky outside incloses a bitter pulp interspersed with flattish seeds. If a hole is made in one of these ripe gourds, and a glass of rum poured in, and suffered to remain 24 hours, it proves a powerful purgative. The pulp itself dried and powdered is commonly used as a purgative in this country, but is one of the most drastic and disagreeable we know. If taken in a large dose, it not only often brings away blood, but produces colics, convulsions, ulcers in the bowels, and fatal super-purgations. The most effectual corrector of these virulent qualities is to triturate it finely with sugar or sweet almonds.

CUCURBIT, the name of a chemical vessel employed in distillation, when covered with its head. Its name comes from its lengthened shape, by which it resembles a gourd: some cucurbits, however, are shallow, and wide-mouthed. They are made of copper, tin, glass, and stone-ware, according to the nature of the substances to be distilled. A cucurbit, provided with its capital, constitutes the vessel for distillation called an *alembic*.

CUCURBITA, the **GOURD**, and **POMPION**: A genus of the syngenesia order, belonging to the monœcia class of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The calyx of the male is quinque-dentated; the corolla quinquefid; the filaments three. The calyx of the female is quinque-dentated; the corolla quinquefid; the pistil quinquefid; the seeds of the apple with a tumid margin. There are five species.

1. The lagenaria, or bottle gourd, rises with thick trailing downy stalks, branching into many spreading runners. These extend along the ground sometimes 15 or 20 feet in length. The leaves are large, roundish, heart-shaped, indented, and woolly. The flowers are large and white, succeeded by long incurvated whitish yellow fruit, obtaining from about two to five or six feet in length, and from about nine to 24 inches in circumference, having a ligneous and durable shell.

2. The papo or pompion, commonly called pumpkin,

Cucumis
|
Cucurbita.

Cucurbita. kin, hath strong, trailing, rough stalks, branching into numerous runners. These are much larger than the former, extending from 10 to 40 or 50 feet each way. These are garnished with large, roundish, lobated, rough leaves, and yellow flowers. The flowers are succeeded by large, round, smooth fruit, of different forms and sizes, some as big as a peck, others as big as half a bushel measure; some considerably less, and others not exceeding the bulk of an orange; ripening to a yellow, and sometimes to a whitish colour. This species is the most hardy of any, as well as the most extensive in their growth. A single plant, if properly encouraged, will overspread 10 or 15 rods of ground, and produce a great number of fruit, which, when young, are generally a mixture between a deep blue and pale white, but change as they increase in bulk.

3. The verrucosa, or warted gourd, hath trailing stalks very branchy, and running upon the ground 10 or 15 feet each way; large lobated leaves, and yellow flowers, succeeded by roundish, knobby, warted white fruit, of moderate size.

4. The melopepo, erect gourd, or squash. This rises with an erect strong stalk several feet high, rarely sending forth side-runners, but becoming bushy upward. It is adorned with large lobated leaves; and the flowers are succeeded by depressed knotty fruit, both white and yellow, commonly of a moderate size.

5. The lignosa, ligneous shelled gourd, often called calabash. This hath trailing stalks, branching into runners, which extend far every way; the leaves are large, lobated, and rough; the flowers yellow, and are succeeded by roundish smooth fruit of a moderate size, with hard woody shells. Of all these species there are a great many varieties, and the fruit of every species is observed to be surprisngly apt to change its form.

Culture. All the species of gourds and pompions, with their respective varieties are raised from seed sown annually in April or the beginning of May, either with or without the help of artificial heat. But the plants forwarded in a hot-bed till about a month old, produce fruit a month or six weeks earlier on that account, and ripen proportionably sooner. The first species particularly will scarce ever produce tolerably sized fruit in Britain without the treatment abovementioned.

Uses. In Britain these plants are cultivated only for curiosity; but in the places where they are natives, they answer many important purposes. In both the Indies, bottle-gourds are very commonly cultivated and sold in the markets. They make the principal food of the common people, particularly in the warm months of June, July, and August. The Arabians call this kind of gourd *charrab*. It grows commonly on the mountains in these desarts. The natives boil and season it with vinegar; and sometimes, filling the shell with rice and meat, make a kind of pudding of it. The hard shell is used for holding water, and some of them are capacious enough to contain 22 gallons; these, however, are very uncommon. The fruit of the pompion likewise constitutes a great part of the food of the common people during the hot months, in those places where they grow. If gathered when not much bigger than a hen or goose egg, and properly seasoned with butter, vinegar, &c.

they make a tolerable good sauce for butcher's meat, and are also used in soups. In England they are seldom used till grown to maturity. A hole is then made in one side, through which the pulp is scooped out: after being divested of the seeds, it is mixed with sliced apples, milk, sugar, and grated nutmeg, and thus a kind of pudding is made. The whole is then baked in the oven, and goes by the name of a *pumkin pye*. For this purpose the plants are cultivated in many places of England by the country people, who raise them upon old dung hills. The third species is also used in North America for culinary purposes. The fruit is gathered when about half grown, boiled, and eaten as sauce to butcher's meat. The squashes are also treated in the same manner, and by some people esteemed delicate eating.

CUCURBITACEÆ, the name of the 34th order in Linnæus's fragments of a natural method, consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities. This order contains the following genera, viz. *gronovia*, *melothria*, *passiflora*, *anguria*, *bryonia*, *cucumis*, *cucurbita*, *fevillea*, *momordica*, *ficyos*, *trichofanthes*.

CUCURUCU, in zoology, the name of a serpent found in America, growing 10 or 12 feet long. It is also very thick in proportion to its length, and is of a yellowish colour, strongly variegated with black spots, which are irregularly mixed among the yellow, and often have spots of yellow within them. It is a very poisonous species, and greatly dreaded by the natives; but its flesh is a very rich food, and much esteemed among them, when properly prepared.

CUD, sometimes means the inside of the throat in beasts; but generally the food that they keep there, and chew over again. See *COMPARATIVE Anatomy*, n° 92—94.

CUDDALORE, a town on the coast of Coromandel in India, belonging to the English, very near the place where Fort St David once stood. N. Lat. 11. 30. E. Long. 79. 53. 30. This place was reduced by the French in the year 1781; and in 1783 underwent a severe siege by the British forces commanded by General Stuart. At this time it was become the principal place of arms held by the French on that coast: they had exerted themselves to the utmost in fortifying it; and it was garrisoned by a numerous body of the best forces of France, well provided with artillery, and every thing necessary for making a vigorous defence.

Previous to the commencement of the siege, they had constructed strong lines of defence all along the fort, excepting one place where the town was covered by a wood, supposed to be inaccessible. Through this wood, however, General Stuart began to cut his way; on which the besieged began to draw a line of fortification within that also. The British commander then determined to attack these fortifications before they were quite completed; and for this purpose a vigorous attack was made by the troops under General Bruce. The grenadiers assailed a redoubt which greatly annoyed them, but were obliged to retire; on which the whole army advanced to the attack of the lines. The French defended themselves with resolution; and as both parties charged each other with fixed bayonets, a dreadful slaughter ensued. At last the British were obliged

Cucurbita-
ceæ
Cuddalore.

Cuddalore obliged to retreat; but the French having imprudently come out of their lines to pursue them, were in their turn defeated, and obliged to give up the lines they had constructed with so much pains and so gallantly defended. The loss on the part of the British amounted to near 1000 killed and wounded, one half of whom were Europeans; and that of the French was not less than 600.

||
Cudworth.

Though the British proved victorious in this contest, yet the victory cost so dear that there was not now a sufficient number to carry on the siege with any effect. The troops also became sickly; and their strength diminished so much, that the besieged formed a design of not only obliging them to raise the siege, but of totally destroying them. For this purpose 4000 men were landed from the squadron commanded by M. Suffrein; and the conduct of the enterprise committed to the Chevalier de Damas, an experienced and valiant officer. On the 25th of June 1733, he sallied out at the head of the regiment of Aquitaine, supposed to be one of the best in the French service, and of which he was colonel; with other troops selected from the bravest of the garrison. The attack was made by day-break; but though the British were at first put into some disorder, they quickly recovered themselves, and not only repulsed the enemy, but pursued them so warmly, that the Chevalier de Damas himself was killed with about 200 of his countrymen, and as many taken prisoners.

This engagement was attended with one of the most remarkable circumstances that happened during the whole war, *viz.* A corps of Sepoy grenadiers encountering the French troops opposed to them with fixed bayonets, and overcoming them. This extraordinary bravery was not only noticed with due applause, but procured for that corps a provision for themselves and families from the presidencies to which they belonged. No other operation of any consequence took place during the siege, which was now soon ended by the news of peace having taken place between the belligerent powers of Europe.

CUDDY, in a first-rate man of war, is a place lying between the captain lieutenant's cabin and the quarter-deck; and divided into partitions for the master and other officers. It denotes also a kind of cabin near the stern of a lighter or barge of burden.

CUDWEED, in botany. See GNAPHALIUM.

CUDWORTH (Ralph), a very learned divine of the church of England in the 17th century. In January 1657 he was one of the persons nominated by a committee of the parliament to be consulted about the English translation of the Bible. In 1678 he published his *True Intellectual System of the Universe*; a work which met with great opposition. He likewise published a treatise, intitled, *Deus justificatus*: or, "The divine goodness of God vindicated, against the assertions of absolute and unconditionate reprobation." He embraced the mechanical or corpuscular philosophy: but with regard to the Deity, spirits, geni, and ideas, he followed the Platonists. He died at Cambridge in 1688. The editor of the new edition of the Biographia Britannica observes, that it is not easy to meet with a greater store-house of ancient literature than the "Intellectual System;" and various writers, we believe, have been indebted to it for an appearance of

learning which they might not otherwise have been able to maintain. That Dr Cudworth was fanciful in some of his opinions, and that he was too devoted a follower of Plato and the Platonists, will scarcely be denied even by those who are most sensible of his general merit. The reflections that have been cast upon such a man as the author, by bigotted writers, are altogether contemptible. It is the lot of distinguished merit to be thus treated. Lord Shaftesbury, speaking on this subject, has given an honourable testimony to the memory of Dr Cudworth. "You know (says his lordship) the common fate of those who dare to appear fair authors. What was that pious and learned man's case, who wrote the Intellectual System of the Universe? I confess it was pleasant enough to consider, that though the whole world were no less satisfied with his capacity and learning, than with his sincerity in the cause of Deity; yet he was accused of giving the upper hand to the Atheist, for having only stated their reasons, and those of their adversaries, fairly together."

It is observed by Dr Birch, that Dr Cudworth's Intellectual System of the Universe has raised him a reputation, to which nothing can add but the publication of his other writings still extant in manuscript. That these writings are very valuable cannot be doubted. We may be assured that they display a great compass of sentiment and a great extent of learning. Nevertheless, from their voluminous quantity, from the abstruseness of the subjects they treat upon, and from the revolutions of literary taste and opinion, it is morally certain that the publication of them would not be successful in the present age. Mr Cudworth's daughter Damaris, who married Sir Francis Masham of Oates in Essex, was a lady of genius and learning: she had a great friendship for Mr Locke, who resided several years at her house at Oates, where he died in 1704.

CUE, an *item* or *inuendo*, given to the actors on the stage what or when to speak. See PROMPTER.

CUENZA, a town of Spain, in New Castile, and in the territory of the Sierra, with a bishop's see. It was taken by Lord Peterborough in 1706, but retaken by the Duke of Berwick. It is seated on the river Xucar, in W. Long. 1. 45. N. Lat. 40. 10.

CUERENHERT (Theodore Van), a very extraordinary person, was a native of Amsterdam, where he was born in 1522. It appears, that early in life he travelled into Spain and Portugal; but the motives of his journey are not ascertained. He was a man of science, and, according to report, a good poet. The sister arts at first he considered as an amusement only; but in the end he was, it seems, obliged to have recourse to engraving alone for his support. And though the different studies in which he employed his time prevented his attachment to this profession being so close as it ought to have been, yet at last the marks of genius are discoverable in his works. They are slight, and hastily executed with the graver alone; but in an open careless style, so as greatly to resemble designs made with a pen. He was established at Haerlem; and there pursuing his favourite studies in literature, he learned Latin, and was made secretary to that town, from whence he was sent several times as ambassador to the Prince of Orange to whom he addressed a famous manifesto, which that prince published

Cudworth

Cueren-
herth.

Cuerpo,
Cuff.

in 1566. Had he stopped here, it had been well; but directing his thoughts into a different channel, he undertook an argument as dangerous as it was absurd. He maintained, that all religious communications were corrupted; and that, without a supernatural mission, accompanied with miracles, no person had a right to administer in any religious office: he therefore pronounced that man to be unworthy the name of a Christian who would enter any place of public worship. This he not only advanced in words, but strove to show the sincerity of his belief by practice; and for that reason would not communicate with either Protestant or Papist. His works were published in three volumes folio in 1630; and though he was several times imprisoned, and at last sentenced to banishment, yet he does not appear to have altered his sentiments. He died at Dergoude in 1590, aged 68 years. It is no small addition to the honour of this singular man, that he was the instructor of that justly celebrated artist Henry Goltzius. Cucrenhert worked conjointly with the Galles and other artists, from the designs of Martin Hemskerck. The subjects are from the Old and New Testament, and consist chiefly of middling sized plates lengthwise. He also engraved several subjects from Franc. Floris.

CUERPO. To *walk in cuerpo*, is a Spanish phrase for going without a cloak; or without all the formalities of a full dress.

CUFF (Henry), the unfortunate secretary of the unfortunate earl of Essex, was born at Hinton St George in Somersetshire, about the year 1560, of a genteel family, who were possessed of considerable estates in that county. In 1576, he was entered of Trinity college Oxford; where he soon acquired considerable reputation as a Grecian and disputant. He obtained a fellowship in the abovementioned college; but was afterwards expelled for speaking disrespectfully of the founder (A). He was, however, soon after admitted of Merton college; of which, in 1586, he was elected probationer, and in 1588 fellow. In this year he took the degree of master of arts. Some time after he was elected Greek professor, and in 1594 proctor of the university. When he left Oxford is uncertain; nor are we better informed as to the means of his introduction to the earl of Essex. When that nobleman was made lord lieutenant of Ireland, Mr Cuff was appointed his secretary, and continued intimately connected with his lordship until his confinement in the tower; and he is generally supposed to have advised those violent measures which ended in their mutual destruction. The earl indeed confessed as much before his execution, and charged him to his face with being the author of all his misfortunes. Mr Cuff was tried for high-treason, convicted, and executed at Tyburn on the 30th of March 1601. Lord Bacon, Sir Henry Wotton, and Camden, speak of him in very harsh terms. He was certainly a man of learning and

VOL. V.

abilities. He wrote two books; the one intitled, *The Differences of the Ages of Man's Life*; the other, *De Rebus Gestis in Sancto Concilio Nicæno*. The first was published after his death; the second is still in manuscript.

CUJAS (James), in Latin *Cujacius*, the best civilian of his time, was born at Toulouse, of obscure parents, in 1520. He learned polite literature and history; and acquired great knowledge in the ancient laws, which he taught with extraordinary reputation at Toulouse, Cahors, Bourges, and Valence, in Dauphiné. Emanuel Philibert, duke of Savoy, invited him to Turin, and gave him singular marks of his esteem. Cujas afterwards refused very advantageous offers from Pope Gregory XIII. who was desirous of having him teach at Bologna: but he chose rather to fix at Bourges, where he had a prodigious number of scholars; whom he not only took great pleasure in instructing, but assisted with his substance, which occasioned his being called the *The father of his Scholars*. He died at Bourges in 1590, aged 70. His works are in high esteem among civilians.

CUJAVA, a territory of Great Poland, having on the north the duchy of Prussia, on the west the palatinate of Kalisk, on the south those of Licici and Rava, and on the west that of Ploczko. It contains two palatinates, the chief towns of which are Inowloez and Brest; as also Uladislaw, the capital of the district.

CUIRASSE, a piece of defensive armour, made of iron plate, well hammered, serving to cover the body from the neck to the girdle, both before and behind. Some derive the word, by corruption, from the Italian *cuore*, "heart;" because it covers that part: others from the French *cuir*, or the Latin *corium*, "leather;" whence *coriaceous*: because defensive arms were originally made of leather. The cuirasse was not brought into use till about the year 1300, though they were known both to the ancient Greeks and Romans in different forms.

CUIRASSIERS, cavalry armed with cuirasses, as most of the Germans are: The French have a regiment of cuirassiers; but there have been none in the British army since the revolution.

CULDEES, in church-history, a sort of monkish priests, formerly inhabiting Scotland and Ireland. Being remarkable for the religious exercises of preaching and praying, they were called by way of eminence, *cultores Dei*; from whence is derived the word *culdees*. They made choice of one of their own fraternity to be their spiritual head, who was afterwards called the *Scots bishop*.

CULEMBACH, a district or marquisate of the circle of Franconia, in Germany. It is bounded on the west by the bishopric of Bamberg; on the south by the territory of Nuremberg; on the east by the palatinate of Bavaria and Bohemia; and on the north by Voightland

Cujas
Culembach.

(A) The founder of Trinity college was Sir Thomas Pope, who, it seems, would often take a piece of plate from a friend's house, and carry it home concealed under his gown; out of fun, no doubt. Cuff, being merry with some of his acquaintance at another college, happened to say, alluding to Sir Thomas Pope's usual joke abovementioned, "A pox on this beggarly house! why, our founder stole as much plate as would build such another." This piece of wit was the cause of his expulsion. The heads of colleges in those days did not understand humour. Anthony Wood was told this story by Dr Bathurst.

Culembach land and part of the circle of Upper Saxony. It is about 50 miles in length from north to south, and 30 in breadth from east to west. It is full of forests and high mountains; the most considerable of the latter are those of Frichtelberg, all of them covered with pine-trees. Here are the sources of four large rivers, the Maine, the Sala, the Eger, and the Nab. This marquisate is the upper part of the burgraviate of Nuremberg.

CULEMBACH, a town of Germany, in Franconia, the capital of the marquisate of the same name. It has good fortifications, and is seated at the confluence of two branches of the river Maine. It was pillaged and burnt by the Hussites in 1430, and by the inhabitants of Nuremberg in 1573. E. Long. 11. 28. N. Lat. 50. 12.

CULEUS, in Roman antiquity, the largest measure of capacity for things liquid, containing 20 amphoræ, or 40 urnæ. It contained 143 gallons 3 pints, English wine-measure, and was 110.95 solid inches.

CULEX, the **GNAT**; a genus of insects belonging to the order of diptera. The mouth is formed by a flexible sheath, inclosing bristles pointed like stings. The antennæ of the males are filiform; those of the females feathered. There are seven species. These insects, too well known by the severe punctures they inflict, and the itchings thence arising, afford a most interesting history. Before they turn to flying insects, they have been in some manner fishes, under two different forms. You may observe in stagnating waters, from the beginning of May till winter, small grubs with their heads downwards, their hinder-parts on the surface of the water; from which part arises sideways a kind of vent-hole, or small hollow tube like a funnel, and this is the organ of respiration. The head is armed with hooks, that serve to seize on insects and bits of grass on which it feeds. On the sides are placed four small fins, by the help of which the insect swims about, and dives to the bottom. These larvæ retain their form during a fortnight or three weeks, after which period they turn to chrysalids. All the parts of the winged insect are distinguishable through the outward robe that shrouds them. The chrysalids are rolled up into spirals. The situation and shape of the windpipe is then altered; it consists of two tubes near the head, which occupy the place of the stigmata, through which the winged insect is one day to breathe. These chrysalids, constantly on the surface of the water in order to draw breath, abstain now from eating: but upon the least motion are seen to unroll themselves, and plunge to the bottom, by means of little paddles situated at their hinder-part. After three or four days strict fasting, they pass to the state of gnats. A moment before, water was its element; but now, become an aerial insect, he can no longer exist in it. He swells his head, and bursts his inclosure. The robe he lately wore turns to a ship, of which the insect is the mast and sail. If at the instant the gnat displays his wings there arises a breeze, it proves to him a dreadful hurricane; the water gets into the ship, and the insect, who is not yet loosened from it, sinks and is lost. But in calm weather, the gnat forsakes his slough, dries himself, flies into the air, seeks to pump the alimentary juice of leaves, or the blood of man and beasts. The sting which our naked eye discovers, is but a tube,

containing five or six spicula of exquisite minuteness; some deniated at their extremity like the head of an arrow, others sharp-edged like razors. These spicula introduced into the veins, act as pump-suckers, into which the blood ascends by reason of the smallness of the capillary tubes. The insect injects a small quantity of liquor into the wound, by which the blood becomes more fluid, and is seen through the microscope passing through those spicula. The animal swells, grows red, and does not quit its hold till it has gorged itself. The liquor it has injected causes by its fermenting that disagreeable itching which we experience; and which may be removed by volatile alkali, or by scratching the part newly stung, and washing it with cold water; for later, the venom ferments, and you would only increase the tumor and the itching. Rubbing one's self at night with fuller's earth and water, lessens the pain and inflammation. Gnats perform their copulation in the air. The female deposits her eggs on the water; by the help of her moveable hinder part and her legs, placing them one by the side of another in the form of a little boat. This vessel, composed of two or three hundred eggs, swims on the water for two or three days, after which they are hatched. If a storm arises, the boats are sunk. Every month there is a fresh progeny of these insects. Were they not devoured by swallows, other birds, and by several carnivorous insects, the air would be darkened by them.

Gnats, however troublesome they may be, do not make us feel them so severely as the musketo-flies (*Culex pipiens*) do. In the day-time or at night these come into the houses; and when the people are gone to bed they begin their disagreeable humming, approach always nearer to the bed, and at last suck up so much blood that they can hardly fly away. Their bite causes blisters in people of a delicate complexion. When the weather has been cool for some days the musketo-flies disappear; but when it changes again, and especially after a rain, they gather frequently in such quantities about the houses, that their numbers are astonishing. In sultry evenings they accompany the cattle in great swarms, from the woods to the houses or to town; and when they are driven before the houses, the gnats fly in wherever they can. In the greatest heat of summer, they are so numerous in some places, that the air seems to be quite full of them, especially near swamps and stagnate waters, such as the river Morris in New Jersey. The inhabitants therefore make a fire before their houses to expel these disagreeable guests by the smoke.

CULIACAN, a province of North America, in the audience of Guadalajara. It is bounded on the north by new Mexico, on the east by New Biscay and the Zacatecas, on the south by Chiametlan, and on the west by the sea. It is a fruitful country, and has rich mines.

CULLIAGE, a barbarous and immoral practice, whereby the lords of manors anciently assumed a right to the first night of their vassals brides.

CULLEN, a parliament-town in Scotland, situated on the sea-coast of Banff-shire. W. Long. 2. 12. and N. Lat. 57. 38.

CULLODEN, a place in Scotland within two miles of Inverness, chiefly remarkable for a complete victory

Culm
||
Culverin.

CULM, or **CULMUS**, among botanists, a straw or haulm; defined by Linnæus to be the proper trunk of the grasses, which elevates the leaves, flower, and fruit.

This sort of trunk is tubular or hollow, and has frequently knots or joints distributed at proper distances through its whole length. The leaves are long, sleek, and placed either near the roots in great numbers, or proceed singly from the different joints of the stalk, which they embrace at the base, like a sheath or glove.

The haulm is commonly garnished with leaves: sometimes, however, it is naked; that is, devoid of leaves, as in a few species of cypress-grass. Most grasses have a round cylindrical stalk; in some species of scœnus, scirpus, cypress-grass, and others, it is triangular.

The stalk is sometimes entire, that is, has no branches; sometimes branching, as in *scœnus aculeatus & capensis*; and not seldom consists of a number of scales, which lie over each other like tiles.

Lastly, in a few grasses, the stalk is not interrupted with joints, as in the greater part. The space contained betwixt every two knots or joints, is termed by botanists *internodium* and *articulus culmi*.

This species of trunk often affords certain marks of distinction, in discriminating the species. Thus in the genus eriocaulon, the species are scarce to be distinguished but by the angles of the culinus or stalks. These in some species are in number 5, in others 6, and in others 10.

CULMIFEROUS PLANTS, (from *culmus*, a straw or haulm): plants so called, which have a smooth jointed stalk, usually hollow, and wrapped about at each joint with single, narrow, sharp-pointed leaves, and the seeds contained in chaffy husks; such are oats, wheat, barley, rye, and the other plants of the natural family of the GRASSES.

CULMINATION, in astronomy, the passage of any heavenly body over the meridian, or its greatest altitude for that day.

CULPRIT, a term used by the clerk of the arraignments, when a person is indicted for a criminal matter. See *PLEA to Indictment*, par. 11.

CULROSS, a parliament town in Scotland, situated on the river Forth, about 23 miles north-west of Edinburgh. Here is a magnificent house with 13 windows in front, built about the year 1590 by Edward Lord Kinlofs, better known in England by the name of Lord Bruce, slain in the noted duel between him and Sir Edward Sackville. Some poor remains of the Cistercian abbey are still to be seen here, founded by Malcolm earl of Fife in 1217. The church was jointly dedicated to the Virgin and St Serf confessor. The revenue at the dissolution was 768 pounds Scots, besides the rents paid in kind. The number of monks, exclusive of the abbot, were nine. W. Long. 3. 34. N. Lat. 56. 8.

CULVERIN, a long slender piece of ordnance or artillery, serving to carry a ball to a great distance. Manège derives the word from the Latin *colubrina*; others from *coluber*, "snake;" either on account of the length and slenderness of the piece or of the ravages it makes.

There are three kinds of culverins, *viz.* the extra-

ordinary, the ordinary, and the least sized. 1. The culverin extraordinary has $5\frac{1}{4}$ inches bore; its length 32 calibers, or 13 feet; weighs 4800 pounds; its load above 12 pounds; carries a shot $5\frac{1}{4}$ inches diameter, weighing 20 pounds weight. 2. The ordinary culverin is 12 feet long; carries a ball of 17 pounds 5 ounces; caliber $5\frac{1}{4}$ inches; its weight 4500 pounds. 3. The culverin of the least size, has its diameter 5 inches; is 12 feet long; weighing about 4000 pounds; carries a shot $3\frac{3}{4}$ inches diameter, weighing 14 pounds 9 ounces.

CULVERTAILED, among shipwrights, signifies the fastening or letting of one timber into another, so that they cannot slip out, at the corlings into the beams of a ship.

CUMA, or **CUMÆ** (anc. geog.), a town of Æolia in Asia Minor. The inhabitants have been accused of stupidity for not laying a tax upon all the goods which entered their harbour during 300 years. They were called *Cumani*.

CUMÆ, or **CUMA** (anc. geog.), a city of Campania near Puteoli founded by a colony from Chalcis and Cumæ of Æolia before the Trojan war. The inhabitants were called *Cumæi*. One of the Sibyls fixed her residence in a cave in the neighbourhood, and was called the *Cumean Sibyl*.
