MALTA

Information on witchcraft practices in Malta comes from its Inquisition tribunal archives, luckily saved from total destruction during the French occupation of Malta (1798–1800). Witchcraft became a significant preoccupation of the Malta Inquisition after the arrival of the Apostolic Visitor Monsignor Pietro Dusina in 1574. Witchcraft-related proceedings rose in importance in the mid-1590s. By the early seventeenth century, witchcraft cases accounted for one-third of the Inquisition's caseload—a level approximately maintained until the late eighteenth century.

Two main factors influenced the ways the Maltese adapted and shaped their witchcraft beliefs. First, Malta's crowded urban harbor area was constantly receiving people from neighboring Mediterranean lands and beyond. Second, Malta was an intensely Catholic society, a situation that inevitably colored the beliefs and thinking of its inhabitants.

Malta's harbor towns were crowded, with neighbors able to spy on each other, leaving little room for secrecy. Therefore, the more exotic types of witchcraft, such as cannibalism or night flying, occurred only in occasional denunciations by rural villagers in the late sixteenth and early seventeenth centuries. But the fact that any potentially useful witness would be acquainted with the accused and that the accused could not have done these things without being observed meant that Maltese Inquisitors rarely took accusations of exotic types of witchcraft seriously.

Meanwhile, sophisticated foreign travelers and traders introduced new ideas into Maltese society. The

presence of many people of different cultural backgrounds made residents of Malta harbor towns more tolerant of strange ideas and less threatened by them.

Maltese Holy Office records reveal a steady increase in witchcraft cases from the 1590s, with the flow of accusations remaining high until the end of the eighteenth century, when the tribunal was abolished. The punishments inflicted until the early 1630s were rather harsh, although they never ended with the execution of the accused. Subsequently, however, there was no significant trend toward either severity or leniency. By the time of Inquisitor Fabio Chigi (1634–1639)—later Pope Alexander VII—the tribunal came to adopt a more bureaucratic approach, with more thorough examinations of witnesses and more formal and detailed recording procedures. The tribunal settled into a routine that enabled it to look conscientiously into each case. Nonetheless, its basic methods for handling witchcraft remained unchanged throughout the tribunal's existence.

MALTESE WITCHCRAFT PRACTICES

A fairly clear distinction separated the type of witchcraft pursued by men from that practiced by women. Men, both clerics and others, concentrated on such potentially profitable brands of magic as treasure hunting. Perhaps the best Maltese necromancer of the early seventeenth century was the military engineer and member of the Order of St. John, Fra Vittorio Cassar. Women also shared men's fascination for buried treasure, but they almost monopolized most types of divination, conjuration, and *maleficium* (harmful magic), especially those aimed at love magic. Healing was also largely undertaken by women, although a few clerics and some slaves—largely Muslims, as well as a few members of the Jewish minority—attempted it for profit. Maltese men and women displayed fundamentally divergent motives in their attempts to manipulate supernatural forces: basically, men merely sought gain, whereas women's motives were more varied and complex.

Love magic was practiced primarily by unmarried women, including widows (who were not always elderly). Married women occasionally resorted to love magic to win a husband back from another woman (though some simply accused the other woman of love magic herself). Married women also resorted to divination to ascertain whether or not their husbands, away at sea, were still alive and, if so, if they had remained faithful. Others used more passive forms of love magic to soften a husband's harsh treatment of them. Conversely, the fact that a woman was in a stable marriage argued greatly in her favor if denounced, particularly since women under male supervision could be better controlled.

Poor moral behavior contributed greatly toward suspicions of witchcraft. This was one reason why courtesans featured so much in the list of those denounced. Living outside recognized moral norms, courtesans

were expected to have few scruples about violating conventional religious standards. They also had more reason to resort to witchcraft in order to entice men, thus earning the name of *meretrice* (prostitute). As with most witchcraft, the courtesan's motives can generally be reduced to love or gain. But it is clear that the courtesan-witch did not make a fortune from her witchcraft.

Another factor featuring prominently in the tribunal's thinking, and perhaps even more so in the thinking of the Maltese urban populace, was the nationality or place of origin of the "suspect." A good number of those accused in Malta's witchcraft trials were in fact foreign-born. The English traveler George Sandys, who visited Malta in 1610, commented how Malta was a place that saw an influx of people of all kinds. Many of them had moved into the harbor area, particularly Valletta, from the Maltese countryside. Many residents of Valletta came from Sicily, other parts of Italy, Greece, or elsewhere, not counting the large number of Muslim slaves. Four main groups stand out: Greeks, Sicilians, French, and male Muslim slaves serving the Order of St. John. It was mainly foreigners residing in Malta, rather than transients, who were accused of witchcraft. Such foreigners were more likely to practice certain types of witchcraft in order to gain a living in a strange environment. Male Muslim slaves were experts in divination, healing, and to some extent even love magic. But in the latter category, women of Greek origin seem to have been particularly sought after—and also to bring about impotence. Moreover, for the elderly, unmarried, or widowed popular healers of the countryside, witchcraft offered a way of gaining a certain prestige as well as providing a means of survival. A similar pattern emerged from the accusations against the male Muslim slaves, who were out to amass enough money to ransom themselves from slavery and return home.

PUNISHMENTS

As in other branches of the Roman Inquisition, the sudden increase of witchcraft-related cases in the 1590s marked a pronounced shift in the Inquisition's priorities, which is more easily identified than explained. Sixtus V's 1586 bull against magic was clearly significant in this context, describing the types of activity most commonly dealt with by the Inquisition in the 1590s and early 1600s, although the first serious clampdown on witchcraft in Malta appears to have taken place immediately after the terrible outbreak of plague in 1592–1593 and more specifically from 1595 onward.

The Inquisition's public punishments for witchcraft offenses certainly succeeded in advertising its disapproval of such activities, although they did not dissuade people from practicing such beliefs, as the continual flow of accusations throughout the late seventeenth and

eighteenth centuries shows. On such occasions, the methods used were meant to ensure adequate publicity and humiliation for the penitent. Penitents were made to stand at the Annunciation Church run by the Dominican friars or, more rarely, at the parish Church of St. Lawrence, both in Vittoriosa, holding a lighted candle during High Mass, usually on a feast day, to ensure that the largest possible audience witnessed the event. Public scourging, the tribunal's other main form of punishment, was inflicted in the main squares of Vittoriosa, and the penitent was then usually exiled. However, the tribunal's primary aim was to correct rather than punish. Hence, torture was generally reserved for those unwilling to accept this correction; Malta's witches were never executed, not even in the mass trials of the early seventeenth century.

By the late 1640s, the tribunal had almost accepted witchcraft as a fact of life in Malta and had established its own routines for dealing with it. The number of voluntary confessions for witchcraft increased by the mid-seventeenth century and remained steady right up to the last years of the tribunal. Nonetheless, it appears that Maltese society began to frown upon witchcraft practices, indicating that the tribunal's policy of publicizing its dealings with known offenders had indeed paid off. Obviously, the Inquisition had not been successful in eradicating witchcraft from Maltese society. Some witches saw little to fear from the Holy Office. They either believed they would never be caught, or even if they were, the mild punishment did not deter them. Popular magic outlasted the tribunal, which was suppressed in 1798. Some Maltese even seem to have been virtually addicted to witchcraft as a way of life. Thus, it continued to be practiced in the form of healing and as a way to ward off the evil eye, right into the twentieth century.

MANDRAKE

The mandrake plant, *Mandragora officinarum*, is probably the best-known poisonous herb found in the witches' pharmacopoeia. Mandrakes were the subjects of much folkloric herbal beliefs, including the concept that the plants generated at the foot of a gallows from the semen of the executed. Mandrake plants were thus considered to be partially "human" and to have roots that resembled either the lower limbs or genitalia of human males or females. Sixteenth-century herbals commonly presented the "male" and "female" varieties of the plants. For example, such plants are shown in Johannes de Cuba's *Hortus Sanitatus*, a sixteenth-century herbal published in Frankfurt.

Being partly human, mandrake plants were thought to emit horrible screams when harvested, which gave rise to the folk belief that a dog should be employed to draw up the root because the scream of the plant could kill a human. Early herbals sometimes show this method of harvest employing such "drug-sniffing

Poisonous plant linked to witches and thought to grow under gallows from the semen of the executed. Because the mandrake was partly human, it emitted screams when pulled. (TopFoto.co.uk)

dogs.” Other items of mandrake folklore stated that one should not dig up the herb until sunset and that one should not dig if it was windy. Witches digging mandrake roots at night at the foot of a gallows are shown in a painting from about 1650 by David Teniers the Younger (found today in the Staatliche Kunsthalle in Karlsruhe, Germany). Teniers depicted a witch busily digging up a root while a freshly harvested mandrake root stands nearby, looking very humanoid in its appearance.

Like other poisonous plants thought to be used by witches, mandrake contains hyoscyamine, atropine, and scopolamine. These drugs affect the cardiovascular system and can produce hallucinations or make the individual think he or she is flying or floating. As with other poisonous herbs used by witches, mandrake could also be manipulated by a witch without causing her death, or it could be simply made up into a poison. Oddly, although mandrake was considered the very epitome of a poisonous plant used by witches, it was also believed that it could be used effectively to treat someone who was possessed. (One presumes that this was due to the herb’s sedative effects.)

Mandrake roots are probably the witches’ poisonous herbs most commonly depicted in the visual arts of the sixteenth and seventeenth centuries. Aside from their presence in herbals, one also finds mandrake roots in various seventeenth-century paintings. Apart from the Teniers painting, they include *Witches’ Sabbat* by the Flemish artist Frans Francken the Younger, completed in 1607 and owned by the Kunsthistorisches Museum in Vienna. A male mandrake root is prominently shown in the painting’s central area, close to several witches who are working *maleficia*. Two of these poisonous herbs also appear in a drawing by the seventeenth-century Dutch artist Jacques de Gheyn, entitled *Witches’ Scene*, now in the Musée des Beaux-Arts, Rennes, France.

MANDROU, ROBERT (1921–1984)

One of extremely few distinguished French academics from a working-class background, Mandrou made the single most important twentieth-century French

contribution to the history of witchcraft with his 1968 doctoral thesis, *Magistrats et sorciers en France au XVIIIe siècle* (Magistrates and Witches in Seventeenth-Century France).

Secretary of the cutting-edge French journal *Annales: Economie, Sociétés, Civilisations* from 1954 to 1962 and then Lucien Febvre’s successor at the prestigious École Pratique des Hautes Études before becoming professor of history at the University of Paris-X (Nanterre) in the revolutionary year of 1968, Mandrou is best remembered today as a prolific scholar. He published many widely read books, starting with *A History of French Civilization* that he coauthored with Georges Duby in 1958 (English translation, 1964). Three years later came Mandrou’s pioneering exercise in the history of *mentalités* (mentalities—the ideas and values that a society shares), his *Introduction to Modern France, 1500–1640: An Essay in Historical Psychology* (English translation, 1975), which has remained in print continuously for forty years. In 1964 came another pioneering work, not yet translated, analyzing French popular culture in the sixteenth and seventeenth centuries through the contents of chapbooks from the Bibliothèque bleue (Blue Library) of Troyes. Another synthetic work, *France in the Sixteenth and Seventeenth Centuries* (1967), preceded Mandrou’s thesis on witchcraft. An interesting monograph on the Fuggers as landed gentlemen in Swabia (translated into German in 1997) followed it in 1969. (A forced laborer in Germany during World War II, Mandrou admired many things German and often spent his vacations there.) *Louis XIV in His Time* (1973) completes the list of Mandrou’s major titles. His final book, an edited collection of texts titled *Possession and Witchcraft in Seventeenth-Century France* (1979), returned to the topic of his dissertation.

A generation after it first appeared, only parts of Mandrou’s sprawling investigation of the treatment of witchcraft by French appellate judges—above all, those who sat on the bench of the *Parlement* of Paris, probably the most prestigious secular court in sixteenth- and seventeenth-century Christendom—have endured as authoritative contributions to witchcraft scholarship. Of its three parts (the medieval heritage to 1600; the major scandalous trials of the early 1600s, often linked to demonic possession; and the progressive abandonment of the crime of witchcraft at the appellate level after 1640), one can say that its scholarly credibility has been utterly eroded at the front but barely affected at the back. Mandrou’s first section is now completely discredited, but his second part retains partial validity, and his final section has suffered only minor damage from subsequent critics.

Despite its impressive bibliographical apparatus (345 published primary sources plus a survey of French parliamentary archives), the greatest weakness of Mandrou’s thesis has been its inadequate use of primary sources

from French *parlements*, above all the *Parlement* of Paris. Believing—incorrectly—that its *plumitifs*, or draft minutes of deliberations in criminal cases, were unreadable, Mandrou blandly assumed that Parisian appellate judges routinely confirmed upward of 90 percent of all death sentences for witchcraft until well into the seventeenth century, when Cartesian skepticism took hold. Unfortunately for Mandrou, within a decade of publishing his thesis, an expatriate American had successfully deciphered over 1,000 of these *plumitifs* from cases of witchcraft and demonstrated that the *Parlement* of Paris had *always*—ever since the fifteenth-century *Vauderie d'Arras*—practiced the level of judicial skepticism about witchcraft that Mandrou assumed it had acquired only by 1640 (Soman 1977). Subsequently, additional work in provincial French *parlements* has similarly shown persistent judicial skepticism about witch hunting at the appellate level throughout the French kingdom. The early-seventeenth-century “crisis of Satanism” lying at the center of Mandrou’s second section never occurred, at least not at the level of French appellate courts.

However, Mandrou saw correctly that a few spectacular, well-publicized cases of demonic possession did much to change educated public opinion about witchcraft in France by the mid-seventeenth century; subsequent scholarship continues to highlight such cases as Urbain Grandier, the Jesuit parish priest of Loudun who was accused of bewitching an entire convent of Ursuline nuns—and now we understand far better why Cardinal Richelieu never permitted the *Parlement* of Paris to intervene in his trial. Similarly, Mandrou’s final section on the decriminalization of witchcraft throughout France slighted its close connection with the scandalous “Affair of the Poisons” (1679–1682) but remains an otherwise authoritative account.

MANICHAISM

During the Middle Ages, ideas derived from Manichaeism, a Near Eastern religious movement, influenced the formation of the inquisitorial stereotype of the witch. Based on Gnostic principles and founded by the Iranian prophet Mani (216–277 C.E.), Manichaeism spread east as far as China and west into North Africa and southern Europe. Although described

as a Christian heresy (see the influential fourth-century text *Acta Archelai*), its roots were in Zoroastrianism, with influences from Christianity and Buddhism. Mani described himself as the promised Paraclete of God (Kephalaia 1:9–14) and the ultimate prophet (the title “Seal of the Prophets” is later used by Mohammed [Sura 30:44]), who had received a final, angelic revelation of the divine character of the universe at the age of twenty-four and then had begun an aggressive evangelism across the Persian Empire. Among the factors that helped spread his faith was its simplicity, its emphasis on a dualistic universe, and the injunction to translate his teaching to all peoples in their own language.

In his conception of the human predicament, Mani described three ages (past, present, and future) and a dualistic universe in which a continuous struggle occurred between the Kingdom of Light, with its focus being the Father of Greatness, and the Kingdom of Darkness, ruled by the Prince of Darkness and his five evil archons (demon, lion, eagle, fish, and dragon). At the heart of this struggle was the desire of the Father of Greatness to separate and return all his particles of light that had become trapped within the flesh of animals and plants during the process of the creation of the earth. It was the task of the evil forces coextensive with the forces of light to excite sexual lust and gluttony within all created beings, keeping the light particles impossibly commingled and thus lost to the Kingdom of Light. When their efforts failed, small pieces of light became disentangled from the darkness, and the sun and the moon functioned as two chariots bringing these pieces back from the world to the Father of Greatness. In the final age, a total conflagration of the earth would occur, ending with a complete separation of light from darkness, with the forces of evil sealed away forever within a bottomless pit.

Following the creation of the earth, Eve was seduced by an evil archon and subsequently gave birth to Cain. She then engaged in an incestuous relationship with both Cain and Abel, endangering humanity. Adam and his first son Seth were taught by “Jesus of Light” to adopt an ascetic lifestyle, which would protect the light particles within them. This discipline was then proposed by Mani as the basis for the rule of life of the elect, a select body within his community whose minds had been freed by the divine spirit *Nous* (knowledge) and who maintained strict ascetic practices, including sexual abstinence, poverty, and vegetarianism. The elect were not allowed to practice magic, own property, engage in commerce, kill animals, or even cut or step on plants because these living beings contained particles of light (referred to as the substance of the divine “Suffering Jesus”). The elect were assisted by a group of auditors who prepared their meals and performed all mundane tasks for the religious community. The auditors had a less rigid regimen but would not be directly

freed at death to join with the Father of Greatness; instead, they would have to be reincarnated as vegetable matter. All those who were not brought to this revelation were reincarnated as animals and eventually sank into the dark regions of the Netherworld.

Christianity found Manichaeism heretical for many reasons, starting with Mani's teaching that the soul suffered not from a weak and corrupt will but from contact with matter, which entrapped the light within the flesh. Evil was not the result of human sin but a physical reality; personal misfortunes were miseries to be endured, not the result of sins. The independent power of the evil forces also clashed with God's omnipotence and was refuted by several Church Fathers (Serapion of Thmuis, Tertullian, Titus of Bostra) on the grounds of human free will versus dualistic determinism. Among the arguments made against the passive avoidance or abhorrence of evil in Manichaeism is that it did not allow credit for the human ability to overcome evil.

Ultimately, it became the practice in the Middle Ages to label as Manichaeism any dualist Christian heresy, such as the tenth-century Bogomils (founded among the Slavic peasants of the Balkans) and the Cathars. It is clear that both of these groups adopted aspects of Manichaeism, including strict vegetarianism, abstinence from sexual intercourse, and drinking wine as a way of avoiding contact with the abominable. The contrast between the opulent wealth of the Orthodox Church and nobility and the physical misery of the Slavic peasants made them ready converts to Bogomilism's ascetic dogma and allowed them to participate in passive resistance, abstaining from violence against animals or humans.

The Cathars, strict dualists and iconoclasts, appeared first in the 1140s in Italy and spread across southern France and Spain. Although there were a number of sects identified as Cathars, they all shared the belief that the destruction of war and natural catastrophes were evidence of the Devil's rule over the world and that God either could not or did not choose to interfere. The battles between divine forces took place on a cosmic rather than an earthly level. The Cathar community, divided into auditors, believers, and the perfect, therefore battled against matter (even to the extent of replacing water baptism with the *consolamentum*, laying on of hands by a perfect). All flesh or earthly product was considered the essence of evil, and thus procreation was avoided because it would result in another soul being trapped in a bodily prison. The goal was to achieve perfection and liberation from the world through the obtaining of knowledge first revealed by Jesus, the messenger. Because the Cathars identified the official Church as a lying institution established by the Devil to keep humanity enslaved within the body, they were fiercely attacked and condemned as a danger to the Church and to civil order.

In constructing the stereotype of the witch, medieval demonologists drew upon and also misrepresented a

number of Manichaean ideas as developed by the Cathars. In describing witches as heretics, inquisitors claimed that they, in the manner of dualist heretic, had exaggerated the power of the Devil, so much so that they actually worshipped him. The description of sexual promiscuity and gluttony at the witches' Sabbat derived ultimately from the Manichaean belief that evil forces had excited these passions in order to keep light entrapped in matter. St. Augustine's description of sexual irregularities at the assemblies of Manichaeans gave medieval demonologists an authoritative source for such accusations. The claim that witches trampled on the cross as a symbol of their rejection of Christianity when making a pact with the Devil derived ultimately from the Manichaean and Cathar rejection of all physical material as evil.

MARCHTAL, IMPERIAL ABBEY OF

As in several other small states in southwestern Germany, witch hunting at Marchtal reached a peak between 1586 and 1596, but an extremely late witch panic took place between 1745 and 1757 that resulted in the execution of six women and the death of another in jail. This self-governing Premonstratensian Abbey, refounded in 1171 by Pfalzgraf Hugo II of Tübingen and his wife Elisabeth, had its seat on the edge of the Swabian Alb and belonged to the Swabian Circle of the Holy Roman Empire. Its abbots, who were authorized to establish a *Hochgericht* (high court) to hear capital trials in 1518, gradually enlarged their properties and rights until Marchtal controlled over twenty villages with a total population of about 2,700 by the eighteenth century. Marchtal developed a three-level jurisdiction, with a chief justice in Obermarchtal as the highest secular magistrate.

Marchtal's witchcraft trials share one salient characteristic: accusations of *maleficium* (harmful magic) originated especially in one village, Alleshhausen, located on the Federsee, where the peasants possessed a significant

portion of the land and often defied the abbot's control. At the initial trials in 1586, the *Vogt* (governor), Bernhart Bitterlin (who unsurprisingly came from the Federsee area), played a decisive role. He investigated the charges of witchcraft in Alleshausen and used torture to obtain the names of the witches' accomplices. Under the government of Abbot Konrad Frey (1571–1591) and his successor Johannes Riedgasser (1591–1600), Marchtal's witchcraft trials were most intense and resulted in the death of at least forty-nine people. The abbots gave their secular magistrates plenty of rope, not accelerating or preventing or alleviating witchcraft trials in their territory. Later, around 1627–1628, at least five more women were convicted. Witchcraft accusations in Marchtal usually followed the same pattern, but the responses of the authorities to the accusations were less predictable. Especially after the Thirty Years' War (1618–1648), the authorities rejected several denunciations from Alleshausen and punished the accusers. In 1745, the political and economic elite of Alleshausen, who officiated at the local court, once again assumed the role of the primary prosecutors. During the lawsuit, they also became influential members of the high court in Obermarchtal. They complained that a poor woman, Catharina Schmid, had used witchcraft to destroy her affluent neighbors' property because of a grudge against them. Schmid was arrested but did not confess. So Josef von Sättelin (mayor of the Catholic part of the imperial city of Biberach from 1741–1764) was consulted as a *Gutachter* (judicial expert) to advise the court in the conduct of the trial. At first, von Sättelin proposed to release Catharina Schmid from jail and to reintegrate her into Alleshausen; according to the Carolina Code (the imperial law code, 1532), he stated, there had not been sufficient evidence to justify the application of torture, only rumors. But the prominent inhabitants of Alleshausen ignored this unwelcome advice and expanded her trial with new accusations, now also directed against the accused's daughter, Maria Tornhäuser. They wanted both women convicted, and they finally succeeded: after languishing in jail for nine months, the mother accepted her daughter's denunciation. Despite his scruples, Josef von Sättelin no longer objected to their execution, which took place on March 9, 1746.

During the rule of a new abbot, Edmund Sartor (1746–1768), another five suspected women were accused. Four of them were convicted of witchcraft and executed, two in March 1747 and two more in November 1747, and the fifth died in jail in October 1747. Von Sättelin's *Gutachten* (judicial opinions) revealed an interesting transformation. His later *Gutachten* were no longer informed by the Carolina Code. Instead, he now made additional trials possible by arguing that witchcraft was caused by a pact with the Devil, as demonologists said, and necessarily stemmed

from diabolical malice. Later he argued that reason dictates the existence of witchcraft. His final argument implied that neither secular laws nor scientific logic was decisive, but that witchcraft was constituted by nature.

In the end, it was the same elite of Alleshausen, who had begun this cycle of persecutions, who brought an end to witch hunting. The *Amtmann* (bailiff) of Alleshausen offered a new interpretation of the damages attributed to witchcraft: the harm to livestock, he said, was not provoked by witches but caused by the peasants through their disregard for proper animal husbandry. In this way, the concept of witchcraft no longer provided an adequate explanation. Afterward, two newly appointed *Gutachter* from Schussenried and Ulm took the same position regarding the reality of witchcraft. No further trials were opened after 1757.

MARIA THERESA, HOLY ROMAN EMPRESS (1717–1780; RULED 1740–1780)

Maria Theresa was a reforming empress whose skepticism regarding witchcraft contributed to its decriminalization in Austria, Hungary, and Bohemia.

As the eldest daughter of Holy Roman Emperor Charles VI, who had no male heir, Maria Theresa was heiress of the house of Habsburg, archduchess of Austria, and queen of both Hungary and Bohemia; but she became empress only through her husband, Duke Francis of Lorraine, who was elected Holy Roman Emperor in 1745. She had married him before beginning to rule after her father died in 1740. Although the major European powers had officially accepted Charles VI's Pragmatic Sanction (which guaranteed the right of female succession within Habsburg lands) at the time of its proclamation in 1713, Prussian challenges to Maria Theresa's succession provoked a seven-year war and at first prevented her husband from becoming emperor. Ultimately, she fended off these and additional affronts to emerge as one of the Habsburgs' longest-reigning and most successful monarchs. As the only woman Habsburg ruler, she is best remembered for her successful defense of her realm; her Catholic

piety; and an enlightened commitment to political, legal, social, and educational reform.

This commitment emerged clearly in her attitude toward witchcraft. As early as the mid-1750s, we have evidence of Maria Theresa's personal skepticism regarding magical crimes through her reaction to accounts of vampires and witches in Moravia and Bohemia. In response, she dispatched an investigative commission that included two physicians, Johannes Gasser and Christian Vabst. After receiving their report, she consulted her own principal court physician, Gerard van Swieten, director of the Hofbibliothek (National Library) and reformer of the University of Vienna, who concurred with the recommendations of his medical colleagues: crush such superstitions through political power. It is worth noting that, like Maria Theresa's later witchcraft patent, van Swieten's 1755 treatise on vampires affirmed the reality of miracles and Satan's earthly powers before it upheld the virtues of natural science and exposed the dangers of ignorance. In March 1755, the empress forbade her subjects from following their customary practices when fears of the supernatural led to specific allegations of harm. Instead, the authorities must investigate all cases involving vampires (*magia postuma*), apparitions, witchcraft, treasure hunting, or diabolical possessions using rational means. By January 1756, the government of Maria Theresa ordered that the royal appeals court in Hungary automatically review all decisions by lower courts involving charges of witchcraft. In response to such a trial in the Tabor district of Bohemia, she issued a resolution on July 30, 1756, stating, "It is certain that witches are found only where ignorance is; correct this and no more will be found. [The accused] is no more a witch than I" (Kern 1999, 170).

The empress's attitude toward witchcraft is best reflected in her government's *Artikel von der Zauberey, Hexerey, Wahrsagerey, und dergleichen* (An Article on Sorcery, Witchcraft, Divination, and Similar Activities), issued on November 5, 1766 (Kern 1999). Although trials for witchcraft had been on the wane for decades in the western lands of the Habsburg monarchy, they persisted in the eastern kingdoms of Bohemia and Hungary. By the 1750s, Maria Theresa had already begun to take steps to suppress trials for witchcraft, but this edict made them virtually impossible to prosecute by the late 1760s. Compiled by a court commission directed by Count Michael Johann von Althann for inclusion in a forthcoming penal code, the patent fills seventeen printed pages, in which the empress's legal advisers defined the prohibited activities and outlined their prosecution.

Although the *Artikel* nowhere denied the reality of diabolical magic, it had the overall effect of severely limiting the possibility of prosecuting anyone for witchcraft. Its text and tone suggest that although diabolical sorcery was possible, it certainly did not occur in

the Habsburg lands. The contradictory purposes of the patent became clear from the titles of its first few sections, which juxtaposed the outlawed activities in question ("the offense of sorcery") with a series of qualifiers stressing the frivolity of the threat: "delusion," "credulity," "false," "fraud," and "madness" (Kern 1999, 165–166). Its following sections contributed variously to a basic dichotomy informing all legal proceedings concerned with magical events: extremely rare diabolical crimes versus widespread and potentially criminal illusionary beliefs. Sections 1 and 2 established the practice of magic as an outlawed activity.

Nonetheless, section 3 reformulated the way magical crimes should be understood in a skeptical tone, implying that most matters concerning sorcery or witchcraft coming before the courts stemmed from popular ignorance. It accordingly established a legal basis for proceeding in such cases with a considerable degree of doubt. Sections 4 and 5, which created the possibility of distinguishing legitimate from illegitimate cases, directly emphasized this issue; section 6 firmly prohibited investigators from using superstitious methods in their inquiries. The decree further indicated that only the sovereign had the authority to investigate and decide cases that might have legitimate merit; thus, sections 7 and 12 created exclusive legal prerogatives for the sovereign and her legal counselors. The remainder (sections 8–11, 13, and 14) delineated careful guidelines for proceeding with investigations, emphasizing the need for skeptical inquiry. Its final two sections (15 and 16) extended those guidelines to the investigation and suppression of continuing widespread popular superstitions. Not only were witchcraft trials to be stopped, but also the folkloric beliefs sustaining accusations of witchcraft should be stamped out.

The paradoxical message of Maria Theresa's "Article on Sorcery" hinged on a reassessment by state authorities of the threat that magical activities posed to Austrian society and a new conception of the state's role in addressing it. Policy-makers did not see the Devil or his minions as real threats to social order, and beliefs in the Devil's powers had lost currency among most, but not all, the educated and politically powerful elites in Habsburg lands. Because of the stronghold of state-sponsored Catholic orthodoxy on Austrian religious practice, skeptical medical and legal scholars like van Swieten or von Althann could not denounce demonic magic and witchcraft outright, because the manifest powers of the Devil and the possibility of his malevolent intercession remained tenets of Christian faith. Instead, officials sought to downplay the powers of the Devil, attributing beliefs in demonic magic and malefice to the inherently superstitious populace. Although the impetus for constructing the 1766 patent emerged from Maria Theresa's efforts to reform criminal and civil law and create a judicial system based on

the abstract principle of justice, Bohemian and Hungarian witch and vampire cases during the 1750s and 1760s provided a more concrete stimulus.

MARY, THE VIRGIN

Though there are only a few references to the mother of Jesus in the New Testament and Jesus himself had a rather distanced relation to her, Mary became, at least from the Carolingian epoch onward, the second most important holy figure in Christianity, with her cult reaching its peak in the late Middle Ages. Some late medieval prayers addressed Mary as more powerful than Jesus because he has to be obedient to his mother. She was painted as Virgin of Mercy, beneath whose mantle her adepts found protection not only against demons but also especially against the wrath of God the Father, who desires to destroy sinful mankind. Many *exempla* taught that Jesus could forgive a sinner who had offended him, but never one who had offended his mother. The Virgin, more than other saints, was used to exorcise and Christianize places vowed to another religion; after anti-Jewish pogroms, for example, Marian sanctuaries were regularly erected on the place of the former synagogue.

In connection with witchcraft, several aspects are of interest: Did the Virgin appear in charms and magic? What did the witches think of her? Could she protect even a sorceress?

The protection of the Virgin was thought to be of the greatest power against the Evil One; her name can be found in many an apotropaic charm. Mary helped even those who made a pact with Satan, the most famous proof of which was the miracle story of Theophilus, told in all European tongues. This originally Byzantine motif could even apply to rueful sorceresses. In the Dutch play *Marieken van Nieuwmege* (ca. 1500), the protagonist Marieken (i.e., "little Mary") made a pact with an incubus, but she had to change her name in order to stop the power of her patron saint. She, however, chose Emma (where the first letter of Mary's name appears twice) and was saved in the end.

Although the confrontation between the Virgin Mary and demons was a standard motif of preachers, she did not play any important role in specialized antiwitchcraft theology or practices of the Church. For women of all kinds, their relation to the Virgin was of central

importance. It became especially obvious on those occasions in the late Middle Ages and the early modern epoch when a woman showed signs both of being a mystic and a witch. The peasant Chiara Signorini, condemned in 1519 at Modena, manifested a complex mixture of veneration of the Virgin Mary and magical practices. Signorini conceded under torture that she had caused many people to fall ill by demonic help. However, she also confessed to being close to the Virgin, who (and not a demon) actually caused these maladies, in order to revenge herself after being offended. In late-seventeenth-century Normandy, Marie Benoist de la Boucaille was a famous healer and ecstatic who claimed to have had many visions of Mary, Jesus, and God; but she also showed a Devil's mark and was condemned for witchcraft and false prophecy. "Real" witches usually avoided any veneration for the Virgin, at least according to their confessions. Many of them, when denying Jesus, had to abuse his mother also. According to the *Malleus Maleficarum* (The Hammer of Witches, 2.2), witches called her the "fat woman."

Especially from the fifteenth century onward, a huge number of popular blessings have been recorded that address the Mother of God, the Virgin, or the suffering mother, sometimes begging for help in love affairs but more often seeking protection from illness and dangerous animals (especially snakes, because the Devil seduced Eve in that form and Mary was called the second, sinless Eve). To further this aim, apocryphal situations were created, as in the following early modern High German charm: When Jesus was wounded by the arrows of two demons, his mother came and agreed to help him, if he would give her half of the earth and half of heaven. Jesus promised, and Mary called fifty-five angels and healed her son; in the same way, the pains of the person saying this charm would be healed. From the standpoint of religious psychology, male-centered Christianity obviously required a female "goddess" nearly as mighty as the male god himself, a superhuman woman onto whom cravings for motherly nurture and understanding can be projected. Therefore, the thirteenth-century mystic Mechthild of Magdeburg literally called her *goettinne* (goddess) in her work *The Flowing Light of the Godhead* (Mechthild of Magdeburg 1998, 3.1; 3.4). Meanwhile, Lollards abused the Virgin as a witch, and Luther reversed Mechthild by calling her an *Abgöttin* (idol) (Luther 7: 568, 573 f.). Mary, also, like her son, became a rich subject for blasphemies, for example, cursing "by Mary's limbs" or "by the Virgin's cunt," and was often abused as a whore in Italy. But there is also evidence that the Virgin became the object of male sexual fantasies, expressed in many miracles with visions of Mary kissing or even lactating her celibate admirer.

Mary's cult provoked a definitely negative reaction from Protestant reformers. In Tridentine Catholicism,

Mary's glory was exalted even higher as she became the patroness of every anti-Protestant action, including military ones. The triumphant Catholic Church spread the iconography of the Immaculate Conception—the woman of the Apocalypse crushing the snake underfoot—over all countries under her rule, and her famous apparitions and miracles at Lourdes and Fatima have helped maintain her veneration until the present day.

MATHER, COTTON (1663–1728)

Cotton Mather was New England's most celebrated Puritan and a staunch believer in the reality of witchcraft.

Mather played an important role in the case of the Goodwin children in Boston in 1688 and later in the witch hunting in Salem in 1692–1693. During these years, Cotton Mather advanced his views on witchcraft in private correspondence, sermons, and books: *A Discourse on Witchcraft* (1689), *Memorable Providences, Relating to Witchcrafts and Possessions* (1689), and *The Wonders of the Invisible World* (1692). Mather preached that witches represented the Devil's special war against New England, but his actions usually discouraged witch hunting.

The son of Increase Mather, minister of the Second Church in Boston and president of Harvard College, Cotton Mather (named for his grandfather, John Cotton) entered Harvard College at the age of twelve and earned his MA in 1681, at age eighteen. In 1685 he was installed as his father's assistant at Second Church

in Boston. During Increase Mather's long mission in England (1688–1692) negotiating a new charter for Massachusetts, Cotton at the age of twenty-five was left in charge of the largest congregation in New England.

The author of over 400 works, Cotton Mather combined modern scientific interests, or "rational philosophy," with a strong belief in the existence of witchcraft. No Puritan better displayed the seventeenth-century New England curiosity about the physical universe than Mather did in his *Curiosa Americana* (1712–1724). An avid reader of current scientific literature, Cotton Mather was familiar with the writings of such mechanistic philosophers as René Descartes, Pierre Gassendi, and Robert Boyle. His lifelong interest in scientific issues earned him membership in the Royal Society of London, and his account of the smallpox inoculation episode of 1721 was published in the society's transactions. The best example of Cotton Mather's scientific attitude is his *Christian Philosopher: A Collection of the Best Discoveries in Nature, with Religious Improvements* (1721), where he pronounced Isaac Newton "the Perpetual Dictator of the Learned World in the Principles of Natural Philosophy" (p. 65). His magnum opus was *Magnalia Christi Americana* (1702), an ecclesiastical history of New England from its founding to his own time.

Cotton Mather's belief in witchcraft was influenced most by William Perkins, the prominent English Puritan preacher and demonologist, whose *Discourse of the Damned Art of Witchcraft* (1608) made him the chief authority in seventeenth-century England on witchcraft; by the Cambridge Platonist Henry More, whose *Antidote Against Atheism* (1653) not only accepted the reality of witches but even upheld their sexual intercourse with the Devil; by the famous Puritan preacher Richard Baxter, whose *Certainty of the World of Spirits* (1691) related many abnormal events as evidence of the invisible power of spirits; and lastly by Joseph Glanvill's *Saducismus Triumphatus, or Full and Plain Evidence Concerning Witches and Apparitions* (1681), which attempted to ground the belief in witchcraft scientifically on the basis of unshakable evidence.

To the thought of these authorities on witchcraft, Mather added a uniquely American perspective; he was obsessed with the view that the Devil had waged a war against Puritan New England since its founding: "The New Englanders are a People of God" settled in America, which was "once the Devil Territories" (emphasis in the original). Hence it was "a rousing alarm to the Devil, when a great Company of English Protestants and Puritans, came to erect Evangelical churches" in America. The Devil, accordingly, "tried all sorts of Methods to overturn" New England. Events in Salem proved that an "Army of the Devils is horribly broke in upon" the land, and the witches found there are evidence of an "An Horrible Plot" on the part of the

“Devil against New England” (Mather 1693c, 13–14, 74). New England therefore played a crucial role in fighting the Devil; as Jesus resisted the Devil in the wilderness, so now New England should stand against the Devil’s temptation in the wilderness of America (Mather 1693c, 174–178).

Cotton Mather’s first practical encounter with witchcraft came in the case of the Goodwin children in Boston in the summer of 1688, a story he described in *Memorable Providences, Relating to Witchcrafts and Possessions* (1689). An old Irish widow, Mary Glover, had confessed to be in league with the Devil, bewitching the four children of John Goodwin and practicing image magic. Before she was hanged in Boston in November 1688, Mather twice visited Mary Glover in jail; he claimed “she never denied” her guilt of “witchcraft,” or of “her confederacies with the devils,” or “her covenant with hell” (Hall 1991, 272). Following her execution, Cotton Mather preached a suitably damning sermon on the threat of witchcraft, asserting that “Witchcraft is the most Mōnstrous and Horrid Evil” because it is “a Renouncing of God, and Advancing of the filthy *Devil* into the Throne of the Most High. . . . *Witchcraft* is a renouncing of *Christ*, and preferring the Communion of a loathsome lying *Devil*.” And given “there are witches, we are to suppose that there are devils too” (Mather 1689b, 98–99).

Four years later, Cotton Mather was caught up in the drama of the largest witch hunt in New England. But we must remember two things about his role. First, his father Increase had returned from England in May 1692, and the younger Mather deferred to his leadership. Second, Cotton Mather’s behavior (not unlike that of many European Protestant ministers facing witch hunts) displayed a curious mixture of public endorsement for these prosecutions and private warnings about their dangers.

Seventeenth-century New England exhibited many signs of a witch craze: a large witch hunt claiming twenty deaths, more than half of the total victims for all New England, occurred in Salem in 1692 (nineteen Massachusetts men and women and two dogs were hanged for witchcraft, and one man was pressed to death for refusing to plead to the indictment). The first witchcraft accusations occurred in Salem Village, a parish of the town of Salem, in early February 1692. Two young girls fell into strange fits, much like those in the case of the Goodwin children in Boston, and soon other girls in the village exhibited the same behavior. Claiming that witches were afflicting them, the girls provided names of villagers, who were arrested and put in jail on charges of witchcraft. Facing a growing witchcraft hysteria, the new governor of Massachusetts, Sir William Phips, established a special court of Oyer and Terminer on May 27, 1692, to hear and determine the witchcraft cases in Salem. On June 10 the first execution occurred. The trial

and its outcome troubled so many that in June the governor turned to leading ministers for advice. In response, Cotton Mather composed “The Return of Several Ministers,” which urged caution in relying on the use of spectral evidence (an image of a person visible only to the witchcraft victim whom the specter was said to have attacked in some way) in court. However, the report nonetheless urged “the speedy and vigorous Prosecution” of those guilty of witchcraft (Mather 1693b, 291). The judges paid more attention to the second recommendation than to the first, giving the girls enormous power to manipulate the court. Accordingly, by July 19 five more women had been executed.

Cotton Mather’s eschatological visions ran high during that time; events in Salem signified that “there never was a poor plantation, more pursued by the *wrath* of the *Devil*, than our poor *New England*” (Mather 1693c, 74). On August 4, 1692, he delivered a sermon warning that the Last Judgment was at hand. Calculating from Biblical evidence that the year 1697 would be the year of the End, he deemed New England as leading the final charge against the Devil and his minions. Seeing the affairs in Salem as proof of an “Horrible Plot against the Country by *Witchcraft*” aiming to “Blow up, and pull down all the churches in the Country,” Mather urged New Englanders not to “allow the Mad Dogs of Hell” to have the upper hand (Mather 1693c, 14, 22).

By late September 1692, the witchcraft hysteria reached its peak, and eight more women had been hanged. Worried about the trials, Phips again turned to the spiritual leaders for advice. In October, Increase Mather composed his *Cases of Conscience*, challenging the court’s procedures head-on by denouncing the use of spectral evidence and arguing that it was better for ten suspected witches to escape than one innocent person be condemned, a view endorsed by many ministers. However, Cotton Mather was given the official trial transcripts and in the same month composed *The Wonders of the Invisible World*, which described the court proceedings favorably. The governor, however, accepted Increase Mather’s views and abolished the special court. Soon the storm was over.

Robert Calef, a Boston merchant who hated Cotton Mather, read *The Wonders of the Invisible World* as both a justification of the trials and an attempt to minimize Mather’s own role. Calef claimed that Cotton Mather was constantly warning that “the Devils were walking about our Streets with lengthen Chains making a dreadful noise in our Ears” (Calef 1700, preface). The truth, of course, was more complicated. The younger Mather never repudiated his father’s loathing of spectral evidence, which had fueled the Salem witch hunt. If Cotton Mather persuaded authorities to proceed with the execution of George Burroughs, a former Salem minister, despite Burroughs’s ability to recite the Lord’s Prayer perfectly while on the gallows, this intervention

must be set against Cotton Mather's visible desire to avoid turning Mercy Short's "unnatural afflictions" into a witchcraft case at Boston during 1692–1693 (Boyer and Nissenbaum 1974, 24–26). Although Cotton Mather repeated his original views on the Salem trials in his *Magnalia Christi Americana* (1702), his later diaries reveal regret for his role in the trials and executions.

MATHER, INCREASE (1639–1723)

Increase Mather was an American Puritan minister, theologian, and demonologist; president of Harvard

College from 1685 to 1701 whose *Cases of Conscience Concerning Evil Spirits Personating Men* (1693), a response to the Salem trials, quoted numerous witchcraft treatises, some now neglected.

Evidence of demonic activity at Salem divided pastoral opinion in the Massachusetts Colony. Judges appeared naively to dismiss the possibility that God could allow the Devil to assume the shape of an innocent person to perform evil. On June 15, 1692, several Cambridge ministers wrote to the Salem judges, warning that "a demon may, by God's permission, appear even to ill purposes, in the shape of an innocent, yea, and a virtuous man" (I. Mather 1980, 290). On August 1 the conclave commissioned Mather to write *Cases of Conscience*. By the time Governor William Phips received it, the trials were essentially over.

Increase and his son Cotton Mather disagreed over Salem. Cotton conceded that spectral evidence was unreliable but defended confessions as sufficient proof of guilt (C. Mather 1980, 14–16). His *Wonders of the Invisible World* was rushed into print before Increase's *Cases of Conscience*, though he had begun the former after the completion of his father's work. Cotton seemed to rebut his father's arguments preemptively (Hall 1988, 262–263). Contemporaries evidently thought so: Increase formally denied in a postscript to *Cases of Conscience* that the two books disagreed (I. Mather 1980, 288–290).

They did agree on the fascination of the "invisible world." In 1696 Increase published *Angelographia* and *A Disquisition Concerning Angelical Apparitions*, with a subtitle that revealed intimate connections with Salem: "In Answer to a Case of Conscience, Showing that Demons Often Appear Like Angels of Light, and What Is the Best and Only Way to Prevent Deception by Them."

Like Joseph Glanvill, Henry More, and others, the Mathers considered proofs of witchcraft necessary to rebut modern "Sadducees," who reputedly doubted the reality of "spirit"—angels, demons, ghosts, and the immortal human soul. "Sadducism [*sic*] is a degree of atheism, and commonly ends therein" (I. Mather 1696b, sig. K3v). *Angelographia* begins: "There are such beings as angels. They are not mere *entia rationis* [beings defined by reason alone], imaginary beings, or apparitions. . . . The Sadducees said. . . that the angels are not real beings, but only apparitions and impressions made in the minds of men" (I. Mather 1696a, 5).

Allusions to Salem (which was never mentioned by name) implied proof of demonic reality: "some who object that the age wherein we live has no demoniacks, or possessed persons, do from thence suspect the whole Gospel of fabulosity or imposture. That there are in this age enigmens, late examples amongst ourselves (and more than a few of them) are an awful

The Puritan minister Increase Mather and the title page of his *Cases of Conscience Concerning Evil Spirits*, 1693. (Corbis)

conviction. . . .” (I. Mather 1696b, sigs. K3v–K4r). Evil demons implied good angels: “there are evil angels: men cannot but perceive that. . . from the bodily possessions. . . if there are evil angels, reason saith they were once good. . . . And if the evil angels were once good, we may rationally conclude that there are some who are, as originally they were, holy spirits” (I. Mather 1696a, 7).

Good angels are still present: “Their appearings are in a great measure ceased, but their working is not” (I. Mather 1696a, 63). Both Mathers sought apparitions of good angels soon after Salem: Increase convinced himself of experiencing one in September 1693, and Cotton soon followed suit (Hall 1988, 273).

MAXIMILIAN I, DUKE OF BAVARIA (1573–1651, RULED 1597–1651)

Educated as a witch hunter, the cautious Duke Maximilian never became one because he could not readily determine the guilty witch from the innocent accused. Bavaria’s iron prince-electoral had replaced his father Wilhelm V “the Pious” of the Wittelsbach dynasty (1548–1626, r. 1579–1594/1597) during the 1590s, when Bavaria was close to bankruptcy, before formally succeeding him in 1597. Maximilian became one of very few German princes who ruled before, during, and after the Thirty Years’ War. As the founder and head of the Catholic League, he took action against Frederick V in 1618, when this prince-electoral of the Palatinate of the Wittelsbachs was elected king of Bohemia. Maximilian’s army crushed the Protestant army in 1620 at the battle at the White Mountain near Prague, terminating Frederick’s kingship after only one winter. Holy Roman Emperor Ferdinand II subsequently rewarded his cousin Maximilian’s support by transferring the Palatine electoral vote to the Bavarian Wittelsbachs in 1623. As leader of the Catholic League, Maximilian became so deeply embroiled in warfare that his duchy was occupied twice during the war by foreign troops and lost about half of its population, mainly through epidemic diseases rather than military action. Bavaria emerged from the war exhausted but intact, while Maximilian secured both the title of prince-electoral and the territory of the Upper Palatinate for his successor. In his political testament, however, he recommended to his son Ferdinand Maria never to wage war except for the purpose of national defense because it placed too heavy a burden on the people.

The Spanish Jesuit Gregory of Valencia, a zealous demonologist, prepared Maximilian to be a witch hunter. Gregory literally spent days with his young pupil in the torture chambers, as we learn from Maximilian’s letters to his father in Munich. At the age of sixteen, Maximilian had to watch the trials of witches at Ingolstadt. Throughout his long life, Maximilian was ready to support witch hunts. Many of his councilors and officials, some educated at the University of Ingolstadt in the same years, harbored similar ideas; many of the Franconian prince-bishops whom Maximilian recruited into the Catholic League had also matriculated at Ingolstadt. Maximilian and his Austrian

cousin, who would become Emperor Ferdinand II (1578–1637) were the most prominent rulers during a generation of witch hunters. Furthermore, Maximilian, like his father, was married to a Lorraine princess, Elisabeth Renée (1574–1635), and thus closely allied with the rulers of this prolific witch-hunting duchy.

Despite all his zeal, however, Maximilian was a very cautious ruler, consuming his energies in the service of his people and spending many hours each day studying mountains of files. He was unwilling to tolerate administrative sloppiness, especially in the administration of the law. These positive aspects of Maximilian’s personality may have motivated Bavaria’s estates to secure his father’s early resignation, thus ending the terrible witch hunt of the years around 1590 and securing a more capable young ruler.

This calculation worked out, at least to some extent. Maximilian knew how to use witch-hunting rhetoric but never turned into a witch hunter himself. After some executions in 1600, when zealous councilors attempted to launch a general witch hunt throughout Bavaria, representatives of the estates and the Privy Council stopped them, and Maximilian conceded a review of the legal procedure. As a result of obvious irregularities and after heated debates within his government, Maximilian agreed to the expensive procedure for asking legal opinions from different parts of Europe, including German governments and law faculties, two Italian universities, and demonologists from Lorraine (Nicolas Rémy) and the Spanish Netherlands (Martín Del Rio), all of which had to be discussed by his councilors in written legal opinions. In conclusion, the witch hunt was terminated, and legal procedures in general were reviewed. The Court Council, whose detailed minutes recorded its sessions, controlled the lower courts more tightly. No torture was to be applied in Bavaria without the Court Council’s written consent. A general legal reform was begun, including the most detailed legislation anywhere in Europe against superstition, magic, and witchcraft, forty printed pages altogether, compiled between 1608 and 1612. A local judge, who had deceived the Court Council in order to conduct a local witch hunt in the Bavarian exclave of Wemding, was sentenced to death in 1613.

Although hundreds of cases of magic and witchcraft were scrutinized in Bavaria during Maximilian’s long reign, there were few executions. To the great disappointment of some of his councilors, particularly his Jesuit confessor Adam Contzen and the faction around the zealous court councilor Dr. Johann Sigmund Wagnereckh, Maximilian never became a witch hunter, despite all his verbal radicalism. His hesitation was motivated not by doubts regarding the reality of witchcraft or the existence of witches, but by the difficulties of distinguishing genuine witches from innocent people who were exposed to suspicion by the enemy of mankind, the

Devil. The degree to which reason of state entered into the prince-electors' motivation is difficult to estimate. For the members of his Privy Council and the leaders of the estates, the general welfare of Bavaria's people was the guiding principle; it seems likely that Maximilian shared their opinion, although he never said so in public.

MAXIMILIAN I, HOLY ROMAN EMPEROR (1459–1519, RULED 1486/1493–1519)

The son of Emperor Frederick III and Eleanor of Portugal, Maximilian laid the foundations for the rise of the Habsburg dynasty to world historical importance. Married in 1477 to Mary of Burgundy, heiress of Charles the Bold, he was elected “king of the Romans” in 1486 and succeeded his father as Holy Roman Emperor of the German Nation in 1493, although his coronation took place only in 1508. After his wife's death in 1482, Maximilian secured the Low Countries for their son Philip I of Burgundy, whom he married to Juana of Castile and Aragon in 1496. Maximilian's oldest grandson, Philip's son Charles (1500–1558), became king of Spain (1516), duke of Burgundy, and Holy Roman Emperor (1519); his second grandson Ferdinand (named for the Aragonese grandfather who raised him) acquired Habsburg Austria and later became king of Bohemia and Hungary (1526) and finally Holy Roman Emperor (1556). At least two demonologists tried to gain Maximilian's support. Heinrich Kramer traveled to Brussels in November 1486 to gain the king's approval for his book *Malleus Maleficarum* (The Hammer of Witches, 1486). The result must have been disappointing: only Kramer's petition is mentioned in an appendix to the *Malleus*, with the text of Maximilian's response suppressed. In 1508, Johannes Trithemius (1462–1516), abbot of the Benedictine monastery St. Jacob in Würzburg and a

specialist on occult affairs, answered eight theological questions asked by Emperor Maximilian at the town of Boppard on the Rhine. Three of these (nos. 5–7) concerned witchcraft. Although Trithemius's answers were published during Maximilian's lifetime (*Liber octo questionum ad Maximilaneum Caesarem* [Book of Eight Questions to Emperor Maximilian], Oppenheim, 1515), both the circumstances of the event and the emperor's interests remain unclear. Maximilian's curiosity regarding cultural phenomena was insatiable, which was one of the reasons he was so tremendously popular in Upper Germany and Austria. But there is no evidence that Maximilian ever encouraged witchcraft trials in his possessions. Neither Tyrol nor Austria saw any executions during his reign, although the emperor was concerned about the frequent clusters of witchcraft trials in the Netherlands, his Burgundian heritage.

MECHANICAL PHILOSOPHY

Seventeenth- and early eighteenth-century mechanical philosophy, which held that nature operated like a machine in accordance with the laws of nature, led some educated men to question their belief in witchcraft. The mechanical philosophy provided one of the main philosophical foundations for the Scientific Revolution. It is most closely associated with the work of the French philosopher and mathematician René Descartes, although many other scientists, including Galileo Galilei and Johannes Kepler, subscribed to its basic elements. Mechanists argued that nature operated mechanically, just like a clock or some other piece of machinery. According to mechanists, nature consisted of many machines, some of them extremely small. The human body was itself a machine, and its center, the heart, was likewise a piece of machinery that moved other parts of the body. Because God made the human body, it was superior to any human-made machine, but it was still nothing more than a machine. The only part of a human being that was not a machine was the mind or the soul, which according to Descartes was immaterial and therefore completely different from the body and the rest of the natural world.

Descartes argued that matter was completely inert or passive. It had neither a soul nor any innate purpose. Its

only property was extension, by which Descartes meant its physical dimensions, such as length, width, and depth. Without a spirit or any other internal force directing its action, matter simply responded to the power of the other bodies with which it came in contact. According to Descartes, "There exist no occult forces in stones or plants, no amazing and marvellous sympathies and antipathies, in fact there exists nothing in the whole of nature which cannot be explained in terms of purely corporeal causes, totally devoid of mind and thought" (Easlea 1980, 111). This view of nature posed a direct challenge to Neoplatonism, which held that the natural world was charged with various occult forces and therefore provided the main philosophical foundation for the practice of natural magic.

The mechanical philosophy also presented a challenge to the belief in witchcraft. The view that nature operated in a regular, predictable way, in accordance with immutable laws, called into question the belief that witches used the power of the Devil to intervene in the operation of the natural world. Those who adopted Descartes' philosophy, known as Cartesianism, did not necessarily deny the existence of good or evil spirits, but they did reject the view that those spirits could change the course of nature. The English philosopher Thomas Hobbes, who differed with Descartes on many issues but nevertheless also subscribed to a mechanical view of the universe, went so far as to deny the existence of spirits altogether. For Hobbes, even God was material, and the spirits and demons mentioned in the Bible had thin bodies that were incapable of being perceived by human beings.

Nevertheless, the mechanical philosophy had only limited success in undermining the belief in witchcraft among educated people. The main reason was that other natural philosophers modified Descartes' mechanical view of nature to allow for the intervention of spiritual forces. The English philosopher Henry More, who had originally been an admirer of Descartes, and the scientist Joseph Glanvill both claimed that spiritual or occult forces were necessary to explain various natural phenomena, including the motion of matter. Glanvill argued that spirits played an active role in nature and that scientists could acquire empirical evidence of their activities. He contended that the phenomena attributed to witchcraft provided evidence for a mechanistic natural theology, in which the Devil, like God, worked through the normal course of nature. For Glanvill, the Devil was part of nature, and the empirical study of demons had scientific validity.

The limited influence of the mechanical philosophy on the decline of witch beliefs among educated people can best be seen in the work of the Dutch Reformed minister and theologian Balthasar Bekker. Bekker was one of the most radical skeptics regarding witchcraft in the late seventeenth century. In his four-volume

treatise, *De Betoverde Weereld* (The World Bewitched, 1691–1693), Bekker denied that the Devil could intervene in the operation of the material world. Once the Devil was denied this ability, the possibility that a human being could commit the crime of witchcraft vanished. Bekker was admittedly a follower of Descartes, and he clearly accepted a Cartesian view of the sharp distinction between spirit and matter. But Bekker did not rely primarily on the mechanical philosophy or any other scientific evidence to attack the belief in witchcraft; the main foundation for his skepticism was his biblical scholarship, which he used to show that God maintained sovereignty over the world and had never allowed the Devil to exercise power within it.

Although the mechanical philosophy called into question the *beliefs* of some educated people in witchcraft, it had little influence on the decline of witchcraft *prosecutions*. The decline in the number of trials began in some European countries as early as 1600 and in most regions of western Europe by 1670. These were the years when the mechanical philosophy first made its appearance. Its spread, however, was a gradual process, and it was controversial. It took some time for this new mental outlook to make its mark in the universities, the legal profession, and state bureaucracies. It is unlikely that the judges and officials who applied the early brakes on witch hunting during the first seventy years of the seventeenth century were even exposed to, let alone influenced by, these new ideas.

The critical period in the reception of the mechanical philosophy appears to have been the years between 1690 and 1720, the period of the early Enlightenment. Thus, mechanism did not appreciably affect the mental outlook of the educated classes until well after prosecutions had begun to decline and, in some cases, until after they had stopped altogether. In Geneva, for example, the first magistrate to profess an adherence to Cartesian ideas, Robert Chouet, wrote a critical commentary on Geneva's prosecution of witches in 1690, almost forty years after the last witch had been executed in that republic, although only nine years after the last Genevan witch had been banished. Even in France, where the mechanical philosophy may have taken root somewhat earlier than in Geneva, Cartesianism probably did not have the negative influence on the level of prosecutions that scholars have often attributed to it. Certainly the members of the *Parlement* of Paris, who played a decisive role in the decline of French witch hunting after 1624, could not have been influenced by Cartesianism until long after they had brought executions for witchcraft to an end.

If the mechanical philosophy played any role at all in the decline of witch hunting, it was at the end of the process in the late seventeenth and early eighteenth centuries, when the last trials took place and witchcraft was decriminalized, but not in the earlier decades of the

seventeenth century, when some dramatic reductions in the number of trials occurred. Even during the later period, however, the influence of philosophical ideas on the conduct of prosecutions was limited. Witchcraft trials ended mainly because authorities came to the realization that it was impossible to prove the crime, not because they denied its reality.

MECKLENBURG, DUCHY OF

Mecklenburg, a Lutheran duchy in the northeastern part of the Holy Roman Empire, had more than its share of intensive persecution of witches between 1560 and 1700. In a region with a population of roughly 200,000 around 1600, there were more than 4,000 witchcraft trials, at least half of them ending with the death of the accused. The worst persecutions came in two large waves, cresting between 1599 and 1614 and again between 1661 and 1675.

These two times of persecution were quite different in nature. In the first phase, when Mecklenburg was politically unified, the victims were primarily members of fringe groups or groups caught in the midst of local social conflicts. The second, later phase, coming after

Mecklenburg had been divided into two duchies in 1621, grew into mass persecutions that sought to wipe out witchcraft by eliminating anyone suspected of it. The expanding and intensifying persecutions provoked resistance from some of the families affected and from several of Mecklenburg's religious leaders. At the same time, the shift away from fear of diabolical witchcraft and criticisms of the trials led to the end of the persecutions between 1681 and 1683 in Mecklenburg–Güstrow and around 1700 in Mecklenburg–Schwerin.

Early sorcery trials can be traced back to around 1480. In such trials, it is sometimes difficult to draw a clear line between trials aimed at persecuting witches for the damages they caused (*maleficium*) and later cases that saw the Devil as partner of the sorceress. In 1558 we find the first evidence of true witchcraft hearings. Archival sources show that Mecklenburg held about ten witchcraft trials per year by 1570. The massive increases in the early phases of prosecution came with attempts to enforce Mecklenburg's evangelical ecclesiastical ordinances of 1562 and 1572. Crimes were defined largely according to the terms of the Carolina Code (1532), with some of its standards intensified.

Local rulers could now follow through on chasing down and punishing witches, using stricter regulations and penalties for breaches of law. At the same time, the Lutheran rulers also prosecuted fortunetellers, treasure hunters, and people who earned their living by counteracting witchcraft (*Hexenbanner*) on the basis of confessional considerations. Mecklenburg's late-sixteenth-century witch persecution was based on complaints from individual farmers and municipalities; their claims of evil magic were mainly directed against people from families that were already stigmatized.

Around 1600, Mecklenburg's persecutions reached their highest point. Between 1604 and 1615, there were an average of thirty witchcraft trials per year in the region, which was also suffering from epidemics and crop failures. Witch prosecution usually took the form of small groups of trials clustered together. Because magistrates were required by law to send the briefs and documentation to the faculties of law and the judiciary chancelleries, a system of relatively mild verdicts became the norm. Sentencing in Mecklenburg did not employ full force against all of the criminal aspects of witchcraft. A rather skeptical Protestant providentialism led to a relatively temperate interpretation of witchcraft. Certain elements of the cumulative concept of witchcraft were abandoned; for example, witches who flew and were transformed into animals were not part of confessions elicited, nor did Mecklenburg's clergy or judges accept them.

More important than the theoretical differentiations was the practice of following the *processus ordinarius* (ordinary procedure). Witchcraft was not considered a *crimen exceptum* (the excepted crime) in Mecklenburg

in the early stages of trials. On the contrary, the tendency was to lean toward moderation and caution in dealing with circumstantial evidence and torture. Prominent Mecklenburg jurists like Johann Georg Goedelmann and Ernst Cothmann symbolized the attitudes of the region's ruling classes and administrators, who adhered to humanistic principles of thought. Thus the use of defense lawyers was always allowed in witchcraft trials, and they appear in roughly one in five court cases regarding witchcraft. Rumors of witchcraft were treated with reservation, and a single accusation never sufficed to open a proceeding. Additional evidence was also treated cautiously. In slightly more than half (55 percent) of these cases, torture and the death penalty were permitted.

Local courts were less scrupulous about enforcing these strict codes, and they offer numerous examples of breaches of law in witchcraft cases before 1600. The systems of serfdom and farmers' loss of property rights to manorial lords ran parallel to the early witch persecutions in a sparsely populated region with several types of seigneurial and lesser manorial courts. At the same time, the regional government strove for better discipline and professionalism in local law courts. They dismissed various members of small town and district courts from their offices after investigations into breaches of law.

A specific type of persecution of witches developed in different jurisdictions—both the smaller and larger autonomous cities, and the noble and district courts. It focused primarily on those groups of the population caught in the middle of social tensions and conflicts. In the larger cities and offices, this meant primarily the poor and people from fringe groups. In the smaller towns, it was often people associated with the municipal elite; in noble courts, it was members of the farming community who had protested against the loss of their power and rights. Seigneurial courts, reflecting conflicts between the nobility and their subjects under the new social and legal manorial system, primarily conducted witchcraft trials in the first period. However, the intensity of these disagreements diminished considerably during and after the end of the Thirty Years' War. The noble court leaders and civic judges in the lake areas both lost interest in witchcraft trials and consequently dismissed accusations from ordinary people.

These social differences in addressing conflict leveled out after Mecklenburg's mass persecutions began. The late-seventeenth-century persecutions also reflected other changes. Unlike the earlier persecution, witchcraft no longer manifested itself in the practice of magic or in neighborhood quarrels; rather, ties to witchcraft were now sought through kinship and association with other witches. Trials no longer targeted small fringe groups and poorer people but expanded significantly to include middle- and upper-class defendants. Similarly,

witchcraft became less gender-specific; the longer these persecutions continued, the more likely they were to accuse men and children.

Mecklenburg experienced numerous intense waves of persecution following the end of the Thirty Years' War. At this time, its largest chain of trials took place, involving more than eighty people in the village districts of Redentin and Bukow. The governments in both parts of the duchy (Schwerin and Güstrow) actively supported these trials, but they used very different means. In Mecklenburg-Schwerin, the government increasingly discarded the stricter safeguards of public law and minimized the legal prerequisites for circumstantial evidence in witchcraft trials, thus allowing for chains of trials to develop. A witch's accusations toward her conspirators were accepted uncritically and used as the basis for new trials against "accomplices." One's chances of being cleared of such charges and released were minimal. Instead, in cases in which witchcraft was not proved, the basic suspicion was cause for banishment from the duchy. There was little supervision of local courts, because Schwerin law often employed special commissions. Even though its sovereign, Christian Louis I, personally called for an end to all witchcraft trials, he lived abroad; his chief civil servants, Chancellor Hans Heinrich Wedemann and later Adolf Friedrich zur Nedden, ignored his order and continued to issue commissions. Only after the death of Chancellor Nedden in May 1700 could the persecutions of witches be ended in Schwerin.

Meanwhile, persecution of magic and superstition became the core elements of an intensive campaign of confessional Lutheran discipline in Mecklenburg-Güstrow. As a result, every rumor of witchcraft was investigated—but not with the same legal procedures or standards as in Schwerin. The elimination of witchcraft was pursued with equal determination in Güstrow, but its extensive inquisitions and visitations were accompanied by rigorous controls over its local courts by upper-level and professional judges.

Mecklenburg's learned and pious experts studied each piece of evidence from each case with a high degree of exactness, often resulting in long periods of imprisonment for the accused without the case ever being decided. Many died in prison or were not released until the early 1680s. Meanwhile, because of their experiences in dealing with these trials, members of the clergy were quick to develop a more critical attitude toward witchcraft trials. In the long run, they were able to delay or prevent chains of new trials caused by accusations from those convicted, and they finally devalued the confessions of pacts with the Devil and the witches' Sabbats. Witchcraft was dismissed as a "superstition," and the persecution of witches ended by 1700.

MEDEA

Medea is one of the great paradigms of the classical magician, and hence of the female witch in later times. Granddaughter of the sun and niece of the divine magician Circe, she fell in love with Jason during his search for the Golden Fleece and aided him with her magic. A woman of violent emotions, her enmity could be fatal. When she abandoned her family for love of Jason and her brother tried to pursue her, she killed him without compunction; when Jason fell in love with another woman, Medea sent her a robe anointed with an unguent intended to kill; and having restored the youth of Jason's father by cutting him into pieces and boiling them in a pot with magical herbs, she persuaded the daughters of Pelias (the king who had sent Jason on his expedition for the Golden Fleece) to attempt the same, but made sure they failed by giving them inefficacious herbs. This was an aspect of her magic that early modern writers particularly noted. Marsilio Ficino and Johann Weyer, for example, drew attention to it; Cornelius Agrippa remarked in *De Occulta*

Philosophia (On Occult Philosophy, Book 1: 15) that some physicians were claiming to be able to restore a person's youth by giving him or her a concoction made from viper's flesh and hellebore. Medea could also control the weather by calming storm and sea and blight fruitful nature by piercing the liver of a doll made for just this purpose, and she had the evil eye. When a bronze giant called Talos menaced Jason and the Argonauts, Medea uttered invocations and then fixed the giant with the power of her evil eye and killed him.

Medea came from Colchis, a region just south of the Caucasus Mountains, and so was not a Greek. Consequently, Euripides, in *Medea* or *Andromache*, portrayed her in the light of the Greeks' view of the world that was divided between civilized people like themselves and barbarians, who indulged their passions with murder or occasionally with incest. Ancient authors frequently underlined two characteristics of her magic. She used *pharmaka*, herbs or minerals with preternatural powers, making her a *venefica*, a woman who either poisons others or works poisonous magic against them; and she worshipped Hecate, a goddess associated with the earth and the moon and hence the deity par excellence of magic. Significantly, then, we are told by the third-century-B.C.E. Greek poet Apollonius Rhodius (*Argonautica* 4.50–4.53) that Medea was well-acquainted with graveyards, having spent much time wandering through them.

The story of Medea, therefore, contained several features reminiscent of the medieval and early modern scholarly image of the witch. Her emotions were both strong and malicious; she indulged herself with illicit love and sex; she employed herbs for magical purposes, which might be beneficent or maleficent according to the prompting of the emotion that currently ruled her; she had the evil eye; she worked weather and crop magic by piercing enchanted dolls; she belonged, as it were, to a society other than that which is regular and civilized; and her magic was performed in conjunction with a deity who had power over the spirits of the dead and was capable of producing extraordinary phenomena. The portrait by Ovid (*Metamorphoses* 7.180–191) of her working a necromantic ritual was particularly vivid and highly theatrical. Medea let her hair and dress float free; she paced barefoot up and down without apparent purpose; she operated at night; and instead of uttering comprehensible words, she shrieked and howled almost like an animal. The marks of civilization had disappeared, and in their place she exhibited the signs of a person who had willingly cast aside the usual restraints observed by the rest of society. Medea thus became alien and frightening as she sought to rend the veil normally dividing the realm of the living from that of the dead. Later writers on witches and demonology, all educated in the Greek and Latin classics, therefore had little to do to develop their

portrait of a witch. All they needed to add were the purdy Christian elements.

MEDER, DAVID (1545–1616)

At the beginning of the seventeenth century, David Meder, a Lutheran minister in Saxony, passionately propagated the existence of an aggressive witch cult on earth and called for its extinction. Despite his fierce zeal, he desired only moderate witch hunts. Meder was close to the official mainstream in the early seventeenth-century electorate of Saxony, which crafted extremely severe legislation against witchcraft yet followed a relatively mild and scrupulous policy in witchcraft trials.

Born in Naumburg in the electorate of Saxony, Meder studied theology at the University of Leipzig and became a general inspector of Lutheran churches and schools for the small county of Hohenlohe (in southwestern Germany) in 1577. He returned to his place of birth as a preacher in 1595, later moving to the nearby Saxon town of Nebra, where he died.

Because of the divided views on witchcraft trials between the general population, who wished to eliminate witches, and the judges who pronounced sentences, who needed proof to justify them, Meder tried to influence public opinion through a series of sermons. Together with other material, his witch sermons were published in 1605, with a second edition in 1615.

In Meder's opinion, the main reason for the growth of witchcraft was the deteriorating state of mankind, manifested in increasing wickedness to which too many Christians yielded. This deterioration was further exacerbated by attacks on true Christianity from Catholics, Muslims, and Calvinists.

In his sermons, the Lutheran theologian cited the Hebrew Bible, the Church Fathers, and Martin Luther, all of whom accepted that witches existed on earth. Meder passionately opposed all skeptics of witch hunting; in his eyes, witchcraft was a capital crime, which surpassed all other sins. Witches, he believed, caused much damage; they were responsible for murder, diseases among humans and livestock, theft, and poor harvests. Their destructive undertakings were based on a pact with the Devil, who granted them powers. The pact was supposedly complemented by copulation with the Devil. Unlike many other Protestant authors, Meder accepted the witches' Sabbat, the collective

element in the witch paradigm, as true. He used certain recent trials as evidence that sorcery was not confined to women. Men and even children performed this destructive art. Because this capital crime encompassed the Seven Deadly Sins and violated almost all Ten Commandments, this Lutheran preacher called upon the authorities to take action by conducting witchcraft trials—including handing out death sentences.

Despite his vehemence, Meder called for relatively modest witch hunts. He dismissed imposing death sentences for conviction of nondiabolical sorcery, believing that imposing penance was a fair punishment for such offenses. He criticized excessively harsh torture and largely dismissed denunciations from convicted witches. Meder opposed the swimming test and accepted only testimonies of respectable Christians or unforced confessions as proof. Meder exemplified the providentialist tradition within Lutheranism stemming from the Württemberg school of Johann Brenz, which saw the growth of witchcraft as a kind of godly providence (Midelfort 1972, 36–66). Thus God permitted witchcraft through the Devil's agency in order to chasten sinful mankind and warn the faithful, but, nevertheless, God allowed Satan no independent power. Thus, the powers of witches were horrible, but—because only God reigns—limited.

Meder's approach was not exempt from contradictions, for he could not reconcile his implicit clamor for an extinction policy in the first part of the book with his explicit demands for relatively mild treatment of alleged witches. His explanations also followed providential theology on another level. Because this school rejected the reality of weather spells, Meder's assertions on this very important topic for contemporaries were contradictory. On one page he attributed the obliteration of harvests by hailstorms to the magic of witches but rejected such thinking on another page. Meder's two editions of his eight witch sermons demonstrate the degree of reception of his thoughts.

MEDICINE AND MEDICAL THEORY

Spider webs, ant eggs, snakeskin, extract of wood lice, extract of foxglove, beetle's blood, and an elixir with seventy-nine different ingredients . . . "This was not, as

would be reasonable to suppose, the first aid kit of a local witch left behind and found after her arrest. It was part of the pharmacopoeia of the University of Glasgow found by William Cullen on taking up an appointment as professor of medicine in 1751” (Larner 1984, 142). Astonishing as it might seem, it would be nonetheless simplistic to assume from this evidence that early modern learned medicine was rooted in a seedbed of misconceptions, that its practitioners had a poor understanding of the workings of the human body, and that the contents of their medicine chests were useless and most of their prescriptions potentially harmful. In *A Midsummer Night’s Dream*, Bottom’s words remind us of the curative power of a spider’s web against hemorrhages: “I shall desire you of more acquaintance, good master Cobweb: if I hurt my finger, I shall make bold with you” (III, I, 164–165). In terms of therapeutics, learned and popular medicine substantially overlapped, and both were powerless to heal serious illnesses.

Despite notable developments in the history of medicine during the last few decades, its nexus with early modern witchcraft still awaits a global assessment. The spectrum of questions raised by this intricate relationship is discouragingly wide. It has recently been held that the idea of witchcraft, “a composite subject consisting of discussions” about all facets of human civilization (Clark 1997, viii), was inherent in the moods, minds, and culture of early modern people. Nevertheless, from the vantage point of the treatment of sick people in early modern Europe, two broad questions can be formulated. First, how did an age commonly defined by historians as one of scientific advancements adjust itself to widespread beliefs about diseases of demonic origin? Second, how did learned medicine of this period succeed, if at all, in imposing its intellectual superiority and forcing cures that relied on magic and religion into a corner?

MEDICINE AND CHRISTIANITY

Christianity had always been a healing religion with a strong affinity between saving souls and healing bodies. Illnesses came ultimately from an offended God as a result of sin. When early modern people fell ill, they did not generally assume that their ailments were caused by witchcraft. However, if the signs of disease appeared weird and suspicious, both common belief and Holy Scriptures allowed that it might have been engendered by bewitchment cast by malevolent persons with the help of the Devil. Curative remedies, nevertheless, should not be magical, and their healing power must be implemented through prayer by both patients and doctors. Only Church hierarchies could establish the orthodoxy of a prayer. After the mid-sixteenth century, ecclesiastical hierarchies increasingly disavowed the centuries-old healing practice of divines, although much ambiguity persisted about the practice of exorcism in Catholic lands. No doubt, when the sixteenth-century physicians

Girolamo Cardano and Johann Weyer asserted that diseases apparently caused by witches could be traced to natural origins, they were anticipating the secularization of a discipline; but the separation of functions between medicine and religion occurred very slowly.

THEORETICAL FOUNDATIONS OF EARLY MODERN MEDICINE

Recent works in the history of medicine have demolished Whiggish notions of scientific advancements, emphasizing elements that appear progressive in a modern sense. Much of the attention of historians now concentrates on how early modern people experienced medicine in terms of therapeutics and relief from anxiety and pain.

A preliminary digression on the theoretical mold of ancient medicine seems necessary before dealing with medical practitioners and patients. Unquestionably, any changes in sixteenth- and seventeenth-century medicine took place within these deep-rooted assumptions. The Hippocratic/Galenic tradition retained its preeminence throughout Renaissance, baroque, and Enlightenment Europe. Galenic physicians followed humoral theories, understanding the human body as composed of masses of four fluids: blood, phlegm, yellow bile, and black bile. It was a microcosm related to the larger macrocosm of the universe. Humors were linked to the seasons, to the four ages of humankind (childhood, youth, adulthood, and old age), and were the product of the four Aristotelian qualities (hot, cold, dry, and fire). Good health resulted from a balance among these four humors, and any alterations in their nature might jeopardize a person’s physical condition. The putrefaction of humors through contagion from some poison, as in plague, could also cause illness. Therefore all treatments aimed at blocking corruption and readjusting imbalances through bleeding, purging, vomiting, and evacuating. Healing meant restoring a harmony between macrocosm and microcosm. The best means of maintaining health was to practice moderation by avoiding exhaustion, overeating, overdrinking, overheating, and immoderate passions. Immorality and a vicious life were perceived as causes of disease.

The most challenging break with the Galenic paradigm came from the physician Theophrastus Bombastus von Hohenheim, called Paracelsus (ca. 1493–1541), who carried out a head-on attack on tradition by proposing a novel physiology and anatomy. Contrary to Galenic wisdom, which ignored the existence of specific diseases, he taught that an *archeus* (vital force) external to the human body caused disease and offered a basis for understanding that illnesses were real entities. Paracelsus’s chemically based medicine emphasized the process of fermentation and putrefaction at the basis of physiology. After him, iatrochemistry gained much prestige in the treatment of illnesses, in opposition to the herbal remedies mostly used by

Galenists. Iatrochemistry was soon joined by another feature of medical examination, iatromechanics, contending that human body processes obeyed the same laws of physics ruling earth and the planets. A description of sixteenth- and seventeenth-century medicine must include the many breakthroughs in anatomy (with decisive influence on forensic medicine), physiology, and pathology by Jan Baptista van Helmont (1579–1644) and his son Franciscus Mercurius van Helmont (1614?–1699), Théophraste Renaudot (1586–1653), Giorgio Baglivi (1668–1707), or Friedrich Hoffmann (1660–1742). But all these advances cannot conceal a stronger reality: throughout early modern times, methods of treatment remained overwhelmingly Galenic, and “few of the theoretical changes introduced, even the Paracelsian ones, made much difference in how illnesses were treated and none, by itself, contributed to cures” (Lindemann 1999, 88).

LEARNED DOCTORS

There seems to be an almost perfect correlation between mid- and late-seventeenth-century post-Galenic medicine and the end of witchcraft persecutions. But how can we reconcile this temporal coincidence with the fact that no radical epistemological changes characterized the birth of the new medicine? In fact, the decline of witchcraft was a complex sociocultural event, unrelated in any direct way to progress in medical science. What most recent studies have shown is that an empiricism that stressed observation and experience became the dominant theory among physicians, an investigative paradigm previously inconceivable within a community of Christian physicians.

The strongest challenges to the belief in witchcraft among university-trained scholars of the sixteenth century had come from physicians. And yet many of them, like Giovan Battista Codronchi, Pietro Piperno, or William Drage, championed the causation of illnesses by witchcraft. But unlike lawyers, philosophers, and theologians, physicians received a professional training that eventually allowed them to make a different diagnosis and provide naturalistic explanations for diseases. From correspondence in 1653 between a New Haven physician, Nicholas Augur, and John Winthrop Jr., medical doctor in Connecticut and later fellow of the Royal Society, we can observe the shaping of a different diagnosis. The illness of four young girls displayed symptoms similar to their counterparts in Salem forty years later, but these physicians ignored the girls’ narrative of diabolical bewitchment. Instead, Augur searched for natural explanations for their fits, and his differential diagnosis included three possibilities: “I must needs say that strange and various accidents and distempers do arise both from the obstruction of the spleen as well as from hysterical passions, and sometimes from the retention of overflowing of the menses. . . .” (Gevitz

2000, 24). The writings of such well-known early modern doctors as Johann Weyer, Jean Fernel, Ambrose Paré, Girolamo Cardano, Daniel Sennert, Edward Jorden, or John Cotta tried to clarify the nature of odd and puzzling symptoms in patients. However, many of them rejected both the Paracelsian paradigm and the entire Hippocratic/Galenic tradition. The dividing line between tradition and modernity remained uncertain, and the dominant ethos of every scientific corporation avoided the most radical positions.

For skeptical physicians, this caution meant that almost nobody would attempt to disprove the authority of Holy Scriptures in matters of witchcraft, with the probable exception of Weyer. Practically things fared quite differently, because we know from several cases that physicians did not accept witchcraft as a serious possibility when natural causes could explain suspicious possessions, illnesses, or deaths. The “long” sixteenth century was an era dominated by antagonistic forces that tended to blur in complex ways. The erudition of some medical doctors encompassed a variety of subjects: magic, philosophy, religion, alchemy, and occult studies. Some became astrological physicians, believing that heavenly bodies could affect the human body and cause illness.

No early modern medical practice better reveals this synthesis of late Renaissance learning than the amazing career of Richard Napier, an Anglican theologian, master of arts at the University of Oxford, and parson of a rural parish in Buckinghamshire. His detailed casebooks of some 60,000 consultations from 1597 to 1634 shed light on multiple health problems of all social classes (Macdonald 1981). Apparently, sick people used to go to doctors mainly to receive physical treatment; only 5 percent of Napier’s patients suffered from mental as distinct from bodily illness. In this age, few people from any social class would have questioned Napier’s medical advice, his mix of astrology, magic, Christianity, and science. But by the waning years of the seventeenth century, academically trained doctors had largely succeeded in branding medical astrologers as quacks.

CAUSES CÈLÈBRES AND NEW PARADIGMS

It seems self-evident to admit that there was no incongruity at all between a “scientific” age and medical diagnoses based on demonological beliefs. The presence of demonic pathologies in academic medical milieus was no marginal and exotic aberration (Clark 1997). However, the guiding principle governing medical studies, namely differential analysis, proved to be the most intractable among all fields of learning to reconcile with the presence of a demonic agency. Historians know that it is difficult to reconstruct a coherent picture explaining the establishment of a

new scientific paradigm. Regarding medical care and the etiology of illnesses, witchcraft could be discerned as an interpretive proposition based on the principle of irradiation from a center. It has been argued that the Mary Glover and Anne Gunter cases (1601–1604) marked a turning point in the history of witchcraft in England because the unveiling of both women’s simulated illnesses “encouraged medical sceptics to advance their cause . . . and helped to increase the burden of proof” (Macdonald 1991, li). And in France, a similar emergence of ideas emphasizing empirical medical explanations for simulated cases of diabolical possessions extended from the Marthe Brossier case (1598) through the great scandals of Loudun (1633–1634) and Louviers (1643–1644), all of which spawned major controversies, including alternative diagnoses challenging the apparent proofs of diabolical illnesses and encouraging skeptical explanations.

PATIENTS AND PRACTITIONERS

Was the world of university-trained and town-based physicians representative of the reality of medicine and medical care in early modern Europe? Because 80 percent of its inhabitants did not live in cities, a meaningful understanding of health care systems in the past requires some knowledge of how they worked in the countryside. Unfortunately, our information is far from satisfactory with regard to where, when, and how healing practices were implemented in European villages.

In old Europe, medical care began within the household and the neighborhood, where older, experienced women practiced midwifery and pooled their wisdom to cure minor bodily afflictions. It is more difficult for social historians to assess how many health workers were available beyond the circle of neighborly first aid to cure the sick in rural areas. And certainly, numbers matter. We know, for instance, that the rural district of Veluwe in Holland had one medical practitioner for every 1,400–1,700 inhabitants in the sixteenth century. In the more urbanized parts of north Holland, this ratio was 1 to 500, and late sixteenth-century Norwich had ratios of 1 to 200. Clearly, the early modern European health system was not a total disaster.

But we must not forget the inadequate sanitation of old Europe. In seventeenth-century Tuscany, for instance, which enjoyed a relatively good sanitary system, numerous village communities petitioned the Grand Duke to find them a reliable *cenusico* (barber). Of course, in attempting to assess the medical context of witchcraft, numbers matter less than the quality of the medical care offered, and the range of healers, especially in rural areas, could be extremely diverse. University-trained physicians were rare, but there was a fair supply of less well theoretically trained medical practitioners. Beyond the circle of first aid, a net of surgeons,

barber-surgeons, apothecaries, and licensed mountebanks came into play to heal fractures, wounds, abscesses, and a range of minor afflictions.

Alongside these authorized health workers, an unofficial (and illegal) health system flourished: a net of male and female healers able to identify ordinary illnesses and to prescribe medicines for them, thereby providing an additional, sometimes substitutive health service. Workers in both systems generally drew on a common pharmacopoeia, based on herbal lore, minerals, and specific prayers. Admittedly, the practice of learned physicians was more interventionist and painful, but the principal difference between medical practitioners of these two systems was gender: official medical practitioners were all male, whereas most illegal healers were female. We have much evidence that people tried all the medical options locally available in their attempts to recover health, but it is difficult to say which system enjoyed a larger clientele and better reputation. To be sure, one reason why the unauthorized health service appealed to so many people in the past must have been the shortage of stable official, village-based medical practitioners, whose fees were probably also higher.

CURATIVE MAGIC

Whenever infants suffered a sudden illness or anyone experienced a prolonged wasting away of the body, such misfortunes could be contextualized in a scenario emphasizing personal enmities; in such cases people had stronger reasons to see themselves as victims of spells and to consult a cunning woman or man with a reputation for discovering witches. Heinrich Kramer wrote in the *Malleus Maleficarum* (The Hammer of Witches, 1486) that “such witches . . . can always be found at interval of one or two German miles and they seem able to cure anyone who has been bewitched by another witch” (Kramer 1996, 159). He was describing cunning women or men, whose very ubiquity greatly deepened the problem of the medical aspect of witchcraft. Kramer’s calculations could be generalized throughout early modern Europe, but it would be misleading to follow either his or the later and much stricter Reformation-era theological condemnations of such people as “witches.”

Cunning men and women were not “witches” but merely pundits of an illegal health system, and their polyvalent skills were not restricted to curing magical illnesses. They were rooted in their local communities, and people stubbornly sought their services despite all prohibitions by public authorities. Historians have learned about some famous healers who attracted patients from large areas. In sixteenth-century Tyrol, a magician who worked as an innkeeper and coppersmith drew clients from a zone extending from eastern Tyrol

Physicians treat victims of witchcraft, including one suffering from demonic possession who vomits toads and snakes. To the right, a witch invokes a demon while other witches attend a Sabbat. From G. A. Mercklin, Tractatus Physico Medicus, 1715.

to Bolzano and Merano in south Tyrol. The *stregoni* (male witches) of the Tuscan village of Galatrona, whose clientele ranged from Lorenzo the Magnificent to very ordinary Sienese people, extended their activity over a good part of early seventeenth-century Tuscany and probably passed their skills down. Unfortunately, we have no way of knowing the ratio between diseases reportedly caused by witchcraft and the surely much larger general morbidity anywhere in Europe.

COULD MEDICINE WORK?

If early modern medical prescriptions were effective against minor ailments, it is beyond doubt that its remedies and procedures were “ill-equipped to deal with organic disorders through drugs or surgery. Many men . . . died from incompetent diagnosis or treatment whose lives would have been saved today” (Thomas 1973, 251). Should this overt neglect of sanitation in the past suggest that our early modern ancestors did not “go to the doctor” with the same expectation to recover health as people living today? To decode the medical stories recounted by patients, mostly illiterate, and discover inner psychological meaning behind their “going to the doctor” is not an easy task. What remedies did they request? If medicine was often powerless to heal, did the sick really expect that a recovery was likely to

happen after narrating their misfortunes to doctors? This assumption has been questioned on several grounds: early modern people had a different mental equipment to face misfortune; their threshold of pain was higher, and their attitude about death more fatalist. “They might crave release from their illness, but they also recognized that the length of their days was measured by God” (Brockliss and Jones 1997, 305). No matter whether their disease was of natural or preternatural origin, early modern patients apparently consulted any kind of doctor who could offer them some psychological support.

Many medical practitioners provided effective therapy, whether orthodox or magical, to cure diseases that might have psychosomatic origins. Edward Jorden, discussing the medical value of charms, amulets, and holy water, observed that their success was due “to the confident persuasion which melancholic and passionate people may have in them” (Thomas 1973, 249). The best chance of any medical practitioner lay in a patient’s imagination, enhanced by the secret rituals with which cunning men surrounded their practice. Indeed, the knowledge of the placebo effect must have been familiar to both health systems.

THE TWO SYSTEMS SEPARATE

If therapeutics of the period achieved no substantial improvements, did the increase in medical knowledge induce any changes in the relation between medical practitioners and patients? We possess scattered but meaningful evidence about the evolution of the medical aspect of witchcraft, which suggests that it was the quality of medical service being offered that mattered most. It has been recently argued that as more advanced medical knowledge and official healing penetrated local communities, “the more the latitude and rationale for thinking and acting in terms of witchcraft decreased” (Gijswijt-Hofstra 1991, 110). This is certainly true as far as witchcraft accusations were concerned. There are also indications that increases in medical knowledge eventually changed the balance between the two health care systems. Early modern historians have tried to discern where and when, if at all, the clientele of the unofficial health system shrank as the web of authorized medical practitioners grew. Early-eighteenth-century Europe certainly witnessed a progressive masculinization of the discipline, and there are traces of professionalism that widened the gap between learned and popular medicine. It was a slow but steady parting of ways about curative magic that separated ordinary people from educated ones. Recent studies have shown a shift in cultural psychology stimulated by changes in material realities, including the rise of medicine as a commodity market, as a part of the birth of a consumer society. Another process of diffusion can also be discerned as new fashions and lifestyles eventually spread

from urban centers. There, educated and affluent patients sought out socially respectable university-trained physicians as a symbol of their distance from ordinary people.

MELANCHOLY

A disease in early modern Europe that was synonymous with a nonviolent form of madness. The word *melancholy* has an extremely long and famous history that from ancient Greece crosses the Christian old regime and enters the contemporary *Diagnostic and Statistical*

Manual of Mental Disorders (4th ed., “Depression with Melancholy”). In the original sense it referred to a disease and a temperament. The Anglican divine Robert Burton summarized this latter implication in 1621 as follows: “Melancholy . . . is either in disposition, or habit. In disposition is that transitory melancholy which goes and comes upon every small occasion of sorrow, need, sickness, trouble, fear, grief, passion or perturbation of the mind. . . . In which equivocal and improper sense we call him melancholy that is dull, sad, sour, lumpish ill-disposed, solitary, and any way moved or displeased. And from these melancholy dispositions no man living is free” (Burton 2001, 143). An equation of the melancholic with the commonplace harmless mad would be a misleading oversimplification, incapable of grasping the assortment of characteristics included within that catchall mental disorder described by the melancholy syndrome.

Literally, melancholy was the “black bile,” one of the four humors flowing within the human body. It imitates earth, increases in the autumn, and prevails in adulthood. A balance of humors assures good health, but melancholics were thought to suffer from an excess of black bile. It could also favor the development of exceptional intellectual faculties. The Bordeaux judge and demonologist Pierre de Lancre was certainly not alone to maintain that black blood, from which the melancholy mood comes, is so sour that it may corrupt the brain, and its color, a symbol of darkness, makes Satan take advantage of melancholics. The interpretative power of melancholy was immense in literature, drama, and painting. Being a cultural artifact, it was highly changeable, and over time, it came to be characterized by a contrasting variety of attitudes and behaviors. For instance, the earliest opponents of religious enthusiasm in seventeenth-century England argued that it was caused by melancholy, but during the eighteenth century, orthodox controversialists claimed that such enthusiasm was a sort of madness.

Among other things, the melancholy syndrome became a European-wide mark of gentility. In England, it became a fashionable disease for late Renaissance courtiers after the appearance of Burton’s *Anatomy of Melancholy* in 1621: British patients of rank preferred to be melancholic rather than merely sad or troubled. Between 1597 and 1634, two-thirds (forty of sixty-two) of all of the mentally disturbed gentry patients of the Buckinghamshire physician Richard Napier complained of black bile, whereas only one-sixth of his ordinary patients bemoaned melancholy. Since Napier “sought also to articulate his patients’ maladies into categories that were at once scientifically useful and consistent with popular usage . . . Ordinary people merited more often the rude and common word mopish” (MacDonald 1981, 164). In Germany, in the course of the sixteenth century, “melancholy declined as a theme for painters

and became increasingly common in literature and life toward the end of the century” (Midelfort 1984, 114). As a medical diagnosis, melancholy became prominent through the growing influence of Galen’s humoral theories among German academic psychiatrists. This change is particularly evident with the treatment of mad princes. Humoral-based therapy replaced “the common practice around 1500 of simply locking or chaining an offensive prince. . . . By the late sixteenth century, princes were regularly subjected to . . . purging, bleeding, change of diet and were expected to change,” whereas poorer Germans, not unlike Napier’s ordinary English patients, “went mad with a difference” (Midelfort 1984, 125). In 1575 a Protestant landgrave (count) reported that a woman thought to be possessed was “more likely suffering from weakness in her head and silly melancholy thoughts”; however, this suggestion of melancholy came from a prince, not a villager (Midelfort 1984, 130). After 1600, most of the 200 male and female insane admitted to Juliusspital of Catholic Würzburg were described as “melancholic” (Midelfort 1984, 377).

Melancholy people, surrendering to the power of the Devil, might have been more prone to commit suicide; this phenomenon is well attested in England by the notable increase of suicides reported to the King’s Bench between 1500 and 1650. In sixteenth-century France also, suicides were frequently blamed on anxiety and melancholy.

MELANCHOLY AND FEMALE WITCHES

Because, according to the Scriptures, the agency of Satan could not be denied, early modern skeptics argued that the signs of disease caused by morbid humor, above all by black bile, revealed his work. In cases of bewitchment, all kinds of visions and hallucinations were much debated by physicians, theologians, and judges who maintained that senses could be cheated by passions and alteration of physical condition due to humoral unbalances. By the late sixteenth century, the very concept of witchcraft became an intellectual, religious, and political battleground, where melancholy eventually occupied a pivotal position.

The Dutch physician Johann Weyer first used melancholy for the strategic purpose of making witchcraft a sex-specific (and age-specific) crime. “Most often . . . that crafty schemer the Devil thus influences the female sex, which by reason of temperament is inconstant, credulous, wicked, uncontrolled in spirit, and (because of its feelings and affections, which it governs only with difficulty) melancholic; he especially seduces stupid, worn out, unstable old women. . . . Now . . . consider the thoughts, words, sights, and actions of melancholics, and you will understand how in these persons all the senses are often distorted when the melancholic humor seizes control of the brain and alters the mind” (Weyer 1991, 181, 183). Trying to

demolish the reality of the demonic pact and the Sabbat, Weyer wanted to show that the witches’ confessions were caused by disturbed minds. “For clinical reasons he linked delusion to gender; but at least this led him to exclude all women from the witchcraft population” (Clark 1997, 199–200). The medicalization of witchcraft was also championed by the Kentish intellectual Reginald Scot in 1584: “melancolie abuseth old women . . . abounding in their head, and occupieng their braine, hath deprived or rather depraved their judgement and all their senses” (Scot 1972, 30). Borrowing melancholy from Weyer, Scot similarly planned to employ it in order to discredit the confessions of old women.

But Weyer’s stance was not flawless and could not be adapted to a large number of accused witches. Such was the contention of Thomas Erastus and Jean Bodin: the former (a fellow physician) denied in 1572 that women’s brains were dulled by melancholy vapors; the latter refuted Weyer’s melancholia thesis shortly afterward within the context of a global demolition job. In *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580), Bodin called Weyer an ignorant physician who did not even know that, according to Galen, women’s humor is contrary to adult melancholy because it derives from heat and dryness, whereas women are by nature cold and wet.

GENDER

Did more women than men suffer from milder forms of mental illness in early modern Europe? Is a superabundance of melancholic women confirmed by contemporary statistics? Of course, conclusive statistical evidence is hard for historians to get. According to Erik Midelfort (1999), in the Renaissance the medical language of melancholy and madness was not highly gendered; except for hysteria, physicians expected to find roughly the same maladies among men and women. However, the casebooks of Richard Napier registered more women than men among his mentally disturbed patients. We know that, on a European average, between 75 and 85 percent of all those accused of witchcraft were women. Frailty of mind, fickleness of behavior, and notorious lustfulness: such physical deficiencies, when combined with mental delusion engendered by melancholy, made the weaker sex the Devil’s favorite targets. From witchcraft trials comes much evidence both of women who felt themselves bewitched and of female witches who confessed they had made a pact with the Devil, lived with him as man and wife, flown to the Sabbat, and so on. In the former cases, historians might still be inclined to consider possessions as evidence of hysterical syndromes. In the latter cases, interpreting such narratives, when they are not clear and simple products of torture, poses a continuous challenge. Some seventeenth-century physicians,

magistrates, or theologians diagnosed these women, who were suffering from melancholy, as being mentally deranged. Today's psychologists and psychiatrists have sometimes speculated about the psychic balance of the accused. Certainly, it does not seem that European magistrates, even if they had trouble distinguishing demonic possession from madness, ever confused mad people—female or male—with witches.

Can one learn more by digging deeper in such material? Will clues emerge to better define the psychic identity of womanhood within the melancholic tendencies of women under trials? No doubt, witchcraft material will continue to provide grist to psychoanalytically minded historians.

MENGGHI, GIROLAMO (1529–1609)

Mengghi was the most prominent exponent of exorcist theory and practice in Counter-Reformation Italy.

Called "Il Viadana" after his birthplace in the diocese of Cremona, Mengghi entered the Observant Franciscan

order around 1550. His career as a practicing exorcist and writer was spent in Bologna and Lombardy, bringing him the rewards of office: Pope Clement VIII appointed Mengghi head of the Franciscan Province of Bologna from 1598 to 1602. He died in 1609 in his native town of Viadana; the inscription on his tombstone relates the joy of the infernal hosts at the death of their most rigorous assailant and describes him as the greatest exorcist of his century.

Certainly he was the most prolific. Not long after his entrance into the Franciscan order, Mengghi composed the first of many exorcist manuals, the vernacular *Esorcismo mirabile da disfare ogni sorte de maleficii per un devoto religioso composto* (Wonderful Exorcism to Undo Any Kind of Maleficium, Composed by a Devout Religious), published in Venice in 1555. The novel aspect of this work was its announced focus on using exorcism as a weapon, not only against demonic possession but also against the more common negative effects of bewitchment or *maleficium* (harmful magic). Although he never took a university degree, Mengghi did edit the unpublished Latin exorcist writings of the Dominican inquisitor Sylvester Prierias (1456–1523), an anti-Lutheran polemicist and master of the sacred palace under Pope Leo X. Mengghi's future work would draw heavily on Prierias and on other experts in demonology and witchcraft, especially Michael Psellus, Johannes Nider, and the *Malleus Maleficarum* (The Hammer of Witches, 1486).

The most successful of Mengghi's works was the Italian *Compendio dell'arte essorcista* (Compendium of the Exorcist's Art) first published at Bologna in 1576. Literally a compendium, assembling opinions, stories, and examples from earlier authorities, it went through twelve editions by 1605 (fourteen, including two Latin editions in 1580 and 1601). His 1577 Latin *Flagellum daemonum* (Whip of Demons) appeared in twenty-one editions by 1608, with another eight between 1626 and 1727. These numerous editions and the many surviving copies testify to the popularity and wide demand for Mengghi's writings. Inventories of books owned by parish priests throughout Italy invariably included at least one of Mengghi's works, which served as basic manuals for the pastoral work of bringing relief to people suffering from the effects of *maleficium* or possession. He presented exorcism as just one of the "ecclesiastical medicines" offered by the Church; this category, which included blessings, sacramentals, and other clerical weapons against harm of negative supernatural origin, was central to the functionalist appeal of his work.

His later works, *Fustis Daemonum* (Club of Demons) of 1584 and *Fuga Daemonum* (Expelling Demons) of 1596, drew heavily from his own work in the field and appealed frequently to his own experience. The repeated statement, "Vidi con occhi miei" ("I saw with my own eyes"), asserted the authority of his position as an

expert and an eyewitness to vouch for the reality of the events he describes. There is a curiously empirical side to this type of argument from experience that, no matter how fantastic the alleged occurrence, was probably more compelling to his audience than his sophisticated scholastic arguments. Menghi described public dispossessions, some in front of learned audiences, including skeptical “enemies of adjuration” who were won over by the performance they witnessed. Throughout it was the expert, accomplished practitioner, the *esorcista perito*, who spoke, and his firsthand anecdotes were clearly designed to remind the reader of this fact. Clerics testifying in sixteenth- and seventeenth-century Roman Inquisition trials frequently cited his works as an authoritative, learned source supporting their diagnoses of *maleficium* or possession.

Menghi’s career coincided with the post-Tridentine effort to reform the Church in “head and members,” which put special emphasis on the clergy. His works were aimed at correcting abuses in the practice of exorcism by providing clear guidelines as well as a theoretical justification for the efficacy and legitimacy of this office. The dedication of the *Flagellum Daemonum* of 1576 to the reforming cardinal of Bologna, Gabriele Paleotti, was indicative of the official and institutional context within which Menghi worked. The tactic of publishing both Latin and Italian versions indicated a reformer’s zeal to reach the widest possible audience. The revival of exorcism and the promotion of ecclesiastical remedies in late sixteenth-century Italy, a movement led by Menghi, provided an approved orthodox means of addressing popular fears of *maleficium* and thus contributed to the low level of witch hunting in Italy.

MENNONITES

With their highly spiritualized view of the relation between God and human beings, Mennonites allowed

the Devil no real influence in the natural world and attached very little importance to witchcraft.

In 1536 Menno Simons (Simonsz, 1496–1561) reorganized an Anabaptist community in deep disarray, one year after the disastrous failure to found a chiliastic New Jerusalem in the German town of Munster. Menno was a former Catholic priest who became an Anabaptist but rejected the millenarianism of the Munsterians and taught that the use of force was forbidden to Christians who wanted to lead a godly life. The only way to find God was through a spiritual search leading to a rebirth in Jesus. In the Mennonite perception, the Devil was not an anthropomorphic spirit but an almost abstract principle of evil. Within the parameters of this cosmology, it was impossible to conclude a pact with a demon, let alone have sexual intercourse with him.

By the end of the sixteenth century, most Mennonites lived in the Dutch Republic, where they were a tolerated religious minority. By the following century, the Mennonites had split over a variety of dogmatic disagreements, eventually forming three main groups, all with geographical names: the Frisians, the Flemish, and the Waterlanders (named from the region directly north of Amsterdam). The Frisians were the most orthodox group, the second was somewhat less stringent, and the Waterlanders were relatively the most flexible. It should be noted that these three groups were themselves subdivided into a multitude of microconfessions. It was their usual practice to ban anyone who refused to accept the interpretation of the religious dogmas of his or her particular congregation. The implications were quite serious: other members refused to speak with someone who was excommunicated. Despite this harsh ostracism, Mennonites never demanded the application of physical force against members who had gone astray; a person could be banned but should not be persecuted. In this sense, tolerance remained a leading principle.

Their immaterial perception of the Devil and their readiness to allow other people to choose their own road in matters of religion remained essential elements of Mennonite faith. To them, witchcraft was not really an issue; consequently, few of them ever took the effort to put his or her views on this matter on paper. Pieter Twisck (1565–1636), minister of a Frisian congregation in the Dutch town of Hoorn, did take witchcraft seriously, however. In 1620 he published a chronicle about “the downfall of the tyrants” in which he related numerous stories he had found in pamphlets and other sources from abroad, combined with some incidents he had witnessed himself. In 1639 Jan Jansz Deutel, a Mennonite printer, also from Hoorn, wrote a short treatise against witchcraft that was published only in 1670 by his son. In Deutel’s eyes, all stories about witchcraft were “fables, jokes, twaddle, lies and conceit.” God would never allow

anybody, neither the Devil nor a human being, to alter nature. A heartfelt trust in God was incompatible with a belief in witchcraft.

Abraham Palingh, a textile trader from Hoorn and member of its Waterlander congregation, expressed a similar view in a book he published in 1659. Antonius van Dale (1638–1708), a medical doctor from Haarlem, became the fourth Mennonite to write about these matters. An exponent of the early Enlightenment that blossomed in the Dutch Republic with the philosophy of Baruch Spinoza, van Dale's *De oraculis* (On Oracles) of 1683 tried to combat superstitious beliefs in oracles, demonic possession, and witchcraft. In the 1690s van Dale was involved—though indirectly—in the uproar that followed on the publication of Balthasar Bekker's *De Betoverde Weereld* (The World Bewitched, 1691–1693). *De oraculis* was translated into French (1687), English (1689), and German (1730). Voltaire used it as the basis for the entry on “Oracles” in his *Dictionnaire philosophique*.

MENTAL ILLNESS

Many early modern Europeans included the Devil among the possible causes of madness, thus illustrating that the symptoms of mental illness are culturally relative and viewed as violations of conventional social norms and that mental illness is notoriously difficult to define. In 1810, a London physician registered the causes of insanity among admissions to Bethlem Hospital (“Bedlam”): “*A Table of the Causes of Insanity of about one third of the patients admitted into Bedlam: Misfortunes, Troubles, Disappointments, Grief* (206); Religion and Methodism (90); Love (74); Jealousy (9); Pride (8); Study (15); Fright (51); Drink and Intoxication (58); Fevers (110); Childbed (79); Obstruction (10); Family and Heredity (115); Contusions and Fractures of the Skull (12); Venereal (14); Small pox (7); Ulcers and Scabs dried up (5)” (Porter 1987, 33–34). Earlier diagnosticians would

have given an even longer list and included bewitchment.

Identifying the insane is easier than defining them. Which actions, thoughts, or emotions were considered abnormal? Not surprisingly, early modern people recognized the insane by the way they behaved: strange motions of the body, threatening or harming people, or going naked were commonplace indicators of madness. Lunatics were considered ill, but might be beaten if unmanageable or locked up if considered dangerous. The deranged were believed to be deprived of their souls and therefore no better than animals. In the late sixteenth century, London's Bethlem Hospital held about twenty babbling manacled madmen who attracted thousands of tourists each year. Figures on the insane are hard to get. Between 1597 and 1634, some 60,000 patients flocked to the “consulting room” of Richard Napier, physician and parson of a rural parish in Buckinghamshire; about 5 percent of them, 1,286 females and 748 males, appear to have been mentally disturbed (Macdonald 1981).

But were such unfortunates curable? Some hospitals were available for them, where they received mostly religious consolation. Therefore, no doubt for the poor, it seems difficult to prove Richard Burton wrong: “For the diseases of the mind, we take no note of them” (Burton 2001, 69). Was this omission regrettable? In recent decades, the “storm over psychiatry” has projected his influence onto historians. Was the eighteenth century really a disaster for the insane (MacDonald 1981)? Should the two centuries before Michel Foucault's “great confinement” of 1656 be viewed as a world relatively safe for lunatics, when the treatment of madness depended mostly on family care?

Our best information about the actual treatment of poor people's madness in early modern asylums overturns now-conventional Foucaultian wisdom about first venerating madmen as holy fools and then confining them en masse. Two converted rural monasteries in Protestant Hesse with extremely careful records from 1550 to the Thirty Years' War show a clear increase in the number of mentally ill patients admitted after 1580, rising from 13 percent to 28 percent of all residents. This post-Reformation transformation of medieval piety and charity “provided comfort for the helpless in ways so attractive that people clamored to be admitted” (Midelfort 1999, 358–365). Interestingly, they admitted about four times as many insane men (141) as insane women (33)—almost the exact reverse of the percentage of male and female witches—although the male/female disproportion was much less (8 to 5) in the Juliusspital of Catholic Würzburg over the same period (Midelfort 1999, 376–377).

Not unlike contemporary neuropsychiatry, early modern medicine identified madness as an organic disease. In fact, according to Galenic medicine, afflictions

of the mind were closely connected with bodily “distempers” and resulted from an alteration of proper humoral balance. Minor psychic disturbances were considered as forms of melancholy and treated with purging and bloodletting until the late seventeenth century, when research on the nervous system pioneered by Thomas Willis signaled the decline of humoralism.

MENTAL ILLNESS AND WITCHCRAFT

Although none of the poor madmen admitted to Hessian asylums was considered demonically possessed and although Tudor and Stuart Essex showed only “a very slight connection between mental derangement and witchcraft beliefs” (Macfarlane 1999, 183), possession by the Devil was, theoretically, a distinct phenomenon. It was admitted that a melancholic temperament might make the Devil’s work easier. But because a witch could have sent an evil spirit into a victim, the notions of possession and bewitchment were amalgamated. And unless fraud was involved, diabolical intervention offered a plausible explanation for the symptoms of possession: the afflicted person would fall into convulsions and contortions, displaying abnormal strength, vomiting pins, and speaking languages previously unknown. If demonic possession might explain any kind of insanity, tracing the history of madness becomes even harder.

Yet it seems clear that the heyday of witchcraft persecutions (ca. 1580–ca. 1660) deserves the label of a golden age of demoniacs. Close scrutiny of witchcraft and possession cases occasionally made physicians think that some demoniacs (and even witches) were mentally ill. In women, acute neuroses were attributed to a “wandering womb”: under pressure of internal vapors, “the womb moves up or sideways to crush the organs around it . . . physical and mental illness, fits of unconsciousness or hysteria, were likely to follow” (Wear 2000, 142). Around 1600, skeptical physicians like Michel Marescot in France or Edward Jorden in England blamed the symptoms of demonic possession on hysteria rather than witchcraft. Johann Weyer, in order to defend witches through an insanity defense, had previously “seized upon the exclusively legal language of *furor* and infused it with the medical discourse of melancholy” (Midelfort 1999, 226).

MERGENTHEIM, ECCLESIASTICAL TERRITORY OF

Within forty years, from 1590 to 1631, approximately 500 persons were executed for witchcraft in the region of Mergentheim, a small ecclesiastical possession in southwestern Germany owned by the Teutonic Order. Before the Great Plague (“Pest”) of 1626, the two major cities, Mergentheim and Markolsheim, had about 3,200 inhabitants. Half of them died in the Great Plague.

The Teutonic Order was an ecclesiastical order of knights whose extensive lands along the Baltic were secularized by Prussia during the Reformation in 1525; its surviving Catholic members continued to govern a few territories within the Holy Roman Empire, covering approximately 77 square miles. The Teutonic Order moved its seat from Prussia to Mergentheim, a little town located between Stuttgart and Würzburg of a round 2,000 inhabitants (the order still exists today, with its seat in Vienna).

Four major witch hunts took place in the area of Mergentheim. They all followed the same course, typical for most parts of Germany. A witch hunt started with a single complaint of *maleficium* (harmful magic), often against someone whose family had been involved in a previous case of witchcraft. This person was arrested, tortured, and forced to name other persons she (or he) had met during the witches’ Sabbat. These persons were then arrested and questioned about further participants. A chain of denunciations developed and continued to expand until the witch hunt finally collapsed, for various reasons that have never been examined accurately.

During Mergentheim’s first campaign, in 1590, a total of 68 people were arrested. We know that 9 of them were executed and 7 were released, but we do not know what happened to the other 52 people. In the second episode, during the years 1601–1602, 52 people were arrested and 43 were executed; the fate of the others is not known. In the third campaign, which took place in 1617–1618, no fewer than 213 persons were arrested. All but 13 of them were executed, and 3 of them died during their imprisonment. In the fourth and final witch hunt, from 1628 to 1631, another 136 people were arrested: 122 of them were executed, 10 were dismissed, and the other 4 died in prison. Overall,

of the 584 people who were arrested, 493 (or 84 percent) were female (Wohlschlegel 1990).

So far, only the last wave of persecution between 1628 and 1631 has been examined systematically (Midelfort 1972, 143–155; Wohlschlegel 1990), using records at Ludwigsburg and Stuttgart. Details about the first three waves of witch hunts are available in the so-called *Hexenkartothek*, drawn up by Nazi SS. Despite some double naming, its data about Mergentheim seem generally reliable:

arrested: 493 females + 91 males = 584
executed: 333 + 54 = 387
dismissed: 21 + 6 = 27
died in prison: 8 + 0 = 8
unknown: 83 + 10 = 93

The archives of the Teutonic Order in Vienna, which contain a great number of files, have not been evaluated systematically for evidence about Mergentheim's witch hunts.

Some details have been established: more than half of these women were married. Socially, these women came from all walks of life except the nobility; many of them came from mayoral and craftsmen families, and families of tavern owners made up a disproportionately large part. Their ages ranged from twenty to sixty. The ninety-one masculine defendants, whose ages ranged from eleven to seventy-five, came exclusively from the two larger towns, Mergentheim and Markelsheim; in the smaller villages, only women were arrested. A closer examination of the kinship networks among arrested people showed that "witch families" existed, in which up to eight people were arrested. It is interesting that a large share of the people who had previously profited from these witchcraft trials were themselves accused and arrested as the persecution continued.

Although Mergentheim's witch hunting occurred at times typical for these regions (the 1628–1631 cycle in particular corresponds to the greatest wave in southwestern Germany), neither the first major European persecution wave of the 1560s nor the last a century later affected Mergentheim. The causes for Germany's witch hunts, as discussed in recent literature, such as famines resulting from agrarian crises associated with the Little Ice Age, seem relevant in the case of Mergentheim, although we cannot prove the immediate cause of any of these four outbreaks of witch hunting.

Witchcraft trials were carried out in this area using the extremely formal procedure specified by imperial law. Judges were required to ask over 100 prescribed questions, and the answers were recorded. The judiciary of the Teutonic Order (whose lands were surrounded by Protestant territories) considered itself unable to carry out such procedures without assistance. In the last two witch-hunting campaigns, Mergentheim's government

consulted the largest nearby ecclesiastical ruler, the prince-bishop of Bamberg, who sent a judge with experience in witch procedures. The Bamberg judge worked remarkably quickly. Normally, only ten days elapsed between a suspect's arrest and her execution; it took longer only if the accused were pregnant or ill. As was customary at the time, the convicted witch or her heirs paid the costs of the procedure. However, although the financial records are unusually rich for the 1628–1631 wave, we have no evidence that the Teutonic Order profited in any way from this affair, despite the claim still made by people in Mergentheim that *Hexengeld* (witch money) financed the tower of their town church.

MERLIN

Merlin is the legendary magician who advised King Arthur. Merlin's origins lay in two Welsh figures, Myrddin, the author of bardic poetry, and Ambrosius, a wonder child and prophet from a medieval Welsh-Latin source. Geoffrey of Monmouth's *Historia Regum Britanniae* (History of the Kings of Britain) combined them to create Merlin, who is a central figure in the Arthurian legend and an exemplar of the all-powerful magician. Merlin explains the riddle of the dragons underneath a falling tower, transports Stonehenge to Salisbury Plain, and engineers Arthur's conception by transforming his father's (Uther Pendragon's) appearance.

Geoffrey of Monmouth used Merlin again as a wild man and prophet in *Vita Merlini* (Life of Merlin, ca. 1150), where he interacted with more localized Welsh characters rather than Arthurian heroes. Another Welsh-Latin source linked *Merlinus Sylvestris* (Merlin of the Woods) to *awenyddion* (the inspired) who prophesied while in a state of trance. These Welsh references formed the basis for the modern transformation of Merlin into a shaman figure. However, Geoffrey's Merlin was already an established narrative type combining elements of the wonder child/prophet who triumphed against impossible odds, the magician-engineer who created marvels, and the wise protector.

An independent tradition of Merlin romances began about 1200. Although indebted to Geoffrey, they added magical transformations, prophetic dreams, and

material from the Antichrist legend. A devil raped a nun in order to create a diabolical child. The baby Merlin was baptized and saved but was often referred to as “son of Satan.” Merlin possessed magic power, but he was a long way from the omnipotent figure of modern treatments, and a woman magician who took on the role of Arthur’s protector eventually imprisoned him.

Undoubtedly, some episodes were rooted in folk tradition, for example, the wonder child without a father, the building that could not stand until some secret was revealed, the mysterious helper-figure, the motif of the triple death, tears and laughter provoked by ironic occurrences, and shape shifting. Their very familiarity must have added to the impact of the Merlin figure and given an air of authority to pseudohistorical works such as Geoffrey’s. Merlin became important again during the nineteenth-century Arthurian revival. Here, he was unequivocally a powerful magician, and this image permeated subsequent reworkings in which the Arthurian legend functioned as an image of a lost world. Increasingly Merlin, and his spiritual descendents such as J. R. R. Tolkien’s magician Gandalf, were situated in a fantastic and romantic Dark Age Britain, which was viewed as a context for magic or for a struggle between ancient and modern ways of life. Often the Welsh sources and the romances were treated as a coherent tradition in which the remnants of a pre-Christian figure could be discovered. This ignored Merlin’s links with other figures and variations within the narrative material but remained an important feature in modern New Age reconstructions.

METAMORPHOSIS

Assuming another shape or transforming a victim is called metamorphosis. Metamorphosis was usually an innate capacity, but it could also be acquired, either from the Devil or from another witch.

European witches mainly took the shapes of hares, cats, wolves, dogs, mice, bees, toads, flies, and certain types of birds, but they could also appear as inanimate objects (wisps of straw, cartwheels) or natural phenomena (lights, mists, small whirlwinds). A rough gender distinction is discernible in folk traditions,

though less so in trials: hares, cats, and the nightmare tended to be female witches, but werewolves were mostly male. According to one edition of the fifteenth-century *Evangiles des quenouilles* (Gospel of the Distaves), a werewolf’s son would inherit the same destiny, but his daughter would be a nightmare (Jeay 1985, 143–144).

Shape changing was recorded in folk traditions in parts of Europe from antiquity to the modern period, and it was mentioned in some of the earliest recorded confessions of witches: Matteuccia of Todi admitted going to the Sabbath in the shape of a fly in 1428 (Ginzburg 1990, 70–73, 299). Early modern courts often paid little attention to allegations of transformation, sometimes due to skepticism (or to mainstream Christian theology, which denied that metamorphosis was possible), but mainly because they were impossible to prove unless defendants confessed, which many did not (Briggs 2000, 90–91). Though witches’ metamorphoses have often been attributed to pathological delusions, drug-induced hallucinations, mistakes of perception, or irrational credulity, shared traditions about shape changing appear to have arisen from different cultural understandings of personhood and of human relations with the world of spirits (Napier 1986, 4–29).

Recent scholars have looked more closely at the cognitive systems, both intellectual and folkloric, in which metamorphosis was intelligible as a rational proposition. As Stuart Clark has demonstrated, the place and powers assigned to demons in the natural world enabled intellectuals to make sense of reported transformations by classifying them as illusions; though demons had no power to transform miraculously a human being, it was within their natural capacity to surround bodies with illusory forms and interfere with people’s senses and imaginations, so that transformations could be true in appearance but not in reality (Clark 1997, 157–167). Carlo Ginzburg situated shape-changing traditions within an archaic, shamanistic belief system relating to mediators who fell into trances and dreamed that their souls went out in animal shapes to the otherworld to secure benefits for their community (Ginzburg 1990). Eva Pócs emphasized the ambivalence of such ecstatic mediators in central, eastern, and southeastern Europe: they were capable of harm as well as good and were part of a dualistic system in which individuals born with cauls had spirit doubles in animal shapes and were opposed to supernatural figures with similar attributes (Pócs 1999). These traditions are well delineated in eastern, central, and southeastern Europe, as well as parts of the Baltic.

Western European shape-changing traditions show enough similarities to indicate common ancestry at some stage, but they are less often connected with clearly

Metamorphosis (shape changing) is common in European folklore. Witches assumed the body of animals, fish, and insects, but also of inanimate objects. Here witches have become on the left, various animals, and, on the right, a wolf. From Ulrich Molitor, De Laniis et phitonicis mulieribus (Concerning Witches and Fortunetellers, 1489). (Stapleton Collection/Corbis)

defined, potentially beneficial roles like those of the *benandanti* (do-gooders) or the Livonian werewolves. Scandinavian folklorists' research indicated that shape changing there was part of a wider scale of extracorporeal manifestations of aspects of the self in altered form; they were not confined to mediators or witches but could happen with variable degrees of intensity and visibility to almost anyone and did not require trances. A person's *hug* (thought, feeling, will) could wander away from the body in certain circumstances (such as intense longing) and be perceptible elsewhere, either invisibly or, if very strong, apparent in a shape (*ham*). One of the projections of the *hug* was the *fylgje* that accompanied a person as a sort of guardian spirit, which could take animal shape and was visible to people with second sight (Kvideland and Sehmsdorf 1991, 41–81). Anthropological studies of shape changing in contemporary societies related it to different cultural constructions of personhood, particularly where social role was a vital component, and states

of personal crisis could precipitate a corresponding instability of shape that may be both visible to others and experienced as a bodily transformation by the shape changers themselves (Jackson 1989, 102–118).

Shape changing was deeply rooted in narrative traditions. Personal experience stories were the most persuasive genre, but because transformations were always more told of than witnessed or experienced, the genre with the widest influence was the legend, a story told as a true report of specific people's experiences, which might be reported as news yet followed a traditional narrative pattern. Some of these memorably simple but highly adaptable story schemas endured over very long periods, in literature as well as oral tradition, and were sometimes reported as personal experiences by witches or their victims. St. Augustine's fifth-century account of Italian witches transforming travelers into pack horses by feeding them bewitched cheese (*City of God*, XVIII.xviii)

belongs to the same family as Homer's story of Circe transforming Ulysses's companions (*Odyssey*, X), Apuleius's *Golden Ass*, and a later medieval "true" story reported in the *Malleus Maleficarum* (The Hammer of Witches, 2.2.4) about a witch in Cyprus transforming a sailor into a horse by giving him eggs to eat (Roberts 1996, 192–194). A related motif, of witches using a magic bridle to transform their victims into horses and riding them, was common in European legends from the Middle Ages and surfaced in the accusations of witnesses against witches in the early modern period (Thompson 1955–1958, Motif G241.2.1.1). Anne Armstrong testified in Northumberland in 1673 that she had been transformed into a horse in spirit by a witch who put a bridle on her head and rode her to the witches' meeting, where they appeared in the shapes of hares, cats, mice, and bees; a Cambridgeshire woman had made a similar accusation in 1659, but the judge refused to believe her (Ewen 1933, 358–361, 457). Witches' victims in eighteenth-century Hungary also told their own versions of this story, sometimes even with the same minor detail about the horse being tied to a post outside the meeting, which Anne Armstrong had also mentioned (Pócs 1999, 79–80, 93). A regular motif in legends about shape changers was the "analog injury" (or "repercussion"): a wound inflicted on the animal shape produced a corresponding mark on the human body (Thompson 1955–1958, Motif G252). It occasionally featured in trial records: one witness against Gerard Horiel of Jonvelle in 1610–1611 said she thumped a cat with a stick when it attacked her in bed one night, and afterward Horiel had a bruise on his nose for a month (Oates 1993, 282). However, it was also a detail that often crept into news reports of encounters with shape changers, as specific details were forgotten in transmission and replaced by the typical elements of familiar narratives (Oates 1989, 314–315).

Such stories were all the more persuasive when reported by credible informants; it was this that prompted St. Augustine to formulate a theory of illusory transformations provoked by demons (with God's permission), which accepted that witnesses reported truthfully, accounted for any effects observed, and at the same time denied that either the human soul or body could be really transformed except by God (*City of God*, 18.18). The *Canon Episcopi* (ca. 906) emphatically condemned the belief in shape changing, and that became the standard position in penitential texts. Twelfth- and thirteenth-century interpretations of transformations, including those of Gerald of Wales, Gervase of Tilbury, and Thomas Aquinas, built on St. Augustine's foundations and enlarged on the ways demons could make them seem to happen, for example, by borrowing

animals' bodies (Bynum 2001, 93–109). Commentators did not suggest that demons caused these deceptions in response to culpable human intentions until after the establishment of the idea of the witches' pact with the Devil. On the contrary, William of Auvergne in the mid-thirteenth century sought to demonstrate that suspected werewolves were unjustly blamed for eating people and were themselves innocent victims of the deceptions of demons (*De universo* [On the Universe], 2.3.13). It was not until the late fifteenth century that writers made any serious effort to account for the apparent transformations of diabolical witches and to explain away the *Canon Episcopi* (e.g., *Malleus maleficarum*, 1.10; 2.1.8).

With the proliferation of trials in the late sixteenth century came fresh reports of transformations, leading to more publications interpreting them. Intellectuals expressed varying degrees of belief, ranging from Jean Bodin's conviction that physical transformations were possible to Reginald Scot's skeptical dismissal of all the reports as untrue; however, few writers shared such extreme views (Clark 1997, 195–213). Some followed medical tradition, as Johann Weyer did, in attributing confessed transformations to melancholic delusions or the effects of drugs, though demons might sometimes be involved. Others, including the magistrates Nicolas Rémy, Pierre de Lancre, and Henry Boguet, refined the theory of demonic illusions to explain how witnesses saw the shapes that witches confessed they took (which medical theory could not easily account for). Either the demon went about in animal form committing harm and altered the witches' imaginations so that they dreamed they did those things in other shapes; or the witches were there in person and the demon altered observers' perceptions so they saw the witch as something other; or else he surrounded the witch with a cunningly fitted animal skin or an airy likeness of another species that would deceive observers' eyes.

Multiple interpretations of transformations were current in early modern Europe, and there was no single, unified folk view any more than there was unity among the learned. Aspects of demonology became common knowledge at all social levels: witches confessed that demons transformed them or gave them their magic wolf skins. Where some understood it as a roving spirit double in animal shape, others took it to be a form of magical disguise of the body or even a physical transmutation, as a boy in Franche-Comté did in 1643, when he testified that after hitting a wolf with a stick he saw it immediately turn back into the shape of a beggar, Claude Chastelan, who was executed after confessing (Oates 1989, 352–354).

Legends about shape changing continued to be told until the twentieth century in some areas. Scholarly interest in them did not disappear altogether with the gradual exclusion of demons from the material world

during and after the seventeenth century; the occult revival of the nineteenth century and the emergence of the disciplines of psychology, ethnography, anthropology, and folklore all stimulated new interpretations. But the emphasis was no longer on explaining how transformation could appear to happen, visibly and with material consequences, which, in the case of werewolves, were illusions that could bite.

MEYFART (MEYFAHRT), JOHANN
MATTHÄUS (1590–1642)

Author of the *Christliche Erinnerung an gewaltige Regenten* (A Christian Reminder to Powerful Princes, 1635), Meyfart opposed witch hunting by underscoring the cruelties of witchcraft trials. Among all opponents of witch hunting, Meyfart was by far the most emotional, and his outrage was not just personal attitude but was inspired by specific cases in his environment. An orthodox Lutheran, he fervently accused the princes for their lack of compassion and their officials for inhumane cruelty. Although not the first author to attack witch hunters in the German vernacular under his full name (Trunz 1987, 212) (Johann Weyer and Anton Prätorius did this earlier), Meyfart's literary skills enabled him to invent the most powerful metaphors for this purpose. Whereas Weyer, Adam Tanner, and Friedrich Spee became entangled in juridical and theological discussions and appealed primarily to the reader's reason, Meyfart portrayed the hardships of the trials in full detail, constantly appealing to the reader's compassion. His descriptions of contemporary prisons were unprecedented, as was his ability to make the reader identify with those poor victims suffering all the fear and anguish of imminent torture. Meyfart not only taught rhetoric: he was a master of language, a poet, at times displaying the fervor of Jewish prophets.

Born in Jena, the son of a Lutheran pastor, Meyfart spent his youth in Thuringian villages where his father served as a pastor, attended the princely gymnasium at Gotha, and studied at Jena. He graduated in 1611 and turned to theology. In 1614, Meyfart matriculated at Wittenberg but returned to his father's house at Jena after contracting an infectious disease. Meyfart claimed later that his *melancholia hypochondrica*, which plagued him for the rest of his life, also began then. Meyfart became *adjunctus* at Jena's philosophical faculty before being appointed professor in 1616 at the Gymnasium Casimirianum of Coburg, the upper school of Prince Johann Casimir of Saxe-Coburg (ruled 1596–1633), where he taught for sixteen years. In order to become its director in 1623, Meyfart had to acquire a doctoral degree from Jena.

Now married, with children, Meyfart was a successful theologian and a public figure. However, he became entangled in a permanent feud with General Superintendent Caspar Finck (1578–1631). Relations worsened after 1626, as tensions and morbidity rose when Franconia experienced crop failure. Court preacher Nikolaus Hugo felt personally insulted by Meyfart's attacks against the clergy and particularly its conduct in witchcraft trials. In 1632, deeply embroiled in these quarrels, Meyfart received a call from the University of Erfurt, belonging to the prince-electors of Mainz, but recently conquered by Gustav II Adolf of Sweden. Meyfart became dean and eventually chancellor of the

Swedish university at Erfurt, where he spent the rest of his life, despite being stripped of his office during a Catholic interlude.

Although staunchly Lutheran, the tiny principality of Saxe-Coburg suffered a surprising number of witchcraft trials, about 178 during Johann Casimir's reign. Not just its clergy, but even more its lawyers and officials, the prince included, were supporters of witch hunting. In February 1629, Johann Casimir issued *Gerichts-Ordnung, die Hexerey betreffend* (Regulations for Witchcraft Trials) resembling those in neighboring prince-bishoprics. Meyfart wrote *Christliche Erinnerung* in 1631, when these terrible persecutions had already ceased in the Catholic bishoprics but continued uninterrupted in Saxe-Coburg and peaked that very year. The driving force behind the persecutions was the court preacher Hugo, who publicly attacked the *Schöppenstuhl* (court of lay judges) for its complacency. By 1631 the lawyers of the *Schöppenstuhl* had started referring to Meyfart's opinion.

However, his *Christliche Erinnerung* was not published until 1635, when Meyfart had reached the safety of Erfurt and witch hunting was over: therefore, it was no longer necessary. A generation later, when witchcraft trials resumed in Thuringia, it was forgotten; another generation later, when Christian Thomasius commissioned a reprint in 1703, witchcraft trials had already ebbed in Protestant northern Germany. It is hardly surprising that Meyfart saw the Jesuit Martín Del Rio as the main defender of gruesome witchcraft persecutions. More surprisingly, he hardly ever referred to Protestant authorities and instead quoted other Jesuits (Tanner and Spee) as defenders of humanity. Because Meyfart clearly aimed his book at a Protestant audience, it seems likely that he tried to become the Protestant Spee. But since his publication came too late, his emotional tone was—and to a modern reader, still is—irritatingly overwrought.

MICHELET, JULES (1798–1874)

Michelet was author of *La sorcière* (The Witch, 1862), an account of witchcraft in European history that stands outside of any known historical canon and yet addresses itself directly to the historian's task.

Michelet grew up in a poor Parisian family that struggled unsuccessfully to maintain a print shop founded during the French Revolution but blighted by Napoleonic censorship. A brilliant example of people newly empowered by the meritocratic standards of postrevolutionary France, he rose rapidly within the educational system, becoming a professor at the École Normale, chief of the historical section at the Royal (now National) Archives, and professor at the Collège de France by the time he was forty. His charismatic style of teaching won him the admiration of students, in whom he inculcated the values of the Revolution of 1789 in the hopes that they would form the generation capable of completing its work (Wilson 1972: I, chaps. 1–5). But his enthusiasm for the Revolution of 1848, and his refusal to take an oath of loyalty to Louis Napoleon's imperial government gave ammunition to the many historians who disliked his poetic historical imagination, poetic style, and radically liberal values. Driven from both teaching and archival positions, with no access to documents, Michelet composed a series of brilliant meditations in mythical naturalism—*The People, Woman, The Bird, The Insect, The Mountain, The Sea*, and so on.

In 1862, Michelet returned to a historical topic and composed one of his most famous and challenging books, *La sorcière*, which combined his extraordinary narrative abilities and his mythic voice with a wide knowledge of the documentation of earlier periods in French history. Book 1 traces the (imagined) experience of a serf's wife, at the bottom rung of feudal society, and follows her on her discovery of the magical forces of nature, forces unknown to the nobles and priests who dominated the social world. Her contact with this other world moved from the companionship of a helpful if mischievous imp to the great Satan, whose penetrating embrace transformed her vision of the world. All this was set out against the background of a viciously intrusive Church, inflamed by the

projections of its own moral corruption. This exceptional historical novel, in which Michelet never once questioned the existence of magic (indeed, he described it as real), defied all historical canons of narration and left many conventional historians at once fascinated and appalled.

Book 2, however, consists of three early modern cases of witch persecutions, well documented and well reconstructed. (One served as inspiration for both Aldous Huxley's 1952 book *The Devils of Loudun* and Ken Russell's 1971 movie *The Devils*.) By making an abrupt transition from a kind of imaginative mythical anthropology to the kind of detailed and masterful historical reconstruction that even the most positivist historian could admire, he wed his mythical vision to the historical documentation through his understanding of the moral madness that underlay the discourse of witchcraft persecution. The book's two parts were tied together mainly through Michelet's relentless anticlerical bias; *La sorcière* was, above all, a meditation on the corruption of the Church that could produce such inquisitorial minds and institutions and on the (profoundly Christian) understanding that suffering and humiliation could bring empowerment. For him, witchcraft and rebellion represented the two major forms of popular resistance: "From there [disappointed expectations that God would intervene in history and rid them of the brutal aristocracy that embittered their lives] the Black Mass and the *Jacquerie* [peasant rebellion]" (Michelet, 1959, 101).

In a sense, the book represented a mirror image of the *Malleus Maleficarum* (The Hammer of Witches, 1486). Indeed, Michelet had a chapter on that demonology. It validated both his mythic heroine's rejection of her dominant culture and the counterreality she then discovered. At a time when conventional historians unanimously shunned this topic, Michelet permitted himself a bold and judgmental discourse that anticipated Nietzsche in assaulting the moral imagination of the Church:

As long as God punished himself, *brought his own hand down*, or struck with *the sword of an angel* (according to the noble antique formula), there was less horror; this hand was severe, that of a judge, and yet of a father. The angel, in striking remained pure and clear, like his sword. It was nothing like this, when the execution was done by disgusting demons. They did not imitate at all the angel that burned Sodom, but who first left. They stayed, and their hell is a horrible Sodom where the spirits, more soiled than the sinners handed over to them, draw odious joys from these tortures they inflicted. That is the teaching one finds on the *naïve* sculptures spread out over the doors of churches. They taught the horrible lesson of voluptuous pain.

Under the pretext of these torments, the devils pour out on their victims the most revolting caprices. Immoral notion (and profoundly guilty!) of a supposed justice that favors the worst, gives dominion to its perversity in giving it a toy, and corrupts the demon himself. (Michelet 1959, 46) (emphasis in the original)

In his journals at the time of *La Sorcière's* publication, Michelet wrote that he had announced the death of Christianity, a necessary precondition for making the best of what it had to offer possible.

The book met immediate resistance; after losing a legal case, Michelet had to eliminate two passages (in one he referred to the doctrine of the Trinity as boring and saints' lives as insipid) and find a new publisher. And yet, *La Sorcière* was Michelet's most popular book. As Roland Barthes pointed out (Barthes 1959), it was uncannily modern. What Michelet's positivist critics considered an insult—his *poésie*—reflected a level of empathy and understanding that finds far more appreciative audiences among modern historians, who are more familiar with the anthropologist's craft, more willing to link deeds to the *mentalités* of an age, and equally, but safely, anticlerical.

MIDELFORT, H. C. ERIK (1942–)

An American-born historian, Midelfort's publications have molded the research of the current generation of scholars of witchcraft. Born into a family of physicians of Norwegian origin, he became interested in the problem of witchcraft while an undergraduate at Yale University (BA, 1964): the more he studied it, the less he understood. Bearing this experience in mind, as a graduate student choosing a dissertation subject, he picked witchcraft, then still considered a weird subject. However, there was the example of Wallace Notestein, whose dissertation on English witchcraft (1908) had not damaged his career as a major historian of Tudor-Stuart England, and who was still accessible at Yale University in the

mid-1960s. A year at Tübingen (1967–1968) proved to be most productive there. Midelfort confronted the puzzling microcosm of the German southwest, one of the most fragmented regions of the former Holy Roman Empire. Receiving little help from his academic adviser, Midelfort immersed himself in the literature and the sources and defined the topics and the geographical and temporal boundaries of his dissertation himself, completing his PhD at Yale in 1970.

The results of his research proved immediately influential. In 1968, he published the first international survey of witchcraft literature since the days of George Lincoln Burr. Its title, “Recent Witch Hunting Research, or Where Do We Go from Here?” sounds as unusual as its approach then indeed was. His comparative regional study of southwestern Germany (Midelfort 1972) has proved a classic. It not only surveyed all the major and minor witch hunts of this witch-ridden area but also analyzed the region’s lively contemporary debates. It put texts into social context, thus breathing life into an important area of early modern intellectual history. Keeping modern interpretations of social theory in the background, Midelfort conjured up a lively and more adequate picture of early modern debates. He was the first to acknowledge in English the overwhelming importance of Johann Weyer, who had endeavored to invent a comprehensive defense of accused “witches” prior to Reginald Scot and later opponents of witch hunting and witch beliefs by attacking the sixteenth-century Protestant orthodoxies head-on. Weyer’s claim that those who confessed to being witches—the most persuasive argument for the existence of witchcraft—we re simply insane triggered Midelfort’s long-standing interest in demonic possession and the history of madness in early modern Europe, ultimately leading to what is perhaps his most ambitious work (Midelfort 1999).

The application of psychological theory proved even more difficult than the application of social theory. By analyzing contemporary descriptions of these diseases, Midelfort abandoned the idea of using anachronistic diagnoses and tried to understand how contemporary physicians, lawyers, and divines interpreted these symptoms. Again, his method of contextualizing contemporary texts, such as an intriguing microstudy on Germany’s “mad princes” (Midelfort 1994), proved to be highly successful and were certainly suited to demolishing light-handed anachronistic interpretations, especially those by Michel Foucault. Another recent study on the late-eighteenth-century exorcist Johann Joseph Gassner, who used witchcraft to explain diseases, shattered a number of facile assumptions about the Enlightenment.

In 1970 Midelfort joined the History Department at the University of Virginia, becoming professor in 1987 and obtaining an endowed chair in 1996. Throughout this period, Midelfort mediated masterfully between

the academic cultures of the United States and Germany, producing English translations of major German scholars (e.g., Bernd Moeller, Peter Bickle, and Wolfgang Behringer) and, of course, Johann Weyer (Midelfort and Kohl 1998), while alerting U.S. students to the attractions of central European history. In Germany, Midelfort is a member of an international workshop on the history of witchcraft (AKIH) and coeditor of the publication series *Hexenforschung* (Witchcraft Research, 1995ff.) and of the *Dictionary of Early Modern Europe*. During his numerous stays in Germany, at conferences, as a visiting scholar, and as a research fellow, his accessibility, wit, and thought-provoking contributions have stimulated scores of younger German scholars. In the United States, he won many fellowships, and each of his major publications received awards, including two Roland Bainton prizes (1995 and 1999) and the Phi Beta Kappa Ralph Waldo Emerson Award for history (1999).

MIDSUMMER EVE

According to folklore, the evening and night before summer solstice are filled with all kinds of magic. Good and evil forces were known to be more active on this evening than at other times of the year. Herbs, dew, and water from wells should be collected on this evening because of their healing qualities. But Midsummer Eve is also regarded as one of the year’s most important dates for black magic and witch merrymaking. Witches were thought to be particularly dangerous on Midsummer Eve, when they traveled through the air to their gatherings; that is why bonfires were lit to protect animals, crops, and humans against potential harm by keeping witches, trolls, and dragons at bay.

ST. JOHN'S DAY

Because Midsummer Eve was associated with many heathen practices, the Christian Church tried to ban many of the evening's traditional festivities while simultaneously giving the summer festival a Christian meaning. During the time of St. Augustine, around 400 C.E., the feast day of St. John the Baptist was moved close to the summer solstice in order to supplant pre-Christian celebrations.

Most traditional celebrations surrounding Midsummer Eve fell on June 23 (according to Christians, one day before St. John's birth), two days later than the actual summer solstice. Given the close proximity of these events, midsummer celebrations by both the people and the Church covered the entire period of June 21–24. The two traditions gradually merged with each other. Thus the magical significance of St. John the Baptist's Eve could result in a variety of rites—most commonly setting bonfires, rolling wheels of fire, and gathering magical herbs.

FOLKLORE AND MIDSUMMER

Throughout Europe, ancient folk narratives offered profuse descriptions of midsummer themes, in which all nature was filled with maximum-strength magical force on the longest day of the year. In late-fifteenth-century southern France, Canon Martin of Arles described how Basques lit Midsummer Eve bonfires, attempting to protect themselves and their crops from the destructive forces of witchcraft. Similar midsummer bonfires as antisorcery rituals have profoundly deep roots in several parts of Europe.

Especially in Slavic and Orthodox Europe, stories abounded of naked witches, oiled in witch lotions, who climbed up chimneys and flew through the air to witch Sabbats on the eve preceding St. John's Day. For such reasons, Midsummer Eve celebrations frequently occurred on Bald Mountain in the vicinity of Kiev. Witches were also said to have poured water, boiled with embers from Kupala's midsummer bonfire, over themselves or to have used an ointment made from gentian to improve their flying skills (Ryan 1999).

Other herbs, too, should be gathered on Midsummer Eve because of their professed magical powers. Such traditions can be discovered in both recipes and criminal cases from the Middle Ages. Herbs collected on the eve of St. John the Baptist were especially useful for their magical powers over love and human destiny. (For example, magical plants played a significant role in Shakespeare's *A Midsummer Night's Dream*, written at the end of the sixteenth century.) Herbs picked on this evening could be used for a number of different purposes: they could cure sterility and impotence, but they could also *cause* impotence. In a 1539 Swiss witchcraft trial near Geneva, the accused witch had fed her neighbor's cow a special kind of herb on Midsummer Eve, after which the cow suddenly died (Monter 1976, 56).

Numerous countries preserve mythological versions of the witches' Sabbats. An instance of this practice exists in the story of Jane Maxie, a young servant girl from a small village in Devon, in southwestern England, who was rumored to be a witch. Under interrogation in 1638, Jane described witch gatherings every Midsummer Eve: "those that would be witches must meet the divell upon a hill and then the divell would licke them, and that the place was black." On the following Midsummer Eve, "the divell would meet them againe, and licke them as before" (Sharpe 1996, 77).

In some countries correlations were made between Midsummer Eve and the burning of witches by placing a witchlike doll on top of the traditional bonfire, or perhaps a witch's broom and hat, to be destroyed as symbols of evil. This tradition, however, is more recent, dating from the end of the nineteenth century, long after the last witches had been burned at the stake in the Western world. Such straw dolls could also symbolize winter.

In the far north of Europe, where midsummer brings the midnight sun, celebrations of the sun played a special role after the winter's long darkness. Confessions exist from Scandinavian witchcraft trials in which the witch's activities were directly related to Midsummer Eve celebrations. For instance, Danish court records and folktales described witches from Jutland who traveled as far as the church of Troms County, in Arctic Norway, to celebrate Midsummer Eve, riding northward on cats. Upon arrival at the church, they played card games, danced, ate, and drank. "To ride to Troms" was a common expression in Denmark and especially in Jutland. At Troms Church, the witches gathered to take part in obscene amusements with the Devil and to renew their satanic pacts (Kristensen 1901).

IN COMPANY WITH THE DEVIL AT THE GREAT MIDSUMMER EVE FEAST OF 1662

The persecution of accused witches and sorcerers in eastern Finnmark during the winter of 1662–1663 was the worst of its kind anywhere in Norway (Lilienskiold 1998). More than thirty women and some young girls under twelve years old were brought before the court in the course of a few months. Eventually, eighteen women were burned at the stake, and three others were tortured to death before sentencing. Mari Olsdatter (who had not yet turned twelve, according to reports) was among the prisoners, largely because her mother had been burned as a witch several years earlier. Mari began by telling of her visit to hell, along with many other local witches. Satan himself presided from a pond of sulfur, showing her the general "character and grandeur" of the place, according to court records. After the women had been shown around Satan's abode, a party was held at a local mountaintop called Domen on Midsummer Eve 1662. This time as well, Satan was the

center of festivities, playing music for a circle dance on his red violin under the light of the flaming midnight sun on the top of Domen. Mari told in great detail about those who held hands while dancing. Following the dance, Satan served beer to the women from a silver bowl. This Midsummer Eve night at Domen came to an end when Satan accompanied each of the women homeward. Mari's confession and disclosure of who had taken part in the Midsummer Eve celebration with Satan resulted in the deaths of several women.

MIDWIVES

The link between midwives and witchcraft is one of many issues involved in the witch hunts in which a clear disjuncture separates learned theory from actual practice. As men, and generally childless men, demonologists had little experience with midwives, so they speculated that these women's knowledge must come from the Devil, whom they repaid with the bodies of children. Most men and women—even those who accused others of witchcraft—had too much respect for the midwives on whose skills they depended to believe they were in league with Satan and knew very well that these skills came from earthly training and years of practice.

The *Malleus Maleficarum* (The Hammer of Witches) of 1486, Europe's most influential treatise on demonology and witch hunting, stated without doubt that witchcraft was particularly rampant among midwives: "No one does more harm to the Catholic Faith

than midwives. For when they do not kill children, then, as if for some other purpose they take them out of the room and, raising them up in the air, offer them to devils" (Kramer and Sprenger [sic] 2001, 189). The *Malleus* recounted several stories of midwives who murdered infants, offering their unbaptized bodies for magical purposes, in particular the concocting of ointment that allowed witches to fly. The *Malleus* took some of its stories of midwife-witches from the earlier *Formicarius* (The Anthill) by Johannes Nider, and its examples were repeated verbatim in some later demonological works, including those by Jean Bodin, Martín Del Rio, and Henri Boguet.

Why did demonologists link midwives and witches? One reason was that learned authors used traditional myths of Jewish ritual murder, in which Jews supposedly used the bodies or body parts of Christian children in various ceremonies to create a stereotype of the activities of witches. Witches, like Jews, sought the blood or fat of innocent children, and what better source of this than midwives? Midwives also had access to other body parts associated with births that were judged to have magical powers: the placenta, the umbilical cord, and the caul (a piece of amniotic membrane that sometimes covers or is attached to an infant's head at birth, widely believed to have magical properties and to mark the infant as distinctive). Thus, more than other women, they were used to handling materials that had special power. This connection and their vital role in bringing children into the world explained to demonologists why Satan would be especially interested in recruiting them, for no other type of woman could be more helpful to his cause.

Some scholars of witchcraft have used the writings of demonologists about the evil of midwives as evidence that the witch hunts were primarily an attempt by male religious, political, and medical authorities to eradicate female healers, midwives among them. Midwives, they argued, were often "wise women" who had a wide knowledge of the healing and contraceptive properties of herbs and other materials, which they handed down orally as part of women's traditional culture. The witch hunts enabled male physicians to gain control of the birth process and male authorities to suppress women who were independent and skilled in birth control and abortion.

There are several problems with this line of argument. One is that the chronology is wrong. Though a few male midwives made inroads among the upper classes in England and France during the period of the witch hunts, most physicians were completely uninterested in obstetrical issues, and female midwives continued to handle almost all births in Europe and North America. City governments, rulers, and in some places religious authorities did concern themselves with midwives, but generally they attempted to recruit more women into the profession and train them adequately,

not push women out. Women were barred from university medical training and formal apprenticeship as barber-surgeons, but this prohibition had begun long before the period of the witch hunts, and women's exclusion from medical schools continued into the late nineteenth or even twentieth centuries.

A second problem with viewing the witch hunts as a campaign against midwives is that doing so misrepresents the social and economic position of early modern midwives. Though midwives were generally middle-aged and older women—the population group most prevalent among those accused of witchcraft in many parts of Europe—the similarities stop there. Particularly in urban areas, midwives were well-respected, quite well trained, and relatively well paid. In many villages, women elected or otherwise chose the midwives, a clear indication of esteem for their skills. They were generally the wives or widows of artisans or shopkeepers, not marginal and dependent members of society. In many parts of Europe they were literate, for midwives' manuals were published in many European languages beginning in the early sixteenth century—some written by midwives themselves—and city or religious authorities often expected midwives to be able to read the ordinances and oaths of midwifery that they issued. The era of the witch hunts saw a sharp increase in infanticide cases and increasing penalties for abortion, but the accused was almost always the mother, not a midwife. Midwives did appear in cases alleging infanticide or abortion through witchcraft, but as expert witnesses, called in to assess whether a woman had been pregnant or whether supernatural causes might have led to the death of an infant. They also appeared as witnesses in other types of court cases, such as rape, premarital fornication, and infanticide by natural means, and judges took their opinions very seriously.

A third, and the most significant problem with this line of argument is that it mistakes demonological theory for the actual course of the witch hunts. The learned authors of demonological works were apparently the only early modern people who believed that midwives were especially likely to be witches, for their number among the accused was strikingly small. In all the English witchcraft trials, only a few of the original sources identified the accused as a midwife, and in the unusually well-documented Scottish cases, which number in the thousands, less than 1 percent of the accused were midwives. In New England, only one midwife was suspected of witchcraft, and none was tried for it; Anne Hutchinson, the religious leader expelled from Massachusetts Bay Colony for teaching beliefs contrary to those of the Puritan leadership—and for doing so as a woman—was sometimes labeled a witch or midwife or both in later literature, but there is no evidence that she was either.

Even in the central European heartland of witch hunting, where demonological theory had the strongest

impact, the statistical presence of midwives among those accused of witchcraft is negligible. There were a few spectacular cases, such as that of Walpurga Hausmännin, burned at the stake in 1587, who was accused of killing and eating unbaptized infants and causing stillbirths and the deaths of mothers in childbed. Her case was sensational enough to make it into one of the newsletters published by the Fugger family business; however, this merely indicates its unusual nature, not its typicality. A few of the midwives' ordinances that began to be issued in the fifteenth century—first in German cities and then elsewhere in Europe—did forbid midwives to use (in the words of a 1567 English ordinance) “any sorcery or incantation in the time of the travail of the woman,” but many made no mention of magic at all, though they went on for many pages about training, procedures, and fees. Actual court cases against midwives followed the same pattern as the ordinances, for, like physicians and barber-surgeons, midwives were occasionally accused of negligence or malpractice, but these cases almost never involved charges of witchcraft.

MILAN

The city of Milan and its surroundings offer a good example of the way witch beliefs grew in northern Italy between the late Middle Ages and the end of the seventeenth century, with inquisitorial activities directed

against magical practices increasing during the second half of the sixteenth century. Statistics are difficult to gather because the Holy Roman Emperor, Joseph II, ordered the destruction of all the Inquisition's records in 1788. Extant cases mention the executions of sixteen women and two men. This relatively modest number is due not only to the lack of information but also to the fact that a greater number of executions took place in towns and valleys around Milan.

Milan's first case of major interest involved a man called Giovanni Grassi of Valenza (Piedmont). He was arrested around 1375, brought to Avignon, and prosecuted by a Franciscan inquisitor who accused him of having dealings with the Devil. Grassi saved his life by confessing his crime. But ten years later he was arrested again in Milan and charged with similar accusations by a Dominican inquisitor in Sant'Eustorgio, where the Inquisition had its headquarters. Convicted as a second offender, or *relapsus*, Grassi was condemned to the stake and handed over to the city's *Podestà* (highest official), who duly burned him. In the very same years, Milan's Dominicans also judged two women, Pierina de Bugatis and Sibillia Zanni, for crimes linked to magical beliefs and deeds and condemned them to light penances. In 1390, like Grassi, they too were rearrested on the same charges. During their new interrogations, they confessed to participating in a *ludus* (game) paying homage to the *domina ludi* (Lady of the Game), called *Madona Oriente* (Lady of the East) or "Diana" or "Erodiade," borrowing these names from the now well-known *Canon Episcopi* (ca. 906). Their spells seemed different from those mentioned in later witchcraft trials: there were no confessions of killing babies, no blasphemy or descriptions of Sabbats; at one moment, Pierina mentioned a spirit called "Lucifello," who appeared and spoke to her in the shape of a man. Milan's new inquisitor seemed inclined to treat the two women's beliefs as real, beyond their unfortunate status as relapsed heretics. Both were condemned to death and handed over to the *Podestà*.

In the early fifteenth century, unlike the bloody repression of witches in the nearby diocese of Como, Milan offered little evidence of inquisitorial activity for either diabolism or *maleficia* (harmful magic). Around the mid-fifteenth century, we find many trials against men and women accused of heresy for beliefs and acts connected to magic and Devil-worshipping, but they took place in nearby valleys, not in Milan itself. These trials around 1450 were led by the inquisitor Luca di Lecco, whose sentences were not particularly severe, although several women were accused of having been seduced by the Devil to worship a *domina ludi*, now declared a demon, and of performing many heretical acts, such as stealing the Eucharist for their ceremonies. By the late fifteenth century, we find considerable confusion about the way to proceed in such cases, proved

by the fact that both prosecutors and prosecuted addressed protests to the Duke of Milan, Francesco Sforza. The inquisitor most active at this time, Paolo dei Filiberti, was often supported by Francesco Sforza, who mentioned in his letters that babies were slaughtered and even eaten at the Devil's orders.

Around 1460, Girolamo Visconti, a scholarly friar at Sant'Eustorgio, using the tradition of trials accumulated since the late fourteenth century in his convent, wrote two treatises about *lamiae* and *striae* (witches), in which he affirmed the reality of beliefs and practices attributed to witches. Like other Renaissance Italians, Visconti decorated his account of this new phenomenon with words taken from classical antiquity.

After 1484, when the papal decree *Summis desiderantes affectibus* (desiring with supreme ardor) was promulgated, trials for witchcraft increased in Milan. Under the rule of Ludovico il Moro and at the very beginning of the sixteenth century, Milan and its surroundings experienced the activities of Rategno, Bernardo of Como, whose deeds as inquisitor of Como affected Milan; a mountainous place named Tonale appeared in sources during those years as one of the best-known Italian locations for Sabbats. Many trials held from 1483 through 1485 in Bormio, ruled by Como, were mentioned in Heinrich Kramer's *Malleus Maleficarum* (The Hammer of Witches, 1486).

During the first decades of the sixteenth century, many witchcraft trials took place in the Alpine valleys, especially in Valcamonica but also in Lugano and Mendrisio. These trials were all linked to the bishop of Como more than to Milan. A few cases were also reported in 1517–1518 around the city of Brescia and in two small towns, Orago and Lomazzo, not far from Milan. During the second half of the century, Milan's most distinguished figure was undoubtedly its cardinal-archbishop, St. Carlo Borromeo, who prosecuted witches with such intensity that his actions provoked a polite but firm intervention from the Roman Inquisition.

In Milan, the end of the sixteenth century and the first twenty years of the seventeenth century were still marked by witch hunting, with a handful of burnings being recorded in the city. The persecution of witches slowed and ended around 1640–1650. The last known execution occurred in 1641. Nevertheless, in the northern valleys, lay tribunals maintained a policy of ferocious persecution lasting until the beginning of the eighteenth century.

MILK

Milk has played a very important part in European witchcraft and popular magic, in pre-Christian and Christian mythology alike, generating a rich variety of magical measures and countermeasures. Innumerable beliefs and practices reveal the intimate connections between witches and milk. In Europe, milk witches spawned a rich variety of beliefs and rites, because village witchcraft grew from neighborhood conflicts, often between women. Cows and milk were basic for survival in early modern agriculture, and absolutely all work related to milk (except some cheese making) was done by women. Thus there was an automatic association among cows, milk, and the huge predominance of women among witches.

MYTHOLOGICAL FOUNDATIONS

Beneath these associations lay Indo-European mythical legacies regarding milk and cows and some beliefs and rites related to supernatural beings and milk dating from pre-Christian times. Certain Indo-European deities, particularly such gods of thunder as Indra, Zeus, or Jupiter, were due a sacrificial offering of milk (the belief that a fire that came from lightning can only be put out by milk survives in several parts of Europe). Indo-European linguists have reconstructed traces of the original myth (assaults of the lightning-god against monsters of the underworld in order to obtain stolen cows) from some legends in southeastern Europe that describe lightning striking a devil who is concealing a cow, sometimes under an elderberry tree or "devil's tree." The topos of a dragon that snatches milk or steals a cow also appears in the Balkans: killing the dragon restores the milk from dried-up cows. Pre-Christian mythologies about milk witches or milk fairies are known to practically all European peoples, and some demonic female figures have cow or milk attributes: the milk churn belonging to German, Czech, Hungarian, or Scandinavian witches (this is how they can be recognized on Christmas night); Romanian witches who travel to their Sabbath on a milk bucket or churn; Celtic fairies who steal cows and milk; Romanian and eastern Hungarian fairies and witches who can take the shape

of a cow but can also saddle and thus ruin a cow; and Bulgarian witches who "pull the moon down" from the sky, which becomes a cow upon reaching the ground and can then be milked.

Features of pre-Christian mythologies persist in modern-day popular beliefs of various European peoples. A gift of milk is offered around the time of the winter solstice for the dead or demons who visit the living then (e.g., for the "Perchta" in southern Germany or Austria between Christmas and Twelfth Night). Among the peoples of the Balkans or among the Irish and the Scots, fairies of a definitely "deadly" character are associated with various milk rites, as are the pressing demons of the night called *mahr* or *mare* by Germanic peoples. In return for receiving milk, these beings increase the prosperity of the household and abstain from harming family members. Milk offerings associated with Bulgarian, Serbian, and Greek fairy cults occur in the context of healing rituals: healers offer the fairies a sacrifice containing milk when invoking them for assistance. Swiss and German folklore describes milk offerings given to the ghost of the house. Offering milk to a house snake, which impersonates the spirit of the ancestors, is recommended in most of Europe (if it is not fed milk, the head of the family will die). In the Balkans and some Slavic parts of Eastern Europe, the "fate women" who determined a baby's destiny at birth received an offering of food: on the first or third night after the birth, various foods, including milk, were prepared for them so that they would give the newborn a positive destiny.

MILK MAGIC AND FERTILITY RITUALS

The myth of vanquishing the cow-snatching demon—where the drought also ends when the cows are recovered—emphasizes the connections between rainfall and milk in Indo-European mythologies. Some beliefs of modern European peoples suggest that a magically induced absence or increase of rain induces a similar decrease or increase in milk yield. The practices of milk magic performed at sacred water springs, noted in German and French sources, draws on the same belief, as do the magical activities and practices of the rain magician or milk magician (the figure shows a witch milking the pillar and thus bringing rain). The correspondence between milk magic and rain magic is most clearly shown through the widespread beliefs in and rituals of dew picking in central and mainly southeastern Europe. The people of a village collect all the dew from the grass of the neighboring pasture by repeatedly pulling a tablecloth or other textile over the grass, usually during a spring or summer festival like Whitsun or Midsummer. The villagers thereby snatch the milk from the cows belonging to the neighboring village farmers; in accordance with the theory of limited goods, the increase in

their milk yield exactly equals the drop in milk production from the neighbors' animals. Fertility rituals connected to the occasion of the first milking or to the first milk and manifesting in pouring or spraying water are known in a several places in both western and eastern Europe.

WITCHES DOING MALEFACTION TO COWS AND MILK

The theory of limited goods also explains why it was customary throughout Europe to attribute milk snatching to witches: by depriving others, one increased one's own milk yield. According to legends known all over Europe, witches stole milk from their neighbors' stables or gardens or acquired it by stealing objects related to the cow; by picking up its footprint or dung; or by milking such objects as a fencepost, a pillar of the house, or a gatepost: through the principle of participation magic, one acquires milk through an attribute of the cow or her owner. The witch who steals milk or damages the cow harms others for his or her private benefit—a general theme about milk witches throughout Europe, from France to Scandinavia or Romania. Everywhere such witches snatched milk or else spoiled it and the related dairy products.

Both in the Europe of the witchcraft trials and in more modern times, related legends described the milk witches' operating methods, the ways of identifying them, and the means of remedying their damage. Many beliefs associated damages to cows and milk with certain "witching days": Walpurgis (central and western Europe); Midsummer (central and eastern Europe); St. Luca (central Europe); or St. John's Day (essentially all of Europe). Legends mention witches sneaking into stables or stroking the cows. Particularly in western and northern Europe, witches with the evil eye can do harm by appearing unexpectedly at the time of calving or churning, drying up the milk of either a human mother or a cow by their jealous looks. All over Europe, witches sent helping animals or familiars—principally a cat or a frog—in order to snatch the milk (but one also finds rabbits or hedgehogs in western and northern Europe and snakes in eastern Europe).

Because of the witch's malefice, a cow gives no milk at all or its milk is bloody; the production of dairy products (e.g., churning butter) may fail, or the result is inedible. Even in contemporary Europe, such spells are considered realistic dangers in several places. Wherever the institution of village witchcraft and its accompanying beliefs and rites remained active (as in

A witch milks an axe handle, from Johann Geiler von Kaysersberg's sermons on witchcraft published as Die Emeis (The Ants), 1516. Witches were accused of stealing milk, a serious crime in an agricultural society. The cow in the background links cows, milk, and the prevalence of female witches. (Cornell University Library)

some parts of present-day central and southeastern Europe), people knew and practiced innumerable magical methods to protect themselves against witches and prevent the spoiling of milk, as well as performed rites relating to milk on festive occasions. For example, on the first day the animals were herded out to pasture, villagers would protect them with prayers, spells, sacred water, sanctified poppies, a cross drawn over the stable, garlic tied to the cow's horn, thorny branches of rosehip, iron objects, or with millet scattered around the stable. It was a general principle in many places in Europe that no stranger should be present at the time of calving or churning.

Identifying the witch who had laid a curse on the milk, summoning her to the house and forcing her to cure the damage still formed part of the resolution of malefices within some twentieth-century European village communities. In most places, however, only folklore collections recorded these popular legends with a rich scale of variants. Essentially, these procedures required some technique of divination in order to identify the culprit and then force her to remove or cure the spell, usually carried out by a specialized witch doctor or healer, using various techniques to identify and symbolically harm some personal attribute of the suspected witch, who would then promptly appear at the house and be forced to remedy the spell. According to other widespread legends, the cats, frogs, snakes, and other creatures believed to be accomplices of the witch would be injured, thus provoking the witch to withdraw the spell. Other widespread legends from western and central Europe testify that it was also customary to harm the witch by analogy, damaging the milk or urine of the bewitched cow either by smoking it (hanging a boot containing the cow's urine over the smoke), beating the milk over the doorstep, immersing pointed or red-hot objects into the milk and stirring it, or even by spreading a coat or blanket over the cow and beating it.

MILLENARIANISM

In the most general terms, millenarianism or millennialism is the belief in a radical transformation of *this* world into one of justice, peace, and fellowship; it focuses on collective, this-worldly salvation. In Christian prophecy it is the expectation of a 1,000-year period (hence its name), mentioned in the Book of Revelation, during which Jesus is to rule and holiness is to prevail. On the surface, millennialism would seem to have little to do with witchcraft. But two forms of millennialism show distinct predilections for a discourse of magic and witchcraft.

As opposed to an egalitarian vision of the millennium in which the "saved" inhabit a world without class distinctions, where everyone lives by honest labor with none to harry them (Isaiah 2), many versions imagine a world of magical fertility in which labor is not necessary. These magical millennial visions appeal to those who believe that the spiritual world can defy the laws of nature.

Millennialism also spawns intense magical practices among those believers convinced that the advent of this millennium is imminent. Such movements of *apocalyptic* millennialists often perform rituals that will bring on the transformation. The Ghost Dance that spread through various Native American tribes at the end of the nineteenth century promised that its proper execution would prompt nature to shed the white man and his world as a snake sheds a skin.

In general, apocalyptic time (the period of transformation from the current "fallen world" to the redeemed millennial kingdom) encourages magical thinking, since these are by definition stupendous times, when the cosmic struggle between good and evil reaches its climax and definitive solution. Charismatic prophets regularly exhibit thaumaturgic capacities that demonstrate both their cosmic power and their benevolence. This increases the size and devotion of their following and sets in motion certain kinds of "idol worship," in which the messiah figure commands absolute obedience from a following that, despite their initial act of independence in breaking with their culture of origin and joining the dissident movement, no longer exercise independent judgment.

Such groups often meet with strong, even violent opposition from those in power (whether indigenous or imperialist), and among their ways of resisting repression, we find magical procedures that ensure immunity

from the weapons of the enemy. Ghost Shirts were bulletproof, as were the very bodies of the Chinese Boxers (ca. 1900) who had gone through the proper initiation. The Anabaptist Thomas Münster, a leader of the German peasant revolt in 1524–1525 who preached the imminent end of the world, boasted that he would catch bullets in his sleeves. Such magical promises regularly led these movements into devastating failures when real bullets decimated the apocalyptic armies.

Apocalyptic time, however, also stimulates fear of malevolent witchcraft. Most apocalyptic scenarios contain cataclysmic phases in which vast destruction rains down upon humanity (e.g., *Revelation* 3–19). These tribulations result from the final and universal battle of good with evil, and, as a result, most apocalyptic expectations, whether they anticipate a coming millennium on earth or the end of the world, foresee cosmic battles. Such scenarios often begin with a metastasis of evil in the world, often led by an anti-messiah (Christian Antichrist, Muslim *Dajjal*). This evil figure (curiously like the mutant supervillains of comic books) has myriad minions who do his (almost never her) work in the world, preparing for his coming.

In the Christian West, from the fourteenth century onward, these apocalyptic fears often projected onto witches the role of minions of Antichrist. In their *anti*-apocalyptic phases, trying to discourage the sense of imminence, elites emphasized the terrors of the transition in order to discourage people from *wanting* the apocalypse to occur. In their apocalyptic phases, however, such elites often used the language of conspiracy and evil coming from below (chaos, anarchy), to fight against forces that threatened their dominion. This scapegoating technique targets certain people as the apocalyptic enemies. For Christians and Muslims, the primary apocalyptic scapegoat has been Jews, but at the end of the Middle Ages, Christianity added an ominous new enemy to its list of agents of Antichrist—a diabolic conspiracy of witches, primarily women.

Attacks on witches began in earnest in the early fifteenth century, in part because of an elaboration of a vast satanic conspiracy in which witches were perceived as agents in a cosmic plot by the Devil to destroy Christendom. The “witch’s Sabbat,” a parody and subversion of every element of Church ritual, was the centerpiece of the activity of the Devil and his servants, the witches. By the late fifteenth century, witchcraft accusations had become so common in some areas that Europeans could consider every “bad” thing that occurred (failed crops or business ventures, miscarriages, illnesses, accidents, etc.) as the *maleficia* (evildoings) of witches.

The apocalyptic dynamic here conflates the Devil’s minions with the Antichrist’s, and the panic behind the accusations sometimes reached frenzied levels, especially in Germany. The literary climax of this aggressive

paranoia came with the publication of the Dominican inquisitor Heinrich Kramer’s *Malleus Maleficarum* (The Hammer of Witches) in 1486, with its ferocious misogyny and prurient fascination with the Devil’s female “agents.” Born of apocalyptic paranoia, the fear of witches became a hallmark of many subsequent apocalyptic episodes, especially in the early modern period, where a significant part of the elite embraced apocalyptic beliefs (Clark 1997). Indeed, in the sixteenth and seventeenth centuries, intense apocalyptic episodes (the early Reformation) occurred, and even after the early expectations had passed, both Catholic and Protestant authorities, permeated with the language of guilt, sin, and fear of the Devil, found the language of coercive purity aimed at exterminating witchcraft a particularly attractive solution to the persistence of evil. As late as 1692, Cotton Mather delivered an apocalyptic sermon on the text of Revelation 12:12 to account for the activities of the Devil and witches at Salem, Massachusetts.

Witch-hunting episodes also illustrate a key aspect of the dynamics of apocalyptic time. In periods of waxing and optimistic expectation, women often played prominent roles in millennial movements. But with the waning of such expectations (and hence the popularity of the movement), women’s behavior, previously considered holy, became viewed as disorderly and dangerous. This perspective offered two hypotheses about the nature of early modern witchcraft persecutions: first, that their spread corresponded to more localized apocalyptic anxieties in the aftermath of earlier European-wide ones (early Reformation); and, second, that the ebbing of persecutions corresponded to an increasingly anti-apocalyptic attitude taken by elites. The “rationalism” that put an end to the participation of the educated elite in witch hunts may well have influenced the de-eschatologization of the Enlightenment.

MILLER, ARTHUR (1915–2005)

Famous for writing *The Crucible*, his 1952 play about the Salem witchcraft trials, Arthur Miller brought a contemporary American meaning to the term *witch hunt*.

Having grown up in New York, against the backdrop of the stock market crash of 1929 and the Great Depression, Miller rose to prominence in the 1930s as one of the outstanding playwrights of his generation, espousing President Franklin Roosevelt's attempts to improve social conditions. The onset of the Cold War and the unscrupulous "Red Scare" campaign waged by Senator Joseph McCarthy and the House Committee on Un-American Activities to discover Communists in the government and the entertainment industry caused him to reconsider the citizen's role in resisting irrational but state-sponsored social pressures. The abject recantation of his friend and mentor, Clifford Odets, before McCarthy's committee, combined with Odets's willingness to implicate others, finally compelled Miller to write *The Crucible*.

The play took as its theme the well-known cycle of witchcraft trials that had convulsed Salem, Massachusetts, between June and September 1692. The parallels between McCarthy's persecution of U.S. Communists and the Puritan-inspired witch hunts of the late seventeenth century were obvious, but Miller's skills as a playwright allowed *The Crucible* to transcend simple political allegory and become one of the most frequently produced plays in U.S. theater. Although he made good use of original sources (including the three-volume typescript of the trials, lodged in the Salem Court House), Miller pointed out that this play was "not history in the sense in which the word is used by the academic historian." The characters were "creations of my own, drawn to the best of my ability in conformity with their known behavior," while his aim as an author was to enable the reader "to discover . . . the essential nature of one of the strangest and most awful chapters in human history" (Miller 1978, 2). As a result, he increased the age of Abigail Williams in order to make her sexual relationship with John Proctor more plausible and palatable; he reduced the number of young girls charged to just five, in order to permit greater narrative clarity and fuller dramatic characterization; and he reduced the numerous judges present at the hearings to only two.

Miller provided an unhistorical although dramatically satisfying ending. He conveyed the impression that Proctor's noble death gave the lie to the allegations and that the trials had burned themselves out by autumn of 1692; but that was not the case. Prosecutions continued until April 1693, and their final abandonment—a month later—did not reflect either a rejection of a belief in the reality of the Devil or of the efficacy of witchcraft and demonic possession.

Despite such historical license, Miller's play plausibly recreated the simmering sexual and social tensions present

in a tightly knit frontier community, where the problems created by greed, land hunger, and a domineering theocracy exploded—with devastating results—through the misconstrued actions of some thoroughly bored and repressed adolescents. Miller saw "bewitchment" as a mental state, here taking the form of mass hysteria that could be fomented by self-seeking and self-appointed "saviors" in order to gain power and influence over the frightened, the gullible, and the weak-willed.

In a case of life imitating art, Miller—probably on account of his authorship of *The Crucible*—was himself hauled before the House Committee in June 1956. He chose to echo the fictionalized sentiments of John Proctor, refusing to inform against his Communist friends and acquaintances and proclaiming that "I am trying to, and will, protect my sense of myself. I could not use the name of another person and bring trouble on him" (Martine 1979, 191). On May 31, 1957, he was found guilty of contempt of Congress, receiving a suspended jail sentence and a fine of \$500. However, as the "inexplicable darkness" and dread engendered by McCarthyism began to dissipate, the U.S. Court of Appeals quashed his conviction in 1958.

MIRACLES

Two criteria are necessary to define an incident as miraculous: it must stand in contradiction to what the observer knows from experience to be the common or natural way things happen, and he or she must associate it with some numinous power. What is regarded as miraculous, therefore, depends on the education of the observer and the worldview of the society he or she lives in. The histories of all higher religions abound in records of miracles, the main effects of which may be described as power over animate and inanimate nature; healing or reviving humans and animals; punishing disbelievers and evildoers; changing psychic states; and contacting the supernatural through visions, apparitions, voices, or dreams.

For Christians, the belief in miracles is of course guaranteed through the many marvellous phenomena recorded in the Hebrew and Christian Bibles. Most wonders worked by the saints—or, theologically, by God acting through the saints' intercession—are imitations of the deeds of Jesus. However, if a miraculous phenomenon occurs within a dualistic religion like Christianity, the problem arises: which numinous power caused it, God or the Devil? The positive or negative effects of the action in question cannot provide an answer, because God also does painful things to people he wants to correct, whereas the Devil helps people in order to seduce them. Therefore many miracles of saints and misdeeds of witches, taken by themselves, reveal the very same structure. When, for example, Saint Bridgit of Sweden (d. 1373) learned that a respected clergyman did not believe her revelations, she prayed to Jesus, who promised to castigate the man. Soon he became depressed and died from gout. But causing gout by an evil spell was also a common accusation in witchcraft trials, as late as when the last sorceress's stake was kindled in Germany in 1749 for Maria Renata Singer. Several comparable instances could be cited, which were done in very similar ways both by holy and unholy women: influencing the weather, multiplying food, and contacting the dead. Perhaps the ambivalence between divine and devilish help is especially clear when we consider a piece of trial testimony against the *Vaudois* (Waldensians, but used to label witchcraft) of Fribourg in 1430. There a woman is mentioned who had served God so well that whenever she asked him to avenge an offense she had endured, he did so immediately. Was this the prayer of a saint or of a witch? Was the following miracle God's work or the Devil's, whom the woman venerated as God?

The same problem arose when a man or, more often, a woman claimed to have benefited from internal miracles, such as illuminations by the Holy Spirit or supernatural visions and apparitions. Were these true manifestations of the godhead or illusions caused by the evil one? This difficult question was one reason that the discernment of spirits became more and more elaborate in the later Middle Ages. But it remained unreliable. In 1391, Do rothy of Montau was on the verge of being burned as a sorceress, according to the judgement of the competent ecclesiastical jurisdiction, because many priests did not believe that her miraculous voices and visions came from God; today, the Catholic Church venerates her as the patroness of Prussia. Joan of Arc, who presumed to hear the voices of Saints Michael, Catherine, and Margaret, was burned as a witch in 1431 and achieved sainthood in 1920.

As soon as these manifestations are no longer interpreted within a religious scheme but considered as natural or psychic phenomena or frauds that had been misinterpreted in either good or bad faith, the question

of the miraculous becomes obsolete. This criticism started with the Reformation, which confined miracles to biblical times; it was continued by the Enlightenment and carried further by such modern sciences as psychology and parapsychology explaining away the incredible. Today, the belief in miracles survives as a dogma within text-based religions, such as Christianity, Judaism, and Islam. In Catholicism, two miracles are still necessary for canonization, and Pope John Paul II presided over the canonization of more saints than any other previous pontiff. Nevertheless, one suspects that most Christian theologians and clergy often ignore miracles. The number of officially accepted wonders is small in the present and usually related to special places of pilgrimage like Lourdes, where a group of theologians and surgeons are specially deputed to supervise very critically the operations of the supernatural.

Writing in the mid-eighteenth century, after the era of the witch hunts, the Scottish *philosophe* David Hume epitomized the Enlightenment view of miracles: "No testimony is sufficient to establish a miracle, unless the testimony be of such a kind, that its falsehood would be more miraculous than the fact which it endeavours to establish" (1748, pt. 1).

MISCONCEPTIONS ABOUT THE WITCH HUNTS

Witchcraft attracts popular interest; everyone "knows" something about it. Even if this knowledge differs from scholarly knowledge, it may not be "wrong"; scholars and the general public may simply have different interests. Nor is scholarly knowledge necessarily "right." Research develops, new discoveries are made, and accepted theories are overturned.

Nevertheless, there are several widely held beliefs about the European witch hunt that can be regarded as incorrect in the light of current scholarship. Often these beliefs derive from the scholarship of earlier generations:

theories that have been overturned still linger on. Partly this is because nonscholars have no immediate access to the latest research, but also particular ideas continue to be repeated because they serve a contemporary purpose.

The first set of misconceptions derives from movements of thought in the eighteenth and nineteenth centuries: the anticlerical tendencies of the Enlightenment and the Romantic movement. Those appealing to modern rationality and truths derived from nature were often hostile to what they saw as domination of life by churches committed to outdated and artificial intellectual traditions. Witch hunting represented everything they disliked about organized religion. As the modern world has become more secularized, some of these anticlerical tendencies have been enhanced. The ideas they have produced are often effective, but some are misleading.

1. Role of the Inquisition. The institution that, above all others, has symbolized religious obscurantism and oppression is the Inquisition. Its dominance in the discussion has given rise to several related misconceptions. The first idea is simply that “the Inquisition” was the main body responsible for witch hunting. In fact, although a few inquisitors helped to develop the witch hunt in its early stages (for instance, by writing the *Malleus Maleficarum* [The Hammer of Witches, 1486]), the Portuguese, Spanish, and Roman Inquisitions effectively prevented witch hunts during the sixteenth and seventeenth centuries in southern Europe. Executions were overwhelmingly the responsibility of secular criminal courts.

The second idea is that the papal Inquisition, which had been established to persecute the Cathar and Waldensian (*Vaudois*) heresies, moved on to hunting witches in order to keep itself in business. However, the chronology does not support this belief. It used to be believed that there were mass witch hunts in the early fourteenth century, shortly after the suppression of Catharism, but they have been shown to be based on documents forged in 1829 by Étienne Léon de Lamoignon-Langon.

The third idea is that the Inquisition burned witches in order to save their souls. In fact, the Inquisition’s preferred aim was to reclaim heretics to the true faith *without* burning them. Those whom it burned (or rather, whom it handed over to the secular authorities for burning) were *impenitent* heretics or else repeat offenders. Burning did not save their souls but simply punished them for their crime.

2. Role of torture. Along with the emphasis on the Inquisition comes an emphasis on torture. Torture was, of course, extremely important in witch hunts, so this is not entirely a misconception. However, the tortures that are reported in popular accounts of witch hunting or displayed in “museums of torture” in various parts of the world, are usually the most extreme and dramatic physical ones; the false implication is that these were normal.

3. Inevitability of conviction. The idea of torture points to the idea that trials of witches were so stacked against the defense that convictions were the only possible outcome. In fact, about half of suspected witches actually endured torture without confessing—when it was done strictly according to the official rules, which was often not the case. Even during large-scale witchcraft panics, there were always some acquittals, and many other cases were dropped before reaching trial. The idea of inevitable conviction is common because people are receptive to the idea that witch hunting was cruel and barbaric.

4. Financial profitability. Another common idea is that witches were accused in order to make money. Usually it is said that the authorities themselves stood to profit, but sometimes accusations by neighbors are said to have been motivated by the neighbor’s desire for the alleged witch’s land or goods. It is true that some courts could confiscate a criminal’s goods, but many other courts did not do so, and “confiscation” is a misleading term. Most witches were too poor to have any possessions worth coveting. A few active witch hunters like Matthew Hopkins received payment, but even he received only modest fees plus expenses; it was certainly not desire for money that made him a witch hunter. Some rich witches were accused because of resentment at their wealth and stinginess, but they were a tiny minority. The idea of witch hunting for money is attractive because it attributes to the witch hunters a motive that is readily understood in the modern world—but it is a modern myth projected onto our ancestors.

5. Swimming a witch. A misunderstanding of the “swimming test” (water ordeal) led some to believe that witches could be detected by dropping them in water. If they floated, they were guilty. If they sank, they were innocent—but they drowned. In fact, ropes were tied to suspects to pull them out of the water; moreover, this test had no legal value anywhere in Europe. This belief functions as an affirmation of our own cultural superiority: people today are cleverer or more sensible than the ignorant witch hunters. An early instance of a backlash against this belief from the 1850s comes from the Scottish explorer David Livingstone, who explained the swimming test to Africans as part of “the wisdom of my ancestors” in order to criticize some of their own traditional customs.

6. Witch hunting meant woman hunting. Witch hunting is often described as a more or less conscious device used by men for repressing women. In fact, although there is a clear relationship between women and witch hunting, it is quite complex. Feminist scholarship has done much to bring these issues, which traditional anticlerical scholars had ignored, to the forefront of the discussion; but the results have not gone as predicted. Witch hunters did not target women *as such*,

they targeted witches. At least 20 percent of all executed witches were men, and there are places where most of them were men. Moreover, the bulk of the testimony against female witches came directly or indirectly from other women.

7. The “Nine Million Witches” trope. As part of their stress on the enormity of the witch hunt, early feminist scholars were among those emphasizing the largest possible numbers for executions of witches. In the eighteenth century, Voltaire mentioned a speculative figure of 100,000 executions for witchcraft. A misreading by a late-eighteenth-century German archivist was extrapolated and inflated by Gustav Roskoff, a Viennese professor who published a widely read *History of the Devil* in 1869, into a statistical balloon of “9 million witches executed.” A pioneering anticlerical feminist, Matilda Joslyn Gage, took it from Roskoff in 1893 and inserted it into early feminist discourse. Although this number was a wild guess ultimately based on completely erroneous research, it achieved a wide circulation because those wishing to emphasize the importance of witch hunting tended to pick the highest of the various figures available. In more recent times, the figure of 9 million was frequently repeated by Nazi propaganda (which otherwise seldom agreed with feminists) and, turned back against them, facilitated comparison with the standard figure of 6 million Jews murdered in the Holocaust. The true number of executions for witchcraft will never be known precisely, but the currently accepted scholarly estimate is under 50,000—close to Voltaire’s figure. The importance of witch hunting does not lie primarily in the numbers executed, but in the climate of fear induced even by sporadic executions. “Overkill” seems the appropriate term here.

8. Midwives and healers. Two related misconceptions have to do with midwives. The first idea is that witch hunters especially targeted midwives when babies died. In addition to being a feminist idea, this one had an anticlerical element: the Church was believed to have been hostile to midwives because they tried to reduce the labor pains ordained for women to punish the sin of Eve. Some demonologies (including the earliest major one, the *Malleus Maleficarum*) did denounce midwives, believing that their access to babies gave them material for cannibalistic infanticide, but most ignored midwives. Some midwives were indeed accused of witchcraft, but too few to suggest that they were being targeted; most midwives seemed to have been well-respected people who were most unlikely to be accused by their clients or neighbors.

The second misconception involving midwives and healers is that an emerging male medical profession led an attack on traditional women healers—including midwives—by labeling them as witches. It appealed to an early generation of feminist historians in the 1970s, but no evidence supports it. Folk healers in early modern

society could be either men or women. Some of them were accused of witchcraft, often when their cures went wrong, or they had a dispute with a client or a rival healer. But the role of the medical profession in witch hunting was peripheral—they were far less important than lawyers, for instance, and they were among the first important early skeptics about witchcraft.

9. Witchcraft as a surviving pagan cult. Modern pagans of the Wiccan movement have supported the idea that the witches who were hunted in early modern times practiced a pagan religion that had gone underground with the coming of Christianity. Its members worshiped a horned god, “Dianus,” and were organized in covens of thirteen. When the Christian Church discovered this religion in the late Middle Ages, its members were persecuted for allegedly worshiping the Devil. Outline versions of this theory appeared occasionally in the nineteenth century, but it took enduring and detailed form in 1921 with a book by the Egyptologist Margaret Murray, *The Witch-Cult in Western Europe*. It came at the height of a vogue for “pagan” survivals and had a convincing appearance of deep scholarship. The book was in fact fraudulent—Murray’s sources frequently did not say what she said they said—but that was not realized at the time. Murray’s theory became influential, though it was never universally accepted. Historians familiar with the records of witchcraft trials frequently criticized it, but often they could say only that they had found no evidence for the theory in their own research. The theory even gained a fresh vogue in the 1960s among historians interested in popular movements. The painstaking work of exposing Murray’s fraudulent use of sources was not undertaken until the 1970s (Cohn 1975).

By then, the modern Wiccan movement, whose founders wished to believe that they were inheriting an ancient tradition, had embraced Murray’s theory. *Witchcraft Today* (1954), the key book by the movement’s main founder, Gerald Gardner, announced that the author belonged to a coven of witches that had survived since pre-Christian times. The book had an approving introduction by Murray herself. Her theory thus gained a new lease on life, and the witch hunt became known as the “Burning Times” among Wiccans believing themselves to be successors of the witches. Some Wiccans still adhere to the theory, but many others have recognized that it cannot survive historical scrutiny.

10. Ergotism. Finally, we have an idea that depends on no past intellectual tradition but has achieved popularity through its very modernity. The idea is that the symptoms of demonic possession were caused by ergotism—eating rye contaminated by the ergot fungus. Those afflicted accused others of “bewitching” them, thus causing witch hunts. Some versions of the idea focus on Salem, whereas others extend it to all cases of demonic possession or even all witch hunting.

However, the ergotism theory has been discredited at Salem for various reasons, including its inability to explain why only the “afflicted girls” suffered from it (ergotism affects entire households, and men as much as women) and why their symptoms were often brought on by the presence of the accused witches. Nor has ergotism achieved much success in explaining cases of European demonic possession, which were rare exceptions to the normal pattern of witchcraft accusation based on neighborhood quarrels. However, the much-quoted fact that ergot is the source of lysergic acid diethylamide (LSD) adds to its attraction: people are fascinated by the idea that their ancestors also experienced drug-induced hallucinations. The idea’s “scientific” appearance gives it high status in a world dominated by technology and populated by millions of literate drug users. The theory was first popularized in 1976 by a *New York Times* article headed “Salem Witch Hunts in 1692 Linked to LSD-Like Agent.”

In general, many of these ideas are attractive because they enable people to sympathize with the victims of witch hunting and to feel indignant at their cruel fate. It is perhaps natural to feel that there must have been some obvious fault in the witch hunters: they were wicked, ignorant, or both. Contemporary individualism has enhanced this tendency. Individuals who do not fit into the surrounding society and who struggle to overcome collective prejudice in order to realize their true worth are the heroes of numerous genres of modern culture. People identify with witches as misunderstood individuals of this kind. A willingness to empathize with people of the past, particularly victims of persecution, is laudable. However, historians wish to extend the same understanding to *all* the people whom they study—witch hunters as well as witches. Calling witch hunters wicked or ignorant cannot explain why they did what they did; moreover, many of them were clearly not ignorant, and some were considered pious rather than wicked. History is not an easy subject.

MÖDEN, JOHANN (JAN)
 (CA. 1590S–1663)

Measured by sheer length of time and number of workplaces, *utriusque juris doctor* (doctor of both laws—civil and canon) Johann Möden seems one of the busiest jurists involved with seventeenth-century witchcraft persecutions in the Rhineland—an unusually energetic legal expert who hired his services out tirelessly in a dozen different places, working for Lutherans as well as Catholics. He epitomized the kind of entrepreneurial witch hunter that Friedrich Spee knew from personal experience.

Though we know much about his activities, his biography remains fragmentary. Möden was born at Koblenz in the 1590s, probably the son of a certain Herr Johann Möden who had lived in a high-status neighborhood since 1591. Matriculation registers show young Möden as a student from Koblenz (*Confluentinus*) enrolled at the Jesuit College of the University of Mainz in 1612 and 1613; in 1613 he began studying law at the University of Würzburg, where he probably received his doctoral degree in both civil and canon law. After Möden finished his studies, we know almost nothing about him, except that he married the daughter of a local official (*Schultheiss*) of Remagen and had his first child in 1619.

In 1627, Möden appeared on the regional scene of witchcraft persecutions. The outbreak of Archbishop Ferdinand’s “war against the witches” (Schormann 1991) in the electorate of Cologne offered unprecedented opportunities, which Möden exploited ingeniously. Thus, we see him assisting the notorious Dr. Franz Buirmann in the town of Ahrweiler in 1628–1629 at trials that led to the death of at least twenty-six people. Möden soon became a *commissarius* (commissary) himself, working until 1633 in more than 100 trials in the various territories of the counts of Manderscheid-Blankenheim, Manderscheid-Gerolstein, and Manderscheid-Schleiden. His first engagement took place in the northern districts of Manderscheid-Blankenheim, very close to Cologne territory. Möden next moved to further similar business in the adjoining *Herrschaft* (estate) of Satzvey.

Though in the following years there was a notable decline in prosecutions, Möden and his colleague Buirmann moved their business to the Rhenish parts of the electorate of Cologne. Herman Löher, from Rheinbach, described their activities in his locality as well as in Meckenheim, where Möden was responsible for

some seventy executions. In November 1637, Möden became acting mayor for one year of Münstereifel, where he had settled in 1629 and married his second wife about 1636. Although local notables became godparents for two of his children, Möden began to experience familial and economic decline. His second wife probably died by 1641, leaving him with enormous debts (he owed 1,465 Reichstaler to twenty-three creditors). We can therefore assume that Löher's description of Möden as needing money desperately because of his wife's obsession with pomp went beyond simple rhetoric.

In 1641–1642, Möden left Münstereifel, taking two of his seven children (the youngest born in 1640), and moved back to Koblenz. In professional terms, his decision proved useful. He conducted witchcraft trials at the Cologne exclave of Rhens from 1645 to 1647; in 1646, he started a long-lasting engagement in Winningen near Koblenz, a Lutheran exclave of the lower county of Sponheim. He also worked at the nearby lordship of Bürresheim in 1647 and gave his counsel on trials at the Sponheim county district town of Kastellaun in 1648. In 1649 he worked in the Cologne district of Altenahr and in 1653 in the county of Sayn-Hachenburg; in 1654 and 1656 he was again occupied with providing counsel for trials in Lutheran Kastellaun. When Winningen's persecutions finally ended in 1659, Möden disappeared as well. He died in Koblenz on February 24, 1663.

Möden practiced both as a Cologne-type commissary, exclusively in charge of the procedure, and later, in more southern territories, through the "mixed" method involving close cooperation with village committees and local officials. Like his colleague and mentor Buirmann, Möden combined working in a respectable field with earning respect, money, and a reputation for ruthlessness through a specialization in witchcraft trials. If a surplus of jurists existed in the seventeenth century, such careers as Möden's exemplify the possibilities of compensating for structural underemployment. A final assessment of his social achievement acquired in this manner is difficult. His and his first wife's popularity as godparents in Münstereifel could reflect prophylactic considerations by fearful neighbors. In his later Koblenz period (1641–1662), Möden never gained access to the inner circle of city councilors. After Trier's Archbishop-Elector Karl Kaspar von der Leyen (1652–1676) stopped witchcraft persecutions around 1653, Möden's ongoing business in neighboring territories could hardly give him any further respectability in his hometown. When he died, he left one adult daughter at home unmarried.

WALTER RUMMEL

Many thanks to Karin Trieschnigg (Münstereifel) for kindly offering me her overwhelming collection of information on the family history of Dr. Johann Möden.

MODENA

The prosecution of witchcraft at the northern Italian city of Modena (in Emilia) was carried out by the Inquisition, mainly in the sixteenth century, and followed the usual patterns for Mediterranean ecclesiastical tribunals. Modena's significance is simply that its inquisitorial records are better preserved than in most other Italian cities. Although significant energies were devoted to the repression of magic in all its different forms, there was little attention paid to diabolical witches, and apparently only one of them was ever executed here, in 1539. Although some key components of the cumulative concept of witchcraft (the Devil, the Sabbat) were present by the end of the fifteenth century, its prosecution remained a rare occurrence in Emilia, except for a real panic in nearby Mirandola in 1522–1523. After a long interval when the Roman Holy Office battled the spread of Protestantism, sorcery and magic reappeared among the priorities of the Modenese Inquisition toward the end of the sixteenth century. However, by this time, the Roman Holy Office had practically ruled out the prosecution of witchcraft through its cautious attitude.

An Inquisition tribunal established in Modena around the end of the thirteenth century was staffed by Dominican friars, dependents of the chief inquisitor for the duchy of Ferrara and Modena, then residing in Ferrara. Surviving trials from the Modenese branch include several early cases of magic attributed to demonic intervention, the most significant being that of Benvenuta Mangialoca, tried in 1370 for healing and divinatory magic using traditional popular remedies and the invocation of "spirits" (Biondi 1993). The court found her guilty of heretical magic, imposing relatively light spiritual penances but adding the humiliation of making her wear the special punitive robe of convicted heretics, with two yellow crosses. Her punishment

characterized Inquisition policy toward illicit magic and witchcraft in the following centuries.

After a long gap (1382–1495), the Modenese Inquisition's records resume, first fragmentarily and then in almost complete form after 1517. The tribunal's activity increased under the determined leadership of Bartolomeo della Spina, author of the *Quaestio de strigibus* (An Investigation of Witches, 1523) and vicar of the Inquisition from 1518 to 1520 (Ginzburg 1990; Bertolotti 1991). A substantial number of trials from 1517 to 1520 revealed the pervasive presence of magic in everyday life and the pivotal role of the clergy in its practice. Male *stregoni* (wizards), mostly literate and middle class, figured prominently among those prosecuted for conjuring demons (generally using books of necromancy), foretelling the future, or finding hidden treasures. Female sorceresses, who were often of lower status, performed love magic and healing magic, usually derived from popular traditions.

All practitioners of magic required some consecrated objects or Catholic rituals to reinforce their spells or incantations. The Modenese clergy frequently practiced magical rituals themselves, although they were seldom prosecuted because they enjoyed widespread acceptance in the community and active support from the local Church. When, in 1517, the Inquisition tried the Cathedral exorcist, Don Guglielmo Campana, who had performed an endless series of diabolical incantations, both the bishop's vicar and the cathedral chapter mobilized in his favor, forcing the court to pronounce a favorable sentence (Duni 1999). People from very different backgrounds intersected through the practice of magic; the humanist and poet Panfilo Sassi and a sorceress from a mountain village, Anastasia la Frappona, were both tried in 1519.

In the early sixteenth century, Modenese inquisitors did not condemn magicians and sorceresses as members of a diabolical sect, but rather for overestimating the powers of Satan and therefore implicitly worshipping him through their practices. The gravest punishments were exile from Modena (up to ten years) or imprisonment (for two or three years), besides varied penances and such "shaming rituals" as standing in front of church for several Sundays wearing the garments of convicted heretics.

The relative lack of interest in witchcraft on the part of the Modenese Inquisition contrasted sharply with the treatment of convicted witches in Mirandola, a tiny city-state some 20 miles north of Modena ruled by Count Gianfrancesco Pico, where at least ten people were burned at the stake in 1522 and 1523. Although it is impossible to understand fully this dramatic event due to the total loss of trial records, it is clear that the witch hunt of Mirandola marked a turning point for the entire area. By the 1530s, the Modenese records contain increasing references to diabolical witchcraft,

an escalation culminating in 1539 with the trial of Orsolina Togni, *la Rossa* (the red one), the first Modenese witch to confess the full range of stereotypical activities (the Sabbat, sexual intercourse with the Devil, apostasy, etc.) and the only witch ever sentenced to death at Modena. The presence of diabolical elements continued in the following decades, reaching its most complete expression in 1564 with the trial of Antonia Vignola. However, witchcraft became less of a priority for the Inquisition, which devoted its energies to destroying Modena's strong and well-rooted Protestant community in the 1560s and 1570s: the number of trials for magic and witchcraft declined from almost five per year in 1517–1523 to less than one per year between 1530 and 1570 (thirty-three and thirty-eight, respectively).

In the last twenty years of the sixteenth century, when the threat of Protestantism had passed, Modena's Inquisition returned to repressing magical practices, but from a different perspective. Its inquisitors now scrutinized the entire range of popular "superstitions," from healing rituals to divinatory magic, seeing them as abuses of supernatural powers to which only the Catholic Church had legitimate access. The goal was to redirect the requests of the Modenese faithful for supernatural assistance from the sorceress and folk healer to the priest, who alone could guarantee the orthodoxy of the supernatural remedies applied. Unfortunately, some of Modena's lower clergy showed clear signs of professional inadequacy. Unlike the days of Don Campana in 1517, priests and friars were now frequently prosecuted for magic and the abuse of sacraments: there were twelve trials between 1580 and 1600 (O'Neil 1984). Increased attention was also directed to female practitioners, especially prostitutes accused of casting love spells and using "superstitious" *orazioni* or prayers (O'Neil 1987; Fantini 1999). Meanwhile, references to "diabolical" witches disappeared. Clearly connected to the changing policy of the Roman Holy Office with respect to witchcraft after the 1580s, this trend is difficult to chart with precision, especially given our fragmentary knowledge of the massive records extant for the seventeenth century, which, to date, have been almost untouched by historical investigators. But if Modena was anything at all like Siena, no maleficent witches will ever be found in its seventeenth-century inquisitorial records.

MOLITOR, ULRICH (1442–1508)

A jurist who served both at the episcopal court of Constance and later at the court of Sigismund, the count of Tyrol (often referred to as "Archduke Sigismund") Ulrich Molitor wrote an early treatise on witchcraft that stood as a counterpoint to the *Malleus Maleficarum* (The Hammer of Witches, 1486). Entitled variously *De Laniis et Phitonicis Mulieribus* (Concerning Witches and Fortunetellers) and *Tractatus de Pythonicis Mulieribus* (Treatise Concerning Women Who Prophesy), it first appeared in 1489 and was reprinted many times in both Latin (with "Laniis" changed to "Lamiis") and German. Although Molitor accepted that anyone who actually made a pact with the Devil and renounced God deserved death for apostasy and idolatry, he also argued that the powers attributed to witches were illusory, emphasized the role of the Devil and the fact that his power depended ultimately on God's permission, and noted the ease with which the Devil could be resisted. Ironically, Molitor's book was the first treatise on witchcraft to be illustrated with woodcuts, which depicted as real the very activities his word denied. Born in Constance, Molitor studied at the universities of Basel and Pavia, from which he earned a degree in canon law in 1470. Returning to Constance, he served first as a notary and then as vicar in the episcopal court. In 1482, he began working at the court of Sigismund, becoming an adviser and then in 1495 or

1496 chancellor of Tyrol. In 1497, he became a procurator of the *Reichskammergericht*, the recently created imperial chamber court. In addition to his most famous work, *De Laniis*, Molitor wrote a number of legal texts and a comedy.

DE LANIIS

In 1485, the papal inquisitor Heinrich Kramer conducted an extensive investigation of witchcraft in the area around Innsbruck, the capital of the county of Tyrol. Although it ended with the acquittal of all seven suspects actually prosecuted, Kramer investigated approximately fifty people, including some from the archduke's household. Sigismund apparently remained relatively aloof from these proceedings, but was sufficiently disturbed by them that he commissioned Molitor to clarify the issues for him.

This Molitor proceeded to do in the form of a dialogue involving himself, the archduke, and another jurist named Konrad Schatz. This form was a standard scholastic device, and Molitor used it to deliver a standard Christian message. Drawing on these recent events, at almost the same time that Kramer was composing the *Malleus Maleficarum*, Molitor developed an alternative perspective deeply rooted in the *Canon Episcopi* tradition of denying the reality of most experiences attributed to witchcraft and magic while insisting on God's ultimate control over the rest. After some discussion, all three concluded that witches could not affect the weather, cause illness or impotence, change into animals, fly to the Sabbat, procreate with demons, or foretell the future. Of course, such things were possible if God permitted them; but only the Devil had this limited power, and he worked mainly through natural processes and his power to create illusions to deceive people into thinking they had magical powers. Molitor acknowledged that some people did turn from God to the Devil and asserted that a real pact deserved death for apostasy and idolatry, but he ended by noting the Devil could be easily defeated through Christian devotion.

Like the *Malleus*, *De Laniis* treated witchcraft as something particularly associated with women, perhaps because the great majority of suspects in the Innsbruck investigation were women, resulting from a long-standing folk tradition linking harmful magic particularly (though by no means exclusively) with women. Unlike Kramer, Molitor did not try to explain this association, noting only that women turned to the Devil because of poverty, despair, hatred, or some other temptation. He concluded by exhorting women to resist the Devil's blandishments by remembering the story of the virgin Justina, who fought off three demons with the sign of the cross.

ILLUSTRATIONS

De Laniis was the first book about witchcraft to be illustrated with woodcuts showing witches and the Devil

engaged in various activities discussed in the text. Ironically, these pictures, which became models for future illustrations, depicted as real things those that Molitor's text argued were only illusions. Perhaps Molitor hoped the illustrations would draw credulous readers whose ideas would then be set straight by his words, but it seems almost certain that despite his skeptical text, the book became a wellspring of images that made witchcraft seem real, helping thereby to fix the impression that witches and their magic posed a real and potent threat to individuals and to the Christian community generally.

MONSTERS

Monsters are real or imagined entities that serve as a binary opposition in the process of defining what is human. Whether they are live, described, depicted, or used as figures of speech, monsters function as representations of the other face of humanity, some bestial or demonic alter ego that must be repudiated and effaced in order for the authentically human being to assert its civilized selfhood. They are ugly because they are deformed, literally "out of shape," deviating from the beauty of standardized corporeal order. Another fundamental meaning of the monster—perhaps the most important aspect for an anthropological understanding of its mythological and social significance—is its hybrid character. Monsters create confusion and horror because they appear to combine animal elements with human ones; they posit a possibility of animal origins, of bestiality. They thus represent a call to antisocial instincts and a threat of regression that the civilized self must struggle to overcome in order to maintain the precarious barrier of civilization.

Witches, beings who transgress the confines between human and nonhuman, are also a kind of monster. The monster shares a number of characteristics and functions with the witch: they both may have a connection with supernatural forces; their appearance may indicate an evil done or about to be done; they may appear in times of social crisis; their wicked origins are attested to by their telltale bodies; they may have an "unnatural" connection with animals; they may be agents of divine or diabolical retribution; they may tempt good people off their path of righteousness; a possessed person may be monstrously deformed; and they are both associated with powers of transformation, illusion, deception, and diabolic intervention. Both the witch and the monster are also categories of narrative and appear in narrative traditions in which their identity ranges freely from physical to moral qualities and back again. Finally, the categories of the monster and the witch take on negative or positive connotations over time and in different places. For example, the siren of antiquity (half-woman and half-bird or fish), symbolizing the extremely negative consequences of succumbing to the lure of feminine charms, appears today in the form of a widely merchandized mermaid, presented as a role model for little girls

GENDER AND MONSTROSITY

Aristotle's scientific writings—authoritative texts well into the seventeenth century in Europe—established the medical precept that the cause of monsters was to be found in the struggle of the formal agent (male seed) to dominate the female matter. Depending on the strength, heat, abundance, or deficiency of the seed, its formative movement prevailed more or less efficiently over the generative secretion of the female (the menses). Because when it came to reproduction, "like should produce like," a baby that did not resemble its parents was already "a sort of monstrosity"; following this logic, the birth of a female was "a first departure" from a successful reproduction (Aristotle, *Physics* 4.767b–769b). Monstrosity was thus placed on a graduated scale of imperfection falling away from the realization of the intended perfect male form.

During its height of popularity in the early modern period, the pseudo-Aristotelian science of physiognomy, the art of reading a man's character from his physical features, further popularized the idea that, as one Italian author of the period put it: "Woman is a monster of nature, she is an imperfect man, as many Learned writers are pleased to determine, which we may deduce from all her parts" (Ghirardelli 1670, 624). Feminine qualities such as deceitfulness, vagueness, and capriciousness were thus considered monstrous signs of the naturally deformed female physiognomy.

FORM AND FUNCTION

The monster defines the limits of the human at both its "lower" and "upper" thresholds: half-animal or half-god,

what is other is monstrous. A monster is “not human,” then, and explicitly signals its foreign status with its body: too many limbs, or not enough, or not in the right place, or unnaturally formed. Certain characteristics of the monster are perhaps universal, but only those that describe the place it occupies in the social order and its relation to the interpretive community that defines it as such. In other words, a monster always indicates a transgression, a breakdown in hierarchy; it is quintessentially a symbol of crisis and undifferentiation. However, beyond these attributes a monster can take on any form: a baby born with birth defects, an extraordinarily talented or depraved person, a machine that moves or speaks, the state, women, peoples with different colored skin or unusual customs, an android, or an extraterrestrial.

The designation of a vulnerable member of the community as an agent of the sacred or the diabolical can provide an effective way to identify and contain the forces of evil or misfortune that could contaminate the entire community. Ritual slaying or ostracism of the dangerous element in the form of a sacrificial victim can act as a safety valve to tension that could otherwise erupt into destructive violence. From this perspective, both the monster and the witch have been viewed as scapegoats and their histories analyzed according to the scapegoat mechanism.

In addition to its mythological and poetic representations, the monster has appeared textually in the form of omens in prodigy books (Paré 1982), as a sign to be interpreted in the divination arts (Cicero, *De Divinatione*), as proof of the marvelous creativity of nature or God (Pliny, *Natural History Libri VII*; St. Augustine, *City of God*), as an object of scientific curiosity in the Aristotelian tradition, as illustrative figures in moralizing emblem books (Alciati 1985), and as a rhetorical figure or concept (Hobbes, *Leviathan*).

HISTORY OF THE MONSTER

In ancient times, the appearance of a monster, as an event happening outside the ordinary course of nature, was interpreted as an indication of divine will. *Monstrum* and *teratos*, the Latin and Greek roots of *monster*, did not signify a deformed being, but fell in the same category as other terms belonging to the divinatory sciences, only migrating later through association to the natural sciences. A *monstrum* (from *monere*, to warn or threaten) was by definition a terrible prodigy, not for what it was—a piteously deformed infant destined to die quickly by natural causes or by ritual sacrifice—but for what it foretold as a sign of coming calamity. How that sign was interpreted was purely a matter of historical context. For example, the ancient Chaldeans assigned one-to-one correspondences between limbs and exact events,

either auspicious or ominous portents: an extra finger meant abundant crops and so forth. The appearance of a monster thus presupposed an interpretive community, a social order to which it was addressed, and a priestly caste charged with deciphering its precise significance.

More recent “readings” of monstrous bodies, in addition to predicting political changes or calamitous wars, had precise propagandistic purposes. Martin Luther, for example, made great use of a famous monster baptized the *Mönchskalb* (the monk-calf), whose image appeared in numerous pamphlets as an emblem of Catholic depravity. Interpretation of monsters in the Renaissance was nothing less than an alternative political science, more popular and contemporary in nature than the erudite fare of princely counselors like Niccolò Machiavelli.

Monstrous births continued to inspire pious terror well into the modern period. In 1543 in Avignon, we are told, King Francis I ordered a woman to be burned along with her dog because she had given birth to an infant with canine features. The woman eventually confessed to having had intercourse with the dog; her monstrous progeny was thus interpreted as a sign of her wickedness and a divine punishment for her unnatural desires. As late as 1825, in Sicily, a baby girl born without a brain provoked such terror that those attending the birth threw her down a deep, dry well. She was saved only by order of the mayor (Taruffi 1881, 1:7:11).

Fear of monstrous births was also inspired by their supposed connection with demons, who were said to be responsible for parenting monsters through various techniques of “artificial insemination.” In demonology texts, such as Francesco-Maria Guazzo’s *Compendium Maleficarum* (A Summary of Witches) of 1608, demons and monsters were also linked by an obvious and relatively unproblematic correlation between moral depravity and corporeal deformation: the demon assumes a monstrous appearance; or to be more precise, demons *are* monsters, and monsters *are* demons. This association between evil and ugliness is widespread and deeply ingrained in the Platonic/Judeo-Christian tradition in which, conversely, truth and goodness are equated with beauty.

During the early modern period, monsters gradually lost their terrifying association with the forces of the sacred and became objects of wonder or curiosity to be put on exhibition in public squares and museums. Famous freaks of this period who traveled around Europe to show themselves included the double-bodied Lazarus and his brother Baptista who grew out of his side, and the giant Giovanni Bona. Stuffed animals made out of various animal parts pieced and sewn together to represent fantastic creatures such as hydras, basilisks, and dragons were sold by charlatans and were

David Ryckaert III (1612–1661), *The Witch*, shows a Dutch witch battling and sending off monsters and demons in hell. The zoomorphic monsters remind us of their bestiality and opposition to humans. (Erich Lessing/Art Resource)

in great demand. Scientific collections called “cabinets of curiosity” often contained specimens of monstrous animals or deformed human fetuses and even extended to live specimens such as the dwarves Sebastiano and Angelica Biavati, who lived their whole lives in a museum in Bologna on a permanent salary.

MONTAIGNE, MICHEL DE (1533–1592)

The best-known French author and thinker of the sixteenth century, Michel de Montaigne’s collection of personal reflections, the *Essays*, was popular in his lifetime and has undergone hundreds of editions and translations.

His *Essays* continue to be read today, and scholarly interest in their author—including his famous digression ridiculing belief in witchcraft—remains high.

Montaigne's family came from the Bordeaux region; they were wealthy and well connected. He was a relative of two writers on demonology, Pierre de Lancre, and (through his Spanish Marrano mother) Martín Del Rio. Educated in classical humanism, Montaigne became a judge at the *Parlement* (sovereign judicial court) of Bordeaux in 1557. He served until 1570, when he sold his position to Florimond de Raemond and retired to his country estate, seeking tranquility in order to reflect and write during a time of brutal civil war. His early retirement was frequently interrupted by politics and military ventures as well as by two terms as mayor of Bordeaux, making him a participant in as well as an observer of the events of his turbulent age.

Based on a firm belief in the unknowability of God's intentions and his readings of the classics, he adopted a position of skepticism, summed up in his famous rhetorical question, "Que sçay-je?" (What do I know?). He attempted to avoid the extreme positions of his day because their adherents claimed true knowledge. Because humans could not know the mind of God, Montaigne argued that they should follow the religion of their country. Montaigne primarily blamed the Protestants for the chaotic civil war that raged for thirty-five years, but he also criticized Catholic zealots who similarly mistook their extreme opinions for facts. Montaigne was an early example of the Gallican Catholic *politique*, holding that it was unjustified to label dissidents as heretics and to kill people for such disagreements. This position, which ultimately prevailed under King Henry IV, was attractive to many of his contemporaries (and to modern readers) but aroused bitter hatred from zealous Catholics.

In his writing, Montaigne touched frequently on popular credulity. His essay, "On the Lame" (1588), addressed the belief in witchcraft and the penalties meted out to convicted witches. Montaigne revealed his basic skepticism toward the supernatural, stating, "All miracles and strange happenings hide away when I am about." He mocked the works of demonologists. "My local witches go in risk of their lives, depending on the testimony of each new authority who comes and gives substance to their delusions." He then told about observing and conversing with a group of old women who had been convicted of witchcraft, through the courtesy of an unnamed prince who wanted to overcome his distinguished visitor's skepticism. (In this context, he never mentioned his experience as a judge in the *Parlement* of Bordeaux, because witchcraft cases were unheard of there in the 1560s.) Montaigne concluded, "In the end, and in all honesty, I would have prescribed not hemlock for them but hellebore. 'Their case seemed to be more a matter of insane minds than

of criminal behavior.' [quoting Titus Livy] . . . After all, it is putting a very high value on your opinions to roast a man alive because of them" (Montaigne 1991, 1166–1169).

Montaigne's opinions on witchcraft inevitably caused controversy, because belief in the power of the Devil and witches was an important part of the fight against Protestant heresy. The position that witchcraft was only a fantasy of old women was attributed to Montaigne (sometimes coupled with such heretics as Johann Weyer) and was mentioned many times in demonological writings as a particularly dangerous idea that gave impunity to witches. Martín Del Rio, the most authoritative orthodox Catholic demonologist, sharply criticized Montaigne's views, calling him an unbeliever who endangered the fight against the Devil through his opinions.

Pierre de Lancre, despite his admiration for Del Rio, defended his distant kinsman Montaigne against Del Rio's criticisms, stating that Montaigne "did not present this proposition as true . . . no more than his other opinions. . . . leaving all things in doubt, where it seemed bold to decide them absolutely" (Lancre 1622, 339). Nevertheless, family honor aside, de Lancre was concerned that judges might let such views deter them from their responsibility to punish witches.

Montaigne lived and died as a Catholic. He traveled to Italy, where he visited the shrine at Loretto, met with Juan Maldonado, and had an audience with the pope. He was also careful to submit his work to papal censors. He died long before the religious wars ended and did not see Henry IV's triumph.

MONTER, WILLIAM (1936–)

Professor emeritus of early modern European history at Northwestern University in Illinois, where he taught from 1963 to 2002, Monter has exercised considerable influence on a generation of witchcraft research.

After completing a dissertation on Geneva, Monter became interested in witchcraft research during the Vietnam-protest era, while reading both Carlo Ginzburg's and Hugh Trevor-Roper's utterly contradictory accounts of it in 1967. By 1969, Monter published a collection of essays and sources titled *European Witchcraft*. Three years later, following Erik Midelfort's example, he provided a historiographical survey, dividing witchcraft into three major currents: rationalist,

romantic, and social scientific. An active witness to the “ongoing renaissance in the historiography of European witchcraft” (Monter 1976, 9), Monter contributed one of the most important early comparative studies on a region labeled as “the borderlands during the Reformation,” including Calvin’s Geneva Unlike Alan Macfarlane or Mdelfort, Monter emphasized the importance of popular belief, and, unlike Keith Thomas, Monter’s study paid close attention to regional differences between such territories as the Franche-Comté and the Swiss Canton of Fribourg (both Catholic) on the one hand, and Geneva and Bern (both Reformed) and Montbéliard (Lutheran) on the other. Monter succeeded in destroying stereotypes about uniform patterns of persecution or of patterns depending on the form of religion. Furthermore, he insisted on putting his results into a European perspective.

Two recurrent themes in his publications deserve comment: that the “witchcraft of the Germanic core of the Holy Roman Empire” could be taken as “normative” (Monter 1976, 191; Monter 2002) and that Geneva’s Calvinists took a relatively moderate approach toward witchcraft (Monter 1976, 42–66). However, the Holy Roman Empire contained large territories with no executions of witches during the early modern period. Moreover, Geneva was located near the center of the Romance-speaking areas where the cumulative crime of witchcraft first emerged. The sixteenth-century urban republic was an angst-ridden society, driven by fears of plague-spreaders and witches; its “gentle Calvinists” killed more witches within their narrow confines than all popes in Rome together, or Luther’s princes in Saxony, or most European towns.

Monter’s publications are among the most illuminating on witchcraft and related subjects. His well-written survey *Ritual, Myth and Magic in Early Modern Europe* (1983) provided insights into the cultural fabric of different strands of Catholicism, Protestantism, and Judaism in all parts of Europe and their overseas colonies. It drew on recent research in all major European languages, and by treating witchcraft as one of many subjects, put it in perspective. In contrast to anthropologically oriented historians, Monter always emphasized the importance of “culture,” popular as well as religious or intellectual. In numerous essays, he drew attention to the significance of such subjects as sodomy, child witches (1993), or male witchcraft (1997), with predominance in places like Normandy or the Alpine regions that can hardly be explained socially. Subsequently, he explored the group dynamics of a possessed Lorraine village with a parish priest who was a future saint, proposing it as a Catholic counterpart to Puritan Salem (Monter forthcoming).

Viewed as a whole, his publications combined the rational, romantic, and social-scientific approaches to witchcraft that he long ago identified in the historiogra-

phy of witch hunting. Monter served on the editorial board of the *Encyclopedia of Witchcraft: The Western Tradition*.

MOON

The moon has occupied a pivotal role in myth, religion, and magic, assuming a divine or at least anthropomorphic nature (sometimes male, sometimes female) in the majority of belief systems since prehistoric times. As a measurement of time, the moon and its cycles designated the various phases in the agricultural calendar as well as indicated appropriate times for the gathering of marine produce and sailing the seas. As a celestial force endowed with personality or divinity and associated with time, the moon and its movements were naturally regarded as exerting an influence on humans and their destinies, occupying a central position in the astrological system.

In terms of witchcraft and the occult, the moon has a revered and powerful function in the practice of

The moon presides over a witches' dance (from an eighteenth-century chapbook). The moon has been linked to witchcraft since antiquity. Meetings and activities were most effective when coordinated with the phases of the moon, especially a full moon as shown in this illustration. (Bettmann/Corbis)

magic. In ancient Greece, witches regularly invoked Selene, goddess of the moon, in their rites and incantations, often calling on her to assist their work by either shedding or concealing its light. Later in her myth cycle, Hecate also became associated with the moon. In both Greek and Roman literature, witches such as Medea were described as working with the moon, and the practice of drawing down the moon was a renowned art of Thessalian witches in particular. This magical art was sometimes presented in literature as the means to assist in the performance of rituals that required secrecy and, therefore, darkness. An alternative motivation for the act was presented in

the *Pharsalia* (6.505–6.506) by the Latin author Lucan (C.E. 39–65) who referred to a lunar fluid, emitted by the descending moon, that coated earthly foliage, endowing it with miraculous properties. In a similar vein, the ancients believed in the magical properties of stones from the moon, which were worn for a variety of purposes, including as amulets, and sold by magicians. Pliny, in his *Natural History* (37.164), also mentioned *glossopetra*, which fell from the sky during the waning of the moon and was used by “moon-diviners.”

In early modern Europe, the moon continued to be regarded as a central part of a variety of forms of occult

practice. The idea of drawing down the moon continued as a belief as illustrated in the speech of Hecate in Shakespeare's *Macbeth* (Act 3, Scene 5). In alchemy, the moon was a major cosmic force, representing the metal silver and the feminine principle as well as being an astrological influence that required acknowledgement in particular operations; by working under a waxing moon, for example, one obtained purer metals. In folk magic, the moon and its phases marked propitious times for the working of spells and similar endeavors such as summoning fairies or other supernatural beings. The links between the moon and witchcraft also continued, with consistent references in the literature of the persecution era to Satanism, its practitioners (and victims), and the lunar cycles. The *Malleus Maleficarum* (The Hammer of Witches, 1486) stated that devils, who could only operate through the medium of natural forces, "molest men at certain phases of the moon" (1:5). It regarded men who were vulnerable to such situations as lunatics, thereby reflecting the age-old folk-tale tradition of lunar-inspired madness. Such thinking was closely aligned with the belief in lycanthropy, a state of transformation often regarded as being determined by certain phases of the moon. Witches were believed to meet at times designated by the cycles of the moon, the full moon being an especially favorable time for gatherings. This association between the witch and the moon was particularly strong in the artwork of the persecution era (and beyond), with consistent images of a full or crescent moon watching over the predominantly female figures and their activities. In a Victorian magical text, Charles Leland's *Arcadia: Gospel of the Witches* (1889), the author wrote of witches gathering once a month "when the moon is full" to worship the goddess Diana in a passage that clearly drew from ancient beliefs concerning the moon and one of its principal deities.

MORA WITCHES

The large village of Mora was the first center of Sweden's great witch hunt of 1668–1676. Because the earliest and until recently the most widespread source of information about the entire affair was an account written by Mora's vicar, Elaus Skragge, his parish became the Swedish equivalent of Salem. Skragge's account, which covered the August 1669 hearings into

suspected cases of witchcraft in the parishes of Älvdalen and Mora by the Witchcraft Commission, was translated into Dutch as early as 1670. It was published in German the same year; by the turn of the eighteenth century it had appeared in several editions, including English and French translations. There was a link to North America, where Cotton Mather was well aware of the Swedish witch hunt when discussing the possessed children of Salem (*Discourse on Witchcraft*, 1689; *The Wonders of the Invisible World*, 1693).

The early translations of Skragge's account have given rise to a greatly exaggerated view of the Blåkulla trials, due to misunderstandings and incorrect translations of the original text, which have influenced even relatively modern studies (e.g., Robbins 1959, 348). The first Dutch translation stated, with no support in the original, that eighty-four adults and fifteen children were put to death.

Skragge's account belonged to the initial phase of Sweden's great witch hunt, which afflicted Dalarna from 1668 to 1671. Official hearings began in Dalarna in the summer of 1668, when an eleven-year-old girl called Gertrud Svensdotter, who lived in the village of Åsen in the parish of Älvdalen, disclosed strange and terrible tales of widespread consorting with the Devil. Based on testimonies principally given by children, the local court passed eighteen death sentences, which were in due course referred to Svea High Court in Stockholm. In March 1669, it ratified seven death sentences, those passed on adults who had confessed their guilt, including two seventeen-year-old maidservants. Those whose death sentences were revoked included four children (Ankarloo 1990, 295). The death sentence was not usually passed on children under fifteen years of age, the only notable exception occurring in Stockholm in 1676, when the witch hunt finally came to an end. There a thirteen-year-old boy called Johan Grijs was executed because his perjury had caused a number of people to be sentenced to death.

From Älvdalen, rumors of witchcraft quickly spread to the neighboring parish of Mora. The increasing disquiet in the region resulted in a government decision to appoint a Witchcraft Commission, which held hearings in Mora in August 1669, presided over by Councillor Lorentz Creutz. The local community demanded the establishment of special courts of law. The Witchcraft Commission passed the death penalty only on those who had confessed (a prerequisite that was later abandoned at the culmination of the great witch hunt) and who proved to have had prolonged dealings with the Devil. This latter criterion enabled younger witches (for instance, two women in their twenties) to escape the death penalty. The hearings of the Witchcraft Commission lasted only a few days. The commission interrogated a total of sixty suspects in addition to an even larger number of children

(Ankarloo 1990, 295). In view of the large number of confessions that resulted, one suspects that torture was employed. The execution of those who had confessed took place on August 25, two days after the commission had departed from Mora. Of the twenty-three who had been condemned to death, fifteen were beheaded and then burned at the stake in Mora. Six others were executed in Älvdalen at the same time (Ankarloo 1990, 295). Hopes that the authorities would now take control of the situation proved to be in vain. The abduction of children to Blåkulla spread like wildfire, and other parishes requested government help to deal with the situation. Another Witchcraft Commission was appointed in 1671. A further fifteen people were executed (Ankarloo 1990, 296). That finally brought the witch hunt in Dalarna to an end, but in the rest of Sweden, the panic was only just beginning.

Julio Caro Baroja noted that one aspect of Elaus Skragge's account regarding the Blåkulla tales was unique in European tales of witches: namely, Satan's death and resurrection (Caro Baroja, 1965, 207ff.). The narrator of this occurrence was the afore mentioned Gertrud Svendsdotter. The record of the proceedings described her tale in great detail because it contravened accepted theological doctrine. Anders Nohr Moraeus,

Witchcraft at Mora, Sweden, including the flight of witches to Blåkulla, child witches, sex with the Devil, and the execution of witches. (Anonymous, Sabbat der Hexen von Mora, 1739–1745. Directmedia Publishing GmbH: Berlin, 2003)

the cleric present at the hearing, therefore instructed the girl about the nature of God and explained how the Almighty does not change, become ill, die, or the like. The girl had described how Satan fell ill at Blåkulla and had lain on a bed in the banqueting hall, grunting, groaning, and appearing to be so ill that his guests had wept and mourned for him. Despite the efforts of one of the most experienced witches to cure him with liniments and cupping, he continued to lose strength. Finally, he was led out to another chamber, but a ghost-like image of him remained in the bed, as though it was his dead body. At this point, Satan's son-in-law entered the room together with his wife and two of his daughters, and with tears and weeping they carried him out, as though to be buried. However, Satan suddenly regained life; rushing back into the room, he danced around with one of the young witches in his arms to the delight of the guests.

This tale has been interpreted as a misunderstanding of the biblical theme of Jesus's death and resurrection. The mention of Satan's son-in-law is of particular interest. At the beginning of the witch hunt, a number of references described Satan with a wife and children. In Älvdalen, these clearly referred to the vicar's own family. At one point, Satan was referred to as "Lasse," a nickname for the vicar, Lars Elvius. In the section of the records referring to Satan's death and resurrection, the names of Satan's two daughters, Sara and Margeta, were crossed out, but they were in fact the names of two of the vicar's daughters.

Elaus Skragge's report of Gertrud Svendsdotter's confession did not tell the entire story. The background to the Blåkulla trials took place in 1667, when Gertrud, then eleven years old, was herding goats together with a slightly younger boy on the banks of the river Österdalälven, near the village of Åsen. The children fought over a chunk of bread, and the boy, who came out the worst in the tussle, told the tale to his father so dramatically that before long the vicar, Lars Elvius, came to hear of it. The boy claimed that while the children were fighting, some of the goats had strayed out to an islet in the river, and Gertrud had fetched the goats by walking out on the water to the little island. In September 1668, the court concluded that Gertrud's walking on water was the first substantial indication of what turned out to be widespread witchcraft. It could equally well have become a miracle, but the record called it the work of the Devil. Satan had oiled the girl's feet so that she could wade out across the current without touching the riverbed.

In another episode from the girl's story, Satan showed Gertrud and the other witches "the whole world." In spite of the fact that they had calves to ride on, most of the journey was made by boat. During the boat trip, Satan instructed the youngest members of the party, including Gertrud, to keep the calves calm by scratching

them on their necks while Satan himself rowed the boat with mighty strokes of the oars. During the boat ride, they noticed a man who stood and scooped salt from the water onto the shore. Satan and the witches took a supply of salt with them before proceeding onward. After some days, they reached the shore, from whence they flew onward, passing towns, villages, and churches. On their return, Satan confiscated all the salt, so the only thing that Gertrude and the others had to show from their long journey was exhaustion. Toward the end of the nineteenth century, at the time of a religious revival, stories of Blåkulla were heard again in the province of Dalarna. This time, however, the destination was called Josefsdal, an adaptation of the biblical valley of Jehosaphat, *Josafats dal* (*dal* means valley).

MORAVIA

Witchcraft persecution in Moravia in the late Middle Ages and the early modern centuries has not been

systematically researched, except for the northern Moravian witchcraft trials of 1678–1696. At present, the total number of known victims of the witch hunt in Moravia (including the northern Moravian witchcraft trials) was roughly 300 people, most of whom were executed. Considering the substantial losses of source material, especially records of town criminal courts before 1620, the real total was considerably higher.

Today part of the Czech Republic, Moravia (Morava) in the ninth and early tenth centuries was the center of the vast empire of Greater Moravia, which included Bohemia, Silesia, Slovakia, southern Poland, and northern Hungary. Later, Moravia became a margravinate in the Holy Roman Empire under the suzerainty of the princes and then kings of Bohemia.

Moravia's laws and juridical system in the medieval and early modern periods closely resembled those of Bohemia. Criminal courts in over 200 Moravian royal and patrimonial towns tried most of the region's witches until the battle of the White Mountain in 1620. Afterward, patrimonial courts took a more active part in prosecuting sorcery in Moravia alongside the town courts. The Land court, the only one with authority over all of Moravia, almost never heard any cases of sorcery. The Court of Appeal in Prague only established its authority to approve all death sentences from Moravian town and patrimonial courts in 1700. Like Bohemia, Moravia's first detailed legal regulation for the offense of witchcraft (sorcery) came only with the Josephina, the criminal code of Emperor Joseph I for Bohemia, Moravia, and Silesia, decreed in 1707, a time when witchcraft trials had almost ended in Bohemian crown lands.

Unlike Bohemia, Moravia lacks information about the activities of its fourteenth-century papal inquisitors. Moravia's most notorious inquisitor was certainly Heinrich Kramer (Institoris), author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), who was named papal inquisitor to Moravia and Bohemia in 1500 by Pope Alexander VI at the instigation of the bishop of Olomouc, Stanislav Thurzo. Kramer settled in Olomouc, which boasted an important Dominican monastery, until 1505. He made no attempt to conduct witchcraft trials in Moravia; his task was rather to eradicate various Czech heresies. In April 1501, he published two tracts at Olomouc against them, but never began any inquisitorial trials against heretics in Moravia or Bohemia; his five years there were devoted to public disputes and literary polemics.

Inquisitorial procedure had long been known in Moravia, but as late as the first half of the seventeenth century it was used only by town courts in prosecuting capital crimes and then only in some southern Moravian towns owned by the capital city of Brno. Until the outbreak of the northern Moravian witch hunt in 1678, the offense of witchcraft meant simply *maleficium* (harmful

magic)—mostly poisoning people or cattle, causing illness or damage to property, and sometimes administering love charms. There was no diabolism, no apostasy, and no participation in witches' Sabbats. Moravia's first known trial for harmful sorcery occurred around 1350 at Brno: the accused women were required to swear a purification oath. Sporadic trials against performers of harmful magic dotted the final quarter of the fifteenth century. Moravia's first known execution for this crime occurred in 1494 (four years before the first such instance in Bohemia) at the southern town of Uherské Hradště, where a woman was sentenced to death for harmful sorcery, in addition to other crimes.

Only sparse information survives about Moravian witchcraft trials during the first half of the sixteenth century. Trials and executions increased gradually after mid-century. Before 1620, they were individual affairs, with one outstanding exception: the series of witchcraft trials from 1571–1576 in the patrimonial town of Velká Bíteš in southwestern Moravia, where at least twenty-two women were executed (fifteen of them in 1576) for harmful witchcraft, mainly poisoning humans or cattle or magically stealing milk. After 1620, Moravian witchcraft trials still usually remained individual affairs, even when mass witchcraft trials took place after 1651 in the neighboring principality of Neisse in Silesia, claiming hundreds of victims.

The single dramatic exception—by far the largest mass persecution of witches in Moravian history—was the northern Moravian witchcraft trials, which lasted from 1678 to 1696. They began at Easter 1678 in the lordship of Velké Losiny, after someone profaned the consecrated Eucharistic wafers, attempting to use them to perform magical spells. The guardian of Velké Losiny, Anna Sibyla (countess of Galle), called in a lawyer with vast experience in the field of witchcraft trials, Heinrich Franz Boblig (1612–1698), from the Moravian capital at Olomouc. Boblig came from a patrician family of Edelstadt; his father had been ennobled and served as mayor of the rich mining town of Zuckmantel in Silesia. He never completed his law studies (probably at Vienna University) and lacked a doctor's degree. By 1638, Boblig had become a judge in the Silesian principality of Neisse; his career culminated during the mass witchcraft trials, which took place there in 1651–1652. Sometime later, he moved to Olomouc. He came to Velké Losiny in September 1678 as chairman of the newly established special patrimonial court, charged with finding its alleged witches.

The first executions took place at Velké Losiny in August 1679. That same month, Boblig succeeded in becoming head of another newly established special patrimonial court of justice in the rich town of Šumperk (German Mährisch Schönberg), owned by a great Moravian and Silesian aristocrat, Prince Karl Eusebius of Lichtenstein. The dean of Šumperk,

Christoph Alois Lautner (1622–1685), opposed the proceedings of this special patrimonial court (among the first people accused were Lautner's housekeeper and the wife of his friend, the former mayor Kaspar Sattler).

Lautner came from a rather poor family in Šumperk; his father had been a soldier during the Thirty Years' War. Lautner studied theology at Landshut in Bavaria, then philosophy and law at the University of Vienna, and theology again at the University of Graz (Styria). He was ordained a priest at Olomouc in 1656, where he remained as a chaplain before becoming a village priest at Dolní Moravice by Rýmařov in northern Moravia (1658–1663), then a dean in the Silesian town of Osoblaha (1663–1668), and finally dean of his native Šumperk. Lautner was an extraordinarily well-read priest. His rich library reflected his various interests; unlike Boblig, he even owned and read the *Malleus Maleficarum*. Boblig recognized a dangerous opponent in Lautner and soon charged him with witchcraft. Consequently, Lautner was arrested in August 1680 with the approval of the bishop of Olomouc, Karl II of Lichtenstein. The bishop immediately created a special commission ("committee of justice") for the purpose of investigating witchcraft charges against Lautner and some other clergymen from his diocese: it contained four men, including Boblig. Lautner remained imprisoned for five years.

Meanwhile, Boblig's tribunals in Velké Losiny and Šumperk passed death sentences and executed several dozen persons, mainly women. Lautner's housekeeper Susanna and Maria (the wife of Kaspar Sattler) were executed for witchcraft in December 1682. Sattler was put to death for the same offense, together with his daughter Elisabeth in August 1683. Dean Lautner was first interrogated in August 1680, and his examination was repeated many times. The bishop of Olomouc approved his torture in June 1684. After numerous postponements and delays, Lautner was condemned by the episcopal "committee of justice" in September 1685 to be defrocked and then burned at the stake. After the bishop of Olomouc approved this sentence, Lautner was burned on September 18, 1685, in the bishop's patrimonial town of Müglitz, in the presence of an enormous crowd. In all probability, Lautner was the only Catholic priest ever executed in Moravia or Bohemia for the offense of witchcraft. Boblig's witchcraft trials continued after Lautner's execution, lasting until 1696, but with less intensity. Overall, roughly 100 people (mainly women) died during these northern Moravia witch hunts, including 48 people from Šumperk (27 women and 21 men).

We do not know when the last death sentence for witchcraft was carried out in Moravia; it probably happened during the first half of the eighteenth century.

MORE, HENRY (1614–1687)

More was an English theologian and believer in the reality of apparitions, spirits, and witches. More belonged to a small band of philosophers known as the Cambridge Platonists because of their metaphysical interests and beliefs. Though fascinated by the spirit of inquiry in the occult sciences, More maintained a devout Christian faith. Astrology, for example, he dismissed as "a fanciful study built upon very slight grounds" (*Enthusiasmus Triumphatus*, 1656). He exerted an important influence on the debates about witchcraft in the second half of the seventeenth century, representing the conservative view that skepticism in such matters was dangerously linked to atheism. Over time, however, his opinions lost favor and would be branded "superstitious" by eighteenth-century free thinkers.

More was born at Grantham in Lincolnshire, the son of a minor gentleman. His parents were strict Calvinists, but as he grew up, More inclined toward a more moderate faith. He was educated at his local

grammar school and in 1631 entered Christ's College, Cambridge, which was to remain his home and haven for the rest of his life. More was elected to a fellowship in 1639 and soon afterward took up holy orders. In the 1640s and 1650s, More remained staunchly loyal to the royalist cause but after 1660 refused all preferment and promotion offered in reward. Instead, More adhered to a life of contemplation, conversation, and composition; he was a prolific writer who translated his own work into Latin. He died in Cambridge in September 1687, much missed as an inspirational teacher.

More was remembered as a Christian mystic as well as a scientist in the providential tradition, an Anglican who spent his working life promoting a comprehensive natural theology suited to an age of science and experiment. The diverse subjects covered in his books included the doctrine of providence, the nature of the soul, idolatry, transubstantiation, the Kabbalah, and a commentary on the visions of the prophet Daniel. In 1653, More published his best-known contribution to witchcraft literature: *An Antidote Against Atheisme: or an Appeal to the natural Faculties of the Minde of Man, Whether There be no God*. It included the story of a Cambridge witch who refused to repent; at her execution, which More may have attended, an unnaturally strong gust of wind shook the gallows. He had certainly witnessed some trials of East Anglian witches in the mid-1640s. Despite its local anecdotal evidence, his book was also a serious work of theology, drawing upon such authorities as Jean Bodin, Johann Weyer, and René Descartes and lamenting that free thinking and discussion in religion was undermining God's order. He argued that because the existence of God and a spiritual realm was beyond question, then the power of witches must surely follow. Witches, in More's opinion, were powerless and poor but were tempted through weakness and impiety to follow the Devil's path. He believed that witches gathered in covens to make pacts with the Devil, a continental idea rarely known in England before his own time.

In his later years, More became a strong supporter of the credulous physician Joseph Glanvill (who had long admired More's own work). He reputedly edited Glanvill's polemical *Saducismus Triumphatus* (Sadducism Conquered) of 1681, which also connected skepticism with atheism; there is little doubt that More influenced it. Like Glanvill, More believed that accumulated testimonies demonstrating the reality of witchcraft would ultimately confound the skeptics and would offer a lasting antidote to atheism. The flaws in this line of reasoning were, first, that the data of hauntings and bewitchings could never be tested, and, second, that skeptics would never accept any evidence they considered to be ridiculous. As David Hume later argued, no testimony was sufficient to prove a miracle unless its falsity was more miraculous than the fact it sought to establish.

More died before his worst fears about the progress of atheism and the decline of the miraculous were realized;

but after 1700 it was clear that the occult medieval world of witches and spirits was crumbling as the foundation for Christian faith that More, Glanvill, and others of their generation believed it to be.

MOSES

Among the personages found in the Hebrew Bible, none was more venerated than Moses, and none, save perhaps Elijah, had a greater reputation for performing miraculous deeds and communing directly with God. Because his actions were considered part of the Israelite understanding of divinely shared power, Moses was not considered a magician or sorcerer or a practitioner of divinatory magic. Thus, when his staff was transformed into a snake (Ex. 4:2–3) or he struck the Nile with his staff and it turned into blood (Ex. 7:15–18) or he extended his rod to open the Red Sea (Ex. 14:13–31) or struck a rock to produce a stream of water (Num. 20:10–13), these events were seen as manifestations of God's power over creation, not a conjuration of forces by Moses. The storyteller, however, demonstrated a clear understanding of Egyptian magical practices in the narrative of the plagues (Ex. 7–11), indicating that, although magic was not part of the Israelite theological premise, the Egyptian audience for the match between Moses and the sorcerers would be impressed by the abilities of God's representative (compare Acts 7:22 for later tradition on this).

By tradition, Moses was the recipient of the divine judicial code contained in the Books of the Pentateuch that functioned initially for the Israelites and the later Jewish community as the basis for judicial procedure and their official system of justice. During the Christian era, the strength of this legal and authoritative tradition transformed these statutes into a divinely inspired set of injunctions upon which life was to be based and from which society's leaders could draw to solidify their own authority and preserve their people from error (Deut. 31:24–29). As a result, the laws against witchcraft (Ex. 22:18 [22:17]; Lev. 19:26; Deut. 18:10–14) were given the force of divine command and irrevocability because they were a part of the Mosaic code. In addition, the injunctions on these matters were used (along with the story of the suffering of Job and the principle of grace

in the New Testament) as the basis for the Protestant understanding of demonology and how to combat it.

During the Middle Ages and subsequently during the period of the Reformation, the figure of Moses became canonized into a dual character. He was both the quintessential lawgiver, having received through direct divine revelation the primal judicial code and the model for a divinely chosen secular leader. In the former role, he became the authoritative figure upon whom magistrates, judges, and exorcists based their commissions and upon whose code of justice they relied in dealing with criminals and those accused of witchcraft or dealings with demons. This was even the case with Protestants, who tended to rely more on the Gospels and Paul's concept of public office as a "divine ministry." The Protestant pastors of Strasburg, in their April 1538 treatise on witchcraft, enjoined godly rulers to "administer not their own judgment, but that of the Lord and they ought therefore to follow His Law" (i.e., the Mosaic code). Their combating of witchcraft therefore became a license to deal with social deviance, as they defined it, while using a theocratic underpinning as justification for their actions and beliefs.

As noted by the early-seventeenth-century English clergyman William Pemberton, Moses had two roles: he was a prophet of God and the ruler of God's people. In this latter capacity, he transmitted his authority down through the ages to kings and other rulers by means of God's instructions to Moses's successor Joshua (Josh. 1:1–9). Because these early leaders had been given the book of divine laws on Moses's death, it was attendant upon them to obey and enforce them vigorously. That model of leadership was in turn applied to later periods. Thus witchcraft, which violated both the first and third commandments (Ex. 20:3, 7), also threatened the entire system of law, and it became the paramount duty of secular leaders to eliminate it. In addition, and again based on the biblical narrative, Moses's achievements in combating magicians (Ex. 7:11–9:11) and usurpers of his power (Num. 16:27–33) became a portion of the argument, such as that made by Jean Talpin in 1567, that kings were to be venerated because of their ability to perform miraculous deeds, such as applying a healing touch to their subjects (compare Moses's raising a bronze serpent to cure his people of snakebite in Num. 21:8–9). As a result, the person and the tradition that surround Moses became singularly useful to religious and civil authority.

MOTHERHOOD

In local accusations, learned demonological treatises, and plays, the witch was often an inversion of what early modern people expected good mothers to be. Much like today, good mothers nurtured their children both physically and spiritually, cooked nutritious food for their families, and cared for them when they were sick. Unlike today, society also expected them to assist other women during childbirth. Conversely, witches poisoned their own or other people's children, nursed and nurtured demonic imps or animal familiars rather than children, dried up other women's milk or menstrual flows so that *they* could not mother, killed farm animals, and made food spoil. Issues of maternity and images of bad mothers emerge very often in witchcraft trials and the literature of witchcraft, including confessions by women admitting they were witches. This identification of witches with bad mothers was rooted in the circumstances of witchcraft charges, and may also be linked to deep-seated psychological ambivalence in people's emotions about mothers, as well as ambivalence about being a mother felt by mothers themselves.

Charges of witchcraft sometimes grew out of often long-standing quarrels among women, which generally emerged during activities in which women normally engaged. Women spent much of their time caring for children and animals and preparing food, often in the company of other women, and childbirth was experienced within a group of female relatives and friends. All these activities held possibilities for misfortune or tragedy: flocks of geese strayed into gardens and ruined them, cows lost their milk and the calves died, children became ill or injured, or mothers and children died in childbirth. Such incidents could easily be the origin of a witchcraft accusation, and the woman most likely to be accused was often one whom the others felt was somehow deficient in her own mothering: she was past child-bearing age, her own children had been sickly and died, or her own animals fell ill. Thus the accused had reason to project their own greatest shortcomings as mothers onto another woman who had bewitched them and their families. The male authorities who heard witchcraft cases largely shared women's ideas about what made a good mother. Although they added ideas drawn from demonological theory, they still described the

witch's actions and character as those of a bad mother who had turned to Satan in her desire for revenge on other people's children.

Lyndal Roper and Deborah Willis have noted that psychoanalytical theory, especially that of Melanie Klein, could be helpful in exploring links between motherhood and witchcraft that went deeper than openly acknowledged notions of good and bad mothering. Klein's work centered on the experiences of early infancy, particularly the development of such negative feelings as envy, aggression, fear, and hate that accompany the love and attachment an infant feels toward its mother. These negative emotions were suppressed as children learned it was unacceptable to express them openly but remained part of the subconscious and might emerge later in fantasies about or aggression toward mothers or other people one expected to be nurturing, such as caregivers. Both Roper and Willis warned that psychological theory developed through analyzing modern people must be used carefully when looking at individuals who lived hundreds of years ago, but because envy and anxiety played such a central role in witchcraft trials, it is useful to consider why they are such powerful emotions. Explaining people's fantasies lies at the heart of both modern psychoanalysis and modern studies of the witch hunts, so an etiology for the witch hunts that incorporates the psychic and emotional state of those involved seems more accurate than one that does not.

As an aid to understanding certain aspects of witchcraft, recent medical research about the experience of motherhood may be even more useful than theories about infantile development. Physicians and psychologists have studied what is now labeled postpartum depression or postpartum psychosis, in which hormonal and other changes in the mother's body after birth can lead to serious clinical depression or even delusions about oneself and one's children. In a few ghastly recent examples, this psychosis has led mothers to kill or attempt to kill their own children, explaining this behavior as a desire to keep them from harm or prevent them from doing evil. This same language occasionally emerged in the confessions of early modern women accused of witchcraft, who reported that the Devil had tempted them to kill their own children, though they generally denied giving in to this temptation.

Women who *were* found guilty of killing their own children were also sometimes accused of witchcraft, with authorities arguing that only the Devil could lead a mother to kill her own child. In Belgium, such women were executed in even more gruesome ways than "normal" witches, such as being impaled on a stake before being burned or having the offending hand cut off before being drowned. It is impossible to tell, of course, whether such women suffered from what would currently be labeled "postpartum depression," but that

is a distinct possibility; historians have frequently noted that behavior ascribed to divine or demonic forces in the early modern period is explained in medical or psychological terms today.

Given the sleep deprivation and other problems associated with new motherhood, many mothers who are not clinically depressed often feel ambivalence toward their infants, emotions that they feel guilty about and rarely express openly. Though the cultural context of the modern world and the world of the witch hunts is very different in many aspects, in both eras mothers were expected to be loving and nurturing, and those who were not were regarded as unnatural. Thus it is not surprising that women whose children had become sick or had died should have projected their negative feelings onto someone other than themselves, accusing a neighbor, acquaintance, or servant of witchcraft.

MOUNTAINS AND THE ORIGINS OF WITCHCRAFT

Was witchcraft a phenomenon concentrated in the mountainous areas of Old-Regime Europe? Over half a century ago, Fernand Braudel's influential *The Mediterranean and the Mediterranean World in the Age of Philip II* (1949) suggested that mountains constituted a world apart from civilization, the privileged shelter of witchcraft. Braudel's geographical determinism was later taken up by Hugh Trevor-Roper, who maintained that "mountains are the home not only of sorcery and witchcraft, but also of primitive religious forms and resistance to new orthodoxies" (Trevor-Roper 1967, 106); at high altitudes, thin air breeds hallucinations, and such natural phenomena as storms, cracking glaciers, or avalanches foster beliefs in the power of the Devil. No wonder that western Europe's great witch hunts began in the Swiss and French Alps and continued in other mountainous zones: the Jura; the Vosges;

the Pyrenees (both the Spanish and French sides); the Valtelline; or the northern mountain valleys of Italian bishoprics like Milan, Brescia, or Bergamo. Historians have long debated the association between geography and witch hunts. Today, the "mountain theory" concentrates on two issues: the association between the Alpine region and the origin of the craze and an indirect corollary to the mountain theory, a climatic interpretation of witch hunting in general.

ORIGINS

Historical research currently agrees that the geographical birthplace of witch hunting was largely confined to western Alpine areas, including Dauphiné, the Pays de Vaud, Savoy, the Val d'Aosta, Fribourg, Lucerne, and Bern. Between 1375 and 1440, primarily in three dioceses of western Switzerland (Geneva, Lausanne, and Sion) Europe's first fully developed cases of diabolized witch hunting occurred. Trevor-Roper provided an early version of the acculturation thesis to explain this location. Witch hunting happened, he said, because Dominican inquisitors had reached into backward and incompletely Christianized mountain communities, which were also haunts of heretics. His interpretation was soon opposed by Jeffrey Russell, who maintained that "witchcraft descended from heresy more than from sorcery and first appeared in the lowland cities where heresy was strong, only later spreading into the mountains where it gained strength from the lingering practice of ancient sorcery" (Russell 1980, 72).

Subsequently, Arno Borst claimed that both interpretations needed reappraisal. Borst's argument hinged on two preliminary questions. First, was the early-fifteenth-century Alpine territory really a backward place? By 1400, Borst argued, the Alpine region had become a very active crossroads between Italy and northern Europe and had begun to gear its economy to distant European markets. Second, if from an economic and institutional point of view the Swiss federation resembled the modernity of northern Italian or upper Rhineland areas, why did the first significant trials take place in the Simme valley, high in the Bernese Alps?

Borst claimed that this very dynamic social change engendered a social and a spiritual crisis, producing witch hunts as one of its side effects. Using the account of the trial of a well-off peasant named Stadelin by a Bernese patrician Peter von Greyerz (a judge in the Simme Valley between 1392 and 1407) as retold by Johann Nider in his *Formicarius* (The Anthill, 1437–1438), Borst described the introduction of witchcraft in the valley. Some episodes revealed that Stadelin's rise in social status contrasted with several misfortunes (dead babies; damages to animals and crops) of his fellow villagers; his jealous neighbors eventually blamed him for causing them through the intervention of the Devil. In the end, the original forms of

Alpine witchcraft involved the clash between an open and dynamic society and a closed one.

Borst proposed three conclusions: (1) we cannot dissociate demonological theories built by intellectuals from the superstitions of Alpine villagers; (2) mountain culture cannot be blamed for the origins of the craze; but (3) the phenomenon of early witch hunting was nevertheless specifically Alpine. During the 1430s, as papal inquisitors and secular judges carried out the earliest methodical witch hunts in the Swiss and French Alps, several texts (Nider's tract, the anonymous *Erroris Gazariorum*, the treatise of Claude Tholosan, and Martin Le Franc's *Defender of Ladies*) provided "important testimony to the revolution in thought about sorcery and witchcraft" (Kors and Peters 2001, 159) and marked the definitive formation of the idea of the witches' Sabbat (Ostorero, Bagliani, and Tremp 1999).

CLIMATE

When Peter von Greyerz asked Stadelin "how he was able to cause hailstorm and tempest, the criminal answered that he stood in a field saying certain words and begged the most powerful of all demons to send him a lesser demon to strike whatever Stadelin wished" (Kors and Peters 2001, 159). Here historians could spotlight some ways in which Christian doctrine was already transforming popular beliefs. But couldn't one of these Alpine *maleficia*—the weather-making witches—be associated with some more basic and deep-seated cause, specifically with the cooling of the global climate known as the Little Ice Age, which afflicted Europe intermittently between 1430 and 1770? In fact, in some of the harsher phases of climate deterioration, agricultural failures led to disastrous food shortages, subsistence crises, and hunger that overlapped with some of the fiercest episodes of witch hunting.

Recently, Wolfgang Behringer has used the extreme sensitivity of sixteenth-century Germans to a series of agricultural disasters provoked by meteorological changes to explain this chronological coincidence. If the first major witch hunt (in Wiesensteig in 1563) "served as an example for radical eradication of 'the evil,' between 1562 and 1565 an interesting debate emerged about the possibility of weather-making. In a small Imperial city, Esslingen, an Evangelical preacher, Thomas Naogeorgus, supported popular demands for witch hunts and urged the magistrates to extend its persecution . . . as a kind of regulation of the weather" (Behringer 1999, 367). A scholarly debate ensued about whether witches could raise such disastrous hailstorms. Behringer found the connections between the Little Ice Age and witch hunting primarily within the Holy Roman Empire, but occasionally elsewhere:

Where demographic pressure and economic depression lingered on, unstable governments were prone to

new demands for persecution with every change due to the Little Ice Age. . . . Contemporary court records and broadsheets tell us about the importance of meteorological events as triggering factors in the background of these persecutions. . . . During the third decade of the 17th century, when the Thirty Years War occupied the governing elites, organized witch hunts in the ecclesiastical territories of the Empire reached their peak. The climax of witch hunting again coincided with some extraordinarily dramatic meteorological events. (Behringer 1999, 370)

Most recently, the geographic/mountain theory has been widened into a hypothesis contrasting the big climatic difference between areas of moderate witch hunting (Italy, Spain, Southwestern France) with the areas of severe hunts, finding the cold as a factor more vague but richer than mountain theory (Bechtel 1997, 770).

If the age of witch hunting overlapped with the Little Ice Age, the nexus between the two phenomena seemed to be limited to a very loose chronological coincidence in most European states. Places like England, Scotland, Spain, or sub-Alpine Italy were certainly agrarian societies that also endured colder winters, subsistence crises, and occasional meteorological disasters, but villagers' imaginations rarely connected unusually severe storms with witchcraft. In England, "the storm at sea which affected a single ship might sometimes be attributed to witchcraft, but on land the action of a tempest was usually too indiscriminate for such an interpretation" (Thomas 1973, 668). Similarly, in Scotland, witchcraft was blamed "occasionally for storm raising; it was rarely held to be responsible for large-scale disasters in which the suffering might be random" (Larner 2000, 82). In sixteenth- and seventeenth-century Spain, Aragonese considered mountains to be the shelter of bandits and witches, but there is no trace of weather-making witches (Tausiet 2000); if "ritual . . . for calling up storms were included in the repertoire of witches" during the Basque craze of 1609–1614 (Henningsen 1980, 88), it remained utterly marginal. In Italy, although accusations of causing hailstorms were rife in the northernmost Alpine valleys, no witches were ever reported to have caused damaging meteorological phenomena in the Sieneese countryside, although agriculture there also suffered from many cold winters and wet summers. Historians have yet to explain this extremely uneven geographical distribution of witches' interference with the weather—or with such other human activities as sexual intercourse.

MOURA, MANUEL VALE DE (D. 1650)

Vale de Moura wrote nine books, including *De incantationibus seu ensalmis* (On Incantations or Ensalmi [evil incantations]), published at Evora in 1620 (the only edition known). It was a long treatise about verbal magical healing, which briefly mentioned *maleficium* (harmful magic) and diabolical witchcraft. The author was obviously familiar with demonology; he described the diabolic pact, asserting that the Devil marks his followers and kills little children through witches. It was an erudite work filled with citations of Italian and Spanish theologians and canonists, Greek and Latin classics, the Church Fathers, and Holy Scripture.

Little is known about his biography. Vale de Moura was born in Arraiolos, studied theology at the Jesuit University of Evora, and later graduated with a degree in canon law from the University of Coimbra. In 1603, he entered the Inquisition as deputy (*deputado*) of the Evora tribunal.

The treatise *De incantationibus seu ensalmis* was divided into three sections. The first part attempted to refute the positions of João Bravo Chamisso, a lecturer at Coimbra University, who had asserted in 1606 that some words had intrinsic healing powers and that such power did not come from an implicit pact with the Devil. Vale de Moura presented a doctrine, which he believed defensible, regarding the legitimacy and efficiency of healing with words. He stated that the saints created blessings and holy words, to which the Lord gave His merits, and added that in the Hebrew Bible Solomon expelled demons from human bodies by pronouncing words. Vale de Moura suggested, following Cajetan and St. Thomas Aquinas, that many of these words had later been misused in vain ceremonies; although unapproved, they could still be tolerated because they resulted from Christian devotion. But, the author claimed, whenever it was not proved that natural effects or divine virtues underlay a healing ceremony, one might conclude that the healing originated in diabolical powers.

In the second part of *De incantationibus*, the author refuted the incorrect opinions presented in the first part and put forward his own doctrine. He condemned all healing of diabolical origin, stating that Devil's "benefits" were always injurious. He distinguished between sorcerers and *saludadores* (healers): the former act in ceremonies using words, holy objects, or herbs, and the latter act through personal virtue. He stressed that words had no intrinsic power to produce healing effects. Hence if they did produce such effects, they came from external virtues. He insisted that one must be careful about spells that supposedly resulted from divine revelation, as they might be either real or imagined and might sometimes come from God or good angels and other times from the Devil, especially when they were "fantastical" or "imaginary." Some effects were natural and were caused by excessive imagination. Vale de Moura believed those healed through their own supplications should not be condemned, as long as they made no pleas forsaking divine providence. Therefore, he says, it was permissible to cast spells, using holy words invoking God, in order to plead for health or tame a tempest, and always having steadfast faith that such pleas could be granted by God. However, the strongest argument Vale de Moura presented in his second part was that *all* healing through prayer was in general suspicious. Although holy words or church prayers were pronounced in such acts, they were nonetheless evil, for the Devil normally acted under the cover of sanctity.

The third part of Moura's book dealt more specifically with issues of jurisdiction over those who healed through spells. Vale de Moura asserted that only the Inquisition should be responsible for surveying such practices, because until proven otherwise, all healers

were suspected of heresy and should therefore be prosecuted by the one court with jurisdiction over heresy. Moura's aim throughout was to limit the sacred field and to place it solely in the hands of its official representatives. Thus he stressed the efficiency of the Church's invocative prayer and exorcism when done by ecclesiastics and insisted that holy words should be pronounced only in holy places. Thus there was no need to turn to private prayers by laypeople.

The impact of Vale de Moura's work was not great. In Portugal, few quoted it, although some Spanish inquisitors followed his advice. Vale de Moura's positions were not immediately adopted by the Inquisition. However, there would come a time, in the first three decades of the eighteenth century, when healers would suffer much from Portugal's Holy Office.

MUCHEMBLED, ROBERT (1944–)

A leading French historian of European witchcraft, Robert Muchembled has made numerous significant contributions to this topic at both the archival and synthetic levels.

A lifelong social historian working loosely within the French *Annales* tradition, Muchembled's earliest archival-based work on witch hunting deployed documentation from southern parts of the former seventeen provinces of the Netherlands, particularly the region of Cambrésis (Muchembled 1979, 159–261), in service of the "acculturation thesis." He incorporated this witchcraft research into a chapter ("The Repression of Witchcraft and the Acculturation of the Rural World") of his first book to be translated into English: a general survey titled *Popular Culture and Elite Culture in France, 1400–1700*. He has often employed witchcraft as an unusually vivid illustration of this process (e.g., Muchembled 1984). Over time, however, Muchembled has considerably softened the originally sharp contours of his dichotomy between a strongly dominant elite and their often-passive

subjects. The evolution of his position on cultural history can perhaps best be seen in what is probably the best-known and most widely translated among his many books, *L'invention de l'homme moderne*, between its first (1988) and second (1994) editions, where a "society of compromises" deployed various strategies—adaptations, bricolage, resistances—to accommodate civilizing and confessional norms to which they supposedly conformed. Some of his works (e.g., Muchembled 1995) ranged widely across cultural history, blending chapters on Norbert Elias's court civilization, the role of women (a latent concern of most major witchcraft specialists), urban festivals and violence, French raconteurs as cultural mediators, village sociability, legal forms of social control—and, of course, witchcraft.

As a witchcraft scholar, Muchembled has exploited some significant archival discoveries. Three in particular stand out. First, he pioneered a "ground-up" perspective on witch hunting by uncovering some early-seventeenth-century petitions from the "better" (and richer) inhabitants of some Netherlands villages, encouraging their sluggish rulers to increase prosecutions of local witches by offering to pay the costs of such trials (Muchembled 1979, 192–196). Second, he explored the gruesomely macabre history of the child witches of Bouchain in Hainaut, the earliest (but unfortunately not the worst) known wave of trials and executions of witches well under the legal minimum age anywhere in Europe (Muchembled 1990). Third, he presented a richly documented microhistory of a relatively late witch-hunting episode in a tiny village of Francophone Flanders (Muchembled 1981); among other merits, this work first called attention to the role of feminine gossip in establishing the *publica fama* that often underlay witchcraft accusations.

At a synthetic level, one cannot ignore Muchembled's vigorous polemic with his prominent Italian colleague Carlo Ginzburg over the cultural origins and significance of the Sabbat, which produced some light as well as much heat (Muchembled 1990). Subsequently, Muchembled's most important contribution has been his effort to expand and reshape his sociopolitical analysis of witchcraft from his original southern Low Countries regional perspective to a more truly panoramic European level (Muchembled 1993). He has also shifted his cultural history perspective from the witch and her accusers to her supposed accomplice, the Devil (Muchembled 2000). Both endeavors have subsequently taken the form of lavishly illustrated coffee-table books (Muchembled 1994, 2002), each the best of its particular genre; the latter is a by-product of a television program on the Franco-German channel *Arte*, born from a critique that Muchembled's *Devil* discussed innumerable twentieth-century films but lacked any illustrations.

MÜNSTER, PRINCE-BISHOPRIC OF

The largest ecclesiastical territory of the Old Reich in northwestern Germany, the prince-bishopric of Münster had relatively few witchcraft prosecutions in comparison to neighboring territories, such as electoral Cologne. The bishopric spread across an area of roughly 11,000 square kilometers (4,247.5 miles) and contained about 200,000 inhabitants by 1700. Between the mid-sixteenth century and the end of the seventeenth century, about 450 such cases can be proven; about 170 cases ended with the execution of the defendant. One-third of those executed were men, a relatively high percentage. However, because of the fragmentary nature of the sources, our information is very incomplete.

The first documented witch burning in this territory occurred in 1544; the last provable execution came in 1699, when a woman was sentenced to death for fortunetelling and witchcraft. Three local witch hunts can be discerned from documents surviving in regional archives. In 1624, twenty people were executed for witchcraft in the town of Lüdinghausen within a few

months. In the county of Werne, in the southern part of the bishopric, the "witch craze" resulted in over sixty witchcraft trials, more than thirty of them in 1629. In 1629–1631, twenty-five accused witches died at the executioner's hands in the city of Coesfeld. Meanwhile, in the city of Münster, witchcraft trials are recorded from 1552 until 1644, with the worst persecutions occurring between 1627 and 1635.

The intensity of witchcraft prosecution differed by locality. The county courts, controlled by the government in Münster, pursued a relatively cautious policy with respect to witchcraft accusations that resulted in only a few trials, all carried out through a *processus ordinarius* (ordinary procedure). Only 27 of the 170 known executions were carried out by county courts; there were no mass prosecutions. However, some individual seigneurial courts became strongholds of prosecution, carrying out trials independently of the Münster government under the pretext of exercising their sovereign rights of criminal jurisdiction. These trials served as vehicles of self-assertion for local nobility and were mostly characterized by arbitrary procedures and infringements of legal requirements.

One peculiarity of the bishopric of Münster was the swimming test (the cold water ordeal), which was not only a mass phenomenon there but also was carried out in a unique way. The water ordeal, widespread in sixteenth- and seventeenth-century Westphalia, continued the medieval tradition of ordeals. It followed the usual rules: an accused witch was declared innocent if she sank but guilty if she floated on the water's surface, because the "pure water" refused the witch's body that had become ethereally light due to her sexual intercourse with the Devil. Local courts usually arranged the test during an ongoing trial, where the ordeal served as an "indicator for torture." However, in the bishopric of Münster the test took another form. Here, some noble courts developed regular water-ordeal centers, where every subject could voluntarily ask to undergo the swimming test, on condition of paying a large amount of money to the noble judge. Because more than 200 "independent" water ordeals can be proven in the bishopric between the years 1590 and 1650, we can speak of a mass phenomenon.

This peculiar practice, unique to Europe, resulted from the same constellation of legal conflicts that had stimulated the prosecutorial zeal of some seigneurial courts in the late sixteenth and the early seventeenth centuries. The local nobility was in fierce conflict with the government of the prince-bishopric, trying more and more vehemently to conserve its traditional jurisdictional rights in reaction to the threat from Münster, while the central government fought to standardize administration and jurisdiction. Witchcraft trials offered the local nobility a welcome method for upholding their right of criminal jurisdiction. Similar

motives underlay the creation of water-ordeal centers at noble courts. The Münster government firmly opposed the swimming test, publishing several prohibitions of this practice. By systematically violating these prohibitions, the nobility (always by referring to their “good old right”) expressed their resolve not to bow to the policy of the central government. This conflict between the nobility and the regional government was literally carried out on the backs of their subjects.

MURATORI, LUDOVICO ANTONIO (1672–1750)

A proponent of reason and enlightenment who ignored or discounted the anxieties of the educated elites and attributed belief in witchcraft to the ignorance and credulity of uneducated people, Muratori was an Italian antiquarian, historian, and critic, editor of several multivolume collections of fundamental medieval historical documents. Trained in philosophy and both civil and canon law and ordained a priest, he managed the Ambrosian Library in Milan before becoming librarian of Rinaldo I of Este’s court in Modena.

As its title indicated, Muratori’s *Della forza della fantasia umana* (On the Strength of Human Fantasy, 1745) examined the phenomena of witchcraft as examples of the power of the human imagination (or fantasy) to distort and falsify reality. Muratori’s contempt for the intellect of common people was matched by his misogyny. He accepted the stereotype of the witch as female, and, following a strain of opinion dating from the *Canon Episcopi* (ca. 906), presumed that the phenomena of the Sabbat had no basis in external reality; these illusions were mostly suffered by women afflicted with a diseased and “filthy” imagination.

The most important chapter of Muratori’s treatise was the tenth. There he described treatises against black magic as “a great forest where there is some truth, much simplemindedness, a great number of impostures” and concluded that “perhaps some people believe too little about this vile art, which horrifies anyone who is a true Christian. But on the other hand, there are great numbers of people who believe too much about it.” Many phenomena attributed to demons by “incautious or weak fantasy” were either natural effects or outright fables (Muratori 1995, 100). Muratori did not contest the reality of demonic possession but called it a “truth mixed with many false suppositions”; most possession was

imaginary: “Exorcists certainly have power from God to cure those who are truly possessed; but they also have the misfortune to produce many imaginary [victims]; many are the tricks played by the frailty of female fantasy.” Outbreaks of possession in Milan and elsewhere when relics were shown during Church services were a localized custom (*uso*) or “observance” rather than evidence of demonic presence. “When the relic is covered up, all that great noise ceases and there are no possessed persons left. . . . The ruined fantasy of one woman pulls a hundred along behind her” (Muratori 1995, 104).

The same applies to ghosts (*fantasmi*), which were frequently sighted during outbreaks of plague and other times of universal fright: Muratori advised his readers to investigate skeptically, “to spare themselves an imaginary [*sognato*, dreamed] but real evil, accompanied by the loss of tranquillity and health.” Ordinary people should consult men who were wise and learned, rather than common rumors and the gossip and imaginations of silly women (*donniciuole*) (Muratori 1995, 104). It had also been proved that one person’s imagination could not produce physical effects on another person through the evil eye; besides, it made no sense for someone to communicate a disease while not suffering from it herself. Muratori derived his disbelief in the evil eye from his understanding of communicable diseases. Mentioning it reminded him of some precautions he had omitted from his recent *Del governo della peste* (Treatise on Managing the Plague): in the presence of plague sufferers, one should not only cover one’s nose and mouth but never swallow one’s own saliva, instead spitting constantly, as tobacco chewers do. Accusations of the evil eye and other witchcrafts have fallen on many “poor old women, even good and innocent Christians” and parish priests often vainly oppose these “vain and injurious rumors” (Muratori 1995, 105).

Muratori’s treatise continued a preoccupation with the power of imagination that had motivated discussions of witchcraft since the fifteenth century. In 1749, Girolamo Tartarotti investigated the question more nervously, insisting passionately that the unreality of witchcraft phenomena must not be construed as disproving the reality of demons or of magic.

MURRAY, MARGARET ALICE (1863–1963)

Perhaps the most controversial twentieth-century author to investigate witchcraft, Margaret Murray's theories infuriated experts but persuaded much of the general public, inspiring much of the ritual and organization of modern neopagan witchcraft (the Wicca movement) from the 1950s onward.

Murray maintained that European witchcraft was an organized form of pagan worship originating in remote prehistory and surviving in secret throughout the Christian era. Its purpose was to ensure the fertility of crops, animals, and people by seasonal rituals and by periodic sacrifices of animals and human beings. She saw this as a joyful, life-enhancing religion that Christians had persecuted; she claimed it had had numerous secret followers, including several medieval kings and famous figures such as Joan of Arc. Although her theory gained very little support from professional historians, it reached the general public both through her entry in the authoritative *Encyclopedia Britannica* and indirectly through novels and films that exploited it.

Murray was born in Calcutta, where her father's business was based. She passed some of her childhood in England but received little formal education, despite her intelligence; her autobiography hinted that her life was one of middle-class inactivity and boredom throughout her teens and twenties. In 1894, when she was thirty-one, new horizons opened: she attended a course on Egyptology at University College in London and made such rapid progress that in 1899 she was appointed a junior lecturer in hieroglyphics on the recommendation of her tutor, Professor Flinders Petrie. The study of Egyptian antiquity became her life's work, and she earned considerable respect in this field.

The outbreak of war in 1914 disrupted academic life. Murray found herself with no students to teach and no possibility of fieldwork in Egypt. After a short spell as a nurse in a French military hospital, which badly affected her health, she turned to new studies, first the Grail legend and then witchcraft. She had "started with the usual idea that witches were all old women suffering from illusions about the Devil" but "suddenly realised that the so-called Devil was simply a disguised man" and immediately concluded that he was a masked priest of some ancient, primitive religion (Murray 1963, 104). Murray always treated this as her personal insight, achieved purely through reading primary sources; even

though others had previously put forward similar theories—including Jules Michelet, Charles Leland, and Karl Pearson, a professor at her own college.

Murray's theory about witchcraft was set out in an article in *Folk-Lore* in 1917 and then in a book, *The Witch-Cult in Western Europe*, in 1921. Witches, she said, everywhere worshiped the same deity, a phallic "Horned God" dating from prehistoric times; they followed exactly the same ceremonies on the same dates; and they were organized in groups of thirteen ("covens"), each group obeying a male leader who impersonated the god and had sexual rights over them. She believed that from time to time the leader (or a substitute) would be willingly burned to death to ensure the fertility of crops; here, she was influenced by Sir James Frazer's study of the "Killing of the Divine King" in *The Golden Bough*.

In one sense, her view of witchcraft was resolutely rational. Reading trial records and other writings from the time of the witch hunts, she seized upon anything for which she could devise a natural explanation, however implausible, and accepted it as proven fact; anything magical or supernatural she simply ignored. So, if a text described an encounter with a black, horned, and cloven-hoofed devil, she would take this to mean a man in black clothing wearing an animal mask and with a peculiarly shaped boot; if a witch confessed to riding to the Sabbath on a "little horse," she would accept the horse as real, even if the witch also stated that this "horse" was a wisp of straw. This selectivity seriously misrepresented her sources.

Her work also suffered from a total disregard for chronology and cultural context, mixing evidence from many countries and many centuries; that was common practice among comparative mythologists of her period and was not criticized at the time, though it is now seen as a serious flaw. Furthermore, she was an enthusiastic system builder, erecting rigid universal rules on very weak evidence. One of her most influential notions was the coven of thirteen, yet she herself admitted that only one witch actually mentioned this number; she resorted to dubious manipulations of figures in the attempt to prove that it was widespread. Similarly, the four seasonal festivals she claimed were held annually everywhere (Candlemas, Beltane, Lammas, and Halloween) were only mentioned as a group in one source. Murray ignored the fact that even in England several other dates are also mentioned (e.g., the Lancashire witches met on Good Friday).

However, some aspects of her book provided a welcome change from much conventional wisdom on the subject. Many writers had explained witch hunting as the result of ignorance, hysteria, and the use of torture to obtain confessions; a small minority, such as the eccentric Montague Summers, believed that Devil worship had actually occurred, with supernatural

results. In comparison, Murray's interpretation seemed both novel and demystifying; it effectively eliminated both sides of this argument, opening the way to more rational discussion. This may explain why in 1929 she was invited to contribute the entry on "witchcraft" to the *Encyclopedia Britannica*; characteristically, she seized this opportunity to put forward her theory as if it were universally accepted.

Her second book, *The God of the Witches* (1933), written for a wider audience, was an emotional and openly anti-Christian defense of the "Old Religion" (not only was this term taken from Leland without acknowledgement, but her position was also disturbingly similar to contemporary Nazi propaganda on the topic of witchcraft). She painted a glowing picture of the devotion of witches toward their god and his human representative, expressed through feasts and dances, though reticent about their sexual orgies, which she had described in her earlier, more academic book. Such unpleasant activities as animal sacrifice and the killing of babies were mentioned only in passing, but the ritual killing of the coven leader was strongly emphasized.

Her third study of witchcraft, *The Divine King in England*, appeared in 1954, when she was ninety-two. It presented the sensational conspiracy theory that many kings, from Anglo-Saxon times to the early Stuarts, belonged to the "Old Religion" and had to be killed unless some prominent member of their family or court agreed to die as a substitute. In the same year, she also wrote an approving introduction for Gerald Gardner's *Witchcraft Today*. Gardner said that in 1939 he had been initiated into a coven in Hampshire whose practices were very like those Murray described; she took this as proof of her views, seemingly unaware of the alternative possibility that these "witches" (who were well-educated, middle-class people) could have simply read her books and copied what they found there.

Murray's last two books appeared in the year she died at the age of 100: an autobiography, and *The Genesis of Religion*, a rather sketchy work in which she first acknowledged the importance of goddesses in prehistoric cults.

Until the 1960s, most professional historians simply ignored Murray's work, presumably thinking her theory so self-evidently absurd as not to need rebuttal. However, a few historians (e.g., George Lincoln Burr in *The American Historical Review*) and folklorists (e.g., W. B. Halliday in *Folk-Lore*) had written strongly critical reviews of *The Witch-Cult*. In the late 1920s and the 1930s, C. L'Estrange Ewen researched numerous primary records of English witchcraft trials without finding any traces of an organized cult. But Murray simply ignored any adverse comments; her books grew steadily more dogmatic and extreme.

A time came, however, when historians finally realized how strong her influence was among the general

public; her two main books had been reprinted in paperback, popular writers and novelists had taken her ideas on board, the Wiccans were citing her to prove that their religion was ancient paganism. Silence was no longer appropriate. Norman Cohn and Keith Thomas included a few pages savagely criticizing Murray in their analyses of the general history of witchcraft beliefs (Cohn 1975, 107–115; Thomas 1971, 514–517); Ronald Hutton, while exposing the flaws of her theory, described the cultural influences that shaped it (Hutton 1991, 301–306; Hutton 2000, 194–201).

From the point of view of historical and anthropological studies, Margaret Murray's theory has proved valueless; however, she played a significant (though unintentional) part in the growth of twentieth-century paganism in Britain and the United States and in the image of the witch in modern popular culture.

MUSIC

Music plays an important role in both ancient and modern religions, and it is therefore unsurprising that it should have strong associations with magic and witchcraft. Music has been used throughout the centuries in a number of ways to enhance rituals and to produce altered states of consciousness allowing, it is sometimes alleged, contact with supernatural deities. Beyond this, classical and modern composers have chosen the theme of "witchcraft" for large numbers of their works, some of which will be discussed below. However, finding examples before the early modern period can be

extraordinarily difficult. One has to rely mainly on court documents and stage works from the sixteenth century, with an increasing abundance of material available up to the present time.

Margaret Murray was largely responsible for introducing witches' alleged musical activities to the public, which included them "singing most filthy songs" and generally performing "a kind of villanous musicke" (Michaëlis 1613, 336). Her descriptions of the music, mainly tortured out of Scottish and European victims, conformed to traditional folk gatherings gone awry, with dissonance and irregular rhythms suggesting the laws of misrule. Sixteenth- and seventeenth-century drama encouraged this tradition, with suitably exaggerated stage directions in such works as Ben Jonson's *The Masque of Queens* and, most famous of all, Henry Purcell's opera *Dido and Aeneas*. The infernal music theme continued in eighteenth- and nineteenth-century literature with such works as Robert Burns's *Tam o' Shanter* and Johann Goethe's *Faust*, both of which incorporated music and have received numerous musical settings. Twentieth-century written accounts of music appertaining to witchcraft have often repeated Murray's interpretations, adding personal biases in Montague Summers's and Dennis Wheatley's descriptions of demonic music. Significantly, it was Gerald Gardner who introduced magical elements into the witch's music (Scire 1999). This trend has been reinforced by the otherworldly music introduced by authors such as Kenneth Graham in the episode with Pan in *The Wind in the Willows* or Karen Ralls-MacLeod in *Music and the Celtic Otherworld*.

"ROUGH MUSIC" IN CLASSICAL AND ROMANTIC EUROPE

Considerably more material can be found in the classical music repertoire, where the witchcraft theme has always been and still is popular. Even a superficial survey uncovers hundreds of works, including many compositions that may be divided into vocal/choral and orchestral/instrumental.

Sixteenth- and seventeenth-century stage works used a variety of music by different composers, and thus there is, for example, confusion about who wrote what concerning William Shakespeare's *Macbeth* and Thomas Middleton's *The Witch*. In a more skeptical age, Purcell broke the mold of hideous music for witches with a stunningly beautiful anthem, *In Guilty Night*, but a century later Thomas Linley hinted at what the nineteenth century would provide in terms of harmonic and melodic dissonance in his *Ode on Witches and Fairies of Shakespeare*. Modeste Mussorgsky wrote a choral version of his famous *Night on Bald Mountain*, including the obligatory "Black Mass" scene, and Felix Mendelssohn, Robert Schumann, and Johannes Brahms also wrote choral and vocal works on similar

themes. The twentieth century saw a revival of Purcell's departure from the earlier haglike stereotypes. In an age of Wiccan themes, works such as John Corigliano's *Song to the Witch of the Cloisters* and Max von Schilling's poignant *Hexenlied* portrayed witches in a far more favorable light.

As one would expect, orchestral/instrumental music has obvious problems attached to it, since the absence of text forces one to rely on the composers' own program notes (when they exist). A few mainly anonymous witches' dances have survived from the seventeenth century, attached to productions of *Macbeth*. In the eighteenth century, Joseph Haydn's so-called *Hexen-menuet* (from his string quartet, the *Fifths*) had no real bearing on witchcraft whatsoever. However, in the nineteenth century, the expansion of the orchestra combined with interest in Gothic themes to create a dramatic increase in the number of works reproducing witchcraft themes. Hector Berlioz's *Songe d'une nuit du Sabbat* from his *Symphonie Fantastique* introduced violent syncopation, *col legno* (wood of the bow) playing, and general musical mayhem. This work was matched by Mussorgsky's famous *Night on Bald Mountain*, famously recycled in Walt Disney's *Fantasia*, and his "Baba Yaga" in *Pictures from an Exhibition*. Less well known were two contrasting works by Antonin Dvorak: *The Noonday Witch* and a piano piece for four hands called *The Witches' Sabbath*.

In the twentieth century, the Russian composer Anatol Lyadov wrote a jagged, infernal *Baba Yaga*, and Alexander Scriabin conceived a diabolical counterpart to his *Messe blanche* with the discordant *Messe noire* in 1913. Other twentieth-century works maintained the harsh sounds, including Franz Waxman's *Goyana* and Ian Ballamy's chamber work *Walpurgis Night*. Samuel Barber treated the theme more broadly to match the sorceress' range of emotions in *Medea's Meditation and Dance of Vengeance*. The influence of Igor Stravinsky's *Rite of Spring* (a pagan scenario, not a specific witchcraft event) could be seen in many works after its first performance in 1913. The complete opposite of the evil aspects of witchcraft was stressed in James MacMillan's *The Confession of Isobel Gowdie*, which painted a picture in orchestral terms of the grief and sense of guilt felt at the execution of so many innocent women in the "burning times."

The interpretation of witchcraft in classical music has varied throughout the centuries. The dissonance and rhythmic angularities at the start of the early modern period swelled in the nineteenth century and receded in the twentieth, sometimes replaced by far more favorable portrayals at a time when witchcraft was revived in benign forms. One constant feature is that male witches have been very poorly represented, with just a few to be found, mainly in operas.

MUSIC AND WITCHCRAFT TODAY

One might ask what music is actually used by witches for their rituals and ceremonies in the third millennium. The results of an extensive survey in 2001 conducted in England, with some input from the United States, provided useful information. According to circumstances and the availability of musicians, either recorded or live music is played before, during, and after rituals. Before a ritual, it is usually recorded, and its task is to relax the participants; examples mentioned were Enya and Loreena McKennitt. During the ritual, the recorded music used was mainly instrumental or wordless, because words of songs might clash with the primary emphasis of the rituals. When recorded, the music was chosen for a number of different reasons: to build up energy, to bind the group, to aid altered states of consciousness, to encourage the visitation of spirits—and practically, to obliterate external noises from traffic or other distractions. Examples were thus extremely varied, taken from the popular classical, folk, World, or New Age repertoire. Examples included Richard Wagner, Carl Orff (*Carmina Burana*), Clannad, Native American chants, Carolyn Hillyer, and Nigel Shaw. When musicians were available, live music used whatever instruments were available—often the acoustic guitar. Even if the group did not contain musicians, drumming and chanting were frequently employed to build energy and create a trance-like state

of mind. After the ritual, music was also used for social purposes if live or as background sound for the feasting and possibly dancing that followed. Certain types of music were *not* popular at meetings: commercial pop, jazz, and “difficult” classical music. The reasons probably include the age of the participants, who were mainly above their mid-twenties and the feeling that such music was not suitable for joyful or emotional gatherings. It was of overriding importance to make music an important part of the religion, whether in its historical setting or in contemporary practices.

N

NAPLES, KINGDOM OF

Relative to north-central Italy, the southern Kingdom of Naples participated only marginally in early witch hunts during the fifteenth and sixteenth centuries. Chronicles did not record any persecutions in the south; the vast demonological literature, both Italian and European, contained no traces of activity in the south compared to references to northern Italy, where the large numbers of trials and the zeal demonstrated by inquisitors such as those in Como merited commendation from Heinrich Kramer, the author of the *Malleus Maleficarum* (The Hammer of Witches, 1486). Except for a few late-sixteenth-century works such as Giovanni Lorenzo d'Anania's (Anania) *De Natura Daemonum* (Of the Nature of Demons, Venice, 1589), Leonardo Vairo's *De Fascino* (On Enchantments, Venice, 1583), and, later, medical examiner Pietro Piperno's *De magicis affectibus hominum dignotione, praenotione, curatione, medica, strategemmatica, divina, plerisque curationibus electis, et De Nuce beneventana maga*. . . (On Magical Ailments, Their Diagnosis, Prediction, and Treatment with Select Cures, Medical, Strategic, and Divine, and On the Walnut-Tree of Benevento; Naples, 1634), literature on the theme of witches remained underdeveloped and did not influence debate about their repression.

Although references to inquisitorial activity concerning witchcraft are scarce, it is possible to trace a general picture of the attitudes adopted by local ecclesiastical authorities toward witchcraft from documents conserved in the diocesan historical archives of Naples and from the sentences and abjurations conserved in the Trinity College Library in Dublin, which anticipated and in some ways inspired the changes in the official position outlined in *Instructio pro formandis processibus in causis strigum, sortilegiorum et maleficiorum* (Instruction for Conducting Trial Procedures Against Witches, Sorcerers, and Evildoers, ca. 1620).

Three witches (called *janare* or *magare* in southern Italy) were condemned to death in 1506 by the inquisitor-general of the Kingdom of Naples, and around 200 trials were initiated by Beneventan archiepiscopal curia, the outcome of which is unknown. Otherwise, nothing is known of the repression of witchcraft in southern Italy before trials were conducted in Naples in 1574, 1580, and 1590; between 1582 and 1601, 143 trials were held

in the capital (Romeo 1990, 20, 166–167, 179). In the rest of the kingdom, trials against superstition were recorded at Bitonto in 1594; at Capua, where 130 cases of magic were tried between 1600 and 1715; and at Gallipoli, where three sorceresses were tried for witchcraft in 1600. Throughout this region, judges—regardless of the gravity of the errors confessed—merely required the accused to repent, recant their errors, and accept spiritual penances (D'Ippolito 1996, 425–437).

Documents from the Holy Office conserved at Trinity College Library in Dublin contain numerous cases in which subjects of the Kingdom of Naples appeared spontaneously before the tribunal of the Inquisition in Rome to confess they were sorcerers or necromancers, together with a few inquiries from local ecclesiastical tribunals in Naples, Lecce, and Teano. These trials also provide evidence that pagan spirituality was so profoundly imbued with official Christianity that it was experienced and practiced without any sense of wrongdoing. The judicial sentences indicate that the inquisitors were principally concerned with punishing the error of “believing that it is right to serve the work of the devil” (Trinity College Library, Dataria, Vol. 1228, ff. 111–114). The nature of these offenses, mostly entailing minor suspicions of heresy, and the primarily spiritual penalties imposed were never very severe (e.g., whipping, confinement to a cloister for regular clergy, formal imprisonment for a brief period, or, at worst, five years in the galleys). The Congregation of the Holy Office demonstrated a “southern” orientation that seemed far less rigorous than the attitude of Milan's famous cardinal-archbishop, St. Carlo Borromeo.

In general, the severity of southern Italian authorities against superstitions was restricted to their definitions of what constituted illicit use of the sacraments and sacramental objects. At the same time, ecclesiastical authorities sought to strengthen the thaumaturgical-defensive system of sanctioned traditional rituals (especially exorcism) and increase such forms of popular devotion as the cult of saints while limiting their repressive action to intimidating marginal and subaltern segments of society to discourage them (without much success) from engaging in magic spells and syncretistic practices. In the late sixteenth century, a “campaign of aggression and intolerance” was directed

against superstitions, in line with Sixtus V's *Coeli et Terrae Creator* (Creator of Heaven and Earth, 1586) and *Immensa Dei Aeterni* (The Infinity of the Eternal God, 1587). Notwithstanding the gravity of the apostasies committed by the accused (participation in the Sabbat, homage to or pact with the Devil) and the atrocities they confessed (often spontaneously), no known cases involved accusations of diabolical witchcraft. The principal goal was instead to circumscribe and relativize the errors of the faithful: exorcism was preferable to burning at the stake because it transformed the witch into someone possessed by the Devil (Romeo 1990, 244).

Southern tolerance was also associated with the futile efforts of southern bishops to eradicate superstitions practiced by their clergy. Even after the Council of Trent, even higher-level southern monks lived in concubinage, moral laxity, and superstition. Numerous sentences from the Trinity College Library records detailed proceedings against members of the secular and regular clergy, including some cases against ordinary diocesan clerics accused of dealing with the Devil. A somewhat classical interpretation attributes such corruption among southern Italian clergy to the particular structure of the Church in the region, which was more receptive to it. This institution was controlled by laypeople and managed by refractory clergy who were often ignorant and superstitious, indifferent to the spirit of reform, and unresponsive to an inner religiosity founded on the purity of the evangelical message. These conditions are crucial to understanding the failure of the post-Tridentine Church's commitment to Christianizing the countryside. Ancient superstitions continued to thrive among the faithful. Southern bishops who lamented the presence of rites and cults of pagan origin frequently denounced them in the late seventeenth century and throughout the eighteenth century (Tamblé 1996, 545). Twentieth-century anthropologists and folklore scholars studied these same beliefs and practices.

NASSAU-SAARBRÜCKEN, COUNTY OF

The county of Nassau-Saarbrücken, Lutheran since 1575, experienced only fifty-two witchcraft trials between 1578 and 1679, making it—like the Calvinist duchy of Pfalz-Zweibrücken—one of the territories in this region with a relatively mild pattern of witch hunting. Through strict regulation of the costs of witchcraft trials, the counts of Nassau-Saarbrücken succeeded in preventing the expansion and worst excesses of witch hunts, although they were not opposed in principle to the persecution of witches. Nassau-Saarbrücken's witchcraft trials were concentrated in areas subject to the criminal courts of the abbey of Wadgassen (nineteen trials), the lordship of Ottweiler (thirteen trials), and the lordship of Uchtelfangen (seven trials). In these three courts, other local lords shared criminal jurisdiction with the counts, although their respective rights were often in dispute. As in other German Protestant territories, women comprised almost all (95 percent) of the accused and executed witches in Nassau-Saarbrücken (Labouvie 1997, 45).

Summaries and statistics pertaining to the Nassau-Saarbrücken witchcraft trials have been studied as part of the Saar region (e.g., Hoppstädter 1959; Labouvie 1991, 1997). Unlike other major rulers in the Saar region (the elector of Trier, the duke of Lorraine, and the duke of Pfalz-Zweibrücken), the counts of Nassau-Saarbrücken ruled a relatively coherent territory as resident lords. They could thus exercise greater control over witchcraft trials than absentee rulers governing fragmented territories. The counts followed the Carolina (the 1532 code of criminal procedure for the Holy Roman Empire) on matters of evidence, the application of torture, and consultations with legal experts, and local customary laws (*Weistümer*) regulated the costs and length of trials and the arrest and imprisonment of suspects. The counts published no special witchcraft mandates: general ordinances of criminal procedure

governed court fees, wages of court officials, payments to witnesses, and the use of torture. However, complaints from the count's subjects about increasing costs of witchcraft trials led to promulgation of an official mandate at the beginning of the seventeenth century aiming to eradicate abuses and fix the level of wages and subsistence expenses of everyone involved in witchcraft trials.

Witchcraft allegations in Nassau-Saarbrücken between 1535 and 1734 were usually treated as cases of slander and did not trigger criminal proceedings—another reason for the relatively low number of witchcraft trials there. Unlike other Saar region territories, the terms for both female (*Hexe*) and male (*Hexenmeister*) witches were apparently established at an early date. Accusations of witchcraft came from both men and women, but with one exception, their targets were always women who were accused of making people ill or blind, bewitching dairying processes, or performing other serious acts of harmful magic.

The first known witchcraft trial took place in 1578 in Uchtelfangen following an accusation brought by court officials. The first witchcraft trials pursued with the help of organized village witch-hunting committees (*Hexenausschüsse*) also occurred in Uchtelfangen and nearby villages in the lordship of Ottweiler in 1595. Such witch-hunting committees were, however, much less widespread in Nassau-Saarbrücken than in other nearby states, for example, the duchy of Luxembourg, the electorate of Trier, or the territory of the imperial abbey of St. Maximin.

The witchcraft trials in the territory of the abbey of Wadgassen constituted a peculiar episode in the Nassau-Saarbrücken story. Although formally subject to the ultimate sovereignty (*Landeshoheit*) of the counts of Nassau-Saarbrücken, the abbey stood under the direct administrative authority (*Vogtei*) of the duke of Lorraine. This meant that it was forced—sometimes militarily—to seek advice in cases of witchcraft from the central legal tribunal in Lorraine (the *Change de Nancy*) rather than from the main court of the counts in Saarbrücken (the *Oberhof*). The dukes of Lorraine clearly pursued a long-term policy of establishing their own sovereignty over Wadgassen. Its witchcraft trials thus took place against a backdrop of conflicting priorities of its rival lords, whose territorial disputes were finally settled by treaty only in 1766.

Although the property of executed witches was not confiscated in Nassau-Saarbrücken, the trial costs were settled by surviving relatives, as the Carolina stipulated. Nonetheless, the question of paying trial costs when the property of the condemned witch was insufficient to cover them arose as early as 1595, at Uchtelfangen. Although the Carolina made the authorities meet the costs in such cases, the count of Nassau-Saarbrücken insisted that customary laws (*Weistümer*), which

required the heirs of the condemned to settle such costs, should be followed instead. His ordinance made it clear that trial costs must be settled at the local level, without intervention from the count's officials. Because neither local witch-hunting committees nor local lords were willing to take responsibility for paying the often horrendous costs involved in witchcraft trials, this ordinance significantly dampened local enthusiasm for witch hunting. In 1613, the count also repealed an earlier ordinance stipulating that witchcraft suspects must be kept only in prisons subject to his authority. Putting suspected witches in prisons belonging to lords of the relevant local criminal courts provided another means for the counts to avoid expenses in witchcraft trials.

The Thirty Years' War, which caused an 84 percent decline in population in Nassau-Saarbrücken, also brought its witchcraft trials to an end (Labouvie 1991, 252). A few trials occurred after 1648. In the last known case, a woman subject to the criminal court of Ottweiler claimed to be a witch in 1679. Legal advice on her case was sought from jurists at the University of Strasbourg, who recommended that the woman be questioned by clerics. Although the verdict is unknown, many indications suggest that she was treated mildly by the men who judged her.

NATIVE AMERICANS

Until very recently, virtually every native North American people believed in witches or evil shamans, who used their special access to potent spiritual power to attack enemies with disease, "accidents," bad luck in hunting, and other misfortunes. Witches were nearly as ubiquitous as life's troubles, and nearly anyone could be a witch; thus, people were always on the lookout for secret offenders who gave themselves away through antisocial behavior. Indians across time and space have

held common beliefs about witches, contributing to a shared historical pattern in which communities split into factions advocating different approaches to colonial encroachment and then charged members of the rival faction with witchcraft. When such factions gelled around the revitalization programs of religious prophets, accusations sometimes escalated into actual witch hunts marked by systematic executions. Witch hunts have been rare since the early twentieth century, but belief in witches is still common in some Native American communities.

Quite unlike European beliefs about the supernatural, which divided power into good and bad as personified in God and the Devil, Native Americans believed that all power was double-edged, capable of being put to positive or negative ends depending upon the person who wielded it. Individuals gained access to spiritual power sometimes by communing with a spirit during a dream but most often through a vision quest. During the vision quest, an individual—almost always male—fasted, deprived himself of sleep, imbibed hallucinogens, and sometimes tortured himself until he pictured one or more spirits, usually in the form of animals or meteorological forces such as the wind. The spirit taught the vision seeker its song, gave him fetishes that could be used to call for power whenever it was needed, and explained what taboos would void this gift. The guardianship of an especially powerful spirit enabled the seeker to become a shaman with the ability to affect cures, rain, divination, or other social benefits. But he, and sometimes she, also could cause accidents or make people ill or insane by magically implanting poisonously enchanted objects as mundane as hairs or fingernails into the bodies of their victims or by capturing one of the victim's two souls as it lay exposed during dreaming. Until recent times and sometimes today still, American Indians attributed many, if not most, of their illnesses to such evil-doing.

Among the Indian shaman's most important duties was diagnosing and treating witchcraft. The shaman would work himself into an ecstatic trance by fasting, dancing, contorting himself, and chanting, while people around him drummed and sang until he contacted his guardian spirits, who identified the root of the sickness. If the disease stemmed from an implanted magical item, the shaman would apply a tube to the violated area and suck out the object without breaking the skin. Sickness deriving from a captured dream soul required a more intricate cure because the shaman had to enter an even deeper trance to travel to the land of the dead to retrieve the patient's ghost. At other times, the shaman might trap the witch's dream soul in an insect or frog and then crush it dead.

Indians also depended upon their shamans to identify specific witches, who went to great ends to remain anonymous. Nevertheless, everyone knew what types of

individuals turned to witchcraft. They were jealous, muttering underneath their breath at others' good fortune; hypersensitive, interpreting casual exchanges as insults; selfish, refusing to share food with their neighbors; and outcasts, who might be found wandering alone in the woods. Some of them either were the offspring of an incestuous relationship or participants in incest themselves. Others had been contacted during their visions by spirits oriented toward evil, such as Owl and Coyote in Apache belief, or the horned winged serpent found in Algonquian speakers' pantheon. Although the vast majority of Native American shamans were male and witches were defined as wicked shamans, a high percentage of accused witches were elderly women, as among Europeans. This disparity suggests an underlying hostility toward females who no longer could contribute to the group by reproducing or raising children and who, unlike old men, had little or no formal role in government, but sometimes tried to retain control over a household, apparently to their relatives' irritation.

Witchcraft suspicions were ubiquitous among Native Americans because of a tendency to read any violation of the people's unachievable consensus ideal as a sign of ill will. In the small-scale, face-to-face, and generally decentralized societies of Native America, cooperation was necessary to feed, defend, and govern. Therefore, everyone was under extreme pressure to suppress anger and disagreement with relatives and neighbors in favor of a moderate, pleasant attitude and willingness to share resources with anyone in want. For men, there were few outlets for social tension aside from war against foreign peoples and rough sport, and even fewer for women. Thus, when someone became sick or hurt following unsanctioned but inevitable family squabbles, love rivalries, or political disputes, people were quick to imagine that a witch on the other side was responsible.

The consensus ideal that bred suspicions of witchcraft also suppressed collective action against it. An accused witch was prosecuted only if community leaders agreed on the verdict. However, a witch was in grave danger when such consensus was achieved. A suspected witch was sometimes captured and tortured in order to remove his or her curses and then either warned, banished, or even killed. Customarily a witch was executed and left to rot unburied, but troubles with the witch did not end there. The witch's spirit lingered for a time in anticipation of finding a new host, and, if successful, it returned to plague the community with fresh vengeance.

The witch hunt has been one of the most violent manifestations of Native Americans' internecine responses to colonization, particularly epidemic disease, Christian missions, and harassment from Euro-American governments. European-introduced diseases like smallpox often wiped out most of an exposed community's population,

Chief of Florida Indians consulting a shaman before going into battle. Shamans were common among Native Americans, and functioned to attack enemies as well as to practice beneficent magic. (Ann Ronan Picture Library/HIP/TopFoto.co.uk)

leaving the traumatized survivors to try to determine what had happened. An unfamiliar disease causing such unprecedented mortality had to have a spiritual cause like witchcraft, as the Pima Indians of southern Arizona concluded in 1844–1845 when they killed four shamans in the aftermath of a cholera outbreak. Christian missionaries were less lethal than European diseases but nearly as disruptive. Indian neophytes neglected their people's customary rituals, broke their taboos, and partook of strange new religious forms and in the process turned themselves and their missionaries into obvious targets of witchcraft accusations.

The simultaneous appearance of disease and missionaries provoked particularly aggressive witch hunting, as in southern Ontario when the Hurons executed several French Jesuits and their followers during the 1630s and 1640s. However, witch hunts took their most dramatic forms when Indian societies came under intense pressure from white expansion, leading not only to epidemic disease and proselytization but also to land loss, warfare, alcohol abuse, economic dependency, and in fighting. By the late eighteenth and nineteenth centuries, Indian communities in the path of American expansion typically divided into two factions: an accommodationist wing that agreed to land sales and

reservations in exchange for annuities, peace, and trade benefits; and a “traditionalist” wing that advocated some version of pan-Indian cooperation (including violent resistance), religious revitalization, and rejection of the alcohol trade and land sales. Traditionalists received their inspiration from religious visionaries who claimed revelation from the “Great Spirit” and a special ability to identify witches. Not surprisingly, usually those witches were accommodationists and their leaders. Witch hunts of this type accompanied the rise of some of Native America's most famous prophets: the Delaware Neolin among Ohio River Valley tribes during the 1760s as a prelude to Pontiac's famous uprising; the Seneca Handsome Lake among the Iroquois of upstate New York during the 1790s; and, most notably, the Shawnee Tenskwatawa among the Great Lakes and Ohio Valley tribes and the Creek Indians during the early nineteenth century in conjunction with Tecumseh's campaigns against the United States. Few other witch hunts are so well documented, but they continued to mark intratribal politics well into the twentieth century.

Many Indian groups continue to believe in witchcraft, mostly along traditional lines with some concessions to outside influences. Christian Indians

often associate witches with the Devil rather than traditional guardian spirits. Some people continue to attribute certain accidents, psychological disorders, and “traditional” ailments to witchcraft but acknowledge that “foreign” diseases can have other sources. They also believe that witches work only as individuals, not as part of the “witch societies” that were found during ancient times. Official executions of witches have been rare, but even into the late twentieth century, not unknown in some isolated cases. Most importantly, as the enduring antithesis of community values, the witch continues to define what those values are.

NAZI INTEREST IN WITCH PERSECUTION

Reports about the interest of SS (the *Schutzstaffel*—protection force or defense squad) leader Heinrich Himmler in research on witch persecutions were circulated as early as 1947 by the Berlin newspaper *Telegraf*. The information stemmed from an unknown librarian in Polish Poznan (formerly Posen), where a huge collection of books and some files from the SS were now stored, both giving credibility to such a project. In 1948 and 1951, further information came from a former concentration camp prisoner, Herbert Blank, who had been ordered by the SS to produce summaries of witchcraft trial documents. In 1952, an investigation dealing with the fate of German archival sources in Polish territory offered more hints about the project. However, information about Himmler’s project vanished afterward, until Gerhard Schormann gave a firsthand account of the SS *H-Sonderkommando*’s (special unit H [*Hexen*-witches]) witchcraft-trial collection in his introduction to a short book (Schormann 1981). The news aroused widespread interest in Germany.

Since then, numerous scholars of both early modern Europe and Nazi Germany have used either the original

material preserved in the Poznan archives or the copy on film kept by the Frankfurt Bundesarchiv. After the fall of the German Democratic Republic (GDR) in 1989, Jörg Rudolph discovered additional material in SS files, which had been kept secretly by the Stasi, the intelligence service of the former GDR, for political reasons. By 1999, a study group was able to present a collection of essays examining various aspects of the *H-Sonderkommando*, including, in addition to its political aims and ideological grounds, a critical assessment of the scientific value of the SS collection.

NATIONAL SOCIALIST VIEWS OF WITCHCRAFT AND WITCHCRAFT PERSECUTION

Though clearly reflecting his intention to use the witchcraft-trial material politically against both the Catholic Church and Protestant opponents, Himmler’s interest was also deeply rooted in Nazi ideology. Like other intellectual National Socialists, the master of the extermination camps believed that the victims of late medieval and early modern witchcraft persecution had been pure descendants of the Germanic race. Witches were supposedly adherents and practitioners of a traditional Germanic religious cult, who for this very reason had fallen prey to persecutions instigated by Church authorities in their attempt to erase remnants of paganism. At bottom, this theory drew on anti-Semitism, pretending that the Catholic Church from its origins was penetrated by Jews and a “Jewish” commitment to destroy all racially superior beings.

Like so many other ideas and visions of National Socialism, the pagan interpretation of witchcraft stemmed from a long tradition of antimodern views. After the Enlightenment had disenchanting witch belief in the late eighteenth century, subsequent centuries, longing for romantic inspiration, discovered the “real truth” behind it. In France, Jules Michelet declared the witch to be the people’s authentic medical service; in Germany, Jakob Grimm saw it as incorporating a lost Germanic culture. In England, Margaret Murray (1921) portrayed witchcraft as an ancient fertility cult. But nowhere did the materialization of the witch figure go farther than in Germany and Austria. When Hitler came to power in 1933, the neopagan vision of witchcraft displayed both a “white” interpretation and a “black” counterpart. The former claimed (like Michelet) that witches had been agents of popular medicine; the latter declared that people accused of witchcraft were really groups of Germanic warriors fighting demonic forces through ritual means. The military version, expounded by Vienna Germanist Otto Höfler, was, of course, highly agreeable to Himmler and his “Black Order,” the SS, whereas the more peaceful “white” version, advocated by Himmler’s political opponent, chief ideologist Alfred Rosenberg, fell prey to internal party rivalries.

Independently of these differences, both factions agreed that Christianity had been responsible for slaughtering millions of Germanic victims. Hence, research about witchcraft trials became an act commemorating “racial losses” and honoring the “ordeal of Germanic heroes,” women and men alike. Given the apparent continuity of that confrontation, it also provided ammunition for an ongoing battle. Politically, therefore, witchcraft research figured as “scientific enemy observation,” with full responsibility for the project falling on the SS secret service (SD) and centered at first in the *Amt II Gegnerforschung* (research on enemies) within the central SS administration, the Reichssicherheitshauptamt (National Central Security Department).

Work started in 1935, after Nazi publication of an ideologically revised version of a traditional peasant calendar claiming Church responsibility for millions of slaughtered heretics and witches had been successfully refuted as a scandalously ignorant historical fake. This failure made it obvious that historically accurate antireligious propaganda must henceforth be put on an organized scientific basis.

ORGANIZATION AND PERFORMANCE

The SS witchcraft research group (*H-Sonderkommando*) took pains to conceal its activities, as its abbreviation (“H” for “Hexen”) showed. While the exploration of published literature continued, members began visiting archives within the Third Reich already in summer 1935, extending their investigations to occupied territories as well during the war. When doing so, they never officially revealed their membership in the SS, working under academic or private cover instead; otherwise, they would never have gained access to Church institutions, like the archiepiscopal archives in Trier.

Trial records and related documents were investigated following a fixed scheme, devised not only to establish the basic facts (number of victims, age, sex, and race(!)) but also to provide proof about who made the accusations and trials and especially about the responsibility of the churches. Secretaries later transferred the findings onto typed forms—hence the Polish title *Kartoteka* (card index) and organized it by localities, so that it could quickly be used to furnish local press campaigns. Within a more scientific framework, systematic studies were planned on racial and demographic aspects of the persecutions, on the use of torture, and on forgery in earlier historical accounts.

Though the project’s ideological limits are plain, its perspective from below granted at least theoretically new insights, in particular by focusing on the social context (if one replaces “race” with “social rank”). Furthermore, the SS researchers were not so narrow-minded as to overlook the close alliance between secular and Church officials within learned culture, but their ideology compelled them to use the notion of a

separate (and racially conceived) people’s culture. It is worthwhile to remember in this context that the idea of elite culture as opposed to popular culture would become a cherished approach of some social historians long into the 1980s, before yielding to rather more complex assumptions of differentiated intercultural relations. Meanwhile, the romantic image of witches being simply persecuted for being “wise woman” seems to be as lively as ever in feminist and neopagan circles. Truly modern, on the other hand, was the *H-Sonderkommando*’s intention to popularize its findings by exhibitions and articles in popular papers and by massive use of photographic material.

Despite its ambitious and modern aims, strategies, and approaches, the project’s results were disappointing. With 33,846 cases recorded by the end of 1943, when project work ceased due to the course of war, results lagged far behind the 500,000 or even millions of victims that had been expected. About the role of the Church, apart from confirming what was already known about its propaganda, the evidence rather suggested the reverse, that is, the support persecutions enjoyed from ordinary German people. Obviously, early modern society had been more deeply penetrated by Christianity than the adherents of racial paganism believed. The search for traces of suppressed Germanic cults could not find substantial evidence.

Besides conceptual shortcomings and dead ends, the intellectual mediocrity, indeed dilettantism, of the *H-Sonderkommando* rendered its products useless for antireligious propaganda. Recent reexamination of the material in comparison with the archival sources (Lorenz et al. 1999) demonstrated countless errors, which opponents of Nazi paganism would have been able to reveal as well: mistaken identification of cases, misreading and confusion of names of the accused, misunderstanding of context, and ignorance of what was really happening in local persecutions.

No wonder then that none of its ambitiously planned studies could be finished. Significantly, a personal attempt by SS officer Dr. Rudolf Levin, a leading member of the group, to exploit his product on the academic market by presenting it as a *Habilitation* (second dissertation, necessary to earn tenure) at the University of Munich was defeated by the academic tribunal. Even crisis management by the group’s gray eminence, prominent National Socialist historian and SS officer Professor Günther Franz, could not improve the situation.

The mediocrity of the group’s philologists tells something about their motives for participating in the project: to exploit it as a vehicle for an academic career otherwise not accessible. The “modernists” within the group, however, those in charge of distributing the product to the public, used it as a chance to develop techniques crucial for their future careers in postwar German press and marketing. Thus, the head of the SS

office on “scientific enemy observation,” Professor Dr. Franz A. Six, became a leading figure in West German marketing in the postwar era.

Given the scholarly deficits of the SS witchcraft trial collection, its usefulness for current research is limited. Except for its photographic copies, transcriptions, and extracts of original documents, the *Kartotheka* cannot be used to substitute for otherwise lost archival material. However, it does have advantages as a means for surveying or checking sources and getting hints about some rather irregular findings, such as the sixteen witchcraft executions it reported as taking place in 1629 and 1630 in the village of Sehlem near Trier. These cases were documented only by a note in the Sehlem parish register, quite an exception to the contemporary doctrine denying condemned witches both Christian burial or even recording them. Given their generally superficial procedure, the SS researchers in this case surely relied on a local informant, probably someone working through parish registers for the sake of racial genealogy.

NECROMANCY

Derived from the Greek words *nekros* (dead) and *manteia* (divination), necromancy is a form of divination in which the dead are used. Necromancy usually involves some form of direct interaction with a corpse (or parts thereof) to invoke spirits of the dead in order to obtain an omen. This magical act presupposes belief in the afterlife, belief in the life of the soul after the death of the physical body, and the conviction that the spirit of the deceased is endowed with supernatural wisdom or knowledge.

Throughout Western antiquity, necromancy was widespread, with records of its practice in Babylon, Egypt, Greece, and Rome. The oldest literary account of necromancy is in Homer’s *Odyssey* (ca. 700 B.C.E.), in which the divine sorceress, Circe, instructed the hero Odysseus on summoning the deceased (primarily the ghost of the famous seer, Tiresias) for prophetic insight concerning his voyage home (X.488–540; XI.13–149). The Homeric passages contained many intricate details: the rites must be nocturnal and based around a pit and a fire; Odysseus must pour libations to a specified recipe; animals must be sacrificed and their blood drained for the ghosts to imbibe; and prayers must be recited to the ghosts and also to the gods of the underworld (who had to give their consent for the temporary release of the spirits). In a subsequent piece of Greek literature, the *Persians* (472 B.C.E.), the playwright Aeschylus described the practice of necromancy among the royal household of the Medes. This dramatic piece bore similar ritualistic traits to the Homeric description and reflected the Greek perception of Persians as exotic and inextricably linked with the practice of magic.

Roman sources regularly associated necromancy with the working of evil magic by wicked witches. The most infamous necromancer of antiquity was in Lucan’s Latin epic *Pharsalia* (65 C.E.). Lucan’s necromancer, the Thessalian sorceress Erichtho, practiced hideous rituals involving the mutilation and consumption of corpses in her magical pursuit of divination. Although Lucan reveled in the repugnant details of Erichtho’s rites, the graphic detail of his portrayal was also partially designed to reflect the contemporary societal and political condemnation of magic. Beyond the literary tradition, the *Greek Magical Papyri* (PMG) contain spells concerning necromancy, such as PMG IV.2006–2125 (fourth century C.E.), which involved the conjuration of a ghost to assist a magician in a variety of endeavors, including divination.

The practice of necromancy is condemned in the Hebrew Bible, for example in Deuteronomy 18:10–11 (where the necromancer is listed alongside a series of magic practitioners), I Kings 28:8, and Isaiah 16:19. The most famous biblical account of necromancy concerns the witch of Endor (I Sam. 28), consulted by Saul during the war with the Philistines. Saul, dismayed at his situation and bereft at the belief that God had abandoned him, went to the necromancer at night and implored her to reanimate the spirit of Samuel. The woman summoned Samuel, who confirmed God’s rejection of Saul and predicted the defeat and death of Saul and his sons. Theologians were intrigued by the account and various interpretations resulted. The Church Fathers Tertullian and St. Augustine regarded the apparition as real, but argued that it was the Devil who appeared to the necromancer, not the

spirit of Samuel. In contrast, St. Jerome regarded the apparition as a hoax and the so-called pythoness a deceiver. Interpretations of the story by early modern writers were similarly divided; Jean Bodin, the French demonologist, supported the explanation of Tertullian and St. Augustine, but Reginald Scot argued that she was merely a ventriloquist.

In the early centuries of the Christian era, necromancy was a common magical practice, despite its condemnation by the Church. Tertullian warned against becoming involved in activities “in which demons represent themselves as the souls of the deceased” (*De anima* 57.2), an important statement in view of its premise that necromancy was not, in fact, the reanimation of the dead but a process that unleashed demonic forces masquerading as ghosts. This definition characterized the term *necromancy* in the early Christian era and subsequent centuries. By the Middle Ages, necromancy came to be associated with demonology and other forms of malevolent magic.

By the fifteenth century, from when a few necromancers' manuals survive (Kieckhefer 1997), this art was not necessarily associated with the aim of conjuring demons or devils for the primary purpose of divination, but it now encompassed a series of rituals for a variety of aims, including the acquisition of “love” and power in addition to the infliction of harmful magic on others, such as insanity and personal problems. Richard Kieckhefer (1989, 153) explained that a principal stronghold of necromancy was the “clerical underworld.” The fact that clerics could be entrusted with the ritual of exorcism meant that they had access to specific texts that could also provide useful insights into the processes of invoking demons instead of driving them away. Clerics (and some members of higher ecclesiastical orders) also experimented with necromancy in order to verify certain aspects of their faith, such as the sacraments and purgatory. Various books on necromancy were available, including the *Table of Solomon* and the *Treasury of Necromancy*. The Dominican inquisitor Nicolas Eymeric, referred to the latter texts in his *Directorium inquisitorum* (Directory of Inquisitors, 1376); the books were, in fact, publicly burned by him (after he had read their contents). Eymeric recorded numerous rituals alleged to have come from texts such as the *Table of Solomon*, including inversions of Christian rites, such as genuflecting before the demons, baptizing icons or images, and perverting prayer formats. A century later, Joan Vicente, a cleric from Eymeric's region, used the *Table of Solomon* to perform necromantic rituals before the Inquisition caught him.

Not surprisingly, the Church took a severe position in regard to necromancy (among other forms of magic) and, in the late Middle Ages, numerous clerics were accused of practicing it. The contents of various texts on necromancy suggested that some formal education

was required to perform necromancy's most intricate and learned procedures, but the practice of necromancy was not the exclusive domain of the clergy. In 1324, for example, Dame Alice Kyteler was eventually found guilty of practicing sorcery, including summoning demons and the use of body parts for various *maleficia* (evil acts). Although Alice Kyteler escaped being burned at the stake, her assistant, Petronella of Meath, was not so fortunate. In a less spectacular or threatening context, and one in keeping with the original meaning of the art, there are accounts of cunning folk participating in necromantic rites in order to acquire information concerning the diagnosis and treatment of disease. Likewise, ordinary folk summoned the deceased to visit them in their dreams for a series of reasons, including advice on matters ranging from their love lives to finances.

The curiosity that appears to have been a major component of early modern European experiments in necromancy was perhaps best captured in an account of his experience with this so-called black art by Benvenuto Cellini, an Italian goldsmith and sculptor. In 1523, Cellini hired a Sicilian priest to locate a missing woman and was invited to participate in a necromantic rite; he described his reaction: “I, who had a great desire to know something of the matter, told him, that I had all my life felt a curiosity to be acquainted with the mysteries of this art” (*Autobiography*, 64).

A half-century later, a practitioner of so-called high magic, John Dee, astrologer to Queen Elizabeth I, was fascinated with contacting spirits. He sought an alliance with Edward Kelley, an alchemist, medium, and necromancer. Together they created a system of occultism known as Enochian magic, the magic of angels and demons, subsequently influential in the development of the philosophies of the Golden Dawn. A more adept spiritualist than Dee, Kelly invoked spirits, while Dee recorded the rites. Although rumors abounded that both men had been involved in grotesque acts of necromancy entailing tomb robbing, more accurate accounts indicated the use of various magical implements, such as a scrying mirror, and the evocation of angels.

NETHERLANDS, NORTHERN

In the northern provinces of the Low Countries, the region that is now the Netherlands, trials for witchcraft were rare, with very few mass persecutions. The last Dutch witch was executed in 1608, making the Netherlands the first European state where witchcraft accusations ceased to be life-threatening. Both its economic situation and the attitude of its courts were instrumental in this remarkable development.

Until the outbreak of the Dutch Revolt in 1568, the northern provinces of the Low Countries were part of the Habsburg federation of seventeen provinces. After the Dutch Revolt, the northern provinces became an independent confederation, the Dutch Republic, which covered roughly the area of the present-day Netherlands. During the 1580s the southern provinces, located in what are now Belgium, Luxembourg, and parts of northern France, were reconquered by the Spanish army. But the war lasted for eighty years (1568–1648), during which time the boundaries of the new state shifted, depending on military developments.

Around 1500, the new demonology, making people who committed magical actions into accomplices of the Devil, reached the northern provinces of the Low Countries. But it should be emphasized that extreme views, such as those propagated in the *Malleus Maleficarum* (The Hammer of Witches, 1486), were never generally accepted there. Until the mid-sixteenth century, influential theologians maintained the traditional scholastic doctrine as articulated by St. Augustine and Thomas Aquinas. These scholastics distinguished between explicit and implicit pacts. The former was a capital crime, but the implicit pact was made without realizing its horrible implications and should therefore be discouraged by other, less radical methods. It resulted from superstitious practices and thus was merely a sign system through which humans informed demons about their wishes. Superstitious actions therefore implied a demonic covenant, but human beings could perform them while unaware of this implication. Because the laws of nature bound the Devil, these superstitious acts had at best a limited effect. He could create illusions and make people believe that they had, for instance, flown through the air in the company of other people and demons. All this was sheer illusion, however, and it was sinful to believe in its reality. In learned circles in the Low Countries, the *Canon Episcopi* (ca. 906) remained dominant until at least the mid-sixteenth century.

Before 1500, accusations of witchcraft rarely evolved into open trials in the northern Netherlands but were usually handled as minor offenses. Witchcraft was in theory already perceived as a capital crime, but tradition made it extremely difficult to attain a conviction. The *talio* (retribution) was still valid in this period; therefore, individuals who accused others of witchcraft

ran the risk of being executed if they were unable to produce the necessary evidence. In at least one case (in Kampen 1515), a woman was indeed executed after failing to prove her allegations. Usually, the accused were allowed to buy off legal prosecutions by paying a fine or “composition.” Only after the introduction of the inquisitorial procedure did the authorities start investigations on their own initiative. The Burgundian dukes and their Habsburg successors strongly supported this development and restricted the possibility of resolving such quarrels through compositions. During the first half of the sixteenth century, Roman law finally entered court practice in the Low Countries. In 1554, the Flemish jurist Joos de Damhouder published his *Praxis Rerum Criminalium* (Practice of Criminal Matters), which was almost immediately acknowledged as the best manual for judges and lawyers. It taught them how to interpret the laws of the *Codex Justiniani* (Justinian Code), including those regarding witchcraft. Damhouder viewed witchcraft as a form of *lèse-majesté*.

Another important element was the conviction of many jurists that the prince was responsible for the welfare of his people and therefore should ensure that the conduct of his subjects followed Christian standards. Not only the Habsburgs, but even their lifelong opponent Duke Charles of Gelderland saw it as their duty to fight the power of the Devil and his human followers. But the rapid growth of heresy already provided more demonically inspired offenders than they could punish. Although repeatedly instructing their local representatives to prosecute witches and sometimes even taking the lead in a campaign to wipe out these heinous people, as Duke Charles did in 1514, their major concern was to stem the rising Protestant tide. Obviously, both the Holy Roman Emperor Charles V and his enemy Charles of Gelderland desired the eradication of witchcraft; they wanted their law courts to prosecute witches and punish them if proven guilty. But witchcraft was a difficult crime to prove; there were usually no eyewitnesses to the crime, and material evidence was generally also lacking. The only way to prove the guilt of a suspected witch was by forcing her or him to confess. Torture was almost always needed to extract such a confession, but the usual torture devices were not sufficiently effective. In 1502, for instance, the sheriff of Haarlem arrested a woman who was subsequently tortured. But she managed to withstand the pain, despite the use of “exceptional severity,” and in the end she was released. Only after Dutch hangmen had mastered special techniques, the so-called watching and walking, could they force witches into confession. It took several decades to learn this skill, but by 1550 it was known throughout the country.

In 1547, the countryside of the northeastern province of Groningen witnessed the first major

outbreak of trials, during which twenty women and one man were executed. In the 1550s, a wave of prosecutions affected the region between the Rhine and the Meuse Rivers. The total number of victims cannot be established, since most trials took place in small, semi-autonomous domains, where archives have been badly preserved. In the mid-1560s, especially in 1564, the number of trials rose once again, this time in the western province of Holland. Once again, we cannot establish an exact number of victims, because many relevant sources were lost during the tumult of the Dutch Revolt that began a few years later.

Despite this lack of precision, in the third quarter of the sixteenth century prosecutions seem to have reached their highest point in the northern Netherlands. Although the number of trials once again rose around 1590, this period was probably less bloody. After 1595, sizable persecutions occurred only in regions under Spanish control. In 1613, for instance, a

persecution began in the region around Roermond, a small town today in the southeastern Netherlands, in which at least thirty-nine women and one man were executed. But in 1613, Roermond was under Spanish control. This is also true of the chain of trials in August and September 1595 that swept over northern and central Brabant, ultimately reaching Brussels, taking the lives of twenty-nine women and three men; the Dutch did not conquer northern Brabant until 1629.

Some areas (for instance, the northern province of Friesland) remained completely free of witchcraft trials, and in other regions prosecutions began relatively late. No trials occurred in central or northern Brabant until 1585, the year Antwerp surrendered to the Spanish. The region around Antwerp subsequently suffered an economic collapse and severe subsistence problems. In the densely urbanized and highly developed coastal provinces, popular fear of witchcraft was largely decided by economic conditions. The years 1589 and 1595

Execution of the witch Ann Hendricks in Amsterdam, where witchcraft trials seldom occurred. (TopFoto.co.uk)

witnessed the first trials and executions in this region, but in booming Holland they stopped in that same period. In 1564, for example, the number of trials suddenly rose in Holland—but only in towns that depended on trade and shipping, at a time when the sound was blocked because of a war between Sweden and Denmark, thereby severing connections to the Baltic and blocking the grain supply, called the “mother trade” by the Dutch. In 1563, Brussels banned all imports of English wool, and Queen Elizabeth responded by excluding ships from the Low Countries from English ports. Consequently, the economy of towns that depended on the trade with the Baltic and England collapsed. In 1564, particularly vulnerable places like Amsterdam and its surrounding countryside or the port of Delft suddenly became centers of witchcraft trials.

After 1585, the economic focus of northwestern Europe shifted to Holland and more specifically to Amsterdam, where an unprecedented economic boom began. The relative security of subsistence removed much of the fear of witchcraft. During the seventeenth century, many people immigrated from nearby parts of Germany affected by large-scale witchcraft panics. But none of them pressed for a prosecution of witches in their new domicile. Dutch authorities could now easily repel any attempt to influence their policy in this regard. For instance, when Amsterdam’s Reformed ministers demanded in 1597 that the magistrates should suppress heresy and magic, they received the blunt answer that the Dutch had no desire to replace the Spanish Inquisition with Calvinist intolerance.

In the provinces of Holland and Zeeland, it became virtually impossible in the 1590s to convict someone for witchcraft if the defendant refused to confess freely. In 1593 the High Council, the appellate tribunal for the provinces of Holland and Zeeland, overturned a verdict of the court of Holland and Zeeland to torture two women. The High Council acquitted both women, and, as a result, it became virtually impossible to torture people suspected of witchcraft. A year later the court of Holland and Zeeland ruled in favor of a woman who had been convicted by a lower bench to undergo the swimming test (water ordeal). Its decision was based on advice from the professors of medicine and philosophy of Leiden University, which in turn was based on Johann Weyer’s *De Praestigiiis Daemonum* (On the Tricks of Devils, 1563). According to the professors, most women who were accused of witchcraft were melancholics and were therefore likely to be rather fat, which would keep them afloat. They also deemed it conceivable that the Devil would lift them up to prevent them from sinking. It should be noted that both the president of the High Council and the rector of Leiden University

who drafted the university’s advice were members of the Family of Love.

The Low Countries produced very few proponents of the prosecution of witchcraft, with the notable exception of Martín Del Rio. Traditional scholastics like Jacob van Hoogstraten represented an old-fashioned approach to demonology and as such were not founders of a skeptical tradition. However, later opponents from the Low Countries were skeptics who did not believe that the Devil was recruiting an army of human followers. Two prominent early examples of this skepticism are Johann Weyer (born in 1515 as Johan Wier in Grave, a small town not far from Nijmegen) and Cornelis (Cornelius) Loos (born in 1546 in the town of Gouda in Holland). The Erasmianism that dominated the intellectual climate in the Dutch Republic offered perfect surroundings for this skepticism.

There was a market here for vernacular books that denied the reality of the pact and the satanic cult. The first translation of Reginald Scot’s *The Discoverie of Witchcraft* (1584) appeared in Leiden in 1609, albeit in an abridged form, which was reprinted in 1637 and 1638. In 1657 a translation of Friedrich Spee’s *Cautio criminalis* (A Warning on Criminal Justice, 1631) was published. It should be added, though, that King James’s *Daemonologie* (1597) also appeared in a Dutch translation in 1603, as did William Perkins’s *A Discourse of the Damned Art of Witchcraft* (1608) in 1611. But the publication of works supporting the prosecution of witches was rather exceptional. A Puritan minister had made these translations of James’s and Perkin’s books, but they were never mentioned approvingly by leading Dutch Puritans; for instance, Gysbertus Voetius (1589–1676), professor of theology at Utrecht University after 1634 and the undisputed leader of Dutch Puritans, taught that it was morally wrong to prosecute somebody for witchcraft. Fully in line with the Dutch intellectual climate was the publication in 1660 of Weyer’s *Opera omnia* (Complete Works). Original Dutch treatises on witchcraft were also meant to erode the fear of witchcraft; for example, Daniel Jonctys’s plea to restrict the use of the rack (1651), Abraham Palingh’s warning against a resumption of the trials (1659), Herman Löher’s ego-document (a memoir, autobiography, diary, or personal correspondence in whose text the author is continuously present) (1676), and of course, Balthasar Bekker’s voluminous rejection of demonic power (1691–1693).

Together with economic prosperity, an Erasmian tolerance that was broadly shared by secular authorities explains why the judicial search for witches ended so much sooner in the Dutch Republic than elsewhere in Europe. The republic was nominally Reformed, but secular authorities usually declined the Calvinist

ministers' appeals to remodel society, if necessary by force. After 1594 the new jurisprudence regarding the crime of witchcraft spread from Holland and Zeeland to the other provinces; the last execution on the territory of the republic took place in 1608 in the town of Gorcum, the final victim a woman who had confessed to the local magistrates on her own initiative that she had committed a pact and had bewitched several people. At least 140 people lost their lives in witchcraft trials in the northern Netherlands, and that number rises to over 200 by including cases after the beginning of the Dutch Revolt in territories then under Spanish control but now part of the Netherlands. Considering that the population of these provinces rose from about 1 million to approximately 1.5 million between 1500 and 1600, the ratio of victims was remarkably low in comparison to other regions.

The early ending of the trials does not imply that belief in the reality of witchcraft also disappeared. Accusations of witchcraft or sorcery were still made long after legal prosecutions had ended (for that matter, they still are), and occasionally secular and ecclesiastical authorities had to deal with them, for example, through slander trials or similar procedures. Lynchings of supposed witches occurred in Amsterdam in 1624, Rotterdam in 1628, and at Huizen, a village southeast of Amsterdam, as late as 1746. People regularly asked church officials for help to undo what they saw as the effects of witchcraft. The only assistance that Reformed ministers could offer was prayers and communal fasting, but Catholic priests disposed of a far wider range of resources. In the 1580s the Catholic Church had crumbled away almost completely, but a small group of priests soon began building a network of clandestine parishes. These priests, the Jesuits especially, soon detected the value of exorcisms as propaganda and exploited this device to the fullest. Annual Jesuit reports to their superior in Brussels contained dozens of accounts about the exorcisms the Fathers applied to undo bewitchings of people, cattle, and houses and scores of other objects; to drive away demons; or to liberate people who had concluded a pact with the Devil.

Before, during, and after the trials, most accused witches were women, charged with a wide variety of destructive activities. However, in the eastern provinces about half of the accused were male. Most were suspected of attacking their enemies' cattle in the guise of werewolves. But in the trials, only a few men were formally charged with being werewolves. After 1610, lower courts were sometimes inclined to take action against supposed witches, but this never led to a conviction. In Holland, for instance, the fear of witchcraft revived again in the 1650s. In 1659, a woman was even formally accused of concluding a pact with the Devil and offering him her children. But in the end she was only put in the pillory and then released. In theory,

witchcraft remained a capital crime until the end of the Old Régime, but after 1608 this legal provision was only used to prosecute cunning folk and soothsayers, who were never put to death but only banished, and sometimes also flogged.

NETHERLANDS, SOUTHERN

In the historiography of witchcraft, the southern Netherlands (contemporary Belgium), which remained under Habsburg rule until the end of the eighteenth century, has usually been qualified as a region of terrible, centrally organized witch hunts during the sixteenth and seventeenth centuries, in total contrast to its neighbor, the so-called witch-free northern Netherlands. Recent archival research countered this statement and discerns a clear internal difference—chronologically as well as in terms of the intensity of prosecutions—between the Flemish-speaking part and the French- and German-speaking parts of the territory, which in general corresponds to present-day Belgium, minus the prince-bishopric of Liège.

TERRITORY (SEE MAP)

Before we look at the witchcraft trials in the southern Netherlands from 1450 to 1685, it is very

important to fix the territory of that region during this era. The southern (or Habsburg, or Austrian) Netherlands corresponds to the territory of the Low Countries that jurisdictionally did not belong to the Union of Utrecht after 1579. Regions that would later be connected with the Dutch Republic or (after Louis XIV) with France are here considered parts of the southern Netherlands. The territory of the southern Netherlands covered major regions such as Flanders, Artois (with Douai and Arras), Brabant (with Breda, Antwerp, Mechelen, Brussels, Louvain [Leuven], and 's Hertogenbosch), Maastricht, Roermond, Namur, Luxembourg, Limburg, Hainaut (Hainault), Lille-Orchies, Tournai, and Cambrai (Cambay). Recent research has shown that at least 2,564 (and perhaps even 1,000 more) witches were executed in the southern Netherlands during the period 1450–1685 (see Table 1). This number considerably exceeded the 160 witches executed in the northern Netherlands.

WITCHCRAFT TRIALS (1450–1685)

EARLY PHASE (1450–1480)

The ongoing impact of the famous trial of 1459 against the Waldensians in the city of Arras can hardly be overestimated. Fifteen persons were burned at the stake after they admitted to have taken part in obscene Sabbats and to have done homage to a black goat. The ever-increasing sorcery trials within the French-speaking regions south of the linguistic frontier were described in a similar way. Within the sources we find the words *sorcherie* (sorcery) and *vauderie* (Waldensian heresy) as inextricable synonyms: at Nivelles, a woman was banned in 1459 on suspicion of being a *vaudoise ou sorcière* (one who commits sorcery or heresy). Moreover, the crime of sorcery was increasingly mixed with fifteenth-century demonology. The pact with the Devil and his adoration by a sect had become standard items. The short-term consequences of the trials at Arras were substantial: already in 1460, large-scale inquiries were

TABLE N-1: TOTAL OF WITCHES EXECUTED IN THE SOUTHERN NETHERLANDS (1450–1685)

| <i>North of the linguistic frontier</i> | <i>South of the linguistic frontier (French-speaking)</i> | <i>South of the linguistic frontier (French- and German-speaking)</i> |
|---|---|---|
| County of Flanders: 202 | County of Artois, Cambrésis, Lille-Orchies, Tournai: 47 | Duchy of Luxembourg: between 2000 and 3000 |
| Duchy of Brabant: 57 | County of Hainault: 28 | |
| Limburg: 9 | Duchy of Brabant: 31 | |

| in all: 314 | in all: minimum 250 | in all: between 2000 and 3000 |

begun at Tournai, Douai, and Cambrai about possible witches. This exaggerated fervor to persecute forced officials to act. Episcopal inquisitors became aware of the fact they must cope with a new phenomenon. Several tracts were published; in 1477 Jean Tinctor had his tract against the Waldensians translated from French into Latin at Bruges. Preachers influenced the common people in the late fifteenth century using demonological interpretations of sorcery and thus articulating the cumulative concept of witchcraft to make them believe that witches belonged to an organized sect serving the Devil. Peculiarly enough, this belief or interpretation of the crime of sorcery made no headway in the Flemish (Dutch)-speaking part north of the linguistic frontier. In the county of Flanders, sorcery was still punished only in combination with poisoning.

FIRST PROSECUTION AND RELATIVE CALM (1510–1560/1570)

In 1495 Ysabeau Packet, of Huy in the prince-bishopric of Liège, was accused of flying to secret nocturnal gatherings with other witches. After a short jurisdictional procedure, she was burned at the stake on suspicion of harmful sorcery. Witch burnings soon spread to the neighboring county of Namur: between 1509 and 1555 at least forty-eight persons were executed at the stake and thirty-one others banished on suspicion of *vaudoisie et sorcellerie* (heresy or sorcery). Also, fortunetellers were severely persecuted. In the duchy of Luxembourg, at least thirty-three people stood trial on suspicion of witchcraft between 1509 and 1579. Fourteen of them—all women—were burned at the stake. In Artois, French-speaking Flanders, and Cambrésis, officers of justice for the first time concentrated intensively on female witches in the years 1510–1530. Also in the French-speaking part of Brabant, witches were executed between 1539 and 1543 at Limal and Jodoigne and twenty years later at Incourt, Villers, and, once again, Jodoigne. The county of Hainaut burned its first witch only in 1549, but between 1559 and 1576 at least fourteen others followed at Braine-le-Comte. After 1520, the county of Flanders intensified its prosecutions of

sorcery. It took until 1532 to burn the first witches—a man and a woman—at the stake on suspicion “of having given themselves to the enemy of Hell” (Vanysacker 1988, 151). The aldermen of the city of Bruges thus became the first in Flemish-speaking southern Netherlands to execute witches by fire. Moreover, it is striking that in the 1530s, six witches were burned or decapitated in Flanders. During the same period, several fortunetellers were reproached for having made a pact with the Devil. In cases of recidivism, no mercy was shown. Nevertheless, there were no mass executions: after 1538, Flemish stakes were extinguished, at least for witches (although large numbers of heretics were burned), for a period of fifty years, except for two executions at Oudenaarde (1554) and Furnes (1567).

The Flemish-speaking part of the duchy of Brabant avoided witch hunting for a long time. Of course there are accusations of sorcery, but the custom of buying off prosecutions from the officers of justice generally prevented trials. Real trials only started at the end of the sixteenth century at Kempen, ‘s Hertogenbosch, and Malines, as well in Inner and Northern Brabant. Two exceptions were Tienen, where seven women were burned from 1552 to 1554 and 1560 to 1564, and Kasterlee, where a woman was tortured to death during a witchcraft trial in 1565.

SECOND AND GREATER WITCH HUNT (1570–1685)

After a period of relative calm, which lasted longer in some regions than in others, around 1570 new prosecutions based on cumulative witchcraft began. Once again the regions south of the linguistic frontier, and especially the German-speaking territorial jurisdictions of the duchy of Luxembourg, were the pioneers. Recent research has claimed that there were around 2,500–3,000 witchcraft trials in the duchy of Luxembourg between 1560 and 1683; at least 2,000 ended with the execution of the accused. The jurisdictions of Bitburg, Arlon, Gievenmacher, Luxembourg, and Remich were especially zealous. The French-speaking regions of Luxembourg (Bastogne, Chiny, Durbuy, Virton, Marche, Saint-Hubert, and Bouillon) reached their

highest point of persecutions between 1615 and 1630. War stopped most persecutions after 1630, except at Sugny, where eleven trials were held between 1657 and 1661. The last witch of the duchy of Luxembourg and of the whole southern Netherlands was executed in Anloy (near Bouillon) in 1685. Besides the county of Namur, where almost 100 witches died at the stake between 1560 and 1646, the French-speaking part of the duchy of Brabant also had its executions, especially at Nivelles and Genappe, with a minimum of twenty witches executed between 1572 and 1587 and another eight between 1594 and 1601. The county of Hainaut had its prosecutions: at Braine-le-Comte, there were twenty-eight trials between 1581 and 1613, with thirteen women burned at the stake. There were more sporadic prosecutions until 1640, the year in which the eighty-seven-year-old Anna Faulconnier died in jail.

Artois, Lille-Orchies, and Cambrésis had two peaks, in 1590–1600 and 1610–1620. After a period of relative calm, the stakes were once again lit in the decade 1630–1640. For twenty years, only female witches suffered, but from 1650 to 1660 many male witches were especially prosecuted. In the decade 1660–1670, witches again were exclusively female. In all, at least 245 people (203 women and 42 men) were prosecuted for witchcraft between 1550 and 1700. How many died is unknown, because the sources containing verdicts are lacking; we know only that at least 17 men and 30 women were executed. In the Artesian villages of Oisy and Arleux, there were at least 8 (perhaps 13) executions from 1612 to 1614, some of them Cistercian nuns at the abbey of Oisy-le-Verger. In Cambrésis, the villages of Quiévy, Bazuel, Rieux, Fressies, and Hem-Lenglet were especially known for their witch hunts. In addition, villages and cities such as Douai, Bouvignies (in 1679), Valenciennes, Bouchain, and Saint-Amand are to be mentioned.

North of the linguistic frontier, the actual witch hunts began only in 1589. In the duchy of Brabant, we find both the execution of Cathelyne van den Bulcke at Lier and trials against women and girls at Breda and 's Hertogenbosch, all in 1589. The county of Flanders opened in 1589 with the burning at the stake of Lievine Morreeuws in Furnes. For Brabant, Peelland, and Maastricht, the witch craze seems to have been relatively limited until around 1612, with forty-two executions. The year 1595 was especially bloody: from June until September, twenty-nine women and three men were executed in the Flemish-speaking part of Brabant. In the county of Flanders, the persecutions lasted until 1628, with at least 161 executions. The so-called *Westhoek*—with Furnes, Nieupoort, Diksmuide, Sint-Winoksbergen, Dunkirk, Hondschote, Broekburg, Cassel, and Ypres—was the principal home of Flemish witches. Such great cities as Bruges (in 1595) and Ghent (in 1601) also had their “witch years.” The region of Roermond, belonging to the southern Netherlands, had its witch hunt in 1613:

forty executions, with three more following in 1622. In the duchies of Limburg and Overmaas, Eysden had seven executions between 1609 and 1613, and Valkenburg had two executions in 1620.

Around 1630–1646, we see a new flash of prosecutions north of the linguistic frontier. Bruges and Malines had four and three executions, respectively, in 1634–1635 and 1642. The most striking characteristic of the witchcraft prosecutions in the county of Flanders is their late end: Nieupoort still had four prosecutions between 1650 and 1652; Olsene two in 1661; Heestert three between 1659 and 1667; and Belsele burned the last witch in Flanders in 1684. In all, there were at least twenty-three northern executions after 1650.

Within the southern Netherlands we must distinguish between the prosecutions north and south of the linguistic frontier. Namur, Luxembourg, Lille-Orchies, Artois, and Cambrésis had their first serious hunts during the first half of the sixteenth century, immediately followed by Hainaut, but the county of Flanders—without forgetting a first phase of prosecutions around 1530–1540—and the Flemish-speaking part of the duchy of Brabant still awaited their first big trials. The real witch hunt north of the linguistic frontier started only around 1589, lasting until 1612 (Brabant) or 1628 (Flanders); a second cycle began around 1630–1645, and—surely for Flanders—the last executions came after 1650. North of the linguistic frontier there were possibly some 308 witches executed, with Flanders, Brabant, Roermond, and Limburg accounting for 202, 57, 46, and 9 witches, respectively. The essential difference between the Flemish-speaking regions of the southern Netherlands and the northern Netherlands lay more in the chronology than in the intensity of witchcraft prosecutions.

A totally different situation existed south of the linguistic frontier: there witchcraft persecutions began much earlier and were much more violent. After an early first phase, most regions experienced a second peak from 1570 until 1630. Some of them, certainly Artois and Cambrésis, continued their witch hunts deep into the seventeenth century. Nevertheless Namur, with 270 trials and 144 executions between 1509 and 1646, and especially the German-speaking parts of Luxembourg, with between 2,500 and 3,000 trials and at least 2,000 executions between 1560 and 1683, were by far the worst witch-hunting regions in the southern Netherlands. Their proximity to the Trier of Archbishop Johann von Schöneburg, who ordered hundreds of executions between 1581 and 1591, and the direct influence of the witchcraft tract of his suffragan Peter Binsfeld surely influenced the attitude of Namur and Luxembourg toward the crime of witchcraft.

CONCLUSIONS AND EXPLANATIONS

With the exception of some isolated cases, trials in which the pact between a “cumulative” witch and the

Devil stood central were all held in the southern Netherlands before local secular benches of aldermen or feudal courts, not before episcopal courts or central bodies like the Council of Flanders or the Council of Brabant. Witchcraft trials followed normal criminal procedure, but the judges, influenced by demonology, accepted the combination of facts and especially the *punctum diabolicum* (the Devil's spot or mark) as indications of guilt, which permitted arrests, torture, and even condemnations. Death by fire, the typical punishment for witchcraft, necessarily had to be preceded by the suspect's voluntary confession.

If 80 percent of the witches executed in the European witch craze were female, the southern Netherlands was no exception. In Flanders, exactly 80 percent (162 of 202) of those executed were women. In the Flemish-speaking part of Brabant this figure rose to 94 percent. In Hainault, *all* executed witches were women, and in Namur women constituted an overwhelming 92 percent. Only two regions showed a somewhat different picture: in Luxembourg, according to Marie-Sylvie Dupont-Bouchat's now-disputed figures, "only" 75 percent of the executed witches were female, and in the region around Cambrai and Artois, only thirty of forty-seven known cases (64 percent) were women. This figure certainly has something to do with a relative scarcity of sources.

Recent publications have shown that despite excellent historical research, many fallacies persist about the witch hunt in the southern Netherlands. Thus, the statement that the central government decrees of July 20, 1592, and November 8, 1595, greatly stimulated the witch hunt, has become out of date. Those decrees did not mention cumulative witchcraft, and the central government, on the contrary, was reacting against excesses by local benches of aldermen. Also, the impact of the *Malleus Maleficarum* (The Hammer of Witches, 1486) on the prosecuting authorities in the southern Netherlands has been greatly exaggerated. Undoubtedly, the *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599/1600) of the Jesuit Martín Del Rio had far more impact on the witch hunt in his native region. It was this Catholic encyclopedia on witchcraft and on legal procedures in witchcraft trials, first published at Louvain, that made the theories of the *Malleus* known in the southern Netherlands a century after its publication.

In the Netherlands, witchcraft was far from exclusively a rural phenomenon. It began at Arras and spread to many large and small cities: Bruges, Malines, Ghent, Louvain, Antwerp, Breda, Roermond, Lille, Douai, Valenciennes, Nivelles, Bastogne, Durbuy, and Bouillon. Moreover, the influence of the learned city aldermen, who were well informed about the cumulative concept of witchcraft, which they studied in demonological tracts, was considerable. A letter from

the aldermen of Bruges dated 1596 to their "ignorant" colleagues at Courtrai demonstrated this point. These learned aldermen, often humanists, spread the new cumulative concept of witchcraft throughout the region. An analysis of the private libraries of the aldermen of Bruges shows that they were acquainted not only with the *Malleus* or with the "primitive" demonology of their fellow townsman Joos de Damhouder (1507–1581), but also with the later demonological tracts of Paulo (Paulus) Grillando (Grillandus), Jean Bodin, Nicolas Rémy, and Del Rio. This presence of the learned witchcraft concept in Bruges can also be found in the torture sessions and in the formulation of verdicts by the magistrates. In the spread of modern witchcraft concepts and practices (e.g., pricking for a *punctum diabolicum* on the body of the witch), an active role was also played by the touring executioners. In the wake of these touring professionals, one could draw a chronology of witchcraft trials within several regions. Biographical studies on main figures (witches, aldermen, and executioners) could also be illuminating.

NEW ENGLAND

Sixty-one trials for witchcraft are known to have taken place in seventeenth-century New England, in addition to those that occurred during the 1692 Salem witch hunt (Godbeer 1992, 235–237). The notorious Salem trials have often distracted attention away from the many other prosecutions for witchcraft that occurred throughout the seventeenth century in New England, from the 1638 indictment of Jane Hawkins in Boston to the 1697 acquittal of Winifred Benham and her daughter in Connecticut. Some formal complaints never came to trial, and many suspicions were never recorded but lurked nonetheless in the minds of town-folk and villagers, warping their interactions with neighbors or acquaintances whom they suspected to be witches. Belief in the reality of witchcraft and fear of those who might be using occult powers to harm their enemies were part of everyday life in colonial New England. Prosecutions for witchcraft were the tip of a cultural iceberg.

In New England, a witchcraft trial generally took place only after a gradual and often lengthy process during which local suspicions had accumulated and hardened into conviction that a particular individual was indeed a witch. These suspicions resulted from the convergence of otherwise inexplicable misfortunes with problematic personal relationships. Puritan ministers encouraged their flocks to see individual suffering as a punishment from God for sin and inadequate faith. But in common with the English and other Europeans, colonists often preferred to explain illness or mishap for which there was no clear explanation in terms of malign

occult forces that were apparently being wielded against them by their enemies. To blame a particular incident on witchcraft involved holding a specific individual responsible for one’s misfortune. People today who seek external explanations for suffering and misadventure often blame impersonal forces such as corporate power or oppressive governmental agencies, as befits the largely impersonal nature of our society. Premodern men and women were much more inclined to point the finger at individuals, reflecting the intensely personalized environment in which they lived. Most New England communities contained no more than a few hundred adult residents, so that each individual interacted with neighbors in a wide variety of contexts. We deal regularly with all sorts of people who are otherwise unknown to us, but colonial New Englanders lived in communities where “every social transaction was personal in the fullest sense” (Demos 1982, 312).

Most allegations in witchcraft trials related to mysterious incidents that people explained in personal terms. Accuser and accused were usually neighbors with a history of disagreement. The accused had often requested a loan or gift, perhaps of food or a household implement; the accuser had refused but then felt guilty for having done so, especially since communitarian values were accorded great significance among early New Englanders. The person who had refused the original request now shifted guilt onto the aggrieved neighbor by blaming him or her for subsequent misfortunes such as a child’s illness, the sudden death of livestock, or the inexplicable spoiling of food. The assumption underlying most accusations was that a person who felt aggrieved had resorted to witchcraft as a form of revenge.

There was no institutional outlet for the tension and hostility resulting from such disagreements. If a neighbor trespassed upon someone else’s property or committed assault and battery, a law had been broken and the malefactor would be dealt with accordingly; but refusing to give a neighbor food or lend a tool was not a crime, so that the animosity that resulted could not be expressed or mediated directly through civil or criminal proceedings. Allegations of witchcraft provided an indirect outlet for feelings of guilt and hostility that resulted from confrontations of this kind. Such allegations made good sense in a culture that habitually explained human experience in both supernatural and intensely personal terms. The stress laid by Puritan ministers upon the ubiquity of evil and of temptations to commit evil doubtless fostered suspicions that witchcraft lay behind many misfortunes.

Not all New Englanders were equally vulnerable to accusations of witchcraft. When people feared that they had been bewitched and sought to identify the malefactor, they often blamed men and women in their local communities who already had a reputation for occult

skill. These individuals (referred to by contemporaries as “cunning folk”) were known for their expertise in magical divination and also healing techniques that combined spells or charms with simple herbal remedies. Though ministers condemned any such activities as dependent upon the Devil’s assistance, many colonists were less concerned about issues of causation and valued the services provided by cunning men and women. Yet popular belief that occult power could serve both benevolent and malevolent purposes placed such practitioners in an ambiguous and vulnerable position: cunning folk might use their skills to harm as well as to help their neighbors and could easily become the target of suspicion if a disagreement in which they had been involved was followed by a mysterious stroke of bad fortune that befell the other party. Healers were especially susceptible to accusation if their patients grew sicker instead of recovering.

Women known for their “cunning” were much more likely than men to be accused of witchcraft. The power wielded by cunning folk was potentially dangerous whether in the hands of a man or a woman, but occult skill was especially threatening if the practitioner was female: the aura of power surrounding cunning folk contradicted gender norms that placed women in subordinate positions. Neither belief in the efficacy of folk magic nor its practice were gender-specific: men as well as women resorted to and functioned as cunning folk. Yet suspicions that magical skill had been used for malicious ends were much more likely to be directed against female practitioners. Most accused cunning folk were women. Their prosecution testified not only to the ambiguous place that occult practitioners occupied within New England communities but also to specifically gendered fears.

An overwhelming majority (around four-fifths) of those New Englanders tried for witchcraft were women. As in old England, roughly half of the New England men charged with this crime were married or otherwise close to accused women: they were, in other words, guilty by association (Karlsen 1987, 47–48). Except in a few regions, such as New France and Iceland, witchcraft was perceived on both sides of the Atlantic as a primarily female phenomenon. Puritan ministers did not teach that women were by nature more evil than men, but they did see them as weaker and thus more susceptible to sinful impulses. Clergymen reminded New England congregations that it was Eve who first gave way to Satan and then seduced Adam, when she should have continued to serve his moral welfare in obedience to God; all women inherited that potential for collusion with the Devil from their mother Eve. Yet some women were much more likely than others to be accused of witchcraft. Throughout the seventeenth century, women became especially vulnerable to such allegations if they were seen as challenging their prescribed

place in a gendered hierarchy that Puritans held to be ordained by God.

Women who fulfilled their allotted roles as wives, mothers, household mistresses, and church members without threatening assumptions about appropriate female comportment were respected and praised as handmaidens of the Lord, but those whose circumstances or behavior seemed to disrupt social norms could easily become branded as the servants of Satan. Especially vulnerable were women who had passed menopause and thus no longer served the purpose of procreation, women who were widowed and so neither fulfilled the role of wife nor had a husband to protect them from malicious accusations, and women who had inherited or stood to inherit property in violation of expectations that wealth would be transmitted from man to man. Women who seemed unduly aggressive and contentious were also more likely to be accused; conduct that would not have struck contemporaries as particularly egregious in men seemed utterly inappropriate in women. Behavior or circumstances that seemed disorderly could easily become identified as diabolical and associated with witchcraft: the Devil had, after all, led a rebellion against God’s rule in heaven.

Once New Englanders became convinced that a particular person was a witch and had accumulated sufficient evidence to justify a prosecution, they lodged a formal complaint with the authorities and so initiated a criminal prosecution. The penalty for witchcraft throughout the New England colonies was death, as laid down by Scripture. Yet convincing oneself and one’s neighbors of an individual’s guilt was not the same as convincing a court. Of the sixty-one known prosecutions for witchcraft in seventeenth-century New England, excluding the Salem witch hunt, sixteen at most (perhaps only fourteen) resulted in conviction and execution, a rate of just over one-quarter (26.2 percent). Four of these individuals confessed, which made the court’s job much easier. If they are omitted, the conviction rate falls to just under one-fifth (Godbeer 1992, 158).

New England laws defined witchcraft in theological terms, demanding proof of diabolical allegiance. Yet whereas the Puritan authorities depicted witches as heretics and servants of the Devil, ordinary men and women were more inclined to think about witchcraft as a practical problem: believing that their misfortunes were due to witchcraft, they wanted to know who the witch was, and they wanted her punished. The evidence presented in witch cases rarely made any mention of the Devil. That disjunction between legal requirements and the nature of most popular testimony led to acquittal in most cases. That deponents did not adapt their testimony to fit legal criteria suggests that ordinary colonists were very much focused upon practical threats to their safety when thinking about witchcraft and also that at least some people were much less thoroughly schooled

in official ideology than persistent stereotypes of early New Englanders would suggest.

Persons accused of witchcraft in seventeenth-century New England, excluding the Salem outbreak, were less likely to be convicted and executed than their counterparts across the Atlantic. The English statutes enacted against witchcraft in 1542 and 1563 had defined the crime as a hostile act rather than as heresy, so that the preoccupation of popular depositions with practical harm was less problematic. Continental law generally defined witchcraft in theological terms, but in many European countries, the courts used torture to extract the kinds of evidence that would justify conviction for diabolical heresy. The New England authorities, operating under English jurisdiction, had no legal recourse to torture when questioning defendants in witchcraft cases. (The Salem witch hunt was the only occasion on which New England courts gathered extensive evidence of diabolical allegiance; it was also the only occasion on which the authorities used psychological pressure and physical torture, illegally, to extract a large number of confessions.)

The depositions given against New England's accused witches generally fell into one of four categories. Most frequently, villagers and townfolk described quarrels with the accused individual that had been followed by misfortune or illness for which there was apparently no natural explanation; the witnesses claimed that the alleged witch had afflicted them as a direct consequence of these arguments. Second, deponents claimed that the accused had a reputation for skill as a fortuneteller or healer; this established that the accused had occult powers that, it was implied, had also been deployed for malign purposes. Third, witnesses described having used countermagical techniques such as boiling the urine of a bewitched child; if a neighbor suffered an analogous injury or was drawn inexplicably to the house in which the experiment was taking place, that information was offered up to the court as incriminating testimony. And finally, neighbors of the accused would describe generally suspicious behavior, such as extraordinary and perhaps superhuman strength.

These depositions show beyond any doubt the fear that alleged witches aroused among their neighbors, but they were mostly unconvincing from a legal perspective. Magistrates and the learned ministers whom they consulted during many of these cases dismissed testimony relating "strange accidents" following quarrels as "slender and uncertain grounds" for conviction (Hall 1999, 348). Clergymen denounced countermagic as "going to the Devil for help against the Devil" (Godbeer 1992, 81) and warned that Satan was a malicious liar, which hardly encouraged magistrates to rely upon testimony describing countermagical experiments. They were occasionally willing to conclude that divination or other magical practices that ministers

condemned as diabolical proved collusion between the accused witch and the Devil, but even here magistrates were mostly reluctant to convict unless there was explicit mention of the Devil in a confession or hostile depositions.

New England magistrates were ready and willing to convict and execute accused witches, should the evidence against them prove convincing. But as in their handling of prosecutions for other capital crimes, the courts refused to convict unless the evidence satisfied rigorous standards of proof, which meant either a voluntary confession or at least two independent witnesses to an incident demonstrating the individual's guilt. It was difficult enough to secure two witnesses for sexual offenses that carried the death penalty, but the challenge was compounded when dealing with an invisible crime involving alleged collusion with supernatural agents. Only in a minority of cases were New England magistrates convinced that the evidence before them satisfied the established criteria for conviction. At other trials, their fastidious adherence to evidentiary standards resulted in acquittal. Judges sometimes pronounced accused witches to be "suspiciously guilty" but "not legally guilty" of the alleged crime (Godbeer 1992, 173). In some cases, they overturned jury verdicts, rejecting the instincts of local jurymen who were convinced of the accused person's guilt.

The neighbors and enemies of accused witches who had given what they considered to be damning testimony were often infuriated by the reluctance of magistrates to treat their depositions as legally compelling. Sometimes they would confer with each other, gather new evidence against the acquitted individual, and then renew legal charges. Three individuals were each prosecuted on three separate occasions; another five appeared in court twice on charges of witchcraft. All these cases resulted in acquittal. Repeat prosecutions expressed unshaken belief in an individual's guilt and also dissatisfaction with the courts' handling of witchcraft cases. That dissatisfaction sometimes resulted in extralegal retaliation: Mary Webster of Hadley, Massachusetts, was brutally assaulted in 1684, a year after her acquittal, when townfolk became convinced that she had again bewitched one of her neighbors.

As the difficulty of securing a legal conviction for witchcraft became increasingly apparent, New Englanders became less and less inclined to initiate legal prosecutions against suspected witches: there were 19 witchcraft trials during the 1660s, but only 6 during the 1670s and 8 during the 1680s. That dramatic decline was not due to a lessening fear of witches, as would become clear in 1692, when official encouragement of witchcraft accusations in and around Salem Village unleashed a deluge of allegations. The witch hunt of 1692, which resulted in over 150 arrests and 19

executions, was atypical in its scale and intensity. Yet the fears and beliefs that underlay it merely expressed in extreme form assumptions and anxieties that were deeply rooted throughout New England culture.

The damaging controversy over the Salem court's reliance upon problematic testimony that led to the halt of the trials in the fall of 1692 reaffirmed and intensified judicial concerns regarding evidentiary issues. These combined with embarrassment as well as sincere distress over the problematic convictions of that year to discourage future prosecutions. Yet an end to witchcraft trials in New England by the end of the century did not signify an end to belief in and fear of witches. New Englanders continued to use counter-magic against suspected witchcraft throughout the eighteenth century and occasionally assaulted individuals whom they believed to be witches. In July 1787, as the Constitutional Convention was meeting in Philadelphia to design a new system of government that would embody Enlightenment principles, a mob outside in the city streets lynched a woman who was believed to be a witch.

NEW FRANCE

During the seventeenth century, when witchcraft was a serious concern for the elites of Europe and New

England, New France was a recently established, tiny community. In 1660, there were only around 3,000 Europeans in Quebec. This number rose to around 10,000 by the end of the century—only one-eighth of New England's population at this point. The largest cities in New France were small towns by French standards, with Montreal at 500 and Quebec City at 800 in 1663.

The French were not eager to emigrate. Both the severe weather and the fear of attacks from Indians discouraged immigration to New France. Many who voyaged to Quebec did not stay, so the colony's early population was especially transient and unstable. This was different from old France, where towns and villages had existed for centuries and most people stayed in their communities. Those who came to New France were mostly young, unattached males from the Paris region and northwestern France, who were more urban in origins than the mainly rural French population.

This frontier community imported much traditional folklore and culture, which included a strong role for the Devil, magic, and supernatural occurrences. One popular legend was the *Chasse Galerie*, which was a wild ride across the night sky by souls destined for damnation. This was a widely diffused European legend, with many local variants; in Quebec, the hell-bound riders used canoes rather than horses. Belief in the presence and power of the Devil was widespread. The inhabitants of the Ile d'Orléans, for example, feared that, if someone were dying at night, the Devil would intercept the friend or relative who went in search of a priest, so that he could gain possession of the soul of the person who died without absolution. If possible, they would send two carriages for the priest, expecting that at least one could get through. In addition, any unusual climactic condition like comets or strange sounds could be regarded as a diabolical portent.

Religious authorities, perhaps trying to get more priests dispatched to the colony, complained about the ignorance of the settlers as well as their unwillingness to attend Mass or pay their tithes. Still, Catholicism lay at the core of life in New France, with the same mixture of folklore and Christianity that flourished in old France. A church at Beaupré near Quebec City, dedicated in 1658 to Ste. Anne, soon became a scene of miraculous cures. In 1700, after a remarkable cure, Jean Salois hung his crutches on the chapel wall, beginning a tradition that persists to the present.

Unlike the situation in Europe and New England in this period, New France produced few cases involving witchcraft that were serious enough to come to the attention of the courts. In 1658, a disappointed suitor, René Besnard, cast a spell on the marriage of his former sweetheart by tying ritual knots in a string. This *nouement de l'aiguillette* (tying a knot, a ligature), widely practiced and feared in early modern France, was a traditional way of causing male impotence. The couple,

frightened of the spell, could not consummate their marriage, and accused Besnard of causing “perpetual impotence . . . by *malefice*.” The court found him guilty, imposing a heavy fine and banishing him from Montréal. Both secular and religious authorities took this sort of spell casting seriously: the bishop of Montreal annulled the marriage. When both parties eventually remarried and, between them, had twenty-five children, it only confirmed the reality of the spell.

Another serious case, a few years later, involved another disappointed suitor. Daniel Vuil (or Will), a converted Protestant, was accused of causing the demonic possession of Barbe Hallay, who had rejected his marriage proposal. She was brought to Quebec City, where she was exorcized and freed of her demons through the care of the saintly Mother Catherine of Saint Augustine and the intervention of the martyred Father Jean de Brebeuf. Vuil was tried, convicted, and executed—though it is not clear whether it was primarily for blasphemy, for causing Barbe’s possession, or for trading brandy with the natives.

In 1685, Jean Campagnard was charged with several instances of making people ill through witchcraft, including a young woman who refused his advances. The local court found him guilty, but the colony’s appellate court, the Sovereign Council in Quebec City, established in 1663 as the equivalent of a French *parlement* (sovereign judicial court), overturned his conviction. These few cases do not compare to the record of New England, where sixty-one witchcraft trials took place and at most 36 witches were executed.

Several factors contributed to the remarkable paucity of witchcraft trials in New France. For one thing, by the time a viable community was established in Quebec, the French judicial elites were punishing very few people accused of witchcraft. Ordinary people still believed that witches were real and dangerous and accused their neighbors of trying to harm them by diabolical means, but the French judicial system was not responding strongly to these concerns.

Crucial differences also separated the social and demographic structures of New France and old France. Although most of its people lived by farming, Quebec’s inhabitants did not replicate the society of French agricultural villages. The settlements in Quebec stretched along the Saint Lawrence River between Quebec City and Montréal, with properties averaging around 90 acres. Houses were built close to the river on each property, around 300 meters apart. Although conditions were very harsh, within a few years these *habitant* (resident) farmers were substantially better off than their French counterparts.

Most early immigrants to New France were male. In 1660, New France had over six single men for every available European woman. The royal government responded by sending shiploads of women to the

colonies to marry and multiply. Not surprisingly, women, even widows with children, married with ease in Quebec. Marriages took place at much earlier ages, which tended to make families larger as well. Isolated older women were often accused of witchcraft in Europe, but this group did not exist in New France. The basic social unit there was the family farmstead, in which all the members worked together to clear the land, grow crops, and defend themselves against Indian attacks.

In Europe, most witchcraft accusations were made against women, supported by a long tradition of misogyny, but both old and New France emphasized male witchcraft. Quebec’s three most serious cases all involved accusations against single men who had been disappointed in their attempts to marry. This was clearly the result of the unusual gender ratios in New France, where patterns of settlement and a shortage of women produced a society that, at least in its early stages, differed significantly from the old village communities of Europe. These factors apparently underlay the extraordinary scarcity of formal witchcraft trials in New France.

NEW GRANADA

The New Kingdom of Granada (Nuevo Rein de Granada), corresponding to the modern states of Colombia and Venezuela and parts of Panama and Ecuador, was characterized by an especially high incidence of witchcraft trials in comparison with other Spanish American jurisdictions. In 1547 an *audiencia*, or high court, was established at the capital Santa Fe de Bogotá. The first archbishop came in 1553 to Santa Fe to assume the episcopal inquisitorial jurisdiction. From the foundation of the tribunal at Lima in 1570, New Granada was subject to the Peruvian Inquisition until September 26, 1610, when the third tribunal in Spanish America was installed in the city of Cartagena with jurisdiction over northern South America, Central America, and the Caribbean Islands. At the end of the seventeenth century, the Cartagena tribunal declined and was abolished after the proclamation of

independence in 1811 and again in 1821 before the final achievement of independence of South America in 1824. Witchcraft trials occurred during the whole period of colonial rule, with peaks in the decades from 1610 to 1650 and at the beginning of the eighteenth century. Witchcraft, sorcery, and superstitions constituted the bulk of cases registered by the tribunal at Cartagena.

Witchcraft beliefs were widespread at all levels of New Granadan colonial society. In the period 1614–1690, 188 cases of superstitions were tried by the Cartagena Inquisition, of which 58 were witchcraft trials (Henningson 1994, 19). Female defendants far outnumbered their male counterparts. After 1571, the indigenous population was exempt from the inquisitorial jurisdiction. Nevertheless, several witchcraft cases involving Amerindians can be traced even after the installation of the Cartagena tribunal. During the colonial period, a multiplicity of jurisdictions characterized the territory of the Cartagena Inquisition. In distant regions, both ecclesiastical and secular tribunals pronounced sentences in witchcraft cases. Also, the inquisitors were generally not very concerned with the superstitions of the poor, the Amerindians, or the slave population, even though the great majority of witchcraft accusations revolved around individuals of African descent. Often the accusations came from other members of the African population. Nonetheless, the ideas on witchcraft as recorded in trial documents correspond mainly to the European model of witches.

Witchcraft beliefs in sixteenth- and seventeenth-century New Granada included characteristic elements of both the European popular and demonological traditions: the witches were thought to be able to transform themselves into animals, fly through the air, and cause sickness and death through maleficent magic. Defendants reportedly took the shape of tigers, snakes, cats, and birds to fly at night. While their body remained lifeless at home, as if dead, their “soul” went through the air to suck the blood of children and to attend assemblies, where the witches venerated the Devil by kissing his anus. The tribunal at Cartagena was founded at a time when the *Suprema* (the supreme council of the Inquisition) in Madrid had ordered extreme caution to be exercised in dealing with witchcraft accusations. In periods of crisis, however, such as in the 1630s, the inquisitors at Cartagena gave full credit to the accusations. First, two women were arrested, and later, as the witch hunt spread throughout the province, a great number of people were imprisoned. Finally, two women of African descent were sentenced to die at the stake, but the *Suprema* ordered a copy of the documents to be brought to Spain and eventually revoked the sentence of the Cartagena tribunal. In the resulting auto-da-fé (act of

the faith), held in 1634, twenty-one witches were punished, mostly by scourging.

NEW SPAIN

In New Spain, witchcraft cases were subject to the jurisdiction of the Inquisition. Following the Spanish conquest of Mexico in 1520, a monastic and later an episcopal Inquisition was introduced in the vice-royalty of New Spain; until 1570, all sectors of the population were subject to them. In 1571, a branch of the Spanish Holy Office was installed at Mexico City with jurisdiction over Central America, the Spanish dependencies in North America, and the Philippines. It was not abolished until 1820. During its most active period, from 1571 to 1700, it investigated about 2,000 cases (Alberro 1988, 195), including a considerable number of sorcery and witchcraft accusations. Amerindians were exempt from the jurisdiction of the Mexican Inquisition but remained under the control of ecclesiastical courts after 1571. The similarity of procedures that characterized these institutions soon led to a confusion of competencies and jurisdictions. Other evidence indicates that monastic and secular tribunals, especially in distant rural areas, sometimes acted on their own, independently of the Mexican Inquisition, but did not always keep records of their witchcraft cases.

In the course of this long period, witchcraft trials underwent substantial changes in New Spain, due to a changing assessment of the crime of witchcraft. Witchcraft and sorcery were severely punished before 1570, but after the installation of the Inquisitorial tribunal, they were no longer considered heresy, but only superstition. With regard to the nature of witchcraft,

trial documents suggested that in New Spain, the great majority of witchcraft and sorcery cases essentially involved individuals serving individual clients, either by magically curing people or inflicting harm on them.

From 1540 to 1700, the Mexican Inquisition tried 144 people for “superstition” (Henningesen 1994, 10, n. 1). No absolute data are available for the eighteenth century; but there is evidence of 60 cases qualified as “superstitious healing” being investigated by the Mexican Holy Office from 1701 to 1806, including 10 cases classified as sorcery (*hechicería*), and 5 as maleficent witchcraft (*brujería*) (Quezada 1989, cuadro 8). In addition, another source lists 125 different cases instituted by the Inquisition during the same period, including 20 cases of harmful witchcraft, 39 cases of sorcery, and 66 for other forms of superstition (Aguirre Beltrán 1963, 333–376). Evidently, more witchcraft cases were tried by the Inquisition in New Spain during the eighteenth century than in the seventeenth century, once all cases of superstition are included.

WITCHCRAFT TRIALS BY ECCLESIASTICAL INQUISITIONS

During the period before 1571, a peak in the frequency of trials occurred from 1536 to 1543, when Bishop Juan de Zumárraga served as apostolic inquisitor in Mexico. He conducted at least 152 trials, among which 23 dealt with accusations of sorcery and superstition (Greenleaf 1961, 14). The historical documents from these trials enable us to distinguish the witchcraft beliefs reflected in trials of Europeans, Africans, or the mestizo populations from those instituted against Amerindians. Accusations against the first group closely resembled the “superstitions” dealt with by other Spanish tribunals: divination (with or without invocations of the Devil), superstitious healing, and love magic (combined with incantations and the use of magic potions) were the most frequently mentioned offenses qualified as sorcery or superstition. Most defendants in this period (15 cases out of 20) were women (Greenleaf 1961, 112). All were slaves or belonged to the lower classes of colonial society. Trials from this period demonstrate vivid cultural exchanges among all ethnic groups of the colonial population, especially near the bottom of the social hierarchy. Spaniards, Africans, and Amerindians exchanged beliefs and practices of divination, magical healing, and love magic, and introduced such new elements as the use of Mexican hallucinogenic drugs. Intercultural contacts also connected practitioners of magic with their clients, as colonial magicians consulted Amerindian specialists in search of more effective practices or because of their knowledge of local herbal medicine.

However, a different picture emerged from the trials instituted against native Mexican people. The defendants—mainly men—were accused of sorcery and

idolatry; of transforming themselves into such fierce animals as jaguars, lions, or dogs; or of making rain and producing similar effects by magical means. Contemporary colonial descriptions labeled these abilities of indigenous specialists as witchcraft. The trials, however, drew a clear distinction between sorcery and witchcraft: the former supposed an implicit pact with the Devil and the latter an explicit pact and denial of the Christian faith. Additionally, witchcraft was associated with harmful magic. Consequently, the offenses of the Amerindians were usually qualified as sorcery rather than witchcraft.

WITCHCRAFT TRIALS BY THE SPANISH INQUISITORIAL TRIBUNAL

Lacking jurisdiction over Amerindians, the Mexican branch of the Spanish Inquisition also instituted many more sorcery trials than witchcraft cases between 1571 and 1820. Like the “European” defendants of the episcopal inquisition, the great bulk of accusations again dealt with love magic, superstitious healing, and divination. Divination was practiced to find lost objects, for diagnostic purposes in magical curing, for advice in daily life, and to foretell the future. Practitioners could be male or female, but considerably more women were accused of love magic. Some cases were classified as maleficent witchcraft, an offense usually committed by individuals trying to harm another person. According to their ethnic descent, they preferred European, African, or Amerindian methods, including the native Mexican procedure of magically causing the death of a person by breathing in his or her direction.

Very few accusations corresponded to the contemporary European model of witchcraft. In 1614, however, witchcraft accusations suddenly increased in the northern Mexican town of Celaya, following the inquisitor’s proclamation of the Edict of Faith (a list of types of heresy). The resulting inquisitorial trials, held a few years after a famous outbreak of witchcraft had preoccupied the Inquisition in Spain’s Basque country, offered a vision of witchcraft similar to early modern Spanish ideas on witches (*brujas*) and their deeds. As in Spain, the majority of Mexican witchcraft defendants were women of low social status. Although women of different ethnic descent were implicated in the Celaya cases, most were descendants of Spanish colonists. They were accused of assembling at night outside the town, where they allegedly adored the Devil in the form of a billy goat with an obscene kiss. A strange detail of this Mexican version of the witches’ Sabbath relates that the Devil, after the adoration, provided each of the witches with a portion of dung. His gift had special properties. Used as an ointment, it transformed the witches into animals (for example, geese) and enabled them to fly through the air; one woman became a parrot for her

solitary nocturnal excursions. At the trials, the defendants prided themselves on their exploits, including their ability to transport other people through the air to distant places. Several male defendants related their encounters with the Devil and confessed to signing an agreement with him, written in their own blood. Despite these well-known elements of the European witch stereotype, the colonial Mexican version of witchcraft suffered from a lack of coherence, with certain characteristic elements still present in the popular imagination, while the general picture had fallen into oblivion.

NEWBURY WITCH (1643)

Soldiers killed this anonymous woman during the English Civil War, possibly in the belief that she was a witch. Like many stories of witchcraft reported in the popular press, fact and fiction are difficult to separate. What may have been a very straightforward event was probably misinterpreted at the time and then subse-

quently embellished in order to make a sensational story or advance a political point.

In late September 1643, just after the Battle of Newbury in Berkshire, the royalist newspaper *Mercurius Civicus* reported that an angry old woman had left the royalist encampment outside Newbury and had crossed the River Kennet to present herself before the parliamentary army under the earl of Essex. There she had demanded to meet the general himself but had been denied. After a scuffle, she was arrested and charged with attempting to blow up the parliamentary army's magazine. It seems likely that she was executed as a spy or saboteur. At least, that was one version of what happened.

The following month saw this story change in at least three other newspapers. The most frequently repeated version was that parliamentary soldiers had been amazed to see an old woman sailing on a plank (or even, by some blasphemous miracle, walking on the water) and had captured her as a witch.

In wartime, it is likely that many suspected witches, including this one, suffered summary justice; England's worst panic, the Mathew Hopkins episode, lay in the near future. But her execution apparently did not go as planned. A cheap pamphlet published in 1643, *A Most Certain, Strange, and true Discovery of a Witch*, claimed that she caught the bullets fired at her and chewed them up, laughing and mocking the troops as she did so. They were now certain that she must be in league with the Devil and resorted to the customary magical countermeasure of "scoring the witch above the breath"; that is, cutting her forehead in the belief that drawing blood would rob the witch of her power. This done, a soldier placed his pistol beneath her ear and shot her at point-blank range, upon which, the pamphlet said, "she straight sank down and died, leaving her legacy of a detested carcass to the worms" (*A Most Certain, Strange, and true Discovery of a Witch*, 7) Though less gruesome than other wartime stories of this age, like Hans Jacob Christoph von Grimmelshausen's, the episode suggested that the carnage at Newbury had left British armies in a brutal state.

The pamphlet account, with a clear parliamentarian bias, also related that one of the soldiers who apprehended her first saw a tall, lean, agile woman traveling down the river. They set a trap for her. Some soldiers were afraid to touch her, but others obeyed the order to capture her and drag her before the military commanders. After they perceived that she was a witch, a firing squad of two marksmen was arranged. The first lead musket ball bounced off her body (as low velocity bullets sometimes did) and nearly hit the marksman in the face. Enraged, he ran at her with his sword. As the veins of her temple were cut, she realized that the Devil had deserted her. She stopped laughing and began instead to wail and moan, tearing at her hair.

Title page of pamphlet describing the witch of Newbury, caught walking on a plank in the water. (Glasgow University Library, Department of Special Collections)

At the dramatic climax, the propaganda message was delivered. The witch's last words were reported to be: "And is it come to pass, that I must die indeed? Why then, his excellency the earl of Essex shall be fortunate and win the field" (*A Most Certain, Strange, and true Discovery of a Witch*, 7). The defeat of a royalist witch was thus made into a prophecy of parliamentary superiority and provided proof that the Devil was on the king's side. The story of the witch of Newbury therefore revealed itself to have been a powerfully instructive fantasy or allegory, albeit one with little, if any, foundation in fact.

NIDER, JOHANNES (CA. 1380–1438)

A Dominican theologian and religious reformer active in the early fifteenth century, Nider wrote some of the most extensive and influential early accounts of witchcraft. His major work on this subject, *Formicarius* (The Anthill), written in 1437 and 1438, was printed in seven separate editions between 1475 and 1692. It was also an important source of information for the infamous *Malleus Maleficarum* (The Hammer of Witches), written by the Dominican Heinrich Kramer and first published in 1486. The fifth book of the *Formicarius*, which dealt specifically with "witches and their deceptions" ("de maleficis et eorum deceptionibus"), was included in several later editions along with the *Malleus*. In addition to relating numerous stories of witchcraft in the *Formicarius*, Nider treated the topics of magic and sorcery in two other works, *De lepra morali* (On Moral Leprosy) and *Preceptorium divine legis* (Preceptor of Divine Law).

Born in the small Swabian imperial city of Isny in the early 1380s, Nider entered the Dominican Order at Colmar in 1402. At this time, Colmar (now in Alsace, France) was one of only two Dominican houses in German lands controlled by the so-called observant, or reform, movement. We can assume that Nider chose to enter the order at Colmar because he was attracted to the observant movement; he eventually became one of the most important observant Dominican leaders of his day. Following the normal course of Dominican education, Nider underwent his initial training at Colmar, then learned the liberal arts at a Dominican *studium generale* (house of studies; literally "general studies"), and finally received his theological education. He began studying theology in Cologne, possibly as early as 1410, but left before completing his degree and attended some sessions of the Council of Constance (1414–1418). In 1422, he petitioned to be admitted to study theology in Vienna, where he received his degree in June 1425.

Nider taught briefly at Vienna and then served as prior of the Dominicans in Nuremberg from 1426 or 1427 until April 1429, when he moved to Basel to undertake the reform of the Dominican priory there. While in Basel, he not only served as prior of the Dominicans but also became a leading member of the Council of Basel (1431–1449). He delivered the opening sermon of the council, served on its deputation for religious reform, and undertook several important missions to negotiate with the heretical Hussites in Bohemia. Moreover, under his leadership, several of the council's most important deputations and delegations met in his Dominican priory. In late 1434 or early 1435, however, Nider left Basel, returning to Vienna to teach theology. He was elected dean of the theological faculty in 1436. In 1438, he returned briefly to Basel, continuing on that summer to direct the reform of the

female Dominican convent of St. Catherine in Colmar. Upon his return journey, he died at Nuremberg on August 13, 1438.

Although an active intellectual figure for slightly over ten years, from 1426 until 1438, and although frequently occupied during this period with numerous other duties, Nider was nevertheless a prolific author who wrote at least fifteen major treatises, as well as numerous sermons and letters. His topics ranged from the reform of the religious orders to heresy, as well as general moral guides and treatises on the care of souls. Yet he is mainly known as an authority on witchcraft, above all for his most important work, *Formicarius*. This long treatise was composed in the form of a dialogue between a theologian, who was clearly Nider himself, and a lazy but curious student who posed questions on a wide range of moral and spiritual matters. The treatise took its title and its organizing symbol from Proverbs 6.6 (which also served as its opening line): “Go to the ant, O lazy one, and consider its ways and learn wisdom.” Throughout, the character of the student (the “lazy one” of the Proverbs) posed questions and demanded not just scholastic reasoning but also present-day examples to illustrate the theologian’s points. Thus the dialogue of the *Formicarius* often became a collection of morally edifying stories probably intended for use in sermons.

Because of this format, when Nider turned to the topic of witchcraft, he presented not just a purely theoretical, scholastic account of the powers of demons and the workings of sorcery but actual stories of witches and witchcraft that he had heard from other authorities (he never seemed to have actually encountered a witch himself). Many of these stories were set in various locations in the western Alps, mostly the territory of Bern in the diocese of Lausanne, where some of the earliest true witchcraft trials were beginning to take place at this time. Many of Nider’s stories of witchcraft came from a single source, the secular judge Peter of Bern, who had conducted numerous sorcery or witchcraft trials several years earlier in the Simme valley of the Bernese *Oberland*. Nider supplemented these accounts with information from a Dominican inquisitor of Autun who was active against witches, with personal discussions he had in Vienna with a former demonic magician or necromancer who had since reformed and now lived as a pious Benedictine monk, and with the account of certain delegates to the Council of Basel about the burning of Joan of Arc and several other women whom Nider regarded as witches.

The picture of witchcraft that emerged in the *Formicarius* contained most of the elements that became standard parts of the witch stereotype throughout the centuries of the great witch hunts in Europe. Nider described witches mostly as simple rustics who performed harmful sorcery of various sorts—causing

infertility or illness in people or animals, killing small children, damaging or destroying crops, or magically stealing crops from their neighbors’ fields. Witches performed this magic through the agency of demons, and the witches gained their power over demons by formally renouncing their faith and worshipping the Devil at secret nocturnal gatherings. At these ceremonies they also desecrated the cross and the sacraments, cannibalized the bodies of young children and babies, engaged in sexual orgies, and performed various other detestable acts. Notably, Nider’s witches did not fly to these gatherings; night flight was never mentioned in the *Formicarius* except as a delusion.

Although in the course of his stories, Nider described both male and female witches, and although he consistently used male pronouns when referring to witches in general, he is nevertheless the first major clerical authority to argue that women were more prone to witchcraft than men. Immediately after the discussion of Joan of Arc in the *Formicarius*, the lazy student expressed amazement that the weaker sex could be capable of such terrible crimes. Through the voice of the theologian, Nider responded that, shocking as it seems, learned authorities knew that it was not rare for women to wield such demonic power. He then explained how women were more prone to the temptations of the Devil, due mainly to their weaker physical, mental, and moral nature, and produced several biblical, patristic, and classical citations to this effect. Thus, women were more easily seduced into the crime of witchcraft than men. This section of the *Formicarius* served as a basis for the even more extreme misogyny of the later *Malleus Maleficarum*.

Interestingly, alongside tales of nocturnal conventicles and diabolic cults of witches, Nider also presented several accounts that lacked these more extreme flourishes. Most of these stories centered on the figure of a single “great witch,” a man named Staedelin, of whom Nider heard from Peter of Bern. Although called a witch (*maleficus*), Staedelin was not presented as a member of any cult, and although his magic was demonic in nature, he does not appear to have surrendered his soul to the Devil or to have apostasized. Rather, these stories seemed much more “realistic” and probably more accurately depicted certain common magical practices and beliefs that existed before the emergence of the full stereotype of witchcraft. The *Formicarius*, therefore, seemed to represent almost the exact moment when the more developed stereotype of diabolic witchcraft superceded earlier ideas of simple demonic sorcery, at least in the minds of some clerical authorities.

Nider also discussed magic and witchcraft in sections of his moral treatises *De lepra morali* and *Preceptorium divine legis*. Lacking the narrative quality of the *Formicarius*, these treatises generally presented a

more purely theoretical account of the supposed workings of demonic magic, particularly of the various powers and natural abilities of demons, and of the necessity and workings of the pacts that supposedly bound demons to the human sorcerers or witches who commanded them.

NIGHT WITCH, OR NIGHT HAG

A witch believed to wander in the night is called a night witch or night hag.

The origins of the night witch can be traced back to ancient times. In Hebrew belief, for example, the female demon Lilith was associated with the night and its denizens. Lilith, the baby-snatching demon whose presence was a constant threat to mothers and their newborns, subsequently became a powerful force in early modern European demonology; her various powers included the ability to steal semen from sleeping men. In Roman literature of the imperial era, the image of the witch who worked her evil at night was prevalent. In the *Satyricon* (§ 63), Petronius (d. C.E. 65) described the work of the *strigae* (witches; etymologically connected with *strix*, or screech owl), whom he later called *nocturnae* (literally, "women of the night"). These night witches were described as having worked magic on a youth (replacing his innards with straw) and also causing insanity and later death to a valiant man who attempted to drive them away. The connotations of the night have contributed significantly to the belief in and depiction of the night witch, for it is at night that "life

is considered to be in a state of suspended animation, a necessary lull during the hours of the dominion of death" (Caro Baroja 1964, 5).

In Greece and Rome, ghosts and certain deities associated with witchcraft, such as Hecate, were thought to haunt crossroads and similar frightening places at night. Such beliefs remained and were altered and elaborated upon throughout the centuries. In the Basque region, for example, there are various stories about the nocturnal activities of witches, including ones not necessarily relating to evil acts, such as horseback rides in the dark hours. The witch's association with cats (in addition to owls and wolves) was partially based on the belief that witches, like cats, were particularly active at night. The conviction that witches could transform themselves into cats gave rise to various stories (and court cases) involving *maleficium* (harmful magic) directed against infants and children, as well as other random acts of evil. In 1608, Francesco Maria Guazzo, citing Nicolas Rémy, commented: "Remy (II, 5) writes nearly all those who came into his hands charged with witchcraft told him that they changed themselves into cats whenever they wished to enter other people's houses in secret, so that they could scatter their poison there by night" (*Compendium Maleficarum* [A Summary of Witches] 1.8).

The idea of the witch who transformed herself at night predated the early modern European age, as evidenced in the poem by Propertius (ca. 50–ca. 16 B.C.E.) in which he described the activities of a witch who "can change her form into that of a night-prowling wolf" (4.5.14). Similarly, Ovid (43 B.C.E.–C.E. 17) described the witch Dipsas, whom he suspected of performing shape-shifting magic to transform herself into a nocturnal bird (*Amores* 1.8.13–14). In the *Fasti* (6.131–146), Ovid described owl-like birds, which he suggested were old women transformed, who traveled at night in search of unprotected babies to devour. Norman Cohn (1993, 64) noted the existence of similar beliefs among the Germanic peoples prior to Roman and, later, Christian influences. During the Early Middle Ages, belief in the *strigae* continued throughout Germany, and the images that characterized their descriptions in Latin literature, namely, metamorphosis and cannibalism, were reflected in indigenous Germanic folktales. Those gripped by nightmares or suffering from night paralyzes could also find an explanation in the presence and effects of the night witch. Sensations of heaviness, suffocation, and general discomfort were once ascribed to the night witch sitting on a person's chest (hence the term *night hag* or *old hag syndrome*).

The definitive expression of the activities of the night witch was, arguably, participation in the Sabbath, the gathering of witches in remote places that invariably took place at night. Again the motif of metamorphosis was prominent in the conceptualization of the Sabbath,

with stories abounding of witches traveling to the specified location in the form of wolves, cats, owls, and bats. Belief in organized groups of witches flying to the Sabbat, which began to dominate the relevant literature of the fourteenth and fifteenth centuries, has its origins in earlier convictions about women of the night and nocturnal hags; for example, John of Salisbury, in his *Policraticus* (*The Statesman*, 1159) recorded gatherings in honor of Herodias, in which women (*lamiae*, a classical correspondent for *strigae*) banqueted on babies, “some of them being dismembered and gluttonously devoured” (2.17).

NIGHTMARES

The origin of the word *nightmare* can be found in the ancient Germanic and Nordic belief in the *mara*, a supernatural being, usually female, who lay on people's chests at night, suffocating and paralyzing them. The same concept is also present in Slavic cultures: we find the *zmora* in Poland, *kikimora* in Russia, and *morica* in Croatia, which suggests that the *mara* concept may have Indo-European roots. All these terms describe a sleep disturbance phenomenon classified today as sleep paralysis, which has been the subject of intellectual debate for nearly 2,000 years. The physician Galen, writing in the second century C.E., was the first to propose that the experience was caused by gastric disturbances. His explanation remained the dominant physiological explanation for the nightmare right down to the twentieth century. That great Elizabethan witchcraft skeptic Reginald Scot explained: “the mare, oppressing manie in their sleepe so sore, as they are not able to call for helpe, or stir themselves under the burthen of that heavie humor, which is ingendred of a thicke vapor proceeding from the cruditie and rawnesse in the stomach” (Scot 1972, 49).

Scot's views on the nightmare formed part of his attempt to debunk popular beliefs about witchcraft. Nevertheless, not only in England but also in many other parts of Europe, the nightmare experience was often attributed to the nocturnal visits of witches. It was widely believed that they came and straddled those whom they wished to torment, giving rise to the English expressions “hag-ridden” and “witch-ridden.” The physical sensations of paralysis, pressure, and suffocation were frequently accompanied by aural hallucinations and visions of suspected witches.

Examples of people interpreting the nightmare experience in terms of witchcraft can be found in the court records of several European countries. Trial depositions from seventeenth-century Augsburg, Germany, referred to witches' *trucken*, or pressing. In 1666 a pregnant woman named Anna Maria Cramer testified that a witch kept visiting her at night and lying upon her; in 1685 a man testified that his wife complained of feeling someone pressing her at night (Roper 1994, 209). When in 1609, Jean Grand Didier, from the duchy of Lorraine, went to sleep after having exchanged harsh words with a suspected witch, he felt a heavy weight upon him and saw several people in his bedroom, including the suspected witch, whom he imagined had tried to throttle him (Briggs 1996, 115–116).

In parts of western England, occasional accusations of witchcraft resulting from nightmare attacks still reached the courts in the nineteenth century; most concerned people prosecuted for assault after drawing blood from witches whom they believed were “hag-riding” them. In 1871, for example, a twenty-three-year-old farmer from the county of Dorset was sentenced to six months' imprisonment after having beaten an eighty-five-year-old woman he accused of persistently “hag-riding” him. In the previous decade, a Somerset couple, the Clapps, were prosecuted after having drawn blood from an elderly neighbor. The court heard how “between 12 and 1 o'clock, the old lady came into defendant's bedroom, and lay on her feet, when she suddenly felt her body grow stiff. After this complainant laid half across Mr. Clapp's chest, which he stated deprived him of the power of breathing, and rendering him quite helpless” (Davies 1997, 40–50).

The nightmare experience or sleep paralysis may seem to play only a minor role in witch accusations and beliefs, but the very physicality and perceived reality of such supernatural aggression was a potent confirmation of witchcraft. The nightmare experience represented an intimate, brutal assault. People awoke sore, sweating, and tired from the ordeal, and the vivid nature of associated hallucinations helped reinforce the supposed powers of witches.

NIGHTSHADE

Atropa belladonna is an excellent example of a poisonous and medicinal herb believed to be used by witches in the compounds called witches' brews. One finds it mentioned in various demonological and witchcraft texts among the general lists of constituents of such poisonous compounds. For example, Johann Weyer mentioned the use of belladonna in witches' compounds

in his 1563 book *De praestigiis daemonum* (On the Tricks of Devils). In Book 3, chapter 17, Weyer, himself a physician and thus familiar with medicinal plants, wrote that witches were thought to use belladonna, hemlock, and aconite, among other poisons, citing Italian examples from Giambattista Della Porta and Girolamo Cardano, supplemented by an illustration of nightshade's effects on the son of one of his Rhineland colleagues. Traditional names for the plant reveal more of this commonly held folklore. The plant has been called Devil's cherries, naughty man's cherries, and Devil's herb. The word *belladonna* perhaps derives from the herb's ability to cause dilation of the pupils; women used it in infusions to make their eyes look larger. There was even a folk belief that the herb could take on the form of a beautiful woman, which may offer another source for the plant's name.

Witches used brews compounded with poisonous herbs such as belladonna for various supernatural purposes. A witch might have administered belladonna as a poison in a drink. One might also have compounded poisonous herbs, including nightshade, with grease to make a flying ointment. This last belief is supported by the nature of the chemical constituents of nightshade, which include hyoscyamine and atropine, as well as scopolamine. Such drugs produce effects on the circulatory system and can make the individual who uses them feel as though he or she is flying or floating. Aside from its uses in witchcraft, belladonna was also considered an herb that belonged exclusively to the Devil, who was said to tend it personally. Folklore held that the Devil was so fond of his belladonna that he rarely left it alone, stopping his gardening duties only on Walpurgis Night to attend the famous witches' Sabbat.

NODÉ, PIERRE

A Minim friar in Paris during the French Wars of Religion, Nodé published a book in 1578, *Declamation contre l'erreur execrable des maleficiers*

(Declamation Against the Execrable Error of Evildoers). Typical of the intellectual position of zealous Catholics in those troubled times, Nodé lamented that the chaotic conditions of his world were a sign of its imminent end. Like so many others, he considered the troubles caused by the rise and spread of Protestantism in France as the work of the Devil. It was incumbent on all believers in God (Catholics) to fight back and exterminate their enemies. Nodé appealed to the monarch, high nobles, and high court justices to join the battle wholeheartedly.

According to Nodé, witchcraft and magic were an epidemic in his time. Witchcraft involved such horrible sins as apostasy, blasphemy and *lèse-majesté divine* or “treason against God.” French Catholic demonologists frequently made this last charge (borrowed from French legal jargon condemning heretics) as an important argument for imposing the death penalty for witchcraft, even if the witches had harmed no one.

Nodé bemoaned the lack of commitment by the king and high nobles to eradicate heretics and witches. Judges had the responsibility and the duty to pursue actively these “diabolical monsters.” As Nodé stated, “The civil law wishes their bodily death, the holy canons order their spiritual death, and God commands both against them so that this race of perverse malefactors is exterminated from Heaven and earth” (Nodé 1578, 46).

He was clearly angry and frustrated because French royal authorities were not taking this task to heart. French writers on demonology and heresy complained constantly that the French legal system did not pursue witches aggressively. Either “indiscreet pity” or incredulity was extremely dangerous. “It would be far better to exterminate such people from the earth and wipe out all memory of them,” Nodé expostulated, “rather than wait for a great disaster and calamity” (Nodé 1578, 55).

Nodé’s equation of the Protestant heresy with witchcraft, in the context of the anarchic conditions of the civil wars and the perceived presence of the apocalypse, was typical of these writers and preachers. The violence of the polemical wars matched the military violence of the times.

Following conventional wisdom, Nodé’s work examined many aspects of the complex of beliefs comprising witchcraft: the transportation of witches over great distances, werewolves, maleficent crimes, and sexual dysfunction, always linking these evils to the current rise in heresy and unbelief. He also reported a very interesting case. Stating that the Devil could make people hate food, he told of a young woman who died after not eating for four months. The poor anorexic girl died in “extreme languor, dry as wood, thinner than a heron, pale as a sheet and thinner than parchment that shrivels near a fire” (Nodé 1578, 32). Some supernatural evil force must have caused something so extraordinary.

Throughout his tirade, Nodé trotted out clichés stressing the intimate connection between the heresy of the day and Satan’s machinations that were central aspects of Catholic rhetoric during the Wars of Religion, hoping—vainly—to stimulate more active persecution of witches (and Protestants) by the state.

NÖRDLINGEN, IMPERIAL FREE CITY

Thirty-three individuals—all but one of them women—were burned at the stake as witches in the Lutheran city of Nördlingen, Swabia, between 1589 and 1594. It constituted one of the most severe witch hunts seen in a Protestant imperial free city. The main reasons for this persecution were the zeal of the city councilors who tried the witches and the fact that they treated witchcraft as a *crimen exceptum* (the excepted crime), subject to none of the usual safeguards for the protection of the accused. Torture was therefore used to excess, usually forcing accused individuals to confess to witchcraft and denounce others as their accomplices. Records of virtually all trials, which formed part of a wave of witch hunts that occurred in Germany between 1585 and 1595, survive in Nördlingen’s city archive.

Before 1589, Nördlingen had experienced only two witchcraft trials, in 1478 and 1534; both times, the alleged witches were released unpunished. The late-sixteenth-century persecution was triggered by Ursula Haider, a mentally unstable woman who in 1589 had the misfortune to nurse the three children of knifsmith Martin Hindenach, all of whom died of smallpox. Haider had claimed that she was plagued by the Devil even before 1589. Now she confessed that she had killed the second Hindenach child at the Devil’s command, chiefly because its corpse had apparently bled as she held it: contemporaries believed that a body would bleed when touched by its murderer. She was arrested on suspicion of witchcraft on November 8, 1589. Under interrogation, she confessed to other acts of *maleficium* (harmful magic) and claimed that she had seen other Nördlingen women at witches’ Sabbats, thus creating the potential for further trials. Haider was executed with two of the women she had denounced on May 15, 1590. That year, fourteen more Nördlingen

women were arrested, mostly on the basis of denunciations: twelve were burned alive, one was burned after dying under torture, and one (Apollonia Rorendorfer) was released after refusing to confess.

Apart from one execution in 1592, there was a lull in the intensity of persecution from May 1591 until 1593, when sixteen more Nördlingen inhabitants were arrested. Thirteen of them (twelve women and one man) were executed, the bodies of two women who died under torture were burned, and one (Maria Holl) was released in 1594. The impetus for the 1593 trials came mainly from Nördlingen inhabitants who believed themselves to be victims of *maleficium*. Once restarted, however, the process of persecution again relied on denunciations for its continuation. Villagers from outside Nördlingen had a better chance of escaping execution: of nine women arrested as alleged witches at Goldburghausen, Itzlingen, and Sechtenhausen in 1590 and 1593, only one was executed. The council's "leniency" in these cases probably stemmed from its desire to avoid legal disputes with the count of Oettingen, who ruled the area around Nördlingen, over the right to try witches.

Nördlingen's witchcraft trials did not result from social conflicts: those executed came from a wide range of social backgrounds, from the poor and socially marginal to wives or widows of councilors. Nor did the council target particular individuals as witches: around one-third of all suspects were accused of *maleficium* by their fellow inhabitants, and suspects tended in the course of forced denunciations to name alleged Sabbat attendees on the basis of personal vendettas and preferences. However, the city councilors were responsible for the severity of the witch hunt. In 1589 they could either have dismissed Haider as insane or ignored her claims to have seen other women at Sabbats, thereby depriving the hunt of its momentum. They did neither because they were convinced of the reality of witches' Sabbats and of the need to rid Nördlingen of this evil. Crucially, they decided from the outset to treat witchcraft as a *crimen exceptum* and therefore to subject many accused women to extremely severe torture. Mayor Johann Pferinger and jurist Wolfgang Graf, both newly appointed in 1589 and desirous of making their mark, played leading roles in driving the witch-hunting zeal of the council. The active or tacit support of the persecution by a significant proportion of Nördlingen's inhabitants also helps account for its severity. Their anxiety about witchcraft may have increased before 1589 after a series of agrarian crises: it was doubtless heightened afterward by the sight of so many alleged accomplices of Satan burning at the stake.

The immense courage of Maria Holl was instrumental in finally ending Nördlingen's witchcraft trials. The wife of innkeeper Michael Holl, Maria was arrested on the basis of six denunciations on November 2, 1593. Despite

suffering sixty-two bouts of torture with thumbscrews, leg-screws, strappado, and the rack, Maria refused to confess. On that basis and because her relatives from Ulm petitioned the Nördlingen council on her behalf, the council reluctantly released her on October 11, 1594. She was not the first Nördlingen woman to refuse to confess: Apollonia Rorendorfer had shown similar steadfastness in the face of savage torture in 1590. However, Holl's case increased concern on the part of some councilors and inhabitants of Nördlingen that denunciations were an unsafe basis for pursuing witchcraft trials. After three more executions for witchcraft in 1598, there were no more witchcraft trials in Nördlingen. Maria Holl died at the age of eighty-five in 1634. By then one of the richest women in Nördlingen, she had outlived three husbands and all the men who had been involved in her trial for witchcraft forty years before.

NORMANDY

Famous for the trial and execution of Joan of Arc in its capital, Rouen, this northern French province now seems most noteworthy in the history of European witchcraft as the leading punisher of male witches in western Europe. From the early 1540s until well after Louis XIV supposedly decriminalized witchcraft in France, Normandy's appellate court, the *Parlement* of Rouen, investigated primarily men for the crime of *sortilège* (diabolic magic). And, by French (or at least Parisian) standards, Norman judges punished them severely: although such other French *parlements* as Toulouse (1562) or Paris (1568) confirmed death sentences for

witchcraft sooner than Rouen (1574), Norman parliamentary records from the sixteenth and seventeenth centuries identified almost 400 accused witches and about 100 burnings for witchcraft. Almost three-fourths of these defendants were men, as were about two-thirds of those executed (Monter 1997, 572, 584).

The predominance of men among accused witches in Normandy increased over time. When the *parlement* first encountered one or two witches each year (1564–1578), men outnumbered women by only 15 to 10. But the disproportion between male and female witches grew steadily larger after 1600. Under Louis XIII, it surpassed 4 to 1, and by the late 1640s, when the *parlement* again averaged one or two witchcraft cases per year, women had almost disappeared. If certain types of women like old widows reappeared frequently among suspected witches elsewhere, so did certain types of men in Normandy. By far the most feared male witches in this cheese-producing region were shepherds, some of whom possessed veritable arsenals, featuring such items as toad venom and stolen Eucharists, suitable for performing both offensive and defensive magic. Priests were also heavily represented among Norman witches; between 1598 and 1647, seven Norman priests were burned for *sortilège*, another was given a life sentence to the galleys, and a half-dozen others were permanently banished from the Kingdom of France with loss of their benefices (Monter 1997, 582–583). A third dangerous occupational group was Normandy's blacksmiths, who exercised their skill in harming as well as healing horses.

The chronology and severity of Norman witchcraft persecution seemed unremarkable. Repression accelerated sharply here in the 1580s, as it did elsewhere in France. Between 1585 and 1610 the Rouen *parlement* judged over five witchcraft trials each year and upheld over 60 percent of lower-court death sentences for this crime; it ordered at least one witch burned every year until 1615 (Monter 1997, 572–573). However, this court placed little emphasis on the witches' Sabbath; although as many as ten witches were executed in the very worst years, they came from scattered places, and in Normandy no single episode ever grew into a serious panic. At the same time, Normandy experienced no scandals involving sadistic tortures, professional witch finders, "ducking" suspected witches (the swimming test, or water ordeal), or other clearly illegal practices; everything here seemed orderly and regular, except for the oddity that most accused witches were men. When the French phenomenon of bewitched convents finally reached Normandy in the 1640s, it was relatively unspectacular—and the most important female defendant (Madeleine Bavent) was never executed, despite her repeated confessions.

Although witch hunting had all but disappeared in most other parts of France by the time Louis XIV began

his personal reign in 1661, Normandy kept putting its shepherd-witches on trial from 1670 until after 1700. Louis's government tried but ultimately failed to shut it down; despite the royal legislation supposedly decriminalizing witchcraft in 1682, the Rouen *parlement* was still burning them for sacrilege and "so-called *sortilège*" in 1694 and 1703, and sending them to the galleys even afterward. In 1718, Louis XIV's German sister-in-law remarked that "at Paris people don't believe in witches and we hear nothing about them; at Rouen they believe that witches exist, and there one always hears about them" (Monter 1997, 594).

Certainly the Norman *parlement* never displayed the scornful skepticism of their upriver Parisian colleagues about witchcraft. But compared with "offshore Normandy"—the Channel Islands, governed by England but speaking only French during the age of witchcraft trials—the *Parlement* of Rouen seems quite gentle in its treatment of witches. In terms of size and population, its judicial district was a hundred times greater than the Channel Islands (and its legal records are as rich as theirs), yet more women were burned as witches in the Channel Islands than in Normandy. The key to this grotesque discrepancy is that the Channel Islands enjoyed complete legal autonomy while Normandy had a scrupulous, if credulous, appellate court.

NORTH BERWICK WITCHES

The cluster of witchcraft trials that occurred in Scotland in 1590–1591 in East Lothian and Edinburgh was sufficiently widespread and severe to merit the term "witch panic." From late November 1590 until December 1591 the hunt developed, as local magistrates and then the king and privy council uncovered what they believed to be conspiracy and treason by many women (and some men), led by the politically powerful earl of Bothwell.

The causes of the panic were long-term as well as immediate; some of the women and men who were interrogated, tried, and executed in 1590–1591 were accused of witchcraft activities stretching back as far as seventeen years. In 1586, Andrew Melville, the leading Presbyterian, returned from England along with fellow hard-line Protestants intent on creating a godly, disciplined nation. They soon established Presbyterian kirk sessions (parish disciplinary committees) in lowland and northeastern Scotland, where ministers and elders tried to enforce church discipline on a sometimes

resistant population by investigating social disorder, sexual offenses, and popular magical practices. In certain areas, including East Lothian and Edinburgh, many people retained remnants of old Catholic beliefs and rituals. For the Kirk (the national—Presbyterian—Church of Scotland), Catholicism and magical beliefs were indistinguishable. The Kirk found an identifiable enemy in the North Berwick witch hunt: an underground network of witches inspired by the Devil and intent on overturning church and state.

The chain of events began in November 1590 when a servant girl who was a healer was accused by her master of witchcraft, tortured, and found to have the Devil's mark. The scope of the investigations widened, and a treasonable conspiracy involving some forty people was soon discovered against King James VI and his newlywed wife Anne. The network contained assorted practitioners of maleficent witchcraft, love magic, divination, and healing, including a long-established and respected healer, Agnes Sampson, and a schoolmaster, Dr. John Fian. Torturing some of the accused revealed a momentous tale of treasonable witchcraft. The accused came from a wide social range—peasants, servants, urban bourgeoisie, and aristocracy—and showed that belief in and practice of magic was prevalent throughout Scottish society.

The renegade earl of Bothwell, Francis Stewart, whose relations with the kirk and his cousin, the king, were highly unstable, was accused of involvement in the plot; he fled to escape trial and began an insurrection against James that ended with his forfeiture and banishment. Kirk and crown were temporarily allied against this supposed witchcraft conspiracy. James Carmichael, minister of Haddington, located in the area where many of the accused lived, helped King James. Carmichael was an ardent Presbyterian returned from exile with Melville, and one of the kirk's leading reformers and intellectuals.

A number of legal records of interrogations (sometimes under torture) survive from November 1590 to mid-1591. They produced stories that became more elaborate and coherent as the weeks passed, ultimately cohering into one story of a large-scale treasonous conspiracy involving personal appearances of the Devil at the witches' Sabbats. The stories mixed reality with fantasy: witches made pacts with the Devil and conspired to raise storms to prevent Anne's fleet from reaching Scotland and then James's from reaching Norway. After James and Anne returned safely, the witches planned James's death, using such familiar magical techniques as melting a wax image and poisoning his clothes. James was initially skeptical of the witchcraft threat but eventually took it seriously. Although later historians have been too ready to interpret the witchcraft conspiracy from the authorities' point of view, the evidence for its reality began to disintegrate by mid-1591, as witnesses

began to revoke their confessions, asserting them to be false and compelled by torture. There were indeed networks of acquaintance among those implicated in the accusations, but these ordinary links, some indeed based on shared practices of magic and witchcraft, were present in Scottish society from top to bottom.

Surviving trial records of the four most prominent accused witches show Scottish authorities reacting as the fearful and uncontrolled powers of magic, embodied in particular social types, threatened to overturn established social relations: a peasant wise woman with uncanny medical and political knowledge; a subversive schoolmaster in league with the Devil; respectable townswomen revolting against both class and sexual subordination; and Bothwell, who epitomized the sort of aristocratic rebellion against royal power that had plagued James for a decade and Scotland for generations. Socially insignificant accused witches were easily dealt with, but higher up the social scale, resistance to arrest and conviction mounted. In May 1591, Barbara Napier, a well-connected Edinburgh bourgeois, was acquitted of attending the North Berwick Sabbat, though she was convicted on other capital charges. James reacted angrily, and after threatening the assize with "wilful error" in blocking the operation of justice, he obtained a guilty verdict. The trial of Euphame MacCalzean, another wealthy Edinburgh woman from a well-connected legal family, involved a two-week long struggle to obtain a conviction and execution by the exceptionally cruel sentence of being burned alive.

The government seized the opportunity to destroy Bothwell that his contact with witchcraft offered. Bothwell was convinced that his enemy Chancellor Maitland was behind the witchcraft charges, and there is evidence that the government kept the main witness against Bothwell, a man later executed for witchcraft, in protective custody. Brought before the king and privy council in April 1591 to answer charges of treasonable conspiracy with a lately executed witch, Bothwell avoided trial in May when his peers refused to assemble to try him and escaped custody in June when Euphame MacCalzean was executed. In 1593, when he was finally tried for witchcraft, he was acquitted. When accused witches mentioned Bothwell in depositions, they clearly saw him as James's great adversary, so prominent that he became elided with the Devil himself.

Information about the witch hunt reached London in late 1591, while Scotland's witchcraft trials were still proceeding, with a pamphlet called *Newes from Scotland*, composed from materials probably supplied by Carmichael. Its lurid account of the witchcraft conspiracy offered maximum propaganda for King James, struggling heroically and single-handedly against diabolical agents, and contrasted James's

The North Berwick witches and witchcraft; nautical witchcraft, the Devil preaching, witches brewing in a cauldron, the earl of Bothwell reclining, witches eating and drinking in a cellar. (Fortean Picture Library)

divine-right legitimacy with the witches' diabolical subversion. It made no mention of Bothwell, who was still threateningly at large. The witch hunt also inspired James's *Daemonologie* (Demonology), probably written in 1591 but not published in Edinburgh until 1597, during a later witch hunt. James's account of witches' practices included details that he acquired from personally interrogating some of the North Berwick witches and that reappeared in trial records. *Daemonologie*, in orthodox fashion, made explicit the political threat to the established authorities that witchcraft represented. James's book had a baleful long-term effect on Scottish witch hunting by locating witchcraft within a theological framework and defining it as involving a pact with the Devil.

Historians have argued over what part, if any, Privy Council orders of 1591, 1592, and 1597 may have played in prolonging or exacerbating witch hunting after the North Berwick panic. What now seems clear is that the North Berwick witch hunt was a separate event

from the next Scottish witch hunt of 1597 and that the government did not lose control of witchcraft prosecutions.

The witch hunt begun in North Berwick induced a brief lull in hostilities between Scotland's Presbyterian party and its monarch, while they cooperated in pursuing witches who represented each one's deepest fears: Catholic and magical beliefs and practices for the kirk, lawlessness and insurrection for James and his government. It was through witchcraft accusations that Bothwell's political threat was destroyed. When Parliament ratified Bothwell's forfeiture in 1592, it also finally gave the Kirk what it had long sought, legal sanction for Presbyterian church government, though the struggle between church and state would continue.

NORWAY

Almost all witchcraft trials in Norway, which was under Danish rule from 1388 to 1814, took place from 1551 to 1700. With few exceptions, they occurred after the implementation of the Reformation, which reached Norway from Denmark in 1537 after the king had turned Lutheran and Norway's last Catholic bishop had fled. Until the Reformation, the crime of witchcraft had been defined solely as *maleficium* (harmful magic); in medieval Norwegian (and Danish) laws, it deserved capital punishment only if it had caused death or injuries to people or animals. However, the medieval statutes on witchcraft in Norwegian customary law (*Landsloven*, or "Laws of the Lands") do not seem to have been applied until after 1540. The only case of medieval witchcraft dates from 1325, when a woman accused of love magic suffered penance ordered by the bishop of Bergen. In 1520, King Christian II introduced new laws involving harsher procedures in many criminal cases, including those involving witchcraft, that were not put into effect. Nevertheless, continental practice strongly influenced procedures in witchcraft cases as the death penalty came into use.

As one consequence of the Reformation, the Mosaic laws—including Exodus 22:18 (22:17; "Thou shalt not suffer a witch to live")—were introduced into criminal codes throughout Scandinavia. This process followed somewhat different courses in different states. In Sweden, the penalties of the Pentateuch were simply added to the existing law of the land as an appendix. In Denmark and Norway, the Mosaic prohibitions were introduced piecemeal during the century after 1540, with various articles punishing specific deeds; most of the Mosaic laws had been incorporated into the Norwegian legal framework by 1630.

Church and state cooperated closely in this confessional age: the king's laws about witchcraft were read from the pulpit every Sunday, and pastors reminded their congregations that the whole kingdom would suffer from God's wrath unless these creatures of the Devil were brought to justice and suitably punished. The Lutheran clergy cooperated closely with the new Lutheran regime to recommend strong actions against the enemies of God. Witches ranked among the very worst kind conceivable: a *crimen maiestatis laesae divinae*, being a traitor to God, was even worse than being a traitor to the king. Such reasoning made it possible to legitimate the use of torture in witchcraft cases.

In 1584, the Danish king, responding to a petition from the Lutheran bishop of Stavanger, introduced the fully formed concept of demonology into the criminal code of Norway, ordering local authorities to prosecute all kinds of witchcraft, including "superstitious" healing practices that medieval legislation had ignored. This statute, introduced in the diocese of Bergen in 1593, seems to have been known throughout Norway. Finally, a new general witchcraft code was introduced for Denmark and Norway in 1617. It divided the crime into three parts: the pact with the Devil, *maleficium*, and healing practices. Death by beheading was to be employed on persons convicted of the first two categories.

WITCHCRAFT AND CRIME

Norway's recorded witchcraft trials began about 1540. Although there were no mass persecutions until after the enactment of the Witchcraft Code in 1617, an increasing number of trials took place after 1570. The best-known case involved Anna Pedersdotter, a clergyman's wife in Bergen, who, after two trials in 1575 and 1590, was burned at the stake. Bits and pieces of information show both torture and the water ordeal (swimming test) being used in Norwegian witchcraft cases since the sixteenth century, although Danish and Norwegian laws formally permitted neither.

The total number of cases known numbered about 880. In about 780 of these cases, a man or a woman was accused of some kind of witchcraft; the other 100 were defamation suits, initiated by a person who had come under suspicion for witchcraft in a local community.

These cases therefore might not be considered as ordinary witchcraft trials, but they nevertheless are of great interest in completing our knowledge of the ways witch beliefs were dealt with by the parties involved in Norwegian communities.

We know that approximately 310 persons suffered the death penalty for witchcraft in Norway; almost 90 percent of these executions took place during the years 1601–1670 (Næss 1990, 371). Allowing for lacunae in the documents, the total number was about 330. This number can be assessed relatively precisely because public accounts providing detailed information about all expenses paid for imprisonment, and executions have been preserved almost completely from most parts of Norway. Many witches were burned at the stake; but many others, having been “pardoned” by the regional governor or the king from being burned alive, were simply beheaded by the executioner’s axe or sword. Typically, the vast majority of people, both among the accused and those suffering the death penalty, were women; only about one in five were men.

Despite all the attention it has received in recent research, witchcraft was far from the most common kind of offense involving capital punishment in post-Reformation Norway. One consequence of the introduction of Mosaic laws was that capital punishment became customary after convictions for murder or manslaughter, theft, adultery, incest, infanticide, bestiality, treason, or blasphemy. Minor sexual and moral offenses also received severe punishment. In Rogaland County, where most seventeenth-century records have been preserved, during the years 1610–1660 no fewer than 223 people were sentenced to die. Most had been convicted of incest (59), theft (54), manslaughter or murder (51), and infanticide (12); only 14 (or less than 7 percent) had been charged with witchcraft. However, 63 of them escaped, and 45 others were pardoned, receiving milder forms of punishment, often banishment from the county or the kingdom. Only 115 people were effectively put to death; but because witches were never pardoned and, being women, rarely escaped, 13 of them (over 11 percent) had been convicted of witchcraft. Because Rogaland contained about 6 percent of Norway’s total population of about 440,000 inhabitants in the 1660s, it would seem that about 2,000 people were publicly executed, 216 of them for witchcraft, in this small country on the outskirts of Europe in the seventeenth century (Næss 1990, 369–370, 377). And it is worth remembering that the frequent use of capital punishment for many other crimes continued in eighteenth-century Norway, when no more witches were executed.

THE TYPOLOGY OF WITCHCRAFT

The stories told by the victims to Norway’s bailiffs, sheriffs, priests, and judges provide a fairly comprehensive

picture of the various concepts of witchcraft. The accusation of diabolism (pacts with the Devil and participation in the Sabbat) was invariably put forward during the interrogations by bailiffs and pastors urging the accused to confess. Details in Norwegian confessions obtained through the use of torture described meetings with the Devil and other witches on various widely scattered mountains like Domen (in far northern Finnmark), Dovre (in southern Norway), Lyderhorn (near Bergen), and even Blåkulla in Sweden. Because witches flew to the mountain closest to their own community, Blåkulla was mentioned solely in trials from southeastern parts of Norway close to the Swedish border.

There were a total of 789 specific accusations, including 263 for white magic, 398 for *maleficium*, and 128 for diabolism (Næss 1990, 373). The first group comprised various kinds of white magic and healing practices involving formulas and rituals; the use of herbs and strange substances like teeth, toes, and animal tails; and the use of “superstitious” prayers vaguely remembered from Catholic times, naming Jesus and Mary or other holy persons and distorted elements from biblical texts. The step from practicing white magic to suspicion of *maleficium* was often a short one. If the treatment of a patient by a wise woman brought about sickness or even death, she was quickly suspected by the public to be a witch. Over half of these accusations found in the cases tried involved *maleficium*. The evils allegedly done by the accused included the usual charges: manslaughter, killing or injuring of people or cattle, destruction of crops, impotency, and loss of wealth. Because fishing was an essential part of Norway’s economy, its witches were also accused of causing storms and tidal waves that made ships sink and crews drown.

THE LEGAL SYSTEM

As elsewhere in Scandinavia, Norwegian criminal cases followed accusatorial procedures. The offended party indicted the aggressor. In cases involving the public interest, such as witchcraft, the bailiff acted as prosecutor. He could even begin a prosecution when only rumors of witchcraft were at hand. A case was proved when at least two independent witnesses had sworn on the Bible that the accusation was true. Such testimony was often difficult to obtain in witchcraft trials, so the court, often after a request from the bailiff, accepted it as sufficient proof if many people testified that they suspected the accused person of being a witch, even though they did not dare to swear to its truth. Accused witches found it difficult to employ the traditional means of defense, the compurgation, or oath of denial, by which a person in cases the court considered dubious could be acquitted if a certain number of people swore that they believed the accused to be innocent. Although the court gave several accused witches this

opportunity, they found it impossible to persuade enough neighbors to swear to their innocence because they feared becoming charged with witchcraft themselves if they did so.

A bailiff had an enormous influence on the way criminal cases were handled. He acted as public prosecutor on behalf of the king and administered the court. The bailiff imprisoned accused persons; he was responsible for their examination; and he often brought in priests, or sometimes an executioner, in order to help secure a confession. The court justices were twelve local farmers, assisted by a secretary (*soreskriver*) who gradually during the 1600s ended up as the real judge.

THREATS, TORTURE, AND CONFESSIONS

The large number of men and women being accused of *maleficium* and pacts with the Devil can only be accounted for by taking the practices employed by the authorities into account. Facing harsh interrogations, being threatened with going to hell by the pastors, being told what to confess under torture, many of the accused told the stories they knew in advance that they were expected to tell. Even though it was illegal to resort to torture before a sentence had been passed, courts nevertheless employed torture in several cases known to us so as to extract confessions from accused witches.

In order to further strengthen the evidence, suspects were submitted to the water ordeal. First documented in Norway in 1606, the water ordeal was recorded about forty times, although it was probably used much more frequently. Only a few instances are known in Norway in which courts searched for the Devil's mark on the accused's body. Defendants knew what suffering they might expect. According to the minutes of the judge, one imprisoned woman said to another: "Should you choose not to confess at once, they will try you on the water and next you will be put on the rack. After having extended your limbs they will increase your pains by pinching you with red-hot iron tongs." Another woman told the judge that she had willingly confessed at first because she preferred to shorten her life quickly instead of being exposed to the gruesome torture that awaited her.

REGIONAL DIFFERENCES: THE CASE OF FINNMARK AND CHAIN PROCESS

In most of Norway's eighteen counties, one finds that the number of persons burned or beheaded for witchcraft varied between six and fourteen. There were three exceptions: Hordaland killed twenty-two witches and Rogaland twenty-five; but Finnmark stands in a category by itself, executing about ninety-two witches, 30 percent of Norway's total. The relatively high figures from Rogaland and Hordaland reflect the fact that

witches were tried in these counties sooner than in the rest of Norway.

Finnmark, in the far north, had a very small population, no more than about 3,000 persons by 1600, both Norwegian and Sami. The latter ethnic group, however, was barely visible in Finnmark's witchcraft trials; its total of approximately 138 convicted witches includes only 27 Sami men and women (Hagen 1999, 44). Finnmark's contemporary authorities considered Norwegian women much more likely than the less-Christianized and nomadic Sami to practice *maleficium* and enter into pacts with the Devil. The governor, bailiffs, and pastors allowed frequent use of torture and the water ordeal in these cases. The consequences were horrifying: per thousand population, Norwegian women in Finnmark ranked among Europe's most intensely persecuted groups. Chains of accusations caused most of these arrests.

In Norway, no one willingly confessed to have made a pact with the Devil to perform evil. Persons convicted were strongly exhorted to denounce accomplices, who were then promptly indicted. Many local courts accepted such denunciations as independent accusations; two or more sufficed to pass a death sentence, even though this practice contradicted sixteenth-century laws. One case led to new trials due to denunciations from the first woman accused. The case against Gunvor Omundsdatter in Vardø in Finnmark in 1651 lasted for two years before she was burned at the stake, convicted of attending the Sabbath and causing storms that made ships and crews sink. A total of 21 other women were involved in this case, either because they denounced Gunhild or because she denounced them. The great majority of the approximately 92 people (almost all women) who suffered capital punishment in Finnmark were the victims of such chain processes (Hagen 1999, 44–45). In addition, three women died before sentencing, and one Sami man was killed (by another man) during the trial. In total, we know the names of 353 persons denounced by other Norwegian witches. A majority of the death sentences in Norway resulted solely or partly from denunciations.

THE SOCIAL CONTEXT

Although high-ranking persons were occasionally accused and even convicted, as with Anna Pedersdotter at Bergen in 1590, the great majority of people indicted for witchcraft in Norway were old and on the same economic level as others in the community. Most of the accused, men or women, seem to have been from forty to sixty years of age, older than the average life span of people at that time. The typical process leading to accusations for witchcraft included quarreling with neighbors for many years over matters relating to accidents and deaths. Rumors of witchcraft led to suspicion and to accusations.

THE END OF NORWAY'S WITCHCRAFT TRIALS

The period of witch hunts in Norway largely coincided with Denmark's seventeenth-century wars. After the peace between Sweden and Denmark in 1660, relatively few persons were burned; Norway's last execution took place in 1695. After absolutism was introduced in Denmark in 1665, the largely Danish judges and other civil servants began to govern Norway by the 1670s, at both the central and local levels, in a far more modern and professional way than they had in previous decades. New rules imposed on local bailiffs and judges included stricter demands for documentation at all levels about each kind of case handled by a civil servant. The new generation of civil servants brought new and more critical attitudes about proof and evidence in all public matters. This attitude soon spread among judges and governors.

Meanwhile, Norway's old accusatorial legal system was replaced by an inquisitorial system, in which cases were decided by a judge's personal assessment of all evidence brought before him and after personal examination of both the accused and the witnesses. When this way of handling court cases was introduced in Norwegian witchcraft trials, it soon turned out that judges almost always found the evidence insufficient to sustain the accusations and consequently acquitted the persons accused. Although relatives of accused witches had formerly hesitated to defend them in public, from the 1660s onward several men appeared as defense council for the accused, further reducing the possibilities for starting a successful witchcraft trial. So, in a very short period of time, the whole mental climate about witchcraft changed dramatically in Norway.

NUMBER OF WITCHES

Wildly exaggerated figures are often cited for the number of witches executed in Europe, with a preposterous total of 9 million women still enjoying particular favor. This claim ultimately derives from an absurd calculation by an eighteenth-century anticlerical lawyer, Gottfried Christian Voigt, who multiplied up a mere twenty trials in one German city on the assumption that persecution levels had been constant across Europe for many centuries. It was given wider circulation by Gustav Roskoff's 1869 *History of the Devil*, much cited by Protestant and anti-Catholic writers, and was subsequently picked up by the German neopagan movement and by elements in the Nazi party.

American feminists seem to have relied on its appearance in a book by Matilda Joslyn Gage, *Woman, Church, and State* (1893), where she at least stated that only "the greater number" of this imaginary multitude were women. A connection is also made between "the burning times" and Margaret Murray's thesis of witchcraft as an ancient pagan religion under sustained attack from the western Christian Church, for which the idea of massive casualties over a long time span is a particularly convenient fiction. The myth of this early holocaust is probably indestructible, but historians are hampered in their responses by their inability to give

any truly authoritative statistics based on the sources. Records of witchcraft trials across most of Europe are simply too patchy, so that reliable counting is only possible in a few exceptional jurisdictions, not on a national or European scale. Many of the suspiciously round figures given in contemporary sources also turn out to be far too high or lack any basis in fact at all. Few historians now subscribe to the idea of a massive persecution that traumatized either urban or rural society across the Continent, preferring instead to stress the localized, highly variable nature of the phenomenon.

The current estimates suggest a figure of, at the most, 50,000 legal executions in Europe (including Russia) between approximately 1400 and 1780, with perhaps 100,000 persons having been tried for witchcraft before properly constituted courts. The great majority of trials occurred in a much shorter period, around 1570–1630; in most of western Europe between 75 percent and 90 percent of trials took place over these years. In Poland and Hungary, by contrast, the trials peaked in the first half of the eighteenth century. Eastern Europe presents special difficulties because record destruction (above all in Poland) has been so serious, but the high figures once cited for Poland were generated by the same fallacious method that Voigt used in eighteenth-century Germany, that is, multiplying from a few local cases. Although a margin of error must always remain, it is hard to see how the figures could be plausibly increased by more than 20–30 percent on the most generous assumptions about missing evidence.

Unauthorized lynchings and the use of forms of popular justice such as the swimming test represent a separate problem, one that defies any statistical approach, despite the survival of occasional prosecutions of the perpetrators. On current evidence, there must at least have been hundreds of killings and very extensive witch-finding activities; total figures for lynchings may well have been in the thousands, although they are unlikely to have been so high as to alter the overall picture radically. Some of the most striking outbreaks of this kind were in countries like France, Spain, and England, which had low rates of legal executions, thus making unofficial local action an attractive and effective alternative. Rulers and governments always disapproved of such irregular procedures, and over the course of the seventeenth century they reacted with growing effectiveness to punish those involved where they could be identified. Nevertheless, a small number of physical attacks and killings persisted in parts of rural Europe until the late twentieth century.

The apparent lack of witchcraft persecution before 1400 may be deceptive because there could easily have been many trials in local courts and lynchings for which little evidence has survived. A scattering of references to individuals punished for witchcraft may well imply that such action was quite common. No reasonable estimate

of numbers can be given: the victims, unlike later witches, would not have been accused of belonging to a diabolical sect, although the local names for witches were already applied to some of them. Systematic persecution began with small numbers of trials in Savoy and the Dauphiné from around 1400, followed by bigger waves in the 1420s and 1430s. At the least, these Alpine regions must have seen several hundred trials in the decade after 1428, with a high ratio of capital sentences. These persecutions coincided with the emergence of the full-blown theory of a diabolical conspiracy, apparently propagated by the Dominicans. They were, however, followed by something of a lull over the next fifty years, when most trials seem to have been scattered local affairs, with the odd case involving twenty or more, as at Metz in 1456–1457 and Arras in 1459–1460. A second wave of larger-scale persecutions began in the 1480s and 1490s, again primarily around the Alps, continuing until about 1520 in the valleys on the Italian side. Although it is impossible to verify the figures from legal records, groups of trials involving up to sixty executions are said to have occurred in several places; the total cannot have been much short of 1,000 and could easily have reached 2,000. This second peak was again followed by a relative decline that lasted until the 1560s, despite scattered outbreaks like the one in Denmark in the 1540s.

In the 1560s, persecution began to increase again and soon reached unprecedented levels as it spread away from its Alpine heartland to cover virtually the whole of Europe. The vast majority of the trials in western and central Europe occurred in the half-century from 1580 to 1630, with a total of around 40,000 executions dwarfing anything seen before or since. The next fifty years were far milder, with most of the trials occurring in a few spectacular outbreaks (notably the Matthew Hopkins crusade in England, the 1661–1662 hunt in Scotland, the *Zauberer-Jackl* [Sorcerer-Jack] trials of Salzburg, the county of Vaduz between 1648 and 1680, and the Swedish hunt of 1668–1676). Each of these episodes involved hundreds of trials, but conviction rates were usually lower, so that the total of executions in these five instances may have been around 1,000. Elsewhere, growing judicial caution resulted in a massive reduction in the numbers of individual and small-scale trials, so that after 1630 the average rate of persecution probably fell to less than one-tenth of its peak levels in the preceding period. After 1680, there was no more than a trickle of isolated cases apart from the belated persecutions in eastern Europe.

For the period from the 1560s to the 1630s it becomes possible to analyze the statistics in more complex ways, notably to establish comparative rates of intensity across different regions. There are major problems of definition here because so much of Europe,

notably in the Holy Roman Empire, was divided into very small political units unlike modern nation-states. The attribution of more than 20,000 executions to the German lands conceals an exceptionally varied picture. In a region with hundreds of separate territories, about 10,000 of these executions occurred in a dozen locations, some of them quite small, whereas other rulers displayed extreme caution or refused to convict witches at all. A simple comparative measure sets estimates of executions against total population for the end of the sixteenth century. On this reckoning there are striking differences between larger regions: modern Luxembourg had about 5 executions per 1,000 people; followed by Switzerland, with 4 executions; the Spanish (southern) Netherlands, with 2; Denmark, 1.75; Germany, 1.5; Scotland, 1.4; Hungary, 0.27; Italy, 0.2; and England and the northern Netherlands both about 0.13. France and Spain hardly register on the scale, at around 0.04 per 1,000 people. The differences become far greater when very small areas are included; modern Liechtenstein (the county of Vaduz) is way out in front, although per capita totals in a few smaller autonomous German territories were even higher, with the extraordinary figure of 100 per 1,000 inhabitants, 300 executions for a population of only 3,000. The electorate of Cologne led the middle-sized category at 10 (2,000 per 200,000 people), with the duchies of Lorraine and Luxembourg both over 5 (each around 1,600 per 300,000 inhabitants), and the electorate of Mainz not far behind. Although all these figures rest on calculations for both trials and total populations that are very approximate, the orders of magnitude seem fairly well established. Some of the lower figures, including those for the large monarchies of France, Spain, and England, are rather deceptive, because these regions had abnormally low rates of convictions and capital sentences. If the measure were in terms of trials rather than executions, their coefficient would move up quite sharply. Less than 10 percent of some 1,300 witches whose cases went to the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) on appeal were executed, but hundreds were flogged or banished. In England the county of Essex was unusually active, with executions running at 0.82 per 1,000 people; if trials are considered, however, the figure was 4.

What the numbers also show are very different patterns. At one extreme were regions like Lorraine, Luxembourg, and the pays de Vaud, where there were no large crises, and trials were spread fairly evenly across several decades and quite wide areas. At the other extreme, there were the series of intense short-term persecutions, such as at the imperial abbey of St. Maximin, just outside Trier, where at least 400 people (out of a population of only 2,200) were executed as witches from 1586 to 1596. Alongside famous German cases

such as Bamberg (900) and Würzburg (1200), both with two surges within little more than a decade, one must place the Scottish and Danish witch hunts, the panic around Bouchain in the Spanish Netherlands, the Hopkins campaign in England, the various post-1650 cases mentioned above, and many others. Across much of Europe a mixed pattern is evident, with a series of isolated trials but also sudden bursts of more intense activity. In areas like the Franche-Comté or the Labourd, the victims were counted in scores rather than hundreds, but the dynamics were those of true witch hunts. The great persecution was thus a composite affair, which combined endemic suspicions within local communities with terrifying bursts of witch hunting, and the elites were heavily involved in the latter as both instigators and victims.

NUREMBERG, IMPERIAL FREE CITY

Nuremberg, one of the more important imperial cities of the Holy Roman Empire, unusual because of the skepticism of its leading citizens toward diabolical witchcraft and for the city's avoidance of witch hunts.

The inhabitants of Nuremberg (Nürnberg) embraced Lutheranism early on, despite the city's temporary role as the residence of the imperial government (*Reichsregiment*) in 1522–1524. By then, this rich town of about 30,000 inhabitants had reached maximal importance. Its merchants controlled mining activities in surrounding areas, and its craftspeople prospered in the metal industry and other handicrafts. Humanist Johannes Cochläus portrayed Nuremberg as the center of Europe, due to its geographic position as well as to the ingeniousness of its artisans: Erhard Etzlaub had recently invented maps indicating European travel

roads; Peter Hele had invented the portable clock, useful for travelers and merchants; and there were of course Albrecht Dürer and his school, the most daring artists of their time, not to mention Hans Sachs, the shoemaker-poet, and the *Meistersingers*.

Nuremberg was presumably founded around 1000 as a royal castle, but when a royal mint was introduced soon afterward, a suburb developed. By 1200 Nuremberg had its own law and soon after became one of the first German towns with a self-governing council. It was already almost “free” when the council received high jurisdiction in 1320. During the reign of Emperor Charles IV of the Luxembourg dynasty, the “Golden Bull” of 1356 granted Nuremberg the right to host the first imperial diet of each emperor. After 1424, Nuremberg’s prestige soared when emperor Sigmund decreed that this city would harbor the imperial symbols (*Reichsinsignien*), which indeed remained the case until 1796. As one of the few imperial cities, Nuremberg managed to get rid of all feudal remnants, simply by buying the Hohenzollern castle, and constructed its own territory, like an Italian city-state. Nuremberg’s governing families indeed acquired noble status, and it was one of the few German towns where humanism was an urban phenomenon, with Willibald Pirckheimer as a figure of almost “national” importance. Nuremberg even founded a university at Altdorf, within its territory. However, the city suffered terribly during the Thirty Years’ War and never again regained its former importance. Occupied by Bavarian and Prussian troops in the 1790s, it was swallowed by the Kingdom of Bavaria in 1806.

Nuremberg’s attitude toward witchcraft was explored thoroughly by Harmut Kunstmann in 1970. The results of this legal dissertation were then surprising, because contrary to common expectations, Nuremberg experienced no witch hunts. Nuremberg’s legal sources are exhaustingly rich, and it is unlikely that any trial escaped Kunstmann’s attention. It held several dozen sixteenth-century sorcery trials (the death penalty was imposed for poisoning and sorcery in 1520), and there were frequent allegations of witchcraft among the populace, but Nuremberg’s spirit of humanism and capitalism prevented any witch hunts. However, it had a few scattered witchcraft trials in a narrow sense, in which the city councilors proved to be extremely reluctant; one of them, Dr. Johann Hepstein, even ridiculed the existence of witches. Their attitude was reflected in contemporary art and literature: poet Hans Sachs also claimed that witchcraft was nothing but a devilish illusion, and the famous sketches of witches by Albrecht Dürer and his school should be interpreted likewise. Dürer was a councilor and part of Nuremberg’s governing elite, in touch with leading humanists and Venetian and Dutch artists, and it is extremely unlikely that he believed in witchcraft in such an environment. Humanist Willibald

Pirckheimer ridiculed recent ideas of witchcraft in his satire on Luther’s opponent, Johannes Eck, *Eckius dedolatus* (Eck Cut Down). In 1536, the Nuremberg council issued a decree against “Sorcery, Witchcraft, and Divining” that explicitly designated these crimes as frauds. In 1590, a man was executed who had previously served the executioner of Eichstätt and had tried to launch a witch hunt in Nuremberg. Nuremberg’s magistrates took this occasion to demonstrate the town’s attitude toward witchcraft.

Like other upper German imperial cities, Nuremberg’s situation reversed after the Thirty Years’ War, when economic decline prevented any recovery of its former importance. New anxieties entered cities with populations that had shrunk to half their former size. In 1659, two women were executed for witchcraft, and a man was executed in 1660. But although it saw some serious cases until the end of the seventeenth century, Nuremberg had no more executions. All in all, this imperial free city represents the case of an urban environment where the rule of law prevailed and a skeptical attitude toward fantastical crimes was common. Nuremberg became a safe haven for refugees from the Franconian prince-bishoprics, and the town was sufficiently rich and self-confident to withstand all attempts by neighboring princes to force it into cooperation. Among urban elites, it was usually lawyers and artists rather than theologians who distanced themselves from popular beliefs about witchcraft and who maintained Nuremberg’s position as a beacon of independence and freedom. And because Nuremberg dominated the imperial cities of the Franconian circle, its influence prevented atrocities among them, either through legal opinions (as in the case of the small imperial city of Weissenburg) or just by serving as an example generally.

NUSS, BALTHASAR (1545–1618)

Count and judge at witchcraft trials, born in Brückenau, Nuss ranks among the most notorious German witch hunters. In Fulda, the largest prince-abbey in the Holy Roman Empire, at least 203 people died during the trials he led from 1603 to 1606. In contrast to most witch hunters, Nuss was eventually imprisoned for his crimes and finally beheaded in Fulda after spending twelve years in jail. In literature, he has commonly been referred to as “Ross,” although court records invariably called him “Nuss.”

Nuss (who had murdered a priest in his youth) owed much of his career to his mentor, Prince-Abbot Balthasar von Dernbach (1548–1606). When von Dernbach returned to Fulda after twenty-six years in exile, he appointed his old protégé, Nuss, to judge cases involving witchcraft. Nuss immediately began conducting trials in 1603. Würzburg's law faculty instructed the judge of the trial procedures to be followed, but Nuss violated these persecution-friendly rules. Especially spectacular was the trial of Marga Bien, whose husband complained about Nuss to the *Reichskammergericht* (imperial chamber court) but was ultimately unable to prevent her from being burned at the stake.

Nuss did make one grave mistake. In March 1604, he summoned six women belonging to Fulda's upper class, who had already fled with their families. Their summons was publicized in the particularly embarrassing form of an edict. However, none of them returned to Fulda, and several of their relatives filed suit for unlawful trial conduct against Nuss and von Dernbach in the *Reichskammergericht*. Before the court reached a decision, the prince-abbot died in spring 1606. His successor, Friedrich von Schwalbach, ended the witchcraft trials and fired Nuss. Three months later, after discovering that Nuss had embezzled 2,358 guilders, almost half the proceeds from the trial costs paid by the victims' families, Schwalbach had him arrested. The families of the six upper-class women accused in 1604 now returned to Fulda and filed suits against Nuss. After one year of imprisonment, Nuss's formal trial had not yet begun; the former judge appealed to the *Reichskammergericht*, which denied his request for release. After Nuss's second appeal in 1609, the court in Speyer reduced his sentence.

Prison conditions were such that Nuss and his wife produced four of their seven children while he was in jail. He suffered a series of strokes in jail and became increasingly handicapped, to the point at which he was eventually unable to walk and could barely speak. His wife lobbied Fulda's government on his behalf, but in vain. Nuss also received support from a nephew who was a lawyer in Frankfurt. In 1615, Würzburg's law faculty sentenced Nuss to indefinite state custody and ordered him to repay the money he had embezzled. This decision was not severe enough for the court in Fulda: instead, his files were sent to Ingolstadt as part of a second file sharing. In November 1618, Ingolstadt

sentenced Nuss to death. He was beheaded in Fulda at the age of seventy-three.

Nuss was the second German witch hunter to be executed. Five years earlier, Gottfried Sattler, a Bavarian witch judge in Wemding, had already been executed at Munich. A similar case also occurred later in Osnabrück. In 1650, Dr. Wilhelm Peltzer was jailed for his misconduct as that town's chief witch hunter. As with Nuss, the imperial chamber court became involved, but again without resolving the case; Peltzer died in prison, insane. Beheading a witch-hunting judge also proved to people that some witchcraft trials had been illegitimate and suggested that the traditional argument that God would not allow innocent people to be executed was apparently wrong. To Adam Tanner, the first major Jesuit opponent of witch hunting, Nuss's execution demonstrated the danger posed to innocent people by unjust judges. Friedrich Spee was also familiar with Nuss's case, citing Ingolstadt's death sentence (copied from Tanner) in his *Cautio Criminalis* (A Warning on Criminal Justice) of 1631. Spee could have learned about Nuss's witchcraft trials as early as 1612, during his Jesuit novitiate in Fulda. During the nineteenth-century *Kulturkampf* (culture war), Catholic scholars of witchcraft used the example of Balthasar Nuss to demonstrate that Catholic territories could end unjust witchcraft trials on their own and even punish those responsible.

OBRY, NICOLE (CA. 1550–?)

Nicole Obry (Aubry/Aubray) was the main actor in an extraordinary drama of demonic possession and exorcism in 1566. She was then fifteen or sixteen years old, the daughter of a baker in Vervins, a small town in northeastern France. In the fall of 1565, after seeing the ghost of her grandfather, she began to show symptoms that were diagnosed as demonic possession. She was exorcised in Vervins, but because all her thirty demons could not be made to leave her, she was brought to the diocesan capital at Laon in January 1566. Laon was a religiously mixed city, with an active Protestant minority. This was a very tense point in the religious wars. After the temporary end of organized religious warfare in 1563, propaganda and random violence continued. Organized warfare resumed in 1567, not long after this case was concluded.

In Laon, Nicole was exorcised in public (unlike any previous case of this sort in France), on a specially built scaffold in front of the cathedral. She was brought to the ceremonies in great processions, carried by eight or ten men who struggled to control her convulsions and deathlike trances. The exorcisms drew huge crowds. Her main demon was forced to identify himself as Beelzebuth, one of Satan's chief lieutenants. Speaking through Nicole, Beelzebuth also revealed that he was the prince of the Protestant heretics, referring to them as "my Huguenots" and delivering sermons against the heretics. The intimate connection between Protestants and the Devil became a recurrent theme in French Catholic polemic throughout and even beyond the age of the religious wars.

Laon's Protestants were skeptical from the outset. The prince of Condé, their military commander in the recent war and the most prominent Protestant nobleman in France, attempted to halt the exorcisms; he even tried to convert Nicole, but the king ordered her released. The exorcisms, now conducted personally by the bishop, continued. Interestingly enough, unlike many later French cases, no witch was accused of sending the demons into the possessed. The strongest weapon in the bishop's armory was the communion wafer, the Host. It is almost impossible to overemphasize the role of transubstantiation in France at this time. The ultimate charge against Protestants was that they fed

consecrated Hosts to dogs; at the same time, superstitious (but Catholic) shepherds in northern France really did sometimes feed consecrated Hosts to animals precisely because of their supposed miraculous properties.

On February 8, 1566, Beelzebuth and the rest of the demons dramatically left Nicole's body in front of thousands of observers. A plume of smoke was observed rising from her body. This sensational spectacle was one of the most widely publicized acts of the early stages of the religious wars. It was regarded as a great Catholic victory, known across France as the "Miracle of Laon." Catholicism's ability to exorcise demons proved that the Catholic Church was the only true Christian church. Catholic polemicists seized on this incident because the supernatural power of the Host confirmed the correctness of the Catholic view of the sacraments. Pamphlets and books by Guillaume Postel, Jean Boulaese, Charles Blendec, and Florimond de Raemond described this miracle in order to attack Protestantism and defend the Catholic Church. Raemond, who had flirted with Protestantism, converted back to Catholicism as the result of witnessing the exorcism. For Postel, this miracle confirmed the role of consecrated priests and the traditional Catholic hierarchy.

This colorful event introduced the Devil as a key player in Catholic propaganda. For the next two generations, demonology in France was highly political, tied to Catholic attempts to demonize their adversaries. In 1599, supporters of the Catholic cause attempted to block the Edict of Nantes, the religious compromise that was to end violence, by recreating the "Miracle of Laon" in Paris. This attempt, however, proved a fiasco. Although Marthe Brossier was regarded as a fraud, people still continued to believe in demonic possession, and such spectacular public exorcisms as the Loudun nuns endured as popular theater in France far into the seventeenth century. Nicole Obry's miracle was quoted, if not repeated.

OCCULT

The term *occult* covers the qualities in nature hidden from ordinary human observation and understanding and the forbidden practices or rituals used to discover and manipulate these qualities. Occult practices include astrology (understanding the influence of the stars and planets on human lives), magic (the use of intrinsic and extrinsic, natural or supernatural powers to produce effects), alchemy (the study of the means to transform baser metals into gold), and divination (the means for understanding or divining a foreordained destiny). Typically, practitioners of the occult are in awe of the power of nature and are fascinated with the possibility of mastering it—usually for their personal gain. The occultist may also feel some sense of psychological, intellectual, or social superiority over others, or he or she may gain greater acceptance in societies that value occult knowledge (especially with regard to healing and protection against disease).

THE OCCULT, RELIGION, AND SCIENCE

Some historians have argued that magic, which involves the coercion of God, should be contrasted with religion, which involves the supplication of God by prayer. In practice, it is not always possible to distinguish the occult from religion. Both phenomena are based on a belief in the unity of nature, which includes God and the angels at one extreme and human beings and the terrestrial world at the other. In this sense, human beings are a special link in the great chain of being, and they can participate in some of the divine mysteries. Therefore, partial revelation of the occult was a key element in the Hellenistic cults of the ancient world. In contrast, Christians, who emphasized the fallen state of humanity and its tendency to sin, tended to regard the followers of these pagan religions as heretics and devil worshippers, and they attacked all attempts to delve into what they regarded as divine mysteries, such as the miracles of nature. As a result, the limits of natural knowledge were circumscribed and policed, and many occult practitioners were forced into silence or outward conformity. However, Christian occultists have claimed that they are serving God or that they derive their power from the divine. In many cases, the "spells" and symbols they employ in their rituals, as well as their aims, are similar to religious imagery and ritual.

Modern occultists tend to be associated with Satanism or with pseudoscience, although the nineteenth-century followers of the Order of the Golden Dawn were drawn to its mystical religiosity.

It is also important to note the relationship between the occult and science, for the two categories often seem historically indistinguishable. For example, mathematical knowledge was the basis for some medieval technology that appeared to imitate and master nature and shaded imperceptibly into natural magic. Sir Isaac Newton's (1642–1727) alchemical investigations complemented his search for the hidden quality that came to be known as gravity. The difference between the two is that all natural phenomena can be studied and understood, whereas the occult can never be fully understood or systematically investigated because the full source of its power is by definition hidden from the human mind. Moreover, occultists have usually formed private and closed social networks, and they sometimes withhold their arcane knowledge from the world.

Until secular authorities sanctioned them in the modern era (that is, since ca. 1750), occult texts circulated secretly, and many occult practitioners, including witches, were persecuted in the belief that all magic and most astrology were demonically inspired. However, there is a correlation between social status and the degree of tolerance of occultists. From the Middle Ages onward, magicians and astrologers could hold privileged positions at court. Indulgent princes and popes permitted learned men (as opposed to ignorant women) such as Michael Scot (ca. 1175–ca. 1235) and Michel de Nostredame (known as Nostradamus) (1503–1566) to practice their craft in relative freedom. For most people in the modern secular era, the occult has lost its potency and has become a matter of personal curiosity or an object of antiquarian or historical interest.

THE ANCIENT WORLD

The Greek philosopher Plato made a distinction between what was apparent and what was real in the universe, and he suggested how essential parts of nature were transmitted from the higher being by celestial intelligences known as *daemones*. In the *Timaeus* he discussed some of the numerological codes that formed the basis for an understanding of the world. His pupil Aristotle (384–322 B.C.E.), whose works heavily influenced the Western scientific and philosophical tradition up until the seventeenth century, thought that the natural world was ordered in a unified and fairly regular way. Therefore, nature's secrets were open to investigation and reasonable enquiry by humans in terms of the four essences (earth, air, fire, and water). However, both men provided occultists with some justification for secret or mystical forms of enquiry. For example, Aristotle allowed for the existence of a fifth essence

inherent in the stars and planets that influenced earthly matters and provided the basis for astrology. Plato half-seriously suggested that initiation into pure philosophical truth could be compared with initiation into a mystery religion. Neoplatonists took up this suggestion more seriously and blended it with the religion of the first Iranian (Persian) empire, named after the prophet Zarathustra (better known by the Greek form of his name, Zoroaster), who saw all existence as the gradual realization of a divine plan. The Zoroastrian magi (priests) were adept in astrology and the arts of divination, and one branch of the occult was named after them: magic. Neoplatonists such as Plotinus (ca. 205–270), Porphyry (ca. 232–303), and Iamblichus (ca. 250–ca. 330) and the members of Hellenistic cults cultivated a form of gnosis (the special knowledge of spiritual mysteries). They read the revelations attributed to the Egyptian god Thoth, called *Hermes Trismegistus* (Thrice-Great Hermes), that concerned philosophy and the understanding or manipulation of astrology, alchemy, natural history, medicine, and magic. In this way, they argued that only a pious and sequestered magus assisted by the *daemones* could unlock natural and supernatural mysteries. Curses, spells, and enchantments that incorporate divine figures such as Isis have been discovered on stones, amulets, and scrolls from ancient Egypt and Greece also indicate the way in which occult power was associated with the divine will.

The Romans were heavily influenced by Greek writings on the occult, and they were no less fascinated by magic, astrology, and divination as transmitted by the books attributed to *Hermes Trismegistus* (known as the *Corpus Hermeticum*) or Pythagoras—a mathematician who was also considered to be the first practitioner of learned magic. Augury (divination) was widely used and was based on natural occurrences such as thunder and lightning, the flight of birds, and the movement of the planets. However, Pliny the Elder (ca. 23–79), like Cicero (106–43 B.C.E.), Seneca (ca. 4 B.C.E.–C.E. 65) and Galen (ca. 130–200), was skeptical about just how many marvelous things in nature, which seemed out of the ordinary course of nature described by Aristotle, could be ascribed to magic and other occult phenomena. Nevertheless, he recorded many examples of what would be called “natural magic” in his *Natural History*, thereby confirming a trend toward cataloguing the bizarre in nature and providing a basis for later occult investigations.

THE MIDDLE AGES

Early Christian writers such as St. Augustine of Hippo regarded Hellenistic cults as little more than centers of demonic magic. In Judeo-Christian thought, the benign Neoplatonic *daemones* who were neutral spirits intermediate between gods and human beings were recast as

angels who had turned against God. Augustine discouraged speculation about the deeper mysteries of nature, such as monstrous births and other such omens, portents, and prodigies, and he deplored the way in which the practice of magic led people to ally themselves with Satan. As well as the often-quoted scriptural text of Exodus 22:18 (22:17; “Thou shalt not suffer a witch to live”), a locus classicus of such medieval hostility toward magicians was the story of Simon Magus of Samaria (Acts 8:9–24), whose iniquity stemmed from his attempts to rival the power of God in his miracle making. Subsequent Christian polemicists, following Augustine’s views, fostered a distrust of intellectual curiosity, which was viewed as a dangerous and vain pursuit, leading as it did to pride, sin, and, ultimately, heresy (indeed, the occult was often associated with Judaism, and nocturnal assemblies of witches in the presence of the Devil were called “synagogues” for part of this period). Many members of the Latin Church, especially the scholars of the new universities known as the Scholastics, therefore attempted to set a limit on human knowledge. They left many of the deeper mysteries of the universe to God’s will and understanding, and they condemned occult dabbling as a form of “superstition”—in the original sense provided by Saint Thomas Aquinas: a perversion of correct religious devotion.

However, stories of Jesus’s miracles on earth, the wonder-working capabilities of prayer and adjurations, and the intensification of eucharistic devotion from the thirteenth century muddied the boundaries between *mira* (wonders) and *miracula* (miracles) and appeared to sanction some occult techniques based on mechanical and scientific knowledge and directed toward “holy” ends. This relationship was exacerbated from the twelfth century onward by the Europe-wide diffusion of Latin and vernacular translations of Arabic texts on the occult and science such as the *Picatrix* (the Latin translation of “The Aim of the Sage”). These collections of “secrets,” which were supposedly imparted by a sage and often written in code or obscure language, may have encouraged readers to distinguish more sharply between natural magic and demonic magic and to increase interest in the former. However, such texts also opened the way for the study of necromancy (the conjuring of spirits), which was an explicitly demonic technique for controlling nature through Latin incantations and quasireligious ritual, usually undertaken by educated clerics.

During the Middle Ages, horoscopes, medical self-help manuals, books of charms, manuals for divination, and alchemical manuscripts were read with increasing frequency by laypeople as well as clerics. These works comprised discussions of the influence of planets and stars on terrestrial affairs; recipes for procuring a lover; lists of enchantments for causing harm or ensuring personal protection; lists of

protective amulets and gemstones; necromantic formulas and rituals; and instructions for the practice of oneirancy (the interpretation of dreams), chiromancy (the reading of palms), and onomancy (calculation through names). The effectiveness of such phenomena relied upon a variety of assumptions and claims. For instance, occult techniques and recipes were attributed to a classical authority or venerated figure such as Hermes Trismegistus, Virgil, or Albertus Magnus (Albert the Great, ca. 1200–1280), or to demons, as in the case of necromancy. It was often claimed that such spells had been employed successfully on many previous occasions, and there was an assumption that there was clearly some “occult” or hidden quality in the form of words, markings, or material used. In short, many people attributed a large number of occult phenomena to natural but obscure causes, practiced their art in secret or under royal protection at court, and ran an intermittent risk of secular or ecclesiastical prosecution, particularly if such arts caused harm to others.

THE OCCULT RENAISSANCE

From the beginning of the fifteenth century there was an increase in the production of these occult manuscripts. Moreover, after the establishment of printing presses in the cities and monastic or university centers of Europe, books of marvels and “secrets” as well as learned treatises on natural magic ranked among the most popular texts of the literate or listening public. Magic, astrology, and alchemy were openly studied and practiced at many late medieval and Renaissance courts, such as those of the emperors Frederick III (ruled 1440–1493) and Rudolf II (ruled 1576–1612); Pope Urban VIII (ruled 1623–1644); Cosimo de’ Medici in Florence (1389–1464); and Elizabeth I of England (ruled 1558–1603). It has been argued that the occult sciences found favor in court because they provided a useful weapon in the armory of courtiers who sought to eliminate enemies and gain the ear of a ruler. However, astrologers such as William Lilly in seventeenth-century London cast horoscopes for maidservants as well as the nobility, and the vast literature about wonders and witches in northern Europe also suggests that there was a popular interest in the occult.

In contrast to the Middle Ages, this was an “age of wonders” when learned men and women sought to uncover the hidden powers of the universe by turning sharper eyes on nature (the macrocosm) and human experience (the microcosm). It is clear that this change was partly due to the revival of classical learning that lay at the heart of the Renaissance and was also a function of the longing for a more primitive, purified, and intensely mystical Christianity. The philological or historical investigations of this period were fueled by a

Heinrich Cornelius Agrippa von Nettesheim, *De Occulta Philosophia* (On Occult Philosophy), 1531—delineation of a horoscope chart founded on bodily characteristics. Divination was an important occult practice. (Bettmann/Corbis)

desire for greater understanding of the Word of God. They also provided a basis for renewed interest in the Kabbalah (Hebrew mysticism), the *Corpus Hermeticum*, Aristotelianism, Neoplatonism, or the science of the ancients. A typical Renaissance magus such as the Florentine philosopher Marsilio Ficino (1433–1499) used his knowledge of Greek to translate works ascribed to Hermes Trismegistus. On the basis of this work and his Platonic studies, he outlined a form of astral magic that channeled the power of the stars and planets imprinted on the earth by celestial spirits. The German humanist and occult philosopher Heinrich Cornelius Agrippa von Nettesheim explored many of the texts and traditions employed by Ficino. In his *De occulta philosophia* (On Occult Philosophy; first complete edition, 1533), he defended the invocation of demons so long as they were good and the agents of divine miracles. The Neapolitan philosopher Giambattista Della Porta made a distinction between natural and demonic magic, and he aimed to uncover the natural properties in supposedly demonic magic. He explained that his popular *Magia naturalis* (On Natural Magic, 1558 and 1589; translated into English as *Natural Magick* in 1658) was intended to be a “survey of the whole course of nature” (Debus 1978, 13).

Renaissance occultists sought to understand the harmony in the universe and to use its powers to bring concord and unity to the political and religious divisions of Europe. Such philosophical and political

arcana, although clearly attractive to rulers such as the Holy Roman Emperor Rudolf II, whose territories teemed with religious sects and whose court was filled with magi, were often condemned by the Church, and many magi were keen to distance themselves from accusations of sorcery. Therefore, Agrippa published a retraction of his ideas *before* he published the *De occulta*, and the Englishman Dr. John Dee, who practiced necromancy and studied mathematical or natural magic, defended himself against accusations that he was a “conjurer” by protesting that all of his studies had been directed toward God and emphasizing that many wondrous feats were naturally, mathematically, and mechanically contrived.

However, in seeking to reduce the scope of demonic magic and to lend authority to their own natural magic, the occultists undermined some of the theological bases for demonic magic and therefore the keystone in the Catholic and Protestant churches’ campaigns against witchcraft. For example, Giambattista Della Porta supplied a naturalistic explanation for the demonic “witches’ salve” (which was supposed to allow its users to fly to Sabbats or meetings). Consequently, he was investigated by the Inquisition and attacked by Jean Bodin in his book *De la Démonomanie des sorciers* (On the Demonomania of witches, 1580). These attempts to reduce the scope of the Devil’s actions in the world were helpful to such early skeptics of witchcraft as Reginald Scot and Johann Weyer—a former student of Agrippa. However, the skeptics and occult connoisseurs had an unshakeable faith in Scripture and the learned texts of the occult heritage, and they betrayed an enormous condescension toward illiterate men and women whose healing techniques and claims to supernatural power they characterized as mere “superstition.” Thus, their highly selective attacks on peasant beliefs strengthened the Church’s authority to pursue witches and may have strengthened the social position and professional exclusivity of learned magicians, alchemists, and court astrologers.

THE MODERN SECULAR ERA

Technological and scientific discoveries in the sixteenth and seventeenth centuries, as well as the development of competing models of the cosmos, gradually undermined traditional beliefs about the world and discredited the authenticity of some of the ancient texts that formed the basis for occult activity. The growth of scientific academies in the seventeenth century further widened the scope for natural philosophical investigation, gradually stripping natural magic, astrology, and alchemy of their scientific credibility. The English politician and philosopher Francis Bacon (1561–1626) discussed occult qualities in nature, but he argued that true science should take the “mystery” out of things, and he thought it possible to reveal the causes of occult phenomena and to harness this knowledge for the

benefit of the growing nation-state. Scientific pioneers were far from uniformly antioccultist; Galileo cast horoscopes for rich German students, and Isaac Newton expended enormous effort on alchemical experiments. One of Galileo’s late-seventeenth-century successors as mathematician at the University of Padua continued to practice magic while maintaining an outward appearance of scientific “respectability.” Other occultists contributed to modern technological developments. For instance, a mathematician and alchemist at the ducal court in Dresden made the discovery of porcelain manufacture in 1707.

The notion of occult powers continues to hold an attraction for many people. No doubt, there are some who still seek to understand and control the hidden forces in nature, and if the contents of the Internet and the lists of published books are reliable guides, there are probably many more who seek some form of occult “re-enchancement” in a predominantly secular Western world.

OFFENBURG, IMPERIAL FREE CITY

Eighty-nine accused witches lost their lives in this Catholic imperial free city in southwestern Germany, which belonged to the Circle of Swabia and shared a curial vote with the cities of Gegenbach and Zell am Harmerbach. Offenburg had approximately 2,400 inhabitants in 1803. Its early modern history was strongly influenced between 1550 and 1635 by its proximity to neighboring Ortenau and the consequent Austrian influence. Research on Offenburg's witchcraft trials goes back to Franz Volk's "excellent study" in 1882 (Midelfort 1972, 128). Chronologically, there were three distinct phases: before 1608, the wave of trials in 1608, and the great witch hunt from 1627 to 1630.

The first witchcraft trials were mainly isolated incidents; the city council remained relatively reserved. Although fifteen people were executed for witchcraft in neighboring Ortenau between 1595 and 1599, only four witches died in Offenburg during the same time. Consequently, Offenburg's guilds complained about the council's lax stance to the imperial commissioner, the governor of Lower Alsace. In 1599, he ordered the city to pursue witches, but nevertheless follow the Carolina (the imperial law code, 1532). After the Holy Roman Emperor Rudolf II and the *Reichshofrat* (imperial aulic court) confirmed this decision in 1602, Offenburg's next witchcraft trials began in 1603. The family of Barbara Pfäffinger, one of the accused, immediately got the *Reichskammergericht* (imperial chamber court) in Speyer to intervene on her behalf. While a messenger awaited permission to give the council the court's decision, Barbara Pfäffinger was already being secretly arrested and tortured. The council then justified its actions to the *Reichskammergericht* by saying that it had merely carried out the *Reichshofrat's* decision. No large-scale witch hunt ensued.

Sixteen witchcraft trials, leading to between eleven and fourteen executions, took place in summer and fall 1608. Imperial Commissioner Earl Sulz approved the council's trial procedure. The council also addressed the *Reichskammergericht* in Speyer to protect itself before victims of the coming persecution could file suits and additionally sought advice from legal scholars in Freiburg and Hagenau. Nevertheless, Offenburg's 1608 witchcraft trials produced five suits against the city in the *Reichskammergericht*. In each case, the families of persecuted women complained about trial procedure

and unbearable prison conditions. In fact, more witchcraft trials reached the *Reichskammergericht* from Offenburg than from any other imperial free city. After the court again intervened on behalf of the accused, the council terminated its trials at the end of 1608. However, Offenburg did not complain to the imperial aulic court about "obstruction" from the chamber court.

Almost twenty years later, Offenburg's witchcraft trials resumed in November 1627. Some women arrested in Ortenau denounced women in Offenburg for allegedly participating in the witches' Sabbat. Many of the accused were daughters of women burned as witches in 1608. Within three years, sixty people were put to death. There were three distinct phases within this trial wave: twelve people were executed between November 1627 and January 1628; seven further executions followed in mid-1628; and then, after a four-month break, forty more executions took place from late 1628 until early 1630, thirty-two of them in 1629.

The end of Offenburg's witchcraft trials has been mistakenly attributed in older literature to Swedish military occupation. However, the Swedish army reached Offenburg only in September 1632, but the decisive turning point had occurred in late 1629. After social boundaries had fallen at the witch hunt's apex when an influential alderman, Hans Georg Bauer, was executed, the trials lost momentum in December 1629, when a woman, Agnes Gotter (known in Offenburg as "Gotter Ness"), twice survived torture in a searing metal hot seat. Previously, no prisoner had ever survived this torture twice. Offenburg's uneasy magistrates released her and suspended further trials until after Christmas. In early 1630, two alleged witches already sentenced to death withdrew their confessions and were then released, bringing Offenburg's witch hunt to an abrupt end. Further trials took place in 1631, 1639, 1641, and 1642, but all were isolated incidents; there were no further large waves of persecution.

OINTMENTS

Early modern witch beliefs held that witches flew to the Devil's Sabbat by use of ointments that they smeared on themselves or on a broom or pitchfork. Demonologists like Martín Del Rio held that these ointments were efficacious only because of the action of demons, but skeptics like Giambattista Della Porta argued that they had natural properties that caused witches to dream that they could fly and participate in fantastic rites. Modern researchers have found that recipes for ointments contained in late medieval and early modern literature did include potent hallucinogens that were both extremely toxic and fat soluble, so utilization in the form of a fat-based salve was both possible and prudent. Although use of these unguents was not as widespread as the demonologists insisted or as some historians have argued, some late medieval and early modern Europeans used them to induce a profound trance state in which they vividly imagined fantastic experiences that seemed real and that demonologists interpreted as participation in diabolical rites. Furthermore, there is evidence that some people smeared these salves or closely related ones on an unsuspecting victim as a form of sorcery that would induce numbness, disorientation, delusions, and hallucinations.

Among the hallucinogenic plants native to the European continent, members of the *Solanaceae* family almost always became the active ingredients in recipes for witches' flying potions given by both demonologists and skeptics. The psychoactive alkaloids the plants contained are extremely toxic, and an overdose could easily lead to death. However, they were also fat soluble, and in that form readily absorbed through the skin, which was far safer than ingestion while still delivering a powerful dose. Probably any fat would have worked; but at least some of these recipes employed fat from babies or corpses, so they were one source of the idea that witches killed infants and dug up fresh graves.

Some users reportedly smeared the ointments all over their bodies, but they would have been absorbed particularly well through mucous membranes. A more efficient method involved smearing and then "riding" a broomstick or pitchfork, which would have concentrated the application in the anal and female genital areas. Because the ointments often induced a sensation of flight, this probably originated the notion that witches flew on broomsticks.

Many recipes called for a mixture of different *Solanaceae* plants, which themselves contained different combinations of psychoactive alkaloids. Because the different alkaloids probably induced somewhat different psychological effects, the recipes appear to have been tailored to promote specific experiences. Furthermore,

the recipes contained other ingredients beside hallucinogens and fats, and specific purposes for them have also been suggested: wild celery to induce a deep sleep after the hallucinogenic fireworks and cinquefoil, parsley, or smallage to purify the blood and avoid a buildup of the toxins.

Hallucinogenic ointments also appear to have been used as weapons. Because the alkaloids in the *Solanaceae* block the neurotransmitter acetylcholine in the peripheral nervous system, smearing an ointment on the skin could well create a loss of feeling there, and the effects on the central nervous system would have created terrifying delusions and hallucinations in a victim who either had no idea what had happened or thought he or she had been attacked by a witch. The incidence of this tactic should not be overestimated, but because some early modern sorcerers are known to have practiced harmful magic and used poisons, the possibility in any particular case cannot be dismissed out of hand.

Not all recipes and pots of ointments brought forward as evidence of witchcraft appear to have contained powerful hallucinogens, and it is not clear whether they were simple frauds; they were produced simply to satisfy inquisitorial demands, to end the torments of torture; or they worked purely through the power of suggestion. These possibilities have led some historians to deny that they were used at all. However, we possess enough credible eyewitness accounts and instances in which physical ointments were found, to argue that some people did use such salves to induce profound trances in which they vividly imagined fantastic experiences (Sidkey 1997, 190–194). Although these instances did not constitute the diabolic conspiracy posited by demonology, they were probably one of its more important sources.

OPERA

Since the birth of opera in its current form in Renaissance Italy, notably Florence, it has often been used as a medium to reflect human situations and emotions in exotic or unusual circumstances. It is therefore not surprising to find numerous references to witchcraft and related subjects—sorcery, magic, pagan rituals, and so on—in operatic works from the seventeenth century to the present. The repertoire contains a large number of different portrayals of witches that indicate a similarly wide range of emotions and characteristics. There were changes in these trends throughout the centuries, but at the time of the earliest operas the witches were portrayed as evil hags, often with grotesque qualities. These stereotypes were often accompanied by discordant music and harsh, exaggerated rhythms that highlighted their place outside society and concord. However, sorceresses often displayed more complicated traits, for example, grief at their rejection, usually by men, and finally anger and revenge. As we approach the present, operatic witches were treated increasingly sympathetically, expressing a broader view of femininity and regret at past abuses. Male sorcerers and wizards were uncommon, and with a few exceptions (above all, Faust), tend to be given less depth of character.

Henry Purcell's *Dido and Aeneas* was the earliest opera to provide specific parts for witches and to offer a leading role for a powerful sorceress. His witches had "horrid" music to accompany their dances and songs, employing unconventional harmonic and rhythmic features. His Dido was a majestic character whose music highlighted her importance in the plot. Although "furies" and "aerial spirits" appeared in other seventeenth-century operas (including Purcell's *The Indian Queen*), it was another classical sorceress, Medea, who inspired European composers at the time, notably Francesco Cavalli (*Jason*) and Marc-Antoine Charpentier (*Médée*). The emphasis on stage spectacle did not provide composers with much encouragement to explore detailed personalities. In the first half of the eighteenth century, this was still the case to some extent, but the famous German composer George Frideric Handel wrote approximately fifty operas, five of which might be termed "magical," containing characteristics normally associated with sorcerers and sorceresses, witches and wizards: *Rinaldo*, *Teseo*, *Amadigi*, *Orlando*, and *Alcina*. The latter's music displayed for the first time in opera a sorceress who was a fully formed character displaying majesty and passion, evil and vengeance.

In the latter part of the century, the towering figures of Joseph Haydn and Wolfgang Amadeus Mozart

dominated, but neither wrote music specifically for witches. Of Haydn's approximately twenty operas, only one (*Armida*) portrayed a sorceress with any depth of feeling, and Mozart's Colas in *Bastien und Bastienne* was more a cunning man than a wizard. However, his justly famous *The Magic Flute* provided important parts for both the sorceress Queen of the Night and the sorcerer Sarastro. At the end of the century, Luigi Cherubini wrote the three-act opera *Médée*, preparing the way for the dramatic characterizations that would be demanded in the following centuries. Its use of minor chords, harsh chromaticisms, and the use of bass instruments enhanced the atmosphere, rising to a hellish fortissimo as Medea summoned the dark forces.

By arousing strong emotions and emphasizing the importance of the creative imagination, the Romantic movement had a direct influence on cultural taste in the nineteenth century. The world of legend and folklore became increasingly popular, with direct and indirect references to the supernatural and witchcraft. Throughout this century, most European countries produced composers who wrote operas on these themes. In Italy, the great tradition of bel canto reached new heights in terms of its portrayals of witches through the works of Arrigo Boito (*Meffistofele*); Giacomo Puccini (*Le Villi*); and above all Giuseppe Verdi, whose *Macbeth*, *Il Trovatore*, and *Un Ballo in Maschera* each contained many scenes providing his characters with important roles that the music enhanced. In *Il Trovatore*, Azucena, the daughter of a witch burned at the stake, sang a fiery invocation for the destruction of her enemies; in *Un Ballo in Maschera*, Ulrica's dark and austere role balanced the other personalities' lightness. Verdi specified himself how important he believed the witches' roles to be in *Macbeth*.

Apart from an orgy of evil spirits in Giacomo Meyerbeer's *Robert le Diable* that was reminiscent of a witches' Sabbath and its obligatory inclusion in Charles Gounod's *Faust*, there was little witchcraft activity in nineteenth-century French opera. This was similarly true of Russian opera, because the title of Pyotr Tchaikovsky's little-performed *The Sorceress* is totally misleading. A folklore theme can be found in Mikhail Glinka's *Ruslan and Ludmilla*, where an evil sorceress (or fairy) Naina was feared for her evil powers, and there was an allusion to witchcraft in Nicolai Rimsky-Korsakov's *A May Night*. English opera provided very few examples apart from the comic works of W. S. Gilbert and Arthur Sullivan, including *The Sorcerer* and *Ruddigore or The Witch's Curse*. However, Germany produced a preponderance of such works.

The German operatic tradition of this period centered on three composers: Carl Maria von Weber, Engelbert Humperdinck, and Richard Wagner. Although Weber's *Der Freischütz* did not contain witches per se, its overriding theme was so steeped in

supernatural elements, including spell casting in the Wolf's Glen and the appearance of the Devil (Samiel), that its omission would be unthinkable. Humperdinck's *Hänsel und Gretel* (based on the Grimm brothers' *Kinde—und Hausmärchen*) and his *Königskinder* both featured witches in prominent roles. They were both somewhat stereotypical old hags, portrayed by the composer with awkward, leaping music that took on a particularly humorous quality in the former work because of its caricatural qualities. In the latter, the witch used *Sprechgesang* (speech-song), combining pitched notes with spoken dialogue. Wagner's works provided a very different picture, because intense characters who were given, in some cases, very deep and varied emotions, replaced the nameless hags. The three "Norns" in *Götterdämmerung* spun the web of destiny and had powers of divination similar to the witches in *Macbeth* or the Fates in Greek mythology. There was a connection to witchcraft in *Tannhäuser*, because the orgiastic aspects of the "Venusberg" revels could be associated with witches' Sabbats; Venus had an allure similar to Circe's, as both tried to prevent their men (Tannhäuser and Odysseus) from leaving them. In *Lohengrin*, the character Ortrud practiced sorcery for reasons of power, and in *Parsifal* one was introduced to a magician (Klingsor) and the impressive and complicated character of Kundry, who combined sexual and evil passion with pathos and regret.

The late twentieth century witnessed a decline in the number of operas being composed, partly because of the huge costs involved in staging such productions and also because of a reaction against the large-scale works of the nineteenth century. However, at the start of the century, this was not the case: such works as Antonin Dvorak's *Rusalka*, including a part for the witch Jezibaba, and *Armida* were composed. Sergey Prokofiev wrote two operas containing witchcraft issues, the comic *Love for Three Oranges* and the brutal and intense *Fiery Angel*. The latter contained an orgy scene in a convent, an interrogation by the Inquisition, and the final execution of the possessed woman (or witch). There are connections to be made here with Krzysztof Penderecki's *The Devils of Loudun* (1969), where similar atrocities took place. In Germany, Wagner's son Siegfried composed the deeply moving *Schwarzschwaneleich* on the theme of a woman abused and executed as a witch, and Richard Strauss included the sorceress Aithra in *Die Aegyptische Helena*. In the United States, Charles Cadman wrote *A Witch of Salem* in regret concerning the Salem witchcraft trials, and in Britain Sir Michael Tippett composed *The Midsummer Marriage* in praise of paganism, nature, and male–female polarity integral to modern witchcraft, Wicca.

ORACLES

Derived from the Latin noun *oraculum*, meaning a divine announcement or a prophetic declaration; and the Latin verb *orare*, meaning to entreat, pray and ask assistance, oracles, as this etymology indicates, are intrinsically linked with the spoken word—a proclamation understood to come from a divine or supernatural force and to be delivered to a chosen representative.

Oracles have played a long and highly significant role in both religion and magic, as illustrated by the Delphic oracle of ancient Greece, the preeminent seat of oracular power in the ancient Mediterranean. Situated in a deep cleft on the southwest spur of Mount Parnassus, the Delphic oracle was the principal seat of Apollo, the Greek god of prophecy. Here resided the Pythia, the priestess of Apollo, whose role was to commune with the god in order to answer questions put to her by inquirers. In typical oracular fashion and tradition, the utterances of the Pythia were ambiguous, partly because of the belief that the gods do not converse in the manner of mortals. Thus, oracles required specialized interpreters in the form of priests, who unraveled the ecstatic utterances of the divinely inspired priestess. Despite the influence of the Delphic oracle in the lives of both private individuals and state officials, its power began to be questioned by the fifth-century B.C.E., provoking a gradual decline in this once-great seat of oracular wisdom (although records from the site indicate that petitions were still made to it as late as the fourth-century C.E.).

The early Church Fathers railed against so-called pagan oracles, believing that they represented Satan's trickery. Although it was a tenet of Christian belief that only God possessed the omnipotence for oracular vision, this belief did not prevent the Devil from sometimes dispatching predictive information to give credibility to wicked practitioners of the magical arts. Because of this general repulsion toward non-Christian oracles, The Roman Emperor Constantine (274–337) ordered the ransacking of various shrines, such as those at Delphi and Dodona, and Emperor Theodosius (ca. 346–395) continued his policy.

In early modern Europe, the association among oracles, divination, devil worship, and witchcraft in general was cemented. Scholars cited such early Church Fathers as St. Augustine to argue that evil spirits could deceive humans into believing they could predict events. The *Malleus Maleficarum* (The Hammer of Witches, 1486), for example, described the evils of such pagan customs: "Another species of divination is practised by Pythons, so called from Pythian Apollo, who is said to have been the originator of this kind of divination, according to St. Isidore. This is not effected by dreams or by communication with the dead [necromancy], but by means of living men, as in the case of those who are lashed into a frenzy by the devil, either willingly or unwillingly, only with the aim of foretelling the future, and not for the perpetration of any other monstrosities" (Part 1, Question 16).

Despite such protests, the art of divination, expressly that of externally inspired utterances, flourished. The most famous prophet operating in a fashion similar to the oracular priestesses was the French physician Nostradamus (1503–1566). His method for attaining oracular insight was the technique of scrying, a method he believed to have been practiced by ancient Greek oracles:

Gathered at night in study deep I sate,
Alone, upon the tripod stool of brass,
Exiguous flame came out of isolation,
Promise of magic that may be believed.
(*Century* 1.1)
The wand in hand taken at the midst from
BRANCHUS/the branches,
The holm-oak damp from the water and the hem
and the foot,
A certain apprehension and voice, quivering
through the wand's handles,
Radiance divine. The augur settles close by.
(*Century* 1.2)

Each of these quatrains was an invaluable source for Renaissance preparations to access oracular sight, provided by one of its most significant sixteenth-century practitioners. Nostradamus used a magical implement (a wand), similar to the forked rod employed for divining water, and a brass scrying bowl filled with water. The ceremony always took place at night; the seer stared into the bowl, then divided the water's surface with his wand and awaited the emanation of messages. His method corresponded quite closely to descriptions of ancient oracular practices recorded by the fourth-century Neoplatonic mystic, Iamblichus (ca. 250–ca. 330) in *De Mysteriis Aegyptiorum* (On the Egyptian Mysteries): "The woman also who conveys the oracles in verse at Branchidai, whether she is holding the wand that was first given by a divinity and becomes filled with the divine light . . . or whether she dips her feet or

the border of her robe in the water, or receives the god by breathing in vapour from the water, she becomes by all these ways ready for the reception, and partakes of him from without" (Ficino 1972, 127). Marsilio Ficino's Latin translation of Iamblichus, printed at Venice in 1497 and reprinted at Lyons in 1547, gave Nostradamus his information, illustrating the Renaissance revival of ancient oracular traditions.

By the seventeenth century, the belief in oracles among intellectuals began to be seriously rejected, although it remained a topic of discussion (primarily treated as a remnant of the paganism of classical antiquity). Pierre Bayle (1647–1706), in the *Pensées diverses écrites à un Docteur de Sorbonne, à l'occasion de la comète qui parut au mois de décembre 1680* (Miscellaneous Thoughts Written to a Doctor of the Sorbonne on the Comet That Appeared in the Month of December, 1680, 1683) and in the *Dictionnaire historique et critique* (Historical and Critical Dictionary, 1697), and Bernard le Bovier Fontenelle (1657–1757), in the *Histoire des Oracles* (History of Oracles, 1687), both contributed significantly to philosophical skepticism and thereby to the disbelief in such ancient systems of supernatural prophecy.

ORDEAL

Like many non-European peoples, the Indo-Europeans believed that numinous powers would intervene in juridical contentions and decide them, if certain rituals were followed. Only faint hints of such a belief existed in ancient Greece and Rome, where ordeals never became part of the official legal systems; it is remarkable that neither the Bible nor Roman law knew of any of the various types of ordeals used in the Middle Ages and beyond. It is strange that the most prominent legal ordeal mentioned in the Bible was never applied in Western Christian civilization. It was directed against a woman whose husband suspected her of infidelity, and

required her to drink spoiled water; if she vomited it, she was stoned to death (Numbers 5: 11–31).

However, the Teutonic tribes must have used various kinds of ordeals before their conversion to Christianity, because their early medieval law codes (*leges barbarorum*) contained many provisions about *ordalia* or *judicia Dei* (the judgment of God). Ordeals were part of the official legal systems of early medieval kingdoms; in a capitulary of 809, Charlemagne even ordered everyone “to believe in the ordeals without any doubt.” Though some popes showed a rather skeptical position on this question, several synods explicitly approved of ordeals (e.g., Mainz 847, Seligenstadt 1023, Reims 1119).

The usual way of proving something in an early medieval court was through collective oaths; only if this were not possible would the judgment of God be appealed to. Therefore, all ordeals except the duel were done in the presence and with the help of priests who sang paraliturgical formulas and blessed the necessary instruments, which were ecclesiastical property and whose use was permitted by episcopal privileges. Laypeople had to pay an additional fee for this ecclesiastical assistance, beyond the cost of a secular trial.

Depending on region, social standing, and the matter being disputed, a divine decision was sought through different kinds of tests. Among the ordeals affecting both parties, probably the oldest and most widespread one was the judicial duel (which, like the outcome of a battle, was interpreted as a manifestation of God’s will). With very rare exceptions, it was reserved to male fighters—either the persons directly interested or paid champions. In the ordeal of the cross, plaintiff and defendant both stood with uplifted arms before a cross; whoever dropped his arms first lost his case. All other ordeals were one-sided and affected only the accused; most were based on the employment of “pure” elements of nature. The defendant had to walk through fire or over red-hot iron ploughshares or carry a piece of fiery metal a certain distance within a church. Or he had to plunge an arm into boiling water in order to find a small stone or ring thrown into the cauldron. It was not expected that even the innocent could do such things without being injured, but if he was indeed not guilty, his wounds should heal within three days. If they worsened, God had proved him guilty, and the court punished him.

Though generally the secular courts ordered these kinds of ordeals, it is clear that the assisting priest had much, if not decisive, power, because it was his task to judge whether a wound was healing or had become inflamed. When the ordeal by cold water (swimming test) was applied, the accused was bound and thrown into a pool: if the pure element of water refused to accept his body, that is, if he remained afloat, he was considered guilty. If he could manage to stay for some time under the surface, this was reckoned as a sign of

his innocence. In the ordeal of consecrated bread or cheese, a large portion of one of them had to be swallowed, big enough to cause suffocation or to prove guilt if the accused hesitated because of a bad conscience. As a variant of this ordeal, reserved mostly to the clergy, a priest administered the Eucharist, which might cause similar problems to pious people (because they believed in the Eucharist). In some instances, lots were also used in ordeals; a special case was the Psalmbook, whose movement, when hanging from a thread, was expected to indicate the delinquent. Finally, the bier-right was based on the assumption that the corpse of a murdered person would begin to bleed afresh when the killer approached.

The practice of ordeals, which were sometimes sought by the accused themselves as a method of legal compurgation, seems to have had its heyday during the twelfth century. But this was also a period of a growing resistance within a new generation of academically trained intellectuals, among whom Peter the Chanter (d. 1197), master at Paris, played a leading role. They criticized the uncertainty and irrationality of such procedures, and the growing importance of the auricular confession led to the conviction that an avowal should also be indispensable in court. When the Fourth Lateran Council (1215) forbade priests to participate in ordeals, its action led to the increased application of torture as a means of finding the truth. Both the abolition of ordeals and the introduction of torture were based on papal decisions by Innocent III and Gregory IX. However, it took several decades until the council’s canons were implemented into local law, and even afterward there are numerous records showing that ordeals—particularly the swimming test—continued to be practiced in a semiofficial way in several parts of Europe until the nineteenth century.

Like other people suspected of a major crime, presumptive heretics, sorcerers, and witches underwent ordeals, but infrequently. During the Middle Ages, the ordeal of fire seems to have been chosen most frequently in that case, perhaps in a form of anticipation, as burning was the conventional punishment for that crime. The *Longobard Edictum Rothari* (Lombard Law of Rothari, 198) prescribed a judicial duel when the accusation of sorcery was raised; the Thuringian Law (par. 55) allowed a woman suspected of poisoning her husband to clear herself by the ordeal of the red-hot ploughshares or through a champion fighting a duel for her. According to Addition 16 to the Laws of the Bavarians, the water ordeal was to be applied in cases of hexing (*maleficium*). During the High Middle Ages, ordeals were sometimes used in order to discover heretics, as we learn from St. Bernard of Clairvaux (1090–1153), who recorded the detection of a group of Cathars at Cologne by the *judicium aquae* (water ordeal) in a sermon (Super Cantica 66.5.12).

In 1484, Pope Innocent VIII still had to forbid Duke Sigismund of Tyrol to allow ordeals in cases of witchcraft. The *Malleus Maleficarum* (The Hammer of Witches, 1486) mentioned that the ordeal of the red-hot iron was used in Fürstenberg in the Black Forest in 1485, when a woman suspected of sorcery offered herself for compurgation with a red-hot iron and thereby won her case. But Heinrich Kramer, the author of this famous manual, opposed this method of proof and explicitly preferred torture. The judge, however, should propose the possibility of an ordeal, because the witch usually would agree, certain to be protected against harm by her demon. Her willingness to undergo an ordeal would betray her all the more (*Malleus* 3.17f.). In order to eliminate any help from the Devil, another popular juridical manual, the *Layenspiegel* (1509) by Ulrich Tengler, similarly did not accept the ordeal for witches, and the same position could be found in many later juridical texts.

Nonetheless, from the second half of the sixteenth century onward, the swimming test seems to have been used quite frequently in several parts of Europe to discover witches. Oudewater in Holland was famous for its witch ordeal scales, seemingly a postmedieval invention: if an accused person was lighter than expected, he or she was declared guilty. However, other types of ordeal fell into disuse after the sixteenth-century Reformations.

Beyond Europe, in parts of Africa and Madagascar, the poison ordeal was and is applied often at the suspicion of sorcery. If the substance (made from the fruit of the tanghin-tree) given by the witch doctor to the suspected person causes vomiting, he is innocent, if it produces vertigo or trance, his guilt is considered proved.

ORIGINS OF THE WITCH HUNTS

The first true witch hunts began in western Europe in the early fifteenth century. The earliest series of trials took place in Italy and in French- and German-speaking regions around the western Alps. Of course, concern about harmful sorcery had deep roots in medieval Europe, and both officially sanctioned prosecution and popular persecution had been brought to bear on its supposed practitioners long before. But only in the fifteenth century did the full stereotype of diabolical witchcraft develop, which would endure throughout the period of the major witch hunts in the sixteenth and seventeenth centuries.

Of particular importance for the ensuing hunts was the clear development, in the stereotype, of cultic and conspiratorial aspects of witchcraft. That is, witches were held to be members of organized groups engaging in a diabolically directed plot to undermine and destroy Christian communities and ultimately Christian civilization. Although individual trials for witchcraft might resemble earlier trials for harmful sorcery, full-fledged witch hunts were possible only after the notion that witches operated as part of an organized, conspiratorial cult began to become established. A hunt would develop out of a single trial or a relatively contained group of trials, either when authorities became convinced of the existence of large numbers of witches operating in a given area or when convicted witches would accuse, or be forced to accuse, others of membership in their sect. Ultimately, witch hunts arose due to the confluence of particular aspects of western European legal procedure, certain notions of demonic power and activity drawn from standard Christian demonology, and the widespread belief in the real efficacy of harmful magic or *maleficium*.

Concern over harmful sorcery and official sanctions against such magic were longstanding in medieval Europe, and legislation against what were perceived to be malevolent forms of magic existed in classical antiquity as well. In Christian Europe, condemnation and attempts to repress such magic arose from two distinct traditions, the religious and the secular. From the earliest days of Christianity, clerical authorities were convinced that much, if not most, supposed magical activity in the world was actually the result of demonic forces. Magicians who claimed to manipulate natural, if occult, forces were suspected instead of invoking and supplicating demons. Early Church Fathers such as St. Augustine condemned the practice of supposedly

demonic magic as a serious crime against the Christian faith, and early Church legal codes condemned magic for this same reason. Throughout the Early Middle Ages, Christian penitentials, handbooks of penance used by priests in confession, contained condemnations of magic. The penalties prescribed for such practices, however, were by later standards relatively light. Christians who performed magic were to be made to recognize and confess their sins and do penance. In cases of extreme recalcitrance, excommunication might be required. Such penalties generally held force through the twelfth century. Thereafter, the Church's greater concern over heresy and the perceived need to combat heretics more actively began to feed into an increasingly severe response to magic.

In addition to clerical concerns and ecclesiastical legislation against magic, there was also a substantial body of secular legislation in the early medieval period. By no means were secular concerns distinct from ecclesiastical ones. Lay rulers generally accepted the clerical association of magic with demonic invocation and attempted to enforce Christian morality in their legal codes. Nevertheless, in the most general sense, it can be said that, although clerical concerns focused on the supposedly demonic nature of much magic, secular legislation was more concerned with the harmful effects to which magic could supposedly be put. Secular law codes were therefore more narrowly concerned with the crime of *maleficium*, or harmful sorcery. Many of these law codes prescribed execution as a potential punishment in cases involving malevolent magic. Such condemnation stemmed both from traditional Germanic laws against harmful sorcery and from the relatively stringent late-imperial legal codes against magic and magicians. Despite the existence of such legislation, however, prosecutions for harmful magic remained limited throughout the early medieval period. A key factor was the use of accusatorial procedure in most European courts prior to the twelfth or thirteenth centuries.

Under accusatorial procedure, an aggrieved party would initiate a case by making an accusation of a crime. This person then also assumed the responsibility of proving the guilt of the person or persons accused. If the accused was judged innocent, however, then the accuser was subject to punishment. This procedure served to limit the number of entirely specious accusations. With crimes that supposedly involved the use of magic, which was secretive by its very nature, clear proof of guilt was often impossible to attain. In these cases, the accused might be forced to undergo a judicial ordeal. In theory, this practice placed the determination of guilt or innocence in the hands of God. In fact, the practice was highly subjective, and certainly no accuser could be sure of ultimate vindication by these means. In sum, aspects of accusatorial procedure tended to stifle the potential for widespread accusations of harmful

sorcery and would have made difficult the sort of panic and chain-reaction accusations that typified later witch hunts. Beginning around the twelfth century, however, and continuing through the fourteenth and fifteenth centuries, European courts, both ecclesiastical and secular, increasingly moved away from accusatorial procedure and instead adopted inquisitorial procedure as their basic method of operation.

In contrast to accusatorial procedure, under inquisitorial procedure, the onus of proving guilt or innocence for a suspected crime fell on officials of the court rather than on the person who brought the initial accusation. In addition, the court could initiate an investigation or trial, even if no accusation of a crime had been made. In many ways, courts operating under inquisitorial procedure functioned in a more sophisticated way than those under accusatorial procedure in terms of the collection and evaluation of evidence. Yet in cases of suspected sorcery, still a highly secretive crime, visible evidence or eyewitnesses were almost always rare. In such cases, the best means of obtaining a conviction was through the confession of the suspected party. Because it was recognized that people would seldom willingly convict themselves of a serious crime, the use of torture was prescribed in order to extract the truth from suspects. Limitations and controls on the application of torture were established, but they could easily be ignored by overzealous magistrates eager for convictions. Especially in situations in which the nature of the crime aroused widespread anxiety or panic, as was the case with witch hunts, judicial controls on the use of torture were frequently set aside. Unrestricted torture allowed magistrates to extract confessions and to secure convictions for virtually any crime that they might suggest to the accused. The widespread use of inquisitorial procedure and of torture in the courts of western Europe therefore provided a necessary basis for the later functioning of witch hunts.

The existence of a legal and procedural basis alone, however, did not give rise directly to witch hunting. Rather, the basic level of concern over supposed magical activities had to increase among both religious and secular authorities, as did the conviction that practitioners of harmful sorcery were members of heretical and conspiratorial demonic cults. Initial signs of a new level of concern in these areas become evident in the early fourteenth century. The trial of Lady Alice Kyteler of Kilkenny, Ireland, is often seen as a sort of proto-witch hunt from this period. Lady Alice had married a succession of wealthy men. Her first three husbands died under mysterious circumstances, and when her fourth husband began to sicken, she was accused of bewitching these men and then murdering them through sorcery. In 1324, Bishop Richard Ledrede took up the case, and ultimately Alice and a group of suspected accomplices were convicted not just of using harmful

magic but also of renouncing the Christian faith and gathering together as a cult to worship and offer sacrifices to demons. Although one member of this group was burned at the stake, Alice escaped punishment by fleeing to England, and her trial did not trigger any similar accusations in Ireland at the time. Nevertheless, the case revealed a connection being made between harmful sorcery and demonic invocation as well as the cultic worship of a demon.

A similar foreshadowing of later aspects of witch hunts can be seen in the trial of the Knights Templar for heresy, sodomy, and idolatry and the ultimate suppression of the Templars as a military and religious order. In actuality, the case was politically motivated. In 1307, officials of King Philip IV of France brought a range of charges against the Templars so that the royal government could seize the tremendous wealth and property controlled by the knights. Several key Templar leaders were arrested and questioned under severe torture. Ultimately, most confessed to a range of charges involving heretical beliefs and renunciation of the Christian faith, homosexual practices, and the worship of a demon in the figure of a head known as Baphomet. Succumbing to French pressure, Pope Clement V officially suppressed the order in 1312, and in 1314 the Templar grand master, Jacques de Molay, and other leaders were burned at the stake. Although charges of sorcery did not figure significantly in the trial of the Templars, the case nevertheless serves as an example of procedures that would later characterize witch hunts—extreme and unfounded accusations and false confessions secured through the use of torture (many Templars recanted their initial confessions, but this only exposed them to the charge of being relapsed heretics).

The cases of the Templars and of Alice Kyteler also revealed another important aspect of the rise of eventual witch hunts in western Europe, namely, that in the early fourteenth century, charges of harmful sorcery and the cultic worship of demons were being brought against relatively high-status defendants. Charges of the use of sorcery at princely courts occurred throughout the Middle Ages, but the number of clearly political sorcery trials seems to have risen in the early fourteenth century, thereby heightening concerns about the potential threat posed by harmful sorcery among powerful classes across Europe. Not even the papal court was immune. In 1258, Pope Alexander IV had ordered all papal inquisitors to refrain from involving themselves in cases of sorcery, unless the sorcery clearly entailed some form of heresy. In 1320, however, Pope John XXII, deeply concerned over matters of sorcery at least in part because he feared his own political enemies were using magic against him, ordered inquisitors to extend their investigations to include all matters of sorcery that seemed to involve the invocation and worship of

demons, and in 1326 he formally excommunicated any Christian found guilty of practicing sorcery that involved invoking demons.

Concerns about the demonic, heretical, and ultimately cultic nature of much magical activity were rising among clerical authorities throughout the fourteenth century. In the early part of the century, the inquisitor Bernard Gui evinced a clear but still relatively slight concern over sorcery. In his inquisitorial handbook *Practica inquisitionis heretice pravitatis* (The Practice of the Inquisition of Heretical Depravity), written around 1324, Gui devoted only a small section to a discussion of sorcery, and, although he considered sorcery to be an aspect of heresy, did not discuss the nature of heretical sorcery in detail. Fifty years later, however, the inquisitor Nicolas Eymeric, in his handbook *Directorium inquisitorum* (Directory of Inquisitors), written in 1376, presented an extended argument about the necessarily heretical nature of demonic magic. The very act of invoking a demon, Eymeric argued, constituted an act of worship even if no other overt signs of worship were present. Hence, all acts of demonic magic automatically entailed idolatry and therefore were evidence of heresy. Eymeric's arguments proved definitive for many clerical authorities who came after him and provided the basis for inquisitorial action against suspected sorcerers throughout the entire period of the witch hunts.

Once the practice of supposedly demonic magic was firmly established as entailing the worship of demons and thus as a form of heresy, it was perhaps natural that suspected practitioners of sorcery should have become suspected also of operating in organized cults just as other supposed heretical groups were thought to do. Throughout the later fourteenth century and on into the fifteenth, the number of trials for harmful sorcery rose significantly, and critically, in the course of these trials, elements of diabolical heresy were grafted onto charges of simple *maleficium*. These elements of diabolism included the notion that witches were members of demonically organized cults that met secretly to feast, dance, and worship demons or the Devil. They also supposedly engaged in sexual orgies with each other, with demons, or with the Devil, and they performed a number of other horrific acts, such as murdering and eating babies or small children and desecrating the cross and the Eucharist.

The reasons for the rise in the number of trials during this period are uncertain. To some extent, the apparent rise may be a result of better survival of sources from this era. However, contemporary authorities clearly believed that sorcery and witchcraft were a growing threat in the world, which seems to have been reflected in an actual increase in the numbers of accusations and prosecutions. Many studies have revealed that accusations of witchcraft and witch hunts often originated in economic or social disruptions at the local

level: agrarian failures; persistent inclement weather; new economic or commercial patterns in a region; or disputes between neighbors over property, social standing, or any number of issues. An overall rise in trials might be explained by a generalized economic or social crisis that exacerbated such local conflicts. Attempts to link particular rises in prosecutions for witchcraft to more generalized crises of this nature, however, have revealed disjunctures as often as they have uncovered clear connections.

Another general factor underlying growing concern over witchcraft in this period was the drive for religious reform originating in the Church. Many clerical authorities were convinced that Christian faith was declining in the late fourteenth and early fifteenth centuries, and that a general moral and spiritual rejuvenation was needed throughout Christian society. Extremely popular preachers such as Vincent Ferrer and Bernardino of Siena carried this reformist message to the people through the medium of popular sermons. The threat posed by witches to Christian society was a key theme employed by such men. Not surprisingly, a number of early witchcraft trials occurred in Dauphiné and western Switzerland in the wake of Ferrer's journeys through these regions, and Bernardino was associated with several witchcraft trials in Italy.

Most witchcraft trials in this period began with accusations of simple *maleficium* without any hint of other heretical or diabolical elements. Accusations were usually made by people against their close acquaintances or neighbors, in other words, people with whom they would have come into social or economic conflict, and these sorts of tensions generally underlay initial charges of *maleficium*. Once a case was brought to court, however, trained judges, ecclesiastical or secular but equally familiar with concepts of demonic magic and heresy, would introduce notions of diabolism. Once these notions were fully overlaid onto the supposed practice of harmful sorcery, the stereotype of witchcraft emerged, and actual witch hunts were possible. Thanks to the notion of witches operating as members of demonically organized, conspiratorial cults, accusations and trials could now originate not from individual conflicts, but from a general sense of threat to the community. A single accusation might fuel many more, and individual suspects could be expected, under torture or threat of torture, to name fellow members of the large cult of witches that authorities or the entire community might suspect was operating in a region.

The earliest series of witchcraft trials and witch hunts took place in the early fifteenth century in regions of Italy; in Savoy and Dauphiné; in the territories of the Swiss cities of Bern, Fribourg, and Lucerne; and in the diocese of Lausanne and Sion (roughly the present Swiss cantons of Vaud and Valais). In many of these regions, witchcraft trials grew directly out of earlier

trials of Waldensian heretics, and the mechanisms used by authorities to uncover and root out heretics were taken over and applied to witches as well. In particular, close cooperation between secular and ecclesiastical authorities seems to have typified many early witch hunts. At the same time, some of the first sources to describe the notion of cultic, conspiratorial witchcraft were being written in these regions. The Lucerne civic chronicler Hans Fründ described the supposed activities of a cult of witches in Valais in 1428. Around 1436, the French secular judge Claude Tholosan produced a treatise on witchcraft based on his experience conducting witchcraft trials in Dauphiné. Probably also in the middle of the decade, an anonymous clerical author, most likely an inquisitor, penned the *Errores Gazariorum* (Errors of the Gazars or Gazarii; i.e., Cathars, a common term for heretics and later witches), describing the errors of that heretical sect of witches, and in 1437 and 1438, the Dominican theologian Johannes Nider wrote extensive accounts of witchcraft, largely based on trials conducted by the secular judge Peter of Bern in the Simme valley of the Bernese *Oberland*, a mountainous region south of the city. Nider collected many of his accounts of witchcraft while at the Council of Basel, a great ecumenical council of the Church that met from 1431 until 1449 in the city of Basel, just to the north of the regions where the greatest early witch-hunting activity took place. This council, which drew clerics from across Europe, served as a sort of clearinghouse for ideas and concerns about witchcraft and helped to spread the initially fairly localized concern over cults of witches and the dynamics of witch hunting to other regions of Europe. Once the idea of conspiratorial cults of witches became widely established across Europe, witch hunts could and did occur in almost every region of the Continent.

ORTHODOX CHRISTIANITY

Nearly all early modern witchcraft trials occurred in European and American regions where Roman Catholicism or Protestant denominations prevailed; state- or church-sanctioned witchcraft trials were less frequent in Orthodox Christian areas.

Orthodox churches are those Christian churches of the East and of eastern and southeastern Europe that accepted the primacy of Constantinople rather than Rome after the schism of the eleventh century. Slavic Orthodox churches, plus Moldavia and Wallachia, were founded by the missionary activity of the Greek Church from the ninth century onward. The Russian Church in Muscovy became the largest, and, after the fall of Constantinople in 1453, also the only substantial national Orthodox Church in an independent country. It was effectively autocephalous after its rejection of the reunion of the Orthodox churches with the Latin western Church that had been agreed in a Decree of Union at the Council of Florence in 1439, but was thereafter largely repudiated in most Orthodox areas. The Russian Church elected a metropolitan of Moscow in 1448 without reference to Constantinople and established the Patriarchate of Moscow in 1589.

The establishment of the Russian and southeastern European Orthodox churches was accompanied by

other external cultural influences from Byzantium, including the magical and divinatory beliefs and practices that were a notable feature of Byzantine popular culture but excluding, for the most part, the intellectual interest in magic of such Byzantine philosophers as Michael Psellus (1018–ca. 1078). At the level of popular belief, Orthodox Christians had a good deal in common with Latin Christians, although the details of indigenous pagan survival differed. Literary evidence suggests that both in Byzantium and Russia, magic was usually regarded as demonic, and the notion of the pact with the Devil was familiar. At a more official level, the teaching of the Orthodox Church before the schism with Rome was essentially the same in matters of witchcraft and magic as that of the Latin Church.

Insofar as there was an official attitude, it derived from the opinions of the early Church Fathers and acts of the various early councils and synods, which tended to equate witchcraft with paganism. Reflecting the ambivalence of Jewish attitudes toward magic, divination, and witchcraft expressed in Scripture, the Church Fathers were not unanimous concerning the reality of witchcraft. Jewish views ranged from the outright condemnation of Exodus 22:18 (22:17; "Thou shalt not suffer a witch to live") and the "abominations" listed in Deuteronomy 18:10–14 to the frequent references to magical practices and belief in their efficacy. Patristic opinion did, however, agree in condemning magical practices and was supported in this by the tradition of Roman law. Among the early theologians who did appear to believe in the reality of witchcraft, St. Augustine of Hippo, with his extensive knowledge of the magic as well as the philosophy of the ancient world, did most to elaborate a theological view; but as a Latin, his writings had less influence in the East (where he was sometimes regarded with suspicion) than in the West. Augustine's works were unknown in Russia until relatively modern times.

The teaching of the early Church relating to magic and witchcraft, often found as condemnations in patristic sources (e.g., St. Basil and St. John Chrysostom) or expressed as prohibitions (especially to the clergy) in early collections of ecclesiastical law, was summarized at Constantinople in the acts of the Trullan Synod (692), which formalized the work of the fifth and sixth ecumenical councils (Constantinople II and III) but was later rejected by the Latin Church. This synod regulated marriage and sexual behavior. It also forbade association with Jews; mixed bathing; attending horse races, mimes, or animal shows; theatrical dancing; consulting diviners, sorcerers, cloud-chasers, or purveyors of amulets; celebrating the Calends, Vota, and Brumalia (Greek festivals in honor of Pan and Dionysius); wearing comic, satiric, or tragic masks; or jumping over fires at the beginning of the month. One cannot be sure how far this list represented genuine current concerns, but

superstitions, astrology, amulets, and magical practices certainly occupied a large part of Byzantine life.

Apart from a revealing twelfth-century Greek commentary on the Trullan Synod by the Greek canonist and patriarch of Antioch, Theodore Balsamon (Fögen 1995), there was relatively little theological or canonical discussion of magic and witchcraft thereafter in the Orthodox churches; the acts of the Trullan Synod remained the basis of Russian ecclesiastical opinion on the subject until at least the eighteenth century. The reasons are not entirely clear. Certainly the belief in and practice of magic and witchcraft at all levels of society in the East was no less widespread than in the West and the official attitude of the Church no less hostile; in the later Byzantine era, legal jurisdiction in this field was firmly in the hands of the patriarchal court, and cases came up regularly.

By contrast, witchcraft became a matter of anxiety in the medieval Latin Church, where a considerable debate developed on the relation of witchcraft to heresy and demonology. This debate, which continued beyond the Reformation in both Catholic and Protestant churches, never occurred in the Eastern Orthodox churches. Although Byzantium certainly had numerous trials for practicing magic, Orthodox Christendom generally avoided the witch hunts and witchcraft trials of early modern western Europe. Indeed, the Orthodox churches under Turkish domination after 1453 could not promote witch hunts even had they so wished. Outside Muscovy, the other two Orthodox eastern Slav territories, the Ukraine and Belorussia, were under Polish rule until 1650, and the treatment of witches there was largely dependent on Polish practices and prevailing local laws.

In Kievan Russia from the tenth century onward and later in Muscovy, magicians were usually identified with practitioners of pagan rites; witchcraft, or any manifestations of magic or divination, were condemned in princely law codes and canon law collections as pagan, demonic, and “Hellenic” (i.e., Greek pagan). Russian penitentials, episcopal denunciations, and lists of banned books, often derived from the fourth-century *Constitutiones Apostolorum* (Apostolic Constitutions), were as varied as their Western counterparts; most Russian catalogs of sins, again like their Western counterparts, condemned sexual behavior, magic, poisoning, and employing demonic assistance. More than a millennium after the fourth-century *Canons of Laodicea* had condemned the practice of magic by the clergy, the acts of the *Stoglav* (Hundred Chapters) council, convened in Moscow by Ivan the Terrible in 1551 to deal with ecclesiastical abuses, specifically forbade the parish clergy, under pain of ecclesiastical ban, from involvement in magical practices. The *Stoglav* specifically classified magical practices and texts as heresy. Its decisions mostly cited the Trullan Synod and the various lists of

“true and false books” that had their origin in the Greek Church but had been updated in Russia.

Information about punishments for witchcraft and magical practices is sparse and often contradictory. Russian chronicles described many occasions when pagan magicians were put to death by civil authorities or local communities, but perhaps as much for political as religious reasons. Ecclesiastical punishments for magical practices were often relatively mild, and early princely law in Kievan Rus’ regarded magic and divination as matters mostly involving women and preferably corrected by husbands. The extensive manual of family and household management, the *Domostroi*, suggested that this view still prevailed in sixteenth-century Russia.

Muscovite Russia’s first important attempt at a written legal code, Ivan the Terrible’s *Sudebnik* of 1550, never mentioned witches, magic, or superstitious practices. A later version of it from 1589 mentioned witches when specifying levels of compensation for offenses against the honor (*beschestie*) of various social categories: witches came at the very bottom, with harlots. Male sorcerers were not mentioned, although they were certainly common in Russian society, implying that illicit magic still remained within Church jurisdiction. Codified Russian law changed in 1649 with the *Uozhenie*, the code introduced by Tsar Aleksei Mikhailovich (which incorporated many provisions for offenses previously under canon law), and in 1715 with the military code (*Voinskii artikul*) of Peter the Great. These codes, either implicitly (in the *Uozhenie*) or specifically (in the *Voinskii artikul*) made witchcraft a crime against the sovereign or state and punishable by death. Russia’s criminalization of witchcraft and the evident fear of witchcraft among seventeenth-century tsars considerably diminished the Church’s traditional role. Most accusations of malefic magic or witchcraft in Muscovite and early imperial Russia were now brought under the *slovo i delo gosudarevo* (word and deed of the sovereign) procedure, a kind of “hue and cry” designed to identify crimes against the sovereign.

The overlap between ecclesiastical and state jurisdiction and the close association of witchcraft, heresy, and treason can be seen in the accusations brought by senior bishops against Maxim the Greek (the ex-humanist Michael Trivolis) in his trials in 1525 and 1531. They charged him with having “evil intentions” toward the grand prince, communicating with the Turks in order to help them wage war against Russia, indulging in heresy and in Hellenic and Jewish black magic and witchcraft, and practicing sorcery against the grand prince. Half a century later, Prince Andrei Kurbskii, who had fled Muscovy, protested in a public epistle to Ivan IV that the tsar had “falsely accused the Orthodox of treason and magic and other abuses.” Ivan replied: “As for your mentioning ‘treachery and magic’—well, such dogs are executed in all countries.” Ivan’s court

physician and astrologer Elisaeus Bomelius was tortured to death for treason; under interrogation, he implicated several highly placed persons, including Archbishop Leonid of Novgorod, whom he accused of running a coven of fifteen witches; Leonid was found guilty and disgraced, and the witches were burned.

The identification of witchcraft with heresy, evident in the common use in some parts of Russia of the word *heretic* for the more usual *koldun* (the male witch in most villages), meant that non-Orthodox, by definition “heretics,” could often be accused of witchcraft. A striking example is the case of the False Dmitrii, the early seventeenth-century pretender to the Russian throne, who married a Polish noblewoman, adopted Polish manners, and briefly seized power in Moscow with Polish help. Contemporary accounts described him practicing “gypsy sorcery and every kind of devilish magic . . . like Julian the Apostate who did sorcery with devils” and “cast spells with devils”; indeed, he was reportedly buried as if he were a magician, and his Polish wife Marina, called an “evil heretic atheist,” was popularly supposed to have escaped from a mob by turning herself into a magpie and flying away.

Nevertheless, these examples of witchcraft fears in sixteenth- and seventeenth-century Muscovy cannot compare to the scale of the witch hunts in many parts of western Europe. Despite infrequent clerical involvement and concern and the occasionally religious coloring of accusations, Muscovy and Orthodox Europe saw few religious polemics and had no ecclesiastical tribunals resembling western Inquisitions. However, they did prosecute “religious crimes,” and their punishments could be severe; in the 1660s, Grigorii Kotoshikhin, a senior Russian official who fled to Sweden and wrote a hostile account of the internal politics and manners of the contemporary Russian court, stated that the *Razboinyi prikaz* (the ministry for suppressing crime and sedition) dealt with *koldoustvo* and *chernoknizhstv* (sorcery and black magic), which it lumped together with blasphemy, theft of church property, sodomy, and false interpretation of Scripture. Kotoshikhin claimed that the penalty for all these crimes was to be burned alive (for men) or beheaded (for women).

The first article of the first chapter of Peter the Great’s 1715 code of military law (*Voinskii artikul*) was entitled “On the Fear of God” and states that, depending on the nature of the offense, any soldier found to be an idol worshipper, black magician (*chernoknizhets*), gun charmer, or superstitious and blasphemous enchanter (*charodei*) would be placed under close arrest, put in irons, made to run the gauntlet, or be burned to death. It specifies that death by burning was the normal punishment for black magicians who had harmed anyone by sorcery or had dealings with

the Devil. Whoever had not harmed anyone or had dealings with the Devil should be punished by one of the other punishments and made to do public church penance. Its second article states that anyone who hired a magician or encouraged anyone else to do so in order to harm someone should be punished in the same way as the magician. Many cases were in fact punished with such lesser ecclesiastical penalties as public penance. Peter’s military code was based largely on the Swedish military code introduced by Gustav II Adolf in 1621–1622, written when fear of witchcraft in Sweden was strong, and partly on the Carolina (*Constitutio Criminalis Carolina*), the 1532 law code of the Holy Roman Emperor Charles V. Peter’s *Voinskii artikul* indirectly copied the old Roman law distinction between magic that harmed and magic that did not, and the punishment of the former by burning from article 109 of the Carolina (which omits the demonic/nondemonic distinction). The *Carolina*’s requirement that confessions could be extracted by torture was already normal practice in Russia.

The confusion of civil and ecclesiastical law was compounded by Peter the Great’s Church reforms. In his *Ecclesiastical Regulation* of 1721, Peter abolished the patriarchate of the Russian Orthodox Church and established a synod to govern it instead. Insofar as it served as a court, the synod was essentially a branch of the state apparatus and blurred the distinction between civil and ecclesiastical authority even further while depriving the Church of jurisdiction in many areas. In this period, the only specific Russian laws against witchcraft were found in Peter’s military code, although in 1722 the synod obtained Peter’s confirmation of its jurisdiction in cases relating to marriage, blasphemy, heresy, and *volshhebnye dela* (magical matters). This created a curious situation, in which cases of harmful magic could be tried in the highest ecclesiastical court, the Synodal Court, under military law. Peter’s Church reforms also required the clergy to report anything learned from penitents in confession, and bishops were obliged to send annual reports on superstitious practices in their dioceses.

The severe treatment prescribed by the state for those suspected of practicing magic and witchcraft continued after Peter’s death. *Ukazy* (edicts) of March 20 and May 25, 1731, in the reign of the Empress Anna, prescribed death by burning for “deceivers” who practiced magic, and the knout, or in extreme cases death, as the punishment for consulting magicians (the phrasing indicated that male magicians were envisaged). The use of the word *deceivers* (*obmanshchiki*) suggested that the law now regarded witchcraft as a species of fraud, as elsewhere in Europe under the influence of the Enlightenment, even if the punishment was still associated with older views of magic and heresy.

OSBORNE, JOHN AND RUTH (1751)

This elderly English couple was subjected to mob violence at Tring (Hertfordshire) in the summer of 1751. Ruth Osborne, aged about seventy, died as a result of the treatment meted out to her. One of the ringleaders, Thomas Colley, was subsequently convicted for murder at the Hertford assizes and executed at Tring on August 24, 1751, his body left to rot on a gibbet.

The incident has yet to be researched in detail, but it obviously opens up some important issues about witchcraft and witch beliefs in mid-eighteenth century England. There were several incidents of mob action against witches in Hanoverian England, but the Osborne case was unusually well documented because it prompted two printed pamphlets. The English witchcraft statutes had been repealed not long before (1736), but there was obviously widespread fear of and belief in witches among the population at large. Ruth Osborne had supposedly committed a number of acts of *maleficium* (harmful magic), and her husband, some fourteen years younger than she, had a reputation for being a wizard, so that none of the local farmers would employ him. In particular, a farmer turned innkeeper named John Butterfield was convinced that the Osbornes had killed his cattle by witchcraft, a tragedy that had led him to give up farming. Butterfield seems to have orchestrated

the violence against the Osbornes; Colley claimed at his trial that it was the drink Butterfield supplied that caused him to take a leading part in the violence against the couple. This violence was well organized: the intention to "duck" the Osbornes (i.e., subject them to the swimming test) was announced publicly in a number of towns in the area, and some 5,000 people turned up to participate or watch. The Osbornes had taken refuge in the vestry of the parish church but were dragged out. Ruth was thrown into a pond, and Colley repeatedly pushed her further in with a stick. A local doctor subsequently called to the scene confirmed that she had died from drowning.

The pamphlet accounts of Colley's trial and of his subsequent execution very much followed the norms of polite Enlightenment society, stressing the dreadfulness of the events and the ill-advisedness of belief in witchcraft. It was particularly important to present Colley as coming round to a repentant and enlightened state of mind, in which he was able both to realize the enormity of his crime and accept that there was no such thing as witchcraft. In particular, an unnamed gentleman visited Colley in prison, hoping to convince him that his views on witchcraft were totally erroneous. Interestingly, Colley told this gentleman that he had witnessed a similar swimming of a witch, which also resulted in her death, in a neighboring county only a few years previously; because no legal action had been taken against any participants in that event, he thought such practices were legal. Throughout, one senses a tension between the rejection of witch beliefs among the educated, polite world of the gentry and their continuation among the population at large.

The authorities, obviously fearing that Colley might be rescued by mob action, had him accompanied to his place of execution by over 100 troopers from the Horse Guards. The soldiers were jumpy, and thinking they were being fired on, were thrown into confusion when one of their number accidentally discharged a pistol. In the event, there was no riot in support of Colley. Yet the pamphlet describing his execution recounted how the event attracted a large crowd of spectators, many of whom commented on the injustice of hanging a man for killing a witch.

OSNABRÜCK, BISHOPRIC OF

An ecclesiastical territory situated in the northwest of the old Reich, the prince-bishopric of Osnabrück had approximately 120,000 inhabitants at the end of the eighteenth century. Because of the questionable situation of Osnabrück's sources, it is unclear when its witch hunt started. Its first provable witchcraft execution dates from 1501. Because many early records were lost in a fire that completely destroyed the city of Osnabrück in March 1613, we will never know how many witchcraft prosecutions were pursued here in the sixteenth century.

With regard to witch hunts, the bishopric of Osnabrück shows a distinct separation between parts of its territories that had high and low prosecution rates. Available sources suggested that very few witchcraft trials took place in the seven rural offices of the prince-bishopric, although a certain number of undetected cases must be added because of lost materials. Gisela Wilbertz, who produced the best work on this subject, mentioned ninety trials between 1538 and 1669. Over half of them (ffty-thræ) ended with the execution of the defendant; only four men were executed alongside forty-nine women. We can safely assume that only individuals were accused: the prince-bishopric of Osnabrück had no known mass trials.

However, the self-governing city of Osnabrück became a regional center of witchcraft prosecution: at least 276 people were put to death in several major witch-hunting waves between 1561 and 1639. By the mid-1580s, more than 130 people had already fallen victim to Osnabrück's witch hunts; soon afterwards, 22 women were sentenced and executed as witches in 1590 and 17 more women in 1592. Because of the fragmentary state of our sources, we cannot reconstruct the dynamics of any of Osnabrück's witch hunts.

The witch hunt in the city of Osnabrück reached a new peak between 1636 and 1639. The *spiritus vector* (driving force) behind this wave of prosecutions was the mayor, Dr. Wilhelm Pelzer, who was eventually removed from his position because of his judicial excesses and was imprisoned after 1651. The multiplication of witchcraft prosecutions in Osnabrück during these years must be seen against a background of two conflicts. One was the city's tenacious struggle with Gustavus Gustavson, an illegitimate son of the famous Swedish king Gustav II Adolph, attempting to protect its municipal autonomy against a foreign Protestant sovereign; the other involved internal city rivalries. Mayor Pelzer wanted to defend the city's independence against Gustavson at any price and used the witchcraft trials as a political measure. In the same way, he tried to

deprive his rival Dr. Modemann (a follower of Gustavson) of his power: Dr. Modemann's eighty-two-year-old mother, Anna Modemann, was accused of witchcraft along with other patrician women.

There was resistance within the city to Dr. Pelzer's arbitrary policies. Pastor Gerhard Grave, a relative of the executed Anna Modemann and preacher at the Church of the Virgin in Osnabrück, condemned from his pulpit, among other things, the use of the swimming test (cold-water ordeal) in witchcraft trials, regarding this ordeal as illegal. Pelzer took draconian measures to silence Grave, closing his church *cum maximo scandalo* (with very great scandal) in order to continue and intensify the use of the swimming test. For his part, Grave retaliated by making the events surrounding the water ordeal at Osnabrück into a pamphlet printed at Rinteln in the 1640s by Petrus Lucius. Today almost unknown, it was then considered a major attack against the water ordeal.

Another Osnabrück critic of the swimming test was Conrad von Anten, a lawyer at the *Reichskammergericht* (imperial chamber court), the highest appellate court in the Holy Roman Empire. His work about the *Mulierum Lavatio* (The Bathing of Wives), published in 1590, was based on personal experiences witnessing such persecutions; his own wife, Anna Schreiber, also from Osnabrück, had been accused and tortured as a witch. Based on his own experiences, von Anten's erudite treatise scathingly criticized the water ordeal for its degrading character. Besides publishing this book, von Anten also sued both the mayor and city council of Osnabrück in the *Reichskammergericht* for the annulment of his wife's *Urfehde*, her oath to the judge not to exact revenge against her accusers, and also for damages she suffered from personal injuries. Osnabrück's last witchcraft trial apparently occurred in 1639.

OVERBURY, SIR THOMAS (1581–1613)

Trials for the supposed murder of Thomas Overbury exposed the recourse to magic among the social and political elite of early seventeenth-century London.

Born into a prosperous Gloucestershire gentry family, the son of a successful judge, Overbury earned his BA

at Oxford and then entered the Middle Temple in London to begin his legal training. In 1601, however, while visiting Edinburgh, he met and befriended another young gentleman, Robert Carr, at that time page to the earl of Dunbar. Carr came south with James VI and I in 1603 and became a leading royal favorite, becoming Viscount Rochester in 1610. Overbury, the more polished of the two, acted as a sort of mentor for Carr, hoping that Carr's rising fortunes would enhance his own.

By 1610, Carr was involved with Frances Howard, countess of Essex. The countess, whose life has formed the basis for several books (most recently Lindley 1993), planned to divorce her husband and marry Carr. Her granduncle, the earl of Northampton and leader of the powerful Howard faction, approved of this plan, but Overbury opposed it, fearing that his own influence over Carr would be replaced by that of the countess. Overbury had to be removed. His imprisonment in the Tower of London was engineered; both the new governor of the Tower and Overbury's jailer, Richard Weston, were Howard clients. While imprisoned, and probably without Carr's knowledge, Overbury was gradually poisoned. A woman named Anne Turner helped supply the poisons, Weston and an apothecary named James Franklin administered them, and a gentleman named Gervase Hewlys was also involved. Overbury died on September 14, 1613, his death being attributed by a consequent coroner's inquest to natural causes. Frances Howard divorced the earl of Essex on grounds of nonconsummation due to his impotence (the proceedings scandalized Jacobean high society) and married Carr, by this time the earl of Somerset, in December 1613.

By 1615, reports reached court that Overbury had, in fact, been murdered, and proceedings were opened against Turner, Hewlys, Franklin, and Weston that November, with the earl and countess of Somerset being tried in May 1616. All four commoners were convicted and executed; the earl and countess were found guilty but pardoned, being eventually freed in 1621.

The significance of the Overbury case in the history of witchcraft lies in some of the evidence that emerged during the trials of his murderers. It was revealed that in the period preceding her divorce, Frances Howard had consulted various cunning men and other magical practitioners, both to procure magical substances to render her husband impotent (apparently he had appropriate ointments rubbed onto his linen) and to win the love of Robert Carr. In particular, she had been an active client of the astrologer and quack doctor Simon Forman (1552–1611), who had built up a large practice, especially among well-connected ladies, knew many court scandals, and also had a reputation for dabbling in poisons. Like Anne Turner, he lived on the margins of court society and profited from its vices and was

therefore an excellent contact for Frances Howard. Turner became Frances Howard's confidante in 1610 and introduced her to Forman. The two women visited him on several occasions, turning for help after his death in 1611 to another magical practitioner named Savery. When at Turner's trial the judge produced damning evidence of magical dabblings, the packed audience was most scandalized by obscene copulating figures (supposedly aids to love magic) made of lead, brass, and wax, and various parchment charms, one of them with human skin attached to it. A crack in the scaffolding holding spectators while these exhibits were being shown fueled fears that the Devil was in the courtroom. There were reports of a list in Forman's handwriting naming those court ladies who had sought love potions from him.

The Overbury murder trials therefore made two important points. The first was that, even in the early seventeenth century, upper-class people were still willing to use magic to settle their problems and to consult magical practitioners, up-market cunning folk in effect, to help them. The second was that although witchcraft and associated beliefs are often thought of as essentially the products of a rural society, there was clearly a large, and still largely unresearched, network of cunning folk, astrologers, and other forms of magical practitioners in London. In both respects, Overbury's murder prefigured the Affair of the Poisons at Louis XIV's court over fifty years later.

OXFORD AND CAMBRIDGE UNIVERSITIES

In contrast to the situation in other European states, where theology faculties were occasionally called upon to pronounce on witchcraft cases or on the concept of witchcraft more generally, English universities never offered professional opinions on witchcraft in specific instances. Moreover, the English common law, under which English witches accused on capital charges would be tried, was not studied at Oxford and Cambridge but rather at the Inns of Court in London ("civil," that is, Roman law, was offered at both universities, and it was there that ecclesiastical court judges gained their qualifications). Therefore, there was no law faculty to comment on witchcraft cases at English universities, and the Inns of Court do not seem to have been consulted institutionally about witchcraft.

Both English universities enjoyed parallel developments in the early modern period. After a post-Reformation slump, they enjoyed a boom for ninety years after 1550. Matriculations at the two institutions rose to over 900 annually by the 1580s. After a downturn in the 1590s, matriculations rose again to over 1,000 by the 1630s. They fell with the civil wars, and despite a recovery in the 1650s never regained their prewar levels in the late seventeenth and eighteenth centuries. The post-1550 boom was driven by a perceived need for a university-trained clergy, a goal virtually attained by the outbreak of war in 1642, and by a new fashionableness of a university education among the gentry.

Oxford and Cambridge Universities were, of course, responsible for spreading educated views of witchcraft both through theology and through the teaching of classical languages, because Greek and Roman literature furnished many examples of witchcraft and related phenomena. But Cambridge made two specific and important contributions to English witchcraft. The first was its role as a hotbed of advanced Protestant views during the Elizabethan and early Stuart periods. A by-product of this focus was the emergence of a number of clerical intellectuals who published works on demonology, usually along with other writings. The most influential of these intellectuals was William Perkins, whose important *Discourse of the Damned Art of Witchcraft* was published posthumously in 1608. Other Cambridge-based or Cambridge-educated demonologists included George Gifford, author of two tracts on witchcraft; Henry Holland, whose *Treatise against Witchcraft* was published in 1590; James Mason, author of *The Anatomie of sorcerie* of 1612; the physician John Cotta, whose *Tryall of Witch-Craft* appeared in 1616; and Richard Bernard, author of *A Guide to Grand Jury Men with respect to Witches* (1627), a book exemplifying a distinctive English demonological style. Cambridge's second great contribution was to foster,

in the 1640s and 1650s, what soon became a very influential body of Platonic and Neoplatonic thinkers. The most important of them was Henry More, a powerful and respected thinker, who was responsible for the emergence of Joseph Glanvill's *Saducismus Triumphatus* (Sadducism Conquered), an extremely important defense of the belief in witches and spirits, in its full form in 1681. More's own *Antidote against Atheisme* of 1653 pioneered the approach Glanvill and other later defenders of witch beliefs used by assembling apparently authenticated accounts of witchcraft, possession, and other supernatural happenings to prove the reality of the spirit world.

Oxford, however, had the distinction of direct involvement by a large body of its academics in a witchcraft case, the episode involving Anne Gunter, the daughter of a Berkshire gentleman who began showing signs of being bewitched in late 1604. Her case subsequently came to the attention of King James I, and she, together with her father, was subsequently tried for false accusations of witchcraft by the Star Chamber. Anne's sister Susan was married to Thomas Holland, then Regius Professor of Theology and Rector of Exeter College. Anne was lodged in the college for a while, and a number of academics, including some major university figures, gave evidence to Star Chamber, most of them arguing for the reality of her sufferings.

P

PACT WITH THE DEVIL

A purported contract, either implicit or explicit, between accused witches (and sometimes magicians) and the Devil, according to which a person pledged her or his soul to Satan in return for worldly gain, healing and magical powers, or arcane knowledge, was considered a pact with the Devil.

As an essential element of the cumulative or elaborated concept of witchcraft, the pact with the Devil gradually became one of four essential legal proofs (alongside *maleficium* [harmful magic], transvection and metamorphosis, and attendance at the Sabbat) in accusations of witchcraft. An explicit or express pact was not limited to a legal document, often supposedly composed in a person's blood, but also included an array of ritual acts of homage (e.g., kissing the Devil on the buttocks—the kiss of shame), with a material (e.g., monies that later turned out to be potsherds or clumps of dung) or sexual consideration literally reifying the covenant. Figuratively, the rituals were a perversion of feudal ceremonies associated with fealty (e.g., charter, kiss, exchange of a clump of earth) and marriage (e.g., dowry, consummation) concluded between legally (if not socially) equal partners; hence, the Devil was often iconographically depicted as a nobleman who propositioned the prospective witch. The ready familiarity of these legal and ritual concepts, their congruence with existing gender roles, and a strong literary tradition and the reintroduction of Roman law all help to explain the easy reception and centrality of the idea of the pact in late medieval and early modern Europe, especially on the Continent.

EARLY HISTORY

The Western tradition of contract law emerged in Roman jurisprudence in classical antiquity. One of the earliest inferences to the possibility of entering into a private commercial contract with the Devil is found among St. Augustine's works in the fourth century. However, not until a number of legendary incidents were translated into Latin in the ninth century did the idea become widespread. Foremost among these was the story of the monk Theophilus, known both on the Continent and among the late Anglo-Saxons. A Jewish magician persuaded Theophilus to transfer his alle-

giance to the Devil in a written agreement in return for magical powers—an early indication of the anti-Semitism inherent in diabolical belief structures.

During the twelfth and thirteenth centuries, scholastic theologians accentuated a view of all magic as demonic and implied the necessity of a Devil's pact as a precondition to gaining magical abilities. Previously, medieval necromancers operated under the assumption that they could command the spirits of the dead and the demons they summoned. However, Thomas Aquinas forcefully argued for a contractual reciprocity inherent in any concourse with the Devil, emphasizing the existence of tacit agreements or express pacts, either the implicit *pactum tacitum* or a *pactum expressum*, the latter literally a verbal or written contract. Reciprocity implied that the magician was guilty of apostasy, because mortals had little to offer Satan other than their service or their soul, thereby logically condemning all parties to pacts as demon-worshippers and justifying their persecution by inquisitorial officials as heretics. Gradually, as demonologists came to view the contract as essentially one-sided rather than one conducted between equals, the relationship between necromancer and spirit shifted, and “as the master-magician was transformed into the servile witch, the sex of the malefactor changed from male to female” (Levack 1995, 35). Heiko Oberman's theory of an alternate and skeptical Augustinian tradition notwithstanding (a demonological *via moderna* [modern way], exemplified by the *Canon Episcopi* [ca. 906] and the Tübingen scholar Martin Plantsch), the Thomist *via antiqua* (old way) became the dominant ideology by the fifteenth century, echoed in the *Malleus Maleficarum* (The Hammer of Witches, 1486) as well as in later works by Martín Del Río and others during the second (or bastard) scholasticism of the late-sixteenth and early-seventeenth centuries.

The especial significance of this tradition was to render all forms of magic suspicious and encourage their persecution. Initially, secular law codes (such as the *Cardina*, 1532) had condemned *maleficium* only, but by 1582, the pact with the Devil was recognized as a material element of accusations for witchcraft in the law codes of Württemberg, the electorate of Saxony, and the County Palatine of the Rhine. Medieval England, where reception of the *Malleus* was generally

Pact between Urbain Grandier and various devils, introduced as evidence in his trial in Loudun in 1634. The pact is in mirror writing because devils do everything opposite to Christians. (Reprinted from Mephistopheles: the Devil in the Modern World, by Jeffrey Burton Russell, Cornell University Press, 1986)

slow, was exceptional in this regard. Explicit mention of a diabolical compact remained completely absent from English law until 1604; the first English trial reference to an oral pact with the Devil dates from 1612; the first sworn evidence indicating a written pact dates from the investigations of Matthew Hopkins, witch-finder general, in the 1640s.

ELITE AND POPULAR BELIEFS

Some historians have suggested that there never were pacts with the Devil, but rather that they were imaginative inventions, part of the cumulative or elaborated concept of witchcraft developed by demonologists, jurists, and theologians and, hence, completely alien to the popular consciousness. In fact, there were actual persons who believed themselves possessed of extraordinary powers to heal, perform love magic, fly in out-of-body ecstasies, or engage in night battles against phantoms to defend agrarian fertility. There were also

isolated individuals who contracted actual written pacts with the Devil. Obviously, the vast majority of those accused of contracting a pact probably did not do so, and in most cases, the implication is of a tacit or oral contract in any case. However, indications of written pacts should not be dismissed lightly for want of evidence, since their destruction as blasphemies was required, as reported by Martín Del Rio and others. Most contemporary demonologists—including the skeptical Johann Weyer—despondently confirmed their existence.

Additionally, although the evidence is extremely rare, archivists and historians have identified several surviving written pacts in the archives. The most famous of these are the pacts of Johann Haizmann with the Devil, discovered by the Viennese archivist Rudolf Payer-Thurn in 1920 and subsequently described in an article by Sigmund Freud. Convincing circumstantial evidence witnessed by contemporary legal investigations into four Devil's pacts have been located in the archives of the University of Tübingen alone, along with the actual written pact of the student David Leipziger, composed in 1596. Two pacts written in lemon juice by the demoniac Katharina Rieder in 1668 were discovered in Munich using quartz-lamp technology. A gender distinction readily emerges from an examination of these pacts. The pacts contracted by males for money or career advancement tend toward a Faustian model and were probably influenced by the first vernacular printed edition of the tale in 1587, which was immensely popular. However, the female Rieder-pact and its surrounding circumstances more closely resemble the witch model, to include copulation with the Devil, apostasy, and demonic possession, though here once again, given their timing, one should not preclude the possible influence of the Faust legend. A third influence can be traced to the common contemporary practice of contracting obligations with the saints, usually in return for individual healing or communal assurance for agrarian fertility—hence, legal condemnations of the practice of throwing saints' statues into rivers when communes felt they had failed to deliver on their presumed contractual obligations. In a literal inversion of the pact with the Devil, Elector Maximilian I of Bavaria contracted himself, his son, and his daughter-in-law to the Virgin Mary in their own blood in the mid-seventeenth century, and the contracts are still preserved at the dynastic cult shrine at Altötting.

SIGNS OF SKEPTICISM

As the publication of the Faust legend increased the likelihood of persons contracting actual written pacts, and just as persecutions for witchcraft approached their climax in western Europe, a number of skeptics entered into the debate on the cumulative concept of witchcraft,

challenging its fundamental precepts. Foremost among these were Johann Weyer, who thoroughly debunked the efficacy of such contracts according to the precepts of Roman law and current medical theory in his *De praestigijs daemonum* (On the Tricks of Devils, 1563), and Reginald Scot, who refuted the possibility of pacts outright in his *Discoverie of Witchcraft* (1584). Weyer, sometimes considered to be the father of the modern insanity defense in Freudian psychoanalysis, developed the hypothesis of pacts as “leonine” contracts—that is, unfair contracts benefiting the Devil only, who failed to live up to his promises to the witch—thereby rendering them null and void, because they rested upon coercion. Weyer’s arguments did suffer from certain inconsistencies because he too ultimately had to admit certain powers to the Devil, as well as to recognize the existence of attempted pacts, despite their legal invalidity. Nevertheless, Weyer’s influence was great, as was that of Scot in England, so that by the mid-seventeenth century, numerous jurists, scholars, and theologians could successfully assert the illusory nature of pacts with the Devil, resulting in increased employment of the insanity defense in cases of witchcraft and especially demonic possession and suicide.

PADERBORN, PRINCE-BISHOPRIC OF

A prince-bishopric of the Holy Roman Empire with a population between 60,000 and 80,000, Paderborn was located in southeastern Westphalia in between two regions of intensive witchcraft persecution: the county of Lippe to the north and the electoral duchy (*Kurkölnisches Herzogtum*) of Westphalia to the southwest. Paderborn’s power structure was split among three estates with extensive rights of self-determination: the cathedral chapter; the nobility; and representatives of its numerous, but largely agrarian, towns. The prince-bishop’s sovereign criminal justice system did not control the entire territory; sizable areas remained under the autonomous judicial authority of the cathedral chapter and of various noble families, the highest being the lords von und zu Büren and von Westphalen zu Fürstenberg.

Between 1510 and 1702, witchcraft trials against 260 persons are known to have taken place in Paderborn. In 204 cases, these trials ended in execution or death in prison; eighteen prisoners were released; and the outcome of the rest is unknown. Seventy percent of those prosecuted were women; children were occasionally prosecuted. These numbers are only a minimum: although both major noble rulers, von Büren and von Westphalen, left excellent sources, the area’s other legal systems did not.

As early as 1500, the *Malleus Maleficarum* (The Hammer of Witches, 1486) was known among Paderborn’s clergy. Isolated trials took place around 1510 and after 1555, before becoming endemic after 1572. Three main waves of persecution, similar to those in the duchy of Westphalia and other Catholic areas, occurred first in the 1590s and then between 1628 and 1631 and between 1656 and 1659. The first two immediately followed crises caused by extreme inflation or plague.

In 1598, the *Reichskammergericht* (imperial chamber court) intervened against Paderborn’s cathedral chapter, thus preventing further executions, although the canons made reprisals against the relatives of the accused. In 1603 and 1604, Bishop Dietrich von Fürstenberg (ruled 1585–1618) caused a great stir by conducting trials against the prior, subprior, and two monks from the Augustinian convent in Dalheim, following allegations by confessed witches that all four clerics had participated in a witches’ Sabbath. After one monk died during a year in prison, Würzburg’s law faculty issued an opinion that saved the others’ lives. This case, reminiscent of discussions going on at the same time in Bavaria, was still remembered at Paderborn and the abbey of Corvey as late as 1630; in a rather

disguised manner, Friedrich Spee alluded to it in his *Cautio Criminalis* (A Warning on Criminal Justice, 1631).

The high point of persecution, around 1630, produced approximately ninety-five victims, fifty of whom were executed in Büren between March 17 and April 15, 1631, shortly before the *Cautio Criminalis* appeared in print in May 1631. Its author, Friedrich Spee, had taught moral theology at the Jesuit university of Paderborn since 1629. Spee had his share of enemies in Paderborn (including Suffragan Bishop Johann Pelcking), but he also had influential friends, who helped get his book published or recommended it. From 1619 to 1650, Paderborn's bishop was the archbishop of Cologne, Ferdinand of Bavaria, who had not visited Paderborn since the early 1620s. Because source materials are so scarce, it is unclear to what extent the archbishop's representatives and the estates used their administrative freedom either to promote or to prevent witch hunts in the prince-bishop's jurisdiction.

Between 1656 and 1660, a wave of demonic possession among young women in the town of Brakel aroused widespread attention after a Jesuit exorcist, Paderborn theology professor Bernhard Löper, turned the possessions into an uncontrollable epidemic. Löper used the exorcisms to demonstrate the superiority of Catholicism but could not expel the ghosts he had summoned, while the possessed and their families demanded a witch hunt against their enemies. Unsure how to judge the alleged demonic possession, Bishop Dietrich Adolf von der Recke (ruled 1650–1661) asked the Holy Office (the Congregation of the Inquisition) in Rome for guidance: one of his canons, Ferdinand von Fürstenberg, was close to the current pope, Alexander VII. A Roman exorcism expert advised Paderborn's clergy to reduce fear of the Devil and his powers through better pastoral care instead of heeding calls for witch hunts. After reading Löper's reports, Alexander VII doubted that the girls were possessed. But Roman skepticism about the credibility of the possessed and of witches' Sabbats found few supporters in Paderborn, especially when Löper denounced the bishop as a witches' lawyer. Von der Recke and his councilors then permitted witchcraft trials that eventually led to at least fifty executions from 1657 to 1659.

The trials began so slowly that a group of enraged men actually beat nine alleged witches to death on a public street. Paderborn's rulers caught the murderers, put them on trial, gave them death sentences, and following Rome's suggestion, put the more rabid of the possessed in solitary confinement in order to care for their spiritual needs.

These events ended Paderborn's last major wave of persecutions. Von der Recke's successor, the same Ferdinand von Fürstenberg (ruled 1661–1683), brought his Roman attitudes to Paderborn with him. In

1675 he authorized the execution of a man who used a consecrated Host to perform magic—a form of sacrilege punishable by death at Rome far into the eighteenth century. However, the situation in von Westphalen zu Fürstenberg's private jurisdiction was quite different. After a twelve-year-old boy was executed by cutting his arteries in 1694, one of the last witch hunts in Westphalia took place between 1700 and 1702, with twelve people accused and at least three women and two men receiving the death penalty.

PALATINATE, ELECTORATE OF

The widely dispersed territory of the electoral Palatinate, ruled by the older line of the Wittelsbach dynasty at Heidelberg, was situated in Germany between the upper and mid-Rhineland. Until the Thirty Years' War, the electorate also included the Upper Palatinate in northeastern Bavaria. Although the electoral Palatinate played a key role in supporting witchcraft trials in the late Middle Ages, it took the lead in opposing them during early modern times.

Soon after the new belief in diabolical witches had developed in the Swiss Alps during the first half of the fifteenth century, the electoral Palatinate became, as far as we know today, the first German territory to adapt this new belief and start its own witch hunts in 1446–1447. The Palatinate had both territorial and dynastic links with some core areas of the new witch beliefs. However, conditions for a favorable reception of a modern approach to witchcraft were exceptionally good at Heidelberg, especially with the university, which had demonologists such as John of Frankfurt and Nicholas of Jauer. Moreover, the Palatinate had been extremely active in purging heresy; the elector Palatine, its secular ruler, had played an active role, making considerable personal efforts. Even though theologians prepared the witchcraft cases, the electoral Palatinate adopted not the ecclesiastical procedure of witchcraft inquisition, but the secular witchcraft trial developed by Swiss cities. Final decisions and

responsibility in the witch hunt belonged to the elector. More persecutions were documented in the Palatinate until the beginning of the sixteenth century.

However, when the first big wave of witch hunting in the early modern period began around 1560, the by-then-Calvinist Palatinate distanced itself from the common German trend by refusing to carry out witchcraft trials. This refusal remained characteristic afterward. It was due solely to the steadfastness of its administration that persecution of witchcraft never reached the electoral Palatinate from neighboring areas. Because this territory was in the middle of the main regions where witch hunts abounded, such external facts as the climate, geography, or economic position of the Palatinate cannot explain its opposition to the persecutions. And the Upper Palatinate, belonging to a different geographical region, also had no witchcraft persecutions while under the reign of the electors at Heidelberg. The absence of witchcraft trials was not a passive attitude, therefore, but an active policy of the electoral government to defend itself against internal and external opposition. From the outside, electoral policy was confronted with denunciations of Palatinate subjects by foreign witches and demands for persecutions by neighboring rulers. Serfs from the Palatinate became involved in foreign witchcraft trials and had to be defended, and many foreign subjects who fled to the Palatinate from persecutions in their home territories were allowed to settle. The intellectual elite of the electoral Palatinate included a strong group of supporters of the witchcraft trials, who demanded punishment especially for the apostasy and blasphemy of the witches. This group comprised most of the electorate's leading Reformed theologians and prevailed only at the end of the sixteenth century. The debates on the matter of witchcraft created a remarkable scientific discourse, including significant tracts by Thomas Erastus, Hermann Witekind, and Antonius Prætorius. Another dangerous demand for persecution came, as elsewhere in this region, from the populace. They made several accusations of witchcraft that could have started persecutions, but the Palatinate's administration refused all these demands.

Despite all the influence the prince-electors had on politics, the actual governing board was the Palatinate council (*Hofrat, Oberrat*) led by the chancellor. Extremely well-trained civil lawyers dominated this council. It acted as a unified organization that for the most part perpetuated itself, thereby ensuring a remarkable degree of continuity, despite several changes of confession (religion). So the refusal to persecute witches, once established in the 1560s, was maintained and even deepened over time. This policy drew important support from the faculty of law at Heidelberg University, where most councilors and government officials were trained. But of central importance for

implementing this approach toward witchcraft was the Palatinate government's relatively good administrative control over punishing capital crimes. The *Hofrat* at Heidelberg, which oversaw all procedures of the lower courts, ultimately decided all important cases of criminal justice; usurpations of high justice by the populace, as in the electorate of Trier, were unimaginable.

The Reformed Church, established in the Palatinate in the 1560s, could not have been responsible for official disapproval of the persecution of witchcraft. Several Reformed territories in Europe (e.g., Scotland) had severe witchcraft persecutions. Opponents of the persecutions in the electoral Palatinate cannot be squeezed into one single intellectual tradition. Instead, one could develop a model for the electoral Palatinate showing several lines of tradition converging to build up an autonomous regional tradition, which is perhaps best described in Hermann Witekind's *Christlich bedencken und erinnerung von Zauberey* (Christian Thoughts and Memories about Sorcery, 1585). One finds traces of the so-called *Canon-Episcopi* tradition of southwestern Germany (Mdelfort 1972), here in its Reformed version, as well as traces of the humanistic tradition led by Johann Weyer (who was highly regarded in the Palatinate), whose sons Dietrich and Johann reached very high positions in the electoral government. But one must also recognize that the attitude of the Palatinate opponents of witchcraft persecution was mainly rooted in commonly accepted theological and legal norms; many traditional lines of the discourse on witchcraft that were opposed to the persecutions fit into this framework.

Strict observance of formal legal procedures in witchcraft trials saved the electoral Palatinate from rash executions by holding steadfast to ordinary methods (*processus ordinarius*). This demanded a considerable accumulation of proof before proceeding to torture, one nearly impossible to obtain in witchcraft trials. In the Palatinate, commonly used evidence like denunciations and the *mala fama* (bad reputation) were insufficient; the Devil's mark, the absence of tears, or the so-called water test (water ordeal; swimming test) were all inadmissible as evidence. Legal objections usually were in the foreground in official Palatinate arguments because they were unanswerable in imperial law. The electoral Palatinate was not completely alone in this policy. In most other large secular territories of the Holy Roman Empire, like the nearby duchy of Württemberg, an increasingly professional and centralized administration of law in the early modern state usually restricted the number of witchcraft trials and stopped any mass persecutions "to safeguard the dignity of the entire judicial apparatus" (Soman 1989, 14). But the existence of a powerful group strongly disapproving of the persecutions, like that found in the electoral Palatinate, was extremely unusual.

The specific difference here lay in a stronger criticism of the belief in witchcraft. Their fundamental opposition to the belief in witchcraft was based on the theocentric assumption of an almighty God, strongly emphasized by Reformed confessionality, leaving little room for supernatural interference by diabolical agents. God alone ruled the world: sorcery was no more than an illusion of the Devil. The opponents of the persecutions therefore rejected any trials concerning supernatural elements like witches flying or fornicating with devils, because they were impossible. If the damaging effects of *maleficium* (harmful magic) were nonetheless legally punishable, this meant murder through poison or other offenses rationally possible. In the end, only separation from God and the pact with the Devil remained. But, as with all other forms of heresy, Palatinate authorities rejected the death penalty for spiritual crimes. In so doing they went beyond a Calvinist standpoint, as the opposition of Palatine theologians in the second half of the sixteenth century showed. However, using a missionary approach of “convert them, don’t burn them,” curiously like that of the Spanish Inquisition, Palatine opponents of the persecutions demanded to lead those gone astray back to the true belief through pastoral care. In cases in which conversion was ineffective, as a last resort, banishment from the territory was the correct solution. The opponents of persecution supported disciplinary enforcements against people who practiced magic, but not with fire and sword, any more than for Anabaptists or refractory Catholics.

Because the approach toward witchcraft in the electoral Palatinate depended largely on its government, it became unsure when this region was occupied by Catholic troops in the course of the Thirty Years’ War. From 1622–1623 until 1649, Spain and the emperor governed the part of the electorate west of the Rhine River, while Bavaria held those parts to the east. We can make no certain claims about witchcraft trials under Spanish occupation; but we have ample indications that from 1629 onward, a wave of witchcraft persecutions affected the Bavarian-ruled palatinate, apparently influenced by large persecutions in neighboring territories. Burnings occurred, although their exact numbers are unknown. The Bavarian government in Heidelberg, now controlling criminal justice, took up the persecutions with the support of Prince-Elector Maximilian. At that time, examples of witchcraft trials using procedures contrary to established laws occurred in the electoral Palatinate.

Interestingly, those forces in Munich opposed to witchcraft trials (who controlled Bavarian central administration) had no means to exert significant influence over these persecutions in far-off Heidelberg, for personnel and administrative reasons. The councilors and government officials that Bavaria

installed in the Rhine Palatinate were mostly Catholic foreigners from the vicinity of the electoral Palatinate, distant from Bavarian traditions and therefore unaware of the moderate approach now dominant in Munich. So in the electoral Palatinate on the Rhine, the tradition against persecutions ended when its old government fled, while the Bavarians never extended their cautious approach to the Palatinate. Quite different however, was the situation in the Upper Palatinate, where no new persecutions occurred under the Bavarian government. Here the personnel from the electoral Palatinate remained largely intact, being replaced only slowly by Bavarians bringing Bavarian traditions with them. The radical rejection of persecutions by Calvinist authorities was thus gradually transformed into the cautious approach of the Bavarian Catholics, with minimal consequences.

After their return to Heidelberg in 1649, the Palatinate Prince-Elector Charles Ludwig and his government resumed the traditional rejection of persecutions, whose foundations were now strengthened and broadened by increasing religious tolerance and further humanization of penitential procedures.

PALINGH, ABRAHAM (1588/1589–1682)

Palingh was the author of the most prominent Mennonite book about witchcraft, *’t Afgerukt mom-aansicht der tooverye* (The Mask of Witchcraft Pulled Off), published in 1659. Palingh was probably born in Beveren, a small town near Antwerp, and died at Haarlem.

The Spanish army's recapture of the provinces of Flanders and Brabant in the 1580s led to a Protestant exodus to places with more religious freedom. Palingh's family moved to Haarlem, a center of textile industry in Holland. His father, Andries Palinck, first appeared there in a document from 1602. Most Mennonites were craftspeople, and many of them were textile workers. Andries was a weaver and also one of the ministers of a Mennonite congregation in Haarlem. Except for a document from 1618 mentioning Abraham Palingh as consoler of the sick in this congregation, we know little about his early years. As an adult, he understood Dutch, French, and German but not Latin, which implies that he received only a primary education. He became a small trader in textiles; he married twice and had two sons, Andries and Jan. His profession brought him into contact with another textile trader, Herman Löher, whose *Hochnötige unterthanige wemütige Klage der Frommen Unschültigen* (Much Needed, Humble, and Woeful Complaint of the Pious Innocent) was published in 1676 and whose life history Palingh had summarized in his earlier book.

As a religious dissenter who could not read or speak Latin and did not belong to the most prosperous layer of craftspeople and shopkeepers, Palingh stood outside the cultural, economic, and political elites. But his book was nevertheless well received. After 1594 it was virtually impossible to prosecute anybody for witchcraft in the Dutch Republic. But in the 1650s, some local judicial authorities again showed some willingness to receive accusations of maleficent magic, leading Palingh to write his treatise in order to convince the courts and other authorities not to permit any renewal of witchcraft prosecutions. In February 1659, his book was indeed used by the defendant in a trial against a woman accused of having concluded a pact with the Devil.

In his book, Palingh mentioned several authors who supported the persecution of witches, but he countered their arguments using only biblical texts, mentioning no other authority except Erasmus, whose name appeared only once. He specifically refuted the views of Agricola of Sttard, Jean Bodin, William Perkins, and the Jesuit Paul Laymann. (Palingh was unaware that Laymann had not written the treatise he was attacking.) His line of reasoning was first and foremost practical. As a true Mennonite, Palingh argued that magic had no effect and that the Devil could not change the course of nature and therefore could not cause any disaster. He found the whole image of an anthropomorphic Devil who conversed with human beings ridiculous. As a merchant, he expressed amazement at the Devil's business policies as described by demonologists, finding it extremely stupid to invest time and energy training employees who would be executed shortly afterward. He also mocked the professional tactics of the Devil's followers, citing the habits of Livonian werewolves

who, according to Bodin, had to pass through a river in January without wearing clothes in order to transform themselves into marauding animals. Palingh considered the idea of people preparing to dive naked into a river, in midwinter, in a northern country like Livonia, simply preposterous.

Fellow Mennonites apparently found Palingh's negation of the powers of the Devil quite acceptable. Unlike the Reformed minister Balthasar Bekker some thirty years later, Palingh was never attacked by coreligionists for denying that spirits could interfere with created matter. Incidentally, Bekker mentioned Palingh's work very favorably in his *De Betooverde Wereld* (The World Bewitched, 1691–1693). In the 1660s, Palingh also published two pamphlets defending the position of his congregation on problems then under discussion among Mennonites, matters having no connection with witchcraft or demonic powers. His participation in this debate suggested that the members of his congregation considered him a valuable defender of their views. His book was reprinted in 1725.

PAMPHLETS AND NEWSPAPERS

Witchcraft pamphlets—in effect, occasional newspapers—were based on accounts by witnesses of witchcraft-related events or sometimes on court documents. They were important because they spread stories of witchcraft. Such pamphlets were a Europe-wide phenomenon that badly needs a comparative study. In Germany they reported trials such as that of the Pappenheimer family (1600), later translated for Dutch and English readers. The Swedish Mora trials (1668–1670) were publicized through a Dutch translation of a Swedish pamphlet, subsequently retranslated and anthologized by such English demonologists as Joseph Glanvill and read as far away as America; it was also translated into German and French. English pamphlets, currently the best-studied vernacular genre, cost from a penny to a few shillings in English money; although for many a substantial purchase, they were accessible to all but the poorest. Price depended on the number of pages and special features like illustrations. It seems likely that they were circulated among groups

of people or read out to reach a wider, often illiterate, audience.

English witchcraft pamphlets offered a considerable range of form and diversity of content. The first to report a witchcraft trial was produced in three parts in London in 1566, although it is not clear whether the parts were sold separately. Based on pretrial examinations of suspects, an account of the courtroom testimony of their supposed victim, and the confession on the scaffold of the only person to be convicted and hanged, it tells the story of three women from Hatfield Peverell, a small Essex village, who were accused of a variety of *maleficia* (evil acts). Assize court records told us that one, Elizabeth Fraunces, pleaded guilty in court to paralyzing an infant (and was imprisoned accordingly), but the pamphlet records her pretrial confession. She admitted a far greater number of offenses than remain on record, some of them linked with her unwanted pregnancies and unwanted marriage. Apparently she was not prosecuted for these offenses, and so no trace of them remained outside the pamphlet, *The Examination and Confession of certaine Wytches* (London, 1566). The pamphlet gave us information we would otherwise lack and dramatized for us the gendered psychological issues behind a specific confession of witchcraft. By giving details of the suspect's life and of the dynamics of accusation and confession, it helped explain her willingness to confess in a way that other surviving records did not.

The pamphlet also deals with Agnes Waterhouse, who was named in a later pamphlet as Elizabeth's sister, and Agnes's daughter Joan. In the pamphlet, both are accused of afflicting a young girl, Agnes Browne, whose dramatically recreated court performance suggested to the reader that both women had preyed on this innocent. Agnes Browne had, she said, been tormented by a talking black dog with a monkey's face, which tempted her to suicide. Although assize records showed (and the pamphlet confirmed) that Agnes Waterhouse confessed to and was convicted of another offense and hanged, the court records and pamphlet differed in their account of Joan. Assize records showed that Joan was acquitted of bewitching Browne, but the pamphlet ended its report with the jury deliberating the case and implied that she would be found guilty. Here the pamphlet gives vividly represented detail of the case but fails to record fairly the outcome of the trial; it suggests, as pamphlets often do, that all the accused were guilty.

Agnes Waterhouse's scaffold confession also offered information, unavailable elsewhere, about those likely to be convicted of witchcraft. The pamphlet adds to assize records by telling us that Agnes was very poor, was sixty-four years old, and, before her death confessed that she prayed in Latin, suggesting an old, marginalized woman who had not accepted Protestantism. Like Elizabeth Fraunces, Agnes Waterhouse had gone begging in her community, and where charity had been denied,

she said she had punished those who refused her. From this short pamphlet, the reader gains a wealth of information and conjecture about accusers, witches, and their communities, as well as—in this case—two poems and an epistle on witchcraft giving a pious commentary on the subject. It is also possible, by comparison with other records, to offer an assessment of the reliability of stories told in pamphlets.

Pamphleteers can be accused of sometimes sacrificing truthful reporting for a good story, but they also provided details that, where they can be checked, are often confirmed. They wanted to entertain purchasers but also to inform. They were usually anonymous, probably hack writers working for publishing houses in London, sometimes writing whole booklets, sometimes only prefaces for existing documents. Another pamphlet of 1566, *The Examination of John Walsh* (London), was an almost verbatim transcript of a still-surviving church court interrogation of a "cunning man," but the preface (probably by the publisher John Awdeley) added a violently anti-Catholic address to the reader that drew out suggestions in the main text that Walsh was a Catholic and had learned his craft from a priest. This may well illuminate the motives of his accusers and questioners, by associating him with worldwide popish superstitions scorned by proper Elizabethan Protestants.

A Scottish pamphlet of the early 1590s, *Newes from Scotland* (London, 1591), had a similar political undertone but illustrated more graphically the dangers of trusting journalistic sources. It was a narrative (rather than a document-based) account that reported the activities of a large number of witches who intended to harm the Scottish King James VI. These supposedly centered around a satanic ritual in North Berwick kirk. The pamphlet's detailed but highly selective account naively reflected the assumptions of the questioners, including the king. In short, it is invaluable as an official version of events: that the king of Scotland's authority and godliness were confirmed by the attack of Satan's agents upon him. It is, however, almost impossible for a modern reader to assess what really occurred: a very complex background of political feuding that undoubtedly influenced events went completely unreported, buried by propaganda.

Most pamphlets were fairly brief—eight or twelve pages—but they were sometimes lengthened by demonological or sociopolitical commentary. *A true and just Recorde* (London, 1582) was just over 100 pages long, and Thomas Pott's vast *The Wonderfull Discoverie of Witches* (London, 1612) was nearly 200. Both contained pretrial records relating to large groups of witches. The first was probably produced by and for Brian Darcy, a magistrate involved in questioning all the accusers and suspects; an assize court clerk, on the instruction of the judges, compiled the second. In both cases, an attempt was made to prove that there were a great number of witches at large:

the preface of *A true and just Recorde* favored legal reform to burn rather than hang witches, whereas Potts attempted to portray the judicial process as it stood as both merciful and just. Both pamphlets thus had an agenda and used large numbers of witchcraft cases as “data”: illustrations of demonological and political arguments that might or might not be supported by a mass of relatively unmediated documents. Editorial tampering did, however, occur, and readers must be alert.

Witchcraft pamphlets were extremely important in circulating stories of witchcraft, upon which other cases or arguments about them might then be based. In 1619, a pamphleteer writing up *The Wonderful Discoverie of the Witchcrafts of Margarett and Phillip Flower*, an account of the murder by witchcraft of two children of the earl of Rutland, cited several pamphlets, including Potts’s, among his sources to show that witches gave their souls to the Devil. As early as 1584, Reginald Scot in his *Discoverie of Witchcraft* discussed *A true and just Recorde*, among other accounts, both English and European, from which he drew the conclusion that there were no witches as conventionally defined. By 1718, Francis Hutchinson, the noted skeptic, had amassed a collection of instances of witchcraft in pamphlets and quoted at length in his *Historical Essay Concerning Witchcraft* from those reporting the hotly contested case of Jane Wenham (1712). With a much wider range of sources for the study of witchcraft, we are less inclined to regard pamphlets as straightforward reports, but they remain a uniquely valuable repository of stories about witchcraft.

PAN

In Greek mythology, Pan was a rural god specifically in charge of forests, flocks, and shepherds. He was also a

hunter and the inventor of a type of shepherds’ pipe. He was born with horns, a goat’s beard, feet, and a tail, and his body was covered with hair. His appearance was thus so frightening that even his own mother ran away at the sight of him, and when humans encountered him unexpectedly, they often fled in terror. Hence the Greek and then English word *panic*. The supposed derivation of his name from the Greek for “everything” is a false etymology.

Pan was not the only horned divinity in Europe. The Greek god Zeus was sometimes depicted with horns, for example, and the Gallic Cernunnos had stag’s horns. During the Middle Ages, it became common for Jews to be depicted as having horns and a tail, and in a fifteenth-century manuscript, Waldensian heretics are shown worshipping Satan in the form of a goat. So the distinctive animal traits often associated with Satan, especially the presiding Satan of the witches’ Sabbat, had precedents in both pagan mythology and popular hostile depiction of outsiders.

Artists of all kinds rapidly adopted the visual identification of Pan with Satan, and it became a cliché of his representation, even though written accounts of the Sabbat described the Devil as taking other animal forms as well, such as a dog, cat, or bull. Thus, the woodcuts in Francesco-Maria Guazzo’s *Compendium Maleficarum* (A Summary of Witches, 1608) showed Satan in Pan-form receiving the worship of male and female witches, and Jan Ziaruko’s engraving for Pierre de Lancre’s *Tableau de l’inconstance des mauvais anges et demons* (Description of the Inconstancy of Evil Angels and Demons, 1612), one of the best known of the French demonological treatises, depicted Satan as an enthroned goat overseeing the detailed wildness of witches’ behavior during a Sabbat. Once established, of course, the image was reproduced over and over again. The eighteenth-century occultist Eliphas Lévi (Alphonse Louis Constant) helped perpetuate it in a form that became famous: an androgynous winged Baphomet enthroned, with rearing horns, a goat face, and a pentagram in the middle of his forehead. Goya (Francisco José de Goya y Lucientes) too subscribed to the image. *Ensayos*, one of his *Capricho* series, showed witches practicing flying, watched over by an enormous black he-goat, and his most frequently reproduced picture had female witches worshipping a goat-shaped Satan.

Pan as Pan (rather than a type of Satan) was largely forgotten by literature, however, until the nineteenth century remade him into a divinity associated with the wilder and more exciting (that is, sexual) aspects of nature. From then on, English poets in particular used him as a shorthand image for their collective and individual thoughts about nature in the raw. Prose

Pan, a horned god who, because of his horns, goat's beard, hairy body, and terrifying appearance, is associated with the Devil. (TopFoto.co.uk)

writers also took up the theme but transmuted the god into a symbol of aggressive rebellion against conventional morality, most notably perhaps in the early twentieth century when Aleister Crowley, identifying himself at one point with both Pan and the Egyptian god Seth, envisaged him as the god of homosexual passion.

But Margaret Murray finally returned Pan to his older self. In 1931, Murray published a book, *The God of the Witches*, a sequel to her *The Witch-Cult in Western Europe* (1921), which argued that the horned god was the oldest male deity in Europe and that his worship by men and women had been misinterpreted as the adoration of Satan by witches and therefore persecuted by the Church. Several scholars have demolished her theory, but the Pan image lingers on in the worship of the horned god by some modern Wiccans.

PANICS

There is much confusion about what constituted a witch panic. The most obvious examples occurred when very large numbers of accused witches were arrested and burned in one place within a short time. But when did a witch scare develop into something we could legitimately call a panic? One standard (Monter

1976, 89–92) suggested that ten deaths for witchcraft at one place in one year constituted at least a small panic, but there is no consensus among scholars. However, trying to measure witch panics seems like measuring exactly how many people are needed to make up a crowd. The larger witch panics were, the vaguer the estimates become about their actual size—almost exactly like newspaper or police estimates about the size of mass demonstrations. Nevertheless, we can offer a few plausible generalizations about when and where Europe’s major witch panics occurred.

In Europe’s worst witch panics, more than 100 witches were burned in relatively small regions within two or three years. Such episodes were extremely rare; so far as we know, they were confined to a handful of places in present-day Germany. The panic that lasted from October 1628 until March 1630 in the small town of Mergentheim provides a particularly well-documented and ghastly example (Midelfort 1972, 143–155). In all, exactly 117 witches were burned on 32 separate occasions (no more than 6 witches were ever burned together, probably because of limited jail facilities and the danger of controlling such conflagrations). Four more died in prison, probably from excessive torture. Although many accused witches were never imprisoned at Mergentheim, no imprisoned witch was ever acquitted until February 1630.

Some German witch panics were even larger and lasted considerably longer. Ellwangen, capital of a larger territory than Mergentheim, held seventeen execution days for witches in 1611 and seventeen more in 1612; the exact number who were burned in these two years is uncertain, but it probably exceeded 250. This panic continued into 1613, with six more execution days, and did not cease entirely until 1618 (Midelfort 1972, 98–115). Few cases surpassed Ellwangen in sheer ferocity. Perhaps Germany’s worst witch panic afflicted the electorate of Cologne for nearly a decade after 1627, because the government orchestrated it through a network of special commissioners resembling a separate bureaucracy (Schormann 1991), but we have no reliable estimate of its exact dimensions.

Such large panics, with twenty or more burned in a single year, accounted for about 40 percent of the more than 3,200 witches known to have been executed between 1562 and 1666 throughout Baden-Württemberg, which included both Mergentheim and Ellwangen; years with ten or more executions accounted for 70 percent (Midelfort 1972, 72). It is likely that such ratios might be replicated on a macroscale. A rough estimate of Germany’s eight or nine largest known witch panics, or “super-hunts,” nearly all of them conducted (as at Mergentheim or Ellwangen) by ecclesiastical princes, suggests comparable results: in a country with over 300 separate governments, this handful of states apparently accounted for almost 40

percent of the more than 20,000 witches executed in Germany. Because Germany executed more than half of all witches throughout Europe, this handful of major panics probably accounted for at least one-fifth of all witches executed anywhere in Europe between 1560 and 1680.

At the same time, tiny villages occasionally suffered even more from witch panics than the very worst German cases. Consider the case of little Gollion, a completely unremarkable Protestant French-Swiss village of fewer than fifty households in the Pays de Vaud (Taric Zumsteg 2000). Within sixteen years (1615–1631), Gollion experienced six separate outbreaks of witch hunting, during which a total of twenty-five people were executed; nine of them died in one two-month span. Thus, within a generation, roughly one-fourth of Gollion’s adults were burned as witches (almost 40 percent of them men). This ratio clearly surpasses even such disasters as Mergentheim, where, in a population of about 1,250 adults, about every tenth adult (and perhaps every sixth adult woman) was burned. However, Gollion is the worst case yet studied on such a microscopic level.

LARGE WITCH PANICS WITH FEWER BURNINGS

Major witch panics involving hundreds of burnings per year never occurred outside Germany. Sloppy scholarship has exaggerated their frequency elsewhere in Europe (and inside Germany as well) by accepting uncritically the numbers of witches burned found in sensationalist contemporary pamphlets, which deliberately exaggerated the extent of witches and witchcraft. These vast numbers of witches burned invariably shrink drastically upon closer inspection. For example, the well-known demonologist and judge Pierre de Lancre boasted of making several hundred Basque-speaking witches confess their crimes in 1609; well-known scholars (e.g., Trevor-Roper 1969, 112) deduced that this judge burned almost a hundred witches in only four months—but a careful reading of de Lancre’s text identifies barely a dozen witches burned, including three priests (Monter 2002, 41–42). They were, however, enough to trigger a witch panic that soon involved two countries.

As the example of de Lancre suggests, simply counting the number of witches burned is not the only or always the best guide to using the phrase *witch panic* appropriately. It can be legitimately applied in parts of Europe outside Germany where fears of witchcraft obsessed entire regions for several years, even if large numbers of witches were not burned. The hysteria in Basque lands on both sides of the French–Spanish border between 1609 and 1614 provides the best example. Although probably only a dozen witches died on each side of the border, it has been called, with some

justification, Europe's largest witch panic, simply because of its unprecedented scale: in addition to the hundreds of Basque confessions mentioned by de Lancre, the Spanish Inquisition eventually heard almost 2,000 spontaneous confessions of witchcraft, overwhelmingly from children. At least, that is what local interpreters told their employers, because neither the French judges nor the Spanish inquisitors understood Basque. It required sustained efforts by responsible authorities in both France and Spain to prevent their out-of-control officials from doing further damage and finally to calm things down.

The child-driven Swedish witchcraft hysteria lasting from 1668 to 1675 provides another equally well-known and instructive example of a truly large-scale witch panic. This panic spread extremely widely, eventually reaching most of northern Sweden and extending as far south as Stockholm. Exactly like the Basque episode, it involved thousands of children describing their experiences at the witches' Sabbat; unfortunately, in this instance, well over 100 witches were executed before it too could be brought to an end—by executing an adolescent accuser for perjury.

WHEN DID THEY BEGIN AND END?

Nothing resembling the Mergentheim panic occurred in fifteenth-century Europe. As early as the 1420s, large numbers of people were being arrested for witchcraft in Valais or Dauphiné; but local political circumstances and the repression of heresy often help explain such outbreaks, as they do in the first urban instance, the mid-fifteenth century *Vauderie* (Waldensianism, but used to label witches) of Arras. In general, it seems problematic to talk about witch panics in the age of the *Malleus Maleficarum* (The Hammer of Witches, 1486); when Inquisitor Heinrich Kramer arrested fifty women in the Tyrol in 1485, he certainly provoked an extreme reaction—but it was directed more against him than the accused witches (much later, something analogous apparently happened to de Lancre also).

Probably the last major witch panic in Europe was the *Zauber-jackl* (Sorcerer Jack) affair that affected the independent prince-archbishopric of Salzburg from 1677 to 1680; although slightly later than the Swedish case and located in Catholic rather than Protestant Europe, it was similarly child-driven. Here, however, adolescent boys were targeted as witches by the authorities rather than used by them to accuse others. Americans regard Salem Village in 1692 as a major witch panic; it does meet the criterion of twenty deaths in one place within a year, and it occurred even later than Salzburg. Although numerous witchcraft trials were held after 1700 in eastern Europe, no later episodes that deserve to be called major "witch panics" have yet been uncovered.

We know that firm actions by such high-level authorities as the Spanish Inquisition, the *Parlement*

(sovereign judicial court) of Bordeaux, or Sweden's high court of appeals eventually stopped Europe's most widespread witch panics. However, relatively little work has been done so far on why Germany's major witch panics stopped. One explanation uses a list of the 160 people burned as witches on 29 occasions at Würzburg between 1627 and 1629 to argue that they stopped when they became dysfunctional after the traditional stereotype of a witch broke down (Midelfort 1972, 179, 182). In this instance, adult women formed 85 percent of the total in the first five burnings and almost 70 percent of the first fifteen groups. But in the next fourteen clusters, the stereotype collapsed completely: adult women now comprised less than one-fourth of the witches being burned, far outnumbered both by young children (mainly boys) and adult men. However, such clear examples seem unusual.

PAPACY AND PAPAL BULLS

In the development of witch persecution, the Roman papacy and its decisions on official doctrine played a central role. The nineteenth-century denominational approach to Church history presented the attitudes of the popes in a one-sided fashion, either polemically or apologetically. Overinterpretations resulted, rectified by subsequent research and the study of original texts during recent decades. On the whole, our evaluation of

the papacy's role in creating and upholding the doctrine of witchcraft has become more nuanced, but no generally accepted academic consensus on the subject has yet been reached.

The papacy, which gradually developed from the increasing prominence of the bishop of Rome after the fifth century, reached its full stature in the tenth and eleventh centuries, becoming the ultimate authority of the Latin Church in all matters of doctrine, including the issues of demonology and witchcraft. In the Middle Ages, the legal decisions of the Holy See theoretically demanded absolute obedience, but papal infallibility in doctrinal issues was not entirely indisputable. Only after the end of the conciliar movement and the sixteenth-century Protestant Reformation was the pope's absolute doctrinal authority uncontested within the post-Tridentine Roman Catholic Church. Papal statements on the doctrine of witchcraft must also be understood in the light of the dogmatizing of the pope's power of jurisdiction and infallibility in 1870—a declaration that retroactively covered doctrinal statements made by previous Roman bishops and implied their universal validity.

In the Early Middle Ages, the entire western Church, including its popes, was preoccupied with overcoming the relics of paganism. Gregory I (ruled 590–604) attempted a synthesis of popular pagan desiderata with the claims of the Christian faith, particularly by nurturing reverence for relics of saints and the whole area of the miraculous; Christian churches were now built over the foundations of antique temples, thus creating a continuity of religious cults on sites that were not initially Christian. During Charlemagne's reign (768–814), the Frankish kingdom attempted to stamp out the remnants of paganism by issuing capitularies, which were accepted by the popes at imperial synods. Numerous regulations combated the practice of sorcery and opposed such judicial problems as vigilante justice against alleged sorcerers and witches. This attitude characterized Church and civil authorities until the High Middle Ages; papal bulletins on witchcraft were essentially restricted to specific issues, for example, a letter from Pope Gregory VII to King Harold of Denmark strictly prohibiting the lynching of alleged witches.

By the thirteenth century, several developments provoked a tighter organization of the Roman Church: the great Church law compilation, the *Decretum gratiani* (Gratian's *Concord of Discordant Canons*, known as the *Decretum*, 1130–1140 revision), and the first comprehensive textbooks and *summae* (summaries or compilations of theology or canon law) appeared, systematically recording theology in its entirety; in the thirteenth century, the Church was drawing up its own profile even as it began contending with heretical movements from within. The *Decretum gratiani*, accredited and advanced by the papacy, incorporated many stipulations

concerning witchcraft, mainly compiled from early medieval texts; it laid the foundation for legal considerations that subsequently influenced the cumulative concept of witchcraft. Because the *Decretum gratiani* never mentioned such things as witches' Sabbats or a witchcraft sect and rejected the belief in witches flying, in accordance with the Frankish capitularies (*Canon Episcopi*, ca. 906), it rather restricted the evolution of the concept of witchcraft. However, canon law also contained sufficient clauses about heresy in general and its subsequent prosecution to provide substantial support for advocates of severe witch persecution.

An initial turning point toward more severe persecution of witchcraft occurred under Pope Alexander VI (ruled 1492–1503), who issued an ordinance to the Dominicans and Franciscans, to whom the new papal inquisition had been assigned, that sorcery and divination should be prosecuted only when accompanied by a strong suspicion of heresy. This ordinance, incorporated into the *Corpus iuris canonici* (Body of Canon Law, Bk. 6, c. 5, 2), implied certain parallels between sorcery or divination and heresy, which was the Church's primary enemy. Until the beginning of the fourteenth century, further instructions remained sporadic and specific, for example, in 1303, Boniface VIII (ruled 1295–1303) intervened against a bishop of Coventry accused of paying homage to the Devil, and in 1318, John XXII (ruled 1316–1334) took action against individual sorcerers. However, after the prohibition of the Templar order for political reasons, which was justified with the claim that the Templars formed a diabolical sect that must be eliminated, John XXII suddenly adopted a more radical attitude, thus multiplying anti-sorcery precedents.

John XXII resided at Avignon, in an environment rife with suspicion of witchcraft at the French and other courts, where the pope was seen as a possible victim of the black arts. Thus, he took a personal interest in the prosecution of alleged sorcerers. In 1320, the inquisitors of southwestern France (which harbored large concentrations of Cathars and Albigensians), received orders to deal severely with people who practiced divination, the black arts, and demonic sacrifices. Here, heresy became more closely associated with sorcery. His bull *Super illius specula* (Upon His Watchtower) in 1326 proved more fundamental and effective. For the first time, it considered a pact with the Devil as the worst crime of alleged sorcerers. Subsequently, demonological ideas predominated when describing practices previously classified as superstition.

It has justifiably been claimed that this papal bull contained no echoes of the cumulative concept of witchcraft, and this constitution never led to witchcraft trials like those of the fifteenth and subsequent centuries. Its significance lay in the unambiguous classification of all occult practices as heresy, because

they involved homage to the Devil. An ominous step was taken from individual sorcerers toward the great diabolical conspiracy of sorcerers and witches, the existence of which was alleged by later inquisitors. At the same time, linking ecclesiastical trials for heresy with secular implementations of death sentences made sorcerers more vulnerable to the death penalty than previously. This policy was continued by John's successor Benedict XII (ruled 1335–1342), the former inquisitor Jacques Fournier. Although his instructions were generally restricted to resolving individual cases of sorcery, its associations with heresy became more firmly established. Subsequent popes showed relatively little interest in sorcery or witchcraft while the cumulative concept of witchcraft was being created, although some, including Martin V (ruled 1417–1431) and Eugenius IV (ruled 1431–1447), issued statements on the subject that prefigured aspects of subsequent bulls condemning witchcraft. Another decree directed at southern France and defining sorcery as heresy, employed the phrase *summ̄is desiderantes affectibus* (desirous with supreme ardor), later made notorious by Innocent VIII (ruled 1484–1492). A bull of 1437 ordered severe measures against persons who made pacts with demons, worshipped them, and practiced harmful occult arts with their aid, even raising tempests. However, it was very general in character, being addressed to all inquisitors.

The most famous papal bull encouraging witchcraft persecution directly was the *Summis desiderantes affectibus* issued by Innocent VIII in 1484. It was composed at the specific request of Heinrich Kramer (Institoris), papal inquisitor for southern Germany, to help him overcome both ecclesiastical and secular resistance by supporting his enterprises with papal prestige. In one way, this bull was less significant than the standards of Eugenius IV on demonic witchcraft, because its instructions were merely regional rather than universal. Its use by Kramer in the introduction to his *Malleus Maleficarum* (The Hammer of Witches, 1486), giving his book a false appearance of papal approval, was at least as significant as the bull itself. At first glance, *Summis desiderantes affectibus* appears to be committed to a traditional, noncumulative concept of witchcraft. It never mentioned the notion of witches flying and placed no emphasis on women as the embodiment of witchcraft, which was so characteristic of the *Malleus Maleficarum*. Nevertheless, it contributed to the increase in witchcraft trials. Not only did it remind readers of the peculiar heinousness of the crime of witchcraft, justifying the Church's mission to hunt down and punish such offenders, but it also threatened to penalize anyone who resisted the Inquisition in this matter. For these reasons, the bull of Innocent VIII encouraged witch persecutions in the future. Opponents of the trials had to contend not only with the theological position of the *Malleus* but also with

papal promotion of inquisitorial trials against sorcerers and witches.

In the sixteenth century, inquisitorial witchcraft trials decreased drastically throughout northern Europe. The popes, however, were not silent on the problem of witchcraft. Julius II (ruled 1503–1513) encouraged stronger persecution of sorcerers in the diocese of Cremona, against the wishes of local clerics. Leo X (ruled 1513–1521) confronted the Republic of Venice, which sought to hinder papal inquisitors acting against witches and sorcerers. Adrian VI (ruled 1522–1523) confirmed a bull of Julius II regarding the inquisition of Lombardy. Some decrees of the Council of Trent dealt with witchcraft: the guidelines set out in the *Dominici gregis custodiae* (Guardians of the Lord's Flock, 1564) put all books on divination, sorcery, potions, prophecies, spells, and other magic practices on the Index (list of prohibited books).

During the great wave of frenzied witch hunting of the sixteenth and early seventeenth centuries, conducted mainly by Catholic prince-bishops in Germany, the papacy adopted moderate policies. Without ever directly questioning its demonological and judicial aspects, Rome displayed considerable skepticism about the cumulative, constantly intensifying concept of witchcraft. *Instructio pro formandis processibus in causis strigum, sortilegiorum et maleficiorum* (Instruction for Conducting Trial Procedures Against Witches, Sorcerers, and Evildoers) by Pope Urban VIII in 1635 prescribed the traditionally more cautious attitude of the Roman Inquisition for the German empire. Apparently written in reaction to the horrifying reports of massive witchcraft trials in Germany that had gradually reached Rome, it tried to prevent them by requiring proof of black magic before decreeing a death sentence and prescribed less severe punishments for harmless magic. However, Urban's distinctly moderate *Instruction* could not be enforced in many Catholic regions of Germany, where serious witch hunts continued for a long time with support from the local clergy. In regions to which Rome had direct access, relatively few prosecutions occurred.

Because of the legal and theological traditions of the Roman Catholic Church, certain elements of witchcraft theory endured into the nineteenth and twentieth centuries, although they had no practical significance. The *Corpus iuris canonici* remained valid until 1917, so that judicially speaking, the *impotentia ex maleficio* (weakness from harmful magic) delusion about witches flying was still an offense; sorcery, divination, and the like could still be considered heresies for which the Church could execute appropriate punishments. The scholastic concept of demonology was indirectly confirmed when Leo XIII declared Thomas Aquinas to be the normative theologian of Roman Catholicism, and the validity of earlier papal bulls became problematic

after the promulgation of the dogma of infallibility of 1870. Such theoretical statements have had no practical consequences for many centuries, although occasional reports of severe exorcisms by Roman Catholic priests remain a phenomenon distantly related to the complex of the witch hunts.

PAPPENHEIMER FAMILY (1600)

Certainly the most famous clan of cesspool cleaners in early modern Europe, this wandering Swabian family became the principal target of a Bavarian crackdown on witches and other dangerous vagrants in 1600. They suffered punishments that were remarkably cruel even by contemporary standards.

There were several reasons for the exemplary sadism shown to this family of licensed beggars who also earned money as itinerant glaziers, tinkers, and cesspool cleaners. They and their chief "accomplices" were unusual witches: to begin with, most of them, including the ringleader, were men. The Pappenheimers were not Bavarians but foreigners; worse still, they were not members of a settled village community. After being arrested on charges that they had helped a convicted thief murder seven pregnant women in order to make "thieves' candles" from the fingers of unbaptized babies,

the Pappenheimers—father Paulus, mother Anna, two grown sons, and a ten-year-old boy—were taken to Munich by express order of Duke Maximilian and subjected to repeated bouts of relentless torture.

In an "indissoluble amalgam of falsehood and truth, which assembled rumors and reports from two decades" from various parts of Bavaria (Kunze 1987, 149, 154), the Pappenheimers ultimately became scapegoats for a variety of other crimes besides witchcraft. They admitted close to 100 murders, almost ten per year, although not a single corpse was ever found (they explained that they always burned them); they further confessed setting dozens of fires and committing several hundred thefts, many of them from churches. (They claimed they sold such sacrilegious goods to Jews, who were prohibited from living in Bavaria, however.) And of course, the Pappenheimers confessed to witchcraft. Before they were through, they had denounced almost 400 "accomplices," once naming 99 of them at a single torture session; following customary stereotype, 80 percent were women, and 10 percent of the women were midwives (Kunze 1987, 342f, 345).

The chief engineer of the Pappenheimer family's destruction was the ambitious leader of Bavaria's witchcraft "zealots," the chancellor of the court council, Dr. Johann Sigismund Wagnerækh (ca. 1570–1617), whose ideological commitment compensated for his modest standing within Bavarian society. Like Duke Maximilian, Wagnerækh had studied at Ingolstadt during the 1590 witch hunt. He not only directed the Pappenheimers's questioning under torture, but when a tailor arrived at court with a petition to free some of their imprisoned "accomplices," Wagnerækh immediately had him arrested and tortured, and he soon confessed to witchcraft also.

Because Duke Maximilian desired to show his government's teeth to Bavaria's "dangerous classes" by enforcing his drastic laws against them to the fullest, the executions in June 1600 of Paulus Pappenheimer, his wife and their two adult sons, together with two of their Bavarian "accomplices" (including the unfortunate tailor-petitioner), makes truly gruesome reading. At the place of execution, the body of each was torn six times with red-hot pincers, the mother had her breasts cut off, the five men had their arms and legs broken on the wheel, and finally Paulus became one of very few western European criminals to be impaled on a stake, like Vlad the Impaler's Moldavian victims. After these preliminaries, all six were burned alive. For sheer savagery, no other single episode of early modern Europe's theater of judicial terror ever quite matched it.

These brutalities were widely publicized. Woodcuts, printed broadsheets, and chronicles reported them. Bavarian Jesuits passed the news to their demonological colleague Martín Del Rio, who mentioned it in his next edition of his *Disquisitiones Magicae libri sex* (Six

Books on Investigations into Magic). “A chronicler of Freising included them in his world chronicle a few years later among the most important events of the century,” while “as late as 1744 they were referred to in a book published at Leipzig” (Behringer 1997, 232). Although six more “conspirators,” including the Pappenheimers’s ten-year-old son, were burned at another spectacle at Munich in December 1600, the Pappenheimers’s fate did not begin any Bavarian witch hunt: as soon as some of the arrested “accomplices” came from respectable Bavarian families, their relatives protested and the whole investigation was quietly dropped.

PARACELSUS, THEOPHRASTUS BOMBASTUS VON HOHENHEIM (CA. 1493–1541)

Paracelsus was a prophet, philosopher, alchemist, and Renaissance magician.

The fascination of the Swiss Paracelsus stems both from what is known and from what remains unknown about his bizarre and nomadic life as an eccentric and rebellious physician. At times he was considered an impostor, at other times a prodigious healer of fatal diseases who was accused of practicing diabolical arts. His works combined high culture and popular traditions, wide-ranging scientific interests, and an unusual reliance on everyday experiences and myths. Throughout his life, he refused to pursue a normal, professional career, attacked the university teaching of his day, and attempted to revolutionize both the medical and natural sciences by promoting the virtues of alchemy within the context of an original philosophical interpretation of the universe and of illness. Paracelsus challenged the Aristotelian and classical paradigm by introducing new principles of knowledge, which he adopted from the Hermetic tradition and from popular health care. He believed in witchcraft, demons, and evil spells; in the witches’ Sabbath; and in their ability to take animal shape. Nevertheless, the originality of his ideas led him to reject the practice of burning witches at the stake, which he deemed an inadequate response to a phenomenon that was, after all, “natural.”

LIFE AND WORKS

Theophrastus von Hohenheim, also known by his grandfather’s name as Bombast, but only later as Paracelsus (which perhaps meant “beyond Celsus,” one of the most renowned naturalists of antiquity), was born about 1493 in Einsiedeln in central Switzerland. His father, Wilhelm Bombast de Riett, was a physician and the illegitimate son of a Swabian aristocrat. When the family moved to Villach in Carinthia, Theophrastus first came into contact with the world of the mines. He also started taking lessons with religious teachers, one of whom may have been Johannes Trithemius, who was suspected of having practiced black magic. From 1507 to 1511, Paracelsus attended lectures at several European universities but soon became bored listening to the commentaries of distinguished professors. He therefore chose to travel Europe, perhaps as an army surgeon following military troops. Around 1520, he wrote his first work, the *Eleven Treatises on the origins, causes, symptoms, and treatment of the diseases*, and in 1524 he moved to Salzburg. He was sympathetic toward the peasant revolts and soon obtained some fame for his prophecies. Despite his interest in theology, ethics, and politics, he never joined any organized religious group. In 1526, the city of Strasbourg offered him citizenship, and he began practicing medicine, meanwhile dedicating himself to writing a vast work on medicine, which he never completed, and several treatises, including the *Libri Archidoxis* (Archidoxes of Magic: Of the Supreme Mysteries of Nature, of the Spirits of Planets, Secrets of Alchemy, Occult Philosophy, Zodiac Signs).

During the following year, Paracelsus moved to Basel, where he cured the publisher Johann Froben and the humanist scholar Erasmus. Yet this brief period of fortune did not last. Paracelsus started a career as a public teacher but soon made enemies at the local university because of his incessant attacks against mainstream medicine. Consequently, he was reduced once again to living almost as a traveling pauper, which did not, however, prevent him from acting as a prophet and from writing numerous texts, which mostly remained in manuscript form until after his death. They include a work on syphilis, the *Paragranum* (an outline of his theories garnished with some severe attacks on mainstream medicine) and the *De divinis operibus et secretis naturae* (On Divine Works and the Secrets of Nature), a collection of treatises written after 1529 and printed between 1589 and 1590, which probably was to become the first volume of his unfinished *Philosophia Magna* (Great Philosophy). Paracelsus completed his *Paramirum* during a stay in the Swiss City of St. Gallen, in 1531–1532, where he was a guest of the humanist and mayor Joachim Vadian. Subsequently, Paracelsus

Eminent Renaissance magician, physician, alchemist, Hermeticist, and philosopher Paracelsus (Theophrastus Bombastus von Hohenheim) believed in witchcraft but disapproved of executing witches. (Archivo Iconografico, S.A./Corbis)

dedicated himself mostly to social questions and to caring for the poor. Moving between Austria, Switzerland, Tyrol, and Germany, he wrote various works on politics, theology, surgery, astronomy, professional diseases, and thermal cures. In 1537, he was received at the imperial court, where, despite his fame, he failed to obtain favor. Returning to Villach, he wrote the *Trilogy of Carinthia*, his first violent diatribe against Galen's disciples. Poor, ill, and unable to publish his writings, Paracelsus died in Salzburg in 1541.

FORTUNE

The first person to write about Paracelsus was his disciple and assistant Johannes Oporinus (1507–1568), who became a publisher in Basel and printed several of his master's manuscripts. Oporinus described Paracelsus as both sophisticated and vulgar, ingenious and coarse, attracted by the pleasures of wine but not by those of the flesh. The first to condemn him was Thomas Erastus (in 1572), a theologian and physician, who was profoundly convinced of the existence and power of witches. In a severe attack on Paracelsus's works, Erastus defined him as a follower of Satan,

grouping him with other philosophers and naturalists such as Pietro Pomponazzi and Marsilio Ficino.

The final years of the sixteenth century saw the beginnings of Paracelsus's fame, largely thanks to the writings of Petrus Severinus (*Idea Medicinae Philisophicae*, 1571) and Oswald Croll (*Basilica Chymica*, 1609) and to the publication of his works. There was a fashion for *spagyric* medicine, a form opposed to official Galenic practices that followed Paracelsus's example in allowing the treatment of syphilitic patients with chemical compounds (the term is derived from two Greek words referring to the extraction and elaboration of metals). Paracelsus was particularly respected in England (Francis Bacon was among his admirers), as well as elsewhere in Europe, where his fame grew, despite disapproval and censorship, thanks to the Rosicrucian sect. Daniel Sennert, a professor at Wittenberg, wrote a work in 1619 in which he hoped to reconcile the Galenic tradition and Paracelsus's chemistry. Joan (Jan, Jean) Baptista van Helmont (1579–1644), known for his revolutionary discoveries in the field of illnesses, adopted some important concepts from Paracelsus. Johann Wolfgang von Goethe gave Paracelsus and his assistant Oporinus immortal fame when he chose them as models for his Faust and for Wagner. Paracelsus's twentieth-century admirers included the psychoanalyst Carl Jung and Marguerite Yourcenar, who chose some of his features for the protagonist Zénon of her *L'Oeuvre au noir* (The Abyss, 1968). The poets Robert Browning and Ezra Pound also dedicated works to Paracelsus.

THE INTERPRETATION OF NATURE AND OF WITCHCRAFT

Classical Western medicine, inspired by Hippocrates, Galen, and the Arabs and operating within the framework of Aristotelian natural philosophy, assumed that illnesses resulted from an imbalance of the bodily fluids (blood, yellow bile, black bile, phlegm) and of the fundamental physical qualities (hot, cold, dry, and humid). Paracelsus, on the contrary, stated that the universe was a web of relations linking human beings, nature, and the stars (which did not influence behavior on earth). In order to cure the sick, he argued, it was necessary to observe the sky, live virtuously, know alchemy, and understand the secrets of plants and minerals, which were revealed in their *signatura* (signs). The appearance of a particular herb, for instance, indicated its use for medical treatment. All of life, according to Paracelsus, stemmed from the union of three essential metals (sulfur, salt, and mercury), which, through their combustion and corruption or by being in disharmony with one another, determined the course of an illness. Medical treatment required wisdom, close observation, and the application of similar substances (a principle rejected by traditional medicine, like his use of chemical compounds). Other

factors also influenced diseases: the power of imagination, God, demons, and human intentions, which could take the form of evil spells or witchcraft.

Paracelsus did not reject popular medicine, nor did he attribute madness, physical deformity, mental illness, and fatal diseases to such remote causes. In a world he believed to be populated by spirits, half-human figures, dwarfs, and nymphs (some of them benign and even friendly toward human beings), there was also space for witchcraft, which he treated in the short treatise *De sagis et eorum operibus* (On Witches and Their Works, a text that formed part of *De divinis operibus*). Without referring to the pact with the Devil, he argued that witches were born as such because of a certain predisposition and because of their astral “ascendant.” Just like devils, they performed their harmful deeds with the help of the secret forces of nature. Only the virtuous could resist the Devil, whereas witches (whom he described stereotypically) usually followed their instructions, thus causing storms, illnesses, and sexual mishaps. Devils and witches (who could fly and also take different shapes with the help of ointments) held their meetings on top of the remote Heuberg (in the Swabian Alps), where they fornicated, reproduced, held their rites, and prepared evil deeds.

They could, however, be fought by physicians through the use of opposite magical practices, which Paracelsus considered legitimate. He disapproved of witchcraft, devils, and their spells and considered them worthy of punishment, but he was also opposed to burning witches on the stake, arguing that they should be educated and taken care of instead. Later in the sixteenth century, Johann Weyer argued this position far more convincingly. Ever since Erastus, many scholars have asserted that, by combining popular traditions with a strong opposition to the dominant culture, Paracelsus helped to naturalize black magic. Although this statement is not untrue, it must also be said that, by abandoning official explanations of illness, he helped to shape an attitude common among physicians at the end of the sixteenth century (precisely when Paracelsus’s works began to reach a wider audience): they rejected Galenism, feared the Devil, and explained certain fatal diseases through their belief in witchcraft.

PARIS, UNIVERSITY OF

The University of Paris, a main center of scholastic theology and philosophy during the Middle Ages, took a leading role in condemning the practice of magic. In September 1398, the theology faculty of the university, meeting in the Church of St. Mathurin, approved a set of twenty-eight articles declaring the practice of ritual magic to be heretical. In 1402, Jean Gerson the theologian, political theorist, and devotional writer who was chancellor of the university at the time, included the document in a somewhat altered form in his treatise against magic, *De erroribus circa artem magicam* (Concerning Misconceptions about Magical Arts). The articles were later used to condemn the practice of witchcraft.

The faculty took this action in response to what the document referred to as “newly arisen superstitions.” The practice of ritual magic—the summoning up of demons in order to put them at the service of human beings—had flourished during the thirteenth and fourteenth centuries, especially at the universities and at the courts of European rulers. In the thirteenth century, William of Auvergne claimed that he had seen magical books when he was a student at the University of Paris, and in 1277 the archbishop of Paris had condemned “books, rolls, or booklets containing necromancy or experiments of sorcery, invocation of demons, or conjurations hazardous for souls” (Kieckhefer 1990, 157). Magicians defended their rituals on the grounds that they were commanding demons, and they insisted that they were not violating Catholic doctrine. In making this pronouncement, the faculty intended to “assure that this monstrosity of horrid impiety and dangerous contagion will not be able to infect the Christian realm, which formerly has been free from such monstrosities” (Weyer 1991, 577).

Citing St. Augustine’s condemnation of superstitious observances, the faculty attacked “this wicked, pestilential, death-dealing abomination of mad errors, along with all the attendant heresies” (Weyer 1991, 577). The theologians declared that the claims made by ritual magicians to justify their practices were erroneous and in some cases blasphemous. The second article, for example, declared it to be idolatrous to give or offer demons anything in their honor. The third article declared it to be idolatry and apostasy to make an implicit or explicit pact with demons. By “implicit

fact” the theologians meant every “superstitious ritual, the effects of which cannot be reasonably traced to either God or nature” (Levack 2004, 48). Other articles condemned offering incense and smoke and making sacrifices and immolations to demons. Yet another denied that images made of bronze, lead, or gold, of white or red wax, or of other material, when baptized, exorcized, and consecrated, had tremendous powers on those days of the year identified in magical books. The twenty-third article condemned the claim that some demons are good, that others are omniscient, and that still others are neither saved nor damned.

The Paris faculty made its pronouncement just before the first trials for witchcraft took place at the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France). The articles did not say anything about witchcraft as it came to be defined during those trials. The faculty was concerned about theological justifications of ritual magic, not the practices of the women and men who allegedly used magic to bring widespread harm to their neighbors and who also worshipped the Devil in nocturnal orgies. Nevertheless, the Paris faculty’s condemnation of magic as heretical and idolatrous provided authoritative support for later condemnations of witchcraft, especially since it included references to *maleficia* (harmful magic) as well as pacts with the Devil. The *Malleus Maleficarum* (The Hammer of Witches, 1486) made numerous references to it. In the sixteenth century the condemnation was reprinted in the preface to Jean Bodin’s *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580), and quotations from it appeared in Lambert Daneau’s *Les sorciers, dialogue tres-utile et necessaire pour ce temps* (Witches, a Very Useful Dialogue and One Necessary for the Present Time, 1574) and Martín Del Rio’s *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599/1600). Johann Weyer, the sixteenth-century skeptic regarding witchcraft, also devoted the final chapter of his massive *De Praestigiis daemonum* (On the Tricks of Devils, 1563) to this document. It provided support for Weyer’s own condemnation of ritual magic.

PARLEMENT OF PARIS

The *Parlement* (sovereign court) of Paris, the most prestigious court in France, had an enormous influence on witchcraft trials in the kingdom. Its authority in criminal cases stretched over nearly half the country. Although the records of the appeal hearings before it are rather brief, they do extend over virtually the entire period of serious witchcraft persecution, enabling historians to draw important conclusions about both the court’s own practices and events across a wide region.

The statistics reveal a sharp increase in trials from the 1570s to a plateau that lasted until the 1620s; they also indicate that the *parlement* released many suspects and commuted the majority of death sentences, even though the lesser courts were relatively lenient. The Parisian judges were very concerned about procedural irregularities, eventually moving to enforce an automatic appeal in all witchcraft cases. From around the time this right was fully effective (1624), the court had virtually abandoned death sentences for witchcraft, setting a pattern that several other *parlements* followed, before the royal government ultimately put a stop to all trials across France.

The Paris *parlement* was an elaborate organization, with overlapping political, judicial, and financial roles and a complex internal hierarchy. By the early seventeenth century, it held over 200 judges who had inherited or purchased their positions; they formed a *Grand’ Chambre*, five chambers of *Enquêtes*, and two of *Requêtes*. The *premier president* (presiding magistrate) was an enormously influential figure in national politics, so this appointment was closely guarded by the crown, and a *procureur-général* (public prosecutor) and two *avocats-généraux* (deputy prosecutors) were also charged with representing the royal interest and were known as *les gens du roi* (the king’s men). The major business of the *parlement* was that of supervising legislation and managing the application of property law, with criminal jurisdiction as a relatively secondary function. The hearing of criminal appeals was delegated to a special chamber called the *Tournelle*, staffed on a rotating basis by councilors from the other chambers. The *ressort* (jurisdiction) of the *parlement* covered a huge area, stretching from Poitou and the Auvergne to Champagne and Picardy, or close to half of France, and all those convicted of serious crimes in lesser courts within this area were entitled to appeal for a final hearing in Paris. Before Jean-Baptiste Colbert sponsored a new criminal code in 1670, the rules were essentially those specified in the 1539 Ordinance of Villers-Cotterets, which defined the use of the so-called inquisitorial procedure. Under this system, preliminary

hearings gathered evidence from witnesses and through an interrogation of the suspect; if specified standards of proof for an immediate conviction were not met, a court might still decide there were sufficient grounds to subject the accused to torture. When the *Tournelle* heard cases on appeal, the defendant appeared in person, accompanied by papers from his original trial, which were passed to a councilor who acted as *rapporteur*, summarizing the case and making a recommendation to his colleagues, who often also interrogated the accused.

This system meant that appeals were often a costly business, requiring the accused to be brought to the *Conciergerie* in the Parisian *palais de justice* (the seat of the *parlement*) under guard and then held there until the case was decided. Nevertheless, the *parlement* was eager to assert its authority in this fashion, especially when it suspected that the lesser courts had committed procedural abuses. The Parisian judges had a very keen sense of their own status and the prestige of their institution; furthermore, they saw themselves as embodying the higher rationality of the educated elite. They also had a distinctive position where religious values and secular ones overlapped. The court remained strongly Catholic during the Wars of Religion and then split in two between 1589 and 1594, with some councilors remaining in Paris under the Holy (Catholic) League, while the majority formed a royalist *parlement* at Tours. Despite such differences of opinion, the great majority of councilors seem to have favored a moderate Gallican position, hostile to encroachments by either the papacy or the institutional French Church.

The councilors' suspicions of ecclesiastical interference on all fronts almost certainly predisposed them toward a pragmatic rationalist position on issues such as witchcraft. It is unclear whether this was already true in 1491, when the *parlement* struck an early blow against local abuses by posthumously rehabilitating the accused from the sensational affair of the *Vauderie* of Arras thirty years before. This involved a curious jurisdictional anomaly, because Arras—which belonged to the duke of Burgundy, not the king of France—was subject to the Parisian appellate system (Cohn 1975, 230–232). Very early in the major period of persecution, in 1587–1588, the revelation of numerous abuses in trials from the Ardennes led the *gens du roi* to propose that all witchcraft cases should automatically be appealed before the *parlement*. The political crisis of the following years prevented an immediate decision in this sense, but between 1600 and 1604, a new series of abuses led to the formal adoption of this position. Finally, in 1624, the court took effective steps to implement its decision by circulating a printed text to all lower courts, on the eve of its less public move to abandon death sentences for witchcraft (Soman 1992, VII and XII).

The painstaking research by Alfred Soman revealed that the *parlement* heard a minimum of 1,288 appeals from convicted witches between 1540 and 1670; if cases of magicians are included, the number rises to 1,481 (Soman 1992, XIII, 42). Just over 40 percent of the witchcraft suspects had been condemned to death in the lower courts, but the *parlement* confirmed only one-quarter of these sentences, so that just above 100 individuals went to the stake, barely 10 percent of appellants. Two-thirds ended up either banished or released, in roughly equal proportions. These proportions did not change dramatically over the period; the two statistical features that stand out are an increase to 20 percent executed in the 1590s and then a downward trend after 1610. Just over half the appellants were men, in proportions varying from roughly two-thirds in the western part of the *ressort* to one-third toward the eastern border, and there is little evidence of gender bias in the sentences handed out. Most remarkably, of 185 suspects sent to the torture chamber, only one actually confessed, a woman who was merely shown the instruments of torture in 1587. Although statistical precision is impossible because the surviving documents are so laconic about details of cases, the local cunning folk (*devins* and *devineresses*) appear to have been prominent among the accused. The *parlement* clearly took a cautious view of witchcraft charges from the very start, which quite rapidly developed into more extensive skepticism. There was some continuity with attitudes toward other crimes, because the court was inclined to moderate sentences generally, but one should note that in another great persecution that began in the late sixteenth century, some 70 percent of death sentences for infanticide were confirmed (Soman 1992, *passim*). Witchcraft charges seem to have caused special disquiet for two key reasons: the high level of local abuses apparent from the very start, and the legal difficulties of proof when direct evidence from eyewitnesses was virtually ruled out by the very nature of the alleged crime. The *Tournelle* evidently feared that such charges could become a convenient method for settling scores between peasants whom they saw as both superstitious and mendacious.

The repeated evidence that local judges broke the rules, denied the accused their rights, and even resorted to the wholly illegal swimming test could only increase misgivings in the *parlement*. A series of reprimands were handed down whenever such misbehavior was detected; judges might be called to Paris to explain themselves, or special restrictions were placed on the rights of individual courts to hear certain types of cases. A marked drop in the number of witchcraft appeals after the late 1620s suggests that awareness of this watchfulness from the *parlement* had a major effect on the subordinate courts. This must have been reinforced in 1641, when the *lieutenant de justice* and two other officials of the court

at Bragelonne were convicted of murdering a suspected witch and were hanged in the *place de Grève* in Paris; news of this drastic punishment was publicized throughout the whole *ressort*. In a further case from eastern France, the *seigneur* (lord rural estate owner), *procureur fiscal* (fiscal representative or attorney), and another individual from Viviers-sur-Artaut were hanged in effigy in 1647, having fled after a suspect was lynched (Mandrou 1969, 354–356; Soman 1992, XII, 197). By this time, few observers could doubt either the skepticism of the *parlement* or its determination to enforce its authority. In a fascinating conversation from 1643, the *curé* (chief parish priest) of Nanterre recorded asking his friend, the councilor Laisné, why the court no longer convicted witches; he was told that it was very difficult to secure adequate proof, so they convicted them solely for any proven harm they had done or for open sacrilege (Mandrou 1969, 360–361). This policy was still applied in the last major series of cases heard by the *parlement* in 1687–1691, involving nine shepherds from the Brie region accused of poisoning animals and of sacrilege; four were sent to the galleys, three banished, and two sentenced to death (Mandrou 1969, 500–507). Such relative severity, in an exceptional set of circumstances, should not be allowed to obscure the notable success of the *parlement* in securing the rule of law and damping down any threat of mass persecution under its jurisdiction.

PAULUS, NIKOLAUS (1853–1930)

A Catholic priest from the Alsatian village of Krautergersheim, Paulus managed to produce innovative pieces about the role of women in witchcraft persecutions despite a lack of formal academic training, publishing one of the first essays to explore the gender issue seriously. Inspired by the Catholic historian Johannes Janssen (1829–1891), Paulus spent years in

Munich libraries and archives studying sixteenth-century confessional theology. Driven by the Catholic minority position in the German *Kulturkampf*, or culture wars, under the Prussian-dominated German Second Empire, all of Paulus's essays were utterly biased.

Paulus's other writings treat such topics as witchcraft trials in Rome or the participation of Lutheran authorities in witch hunts. Most of his pieces were republished at Munich in 1910 in a collection entitled *Hexenwahn und Hexenprozess vornehmlich im 16. Jahrhundert* (Witch Craze and Witch Trials, Especially in the Sixteenth Century).

PEDERSDOTTER, ANNA (1590)

The trial of Anna Pedersdotter, widow of the Lutheran theologian Absalon Pedersen Beyer, is the most famous prosecution in the history of Norwegian witchcraft. The charges against Anna arose out of the opposition that had developed in the town of Bergen to the efforts by her husband and other clergymen to destroy Roman Catholic images. Instead of charging the clergy, who often had influential patrons, their opponents accused their wives. In 1575, a year after Absalon's death, charges of witchcraft were brought against Anna in a secular court at Bergen, but she was acquitted.

In 1590, however, Anna was charged once again with witchcraft. The family of the woman engaged to Anna's son objected that, although Anna had been acquitted, her neighbors still suspected her. The case against Anna was therefore reopened. The main charges brought against her were for practicing maleficent magic. Anna was accused of inflicting illnesses on various persons who had crossed her, including the wife of a cabinet-maker whom she had falsely accused of witchcraft. The husband of a woman who had contracted a fatal illness claimed that Anna had bewitched her when she picked up a coin that Anna had dropped at her feet. Anna was also charged with causing the death of a young boy by giving him a bewitched cookie. As the trial developed, however, Anna was also charged with devil worship. Her servant, Elena, testified that Anna had turned her into a horse and had ridden her to the Sabbath at a mountain called Lyderhorn. At this location, a famous meeting place of witches in Norwegian folklore, a group of witches allegedly plotted to raise a storm to destroy all ships arriving at Bergen. At subsequent meetings, it was charged, they plotted to burn the town

or cause it to be flooded. A man in white, who claimed that God would not allow it, dispersed this assembly of witches.

The charges of diabolism introduced at Anna's second trial seem relatively bland compared to those that emerged in many German, French, and Swiss trials. The Sabbat Anna allegedly attended involved no promiscuous sexual activity, infanticide, cannibalism, or blasphemous misuse of the Eucharist. Nor was Anna tortured to make a confession, as happened in a few other Norwegian witchcraft trials. Anna's conviction was based mainly on charges of maleficent magic, not devil worship. Even the confessions of two previously executed witches, who had claimed that they had seen Anna at the Lyderhorn, said more about her magical powers than her activities at the Sabbat. The court was also persuaded that a storm that had arisen when Anna was supposedly at the Lyderhorn was caused by her magical powers.

The case of Anna Pedersdotter owes its modern-day fame to a play by the Norwegian author Hans Wiers-Jenssen, an English translation of that play, *Anne Pedersdotter*, by John Masefield (1917), and a Danish film, *Day of Wrath*, directed by Carl Theodor Dreyer (1943). The play and the film took numerous artistic liberties with the historical record but nonetheless addressed two important themes in the history of witchcraft. First, they explored the ways in which tensions within families, in particular, relations between mothers and daughters-in-law, could result in witchcraft accusations. In the play and the film, Absalon's mother, Merete Beyer, had never approved of her son's second marriage to the young and beautiful Anna. When Anna fell in love with Martin, Absalon's son by his first marriage, the relationship between Anna and Merete deteriorated. When Absalon died suddenly upon discovering that his wife and son were having an affair, Merete charged Anna with having caused Absalon's death by witchcraft. Second, the play and film also explored the way in which Anna gradually came to the realization that she was a witch. Having learned from her husband that her own mother had been accused of witchcraft and spared by Absalon's intervention, she began to believe that she had acquired her mother's powers. Her success in winning Martin's affection and in wishing her husband's death reinforced this realization, leading her to confess at the end of the play.

PEÑA, FRANCISCO (CA. 1540–1612)

Peña is known for editing in 1578 a revised and updated edition of Nicolas Eymeric's authoritative *Directorium inquisitorum* (Directory of Inquisitors, 1376), which became the first in a series of annotated transcriptions of treatises on inquisitorial procedure.

Born in Villaroya de los Pinarex, in the Aragonese province of Teruel, Spain, Peña studied at the University of Valencia, earning a master of arts degree. Peña probably left Valencia for Rome during the pontificate of Pius V, armed with an official recommendation from King Philip II to the papal court. He pursued his studies at the University of Bologna, earning his doctoral degree in 1573. Afterward, Peña continued his theological and juridical studies. In 1581 he edited Ambrogio Vignatés' *Tractatus de haeresi* (Treatise on Heresies), along with *Allegatio in materia di haeresi* (Allegations in Matters Concerning Heresies) by Juan Lopez de Vivero. In 1584 followed, among other publications, an edition of Bernardo of Como's *Lucerna inquisitorum haereticae pravitatis* (A Lantern for Inquisitors of Heretical Depravity). Peña's own treatise, *Introductio seu praxis inquisitorum* (Introduction, Or the Practice of the Inquisitors), was not printed until 1655, when it first appeared in Cesare Carena's *Tractatus de officio sanctissimae inquisitionis* (Treatise of the Holy Inquisition).

From the time Sixtus V appointed him auditor of the papal Rota in 1588 (he became its dean in 1604) until his death, Peña worked in Rome as a judge, also becoming a patron for young men commencing their careers at the papal court. During this period, Peña served both as a consultant to the Spanish embassy in Rome and as a papal adviser on Spanish affairs.

Despite his noteworthy diplomatic service for the Spanish crown in Rome, Peña's modern fame rests largely on his edition of the *Directorium inquisitorum*. The exact circumstances surrounding the decision ordering Peña to revise this fourteenth-century inquisitorial guide are unclear. Papal sponsorship was probably part of a general need to revise and update antiquated ecclesiastical texts and decrees for use by the Congregation of the Holy Office. Gregory XIII approved the revised edition, and other papally sponsored texts of this period also confirm this assumption. Peña worked on Eymeric's *Directorium* for several years, and his commentaries constantly pointed out textual variations among the different manuscripts. Peña's edition of the *Directorium* was a one-volume text divided into three parts. The first short part included 26 lengthy commentaries by Peña, and its larger second part contained 83 commentaries. Its final

section, the actual handbook of inquisitorial procedure, contained 131 questions from Eymeric and 180 commentaries from Peña. The work was completed by a selection of papal decrees collected by Peña, a summary, and an index of topics. Peña took a particular interest in the subject of witchcraft and referred to much of the orthodox literature from previous centuries, especially the *Malleus Maleficarum* (The Hammer of Witches, 1486).

**PEOPLE OF THE NIGHT
(NACHTVOLK)**

When Carlo Ginzburg first presented his famous *Benandanti* (do-gooders) in 1966, many scholars initially suspected that it somehow proved the existence of a sect of witches. These charismatic individuals from early modern Friuli experienced ecstasies and worked as healers and witch finders. They supposedly fought imaginary air battles against witches to defend the crop harvest and decide the fate of their communities (Ginzburg 1983). Shamanistically gifted individuals have also been discovered in many corners of Europe. In field studies on Dalmatian islands in the early 1950s, *Krsniki* were still considered opponents of witches and were feared and sought for their divinatory powers (Boskovic-Stulli 1960).

Starting from the Hungarian *Táltos* (shaman), Gábor Klaniczay collected similar ideas throughout eastern Europe, from the Friuli over the Balkans down to the Black Sea, demonstrating that Ginzburg’s seemingly bizarre findings formed part of a much wider puzzle (Klaniczay 1990), thereby making possible a new access to the world of European fairy tales, where archaic folklore meets literature. The nocturnal ride with Diana, the

journey to Venus’s mountain, the game of the good society (*ludus bonae societatis*), strange goddesses, and contact with the deceased, together with gaining prophetic or healing powers, are present in early modern sources as well as non-European cultures (Ginzburg 1991).

The traditional theological device for interpreting such phantoms was the famous *Canon Episcopi* (ca. 906). This key text influenced later notions, although it remains unclear whether learned references or personal experiences were added to texts such as the instruction by the Dominican Bernard Gui, in the chapter on sorcery of his handbook for inquisitors, to ask women whether they believed they flew with the fairies on certain nights (Hansen 1901, 48). Many traces of popular beliefs exist in trial records of inquisitors or secular courts, including two Inquisition trials from Milan in 1384 and 1390 in which women confessed nocturnal flights with a “Good Lady” as their own real experiences (Muraro 1976). Nicholas of Cusa (1401–1464), philosopher and bishop of Brixen, discovered beliefs in a *domina Richella* in remote Alpine valleys, noting in sermons of 1457 that she was called *Holda* in German (*Nicolai Cusae Cardinalis Opera*, 2 [Paris 1514], fol. 170v–172r). A Danish folklorist found traces of a fairy cult recorded in sixteenth- and seventeenth-century trial records from Sicily by the Spanish Inquisition (Henningsen 1990). Although there is room for argument, such images open the gates to Europe’s *Dreamtime*, a sphere, according to Australian Aborigines, where the boundaries between myths and reality or past and present become fluid (Duerr 1985). Numerous motifs of fairy tales, as classified in Antti Aarne and Stith Thompson’s “Motif-Index of Folk Literature,” appeared in trial records as experienced “facts.” Vladimir Propp (1968) concluded that the roots of fairy tales were connected with layers of human consciousness, where linear perceptions of time and Euclidean space became meaningless.

Conrad Stoeckhlin, a shaman-type diviner in the northern Alpine valley of Oberstdorf, who involuntarily triggered a large-scale witch hunt in the prince-bishopric of Augsburg in 1586, claimed to fly with the *Nachtschar* (phantoms of the night) to certain places during the Ember nights (Ember Days were those of special prayer and fasting at the beginning of the four seasons), and during these ecstasies he gained knowledge about the identity of the witches (Behringer 1998). Hitherto unknown to historians of witchcraft, the *Nachtschar* is inextricably intertwined with the notion of the *Nachtwolk*, or night people, in folklore research. When Austrian and Swiss folklorists began collecting folk narratives and fairy tales, they found an astonishing variety of stories about “people of the night” in an area reaching from the Oberstdorf valley where Stoeckhlin lived into western Austria and all across Switzerland into Valais, the very region where

the witches' Sabbat was discovered in the fifteenth century, then partly ruled by the duchy of Savoy. Research into such forms of folk belief could therefore fill gaps in our understanding of the invention of the witches' Sabbat.

The "people of the night" emerge almost everywhere in local narratives from Vorarlberg, the Grisons, and Valais (Beitl 1965). However, ethnographic field studies had independently detected them in the late nineteenth and early twentieth centuries (maps in Liebl 1971, 258–259). Unlike terrifying stories of the "wild hunt," where demonic creatures frighten and threaten those who watch them, the "people of the night" fascinated observers with music of unearthly beauty and never harmed anyone. They could even perform the miracle of the bones, restoring devoured cattle to life the morning after their orgiastic nightly festivities, feasting and dancing at remote Alpine locations. They invited observers to their nocturnal gatherings and invested them with such supernatural abilities as fortunetelling and healing.

According to folk belief, the "people of the night" are the "good society"; they harm only when they feel attacked but otherwise bring people good luck. Sometimes they resemble a fairy society, but other narratives make them seem part of the Otherworld. Well into the seventeenth century, the "people of the night" were not confined to fairy tales: a good number of ecstasies actually claimed to have seen them, received regular visits from them, flew with them, or even belonged to the *Nachtvolk* themselves. A citizen of Lucerne, Renward Cysat (1545–1614), collected dozens of stories from his friends in order to attack this widespread superstition. But Cysat's polemic made it perfectly clear that those whose houses the night people visited were envied and considered lucky by their neighbors. This case serves to show how belief systems were reduced to fairy tales and may also indicate that it was more than inquisitors' fantasies that formed the idea of witchcraft.

PERKINS, WILLIAM (1558–1602)

Perkins's place in witchcraft history is assured by his large work of demonology, *A Discourse of the damned art of Witchcraft: so farre forth as it is revealed in the Scriptures, and manifested by true Experience*, published at Cambridge six years after the author's death, having initially been written as a series of sermons presumably delivered during the 1590s. It was brought to press and prefaced with an "Epistle Dedicatorie" by an obscure Cambridge-educated clergyman, Thomas Hckerling, then minister of Finchingfield (Essex), who was also responsible for editing and publishing a number of Perkins's other works in the years following his death.

The leading English Protestant theologian of his day, Perkins was born in rural Warwickshire and entered Christ Church College, Cambridge, where the great Protestant scholar and preacher, Lawrence Chaderton (1536–1640), taught him. Perkins, on his own account, experienced a somewhat dissolute youth before reforming himself and going on to become a fellow of his college and establish himself as a gifted preacher and prolific writer. In the sixteenth and seventeenth centuries, continental Protestant authors frequently cited his works, which had been translated

into Latin and several European languages. In England, they were widely read and influential well into the eighteenth century.

The *Discourse* lay firmly in the mainstream of Protestant demonology, although it had an unusually heavy reliance on Scripture rather than on other forms of authority. Perkins seldom referred to classical authors, the Church Fathers, other demonologists, or contemporary cases. Rather than *maleficium* (harmful magic), Perkins stressed the centrality of the demonic pact as the central issue in witchcraft (although, like other Protestant demonologists, he was slightly embarrassed by the lack of any scriptural reference to it). Like many other authors, he deplored the popular tendency to attribute a wide range of misfortune to witchcraft rather than to divine providence. Perkins was very much concerned with popular “superstitions,” which impeded correct religious understanding, and lost no opportunity to ridicule Catholic practices he regarded as either superstitious or just as devilish as witchcraft.

In particular, he took a very strong line against cunning folk, those “good” witches to whom the ignorant population (Perkins’s term) flocked so eagerly. Perkins felt that cunning folk, like other conjurors and magicians, derived their powers from the Devil as surely as did the malefic witch. Thus, Perkins could assure his readers that “this must always be remembered, as a conclusion, that by Witches we understand not those onely, which kill and torment: but all Diviners, Charmers, Jugglers, all Wizzards, commonly called wise men and wise women” (p. 256). Such magical practitioners were, indeed, worse than malefic witches, because they pretended to do good and therefore deluded the ignorant populace and led them further from godliness. Perkins, in fact, ended his *Discourse* by stating that “death therefore is the iust and deserved portion of the good Witch” (p. 257).

English court records suggest that Perkins’s recommendation in this respect was not taken to heart by those responsible for administering English witchcraft trials: cunning folk usually suffered the relatively light penalties of penance before the ecclesiastical courts and fines before secular courts. But, more generally, Perkins’s opinions on witchcraft remained influential for over a century, and English advocates of witch hunting drew considerable comfort from the fact that so eminent a man had written in support of their cause. In his justification of the Salem trials of 1692, *The Wonders of the Invisible World*, Cotton Mather cited Perkins’s work extensively, and close study would probably reveal citations among continental Protestant writers on witchcraft. Further proof of the status of the *Discourse* comes from its place as the prime target of an important skeptical work, Sir Robert Filmer’s *An Advertisement to the Jury-men of England, touching Witches: Together with a Difference between an Hebrew*

and an English Witch (London, 1653). Filmer, an advocate of absolute monarchy and a royalist in the Civil War, especially attacked Perkins’s emphasis on the pact, which Filmer obviously regarded as similar to Puritan views on covenant theology, to which this royalist gentleman was extremely hostile.

PERREAUD, FRANÇOIS (1572/1577–1657)

A Huguenot minister of attested probity and reliability, Perreaud wrote two short treatises on demonology published together as *Démonologie ou traité des demons et sorciers, ensemble l’Antidemon de Mascon* (Demonology, or a Treatise on Demons and Witches, including the Anti-Demon of Mâcon) in Geneva in 1653. The first, *Démonologie*, served as a kind of lengthy, self-contained introduction to the second, *L’Antidemon de Mâcon*, which provided a long and mostly circumstantial account of a poltergeist haunting, to which Perreaud and his whole household had been subjected for just over three months at the end of 1612. The latter treatise caught the eye of Sir Robert Boyle, a future member of the Royal Society, who heard the details from Perreaud himself and as a result sponsored an English translation, which appeared in 1658.

DÉMONOLOGIE

The *Démonologie* began with a short preface in which Perreaud explained that in 1652 he visited Bern for the first time for fifty years and there congratulated the city on passing a law against witches. Attacks at the hands of Catholics who blamed the Reformed religion for an infestation of witches in the Pays de Vaud and personal experience of an evil spirit caused him to write his treatise in order “to explain by reliable grounds and principles what one must believe [in relation to witches], the strength and weakness of evil spirits, and the proper remedies and safeguards one may take against them” (Perreaud 1653, 3).

The treatise was divided into twelve short chapters and read like an extended sermon. Perreaud argued that Scripture and human experience all over Europe prove

that both good and bad angels exist and that evil spirits were necessary in God's scheme of things to punish sin and test the faith of believers. Maintaining that witches did not exist was merely one of Satan's tricks. Nevertheless, it was as dangerous to be overcredulous as it is to be unbelieving. Certain phenomena, such as unexpected hailstorms and tempests, might have natural explanations. Deliberate fraud must not be discounted. Malicious accusation, too, was always possible. Demons, however, could act only with God's permission; so if storms do occur, they are likely to be signs of God's anger at our sins.

The word *demon* meant "someone who knows," Perreaud said—actually, it came from a Greek word for an intermediary spirit or deity—and demons possessed two qualities: the power to know and the power to act. Thus, demons could predict the future, because they were immensely skilled at interpreting signs and drawing correct inferences from past actions. But they worked principally through illusions and might persuade people to believe their illusions by manipulating their imaginations or affecting their sight and hearing. Consequently, witches merely imagined they flew to their Sabbats because Satan made use of their proclivity to melancholia to manufacture illusions in their brains.

Demons could do things that were impossible for humans, such as making dead bodies move and speak believably or creating false bodies from congealed air for the same purpose. If witches did in fact fly, it was because they were carried by evil spirits who bore them up, much as a wind carried heavy objects through the air. Satan's aim in all this was the destruction of humanity. He misled people through idolatry as manifested in the Church of Rome or those who claimed to cure diseases by popular magic. The end of the world was not far off, so Satan was constantly inventing new stratagems to ensnare and destroy the faithful. He could not be restrained by superstitious means such as crosses or holy water. A strong faith in God, prayer, vigil, and fasting were the appropriate weapons for a true Christian.

There was nothing in Perreaud's treatises that was in the least novel or unorthodox, and little (save his conclusion) that was distinctively Protestant. Protestant demonologists often quoted from Catholic sources as texts worthy of credence, and Perreaud cited Pierre de Lancre more than once. As an example of the demonological genre, therefore, Perreaud's treatise was limited. As a prefatory sermon to his account of his poltergeist experience, however, it was of immediate interest, because it took on the air of a personal conversation between Perreaud and the reader, a warning of the dangers from preternatural forces whose attentions he himself suffered, and a reassurance to anyone who might find him- or herself one day in a similar position not to

be disconcerted or frightened, because these events were not beyond our courage or our endurance.

PERSONALITY OF WITCHES

Unfriendly, abusive, and, to a lesser degree, antisocial or deviant people run a particular risk of being suspected witches in cultures that believe in witchcraft. Witches are thought to be people who have secretly turned against their communities, engaging in antisocial activities and inflicting harm on their neighbors, so people who believe in them are naturally prone to suspect people who manifest hostility or evince alienation from the community. Early modern European theories about witchcraft were somewhat atypical because they stressed the range of people who might become witches, but they also emphasized hostile and antisocial behaviors. Early modern popular suspicions targeted people, usually women, whose behavior and attitudes made them seem most likely to be responsible for harm suffered by others in their community. However, in early modern Europe as elsewhere, because witches were thought to practice their rites secretly and to inflict harm through occult means, the essential issue was not the suspect's overt behavior but his or her inner orientation. Although cultural images generally emphasized the witch's hostility and perversity, actual witch suspects were not necessarily belligerent or antisocial. Most theories about why people in a broad range of societies feel so threatened by the presumed hostility of witches approach the issue as one of victimization due to cognitive malfunctions on the part of the accuser, manifesting the displacement of other social processes or the dictates of a culturally prescribed narrative. Consideration of the role of personality in witch beliefs, however, raises the possibility that witchcraft beliefs were a way to categorize and cope with people whose habitual use of harmful ritual magic or malevolence in interpersonal disputes threatened the integrity of small-scale communities and the well-being of their members.

CULTURAL IMAGES OF WITCHES' PERSONALITIES

Twentieth-century anthropological studies found that the idea that particularly hostile or otherwise antisocial people were thought to be witches was extremely widespread. In Africa, for example, the Azande believed that

witches were spiteful or dour and quarreled with, threatened, and extorted favors from others. In North America, the Navajo held that witches were particularly mean spirited, while the Tangu of New Guinea said witches were surly, selfish, and unsociable, and took without reciprocating. This lack of respect for the social rules of reciprocity was seen to manifest not only hostility to the other person but also an antisocial disregard for the conventions that held society together. Similarly, the Navajo suspected not only hostile people but also people whose ambition or willfulness disrupted the smooth functioning of society, and the Nupe, Gisu, and Mandari in Africa considered any atypical behavior to be suspect. The Azande added dirtiness and other disregard for socially prescribed hygiene to hostility in their concept of witchcraft. These cultures and the innumerable others that included witchcraft beliefs naturally varied greatly in the specific social norms they thought witches breached and to a lesser extent in the specific ways witches expressed hostility. Nevertheless, the association of a hostile personality with witchcraft is very strong across cultures, and the association of witchcraft with more diffuse socially disruptive behaviors, while less strong, is still significant.

Late medieval European theologians describing witches in their demonologies were primarily concerned with their supposed clandestine activities and so discussed their personalities mainly in regard to their motives for becoming witches. Because they wanted to show how widely the Devil cast his net, they emphasized the range of reasons people succumbed to his temptations and, by implication, the variety of people who might be witches. Even so, though, their characterizations conformed broadly to the cross-cultural norms. For example, the *Malleus Maleficarum* (The Hammer of Witches, 1486) emphasized five personality characteristics that were supposed to lead people into witchcraft: malice, vengefulness, lust, avarice, and gloominess. The first two are forms of hostility, the last two have direct counterparts in witch beliefs of some other cultures, and the middle one, lust, was considered particularly antisocial (sinful) in medieval Christian morality. Even when such learned discussions tried to emphasize the breadth of types of people who became witches, they still conformed broadly to cross-cultural conceptions.

PERSONALITIES OF WITCH SUSPECTS

Anthropological accounts of witchcraft in various cultures have suggested that in practice, suspected witches did not necessarily display overt hostility or perversity, for some suspected people seemed friendly and conformed to social strictures, whereas others who were combative or deviant may not have been considered witches. However, these discrepancies did not mean that personality was unimportant, just that what was at

issue was not so much a suspect's overt behavior and attitudes as his or her inner convictions. Thus, a friendly person's friendliness had to be shown to be hypocritical in order for an allegation of witchcraft to carry weight. Conversely, a moderately belligerent or antisocial person's behavior did not become evidence of witchcraft if it was understood to be the full manifestation of that person's character.

We actually have better information about what kinds of late medieval and early modern people were suspected from popular practices than from demonologies written by learned men, because our main sources for the former are trial records. Records of mass panics are not much help: suspects were drawn in because of testimony obtained through torture, and the courts conducted proceedings in an atmosphere of mass hysteria. Records of small trials of one or only a few suspects are more useful. Although elite fears influenced small trials, they offer a relatively straightforward record of proceedings that were often initiated by commoners, almost always drew on their knowledge and ideas, and were generally conducted according to proper judicial procedures. These records suggest that popular beliefs were closer to the cross-cultural norm than the learned discussions. Most trials began because the accusers thought they had been harmed rather than because they were concerned about a diabolical conspiracy; thus many of the accused were people, especially women, who had reputations for chronic contentiousness. More generalized antisocial behavior sometimes led to a trial but more often played a role as supporting evidence about a suspect's reputation. Some suspects had good reputations and apparently amiable dispositions, but as long as standard judicial procedures were followed, they were far less likely to be tortured, convicted, or executed than suspects with long histories of belligerence.

These European trial records also contain significant information about people who have been less prominent in anthropological research, people who freely confessed to being witches. Social scientists' assessments of them have generally taken the fact of confession to be *prima facie* evidence of a pathological personality and therefore tended not to probe what these people were like apart from their willingness to confess. Their most common assessments have been that confessed witches were either mythomanics, hysterics, or just senile. However, the disappearance of hysteria as a psychological diagnosis, recent reconsiderations of the appropriateness of using modern Western psychological categories to classify people in other times and places, and a new understanding of the influence of cultural expectations on perceptions and experience make such judgments dubious; stories that sound bizarre to modern Westerners may not indicate pathology in another cultural context. In their personalities, beyond a readiness to implicate themselves, confessed witches

actually appear on the whole to have been fairly typical witch suspects, known for their combativeness and general antisociability. If anything, a higher proportion were people who conformed to their culture's image of witches, because that image would have informed their self-definition as witches.

PERSONALITY AND INTERPERSONAL RELATIONS IN SMALL-SCALE SOCIETIES

Social scientists have traditionally looked to witches' personalities to help explain why they were victimized, seeing them as objects of clerical misogyny, scapegoats for social-historical turmoil, explanations for otherwise inexplicable personal misfortune, exemplars of social boundaries, obstacles to patriarchy, or as characters in culturally constructed narratives. In all these approaches, the crucial elements were the accusers and their motives; the suspects' personalities mattered only insofar as they served to focus the victimization process. Looking at the problem from the point of view of the suspects' personalities, however, suggests another line of reasoning. First, in most societies, some people actually did consciously employ harmful ritual magic or unconsciously project malevolent attitudes as tactics in interpersonal disputes. Second, malefic ritual magic often did involve, and unconscious projection of a menacing persona may well have involved breaking social norms or other perverse actions that toughened the "witch's" psyche while intimidating others. Third, people who engaged in harmful magic or who chronically projected a malevolent attitude may have caused harm through physical agents or psychological manipulation; they definitely strained the bonds of community that were vital for the survival and prosperity of small preindustrial communities. Consequently, although witchcraft beliefs exaggerated, distorted, and even invented many of the activities and dangers ascribed to witches and were definitely abused, there was probably real survival value for the small-scale communities on the margin of subsistence where witch beliefs generally originated and flourished in identifying and placating, isolating, disciplining, or eliminating people who consciously utilized harmful magic or those who unconsciously projected a malevolent persona in interpersonal disputes.

PERU

In Peru, witchcraft cases were tried by the Inquisition, first by the episcopal Inquisition and from 1570 by the tribunal of the Holy Office sitting in Lima. This tribunal was abolished in 1818. All sectors of the colonial population except the Amerindians were subject to the Inquisition. From the beginning until the end of Spanish colonial rule in Peru, the native population was exempt from the jurisdiction of the Inquisition but remained under the control of ecclesiastical courts. The Lima inquisitorial tribunal subsumed witchcraft (*brujería*) and sorcery (*hechicería*) trials under the greater category of "superstition." Consequently, the Peruvian Inquisition imposed no death penalty for witchcraft during the colonial period. An extremely broad geographic area fell under the jurisdiction of the Lima tribunal: When the tribunal was established in 1570, all South American Spanish possessions were subject to the Peruvian inquisitorial court. In 1610, after the foundation of a tribunal at Cartagena, the northern part of South America came under a separate jurisdiction, but all regions south of the vice-royalty of New Granada (modern Colombia, Venezuela, and parts of Panama and Ecuador) remained subject to the Lima tribunal. Evidently, the enormous geographical extent of this court's jurisdiction made more effective control possible only in the urban centers of the vice-royalty. To a certain degree, this situation may have accounted for the fact that in Peru, witchcraft and sorcery cases were mainly an urban phenomenon. Generally, the defendants had a low social status and—with regard to the total number of cases—there was a clear majority of trials instituted against women.

STATISTICAL DATA

From 1570 until 1818, that is, during the whole period of its existence, the Lima tribunal instituted 1,566 cases for matters of faith, of which 209 were subsumed under the category of superstition. That is, 13.3 percent of the total number of trials (Millar Carvacho 1998, 230). The majority of the superstition cases were sorcery (*hechicería*) trials. No witchcraft (*brujería*) trials are reported in the records of the Peruvian Inquisition. For

the first period of inquisitorial activities in Peru, from the Spanish conquest in 1532 until the foundation of the Lima tribunal in 1570, no exact data are available. In any case, there is no evidence of important witchcraft or sorcery trials. From 1570 until the end of the 1580s, sorcery or witchcraft had lesser importance than in the next period from 1590 to 1700. The highest incidence of sorcery cases in this period was recorded for the 1590s. In that decade, twenty-six persons were tried, twenty men and six women (Castañeda Delgado and HernándezAparicio 1989, 374). At the end of the sixteenth century, the pope urged the Spanish Inquisition to prosecute all sorcery accusations under suspicion of heresy. In 1629, a special edict was published inviting denunciations of those who practiced witchcraft and sorcery (Medina 1887, 2:35–40), which produced an increasing number of accusations and trials. At the same time, Peru's economic crisis of the 1630s may also have played a part in the increasing inquisitorial activities against all sorts of superstition, as more people probably consulted sorcerers in search of help in a desperate situation. The next period, which continued through the eighteenth century until the end of the Peruvian Inquisition in 1818, was characterized by a high percentage of sorcery trials. Behind bigamy cases, which occupied the first place with 26.15 percent, the Lima Inquisition's ninety superstition cases held second place with 23.07 percent (HernándezAparicio 1993, 391).

DEFENDANTS AND OFFENSES

Most of the defendants were women of a low social status, often widowed, abandoned, or unmarried, who therefore lived at the margin of colonial society. Thus, the majority of the offenders were accused of trying to improve their situation or that of their clients. For example, magical practices were employed to bring a husband back to his wife or to procure a new partner for a client. Many cases also revolved around the precarious financial situation of clients and defendants. In accordance with the mixed ethnic profile of the people involved in sorcery cases, the magical practices were mainly based on contemporary European love magic but at the same time included indigenous Peruvian incantations and magical procedures, such as the use of medicinal plants in magical healing. Since the early seventeenth century, the offenses described in the sorcery trials show that by this time, European and Amerindian elements had merged into a new colonial Peruvian model of magic. African elements were less dominant, although a considerably high proportion of the defendants were of African descent. The majority of the defendants were classified as Spanish or Creole, followed by the so-called quadroons (*cuarterones*), Europeans with one-fourth African ancestry. Although male defendants more often used magical procedures in search of fortune and wealth, female defendants

more frequently practiced love magic and magical healing.

FORM AND NATURE OF MAGIC IN PERU

Magical procedures were quite similar despite differences in gender or in the ethnic or social profile of the defendants: Invocations of demons or of saints who specialized in different kinds of magic were often combined with various incantations, the fabrication of charms, and magic potions. In cases of love magic, the practitioners frequently addressed Saint Martha or the "limping devil" (*diablo cojuelo*), whereas St. Cyprian was invoked in healing sessions. Spanish spells were often used in combination with typical Peruvian materials, such as coca leaves. The use of coca leaves in divination, magical curing, and sorcery was widespread within all levels of society, including with Spanish, Creole, or African women. Coca leaves were also regularly consumed as a stimulant. In magical procedures, coca leaves were often addressed as Incas (pre-Columbian rulers of Peru), Coyas (Inca-princesses), or as "mother Coca" (Mama Coca); in other words, the practitioners, mostly of European descent, invoked an Andean deity. Despite the invocations of the Devil or specific demons, all these cases were defined as sorcery, not witchcraft. Some male and female defendants were even accused of signing contracts with the Devil in order to secure his help in their endeavors to find treasure or love or simply to improve their situation. The Peruvian Inquisition classified these offenses mainly as fraudulent superstitions, notwithstanding the fact that the defendants were accused of an implicit or an explicit pact with the Devil. Peruvians accused of witchcraft were not charged with several activities attributed to early modern European witches: they did not allegedly attend nocturnal assemblies to worship the Devil, perform harmful magic, or fly through the air.

Only a few witchcraft trials are recorded in the viceroyalty of Peru. They were instituted not by the Inquisition but by a parallel institution, the so-called Extirpation of Idolatry. Founded in 1610 in the archbishopric of Lima to prosecute cases of idolatry, sorcery, and witchcraft among the Amerindian population, this ecclesiastical court tried a few Amerindians as witches (*brujos*). These individuals were thought to possess the ability to fly through the air, transform themselves into animals, especially birds, and perform similar deeds. Furthermore, they were accused of bloodsucking witchcraft or of practicing other kinds of harmful magic. All these elements formed part of the native notion of witchcraft in the Andes and were reported in seventeenth-century Spanish colonial historical sources. As a new element, the Spaniards introduced the witches' Sabbath from the European demonological tradition. Eighteenth-century indigenous testimonies reflected

the fusion of the early modern European and the native Peruvian notions of witchcraft. Records of witchcraft and sorcery trials from the late colonial period instituted by ecclesiastical courts against Amerindians show that even in some rural regions, distant from the capital of the colony, several characteristic elements of the European demonological tradition had merged with popular ideas on witchcraft into an hybrid Peruvian concept, almost identical to the demonological stereotype of witches.

PETER OF BERN (FL. CA. 1400)

A Swiss lay magistrate, Peter of Bern was mentioned several times by Johannes Nider in his *Formicarius* (The Anthill, 1437–1438) as an accomplished witch hunter.

Formerly identified as the patrician Peter of Gruyères (or von Greyertz), active 1392–1406 in the upper Simme valley (Simmenthal) of Switzerland; Peter's identity now appears problematic. Regional archives

between 1392 and Nider's *Formicarius* show at least three judges named Peter (Hansen 1901, 91 n. 2; Borst 1992, 108–120; Chène 1999, 223–231). In short, we are not certain who exactly Peter was.

The tales that Nider claimed Peter told him featured two varieties of evildoers: a sect of apostate infanticidal cannibals, male and female, with most of the characteristics later attributed to "witches"; and a dynasty of individual males, who conformed to the older stereotype of the necromancer or sorcerer (Chène 1999, 243–244). Nider conflated several confessions that Peter extorted from his defendants with more recent information he had learned at the Council of Basel, reinterpreting Peter's stories in the light of current ideas to help shape a more "modern" notion of witchcraft beliefs (Bailey 2003, 41–45).

The most famous confession introduced the witches' "cauldron." According to Nider, Peter forced a defendant to confess that her sect of heretics stealthily killed babies in their cradles, so that they seemed to die of natural causes. Later the children were exhumed and boiled in a cauldron, according to an unspecified ritual. When ingested, the broth provided magical knowledge and power, conferring leadership over the "sect." From the sediment in the cauldron, the heretics prepared unguents useful to their arts. (Heinrich Kramer would interpret this unguent as the "flying" ointment that induced demons to transport witches aerially.) Peter forced another defendant to embellish the story, describing ingestion of the broth as the central moment in an initiation that included renunciation of Christianity and ritual homage to the Devil. Peter's tales of protowitches showed influences of late medieval myths identifying Cathar and Waldensian heresies as cannibalistic secret societies (Borst 1992, 115–118, following Cohn 1975).

The central moment of the initiation was counter-Eucharistic: by drinking a broth made from the flesh of murdered babies, the novice witch absorbed heresy through powerful mental images. The ceremony was also an antibaptism, requiring formal renunciation of baptism; not coincidentally, the broth was normally made from babies lacking baptism. By asserting that witches mostly victimized unbaptized babies, Nider (through Peter of Bern), like other early theorists, implied that baptism protected babies from harm, including witchcraft.

Yet the theory was not perfect: to explain why witches sometimes killed baptized babies, Peter blamed parents for not reinforcing baptismal protection with nightly prayers and signs of the cross. Peter was even more obsessed by the efficacy of sacramental crossing than by baptism. One tortured defendant confessed striking victims with hail and lightning yet admitted being powerless against anyone protected by the sign of the cross. Peter crossed himself constantly, and so when

he injured himself badly in a fall, he attributed the lack of divine protection to his own negligence: losing his temper and even naming the Devil, he canceled the protection gained earlier by crossing himself. This comforting scenario was corroborated by the “confession” of a man Peter burned at the stake (Stephens 2002, 190–206, 241–252).

Nider’s portrayal of Peter’s obsessive interest in infanticide, cannibalism, ritual, and demonic encounters reflected deep insecurities about the efficacy of the Church’s sacraments and sacramentals, particularly baptism, the Eucharist, and the sign of the cross. Nider’s detailed anecdotes of Peter’s exploits, intended to allay widespread clerical anxieties, probably exacerbated them, particularly after Heinrich Kramer quoted them in *Malleus Maleficarum* (The Hammer of Witches, 1486).

PFALZ-ZWEIBRÜCKEN, DUCHY OF

Thorough research into the witch persecutions that occurred in the duchy of Pfalz-Zweibrücken is not yet complete, but it appears that there were only a few episodes of witch hunting in this initially Lutheran and then Calvinist territory from 1575 to 1590 and 1629 to 1633. As elsewhere in western Germany, the persecution was concentrated mainly in areas in which jurisdictional rights were divided among different lords

(as was, for example, the case at the criminal court of Neunkirchen/Nahe, where there were about thirty-six witchcraft trials) and in areas in which rights of lordship were a matter of dispute (such as those subject to the criminal court of Hornbach, where there were approximately thirteen trials). In those parts of the Nahe and Saar regions that were subject to the territorial authority of Pfalz-Zweibrücken, witch hunts were pursued by the combined efforts of *Hexenausschüsse* (witch-hunting committees organized at the village level) and minor lords with rights of criminal jurisdiction. In those territories bordering the duchy of Lorraine, however, witchcraft trials were investigated ex officio; this happened at the criminal court of Hornbach. No trials are known to have occurred in the areas bordering Alsace and the Palatinate, such as Amt (district) Bergzabern. As was the case in other Protestant territories, women were clearly the main focus of witchcraft trials in Pfalz-Zweibrücken. Only a tiny proportion of the trial records have survived; references to trials can, however, be found in records of ecclesiastical visitations and in the trial records of the *Reichskammergericht* (imperial chamber court).

THE ATTITUDES OF THE DUKES OF PFALZ-ZWEIBRÜCKEN TOWARD WITCH PERSECUTION

As early as 1532, Duke Wolfgang of Pfalz-Zweibrücken (1532–1569) asked the Lutheran reformer Johannes Schwebel for advice about how to proceed in cases of accusations of witchcraft. In response, Schwebel advocated a cautious approach, recommending only the legal prosecution of allegations of murder and harm caused by magical means. Schwebel’s answer was in line with the precepts of clause 44 of the Carolina (the code of criminal legal procedure issued by Charles V for the Holy Roman Empire in 1532). The Carolina’s definition of the crime of sorcery and its regulations regarding trial procedures and the settling of trial costs constituted the main influences on witchcraft trials in Pfalz-Zweibrücken under the next two dukes, Johann I (1569–1604) and Johann II (1604–1635), who did not promulgate any ordinances relating specifically to the conduct of witchcraft trials. A clear process governed all criminal cases. The ducal chancellery authorized the arrest, interrogation, and torture of alleged witches, sometimes including a detailed list of questions that were to be put to the suspect. On the whole, the chancellery lawyers adopted a “wait-and-see” attitude toward accusations of witchcraft and encouraged local officials to treat such accusations with moderation. Despite their efforts, witchcraft trials became endemic during the rule of Duke Johann I between 1574 and 1590 (in Hornbach and Neunkirchen/Nahe), although Johann consistently tried to limit the spread of the trials by ordering arrested women released on bond, by

concerning himself especially with the issue of the correct settlement of trial costs, and by attempting to prevent trials that were not carried out in accordance with the Carolina. Johann I's moderate stance led opponents to bring lawsuits against him at the *Reichskammergericht* in 1592 and 1594, accusing him of being extremely skeptical with regard to witchcraft trials. His insistence on strict adherence to the Carolina was met with particularly vehement opposition from minor lords who possessed rights of criminal jurisdiction.

WITCHCRAFT TRIALS AT THE CRIMINAL COURT OF NEUNKIRCHEN/NAHE: A CASE STUDY

The criminal court of Neunkirchen/Nahe belonged to the count of Veldenz and was held as a fief by the dukes of Pfalz-Zweibrücken: the four villages of Neunkirchen, Gonneseweiler, Selbach, and Eckesweiler were subject to its jurisdiction. The lords of Sötern in part held rights of jurisdiction. As a result of the involvement of *Hexenausschüsse*, seventeen witchcraft trials occurred in Gonneseweiler in 1580, in the course of which ten women were executed. In 1589, working in conjunction with the local *Hexenausschüsse*, Georg Wilhelm of Sötern had six women of Selbach arrested: four of them were forced through horrific torture into making confessions of witchcraft and were subsequently executed. Georg Wilhelm and the *Hexenausschüsse* forced the relatives of the executed women and the two remaining women (who were released) to meet the extremely high trial costs of approximately 900 florins. The six families thus affected were ruined financially and reduced to begging for a living.

Duke Johann I of Pfalz-Zweibrücken then intervened against this clear breach of the law and forced the *Hexenausschüsse* and Georg Wilhelm to reimburse the families for their forfeited property. Georg Wilhelm and his son, Conrad, promptly brought a lawsuit against Johann I at the *Reichskammergericht*. The verdict is unknown, but no more witches were tried at the criminal court of Neunkirchen until 1629, again on the initiative of local *Hexenausschüsse* and the lord of Sötern, Johann Reinhard. At least nine people were executed in 1629–1630. In 1633, further trials were pursued against six individuals featuring the imposition of excessive costs, fraud, bribery, and the manipulation of legal proceedings. Local witch-hunting committees were also active in the Pfalz-Zweibrücken areas of Meisenheim, Lichtenberg, and Zweibrücken.

REASONS FOR THE PFALZ-ZWEIBRÜCKEN TRIALS AND THEIR CESSATION

The first witchcraft trials in Pfalz-Zweibrücken were triggered by the intensification of ecclesiastical visitations, during which popular magical practices, previously

categorized as “superstitions,” were criminalized and linked with the crime of witchcraft. Despite this, relatively few accusations of sorcery ended in witchcraft trials, primarily because the moderating influence of the ducal chancellery prevented the escalation of witch hunts. The trials at the criminal court of Neunkirchen/Nahe were in all probability triggered by the mass persecution of witches in the neighboring territory of the electorate of Trier in the late sixteenth century. Strict adherence to the Carolina and the close links between the dukes of Pfalz-Zweibrücken and the authorities in the Palatinate, who were opposed to witch hunts, ensured that mass witchcraft trials never occurred throughout the duchy. Members of the collateral line of Pfalz-Birkenfeld also adopted a critical attitude toward witchcraft trials. The devastating effects of the Thirty Years' War, which wiped out almost 90 percent of the population of the Pfalz-Zweibrücken territories in the Saar region, ensured that no further witchcraft trials took place there.

PICO DELLA MIRANDOLA, GIANFRANCESCO (CA. 1469–1533)

Author of the best-known Italian Renaissance dialogue on witches, Gianfrancesco was the son of Galeotto I of Mirandola and of Bianca Maria d'Este, illegitimate daughter of Niccolò III of Ferrara, and the nephew of the famous Renaissance philosopher Giovanni Pico della Mirandola. Only six years younger than his uncle, Gianfrancesco thrived on the cultured society that Giovanni frequented. After Giovanni died in 1494, Gianfrancesco wrote a biography that introduced the first edition of his uncle's works (Bologna 1496). Although they agreed in some matters, including their views concerning judicial astrology, their philosophical positions were generally very different.

We know little about Gianfrancesco's childhood; he may have studied in Ferrara or Milan, where he participated in a tournament at the Sforza court in

January 1491. Two months later, Gianfrancesco married a Neapolitan heiress, Giovanna Carafa, and used her dowry to purchase the hereditary title to the tiny principality of Mirandola from his uncle Giovanni. From 1491 to 1499, Gianfrancesco dedicated himself to studying humanist philosophy, meeting the most important contemporary intellectuals and politicians, and composing numerous literary and philosophical works that were published at the beginning of the sixteenth century. His letters circulated in manuscript form before being translated into French in 1498 and into English by Thomas More in 1510. The friendships established through his uncle's connections in the cultured court societies of Bologna, Ferrara, Florence, and Mantua were very important to Gianfrancesco's career. But the most important influence was his encounter with the friar Girolamo Savonarola, whom Gianfrancesco met in 1491. In 1497, Gianfrancesco defended Savonarola twice in response to attacks by a Franciscan monk, Samuel de Cassini (Cassinis); the next spring, he composed a third defense in the vernacular directed at Florentine public opinion, but his work could not save Savonarola from being burned at the stake in May 1498. Gianfrancesco never stopped defending Savonarola, nor did he stop inviting disciples like Pietro Bernardini or Fra Luca Bettini to stay with him. He worked on composing a *Vita Hyeronimi Savonarolae* (Life of Girolamo Savonarola) until his death.

In 1499, Gianfrancesco's father, Galeotto I, died. Gianfrancesco's life became enwrapped in a long twisting struggle to claim the hereditary principality as Galeotto's eldest son, while his mother—aided by the French and the Milanese—favored Gianfrancesco's younger brothers. In 1502, after a long siege, the castle of Mirandola fell into the hands of his brothers; Gianfrancesco was imprisoned and later exiled. For eight and a half years, Gianfrancesco traveled to various Italian cities, serving the emperor and the pope while remaining in contact with important German humanists. The recovery of the castle of Mirandola became part of a plan to conquer the city for the Papal States by Pope Julius II, who personally conducted its siege and capture from December 1510 to January 1511. Gianfrancesco's satisfaction was brief; the Milanese commander Gian Giacomo Trivulzio soon seized Mirandola and expelled the heirs. In 1514, with the mediation of the imperial vicar, they reached an agreement, giving the land and some rural villas to the brothers.

Gianfrancesco composed a dialogue about witches, *Strix, sive de ludificatione daemonum* (The Witch, or the Deceptions of Demons), published in Bologna in 1523, with the practical purpose of justifying a violent repression he had recently conducted in Mirandola against numerous witches in 1522 and 1523, earning an indignant reaction from the population of the castle and the nearby villa. Although created for specific

personal political purpose, his treatment became immediately popular. A vernacular translation by Fra' Leandro Alberti appeared in Bologna in 1524; *Strix* was translated again in Tuscany in 1555, appearing in the canonical work of Turino Turini. Gianfrancesco's text was also included in a collection of theoretical works published in Padana during the first half of the sixteenth century, alongside works by two Dominicans, Silvestro Prierias and Bartolomeo della Spina, both inquisitors and papal theologians.

One can immediately distinguish Gianfrancesco's account by its originality. He wrote not as an inquisitor but as a scholar who attended these trials in his capacity as count of this small principality and wanted to answer an important question: was this "cult of Diana," consisting of ten people in Modena and Mirandola, the same bacchanal pagan assembly of antiquity described as a superstition by the *Canon Episcopi* (ca. 906) and included in Gratian's *Decretum* (Concord of Discordant Canons, known as the *Decretum*, 1130–1140 revision), or was it instead a new form of heresy? Gianfrancesco argued in dialogue form, with the participation of four people: Fronimo (the scholar, wise and sensitive, that is, Pico himself) and Dicasto (the judge, modeled after the Dominican inquisitor Girolamo Armellini) in conversation with Apistio (an unidentifiable skeptic), who at the conclusion became Pistico (the believer), now persuaded of witchcraft's satanic nature; a witch entered in order to testify about the "cult of Diana." In a text rich with the quotation and reinvention of pagan ceremonies, the author linked modern witches' Sabbats with many antiquated beliefs, but differentiated them in some important rituals, especially the presence of devils. Modern witchcraft differed from the beliefs described by the *Canon Episcopi*, but the origins of both heresies were embedded in ancient paganism. Recent studies about the historical context in which these witches were tried have illuminated the jurisdictional conflicts among the inhabitants of Mirandola that aggravated the cruelty of the repression; but Gianfrancesco's dialogues demonstrated that this persecution of witches was motivated above all by intellectual and ideological convictions.

PIEDMONT

The early history of witchcraft in the Piedmontese state was dominated by developments that occurred mainly in its western and northern French-speaking parts, including the Val d'Aosta. The central role of the dukes of Savoy-Piedmont in helping create the doctrine of the witches' Sabbat at the time of the Council of Basel is now well-known (Ostorero et al. 1999), and considerable evidence about fifteenth-century trials in the northwestern parts of Savoy-Piedmont has been preserved at Turin among the fiscal records of ducal officials. However, this entry will focus primarily on the Italoophone territories comprising the present-day Piedmontese region, created after the unification of the Kingdom of Italy in 1860, when Nice and Savoy went to France.

During the time of recorded trials for sorcery and witchcraft (local records date from 1292), the House of Savoy subjugated many local lordships. In the thirteenth century, Piedmont was composed only of Turin, Aosta, and Savoy, but in the fifteenth century included within its borders Cuneo, Vercelli, Biella, Ivrea, Tenda, and Nice. The state added Asti, Alba, and Saluzzo in the sixteenth and seventeenth centuries. In the first decades of the eighteenth century, when Piedmont's rulers became kings, it annexed (through international treaties with France, Austria, Spain, and England) Alessandria, Tortona, the Lomellina and Novara (taken from the duchy of Milan), and the Monferrato of Acqui and Casale (taken from the duchy of Mantua). The present Piedmont region took form only after the unification of the Kingdom of Italy, when the territories of Nice and Savoy went to France, and Liguria (acquired in 1815) broke away from the Piedmont.

In his constitutions of 1430, the Savoyard Pope-Duke Amadeus (Amedeo) VIII (1383–1451, ruled 1416–1451) established the death penalty for heretics and casters of harmful spells (*sortileges*); by that date, Dominican Friars had not yet assigned inquisitors to

Torino, Vercelli, Alessandria, Novara, Savigliano, and Ivrea. As late as 1673, Duke Carlo Emanuele II reaffirmed the death penalty for anyone who cast spells and charms. Important information has also been obtained by consulting both state and municipal archives, which sometimes document expenses for building scaffolds or stakes (Centini 1995, 31–32) or still keep important trial records (Merlo et al. 2004). From published documents (Centini 1995, 32–52), we learn that the oldest case of witchcraft known in Piedmont dates back to 1292: a woman from Villafranca, who was forced to pay a fee for *sortilegia in visione stellarum* (casting spells while stargazing). A certain Lorenza di Cumiana was the first sorceress burned at the stake, in 1321; Bertolotto, her accomplice, was hanged.

Many fourteenth- and fifteenth-century trials were held, often in Alpine regions: the valleys of Lanzo and Susa, the Canavese, Bardonecchia, Pinerolo, Cuneo, Mondovi. Overall, between 1292 and 1417, twenty-six persons were put on trial (eight of them men) and seven received death sentences. Between 1421 and 1445, many more charges and sentences are documented: thirty-one people were investigated (eleven of them men), with twenty-five death penalties. Between 1461 and 1479, we find thirty-five accused people (including seven men) and nineteen executions. Because of inaccuracies in the sources, we exclude thirty-two mountain dwellers accused of casting spells in Savoy in 1436, several women who were tried as witches in the Canavese between 1350 and 1390, and almost forty townsfolk in Andezeno in the late fifteenth century, where Catharism overlapped with accusations of devil worship, promiscuity, etc.

During the sixteenth and the seventeenth centuries, the phenomenon seemed to decrease in the modern Piedmontese geographical area; for example, only four witches were tried at Turin during the lengthy French occupation before 1559. Between 1530 and 1682, not counting sketchy data, we note only thirty-three sentences (only five concerning men) and fourteen executions.

Overall, from 1292 to 1742, we have—besides many uncertain cases—a total of 242 people under investigation for witchcraft in Piedmont, including 120 women and 30 men; capital sentences and deaths in prison totaled 82. Centini (2004) found for the period from 1329 through 1740 a total of 102 people under investigation; trials, 79; capital sentences, 49; amputations, 2; fines paid, 12.

In Piedmont, the bishops' ancient power to judge in matters of faith, including heresy and witchcraft, was never taken away; the records of diocesan synods from the 1550s offer substantial evidence about practices of popular magic; the bishops assigned punishments to witches, magicians, wizards, and fortunetellers (Corrain

and Zampini 1970). Although dossiers of trials held before episcopal courts have disappeared from many diocesan archives, some information can be extrapolated from annals and chronicles. One set of court records from the bishop of Acqui (which became Piedmontese only in the eighteenth century) includes fifty-seven persons put on trial for illicit magic between 1585 and 1727. They include thirty-six men and only twenty-one women; most of these men were soldiers, quartered in Monferrato during the time of the succession wars around 1630. Their punishments never exceeded canonical penances, fines, and gifts to charities (Panizza 1994, 178–179).

St. Bernardino of Siena, during one of his sermon campaigns in Piedmont (probably in 1417 or 1418) alleged that Piedmontese witches had already killed five inquisitors in previous years, so that no one wanted to serve in those places and “*mettervi mano*” (meddle with them). Bernardino explained how such *male genti* (evildoers) performed the nefarious practice of the *barilotto*—communal drinking from a keg of wine polluted with the pulverized corpse of a baby, which was passed around and shared during their Sabbat as a sign of their fealty to Satan. The gray friar’s passionate exaggerations, however, did capture a kind of local Piedmontese color: the fact that it was, historically and geographically speaking, in the front line among those territories between France and Italy where Catharism had existed in the Western Alps.

The confessions of Piedmontese sorcerers under investigation revealed their desire to master the magical arts, sometimes as a way to manipulate the ruling powers. Magic spells bedeviled the court of Savoy as far back as the time of Pope-Duke Amadeus, and similar spells continued to be cast on the lives of the Savoy kings, deeply worrying the Turinese court in the first thirty years of the eighteenth century. Another good late example was the 1752 case of several residents of Alessandria who were involved in various underground activities, including trafficking in books of magic and necromancy, stealing various body parts from hanged men, and making talismans that their friends (men, mostly soldiers) used mainly to look for hidden treasures in the hills (Panizza 1989, 36–37). Testimony about witchcraft in seventeenth-century rural Piedmont, beyond its traditional contexts of popular magic, offered tantalizing bits of evidence about the survival of practices and rituals apparently connected to ancient heresies that once flourished in the mountains (Gremmo 1994, 12–17, 22, 50).

PIPERNO, PIETRO

Seventeenth-century Italian philosopher and physician from Benevento, Piperno was author of *De magicis affectibus horum dignotione, praenotione, curatione, medica, stratagemmatica, divina, plerisque curationibus electis, et De Nuce beneventana maga . . .* (On Magical Ailments, Their Diagnosis, Prediction, and Treatment, with Select Cures Medical, Strategic, and Divine, and On the Walnut Tree of Benevento), published at Naples in 1634 in five books and reprinted in 1647 with an added sixth book. The appendix was reprinted in 1640 at Naples, along with a treatise in Italian on the same subject (*Della superstiziosa noce di Benevento: Trattato storico . . .* [On the Magical Walnut Tree of Benevento: A Historical Treatise]), containing sensational anecdotes.

Reasoning from effects to causes, the work enlisted the symptomology of diseases to prove that demons exist. It discussed witchcraft as the means whereby demons caused disease and possible remedies, both

natural and supernatural (e.g., exorcism, prayers, blessed amulets), for curing ailments. Like other treatises that defended the reality of demons against skeptical detractors, Piperno's book addressed the vexed question of the relative power of the human imagination. His "extremely unoriginal" (Mori 1994, 181) work relied heavily on citations from sixteenth-century demonologists and exorcists. An appendix discussed the infamous walnut tree of Benevento, the supposed meeting place of witches and demons, mentioned by St. Bernardino of Siena and other fifteenth- and sixteenth-century writers on witchcraft. According to Piperno, the tree emitted natural, intoxicating effluvia that predisposed witches to commit the horrors of the Sabbat.

Piperno's son Nicolò composed a play on the legend of the tree, *La noce maga di Benevento* . . . (The Magical Walnut Tree of Benevento), which was staged in 1665 and 1666 at Benevento and Rome and published in 1682.

PITTENWEEM WITCHES

A small fishing village on the coast of Fife in Scotland, Pittenweem, like most other Scottish villages and towns, accumulated a history of magical operators, often dubbed witches, and dealt with either by the local kirk session (parish disciplinary committee) or by the criminal courts. Because of the nature of the records, Pittenweem's witches emerged quite late, at the end of the seventeenth and the beginning of the eighteenth century. Several complaints involved villagers consulting witches rather than being witches themselves. In January 1693, Margaret Greenhorn, a servant, was referred to the presbytery for consulting a man about things lost, and the minister investigated her again five years later on a similar charge. In May 1697, Agnes Adamson was rebuked for consulting, and the minister took the occasion to lament "how common this scandalous sin is of consulting persons reputed sorcerers anent things secret

or lost" (Ms. record, Scottish Record Office, CH2/183, p. 143). Not that parishioners always accepted their rebukes mildly. In April 1698, Jean Durkie was accused of consulting; when the session censured her, she cursed both minister and elders roundly. In May 1704 she was in trouble again for asking a woman (Nickolas Lowson) to teach her how to be a witch.

It was in this year, 1704, that Pittenweem began to suffer its most notorious (but atypical) witchcraft episode. In March, it was alleged that sixteen-year-old Patrick Morton, the son of a local blacksmith, had annoyed Beatrix Laing, long reputed to be a witch, by refusing to make her some nails. Next day, while passing her house, Patrick noticed a wooden vessel with some water and a fire coal in it, which he took to be a magical charm directed against himself. At once he became so weak that he took to his bed, and there he lay for several weeks, becoming more and more emaciated as time passed. Then at the beginning of May he started to have fits. His body would distort itself into remarkable and unnatural positions, and his tongue would be drawn back right into his throat. Even so, he was able to let people know the names of those he claimed were inflicting these magical torments upon him: Nickolas Lowson, Beatrix Laing, Janet Cornfoot, Margaret Wallace, Isobel Adamson, Margaret Jack, and Thomas Brown, all of whom were arrested and imprisoned, probably in the church steeple, the common place of confinement in places that did not have a town jail.

They were examined by the kirk session on May 29, 1704, and four of them confessed they had made a pact with the Devil, renounced their baptism, and attended meetings along with several others whom they named. This was serious, so the affair was referred to the presbytery, then to the General Assembly, and finally to the Privy Council of Scotland, which was asked for a commission to try the accused. The Privy Council sent three men to Pittenweem to investigate, as a result of which they decided not to proceed with prosecutions and ordered the prisoners' release. The women were set free. Thomas Brown, however, had died in prison. It appears that the local minister had been reading to Patrick Morton an account of the recent Bargarran case in which a young woman had accused several people of bewitching her. We cannot be sure when the minister started his reading, but Patrick did not begin to exhibit signs of demonic possession until halfway through his illness, so it looks as though Patrick may have faked his symptoms in imitation of "the Bargarran imposter," as the young woman involved in that case was called.

The release of the prisoners did them little good. Emotions were running high in Pittenweem, and Beatrix Laing continued to be persecuted by the townsfolk, who imprisoned her for five months and then, when she escaped, prevented her from returning to her own house. She was thus forced to live as a beggar.

Another of the accused, Janet Cornfoot, suffered much more. Escaping from Pittenweem to a nearby village after being tortured, she was sent back by its minister. On her return, a mob lynched her, first pelting her with stones while she was hanging from a rope and finally pressing her to death beneath a heavy door heaped with stones. This outrage reached the ears of the Privy Council, which ordered the arrest and prosecution of those involved, particularly the local magistrates who had signally failed to keep order. Despite a flurry of indignant pamphlets, nothing was done; the council did not pursue the matter further.

PLAGUE

From earliest times, epidemic disease has been associated with preternatural and supernatural forces and powers. Most Europeans, whose understanding of disease, famine, and war was largely drawn from the Bible, were convinced that epidemics were not purely natural phenomena. Disease was frequently seen as a tool God used to chastise wicked people. Certain biblical passages (but rarely the book of Job) facilitated this understanding of disease.

The plagues of Egypt included epidemic disasters God employed to force Pharaoh to free the children of Israel. However, these stories communicated more to medieval and early modern Christians than just God's power over his creation. The biblical account also stressed the ability of Pharaoh's "magicians" to perform acts that mirrored—though never defeated—the miracles Moses performed (Exod. 7:6–11:10). Because many of these miracles were connected with disease, commentators deduced that God was directly involved with large-scale epidemics. Similar conclusions could be drawn from the death of 24,000 Israelites from plague for their sexual immorality and idolatry in consorting with Moabites and worshipping Baal (Num. 25:1–9)—another direct connection between plague and God's wrath. Israel's enemies were beset with plague and were also struck by famine after capturing the Ark of the Covenant (1 Sam. 5:1–6:18). The obvious conclusion was that epidemics were associated with God's wrath and that disease could be averted by avoiding an evil that had aroused God's anger.

Christianity made the link between disease (and the ability to prevent or cure it) and religion even more explicit. Jesus and the Apostles proved their divine mandate by their miracles, most of which cured physical or psychological ailments (disease and possession). Moreover, introducing demons and an explicit Satan (absent in the Hebrew Bible) powerful enough to tempt Jesus in the wilderness added a new and menacing dimension to beliefs about illness. The Christian Church continued these ideas through the cults of martyrs and saints, placing great emphasis on their power over disease and even death. Also, saints' lives often revolved around conflict with Satan or his demonic minions. Evil personified was closely connected with illness.

The historical record also persuaded Christians that humans played an active part in propagating epidemic disease. Although Thucydides believed that the great plague that struck Athens during the Peloponnesian War (431–404 B.C.E.) was natural, he noted that others attributed it to evil forces, especially intervention by Athenian enemies. During the great pandemic that ravaged the Byzantine Empire, Emperor Justinian (ca. 482–565) clearly believed that the plague resulted from tolerating heresy and sexual immorality, especially homosexuality. More importantly for western Christians, during this pandemic, Rome was saved through a procession led by Pope Gregory I (540–604). The appearance of the Archangel Michael (still commemorated on top of Hadrian's Tomb) halted the advance of the disease and confirmed the power of prayer and procession in controlling plague.

PLAGUE AND SCAPEGOATS

Into this environment of disease, the demonic, and religion, the Black Death erupted from 1347 to 1351. During numerous subsequent outbreaks, various reactions emerged that affected future responses to plague. From France to Switzerland and Germany, Christians persecuted Jews as plague spreaders. This intensification of earlier anti-Semitism included accusing Jews of poisoning wells to cause plague. The pope and most of the ecclesiastical hierarchy categorically condemned such charges as irreligious nonsense. But the methodology and rationale behind the accusation are fascinating: Jews were accused of conspiring with lepers (ritually impure outcasts), the infidel rulers of Islamic Spain, and, most important, with Satan himself—that is, with internal and external enemies as well as the Great Enemy. These coconspirators provided the poisons used by the Jews. Thus, from the very first outbreaks of plague in the late 1340s, Christians were convinced that its "causes" lay within, including such "enemies" as Jews, Muslims, lepers, unbelievers (heretics), and such immoral people as prostitutes or homosexuals.

This persecution became a fixed pattern. Avoiding an impending outbreak or ending one required identifying

and eradicating those responsible for provoking God's wrath. Then the survivors relied on penance, prayers, processions, and fasts to appease God. In other words, confronting a basically untreatable epidemic disease, western Europeans attempted to identify those who had "caused" it and thereby limit or eliminate it by sacrificing them. Moreover, plague remained enduringly connected to evil (the demonic).

PLAGUE-SPREADING CONSPIRACIES

Two later plague outbreaks revealed the capacity of Europeans to differentiate between evil people and demonic pacts. From about 1530 to about 1640, a region centered on Geneva, stretching from Lyons to Milan and from Neuchâtel to Turin, experienced frequent accusations that individuals had conspired to spread plague. Interestingly, the governments involved consistently refused to consider the conspirators "demonic." Many features of these conspiracies suggested witchcraft. For example, the conspirators used greases and powders to spread the plague. They took an oath saying, "if I reveal any details, may my soul be given to Satan." And most of them were poor, marginalized women.

Nevertheless, other features encouraged a purely natural understanding of these conspiracies. Barber-surgeons, who mixed the greases and powders or gave instructions for preparing them, led the conspirators. The conspiracies never involved orgiastic rituals and never met Satan. Their goal was to allow plague workers greater opportunity to loot the homes of wealthy people. Thus, even though the conspirators' behavior somewhat resembled a demonic pact, the magistrates consistently saw a purely natural conspiracy based on simple greed.

Only twice did Catholic clerics attempt to interpret plague-spreading behavior as demonic witchcraft, and Catholic officials took neither seriously. In Lyons, a Catholic writer alleged that the plague spreaders were Protestants allied with Satan, but the royal governor and magistracy ignored his charge. In Milan, during the 1630 outbreak made famous by Alessandro Manzoni, some clerical chroniclers implied a demonic connection behind the conspiracy. However, they merely suggested that plague spreading was "diabolical" (evil), not witchcraft involving a demonic pact. Plague-spreading conspiracies remind us that the early modern world was not determined to find supernatural causes for every natural event—even a plague outbreak. Although everyone involved in plague-spreading conspiracies believed that the presence and progress of plague was providential and almost certainly a sign of God's displeasure, no immediate or necessary links were made to demons and witches.

Explicit charges of spreading plague are largely absent from witchcraft accusations, although witches

were routinely accused of causing disease and ill health in both animals and people. Even when Geneva simultaneously experienced plague, a plague-spreading conspiracy, and a witch hunt in the 1570s, the link was rarely made explicit, if at all. One possible explanation is that plague was seen first and foremost as a direct expression of divine judgment and chastisement rather than an evil that God simply allowed. Protestant theology precluded ascribing that much power to Satan, let alone his earthly minions (witches). History and Scripture suggested that life's greatest disasters—massive earthquakes, large-scale famines, devastating floods, horrendous epidemics—were acts of divine providence; Satan might be the prince of this world, but there were limits to his power. Thus, even if an occasional connection was made between individual witches and a specific plague outbreak, it never created a witch hunt. It was simply considered an extreme example of *maleficium* (harmful magic), less important than the judges' emphasis on the stereotypical aspects of demonic pacts and Sabbats.

PLANTSCH, MARTIN (CA. 1460–1533/1535)

Considered one of the most prominent representatives of a moderate understanding of witchcraft during the transition to early modern times, Plantsch studied theology at Tübingen under Gabriel Biel (ca. 1410–1495), who is generally considered the most significant late

scholastic representative of the *via moderna* (modern way). A strict nominalist (nominalism postulates the freedom of the divine will as the highest principle), Plantsch became university principal at Tübingen in 1490 and lectured as doctor of theology after 1494.

Prompted by a witchcraft trial in Tübingen in 1505, Plantsch undertook a thorough theological investigation of the subject of witchcraft, producing a series of sermons that were printed in 1507 as an *Opusculum de Sagis Maleficis* (A Brief Work on Evil Witches). This extensive piece of work, the style of which was more academic-scholastic than rhetorical, considered all the prevalent contemporary aspects of the doctrine of witchcraft. Like the lawyer Ulrich Molitor, who had some impact shortly before, Plantsch upheld certain aspects of the belief in witches, such as their ability to work *maleficia* (harmful magic) and influence the weather, but rejected the notion of witches actually flying and the resulting consequences. Thus, Plantsch must be ranked among the initiators of the *Canon Episcopi* (ca. 906) tradition, which was particularly widespread in southwestern Germany. Further aspects of his nominalist viewpoint included his claim that God's permission was necessary for any actions by witches and his admonition to victims of witchcraft not to use any countermagic. However, Plantsch's scholastic background was evident in the fact that he adopted such aspects of medieval demonology as incubi and succubi.

To what extent Plantsch was actually involved in propagating these ideas is difficult to evaluate, but his reputation as principal and theology professor at Tübingen University and as a gifted preacher undoubtedly gave him a certain level of influence. Furthermore, Plantsch was in contact with such well-known figures in both theology and the arts as Johannes Reuchlin; another humanist, Heinrich Bebel, wrote a short poem for the preface to Plantsch's *Opusculum*. Because of his close relationship with Reuchlin, Philip Melancthon may have acquired his comparatively moderate attitude toward witchcraft during his studies at Tübingen. In the late medieval dispute on the "new" understanding of witchcraft, Plantsch presented his views as the "Catholic truth." Like the *Malleus Maleficarum* (The Hammer of Witches, 1486), but with more formal authority and correctness, the Tübingen professor of theology declared his attitude toward the issue of witchcraft to be correct doctrine—a view, however, at odds with the *communis opinio* (common opinion).

**PLEIER (PLEYER, BLEIER),
CORNELIUS (1595–16??)**

Pleier was a physician who published the *Malleus judicum* (The Hammer of Judges), an anonymous pamphlet opposing witchcraft trials, in 1628.

The son of a Lutheran cleric in Coburg, Pleier received his doctorate at Basel in 1620; he was named municipal physician of Coburg in 1622 and professor at the local *Gymnasium Casimirianum* in 1623. In 1624, he became municipal physician at Kitzingen am Main but lost his position in 1629 during the bishop of Würzburg's recatholicization. Pleier later converted to Catholicism. His exact date of death is unknown.

Pleier was responsible for two medical publications. The anonymous pamphlet, allegedly written by a "Catholic Christian," entitled *Malleus judicum, Das ist: Gesetzhammer der unbarmherzigen Hexenrichter, Aus dem besten Ertz Göttlicher, Natürlicher und Weltlicher Rechten* (Hammer of Judges, in Other Words, a Legal Hammer Against Pitiless Witchcraft Judges, Taken from the Best Divine, Natural, and Human Laws) appeared between 1626 and 1629. The copy in the state library of Bamberg contains a handwritten remark naming Pleier as the author. Pleier based his work on Johann Weyer's *De praestigiis daemonum* (On the Tricks of Devils, 1563) and frequently cited Hermann Witekind's (pseud. Augustin Lercheimer) *Christlich bedencken und erinnerung von Zauberey* (Christian Thoughts and Memories about Sorcery, 1585) and Anton Prätorius's *Von Zauberey und Zauberern Gründlicher Bericht* (A Thorough Account of Magic and Magicians, 1598). In polemical form, Pleier criticized judges, torture, and cruel prisons and demanded "Christian reforms" instead of executions from the authorities. The well-known witchcraft commissioner Heinrich von Schultheis voiced his objections to the *Malleus judicum* in 1634, which entered the collection of Johann Reiche in 1703.

POISON

Poisons have been strongly associated with witchcraft and sorcery throughout the world since antiquity, because they manifest a desire to cause harm; involve secret, often ritual, preparations; and work through a hidden, or occult, process. Even though the defining feature of magic and witchcraft is spiritual or supernatural agency, they actually make extensive use of physical substances. They may be incorporated into secret rituals performed at a distance, but they may also be used to "carry" a spell by being brought to or concealed near the target or by being introduced directly into the victim's body. Such substances may contain intrinsically toxic chemicals or psychoactive agents that are not inherently toxic but open the victim to suggestion; they may even be chemically inert, deriving their power purely from the sorcerer's confidence in and the victim's fear of their magical properties. The inherent uncertainty of allegations of poisoning along with the important role of psychological factors in many cases have led some social scientists to treat fear of poisoning as more significant than the use of poisons. There is no question that such fear is an important phenomenon in its own right, but strong evidence from both anthropology and history suggests that this fear is rooted in the fact that poisons have been used as a real and potent form of interpersonal attack in a wide variety of social settings.

Anthropologists have found varying degrees of association between sorcery and poison in Australia, Oceania, Africa, and the Americas. In some cases, sorcerers use chemically active agents in connection with magic rituals while attributing the poison's power at least as much to the magic as to the substance's intrinsic properties. In other cases, poisons are understood to work without magic, and sorcerers may use them separately, or even as a backup if their regular spells do not seem to be working. In the West, the connection between magic and poisoning goes back to antiquity. There is a linguistic link between poison and magic in both the Greek word *pharmakon* and the Latin *veneficium* (poisoning), and the association was made by the second-century *Epistle of Barnabas*, St. Augustine, Isidore of Seville, and the Venerable Bede. During the

High Middle Ages, magicians flourished at courts, with their intense rivalries and intrigues, and some practitioners provided poisons along with more esoteric services. Similar practitioners operated at the popular level as well, and there is considerable evidence that both specialized sorcerers and ordinary people continued to employ poisons in the early modern period. Allegations of poisoning were among the most common accusations precipitating witchcraft trials, and in German courts the term *veneficium* came to be used routinely as a term for witchcraft.

The types of poisons used included both refined products like arsenic, rat poison, and lye, and locally occurring fauna such as ergot-infested wheat, toxic mushrooms, and parts of various flowering plants. The efficacy of the former was basically a function of dosage, so anyone who could purchase them could use them. Employing the latter was more difficult because the plants had to be located and in some cases picked at a particular stage of growth, the potent parts had to be known, and they had to be prepared in a way that made them effective while not alerting the person consuming them. Poisons were most commonly introduced in food or drink served, lent, or bestowed as a gift, but they could also be secretly introduced into the victim's food stocks or, in Germany, beer cask, which was often kept open near the door. Another form of delivery of psychoactive agents was as a salve smeared on the victim's skin, which caused local numbness and general disorientation that could easily be interpreted into a variety of somatic complaints. The generally surreptitious nature of poison contributed to a strong element of suspicion in neighborly relations in early modern Europe, and it was not uncommon for people to routinely feed pieces of food received from neighbors to household animals before consuming the rest themselves.

The gradual substitution of *veneficium* for "witchcraft" in legal terminology not only reflected the important role of poisons in witchcraft beliefs but also contributed to the gradual decline of witchcraft prosecutions. First, it led to the separation of the physical crime, which even leading skeptics like Johann Weyer and Reginald Scot considered a felony, from the religious and spiritual offenses. Second, the continued prosecution of poisonings and the increased regulation of poisons reduced one of the most common fears that had contributed to witchcraft suspicions.

POLAND

Witchcraft prosecutions peaked in the Polish Crown lands between 1650 and 1750, about a century later than most of Europe, with the exception of Hungary or Russia. Estimates of the number of deaths attributable to the prosecutions have ranged from a few thousand to 30,000. The subject has received relatively little scholarly analysis, and serious research has been hampered by the loss of many court records during World War II. The Polish-Lithuanian Commonwealth of the early modern period included territory that now comprises much of Ukraine and Belarus, plus Lithuania and parts of Latvia. In the fourteenth and fifteenth centuries, witchcraft trials were held before clerical courts, where death sentences were not usually passed. From the sixteenth century, however, jurisdiction passed increasingly to secular courts, where the death sentence (burning at the stake) was common. Legal persecution ended in Poland only in 1776, with the repeal of the witchcraft statutes. However, illegal reprisals persisted into the nineteenth and even twentieth centuries. One of the most obvious explanations for the late peak in the number of trials is the crises and invasions that Poland experienced in the late seventeenth and early eighteenth centuries. The best extant records come from the area around Poznań, known as *Wielkopolska* (Greater Poland), and from Gdansk (Danzig), Cracow, Lublin, and Bydgoszcz.

GEOGRAPHY AND STATISTICS

The statistics quoted by the majority of historians of the European witchcraft prosecutions have been derived from Bogdan Baranowski's estimate of a total of 15,000 deaths, found in the French summary of his work *Procesy czarownic w Polsce w XVII i XVIII w.* (Witchcraft Trials in Poland in the Seventeenth and Eighteenth Centuries). Baranowski, using a figure of 1,250 Polish towns, supposed that each town court tried an average of four cases of witchcraft during the period and sentenced two people to death from each trial. He added 5,000 deaths to reflect the illegal murders of people suspected of witchcraft, making a total of 15,000 deaths

throughout the period (Baranowski 1952, 178). His calculations included only the territory known as the Crown lands of Poland, excluding both Silesia and the Grand Duchy of Lithuania. However, in an epilogue to the first Polish translation of Kurt Baschwitz's work *Czarownice: Dzieje procesów o czary* (Witches: A History of Witchcraft Trials), published in 1963, Baranowski revised his statistics down to a few thousand. Trials for sorcery or magical practices were also heard prior to the sixteenth century, but according to extant records, the peak of the persecution was between 1650 and 1750 (from work carried out on *Wielkopolska*). There appear to have been more trials in the western areas of Poland and fewer in areas to the east, where Orthodoxy replaced Catholicism as the predominant religion. This geographical and chronological diffusion may be merely a reflection of the extant records rather than an accurate account of the prosecutions.

The percentage of cases in which the death sentence (burning at the stake) was passed varied substantially geographically, from close to 100 percent in some towns of Greater Poland to under 50 percent in those privileged towns (e.g., Cracow and Lublin) where appellate systems were in place. However, in private towns (that is, owned by a noble, a king, or the Church), final jurisdiction was often in the hands of the manorial lord. Therefore, because charges were often instigated by him or at his instruction against his peasants, the sentences were frequently carried out on the morning following the trial. Those tried were almost exclusively peasants, because only their peers could try the nobility. Occasionally minor noblewomen appeared in trials, but that was rare.

In the nineteenth century, an attempt was made to centralize the archival collections, and many records were moved to Warsaw to the Archiwum Główne Akt Dawnych (AGAD; Central Archive of Old Records). Due to extensive bombing during World War II, up to 90 percent of these records were destroyed. Thus, where records have not survived, our information is necessarily based on the work of authors writing before 1939 who were familiar with the lost sources. Another collection of primary material comes from an unexpected source, which has barely begun to be used in Poland: during World War II, the *H-Sonderkommando* (Special Unit H [*Hexen* = witches]), under instructions from Heinrich Himmler, extended their collection of witchcraft trial records into the occupied territories. This collection, known as the *Himmlerkartoteka* (Himmler card index), is held in Poznań, with a copy in Berlin.

CHRONOLOGY OF THE TRIALS

The earliest literary mentions of individuals employing witchcraft in Poland appeared in the chronicles of Marcin Bielski and Jan Długosz. They tended to

describe individuals whose practices were more commonly regarded as sorcery or slanders against women. In many trials before fifteenth-century clerical courts, the accused was charged with causing impotence, divination, or illness. In other cases, men sought to dissolve marriages because their wives had reputations as witches. In Poland, as in the West, clerical courts almost never passed death sentences (although the first execution in Poland, in 1511, occurred in an ecclesiastical court, with the initial execution pronounced by a secular court in 1544); instead, the accused were required to apologize, swear not to repeat the crime, and pay a suitable fine. Banishment became more common in the sixteenth century, when the charges made against those accused of witchcraft became more elaborate. Rituals that had previously been encouraged even by the town authorities (for example, in Biecz, a well-known witch called *Mater Diabolica* [diabolical Mother] Zachariaszek had been hired as late as 1600 to find stolen goods) now became unacceptable. In the secular trials from the sixteenth century, especially those from Kalisz and Poznań, starting in 1544, charges were generally made against the so-called cunning folk. Confessions included descriptions of invocations of a pseudoreligious nature to the Virgin Mary and the saints and the use of herbs to restore ruined beer or to make cows produce more milk.

At the court of the Polish king Sigismund II Augustus (ruled 1548–1572), rumors of the deployment of witchcraft took on a political nature (as in Russia). They never reached any judicial court but instead served to ruin the reputations of those involved. The accusations were leveled first at the king's mother Bona Sforza, an Italian (a typical xenophobic tactic against foreigners). Foreigners were more often perceived to use magic in the context of warfare. A witch employed by Bona was arrested on the orders of King Sigismund, who was ready to try her and sentence her to death. She was taken to Brest, but the king

was also on his way there. His astrologer Proboszczewicz advised him that he would be in danger from fire in that city, so he moved the witch to Dubnik, where the sentence was carried out. In turn, the king's wife, Barbara Radziwiłłówna, was accused of employing love magic to seduce the king. Sigismund Augustus appears to have been particularly susceptible to these practices, because his later mistresses, Susanna Orłowska and Barbara Giżanka, were also thought to have been witches.

This sample of 251 trials involved 511 defendants, 96 percent of whom were female. The largest outbreaks came at Kalisz (1650–1680), Gniezno (1670–1690), and Grodzisk (1710–1720). There was a steady trickle of trials heard at Kleczew. The maximum number of deaths (24) occurred between 1707 and 1711. From this sample, only four places, including Poznań, heard more than twenty trials.

After the major disruptions of Poland's mid-seventeenth century "deluge," witch hunting gathered momentum during the late seventeenth and early eighteenth centuries. The reasons suggested include cultural backwardness, although in light of Poland's intellectual achievements in the Renaissance and highly developed relations with western Europe, this is a debatable viewpoint. A better reason employs the social-strain gauge theory of witchcraft: the wars and economic disasters that ravaged Poland left behind a new level of fear and suspicion, increased by severe competition for resources. In this heightened atmosphere, accusations of witchcraft were more likely to surface and be pursued vigorously.

ACCUSATIONS

By the late sixteenth century, Polish witchcraft trials began to contain mentions of the Devil. Eventually, suspicion of concrete harm or *maleficium* was no longer required for a charge to be brought; that of making a pact with the Devil sufficed. Accusations displayed many features common to western European witchcraft, such as love magic, causing harm to people or animals, and attendance at the Sabbat. Charges also included inflicting devils upon someone, which could be done through food or drink. A particularly Polish feature was that of *koltun*, or a condition of matted hair, known as *Plica Polonica*, which was also believed to be the result of bewitchment. Victims would not cut off their hair for fear of death or blindness. Court charges involving *koltun* persisted well beyond the repeal of the witchcraft acts in 1776.

In a collection of trials from Grodzisk, Greater Poland (1707–1737), and also at Kleczew, the accused admitted to stealing the Host and then beating it until it bled and the Christ Child appeared. The blood was then used in various spells. This echoed the bleeding

TABLE P-1 PRELIMINARY SURVEY OF TWENTY-FIVE TOWNS IN WIELKOPOLSKA

| Dates | Trials | Accused Women/Men |
|-----------|--------|-------------------|
| 1500–1575 | 6 | 6/0 |
| 1576–1600 | 8 | 10/0 |
| 1601–1625 | 15 | 18/3 |
| 1626–1650 | 14 | 25/1 |
| 1651–1675 | 36 | 81/1 |
| 1676–1700 | 78 | 188/5 |
| 1701–1725 | 47 | 75/5 |
| 1726–1750 | 38 | 62/5 |
| 1751–1775 | 6 | 16/0 |
| 1776–1800 | 3 | 9/1 |

Host accusations, usually leveled against Jews in Germany, Poland, and elsewhere in the medieval period. Coincidentally, the peak in the number of witchcraft trials coincided with an increase in accusations of the blood libel (the baseless charge that Jews used Christian blood for religious purposes) in Poland. Usually powders of varying colors were used to harm people, animals, or crops, but sometimes manure and other elements were said to have been buried under the intended victim's threshold.

The witches' gathering, or Sabbat, took place on *Łysa Góra* (Bald Mountain). However, like Sweden's Blåkulla, this did not refer exclusively to the mountain bearing that name in the *Góry Świętokrzyskie* (Holy Cross Mountains). In the trial records, it indicated any local area that was a supposed meeting place. Feasts of abhorrent food were served, weddings were celebrated between witches and devils, and the witches usually were reported to have had sex with their devils. In contrast to popular belief, Polish trial records rarely mentioned diabolic ceremonies, orgiastic behavior, or boiling babies for their fat. Moreover, the traditional concept of the Devil's pact was replaced by sexual consummation between an individual devil and a witch. These devils were often named and described as brightly clothed. The Devil's mark is rarely found in trial accounts, but there are descriptions of the Devil biting the accused in a particular finger. Silence during torture was ascribed to the presence of the Devil, who purportedly prevented the accused from confessing.

THE CRIME OF WITCHCRAFT

Witchcraft was prohibited and punished in several statutes, the first of which appears to come from the Synod of Buda in 1279. A provincial law was passed that forbade anyone other than a bishop to give penance to a practitioner of witchcraft. In the fifteenth and sixteenth centuries, episcopal courts heard most of the cases. Jurisdiction was removed ostensibly from the secular courts and placed under the clerical authorities under the Cracow Constitution of 1543; subsequent royal decrees from 1672 and 1713 confirmed this. Nonetheless, municipal secular courts held most Polish witchcraft trials because they involved material harm. Village courts were ordered to refer such cases up to municipal courts, and indeed the statute of 1745 forbade village judges from trying such cases on pain of death. Many town courts in Poland used Magdeburg Law, which was often quoted in cases, along with some modern legal authorities, including the Flemish jurist Joos de Damhouder and the Saxon jurist Benedict Carpzov (II). Polish courts also had the custom of referring to the breaking of the biblical commandments, especially Exod. 22:18 (22:17; in the King James Version, "Thou shalt not suffer a witch to live").

There was a similar pattern to the case procedure. Another individual usually brought charges against the accused. The accused witch was questioned and then tortured. After torture, her confession was confirmed, and often the torture was repeated. The use of torture was apparent in virtually every case from *Wielkopolska*, even those involving children. It took such forms as burning the accused with straw, racking, and burning candles under the arms or against the lips. It was supposed to be employed only three times, but there were many exceptions to this rule. Those who died in the course of torture were often declared to be witches, buried under the gallows, and denied burial in consecrated ground.

A controversial case, said to have taken place at Doruchów in 1775, has been the subject of much speculation (Tazbir 1966). An eyewitness account that appeared in 1835 described the case. The author gave a full description of the trial, torture, and execution of fourteen women. No trial record is extant, although there is a reference to the trial of six women in the same area in 1783. It was said that disgust at the Doruchów case hastened the end of the legal persecution. In the *Sejm* (Parliament) of 1776, torture and the trying of witches were forbidden by statute, at the representation of the castellan of Biecz, Wojciech Kluszewski.

However, there was another controversial claim involving an even later case, from 1793, sometimes mentioned as the last case in Europe. Its inclusion in Georg Wilhelm Soldan's work has ensured exposure. It was said in 1801 that when a Prussian commission arrived at a certain town in Poland in 1793, it saw the remains of stakes and was told by the town magistrate that two witches had been burned there. The account has been contested by Polish historians, who have dismissed it as German propaganda because the vague terminology used in describing the event provokes doubt about its authenticity. However, there were accounts of slander cases and even lynchings involving witchcraft long after that date, including the famous case of Krystyna Ceynowa of Chaupy, who was drowned in 1836 after several duckings (the swimming test). Other women were still occasionally ducked in ponds or rivers in the nineteenth century.

POLISH DEMONOLOGY

Descriptions of demonology, witchcraft, and magical remedies appeared in a variety of Polish printed sources, from early treatises to the calendars and encyclopedias of the late eighteenth century. The most important work was the first translation into any European vernacular of *Malleus Maleficarum*, under the title *Młot na czarownice* (The Hammer of Witches) by Stanisław Zambkowicz, secretary to the castellan of Cracow, in 1614. The author translated only the second part and provided a short introduction. He dedicated the book to Prince Ostrogski and published it in Cracow. The

printing house of Wojciech Regulus in Poznań published several works that were influential in the witchcraft debate. Among those was an anonymous work, which was an adaptation of, or heavily influenced by, the work of Friedrich Spee, titled *Czarownica powołana* (A Witch Denounced) in 1639. It was the most famous among several works attacking abuses perpetrated by the judiciary in witchcraft trials. Daniel Wisner, Serafin Gamalski, Bishop Józef Andrzej Załuski, and Bishop Kazimierz Florian Czaratoryski also attacked the judiciary. Of particular note are the works by Jan Bohomolec and Benedykt Chmielowski.

POLTERGEIST

A spirit or ghost that makes itself known by loud noises or movements is known as a poltergeist.

In some witchcraft trials one could observe a poltergeist pattern: inexplicable sounds are heard, inanimate objects move of their own accord, and people are lifted into the air in inexplicable ways. A well-known example is the case against the drummer of Tedworth, who was held responsible for the strange phenomena in the home of John Mompesson, a magistrate of Tedworth, Wiltshire. The phenomena continued from March 1662 to April 1663, and began after Mompesson, in connection with a forgery trial, had confiscated the drum of a vagrant confidence trickster, William Drury. The magistrate kept the drum in his own home after releasing Drury. The situation became even more annoying when the strange phenomena continued in Mompesson’s home after the drum had been destroyed, particularly affecting his ten-year-old daughter. In the meantime, the confidence trickster had been sentenced in Gloucester to transportation to Virginia for stealing pigs, but he escaped by jumping overboard from the convict ship. At the beginning of 1663 he reappeared with his trickery and a new drum a few miles from Tedworth. Mompesson had him arrested and charged with practicing witchcraft; although several of the local gentry testified against him, Drury had to be acquitted for lack of evidence. The celebrity of the case was due first and foremost to the Reverend Joseph Glanvill, chaplain to Charles II and a Fellow of the Royal Society, who went to Tedworth to investigate the matter and later described it in his *Sadducismus Triumphatus* (*Sadducism Conquered*, 1681), which gave the author a reputation as a father of modern psychical research.

An unspecified number of similar cases can be found among European witchcraft trials. From Denmark we have the famous case of the haunted house in Køge (*Køge Huskors*), where a rich merchant’s house in this Zealand city was haunted by what we would call poltergeist manifestations. They did not cease until 1613, after seven local witches had been burned. During their trial they confessed that they had conjured the Devil up from a well and sent him into the merchant’s house in the form of a rat. Many years later his widow wrote an account of the events, which was later published by the

minister Johan Brunsmand in 1674 and translated into both Latin (1693) and German (1696).

The last Danish witchcraft trial, which took place in 1708 at the district court of the estate of Schelenborg on Funen island, also involved poltergeists; fourteen-year-old Anna Lauridsdatter was finally sentenced to the workhouse for life, and an adult woman, Karen Madsdatter, whom she had named as her mentor, was condemned to the stake. On the farm where Anna was a servant, heavy flour bags, kneading troughs, and many other objects were observed flying around without anyone being able to see who was moving them. At the Funen County Court, though, the judges partly overturned the local court's verdict. The adult woman was acquitted but was sentenced to make a public apology for the scandal she had caused with her false confession. The lower court's conviction of the young girl, however, who would not retract her statement, was upheld. She insisted that she had renounced Christianity and that the Devil, in the shape of a dog or a cat, had carried out her sorceries at the farm after she had invoked him. The enlightened high court judges tried in vain to get Anna Lauridsdatter to admit that she had performed these acts herself, but although she had been caught in the act several times, she denied it vehemently.

The descriptions of poltergeist phenomena in these trials were fairly constant. What changed were the explanations. During the witch persecutions, they were explained as witchcraft and the work of the Devil. During the Enlightenment, authorities tried to expose the phenomena as fraud or lies—as something that had not taken place in reality. Today they are sometimes explained by a parapsychological theory that claims that such phenomena always happen in connection with young women on the threshold of their teenage years, which are apparently related to certain psychical forces that are released in that connection.

POMPONAZZI, PIETRO (1462–1525)

Born in Mantua, this Aristotelian philosopher of the Renaissance studied at the University of Padua, where he earned his degree in 1487 and taught natural philosophy from 1488 until 1509 before moving to Ferrara and then to Bologna in 1511, where he died in 1525. Often (although incorrectly) denounced as an "atheist" who denied the immortality of the soul, he was also extremely skeptical about the supernatural phenomena that underpinned witchcraft theory in his age.

Pomponazzi owed much to Aristotle, as his numerous works show. At Bologna, he wrote his most famous (or notorious) work, *De immortalitate animae* (On the Immortality of the Soul, 1516). Here the original elements in Pomponazzi's position were derived from Aristotelian philosophy. He affirmed that no philosophical arguments derived from reason could demonstrate the hypothesis of the soul's immortality. Many works were written to refute Pomponazzi's conclusions. Although he never actually denied the immortality of the soul, his analysis led some of his followers to reject the dogma. Pomponazzi claimed to accept the authority of the Church in all matters of faith but refused to allow such considerations to influence his judgments in the realm of philosophy, whose autonomy he staunchly defended. He sought to reconcile his position with the dogmas of the Church by distinguishing between faith and knowledge, asserting that what is true in theology may not be true in philosophy. Some denounced him as a heretic.

With respect to witches and demons, Pomponazzi's main work is *De naturalium effectuum causis sive de incantationibus* (Of the Causes of Natural Effects, or of Incantations), written in 1520. Pomponazzi sought and found natural explanations for apparently wondrous events. He accepted the existence of angels and demons, but he argued the existence of natural causes to explain many apparently supernatural events. Pomponazzi was enough of a Christian to say that demons exist, but enough of an Aristotelian to deny that they can act on humans. By describing a natural world that had no need of demons, Pomponazzi influenced witchcraft skeptics such as Johann Weyer, Reginald Scot, and others. But, although he took a generally skeptical stance about the possibility of witchcraft, we should not exaggerate his radicalism; Pomponazzi accepted astrological influences and believed that words used in incantations or characters in talismans worked through some power of imagination (*vis imaginativa*) flowing from operator to patient.

Through such arguments, he revealed his desire to investigate nature in order to discover the real causes of odd events and to reject all ideas of occult causation. Any marvels or apparently strange events were, therefore, due to natural laws. Pomponazzi repeatedly

claimed that his theories relied on Aristotle in exactly the same way as he had done with the immortality of the soul, yet he declared his desire to subject all his arguments to the Church's approval (however, *de incantationibus* was printed at Protestant Basel in 1556 through the efforts of an exiled Italian scientist, Guglielmo Grataroli).

Likewise controversial was Pomponazzi's book, *De fato libero arbitrio, praedestinatione et providentia Dei* (Of Arbitrary and Free Will, Predestination, and the Providence of God), written at the very moment (1520) when Martin Luther was so dramatically challenging free will, but not published until 1567. It dealt with determinism and predestination, another of Christianity's important but insoluble dilemmas. Here Pomponazzi first affirmed determinism but later managed to combine and reconcile traditional and progressive features. Thus, human free will coexisted with God's foreknowledge without being incompatible or contradictory. He maintained that divine omniscience did not preclude free will. His attempts to save human freedom without rejecting St. Augustine were unconvincing but original. Among Pomponazzi's many critics who wrote treatises against Pomponazzi's theories, the outstanding ones were Gasparo Contarini and Agostino Nifo.

**PONZINIBIO, GIOVANNI
FRANCESCO/GIANFRANCESCO
(FIRST HALF OF THE
SIXTEENTH CENTURY)**

In his *Tractatus subtilis, et elegans, de lamijs, et excellentia utriusque iuris* (Subtle and Elegant Treatise on

Witches and the Excellence of Both Civil and Canon Law), written in 1519–1520, this somewhat skeptical lawyer from Piacenza denied the witches' flight to their nightly reunions because, he argued, demons no longer possessed powers after Jesus's death and so could not carry witches through the air. Although he dismissed Sabbats as nothing more than the fantasies and illusions of ignorant people from the lower social classes, he at the same time recognized that Sabbat-like gatherings must exist because the worship of the Devil formed the antithesis of the Christian religion and the sacraments. Ponzinibio was in no way a disbeliever in sorcery. He stated that men could be bewitched by incantations and *maleficia* (harmful magic) or by the evil eye. Thus he posited that it was untrue that witches carried the Sacrament to the Sabbat, offered it to the demon, and did the other things recorded in inquisitorial trials; and that it was not true that witches entered houses at night to suck children's blood, because a just God permitted no one to be injured unjustly and that everyone, even unborn children, had a guardian angel.

As a civil lawyer, Ponzinibio was profoundly angered by the injustices of inquisitorial procedure, whether applied to heretics or to sorcerers who had been defined by the theologians as heretical. So Ponzinibio attacked the whole system in his treatise: according to him, civil law had the same authority as canon law to discuss theological questions. He was very critical of the procedures used in witchcraft trials, urging judges to verify the authenticity of the accuser's testimony and the defendant's confessions, in addition to ignoring everything about the Sabbat and witches flying there.

By asserting the equality of Roman law with canon law even in theological matters and the consequent necessity of adding lay assessors to inquisitors, Ponzinibio aroused the wrath of inquisitors and theologians. Within a few years, the Dominican Bartolomeo della Spina criticized him vehemently in *Tractatus de pre-eminentia sacre Theologiae super alias omnes scientias* (Treatise on the Supremacy of Sacred Theology over All Other Sciences). For centuries, Spina pointed out, university faculties of theology had always ranked theology as the supreme science, by which such questions as witchcraft should be decided. In 1525, in three succeeding *Apologiae in Ponzinibium de lamijs* (Defense from Ponzinibio's On Witches), Spina refuted the lawyer's theories, relying on the Bible, the Church Fathers, and the *Malleus Maleficarum* (The Hammer of Witches, 1486). In his second *Apology*, Spina accused Ponzinibio of being a heretic, demanding that he renounce his theories and that inquisitors burn his treatise. Nevertheless, Ponzinibio's tract was reprinted (by Protestant heretics) at Frankfurt in 1592, together with Paolo Grillando's

Tractatus de haereticis et sortilegiis (Treatise on Heretics and Sorcerers).

POPULAR BELIEFS IN WITCHES

Some wicked women . . . believe and profess that, in the hours of night, they ride upon certain beasts with Diana, the goddess of pagans, and an innumerable multitude of women, and in the silence of the night traverse great space of earth, and obey her commands as of their lady, and are summoned to her service on certain nights. But if only they alone perished in their faithlessness, without drawing many other people with them into the destruction of infidelity, for an innumerable multitude . . . believe this to be truth. . . . (Kors and Peters 2001, 62)

With frustration, the *Canon Episcopi* (ca. 906) illustrated the existence of some deep-rooted and centuries-old popular beliefs about witches. Time and again, we must ask some essential questions about witches: Who were they? What did they look like? What were they supposed to do? Why did people believe in their powers? And, not least, did witches really exist?

DEFINITION

For most early modern people, a witch was someone who had performed some hostile act. But historians are wary of adopting restrictive definitions that could mislead them in understanding the surviving sources. An analysis of the language used in the trials can take us far because contemporaries often used a term like *witch* interchangeably with other *dramatis personae*. Specialized practitioners, similar to a sorcerer, a healer, or a soothsayer, acted in opposition to the witch. In this broader sense, *witch* could be extended to almost any operator within a complex ideology that was basically designed to explain unexpected misfortune. Therefore,

in this larger meaning, a witch could refer to any person with specific abilities for casting spells, magical healing, fortunetelling, or finding lost objects.

THE MALEFICENT WITCH

From a deep reading of witchcraft trials, two black-and-white opposed categories emerge: the just and the wicked, the forces of good who fight against the forces of evil. Theologians ruminated on the reciprocal necessity of these binary opposites. Tuscan villagers expressed such a vision of the world with the oft-repeated expression, "since I can distinguish the good from the evil." A witch, then, might be seen simply as the personification of a "primary factor" intrinsic to human nature: the evil. But throughout early modern Europe, the witch usually remained only a bit player, not a protagonist. In daily life within the village communities of old Europe, it was generally necessary to coexist with witches, even if sometimes it became unavoidable to destroy such evil people.

APPEARANCE, SEX, AND AGE

The nineteenth- and twentieth-century archetypal fairy-tale witches were old, female, and ugly. This picture resembled the sixteenth- and seventeenth-century stereotype shared by all social classes, although it tended to collapse during the largest witch hunts, whose victims included men, young women, and even child witches. Though this stereotype remained generally valid in ordinary situations, ugliness should be discounted from the identikit of a witch; behavior and personality were the determining criteria orienting people's judgment. No wonder that in order to distinguish witches from harmless neighbors, contemporaries often resorted to other devices, like looking for the Devil's mark or using the water ordeal (swimming test).

It remains emphatically true that, so far as we can determine, most witches were indeed females beyond childbearing age. As to age, 173 women in a sample of 304 witches from such diverse places as Geneva, Essex, Württemberg, the Department of the Nord in France, and Salem were older than fifty (Levack 1995, 142). But such statistics must be squared with the important fact that a good number of people tried as witches had been suspected for many years, even decades. As to gender, an identikit should not ignore the fact that in many countries (including Germany, the heartland of witch hunting), men amounted to over 20 percent of accused witches or that in some places they might even have been a majority.

THE MAKING OF A WITCH

The witch was a social construction, and his or her identity was the outcome of complex relations with his or her social environment. Because historians, inquiring about the origin of a witch's evil reputation, usually

face severe deficiencies in their source materials about the witch's early life, general explanations can easily become overly schematic. It has been suggested that "once we start aggregating, the variables multiply so fast that chaos theory, with its pattern of unpredictability, is the scientific model which best fits the case" (Briggs 1996, 53). What can be said about the kinds of people who were most vulnerable to accusations of witchcraft? Meticulous research suggests that most witches cannot be described as "outsiders," migrants (such as shepherds), forest dwellers, peddlers, or wandering beggars. Instead, the great majority of suspects were long-term neighbors of their accusers, inserted within the dynamics of a village community. The popular belief that the power of a witch was handed down by blood from parents to child within certain families did not contradict the assertion that witchcraft was an art that had to be learned.

PERFORMANCES

In a way, witches were performers, and witchcraft was a performance art. Maleficent witches possessed the power to commit a great variety of social crimes; we badly need a comparative profile of these *maleficia*. Future research must sort out and analyze basic uniformities in order to describe and, if possible, explain the huge range of local peculiarities. It appears a thorny task to distinguish power on an individual basis (England, Tuscany, Hungary, Scotland) from power on a collective basis (mostly Germany and northern Europe). Witches mostly performed their misdeeds against neighbors through the intrinsic powers of their speech, touch, or gaze. The words spoken by witches—which in most instances were religious in origin—were perceived as powerful but did not require any special knowledge or information. Most attacks of witchcraft can be summed up as a set of words (often curses) spoken in a crisis by someone with a dubious reputation. In sixteenth-century Lorraine, Jean Regnauldin had earned the enmity of a suspect woman by testifying against her on a previous occasion, so she uttered threats against him, wishing that he might have the bar of a door across his stomach. That night "something like a person climbed on his bed and grasped him by the throat with such force and violence that he thought he was about to be strangled" (Briggs 2002b, 14). The nightmare of being attacked in one's own bed was a recurrent feature in witchcraft reports. During the Basque craze (1609–1614) or in Sweden (1668–1676), this phenomenon even took the dimension of a vast Sabbat-dream epidemic.

COEXISTING WITH WITCHES

Maleficent witches were pivotal constituents of an ideology that functioned in a symbiosis with other performers, such as the white witches or "cunning folk"

(randomly female or male) who were consulted as counterwitches, healers, and diviners. Willem de Blécourt, adapting the chessboard metaphor from anthropologists, maintained that within the web of relations that regulated communal conflict, if any one piece was separated from the others, its meaning became incomprehensible. Some magical specialists performing within the spectacle of witchcraft were also called witches, through a process of lexical assimilation shared by the Roman Inquisition and Protestant authorities. Antiwitch procedures were extremely widespread but basically uniform throughout Europe, and they mainly targeted divinatory and curative magic. The counterwitch, as well as the witch, was believed to possess special powers rather than knowledge. Their power was strengthened by a secrecy that their customers were careful to respect, lest something go wrong with the counterspell. Because the objects and words (most often specific prayers) considered to have special power were practically limitless, customers did not ponder much about the meaning of these magical techniques, provided they were effective—and the ubiquity of countermagic throughout Europe should convince historians that such methods frequently worked.

White magic certainly remains a demanding topic for researchers. The power of the healer was two-edged and therefore a source of both hope and fear. Although a white witch might occasionally have been accused of casting spells, this "symbiotic" coexistence between the harmless witch and the malefic one hid many pitfalls. Historians must be wary of being sidetracked by the popular contention that those who know how to heal also know how to harm, an idea consequently implying that a white witch who failed to perform a remedy might eventually be suspected of witchcraft. Unfortunately, many witchcraft trial depositions cannot tell us how often accused witches had been active healers in their villages or were merely evildoers compelled to lift spells that they themselves had cast.

Moreover, the strong antimagic healing campaign by both secular and ecclesiastical hierarchies in the late sixteenth century may have caused an anomalous drift in the system. This blurring in the sources could probably be reduced by carrying out a closer scrutiny of the reputation enjoyed by the witch doctor within the community in normal times, uncorrupted by the distorting mirror of witchcraft trials. In truth, cunning men might have been consulted with trepidation, but were they really accused by their neighbors of using their power maliciously? In the villages of late-sixteenth-century Siena, for instance, several female healers generally considered by their neighbors as godly persons (*spirituale*) were denounced to the inquisitors for magical healing because their customers were refused absolution by their confessors for not doing so. But such healers were never suspected of committing the sort of deeds

attributed to a neighborhood maleficent witch (*strega*). And no such ambiguity ever affected the behavior of Tuscany's most powerful cunning folk and soothsayers, all males, who had a regional reputation and were never accused of harmful witchcraft.

DESTROYING WITCHES

In most regions of early-seventeenth-century Europe, "it was not a meaningless coincidence when a small child, who had previously been healthy, fell ill and died, nor an inexplicable misfortune when a pig began to sicken" (Henningsen 1980, 30). Such things were sometimes attributed to an evil acquaintance. But if all steps for controlling the witch through ordinary ritualized procedures failed, the quality of the human village relationships acquired a dramatic Mozart-like *re-majore* tonality, as people resolved to charge the witch formally and demand retribution for the harm they had suffered.

ACCUSATIONS FROM BELOW

It is now generally acknowledged that the impulse to prosecute maleficent witches usually came from ordinary people. But why were some misfortunes, such as the sudden death of a baby, explained in personal terms by blaming a neighbor as the perpetrator, and others not? The etiology of witchcraft led the victim to locate the misfortune in the web of social relations and to personalize the responsibility. Therefore, it is hardly surprising that the motif of retaliation permeated so many witchcraft trials so deeply, appearing as a corollary of personalistic thought. Witchcraft accusations should be seen in relation with this particular misfortune syndrome. The patients of the Oxford physician Richard Napier rarely accepted chance as a cause of their misfortune. Would they have accepted the concept of divine providence proposed by British clerics then, or even a century later? Much like in the time of the *Canon Episcopi*, "there is little evidence that popular beliefs changed in response to religious instructions, either before or after decriminalisation, and there is much to suggest that they continued in their earlier form. Indeed, the frequency with which local communities took illegal counter-actions against suspected witches suggests strongly that popular witch beliefs persisted for many generations after the trials had stopped" (Levack 1999, 46). Still, historical research struggles discontentedly with a lack of consensus about whether or not the impulse to prosecute witches also stopped from below.

DEVIL WORSHIPPING AND "ALLIED BELIEFS"

Researchers are today in agreement that throughout Europe, on the Continent as well as in the British Isles, popular classes thought in terms of *maleficium* (harmful magic): for them, a witch was someone with the super-

natural ability to harm others. On the whole, demonic elements remained marginal at the popular level. Most essential ingredients in the formation of witch beliefs, for example, the English belief that witches kept "familiar" in their houses who sucked their blood or the Basque belief that such spirits were usually toads, came from pagan religion and folklore. Although the role of imps in continental Europe badly needs research, the casebooks of the Oxford physician Richard Napier point to a widespread notion of imps and spirits, described as being like mice, cats, dogs, bees, toads, and so on. Were such ideas part of pre-Christian lore, like weather spirits or forest gods? Napier's patients often appear convinced that they embodied both a good spirit and an evil spirit. Fairies as well could be either wicked or mischievous people. No doubt, villagers inhabited a mental world where religious rituals coexisted with other important areas of allied beliefs, including the presence of witches, ghosts, and fairies. It was a world lacking homogeneity, even if there were probably interconnections of strands of beliefs (Larner 2000) that historians can reconstruct only with difficulty. Beliefs about fairies exemplify this ambivalence: they were liminal creatures, midway between good and evil, and had to be treated with caution. Occasionally, historians encounter archaic fantastic beliefs revolving around particular people, basically all performing some form of magical healing, like the *Krsniki* (Christians) in Slovenia, the *Benandanti* (do-gooders) in Friuli, the *Nachtscahr* (phantoms of the night) in the Bavarian Alps, the *donas de fuera* (women from outside) in Sicily, or the *táltos* (shamen) in Hungary. The extravagant popular perceptions (Behringer 1998) of these healers might be local variants of a Europe-wide belief in fairies. Such archaic survivals include tales of ecstatic experiences of flight in unconscious states.

This enormous variety of European convictions and magical practices (to which many others could be added, including such basic notions as cannibalism or metamorphoses into animals) certainly pose serious challenges to historical reconstruction. With current technology, future trends of research can compare thousands of witchcraft trials in order to facilitate a detailed morphological analysis of such archaic survivals, mapping their geographical and chronological variations—and possibly provide an explanation of their meaning for ordinary people. In the eight centuries between the *Canon Episcopi* and Voltaire, were these pre-Christian notions altered under the pressure of the conquering medieval and post-Reformation Christianity? We know that the specific concept of the witches' Sabbath was formed shortly before 1450 in a large Alpine area, where such notions were still thriving in the early modern period. It remains unclear how far this new demonological doctrine represented a willful "mistranslation" and appropriation of popular notions by literate

clerics and laypeople. But popular beliefs in malevolent spirits fitted extremely well with the Christian image of demons, and such customs as folk dances played a role in the construction of the Sabbat.

We know that during the heyday of witchcraft trials, some important confessions about the nocturnal rides, pacts with the Devil, the repudiation of Christianity, secret nocturnal meetings, desecration of the Eucharist and the crucifix, sexual orgies—even about sacrificial infanticide and cannibalism—were not made under torture or extreme psychological pressure. How should we interpret such unforced confessions? With hundreds of voluntary Basque confessions to explain, Gustav Henningsen maintained that during a witchcraft trial, an accused person not infrequently suffered a reversal of identity, accepted the negative personality pattern, combined his or her imagination with what he or she already knew about witches, and fabricated the confession expected of him or her.

DID WITCHES REALLY EXIST?

The horns of this dilemma concern the question of the self-awareness of being a maleficent witch, as well as the recurring theme of the existence of some sectarian organization practicing the complete inversion of Christianity. In the *Malleus Maleficarum* (The Hammer of Witches, 1486), the belief that witches formed a sect with its own rites of initiation and abjuration was expounded systematically. Despite the earnest insistence of some contemporary Wiccans, the evidence does not support the widespread contention that the witches of old Europe formed organized groups to perform rituals or for any other purpose. Apart from the fact that “witches” did exist as living healers, and apart from the fact that people “knew” who they were, did the maleficent village neighborhood witch live up to her role? Was she aware, did she internalize such an identity? Keith Thomas suggested that some of them used witchcraft to improve their condition when all else had failed; it is also possible that some Scottish suspects of witchcraft “accepted their own reputation and even found ego-enhancement in the description of a ‘rank witch’ and the power that this gave them in the community” (Larner 2000, 94).

POPULAR PERSECUTION

The term *popular witch persecutions* demands precision. Given the widespread belief in the malevolent character and power of witches in Latin Christianity, it seems almost trivial to conclude that persecutions, especially in times of crisis and disorder, were profoundly popular. Similarly, it is plain that governmental judicial action against witches relied on this popularity to produce evidence supporting specific accusations, apart from the rather unusual self-propelling persecutions, based primarily or exclusively on evidence produced by torture (as, for example, around 1627 at Bamberg and Würzburg in Franconia), in which the confession of alleged “accomplices” sufficed to nurture further trials.

But German witchcraft trials usually had a social basis and responded to popular demands. Due to their preoccupation with judicial procedures, older historical perspectives and especially traditional legal history disregarded such social contexts. But even witch hunts started by the authorities with so-called general inquisitions only *reacted* to rumor and unrest among their subjects, who already knew which suspects should be accused, condemned, and burned. With the overwhelming evidence produced by social historical research since the 1970s and the corresponding shift in perspective, one cannot seriously maintain the simplistic notion that witch hunting proceeded essentially from “above” (Horsley 1979). Regardless of their mode of introduction (whether by private accusation or official inquisition), witchcraft trials relied upon a broad variety of popular incentives. Leaving aside the role of propaganda (invariably from elite culture), persecutions always combined pressure from below and (re)action from above.

The question, then, is, what qualified a witch hunt as “popular” in terms of active participation and not only in terms of attitudes? What were the features of popular participation, apart from furnishing the authorities with accusations and evidence? How can we assess the relationship between subjects and authorities, once the latter gave way to the demands of the former, and, finally, what was the impact of such cooperation on the trials?

LEVELS, STRUCTURES, PATTERNS

Long before formal charges were presented, popular action against witches started with socially ritualized strategies of reconciliation or countermagic, which frequently involved a specialist. If such actions failed and formal appeal to the authorities was impossible, such forms of self-help as beating or even lynching could be practiced. Continuous protests over years, particularly public scolding, seem to have been frequently practiced.

When seeking aid from official justice instead of militant self-help, individuals approached a local court or a local official with specific charges or at least a general

demand for action against suspects. It was most desirable to make the authorities not only start inquiries but also transform the charges into *ex officio* accusations (magisterial approach). Private accusers could thus avoid the responsibility of paying for any financial and physical damage if the accused was found innocent. However, especially in territories of medium size, the authorities, though basically willing to support inquiries, preferred to keep such accusations private, with all financial risks remaining fully on the original accuser. Such considerations could deter accusers from pursuing further action until the community assumed full judicial and financial responsibility.

Partly because of such peculiar problems and partly because of the scope of action the population demanded, witch hunts often started only after subjects and communities had delivered formal addresses to the authorities. Thus, in 1598, the jurors of the county of Vaduz (modern Lichtenstein) demanded a public audience day to present their charges against specific persons. While getting official approval for persecutions, such meetings and petitions also arranged the terms to fit popular interests: complete competence to local officials without central supervision, extensive use of torture to speed up procedures and minimize the risk of liberating prisoners, and generous confiscation standards to avoid having communities pay the sizable costs of such operations.

In pursuing these ends, interested groups (e.g., parents of bewitched children in Swedish Mora, provincial estates in Vaduz or Jülich-Berg, and whole village communities in several parts of the Holy Roman Empire) confronted magistrates and rulers with their demands. To overcome governmental or magisterial resistance, proponents drew extensively on Christian discourse (e.g., references to Exod. 22:18 [22:17]), reminding authorities of their duties before God, threatening divine wrath, and painting terrible scenes of the consequences of the witches’ reign. Political pressure also played a role: subjects threatened to withdraw their oath of loyalty, and peasants threatened emigration (Scotland, the electorate of Trier) if the trials they demanded were not granted. More subtle strategies presented such demands on occasions of raising taxes or addressed princes by emphasizing the efforts in neighboring territories, thus exploiting political and confessional rivalry. If local officials supported princely objections against unrestricted persecutions, physical action reinforced verbal efforts: complaints about “hard pressing” from subjects often appeared in reports about such situations, although they also served to justify local officials in doing what they wanted anyway.

In several western regions of the Holy Roman Empire, including the southern Netherlands, popular promotion of witch hunts went as far as creating

communal committees. Formally and legally, they acted as a collective accuser, financially backed by the community, thus relieving individual accusers from the responsibility of paying the costs in case trials ended without condemnation. In practice, these committees did much more than present formal charges to courts or officials: their members collected evidence, hired notaries and lawyers, arranged for hearing witnesses, and even arrested and guarded the accused themselves. They exploited such functions to the point of continuing formal interrogations with their own methods, thus ensuring a high degree of success. Finally, the committees organized executions and accounted for all costs.

These committees represented the triumph of popular witch hunting. In certain regions of the electorate of Trier and in the nearby duchy of Luxembourg, they also produced numerous “unauthorized” trials, coming close to legalized lynching and social tyranny. But even when they were subjected to governmental control, the close alliance between village committees and local authorities guaranteed that the former had the final say: these committees of peasants, through continuous abuses of power and massive social support, determined who was to be accused. In rare cases, some victims obtained revenge (their justice), either by themselves denouncing their opponents as alleged accomplices or by their families demanding a similar fate for other members of the community through a simple but conclusive analogy.

This picture would be incomplete without considering the contribution made by instigators fueling popular fears about witches. Government ordinances trying to calm popular temper for reasons of political expediency were quick to denounce the “restless subjects” responsible for such disorder. But members of elite culture, like local priests (for example, in Cambrésis or Luxembourg) or preachers, sometimes assumed the role of instigators as well. In major western monarchies, which never tolerated such village committees, traveling witch finders made a temporary career of promoting and organizing real campaigns in villages and regions (Essex, Languedoc, Catalonia), drawing heavily on popular support. The Jesuit Friedrich Spee even reported entrepreneurial witch hunters in the electorate of Cologne who sent subordinates to villages stirring up peasant support for persecutions, so that their master’s “accidental” arrival there sufficed to start trials. Nevertheless, the role of such figures should not be exaggerated: English villagers had less need of Matthew Hopkins than he had of them.

The range and success of popular persecutions demonstrated how local conditions could override governmental policies. Hence, the crucial importance of local officials, notaries, and clerks, who protected committees against critical supervision from above. Town

magistrates and minor lords were important allies as well. Political reasons sometimes induced magistrates to start witch hunts to appease the population (for example, in Reutlingen and Lemgo), whereas minor lords realized that supporting popular demands for trials could help to defend or even extend their judicial rights against the territorial princes’ desire for governmental centralism. Not surprisingly, therefore, popular pressure was rarely directed against feudal lords. Such alliances between parts of the population and local authorities created a type of unauthorized and technically illegal trials (Votmer 2002; Kamen 1993).

Judicial localism did not interfere with inquisitorial procedure. On the contrary, the latter actually furthered social participation by using social evidence (e.g., testimonies about a suspect’s reputation) in witchcraft trials. However, when localities successfully avoided the requirements of imperial law and allowed local courts and village jurors to exercise their traditional rights and customs, popular input on the trials increased.

Judicial localism prevailed in most European states (for example, Poland), where we know of intense popular influence on persecutions. It therefore seems to have been an essential prerequisite to fulfill what at least part of the population wanted. However, we should not overlook the dissenting minorities, which for obvious reasons had to disguise themselves behind silence. Much scandal was required, often bloodshed, before governmental interest in local affairs encouraged those groups to express their opinions, thus revealing that “popular” persecutions were almost never unanimously popular.

PORTUGAL

Portugal was a country without "witch hunts." It experienced thousands of recorded witchcraft accusations, much surveillance by judicial authorities, and considerable repression, but there was no "witch hunting." Although various tribunals (secular, episcopal, and, after 1536, the Inquisition) prosecuted several thousand people, only around ten cases of capital punishment are known between the mid-sixteenth century and the end of the eighteenth century. Most sentences involved exile, confinement, fines, and shaming rituals (e.g., public exposure at church doors or wearing distinct clothing). In other words, repression was not harsh. Hence, in the early modern period, Portugal avoided the witch panics and fears that afflicted many other parts of Europe. Most Portuguese victims were healers and sorcerers who practiced love magic or divination, not women accused of going to Sabbats or bringing death or illness to their neighbors. On the other hand, judicial prosecution reached its peak here in the first half of the eighteenth century, at a moment when persecution had practically ended in the places where witch hunts had been most violent.

A number of factors combined to produce such an unusually mild degree of repression: first, the education received by Portuguese elites at Coimbra University, with its strongly neo-Scholastic Thomist basis; second, a united, prestigious, and powerful Portuguese Church, undisturbed by the Protestant Reformation; third, the Church's patient Christianization of rural Portugal throughout the early modern era; fourth, a well-established anti-Jewish tradition throughout Portuguese society, which concentrated the Inquisition's attention on combating crypto-Jewish converts; and, finally, the specificity of Portuguese judicial procedure, namely, the absence of any attempt to treat witchcraft as an "excepted" crime (*crimen exceptum*).

In Portugal, forms of superstition were treated as crimes *mixti fori* (of mixed courts). In other words, those who practiced such superstitions could be prosecuted by the crown courts, by ecclesiastical courts, and, from 1536, by the Inquisition. Crimes of heresy were reserved for the latter.

The earliest legislation for this type of crime was ecclesiastical. The Braga Synod of 1281 prohibited divination or any other "deeds of magic." In fact, episcopal surveillance was maintained throughout the fourteenth and fifteenth centuries, as can be seen in provisions of the Lisbon and Braga Synods of 1393 and 1439, respectively. Episcopal legislation increased after the beginning of the sixteenth century; diocesan constitutions introduced specific sections on how to deal with the problem of "superstitions," especially forbidding divination. Convicted magicians were excommunicated, as they had been in the Middle Ages. Nonetheless, during the sixteenth century, these constitutions referred only briefly to crimes of superstition. The use of holy objects in witchcraft, invocation of evil spirits, divination, and magical healing practices were forbidden, but the sentences proposed were lighter than in previous royal legislation. By the seventeenth century, the list of forbidden practices was extended and the degree of seriousness attributed to them increased. (The first constitutions regulating such practices came from the diocese of Guarda, printed in 1621.) Monetary fines, imprisonment, and exile were some of the means at the disposal of the ecclesiastical judges ruling on these cases.

Crown competence over illicit magical practices began with legislation in the reign of King João I; his royal edict of November 1385 forbade a series of practices, including pacts with the Devil, charms, and divination, all punishable by exile. Afterward, all the kingdom's law compilations included provisions on this matter. The *Ordenações Afonsinas* (issued by Afonso V in 1446) suggested capital punishment for those practicing witchcraft, with lesser sentences for divination and other forms of superstition. The *Ordenações Manuelinas* (issued by Manuel I in 1512) added more detailed descriptions of the condemned practices and classified punishable crimes into four levels. The first included the most serious crimes, such as using holy objects for purposes of illegal magic, invoking evil spirits, or performing love magic, all of which deserved capital punishment. The second encompassed divination, as well as possessing objects linked to the world of the dead and using them to harm others; such offenses were punishable by exile, branding on the face by hot irons, and monetary fines. The third group covered healing practices, and the fourth forbade healing or blessing animals without possessing a special license from the king or the bishops. Such minor cases were punishable by monetary fines and exile, depending on the accused

person's social condition. Manuel's code completed Portugal's secular legal framework for these crimes; the *Ordenações Filipinas*, issued in 1603 by Filipe II (Philip III of Spain), added nothing new.

The Inquisition's ordinances (*Regimentos*) defining the extent of its justice did not originally cover such matters. The first to do so were the ordinances of 1640, although there were some earlier letters from Portugal's inquisitor-general, Cardinal Henrique, which included provisions about divination. The 1640 ordinances forbade witchcraft, divination, and superstition whenever diabolical machination was presumed to exist. In case of a relapse, capital punishment was foreseen, always to be executed by royal courts. Less serious crimes were punishable by exile, prison, whippings, and defamation. In 1774 Portugal's last Inquisition ordinance was published, marking the end of state repression of magic and superstitious deeds by envisaging them as "idealistic and fantastical crimes" and declaring their perpetrators "impostors" who needed to be reeducated.

However, this legal framework tells us nothing about how royal or inquisitorial prosecutions were carried out in practical terms. Little is known about practices of royal justice, because all original documentation has been lost. We know that several kings (Duarte, Afonso V, João II, João III, and Sebastião) issued letters of pardon to witches prosecuted by royal courts. Other documents reported royal investigations of the practice of such crimes and told us of witches in crown prisons, but none bore specific information about such actions. However, one extremely violent episode of repression against witches was carried out by a royal court: in 1559, a trial ordered by the duke of Aveiro's judge sentenced six women to the stake in Lisbon. It was followed by an official inquiry in the Lisbon area, ordered by the Queen-Regent Catalina, which subsequently resulted in another execution. That was as close as Portugal ever came to a witch hunt.

The actions of Portugal's ecclesiastical courts are better known. Both bishops in their dioceses, mainly during their pastoral visits, and the Inquisition through the prosecution of the practitioners of such deeds left copious traces of their intervention (the Inquisition's first trials against sorcerers were held in 1541). As far as the number of prosecutions is concerned, bishops were apparently much more active: between the sixteenth and eighteenth centuries, several thousand individuals were prosecuted. In the diocese of Coimbra, our best-known example, around 2,000 cases were denounced during the bishop's visits between 1640 and 1770. Although it investigated many fewer cases, the Holy Office's treatment of these crimes was far more severe. Nonetheless, of the 912 cases brought before its three courts between 1540 and 1774 (370 at the Coimbra tribunal, 288 at Lisbon, and 254 at Évora), only four were "released to the secular arm," that is, sentenced to

death: a man at Évora in 1626, a woman at Coimbra in 1694, another man at Lisbon in 1735, and another woman at Évora in 1744.

The first half of the eighteenth century marked the summit of repression in Portugal, as the number of cases prosecuted both by episcopal justice and the Inquisition increased greatly, especially the persecution of healers. At this time, Christianization campaigns condemned practices and beliefs that were widely disseminated among the Portuguese; but they were carried out with much patience, seldom employing violent measures.

POSSESSION, DEMONIC

The western Christian tradition shares with many other religions a belief that evil spirits can inhabit the body, causing dramatic physical and behavioral changes. Possession is sometimes said to be caused by witchcraft or a curse; at other times, its agonies are seen as God's punishment of a person's own sin. Devils can also possess a person spontaneously, with God's permission. In early modern Europe, the diagnosis of possession occurred on its largest scale in Christian history. Alleged witches were executed for causing possession, and some demoniacs assumed the role of oracles, as their "demons" discoursed on religious controversies or foretold the future.

SYMPTOMS OF POSSESSION

Most theologians agree that possession is a condition of the body manipulated by demons, not of the soul. Symptoms of demonic possession in the New Testament have influenced understandings of the phenomenon throughout Christian history: they include loss of sight (Matt. 12:22), hearing (Mark 9:25), or speech (Mark 9:17, 25–29; Matt. 12:22); superhuman strength (Luke 8:29; Mark 5:3–4); mania or suicidal tendencies (Mark 9:17–22); and falling “as if dead” (Mark 9:26–27). Beyond biblical precedents, criteria for diagnoses of possession have derived from an accumulation of authorities: Francesco Guazzo’s *Compendium Maleficarum* (A Summary of Witches, 1608) listed around fifty possible signs of possession, including speaking in languages unknown to the sufferer, grotesque bodily distortions, and strange movements under the skin. For the female possessed, symptoms of the Devil’s presence have been seen in the light of assumptions about natural female capacities and limitations: uncanny strength, knowledge of theology or foreign languages, talking in a “manly” voice, blaspheming, or a fondness for drinking songs are all recorded as typical symptoms of diabolic activity in women. Revulsion in the face of Christian symbols or rituals has often been depicted as decisive evidence that demons, not a natural ailment, are the cause of the person’s condition. In the early modern period, naturalist explanations maintained that all signs of possession, however strange, could have physical causes such as melancholy or “the mother” (hysteria). Indeed, the Catholic Church traditionally advised clerics to consider medical explanations of apparent possession to prevent frivolous or fruitless exorcisms. Historically, almost all mysterious or spectacular conditions, especially those with a mental or behavioral aspect or those that follow an unpredictable course, have at some time been seen as signs of possession.

However, we cannot assume that everyone diagnosed as possessed really did present with those symptoms or traits that were recorded as decisive. Aside from the fact that many accredited symptoms of possession seem implausible to most modern readers, historical actors have often “seen” possession for quite specific, if unconscious, reasons. By the time we reach surviving accounts of diagnosed demoniacs, their condition has usually progressed from an amorphous collection of physiological and psychological disturbances to a neatly categorized set of responses to preselected criteria, designed to help clerics and physicians decide what to do with them and who should treat them.

Many of those diagnosed as possessed were probably suffering from something, if only a kind of delirium. A modern association of possession with different forms of mental illness, such as posttraumatic conditions, does not seem out of order; but for historical cases, it

raises complex and ultimately unsolvable questions about the limits of retrospective diagnosis. Suggestions that apparent possession might be caused by food poisoning do not stand up to critical scrutiny. In the last analysis, possession remains for Christians a spiritual affliction that can only be legitimated through clerical diagnosis and cannot therefore be reduced to the spiritual equivalent of some biologically identifiable disease. Rather, its epidemiology in any given era is related to the significance attached to its perceived causes and claimed cures.

REASONS AND CAUSES

Christian belief holds that, with God’s permission, possession can occur when a demon or demons enter the body of a person made vulnerable through her or his own sin; when demons are sent by outsiders, notably witches; or when demons attack human beings of their own accord to spread their malice. Whatever its precipitating cause, a diagnosis of possession is usually recorded for some exemplary purpose, as a medium of divine instruction. For example, possession fulfils the purpose of exposing the sin of witchcraft; it can be a torment sent to test the faithful or punish sin; or a successful exorcism can show the Devil’s fear of the Christian deity. All these causes share the notion that God “uses the powers of evil to promote His own wise and mysterious purposes” (“Demonic Possession,” *Catholic Encyclopedia*). In Christian history, therefore, possible public responses to possession, especially in the form of exorcism, have mattered almost as much as the reasons for its diagnosis.

Jesus’s exorcisms served publicly to prove his divinity, and gospel accounts do not dwell on the moral condition of the possessed. New Testament demoniacs were not generally represented as suffering for their or others’ sins: they were simply victims of “unclean spirits.” Nor were possessing demons yet assimilated with the image of the Devil as the Hebrew Bible’s adversary of God: they were still incursions from a morally ambiguous spirit world, which could only be influenced by spiritually gifted people. Through the mouths of biblical demoniacs, “devils” gave reluctant testimony of Jesus’s divinity (Matt. 8:29; Mark 1:24–25; Mark 5:7; Luke 4:34, 41; Luke 8:28). These examples and the story of the girl possessed of a “spirit of divination” (Acts 16:16–18), have underscored the historical notion that the possessed are granted special insight, including an understanding of holy mysteries. Because John 8:44 refers to the Devil as the “Father of Lies,” however, theological commentators have generally argued that, although devils may sometimes speak the truth, they will also “mix honey with poison,” adding evil fabrications to lead the faithful astray.

In antiquity, possession and exorcism contributed to the spread of Christian cults. Many early Christian

proselytizers undertook exorcisms to demonstrate the special claims of the new religion, and the behavior of some demoniacs was a litmus test for the authenticity of holy relics. The primary function of these “seismographs of sanctity” (Brown 1977, 13) was not to be healed by exorcists; rather, their “devils” might be almost permanent fixtures at new holy sites, there to proclaim wildly the invisible potency of an apparently mundane object, such as a saint’s bone or garment.

In the context of Christian martyrdom, possession offers the opportunity to display a martyr’s willingness to endure the Devil’s torture from within. Historical accounts sometimes parallel possession with the torments of St. Anthony or even Job, who were not possessed but whom demons tormented to test their faith. Possession in this sense overlaps with *obsession*, a term that usually meant torment by devils from the outside but that is also used interchangeably with (or even, in many Latin texts, instead of) *possession*.

By the later Middle Ages, possession was increasingly understood as something suffered either as punishment for one’s own sins or as the consequence of another’s sins. Early modern commentators listed as typical causes of possession such sins as infidelity, the use of magic, contempt for religion, and causing harm to others. Parents cursing children was also cited as a common cause. The fact that possession could be punishment for using magic, however, alerts us to the possibility that witches themselves might be seen as possessed, even though they were also believed capable of causing possession in innocent victims. The moral position of the possessed, whether victims or sinners, is rarely clear: their standing depends on the significance God assigns to their possession; so possession in Christianity has more than one potential meaning or function.

EARLY MODERN POSSESSION

The early modern era has been called the “golden age of the demoniac” (Monter 1976, 60). Although a vast “hinterland” of possession (Clark 1997, 390) apparently existed throughout the Middle Ages and beyond, what was distinctive about this period is the simultaneous proliferation of many different forms of possession, interpreted and exploited for a wide range of purposes. Possession occurred across Europe and in its colonies, among members of the Catholic, Lutheran, and Reformed churches. The rise in publicized possessions intersected with several social phenomena, including local campaigns against so-called superstition, fear of witchcraft and the occurrence of witch hunts, interconfessional conflict, heightened anxiety about the end of the world, a rise in public prophesying, and the pursuit of holiness through direct divine inspiration. In this era, all these phenomena—none of which was entirely new—were inflected by an intense fear of demons: in combination, they helped generate a virtual epidemic of possession.

Possession affected individual adults and children. It occurred among sexually mixed groups of all ages, as well as in female convents. Some individual demoniacs claimed attention through dramatic public exorcisms, making scandalous witchcraft accusations or prophesying. Catholics used exorcism most extensively; but widespread anxieties about the encroachments of the Devil in the world and the peerless example of Jesus’s own exorcisms meant that even those churches following strictly biblical precedents might legitimately employ exorcism as a form of proselytism. A conservative estimate, based on published sources alone, would suggest that several hundred cases of possession were diagnosed, involving hundreds of exorcists to remedy them, with many thousands of people witnessing major public exorcisms.

Although our knowledge of publicized cases tells us about the uses of possession for those who were not possessed—exorcists and their public—the experiences of the possessed themselves are of primary importance. It is hard to say why so many people in this era experienced what came to be seen as possession: even now, explanations of psychosomatic afflictions are rarely simple, and the geographical diversity and multiple forms of possession in this period make conclusive analysis especially difficult. At a time of such turbulent change, any number of circumstances could have induced real psychological discomfort, especially among socially marginal figures. In this regard, the story of Françoise Fontaine, whose first signs of possession appeared after royal soldiers raped her during the French religious wars, may stand for many. Publicized possessions also appear to have fed an unconscious awareness of the possibility of becoming possessed oneself. Critics of possessions leveled charges of “copycat” displays, and although the causes of outbreaks were doubtless more complex, knowledge of role models cannot be discounted as an influence.

WITCHCRAFT

From the late fourteenth century, campaigns against alleged superstition led to a growing “demonization” of popular healing methods, with several apparent implications for the history of possession. The clerical view that local healers might be guilty of witchcraft appears to have encouraged local people to seek help from priests. Villagers also appear to have become more inclined to see witchcraft and demons in otherwise inexplicable diseases, in many cases pointing to a diagnosis of possession. The notion that a witch had to be identified before bewitchment of any kind could be cured fed into this impulse. Priests influenced by demonology also appear to have been more interventionist in diagnosing possession. For example, in 1565, Nicole Obry’s family originally accepted her self-diagnosis that the spirit of her dead grandfather

possessed her and used such remedies as holy water and pilgrimages to help her. Only when a Dominican diagnosed the presence of a demon and proceeded to public exorcism did her story reach beyond her village. In the late sixteenth century, the wide dissemination of exorcism manuals among senior and junior clergy alike probably contributed to a wider diagnosis of possession at the local level.

Most people believed that devils could enter one's body and that witches could make this happen. Although some critics doubted that witches could send devils into other people, arguing that this attributed too much power to witches, Jean Bodin argued that it was possible, with God's permission. (Bodin 1580, fol. 76r and 160v). In cases of possession, witchcraft now became by far the most common diagnosed cause. Contemporary commentators noted the phenomenon: Father Gerard Grudius, describing the exorcisms he performed at Annonay in 1581, remarked "It is a great pity to see today that witches have such power, which is a bad sign" (quoted in Benedicti 1611, 70). Another exorcist at Loudun wrote in 1634: "In these unfortunate times we see that most possessions occur through malefice, God permitting that demons afflict the bodies of the most innocent through the intervention of witches and magicians" (Tranquille 1634, 68.)

Rather than simply expelling demons, clerics used exorcism in witchcraft show-trials to elicit information from the "possessing" devils. The Roman Ritual of 1614, published in part to curb such excesses, nonetheless explicitly permitted interrogation of the possessed, since the more one learned about the Devil's *modus operandi*, the easier it became to expel him. Exorcists stretched this concession by continually asking "demons" for testimony about the source of their victim's affliction. Because this apparent solicitation of the Devil offended some observers, exorcists reinforced demonic testimony with evidence from the possessed, speaking "as themselves" between bouts of demonic activity. Thus, the scriptural example of devils correctly identifying Jesus together with the pervasive Renaissance idea of the Devil as a natural magician who could do, see, and know beyond human capacities served as counterweights to fears of demons telling lies. In several notorious cases, mainly in France, the "devils" of the possessed told about the location of magic charms, which they said had to be found before they would leave the bodies of their victims. Such exorcisms sometimes lasted for months or even years, as "devils" postponed their departure dates. Thus, possession became a virtual profession for some, physically draining and frequently coerced.

POSSESSION AND PROPAGANDA

The premium on signs of direct divine action and intense rivalry between Christian churches in this period enabled exorcists to make demonic possession a

high-profile public issue. The possessed, successfully exorcised, took a prominent role in trying to convince audiences of the rightness of one church or another: marginalized Jesuits and Puritans in England used the possessed to show God's favor, and Catholic zealots on the Continent mobilized the possessed against Protestant and Catholic doubters alike. The logic of asking demons to defend a claim of divine favor was shaky, but the very paradox of "devils" being forced to acknowledge the power of God acting through a particular cleric or church made these performances convincing to many observers. (The risks to credibility were obvious, however, even to broadly sympathetic viewers. When an exorcist in the Catholic Low Countries ordered a devil to admit that the Catholic Church was the true church, another Catholic critic wrote that "if the bedevilled had said the contrary, they would have made a marvellous parade of it" [Lottin 1985, 129–130]). The displays of demoniacs also appeared to many as clear signs of the advent of the Antichrist, a harbinger of the Last Days, with possession offering significant evidence of Satan's malice loosed on the world (Clark, 1997, part III).

Each exorcist relied on the possessed to exhibit enough demonic revulsion and torment to prove his charismatic power to confront the Devil. Symbiotic relationships developed between the possessed and exorcists, who exhibited what psychologists call "codependency" and possibly a degree of mutual exploitation. Skeptics, voicing opinions heard since antiquity, compared their public displays to traveling shows or bear baiting and made accusations of sexual liaisons between female possessed and their exorcists. The demoniacs were often socially marginal figures—young women and youths—but they rarely came from the very lowest social strata and usually enjoyed at least minimal support among the elite. The possessed in sixteenth-century Augsburg, for example, included maids of elite families, whose exorcisms demonstrated the power of Catholic ritual in a confessionally divided city (Roper 1994).

POSSESSION AND SPIRITUALITY

European Catholicism underwent a major spiritual revival in the early modern period, with a rising cult of so-called living saints, charismatic figures who became a focus of veneration. Such people had characteristics in common with the possessed: possession was seen as a phenomenon akin to ecstasy, characterized by trance states and a capacity to expose otherwise inaccessible knowledge, such as news from purgatory or other people's hidden sins and private thoughts. Insofar as such displays by the possessed were deemed licit, these people functioned as a type of church-sanctioned witch, in a time when traditional witches were being persecuted. Indeed, the possibility of witchcraft accusations

against the possessed (and ecstasies) was ever-present. And although demonic possession offered some of these people, mostly women, an opportunity to display God's favor through their visible capacity to suffer, a sense of taint surrounded possession. Ecstasy and possession were considered legitimate only if the suffering was entirely involuntary, so any signs of personal pride in public success could create suspicions of witchcraft. No clear line separated possession, ecstasy, and witch status: categories were determined in an ad hoc manner, often subject to such extrinsic factors as patronage. Exorcists sometimes used their rite to test ecstasies, with the aim of summoning any devils lurking behind apparent displays of holiness; even St. Teresa was exorcised to ensure her holiness was not demonic. Possessed women and ecstatic mystics were extremely ambiguous figures: their resistance and suffering made them appear holy in times that craved holiness, but they were also highly suspect in times that saw the Devil everywhere.

It is not difficult to situate demonic possession in convents within the context of the increasingly rigorous religious standards imposed by the post-Tridentine Catholic Church; it is less easy to draw a line between possession as a conscious or unconscious response to this environment. At one extreme of the religious spectrum, a desire for self-mortification led some religious women to overdo their physical suffering in a way that simply turned their minds. This happened in possession cases in New Spain, at Lille in 1613, and at Montdidier, under the influence of Madeleine de Flers, an ecstatic who was allegedly possessed herself but who was also said to have caused other nuns to fall into possession. Other nuns appear to have pretended to be possessed or convinced themselves they were possessed to escape religious life, and this possibility was noted by contemporary authors. And one possessed woman in Germany "seems to have found in demon possession a way of expressing the two violently contradictory ways she felt about religion" (Midelfort 1989, 113–127)

FRAUD AND SKEPTICISM

In the thirteenth century, Abbot Caesarius of Heisterbach had a monk in one of his dialogues remark, "I do not deny that some have pretended to be possessed for worldly gain, but in many cases there is no pretense" (Caesarius von Heisterbach 1929, 333). Yet it is impossible to know how many demoniacs have been consciously fraudulent: the question is clouded both by the problem of perception in a Christian culture—one needs to believe in order to see—and because most recorded confessions of fraud tended to follow some kind of threat or coercion. The many proofs and signs of possession also make it open to suspicion of fraud: demoniacs in the early modern era quaked seemingly on cue in the presence of mundane items (such as unblessed water) presented to them as holy, and the stop-start quality of symptoms in the presence of

clerics was interpreted as collusion. Nor did those seen as possessed always embrace the diagnosis: Louise Capeau at Aix protested that she was not possessed, and the duke of Jülich-Cleves was a unique case of a major ruler who underwent exorcism for six months against his wishes in 1604. In both cases their protests were interpreted as proof of the Devil's presence. It could be said that a secularist search for the "reality" behind the displays of the possessed misses the point. The historical reality was what the documents described: situations of extreme passion, confusion, coercion, and suggestibility. Pressure to prove fraud arose within specific politico-confessional contexts, giving diagnoses a significance beyond the immediate question of how to treat the possessed. Literature voicing skepticism about demonic possession, originally embedded in such contexts, became part of a growing tradition that has helped shape both outright modern rejection of possession and ambivalence among Christians. Ironically, though, there are modern examples of secular doctors sending people who claim to be possessed to exorcists, who are sometimes able to cure them, as if by placebo.

POTIONS

From the Latin *potare*, meaning "to drink," potions are a fundamental element of witchcraft and magic, having an ancient history in both literary depictions of the occult arts and their actual practice. In ancient Greece, the use of *pharmaka* (drugs or potions) was not always magical, and the term *pharmakeia* (the administering of

drugs or potions) can be divided into three main categories: magical uses, poisoning without magic, and the practice of medicine or healing.

The first recorded use of *pharmaka* by a witch occurs in book 10 of Homer's *Odyssey* (seventh-century B.C.E.), describing the sorceress Circe administering *kaka pharmaka* (evil drugs) and *pharmaka lygra* (dangerous drugs) to Odysseus's men, the results of which transformed them into pigs. In addition to the magic of transformation, Circe practices the art of rejuvenation, which is also achieved by using another potion or *pharmakon* to return the men to their previous form, but with a more youthful demeanor. The other major practitioner of potions in Greek literature was the sorceress Medea, whose magical poisons were the cause of several often-violent deaths throughout her myth cycle, including death by self-combustion. The *Argonautica* by the poet Apollonius (second-century B.C.E.) depicts Medea's early career as a sorceress in the art of *pharmakeia*. She kept a casket full of *polla pharmaka* (many drugs), some of which healed and some of which killed; in one particularly evocative passage in book 3, Apollonius describes one of Medea's potions called *pharmakon Prometheion* (the charm of Prometheus). This potion came from a magical plant that sprang from the fluids released from the Titan's veins while he was being perpetually torn open by an eagle, a punishment by Zeus for his insolence. To prepare this potion, one had to bathe in seven streams, sing rituals to Hecate, then be clothed in black, and cut the plant in darkness. This process clearly illustrates the symbiotic relationship between potion making and ritual, and Apollonius's description emphasized the ancients' differentiation between such occult arts and the more straightforward work of the herbalist.

The tradition of actual potion making in antiquity was best illustrated by the *Greek Magical Papyri* (PGM), which offered a collection of spells from Greco-Roman Egypt between the second-century B.C.E. and the fifth-century C.E. Herein were recipes for numerous magical outcomes, involving the use of a variety of substances ranging from basic ingredients to such exotic, hard-to-find, and expensive substances as myrrh, crocodile teeth, and body parts of wild animals (for example, a wolf's head). One of the recurring spells from the *Papyri* was a love potion or philter (e.g., PGM 4:2441–2621), a spell of attraction consisting of various animal and insect parts, including "the fat of a speckled goat that is a virgin" and "moon beetles" as well as frankincense and onions. The recipe told the spell caster how to prepare the ingredients, such as thorough pounding in a mortar and placement in a lead container. The instructions for the potion's use were complex, involving the enactment of the spell at a precise location (a high roof) and a specific time

(moonrise) together with a series of lengthy invocations to Hecate in her various guises.

The use of potions, particularly for love, was sufficiently widespread in antiquity that authors opposed to magic regularly advised unsuspecting men against allowing women to dabble in such things. For example, Plutarch's *Moralia* 139.5 (second century C.E.) warns husbands to be wary of love potions (*philtera*), which he aligned with sorcery (*goeteia*) because they could, at the very least, undermine male authority in the household. The inherent danger of such magic was illustrated in the references to the adverse affects on the object of the spell: Suetonius (69–140 C.E.) describes how the Roman Emperor Caligula went insane after imbibing a philter dispensed by his wife, Caesonia.

The use of potions in early modern Europe, as in antiquity, involved a sometimes-vague definition in terms of the practitioners, blurring the lines of classification among healers (or doctors), herbalists, poisoners, and witches. The stereotypical view of the woman healer or herbalist executed or ostracized on charges of witchcraft testified to this skewed taxonomy; as Scotland's Sir George Mackenzie observed in 1678: "Not only witches but even naturalists may give potions that incline men and women to lust" (*Laws and Customs of Scotland in Matters Criminal*). Nevertheless, evidence of making potions was a topos of witchcraft literature, trials, and records. Amid numerous accounts of potion making was a reference to the use of human parts, "especially the bodies of those who have been punished by death or hanged," in Francesco Maria Guazzo's 1626 *Compendium Maleficarum* (A Summary of Witches, book 2, chap. 2). Guazzo continued in the same vein: "For not only from such horrid material do they [witches] renew their evil spells, but also from the actual appliances used at executions, such as the rope, the chains, the stake, and the iron tools." He also described some of the ingredients used in deadly potions, including "leaves and stalks and roots of plants; from animals, fishes, venomous reptiles, stones and metals," and explained that "sometimes these are reduced to powder and sometimes to an ointment" (2:3). Such deadly potions and, more significantly, those who used them, were often blamed for spreading outbreaks of the plague, as exemplified by an incident in Geneva in 1545, when a witch hunt was orchestrated after a man had confessed to having started a pestilence by anointing the foot of a hanged man as well as several door bolts with such a potion.

One of the most common beliefs connected the use of potions in witchcraft with the witches' flight. Ointments used for flying supposedly included the fat of children as well as assorted narcotics. Among the most detailed account of flying potions was that given by Jean de Nynauld in 1615 in his *De la lycanthropie, transformation, et extase des sorciers* (Lycanthropy,

Metamorphosis, and Ecstasy of Witches). Nynauld specified, however, that the potions used only gave the impression of flying: for such a sensation, a witch could take belladonna (deadly nightshade), eat the brain of a cat, or if a more exotic potion was unavailable, get drunk. For the hallucinogenic effect of travel to a Sabbat, Nynauld explained that a witch could prepare a potion also composed of baby fat plus, among other ingredients, the juice of water parsnip and, again, belladonna (which does produce hallucinogenic effects). Despite the doubts by authors such as de Nynauld that witches could actually fly, popular belief in many countries maintained they could—aided, of course, by Satan. Artwork both before and during the persecution era consistently combined the image of the witch with potion making and flying, specifying the flight-inducing powers of the witches' concoctions. In a chiaroscuro woodcut by Hans Baldung [Grien] of 1510, four witches were depicted: three involved in the process of potion making and one, in the air, riding a demonic goat. The stereotypical implication of the image was the direct association between the airborne witch and the potion of her "sisters," the vapors of which curled into the air, whirling about in a "flying" motion.

The more fantastic accounts of witchcraft include many references to the Devil's role in providing both potions and powders to the witch. The powders often came in different colors, each denoting the substance's specific use. Alternatively, the witch could make her own potions or powders, sometimes at the Sabbat, from such ingredients as toad venom, body parts (particularly from stillborn babies), and stolen Hosts. The belief that such substances could heal as well as harm indicated the contradictory societal perceptions of the witch's powers; she could be sought by a desperate client to provide a cure beyond the abilities of more official healers or medical practitioners, thereby simultaneously signifying the role of the witch as a potentially viable alternative to the curing powers of God.

Potions, along with amulets and spells, were also believed to prevent or ease the pain of torture. This, unfortunately, often led to the torture of the accused being prolonged, usually until a full confession was obtained.

POZNAŃ

Poznań, the capital of Wielkopolska (Greater Poland), is famed as the location of both ecclesiastical and secular courts that heard some of Poland's earliest witchcraft trials (fifteenth century) and the purported last trial in Europe in 1793. This case remains a subject of controversy; Polish historians have dismissed it as German propaganda in the wake of the partitions of Poland, but its inclusion in Wilhelm Soldan's widely used history has ensured subsequent citation. It was reported in 1801 that when members of a Prussian commission reached a certain town in Poland in 1793, they saw the remains of stakes, and the town magistrate told them that two witches had been burned there. Polish historians are convinced that the vague terminology used to describe the event makes its authenticity dubious. This case was mentioned in the *Himmlerkartoteka* (Himmler card index), a collection of trials gathered by the *H-Sonnderkommando* (Special Unit H [Hexen = witches]) on the orders of Heinrich Himmler, whose more than 30,000 cards are now housed in the state archive in Poznań. The archive also contains records from the *województwo* (palatinate) of Wielkopolska (Greater Poland).

CASES

Accusations of witchcraft were heard by Poznań's ecclesiastical courts as early as 1430 (*Acta* number 1016), and over a dozen sentences were passed down over the next century. Cases were brought on charges of counter-magic, preventive practices against illness, causing illness, attempted murder by female spouses, increase of crop output, and causing impotence. Poison was still largely synonymous with witchcraft, as a case from 1517 reveals (*Acta* number 1709). Witchcraft accusations were also used as a mechanism to dispose of unwanted spouses, as illustrated by the case of Malgorzata Zawarta, whose husband accused her of witchcraft. It was also claimed that she used the finger of a hanged man to improve beer fermentation. She was sentenced to death but was later pardoned (*Acta* number 1016). An ecclesiastical court probably passed the first death sentence in 1511, but they were rarely

carried out. The majority of cases ended in recantation or another form of punishment, such as an offering to the Church. Ecclesiastical courts continued to hear cases until the mid-sixteenth century. Secular courts (despite jurisdiction having passed officially to the ecclesiastical courts in 1543) heard their first cases of witchcraft in 1544, those of Dorota Gnieczkowa (sentenced to death at the stake) and Agnieszka of Żabikowo. In a similar fashion to the cases heard before ecclesiastical courts, accusations consisted largely of pouring wax to divine the identity of a thief, washing cows with herbs to protect the milk yield, or other harmless practices. In the seventeenth and eighteenth centuries, trials began to include details of diabolic practices, and death at the stake was the usual sentence.

DEMONOLOGY

Poznań contained printing houses of various Christian confessions, which published some of the most important treatises, as well as many legal codices, including *Speculum Saxonum* (Law of the Saxons); Chelmno Law; Magdeburg Law; Polish Crown Law; and a collection of Roman, Canon, and Saxon laws. Of particular note was Wojciech Regulus's publishing house, responsible for the publication of an anonymous work in 1639, *Czarownica powolana* (A Witch Denounced). It was considered by some to be the first vernacular translation of Friedrich Spee's famous *Cautio Criminalis* (A Warning on Criminal Justice) of 1631, but it differed from Spee's work in many respects. It was published in the same year as Daniel Wisner's *Tractatus brevis de extramagi, lamii, veneticis* (Brief Treatise on Magic, Witches, and Poisoners), which also criticized the abuses committed by the judiciary during witchcraft trials. This work, significantly, was dedicated to Łukasz and Krzysztof Opaliński. The latter wrote a satirical verse ridiculing the tendency to attribute all misfortune to witches, who were generally harmless peasant women. Another work critical of judicial abuses was Serafin Gamalski's *Przestrogi duchowne* (Clerical Warnings), published posthumously in 1742. The author claimed to have heard the confessions of those accused of witchcraft and was convinced of their innocence. A common feature of these Poznań authors was their emphasis on the large number of witchcraft executions, which, however, is not corroborated by the extant trial records.

PRÄTORIUS, ANTON (1560–1613)

A German Reformed parson, in 1598 Prätorius published the important treatise *Von Zauberey und Zauberern Gründlicher Bericht* (A Thorough Account of Magic and Magicians), which clearly opposed witchcraft persecution and demanded abolishing torture immediately; he was one of the first authors in Germany to propose this radical solution.

We know little about his early years or his education. After 1581, he was recorded as teaching in Lippstadt, later becoming headmaster of the Latin school in Kamen. He appeared in 1587 as a Lutheran deacon at Worms and in 1589 as a Reformed deacon at Oppenheim in the electoral Palatinate. In 1592, Prätorius became parson of Dittelsheim, a Palatine village, moving in 1595 to Offenbach am Main in the county of Isenburg-Büdingen. From 1596 to 1598, he held the post of court chaplain at Birstein before returning to the electoral Palatinate as parson of Laudenbach, where he remained for the rest of his life.

The cause that provoked Prätorius's treatise against witchcraft persecution was the abominations of the trials he had personally witnessed because of his position as court chaplain in Birstein. In 1597, he was directly involved in the trials against four women accused as witches. Despite vigorous intervention in their favor, he was unable to save their lives. Shaken by this experience, Prätorius wrote his book and returned to serve in the electoral Palatinate, which rejected persecution. Prätorius originally published his treatise under the name of his son Johannes Scultetus. When the book sold out quickly and was republished in 1602 and 1613 in rewritten editions, he used his own name. (Another edition in 1629 simply reprinted the 1602 edition.)

Prätorius was skeptical of the belief in witchcraft, not only criticizing the procedures of its persecution but also denying the reality of witchcraft. He named Benedikt Pererius, Johann Georg Goedelmann, Otto Melander, and especially Hermann Witekind from the electoral Palatinate as his most important predecessors and role models. Moreover, the electoral Palatinate's rejection of witchcraft persecutions obviously influenced Prätorius through his contacts and employment.

Prätorius showed an intimate knowledge of most contemporary treatises on witchcraft but commented on them only briefly. He founded his arguments mainly

on the Bible, following common exegetical practices among Reformed theologians. Like other skeptics, Prätorius's viewpoint was theocentric: God is almighty; only he could override the laws of nature in his creation, and neither the Devil nor wizards possessed any physical powers that transcend nature. Physical harm through magic thus could not be real. Nor were any of the three elements (the witches' flight, participation in the Sabbath, and sexual intercourse with the Devil) that constituted witchcraft in the strict sense; all of them existed only in fantasy. Here Prätorius did not rely on the Bible alone but founded his argument also on the empirical reasoning of Hermann Witekind, typical of Reformed discourse in Germany.

According to Prätorius, all witches were guilty of the spiritual crime of apostasy and the diabolical pact. Their crimes were most horrible and would be punished by God with eternal damnation if the sinner did not repent. This did not, however, justify the death penalty by secular justice. Although unlike Witekind, Prätorius relied mostly on the Hebrew Bible and affirmed the validity of the Mosaic laws, he emphasized with Johann Weyer that the death penalty of Exodus 22:18 (22:17) was not directed indiscriminately against all kinds of sorcerers, but only against poisoners. With any spiritual crime, the sinner could always repent, after which God no longer desired his physical destruction. In principle, sorcery must be punished by secular justice, but in cases of conversion, not with the death penalty. He thus adopted the social-disciplinary position of his predecessors, not deterring sorcery post facto through criminal justice but preventing it by restoring true Christian faith and conduct among the people.

Concerning procedural law, Prätorius began by rejecting the idea of witchcraft as a *crimen exceptum* (excepted crime). For him, correct legal proceedings began with humane conditions of incarceration. His critical descriptions of the often-inhumane conditions of early modern imprisonment could be considered standard. However, his arguments against torture were quite revolutionary: based on his personal experiences in prosecuting witchcraft, Prätorius demanded nothing less than the immediate abolition of torture in European criminal proceedings. None of his predecessors had demanded this in such radical fashion. This achievement secured Prätorius an important place in the history of German criminal law, even though he did not argue for open assessment of evidence as a replacement for torture, thus making his argument less forceful.

PRÄTORIUS, JOHANNES (1630–1680)

Prätorius (whose real name was Hans Schulte and who should not be confused with Anton Prätorius, who used the pseudonym Johann Scultetus) was a graduate of Leipzig University, a polymath, and a Baroque poet. Under numerous, deliberately amusing pseudonyms (such as Steffen Läusepeltz, or "Stephen Lice-Fur"), he published more than fifty treatises and collections of myths and fairy tales, dealing predominantly with occult themes and folk beliefs or superstitions. In his *Bockes-Berges Verrichtung* (Performance at the Blocksberg), published in 1668, Prätorius provided a compilation of popular and learned ideas about magic, sorcery, and witchcraft. As a result of its use by Johann Wolfgang von Goethe and the brothers Grimm, this compilation also influenced nineteenth-century German literature.

Prätorius was born in the Lutheran village of Zethlingen in Sachsen-Anhalt. After attending grammar school at Halle, he matriculated at the University of Leipzig. He pursued various branches of study in the natural sciences, graduating with a master of arts degree in 1653. After giving several unsalaried lecture series on astrology, chiromancy (or palmistry), and geography at the university, he was named poet laureate, a title he valued very highly, in 1659. Remaining in Leipzig until he died of the plague a few days after his fiftieth birthday, he used the resources of the university's library (housed in the so-called *Paulinum*) as the basis for his many treatises and

anthologies. The works of Prätorius had considerable influence on other German writers; Hans Jacob Christoph von Grimmelshausen had already drawn on them before Prätorius's death, and Goethe, Friedrich von Schiller, and Clemens Brentano also valued the treatises of Prätorius as treasure troves of material to be utilized in their own publications (Goethe, for example, drew on the *Bockes-Berges Verrichtung* in creating his immortal Walpurgis Night scene in part 1 of *Faust*, published in 1808). Prätorius's collection of stories about the Silesian mountain spirit Rübzahl remains well-known to this day.

After Prätorius had announced its publication several times, in 1668 finally appeared the *Bockes-Berges Verrichtung/oder ausführlicher geographischer Bericht von den hohen trefflich alt- und berühmten Bockes-Berge. Ingleichen von der Hexenfahrt und Zaubersabbathe, so auff solchen Berge die Unholden aus gantz Teutschland jährlich den 1. Mai in Sanct Walpurgisnacht anstellen sollen* (Performance at the Blocksberg, or Detailed, Geographical Report of the High, Excellent, Old, and Famous Blocksberg. Also Treating of the Witches' Journey and Magical Sabbath, That the Witches from All over Germany Supposedly Attend Every Year on This Mountain During Walpurgis Night, the First of May). Prätorius used a travel narrative, written by another author in 1653, to begin the German version of his treatise: it described a journey over the Blocksberg (which lay in the Harz region) and other nearby places. The rest of the work was divided into two main parts. Here Prätorius used the *Blocksberg* of the title (also known in German as the *Brocken*), presented as the chief meeting-place of German witches, as a thematic introduction to a broader discussion of witchcraft belief. Prätorius devoted the first part of the work to describing various sinister places, such as those where witches supposedly gathered, and accursed caves, lakes, or mountaintops that were supposedly haunted by ghosts and spirits.

The second part of the work was divided into eight chapters. Here Prätorius presented "reports" about the flights of witches and the supposed activities of witches at their gatherings, or Sabbats, and told stories of various horrible occurrences that had allegedly involved the practice of harmful magic. He went into great detail on the themes of the Devil's sexual relationships with witches and of incubi, succubi, and changeling children, drawing on the Tannhäuser legend of the *Mons Veneris* (Venusberg, or Venus Mountain), written by Heinrich Kornmann in 1614. Prätorius also discussed the possibility that witches could change themselves into animals. He concluded the work with a collection of popular stories about ghosts and spirits, including tales of the mountain-spirit Rübzahl and of the "furious army," a horrific-looking group of spirits of dead men who were believed to travel at night, marauding and generally terrifying the living.

The *Blockes-Berges Verrichtung* offered a compendium or textbook of witchcraft, aimed at an interested public. In composing it, Prätorius used a vast range of ancient, medieval, and contemporary writings and treatises, including authors from both sides of the debate about witchcraft belief. Prätorius drew uncritically on their work, using any stories that seemed to fit best into his own compilation. Thus, he drew both on the work of the skeptic Johann Weyer and used material from the hard-line *Malleus Maleficarum* (The Hammer of Witches, whose author he mistakenly cited as Jacob Sprenger). He took information pell-mell from Catholics and Protestants—Johann Geiler von Kaysersberg, Ulrich Molitor, Olaus Magnus, Girolamo Cardano, Paulo Grillando, Jean Bodin, Nicolas Rémy, Lambert Daneau, David Meder, and Benedict Carpzov, among others. Prätorius was genuinely convinced of the real corporeal existence of the Devil and the demons and evil spirits who served him; he believed that witches really made pacts with the Devil and had intercourse with him, changed themselves into animals, flew to Sabbats, and performed harmful magic.

PRICKING OF SUSPECTED WITCHES

A common way of detecting the "Devil's mark," an insensitive spot that would not bleed when pricked with a pin, was called pricking. If such a mark was found, it provided important evidence for prosecuting a witch.

The insensitive spot was only one kind of Devil's mark. Other marks were detected by means other than pricking: a protruding teat with which English witches were believed to suckle their "familiar" (the witch's mark); an area of discolored skin, sometimes perceived as the shape of a small animal or as the imprint of the Devil's claw; a mark in the eye, which a few witch detectors claimed to have special powers to see; or simply a mark that the suspect confessed to possessing and that therefore required little or no physical verification.

Physical verification by pricking was often a lengthy process involving an experienced pricker and

numerous witnesses. The suspect would be blindfolded, partially or wholly stripped, and pricked with pins until a spot was found where a pin could enter undetected. Sometimes their body hair would be shaved. The pins varied in length from two fingers' breadth to 3 inches, occasionally more. In one French case from 1624, a pin of four fingers' breadth sank into a suspect's buttock irrecoverably. Jean Bodin, citing Revelation 14:9, expected the mark on the forehead or hand. In practice, prickers found marks in a variety of locations, with the back, shoulder, buttock, or thigh being common. Theologically the Devil's mark was equivalent to Christian baptism, which could be administered only once, but two or more marks were often found.

Church ministers or gentlemen supervising pretrial investigations might do their own pricking of suspects. The court might commission physicians, surgeons, or quasi-medical men (such as barbers). Executioners' anatomical expertise could be used for pricking as well as judicial torture. Judges or court officials might do their own pricking. A few courts commissioned women prickers; one Franche-Comté case called them *chirurgiennes*. Some regions had itinerant professional prickers; in 1621, a hangman based at Rocroi, near the French border with the Netherlands, admitted he had done this service for pay 231 times.

With practice, it was probably easy to find insensitive spots. Many "marks" were probably birthmarks or warts, both of which could be insensitive. Most suspects were older people who had spent a lifetime in physical labor and whose nutrition was sometimes poor; many of them had old scars or circulatory or arthritic problems associated with losses of local sensation. It would be interesting to know what proportion of witchcraft suspects might have had physical features vulnerable to the pricker. One Scottish pricker in northern England claimed to find marks on twenty-seven out of thirty suspects brought to him, which might be some indication. This pricker, however, was a professional and, like his colleague at Rocroi, seems to have been a fraud.

With amateur prickers, the problem was more likely to be self-deception; if they were convinced that the mark existed, they would be less rigorous in their search. Did the pin *really* enter so deeply and was there *really* no pain? Occasions when the suspect felt and expressed pain were sometimes recorded, but they represented failures on the pricker's part; probably most such occasions were passed over silently. Some suspects' claims to feel pain were rejected because they could not identify the spot precisely enough or simply because no blood flowed from it. Ultimately, pricking depended more on belief and perception than on physical evidence.

Technically, pricking was not "torture." The aim of judicial torture was to inflict pain in order to secure a

Courts employed pricking with pins to detect the Devil's mark, the insensitive spot on a witch's body where the Devil had marked his servant. (TopFoto.co.uk)

confession: pricking, by contrast, aimed to inflict *no* pain in order to secure physical evidence. Some pricking may have been connected with the popular belief that scratching them to draw blood could counteract witches' magic, and here pain would be expected. In practice, pricking was a coercive procedure that could help to break down a suspect's resistance and make a confession easier to obtain. Numerous witches began to confess after they were told that a mark had been found. This was particularly important for women, for whom being stripped, shaved, searched intimately, and pricked by men could be a form of symbolic rape.

Unlike the swimming test, which resembled a judicial ordeal (an appeal to God to display the truth), pricking seems to have had no medieval antecedents and has not been traced back further than the mid-

sixteenth century; unfortunately, many reports of the finding of the "mark" leave the discovery method unspecified. Pricking undoubtedly gained in importance during the early seventeenth century, above all in Protestant regions, where the Devil's mark seemed relatively more important than among Catholics. For example, the Inquisition did not use pricking.

The belief that the Devil might remove his mark in order to protect witches may have been a largely Catholic one. In 1631, the Jesuit Friedrich Spee complained that if the pricker failed to find a mark, the judge would decide that the Devil had removed it in order to protect the witch. This could occasionally be used against a suspect, enabling the prosecution to claim that a suspect was still guilty even though no mark had been found, which seems to have happened with another Jesuit, Urbain Grandier, in Loudun in 1634. But more often, the belief in the mark's erasability seems to have discouraged courts from seeking it. Some suspects even volunteered to be pricked in the belief that it would prove their innocence.

Usually of lower-class origins, professional prickers were among the few people who clearly stood to profit financially from witch hunting. During periods of intense witch hunting, they could make a windfall profit by offering their services to worried local authorities. They flourished particularly in seventeenth-century Scotland, where about ten professional prickers are known. Payment by results opened a temptation to outright fraud, for which five Scottish prickers were prosecuted or reprimanded. Two turned out to be women dressed as men. The activities of an unnamed Scottish pricker in the north of England in 1650 are particularly well documented. He pricked many women brought to him through neighborhood denunciations, charging 20 shillings apiece, and his evidence seemed to have been central in their trials. He had presumably begun his career in the Scottish panic of 1649. He was executed for fraud in Scotland after reportedly confessing responsibility for the deaths of 220 witches (the Rocroi hangman, who may hold the European record by discovering a mark 231 times, was sentenced to perpetual service in the galleys by the *Parlement* of Paris).

In 1631, Friedrich Spee warned that prickers should be watched carefully because they were prone to fraud: they would cry out that a mark had been found, or would use a retractable bodkin. An illustration of such a bodkin was published by Reginald Scot in 1584, though he cited it as a general proof of the possibility of fraud in witchcraft accusations and did not specifically mention pricking. Most prickers seem to have preferred ordinary needles, rather than bodkins with handles. The exposure of frauds fueled skepticism about prickers by the mid-seventeenth century, even among the medical profession: for example, Genevan surgeons searched over a dozen suspected witches after 1622 but

never found an unambiguous Devil's mark. The practice was never banned but faded away along with the witchcraft trials.

PRIERIAS, SILVESTRO (CA. 1456/1457–CA. 1527)

Theologian and inquisitor best known as the first Roman respondent to Martin Luther, Silvestro Mazzolini da Prierio or Prierias (as he is usually called, after his birthplace in Piedmont, Italy) wrote several influential works on witchcraft and demonology that helped fuel witch hysteria in early modern Europe.

Born in 1456 or 1457, Prierias entered the Dominican order in 1471, joining the reformed Observant branch of Lombardy. After studying philosophy and theology at the *studium generale* (house of studies) in the convent of San Domenico in Bologna, he began his teaching career there in 1489 as master of studies, later serving also as its regent master (1499–1502). In 1508 came appointments as both vicar general of his Lombard Dominican congregation and inquisitor for Brescia, Crema, and environs, a position the friar held until 1511, when he was transferred to Sant'Eustorgio in Milan as inquisitor for the busier territories of Milan, Piacenza, and Lodi. The Observant Dominicans lost control of Sant'Eustorgio in 1512, and Prierias moved to Cremona as prior of the convent of San Domenico. In 1514, he was sent to teach theology in Rome where, in the following year, Pope Leo X appointed him to the chair of theology at the University of Rome, while also naming him master of the sacred palace (i.e., official theologian of the papal curia) as well as Roman inquisitor, responsible for all inquisitional activities of the tribunal at Santa Maria sopra Minerva. In 1518 the pope assigned to Prierias the task of evaluating the orthodoxy of Martin Luther's *Ninety-Five Theses*; the Dominican's resultant critique, the *Dialogus* (Dialogue), as well as subsequent

elaborations and responses, set in motion the process that soon led to Luther's condemnation as a heretic. Prierias died in Rome, most likely in 1527.

Among Prierias's other major works are the 1503 *Rosa aurea* (Golden Rose), a preacher's handbook reprinted nineteen times in the sixteenth century, and the 1514 *Summa summarum de casibus conscientibus* (Complete Compendium of Cases of Conscience), better known as the *Summa silvestrina* (Silvester's Compendium), a theological, moral and canonical handbook for confessors, reprinted twenty-nine times.

Most important for our subject, however, are his early treatises on the Devil, demonic possession, and exorcism, the *Tractatus de diabolo* (1502, reprinted 1573); the *De strigimagarum, demonumque mirandis* (Concerning the Prodigies of the Witch-Magicians and Demons, 1521, reprinted 1575); and the various relevant entries (e.g. *Haeresis*, *Maleficium*, *Superstitio* [Heresy, Sorcery, Superstition]) in the *Summa silvestrina*, some of which represent the core of Lenten sermons collected in his *Quadragesimale aureum* (Golden Lenten Sermon Series) of 1515.

Prierias's interest in demonology and witchcraft surfaced early in his Dominican career and remained a constant preoccupation thereafter. Already as regent master in Bologna, if not sooner, he participated in exorcisms and witchcraft trials and summarized the fruit of this experience in *De diabolo*. Prierias's approach was consistently hard-line; his goal, to overcome the leniency toward witchcraft and related activities encouraged by traditional interpretations of the Church's central legal text on the matter, the *Canon Episcopi* (ca. 906), which consigned such phenomena merely to the realm of personal delusion and harmless superstition. Prierias acknowledged that in earlier centuries this may have been true but warned that recent times had seen the birth of a new, internationally organized sect of heretics consisting of antinomian, devil-worshipping women and men who, through nocturnal flight, gathered for orgiastic Sabbats, engaged in sorcery, and wrought acts of malevolence against private citizens and the established Christian order.

Prierias told us that he wrote his longest work on the subject, the *De strigimagarum*, because he had encountered alarming skepticism among his peers while serving as judge in a Roman witchcraft trial. Besides its intransigence, *De strigimagarum* was noteworthy for the neologism introduced by its author, namely, the term *strigimagus*, created to enforce the view that the two hitherto distinct categories of persons, the common witches (*striges*) and the more prestigious scientific-philosophical magicians (*magi*), were in fact equally diabolical and deserving of elimination. However, beyond this, the work added little to earlier works by other writers or by Prierias. Ultimately, Prierias's efforts helped to heighten Christendom's awareness and

fear of this “new sect” of witches. However, the theologian-inquisitor was only partially successful in his own homeland: although early modern Italy prosecuted witches, their punishments were usually lenient, and actual executions were few, relative to the rest of Europe.

PRODIGIES

Prodigies are phenomena—natural or supernatural, but often marvelous or wonderful—that are interpreted as signs of future events, usually disastrous.

“Prodigies” include monsters, deformed births, comets, wars, famines, pestilence, earthquakes, ghosts, dreams, demons, and witches. Belief in prodigies rests on belief in a theocentric (God-centered) and unified universe. In this way, the divine plan may include unusual events or creatures on earth that people interpret as punishments or as spurs to action and moral reformation. Similarly, aberrations in the natural order are considered to be the result of human discord and sin. Such wonders can also be given scientific or natural explanations, but in the Western tradition, theological or eschatological (related to the Last Judgment and the end of the world) explanations have predominated. The literature of prodigies is large, reaching its peak in Europe during the religious and political unrest of the early modern period between 1450 and 1750.

PRODIGIES IN ANTIQUITY

Such classical authors as Aristotle, Virgil, Seneca, Pliny the Elder, and Plutarch recorded numerous prodigies. Cicero attempted to categorize and explain prodigies in *De divinatione* (On Divination). He explained that the meaning of “prodigy” derives from the way in which such wonders “predict” (*praedicunt*), but argued that some wonders should not be given a prodigious interpretation.

The Judeo-Christian tradition is full of prodigious events. For example, in the Hebrew Bible, plagues of locusts, frogs, and caterpillars rain down upon such wicked kings and nations as Pharaoh and the Philistines. In the New Testament, the Gospels of

Matthew, Mark, and Luke also provide lists of prodigies and portents of future calamities. Jesus’s warning of the impending days of vengeance (Luke 21:25), “And there shall be signs in the sun, and in the moon, and in the stars,” was often cited by medieval and early modern doomsayers. Moreover, according to the Revelation of St. John, the four horsemen who would appear at the Apocalypse would rain down war, famine, and plague on the earth. Indeed, a medieval prophetic legend, the Fifteen Signs before Doomsday, described a succession of prodigies that would appear in the fortnight before the Last Judgment. The book of Revelation also describes how the binding up of Satan at the second coming of Jesus would last 1,000 years. As a result, medieval and early modern Europeans believed that an upsurge in prodigies, including false prophecy, magic, and witchcraft, was caused by the Devil, who was angered at the thought that he had little time left and was hastening to do as much damage as he could. The approach of the millennium was also signaled by the appearance of the Antichrist, with whom many prodigies were associated. St. Augustine, following Pliny the Elder and Cicero, found the preoccupation with the evils that were supposed to follow specific wonders disagreeable, because it detracted from the more general wonder and beauty of God’s plans and led people to expect an imminent Apocalypse. However, later medieval and early modern writers enthusiastically embraced the biblical emphasis on prodigies as divine messages and signs of things to come.

MEDIEVAL AND EARLY MODERN PRODIGIES

Much of the classical tradition of prodigy literature was transmitted through the writings of the encyclopedist Isidore of Seville and Albertus Magnus (ca. 1200–1280), as well as by the authors of numerous texts on herbs (herbals) and strange animals (bestiaries). Although the scope for wonderful yet essentially regular species widened as natural causes were investigated under the influence of Arabic and Greek texts, most medieval writers accepted God’s prerogative to suspend the normal laws of nature and produce prodigies. Therefore, singular events such as the conjunction of planets (e.g., Mars and Saturn in 1484), bright comets (e.g., Halley’s Comet of 1066), and snow in summer or plagues of mice were interpreted as threatening and divine messages.

Religious disputes and political tensions contributed to a spate of prodigy literature during the sixteenth century. There was an enormous range of texts, from single-sheet woodcuts of monstrous births with a brief interpretation—such as that of a two-headed child born to Jewish parents in Venice in 1575—to large and apparently disorganized encyclopedias of prodigies such as Conrad Wolffhart’s (pseud. Lycosthenes) 1557

Prodigionum ac ostentorum chronicon, quae praeter naturae ordinem (Chronicle of Prodigies and Portents That Are Outside the Order of Nature). It was translated into English and updated in 1581 by Stephen Bateman as *The Doome warning all men to the Judgemente*. Some of the prodigies that they described had precise scriptural foundations. For instance, a seven-headed monster was interpreted as a clear warning of the seven-headed mount of the whore of Babylon described in Revelation 17:3–18. Other prodigies, such as an earthquake in the Italian city of Venice in 1511 in which certain statues on public buildings were damaged, were given more localized political interpretations by witnesses.

Prodigies were often related to providences (punishments of the ungodly), and consequently the early modern fascination with such curiosities was sharpened by confessional strife. Protestants and Catholics directed the accusation of being Antichrist against each other. For instance, Martin Luther considered the Roman papacy to be Antichrist, whereas Catholics viewed Luther as the Antichrist or at least one of the signs of his coming. The advent of the Antichrist was also taken as the surest of many signs that the struggles of the English Reformation were part of the last and decisive confrontation between good and evil described in Revelation.

Because witches and prodigies both had eschatological significance and scriptural justification, they were often discussed in the same breath. In addition, early modern men and women believed that many prodigies had demonological causes and associated them with the final struggle between good and evil. One demonologist detected signs of the Antichrist's activities in the rise of witchcraft, explaining in 1623 that the Antichrist had in fact been born twelve years before. According to the influential Catholic theologian St. Robert Bellarmine (1542–1621), the Antichrist would be a “noted magician” (magus). Conrad Wolffhart and Stephen Bateman both cited witchcraft trials in their books as signs of mankind's future destruction.

The English politician and philosopher Francis Bacon (1561–1626) dismissed such prodigies as “monstrous births” as irregular but naturally occurring variations. Popular skepticism about prodigies is particularly evident from the mid-seventeenth century, when the prodigious interpretation of comets, for instance, was often condemned as a facet of vulgar superstition or of overzealous Christian belief. However, “scientific” explanations of the return of comets could still coexist with a divine, if less frequently used, prerogative to warn men and women of future doom. In the modern “scientific” age, one catches a few echoes of the eschatological understanding of natural events in recurring fears about “apocalyptic” disasters such as asteroid impact and global warming.

PROOF, PROBLEM OF

The issue of proof is central to any analysis of the witch hunts. Investigators who argue that the hunts were campaigns to control certain types of people imply that proof of witchcraft was not particularly important in the persecutions. In this view, if authorities wished to discourage women from asserting their views, for example, they would attack assertive women, with the accusation of witchcraft a mere cover. But if the hunts are considered as efforts to uncover criminals responsible for actual, perceptible damage to humans, animals, or property, proof must play a large role in any discussion.

Questions of evidence and proof in the courts are also related to the use of torture. Understanding it as a repressive mechanism or as a warning to others not to engage in certain behavior also supports the conclusion that the witch persecutions were largely ways of marking acceptable social boundaries. But insofar as the application of torture in criminal cases on the European Continent and Scotland (it was rarely used in Scandinavia or England) may be seen as an attempt, however crude, to get at the truth, then the hunts become drives to eliminate perceived evildoers. The two major Continental law codes in force during the witch hunts, the German *Carolina* of 1532 and the 1539 French statutes of Villers-Cotterets, made clear that torture was to be used only in specific circumstances, when several clues (*indicia*) appeared to connect a suspect to a crime. For instance, Hans is found stabbed to death, Fritz owns a knife that fits the wounds, and the two men were seen arguing shortly

before the homicide. If Fritz does not confess voluntarily, the courts might order him tortured.

To pass a guilty sentence in a capital case, Continental courts usually insisted on “complete proof,” which was either the testimony of two eyewitnesses or a confession, sometimes dubbed the “Queen of Proofs.” These standards appeared along with the new “Romano-canonical,” or inquisitorial courts, beginning in the eleventh century. The requirement of complete proof could often be satisfied only through a confession; hence, on the Continent, pressure mounted to obtain one when *indicia* existed. In all types of criminal cases, a suspect’s generally poor reputation constituted an *indicium*. But *indicia*, especially in troubled times or in a jurisdiction operating without the supervision of appellate courts, might be as minor as an ugly appearance.

Juries in England did not require “complete” proof, so courts there had little need to use torture. However, standards for conviction were not necessarily higher. In fact, courts in both old and New England sometimes found defendants guilty of witchcraft on the basis of reputation and circumstantial evidence, for example, that a quarrelsome woman passed by a baby who fell ill and died.

Whether or not torture was used in judicial proceedings, witchcraft was regarded as an extremely serious crime throughout Europe and North America from roughly 1430 far into the 1700s. It was simultaneously like and unlike other capital crimes: no other offense was ostensibly carried out with the help of a supernatural power, yet the damage that resulted was similar to the injuries inflicted for other reasons. Detailed case studies of witchcraft trials have shown that although the charge of allying with the Devil usually received close attention from authorities, witnesses focused on the damage defendants had allegedly done to creatures and things. Thus, suspects in witchcraft trials received much the same treatment as in other felony cases. However, the means of identifying suspects was often different, because people who had supposedly attended a witches’ Sabbath might be pressed under torture to name others who had taken part. Yet even this chain reaction effect was not peculiar to witchcraft trials; members of a gang of thieves, for instance, might have undergone similar treatment. These two kinds of charges seem interwoven in at least one large case, the *Zauberer-Jackl-Prozess* (Sorcerer-Jack-Trial) held at Salzburg from 1677 to 1680.

Lower courts might quickly turn to torture and accept its results, especially if great fears of witches affected a given area. Higher courts often had higher standards of evidence. Removed from the emotional ground of unexplained destruction and from the reputation anyone bore in a face-to-face community, appellate justices based their decisions on written evidence,

sometimes supplemented by personal interrogation of defendants. French appellate courts (*parlements*), for instance, began to overturn all death sentences for witchcraft by local tribunals in the 1620s. Similar trends appeared later in Denmark, Sweden, and Scotland.

Likewise, urban courts displayed more skepticism about proofs of witchcraft than their rural counterparts. No convictions are recorded for Frankfurt, Germany, for example, although several cases dragged through the city’s courts for years. Conviction rates in Geneva were much lower than in close-by rural areas. The issue of reputation was less important in a city than in a village; in the former setting, high mobility meant that status rested largely on documents or direct testimony about actions. Circumstantial evidence figured less strongly in places where hundreds of people might have been nearby when someone’s baby died unexpectedly. What might be called the social geography of evidence was terribly, perhaps even decisively, important.

For various reasons, standards of proof in witchcraft cases declined in many parts of western Europe during the witch hunts. Fear of witches might heighten suspicion of anyone, whether a social deviant or not. If a vehement witch hunter stirred an area into action against witches, news of trials close by sometimes prompted both local peasants and officials to read events in the worst possible light.

Some well-documented hunts show that lowered standards of evidence evoked widespread objections; in turn, such criticisms helped to end trials in many locations. Prompted in some instances by the vehement objections to the misuse of torture that Friedrich Spee made in 1631, seventeenth-century German judges finally found that they could no longer tell who was a witch, because anyone could be accused, and given the harsh methods of the torture chamber, almost anyone could be made to confess. Once the number of people handled in this way reached a certain level, it became clear that innocent residents had been convicted. At that point, the problem of what constituted reliable proof was unmanageable, and hunts collapsed on the spot.

The witchcraft trials of 1692 in Salem, Massachusetts, provide another vivid example of this trend. Earlier in New England, juries had infrequently returned guilty verdicts in witchcraft cases, and when they did, judges sometimes overturned them. But in a tense atmosphere of political insecurity and Indian attacks, juries in Salem Village accepted “spectral evidence” as proof of witchcraft in one fatal year. Witnesses testified that defendants’ specters had attacked them, even when the accused had demonstrably been elsewhere. But in 1693 the members of one jury repudiated their decisions of the previous months, saying that they had relied on “such evidence against the accused, as, on further consideration and better

information, we justly fear was insufficient for the touching the lives of any” (Kors and Peters 2001, 437).

In place after place, the witch hunts subsided over the issue of proof, despite continuing references to the power of the Devil and his minions. When large numbers of people were accused (several hundred were named, at least unofficially, in the Salem affair) and the standards of proof were quite low, anyone might be convicted. Witch hunts sometimes fell, in effect, from their own weight.

A focus on how standards of proof in witchcraft cases declined and finally rose suggests that the trials were not about disciplining any category of people; they resembled other contemporary criminal processes in their examination of evidence, except that panics about witchcraft were more likely than other crimes to afflict a given area. Witches could allegedly fly and gather anywhere in great numbers in an instant, so that their danger seemed acute to many Europeans, particularly when assiduous witch finders, news of other trials, or general anxiety highlighted their activities. The erection of new social boundaries or definitions cannot be correlated with witch hunts. Sometimes they occurred where such change never happened, but in regions of great social realignment they may have been minor or completely absent. Instead, the witch persecutions centered on the issue of proof.

PROTESTANT REFORMATION

The Reformation, which began in Germany by 1520 and quickly spread to the whole of central, western, and northern Europe, had considerable impact on the history of European witchcraft trials. By the mid-fifteenth century the concept of witchcraft had already acquired clear contours, and the first substantial prosecutions of this new “sect” had already begun. Meanwhile, the Inquisition’s longstanding preoccupation with older kinds of heretics took a back seat in Germany, where such trials had petered out entirely long before the Reformation began. Both ecclesiastical and secular authorities who retained their allegiance to Rome turned their undivided attention to fighting the Reformation.

The Reformation did not end the witch hunts; instead, most of the new Protestant churches evolved distinctive theological frameworks for persecuting alleged witches. After its consolidation at the Council of Trent (1545–1563), the Roman Catholic Church refurbished its late medieval doctrines. By the late sixteenth century, alleged witches and sorcerers were persecuted with varying intensity by every confessional denomination, except the underground Anabaptist sects. The climax of the witch persecution occurred between the Peace of Augsburg (1555) and the Peace of Westphalia (1648). Certain historians have extended the Reformation period into the seventeenth century, which suggests that the Reformation was an essential element in the increased frenzy against witches. However, it is more helpful to distinguish between the pre-1560 reformations and the subsequent confessional period (late sixteenth and early seventeenth centuries), when conditions were entirely different in the Holy Roman Empire, where most witch hunts occurred.

Except in Upper Germany, where Heinrich Kramer had already conducted extensive witchcraft prosecutions, Protestantism generated a reserved attitude toward witchcraft trials. The phenomenon was approached primarily through expositions of the first commandment, as a continuation of earlier attacks on superstition by medieval preachers. Their aversion to Dominican Scholasticism and to the papal Inquisition contributed to the fact that the early reformers, at least Martin Luther and the Swabian reformer Johann Brenz, opposed the cumulative concept of witchcraft. With Philipp Melancthon and Jean Calvin, humanist influences increased their skepticism toward certain elements of the concept of witches. Because the Reformation was predominantly concerned with the beliefs and practices of laypeople, forms of superstitious practices came under constant scrutiny. Early Protestants widened their interpretation of violations of

the first commandment to include reverence paid to saints and idolizing elements of creation, as well as to astrology and everything that distracted people from real faith in God. Every Christian was exposed as a radically superstitious being.

The background for this was the idea, shared by all streams of the Reformation, of human beings' inherent sinfulness and consequent inability to obtain righteousness before God with their own strength, necessitating complete dependence on God's forgiveness and grace. In the early stages of the movement, all Reformers favored spreading the Gospel without force, and Luther's rejection of civic punishment for heresy was one reason for his criminal conviction in 1520. Finally, the strongly eschatological aspect of the early Reformation assumed that the end of the world was imminent and led to a strong conviction that the reformation of the Church was the last great event in world history, one that would transform the whole Church in accordance with God's will. In Luther's later works, we find the assertion that sorcery and superstition had decreased when the Gospel began to "run its course," but that evil was again increasing, since the Reformation had not prevailed everywhere.

The concept of witchcraft survived the Reformation not because, as liberal nineteenth-century Protestantism asserted, some medieval "relics" were unintentionally retained. Rather the Reformation was subject to a premodern interpretation of the world to a significantly greater degree than "enlightened" or "disenchanted" Protestant theology was willing to admit. When Ernst Troeltsch distinguished "old" and "new" Protestantism around 1900, his principal criterion was the strong supernaturalism of old Protestantism. This, in fact, explained why concepts of sorcery and witchcraft, varied though they were, could be retained in Protestantism until the eighteenth century.

Further developments in the Reformation movement strengthened this phenomenon. In 1530, the failure of an attempted consensus between different reform movements within the church became apparent, and separate church structures soon evolved in German Protestant territories, England, and the Scandinavian countries. Their disciplinary regulations generally included clauses prohibiting sorcery but did not define this concept. In every Protestant region (as in places retaining allegiance to Rome), regulations treated witchcraft, divination, and similar violations of the first commandment as serious religious offenses.

At the same time, there was growing pressure to apply religious discipline in order to display the success of the respective confession and to enforce its requirements. The particular Protestant emphasis on the prohibition of even harmless sorcery and the misuse of Christian symbols and subject matter (often called white magic) enormously widened the circle of possible

offenders. On the one hand, this element of Reformed doctrine encouraged witchcraft trials and was adopted later by the Catholics; on the other hand, the Reformation stressed the individual believer's direct relationship to God, an aspect that discouraged mass persecution. Thus with regard to sorcery, the central message of the Reformation was that people should not blame misfortune or affliction on witches and sorcerers but accept that even unnatural sickness was due to the direct will of God. In following decades, this argument of the requirement of God's permission for witchcraft combined with widespread rejection of the concept of witches flying and holding Sabbats—both of which are specific to the Reformation—reduced the prospects for large-scale witch hunts in Protestant Europe.

By the end of the Reformation movement around 1555, a theological system had developed that conformed to its original ideas but left the issue of witchcraft unresolved. Therefore, during the subsequent confessional period, a relatively open discussion of the doctrine of witchcraft was possible within Protestantism, in sharp contrast to the doctrinal tradition of the Roman Catholic Church after the condemnation of Cornelius Loos in the 1590s. Protestant opponents of the witchcraft trials such as Johann Weyer, Anton Prätorius, Johann Matthäus Meyfart, and numerous others were not considered outsiders by supporters of severe witch persecution. However, by 1600 the concept of witchcraft had changed within Protestantism, because Protestant (and in particular, Lutheran) theology had reverted to the Scholastic interpretation of Aristotle and now accepted the cumulative concept of witchcraft, including the notion of witches flying and holding Sabbats.

Nevertheless, even orthodox books on doctrine, such as those of Johann Gerhard, contain no statements that exceed God's permission for practicing witchcraft. Much Protestant exegetical literature of the confessional period interpreted the biblical statements on witchcraft with a reservation not unlike that of the Early Middle Ages; in addition, the great increase in the philological knowledge of Protestant exegetes encouraged doubts about the validity of the contemporary concept of witches. Thus the theological spectrum of the Reformation was considerably broad; by the late sixteenth century, a cautious graduation separated the strong Lutheran theology as expressed in the *Formula Concordiae* (Formula Concord) of 1577, Melancthonian Lutheran theology, and Reformed Calvinism, which already partly rejected elements of supernaturalism and thus started a theological development that led to a radical rejection of the fundamentals of the witch hunts. However, witchcraft trials occurred in nearly all territories and states of the various Protestant denominations, with the Calvinist electoral Palatinate being the most important exception. Within

Germany, the focal point of witchcraft persecution, Reformed territories usually conducted fewer trials than Lutheran states.

Church historians have evaluated the Reformation's role in the history of witchcraft trials from various perspectives. In the early nineteenth century, Protestant historians firmly rejected any notion of confessional "guilt" for mass prosecutions; in the late nineteenth century, Catholics claimed exactly the opposite, that the Reformation laid the foundation for the hysteria about witches. The consensus from these debates is that the Reformation undoubtedly permitted a continuation of witchcraft trials and that this was not unintentional and was theologically motivated. However, relatively recent empirical studies (Midelfort 1972) suggested that, at least in Germany, Catholic territories pursued these prosecutions with somewhat greater intensity than most Protestant territories. One reason for this lay in the theological emphasis on an inscrutable divine Providence that characterized the Reformation; in addition, Protestantism had several leading figures, not all of whom were interested in witchcraft trials. However, a comprehensive study of the influence of the Reformation on the history of witchcraft trials, based on the insights gained over the last fifty years, is still a desideratum for historians of Christianity and of the witch hunts.

PRUSSIA

Witchcraft trials were common in early modern Prussia, being held in at least fifty places, but the

destruction of the Prussian archives in the twentieth century prevents an accurate estimate of the number of trials and executions. However, sources do exist in the Polish state archives in Gdańsk and in Bydgoszcz and in the library of the Polish Academy of Sciences in Gdansk (Danzig).

The political and ethnic history of this region, like so much else in eastern Europe, is complex. The Teutonic Order, which forcibly Christianized this territory, favored German colonization in the area. In effect, the population that developed mixed native Prussians with Germans, Poles, and Pomeranians. After Poland's King Casimir IV defeated the Teutonic knights in 1466, their lands were divided into Royal Prussia, which was incorporated directly into Poland, and a vassal-state ruled by the order. The latter part became the duchy of Prussia in 1525, when the grand master of the Teutonic Order converted to Protestantism. This entry examines the territory of ducal and Royal Prussia proper and excludes the Brandenburg section of the Prussian state. Ducal and Royal Prussia's population in the sixteenth century was between 500,000 and 800,000; by the late eighteenth century, Prussia's population was between 2 and 2.5 million.

THE LAW

Although the Chełmno Law was commonly recognized, it had no uniform codification and hence was locally applied in the three most popular revisions, its Lidzbark, Nowe Miasto, and Toruń versions. All Prussian laws penalized witchcraft with death by burning. The Teutonic knights, who were technically friars, ran ecclesiastical courts, which commonly heard cases of misdeeds against God and religion, witchcraft included, before and after accepting Polish suzerainty in 1466. Because witchcraft was treated relatively mildly under canon law (fines or penance usually involving public display of the sentenced clad in humiliating attire, commonly in front of the church at the time when the locals gathered for Mass), sorcery cases increasingly reached municipal and other secular courts; many autonomous Prussian towns passed so-called Willkür (discretion; arbitrary action), city and village statutes against witchcraft. Some of these statutes stipulated that witches be burned alive, some sent the witch to the block before burning, and some decreed banishment for life. After 1532, ducal Prussia followed the Carolina (the *Constitutio Criminalis Carolina*), the imperial law code promulgated in that year, and Royal Prussia recognized it on an auxiliary basis. Prussian laws were not reformed until the mid-eighteenth century. In 1746, King Frederick IV granted Samuel von Coccei the authority to reform the Prussian legal system, and a royal decree in 1750 made all death sentences, corporal punishments, and torture subject to royal approval, although torture was not abolished until 1754, well after the end of

witchcraft trials. The motivation for this judicial reform was state centralization, not humanitarian considerations. Royal Prussia abolished witchcraft as a crime only in 1776, due to the constitution adopted by the Polish parliament.

TRIALS IN PRUSSIA

Because of the ruination the Prussian archives suffered in World Wars I and II, the history, intensity, and extent of witchcraft trials in Prussia can be reconstructed only fragmentarily; occasionally an older work (Lilienthal 1861) provides information that has since been destroyed. Our earliest surviving Prussian evidence comes from the bishopric of Chelmno, where sorcerers were given ecclesiastical penances and occasionally banished. Exile was a means to maintain peace and order within a village; as late as 1724, the need to do this was stated explicitly as the grounds for a sentence of banishment given by a local court in Starogard.

Of course, witches were frequently put to death: for example, the Cistercians had two women beheaded and burned at Oliwa in 1662 (Rozenkranz 1993) and three more in 1664 (Bogucka 1997). On rural estates owned by self-governing towns, witchcraft convictions seem much more frequent and severe. In the towns, such trials appear even more numerous. The accusations were absolutely stereotypical: casting spells on humans or animals, acting in alliance and fornicating with the Devil, and producing poisons. Despite massive destruction, surviving sources indicate that witchcraft trials were held in some fifty Prussian localities (Bagart, Biały Bór, Braniewo, Bydgoszcz, Chojnice, Czerniejewo, Fordon, Gdansk, Głębock, Gniew, Grudziądz, Jantar, Kętrzyn, Królewiec, Kwidzyń, Młynary, Mrągowo, Nowe, Nowy Dwór Gdański, Olecko, Oliwa, Orneto, Ostróda, Pasztek, Pieniężno, Prabuty, Pszczółki, Puck, Rębielicz, Romankowo, Rudno, Skarszewy, Staniszewo, Starogard, Stary Targ, Straszyn, Subkowy, Szestno, Szczodrowo, Szczytno, Szpengawsk, Tczew, Toruń, Trąbki, Tropy, Tuchola, Ujeścisko, Wejherowo, Włocławek, and Zalewo).

Any figures for Prussian witchcraft trials can only be estimates. Furthermore, the number of people convicted for witchcraft cannot be determined because the materials in our possession frequently mention the initiation of a trial or represent only fragments of court files, without final sentences. However, some fragmentary information suggests that witchcraft trials were relatively frequent in Prussia, the only largely Germanophone Baltic region, just as they were in other Germanic enclaves in eastern Europe. In 1571, according to Hans Spatte's reliable chronicle from Gdansk, Prussian prisons held 134 women convicted of witchcraft, and 60 of them were burned (Simson 1902). This fairly early and possibly greatly exaggerated number of

arrests could have been caused by a massive hunt for Prussian folk healers who might have bewitched the young mentally ill Prince Albrecht. A record of criminal cases for the year 1595 lists 655 trials in Prussia, including 50 for witchcraft (this figure of 8 percent is relatively high in comparison with other German evidence, but not remarkable) (Wunder 1983).

A few localities produced numerous trials. For example, Fordon (now a district of Bydgoszcz), a place with only 271 inhabitants in 1674, held 73 witchcraft trials between 1675 and 1747, mostly coming from three neighboring villages (Żołędowo, Jastrzębie, and Niemcz). Another town of equal size, Nowe, recorded 28 persons accused of witchcraft. In one quite small Prussian city, Braunsberg, over 120 witchcraft trials are known before 1772. Its Old Town banished several sorcerers between 1534 and 1604 before burning its first witch in 1605 and its last in 1670; its New Town (whose records began only in 1600) burned its first witch in 1610 and its last one in 1686. Overall, trials came in small clusters (a maximum of 6) and under half of those tried (58 of 122) were executed. In Braunsberg, witches agreed that the Devil had no nostrils (Lilienthal 1861, 99). Prussia's last witchcraft trial took place in 1767, with the last execution for witchcraft in 1767 (in Oliwa).

Despite the formal abolition of witchcraft prosecution imposed in the second half of the eighteenth century, attempts to put witches on trial in Prussia were made as late as in the nineteenth and even twentieth centuries. When unsuccessful, such attempts sometimes ended in lynchings. In 1811 a woman accused of witchcraft (in connection with the great fire of the town) was executed by burning in Reszel. The court, however, did not consider the case in terms of witchcraft, but arson. In 1836, a woman suspected of witchcraft in the village of Chałupy was dunked, and she drowned. The justice administration judged the lynching severely and sentenced the ringleader to prison for life. Several claims of witchcraft were filed with the court of Puck as late as in the pre-World War II period. The court, however, dismissed the suits; witchcraft trials then disappear from the records. All that remains of the trials are local topographical names, such as Łyse Góry (Sabbat Hills), Góry Czarownic (Witch Hills), and Stawy Czarownic (Witch Ponds).

PSYCHOANALYSIS

Because psychiatry is traditionally associated with pastoral care and demonic possession with hysteria and insanity, psychoanalysis has proven a particularly fruitful interdisciplinary method for investigating the witch hunts in late medieval and early modern Europe. Psychoanalysis is the psychiatric method of studying the individual subconscious as a case history in order to diagnose disorders of the mind. The reasons for its usefulness as a historical tool are essentially twofold.

First, since the nineteenth century, seminal figures in psychiatry repeatedly and consciously referred back to the witch hunts and demonology as historical examples to justify their own contemporary theories. They eulogized the sixteenth-century skeptical witchcraft theorist Johann Weyer as the father of modern psychiatry, struggling against ignorance and superstition. In 1801, Phillipe Pinel praised Weyer in his *Traité médico-philosophique sur l'alienation mentale ou la manie* (Medical-Philosophical Treatise on Mental Alienation).

To his fellow "enlightened" physicians, Pinel explained the therapeutic value of exorcism: it offered an emotional shock treatment to cure deluded sufferers of demonic possession through cathartic ceremonies imbued with strong emotional connotations. The first man to hold an academic chair of psychiatry in France, Jean-Martin Charcot, coedited *Demoniacs in Art* (1887), which contained artistic representations of the possessed from the fifth to the eighteenth century. With a romanticized perception of Weyer, Charcot developed an analytic method known as "retrospective medicine," using his own theories about hysteria to analyze historical cases of possession.

Sigmund Freud, the foremost pioneer of psychoanalysis, learned about retrospective medicine while studying with Charcot in Paris in 1885. Freud also read widely in early modern medicine, theology, interpretations of dreams, and demonological literature. He developed a lifelong admiration for Weyer and incorporated the tenets of retrospective medicine into his own analyses of hysteria. Later, Freud made a detailed study of the demonic possession of Johann Christoph Haizmann, a seventeenth-century painter—arguably the first work of psychohistory. Since that time, numerous scholars, with varying degrees of success, have applied psychoanalytic methods and categories to explain subconscious motivations among witch hunters, accused witches, and demoniacs. Two noteworthy examples studied witch persecutions in early modern New England (Demos 1982) and offered a gender analysis of witchcraft trials in Augsburg (Roper 1994).

A second reason why a psychoanalytic perspective has enriched historical analysis of the witch hunts lies in the precocious sixteenth-century evolution of psychiatry and psychology as subjects of systematic investigation. Casuists and demonologists of all confessions (Weyer, for example, was Protestant) undertook such investigation; however, the Catholic Society of Jesus produced many early prominent leaders in this field. Indeed, Martín Del Rio, a prominent Spanish Jesuit and demonologist, coined the term *psychiatry*. In his *Florida Mariana* (The Flowers of Mary) of 1598, Del Rio specifically described Jesus as a psychiatrist (*psyche + iatrus* = "healer of souls") who authorized his representatives on earth to heal troubled or afflicted souls through various cathartic religious rituals and sacraments (e.g., baptism, auricular confession, pilgrimage, exorcism, etc.); Del Rio and other theologians literally touted such methods as "spiritual medicine." Widely recognized by contemporaries throughout Europe as "spiritual physic," its practitioners (referred to by the Italian exorcist, Giralomo Menghi, as *medici spirituale*) supplemented ordinary "physicians of the body" (*medici coporale*). In Catholic Europe, "spiritual physicians" were no mere allegory to "real" doctors; their domain was officially recognized by jurists and

even by physicians. Their perceived efficacy in treating both psychic and somatic illnesses agreed with orthodox perceptions of natural philosophy, Galenic humoral pathology, Aristotelian physics, and the Catholic casuistry of moral theology. As a relatively coherent psychiatric system, “spiritual physic” had strong social and moral components.

The twisted path from “spiritual physic” to modern psychoanalysis is complex, but there is a continuous emphasis in both on sexuality, sin, morality, and emotions. The earlier form provides some important keys to supplement the potential of psychoanalysis for studying the historical mentality behind witchcraft trials, especially how the closely related rituals of judicial confessions and torture aided in construction of the self. Finally, “spiritual physic” offers a frequently ignored historical argument that psychoanalysis, as a scientific method, has been linked for many centuries with medicine and pastoral care.

PURITANISM

A movement that shaped many of the ideas English demonologists held in the late sixteenth and seventeenth centuries, Puritanism also lent support to the prosecution of witches in England during the 1640s and in New England in 1692. Conversely, under some circumstances, Puritanism made it more difficult for courts to convict witches.

The term *Puritan* is applied to English Protestants of the late sixteenth and early seventeenth centuries who sought to make the English Church more fully Protestant and thus bring it into greater conformity with the Reformed or Calvinist churches on the European continent. Puritans were dissatisfied with the Elizabethan Settlement of Religion of 1559, claiming that it left the Church only partially reformed. They sought therefore to remove the vestiges of popery from English religious services, such as the wearing of vestments by the clergy, genuflection, the use of the sign of the cross, and bowing at the mention of the name of Jesus.

Puritans were divided on the issue of church government. Moderate Puritans were willing to work within the established episcopalian system of church government (i.e., a hierarchy of archbishops, bishops, and archdeacons), but more radical groups advocated the introduction of either a presbyterian system, in which a hierarchy of clerical synods and assemblies governed the church, or a congregational system, in which individual congregations possessed considerable autonomy and were only loosely associated in a national church. Presbyterians attempted without success to introduce their system of church government during the reign of Queen Elizabeth I (1558–1603). Only during the Puritan Revolution of the 1640s did the Westminster Assembly authorize the introduction of presbyterianism. That system, however, was soon replaced by a congregational structure of church government during the 1650s. Members of Protestant sects that wished to separate from the Church of England are generally not classified as Puritan, and after 1660 it is customary to refer to the heirs of Puritans, such as Presbyterians, Congregationalists, Baptists, and Quakers, as dissenters rather than Puritans.

Puritans were often identified by their religious fervor and the intensity of their commitment to religious reform. They were the “godly” ministers and laymen, the more zealous or “hotter” sort of Protestants, “saints” who were confident that they were members of the elect. As members of a godly community, Puritans practiced a rigorous moral discipline and sought to impose that same discipline on others. Because Puritans remained within the Church and only occasionally were prosecuted for nonconformity, it is often difficult to distinguish between them and the more orthodox English Protestants who are later referred to as Anglicans. Nevertheless, many prominent English demonologists between 1587 and 1646 (e.g., Henry Holland, George Gifford, William Perkins, Alexander Roberts, Richard Bernard, and John Gaule) acquired reputations as godly ministers and were sometimes referred to as Puritans. Theologically these men were all staunch Calvinists who resisted the efforts of Arminians (named for the Dutch theologian Jacobus Arminius) to weaken or modify the central Calvinist doctrine of predestination. Perkins, whose status as one of the most respected English theologians survived long after his death in 1602, provided inspiration for an entire generation of Puritan divines, including the most famous New England demonologist, Cotton Mather.

These “Puritan” demonologists agreed on most major questions regarding witchcraft and diabolism. First, like all good Calvinists, they proclaimed the sovereignty of God and the dependence of all demonic activity on divine Providence. The Devil worked only with the permission of God, and witches exercised no power of their own. Second, they emphasized the

demonic or spiritual nature of the witch's crime, focusing on the pact with the Devil rather than on *maleficium* (harmful magic), which was the exclusive concern of the English witchcraft statute of 1563 and the primary concern of the statute of 1604. Their concern with the diabolical nature of witchcraft, which usually did not include references to the witches' Sabbat, also led them to argue that the white magic performed by healers and cunning folk, which they classified as superstition, was just as dangerous as *maleficium*. Third, these ministers, like many Protestant demonologists on the Continent, identified witchcraft with Roman Catholicism. This tendency was reinforced by the Protestant classification of Catholic religious ceremonies as magical and the Protestant claim that many witches were papists. In his *Treatise against Witchcraft* (1590), Holland compared saint worship to devil worship and the sign of the cross to witchcraft. Finally and most distinctively, these Puritan demonologists placed a strong emphasis on the Apocalypse and the identification of witchcraft as the work of the Antichrist and the Devil during the final days. Roberts, for example, in *A Treatise of Witchcraft* (1616), declared that witchcraft was one of the dreadful evils prophesied for "these last days and perilous times" (Clark 1997, 325). The most powerful expression of this apocalyptic witchcraft literature was Cotton Mather's *Memorable Providences Relating to Witchcrafts and Possessions* (1689), in which he claimed that demonic possession and witchcraft were signs of the Devil's activity during the final days.

The most obvious disagreements among these English "Puritan" demonologists concerned their recommendations for proceeding against witches. Gifford, Bernard, and Gaule all urged considerable caution after observing miscarriages of justice in their native counties. The others took a harder line, including Perkins, who in *A Discourse of the Damned Art of Witchcraft* (1608) listed numerous proofs of diabolical activity that could result in a witch's conviction. He urged the execution of witches without exception because they depended on Satan as their God. Roberts defended the prosecution of Mary Smith in King's Lynn, Norfolk. The main concern of most of these godly ministers, however, including Perkins, was to prevent their parishioners from falling into theological error, not bringing accused witches to justice.

Puritanism did, nevertheless, inspire some ministers and lay magistrates to prosecute witches as part of a campaign to purge society of its diabolical contaminants. These efforts became most evident in England when Puritans gained control of the church and local government during the English Civil War. The largest witch hunt in England's history, the campaign Matthew Hopkins and John Stearne conducted in East Anglia in 1645–1647, can be attributed at least in part to Puritan

zeal. The religious orientation of Hopkins cannot be ascertained, although his reference to the marriage of the Devil to witches according to the order prescribed in Book of Common Prayer (the service book of the English Church) suggests Puritan sympathies. John Stearne, however, who served as Hopkins's assistant, was clearly a zealous Puritan layman, and in his treatise, *A Confirmation and Discovery of Witchcraft* (1648), Stearne described the prosecution of witches as a spiritual duty. Puritanism was pervasive in Essex at that time that Hopkins and Stearne were actively trying to discover witches. Many of the parishes in that county had replaced "scandalous" ministers with godly Puritans during the early years of the Civil War. A widespread iconoclastic campaign in Essex and Suffolk to destroy statues and paintings that Puritans considered idolatrous provides further evidence of the strength of Puritanism in the area where Hopkins and Stearne were most active. Millenarian sentiment was also strong in all Puritan counties during these years, especially in Essex. The strength of Puritanism in these areas helps to explain why local communities invited Hopkins and Stearne to discover the local witches they feared were in their midst and why those same communities encouraged or facilitated their prosecution.

In New England, where Puritanism was dominant from the settlement of Massachusetts Bay Colony by nonseparating Congregationalists in 1628 until the end of the seventeenth century, the connections between Puritanism and witchcraft were different from what they were in England. Owing to Puritan influence, the crime of witchcraft in Massachusetts was defined in demonic terms, and consequently witches could not be convicted without evidence of having made a pact with the Devil. This definition of the crime led to the acquittal of a great majority of witches accused by their neighbors of *maleficium* before 1692. In that year, however, the fits experienced by a group of young girls in Salem Village led the Salem community to attribute their afflictions to witchcraft, thus initiating a large witch hunt in which more than 150 individuals were arrested and 19 executed. Puritanism contributed to the Salem witch hunt in three related ways. First, the Puritan belief that God spoke to his chosen people of Massachusetts through signs and events in their daily lives—the remarkable providences that Mather discussed in his treatise of 1689—led them to interpret the afflictions of the girls and also the Indian war that had recently devastated the colony as signs of God's disfavor. The sermons of Samuel Parris, the minister in Salem Village, and his predecessor Deodat Lawson prior to the trials also encouraged their parishioners to believe that the misfortunes lay within the community itself and were the result of God's punishment. The accusation and prosecution of witches at Salem can thus be seen as a Puritan response to these supernatural

signs of divine anger. Second, the girls whose fits triggered the episode were brought up in pious Puritan families (some were members of the Parris household), suggesting a link among Puritan religiosity, demonic possession, and witchcraft accusations. Third, residents of Salem Village made many of the accusations against people who had apparently assimilated the commercial values of nearby Salem Town and who therefore posed a threat to the traditional Puritan values that the farmers of Salem Village were struggling to maintain.

The trials originally won the support of the Puritan ministers of the Boston area, under the leadership of Cotton Mather, who in a letter to the governor of the colony on June 15 urged the vigorous prosecution of the witches. In the end, however, it was a sermon by the Puritan minister Increase Mather, Cotton's father, in October that helped to stop the trials. The sermon, which was soon published as *Cases of Conscience Concerning Evil Spirits Personating Men* with endorsements by fourteen Massachusetts ministers, called for procedural caution in the trials on the grounds that the Devil might have made the girls see the specters of innocent people afflicting them. This skepticism regarding the validity of spectral evidence, itself a reflection of Puritan beliefs regarding the nature of demonic power, led to the termination of the trials and the release of the witches still in prison. The contrasting positions taken by Increase and Cotton Mather during the Salem witchcraft trials demonstrate that the relationship between Puritanism and witchcraft in New England, just as in England, cannot be expressed in simple terms. A determination to rid the world of the

Devil's confederates may have led many Puritans to support the prosecution of witches, but the Puritan belief in the limitations of demonic power by a sovereign God ultimately helped to bring them to an end.

QUAKERS

From its beginnings in the late 1640s and early 1650s, the Quaker movement was regularly associated with demonism and witchcraft. Opponents frequently accused Quakers of using bewitched objects in order to make new converts; tales of enchanted ribbons, bottles, and strings figured prominently in early anti-Quaker literature. The leadership of the new sect was particularly susceptible to such accusations. George Fox, for example, whose charismatic and forceful personality was crucial to the formation and survival of the early movement, was routinely represented as a sorcerer or witch, employing a wide range of diabolical devices in his search for proselytes. Women and the impressionable young were considered particularly vulnerable to such approaches.

The strange actions and habits of the Quakers provoked yet further comparisons with the behavior usually attributed to witches and the possessed. The act of quaking bore obvious similarities with the fits suffered by those who were thought to be possessed by demons; indeed, numerous ex-Quakers either claimed to have been bewitched or, like James Nayler, reputedly suffered this fate. The unconventional behavior of others was equally suspicious. Some were accused of necromancy by seeking to raise the dead. Their habit of meeting frequently in dark, secluded places in the dead of night (usually to avoid detection and molestation) fueled popular suspicion that such nocturnal gatherings were in fact diabolical Sabbats.

Occasionally, such suspicions mushroomed into full legal proceedings against Quakers for witchcraft. In 1659—a year characterized by intense social, religious, and political anxiety in England—trials of Quakers took place at Cambridge, Sherborne (in Dorset), and Dartmouth (in Devon) in which members of the sect were variously accused of meeting with the Devil and employing witchcraft. In addition to such official actions, Quakers were also frequently subjected to popular shaming rituals such as ducking and pricking, procedures normally applied to suspected witches.

Quakers responded to such treatment by accusing their opponents—particularly the clergy, whom they saw as orchestrating these events—in kind. Fox and his deputies repeatedly accused their persecutors of acting like the Old Testament magicians Jannes and Jambres and the New Testament witches Elymas and Simon

Magus. The Quaker conception of witchcraft, however, like that of other contemporary radical sects, differed from the established one by defining it as an act of spiritual apostasy. The Quakers rarely, if ever, suggested that their enemies employed physical spells against them, but rather stressed the extent to which the spirit of witchcraft motivated their actions.

The widespread association of the Quakers with witchcraft was long-lasting and frequently revived during times of acute religious and political crisis. Their treatment as surrogate witches owed much to the fact that they were widely feared and reviled, especially by those in authority, who accused them of attempting to invert the social and political order. Symbolically, in the eyes of the establishment, Quakers shared many characteristics with witches and were often perceived in conspiratorial terms as part of a wider Catholic or Jesuit-inspired plot to subvert the Protestant nation (association with Catholicism provided further evidence of their diabolical nature and intent). Their prosecution in large numbers after the Restoration might well, then, have represented an important shift in official attitudes: the threat posed by them and others who refused to conform to the restored Anglican church now replaced that previously attributed to witches. The decline of trials for witchcraft in this period and the concomitant legal assault on religious dissent are certainly highly suggestive, though still unproven.

R

RABANUS MAURUS (CA. 780–856)

An early medieval commentator on magic, Rabanus (properly Hrabanus) Maurus was a German Benedictine monk who, after twenty years as abbot of the important and influential monastery of Fulda, became archbishop of Mainz. Regarded by his contemporaries and his immediate posterity as a great teacher, he lived at a time when the Carolingian Empire was under threat from dissident and hostile forces both at home and abroad. He played an important role in church reorganization and monastic reform, convinced that active and well-educated clergy represented the best hope for the future of the Church. He wrote voluminously, principally exegetical treatises, pastoral essays, and encyclopedic compilations. In *De institutione clericorum* (The Education of the Clergy), he described the grades and appropriate clothing of ecclesiastics, described and discussed the liturgy, and outlined the education of a preacher. *De universo* (The Whole of Creation) was a major compilation in twenty-two books that uses a very large number of excerpts from other authors, whose work Rabanus interprets and expands according to his own system and understanding. Rabanus also wrote poetry, although none of it can be called exceptional. The ascription of the well-known hymn “Veni, Creator Spiritus” to him is very dubious.

DE MAGICIS ARTIBUS (ABOUT MAGICAL ARTS)

Magic appeared in several of Rabanus’s writings, but his principal thoughts on the subject were gathered into this short essay. It exists in a single manuscript copy, and although it was highly derivative, it offers us an invaluable insight into the alarm felt by a conservative ninth-century priest surrounded by constant evidences of magical practices in a scarcely converted society. Not surprisingly, therefore, Rabanus opened with the remark that the condemnable arts of magic, incantations, and various other superstitions were to be found among “pagans and false Christians” who practiced divination and other wrongheaded observances. These arts had proved powerful because they had been passed down to humankind by evil angels all over the world for many centuries, and they included knowledge of the

future and of things pertaining to hell or the underworld, various methods of divination, and necromancy. But all this was mere magical trickery.

“Magicians,” said Rabanus, “are people who, in the vernacular, are called ‘workers of harmful magic’ [*malefici*] because of the gravity of their misdeeds. These people, with God’s permission, stir up the elements, and throw people’s minds into confusion, (although less so in those who have faith in God), and kill without any blast of poison, but merely by physical violence” [*Patrologia Latina* 110.1097].

Rabanus went on to describe various kinds of divination—necromancy, hydromancy, geomancy, and so forth—supporting all his remarks by copious references to classical literature and the Bible. A Christian should avoid all these arts, he said. He discussed the contest between Moses and Pharaoh’s magicians and the appearance of Samuel, conjured by the witch of Endor at King Saul’s request, concluding that (apart from Moses) the pagans were dependent on illusions created by Satan. Evil spirits could move much faster than human beings because they were made of air rather than earth, and they could therefore be aware that much more quickly of things that they were then able to announce as though they had known them in advance of their happening. This was also how they were able to perform apparent wonders; for their subtle aerial bodies enabled them to penetrate human bodies and therein create fantasies, whether the person was awake or asleep. Sometimes the spirits’ ability to predict the future rested simply upon their knowledge of signs in nature, much as a physician could predict disease in a way that seemed amazing to anyone not trained in medicine. But evil spirits generally deceived (and were deceived) in their predictions either because of their malicious dispositions or because nature foiled their expectations by producing unexpected weather or temperatures.

“We must therefore be alert,” he wrote,

and with all earnestness be on our guard lest in our time, (in which we see the Christian religion spread over the whole world), the slackness of teachers and idleness of the educated—those few who still survive—destroy the proper worship of the true

God; and lest those who have been corrupted by the demons' illusions bring false divinations among the people of God, and lead astray those who live in the country, and those who have neither learning nor experience. (*Patrologia Latina* 110.1107)

RAEMOND, FLORIMOND DE (1540–1601)

Best known for his history of the rise and decline of Protestantism, Florimond de Raemond offers a particularly interesting example of the complexity of attitudes toward witchcraft in late sixteenth-century France. Born into the Bordeaux judicial elite in 1540, Raemond was educated at the Protestant-oriented College of Presles in the University of Paris. Apparently drawn to Protestantism in the 1560s, he renewed his commitment to Catholicism after witnessing the exorcism of Nicole Obry in 1567. Raemond was closely associated with the most famous witchcraft skeptic among the judges of the *Parlement* (sovereign judicial court) of Bordeaux, Michel de Montaigne, whose seat he purchased in 1570 and for whom he maintained a high regard his whole life. But Raemond was also married to a sister of the most bloodthirsty and credulous judge at Bordeaux, the demonologist Pierre de Lancre. Unlike most of his Bordeaux colleagues, Raemond adopted his brother-in-law's views about witches rather than those of Montaigne.

Raemond was an active writer, publishing several works on contemporary issues. His 1597 work *L'Anti-Christ* shows his thought well. Interestingly, he began from a skeptical viewpoint about human ability to understand the mysteries of God, directly acknowledging his debt to Montaigne. But, unlike Montaigne, this position led him to embrace the authority of Catholic dogma. Raemond stated that belief in the Antichrist was an article of faith and that all loyal Catholics had to fight against the Devil and his allies, the Protestant heretics. In the current violent and corrupt age, he said, heresy had come to flourish not just in secret places but also in broad daylight. One signal proof of the arrival of the Antichrist, the ally of the heretics, was the expansion of witchcraft. Although the *Parlement* of Bordeaux seems to have been the very last French appellate court to approve an execution for witchcraft (the first documented instance came in 1594), Raemond insisted that the court had been active and severe, claiming that so many witches had been turned up that there were not enough

judges to conduct all the trials and that the prisons were full of accused witches. He died before his brother-in-law Pierre de Lancre would fulfill this prophecy.

Raemond's Catholicism resulted from a deep personal conversion; he adopted positions very unlike the moderate Gallicanism held by most of his judicial colleagues, even arguing that France needed a real inquisition, like Spain's, to deal with heretics and witches. Raemond blamed all the troubles of his day on the Reformers, followers of a false diabolical sect. The Protestants who died for their faith were not martyrs, he claimed, but people who were "possessed by the Devil." (Raemond 1957, 792).

Another of Raemond's works, published posthumously, repeated these arguments, calling Martin Luther "if not the Antichrist, at least his advance rider" (Raemond 1605, 234) and tying Protestantism closely to the work of the Devil, the coming of Antichrist, and thus to the Apocalypse. In both works, Raemond discusses the exorcism of Nicole Obry, which he witnessed and which turned him back to Catholicism. He called the exorcism "A famous miracle and one of the greatest that the human eye had ever seen, and that Devils themselves could not explore (Raemond 1605, 140)." The special ability of the Catholic Church to produce this sort of modern miracle validated the Church's claims and became an important weapon in the fight against heresy as well as witchcraft.

RAIS, GILLES DE (1404–1440)

Better known as "Bluebeard," Gilles de Rais was a nobleman from southwestern France whose dramatic career combined chivalric ideals with the harsh realities of war and set dramatic displays of personal piety against the most disturbing allegations of child abuse and devil worship. Orphaned while still young, he greatly increased his lands through a combination of inheritance, dynastic marriage, banditry, and simple extortion to become one of the foremost nobles in France, controlling chains of fortresses dominating the Loire Valley from Angers to the Atlantic seaboard.

In 1427, he led his troops against the English forces around the Mayenne and Sarthe Rivers. In 1429, he was

named one of the chief commanders of the army that would be led by Joan of Arc. Their brief but dazzlingly successful partnership appears to have been based upon mutual trust, utterly untarnished by any form of jealousy. Rais quickly proved himself an extremely brave and loyal knight and a thoroughly competent general. He distinguished himself in raising the siege of Orléans on May 8, 1429, and at the battle of Patay on June 18, 1429. Rais was chosen to carry the ampoule of holy oil to Reims for the anointing of Charles VII at his subsequent coronation on July 17, 1429. The king created him marshal of France that same day as a reward for his services. He fought beside Joan during her unsuccessful attack on Paris on September 8, 1429, and it was to him that she called when she fell wounded.

During the following year, Rais became embroiled in internecine struggles for power at court. He was stationed in the French garrison at Louviers, only a few miles from Rouen, during the critical weeks when Joan faced her interrogators on a charge of heresy. It is not clear whether he contemplated making a rescue attempt. Like the king, however, he offered no ransom for her. In 1432, he distinguished himself by breaking the English blockade and relieving a beleaguered French garrison at Lagny. This would be his last significant action during the Hundred Years' War; in 1433, his patron, Georges de Tremoille, fell from power at court, effectively ending Rais's military career. Deprived of royal favor, he now waged a private war on the Burgundians, amassed an enormous private library, and founded a religious college dedicated to the Holy Innocents. On May 8, 1435, the sixth anniversary of the city's liberation, he staged *The Mystery of the Siege of Orleans*. Not only did Rais write the play, but he also performed a leading part on stage, together with 500 other actors, and paid for food and drink for everyone from his own purse. As a result of such extravagances, and of the enormous sums he bestowed upon churches under his patronage, he became deeply indebted. Possibly as a result, he made the acquaintance of a Florentine magician, Francesco Prelati, and they embarked upon many experiments to discover the secrets of the philosophers' stone.

In November 1439, Charles VII issued a grand ordinance proclaiming the establishment of a royal army and an end to the depredations of the free companies and brigands, who were ravaging France. Gilles de Rais, with his private armies and castles, was a prime target of the legislation. Desiring to revenge himself upon his political rivals, particularly the duke of Brittany, Rais effectively invited exemplary punishment in May 1440 by seizing a castle belonging to one of the duke's agents and dragging the man's brother—a priest—from church during mass and chaining and imprisoning him. This last act outraged the ecclesiastical courts. Ignoring a fine for his misconduct, Gilles now became

the target of an investigation by the bishop of Nantes, which centered on allegations, dating back several years, of witchcraft and child abduction.

Arrested on September 14, 1440, and accused of performing necromantic invocations of demons with Prelati in hope of obtaining wealth, power, and knowledge from devils, Rais was also charged with the ritual murder of countless children. He was brought before the tribunal to hear depositions gathered from his former servants. Although his opening defense was haughty, challenging both the competence of his judges and their impartiality, his attitude toward the court soon underwent a profound change. Having been excommunicated from the Church and having almost certainly been tortured within an inch of his life, he publicly begged forgiveness at his next appearance before the tribunal, just two days later, for his previous insulting behavior and confessed to having practiced alchemy, devil worship, sodomy, and infanticide. The first part of this public confession inspired feelings of clear revulsion, but its conclusion, emphasizing his piety and offering himself as an object of pity, persuaded his judges to lift the sentence of excommunication.

Now a humble penitent rather than a proud nobleman, Rais sought to provide the clergy and people of Nantes with a parable of redemption, showing how an evil life could still demonstrate the miraculous and providential intervention of God, who had saved his soul through the act of sentencing him to death. Accordingly, Rais was hanged beside the bridge at Nantes on October 26, 1440, impressing the assembled crowd with his contrition and bravery. His abject confession enabled him to save his body from the flames and to obtain Christian burial at a nearby Carmelite Church and allowed his heirs to enjoy his estates.

Set against the backdrop of Joan of Arc's canonization, radical reassessments of Rais's life and career began in the 1930s. Aleister Crowley saw him as a man of science destroyed by an intolerant Roman Catholic Church (Crowley 1930, viii, xviii). Margaret Murray saw both Joan of Arc and Gilles de Rais as members of an underground pagan religious tradition who had willingly sacrificed themselves, going to their deaths as victims required by the "Old Religion" that their royal master might live and reign for a further span of years (Murray 1961, 193, 197). French writers have produced less bizarre theories than those of Crowley and Murray, but remain only slightly less titillated by his trial than by that of St. Joan (Bataille 1972a and 1972b).

RANFAING, ELISABETH DE (1592–1649)

The Venerable Mother Marie-Elisabeth de La Croix de Jésus, founder of the religious order Notre-Dame-du-Refuge, began her religious career as a demoniac.

As a pious widow in her twenties, the Lorraine noblewoman Elisabeth de Ranfaing experienced inner torment when a suitor, Charles Poirot, asked to marry her. She saw Poirot's interest in her as a diabolical plot to prevent her from fulfilling a vow of chastity. Exorcists diagnosed her torment as possession and exorcised her in public. On the basis of Ranfaing's claims during her exorcisms, Poirot and a woman accomplice were convicted of witchcraft and executed in 1622. Ranfaing's behavior impressed elite patrons seeking to promote the current Catholic spiritual revival. With their support, she founded in 1624 an order for the reclamation of prostitutes, Notre-Dame-du-Refuge, which was formally instituted by a bull of Urban VIII in 1634. A secret circle of followers, called Médaillistes, worshiped her as a living saint. Some Jesuits who resented the involvement of other Jesuits in her group attacked this cult, which disbanded in 1648. Her order opened sixteen houses across Lorraine, France, and Sicily but did not survive the French Revolution.

Ranfaing's story is one of several from this era in which demons played a vital role in the cultivation of perceived sanctity. Not only was Ranfaing said to be possessed by demons who tortured her—a "standard" feature of possession—but she also alleged that her torment was caused by a witch. Thus, her state of possession did not result from her own sin, and her own intense struggles against her unacknowledged feelings of attraction to her physician Poirot were interpreted as signs of possible sanctity. In a term indicative of the seventeenth-century Catholic preoccupation with virtue through suffering, Henri-Marie Boudon described Ranfaing as "the great sufferer of her age" (Boudon 1686, 17).

A widow with three daughters living in secular society, Ranfaing was not the most obvious candidate to become a living saint, yet she found friends among the ducal household of Lorraine. This support existed regardless of—or perhaps because of—her controversial witchcraft accusations against Poirot and a Minim Provincial; her only local contemporary who actually became a saint (Pierre Fourier) expressed skepticism about Ranfaing's possession. Outside Lorraine, the authenticity of her possession was challenged in print by a young Minim ([Pithoys] 1972). In an era of moral enthusiasm, her mission to preserve herself, and later other young women, from sin gained widespread approval. The convent's benefactors included Duke Charles IV of Lorraine; Jean de Porcelet de Maillane, count-bishop of Toul; Eric of Lorraine, count-bishop of Verdun; Pierre Coton, the Jesuit confessor of Louis XIII; and Cardinal Pierre de Bérulle. Ranfaing was a friend of the mystic Mother Alix le Clerc, who herself suffered from persistent demonic torments.

Ranfaing fascinated a group of male and female admirers, religious and lay, who believed she enjoyed direct communication with God and saw her as the means to their salvation. The enemies of this group called them the Médaillistes, from the little religious medals, blessed by Ranfaing herself, that they wore and sold. In some ways, the Médaillistes resembled other secret sodalities that emerged around the post-Tridentine Jesuit order, becoming a common feature of early modern Catholicism. Their members practiced mortifications and intensive prayer, as well as frequent communion.

The fact that Ranfaing had become known initially through her possession by demons left her vulnerable to those who felt threatened by her cult. In 1628, two years after she had been delivered of her demons and six years after Poirot's execution, a provincial of the Capuchin order still referred to her disparagingly as "this possessed woman" and accused her followers of using their medals and other paraphernalia for magical purposes. In the mid-1640s, an internal Jesuit conflict finally disbanded her cult by claiming that those Jesuits who followed her had become a sect of magician-priests, serving a woman whose possession by demons had left her in a state of moral and spiritual ambiguity. Her four main Jesuit followers were expelled, and other Jesuits were warned to avoid her. Nonetheless, one Jesuit follower, Jean d'Argombat, began a hagiographic account of Ranfaing's life, which remained incomplete at his death in 1654.

RATEGNO, BERNARDO OF COMO (D. 1510)

Rategno was a Dominican inquisitor, author of the inquisitorial manual *Lucerna inquisitorum haereticarum pravitatis* (A Lantern for Inquisitors of Heretical Depravity) and the witchcraft tract *Tractatus de strigibus* (Treatise on Witches, ca. 1510). Active in northern Italy in the late fifteenth and early sixteenth centuries, Rategno earned the reputation of being a ruthless persecutor of witches. His treatises, essentially reference guides for inquisitors, justify the prosecution of witches (*Tractatus de strigibus*) and outline the proper procedures for such prosecution (*Lucerna*). Both works offer modern scholars important sources for Italian witch beliefs and early witchcraft trials.

We know little about Rategno. A member of the Dominican Congregation of Lombardy, he preached frequently in the diocese of Como in the late fifteenth century and served as inquisitor there, engaging in a zealous prosecution of witches from 1505 until 1510, when he probably died. While serving as inquisitor, he composed both of his treatises, which were first published—together—at Milan in 1566 and reissued at least three times before 1700. The renowned Spaniard jurist Francisco Peña published a 1584 Roman edition with commentaries.

Although Rategno never explicitly cites the *Malleus Maleficarum* (The Hammer of Witches, 1486), scholars have noted similarities between the main arguments of *Tractatus de strigibus* and those in the notorious German tract. Rategno's descriptions of the witches and their diabolical assembly, the so-called game (*ludus*), agreed with those of other northern Italian demonologists and, like them, reflected local witch beliefs. For instance, Rategno refers to the witches' rite of feasting on the meat of an ox that the Devil later resuscitated—

also described in other witchcraft tracts by Girolamo Visconti and Bartolomeo della Spina and found in the records of a witchcraft trial at Modena in 1519.

In *Tractatus de strigibus*, Rategno defined the term *witch* and included a description of witches' crimes. Rategno's "modern" witches, mostly women, renounced the Christian faith and surrendered themselves body and soul to the Devil. They were physically transported to their diabolical meetings, where they engaged in blasphemous, heretical rites and copulated with demons. The witches inflicted harm on livestock, crops, and other persons' health by magical means. The Devil also helped them bring about impotence and other impediments to the consummation of legitimate sexual relations. According to Rategno, their dreadful transgressions, and especially their apostasy and devil worship, justified severe punishment from inquisitors. He ended the *Tractatus de strigibus* with a brief discussion of appropriate judicial procedures for witchcraft cases, a matter he developed more fully in the *Lucerna*.

Throughout *Tractatus de strigibus*, Rategno denied that the misdoings confessed by witches were illusions, though he conceded that they may be at times. Drawing on witnesses' testimonies from trials he had conducted in the region of the Valtelline (Valtellina; Veltin), he concluded that the witches' transgressions were real. Rategno avoided contradicting the authoritative *Canon Episcopi* (ca. 906), which stated that at the time of the Council of Ancyra (Ankara) in 314, women deceived themselves by believing they rode at night with the goddess Diana. Rategno argued, however, that in more recent times, witches might be physically transported to diabolical meetings where they would perform terrible crimes.

Using records of witchcraft trials he found in Como's inquisitorial archives, Rategno argued that the diabolical sect of witches had only come into existence some 150 years earlier. Although our earliest surviving records of witchcraft trials in the region of Como date from the 1450s, modern scholars have used Rategno to prove that witches had been prosecuted in this region since the mid-1300s. Rategno's assertion was reinforced by a certain legal opinion (*consilium*) attributed to the renowned fourteenth-century Italian jurist Bartolo of Sassoferrato, which discussed the trial of a witch found at Orta, a village northwest of Novara. But in 1975, Norman Cohn identified this *consilium* as a late-sixteenth-century forgery, perhaps based on the *Tractatus de strigibus*, by the Novarese jurist Giovanni Battista Piotta (or de' Ploti).

REBELS

Witches were often depicted as rebels, although very few of them actually assumed that role. Demonologists and witch hunters considered witches to be heretics and apostates and therefore guilty of treason against God. In this regard, witches were compared with their alleged master, the Devil, who began his malevolent career with an act of rebellion against God. "The most notorious traitor and rebel that can be is the witch," wrote the English demonologist William Perkins, "for she renounceth God himself, the king of kings, she leaves the society of his Church and people, she binds herself in league with the Devil" (Perkins 1613, 651).

Witches were also accused of rebellion against human political authority. Demonologists linked the crime of witchcraft and political rebellion by citing the Hebrew Bible, which declared that "rebellion is as the sin of witchcraft" (1 Sam. 15:23). In the fifteenth century, secular and ecclesiastical authorities often claimed that peasant rebellions were manifestations of witchcraft. At the Council of Basel (1431–1449), the bishops believed that rebels in the countryside belonged to a satanic conspiracy and consequently took steps to eradicate witchcraft. The reference in the *Malleus Maleficarum* (The Hammer of Witches, 1486) to sorcerers who were archers reflected fears in German lands of Swiss archers who had defeated the army of the Holy Roman Empire in 1477. It also revealed the fear that peasants from southern Germany might obtain Swiss military assistance in an uprising against the empire. Throughout the period of witch hunting, Bohemian rebels against Habsburg rule were often accused of worshipping the Devil. Accounts of a massive diabolical conspiracy in the Pays de Labourd in southwestern France

were conditioned by the fact that this area was a center of Basque resistance against the French monarchy.

The identification of witchcraft with rebellion was particularly strong in Scotland. In 1590, a group of Scottish witches were accused of having tried to kill their king, James VI, and his new bride, Anne of Denmark, as they sailed for Scotland across the North Sea. In this case, charges of witchcraft became closely associated with charges of treason. Shortly after the restoration of Charles II in 1660, Scottish royalists tried to link the Covenanters, who had rebelled against King Charles I, with witchcraft. At a drunken ceremony in the town of Linlithgow in 1661, magistrates attached an inscription reading, "Rebellion is the mother of witchcraft" to a chest representing the Ark of the Covenant (Kirkton 1817, 126).

The connection between witchcraft and rebellion was not as strong in England as in Scotland, but during the English Civil War (1642–1646), a radical clergyman, Thomas Larkham, was accused of witchcraft, rebellion, and treason. The philosopher Thomas Hobbes, who denied that witches had any real power but thought they should be prosecuted for claiming to be witches, considered witchcraft a crime of disobedience and rebellion. During the Jacobite uprising of 1715, the clergyman White Kennett preached a sermon entitled "The Witchcraft of the Present Rebellion." This indictment of both Scots and English who had tried to overthrow King George I reveals that the rhetorical association between the two crimes remained strong even at a time when the crime of witchcraft was no longer being prosecuted.

Although witches were often accused of rebellion and treason, few can be shown to have actually participated in any kind of political conspiracy, protest, or rebellion. The recognition that most witches were scapegoats for the misfortunes experienced by their neighbors makes it unlikely that many witches were in fact rebels. Only occasionally did accused witches actually engage in activities that could be viewed as rebellious. Practitioners of ritual magic, who were occasionally tried for witchcraft, sometimes directed their maleficent magic at political leaders whom they wished to depose or replace. In colonial Peru, witches served as defenders of native Andean culture during the period of Spanish rule, encouraging disobedience to the parish priests and local political authorities. If one were to extend the definition of rebellion to include defiance of conventional social norms and standards of feminine behavior, a large number of witches might qualify as actual rebels.

REICHSHOFRAT (IMPERIAL AULIC COURT)

The *Reichshofrat* (imperial aulic court) (est. 1497–1498), was the Holy Roman Empire's second highest appellate court, after the *Reichskammergericht* (imperial chamber court). In addition to its legal duties, this court also had an advisory and administrative role. In contrast to the *Reichskammergericht*, the *Reichshofrat* did not have a permanent seat. Instead, it traveled with the emperor, sitting wherever he resided. During the age of witch hunts, this was usually Prague or Vienna.

As Vienna's Hage House, Court, and State Archive has only recently begun editing a modern index of files, the *Reichshofrat* has not yet been researched as extensively as the *Reichskammergericht* in Speyer. Because of its close ties to the emperor's court and its mostly Catholic officers, the *Reichshofrat* was seen as an imperial tool in religious and constitutional disputes by the late sixteenth century. With its greater political power, the *Reichshofrat* was mainly occupied with settling political disputes, rather than private conflicts, as the *Reichskammergericht* did. However, its exact role remains unclear, despite theories that a north–south conflict and religious differences were responsible for the antagonistic relationship between the two courts. The assertion that the *Reichshofrat* seemed downright medieval in the sixteenth century certainly deserves closer examination. The court's organization, however, is known. In the Aulic Court Order of 1539, a president was appointed to represent the emperor. The court's procedures were probably less elaborate than those of the *Reichskammergericht*, therefore making the *Reichshofrat* considerably quicker at resolving disputes.

Friedrich Spee mentioned the *Reichshofrats* role in German witchcraft trials. In the preface to his second edition of *Cautio Criminalis* (A Warning on Criminal Justice) in 1632, Spee (writing as his former student, Johannes Gronaeus) claimed that numerous members of both the *Reichshofrat* and the *Reichskammergericht* had requested a new edition of his book to "ready the way to further prove and research the truth." The *Reichshofrat* was apparently considered an opponent of witchcraft

trials, as was the *Reichskammergericht*. A remark by Melchior Goldast in his posthumously published work on the confiscation of witches' estates further illustrated this perception: Goldast demanded that the *Reichshofrat* encourage lax estates to conduct witch hunts.

Unlike those of the *Reichskammergericht* in Speyer, the *Reichshofrats* decisions regarding witchcraft are not well known. First, the famously antagonistic relationship between these two courts shows up even in the matter of witches. Offenburg's guilds complained to an imperial commissioner in 1599 about their city council's restrained persecution practices. In the name of the *Reichshofrat*, the commissioner demanded that the city start conducting witchcraft trials, but only in adherence with the Carolina Code, the imperial law code. When the *Reichskammergericht* repeatedly intervened on behalf of the accused at the high point of persecution in 1608, Offenburg's council complained to the *Reichshofrat*. The *Reichshofrats* position regarding witches seemed rather ambivalent. Other trials, in which plaintiffs unsuccessfully tried to take action against unlawful prosecution first in the *Reichshofrat* and then in the *Reichskammergericht*, give the same impression of ambivalence.

The *Reichshofrats* successful intervention in witchcraft trials in Bamberg and the electorate of Cologne stands in clear contrast to the above examples. In the prince-bishopric of Bamberg, the *Reichshofrat* intervened often in 1630 and 1631—once on behalf of Dorothea Flöck, who had been imprisoned for witchcraft and was executed during the ongoing aulic processes. Nevertheless, the numerous *Reichshofrat* cases from Bamberg seem to have hastened the end of that city's witchcraft trials, helped by several personal interventions by Emperor Ferdinand II and Pope Urban VIII and the sudden end of Würzburg's hunts.

In the electorate of Cologne, the *Reichshofrat* also intervened on behalf of those persecuted for witchcraft. Its May 1639 *inhibition de non ulterius procedendo* (order to stop proceeding) on behalf of Gerhard Urbach, who had been arrested for sorcery, led to a noticeable reduction in the number of witchcraft trials; until then, an excessive number had been conducted (Schormann 1991, 165). To prevent further complaints to the *Reichshofrat* from victims of persecution, the electorate of Cologne's court ordered that everything having to do with witchcraft be conducted henceforth "according to legal order." Because it was so closely tied to the imperial court, the *Reichshofrat* had greater political authority than the *Reichskammergericht*.

Perhaps the *Reichshofrats* biggest case concerning witchcraft involved the protest by families of victims executed for witchcraft in the county of Vaduz that went to Emperor Leopold I and eventually to the *Reichshofrat*. The court accepted the accusations of excessive torture and extortion against the count of

Vaduz, Franz Carl von Hohenems, and ordered him removed from office (Monter 2002, 33).

Whether or not its interventions on behalf of persons persecuted for witchcraft were always as successful as those in Bamberg and the electorate of Cologne, and exactly what the antagonistic relationship with the *Reichskammergericht* regarding witches entailed, will become clear once the files in Vienna have been thoroughly examined.

REICHSKAMMERGERICHT (IMPERIAL CHAMBER COURT)

Founded by the Diet of the Holy Roman Empire at Worms in 1495, the *Reichskammergericht* (imperial chamber court) was—together with the *Reichshofrat* (imperial aulic court)—one of the two highest courts of the Holy Roman Empire. In the mid-nineteenth century, Paul Wigand used a few cases to argue that the imperial chamber court had assisted people against witchcraft persecution, reprimanding lower courts that had permitted unbearable conditions of incarceration, used magical drinks to get confessions, or performed water ordeals (the swimming test) (Wigand 1851, 73–82). Recent research has largely upheld this assessment while greatly deepening our knowledge of the amount and the contents of the imperial chamber court's judgments in matters of witchcraft (Oestmann 1997).

COMPETENCE

The imperial chamber court dealt with witchcraft through several indirect means. Its types of proceeding

included litigation over jurisdiction, appeals in cases of verbal injury to reputation (*actio iniuriarum verbalis*) or of bodily injury (*actio iniuriarum realis*), grievances for annulment, and pleas for mandates. The suits concerning annulments and mandates were especially important.

The judges, or assessors, of the imperial chamber court intervened in several witchcraft cases, because they claimed the highest jurisdiction in the Holy Roman Empire and tried to enforce a correct proceeding for every subject. However, with regard to criminal law, its jurisdiction remained limited: Charles V's criminal code of 1532 (the Carolina Code: [*Constitutio Criminalis Carolina*]) included a clause leaving the possession of criminal jurisdiction to the princes and other imperial estates. Nonetheless, an imperial chamber court law of 1555 permitted anyone to apply to the *Reichskammergericht* in cases involving severe violations of general rules of criminal procedure.

DECISIONS

About half of the 131 legal proceedings instituted by victims of witchcraft trials against local and territorial authorities were mandate lawsuits (*mandata*). The next most frequent forms were legal proceedings for annulment (*querelae nullitatis*) and suits where the assessors issued a *citatio super injuriis* in cases of bodily injuries. In general, the immediate result of a mandate lawsuit was a notification by the imperial chamber court that the plaintiff was now under the emperor's protection. In most cases, these mandates were subsequently confirmed by final sentences. In suits for annulment, we have only the texts of four final sentences, all nullifying the original sentences.

It was the imperial chamber court's chief interest to use its influence in criminal jurisdiction only when principles of legal procedure had been exceeded. A contemporary scholar (using the pseudonym Adrian Gylman) wrote that not all pleas for mandates in witchcraft cases were successful (Fuchs 1994, 58). It is evident that the court made a strict separation between ordinary witchcraft trials and those it considered irregular.

Within the texts of their rulings, the imperial chamber court's assessors seldom indicated the reasons for their decisions. But with regard to mandates, it is nevertheless possible to see that the Carolina Code provided their principal guidelines: Only qualified persons should participate in examining and judging crimes. Every judge should have sufficient evidence before ordering the torture of a suspected witch. In examining crimes, magical procedures were strictly forbidden. And prison conditions should not harm people's health.

Many of the imperial chamber court's assessors obviously had no doubts that witchcraft was a severe crime. In 1588, an assessor's vote that led the court to

pass sentence even called witchcraft an extraordinary crime (*crimen exceptum*) (Fuchs 1994, 50–58). But it is clear that even this was no reason for the court to tolerate transgressions of the *p rocessus ordinarius* (ordinary procedure).

EFFECTS

It remains unclear how far the imperial chamber court's selective interventions affected the prosecution of witchcraft in the Holy Roman Empire. Some of the mandates in favor of the victims may have induced local and territorial authorities to abandon witchcraft trials completely; in the county of Eastern Frisia, for example, such trials seem to have been abolished permanently after local authorities received writs of mandate to stop torturing some women. But even here it is not possible to establish a clear causal link from the mandates to the cessation of witchcraft trials. And in other territories, witchcraft trials did not end after mandates had been issued against their legal malpractices.

In general, we can say that the imperial chamber court tried to stop legal abuses in criminal procedure within the territories of the Holy Roman Empire. The court helped some victims of witchcraft trials. However, it is evident that their number was very small, measured against the bulk of witchcraft trials in the empire. This must be attributed to the fact that the imperial chamber court had only limited competence in criminal affairs—and by no means were all of its assessors opposed to witchcraft persecutions.

RÉMY, NICOLAS (CA. 1530–1612)

Best known for a work of juridical demonology in Latin, the *Daemonolatria* (Demonolatriy), Rémy was

born at Charmes in the duchy of Lorraine. He studied law at Toulouse and worked in France from 1563 to 1570 before returning to his native duchy. In Lorraine, he became privy councilor to Duke Charles III in 1575, served as an *échevin* (supervisory judge) at the ducal court of Nancy from 1576 to 1591, and was ennobled in 1583. Rémy ended his career serving as Lorraine's chief prosecutor, or attorney general of Lorraine, from 1591 until resigning in favor of his son Claude-Marcel in 1606 (Cullière 1999, 73–78).

The author of other works, including histories, Rémy composed the *Daemonolatria* at his country estate after fleeing Nancy during an outbreak of plague in 1592; it was published at Lyons in 1595 (Rémy 1998). He dedicated the book to Duke Charles III's paralyzed son Charles, cardinal of Lorraine, bishop of Metz and Strasbourg, and regional apostolic legate for Metz, Toul, and Verdun, who later suffered from bewitchment. *Daemonolatria* was reprinted eight times, with two German translations. Together with other Catholic works on demonology and witchcraft written around the same time, including those by Henri Boguet, Pierre de Lancre, and Martín Del Rio, most of them the products of specific regional prosecutions, confessions, and executions, Rémy's book helped displace the *Malleus Maleficarum* (The Hammer of Witches, 1486) as a guide to judges in witchcraft trials at the height of the prosecutions around the turn of the seventeenth century.

Rémy based the *Demonolatriy* both on his immense reading in both ancient and recent literature and on local court records. On the title page, he claimed he had judged 900 witches in fifteen years (later reduced to 800 in the text), and he mentioned over 125 of them (some of whom were not tried in Lorraine) by name. Rémy seems to have been an unusually meticulous author, citing individual confessions, mentioning convicted witches by name, and noting the date and place of each execution (not always consistently) in the margins. Historians (Briggs 2002) now believe that Rémy's numbers were considerably exaggerated—a piece of late-humanist bombast—and that "900" should be translated as "many." However, abundant fiscal sources in the archives confirm only a handful of Rémy's names and dates, but the vast majority of the more than 125 names the *Demonolatriy* mentions remain impossible to verify. In book 1, Rémy observed that many of the details of witchcraft confessions should be kept out of the public record lest the curious public discover the secrets that would lead to their own damnation. He did not follow his own advice.

Rémy relied heavily on the work of earlier demonologists, particularly Jean Bodin (whom he may have met in Toulouse). Like Bodin, Rémy considered the

Nicolas Rémy's witchcraft treatise Daemonolatria (Demonolatriy), often served as a guide to judges in witchcraft trials and went through eleven editions. This illustration (from the 1693 German edition) depicts a Sabbat at the Blocksberg (a mountain in Germany where witches gathered). Witches administer the kiss of shame to the Devil (the goat), while others dance with demons around the mountain. (Cornell University Library)

prosecution of witches a religious as well as a secular obligation, and his book appeared to be irrefutable both as sound Catholic doctrine and as scientific legal evidence. A trained jurist, he also cited Scripture, Roman law, and recent legislation, justifying the prosecution of suspected or accused witches and placing great reliance on the confessions of convicted witches. The *Demonolatriy* is also especially important for Rémy's articulate insistence on the immunity of civil magistrates not only from acts of witchcraft and diabolical sorcery but also from demonic temptation by virtue of their legitimate office and because of the divine sanction of princely rule. Even witches in legitimate custody were immune to the temptations of their demons.

Rémy's insistence upon the virtually priestly character of civil magistrates was consistent with contemporary ideas of the divine justification of civil rule.

Rémy divided the work into three sections: the first dealing elaborately and in great detail with demonic powers and the means by which demons tempted humans to become witches, the second with the activities of witches (chiefly with their use of poisons), and the third with further examples and conclusions, expressly condemning those who denied the reality of witchcraft.

Rémy asserted that demons not only tempted humans into their service by promises of rewards and power but also coerced them into their service by striking fear into their hearts, citing a confession made in 1586 to the effect that a demon had compelled one Claude Morèle into its service as a witch by threatening to kill Morèle's wife and children. Although the book was directed at a learned public and written in learned Latin, Rémy did not organize it systematically. Rémy's vast learning, his citation of hundreds of cases, and his elaborate descriptions of demons' influence over witches made for a disorganized work, in which one anecdote leads to another and references to classical authors and literary figures are made to seem contemporary. In spite of its difficult language and flawed construction, the work remained one of the most used and respected sources for demonological and legal ideas for nearly a century.

Leaving his book aside, it is possible to measure Rémy's influence on witchcraft persecutions in the duchy of Lorraine during his time as attorney general, thanks to remarkably complete fiscal records (every witch had to be publicly executed, creating budgetary expenses that were invariably recorded). Witchcraft trials had begun to multiply in Lorraine in the 1570s, starting before Rémy became one of three judges at the ducal court of Nancy. One can measure a rapid increase in witch burnings in the 1580s, before Rémy took office as chief prosecutor. His advent spelled neither an increase nor a decrease in Lorraine's witchcraft trials; they remained at a remarkably stable level for the forty years after 1590 (more than twenty recorded executions each year, with records about 90 percent complete). These forty years exactly coincided with the period when the two Rémys, father and son, directed official persecutions in Lorraine. So far as possible, they practiced what the *Demonolatriy* preached and made their duchy into the single worst witch-hunting state of French-speaking Europe. They did not begin this process, but they maintained it in Lorraine at brutally high levels.

RENAISSANCE DRAMA, ENGLAND

English dramatists from the late 1580s to the 1640s were keen to exploit the fuzzy categories of witchcraft and magic as a familiar source of character types, plots (many of them comic), and theatrical spectacle and as a way of affirming conventional gender relations and the political status quo. Reginald Scot's *Discoverie of Witchcraft* (1584) was an important source for details of witchcraft, though dramatists generally used sources indiscriminately. Magical and witchcraft materials appeared in plays throughout the period, though some periods, such as the mid-1590s, saw a surge in the fashion for witchcraft plays. Witchcraft motifs persisted because they lent themselves to a variety of dramatic treatments, from the burlesque and comic to the intellectual and tragic. Both female witchcraft and male magic (the latter treated more sympathetically) provided opportunities for theatrical spectacles. They were often associated with comedy, because both comedy and witchcraft in different ways pursued social disorder. The frequency of witchcraft motifs in plays bore little relation to the periods of greatest witchcraft prosecution in England, and in general, playwrights, if they took witchcraft seriously at all, were interested less in the actualities of witchcraft prosecutions than in witchcraft as a symbolic social system representing women's illicit challenge to patriarchy.

Endymion by John Lyly, performed at Elizabeth I's court in 1588 by boy actors, was the first of many plays representing female magic as a threat to patriarchal marriage and the established political order, here embodied in Cynthia, who represented Elizabeth. Its sophisticated, learned mode presented female figures associated in benevolent and malign ways with the powers of the earth, flowers, and herbs. Dipsas the sor-

ceress is a literary descendent of Medea in book 7 of Ovid's *Métamorphoses* (1–8 C.E.), with power to control the operations of nature and restore youth to old age. Dipsas's magic is contained and transformed by the true sovereignty and divinely appointed power of Cynthia, and in the end, Dipsas submits to Cynthia.

Magic's challenge to established authority was invariably defeated in plays of the period, in plots that finally contained, dispelled, transformed, or destroyed its threat. The combining of learned and popular witchcraft lore in Lyly can also be found in Christopher Marlowe's *Dr Faustus* (ca. 1589). In this play, Marlowe probed the early modern period's concern with the reality, extent, and seriousness of magic's powers. He deployed three perspectives on Renaissance magic: orthodox demonology, condemning it; "high," intellectual magic, celebrating its occult truths and mysteries; and popular magic, assuming the closeness of devils and their powers to transform or cause mischief (Roberts 2000, 62). The mixture of magical materials found in *Dr Faustus* was typical of many witchcraft plays of the period, though few deployed those materials as cogently as Marlowe did to produce not only popular spectacle and learned disputation but also a sense of the protagonist's inferiority as he fantasizes the power that will flow from magic, then struggles with its failure. A compact with the Devil was also a motif in George Chapman's *Caesar and Pompey* (ca. 1605), the anonymous *The Merry Devil of Edmonton* (ca. 1602), and Barbabe Barnes's *The Devil's Charter* (1606). Robert Greene was quick to imitate Marlowe's play in his *Friar Bacon and Friar Bungay* (ca. 1590), in which a male magician performs amazing feats, though, unlike Dr. Faustus, he finally renounces his magic and turns to God. The male magician was to reappear in plays throughout the period, including William Shakespeare's *The Tempest* (ca. 1611).

The 1590s also saw the appearance in plays of the wisewoman, a figure from popular culture. Both John Lyly's *Mother Bombie* (ca. 1590) and Thomas Heywood's *The Wise Woman of Hogsdon* (ca. 1604) survive, though only the titles remain of *Mother Redcap* (ca. 1597), *The Witch of Islington* (ca. 1597), and *Black Joan* (ca. 1598), also possibly a wisewoman play. Female practitioners of magic were usually depicted as wicked and male ones as good, and they were sometimes contrasted in the same play: Prospero and Sycorax in *The Tempest*, Edward the Confessor and the Weird Sisters in Shakespeare's *Macbeth* (ca. 1605), and Reuben the Reconciler and Mother Maudlin the witch in Ben Jonson's *The Sad Shepherd* (ca. 1636). Women with ambitions to employ magic were denigrated as witches and interpreted as sources of disorder aiming to destroy the reasonable order of male rule. Shakespeare's *Henry VI, Part I* (ca. 1590) contains the strong, eloquent

The Witch of Edmonton

A known true S T O R Y.

Composed into

A TRAGICOMEDY

By divers well-esteemed Poets;

William Rowley, Thomas Dekker, John Ford, &c.

Acted by the Princes Servants, often at the Swan-Hill in Drury-Lane,
once at Courts with singular Applause.

Went forth first in 1621.

London, Engraved by J. Coulter for Edward Blount at the Angel

The English Renaissance drama *The Witch of Edmonton*, 1621, featuring the witch Mother Sawyer. (TopFoto.co.uk)

warrior woman, Joan la Pucelle, champion and inspirer of the French against the English. Shakespeare started by making visible the social and ideological processes by which opposed identities of witch and saint are assigned to Joan by the English and the French, respectively, but by the end of the play, he has placed Joan in the former category by showing her invoking demons to support her failing powers. Even so, in Joan he suggested the possibility of women exceeding the limits that gender conventionally placed on them.

Shakespeare made more use of the discourses of witchcraft and magic than any other dramatist of the period, drawing on them as a source of metaphor, analogy, and ideas, and his notions of magic were strongly gendered. The witches of *Macbeth* bore little resemblance to contemporary village witches; instead, they symbolized the disturbing idea of female power. The question of the reality of their power and agency was insoluble: Witches might be either supernatural agents (as the added Hecuba scenes would suggest) or merely representatives of female powers of intuition and foresight that a male warrior society marginalized. However, Shakespeare extended the idea of female dominance to Lady Macbeth, whose deliberate rejection of her femininity went along with political

insubordination and the destruction of the patriarchal order. Shakespeare regularly went beyond the stereotype of the witch to fashion the more threatening, gender-transgressing figure of the dominating woman with a masculine spirit, including Margaret in the *Henry VI* plays (ca. 1590) and in *Richard III* (ca. 1591), Lady Macbeth, and Paulina in *The Winter's Tale* (ca. 1609); witchcraft was merely a suggestion to account for their woman-exceeding powers (Willis 1995, 167).

The Wonder of Women, or The Tragedy of Sophonisba (1604–1606) by John Marston resembled *Macbeth* in its scheme of gender oppositions, with Sophonisba, the epitome of beauty and sexual propriety, opposed to the witch Erichtho, with supernatural powers and necrophiliac desires. Marston's portrayal of Erichtho was lifted directly from book 6 of Lucan's *Pharsalia*: Like in the original, Erichtho can control the environment and deploy charms that compel even the gods of the underworld. Her sexual skills, though, were drawn from seventeenth-century witchcraft beliefs. The sharply contrasted female figures served to demonstrate the dangerous instability of men's feelings toward women, whether good or bad. At the same time, Marston made the most of the sexual turns of the plot, including having the hero have sex with Erichtho as a succubus.

Plays that dramatized a coherent gender ideology were in the minority, though they have been given a prominence in recent studies. Ben Jonson's *Masque of Queenes* (1609), written for private performance at court, with Queen Anne and her female courtiers appearing as the queens, drew on both classical and contemporary witch lore for the witches in its anti-masque (a grotesque parody of a masque). Its logical structure, opposing the subversive disorder of the witches against the heroic virtues of the queens, seemed to depend on conventional gender politics, though the queens' being women warriors in a court with James I as sovereign made its gender argument more complex.

More typical of witchcraft plays of the period was the hugely popular and anonymous *The Merry Devil of Edmonton*. It was written sometime before 1604, was printed six times in the seventeenth century, and was regularly performed, including once before James I in 1618. A Dr. Faustus figure is the "merry devil" of the title; his pact with the Devil has reached its end, but he goes on to renounce the Devil and turn instead to a love intrigue in which his tricks are purely natural. Also opportunistic in its use of magic and witchcraft for entertainment purposes was *The Witch* (1609–1616) of Thomas Middleton. Its lurid, comical witches include Hecate and three others who are dedicated to causing mischief around the sexually hypocritical court. They indulge in every evil activity that Middleton could cram in from his sources, including Scot's *Discoverie of Witchcraft*: boiling unbaptized babies for their fat,

transvection (the flight of witches), and comic sexual license. Hecate complains about sons who would rather “hunt after strange women still / Than lie with [their] own mothers” (Corbin and Sedge 1986, 94). The play’s disappearance from the repertoire may have owed more to its possible allusions to the Essex affair of 1610–1617 (a sordid scandal involving love magic and poison that centered on Frances Howard and Robert Devereux, the third earl of Essex) than to any failure to entertain.

The more serious the threat a witch presented, the more firmly she was removed from the play’s conclusion. Mother Sawyer in *The Witch of Edmonton* (1621), by Thomas Dekker, John Ford, and William Rowley, is executed, like her historical original, because her community blames her for its disorders. This play was unique in dramatizing the social process by which a witch was created, and it presented a potentially skeptical view of witchcraft alongside the familiar credulous one. The witch got a chance to condemn the social evils around her. In Ben Jonson’s *The Sad Shepherd*, the forest-dwelling witch Mother Maudlin may also have represented a critique of Robin Hood’s quasi-aristocratic society, though as the play was not finished, it is hard to tell. One of the last witchcraft plays of the period, *The Late Lancashire Witches* (1634) by Thomas Heywood and Richard Brome, was conventional in conception though strikingly action-packed and carnivalesque. It ignored the real Lancashire witchcraft trials and presented the witches as overturning society’s sexual order. Because their appetite for mischief produced comic results, they were left unpunished at the end.

REVENANTS

According to usual folklorist terminology, revenants, that is, dead people returning to the world of the living (from Latin *revenire*), are different from ghosts because the former possess a material body, albeit of some alien substance, whereas the latter are incorporeal. In German, a revenant is called *Wiedergänger*, *Lebender Leichnam* (living corpse), or *Untoter* (undead); in Old Norse, a revenant was called *draug*. Several texts from Iceland showed these material specters as malignant and dangerous beings, against whom apotropaism, fighting, or destroying was necessary. The men and women who become revenants may have failed to find their way into the otherworld because they had died prematurely, because their corpses were unburied, or because they had an evil character. A special case of the revenant is the vampire, a reanimated corpse fond of drinking blood. Some other mythological figures, especially mountain-dwelling dwarfs, may also be a form of revenant. However, continental sources do not always make a sharp division between a corporeal revenant and a nonmaterial specter. We learn from the autobiographical *Arndt Buschmann’s Miracle* that when the peasant Arndt Buschmann’s deceased great-grandfather appeared to Arndt in November 1437, he did so at first in the form of a seemingly real dog, only after conjuration taking the form of a human-shaped ghost.

Christian writers of the Middle Ages and later explained such phenomena as the appearance of the souls of impious or sinful persons who craved help by the living through prayers, alms, and masses. They were allowed to leave their after-death dwelling place, purgatory, through God’s special grace, in order to get a chance to shorten their penance. Such records began to be written down frequently from the twelfth century onward, peaked in the late Middle Ages, and became discredited after the Reformations.

Whereas pagan revenants were frequently dangerous, the Christian cult of the dead created a legend of the “helpful dead.” These were people who became revenants only for some special purpose, as in a popular legend from the later Middle Ages in which a knight who often prayed for the dead is attacked by his enemies in a churchyard; the skeletons open their graves and drive away his aggressors. In another example, in the legend of St. Fridolin of Säkingen, a cooperative corpse accompanies the saint to court so that his testimony can help the saint win his case. But medieval

Christians also told stories about aggressive corpses: The original form of the “dance of death” was a dance in which the dead took the living with them.

Collective apparitions of the dead formed a widespread element within European folk traditions. On stormy nights, at certain times of the year (mostly during winter), an army of the dead rode through the skies, variously called *exercitus ferialis*, *familia Harlechini*, or *Mesnie Hellequin*. The army was ruled by the Wild Hunter (*Wütender Jäger*), also identified with King Herla, Theodoric of Bern, Frau Perchta, or some similar figure. It is obvious that this leader of the dead was a replacement for some pre-Christian psychopomp (a deity who accompanies the departed into the other world). Portentous battles between dead men have often been seen in the air, from classical antiquity until modern times. The Christian interpretation declared these soldiers to be souls who had to endure this form of terrestrial purgatory. This motif entered medieval literature in partly secularized variants, for example, e.g., Andreas Capellanus’s *De Amore* (On Love 1184–1186, I, 15), Boccaccio’s *Decameron* (1349–1353, V, 8), or, in the sixteenth century, Pierre Ronsard’s *Hymne des Daemons* (Hymn of the Demons 1555, verses 347ff).

Connections between witchcraft and revenants were limited to cases of necromancy. That sorcerers and sorceresses could also become revenants is not remarkable within the Christian worldview, but it was a possible fate of all kinds of sinners, though according to the Old Norse sources, sorcerers were especially likely to become phantoms.

RIEZLER, SIGMUND (1843–1927)

The son of a Munich merchant, Sigmund Riezler received his academic training from Heinrich von Sybel (1817–1895) and Wilhelm von Giesebrecht (1814–1889), both students of Leopold von Ranke. However, the liberal Riezler criticized historicism because of its lack of attention to the darker sides of history, and he remained interested in culture, as well as politics and economy, as he demonstrated masterfully in his *Geschichte Bayerns* (History of Bavaria, 8 vols.). Riezler

started his career as an archivist and librarian, and despite his massive book on witchcraft and considerable resistance from the Catholic Bayerische Volkspartei in parliament, he was appointed to the first chair of Bavarian history at the University of Munich. In 1901, he was even raised to the nobility as Sigmund von Riezler, and he became a privy councilor of Bavaria’s Prince Regent Luitpold three years later. Although specializing in his native Kingdom of Bavaria, Riezler was not considered a provincial historian, and he was made coeditor of the *Historische Zeitschrift*.

Riezler’s *Geschichte der Hexenprozesse in Baiern: Im Lichte der allgemeinen Entwicklung dargestellt* (1896) was innovative in a number of ways. It was a comparative regional study, focusing on the former duchy/electorate of Bavaria, about two generations before this type of study became fashionable. Riezler put witchcraft into the wider context of the culture of the Counter-Reformation (as the subtitle of the book indicates) and related it to the spirit of particular decades and the character of particular actors: princes, lawyers, or theologians. By rearranging the subject on a regional level, a completely new and more coherent picture of the age of witchcraft trials emerged. The Middle Ages evaporated, and the decades around 1600 moved to the center of the story. Instead of denouncing the actors and authors, Riezler really scrutinized their texts and deeds, and—despite his strong liberal and rationalist bias—he employed the hermeneutical approach of “understanding,” always illustrating his interpretations with exact quotes from the sources and even editing a number of them, for example, a new document on the trials against the Waldensian witches in the fifteenth century or on an interrogation scheme of 1622. It seems that Riezler was one of the first researchers who systematically worked with trial records.

Some of Riezler’s suggestions for study have yet to be fully explored, for instance, the differences between Latin and Orthodox Christianity. He provided a thorough discussion of previous publications on his subject and a clear outline of his methodology. He considered himself a pathfinder and acknowledged only the American researcher George Lincoln Burr as a peer in historiographic expertise. (Joseph Hansen’s massive volumes were still to come.) Even after more than a century, his work is an admirable achievement, and—last but not least—a good read.

RINGS, MAGICAL

Since ancient times, rings have been both symbols and genuine tokens of magic, considered as amulets possessing power, even divinity. Uncountable are the mentions of magical rings in ancient and medieval literature. Rings warded off hunger and thirst; made one beautiful or ugly, young or old; foretold the future; protected against injury; or brought their wearer love. Rings could make the wearer invisible or give the strength of twelve or more men even to dwarves. Medieval literature even offered directions for manufacturing rings that would ensure victory in fencing contests, although only in Tolkien's twentieth-century pseudo-medieval world does a ring provide enough power to rule the universe (Middle Earth).

Legends affirmed that such magical rings had been made by supernatural beings. Their effects were as various as the materials from which they were formed and the ways either mortals or supernatural beings came to possess them. A ring could be a gift from a supernatural being; dwarves were famous for their artful forging. But elves, nature spirits, helpful animals, or even the Devil could provide a magical ring. Such gifts, with their magical properties, might, however, bind the recipient to the provider even beyond death, like Charlemagne to Fastrada in the legend.

The notion of a magic ring and its various effects derived from several concepts. Strongly connected to such rings, which in most cases contained some precious jewel, was the medieval belief in the power of magical stones. Surviving examples of magical rings, mostly set with precious stones, come from various parts of late medieval Europe: A British example, with five diamonds and a ruby, promises luck to whoever wears it; another example, from fourteenth-century Italy, contains a "toadstone" (actually a fossilized fish) set in gold and inscribed with two Gospel verses.

RINGS AS HABITAT OF DEMONS

The powers of such magical rings supposedly came from demons and spirits dwelling inside them. To put a spirit into a bottle, or more often into a ring, was a much-admired art in medieval times. Solomon reputedly tamed legions of spirits with his magic ring; many medieval magicians and other powerful men, including some popes, supposedly possessed demonic helpers enclosed in rings. Early modern times ascribed these rings to witches, who were able to seduce honest people with their help.

RINGS IN CEREMONIAL MAGIC

In ritual and ceremonial magic, rings represented the angel or spirit that the magician intended to evoke.

John of Morigny, in his fourteenth-century *Liber visionum* (Book of Visions), gave instructions for making and consecrating a "ring of power." Such a ring had various uses: Wearing it enabled one to experience prophetic dreams from the Virgin Mary, win disputations, or disperse evil spirits. In the medieval series of texts known as the *Liber de angelis* (Book of Angels), magic rings corresponded to the planets. For example, the texts include instructions to make a ring on which is written the character or magical sign and the name of the angel of the Sun. At every sacrifice, this ring was to be worn on the little finger of the left hand.

In late medieval medicine, a whole range of objects—jewels, rings, pilgrim badges, and brooches—were carried on the person by individuals of both sexes and all social groups to guard against sudden death, disease, and the attacks of human enemies or diabolical agents. A fifteenth-century duke of Burgundy wore a ring with a stone that could detect poison. Many of these surviving objects carry inscriptions testifying to their effectiveness in warding off particular diseases, for instance, epilepsy and plague. Written medical sources offered plentiful corroborative evidence for the success of such amulets in warding off and occasionally healing diseases.

RITUAL MAGIC

The most unorthodox form of the occult sciences, ritual magic was performed primarily by monks, priests, and other learned men and was tolerated for most of the Middle Ages. Many secular and ecclesiastical princes had astrologers, diviners, and magicians in their courts, although by the fifteenth century there were calls for the suppression of these crafts. Ritual magic's opponents associated it with demonic activity, whether or not its practitioners explicitly invoked demons. Because the powerful continued to patronize learned sorcerers, critics began to project their discourse about demonic sorcery onto unlearned women practitioners. The efforts to demonize high magic therefore helped lay the groundwork for the witch hunts.

ORIGINS AND MEDIEVAL DEVELOPMENT

Ritual magic's origins lay in classical antiquity as a means of harnessing the power and knowledge of spirits,

or *daemones*, thought to reside in and operate the heavens. Early Christians soon reshaped it to fit a Christian cosmology, turning Roman *daemones* into angels and demons. Christian ceremonies, prayers, and holy objects replaced or were added to ancient conjurations to produce a highly elaborate set of rituals that aimed to communicate with and manipulate the supernatural realm. Throughout the High Middle Ages, Muslim and Hebrew texts were added to the mix. Because ritual magic was a highly learned art, its practitioners needed to possess Latin and a fairly extensive knowledge of Christian liturgy. They had to be precise in the recitation of dense texts and extremely careful in the preparation of the necessary equipment. Secrecy was critical, and translation of ritual magic texts from Latin into the vernacular was thought to divest them of their power.

The goal of all ritual magic was to summon supernatural beings for a variety of purposes through the

precise performance of prayers and rituals. It was believed that angels and demons possessed superior knowledge to humans and had the ability to transport themselves, invisibly and speedily, anywhere in the cosmos. Through proper ceremonies, ritual magicians hoped to compel these beings to provide secret knowledge, the location of hidden treasure, transportation to exotic places, marvels to impress friend and foe, the means to compel love, and even the ability to reanimate the dead. A few promised techniques to achieve the beatific vision. Often, special equipment was required: waxen images, amulets, consecrated pens, untouched parchment, magic circles, swords, candles, crystals, mirrors, or fingernails, although the central operation was the recitation of texts. Prior to recitation, the practitioner usually had to perform long, complex rites of purification.

Ritual magic, practiced in a magic circle with the help of a text and various other aids. Manuscript initial, 1481. (Archivo Iconografico, S.A./Corbis)

Ritual magic frequently fused with natural magic, especially astrology, and the conjuring of angels and spirits required awareness of the system of correspondences that purportedly governed the operations of the cosmos. Ritual magic remained popular through the medieval and early modern periods, and many unscrupulous practitioners made a good living pretending to call up spirits for naive clients.

Ritual magic that explicitly called upon demons was called necromancy and was routinely condemned by Church leaders. By the fourteenth century, necromancy had become a major underground activity for underemployed clergy or university students. Convinced that Holy Orders imbued them with the spiritual power to exorcize or expel demons from the possessed, clerical necromancers further assumed that they could control these malevolent spirits. Many ritual magicians, however, preferred to identify their supernatural assistants as angels, spirit beings, the Virgin Mary, Jesus, or God the Father himself. The fourteenth-century Honorius of Thebes contended that because only godly men could command the spirits, the Church's persecution of magicians was misguided.

Many medieval ritual magic manuscripts have survived, such as the *Key of Solomon*, the *Sworn Book of Honorius*, the *Book of Angels*, and the *Ars notoria*, which called upon God or angels to provide the wisdom of the cosmos. Later seventeenth- and eighteenth-century *grimoires* (magicians' books for invoking demons) have much in common with their medieval predecessors, because occultists assumed that ancient sorcerers such as Solomon had possessed access to the secret names of God and angelic beings. Manuscripts that appeared to be ancient were highly treasured; to be effective as magical objects, moreover, they had to be meticulously copied by the magician's hand with consecrated pen and paper.

ATTEMPTED DEMONIZATION OF RITUAL MAGIC

In the fourteenth and fifteenth centuries, many polemicists and some authorities began serious efforts to suppress the practice of ritual magic, which had become thoroughly intertwined with courtly culture. In 1390, the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) condemned sorcery as a civil offense, and it began trying some local magicians, adding diabolical elements to the charges of illicit magic. Eight years later, the University of Paris decided that demon-assisted sorcery was heretical, since it required a pact with the Devil. Laurens Pignon, a Dominican confessor to the dukes of Burgundy, composed a treatise in 1411 warning the Burgundian court against its fascination with ritual magic. In the process, he demonized all magical practices and blamed the Orléans-Burgundy

rift on princely dabbling in the occult. Thus, learned opposition to courtly ritual magic helped influence the development of the witch stereotype and of judicial action against it. The trial in 1440 of Baron Gilles de Rais helped reinforce suspicion that ritual magic involved diabolical agency and led to the sacrifice of children.

RENAISSANCE NEOPLATONISM AND RITUAL MAGIC

Like the other occult sciences, ritual magic enjoyed a revival in the later fifteenth century thanks to Renaissance humanists' interest in Neoplatonism, as well as to the needs of princes to gain some predictive ability over their rivals. A major dispute arose, however, among ritual magic practitioners as to whether the printing of such texts vulgarized them. The physician Heinrich Cornelius Agrippa von Nettesheim raised the ire of many contemporaries in 1531/1533 for publishing many conjurations and recipes in his *De occulta philosophia* (On Occult Philosophy). This work praised the occult sciences and ritual magic, and through it Agrippa's reputation as a magus was elevated, although many opponents blamed him for making magic easier to perform.

For Agrippa, the three worlds—elemental, celestial, intellectual—each received influences from the one above it through rays of divine virtues that traveled downward. Because ritual or ceremonial magic involved the angelic beings of the highest realm, it was the pinnacle of the natural order. For Agrippa, ritual magic was the highest form of philosophy and relied entirely on benevolent angelic beings and natural cosmic forces, without diabolical agency. It required complete inner purity on the part of the practitioner combined with profound training in natural philosophy, mathematics, astrology, and theology.

It is hardly surprising that the Reformation quickly demonized such views. After his death in 1535, Agrippa became the subject of diabolical rumors as a proto-Faustus. His public disavowal of the invocation of demons as a horrible perversion of true magic proved to little avail, as did his condemnation of inquisitors who persecuted women for black magic. Like most ritual magicians, Agrippa did not believe women could perform any kind of serious magic effectively.

Were the experiments of ritual magicians "successful"? In the 1580s, the English alchemist John Dee conducted with Edward Kelley (ca. 1554–1595) a series of crystal-gazing experiments (scrying) during which Kelley purported to see spirits; Dee, the actual crystal-gazer, saw nothing but believed the reports of his partner. The firsthand account of a "successful" necromantic experiment performed in the Roman Coliseum by a Neapolitan priest for the artist Benvenuto Cellini was only one of many contemporary tales suggesting

that ritual magicians could produce some effects that astonished their clients. On the other hand, Gilles de Rais's confession that he always arrived too late to see the spirit beings summoned by his professional necromancers suggests that many practitioners relied heavily on the gullibility and suggestibility of their clientele.

THE REFORMATION AND RITUAL MAGIC

Despite the protests of ritual magicians, their art was demonized by both Catholic and Protestant polemicists, primarily because of its close associations with both learned necromancy and popular conjurations. After about 1580, the various Mediterranean Inquisitions began to prosecute cases of illicit magic with great vigor, while many secular states passed laws against the invocation of spirits, divination, or magical healing. England's Parliament passed such a statute in 1563, although enforcement was generally lax. Even the 1604 English statute condemned only the invocation of evil spirits, not the invocation of supernatural beings in general. Despite the antimagic polemics and the dangers to magicians posed by the witch hunts, learned magic survived, enjoying something of a revival after the decline of witch persecution; in the eighteenth century, Giacomo Casanova found no lack of clients.

When performed seriously, ritual magic, like its cousin alchemy, was no shortcut to riches or an easy game for charlatans. Following its intricate and demanding prescriptions and its elaborate, daylong invocations and prayers could produce unusual or visionary experiences in a practitioner. Ritual magic's centuries-long endurance testifies to the compelling power of the magical-religious act and of the deep desire to change the hand that fortune has dealt. It also illustrates the permeability of the boundaries between perceived reality and fantasy and helped condition people to believe the strange stories of magical flight, Sabbat banquets, and magical acts arising out of the witchcraft trials.

RITUAL MURDER

To kill a member of an ethnic or religious group different from one's own and collect his or her blood in order to be able to benefit from his or her virtues is to commit a ritual murder. Because blood is a constitutive element of groups, the accusation of ritual murder as "blood libel" is extremely old. One might add that logically the charge is absurd, because it implies that the perpetrators of such crimes consider their victim's blood to have qualities superior to their own. However, there are examples of ritual murder accusations dating back to Mesopotamia in the Bronze Age and also ancient Rome, where pagans cast aspersions on Christians because of their celebration of the Eucharist as the body and blood of Christ (Cohn 2000, 1–15). Later, other Christian dissident groups—Manichaeans, Cathars, or Waldensians—bore the brunt of these charges.

Despite the magical character of ritual murder, the accusation of ritual murder belongs more to religion than to sorcery. The charge, frequently made in the Christian-Latin West beginning in the tenth century, was largely a matter of Christians asserting their separateness from Jews, who were presented as dangerous. However, beginning with the Fourth Lateran Council (1215) and the elaboration of the concept of transubstantiation, Jews were accused of sinning against the Eucharist with the help of "bad Christians." Jews were accused of making pacts with the Devil, collaborating with sorcerers, and using the blood of Christian infants for magical purposes (Trachtenberg 1943). Thus, the charge of ritual murder linked Jews and witches. Christians believed both were magicians who needed to murder children.

From the twelfth through the sixteenth centuries, commencing with the English case involving William of Norwich, there are sixteen documented cases of persecution for ritual murder. Ritual murder charges spread eastward from England and France and peaked in the fifteenth and sixteenth centuries. Accusations in eastern Europe began at the end of the fifteenth century

Depiction of Jews, identified by their purses and circular patches, taking blood from the child, Simon of Trent, in 1475. Fifteen innocent Jews were burned for ritual murder, an anti-Semitic libel. Both Jews and witches were thought to murder children. (Fortean Picture Library)

and increased in the seventeenth and eighteenth centuries, especially in Poland. The blood libel died out in England and France after the fourteenth century with the expulsion of the Jews (Hsia 1988, 2–4). Two types of charges appeared in the late Middle Ages, one against Jewish communities, as in the case of Little Simon of Trent in 1475, and the other against converts, as in the case of Santa Nina de la Guardia in Toledo, 1490–1491.

Approximately 100 cases of accusations of ritual murder can be enumerated in Poland between the end of the sixteenth century and the Third Partition of Poland in 1795. The motivations for these charges, as for those that would appear again in the nineteenth century, were not related to witchcraft but employed anti-Semitism for political objectives (Tollet 2002).

Despite the refutation *in petto* (privately) of ritual murder accusations by Cardinal Laurent Ganganelli (the future Pope Clement XIV) in 1759, this calumny had an extremely long life in east-central Europe (Tollet 2003). The last known serious affair dates from 1946 and caused a pogrom at Kielce, in Poland, in which the victims were survivors of the Nazi camps or of exile in the Soviet Union (Hillel 1985). Not until the Second Vatican Council (1962–1965) did the Roman Catholic Church declare in conciliar records that the accusation

of ritual murder was unfounded. Belief that Jews practice ritual murder and use human blood has been widely accepted in the late-twentieth-century and the twenty-first-century Muslim world.

ROBBINS, ROSSELL HOPE (1912–1990)

The compiler of the first English-language encyclopedia of witchcraft was born in Wallasey, Cheshire, England, and educated at the University of Liverpool and Emmanuel College, Cambridge. Robbins came to the United States in 1937 on a fellowship. He became a U.S. citizen and served in the U.S. Army in World War II, working with the War Department on issues concerning the treatment and repatriation of prisoners of war. After the war, Robbins taught at Polytechnic Institute of Brooklyn (now the New York Polytechnic Institute). From 1954 until 1969, he held visiting professorships at several colleges and universities in North America. Robbins was International Professor at the State University of New York at Albany from 1969 until his retirement in 1982. Also trained in music, he specialized in medieval poetry, devoting particular attention to the edition and analysis of Middle English verse.

However, Robbins's best-known work was in the field of witchcraft. Much of his time as an independent scholar was spent surveying the extensive witchcraft

collection at Cornell University, one of the world's foremost collections of primary sources on the subject. In 1959, he published the *Encyclopedia of Witchcraft and Demonology*. The work enjoyed considerable popularity and was reprinted numerous times, most recently in 1984. It was translated into Spanish in 1988 and into Russian in 1996. Robbins also published *Witchcraft: An Introduction to the Literature of Witchcraft* in 1978, a reprint of the introduction he wrote for the catalog of the Cornell Witchcraft Collection, which had been published the previous year.

Robbins's *Encyclopedia* is still a useful reference work. It contains entries on most of the authors, works, and topics familiar to scholars of the primary sources, particularly treatises. Its paraphrases and assessments of the treatises' argumentation and its biographical information on the authors, where known, are generally accurate. Its coverage of witchcraft trials is much less extensive and, given the advances in archival research since 1959, obviously inadequate.

Robbins's own explanations of witch hunting were simplistic and were probably refracted through the contemporary experience of Nazi persecutions: He emphasized alleged ideological and financial incentives for "the Inquisition" to invent a new heresy of witchcraft after exterminating the Waldensians and the Cathars (Robbins 1959, 8–9, 15–17, 271; 1978: 20–21, 32). But these theories do not obtrude excessively into the entries of his *Encyclopedia*. One can still agree with Sir Keith Thomas's assessment that it "contain[s] many trivial errors of fact. Its central thesis is disputable . . . but it rests upon a basis of genuine scholarship, contains a valuable bibliography and is a serious contribution to the subject" (Thomas 1971, 436n; cf. 456–457).

Robbins bequeathed his personal library to the University of Rochester, where it now forms part of the medieval collections of the Rush Rhees Library.

ROMAN CATHOLIC CHURCH

In the aftermath of the Protestant Reformation, the Catholic Church and the papacy reaffirmed themselves as the sole authentic interpreters and heirs to the Western Christian tradition. Since late antiquity, this tradition had always considered witchcraft a heresy and apostasy, treating it primarily as a ritual of devil worship and a form of faith in demonic powers rather than as a magic art or a manner of casting evil spells against others. Such traditional doctrines about the Devil and his followers survived largely unaltered throughout the sixteenth century, as the Catholic Church introduced few doctrinal changes concerning witchcraft and the power of witches. One must remember, however, that the belief in witchcraft could hardly have affirmed itself in early modern times without the support of the papacy and its most illustrious theologians, without the legal procedures employed by the papal Inquisition as it extended canonical jurisdiction, or without the normative decisions of Church councils. To what extent were the Roman Catholic Church and the papacy responsible for the witch hunts that took place throughout the Western world?

Influenced by doctrinal controversies, past historians frequently accused the Catholic Church of having legitimated these massacres and of having supplied doctrinal and juridical weapons to witch hunters. Currently, scholars usually advocate more moderate positions: In the early modern period, all Christian churches and secular powers continued to persecute witches, with no substantial differences among them. Besides, the modern Inquisitions were very skeptical about *maleficia* (harmful magic) and reluctant to impose capital punishment on those accused of devil worship, sorcery, or the creation of evil spells. After the Reformation, the Catholic Church relied just as much as other Christian movements in the West on the practice of catechism to free the masses from superstitious beliefs. While the Church never officially pronounced itself against the belief in witchcraft, it certainly felt compelled to defend its own rites and sacramental practices against the "competition" of sorcerers, pseudosaints, and popular healers. The Catholic Church preserved the rites of exorcism and blessing, which had been abolished by the Reformation and which, some scholars have argued, provided efficient means of reassuring the masses, while preserving many superstitious elements, as Protestants polemically stressed. Generally speaking, the Devil continued to exist for the Catholic Church; he kept subjugating people's souls and taking possession of their bodies (a phenomenon described in the Gospels), but he was deprived of a part of his power to influence nature and to plot against the faithful.

FROM LATE ANTIQUITY TO THE MIDDLE AGES

The oldest books of the Hebrew Bible have remarkably little to say about Satan, devils, or their curses. According

to the norms indicated in some sections of the Pentateuch, God called for a thorough repression of witchcraft (Exod. 22:18 [22:17]; Lev. 19:31; Deut. 18:9–11). The situation is different in the New Testament: Jesus was tempted by Satan, expelled evil spirits from the bodies of the possessed, and explained evil by describing it in its diabolical form. The Acts of the Apostles also refer to exorcisms and abound with descriptions of demons and black magic. Simon Magus, for instance, who appears in the Acts, became to the Christian tradition (also thanks to the Apocrypha) an emblem of the heretic who relies on spells and black magic. The Book of Revelation also attributes to demons or fallen angels a far-from-marginal role in the realization of divine providence, which would bring about the end of the world. Since its origins, the Church therefore lived in fear of the Devil—the source of all evil and sin, its absolute enemy—and relied on exorcism (including the rite of baptism) to counter Satan's power over the faithful.

During late antiquity, the Christian mission consisted largely of expelling demons, promoting sanctity, and recalling the reliability of effective divine protection (Brown 1972). In this context, sorcerers became disturbers of public order, and the Christian emperors soon imposed laws punishing their crimes severely. However, accusations of working evil spells, persisted and took new forms over time. Whereas in earlier times, pagan writers had frequently accused Christians (and Jews) of practicing incomprehensible rites and committing horrible infanticides, now it was the Christians who treated the religious cults of the gods of antiquity as demonic rites and who attributed to the earliest heretics precisely the same awful crimes of which the first Christian communities had been suspected. This led to the idea that there could be pacts with the Devil and that practicing magical rites was tantamount to renouncing the true faith (apostasy) in favor of devil worship. St. Jerome (ca. 340–420) recalled that devils could take physical shape; St. Augustine specified that evil deeds committed by devils were authorized by God but could nevertheless come about through human evocation. Satan did not have unlimited powers, and frequently his exploits were illusions. Yet evil spells existed, according to St. Augustine, and devil worship was a frequent practice among heretics and others who had abandoned the consolations of the true faith. Besides, the Council of Elvira (306) had already officially recognized the belief in the power of evil spells.

Three centuries later began the spread of the legend of Theophilus, a man who, during the fourth century, had made an agreement with the Devil, to whom he had promised his soul at the moment of his death in exchange for a bishopric, worldly pleasures, and the power to take revenge on his enemies. The tale of

Theophilus contributed to the spread of a new belief, according to which it was possible to sign pacts with the Devil and to renounce eternal salvation in exchange for supernatural powers. By the High Middle Ages, popes and bishops oscillated between the idea that witchcraft was merely an illusion and the opposite hypothesis that devil worshippers could obtain real and terrible power to harm others (causing, for instance, male impotence and natural disasters). The latter ideas, which could be found throughout most of Europe, were indispensable in forming the myth of the witches' Sabbat.

PAPACY, INQUISITION, AND THEOLOGY: PACTS AND WITCHES' SABBAT

The Roman Catholic Church is a religious institution that has always maintained its own juridical apparatus and its own tribunals. The foundation of Church legislation lies in canon law, which was first systematically defined in the latter half of the twelfth century by the lawyer Gratian in his *Concord of Discordant Canons*, known as the *Decretum*, a collection of citations from saints and Church Fathers, laws, pastoral decisions, and conciliar decrees. Subsequent normative decisions coalesced around the *Decretum*, which the papacy then imposed as official laws and terms of reference for the Church. The *Decretum* included a tenth-century text known as the *Canon Episcopi* (ca. 906), which urged priests to oppose the widespread superstition and false belief that some women flew at night on the backs of animals, following a goddess to reach Satan. For several centuries, this text prevented the Church from accepting as true the tales that ultimately created the bloodthirsty myth of the witches' Sabbat.

Nevertheless, the Christian model of witchcraft imposed itself as a consequence of the belief in pacts between apostates and demons and the belief that sexual intercourse was possible between humans and devils. Among the advocates of this idea was St. Thomas Aquinas, the premier theologian of the medieval Latin Church, who argued that demons could either assume a passive role as *succubi* or an active part as *incubi* and unite themselves sexually with humans, ordinarily women, thus exchanging semen with the scope of procreation. Although Aquinas's works made no mention of the witches' Sabbat, his doctrines on witchcraft marked an important turning point. Sorcery, clairvoyance, evil spells, black magic, and ultimately all kinds of effective magic rites were based, according to Aquinas, at least *implicitly* on a pact with the Devil.

This assumption led to the idea that all forms of magic and witchcraft were heretical and thus supplied the newly founded tribunals of the Inquisition with a legitimating principle that allowed them to proceed against witchcraft, black magic, and superstition as well as against actual and overt crimes of heresy. The Fourth

Lateran Council (1215), which preceded the creation of the tribunal, had been dedicated to heresy, not witchcraft; it had sought to crush the Catharist heresy, which upheld a body of Manichaean doctrines by believing in the absolute opposition between the forces of good and evil (according to which the Devil was deemed capable of opposing God). The papal Inquisition, founded on the basis of the popes' right to delegate judges who could act outside of traditional episcopal jurisdictions, fought Catharism and other recent forms of heresy. With the appointment of Conrad of Marburg as a judge (1231), however, the prosecution of heretics became closely intertwined with the struggle against witchcraft—with fatal results. Conrad acted according to the principles of the Inquisition, which did not require private charges against the accused and which could employ torture in order to obtain a confession, the supreme proof of guilt. The bloodthirsty Conrad started trials all over Germany and, more important, inspired a papal bull giving additional legitimacy to the belief in devil worship: Gregory IX's *Vox in Rama* (A Voice in Rama, 1234).

The originality of this text, which discussed devil cults, witches' banquets, and animal metamorphoses, lay not in its contents but in the fact that it quoted juridical proofs obtained by the Inquisition and declared them true. Later, in 1258, Alexander IV reduced the Inquisition's powers in its fight against witchcraft and superstition, limiting prosecution to cases in which the criminal's heretical intent (the so-called flavor of heresy) was undisputed. His declarations, however, were succeeded by a new wave of trials against sorcerers and witches during the first decades of the fourteenth century and, hence, against a very different political, social, religious, and juridical background. An increasing fear of conspiracies against Christianity and the papacy culminated in acts of intolerance directed against minorities: lepers, Jews, Waldensians, Cathars, and Knights Templar were accused of diabolical deeds, murder by poison, and attacks against the bastions of the true faith and the papacy. From Avignon, John XXII's bull *Super illius specula* (Upon His Watchtower, 1326) authorized the Inquisition to proceed against agents of evil, whose diabolical crimes had already been defined and distinguished in a papal *consulta* of 1320.

Throughout the following century, the number of witchcraft trials imposed by the Inquisition was very small compared to the number directed against heretics. Nevertheless, the Church's intolerance toward necromancy and erudite magic grew (a trend well expressed in Nicolau Eymeric's manual *Directorium inquisitorum* [Directory of Inquisitors, 1376]). The model of the witches' Sabbat spread during the second half of the fifteenth century and eventually led to the greatest witch hunts in Western history. According to

one theory (Bossy 1988), a source of the myth of the Sabbat (as a formal counterreligion based on the cult of Satan) was the nominalist obsession with sins committed against God, the father and ruler of the universe. Thus, nominalist theologians such as Jean Gerson shifted the concerns of the faithful and the judges from the damages caused by evil spells toward the sin of heresy, which included superstitious devil worship.

Although there is some validity to this explanation, it nevertheless needs to be stressed that in the long run, the lack of concern with the physical harm brought about by malefices did not provoke an increase in witchcraft accusations but, on the contrary, led to their decrease. At the same time, the practice of treating witchcraft primarily as a crime of heresy led to the application of the canon law, which meant that if the trials were conducted correctly, repentant criminals could obtain forgiveness after a first conviction.

Undoubtedly, the preaching of the mendicant orders (the Dominicans and the Franciscans) did much to nourish general fears of demons and witches. Heinrich Kramer, author of the infamous *Malleus Maleficarum* (The Hammer of Witches, 1486), was a Dominican. His order dictated the contents of the papal bull in which Innocent VIII, in 1484, approved the idea that a new sect of heretical witches (unknown at the time of the *Canon Episcopi*) had infected Europe, constituting a threat to Christianity and deserving to be burned at the stake. Consequently, the number of trials concerning witchcraft and witches' Sabbats increased dramatically in both ecclesiastical and secular courts. There was an ongoing dispute within the Church between those who accepted the positions of the *Malleus* (which claimed that witches could fly and that they met during Sabbats) and their more cautious opponents, who distanced themselves from the trials (the latter included the eminent theologian Thomas de Vio, Cardinal Cajetan, who expressed his ideas in a commentary on St. Thomas in 1520). The number of trials decreased after the first two decades of the sixteenth century, when the Reformation created an enormous increase in heresy trials, often by secular courts. The Spanish Inquisition, which deemed the Jews its prime enemies, showed little concern for witchcraft; its Roman counterpart, founded in 1542 to fight Protestant heresy, soon had to struggle once more with popular superstitions and the belief in evil spells.

THE EARLY MODERN AGE: EXORCISM, WITCHCRAFT, AND SUPERSTITION

In their religious controversies, Catholics and Protestants hardly ever accused each other of witchcraft. Protestants accused the pope of promoting superstition; Catholics replied by comparing the leaders of the new churches to demonic figures. But the rupture of the religious unity of Western Europe had no

immediate impact on witch hunts. Violence against witches reached its peak between the late sixteenth and mid-seventeenth centuries, long after the division between Catholicism and Protestant confessions had been established. How can we explain this? And what was the Catholic Church's role in promoting the immense spread of witchcraft trials during the beginning of the early modern period? According to many scholars, there was little substantial difference between the numbers of witch hunts in areas that remained faithful to Rome and in those that had converted to Lutheranism or Calvinism. Religious quarrels nourished a sense of instability and a feeling of imminent threat to Christianity that went beyond doctrinal differences, which perhaps best explains the origin of witch hunts within the context of modern religious controversies.

Catholics and Protestants persecuted witches in often similar manners but on the basis of different legal conventions. Each group included ardent advocates of witchcraft trials as well as skeptics promoting judicial moderation and seeking to convince ordinary people to see the origins of evil in the mysterious ways of divine providence rather than in the evil spells of witches. After the Council of Trent (1545–1563), the Roman Catholic Church aimed to eradicate superstition and to educate the faithful in ways similar to those of the Reformed churches, which were equally active in promoting unprecedented standards of Christian discipline. Once again, these efforts constitute a joint background against which one needs to explain the presence of witch hunts. Yet Catholicism also had its own, distinctive characteristics. It maintained its tribunals, which were partly concerned with witchcraft (increasingly so, after Protestantism ceased to be perceived as a serious threat), and it preserved a large number of sacraments, rites of blessing, and forms of exorcism, which Protestant churches, with a few partial exceptions, had abolished. The preservation of sacramental rites and exorcisms allowed the Catholic Church to reassure its followers and to calm their fear of the Devil more successfully than did the Protestant churches (Thomas 1971). This hypothesis seems to be confirmed by the fact that in the Mediterranean countries, where the Holy Office and the Roman Church dominated jurisdiction over witchcraft, there were fewer witchcraft trials than in many Catholic parts of northern Europe, which were in close contact with Protestantism.

Recently, historians have stressed that the Roman Inquisition and its Spanish and Portuguese counterparts were overtly skeptical as far as accusations of witchcraft were concerned (Henningsen 1980; Romeo 1990; Tedeschi 1991). They preferred not to send accused witches to the stake and adopted some very intelligent measures. Accusations of complicity were rejected; the existence of *maleficia* had to be proved; the criminal

could be absolved if found guilty for the first time; and tales of participation in witches' Sabbats were not credible. Furthermore, the Catholic Inquisitions claimed competence over witchcraft and usually prevented secular courts from interfering in such cases. In a papal bull from 1586, Sixtus V declared that all magical practices, including sorcery, divination, and working of spells, were heretical and, thereby, gave the Holy Office the exclusive right to judge all such cases. By the seventeenth century, the Roman Inquisition, inspired by Desiderio Scaglia, had established precise guidelines for the treatment of witchcraft, extremely similar to Spanish precedents.

This trend toward moderation, however, was not steady or unbroken. For instance, in 1623 Pope Gregory XV ordered that witches ought to be sent to the stake at their first conviction, thus contradicting canon law. His bull had almost no direct consequences, but it showed clearly that not all Catholic policy-makers shared the Holy Office's skepticism concerning witchcraft. In 1631, when the Jesuit Friedrich Spee wrote a book condemning the practice of burning witches at the stake, equally common in Catholic and Protestant parts of Germany, it was published anonymously, in a Protestant city, and was utterly ignored by the Roman Church—although its positions basically reiterated, in more radical form, ideas already expressed in previous treatises of moral casuistry. The Catholic Church was ready to disregard tales of witches' Sabbats and *maleficia* and even, in many cases, instances of demonic possession, treating them as the effects of illusions, illnesses, or female weakness.

However, Catholicism never abjured the belief in the power of witches and maintained a complex set of doctrines concerning the Devil, doctrines that have survived until the present. During the sixteenth and seventeenth centuries, some cases of demonic possession were used (above all in France) for purposes of anti-Protestant propaganda by demonstrating the superiority of Catholicism, the sole faith capable of expelling demons. Pope Paul V's official *Rituale romanum* (Roman Ritual) of 1614, prescribing how the clergy should practice the rite of exorcism, referred to evil spells (as did its revisions in subsequent centuries, including the twentieth). Exorcists could interrogate the spirits that had taken possession of the human bodies about the origins of these evil spells; sometimes this inquiry led to shocking accusations of witchcraft, occasionally involving entire Catholic monasteries. Several works on exorcism, which contained a wide range of unlikely tales and of superstitious medical recipes, were censured only in the eighteenth century. Control over female sexuality was especially intertwined with cases of demonic possession. It was difficult to distinguish between different kinds of spirits, to separate instances of saintly exaltation from demonic manifestations, and to draw a line between magical rites and exorcisms.

Catholicism, the least formally “rational” of all Christian churches, has always fought superstition and practices of erudite sorcery as if they were competitors to the Church’s own, exclusive efforts to reassure the masses through correct rituals.

ROMAN LAW

Roman law constitutes the written and promulgated laws of the Roman Republic and Empire, from the *Twelve Tables* of the mid-fifth century B.C.E. to the codification by the emperor Theodosius II in 438 C.E. and that of Justinian (ruled 527–565) between 530 and 534. Although the Theodosian Code served as the model for many of the Germanic law collections between the fifth and the ninth centuries, the systematic study, teaching, and application of Roman law in western Europe began with the study of Justinian’s *Institutes, Code, and Digest* in the late eleventh century and continued until the end of the eighteenth century. The *Twelve Tables* has had to be reconstructed from other sources, because no original text has survived. The collections of Theodosius and Justinian excised many older laws. The interest in law on the part of Roman biographers, historians, encyclopedists, and others, however, makes it possible to gain an extensive understanding of the operation of the law. The texts of Roman law regarding magic and sorcery informed learned legal discussions of magic and witchcraft in Europe until the early eighteenth century.

Table VIII of the *Twelve Tables* says nothing about noninjurious magic, but it condemns to death a person who utters a wicked charm that injures another or that removes the grain harvest from someone else’s field. This reflects a limited idea of injurious magic and acknowledges the harm caused by magical means. Later republican law prohibited the secret, nocturnal Bacchanalian rites in 186 B.C.E., once again emphasizing the evil intention of the activity. In 81 B.C.E., the dictator Lucius Cornelius Sulla enacted the *Lex Cornelia de sicariis et veneficiis* (Law of Cornelius on Assassins and Poisoners/Sorcerers), whose interpretation was later expanded to various forms of harmful or forbidden magic and was included in Justinian’s codification (*Institutes* 4.18.5, *Code* 9.16, and *Digest* 48.8).

Examples of a new and broader concept of magic, one that connected it to learning and magical books and reflected the magical ideas of the wider Hellenistic world, were widespread in the Latin literature of the early empire, particularly book 30 of the *Natural History* of Pliny the Elder (24–79 C.E.) and in the writings of Roman jurists, many of which are collected in Justinian’s *Digest*. References to the law in nonlegal sources indicated that many individuals were tried and convicted under the *Lex Cornelia* and other statutes, including one that condemned both the teaching of magic and the possession of magical books.

The best-known single case in imperial Roman law was that of the North African philosopher Apuleius of

Madaura, who was tried and exonerated under the *Lex Cornelia* for divination and sorcery in 156–158 C.E. The case is known from Apuleius's reworking of his oration in his own defense, which offers a broad portrait of competing views of magic in the second century.

In imperial Roman law, the sorcerer, illegal diviner, and general magician are termed *maleficii* (evildoers), a designation that survived and was eventually applied exclusively to diabolical sorcerers and witches from the fifteenth century on. In the Theodosian Code of 438, book 9, title 16, under which imperial laws concerning magic were organized, is *De maleficiis et mathematicis et ceteris similibus* (Concerning Magicians, Astrologers, and Others Like Them). Soothsayers and those who consulted or harbored them were subject to severe punishment. Those who injured others by magic (including erotic magic) were designated as enemies of the human race. Magicians were regularly included among those convicted criminals who could never be pardoned and were considered guilty of the excepted crimes (*crimina excepta*).

As the Roman Empire was Christianized during the fourth century, a number of specifically Christian ideas concerning demonic magic also found their way into imperial legislation and practice, particularly in the *Interpretations* that are appended to the laws of the Theodosian Code. Later Christian legal authorities found learned Roman law perfectly compatible in this instance with Christian theology and canon law.

ROSA, SALVATOR (1615–1673)

An Italian painter and poet, born near Naples, Salvator Rosa is best known for his "protoromantic" landscapes, battle scenes, and genre pieces. He dedicated a smaller share of his work to witchcraft themes. During the 1640s, when living in Florence, Rosa created a closely related group of five preparatory drawings and eight paintings addressing the subject of witchcraft. Initially working for Cardinal Giancarlo de' Medici but seeking independence, Rosa soon sold his paintings, including

his scenes of witches, to other members of the Tuscan and Roman elite. Later, in Rome, Rosa revisited the witchcraft theme in a drawing from the 1660s and in a painting of the biblical witch of Endor, now at the Louvre in Paris (Mahoney 1977, 28.1–5, 82.2 recto; Salerno 1975, 72–82, 210).

ARTISTIC AND INTELLECTUAL ENVIRONMENT

During his training in Naples, his first years in Rome (1635–1640), and while living in Florence, Rosa must have been exposed to nocturnal cabinet pieces (small paintings intended to adorn the walls of a small, intimate room) depicting hell, witchcraft, and sorcery displayed in the studios, shops, and collections in these cities. Though artists who specialized in this genre came chiefly from France, Germany, or the Netherlands, local colleagues also sometimes produced such works. Although they certainly inspired Rosa, his sudden preoccupation with representing witches while in Florence is best explained by the stimulating intellectual environment of the Accademia dei Perocci (Academy of the Afflicted), a typical Italian circle of men of letters, artists, and scientists, of which he was a founding member.

Inquiry into witchcraft and related phenomena in scientific research, theological expositions, and literary writings was highly respected among educated elites in early modern Europe. Even though the question of their reality was fiercely debated, this did not prevent skeptics and believers alike from appreciating their entertaining qualities. Artists representing different demonological subjects were also valued members of these learned circles, and Rosa's Florentine virtuosi colleagues were no exception. The physician Francesco Redi, the painter Lorenzo Lippi, and the philosopher Giovanni Battista Ricciardi all dedicated plays and poems to witchcraft themes. Rosa not only painted witches but also wrote an ode, "La Strega" ("The Witch"), set to music by Marcantonio Cesti. In contemporary documents, Rosa's images of witches, like demonological items in treatises, are called *capricci* and were described as precious objects to satisfy curious minds.

WRITTEN SOURCES

The sources of Rosa's academy's witchcraft lore have yet to be investigated carefully. They include many classical authors (for example, Virgil, Horace, Lucan, Apuleius, Petronius) as well as the sixteenth-century "moderns" Ludovico Ariosto and Torquato Tasso. Demonological tracts were also consulted; a letter by Ricciardi explicitly recommends the work of Martín Del Rio.

Cultivation of ethnological knowledge may also have played a role. For example, the artist's biographer Filippo Baldinucci related that Rosa lent Lippi his copy of a collection of fairytales published in Neapolitan dialect.

THE ICONOGRAPHIC TRADITION

Rosa's witchcraft scenes are typically set in his trademark dramatic landscapes. He is often credited with introducing the northern European type of old-hag witch, created by such artists as Hans Baldung [Grien] and Jacques de Gheyn II, into Italian art, citing his much-copied painting of a nocturnal scene with witches performing incantations (Galleria Corsini, Florence) as an example. However, his witches' scenes show that Rosa was essentially a virtuoso, digesting a vast array of visual examples from both the northern and Italian traditions. Apart from Baldung's old hag, Rosa also included a beautiful enchantress à la Dosso Dossi, *Lo stregozzo* (The Witches' Procession) from an early-sixteenth-century Italian print usually ascribed to Agostino Veneziano, *The Witches' Kitchen* by Pieter Brueghel the Elder, and the matrons from the indoor incantation scenes by Sigismondo Coccapani and Frans Francken II. Rosa may have known some works in the original, but copies and variations in drawing, prints, and painting were common and circulated freely. Inspired by manifold visual as well as literary sources, Rosa seems to have reflected on the variation within witchcraft iconography by exploring and enhancing many different types. In a series of four *tondi* (circular paintings) (Cleveland Museum of Art), Rosa gave a sample book of witchcraft iconography. The first of two nocturnal scenes is similar to the Corsini painting, the second depicts a gathering of male witches. In the two day scenes, we see, respectively, a young, beautiful *maga* enchanting birds, fishes, and frogs, and a procession of female witches attacking crocodiles, their mistress riding an owl. The picture in the National Gallery of Art, London, is truly a painted anthology of acts of witchcraft, sorcery, and magic.

ROYAL HEALING

Royal healing was a custom, dating from the Middle Ages, whereby the monarchs of France and of England touched the swellings of sufferers from the disease known as "the King's Evil," or scrofula, in the popular belief that the royal touch could effect a cure.

The term *morbus regius*, or "the king's disease," was known in the Middle Ages from classical and biblical sources, usually referring to jaundice or leprosy. By the mid-thirteenth century, the term had become associated with the disease of *scrofulae* (swelling of the lymph nodes, or similar swellings on the face or neck), although this was sometimes also confused with the symptoms of leprosy. Gilbert the Englishman, a professor of medicine at Montpellier, noted that *scrofulae* were so called because the swellings (*scrofulae*) multiplied like a sow's piglets (from the Latin *scrofa*, a breeding sow) and that these were popularly known as "the king's disease" because kings could cure them (Barlow 1980, 12–13).

The ability of rulers to cure disease was closely related to contemporary political ideology, in which a high level of sanctity was believed to reside in the royal office, especially after a monarch had been consecrated and anointed with special oil of divine origin. France and later England both had legends concerning the holy oil with which their kings were anointed as part of the coronation service; kingship in both countries became closely linked to the royal healing power.

ROYAL HEALING IN FRANCE

The beginnings of royal healing in France are surrounded by mystery and controversy. Most evidence suggests it began during the reign of Robert II "the Pious" (996–1031) and was continued by Louis VI (ruled 1108–1137). The belief that the French king could heal was discussed at universities, but it is unknown whether healings were organized or regular, or whether the monarchs in question "touched" or healed *scrofulae* in particular (Bloch 1973; Barlow 1980; Buc 1993). Gilbert the Englishman made his statement about kings healing *scrofulae* sometime around 1250; evidence from 1261 shows Louis IX (ruled 1226–1270) touching the swellings of the scrofulous and signing them with a cross in order to effect a possible if not automatic cure (Barlow 1980, 11–12). Although Louis IX had a reputation for personal holiness, the ability to cure resided in the royal office through consecration with the holy oil given by an

angel to St. Rémy for the baptism of Clovis. Louis IX first organized the ritual of royal touching of *scrofulae*, often on such special occasions as the king's departure on crusade or major religious festivals, but also whenever people came in search of a cure. The royal ability to heal the scrofulous was used as propaganda by Philip IV (ruled 1285–1314) and his advisers as part of a collection of royal attributes that became useful weapons in Philip's struggles with the papacy (Bloch 1973, 63–64). Royal healing was later used by Philip's grandson Charles V (ruled 1364–1380) to restore the prestige of the monarchy after the disastrous fate of his father, John II, who had been captured by King Edward III of England in 1356 and died a prisoner in England.

From the 1490s onward, royal healing rites became better organized. Touchings were far less frequent, usually occurring only at coronations and on major religious festivals: Palm Sunday, Easter, Pentecost, Ascension Day, Corpus Christi, Christmas, Candlemas, and festivals of the Virgin Mary. Supplicants were first examined by the royal physician, who chose those allowed to pass before the king (either to avoid infection or to render the royal miracle more likely). The king always attended Mass and partook of the Eucharist before carrying out this duty and washed his hands afterwards in special basins of water (this water itself came to be regarded as having curative powers). While touching the swellings, the king repeated a formulaic prayer, "the king touches thee, and God heals thee." After the ceremony, alms were distributed to the supplicants, some of whom came from the Iberian peninsula, Italy, and the German states (the English preferred their own rulers). In 1515, Francis I of France exercised the royal healing power before the papal court in Bologna.

After 1559, royal healing became closely associated with national and religious identity. Elizabeth I of England was an excommunicate, and both French and English Catholics denied the efficacy of her touch. By this time, the French rite had also become associated with a local saint in the archdiocese of Reims, St. Marcoul, another reputed healer of *scrofulae*. Royal healing became closely associated with his relics, which were visited by the royal coronation procession from the late fifteenth century until 1654, when they were brought to Reims for the consecration of Louis XIV. This was repeated for Louis's successors. Both branches of miraculous healing, along with the efforts of local healers licensed by the monks of Corbeny, appear to have coexisted happily in France (Bloch 1973, 151–176; Poly 1990).

Henry IV, a former Calvinist who had converted in order to retain the French crown, needed to prove that God had accepted him as king, and royal healing formed an important part of his propaganda effort. The rite continued throughout Old Régime France, attracting large crowds of sufferers despite the increasing

skepticism of intellectuals. The execution of Louis XVI in 1793 effectively extinguished royal healing in France. A tentative attempt to revive it for Charles X in 1825 failed to gain sufficient support to continue it.

ROYAL HEALING IN ENGLAND

The beginnings of royal healing in England, although later than in France, are equally mysterious and controversial. Claims for royal touching for *scrofulae*, or at least of leprous sores, have been made for Henry I (ruled 1100–1135), but the most plausible claim for establishing a royal healing rite came in the reign of Henry III (ruled 1216–1272) (Barlow 1980), who was not only an admirer of Louis IX of France but also a champion of a form of national identity centered on the ruler as representative of both people and nation. Henry III was extremely devout, an ordained deacon who sometimes assisted personally at the Mass, and was therefore extremely receptive to ideas of royal sacrality, including healing (Coote 2000, 65–69). For the reign of his son, Edward I (ruled 1272–1307), and his two successors, records exist for royal touching and for the alms given to supplicants on these occasions (Bloch 1973, 56–57; Barlow 1980, 24–25; Coote 2000, 83–119). The sufferers passed twice before the king, who touched their swellings on the first occasion and on the second signed them with the cross. After this, each received alms, which were later replaced by a gold coin (an "angel," so-called from the image of St. Michael on one face) that the monarch held in his hand as he made the sign of the cross. "Angels" became healing talismans in their own right; the supplicants wore them, often permanently, on ribbons around their neck. The belief grew that if the coin were removed, the disease might return. The association of royal healing with "cramp" rings (see below) probably accounts for the ease with which these coins developed their talismanic quality. Nothing comparable happened in France.

Edward III (ruled 1327–1377) may have touched the sick on both sides of the Channel. The claim of English kings to be the rightful rulers of France, asserted officially in 1340, would have rendered this a test of allegiance. Obviously, Edward III employed every propaganda weapon at his disposal to support his claim, although his claim to healing power served to reinforce the primacy of the healing abilities of rightful kings of France. The English denied only that Philip VI of Valois (ruled 1328–1350) was the rightful holder of this title. Royal healing powers were also used as propaganda in fifteenth-century England during the period of instability and political unrest (known as the Wars of the Roses) that characterized the reigns of Henry VI (ruled 1422–1461) and Edward IV (ruled 1461–1483). Sir John Fortescue, Henry VI's Lord Chief Justice, denied that Edward IV, who had usurped the throne in

1461, could exercise the royal power of healing the scrofulous, even after Edward had been crowned and consecrated with the holy oil of St. Thomas (Bloch 1973, 65; Coote 2000, 195–234). Unlike the French, English monarchs never willingly shared the healing of *scrofulae* with local saints, particularly after the Reformation took hold in Tudor England.

As a new dynasty facing a continuing threat of civil war, the Tudors needed to use the full range of royal propaganda. Henry VIII (ruled 1509–1547) touched sufferers from *scrofulae* even after his break with Rome in 1532. Subsequently, English rulers allied royal healing ever more closely to a national identity increasingly divorced from the international Church. Under Elizabeth I, every mention of the Virgin Mary was expunged from the healing liturgy. In 1600, Sir Robert Cotton explained the royal healing capabilities as a function of the queen's anointing, but this was no longer performed with the holy oil given to St. Thomas by the Blessed Virgin; the nature of the oil no longer mattered (Linehan 1997, 189–196). James I (ruled 1603–1625), brought up as a Calvinist in Scotland, would not perform a rite that he regarded as superstitious without first explaining that it was simply intercessory. He refused to make the sign of the cross. His son Charles I (ruled 1625–1649) made more use of the royal healing power, particularly after the outbreak of the English Civil Wars in 1638, both because of his belief in the sacredness of royalty and because it provided valuable propaganda at a time when loyalty to himself was challenged.

Charles's execution in 1649 did not end royal healing; his son Charles II continued to touch the scrofulous while in exile in France until his restoration in 1660. Afterward, the exercise of royal healing became a means to reestablish not simply the Stuart dynasty but the monarchy itself. James II (ruled 1683–1688) was openly Catholic and had no problem in exercising his healing power, but his successor William III, a Dutch Calvinist, refused to administer the royal touch because it was a Catholic superstition (although we have no evidence that William's devoutly Anglican wife, Mary II, daughter of James II, shared his scruples; she might have administered the rite as her husband allowed). Mary's sister Queen Anne (ruled 1702–1714) was the last English monarch known to have touched the scrofulous, although "James III" (the Old Pretender) and his son Charles James (the Young Pretender) continued to perform royal healing in France. This link to the Catholic Stuarts, together with growing intellectual disdain for beliefs that the Protestant English associated with Catholicism, made royal healing officially unacceptable to eighteenth-century English governments.

"CRAMP" RINGS

In England, a custom also arose whereby the monarch would offer gold and silver coins on the altar on Good

Friday; the coins would then be redeemed and made into rings to be distributed by the ruler when necessary or desired. These rings were believed to cure epilepsy and similar diseases involving muscle spasms, "seizures," or fits. Because of their efficacy in dealing with this type of symptom, they became known popularly as "cramp rings." They first appear in the records in 1323 at York, where Edward II was staying. All English monarchs through Mary I (ruled 1553–1558) distributed such rings, which were eagerly sought by sufferers at all social levels. By the end of the fifteenth century, the rings were offered on the altar as ready-made, and the metal now gained its efficacy not through the Church's sanctification but from power transferred by the royal touch (Bloch 1973, 103–105). The practice was ended by Elizabeth I, who never performed it, perceiving it as "Catholic superstition."

RUDOLF II, HOLY ROMAN EMPEROR (1552–1612)

Rudolf II was famous for his intense interest in various aspects of the occult, for his tolerant and diverse court in Prague, and for his humanistic patronage of intellectuals.

The son of Emperor Maximilian II, Rudolf II inherited only the eastern hereditary lands of the Austrian patrimony (archduke of Upper and Lower Austria, king of Bohemia and Hungary), while the west and south remained in the hands of his uncles.

Crowned Hungarian king in 1572 and Bohemian king in 1575, he became Holy Roman Emperor of Germany upon his father's death late in 1576. He made the Bohemian capital of Prague his chief residence after the mid-1580s. One of the Habsburg monarchy's more controversial rulers, Rudolf II has been depicted in a number of ways: as a largely unsuccessful and mentally unstable ruler, distrusted by his nobility, and plagued by the intrigues of his brother Matthias, ultimately becoming a prisoner in his own castle; as a grand protector of the arts and sciences, presiding over the last great humanist capital of Europe; or as a notorious dabbler in several branches of occult philosophy: alchemy, astrology, astral magic, Kabbalah, and Hermeticism.

Mixed views of Rudolf existed during his lifetime. By the last decade of his reign, his brothers viewed him with suspicion, recording their thoughts in a family *Proposition* from 1606:

His Majesty is interested only in wizards, alchemists, kabbalists and the like, sparing no expense to find all kinds of treasures, learn secrets and use scandalous ways of harming his enemies. . . . He also has a whole library of magic books. He strives all the time to eliminate God completely so that he may in future serve a different master. (Evans 1973, 196)

They also questioned his political acumen, for in subsequent years, political confrontation with Matthias would lead Rudolf to relinquish his claims to the Austrian, Hungarian, and Bohemian crowns, and in his last years he descended into depression and seclusion (some called it madness). Within a decade of his death, Habsburg lands rose in revolt and Germany entered the Thirty Years' War. Although Rudolf II's political accomplishments were indeed limited, not all contemporary views of the emperor were negative. Visiting Prague shortly after his death, the imperial jurist Melchior Goldast wrote:

The Emperor Rudolf was, they say, a most intelligent and sagacious Prince who long maintained a wise peace in the Empire; he was cast in the heroic mould and contemned all vulgar things, loving only the rare and the miraculous. His rule was happy, peaceful and secure until the four years before his death. (Evans 1973, 5)

For close to two decades beginning in the 1580s, Rudolf resided in Prague and patronized an international assortment of renowned scholars, artists, architects, alchemists, and astrologers, including such artists as Bartholomaeus Spranger and Giuseppe Arcimboldo, the scientist and playwright Giambattista della Porta,

occult philosophers John Dee and Edward Kelley, and two notable court astrologers, Tycho Brahe and Johannes Kepler (both Protestants), whose astronomical data would be published in honor of their patron as *The Rudolphine Tables*. He was also a great collector of works of art, scientific instruments, and natural objects and oddities; his *Kunstkammer* (chamber for art) became one of the most important collections in European history. Though it was kept private and used by the emperor for his own contemplative purposes, contemporaries hailed it as a miraculous wonder. Rudolf continuously displayed a keen personal interest in both his collections and the works his patronage helped sustain, but they served larger dynastic and imperial purposes as well, reflecting Habsburg political tendencies toward symbolizing inherent unity through harmonious diversity. Rudolf thus turned his own passions—artistic, astrological, or alchemical—into political statements.

Recent scholarship has suggested an even deeper unity among Rudolf's thoughts and actions, not least through his universalist striving: his overt, if also magical, interest in harmonizing religious and political factions, in artistic expression and scientific discoveries, and in the deepest mysteries of occult investigations and creations. Thus, Emperor Rudolf's court at Prague was particularly characteristic of a late-sixteenth-century intellectual atmosphere that was an outgrowth of Renaissance humanist thought and, indeed, its last great flowering—albeit in an extreme Hermetic form. Viewed in hindsight, his reign may surely be judged a failure in political terms and as problematic in terms of later developments in the natural sciences or Enlightenment philosophy. But judged by twenty-first-century standards, his reign was tolerant, moderate, cosmopolitan, and extraordinarily vibrant. Nonetheless, the ethos of its court culture (and of the emperor himself) depended upon an essentially magical cosmology: The world contained hidden sources of knowledge, whose revelation would explain the invisible forces and universal harmonies binding humanity and nature together.

RURAL WITCHCRAFT

Witchcraft belief was essentially grounded in the countryside. Therefore it seems necessary to make a few preliminary observations about agrarian realities on the Continent and in the British Isles. An insightful approach to early modern rural Europe comes from observing a masterpiece of seventeenth-century painting, Peter Paul Rubens's *Autumn Landscape with a View of Heet von Steen in the Early Morning* (1636?). Three-fourths of this wide "oil on oak" shows a motionless world apart: the countryside and the work in the fields. But the countryside is never apart, and peasants are by definition never left to themselves. Thus, on the left of the painting is an overwhelming castle, and Antwerp looms in the middle distance. The proportion of the items in the painting well represents the social and economic reality of Europe. When Rubens painted *Heet von Steen*, some 80 percent of Europe's people still lived in the countryside, and their toil on the land had to feed some 70 million inhabitants. A century later, a demographic and economic spurt in the mid-1700s began a period of sustained growth that almost doubled Europe's population by 1850. Agriculture in the late Renaissance could never have fed some 150 million people, but three centuries later it could.

A topic like rural witchcraft must be understood within the context of related events that turned the agrarian history of Europe upside down. In order to activate the spiral of economic growth, a self-sufficient peasantry had to be transformed into a world of potential consumers attracted by material comfort, status, and urban influences. The age of witchcraft persecutions took place in this historical context in which the tapping of agricultural resources was crucial. Under different patterns of landownership, the interplay of political and economic factors ended up with diverging, and even contrasting, European agrarian economies. Yet on the whole, we can distinguish a fairly common evolution: a growing differentiation within the rural population, eventually causing the crumbling of the peasant community. Historical research has not yet made clear how, or if, the separated patterns of Europe's peasantry were related to a witchcraft belief supposed to be substantially homogeneous. In the end, some questions remain unanswered. Did the endurance of certain forms of magical belief depend on the permanence of the basic characteristics of village communities? And to what degree did slowly improving agricultural productivity eventually engender changes or possible decline in witchcraft beliefs?

STATIC APPROACH

DEFINITION

Is there a Europe-wide common definition for rural witchcraft? Historians tend to use explanations involv-

ing a distinction between witchcraft and sorcery and to point to harmful antisocial actions. In recent decades, research has shown that the underlying theme standardizing witchcraft from the Urals to Salem is *maleficium*, that is, the physical damage done to a person's family or his goods by someone of either sex, but usually a woman. Notwithstanding this focus on the evil side, it is worth emphasizing how often Europe's rural magicians, as in early modern Scandinavia, "dealt with [an] ability to have an influence on fellow humans and on nature—for better or for worse" (Raudvere 2002, 87). In sixteenth-century England, this capability to perform both evil and good is reflected in the lack of any special word to indicate an exclusively maleficent magician: "At this day' wrote Reginald Scot in 1584, 'it is indifferent to say in the English tongue, she is a witch or she is a wise woman'" (Thomas 1971, 518). And in the Sieneese countryside in 1588, a villager under interrogation told the inquisitor about Lisa, a renowned healer: "I met her when I was a little girl; she used to come to our village. I did not know her as a [malefic] witch, but I have heard that she is a witch and heals spells. . . . She throws witches off" (Di Simplicio 2000, 134). These people's lexical ambiguity can be viewed as an epiphenomenon of a mental universe where any kind of magical activity was folded into the umbrella term "witchcraft." Overly strict distinctions between negative and positive magic prevent us from comprehending what was occurring in a specific social context, where black and white witchcraft were intimately inter-related.

Looking for definitions, historians also emphasize the notion of power. A common element in all witch belief is that witchcraft is a generally evil power. Individual witches are wicked persons who perform specific evil acts through often-inherited supernatural powers. "The beliefs which relate to magic, religion, and witchcraft are beliefs about power. The sources of power and the extent to which the individual is prey to them or can manipulate them are the form of any belief system" (Larner 2000, 138). In 1621, Edward Fairfax, a Yorkshire gentleman scared by the power of a witch afflicting his daughter, at first resorted to the supposedly stronger power of some counter-magic such as "charms, tongs and scratches" before relying "on the goodness of God, and invoked his help" (Sharpe 1996, 157).

CAUSATION

Villagers who considered witchcraft real cannot be dismissed as simply ignorant. They inhabited a mental world where religious rituals coexisted with other such important areas of beliefs as the presence of witches, ghosts, and fairies. In a world without effective techniques to deal with everyday crises, belief in witchcraft offered eminently reasonable explanations to people

confronted by specific problems: Witchcraft must be viewed as closely related to a specific notion of causation. In the early-seventeenth-century Basque region, as elsewhere in Europe, "it was not a meaningless coincidence when a small child who had previously been healthy fell ill and died, nor an inexplicable misfortune when a pig began to sicken. All this was thought to be the work of 'evil folk'" (Henningsen 1980). Witchcraft served as an explanatory model for specific misfortunes. When peasants considered the possible origins of misfortune, it was more consoling to attribute it to the agency of an evil person than to an angry God. It is hardly surprising that villagers willing to explain something inexplicable did not often ask: "How did that happen?" Rather, they asked "Who did it?"

THE SYSTEM

The world of witchcraft cannot be written off as something irrational. Villagers' behavior shows that experience, reason, and critical analysis played an essential part in witchcraft beliefs. The assumption that a neighbor's ill will could do some physical harm was founded on experience in a subsistence-level village, where people are closely connected in everyday life and cooperation is necessary. Witchcraft trials allow us to integrate these facts into their social setting and reveal the general meaning of witchcraft as a system in all its contrasting nature. Formal accusations and trials represented only the terminal, traumatic step for controlling wicked neighbors. Centuries-old "natural" or informal devices for controlling witchcraft predated the heyday of European witchcraft persecution and survived afterwards. "The popular understanding was that the disease was the result of a broken relationship with the witch and that the removal of a disease could only be effected in the context of at least some formal acknowledgment of a restored relationship" (Larner 2000, 141). The usual control mechanism, after the identification of the witch, involved either reconciliation, physical intimidation (in extreme cases, lynching), or the undoing of her or his power through stronger countermagic.

All these checks and balances implied the presence in the village of a variety of magical practitioners (cunning folk, soothsayers, witch finders) whose divinatory and curative powers must be considered a logical corollary of "witchcraft as an ideology that explains misfortunes, and an institution that regulates communal conflicts" (Pócs 1999, 9). Were magical healers and maleficent witches believed to be separate groups, or did they sometimes overlap? This thorny problem is made more difficult for historians by the ambiguity of sources and by the very fact that the witch was held to be the repository of a dual function: both malefactor and healer ("*qui scit destruere scit sanare*"). In Lorraine, the demonologist Nicolas Rémy described this basic European dynamic: "The people of our country, especially the

peasants, have an old pernicious custom. When one of them falls ill of some strange and unknown sickness, he at once sets about getting something to eat or drink from the house of the witch whom he suspects to have caused the sickness; and this he eats or drinks in the greatest confidence that it will restore him to perfect health" (quoted in Monter 1976, 179). Basically, separating black from white witchcraft was alien to villagers. Healing was intrinsically a dubious activity, and sometimes only the moral profile of the practitioner could qualify the intention of a performance. Did this system function strongly and deeply within the web that connected malefactors, victims, witch finders, and healers?

Historical research has shown that entire European regions furnish no evidence of a generalized social concern with combating witchcraft. A real problem in comprehending this system is explaining why so few accusations ever reached the judges. Usually, a witch was only brought to court after having been suspected for many years. Both facts suggest that the usual methods for controlling village witchcraft worked successfully, preventing the traumatic and costly outcome of a formal accusation and trial.

PERFORMING WITCHCRAFT

How was an evil act performed? Is there a recognizable pattern in the attitude to *maleficium*? The mobilization of ill will could be activated by cursing, touching, even staring at a person. In the decades since 1970, witchcraft research has reached some consensus about the way evil magical acts were performed. Seldom was a person hurt, wrote Thomas Ady, without crying that he is bewitched, "for, saith he, such an old man or woman came lately to my door, and desired some relief, and I denied it, and God forgive me, my heart did rise against her at that time, my mind gave me she looked like a Witch, and presently my Child, my Wife, my Self, my Horse . . . or somewhat was thus and thus handled" (quoted in Macfarlane 1999, 111). And "the overwhelming majority of fully documented witch cases fall into this simple pattern. The witch is sent away empty-handed, perhaps mumbling a malediction; and in due course something goes wrong with the household for which she is immediately held responsible" (Thomas 1971, 661). Macfarlane placed this charity-refused paradigm within a framework of social and economic change that in prosperous Essex brought about the end of an ordered society, in which no richer man was supposed to take advantage of his neighbors or ignore the needs of a poor neighbor knocking at his door.

More recent works suggests that this paradigm is not universally applicable even in England, where counties no less dynamic than Essex (Kent, Hertfordshire, Middlesex, Surrey) witnessed only minor levels of witchcraft persecution. On the Continent, the validity of this model, tested in local and regional studies, has

been downgraded. According to William Monter, the social dynamics of Jura witchcraft looks significantly different from the charity-refused model. Though there are some cases where that model was precisely repeated, there were a few other instances, especially in Fribourg, where it was precisely reversed, with the spurned beggar later accusing his uncharitable neighbor of witchcraft. In fact, the economic success of some individuals might have been resented by less lucky covillagers. In the German county of Lippe, widespread village economic rivalries, gossip, and tough private conflicts gave rise to witchcraft accusations. At the center of these village dramas stood the role of defamation and revenge in order to settle enmities (Walz 1993). Behind the accusation of infanticide in the seventeenth-century Sienese state, a retaliation-oriented culture for resolving old semifactional grudges is occasionally clearly recognizable. The close-knit village life of “the world we have lost” (as the English historian Peter Laslett termed it) never lacked opportunities to whip up envy and hatred because of a dispute over limited local economic resources or because of more personal disputes over such matters as love affairs.

REGIONAL VARIATIONS

In 1972, Erik Midelfort warned that witchcraft was not a rigid monolith but was flexible and varied. If asked how the divergent developments of European peasantry conditioned such homogeneous witchcraft beliefs, historians could not go much beyond mapping their findings and distinguishing between beliefs that were fundamental, those that were extremely common, and occasionally, those that were peculiar to one society. For instance, nautical *maleficia* appear to be a Norwegian and to a lesser extent a Danish or English specialty, but, surprisingly enough, there is no evidence of shipwreck *maleficia* in the early modern Portuguese witchcraft trials, and there are extremely few recorded cases in Holland. In central Europe, during major persecutions, collective misfortune such as crop failures or livestock and human epidemics were attributed to witches, and storm raising played at least a catalytic role in triggering accusations (Behringer 1999), but in Scotland, witchcraft was “rarely held to be responsible for large-scale disasters in which the suffering might be random” (Larner 2000, 82). In England as well as in the Sienese state, witch belief explained misfortune only in particular; the evil done by witches was interpreted in interpersonal terms. But whereas in central Italy, witches were held to interfere with sex by causing impotence in men, in England no sorceresses made secret ligatures with string to steal virility.

As far as love magic is concerned, a global pattern seems to be distinguishable. The hypothesis that it was more widespread in the Mediterranean region than in northern areas suggests an explanation should be

sought in the relative social position of women. It has been ventured that the more independent-minded English or Dutch women “had less reason to practice love magic than women from the Mediterranean areas, who had much more difficulty in keeping their heads above water without a man, and who were in greater risk of social marginalization” (Gijswijt-Hofstra 1991, 134). For whatever reasons, France must certainly be included among the countries where accusations regarding impotence were rife. A similar contraposition might regard the killing of children, which seems to have been much less widespread in northern countries than in Spain or Tuscany. In the Jutland trials (1609–1687), “271 testimonies relating to death can be enumerated . . . , but only 6 percent applied to children” (Johansen 1990, 356). In England, a slaughter of children took place only during the Matthew Hopkins craze of 1645–1647. In the end, geographic divergence in matters concerning the charges of witchcraft seems to be problematic. Apart from some obvious correlations between the type of indictments leveled and the main occupational structures of an area, many more local studies are necessary if we are to go beyond a mere charting of witchcraft beliefs in terms of the nature of the *maleficium* performed. The causes of the sometimes-erratic geographic distribution of differences have yet to be found. It is evident that witchcraft beliefs resembled local dialects: Each region had its own. It has been suggested that from further research a “system of differences” could emerge (Burke 1990, 439).

DYNAMIC APPROACH

During the “iron century” (ca. 1560–1660, a period of warfare, economic hardship, and social instability), rural witchcraft could not remain unchanged. In 1588 a young Sienese nobleman, Aspremio Borghesi, had a nightmare in his country house. His brother, awakened by loud noises, rushed into the bedroom and saw him standing on the bed waving an unsheathed sword. Aspremio reported the episode to the inquisitor:

We were eleven or twelve people and were having a vigil. We were talking about this Lisa. . . . I said, how do you know she is a witch? I was answered . . . “Can’t you see all her bewitchments? she keeps healing with prayers all day long.” . . . And this reasoning happened because an Edict had come, forbidding healing through the use of prayers. . . . That very night I went to bed with this fantasy and Lisa appeared to me. (Di Simplicio 2000, 132)

As the sixteenth century ended, a wave of religious intolerance spilled over peasant villages to discipline the morals of country folk. Lisa’s case exemplified the increasing religious zeal engendered by Reformation

and Counter-Reformation Europe. From Scottish villages to Mediterranean ones, the sermons of divines condemned any person associated with “witchcraft,” regardless of whether their secret personal power was used for good or ill: Demonologists and canon law decreed that all supernatural powers not emanating from the Church were demonic. To be sure, an association between maleficent magic and the Devil, witnessed physically by the notion that the witch bore on her body the mark of her profession or, in England, the belief that witches might possess a familiar imp, had never disappeared from the villagers’ minds.

But in the course of time, witchcraft became less a mirror of popular belief and more a reflection of demonology. In French and Italian rural areas, there is plenty of evidence that through parish priests and exorcists, the Roman Catholic faith contributed to reinforcing the new brand of witchcraft beliefs. Nevertheless, on the whole, on the Continent as well as in the British Isles, the very idea of a deliberate pact with the Devil and of witchcraft as devil worship was slow to develop among peasants. A reference taken from the heart of the European craze might be considered illuminating: During the witch hunts in the Saar region (1580–1635), the demonological notion of witchcraft remained marginal among the village community (Labouvie 1991).

Can historians relate social and economic changes in rural Europe to a transformation in witchcraft belief? In seventeenth-century Holland, for instance, there were only occasional cases of bewitched goods. The means of livelihood were no longer threatened by witchcraft, a change that has been partly ascribed to the favorable economic developments in these provinces (Waardt 1991). Such a line of research points to the question of whether a “loss of function” might have affected the endurance of rural belief. Labouvie maintained that starting with the mid-seventeenth century, as soon as poor relief took root in the Lutheran, Calvinist, and Catholic areas, accusations of witchcraft against the typical suspects—older women dependent on the personal support of their fellow villagers—receded. More generally, could the combination of a less collective religion, a more market-oriented economy, greater social mobility, and a growing separation of people through the formation of institutional rather than personal ties have undermined witchcraft belief in the “translated Christianity” of the post-Reformation and Counter-Reformation? Because of these changes, did villagers interpret illness, death, and other misfortunes in new ways?

A decisive step toward a new way of thinking and acting was made when ideas of causation—based on the question “How do things happen?”—replaced the old personalistic causality. With reference to the field of health, it has been argued most recently that “the increase in medical knowledge and capabilities gave rise

to a professionalism within recognized medical science, widening the gap between recognized and unofficial medicine, both in terms of content and organization. . . . The more that advanced medical knowledge and healing techniques came to be accepted in local communities, the more the latitude and rationale for thinking and acting in terms of witchcraft decreased” (Gijswijt-Hofstra 1991, 110).

RUSSIA

Witches were prosecuted in Russian courts in the early modern era, following a timeline somewhat later than for western European witchcraft trials. From the late sixteenth through the end of the eighteenth centuries, Muscovite and Imperial Russian courts tried more than 500 cases. Witchcraft beliefs were prevalent throughout this period among elites and common people alike. The kinds of witchcraft described in accusations and court testimony reflected largely unadorned folk practices. Testimony suggests that a simple, kitchen or garden-variety magic, involving spells uttered over such ordinary ingredients as salt or roots, was widely practiced throughout society. Unlike Latin Christianity, Russian Orthodoxy rarely labeled magic satanic and developed no elaborate demonological theory. Instead, churchmen tended to condemn magic as "pagan" or "devilish." The actual content of folk practice relied on natural, "sympathetic magic," poetic incantation, and occasional invocations of biblical figures or saints to gain results. Aside from the limited role of demonology, one of the most notable features of the Russian case was that, as in some of the Baltic areas, the overwhelming majority of those accused of witchcraft were male.

CHRONOLOGY AND DEVELOPMENT

As in the West, scattered evidence of witch belief and fear surfaced early. Medieval chronicles occasionally recorded a killing of a witch or group of witches, but it was not until the late fifteenth century that witches became a more serious concern of the Muscovite grand princes. Prominent figures came under suspicion of witchcraft sporadically from the late fifteenth to the late sixteenth centuries. In 1467, Grand Prince Ivan III of Moscow lost his first wife, Maria of Tver, to what

was assumed to be witchcraft. No more fortunate the second time, Ivan suspected his fractious second wife, Sofia Paleologue, of engaging witches to bring about his death. Witchcraft accusations continued to haunt the world of the powerful and highly placed: Grand Prince Vasiliï III, son of Ivan III and Sofia, raised witchcraft charges when he divorced his childless wife, Solomonïa Saburova, in 1525 and dispatched her to a convent. Ivan IV, the Terrible, reputedly suspected witchcraft in the death of his first wife, and the Romanov tsars of the seventeenth century attributed the deaths of several brides and potential brides to magical causes. During the Time of Troubles, a period of chaos at the start of the seventeenth century, a pretender to the throne, known to history as the First False Dmitriï, allegedly employed magic to delude his followers. In the late seventeenth century, several important men at court suffered popular and official wrath when they were suspected of dealing in magic, and angry mobs tore apart a few of these suspects during the many uprisings of this tumultuous century. Political sorcery remained a punishable crime in Russia into the nineteenth century.

In the seventeenth century, Russian prosecution of witches expanded beyond court circles, increasing in frequency and scale. Although not all of the sources have yet been identified, the hundreds of surviving trial records demonstrate that witchcraft was feared and prosecuted throughout the vast Russian lands. Nearly 300 court cases have been identified for the seventeenth century, and Russian historian E. B. Smilianskaia has discovered 240 cases from the eighteenth century (Smilianskaia 2003, 188). We cannot yet assess how frequent trials for witchcraft were, but it seems safe to say that the numbers of such trials were significant, although never indicative of any full-blown campaign against witches or widespread panic.

The Orthodox Church tried for centuries to involve secular authorities in a campaign against witchcraft, but until the beginning of the seventeenth century, Russian grand princes and tsars usually contented themselves with simply stating their disapproval of witchcraft. In the early seventeenth century, the tsar's courts began to hear occasional witchcraft cases. In mid-century, Tsar Aleksei Mikhailovich took more forceful steps, declaring that practicing witches should be beaten and exiled and that the tools of their trade should be burned. His government also sent forth town criers to announce a strong prohibition of witchcraft (and other vices, such as singing on Sundays, drinking in church, or swinging on swings). The town criers invited the public to submit denunciations. In response, flurries of accusations poured in to local authorities throughout the realm. Trials peaked in the mid-seventeenth century and again in the 1670s, but prosecution continued at low levels for the remainder of the century.

The legal situation changed in the early eighteenth century, when Peter the Great, in his 1721 Spiritual Regulation, declared witchcraft in some contexts to be a crime of fraud against credulous clients. However, other legislation continued to enforce the older witchcraft statutes, and even to strengthen them. Peter's 1715 Military Articles for the first time articulated an association between witchcraft and dealings with the Devil and stipulated harsh punishment and execution by fire for diabolical magic. Imperial Russian courts continued to prosecute witchcraft cases until the end of the eighteenth century. In fact, despite its reputation as an era of secularization, reform, and enlightenment, the eighteenth century witnessed renewed intensity in prosecution. The years 1700 to 1706 were years of relatively active prosecution, and then, after a brief lull, a prolonged wave of trials stretched from 1721 to 1760, gaining steam as the century moved along. The reign of the purportedly enlightened Catherine the Great, while showing a less active record, nonetheless continued the prosecution of witches until the end of the century.

These numbers and patterns suggest that Russia never experienced the kind of devastating panics that took so many lives in western Europe; however, the numbers of trials are large enough to imply that witchcraft remained a serious concern for early modern Russian rulers and their subjects. There was no Russian Salem, just as there was no Russian witch-hunting zealot (like Matthew Hopkins in England, for example) to foment such a panic. The absence of beliefs in night flying, shape shifting, and Satanism may also have limited the scale of accusations. The largest Russian trials involved seven or eight accused witches, as in a particularly dramatic case in the provincial town of Lukh in the late 1650s, but such instances were rare. Denunciations tended to finger lone figures, or sometimes pairs.

THE NATURE OF RUSSIAN WITCHCRAFT AND MAGICAL PRACTICE

Until the late eighteenth century, Russian magic remained largely uncontaminated by the kind of Satanism or demonology that colored early modern western witchcraft belief. Although Russian Orthodoxy drew on the same body of early Christian writings as the Western church, and although precedents were available in saints' lives and apocryphal tales, there is no evidence of an actual case involving accusations of pacts with the Devil until the first decades of the eighteenth century during the "westernizing" age of Peter the Great. Some clerical statements and occasional elements of inverted Christian symbolism suggest that Russian practitioners recognized the power of religious magic. For instance, a few suspects reportedly wore crosses in the heels of their shoes, and others were said to have stolen Hosts for magical use.

Nonetheless, there was no sustained discussion of the role of the Devil in inspiring, empowering, or corrupting the practitioners.

Heresy remained marginal to Russian definitions of witchcraft. Sometimes the term *heresy* was conflated with witchcraft charges, but this accusation rarely had identifiable religious or doctrinal content. Few accused witches appear to have raised suspicion because of heterodox inclinations. Few if any accused witches had ties to the schismatic Old Belief, which broke from mainstream Orthodoxy in the late seventeenth century. Nor did many accused witches have suspicious ties across confessional boundaries.

Because spokesmen for the Church described magical practices as pagan more often than as satanic or heretical, historians have often described Russian religious culture as a dual-belief system, that is, a mixture of paganism and Christianity. Although sorcerers identified in early medieval chronicles were still practicing pagans and although a variety of paganisms intersected with Russian magical practice throughout the early modern era as Muscovy expanded and incorporated non-Christian peoples of Siberia and the north, most Russians appear to have become professing Orthodox Christians by the sixteenth century. Because of the variety of cultural and religious traditions in this vast empire, which by the seventeenth century already spread from Ukraine to the Pacific Ocean, magical practices differed greatly in different regions, but the Russian population appears to have shared a homogeneous belief system regardless of region. Early modern Russians apparently preferred spells that relied on the magical resonance of natural forces, not on pagan deities. For example, a colorful spell for curing alcoholism recommends invoking the same indifference to alcohol as that displayed by a disinterred corpse.

The problem of translation complicates any examination of magical practices in Russia. Are *witch* and *witchcraft* really the appropriate terms to use? Doubt may arise because of the anomalous male majorities among those accused in Russian courts, the limited role of the pact with the Devil, the general absence of "antibehaviors," or inversions of accepted behaviors, and the ambiguous evidence about the acquired rather than inborn nature of malevolent magic. The most common terms found in court records are *porcha*, literally "spoiling," but more appropriately translated as *maleficium* or hexing, and *vedovstvo*, the modern word for witchcraft, derived from a root meaning "knowledge." Other, less common terms include *charouanie*, *chamdeianie* (enchantment), *vorozhenie*, *gadanie* (fortunetelling), and *sheptanie* (muttering, saying spells). *Volkhovanie*, "sorcery," is a distinct term reserved for shamans and pagan priests. Because Russian magicians were thought to have practiced healing and

bewitching using spells and potions and because their own vocabulary uses the term, *witchcraft* does indeed seem the most appropriate translation.

Russian witches dealt with a limited array of issues. They could heal or curse, bewitch, and ruin. They could cast love spells for women, and they could guarantee sexual success or failure for men. Witches played important roles at weddings, where they might “bind” the new husband to prevent sexual union, or, if properly paid, they might protect the newlyweds from the malevolence of uninvited witches. Witchcraft might have been suspected in cases of business competition, for instance, if one tavern keeper seemed to attract all the business or another suddenly found his beer spoiled. Servants or slaves confessed to consulting witches to ensure that their masters and mistresses would be “kind” to them, stop beating them, or let them marry. Others confessed to plotting to kill their masters through magical means. Some witches could locate missing people and lost treasures. Just like western Europeans, Muscovites might have seen *powha*, *maleficium*, at work in any of a number of medical conditions, most commonly swelling or wasting diseases, hernias and ulcers (particularly in children), infertility, impotence, and infant death. The same individuals who served as local healers might find themselves facing witchcraft charges if their cures went awry. Russians did not look to witchcraft to explain natural catastrophes, such as hailstorms or droughts, nor did they accuse witches of drying up their cows or otherwise afflicting their livestock.

Occasional cases involved outbreaks of *klikushestvo* “shrieking,” a form of bewitchment or spirit possession in which the possessed, usually women, lost consciousness, trembled, shrieked, “hiccupped in animal voices,” and “said things not pleasing to God or man” (Kivelson 1991, 76). Sufferers explained that with the onset of this affliction, everything would go dark, the world about them would begin to spin, and they would later remember nothing of what they had said or done. Common belief assumed that witches provoked this affliction, and sometimes in their fits, the possessed would name names. Possession figured only rarely in trials from the Muscovite period, but in the eighteenth century, cases cropped up more frequently. Peter the Great and his eighteenth century successors viewed shriekers with suspicion, charging them with fraud and punishing their excesses harshly. This behavior persisted, nonetheless, throughout the nineteenth century and into the early twentieth century, when possessed peasant women took on new emblematic force as a symbol and characteristic feature of Russia tradition. In the nineteenth century, possession assumed a positive association among the Russian intelligentsia, who

interpreted shrieking sympathetically as a sign of the simple faith of the Russian folk and as an indication of the hard lot of peasant women.

TRIALS OF WITCHES AND THE PROFILE OF THE ACCUSED

Although the Orthodox Church consistently condemned witchcraft, secular courts tried accused witches. Denunciations originated among those who perceived themselves to be victims of witchcraft, or sometimes from the entire community that felt afflicted by magic. Once a denunciation reached the tsar’s officials, the regional governor or a special investigator from Moscow would undertake a general investigation, questioning members of the community about the particulars of the case and about the characters of the people involved. Both accusers and accused would be questioned “firmly,” first individually and then in direct confrontation. The courts were authorized to use torture extensively and repeatedly. Court transcripts reported testimony taken from the accused without torture and then in the torture chamber before, during, and after torture. The transcripts make painful reading. Accused witches were forced to provide answers to a set list of questions: whom they had bewitched, for what reasons and by what means; from whom they had learned magic and to whom they had taught it. If convicted, male witches could be executed—usually by beheading, rarely by fire—and female witches could be burned or buried alive, the standard Muscovite punishment for female felons. Most commonly, however, convicted male witches were exiled to the military frontiers, where they were registered in military units, issued weapons and plots of land, and set to work to defend Russia’s borders. The sources cannot support any firm numbers, but only a few dozen people appear to have been executed for witchcraft, although hundreds were tried and many of them exiled. The date of the last execution for witchcraft remains difficult to establish because of scattered and incomplete sources, but changes in the justice system would point to the second half of the eighteenth century.

As the charges leveled against witches tended to be more prosaic than the charges of night flying, shape shifting, or orgiastic cannibalism encountered in western European sources, it is easier to envision the reality behind Russian accusations. Many accused witches appear to have worked as healers, using a hodgepodge of spells, potions, roots, and ointments with variable success. Some of the accused confessed to learning their craft from a master or healer; others accumulated a stock of remedies by trial and error. Healers as a group were particularly at risk, as were vagrants and wanderers, who often earned the odd kopek here and there by

purveying charms and medicaments. Non-Russians such as Tatars or Chuvash people who wandered into Russian villages could be vulnerable to witchcraft charges as well.

Among the accused Russians who were not healers, two sets of characteristics appear frequently. First, a number of the accused were seen as criminals and ruffians of a more general type, with witchcraft thrown in as an additional charge along with brigandage, theft, or assault; indeed, Muscovite legislation often categorized witchcraft as just another form of criminal behavior, and the term *vedovskoe vo roustvo* (magical criminality) appeared frequently in court records. Second, many of the accused acted in ways considered disrespectful, disobedient, or defiant of established hierarchies. Hence, serfs or slaves who disobeyed their masters or mistresses, wives who challenged their husbands or their in-laws, nephews who defied their uncles, all might find themselves in court facing witchcraft charges.

The overwhelming preponderance of the accused were male, and almost all were of rather low or middling rank. Although the court and ecclesiastical elite clearly believed in and relied on witchcraft to sort out some of their problems, high-ranking people, as in Louis XIV's Paris, were far more commonly charged with consulting witches than with practicing magic themselves. That most of the accused were male is puzzling, but the numbers are clear. Throughout the seventeenth and eighteenth centuries, approximately 80 percent of the accused were men (Kivelson 1991, 75; Lavrov 2000, 116; Smilianskaia 2003). Men may have been more at risk to accusations because they fit better into Russia's suspicious categories: More men than women appear to have wandered around the countryside; more men were involved in common violence and criminality; men generally had more opportunities to rub shoulders with unfamiliar people and to provoke suspicion or anger. Military service may have added to the risk for men. Numerous cases arose in the barracks, where women would not have been present. The same patterns continued in the eighteenth century, when the preponderance of men may have been reinforced by a quirk in the law: The military law codes of Peter the Great perpetuated and even intensified the penalties for witchcraft, while at the same time his church codes took a more typical Enlightenment line and demoted most magic practiced by women from felony to fraud.

WITCHCRAFT IN MODERN RUSSIA

After the end of formal prosecution, in Russia as in western Europe, witch belief continued to exercise a strong hold on the popular imagination. Russian peasants commonly consulted witches and magical healers

into the early twentieth century. Elements of western European folklore gradually crept into Russian belief, probably mainly through Catholic-influenced Ukraine and through the Baltic and Scandinavian countries. By the nineteenth century, when Russian intellectuals described with horror episodes of peasant lynchings of witches, the victims were uniformly female, and peasants attributed to them some characteristic features from western demonological lore: tails, Devil's marks, teats, and so on. Although educated Russians generally lost their belief in magic in the late eighteenth and nineteenth centuries, a revival of mysticism in the early nineteenth century returned some intellectual and cultural cachet to the world of witches, which retained its appeal in Russian arts and letters until the Revolution. Condemned as primitive superstition by the Soviets, witchcraft disappeared both as documented practice and as a topic for scholarly research for almost seventy years. The fall of the Soviet Union has witnessed a remarkable upsurge of mysticism, and witches have again gained a certain degree of popularity as a source of alternative wisdom and healing.

S

SAAR REGION

Between 1500 and 1700, there were at least 591 trials of alleged witches in Germany's Saar region (Labouvie 1991). In terms of the percentage of the population affected, the witchcraft trials in this region, which had around 100,000 inhabitants, can be categorized as severe, although far less so than in some nearby territories; in the imperial abbey of St. Maximin, for example, approximately a fifth of all inhabitants were executed for witchcraft between 1586 and 1641.

The Saar region was a patchwork of territories belonging to different territorial rulers. Two Catholic areas belonged to the electors of Trier and the dukes of Lorraine; other parts belonged to the Calvinist dukes of Pfalz-Zweibrücken and, in the heart of the region, to the Lutheran counts of Nassau-Saarbrücken, who (unlike the others) lived in the Saarland territories they ruled. Because much of the Saar region was distant from its overlords, local conditions were occasionally conducive to persecuting witches. Furthermore—and this was also the case in the Rhine-Meuse (Rhein-Maas) region—the Saar region was characterized by an extreme fragmentation of lordship rights over land, people, and property. Different territorial lords ruled many areas jointly, and minor lords and even rural communities were often beyond the control of the territorial rulers concerning the exercise of criminal law. Witchcraft trials were particularly common in these areas and must thus be set in the political context of attempts by rival or minor lords to assert their rights of lordship (Vollmer 2002).

PHASES OF PERSECUTION, AREAS MOST AFFECTED BY WITCH HUNTS, AND TRIAL PROCEDURES

Witch hunts in the Saar region occurred in six phases: from 1500 to 1569, 1569 to 1586, 1587 to 1605, 1609 to 1623, 1626 to 1634, and 1646 to 1700 (Labouvie 1991, 69). Some relatively early trials of the 1520s and 1530s were triggered by trials in neighboring Lorraine, Luxembourg, and electoral Trier. In the early stages of persecution, one can discern a gradual spread of trials from west and north to east and south in the Saar region, whereas during the main phase of persecution between 1587 and 1634, trials occurred

simultaneously throughout the region. The zeal for persecution seems to have been stronger in Catholic parts of the Saar region: Some 222 trials were held in six district courts (Siersberg, Schaumburg, Wallerfangen, Griechingen-Püttlingen, Griechingen-Saarwellingen, and Beckingen) subject to the dukes of Lorraine, and 165 trials were held in eight district courts (St. Wendel, Blieskastel, Dagstuhl/Wadern, Schwarzenburg, Perl, Mandern, Liebenburg, and Thalfang) under the authority of electoral Trier; by contrast, only 54 trials occurred in the Saar territories belonging to Pfalz-Zweibrücken and 52 in those of the counts of Nassau-Saarbrücken (Labouvie 1991).

The gender balance among the accused witches in the different territories is also noteworthy. In Protestant territories, almost exclusively women were slandered, accused, and executed as witches, while in Catholic areas, up to one-third of all accused witches were men. This difference was apparently connected with different translations of Exod. 22:18 (22:17): "Thou shalt not suffer a witch to live." The Catholic Vulgate Bible used the male form of the word *witch*, but Martin Luther used the grammatically correct female form of the original Hebrew text, thus giving Protestants reason to perceive witchcraft as essentially female (Schulte 2001).

Most witchcraft trials in the Saar region, as in the Rhineland, originated with initiatives taken by the lower orders. This desire to hunt witches "from below" could take the form of petitions to local criminal courts for pursuing action against witches. Witch-hunting committees (*Hexenausschüsse*) were also often formed to bring suspected witches to court on behalf of the whole community. However, such committees were officially prohibited by the dukes of Lorraine and (as in the duchy of Luxembourg) had to operate secretly. In Merzig-Saargau, an area the dukes of Lorraine and the electors of Trier ruled jointly, there is clearer evidence of such witch-hunting initiatives. In Lorraine, trials usually began with accusations by private individuals (*Formalkläger*) or else ex officio by court officials.

In three Saar territories (Trier, Pfalz-Zweibrücken, and Nassau-Saarbrücken), witchcraft trial procedures were based on both local customary law and on the Carolina Code (the code of criminal procedure for the Holy Roman Empire), while territories belonging to

Lorraine followed the duchy's relevant criminal ordinances. These legal differences created different methods for settling the costs of witchcraft trials. According to the Carolina Code, the heirs of an executed witch paid the trial costs, whereas in Lorraine, the property of a convicted witch (dozens fled and were "banished" in absentia) was confiscated to meet the costs. Every territory followed set procedures for making appeals, for sending trial records to higher courts for approval, and for seeking legal advice from external experts. For advice in such matters, Lorraine used its central legal tribunal, the *Change de Nancy*; the electors of Trier used their main court, the *Oberhof*, in Trier; Pfalz-Zweibrücken used its ducal chancellery; and Nassau-Saarbrücken used its *Oberhof* in Saarbrücken or sought advice from the nearest Protestant university at Strasbourg.

MERZIG-SAARGAU

A *condominium*, or territory ruled jointly by two sovereigns (in this case, the elector of Trier and the duke of Lorraine), Merzig-Saargau had 1,200 inhabitants scattered over twenty villages. The elector of Trier shared rights of criminal jurisdiction over those parts of Merzig-Saargau situated on the left-hand side of the Saar River with the duke of Lorraine and those on the right side of the river with the lords of Montclair. The first recorded witchcraft trial in the entire Saar region occurred at Merzig-Saargau in 1500; a total of forty-four were held there during the early modern period. Local witch-hunting committees were active in bringing suspected witches before the local courts by 1588.

Accused witches from villages on the left-hand side of the River Saar were first kept in custody at Siersburg (belonging to Lorraine) and then in Saarburg (belonging to Trier). Suspects from the right-hand side of the river were held first in the castle of the Montclairs, then in Saarburg. However, the main trial always took place in Merzig in the presence of the magistrates representing the territorial rulers of Lorraine and Trier, as well as the criminal court's bailiff and lay assessors. Executions took place near Merzig in the presence of all thirty-five lay assessors. The goods of those executed for witchcraft were confiscated and auctioned off, with the proceeds divided between the Lorraine and Trier magistrates. This practice provoked disputes between the magistrates, as happened in 1588 when a Lorraine magistrate had the goods of an executed woman assessed without the Trier magistrate's knowledge and to his detriment. Occasional attempts were made to moderate the costs of witchcraft trials but never as part of a deliberate policy.

NALBACHER TAL

Nalbacher Tal was a *Gemeinherrschaft*, or a territory over which different rulers held various rights. In this valley, the ecclesiastical foundation (*Stift*) of St. Simeon in Trier was the *Grundherr*, or manorial lord. The duke

of Lorraine was the *Schirmherr*, the lord responsible for protecting it against external attack. And the electors of Trier and the Palatinate shared the *Vogtei* (administrative authority) and *Landesherrschaft* (ultimate territorial authority). Consequently, each lord possessed certain legal rights: St. Simeon controlled the manorial courts, high criminal justice was shared between the electors of Trier and the Palatinate, and the duke of Lorraine was responsible for repressing crimes threatening the security of the Nalbacher Tal. To complicate matters further, the electors of the Palatinate had given their share of the administrative authority (*Vogteirechte*) and thus part of the right to exercise high criminal jurisdiction to the lords of Braubach as a fief. As a result, criminal trials (including witchcraft trials) were held in Dillingen under the alternating chairmanship of bailiffs representing electoral Trier and the lords of Braubach. Understandably, the complexity of legal rights in the Nalbacher Tal led to frequent disputes between Trier and Braubach. The dukes of Lorraine also sought to extend their power by imposing taxes on Nalbach's inhabitants.

A total of twenty-nine witchcraft trials took place in the Nalbacher Tal, which contained only 110 households; in other words, someone from one in every four of its households (26 percent) was executed for witchcraft. Nalbach's inhabitants submitted a petition to the lords of the criminal courts in 1591 requesting action against witches and specifying suspects to be arrested. We have evidence of witch-hunting committees acting there to stimulate witchcraft trials by 1602. As elsewhere, disputes and complaints arose in the Nalbacher Tal over the high costs of the trials, because the goods of executed witches were often insufficient to meet the costs. Local customary law decreed that such shortfalls should be covered by the ecclesiastical foundation of St. Simeon (for the costs of imprisonment) and by the electors of Trier and the lords of Braubach (for the costs of executions). Lengthy witchcraft trials could thus result in significant expenses for the relevant lords. As a consequence, in 1602, the electors of Trier instructed their bailiff to avoid incurring excessive costs in witchcraft trials. The St. Simeon *Stift* was particularly critical of this bailiff's behavior, accusing him of various improper practices in the accounting of trial costs (for example, embezzlement, waste, and illegal seizure of goods). Demands for lowering trial costs and for the bailiff's dismissal were linked to an announcement that the inhabitants of the Nalbacher Tal were too oppressed by the costs of witchcraft trials to pay their rents. Disputes over trial costs contributed to ending witchcraft trials in the Nalbacher Tal after 1612.

WITCHCRAFT BELIEF AND WITCH SUSPECTS

Witchcraft beliefs in the Saar region were predominantly shaped by the fears and concerns of everyday

rural life (Labouvie 1991, 1992). “Mature” witchcraft theory (involving, for instance, sexual intercourse with the Devil or a large-scale sect meeting at a witches’ Sabbat) played a minor role in confessions by alleged witches at the early Saar trials, while harmful magic was at the center of witchcraft allegations. Witches’ Sabbats resembled village festivals, although with negative aspects. However, the rural image of the witch became increasingly demonized through continuing trials and the indoctrination of the lower orders by clerics and judges. After 1611, sex with the Devil and orgiastic witches’ Sabbats became more marked in confessions.

The victims of Saar region witchcraft trials did not belong to any particular social or occupational group. People most likely to fall under suspicion as witches were those who had disturbed their community’s peace (by being particularly quarrelsome, for example), who had connections with another suspected witch, or who had long been reputed as being witches within their community: It was believed that the power to work witchcraft could be inherited or passed on between acquaintances. Anyone who failed to take legal action after being publicly slandered as a witch also fell under suspicion of witchcraft.

The Thirty Years’ War devastated the Saar region, causing population losses of up to 90 percent in some parts, and it temporarily halted witchcraft trials; however, the last such trials took place only in 1679 (with an unknown result) and 1700 (the accused woman was merely excommunicated). We have no clear, single explanation for the end of the Saarland trials, although the unofficial prohibition of witchcraft trials in 1652 by the archbishop-elect of Trier, Carl Kaspar von der Leyen, may have affected his portion of the region. As indicated, endless disputes among witch-hunting committees, lords of criminal courts, and their officials over the high costs of witchcraft trials plagued the Saar region, and the compulsory moderation of costs by some territorial lords slowed the persecution of witches. After 1650, a more cautious treatment of witchcraft allegations was apparent in Saar region’s courts: They were now much more likely to be treated as slanders and become civil rather than criminal cases. Improved poor relief and medical care may have also helped lessen social tensions and thus the likelihood of one neighbor accusing another of witchcraft.

SABBAT

The Sabbat (witches’ Sabbat) was a central component of the elaborate scenario developed in the late Middle Ages to describe the workings of the Devil in the world and the role of humans in that work. A great many texts described the Sabbat as a gathering of witches led by the Devil. Those who attended were transported to a meeting place, sometimes far from their homes. The meetings were almost always at night, and the Sabbat-goers usually appeared to be asleep. They traveled to the meeting either by flying or by walking, though flight seemed to be the preferred option. Often, the witches rode on an object such as a stick or a broom or on an animal, often a goat.

The Sabbat was depicted as a parody of correct religious observance. It could be a fairly small affair of a few dozen or a huge gathering of thousands. It was generally presided over by a devil, often in the form of a

giant male goat with large horns. There was usually a banquet, featuring food that looked appetizing but was described as tasteless or unpleasant. Almost always, it was stated that there was no salt and often no bread.

At the Sabbat, the revelers would dance, usually back to back or in circles with their backs to the center. There would be a sexual orgy, with the Devil, his demons, and the attendees indiscriminately coupling with each other. The orgy was often described as including incestuous sex.

The attendees had to report the evil things they had done since the last meeting, and demons would mete out punishments if the evil deeds were not sufficient. All had to pay homage to the Devil, usually by kissing his anus (the Kiss of Shame). The witches would often be given powders or ointments to assist them in poisoning other people, animals, or crops. These substances were supposedly manufactured from the corpses of infants who were killed for the purpose. At the end of the gathering, everyone would return home in the same way they had come. Their absence would not have been noticed, and they would go about their business as usual.

In many confessions, the Sabbat was described as being like a perverted village fair. Some even testified that the social hierarchy of the real world was maintained in the Sabbat, with wealthier people arriving in carriages, sitting in front, eating elegant delicacies, and being served by their social inferiors. What was known about the Sabbat came entirely from testimony given to legal and religious officials, overwhelmingly through confessions that were usually made under torture. There is no corroborative evidence that witches' Sabbats ever actually took place, but the belief that they did seems to have been very widespread in all levels of society.

ORIGINS

The sources for the notion of the Sabbat are obscure and quite complex. There is, furthermore, a degree of scholarly controversy over these issues. Nevertheless, it seems clear that the concept of the Sabbat was based, at least in part, on some very ancient popular beliefs that had been widely diffused across Europe at the time of Celtic migrations, if not earlier. In many parts of Europe, people told of flying through the night skies, often in the company of female goddesses. The night flights often took place while these people were unconscious, in dreamlike or trancelike states. Often, the night flyers would travel to or be visited by the souls of the departed or by fairy people, who would play music, dance, and feast. In these early accounts, which were frequently very detailed and were not always obtained under torture, the point of the voyage was considered beneficial. The ecstatic travelers described themselves as fighters against evil and defenders of fertility. Often, the accounts included battles against devils or evildoers and humans assuming animal shapes.

The presence of these ancient folkloric beliefs came to the attention of religious officials in the Early Middle Ages, when the Church was working to guarantee its monopoly on access to the supernatural. At the beginning of the tenth century C.E., Regino of Prüm included the following warning to bishops in his collection of canons:

Some wicked women, who have given themselves back to Satan and been seduced by the illusions and phantasms of demons, believe and profess that, in the hours of the night, they ride upon certain beasts with Diana, the goddess of Pagans, and an innumerable multitude of women, and in the silence of the night traverse great spaces of earth, and obey her commands. . . . An innumerable multitude, deceived by this false opinion, believe this to be true, and so believing, wander from the right faith and return to the error of the pagans when they think that there is anything of divinity or power except the one God. (quoted in Kors and Peters 2001, 62)

This document, known as the *Canon Episcopi*, argued that these beliefs were fantasies or dreams, inspired by Satan. It was the belief that these dreams were real that the *Canon* condemned.

In succeeding centuries, Church writers and officials placed increased emphasis on evil and the role of the Devil as an enemy of god and of humankind. Numerous popular heresies were described as inspired by the Devil in his efforts to undermine God's work. This perception became sharper in the fourteenth century, as economic crisis, warfare, and the demographic disaster of the Black Death buffeted Europe. In this atmosphere of fear, lepers, Jews, heretics, and witches were targeted as the Devil's agents and were threatened to be eradicated. Notions of a secret Jewish conspiracy probably fed ideas of the Sabbat: The use of the term *synagogue*, often employed to describe the witches' gatherings, derives from this connection.

In the early fifteenth century, several documents that were written at approximately the same time illustrated the ways in which varied beliefs had merged to form the picture of the Sabbat. Originating mainly from the western Alps between 1435 and 1440, they treat the Sabbat as a reality, no longer as a fantasy of misled women. Johannes Nider, in the *Formicarius* (The Anthill), related stories of devil-worshipping groups who murdered infants and made ointments from their bodies to be used in witchcraft. The unknown author of the *Errores Gazariorum* (Errors of the Gazars or Gazarii [Cathars—a common term for heretics and later witches]) told of gatherings, presided over by the Devil in the shape of a black cat, at which the witches had to pay homage to their master by kissing his

backside. They participated in a banquet and obscene, perverted sexual activities and then were given ointments and powders made from dead children to be used in killing people and destroying crops. An account by a lay judge, Claude Tholosan, included similar stories, learned through testimony he heard in over 100 trials. Tholosan wrote of a sect of witches who, through ceremonies that inverted Christian observance, renounced God, adored the Devil, and sacrificed their children. He also stated, "They imagine in dreams that they travel bodily at night . . . in the company of the Devil." A French poem from the court of Burgundy, written around 1440, gave a full picture of the Sabbat. It told of gatherings of thousands of witches at the "awful synagogue" of the Devil. There, the witches worshiped a devil in animal form, kissing his backside and then drinking, banqueting, and dancing. After group sex, the witches returned to their homes, flying upon broomsticks, to do their evil deeds (quoted in Kors and Peters 2001, 165, 169).

DEMONOLOGISTS DIFFUSE THE SABBAT

By the late sixteenth and early seventeenth centuries, the Sabbat became a central part of demonologists' accounts of the crime of witchcraft. Testimony by thousands of people, in all corners of Europe, seemed to confirm the reality of secret nocturnal gatherings. Jean Bodin, author of the *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580), described the Sabbat in detail as an aspect of witches' crimes. He based his discussion of this theme largely on accounts of recent trials, whose essential similarities he emphasized. He told several stories of the transportation of witches to their assemblies, with or without the use of ointments, and the flight on brooms or chimney mops. At the Sabbats, the witches danced in a frenzied way, adored the Devil, and had to report their evil deeds or be punished. Bodin held that the transportation to the Sabbat was real, not just an illusion or ecstasy. He insisted that the agreement of so many accounts constituted solid proof of the reality of this phenomenon.

Nicolas Rémy read hundreds of witchcraft trials as a judge and public prosecutor in Lorraine. He devoted a section of his *Dæmonolatria* (Demonolatriy, 1595) to the Sabbat, which he examined in great detail. It is clear that most, if not all, of the evidence he used from these cases had been obtained under torture. His sources were an interesting blend of classical and contemporary accounts. In a single section, he might name ancient authorities such as Pythagorus, Cicero, or Plato and then cite the testimony of local peasants who had been sent to the stake. Rémy emphasized that travel to the Sabbat had to be a fact, not a dream. To any suggestion that witches would go to a Sabbat in spirit only or in ecstasies, he argued that the soul and body were inseparable until death. The accounts of the Sabbat he related

were basically identical to most others, though with many minor variations. For example, he reported that in traveling to the Sabbat, people used a variety of means, such as broomsticks, forked sticks, or even just ordinary sticks. Some rode on animals, including bulls or pigs. He insisted, based on the testimony he had heard, that every aspect of the Sabbat—the food, the dancing, and the drink—was disgusting, tiring, and very painful for the participants. This assessment contrasts with that of Pierre de Lancre, who insisted that he was told how much the attendees enjoyed themselves. Rémy was not writing a legal manual for handling witchcraft trials, and he did not explicitly examine the issue of whether attendance at a Sabbat was sufficient by itself to convict a suspect. He did, however, imply that that was the case, pointing out that in regard to serious crimes, *intent* to commit a crime was tantamount to actually committing it: If someone, through attending a Sabbat, indicated an intent to do evil deeds, that should suffice for a death penalty decision.

This and other legal issues were examined in detail by someone who had never judged a case himself—the Jesuit scholar Martín Del Rio, the most respected Catholic demonologist of the early seventeenth century. Del Rio stated that for those who attended a Sabbat, even if they had committed no evil deeds, "the very fact that they allied themselves with an evil spirit by means of a pact, that they were accustomed to take part in a sabbat, and are responsible for what they do there, is sufficient reason" to impose the death penalty (Del Rio 1611, 833). Like many previous Catholic clerics in Italy, he also argued that the *Canon Episcopi* did not apply to "modern" witches, who were not innocent women but rather apostates, heretics, idolaters, blasphemers, and sodomites.

Pierre de Lancre was an appellate judge from Bordeaux who had investigated a widespread witchcraft panic in 1609 and wrote an extensive study based on this episode. Through hearing testimony from hundreds of witnesses, Lancre was convinced that the central problem he confronted in the Basque Pays de Labourd was the existence of a diabolical sect that assembled at countless Sabbats. He stated that, of 30,000 inhabitants of the region, at least 3,000 were witches who had been marked by Satan. Further, Sabbats took place almost every night, and four times a year, there were huge Sabbats, attended by up to 12,000 witches. Much of Lancre's testimony came from young women (below the age at which they could be prosecuted), who testified in great detail, without torture, about what happened at Sabbats. As with Bodin, the general agreement of these accounts was deemed a crucial proof of their reality. The Labourd Sabbats contained all the elements that were by then well known. Lancre was a skillful writer who used emotive and colorful prose to paint pictures of these horrifying events.

*The most famous illustration of the Sabbat, by Polish engraver and painter Jan Ziarnko for Pierre de Lancre's *Tableau de l'inconstance des Mauvais Anges et Demons* (Description of the Inconstancy of the Evil Angels and Demons), 1612. Note the Devil seated on his throne flanked by his favorite witches, the child presented to him as a sacrifice, witches and devils dancing and feasting on the right, witches brewing a storm, witches and demons flying, and other noxious activities that constituted a reversal of Christian society and religion. (TopFoto.co.uk)*

What particularly shocked Lancre was the witnesses' attitude to the Sabbats. Although most writers insisted on the unpleasantness and pain of the Sabbats, Lancre's juvenile witches testified about how much they enjoyed the meetings (something similar happened later with Swedish children at Blåkulla). He stated, "Instead of being quiet about this damnable coupling (with demons), or of blushing or crying about it, they tell the dirtiest and most immodest circumstances with such freedom and gaiety that they glory in it and take great pleasure in telling about it." He reported that one witness said, "The Sabbat was the real Paradise where there was more pleasure that could be expressed" (Lancre 1612, 142, 344).

THE SABBAT IN WITCHCRAFT TRIALS

The Sabbat figured in trials for witchcraft all across continental Europe. Because solid evidence for crimes

carried out with diabolical spells or poisons was very difficult to obtain, accusations of participation in Sabbats offered an alternative way for a judge to prosecute witches.

The attitude of a court to this kind of testimony was crucial in determining how many witches would be accused at any time. If court officials took this testimony seriously and used torture to obtain confessions and fresh accusations, the net could be cast very widely, as happened in many places, mainly in Germany. Rémy's Lorraine preserved hundreds of confessions by witches who had attended Sabbats. In their questioning, often accompanied by torture, the Lorraine judges were more interested in learning names of "accomplices" than in details of what happened at the Sabbats.

The Basque region, which lies across the border between France and Spain, produced voluminous quantities of information about Sabbats. On the French

side, Lancre and his senior colleague Jean d'Espaignet heard hundreds of young witches describe them; they concentrated on arresting several dozen suspects, including a number of priests, who seemed to be the head witches. The French judges tried these suspects on the spot, and the Spaniards reported that they executed as many as eighty of them. The remainder were dispatched to Bordeaux for judgment by the whole *parlement* (sovereign judicial court). The court eventually released most of them because of insufficient evidence, provoking an enraged Lancre to write his treatise in hopes of overcoming the skepticism of his colleagues about the value of Sabbats as evidence.

Across the frontier, witchcraft fell under the purview of the Spanish Inquisition. Refugees from Lancre's reign of terror spilled into Spain, where the Holy Office soon arrested several of them. Though these systems were very different, the handling of this complex case of the Basque witches was similar. The Spanish Inquisition also separated out two dozen or so ringleaders, sending them to Logroño to be examined by the Inquisition tribunal there. At first, these inquisitors took witchcraft seriously, including the Sabbat. They sentenced eleven witches to death at a famous *auto de fe* (act of faith) in 1610. As in France, garrulous, underaged witnesses had deluged them with voluntary confessions about what went on at Sabbats. However, a degree of skepticism emerged shortly after these proceedings. The Spanish Inquisition had not executed anyone for witchcraft for more than sixty years, and the local bishop had never been convinced of anyone's guilt. One inquisitor, Alonso de Salazar Frías, became an open critic of the role of the Sabbat, the original confessions, and the entire proceedings. A year after the *auto de fe*, he traveled through the region, persuading hundreds to retract their confessions. He sent confessed witches to the locations of their Sabbats in order to show how inconsistent their testimonies were. He even conducted experiments with witches' ointments and powders, which showed them to be harmless. No more witches were ever executed by the Spanish Inquisition.

In France, Europe's most prestigious court, the *Parlement* of Paris, tried around 1,250 people for witchcraft in the sixteenth and seventeenth centuries and executed just over 100 of them. While three-quarters of them were charged with attending Sabbats, they were also found guilty of other crimes of witchcraft. Only 7 were convicted and executed solely for attendance at Sabbats.

Many large-scale trials took place in Germany, based on denunciations of so-called accomplices seen at Sabbats. Lists of such accomplices have been preserved from several major German witch hunts, dating back to Trier in the 1580s. In Bamberg and Würzburg, both prince-bishoprics, intense witchcraft persecutions took place in several episodes between 1590 and 1630 in

which the Sabbat operated as the crucial multiplier. Each of these small cities witnessed hundreds of executions of witches, all generated through torture to obtain more names. In such massive trials, even wealthy and influential citizens were accused and tried. These people tended to have a more sophisticated understanding of theological issues, so their confessions were much more detailed than those of the ordinary folk. In 1628, two people accused Burgomaster (Mayor) Johannes Junius of Bamberg of attending Sabbats. After denying all charges, he was tortured; he eventually provided a full and colorful account of his participation in Sabbats. He also named several other prominent citizens as having been there as well. In Würzburg, at the same time, forty-three priests and monks were executed. Their confessions were the most elaborate in all of Germany, full of references to fairy food and parodies of the Mass.

In one very late trial at Bamberg, a witch denounced at least 126 accomplices—who were not arrested. By that time, trials for witchcraft were becoming rare in most of Europe. Attacks on abuses of the judicial system and on the use of cruel torture to extract confessions seemed to have had an effect on theologians and judges. Though stories of fairies and the souls of the dead flying through the night continued to be told, the authorities stopped regarding them as evidence of a demonic sect.

The Sabbat offers an instructive example of the complex relationship between popular and elite culture in early modern Europe. Ideas that emerged from widely diffused ancient folkloric roots had been at least partially integrated into elite culture by the 1430s. During the Reformation, these views were seen as proof for the existence of a diabolical, heretical sect of witches by all confessions. Through publication, preaching, and trials, such concepts permeated the consciousness of people at all levels of society in different ways. When adolescents and even children confessed to attending Sabbats and gave full accounts of their experiences, such views were confirmed, and the efforts to exterminate witches were justified.

SACRAMENTS AND SACRAMENTALS

Writers on witchcraft inherited long-standing debates over the nature and efficacy of Catholic sacraments and sacramentals. Medieval Catholic theology defined sacraments as signs that perform the same acts of divine grace they signify. There are seven sacraments: baptism, confirmation, Eucharist, penance (sacramental confession), extreme unction, orders (ordination), and matrimony. Baptism, confirmation, and orders stamp the soul with a “character,” an indelible *signum spirituale* (spiritual sign), and therefore must be received only one time. Sacramentals are less momentous rituals that have an aura of the sacred: such as the sign of the cross; use of holy water; and various blessed objects such as salt, palm leaves, wax, and bread. Sacramentals and emergency baptisms can be performed by any layperson; the remaining sacraments are to be performed only by priests.

The Council of Florence declared polemically (in 1439) that sacraments “cause grace”; they “contain” it and “confer” it on those who receive them “worthily.” The Council of Trent (1547) reiterated these doctrines, anathematizing definitions of sacraments as metaphors or mere ceremonies (Denzinger 1976, 333, 382). Conciliar decrees reflected centuries-long clashes over sacramental reality between Church authorities and heretical movements. The debates were particularly fierce in the fifteenth and sixteenth centuries, from the Hussite movements in Bohemia to the Reformation and Counter-Reformation.

WITCHCRAFT, SACRAMENTS, AND HERESY

The earliest witchcraft texts reflected anxiety over challenges to sacramental efficacy in several ways. Witchcraft was defined as heresy; the behavior of fifteenth-century witches, more often imagined rather than real, reflected accusations against earlier heretics. Initiation into witchcraft was imagined according to heresiological stereotypes, some predating the twelfth century: One joined a “sect,” renounced Christianity,

met the Devil in person, bound oneself body and soul to him, and demonstrated contempt for Christianity by desecrating crucifixes and other sacramental objects. Like earlier heretics (and like Jews), desecrating witches unleashed normally imperceptible sacramental effects, thus unwittingly demonstrating sacramental reality. Most significantly, witches were forced to confess torturing the Eucharist until it bled or otherwise confirmed transubstantiation, the sacramental doctrine whose lack of universal acceptance caused some of the most persistent controversies and around which the largest cluster of superstitions developed.

The detrimental effects of *maleficium* (harmful magic) were retheorized as equal and opposite to the beneficial effect—literally, *beneficium*—of sacraments and sacramentals. Indeed, *maleficium* depended on the inversion and perversion of literal sacramental energies. Witches were forced to confess that, by desecrating a holy object (a cross, a consecrated Host, and so forth), they regularly caused a devil to appear corporeally. Confessions also confirmed that witches desecrated sacramental materials, especially the Eucharist and chrism oil, in order to prepare charms and other malefic paraphernalia. Conversely, making the sign of the cross, intentionally or not, made devils vanish; demons transporting witches through the air instantly dropped and injured anyone who inadvertently crossed themselves. Pronouncing the name of God, Christ, or Mary had the same effect. Thus, to demonstrate the reality of witchcraft was to defend sacramental efficacy and reality.

In the *Formicarius* (The Anthill, 1437–1438), Johannes Nider reshaped vivid stories reputedly told by a secular judge, Peter of Bern, and others about the opposition between witchcraft and sacraments. Nider was particularly concerned to demonstrate the reality of transubstantiation, baptism, and making the sign of the cross. He generalized from these anecdotes, declaring that witches confessed being unable to overcome properly observed sacramental protections. He presented *Formicarius* as a demonstration that, contrary to appearances, God had not ceased to look after modern Christians. Nider's opposition of *maleficium* to sacred rituals inspired further refinements: *Malleus Maleficarum* (The Hammer of Witches, 1486) claimed that devils always required witches to make their witchcraft materials from profaned sacraments and explicitly proposed sacraments as “remedies” for witchcraft. Later Catholic writers, for example, Bartolomeo della Spina or Francesco Maria Guazzo, perpetuated the opposition.

Before and after the Reformation, Catholic documents showed witches inadvertently demonstrating sacramental efficacy. Ironically, Protestant writers, who opposed various Catholic sacraments, helped perpetuate the connection between witchcraft and sacraments. Martin Luther and his followers reduced the seven sacraments to only two, both based on clear New

Testament texts; the two they kept, baptism and the Eucharist, were precisely those that witches most commonly defiled. This change redefined Protestants' belief in the overall sacramental system but did nothing to reduce their horror of witches, who desecrated both of the "real" sacraments. Meanwhile, Protestant polemics argued that the other "papist" sacraments, lacking foundations in Scripture, were themselves heinous forms of witchcraft, "excrements" overseen by Satan rather than God. The efficacy of most Catholic sacraments could thus be dismissed as either illusory or demonic.

SAFTLEVEN, CORNELIS (1607–1681)

This Dutch painter was one of the few seventeenth-century artists to depict occult themes. Saftleven was born in Gorinchem (Gorinchem) into a family of artists; in fact, his brother Herman, a well-known landscapist, is better remembered today than Cornelis. Cornelis Saftleven is generally considered a painter of peasant genres in the tradition of such artists as Pieter Brueghel the Elder and two of his contemporaries, David Ryckaert III and David Teniers the Younger. Saftleven's work was closely tied to that of Teniers, although he may also have collaborated with Peter Paul Rubens.

Approximately seventy of Saftleven's paintings and drawings contained subjects such as scenes of hell and devils, the temptations of St. Anthony, enchanted animals, and witches. These themes also reflected the influences of the Brueghel family and Teniers. Many of Cornelis Saftleven's occult works depicted animals dressed in clothing and engaged in human activities. Some of these paintings and drawings may be interpreted as showing witchcraft. His concerts of cats and birds were quite similar to works by Teniers and his artistic entourage. In most cases, they were probably *singeries*, allegories in which animals mimic or make fun of humanity. But such motifs may also show transmuted witches, devils disguised as animals, or even enchanted domestic animals. Examples of such works by Saftleven included two drawings from the Rijksprentenkabinet in Amsterdam, entitled *Bird's Concert* and *Cat's Concert*, and a beautiful chalk, wash, and watercolor drawing, entitled *An Enchanted Cellar with Animals*, now in the

Getty Museum in Los Angeles, California. The last showed birds singing under the direction of an ape and a group of rats warming their forepaws in front of a hearth. That vignette of enchanted animals (or perhaps devils in disguise) warming their paws was lifted directly by Saftleven from a print by Brueghel, *St. James and the Magician Hermogenes*. Another concert of hellish cats is included in a painting, the *Temptations of St. Anthony* by Saftleven (its present whereabouts are unknown).

In some of Saftleven's works, the theme was unambiguously witchcraft. These works closely imitated paintings by Teniers and his follower David Ryckaert III. For example, a Saftleven painting entitled *Witches Sabbat*, or, alternatively, *A Witch Entering Hell* (owned by the Chicago Art Institute), showed a witch riding into the mouth of hell on the back of a demon-goat. She was certainly a witch because she carried that most obvious item of witchcraft iconography, her broom. As she rode into hell, the witch caused a large number of anthropomorphic and zoomorphic devils to flee before her. These devils were clearly derived from similar devils by Teniers; in fact, the scene is almost identical to a Teniers drawing entitled *Witch Entering Hell*. Another Saftleven witchcraft painting, *Binding the Devil to a Cushion* (present whereabouts unknown), showed witches tying down a zoomorphic devil. This painting was probably based on *The Witch*, a work by Teniers that is in the Munich Alte Pinakothek, and without question, it was ultimately derived from the scene of witches tying down devils in Brueghel's *Dulle Griet* or from a vignette in his famous painting *Flemish Proverbs*. Not coincidentally, Teniers also painted a work with the same title.

Comparing Cornelis Saftleven's paintings and drawings of witchcraft and other occult scenes with those of other seventeenth-century Dutch and Flemish artists, we find that Saftleven's treatment of witchcraft was quite typical, with no distinctive iconography or unusual specific themes. Witches and devils went about their activities in a generally matter-of-fact manner. Apart from utilizing the folkloric saying of a woman so mean that "she could tie a devil to a pillow," Saftleven adhered to the standard artistic practice of his day and showed his witches and devils as the demonologists said they existed and behaved. What made Saftleven unusual was the large number of themes of the demonic and of witchcraft that appeared in his output. His animal allegory paintings were doubtless taken as humor during the seventeenth century, but they may also be interpreted as far more sinister views of witches transmuted or animals enchanted. Such double meanings were certainly understood by Saftleven's audience, and again, Brueghel, Teniers, and others also made use of the double meaning of animal allegory that did, at times, represent witches and devils.

SALAZAR FRÍAS, ALONSO DE (1564–1636)

Salazar was a Spanish inquisitor who averted a mass killing of Basque witches and who was also directly responsible for the new instructions of August 29, 1614, that led to the definitive cessation of witch burnings under the Spanish Inquisition. He was born at Burgos, where his father was a lawyer, and belonged to an influential family of civil servants and prosperous merchants. At age fifteen, Salazar matriculated at the University of Salamanca, where he obtained his bachelor's degree in canon law after five years. In 1588, he took holy orders, becoming a stipendiary (*racionero*) at the cathedral of Jaén in Andalusia. Its bishop, Francisco Sarmiento de Mendoza, had been a professor of canon law at the University of Salamanca and a judge of the High Court of Valladolid; for Salazar, he was an excellent mentor. By late summer of 1588, Salazar took his licentiate degree in canon law at the University of Sigüenza.

A meteoric career began for the twenty-four-year-old licentiate. The bishop made him his representative on visitations; in that capacity, Salazar traveled throughout the diocese of Jaén, so that, as his autobiography says, there was no "church or font" he had not visited. At the age of twenty-six, he obtained a position as canon with a lifelong benefice of 1,500 *ducados* a year, a high income considering that an inquisitor earned barely half as much. Apparently, Salazar also served as a judge (*provisor*) at the bishop's court. When Bishop Sarmiento died in 1594, it emerged that he had also made the young canon his executor. In the same year, the cathedral chapter sent Salazar to defend the interests of the diocese in a lawsuit with the archbishop of Granada involving tithes. Salazar won the case in two and a half years, during which time he also represented Jaén at a synod in Madrid. After 1597, he spent most of his time in Madrid, representing the new bishop of Jaén, Bernardo de Sandoval y Rojas, in a succession of suits concerning the revenues of the diocese, all of which he won. In 1599, when Don Bernardo was promoted to archbishop of Toledo, one of the most powerful offices in the country, he made Salazar his private lawyer, and by 1600, he had him elected attorney general for the Castilian church. In this new post, Salazar met Crown ministers and the papal nuncio.

A Spanish historian characterized Salazar as a good negotiator with the tact and flexibility to get matters on the proper course; a man with great diplomatic talents; and an experienced lawyer who never gave up, even if he encountered opposition from the highest authorities, but who also only undertook causes he considered just. He attached great importance to written evidence, which sometimes prompted him to hunt through the archives; his love of these sources often resulted in a superabundance of documentation where less would have sufficed. In addition, he had perspicuity, concentration, and a formidable capacity for work: "When Alonso de Salazar took on a case . . . he spared no effort and left no loose ends. From that moment on he lived in a state of permanent preparedness to obtain the best possible result" (Coronas 1981, 19).

Several times, the Holy See, under both Pope Clement II and Pope Paul V, recommended him for a post as inquisitor. But he did not assume that position until his patron, Sandoval y Rojas, became Inquisitor General in 1608. Salazar was the first inquisitor he appointed, being assigned to the vacant post at Logroño on March 23, 1609. When Salazar took up his position three months later, the trial of the witches of Zugarramurdi was in full swing, and as the junior inquisitor, he at first relied completely on his two older colleagues. He spoke up only in June 1610, when they were voting on the cases of two clerical "witches" and six other *negativos*, or "deniers" (those who pleaded not guilty). His colleagues and their assessors agreed to sentence them all to the stake because of the overwhelming evidence against them. But after criticizing the evidence, Salazar alone voted that they should all be interrogated under torture, which was their only chance of survival. Already on this occasion, Salazar came up with the important observation that all of the confessing witches had been unable to tell whether they had gone to the Sabbath in dreams or in reality (*coposamente*). If they could be mistaken on such a material point, Salazar continued, they could also be in error regarding those they named as their accomplices (Henningsen 1980, 178–180).

The next year, on an eight-month journey through the Basque Country with the Edict of Grace for the witches' sect, Salazar fully confirmed his misgivings: "I have not found a single proof, not even the slightest indication, from which to infer that an act of witchcraft has actually taken place" (quoted in Henningsen 2004, 340), he wrote afterward in his report to the Inquisitor General. In his explanation of the genesis of the witch panic, Salazar can almost be said to have anticipated modern communication theory: "The only basis for this rumor-mongering appears to be the punishment of witches at the *auto de fe* celebrated in Logroño, the Edict of Grace and the fact that an Inquisitor has set out to visit so many places. All of which apparently

provides a reason for everything to be immediately thought of as witchcraft. This grows at every telling and today in fact there is no fainting-fit, illness, death or accident that is not attributed to witches” (quoted in Henningsen 2004, 336).

Alongside the almost 2,000 cases he dealt with in connection with the witch amnesty, Salazar also found time for some empirical investigations enjoined on him by the *Suprema* (the supreme council of the Inquisition). Everywhere he went, he tried to check the witches’ confessions against statements from people who were not themselves witches. In Fuenterrabía, for example, he questioned the family of Catalina de Echeverría, an elderly woman who had said, during her confession at Logroño, that when she became a witch, the Devil removed three toes from her left foot. Yet people from her house declared that she had lacked those toes since infancy (Henningsen 2004, 300). In the process, Salazar also carried out two series of scientific experiments. The first series concerned the witches’ meeting places and was conducted in nine different villages; in each, four subjects were selected from those who had made confessions of witchcraft in connection with the witch amnesty. These individuals were secretly taken out to the place where they said the witch meetings had been held. There, they were asked to point out the place more specifically and to show where the Devil’s throne had stood; where the witches’ cauldron had been placed; and where they had eaten, danced, and done other activities. Afterward, the reports with the replies were compared. The information matched in two of the nine experiments, but Salazar claimed that in both cases, information had leaked, so the subjects could have agreed in advance what to say. In the rest of the experiments, the subjects contradicted one another. A second series of experiments concerned the witch powders and flying ointments that had been revealed. The contents of twenty-two jars of these substances were examined by physicians and apothecaries, tested on animals, and, indeed, ingested by an elderly woman. The contents turned out to be quite harmless, and when Salazar pressed the owners of the substances, the witch ointments proved in every case to be something that the supposed witch had concocted to satisfy the persecutors (Henningsen 1980, 295–298).

However, most of the witches’ activities were said to have taken place in a dream world to which only the witches themselves had access and about which one could only get information through them. To solve this problem, Salazar concentrated on the witch stories that had a double aspect, referring to things in both this and the other world. For example, a seventy-year-old man confessed that *outside* the Sabbat world, he lived “in sin” with a woman who was also a witch and that they both went to the same Sabbat. After listening to him, Salazar asked whether they also met and spoke together

inside the Sabbat. But the man told him that “although both partners saw each other in the crowd, they never spoke to one another, nor exchanged a single word about their illicit relationship” (quoted in Henningsen 2004, 282). During the questioning, Salazar operated with four pairs of oppositions, each including an empirically verifiable element:

| | |
|--------------------------------|------------------------------|
| Inside (<i>allá dentro</i>) | Outside (<i>acá fuera</i>) |
| Invisible (<i>invisible</i>) | Visible (<i>visible</i>) |
| Fictive (<i>fingido</i>) | Real (<i>real</i>) |
| Sleeping (<i>durmiendo</i>) | Awake (<i>despierto</i>) |

Using his almost wholly modern anthropological method, Salazar could deal with the confessions of the witches in purely phenomenological terms, unaffected by preconceived opinions about what the Devil and the witches were capable or incapable of. During his subsequent debate with his colleagues, Salazar formulated a number of basic rules for evaluating testimony in witchcraft and criminal cases as a whole: “It is not very helpful to keep asserting that the Devil is capable of doing this or that. . . . The real question is: are we to believe that witchcraft occurred in a given situation simply because of what the witches claim? It is clear that the witches are not to be believed and that judges should not pass sentence on anyone, unless the case can be proven by external and objective evidence sufficient to convince everyone who hears it” (quoted in Henningsen 1980, 350).

That Salazar sometimes offered reflections on the Devil’s capabilities does not necessarily mean that he believed in demonology. His demonological arguments must be viewed as superfluous rhetoric, for they can very easily be removed from the account without the arguments falling apart. This factor is exactly what distinguished Salazar from Johann Weyer, Friedrich Spee, and other famous “witches’ advocates,” in whose discourse demonology is integrated in a quite different way. On the whole, demonology seems to have interested Salazar very little. He did not quote a single authority, and in the catalog of his library of over 800 titles, the genre is represented by only 10 works.

Salazar proposed one of his most original ideas in the discussion of the judges’ evaluation of the evidence, where he argued for a kind of value-nihilism. He claimed that we have no objective method of assessing the credibility of people who confess (*confitentes*, as the Inquisition called them): “In order to resolve the contradictions which emerge from the confessions, my colleagues divide the defendants into three categories: good, bad, and indifferent *confitentes*. However, we have no method or rule which allows us to evaluate each confession other than the arbitrary one that they have used and refer to in their paper. Thus the name of bad *confitente* is given to someone whom another [judge] might call good, and vice versa” (quoted in Henningsen 1980, 436).

In 1618, Salazar was transferred to the Inquisition of Murcia and the next year to the Valencia tribunal, but in 1622, he was back as senior inquisitor in Logroño. His service as a “troubleshooter” at various tribunals ended in 1628, when he became *fiscal* (prosecutor) in the Inquisition’s supreme council, of which he became a full member in 1631. His reports, with their philosophically interesting analysis of the whole foundation of the belief in witchcraft, were buried in the archives of the Holy Office until they were retrieved by the American historian Henry Charles Lea (4: 225–237).

SALEM

In 1692, a witch panic, the largest and by far the most famous in U.S. history, gripped Essex County, Massachusetts. It began in Salem Village, a farming community of just over 200 adults, but then spread rapidly throughout the region. During that year, formal charges of witchcraft were brought against more than 150 people, while many others were named informally. Over half of those indicted lived in Salem village or in nearby Andover, but overall, there were women and men from twenty-four towns and villages. By early October 1692, when court proceedings were halted amid acrimonious controversy, 19 people had been hanged and one man had been killed for refusing to

plead; over 100 people were awaiting trial in prison. (For a list of those formally accused, where they lived, and the court’s verdicts, see Godbeer 1992, 238–242.)

The core group of accusers consisted of girls and young women from godly households in Salem village who had begun to suffer strange fits in the opening weeks of that year. Several of the girls had apparently been experimenting in secret with divination. One of them, for instance, suspended the white of an egg in a glass of water “to find her future husband’s calling” (Godbeer 1992, 34); when she looked into the glass, she saw the image of a coffin. We will never know exactly what prompted the girls’ subsequent fits, but it is likely that fear and guilt relating to their illicit experiments were contributing factors. One of them was the daughter of the minister Samuel Parris; another was his niece. When Parris called in a local physician to examine them, the doctor concluded that they were bewitched. At first, Parris responded by imposing a regimen of prayer and fasting. But in late February, he changed his strategy and pressured the two girls to name their tormentors, encouraging the parents of other afflicted children to do likewise. They named three women, including the pastor’s Indian slave Tituba.

Tituba has figured prominently in the evolving mythology that surrounds the Salem witch hunt, though reliable information about her is sparse. Parris had purchased Tituba in the West Indies and taken her with him to Massachusetts. The minister’s slave had a reputation for occult skill and was commissioned by the aunt of one of the afflicted girls to identify the witch responsible for causing the affliction through the use of countermagic. Tituba baked a cake that contained the girl’s urine and then fed it to a dog. Parris was furious when he found out about the episode, and it is hardly surprising that Tituba figured among the first three witches named by his daughter and niece. Some accounts hold Tituba responsible for teaching divination techniques to the girls, though no shred of evidence supports that contention. She and her husband, John, were described by contemporaries as Indian, yet later accounts made Tituba into an African woman and a convenient scapegoat for the ensuing disasters.

Once local magistrates issued arrest warrants for the three named women, other villagers began to come forward with additional accusations, and before long, allegations spread to nearby communities. By the time the new governor of Massachusetts, William Phips, appointed a special court to deal with the crisis in mid-May, almost fifty people had been charged. Most previous witchcraft trials in New England had targeted one or, at most, a few individuals, so the scale of the 1692 witch hunt was utterly anomalous. Many historians have pondered and recounted the events of that year, offering explanations that range from cynical

manipulation and conspiracy to collective food poisoning. The colony's unusual political situation in early 1692 doubtless abetted the spread of the panic. Massachusetts had lacked a legally established government since the fall of the authoritarian regime headed by Edmund Andros in 1689; until Phips arrived in May 1692, the authorities could only imprison suspects without trial, so allegations proliferated without any possibility of swift resolution. But recent scholarship has suggested that the origins of the witch hunt lay embedded in the preceding decades. Salem Village itself and the region as a whole had been afflicted by a series of crises that fostered witch hysteria. From a modern perspective, these events seem unconnected to witchcraft, but that was not so in the minds of seventeenth-century New Englanders.

Recent threats to the New England colonies had created an intense sense of danger among settlers in the region. Colonists felt imperiled by Native American attacks between 1675 and 1676 and from 1689 to 1691; by political reforms, imposed during the 1680s by the government in London, that threatened to undermine the colonists' independence; by the increasing visibility of religious dissenters; by recent Quaker evangelism; and finally, by news of the imposition of a new charter in 1691 giving freedom of worship and the vote to previously disfranchised groups such as Quakers and Anglicans. New Englanders described these threats in much the same language used to characterize witchcraft: as alien, invasive, and malevolent forces. Hostile residents characterized British imperial officials as "tools of the Adversary," and one of them was even denounced as a "Devil" (Godbeer 1992, 187). Many colonists believed, furthermore, that Indians were devil worshippers and that Quakers who claimed to access divine truth through inner revelation were actually possessed by Satan. To be attacked by Indians or evangelized by Quakers was thus practically equivalent to being assaulted by Satan.

The afflictions in Salem Village unleashed the fears of alien, invasive, and diabolical forces that had accumulated during the preceding years. The crisis of 1692 struck some contemporaries as the climax of a devilish assault upon the region. Those who could be linked in some way to these recent experiences of invasion proved vulnerable to allegations of witchcraft. A significant number of the accused had close Quaker associations; Samuel Wardwell, for example, had Quaker relatives. Several suspects were linked to Indians: One of John Alden's accusers claimed that he had sold gunpowder to Native Americans and had been sexually involved with Indian women. Tituba was marked by her race as well as her reputation for occult skill. Many of the accused were clearly perceived as outsiders, either literally or figuratively. Eight of the Andover suspects were marginalized by ethnic affiliation: Martha Carrier, for instance,

was Scottish and had married a Welshman, and Martha Corey had an illegitimate son of mixed race.

During the decades prior to the witch hunt, the village of Salem had become bitterly divided around a series of issues that paralleled crises in the region at large. The rural settlement that became known as Salem Village had no civil government of its own; it was legally joined with and subordinate to Salem Town. Salem Town needed the food that Salem villagers produced, and it benefited from the taxes that they paid. But some villagers wanted independence from the town, in part because the latter had proven remarkably insensitive to their concerns. The town government was slow to relieve villagers from having to provide men for the Salem Town night watch, even though some of the villagers lived up to 10 miles away from the town center; it was also reluctant to let the villagers form a church congregation of their own, despite the inconvenience of having to travel so far to the town meeting-house. Those who lived closest to the town tended to feel less aggrieved by these issues and became increasingly alienated from villagers further west, who in turn resented their lack of support.

Some villagers also wanted to separate themselves from the commercial spirit that increasingly characterized the town, which was a flourishing seaport. Villagers who saw that way of life as spiritually suspect tended to distrust neighbors who lived nearer to or associated with the town's interests. Factional division was shaped by disparate economic opportunity as well as by cultural values. Those farmers who lived closest to the town had land of a higher quality, enjoyed easier access to its markets, and tended to see the town's development as an opportunity; those living farther west had poorer land, were less able to take advantage of the town's growth, and tended to resent those who could do so.

Salem Village had become increasingly divided, as those who associated with the town aligned against those who were eager to separate and form an autonomous community. Because the village had no formal institutions of its own, it proved extremely difficult to resolve the disputes that arose between these two groups, so animosities and mutual suspicions deepened with each passing year. Proponents of separation from the town eventually secured the establishment of an independent church in 1689 and the ordination of Samuel Parris as their pastor. He was, however, an unfortunate choice: A failed and bitter merchant who resented those who succeeded in the world of commerce, he fueled local hostilities. Parris gave a series of inflammatory sermons that translated factional division into a cosmic struggle between the forces of good and evil. In the minds of his supporters, Salem Town became the symbol of an alien, corrupt, and even diabolical world that threatened the welfare of Salem Village.

The Trial of George Jacobs, August 5, 1692, by T. H. Matteson, 1855. (Bettmann/Corbis)

Divisions within the village were reproduced in the pattern of accusations in 1692: Most accused witches and their defenders lived on the side of the village nearest to Salem Town, whereas most of the accusers lived on the western side. Many of the accused had personal histories or interests that either associated them with Salem Town or otherwise marked them as threatening outsiders. Supporters of Samuel Parris perceived their enemies as evil, so it was but a short step for them to become convinced that those aligned with the town and its interests were servants of Satan. Though the afflicted girls were more than likely influenced by adults to name particular individuals, this was not a cynical attempt to dispose of enemies by labeling them as witches: Villagers pointed the finger of accusation at particular individuals because they truly believed them to be morally deficient and thus likely members of a diabolical conspiracy. In Salem Village and in the county as a whole, those people who had become identified with forces that seemed disorderly and immoral fell victim to accusations of witchcraft as the initial afflictions in the village ignited a witch panic.

To deal with the emergency, the newly arrived governor, Sir William Phips, formed the Court of Oyer and Terminer (to hear and determine). The court proceeded immediately with its work, holding its first session in Salem Town on June 2. Its chief justice was the lieutenant governor, William Stoughton, who soon showed himself to be a fanatical witch hunter; on the first occasion that a Salem jury proposed to acquit an accused witch, Stoughton sent the jurors back for further deliberation. Meanwhile, the most scrupulous member of the special court, Nathaniel Saltonstall, resigned after its first death sentence was carried out on June 10.

Magistrates presiding over previous witchcraft trials had been faced with testimony against defendants that was often impressive in quantity and yet legally problematic. New England's witchcraft laws demanded proof of the Devil's involvement. Because most depositions focused on *maleficia*, the practical harm allegedly inflicted by witches, but rarely mentioned the Devil, an overwhelming majority of accused witches were acquitted, much to the dismay of those who had given incriminating evidence. At first, it seemed that

such problems would not thwart the proceedings at Salem. Over fifty of the accused in 1692 confessed, describing in graphic detail their initiation into the Devil's service and often naming other individuals who had allegedly joined the satanic confederacy. These confessions lent a horrifying credence to the accusations that were pouring in from communities throughout the county. The evidence given by witnesses against the accused contained, moreover, countless references to the Devil and his involvement with the alleged witches; these also facilitated conviction. The first condemned witch, Bridget Bishop (whose basement contained "poppets," or Voodoo dolls), was executed on June 10. Five more followed in July (Sarah Good, Elizabeth How, Susannah Martin, Rebecca Nurse, and Sarah Wilds); another five were sent to the hanging tree in August (George Burroughs, Martha Carrier, George Jacobs, John Proctor, and John Willard); and eight were executed that September (Martha Corey, Mary Easty, Alice Parker, Mary Parker, Ann Pudeator, Wilmot Reed, Margaret Scott, and Samuel Wardwell).

By the end of summer, however, a growing number of critics were casting doubt upon the court's proceedings. Many of the confessing witches had recanted, claiming that their confessions had been forced from them by overly zealous officials through the use of physical torture and psychological pressure. Some of those recanting revealed they had confessed because they had been promised that those who admitted their guilt, renounced their allegiance to Satan, and then cooperated with the authorities would be spared from execution. In a ghastly irony (which exactly parallels the judgments in 1610 at the most infamous witchcraft panic ever investigated by the Spanish Inquisition), only those who refused to perjure themselves by confessing to crimes that they had not committed went to their deaths.

Other than confessions, almost all of the testimony that described the Devil's involvement in the alleged witch conspiracy came from the afflicted girls whose torments had sparked the witch hunt. Most of the information they provided in their numerous depositions supposedly came from the specters of witches that had appeared to them. Puritan theologians taught that human beings could not themselves turn into or produce specters; instead, devils assumed their form and acted on their behalf. Stoughton's court assumed that devils could appear in the image of a particular individual only with that person's permission, so the appearance of a specter could be treated as proof that the individual represented was, in fact, a witch.

Yet a growing chorus of ministers and magistrates, headed by Increase Mather, warned that Satan might represent innocent persons in spectral form so as to incriminate them. That the girls suffered terrible agonies in the courtroom whenever accused witches moved

or looked at them might also be a trick brought about by the Devil rather than a genuine sign of guilt. Because the Devil was a liar, critics warned, evidence that originated with him could not be trusted. These critics cast doubt upon the spectral testimony presented to the court, not because they questioned the existence of witchcraft but because they held that the Devil was sufficiently malignant to use the court in order to attack innocent parties. In other words, their very belief in the Devil's hatred of New Englanders made them doubt such evidence.

Once spectral testimony and the confessions came under attack, the court found itself in an extremely difficult position. There were many depositions against the accused from witnesses other than the afflicted girls, but hardly any of that testimony included references to diabolical involvement such as the law demanded. In early October, Governor Phips halted the trials. That accusers were now naming individuals from prominent families, including the governor's own wife, doubtless figured in his decision. But the collapse of the trials was due primarily to controversy over the evidence being used to justify conviction. The struggle to clear the names of those already convicted would last many years.

By no means did all residents of Essex County support the governor's decision to halt the trials, and his lieutenant governor, Stoughton, was furious. His allies, like those infuriated by the acquittal of witches in earlier years, did not agree that the evidence presented in the special court was inadequate. Even those opposed to the court's proceedings were motivated not by skepticism about the existence of witchcraft but by their commitment to legal rigor. Critics of the court came close to questioning whether an invisible crime was amenable to legal prosecution. But they carefully avoided engaging directly with that issue, which was, after all, deeply disturbing to people convinced of the threats posed by witchcraft.

SALZBURG, PRINCE-ARCHBISHOPRIC OF

After 1675, Salzburg, which was an ecclesiastical state governed by a prince-archbishop until 1803, experienced one of the largest and strangest of Europe's relatively late witch hunts. Limited and incomplete sources suggest that, until the last quarter of the seventeenth century, death sentences for magic or witchcraft apparently remained an isolated phenomenon in Salzburg.

Only eleven executions are known for Salzburg between 1565 (the date of the first witchcraft trial) and 1588. After 1575, there were several trials in Pinzgau, in the southwest, starting when a highly gifted minister and his female cook were accused of weather-making magic. The local authorities carried out witchcraft trials, all dealing with typical *maleficium* (harmful magic), because of massive popular pressure. Doctrines of witchcraft were occasionally mentioned after legally trained experts had intervened. Devil worship and participation in the witches' dance played important roles in trials conducted at Pinzgau in 1585 against a widow and others she accused. Thereafter, only one execution is known in the first half of the seventeenth century (in 1646).

However, the successful 1675 prosecution of a vagrant knacker named Barbara Koller caused a commotion. Two years later, her son Jakob (or Jack) Koller became the center of a massive hunt led by Salzburg's central authorities. Named for the hunt's presumed leader, *Zauberer Jackl* (Jack the Sorcerer), the *Zauberer-Jackl-Prozesse* (Sorcerer-Jack-Trials) grew into one of the last major witch hunts in the Holy Roman Empire. Among other things, Jakob Koller collected a group of young male beggars around himself and reputedly apprenticed them to the Devil. Consequently, those persecuted at Salzburg were over two-thirds male and mostly between the ages of ten and twenty. The women who were executed were usually older. In many cases, the victims had become beggars after their families disintegrated or else were directly recruited from this underclass.

The *Zauberer-Jackl-Prozesse* affected court districts of the archbishopric with different intensities and dynamics. Over half of the arrests occurred in the capital city of Salzburg and its vicinity, whereas they occurred later or not at all in some local courts. By fall of 1678, young male beggars came under such general suspicion that, in certain districts, zealous officers captured all the young male beggars and searched them for scars made by Jack the Sorcerer as a sign of demonic pacts. Despite a large bounty on his head, Jakob Koller was never arrested, but during the ensuing witch hunt, 124 of his alleged followers were executed or died in jail.

Because Salzburg's aulic court was the archbishopric's sole criminal court, local district courts could only make arrests and conduct first interrogations before transferring prisoners to the capital city for trial, sometimes after months in prison. The circumstances surrounding the massive witch hunt led to standardization of interrogations and interrogatory procedures. In particular, references to attending Sabbats, participating in demonic cults, and defaming the Host—crimes elaborately recorded in aulic court interrogation records with rather stereotypical wording—are almost always absent in records from local courts. When the witch hunts began affecting more-settled parts of the populace in the last six months of 1678, the archbishop told the courts to arrest people only if there was well-founded suspicion. The *Zauberer-Jackl-Prozesse* were not completely different from other, unrelated witchcraft trials conducted at the same time or from later trials.

Once the mass witch hunts ended in 1679, Salzburg did not immediately abandon witchcraft persecution. In the 1680s, regular witchcraft trials were aimed at members of the lower classes, and at least thirty-five death sentences were carried out in 1682 and 1683. The center of these hunts (but by no means their only location) was mountainous Lungau, in the southeast, where almost no arrests occurred during the *Zauberer-Jackl-Prozesse* hunt. Salzburg's witch hunts

reached another high point at decade's end, with arrests in several local districts; in Lungau, the so-called Ramingsteiner trials took place. The nine victims were children of miners, who had taken to begging and doing odd jobs after mining declined. Trial judges reinterpreted a make-believe wedding staged by village children as a witches' Sabbat. The figure of *Zauberer-Jackl* played a very indirect role in these trials. Between 1717 and 1720, again in Lungau, three vagrant beggars were accused of transforming themselves into werewolves (lycanthropy) and attacking livestock. Damages from wolves and bears had indeed increased in recent years.

The final trial and execution for witchcraft in Salzburg took place in 1750, six years before Mozart was born: A trial in Mühldorf and Landshut (now part of Bavaria) that had lasted for years ended with a death sentence for a sixteen-year-old nanny.

SANCTA CLARA, ABRAHAM A (1644–1709)

An Augustinian prior and court preacher in Vienna under the Holy Roman Emperor Leopold I, Sancta Clara wrote three books in which he defended witch hunting in the Habsburg lands.

Born in a Swabian peasant family but educated at the Jesuit Latin school in Ingolstadt, Johann Ulrich Megerle entered the Benedictine order in Salzburg and joined the newly formed Discalced Augustinians several years later as Abraham a Sancta Clara. He served as both preacher and priest in southern Germany and Vienna before being appointed court preacher to Leopold I in 1677. He later served as the prior of the Augustinian house in Graz during the high point of

Styria's witchcraft trials before becoming head of his order's province in Germany and Bohemia. Serving both the Catholic Church and the Habsburg dynasty, Sancta Clara helped to shape *Pietas Austriaca* (Austrian piety), so central to the house's early modern ruling ideology based upon alliances among the Crown, the Church, and the estates. His pastoral theology emphasized the reconciliation of human potential in a fallen world with Christian ideals.

In a series of works from the late seventeenth and early eighteenth centuries—*Judas das Ertz-schelm* (Judas the Arch-villain, 1686–1695), *Huy! und Pfu!* (Hooey and Phooey, 1707), and *Wohl-angefüllter Wein-Keller* (The Well-Socked Wine Cellar, 1710)—Sancta Clara helped provide the theological and moral justification for hunting witches. He focused his attacks on Austrian nonconformists and frequently singled out Styria's witches as particular dangers to late baroque society. He drew from his extensive travels in the duchy and exercised a considerable influence upon both Austria's elites and its common people, enjoying a considerable reputation as an eminent preacher and prose writer.

Sancta Clara abhorred what he saw as the superstitions of common people, yet he credulously accepted not only the reality of sorcery but also the reality of the witches' Sabbat. But another aspect of his works is important to an understanding of Austrian trials for witchcraft, especially in the duchy of Styria. Although he emphasized the diabolical nature of the offenses he described, as did most theoretical works on magic, he also highlighted the role of authorities in eliminating the dangers sorcery posed. Sancta Clara repeatedly invoked the importance of authorities in his affirmations of absolutist society, denounced witches and sorcerers as the tools of the Devil, and claimed that no one could live safely in their presence.

SATANISM

A contemporary dictionary defines *Satanism* as "the worship of Satan or the powers of evil" or as "a travesty of Christian rites in which Satan is worshiped"

(*Random House Dictionary* 1987, 1704). Both definitions originated as slanders. Scholars distinguish between ideas *about* Satanism, spread by accusation, and ideas expressed by persons claiming allegiance to Satan (La Fontaine 1999, 87). Concepts of Satanism have varied little historically and have been defined mainly by Christian accusers, not by freely self-proclaimed Satanists. Scholarship has confirmed an enduring symbiosis between Satanism and Christianity: Where Christianity has been demographically absent or negligible, accusations and professions of Satanism are lacking.

HISTORY

Satanism has a far shorter history as creed than as slander. Currently, self-styled Satanist organizations are few and probably small in membership (perhaps in the hundreds or low thousands worldwide); membership criteria and numbers are impossible to know (La Fontaine 1999, 107–109; Medway 2001, 293–294). Aside from slanderous myth (discussed later), no organizations are recorded before the mid-twentieth century.

The promotion of evil, as fantasized by Christian opponents, is conspicuously missing from the credos of known Satanist organizations. Indeed, the founder of one of the two principal North American groups, the Church of Satan, formally advocated obedience to the law (La Fontaine 1999, 97).

Modern Satanist spokespersons do not describe their religion as worship of Satan, whom some Satanists apparently regard as merely symbolic, but as opposition to Christianity. Satanist objections to Christianity concern its denial of bodily pleasure, intellectual curiosity, and the ego in favor of asceticism, intellectual passivity, and self-abnegation. Satanist ideals typically exalt individualism, self-determination, and self-fulfillment, interpreting Satan as archetypal rebel against arbitrary authority and oppressive conformity (La Fontaine 1999, 86–106).

Percy Shelley's assessment of John Milton's *Paradise Lost* prefigured the Satanist critique: "Nothing can exceed the energy and magnificence of the character of Satan. Milton's Devil as a moral being is far superior to his God, as one who perseveres in some purpose which he has conceived to be excellent in spite of adversity and torture." Milton's God tormented Satan "with the alleged design of exasperating him to deserve new torments," not to make him repent (Shelley 1971, 508). Modern Satanist ideals are intellectually descended from Shelley and later nineteenth-century writers such as Charles Baudelaire.

Formal religious Satanism sometimes seems calculated to provoke shock, outrage, and panic among Christians. This observation is truer still of informal Satanism or pseudosatanism in popular commercial culture, particularly in certain "hard" rock music.

Highly publicized, sporadic vandalism with Satanist content typically expresses adolescent rebelliousness, not religious conviction or musical brainwashing. It is "more often than not merely posing, adopting an image" (La Fontaine 1999, 108).

Satanism as slander assumes that Satanists are secret subversives, not exhibitionists, vandals, or sincere public advocates. It has a far longer history than genuine Satanism. The Bible (Ps. 95:5 and elsewhere) declared that pagan gods were only demons. The Hebrew *satanas* means "adversary," and Jesus saw Satan as his principal adversary (Matt. 13:37–39). Subsequent Christianity has contrasted real and imagined adversaries to itself. Christian mythology or folklore frequently has portrayed actual religious competitors—medieval heretics and early modern witches, as well as modern Satanists, pagans, and Wiccans—as Satanists.

Imaginary Satanists enact a kind of reverse Christianity. Their alleged behavior and ritual activities observe Christian categories but invert and pervert Christian ritual content (for example, adoring and praying to Satan or killing and eating infants as a parody of the Eucharist). Intentionally or not, Christian distortions of competing credos and activities as satanic parodies of Christianity domesticate religious otherness, absorbing it into familiar categories. Polar opposition reconfirms Christian ideas of humanity's relation to the supernatural and the divine.

Norman Cohn has traced Satanist stereotypes to pagan slanders about early Christians: political conspiracy; worship of outlandish or shameful gods; and rituals involving sexual promiscuity, cannibalism, and infanticide. The stereotype, whether by or about Christians, describes a secret society dedicated to overthrowing established society. The imaginary conspirators are inhuman or even bestial, deliberately breaking universal taboos. Despite their antisocial aims, the conspirators cooperate as a compact unit, an antisociety (Cohn 1975, 1–15). Given the stereotypical conspirators' inhumanity and antipathy to society, it is fitting that, in Christian versions of the myth, they be subservient to the archenemy of God and humanity.

Accusations of Satanism arose in the Greek Church during the eighth century, and they were documented in the Western Church by 1022. They have a longer subsequent history in the Western Church and inflected the development both of Satan as mythical figure and of stereotypes about his adepts. Satanist myths were disseminated about Cathar and Waldensian heretics, the Templars, and heterodox factions of the Franciscan order, before finally coalescing with other slanders around 1400, creating the specter of the witch.

With *maleficium* (harmful magic), Satan worship formed the core of witchcraft mythology. This combination is distinctive. In other cultural contexts, *maleficium* may involve secretly petitioning

Anton LaVey, founder of the Church of Satan in San Francisco in 1966. No satanic church existed in medieval or early modern Europe. (Bettmann/Corbis)

superhuman personages to harm enemies, but Satan supposedly required a formal contract before granting petitions, exacting the worshiper's body and soul in exchange for enabling the *maleficium*. This feature required Satan's apparition to worshipers in corporeal form, predisposing an extensive mythology of personal interaction: Satan held court, initiated adepts, hosted banquets and sexual orgies, assigned specific *maleficia* (evil acts, or evildoings) to devotees, and physically punished their disobedience or failure.

Accused witches' confessions of encountering the Devil in person, attending Sabbats, and so on were largely extracted through torture or psychological coercion. The concept of Satan as a supernatural person active in the world waned at the same rate as witch hunting and torture. After about 1700, Satan often seemed a metaphor for misfortune or the mysteries of human depravity. Modern societies describe Satanism as a possible motivation for infractions of secular law but not as a religious crime or a crime in itself.

However, Satanism is still prosecuted indirectly: In the 1980s and 1990s, sensational publicity surrounded

accusations that small children were harmed and even killed by "satanic ritual abuse." As in earlier times, epidemic accusations of Satanist crime were stimulated by anxiety over societal change. In North America, where the panic originated, prime stressors were the recent massive integration of women into the workforce and the resulting need to entrust small children to day-care centers. Anxious parents, therapists espousing a philosophy that victims cannot lie or confabulate, and fundamentalist Christians perennially alert to satanic conspiracies "discovered" that the apparently routine ailments and crises of small children were symptoms of physical and sexual abuse inflicted by evil caregivers during satanic rites. Abuse allegedly occurred under improbable circumstances—either during business hours, in public spaces, or, conversely, in inaccessible hideaways and even "spaceships."

A number of "satanic" defendants were convicted by testimony that would normally be inadmissible in criminal court. Accusations were compiled by prosecutors and social workers interviewing small children and by therapists employing controversial "recovered memory" techniques on adult sufferers of personality disorders. Leading questions, overt suggestion, a simplistic theory of repressed trauma, and a dogmatic insistence on "believing the victims" produced horrific accusations that were unproven, unverifiable, and objectively improbable or impossible. Some manifestly unjust convictions were nonetheless upheld (Medway 2001, 175–255).

Uncritical acceptance of satanic abuse testimony replicated the *crimen exceptum* (the excepted crime) justification current during the witch hunt period: "Obvious" satanic adversaries were so devious and sophisticated that they could never be convicted without unconventional testimony.

One satanic rite rarely mentioned in "ritual abuse" mythology is the Black Mass, a modern development of the idea that the Sabbat parodied Catholic rituals. In a final ironic twist to the history of Satanism, this rite, originally invented as a slander, is now sometimes performed by self-identified Satanists (Medway 2001, 387–388).

SATTLER, GOTTFRIED (CA. 1569–1613)

A Bavarian lawyer and assistant district judge who conducted an illegal witch hunt, Gottfried Sattler became famous when the Bavarian Privy Council decided to punish him for misuse and murder, thereby clearly destroying the comforting and widespread idea that God would not permit innocent people to be burned as witches. Sattler's decapitation in 1613 served notice that the innocent could easily become victims as soon as witchcraft trials transgressed the boundaries of the *processus ordinarius* (ordinary procedure). Adam Tanner and Friedrich Spee mentioned Sattler's execution, although without providing exact data. Until witchcraft trials were terminated altogether in the period of the Enlightenment, Sattler's trial remained a key event and an almost unparalleled debacle for the persecution party in Germany.

During an agrarian crisis between 1608 and 1609, Bavarian religious zealots tried to exploit a witch panic in the small Bavarian exclave of Wemding (near the imperial free city of Nördlingen), which was less tightly controlled from Munich. The regular district judge, nobleman Konrad II von Bemelburg, employed a former fellow student from Ingolstadt, Gottfried Sattler, to judge these cases. Sattler was in contact with members of Munich's zealot faction, most of whom had studied law with him at the University of Ingolstadt around 1590, when witch hunts had ravaged the small town and Jesuits such as Gregory of Valencia had justified draconian measures against these enemies of humanity. Presumably, Sattler expected a promotion after conducting his witch hunt.

However, the Wemding trials had far different results than Sattler had anticipated. After several exe-

cutions, the government became suspicious, intervened, and began investigating his conduct of these trials. The Privy Council commissioned Dr. Bernhard Barth, an educated lawyer from Munich who had clashed repeatedly over witchcraft trials with the court council zealots, principally Dr. Johann Sigismund Wagnereckh. Within days, Barth collected such damaging evidence that District Judge Bemelburg (then preoccupied with invading the imperial free city of Donauwörth and subsequently serving as Bavarian governor) was officially reprimanded by the duke for failing to supervise his official, while Sattler was imprisoned and put on trial. The court council chancellor, Wagnereckh, tried to sabotage all the legal steps against Sattler suggested by Barth, but every time, privy councillors such as Dr. Wilhelm Jocher and Count Hans von Rechberg overruled the chancellor's opinion.

Between July and December 1612, the court council discussed this case after every interrogation (ten times a month on average), and all sides apparently agreed that these debates were decisive. There were even public repercussions, as the Jesuit Jacob Gretser openly sided with the zealots, pointing to the witch hunts at Ellwangen. By September 1612, the Privy Council in Munich, then presided over by Dr. Joachim Donnersberger, decided to make an example of Sattler, ordering torture and contemplating punishing his misconduct with the death penalty. The Munich zealots, again led by Wagnereckh, fiercely opposed the sentence and tried to raise support from Duke Maximilian I's younger brother, Prince Albrecht, and from prominent Jesuits such as Gretser. Ingolstadt's law faculty, then dominated by Dr. Joachim Denich, twice confirmed the death sentence suggested by Munich's so-called politicians. When Duke Maximilian—who had himself been an Ingolstadt law student in 1589, along with Wagnereckh and Sattler—hesitated to confirm the death sentence, Wagnereckh persuaded the court council to decide for banishment.

However, the Privy Council considered the Sattler case a matter of principle. Supreme Chancellor Donnersberger ordered the court council to revise its decision within hours to comply with the opinions of both the legal faculty and the Privy Council. In May 1613, Duke Maximilian finally decided on Sattler's execution. Two other officials at Wemding were sentenced to perpetual exile from Bavaria. At the end of June or in early July, Sattler was beheaded at Schwaben (today's Markt Schwaben, east of Munich), presumably secretly, behind the walls of the district judge's castle. At that time, Schwaben's district judge was Johann Georg Herwarth von Hohenburg, chancellor of the Bavarian estates (*Landschaftskanzler*). Not coincidentally, Herwarth was also the leading moderate "politician" within Bavaria.

In 1590, the imperial city of Nuremberg (Nürnberg) had put to death a former executioner who had tried to incite a witch panic, but Sattler was the first witch-hunting judge in Germany to receive such a punishment. His death was an important symbolic victory for opponents of witch hunting. Tanner mentioned it alongside the 1618 death sentence against the Fulda witch judge Balthasar Nuss, another achievement of the Ingolstadt law professors (Tanner 1627, 3: col. 1005). Both death penalties proved extremely important, because they demonstrated that fatal mistakes could occur in witchcraft trials and that victims might turn out to be innocent. Like later opponents of witch hunting, Spee referred to these cases, borrowing evidence from Tanner: “Tanner relates that in earlier years in Germany two bloody judges who had to deal with cases of witchcraft were condemned to death by a judgement of the faculty of law at Ingolstadt and executed, because they had held trials contrary to law, in which innocent persons had been endangered. . . . Who will still doubt that many innocent people have been burnt by these judges?” (quoted in Behringer 1997, 295; cf. Spee 2003, 40).

SATURN

Saturn, god of agriculture and also of time, was linked to the planet Saturn and identified with the Greek god Kronos. Though his story was well known to Renaissance and early modern authors, it was visual artists who linked the physical and sexual violence at the heart of Saturn’s story with the nature and practices of witchcraft and included witches among those groups considered his “children.”

According to Hesiod, Kronos rose to power by castrating his father, Uranus, with a sickle. From Uranus’s genitals, which were thrown into the sea, Aphrodite, the goddess of love, was born. Late medieval authors

Saturn Devouring One of His Sons, by Peter Paul Rubens, 1636. God of agriculture, Saturn was associated with the planet and tied to violence and evil, as were his children, who included witches. To thwart a prophecy that his children would supplant him, Saturn ate them, thus reminding us of the cannibalism of witches. (Archivo Iconografico, S.A./Corbis)

such as Boccaccio told how Kronos/Saturn then suffered the same fate as his father. Because of a prophecy that claimed his son would overthrow him, Saturn decided to devour his children. One of them, Zeus, survived through a trick by Saturn’s consort Rhea. Zeus

later took power by castrating his father, reportedly with the same sickle Saturn had used on Uranus.

Arabic authors and late medieval European mythographers transmitted the classical story of Kronos/Saturn. Gradually, it also became linked to images of Saturn as the coldest, driest, and slowest of the planets, and to the so-called saturnine, or melancholic, temperament. The sinister characteristics of the mythical Saturn—his old age, malevolence, violence, and tyranny—were also attributed to “children” who lived under his planet: criminals, cripples, beggars, the elderly, the poor, and those involved in vulgar and dishonorable trades. As the inscription in a 1531 woodcut of Georg Pencz put it: “[I am] Saturn, old, cold and unclean; evil are my children.” By the fifteenth century, Saturn’s children increasingly included the dead, magicians, and witches; popular almanacs, calendars, and astrological handbooks disseminated information on such relationships in “Children of the Planets” series.

From the late fifteenth century, artists began to depict Saturn’s violence and sexual mutilation more frequently and more overtly. Often, Saturn was shown seated in a chariot pulled by two dragons, holding a scythe or sickle and devouring one of his children. His chariot was emblazoned with Capricorn and Aquarius, representing the portion of the zodiac over which he ruled. Sometimes, his scythe or sickle was strategically positioned over the penis of one of his children or hooked around the penile tails of his dragons. Alternatively, Saturn was depicted leaning on a crutch or with a peg leg, symbols of the power he both won and lost through sexual mutilation.

This focus on Saturn’s violence encouraged links with the cannibalism and castrating powers of witchcraft. It remains unclear whether the hindquarters of the goat in Albrecht Dürer’s engraving *Witch Riding Backwards on a Goat* (ca. 1500) represented the tail of a fish similar to the astrological Capricorn, an allusion emphasizing the witch’s power to emasculate. Similarly, a male figure with a crutch shown ministering over a witches’ night ride in a woodcut illustrating a sermon of Johann Geiler von Kaysersberg in *The Ants* seems a clear reference to Saturn. Was the anonymous artist using this visual allusion to underline the message of Geiler’s text, that night rides were little more than fantasy and illusion produced through melancholy? This link between melancholic fantasies and claims of witchcraft was developed by artists such as Lucas Cranach, as well as by such writers as Johann Weyer. In the last of his *Melancholia* paintings, Cranach placed a head uttering the word *Melancholia* upon the body/cloud within which the imaginative fantasies of the witches’ cavalcades took place: This was surely the head of Saturn, who ruled over the melancholic temperament.

The most graphic relationship between Saturn and witchcraft was expressed in an engraving from the

1580s or 1590s by Crispin de Passe after Martin de Vos, which inspired other artists in turn. It depicted Saturn in his chariot, pulled through the sky by two dragons. Below him were the different groups and activities under his sway: on the right, Amerindians mining gold and silver, paying homage to their Spanish rulers, and cooking human body parts on a grill; on the left, a magician performing necromancy before a cauldron and witches engaged in an orgiastic dance, with three of them flying up in the air through billowing smoke. The figure of Saturn links witches, necromancers, and Amerindian cannibals as children of the same father.

SAVOY, DUCHY OF

Like such other regions of the western Alps as Dauphiné, Valais, or Vaud, the duchy of Savoy is presently considered one of the principal regions where the new heresy of witches and other devil worshippers appeared around 1430 and where important witch hunts were conducted. The emergence of this phenomenon was due in large part to the Duke of Savoy, Amadeus VIII, whose law code of 1430, the *Statuta Sabaudie* (Statutes of Savoy), enacted legislation specifically against sorcerers and heretics and who helped sensitize the local clergy to these issues. Savoyard witchcraft trials continued until the eighteenth century.

Over the centuries, the princes of Savoy acquired sovereignty over a vast territory from the Mediterranean (Nice) to north of Lake Geneva. Their western boundaries bordered the duchy of Burgundy, Dauphiné, and the Kingdom of France; to the east were the Savoyard-ruled Val d’Aosta and Piedmont-bordered Milan. (Savoy presently covers two French departments; this entry also discusses some territories ruled by the dukes of Savoy, in particular the Val d’Aosta, but excludes

Piedmont, Geneva, and Vaud.) Witch hunts appeared in Savoy shortly after its ruler became a duke in 1416, in a period when Duke Amadeus VIII (who would later become Pope Felix V, elected by the Council of Basel in 1439) sought to develop the majesty (*majestas*) of the ducal house and affirm its sovereignty. According to Jacques Chiffolleau (1992, 42), “It is highly possible that the beginnings of the witch hunts in Savoy . . . reflected the need that every secular power felt at that time to pursue such occult and unspeakable crimes that seemed to wrong divine and human majesty.”

From 1415 to 1417, at the beginning of Amadeus VIII’s reign, the trials of a Jewish doctor, Michel de Dissipatis, and a rich bourgeois, Jean Lageret, both linked politically to the Savoyard court, mixed astrology, divination, and *lèse-majesté*, just as the new duke was trying to affirm his power. Accused of conspiracy and subjected to extraordinary proceedings, Lageret confessed to casting spells on the duke by using the faces engraved on coins. The duke’s preoccupation with demonic witchcraft was evident in his legislation; in the 1430 *Statuta Sabaudie*, he introduced the use of inquisitorial proceedings against sorcerers, enjoining his officials to assist the inquisitors.

In the duchy of Savoy, the inquisition of crimes against the faith was divided. The Dominicans supervised it in Savoyard lands within the dioceses of Geneva, Lausanne, and Sion, while the Franciscans controlled it in all other Savoyard possessions in the dioceses of Lyon, Belley, Grenoble, Maurienne, Tarentaise, Nice, and Aosta.

Documentary research on the fifteenth century remains scant, and no complete investigation of the period is currently available. However, several cases can be cited: At Chambéry, eight people, seven of them women, were accused of an undefined crime and died in a bonfire in 1418. The Sabbat was known by the 1440s, with four cases in which testimony mentioned the Sabbat recorded in 1446 on the borders of Lake Annecy, at Talloires. From 1459 to 1462, Chamonix experienced a witch hunt led by the Dominican Inquisition. Six executions took place in Cluses from 1470 to 1471 (Brocard-Plaut 1986, 144–146; Hansen 1901, 473–484). A Franciscan inquisitor, Bérard Trémey, oversaw numerous witchcraft trials in Savoyard lands under the jurisdiction of the Minorite friars between 1449 and 1477 (Uginet 1979). A doctor of theology, Trémey toured his jurisdiction from his base at Chambéry’s Franciscan convent, which seems to have acted as a conduit for diffusing scholarly doctrines about Sabbats and demonology. Throughout his career, Trémey benefited from the indispensable support of the dukes of Savoy, who made him their confessor and adviser.

Few persecutions are known from the early sixteenth century, when France occupied Savoy before the restoration of Duke Emmanuel-Philibert in 1559. In

his *Discours des sorciers* (Discourse on Witches), the demonologist Henri Boguet described Savoy as a land where demons possessed an infinite number of people. Godefroy de Bavois, president of the Senate (the Savoyard criminal court), who displayed a predilection for witchcraft cases, advocated the death penalty for magicians and sorcerers in his *Theorica criminalis* (A Theory of Criminal Justice, 1607). More than 2,000 cases of witchcraft were reportedly brought before the judges of Chambéry from 1560 to 1674, with 800 estimated death sentences pronounced. However, only 40 witchcraft cases have been preserved in Savoy from the seventeenth and eighteenth centuries, just 8 of which—scattered from 1636 to 1715—described Sabbats (Brocard-Plaut 1993).

The climate changed by the eighteenth century. The *Constitutions Royales* (1723) of Victor Amadeus VII no longer mentioned witchcraft, and cases became rarer (Brocard-Plaut 1986, 147–166). An extensive survey on the folklore of the French Alps observed a strong diffusion of the terms *synagogue* or *gogue* and *chète* or *secte* to designate the Sabbat in the entire Alpine arc and principally in Savoy and Val d’Aosta. Based largely on oral testimony, this survey fits perfectly with the documentary fragments of the witchcraft trials and normative texts.

The Val d’Aosta, Savoyard territory, located today in northwestern Italy, was an outpost of early witch hunts. One of the first texts describing in detail the new fantasy of the witches’ Sabbat, the brief anonymous treatise *Errores Gazariorum* (Errors of the Gazars or Gazarii [Cathars—a common term for heretics and later witches]), written around 1437, was created in the Val d’Aosta region. Its author, apparently an inquisitor, might have been the Franciscan Ponce Feugeyron. Inspired by recent persecutions in the region, notably that of Johanneta Cauda in Chambave in 1428, this text offered a meticulous description of the Sabbat and the various evils sorcerers committed with the help of demons. Witchcraft trials led by Franciscan inquisitors and legal representatives (*procurator fiscali*) of the bishop occurred in the Val d’Aosta region beginning at least in the 1420s. According to an extant important dossier of fifteenth-century proceedings, the accused, referred to as *sortilegus*, *sortiligiatrix*, or *charrerressa* (witch), were charged with belonging to a sect of modern heretics who gathered in synagogues (Sabbats) in order to commit harmful magic (*feyturis*). The documents reveal the use of magical formulas, of magical-religious prayers in the vernacular, and of spells to cure various sicknesses or to harm neighbors (Bertolin and Gerbore 2003). Bishop Georges de Saluces (1433–1440) played an important role in the beginning witch hunts in the diocese of Aosta, as he did subsequently in the diocese of Lausanne, where he was transferred in 1440 through the influence of the duke of Savoy.

Further south, in Savoyard Piedmont, inquisitorial proceedings began to mix accusations of heresy with charges of witchcraft in the 1420s. A man from Pinerolo was burned at the stake in 1427 for sorcery that “savoured of heresy” (*per sortilegio sapiente heresim*). In 1429, in the valley of Suse, five people were burned for having solicited help from the Devil to kill men with their evil spells (Centini 1995, 35–37). Thus, throughout the territory of the duchy of Savoy, inquisitors, whether Franciscans, Dominican, or episcopal, had used the image of the Sabbat in trials since the 1420s. Such a united effort must be attributed to the figure of the duke of Savoy, Amadeus VIII, although we do not know precisely the extent to which this phenomenon resulted from his bidding.

SAXONY, ELECTORATE OF

There were more than 900 accused witches, approximately one-third of whom were executed, in the electorate of Saxony, which lay in the eastern part of the old German Empire, bordering the Kingdom of Bohemia with Silesia, the electorate of Brandenburg-Prussia, the archbishopric of Magdeburg, the counties of Mansfeld and Schwarzburg (Hessen), and the Thuringian duchies. Strong relations with its neighbors affected jurisprudence through the exchange of knowledge between the legal faculties of its regional universities, Leipzig (founded 1409) and Wittenberg (founded 1502); both taught Roman and canon law. Foreign jurists often entered Saxon service, and Saxon jurists served in neighboring domains. The reception of Roman law coexisted with traditional common law; both affected legal praxis.

Although inquisitorial trials for heresy and sorcery appeared in the electorate of Saxony by the fifteenth century, traditional criminal laws and regional legal systems remained of central importance in the sixteenth century. In the mid-eastern German states, the *Sachsenspiegel* (Saxon mirror) already stipulated death at the stake for sorcery and heresy in its oldest known version, written around 1224 or 1227. Shortly after 1500, it was enlarged by a gloss making necromancy, fortunetelling, and magical healing into criminal offenses. The completely new criminal offense of witchcraft arose in the fifteenth century in connection with the punishment of heretical Waldensians in Saxony, particularly around Sangerhausen and Dresden, where secular courts repeatedly mingled charges of heresy with accusations of sorcery and ordered burnings. However, unlike in most of western Germany, where full-blown diabolical witchcraft developed long before 1500, belief in maleficent magic remained dominant in Saxony. Moreover, due to the legally independent position of the electorate of Saxony, Charles V’s 1532 criminal code, the Carolina Code, had no legal force there.

After the 1572 Saxon *Constitutionen* took effect, the differences between the imperial criminal code (*Halsgerichtsordnung*) and the Saxon systems of laws involved many questions of civil and criminal law as well as trial procedures. Redefining the crime of sorcery caused far-reaching differences in sentencing. Several jurists and specialists in criminal law found the *Malleus Maleficarum* (The Hammer of Witches, 1486) of special importance in this respect. Punishing sexual intercourse with the Devil by death at the stake, even

when no damage from sorcery had resulted, was new. An accusation from a private party usually started the proceedings in witchcraft trials. However, individual cases could also be started by the Saxon chancellery or by the lord of a manor. Before the seventeenth century, these proceedings allowed no defense by defendants or their family members; formal defenses were verifiable only in exceptional cases.

The 1572 Saxon legal constitutions banned appeals to higher authorities in criminal proceedings. Local feudal courts were supervised by the learned jurists (*Schöffengericht*) who coordinated the process; the final verdict or judgment had to be approved by legal experts on the *Schöffengericht* or university law faculties approved by the electors. The Leipzig learned jurists made the majority of judgments for Saxony in criminal proceedings, whereas the importance of the law professors of Wittenberg declined. Among the over 900 individuals accused of witchcraft in Saxony, officials of the elector sentenced the largest portion. Town and manor courts saw fewer persons charged with the crime of the sorcery; nevertheless, they handled approximately a third of the more than 900 defendants in Saxony who were accused of sorcery (with the first execution in 1407). The number of criminal proceedings was approximately proportionate to the total population (about 700,000 in the electorate by 1600). No significant differences in witch hunting existed between the different courts, although in rural areas, the probability of being accused of sorcery was statistically about 10 percent higher than in towns. Special responsibility for the execution of criminal proceedings fell to rural officials for upholding law and order (*Schösser*) and to town judges. In some special cases, such as in the county of Henneberg, criminal trials fell under the common administration of different sovereigns.

Proceedings related to the criminal offenses of witchcraft and sorcery were also conducted against magicians and magical healers, fortunetellers, and those engaged in “superstitious” practices. For crimes of magic without harmful consequences, the guilty were usually exiled. Even a few persons sentenced to death were exiled; more often, however, the death penalty was “graced” by decapitation with the sword instead of burning at the stake. After 1661, a death sentence could also be commuted to forced labor for the prince (territorial lord). Minor forms of sorcery required milder punishments, for example, being put in the pillory, whipping, house arrest, or even—at the request of the convicted individual’s partner—the nullification of marriage. Some guilty people were banished, other defendants were fined, parish priests were removed from office, and some proceedings were dismissed.

In Saxony, most accusations of sorcery or witchcraft were socially instrumented. They were triggered by various factors, including hailstorms and their conse-

quences, accusations from sick people, and behavior in disputes with neighbors or within the family. Unsuccessful healing and other magical practices also provoked suspicion. Sorcery, heresy, and witchcraft trials continued for more than 350 years, starting in 1407. Two main periods of verifiable proceedings lasted from 1610 to 1630 and from 1655 to 1665, when the number of executions reached its peak. Women comprised 73 percent of those tried for witchcraft in Saxony, most of whom were still married but no longer of childbearing age. However, at least twenty-two children were also accused of sorcery; as a rule, they were beaten and then given into the care of clergymen for education. Social status clearly mattered in the electorate of Saxony. Married women of good social standing usually escaped punishment in witchcraft trials and could expect an acquittal or a suspended execution. Widows of low social status were more frequently affected by death sentences and in significantly higher numbers than could otherwise be expected, given the share of Saxony’s population without possessions. Nevertheless, persons accused of sorcery came from all layers of the population, from beggars to farmers, burghers, and even nobility, roughly in proportion to the statistical size of each group within the total population. Neither Saxony’s rulers nor their Lutheran Church ever mounted campaigns against sorcery and witchcraft after the Reformation, while enforcing the new confessional dogmas. No religious or ethnic minorities were accused of witchcraft: Saxony’s few Roman Catholics, its Slavonic Sorbian population, and its Jews remained undisturbed.

The new Saxon criminal regulations of 1661, substantially influenced by Benedict Carpzov, marked an important break, beginning a slow legal disintegration of the elements of the criminal offense of witchcraft. Saxony’s last known death sentence for sorcery was

PostScript P
ENWITC_Graph_9

carried out in 1689, when the manor court of Ostrau (*Amt Delitzsch*) had Anna Maria Braune burned at the stake, following a judgment by learned jurists (*Schöffentuhl*) in Halle/Saale. Alongside Saxon jurists, physicians and theologians also supported the start of decriminalizing judgments for sorcery by the second half of the seventeenth century. The end of death sentences in Saxon witchcraft trials was also closely connected with the replacement of the Scholastic tradition by the teachings of natural law. Saxony's final criminal proceeding against the offense of sorcery dates from 1766.

SCAPEGOATS

The large majority of persons accused of witchcraft were scapegoats, in the sense that they were falsely blamed for the misfortunes of others. These misfortunes often involved bodily injury, illness, or death, and in many cases, the victims were small children. The naming of a witch as the cause of an illness was especially common when the infirmity had no known natural causes. Even when a natural cause of an illness could be identified, however, witches were blamed for having inflicted the illness on one particular person rather than another. Human disappointments, such as a failure to win the affection of a desired sexual partner

or the loss of money in business, were also blamed on witches. Sometimes, witches were accused of having caused sexual impotence as a means of retaliating against men who had jilted them. The misfortunes attributed to witchcraft could be as minor as the loss of an object, such as a coin. In some cases, witches were blamed for killing livestock, making horses fall sick, or even preventing cows from giving milk. In all these instances, witchcraft served as an explanation for the illnesses and mishaps that occurred frequently in communities challenged by food shortages, poverty, disease, and high rates of mortality. They also occurred in small, close-knit communities where people knew each other and their grievances well and therefore felt that others had reason to harm them.

Witches occasionally served as scapegoats for communal misfortunes, as when famine struck a region or when hailstorms destroyed agricultural crops. In such cases, witches were accused of having called down the hail by casting spells. In similar fashion, fires that ravaged towns and villages during the early modern period were occasionally attributed to witchcraft, although arson was generally prosecuted. In maritime communities, storms at sea could likewise be blamed on witches, especially when there was a loss of life or treasure. A storm in the North Sea that threatened the ship carrying King James VI of Scotland and his bride, Princess Anne of Denmark, to Scotland in 1590 led to the apprehension of both Danish and Scottish witches for having caused the storm by witchcraft.

The naming of witches as scapegoats for personal or communal misfortunes fulfilled two psychological functions. On the one hand, it provided the victim of the misfortune with an explanation of events that did not involve punishment by God for one's sins. In that sense, it freed the individual from personal responsibility for the misfortune that had occurred. On the other hand, it allowed the victim to obtain satisfaction and revenge by identifying and prosecuting another person for the developments that had transpired.

Not all alleged witches were innocent scapegoats. A small minority of the people accused of this crime had actually attempted to harm their neighbors by magical means. Even if they were not in fact responsible for the misfortunes that occurred, their intention to cause harm made them at least partially culpable for their crime. In the same category were those persons who, when suspected of witchcraft, assumed the role of witches in order to frighten or protect themselves from hostile neighbors. The witches who confessed freely to the crime, including those who were senile or mentally unstable, also cannot be included in the category of scapegoats. The same is true for the witches who thought of themselves as rebels challenging the political or social order.

SCHLESWIG-HOLSTEIN, DUCHIES OF

Although Lutheran north-central Europe has not been considered a major witch-hunting region, Schleswig-Holstein can no longer be viewed as an area with few witchcraft trials. With over 600 witchcraft executions in a population of 495,000, Schleswig-Holstein ranks near the middle, not the bottom, of German regions in this respect.

At the time of witch hunts, the duchies of Schleswig and Holstein (politically bound together by treaties), the duchy of Saxony-Lauenburg, and the independent city of Lübeck and other smaller political entities fell within the current boundaries of the German *Land* (state) of Schleswig-Holstein. Beginning in 1581, most of this region was governed either by the king of Denmark or by the duke of Gottorf, whose capital was the town of Schleswig. In Holstein and Lauenburg, both part of the Holy Roman Empire, the Carolina Code (1532) of Emperor Charles V governed legal procedure, together with older ordinances. The Code permitted official public prosecution of sorcery, unlike conditions in Schleswig where Danish law, the so-called *Jyske Lov* (Jutish Law), permitted only private lawsuits against alleged witches for many years to come. In 1576, the Danish king Frederick II ordered high courts to review all locally passed death sentences, further limiting the possibility of arbitrary witchcraft trials. Some provisions in the imperial territories of this region, however, surpassed the Carolina Code in rigor. Yet they did not match the deadly severity of ordinances from other Lutheran rulers, such as those in electoral Saxony or the duchy of Württemberg.

Throughout modern Schleswig and Holstein, 852 witchcraft trials have been verified for the period between 1530 and 1735, 90 percent of them against women. In total, 71 percent of all defendants were put to death. In “the land between the seas,” the pressure from the Europe-wide witch-hunting fever became evident by 1580; after that date, the number of witchcraft trials continually increased until reaching its peak between 1610 and 1635 (Schulte 2001, 67–70, 97–104). These trials started relatively early in Schleswig-Holstein, as in Denmark. They seem to have

revealed that Protestant authorities took the lead in allowing extensive sentences from the very beginning.

The geographic distribution of these persecutions shows there were significant regional differences. The most trial-intensive areas were the fertile and politically fragmented estates where the jurisdiction was in the hands of the nobility, as well as on the island of Fehmarn in the east. In the independent Hanseatic city of Lübeck, by contrast, almost three-quarters of the defendants were not convicted (Schulte 2001, 78) or the problems were solved by simply exiling the “witches.” Individual trials predominated in the duchies because the majority of the proceedings were taken against single persons and ended with a verdict against the defendant. Even so-called small panics were uncommon. The typical witchcraft trial was based on the assumption that *maleficium* (harmful magic) existed, which was primarily attributed to a pact with the Devil and sometimes even to sex with the Devil.

The Danish Lutheran theologian Nels Hemmingsen, as well as the pastor Samuel Meiger from Holstein, helped to shape a moderate theological assessment of witchcraft, which had a major influence on the regional practice of witch hunting. In their writings (in 1575 and 1587), both basically assumed that witchcraft was real and potent, but they maintained a skeptical attitude toward a so-called witches’ Sabbath. In their opinion, the powers of witches were horrible but—given the monotheist view of the world, in which only God reigned—limited. The image of the Sabbath was missing in many defendants’ confessions because most regional authorities regarded their participation in alleged gatherings of witches with skepticism.

The end of witch hunting in Schleswig-Holstein can be attributed to the intervention of the authorities. In the late seventeenth century, King Christian V of Denmark tried to control the jurisdiction of the nobility in connection with his centralization attempts. At the same time, he was successful in sentencing two landlords in Denmark and in Holstein for perversion of justice in major witchcraft trials. His decision apparently had a strong deterring impact, given that only a few death sentences were passed in the following years. Witch hunting subsided thereafter, even before the criticism in the course of the early German Enlightenment could have any effect. The last execution of a witch in Schleswig-Holstein occurred in 1724, and the last trial took place in 1735.

In spite of the absence of mass trials or organized witch committees in villages, Schleswig-Holstein’s many individual trials, which common people often requested and which were then carried out by the authorities, reveal the latent tensions among the region’s population, vented in witch hunting.

SCHULTHEISS, HEINRICH VON (CA. 1580–CA. 1646)

Along with Licentiate Kaspar Reinhard, Dr. Johann (Jan) Möden, and Dr. Franz Buirmann, Dr. Heinrich von Schultheiss ranks among the best-known witch commissioners (*Hexenkommissare*)—individuals who played a pivotal role in sentencing hundreds of people to death during the witchcraft trials in electoral Cologne, especially during the severe persecutions between 1626 and 1631 and from 1641 to 1644. A tract written by von Schultheiss as a means of vindicating his role in the persecutions, the *Aussführliche Instruction, wie in Inquisition Sachen des grewlichen Laster der Zauberey . . . ohn Gefahr der Unschuldigen zu procediren* (Detailed Instruction, on How to Proceed against the Dreadful Crime of Witchcraft . . . Without Any Danger to Those Innocent of the Crime, 1634), offers a window into the mentality of these witch commissioners and of the processes they used to try alleged witches. The tract can be juxtaposed to the works of two contemporary opponents of these witchcraft trials: Michael Stappert, whose *Brillen-Tractat* (literally, The “Spectacles” [Eyeglasses] Tract) was written after 1629, and Herman Löher, whose *Hochnötige Unterthanige Wehmütige Klage der frommen Unschuldigen* (Much Needed, Humble, and Woeful Complaint of the Pious Innocent) was published only in 1676.

Heinrich Schultheiss was born into a wealthy farming family in the village of Scharmede near Paderborn, where his father held the office of bailiff, representing the interests of the Paderborn cathedral chapter, which held manorial rights in this village. Heinrich attended the Jesuit-run cathedral school in Paderborn and then a Jesuit grammar school, probably in Cologne. At first, he followed a clerical career path, but he never became fully ordained. He then studied law, initially at the University of Cologne and then at the University of Würzburg, where he became a doctor of law in 1603. Subsequently leaving the priesthood, Schultheiss became a councillor to the archbishop of Mainz before becoming a commissioner at the high court (*Hofgericht*) of the elector of Cologne around 1610. About 1614, he moved to Arnsberg, the capital of the duchy of Westphalia (one of the territories belonging to electoral Cologne).

There, Schultheiss became a prominent member of the territorial administrative apparatus through his rank as councillor to the Cologne electors. Between

1632 and 1634, he was ennobled, a clear indication of his rapid social rise, and he first became active as a witch commissioner between 1616 and 1617 and again in 1621, supervising witchcraft trials in the towns of Hirschberg (where at least thirteen executions occurred) and Arnsberg. Around 1630, he participated in the major persecution of witches in the duchy of Westphalia, which claimed about 1,100 victims between 1562 and 1728 (Decker 1981–1982, 374). Schultheiss had to flee to Cologne in 1633 because of the effects of the Thirty Years’ War. There, he printed his *Instruction*, on which he had been working since 1631. After returning to Westphalia, he again conducted witchcraft trials in the town of Werl.

Witch commissioners such as Schultheiss were qualified in the law and active at the court of the archbishop-elect of Cologne. They oversaw local criminal law courts in order to ensure that procedures followed the 1607 Witch-Trial Ordinance promulgated for the electorate. They were only supposed to advise local lay judges, but in practice, the witch commissioners took control of the trials and consequently often triggered horrific, excessive persecutions. The practice of sending these commissioners throughout electoral Cologne to supervise proceedings in witchcraft trials at local courts replaced the ordinary custom in other territories, whereby local courts sent trial documents to “expert” jurists at central courts or to law faculties of universities to obtain advice on such cases. However, the Cologne witch commissioners were not deliberately sent to local courts as part of some witch-eradication scheme pursued by the electors; rather they were sent in response to petitions demanding action against witches, delivered to the elector by subjects from various localities. Occasionally, the witch commissioners collaborated with local witch-hunting committees (*Hexenausschüsse*).

A significant loss of relevant trial records makes it impossible to ascertain with any accuracy the number of witchcraft trials in which Schultheiss was involved; only a few documentary fragments detailing his personal activity have survived. However, his persecuting zeal and fanaticism were well attested in contemporary criticisms of the persecutions in electoral Cologne. For example, in his *Brillen-Tractat*, which was probably not originally intended for publication, the priest Michael Stappert described more than twenty-one witchcraft trials where the witch commissioners, including Schultheiss, participated. Stappert had firsthand knowledge of these trials because he had been confessor to their victims. In simple and forceful prose, Stappert told how Schultheiss, through manipulative questioning and torture, had forced suspects to make false confessions of witchcraft and then accuse other people as their accomplices. Like many other clerics with comparable experiences, Stappert changed from a

supporter to a critic of witchcraft trials after realizing that the alleged witches were innocent people who ultimately did not dare retract their confessions for fear of suffering further torture. Herman Löher, a lay assessor from a court in Rheinbach in the Eifel region, condemned the witchcraft trials pursued by the witch commissioners in similar tones. Löher, who fled to Amsterdam after being suspected of witchcraft himself, incorporated Stappert's work into his own critique of the trials and cited Heinrich von Schultheiss (along with Buirmann, Möden, and others) as stereotypes of the merciless, deluded, and insidious witch hunter. Although Schultheiss, like all witch commissioners, received a fee for every witch he tried, neither Stappert nor Löher accused him explicitly of hunting witches in order to enrich himself, as they did with Buirmann. However, it is certain that the role Schultheiss attained as a witch commissioner was significant in ensuring his ennoblement: He made a social, if not a financial, profit from such activities.

THE INSTRUCTION

As the criticisms voiced by Stappert showed, the work of the witch commissioners did not meet with universal approval from contemporaries. It was probably for this reason that Schultheiss wrote his *Detailed Instruction*. In this tract, he justified his own role in the witchcraft trials, called for further persecution, and also offered a guide to how the guilt of alleged witches could best be proved in court. Written in German, his tract was aimed at noble lords who held rights to or participated in the exercise of criminal justice at the local level.

Schultheiss discussed at length the sorts of evidence that justified the pursuit of trials against suspected witches. He refused to accept the legal validity of the swimming test (water ordeal), calling it a superstitious practice. However, he placed great value on the so-called Devil's mark (*Hexenmal*) as a sign of a suspect's guilt. The fact that another suspect had already named a person as a witch during interrogation was, for Schultheiss, an extremely important piece of evidence. He claimed that just one such accusation sufficed to instigate legal proceedings against a suspect. Evidence given by children could also be used against suspected witches because, according to Schultheiss, children were often the victims of seduction by witches. He generally allowed the accused witch no opportunities to defend him- or herself, denying both the accused and their families any access to the trial records. Using examples from his own experience and displaying an ironic pride in his own "ingenious" methods of interrogation, Schultheiss recorded how he—with the help of the torturer—had forced even obdurate suspects to make confessions. In his last chapter, he was particularly concerned to refute the allegation that he and his colleagues had acted overzealously and thoughtlessly

when prosecuting witches. Defending his actions, Schultheiss referred briefly to the *Cautio Criminalis* (A Warning on Criminal Justice, 1631) by Friedrich Spee (an important critic of witchcraft trials) and discussed in depth the work of another important Jesuit witchcraft trial critic, Adam Tanner. In Schultheiss's opinion, Tanner was a patron of witches who fully deserved to be tried for witchcraft himself.

SCIENCE AND MAGIC

Magic and witchcraft have long been associated with the Middle Ages and the Renaissance and presented in opposition to modern "science." The very title of this encyclopedia entry, "Science and Magic," implicitly upholds the persistent idea that the two are distinct enterprises and require different practices. Yet science and magic were indistinguishable for much of the Middle Ages and the Renaissance, and a discussion of the so-called occult sciences (astrology, divination, geomancy, alchemy) is unhelpful and potentially misleading. Magic provided a source of experimental and empirical knowledge about the natural world in the medieval and early modern periods, and it was governed by a specific rationality and internal logic. Historians have shown that magic was not a marginal

set of practices or beliefs in medieval and Renaissance Europe and that interest in natural magic and Hermeticism in the fifteenth and sixteenth centuries provided some of the conditions for the creation of the “new science” in the seventeenth century.

It is, however, important to draw a distinction between folk, or “popular,” magic, which has left extremely few records of its practices or beliefs, and the learned, theoretical approach to magic. Keeping in mind that many more people believed in or practiced magic than we shall ever know, we are required by the paucity of evidence to focus almost entirely on intellectual, learned magic, as theorized and practiced by a relatively small, elite group of people throughout the Middle Ages and the Renaissance. Furthermore, there is nothing inherently good or evil about magic. While distinctions between “white” and “black” magic have been long held and widely discussed for centuries, they become difficult to pin down at a practical level. Theoretically speaking, black magic used the powers of the Devil or his agents, whereas white magic harnessed the forces of the natural world and celestial bodies. As there was no practical way to assess whether the power behind a specific act was divine or diabolical, this distinction was a matter of theory and polemic. It is worth bearing in mind, however, that influential people in the Middle Ages and the Renaissance were heavily invested in the theoretical differences between demonic and divine causes of magic and that many careers were ruined and lives lost as a result.

The conventional modern distinction between magic and science, put forth in the 1920s by anthropologist Bronislaw Malinowski, rests on the difference between hope and reason. Magic relies on the belief that hoping for a result will produce a result, while science uses reason and experience to produce valid knowledge. Yet reason and logic were very much a part of magic in premodern Europe, and desire was embedded in traditional Aristotelian natural philosophy. Concepts of “use” versus “understanding” offer a better way to distinguish between magic and science. Use relates to a technology, whereas understanding yields knowledge, or *scientia*, the Latin term for wisdom. At its most basic, then, magic is a technology designed to accomplish very real and desired results, rather than a greater understanding of the natural world as an end unto itself. Magic is a technology, usually employing occult or unknown forces of nature to achieve specific ends through a series of means, often including words, symbols, or specific objects invested with particular qualities. It is important to keep in mind, however, that many of the theologians, natural philosophers, and scientists who were interested in magic, such as St. Albertus Magnus, Roger Bacon, Giordano Bruno, and Giambattista della Porta, were searching for knowledge about and understanding of the natural world for its

own sake, as well as being interested in magic. In the Middle Ages and the Renaissance, acceptance and manipulation of occult properties was often part of a larger interest in the workings of the natural world.

MIRACLES, MARVELS, AND MAGIC

There is an important distinction to be made between natural and supernatural phenomena, together with their causes. Until the seventeenth century, “natural” was what occurred in nature *most of the time* and what could be observed by a nonspecialist. Natural law under the Aristotelian system was not fixed or rigid but instead was based on customary, everyday experience. By observing many particular instances and learning what usually happened in nature, one could begin to deduce broader rules and causes for such behaviors. Strange particular instances, such as conjoined twins, were regarded as “unnatural” because they were abnormal occurrences. In Aristotelian natural philosophy, the concepts of natural and normal were strongly correlated. Supernatural phenomena always resulted from divine causation. The parting of the Red Sea or the sun standing still would be examples of miracles, occurrences that run contrary to nature’s laws; God caused both. By the thirteenth century, monstrous births, freak meteorological events, and other abnormal phenomena were classified as *praeter naturalis*, or outside of nature.

Preternatural phenomena did not have supernatural causes, yet they were not natural, as they did not follow the customary laws of nature. Rather, their causes were celestial, demonic, or unknown. Marvels could be caused by the placement of the planets in the sky, as it was believed that planets and their locations affected natural objects and events in the sublunar realm by intensifying the qualities of physical objects. St. Thomas Aquinas explained that preternatural phenomena could also be caused by demonic intervention. The intellect of the magus has no power over physical objects; therefore, the frequent use of symbols, hieroglyphs, and words in the practice of magic was to communicate with disembodied intelligences. Aquinas posited that these intelligences had to be demons, which exerted influence over physical objects and could manipulate the forces of nature. Later philosophers debated this point and posited that such intelligences could be either benign or evil, although it was difficult to know the difference. However, after Aquinas, magic and its practice became increasingly linked with diabolical influences, especially in the eyes of the Church.

NATURAL PROPERTIES AND QUALITIES

The unknown causes of preternatural phenomena provoked much theorization, becoming responsible for what became known by the early fifteenth century as “natural magic.” According to Aristotelian natural philosophy, “qualities” were the cause of the attributes of

natural objects. Qualities included such things as color, size, shape, or density and were divided into two broad categories: manifest and occult. Manifest qualities were sensible; they could be directly perceived by the senses. Occult qualities were insensible; they were imperceptible to the senses and were not revealed by experimentation. Precisely because they were insensible, they were considered unintelligible or unknowable. For example, a bezoar (foreign matter, such as hair, in the stomach or intestines) was known to be an antidote for poison, yet there was no way of discovering or explaining *why* it was an effective antidote.

Occult means hidden from view, yet it also has the connotation of beyond the range of ordinary human understanding, as well as secret or known only to the initiated. The occult sciences are so called because they involve the knowledge or use of the mysterious, hidden properties of natural objects. In many cases, it was considered magic to use the generally unknown properties of an herb or mineral, even if its effects were, by our criteria, “natural” or explicable. Thus, much of the medieval and Renaissance understanding of magic depended on the Aristotelian distinction between manifest and occult qualities: Magic dealt more with occult qualities, while science, or natural philosophy, relied on manifest qualities. Magic was linked to the study and manipulation of occult qualities, which were inexplicable. Whether these occult qualities or forces were unknowable (unintelligible to the human mind) or unknown (not presently understood), the point was that the magus or alchemist or astrologer did not fully understand the processes being studied and manipulated because a person was unable to apprehend fully with the five senses the nature of the object being used.

EARLY MODERN NATURAL MAGIC AND THE MAGICAL WORLDVIEW

Natural magic involved harnessing occult natural forces, often in conjunction with the position and influence of astral bodies (while “sympathetic magic” referred to the position of the heavenly bodies on the sublunary realm). The magus either was acted upon or was an intermediary; in either case, the result of the practice of natural magic could be psychological or psychosomatic. There were four forces that one skilled in natural magic could manipulate. The first was the *vis imaginum* (the force of images), relying on figures, hieroglyphs, and talismans. The second was *vis verborum* (the force [or power] of words), based on a belief that words were the essences of things. This force worked through oaths, spells, and incantations. The *vis musices* (the force [or power] of music) dealt with proportion and number and encompassed celestial harmony, numerology, and sympathetic magic. Lastly, the *vis rerum* (the power of things) pertained to the innate forces of things, that is, occult versus elemental

qualities. These elements could be combined; for example, talismans or amulets could intensify or redirect the innate powers of celestial bodies and their influences on the sublunary realm.

Giambattista della Porta is one of the best-known natural philosophers of the Renaissance. He founded the Academia dei Segreti (the Academy of Secrets), dedicated to studying and publishing the secrets of nature. His first published work was the *Magiae naturalis* (On Natural Magic, 1558), a collection of marvels and secrets of nature, as well as an attempt to apply experimental techniques to such marvels and secrets. The central belief underlying this work was that nature was orderly and rational. A natural magician could, if well intentioned, virtuous, and moral, understand this natural order after long study. *Natural Magic* also posited that experimentation could lead the magus to understanding the natural world and from understanding proceed to manipulation.

This spiritual and moral purity of the magus lends an emotional and personal quality to natural magic. A scientist can engage in questionable or illegitimate moral or spiritual practices; so long as these practices do not infringe on the sphere of scientific inquiry, this makes no difference to the final result. The magician, however, is intimately bound up in the quality and results of his or her knowledge and experimentation, as they hinge directly on the magician’s virtues, morals, and intentions. The principles of natural magic as a whole are also intimately related to human spirituality and intellect. The magical worldview is animistic, meaning that mind and matter are linked and can affect one another. The philosopher-magus can bring about changes in the material world through a sympathetic understanding of the network of occult and spiritual forces that animate the universe, just as the workings of nature and the movement of celestial bodies can affect the magician’s physical, emotional, or psychological state.

NATURAL MAGIC, HERMETICISM, AND SCIENCE

Much of what is called natural magic is linked with the Hermetic tradition. Part of the Neoplatonic revival in the mid-fifteenth century, it was based on a corpus of writings attributed to Hermes Trismegistus, or “Thrice-Great Hermes,” who was believed to be an incarnation of the Egyptian god Thoth. The Hermetic corpus is a considerable body of religious, philosophical, and scientific literature, believed to have been written around 2000 B.C.E. but actually composed by a group of Greek-speaking Egyptians in Alexandria in the second and third centuries C.E. While there was no direct link between the Hermetic writings and Christianity (especially early Christian mysticism), there were many similarities, due to the fact that writers of both groups

of texts were drawing on the same sources. Very little of the Hermetic writings was devoted to magic; what little was mentioned dealt with astrology, alchemy, and animated, or living, statues. However, the writings expressed the idea of the animistic, sympathetic universe, which became so central to the philosophy of natural magic.

The *Corpus Hermeticum* (the body of writings of the Hermetic tradition) was discovered in Constantinople (Istanbul) in 1460 by agents of Cosimo I Medici. Marsilio Ficino, the leading Platonist scholar and philosopher of his time, published a translation and commentary in 1464, claiming that Hermes Trismegistus was one of Plato's major influences, and he gave a Christian gloss to the writings by positing that Hermes Trismegistus and Moses had been contemporaries. After Ficino's translation and commentary, the Hermetic writings became one of the most important intellectual traditions of the Renaissance.

Giordano Bruno (1548–1600), a Dominican friar, was a strong adherent to Hermetic philosophy, and he managed to link Hermeticism, Copernican astronomy, and animism. Condemned as a heretic by the Inquisition and burned at the stake in 1600, he represented the last flowering of Hermetic philosophy. In the wake of Bruno's execution, the Catholic Church condemned certain forms of magic, and partly because of Bruno's zeal, Hermeticism and heresy became closely linked. In addition, the revival of many different strains of philosophy from antiquity diminished the novelty and originality of Hermeticism. However, Hermeticism exercised an influence on succeeding intellectual traditions, even after it had been discredited. Dame Frances Yates, in *Giordano Bruno and the Hermetic Tradition* (1964), argued that the Renaissance magician was the immediate ancestor of the seventeenth-century scientist. Both Bruno and Copernicus espoused heliocentrism and Hermeticism, but in the next century, René Descartes and Pierre Gassendi advocated the mechanistic philosophy as a reaction against Hermeticism, contending that influence was not the same as organic descent. Yet Dame Yates demonstrated the importance of late Renaissance magic, and she explored its relationship to science.

SCOT, REGINALD (1538?–1599)

It is one of the peculiarities of English witchcraft history that the first major work written on witchcraft by an English author, Reginald Scot's *Discoverie of Witchcraft* of 1584, was unrelentingly skeptical. Scot was a relatively obscure Kentish gentleman, who, like most of his class, was involved in local administration (he may have been a justice of the peace) and whose only other known publication was a 1574 tract on hop cultivation, *A Perfite Platforme of a Hoppe Garden*. He was apparently moved to write his *Discoverie of Witchcraft* after witnessing and being horrified by trials in his native Kent. The work demonstrated a deep level of scholarship, citing over 200 foreign and 38 English works. For example, Scot was among the few English witchcraft writers to have said much about the *Malleus Maleficarum* (The Hammer of Witches, 1486), a work that he continually held up to ridicule. Jean Bodin's 1580 demonological treatise received much the same treatment. Scot was equally dismissive of such English accounts of witchcraft as the tract describing the 1582 Essex trials or Richard Galis of Windsor's autobiographical account of his own bewitchment.

Scot's *Discoverie of Witchcraft* remained out of print until it was republished in 1651, presumably in response to the renewed interest in witchcraft during the Civil War and its aftermath; another reprinting followed in 1654. A new edition in 1665 had a rewritten title page, reflecting the growing skepticism of the post-Restoration period: It was probably this edition that Samuel Pepys recorded purchasing on August 12, 1667.

Scot's work also appeared twice in Dutch, at Leiden in 1609 and again in 1637.

The work ranged widely, dealing with many topics debated by contemporary demonologists. Although some writers claimed that Scot was a harbinger of modernity and rationality, his thinking was very firmly located in the English Renaissance. There was, of course, a rough common sense in his thinking: Most of what witches were alleged to do was clearly absurd and impossible, he suggested, and it should therefore have been dismissed. Very near the beginning of his book, Scot provided a clear description of that connection between witchcraft accusations and the denial of neighborly charity that Alan Macfarlane would rediscover four centuries later.

Scot maintained two of the basic positions open to skeptics of his period. First, he argued that most witchcraft accusations rested on an unsound theological basis. Most misfortunes that their supposed victims ascribed to witches were, in fact, attributable to divine Providence; popular belief in witchcraft discredited God's power. Second, Scot argued that those who resorted to Scripture to defend witch hunting employed passages that were either mistranslated or described magical practitioners quite unlike the witches of Elizabethan England. Further proof that he was a man of his time was provided by the way in which, like most English writers of the period, Scot was anxious to emphasize the absurdity of Roman Catholic thinking and practices, an attitude that made his attack on the *Malleus Maleficarum* all the easier.

Thus, Scot was able to make mincemeat of most of the basic demonological tenets of the period. The demonic pact not only lacked a scriptural basis (a point that troubled many demonological writers) but was, moreover, patently absurd: There could be no possible bargain between a carnal and a spiritual body. Much the same argument extended to sexual dealings, allowing Scot to reject completely the notion of sexual intercourse between human beings and incubi or succubi (another problem troubling many demonological writers). Scot clearly enjoyed demolishing Scholastic arguments explaining how human semen, essential to produce offspring from intercourse between human beings and demons, could remain hot while stored in an incorporeal body. Bodin's discussion of shape changing, another concept that Scot rejected, provoked a searing demonstration of Bodin's dependence on Ovid's *Metamorphoses*; Bodin's account of the Sabbat came in for a similarly brisk rejection. Scot described witchcraft at various points as a "cousening art," fit to be believed only by children, fools, melancholics, or Roman Catholics. Similarly cavalier dismissals were extended to prophesying, astrology, oracles, divination, and alchemy.

Scot's indictment of magical and related beliefs was, therefore, almost total. But a question remains: Did

Scot reject all spiritual interventions, either good or evil, in human affairs? If this had been the case, his work would indeed have been radical, for well into the eighteenth century, most writers who were opposed to witch hunting and who took a very restricted view of witchcraft were at pains to stress that they did not deny the existence of spirits and that to do so was an important step toward denying Christianity.

Recent scholarship confronting this issue has tended to concentrate on the final section of the *Discoverie of Witchcraft*, the seventy-two-page "Discourse upon Devils and Spirits"—a section unfortunately omitted from what is probably the most widely read edition of Scot's work, that prepared by Montague Summers. In this section, Scot restated his rejection of dealings with the Devil, of demonic magic, and of those notions of witchcraft that hinted at the miraculous. But in this, it has been argued (Anglo 1977), Scot demonstrated the limits to his denial of the supernatural, showing that he was aware of how radical his views seemed and was anxious to deny their ultimate implications. In effect, Scot seemed to have rejected not only the reality of witches but also the reality of spirits, which he saw as entities with no physical being and which could not intervene in the affairs of—and much less harm—human beings. This aspect makes defining Scot's own religious position difficult, and it is perhaps no surprise that a recent analysis of this final section of his great work attempts to connect Scot with the Family of Love (Wootton 2001).

As might be imagined, Scot's work received very hostile treatment from later demonologists. He was aware that he was writing against the grain of contemporary received wisdom, both learned and unlearned, Catholic and Protestant, and subsequent writers demonstrated this point vividly. James VI of Scotland wrote his *Daemonologie* at least partly to refute Scot's views. Scot was also targeted as a pernicious skeptic in such key English works of demonology as those by Henry Holland in 1590, William Perkins in 1608, and Richard Bernard in 1627, while the Puritan witch finder John Darrell also singled him out for criticism in a tract of 1602, declaring that his opinions about hop cultivation were superior to his views on witchcraft. The assertion that James VI, on his accession to the English throne in 1603, ordered the *Discoverie* to be burned by the public hangman lacks any support from contemporary evidence, but it certainly captured the attitude of most learned writers to this book. More equivocally, Scot seems to have been used by some Jacobean dramatists who made witchcraft a theme in their plays, notably by Thomas Middleton in *The Witch* (ca. 1613–1616).

One is left wondering how many of Scot's contemporaries shared his views. Current rethinking about early modern witchcraft rejects the view that there was a

monolithic attitude to witchcraft and stresses that there were a number of intellectually viable positions on the subject, varying from outright credulity to the type of theologically informed skepticism that lay at the core of Scot's thinking. The low intensity of witch hunting in England might reflect the fact that many other gentry with formal or informal local power shared something of Scot's skepticism, even if they were neither willing nor able to write such scholarly tracts on the subject. It seems unlikely that Scot was totally alone in his views—we know that the views of Michel de Montaigne, the most radical French skeptic of Scot's generation, were shared by most of his colleagues on the *Parlement* (sovereign judicial court) of Bordeaux—and the comparatively low levels of witch hunting in Elizabethan and early Stuart Kent might be a sign that they were widely shared by his county's elite.

SCOTLAND

In Scotland, the belief in and practice of various forms of magic, including witchcraft, were widespread and more or less constant until the twentieth century. Scotland contains areas of widely differing cultures and societies—the Highlands, the Lowlands, the Islands, the Borders—and its history of witchcraft needs to be differentiated according to the linguistic, cultural, religious, and political circumstances of each region. Because Scotland is neither monocultural nor monolingual, the magical practitioners of its past were not identical everywhere. Moreover, we know little about witchcraft in Scotland before the Protestant Reformation. The relevant records are sparse; in the Gaelic-speaking Highlands and Islands where culture was largely oral and where no judicial records have survived, there is no indication of how witches were treated. Before the eighteenth century, "Scottish" witchcraft

therefore tended largely to refer to witchcraft in the Lowlands and the Borders and to the post-Reformation period. The first recorded execution of a witch took place in October 1542 at St. Andrews, and the last occurred in June 1727 at Dornoch.

SIXTEENTH CENTURY

Many expected features of witchcraft were missing from sixteenth-century Scotland. Its few Sabbats were distinguished by dancing, not by feasting or indiscriminate sexual activity: No one got there by flying, and no evil spirits were present. Satan rarely appeared to his witches, and when he did, it was only as a man. There was little overt indication of a pact; few witches were tested for the Devil's mark, and those who were found to have the mark did not carry it in their private parts. There is no firm evidence that James VI introduced any so-called continental theories of witchcraft to Scotland after his visit to Norway and Denmark between 1589 and 1590.

At that point, Scottish witchcraft consisted largely of traditional popular magical practices: curing or inflicting illness, providing or administering love charms or protective amulets, divination, and acts of malefice. Quite often, magical practitioners were assisted by what appear to be spirit guides or by fairies (Gaelic, *sithean*). Thus, to be able to work her cures or find stolen goods in 1576, Elizabeth Dunlop relied on the advice of the ghost of Thomas Reid, who had died twenty-nine years before she first met him. In 1588, Alison Pearson was hired by the archbishop of St. Andrews to cure him of illness, and used a spirit guide called William Simpson. Two years later, Isobel Watson gave her own child to a *sithean* and served their king and queen; in 1598, Andrew Man called himself a child of the *sithean* queen who had inherited her fairy gifts of foreknowledge and curing. A spirit he called Christsonday, who looked like a white-clad angel, also attended Man.

But anyone who practiced any occult science or consulted such a practitioner was liable to receive the death penalty under the terms of Scotland's Witchcraft Act of 1563. Witchcraft thus became an offense tried by the state rather than by the Kirk (the National [Presbyterian] Church of Scotland). If the Kirk subsequently uncovered suspect witches, it either dealt with them through its own procedures, if it felt their alleged offenses had little or no substance, or passed them to the civil magistrate, if the Kirk found the case sufficiently serious.

Once in secular hands, suspects were subject to interrogation. Witchcraft was a difficult offense to prove, and the authorities were interested in obtaining either a confession or a set of witness accounts that would amount to serious circumstantial evidence (*indicia gravissima*) against the accused. It is difficult to know how much torture, if any, was applied in these cases;

sweeping generalizations have been based on very shaky foundations. To make torture legal, warrants had to be issued by the Privy Council—and we know of only two certain instances when this happened between 1590 and 1689. Other instances are therefore likely to have been illegal.

Once brought to court, the “panel” (accused) was tried by an assize, or jury. Defendants had the right to legal representation, and the evidence indicates that the advocates did their best to gain acquittals or to have charges ruled inadmissible. About half the panels appearing before the High Court of Justiciary in Edinburgh during the seventeenth century whose verdicts are known were acquitted. A panel could object to witnesses. Witness statements were heard by the assize, and witnesses who contradicted each other could be confronted in open court. After hearing all the evidence, the assize retired and elected its chancellor, or spokesman. Each charge against the accused was considered and voted upon separately: A majority of votes decided “innocent” or “guilty” on each count. Then the total number of guilty or innocent votes was counted, and this formed the final verdict. A death sentence often involved returning the panel to her or his hometown. Executions took place in the afternoon and consisted of garroting followed by burning of the corpse. The panel’s movable property was confiscated to help defray the costs of imprisonment and execution. As these costs were always high, however, confiscation (there as elsewhere) was not profitable.

Clichés about witches being poor, elderly, marginalized women do not apply to the situation in Scotland. The total number of executions, overestimated in the past, stands at about 1,000 according to current studies (approximately two-thirds of whom were women), although continuing research will obviously modify this figure. On a per capita basis, however, Scotland, with a population of approximately 400,000, had the highest ratio of witchcraft executions anywhere in northern Europe. Prosecutions of witches in Scotland were not uniform either chronologically or geographically. There were peaks of severity between 1590 and 1591, from 1597 to 1598, between 1629 and 1630, in 1649, and from 1659 to 1662. The first, often called the North Berwick incident because of a huge convention of witches allegedly held there, was basically a treason episode in which the preferred methods of assassination happened to be magical.

King James VI spent the 1589–1590 winter in Scandinavia with his new wife, Anne of Denmark. During his absence, male and female witches in East Lothian conspired on different occasions to murder the king by four different methods: raising a storm to wreck his homeward-bound ship; manufacturing a magical poison to be smeared on a lintel or threshold in the royal palace, where it could touch and infect the

king; enchanting a waxen image of the king; and finally, enchanting a picture of the king wrapped in a white cloth. Discovered by chance, the plot had many ramifications. The king’s cousin, the Earl of Bothwell, was named as a principal plotter. Some of the accused were probably named as conspirators for personal or family reasons having nothing to do with treasonous conspiracy. A magician with friends in very high places, Richard Graham, may have been suborned to incriminate Bothwell for political reasons; however, Bothwell was unstable enough to have been a genuine conspirator. James examined Agnes Sampson, a witch from Haddington, and John Fian, a schoolmaster from Prestonpans. Both allegedly suffered torture. Like Richard Graham, Sampson seems to have had access to some highly placed people near the king. Many people were arrested; relatively few, it seems, were executed. James had not been particularly interested in witches before. Now, however, properly frightened, he produced a book on the subject, *Daemonologie* (1597), based partly on his recent experiences and partly on the standard theories found in any scholarly witchcraft treatise. There was a further, unrelated outbreak of prosecutions in Aberdeenshire between 1597 and 1598 in which James took some interest, but after he became the king of England in 1603, he soon reverted to his former general indifference to the subject.

SEVENTEENTH CENTURY

After King James had gone, Scottish witchcraft saw one or two changes. In 1607, for example, Isobel Grierson was tried on charges of attacking Adam Clark and his wife in the form of her own cat, assisted by the Devil in the form of a “black man.” The previous year, the Devil had also helped her to harass William Burnet, that time in the shape both of an infant and of Isobel herself. Such shape changing was unusual in Scottish witchcraft cases (Tibbie Smart had changed herself into a badger in a rare instance from 1586), and the Devil still played little, if any, part in the majority of occult operations. More typical were the activities of Isobel Haldane in 1623, curing patients by washing them in the name of the Father, Son, and Holy Ghost (a magical formula frequently charged against Scottish witches); she had visited a *sithean*, after which a spirit guide helped her to foretell the future.

After February 1638, when a religious manifesto called the “National Covenant” was signed by a number of people opposed to the English king Charles I’s innovations in worship, the notion of a covenant or pact seems to have imprinted itself on Scotland’s public consciousness, for the wording of witchcraft *dittays* (indictments) thereafter stressed the overt making of a pact between Satan and the individual witch. Indeed, the wording became formulaic, as in the following

example, which is repeated many times in the manuscript records of the trials:

You, having shaken off all fear of God and regard for the laws, have betaken yourself to the service of Satan, the enemy of your salvation, entered in covenant and paction with him, promised to be his servant and, taking a new name from him, renounced your baptism and suffered your body, which ought to have been a temple to the Holy Ghost, to be polluted and defiled by his having carnal copulation with you: and taken his marks upon you: and also has kept several trysts and meetings with the Devil and others.

The method of the witch's submission to Satan was also formulaic. She would put one hand to the crown of her head and the other to the sole of her foot, saying that all between was his. With these new formulas, of course, the Devil began to make regular appearances in witchcraft accusations. In virtually every case, he took the form of a respectable gentleman clad in black, blue, green, or gray. Satan would offer to help the potential witch, who was usually in a melancholy state or suffering pecuniary hardship, in return for her service and would then have sexual intercourse with her. His wearing green may be significant, for green was a fairy color; here, we may be seeing an example of a fairy encounter reinterpreted by the legal system as a diabolic meeting. Attendance at Sabbats also became a more common feature of accusations, although the Scottish Sabbat seems more an uproarious party than the sinister manifestation of Satan replete with performing evil, unpalatable food, and sexual orgies that learned commentators presented. Indeed, once one reads beyond the new formula of Devil-pact-sex, Scottish accusations differed little, if at all, from the kind of charges laid against their earlier counterparts. One exception, however, involved Isobel Gowdie from Auldearn, who, in 1662, described flying to her Sabbat on a straw (other witches were picked up by a magical wind and whirled to the Sabbat).

The number of accusations increased noticeably in 1649 when the Privy Council and Parliament freely issued commissions of investigation, with the Committee of Estates alone issuing over 350 during the 1649 summer recess. The motive was likely political: The state could assert control over the kirk by making witchcraft a crime rather than a sin and therefore a secular rather than an ecclesiastical concern. Thereafter, the number of cases diminished under Oliver Cromwell's rule over Scotland. But in 1657, accusations began to multiply once more, and although there was a brief interim after the end of the Protectorate in May 1659, the upward momentum resumed once the Restoration had settled in, reaching a climax in 1661 and 1662 when over 600 cases and perhaps 300

executions took place. This severe episode was undoubtedly exacerbated by the activities of several witch prickers, men who offered to test suspects by thrusting long pins into their flesh in search of the insensible spots labeled "Devil's marks." John Kincaid, the most notorious pricker, had also been active in 1649. Ten prickers were finally arrested and prosecuted for fraud.

A legal figure prominent in the second half of the seventeenth century was Scotland's Lord Advocate, Sir George Mackenzie. He published *Pleadings in Some Remarkable Cases* in 1673 and followed this in 1678 with *The Laws and Customs of Scotland in Matters Criminal*, both of which contained observations upon the trials of witches, based partly on his personal experience. Mackenzie was no skeptic, but he did maintain that nature has its secrets and that many extraordinary happenings may have natural rather than preternatural explanations. He was also aware that some confessions were based on fantasy, not fact; further, he stood by the legal position that a witch's threat to work malefice should not be sufficient to condemn her. For that, a confession or the evidence of at least two reputable witnesses was required.

Cases of demonic possession were both rare and late among Scottish witches. The most famous involved "the Bargarran imposter," Christian Shaw, the eleven-year-old daughter of the Laird of Bargarran. In 1696, she accused a number of local adults of bewitching her into fits and making her vomit material objects such as feathers, pins, and balls of hair. Doctors examined her. In 1697, the Privy Council issued a commission of investigation; by the time it was complete, Christian had accused twenty-one adults, and three other children had contributed their fantasies of being transported to a Sabbat and taking part in acts of magical murder. As a consequence, three men and four women were executed.

EIGHTEENTH AND NINETEENTH CENTURIES
Scottish belief in and practice of witchcraft continued long after the Bargarran case. In 1704, for example, the Fife fishing village of Pittenweem saw a sixteen-year-old boy attempt to imitate Christian Shaw's possession, an episode that ended with the murder of one of those he accused; the Dumfries circuit court heard cases of witchcraft in 1709; in 1750, the presbytery of Tain heard more than one case of a woman being violently attacked because she was thought to be a witch; and on the island of Islay in 1772, if women suspected their cattle were bewitched, they employed magical remedies. Curiously, the repeal of the Witchcraft Act in 1736 provoked vocal objections from a faction within the Presbyterian kirk that felt an attack upon diabolical witchcraft represented the thin wedge of an attack upon the Christian religion itself.

Thereafter, we find that visitors to Scotland and Scottish clergymen recorded their impressions of magic among the Highlanders and Islanders in particular, documenting many instances of divination, attempted cure of diseases, fear of the evil eye, and second sight. In 1737, the minister of Speymouth rebuked one of his parishioners for consulting a man who claimed to find stolen goods with the help of a spirit guide; in 1734, Duncan Gregor was referred to the kirk session of Elgin for curing fevers; and James Boswell and Samuel Johnson noted instances of second sight when they visited the Western Isles in 1773. Belief in *sithean* remained strong. As late as 1770, dairymaids on Skye offered them milk, and a man from the island was still praying for protection against them in the nineteenth century.

Both Lowland Scots and English visitors regarded Highlanders and Islanders as “ignorant,” “superstitious,” and “savage.” Their evidence, while interesting and useful, must be treated with caution because it skews our information away from the Lowlands and Borders, where most Scots lived, and suggests that magic was to be found only among “backward” peasantry. Interestingly enough, kirk and presbytery records notably failed to record much practice of witchcraft or any other occult operations in this period, despite visitors’ evidence that these things were still common. This reticence may have been connected with ministers’ embarrassment that, after more than two centuries of conscientious endeavors, the Kirk had signally failed to eradicate its adherents’ willingness to believe in and use preternatural remedies for their everyday problems.

**SCOTT, SIR WALTER
(1771–1832)**

During his lifetime, Sir Walter Scott was Scotland’s most influential and popular author, with a Europe-wide reputation. He wrote novels, collected and edited popular verse, and produced essays and reviews on a variety of topics. His interest in many aspects of the occult can be gauged not only from his own writings but also from the works of others dedicated to him, such as the *Letters of Natural Magic Addressed to Sir Walter Scott* by Sir David Brewster (1832). Scott was well informed about the occult in general and witchcraft in particular. His mother used to lend a toadstone amulet to mothers of newly born children, and throughout his life, he collected a sizable number of books relating to magic and other occult subjects. The witches in his novels may have been portraits tailored to the needs of the tale, but the magic they did was consistent with what we know of real witches through trial records and other factual sources.

Ghosts, fairies, astrology, various forms of magic, dreams, and second sight all appeared frequently in his work; witchcraft in particular played a role of greater or lesser prominence in such novels as *Guy Mannering*, subtitled *The Astrologer* (1815), which had the Gypsy witch Meg Merrilees as a diviner and spell maker. *The Heart of Midlothian* (1818) featured Ailie MacClure, whose status was disputed among three of the novel’s characters: One complained that she “practises her abominations, spaeing [telling] folks’ fortunes wi’ egg-shells, and mutton-banes, and dreams and divinations, whilk [which] is a scandal to ony Christian land to suffer sic [such] a wretch to live”; a second observed that she “only spaes fortunes, and does not lame, or plind [blind], or predevil any persons, or coup [overturn] cadgers’ carts, or ony sort of mischief”; and a third dismissed her as “no witch, but a cheat . . . practising her impostures upon ignorant persons” (Edinburgh University Press 2004, 415, 421). *The Bride of Lammermoor* (1819) was based on a real seventeenth-century incident when a bride died suddenly after her wedding day. Scott introduced a bevy of witches into the story, the principal of whom was Ailsie Gourlay, who distributed herbal cures concocted with the help of astrology, told fortunes, interpreted dreams, and worked love magic, much along the lines of Ailie MacClure.

In 1814, Scott visited the Shetland Isles and Orkney and there bought a favorable wind from a local witch in Stromness before continuing his journey. During the

course of the trip, he picked up a vast amount of information about contemporary magical practices and beliefs; he later worked many of them into his novel *The Pirate* (1822). These novels were set in the eighteenth century. In his two medieval novels, *Ivanhoe* (1820) and *The Talisman* (1825), the magic differed little, if at all, from that in his other stories. However, in *Ivanhoe*, his witches were not Scottish but Saxon and Jewish. The Saxon witch, Ulrica, was depicted as some kind of fiend, while the Jewish witch, Rebecca, was young and beautiful, accused of working cures with the help of the Kabbalah and of making a man fall in love with her through her use of magic. Tried as a witch and sentenced to death, she was found to be wearing protective amulets in her clothing. Records from seventeenth-century witchcraft trials confirm that this detail is accurate.

In 1830, Scott published *Letters on Demonology and Witchcraft*, a compilation of written and oral history, folklore, and speculation about ghosts and fairies as well as witches. For this work, he had done a fair amount of research, extending from the study of well-known treatises such as Reginald Scot's *Discoverie of Witchcraft* to still-unpublished transcripts of Scottish witchcraft trials. Some of his information came from his own experience. In one letter, for example, he told about the discovery of an animal's heart beneath the threshold of a house in Dalkeith, an object that he was later given (in January 1827). The *Letters* thus constituted a classical demonology, unusual only in being composed so late and in being cast in the form of letters. Altogether, then, Scott's antiquarian research and his personal experiences allowed him to preserve interesting and useful information about the continuing prevalence of magical beliefs and practices in his own day.

SCRIBONIUS, WILHELM ADOLF (CA. 1550–1600)

Scribonius was a sixteenth-century German witchcraft theorist, philosopher, and physician from Marburg, who taught logic and natural philosophy at Corbach. A proponent of the logic of Peter Ramus, he published several works in various fields, including, in 1583, *De examine et purgatione sagarum per aquam frigidam* (On the Trial and Elimination of Witches by Cold Water), which upheld the validity of the "swimming test," or cold-water ordeal, whereby suspects were bound hand to foot and thrown into bodies of water. According to Scribonius, the idea that guilty suspects would float

while the innocent would sink was valid for entirely natural reasons: Through their pact with the Devil, witches acquired some of the insubstantiality of spirits, thus causing a tendency to float. (Scribonius opposed traditional religious explanations that flotation occurred because of the criminal's loss of spiritual purity, water being the medium of baptism.)

Between 1584 and 1597, Scribonius's theory regarding the swimming test was opposed by physicians (Johannes Ewich, Hermann Neuwaldt), by Catholic theologians (Peter Binsfeld, Martín Del Rio), and by the Protestant jurist Johann Georg Goedelmann, while another jurist (Jacob Rick) took up Scribonius's defense. Meanwhile, in 1588, Scribonius defended his ideas in *De sagarum natura et potestate, deque his recte cognoscendis et puniendis physiologia . . .* (On the Nature and Power of Witches, and on the Physiology of Rightly Recognizing and Punishing Them), adding no fresh arguments but relying mainly on sarcasm and rhetorical questions to discredit the objections of his critics.

Like Jean Bodin and other late-sixteenth-century demonologists, Scribonius saw demons as a fundamental and pivotal element in the total ecology of life and nature. Without angels and demons, the border between humanity and divinity seemed abrupt and the "great chain of being" incomplete. The doctrine of the Incarnation, asserting that Jesus mediated humanity and divinity by embodying both, apparently offered insufficient comfort to intellectuals seeking scientific or at least logical arguments for the reality and accessibility of suprahuman beings. Scribonius explained his ontological and cosmological views in *Rerum naturalium doctrina methodica* (1577; enlarged editions in 1583 and 1585), which was translated and abridged in English in 1631 as *Natural Philosophy: or A Description of the World . . .*

SCRYING

Scrying, also known as crystal gazing or crystallo-mancy, is a form of divination in which the practice of prolonged staring at a translucent or shining object enables the practitioner to see moving pictures within the object. It is one of the simplest and most widely used techniques to induce a mental state receptive to supernatural phenomena.

METHODS

Scrying employs several different methods, including catoptromancy, in which the speculum is a mirror. This method was known in the fifth century C.E. Later references to catoptromancy are sparse, for other methods of scrying came into fashion. But Iamblichos knew it as an alternative to hydromancy (divination by seeing what certain things do in water), and it was allegedly used in 193 C.E. by Emperor Didius Julianus to ascertain his future. The alternative and in later times more frequently mentioned method, which ancient authors indifferently called lecanomancy (dropping precious stones into water and listening for acoustic manifestations such as whistles) or hydromancy, used a simple vessel of water with or without the addition of a film of oil as the speculum. This technique was borrowed allegedly from Persia, according to ancient Middle Eastern writers. Isidore of Seville described an instance of a holy woman he knew who would pour clean water into a glass goblet and see phantasms of coming events in the water. According to Isidore, the predictions she made from her visions regularly came to pass.

Where scrying was done by proxy both in antiquity and in the Middle Ages, a boy or a team of boys below the age of puberty almost invariably served as the intermediary. The primary reason for this choice was the requirement of sexual purity in many magical operations. Courtesans in Renaissance Venice used little girls for scrying, for identical reasons. John of Salisbury related the famous memories of his boyhood in his *Policraticus* (The Statesman, 1159), in which he mentioned that a priest tried to “teach” him the art of scrying. Fortunately for him, he did not show any affinity for clairvoyance.

PURPOSE

The purpose of the rite was most often precognition, either by direct vision, as in the case of the holy woman, or by inducing a god or daemon (a being intermediate between the gods and humans) to appear in the speculum and answer questions. For this reason, scrying has

been practiced under the aegis of religion. Although the revelation of the future has been the purpose most often given for scrying, the activity has also been used to find lost objects or missing persons and to track down criminals.

FAMOUS SCRYERS

The medieval anthologist of magic Johann Hartlieb described the various techniques in his *Puoch aller verpotten kunst* (Book of All Forbidden Arts, written between 1456 and 1464). Roger Bacon (1214–1294), known throughout his life for his magical practices, was vilified as a scryer and magician even after his death. The Renaissance magician Heinrich Cornelius Agrippa von Nettesheim also used magical mirrors in his occult practices. Michel de Nostredame (1503–1556), generally known as Nostradamus, used scrying to reveal the future of the French kings to Catherine de Medici of France.

John Dee was one of the most peculiar figures in the history of magic and experimental science. After his genuinely scientific years, he tuned to the occult and was especially interested in the art of scrying. He subsequently employed scryers, including the famous Edward Kelly. Dee was reported to possess many crystal globes, one of which is on exhibit in the British Museum. Various legends have arisen surrounding Dee’s “shew stones,” as he called them.

There were good reasons why an early modern merchant such as the famous Anton Fugger found crystal-ball gazing attractive. By viewing this ball, he supposedly could behold his subordinates and purportedly see what they wore and where they lived. With this marvelous piece of early modern spy equipment, Fugger could see without being seen. Fugger’s gazer explained that her crystals contained two banned spirits who carried out the tasks she commanded. A powerful sorceress had transformed the spirits into the crystal Fugger had supplied to her.

All those accused of crystal-ball gazing protested that they had not prepared the balls they had used. They presented themselves as mere technicians. The belief that evil spirits inhabited the balls and were responsible for bringing about the magical powers of vision in them flourished in the Middle Ages. In early modern Europe, the element of the altered state of consciousness, the trance, was obviously looked upon as the effect of diabolical powers. That distinction clearly demonstrates the shift in the operators of supernatural powers: Well-educated, learned magicians who used the crystal in their individual forms of ritual magic, such as the famous John Dee and his successors, escaped prosecution, whereas the poor women who used but did not study the art were vulnerable to witchcraft accusations, as happened to the numerous hydromancers who were prosecuted by the Venetian Inquisition.

SEXUAL ACTIVITY, DIABOLIC

The witchcraft stereotype of fifteenth-, sixteenth-, and seventeenth-century Western Christianity assumed that demons had frequent face-to-face encounters with witches, often involving sexual intercourse.

Such encounters required that demons, despite being generally defined as immaterial spirits, have a bodily presence. Thomas Aquinas theorized that demons could create virtual bodies from compressed air and vapors. Demonic bodies were airy statues, “animated” by an extraneous agent, somewhat like a modern ventriloquist’s dummy. The imposture was extremely convincing, however: Demonic bodies could perform any human activity, including sexual intercourse. Being artificial, demonic bodies had no reproductive capability, or “seed,” but according to Aquinas, a demon could probably perform artificial insemination. First, the demon would form a lifelike female body, or succubus, and copulate with a man, stealing his semen. Then, the demon would transgender the virtual body into a male incubus. Carefully maintaining the viability of the stolen semen by keeping it warm, the demon would copulate with a woman and impregnate her by releasing the stolen semen. This, said Aquinas, would plausibly explain how children commonly known as offspring of the Devil could be begotten on women, although he stipulated that such children were *actually* sired by the men whose semen was stolen. Fifteenth-century demonologists accepted Aquinas’s theory, often citing Merlin as a “historical” example, using Geoffrey of Monmouth’s story that Merlin was sired on a nun by an incubus.

CARNAL KNOWLEDGE

Though it now looks bizarre and irrational, Aquinas’s theory was highly logical in terms of thirteenth-century categories. Since the twelfth century, Aristotelian philosophy had attracted the curiosity and admiration of Western Christian intellectuals. Aristotle had empha-

sized the importance of sensory information for the accumulation of knowledge. His theory of demonic copulation resulted from applying Aristotle’s empirical outlook to biblical and patristic representations of demons. The theory nourished the clerical fascination with demonic corporeality, which had been increasing since the twelfth century. Aquinas only tried to explain the existence of “children of the devil,” but by describing the mechanism so precisely, he opened the possibility that demons might be observed contriving bodies and interacting physically with humans. This hope inspired fifteenth-century clerics and magistrates to intensify their search for demons’ human accomplices.

Many Christian intellectuals were curious to know more about demons; some even desired verification that demons existed. Because sexual intercourse was clearly the most intense and complete form of human sensory experience, copulation achieved privileged status among seekers of demons: Sexual contact with demons provided credible proof of their reality. What was needed was irrefutable proof of the sexual contact. This empirical, protoscientific motivation was rarely acknowledged, but theorists of heresy occasionally enunciated it explicitly while censoriously describing the copulation of heretics with demons. Nicolas Jacquier (ca. 1458) declared that sexual intercourse could occur only when persons were awake and aware of their surroundings; thus, confessions to demonic copulation could not be dismissed as dreams. Girolamo Visconti (ca. 1460) shared this opinion and wished to eliminate the possibility that copulation with demons was a delusion or hallucination caused by disease. About 1460, an anonymous writer claimed that heretics could infallibly distinguish embodied demons from humans because during copulation, all their five senses were optimally engaged, leaving no chance that heretics were mistaking humans for demons (Stephens 2002, 20–21).

A Swiss case from 1465 gives firsthand evidence that, like the writers of theoretical treatises, inquisitors could also envision heresy or witchcraft trials as an occasion for research into the qualities and verifiability of demons. An elderly accused witch, Perrissona Cappit, was forced to testify that, whereas a man’s semen was warm and pleasant, semen received from a devil was cold and “abominable.” Her trial record states explicitly that she was interrogated for the purpose of discovering differences between copulating men and copulating devils. Transcription of her interrogation ended as soon as she provided this information. Although she was executed, she was never forced to confess any *maleficia* (evil acts), only demonic copulation and some other physical interactions with devils (Modestin 1999, 308–309).

Thus, although the new kind of heretics known as witches were apostates, cannibals, and murderers, they were also hunted down for their presumed firsthand

The Devil (indicated by his clawed feet, tail, and face) seducing a witch. From Ulrich Molitor, De Laniis et Phitonicis Mulieribus (Concerning Witches and Fortunetellers), 1489. (TopFoto.co.uk)

corporeal (sexual) experience of demonic reality. In the *Malleus Maleficarum* (The Hammer of Witches, 1486), Heinrich Kramer defined female witches jurisprudentially as defendants but philosophically as “expert witnesses” to the reality of human–demon interaction, especially through interspecies copulation; witches’ confessions provided *experta testimonia* (expert testimony), he said, making such intercourse “credible” (Stephens 2002, 35).

Later writers imagined increasingly sadistic and pornographic encounters between women and demons, although they described sex between succubi and men, including clerics, less frequently. Gianfrancesco Pico della Mirandola (1523) gave egregious examples of both (Stephens 2002, 94–99). The idea that such real and unmistakable contact was possible between humans and demons fascinated even writers not otherwise attracted by witchcraft mythology or pornographic fantasy.

SEX AND THE NEW HERESY OF WITCHCRAFT

Before 1400, certain Christian theologians had claimed that heretics met the Devil embodied as a man or animal and interacted corporeally with him, often kissing his anus and performing other acts of self-abasement to signify their renunciation of Christianity. Explicit sexual transgression was also part of the pre-1400 stereotype, but heretics had illicit sexual relations with one another (particularly incest and sodomy), rather than with the Devil or demons (Wakefield and Evans 1969; Cohn 1975, 1–59). Once demonologists, trial judges, and other literate Christians had assimilated Aquinas’s theories of demonic corporeality and copulation, their speculations fed their paranoid fantasies of heretical behavior. This process of confabulation created a new sexual abomination for heretics. By significantly changing ideas about the sexuality of heretics, Aquinas’s theory of demonic copulation thus had a vast social impact. It demonstrably predetermined many confessions extorted from persons accused of heresy, as the prior examples show and as many later trials and treatises confirm.

Literate confabulation produced a further innovation. Before 1400, stories about human–demon copulation concerned either the siring of antediluvian giants by “sons of God” mentioned in Genesis 6:4 or incubi and succubi, demonic sexual predators who molested unwilling humans. St. Augustine firmly refuted the notion that fallen angels sired giants, but his discussion of incubi and succubi ensured their place in learned Christian demonology throughout the Middle Ages (Stephens 1989, 75–92). Virtuous women were thought particularly susceptible to demonic sexual harassment: St. Bernard (d. 1153), among others, supposedly liberated a woman from an incubus. Beginning around 1400, theologians, inquisitors, and secular judges redefined incubi, identifying them with Aquinas’s artificially embodied demons and imagining that female heretics voluntarily copulated with incubi.

These developments transformed the mythology of subversive demon-worshipping secret societies; heretical stereotypes with some basis in historical fact evolved into the purely mythical figure of the witch. Voluntary copulation with demons joined other transgressions long attributed to heretics, Jews, and various presumed enemies of Christian orthodoxy, notably infanticide, cannibalism, and the desecration of sacramental objects such as crucifixes and Eucharistic hosts. As the keepers of orthodoxy searched for the Devil’s accomplices, they sought clues among their illiterate informants’ folkloric ideas about magical destruction of crops and livestock, the willful infliction of suffering and death by occult means, and magical transformations of people into animals. The new stereotypical heretics that emerged from the process were defined as consummate enemies of both God and humanity. They were so demonically evil

that in Latin discourse, the generic term for “evildoer” (*maleficus/malefica*) became the preferred term for witches of either sex. The crime of witchcraft was simply *maleficium* (evildoing); like *maleficus/malefica*, it carried primarily demonic implications of and hatred of anything good. Meanwhile, courts employing vernacular languages rather than Latin long avoided these demonic implications (Kieckhefer 1976). To them, terms translatable as “magician” seemed more logical, and they mostly retained such connotations: for example, the French *genoeche* or *sovière*; the German *towersche*, *zauberin*, or *hexe*; the Spanish *xorquina*, *hechicera*, or *bruja*; the Italian *strega*; and, of course, the English *witch*.

GENDER

Before 1400, clerics’ sexual curiosity was concentrated on incubi and virtuous women, as the *Malleus Maleficarum* itself admitted (Stephens 2002, 44–46). Afterward, the stereotype of the heretic as witch included both men’s and women’s fornication with demons. However, women and incubi understandably outnumbered men and succubi in witchcraft literature. First, statistically, about 80 percent of witchcraft defendants were women. Witchcraft accusations typically concerned women’s sphere of domestic and social influence (childbirth and rearing, care of the sick, food preparation, some forms of animal care and agriculture). Such “women’s work” attracted and provoked traditional misogyny and social prejudice, particularly when unexpected misfortunes occurred and scapegoats were needed.

Second, the educated men who wrote about witchcraft and human–demon copulation had philosophical (although reprehensible) reasons for concentrating on women and incubi. SilvestroPrierias considered demonic copulation inseparable from witchcraft, claiming that demonic copulation was “so real” (*adeo realiter*) as to produce actual children (Stephens 2002, 73). Without real women, however, the birth of children from demonic copulation was impossible. This fact was so obvious that no writer apparently belabored it before 1650, when the meticulous Giovanni Tommaso Gastaldo (1650–1652, 1: 372; 2: 113) declared that succubi, lacking real bodies, were incapable of gestation.

Moreover, men presumed that women’s sexuality was both insatiable and passive, with females eagerly receiving or undergoing sexual actions performed by men. Thus, the more “virile,” lusty, or even violent or abusive a demon was when copulating with a woman, the stronger was the proof of his reality. The violent beatings that demons supposedly administered to both men and women indicated their reality; violent sex with a “passive” partner proved the same point more emphatically, particularly if a birth resulted. Sometimes, demonic virility was demonstrated by simultaneously penetrating multiple orifices with a pronged penis.

Of course, the weak point in this whole project was its claim to be empirical. Inquisitorial researchers (*inquisitio* means “investigation”) had to rely on confessions gathered from accused criminals through suggestion or, more often, torture. Thus, the desire to experience demonic reality firsthand, especially through sexual contact, could never be satisfied. There was no alternative to repeating the same scripted interviews endlessly. To be convincing, the confessions had to seem sincere; this made extracting them an even longer and crueler process, without ever bringing an interrogator closer to an actual experience. Because women were defined as more corporeal than men and as inherently sexually excessive, they were ideally suited as subjects for investigations of human sexual contact with demons (Stephens 2002, 102–105).

PROTESTANT VARIANTS

Most Protestant theologians readily accepted demonic corporeality but avoided detailed discussions about demonic copulation through incubi or succubi. The fact that Protestant clergymen were almost invariably married to real women probably contributed to their reluctance to expound on such prurient fantasies. Moreover, many Protestant countries used legal systems that minimized or avoided torture. For such reasons, discourse on demonic copulation with witches was largely confined to Catholics, whose clergy were forbidden to marry. In Lutheran Denmark, for example, the most detailed description of a witches’ Sabbath (held in a church) seems almost chaste: The Devil had intercourse with one of the women in the church a few times—but always with the same woman. In today’s Swiss canton of Vaud, where almost 2,000 witchcraft trials were held and where torture was used relentlessly, the “sober and almost sanitized” descriptions of post-Reformation Sabbaths contrast strikingly with lurid accounts from pre-Reformation trials in the same region (this was Perrissona Gappit’s home).

In England, treatises on witchcraft often discussed demonic copulation, attendance at the Sabbath, and other corporeal interactions attributed to witches, but English witchcraft trials ignored such activities. Instead, English witches (almost always women) normally confessed to having “familiar,” demons embodied as cats, dogs, and other small animals that they cared for and fed, sometimes allowing them to suckle blood from the witch’s mark (“witch’s teat”)—an anomalous excrescence somewhere on the witch’s body. That such “maternal,” caregiving physical contact could serve the same criminalizing ends as frenetic sexual transgression provides a peculiarly British variant to the misogyny that characterized educated men’s shaping of witchcraft stereotypes.

**SHAKESPEARE, WILLIAM
(1564–1616)**

England's most famous playwright, actor, and theater professional, William Shakespeare wrote or collaborated on at least thirty-eight plays; he also wrote sonnets and narrative poems. Shakespeare's witches remain the best known of the many who appeared on the stage in Renaissance England or, indeed, who were actually prosecuted in the sixteenth and seventeenth centuries. The chant of the "weird sisters" in *Macbeth* (1606) as they stirred their brew, "Double, double, toil and trouble, / Fire burn, and cauldron bubble" (4.1.10–11), has become the standard refrain for witches in Anglo-American

Macbeth and the Three Witches. While witches appeared in several of William Shakespeare's plays, the "weird sisters" in *Macbeth* are the most famous. (Stapleton Collection/Corbis)

popular culture. Yet there are some textual questions about the witches in *Macbeth*. Furthermore, they are not Shakespeare's only witches; others appeared or were mentioned in many of his plays. They were usually women who inverted gender and class hierarchies and embodied disorder in either festive or threatening ways.

The witches in *Macbeth* were called "weird sisters" in the play; they were only once called witches, although speech prefixes and stage directions in modern editions consistently refer to them that way. They were also called "instruments of darkness" (1.3.123), "night's black agents" (3.2.54), and "secret, black, and midnight hags" (4.1.63). As with other female roles on the Renaissance stage, men played these parts until the eighteenth century. The text referred to the ambiguity of these figures' gender: "You should be women, / And yet your beards forbid me to interpret that you are so" (1.3.43–45). The weird sisters established the atmosphere of the play and set the plot in motion by prophesying what would happen to Macbeth; he then committed murder to make their prophecies come true. A central question in interpreting the play is whether their predictions determined or simply foresaw what happened. Would Macbeth have become a murderer if he had never encountered them? Even in their relation to other characters, the weird sisters were curiously detached from the play's language, structure, and settings. While they addressed Macbeth and Banquo, they refused to respond to questions; their speech was oracular rather than interactive. Unlike anyone else in the play, they spoke in rhyming couplets. They appeared in a vaguely evoked space outside and apart from the play's castles and other than its battlefields. They disappeared entirely from the play's last movement and were never held accountable for their role in the tragedy. When, in the play's last lines, Malcolm summarized what had happened, he revealed that he never knew the role the weird sisters played.

The sisters bore some resemblance to the witches described in English demonology and accounts of prosecutions. They had familiars, or animal companions through whom they worked, as was often claimed of English but not continental witches. By one account, their rage began with a "gift" of food sought from a sailor's wife, refused, and answered with a vengeful curse (1.3). Yet these witches had as much in common with stage traditions as they did with popular belief or local trials. Indeed, the stage was not clearly separable from the courtroom. For the witch to compel belief, she had to be a convincing literary type recognizable to neighbors, accusers, legal personnel, and theater audiences.

Shakespeare may have borrowed material about witches from other plays, such as songs that also appeared in Thomas Middleton's *The Witch* (ca. 1613), or others may have added this material during production or in preparation of the First Folio, a posthumous

edition of most of Shakespeare's plays, printed in 1623 by two actors from Shakespeare's company, John Heminges and Henry Condell. The Folio contained eighteen plays (including *Macbeth*) for which there were no earlier, single-play or quarto editions; thus, without the Folio, these plays would not have survived. Many editors have argued that *Macbeth* as it appeared in the First Folio had been revised for performance and may be based on a promptbook, or a script recording changes made for performance. There was particular interest in such scenes as Act 3, scene 5, when the witches met Hecate, or parts of Act 4, scene 1, which seem to have catered to audience interest in witches rather than advancing the plot. Such moments raise the question of whether the witches were integral to the plot or merely spectacles added for sensational effect. They may, of course, have been a bit of both. Typical of seventeenth-century representations of witches and witchcraft, all of the scenes in which the weird sisters appeared drew together elite and popular, London and village, theatrical and legal beliefs and practices. They straddled a thin line between belief and skepticism, fear and amusement.

In the play's performance history, the witches have been comic figures, then frightening ones, then representatives of inner states. Diane Purkiss (1996) argued that they were a comic spectacle from the start, A. R. Braunmuller that presenting the witches as comic diversions was an eighteenth- and nineteenth-century tradition. By 1794, John Philip Kemble introduced a chorus of at least fifty witches who sang, danced, and offered comic relief. As such accretions were removed, the sisters emerged as more menacing, supernatural, and powerful figures, closely associated with Lady Macbeth, who allied herself with them when she invoked spirits to "unsex" her that she might more effectively urge her husband to make their prophecies come true (1.5). If the witches never entered the play's living spaces, Lady Macbeth was at home, sleeping and eating with her husband, convincing him to commit murder, and conspiring to kill her houseguest. For many critics, this proximity and intimacy made her a particularly disturbing figure. It also suggests that, in English culture, witches' relationship to the body and to domestic life was central to the threat they posed. Some have called them "antimothers" because of their displaced, demonic enactments of nurture, suckling animal familiars at supernumerary teats and injuring rather than caring for infants.

In Shakespeare's plays, almost any woman can be called or become a witch. While James I and others argued that women were more vulnerable to the Devil's seductions because they were weaker than men, women were most often called witches in Shakespeare's plays when they usurped men's powers and privileges, when they fought and spoke out, had beards or wore armor, or

wielded power of any kind. The cross-dressed warrior Joan La Pucelle (Joan of Arc) in *Henry VI Part 1* (1591) was burned as a witch, her valor, prowess, and armor linked to witchcraft. In *Antony and Cleopatra* (1606–1607), Antony called Cleopatra a witch when he thought she had betrayed him (4.13); in *The Winter's Tale* (1609–1611), Leontes called Paulina a “mankind witch” (2.3.68) in a string of insults intended to depict her as troublesome and insubordinate. In *The Tempest* (1611), Caliban’s mother, Sycorax, a “foul” and “damned witch” (1.2.259, 265), was dead long before the play began, yet nonetheless haunted it as the predecessor and counter to Prospero and his “rough magic.” As this incomplete catalog suggests, women’s speech, self-assertion, and sexuality could all be associated with witchcraft; any woman who spoke out, disobeyed, or schemed could be called a witch. In the seventeenth century, *witch* was increasingly part of an arsenal of terms used to distinguish bad women from good and to depict the latter as quiet and submissive, while bad women were disorderly, lower status, racially and ethnically different—simultaneously threatening and laughable.

Witchcraft also provided a language for transformation, seduction, and desire in Shakespeare’s plays. In *The Comedy of Errors* (1592–1594), Antipholus of Syracuse described Ephesus as a world of “Dark-working sorcerers that change the mind / Soul-killing witches that deform the body” (1.2.99–100). Dromio of Syracuse described his surrender to the topsy-turvy possibilities of the place as “turning witch” (4.4.157). In *Othello* (1603–1604), Brabantio accused Othello of using witchcraft to seduce Desdemona, because he could not believe that she would have been attracted to a “moor”: “For nature so preposterously to err, / Being not deficient, blind, or lame of sense / Sans witchcraft could not” (1.3.62–64). Othello presented the story of his adventures as the “only . . . witchcraft I have used” (1.3.168). Yet his later description of the provenance of his handkerchief—woven by a Sybil from hallowed worms and dyed in the fluid drained from maidens’ hearts, which was given to his mother by an Egyptian “charmer” as a talisman that would bind her husband to her—reintroduced an association between himself and witchcraft (3.4.53–73). Thus, witchcraft reentered the play to heighten Othello’s exoticism—and the threat he offered.

SHAMANISM

Shamanism is a distinctive and vital religious phenomenon in the cultural history of many peoples throughout the world. Both scholars and practicing shamans consider it a spiritual world heritage that is shared by most religions. In very general terms, shamanism is a religious practice that attempts to mediate between a profane reality and a sacred spiritual world. The shaman’s contact with presumed guardian spirits has the purpose of alleviating a range of problems and crises in the real world. Healing, clairvoyance, and divination are central powers of a shaman. To bridge the gap between the two worlds, a shaman employs various rituals, symbols, and techniques. Drumming combined with cries, song, and dance is the usual method for inducing an altered state of consciousness. It is often claimed that the shamanic altered state of consciousness is achieved through ecstatic techniques. Mircea Eliade, who wrote the pioneering book on shamanism in 1951, saw trance as an important part of all varieties of this phenomenon and even identified shamanism with techniques of ecstasy. Subsequently, most scholars have considered the state of trance, in which the soul temporarily leaves the body, to be the single most important feature of a shaman.

ASPECTS OF RITUAL

The word *shaman*—*saman*—apparently originated with Tungus-speaking peoples of Siberia and denotes someone who is moved or excited. An English explorer, Richard Johnson, became the first European to describe a shamanistic ritual. On New Year’s Day of 1557, he was staying among the Nenets, an indigenous people in northwestern Russia. There, he observed a peculiar experience that he referred to as “devilish rites.” Johnson’s description contains most of the elements later scholars have attributed to shamanism understood as religious practice:

The Priest does begin to play upon a thing like to a Great Sieve, with a skin on the one end like a

drum. . . . Then he sings as we use here in England to hallow, whoop or shout at hounds, and the rest of the company answer him with this chorus, Igha, Igha, Igha, and then the Priest replies again with his voices. And they answer him with the selfsame words so many times, that in the end he becomes as it were mad, and falling down as he were dead. I asked them why he lay so, and they answered me. "Now does our God tell him what we shall do, and whither we shall go." And when he had lain still a little while they cried three times together, Oghas, Oghas, Oghas, and as they use these three calls, he rises with his head and lies down again, and then he rose up and sang with like voices as he did before. (Hutton 2001, 30)

During the following 200 years, missionaries, explorers, and traders encountered various peoples in Siberia and other circumpolar regions. Their accounts and ethnographic reports spurred considerable curiosity and discussion in Europe. Around the middle of the eighteenth century, the interest among intellectuals and artists and in various courts had reached such dimensions that "shamans became a key exhibit in the European inquest on the supernatural" (Potter 1999, 217).

A SHAMAN AT WORK

During an interrogation about sorcery in northern Norway in 1692, an old Sami shaman named Anders Poulsen described his calling and how he used his drum. The information he provided about his skills illustrates the principal functions of any shaman. As Poulsen testified:

1. He could, with the aid of his gods, remove a spell and reverse its power. If someone had cast a spell upon another, the shaman could send the spell back to whoever had first cast it. Further, by praying to his gods and playing on his drum, he could punish evil people by persuading his spirits to condemn the sinner to hell.
2. He could track down thieves and retrieve stolen property by consulting his drum.
3. He could protect his people's reindeer from being killed by wolves through the power of prayer and music.
4. He could play upon his drum to help relieve the pains of childbirth for women in labor.
5. He could discover how his family was doing at home while he was far away. He could also learn what was happening to other people, even those several thousand miles off, and especially gain knowledge about ship arrivals and the physical appearances of the ships' captains.
6. He could hear the voices of others when he lifted the drum above his head. Poulsen said it was as though two people were talking to each other.

7. He could predict the weather, and he could produce fair weather by playing on his shamanic drum. Pressured by the prosecuting counsel, he divulged how drum playing could also wreak havoc upon ships and seamen.
8. He could use his skills in healing and to give absolution for sins. (Hagen 2002, 338–339)

SHAMANS AND WITCHCRAFT TRIALS

Experts customarily distinguish two main types of shamanism. The first is the type that cultural anthropologists have observed in Siberia, for instance, where shamanism is played out as a process of public performance. The other is more focused on spirit flights experienced during sleep. This second type sometimes appeared in historical studies of court records from witchcraft trials.

In a famous book about the folkloric roots of the Sabbat, the Italian historian Carlo Ginzburg (1991) emphasized its shamanistic elements. He argued that witches' confessions provided insights into rites and myths connected with the ecstatic journey to the land of the dead. His earlier research in Inquisition records from northeastern Italy between 1575 and 1675 investigated the confessions of people calling themselves *benandanti* (do-gooders), who made spirit journeys at night in certain periods of the year and fought the forces of evil as spirits in order to secure good harvests. Ginzburg interpreted the *benandanti* and their spirit journeys as an archaic fertility cult with strong shamanistic features, which the inquisitors gradually simplified into "orthodox" diabolical witchcraft. Meanwhile, on the opposite side of the Alps, a villager named Chonrad Stoeckhlin told a south German court in the 1580s how he fell into a trance and met with an angel who carried him away to distant places, where he joined other people. The judges interpreted the angel as the Devil and Stoeckhlin's nocturnal travels as the flight to the witches' Sabbat, and they ordered him burned (Behringer 1998).

During the age of witchcraft trials, European shamans risked being taken to court for their religious practice. However, shamans were usually perceived as a secondary group in relation to witches. A good example is the Hungarian *táltosok*—shamanlike sorcerers who appeared in connection with witches in the eighteenth century. They were professional healers with special powers given by the deity, especially the abilities to see hidden treasure, find lost objects, heal, foretell the future, and discover the fate of people who were far away. The *táltosok* were involved in a few Hungarian witchcraft trials but constituted a clear minority.

Northern Norway experienced an intense and brutal witch hunt in the seventeenth century. Most of those burned were Norwegian women, and only one-fifth

belonged to the Sami indigenous group. However, men constituted a majority among Sami convicted of sorcery, which indicates that Sami shamanism was primarily a male activity. All over Europe, most shamans convicted of sorcery were men.

THE SOUL JOURNEY

In most witchcraft trials against people who could be labeled shamans, ecstasy and trancelike states were seldom featured prominently. According to Wolfgang Behringer (1998, 143), “The separation of the soul from its body and its trip to certain places is the constitutive element for any great shaman,” and most scholars of shamanism would agree. However, we must also ask if the conception of the shaman as a kind of link between two worlds is largely a fabrication of some eighteenth-century missionaries. Nearly all earlier reports of shamanism-related trances were written by foreign travelers, traders, or priests—observers who described this evil art with great pathos, providing numerous stories about evil drum beating at the foot of naked mountain cliffs and devils who penetrated the minds of shamans (*ecstasis diabolica*). All too often, modern historians have accepted such tales uncritically and incorporated them into their work. Scholars attempting to view this topic in a religious-historical light have generally followed in the footprints of missionaries who, with considerable bias, focused on the state of ecstasy as a fundamental characteristic of shamanism. Yet ecstasy was probably nothing more than the most eccentric part of a shaman’s repertoire.

The concepts of trance and ecstasy carry a long tradition of negative associations. Early modern European Christians used the concept of the trance to condemn shamanistic practice as heathen, devilish, and blasphemous. During the eighteenth-century Enlightenment, “ecstasy” was used to stigmatize shamans as primitive, uncivilized savages. During the colonial period, these concepts were used to brand shamanistic societies as underdeveloped and their religious practices as wholly irrational. By the late nineteenth century, theories referenced a kind of correspondence in temperament among many native peoples. Shamanism alternated hysterical fits (ecstasy) with periods of complete exhaustion (trance). For instance, indigenous peoples in Arctic areas were described as easily moved, nervous, and short-tempered—their temperament marking their religious conceptual worlds. Their form of shamanism was diagnosed as Arctic hysteria and winter depression.

There is certainly a need for a deconstruction of the category of shamanism. Based on his extensive studies in both Scandinavian and Mediterranean Europe, the Danish folklore researcher Gustav Henningsen (1991–1992, 302) claimed that in most parts of Europe, professional magicians did not travel into the spirit world. Calling for a redefinition of concepts and

terminology with reference to the study of shamanism, he argued that the trance theory should be abandoned. Having studied the use of the terms *trance* and *ecstasy* in her fieldwork in Siberia, the French anthropologist Roberte Hamayon (1993, 7) questioned whether these terms were useful in studying shamanism and concluded that “the shaman’s behavior, called ‘trance’ by observers, is qualified by shamanistic societies with reference not to a specific physical or psychic state, but to the shamans being in direct contact with the spirits.” The comparative debate among scholars on the exact nature of shamanism continues.

SHERWOOD, GRACE (CA. 1651–1740)

The most notorious witch of the Chesapeake Bay area, Grace Sherwood faced a string of witchcraft accusations starting in 1697, culminating in a formal witchcraft

trial in 1706. Her experience vividly demonstrates the transfer of witchcraft beliefs from England to colonial Virginia. Sherwood lived in Princess Anne County, in an area that is now Virginia Beach; she was forty-six years old, a wife and mother of three, when the witchcraft accusations began to appear in the court record. Grace was described as a strikingly attractive, strong-willed, nonconformist woman who had a habit of wearing men's clothing. She was also knowledgeable about the use of herbs and was an experienced healer.

Accusations against Grace first surfaced in 1697, when she and her husband, James, sued Richard Capps for publicly accusing Grace of being a witch and of casting a spell that had caused the death of his bull. The case was dismissed, but it was only the beginning of Grace's legal battles to defend her name. In September 1698, James and Grace returned to court, suing neighboring John and Jane Gisbourne and Anthony and Elizabeth Barnes for slander. The Gisbournes had accused Grace of ruining their cotton crop and casting a spell on their hogs, and Elizabeth Barnes had accused Grace of "riding" her—a common charge against witches in America, England, and Scandinavia. Elizabeth claimed to have been forced out of bed by Grace and a devil-like figure. She said Grace rode her about the room until she collapsed from exhaustion, at which point Grace transformed herself into a cat and left through the keyhole in the door. In court, the Sherwoods failed to clear Grace's name; in both slander suits, the juries found in favor of the defendants. Thus, Grace, although not yet formally convicted of witchcraft by the courts, was unable to defend her reputation successfully against charges of being a witch.

James Sherwood died in 1701, leaving his widow to fight her legal battles alone. In December 1705, Grace was again in court, accusing Luke and Elizabeth Hill of assault and battery. Grace claimed Elizabeth had assaulted her, and she sued for damages of 50 pounds sterling. On that occasion, the jury awarded Grace 20 shillings. But less than a month later, in January 1706, the Hills filed formal accusations of witchcraft against Grace. Grace did not appear to answer these charges. As a result, the Hills were required to pay court costs, but the county court ordered that a jury of women should search Grace for the witch's mark and the Devil's mark. The jury, with Elizabeth Barnes as its forewoman, found several questionable marks. A second panel of women was called but refused to serve, causing the court to order that Grace be ducked in water to ascertain her guilt or innocence. Grace was accordingly thrown into Lynnhaven Bay with her hands and feet bound in the usual manner; she floated. Seared again at that point, it was confirmed that she had two black marks in her private parts, and her guilt was therefore confirmed.

The documents that would have recorded what happened next were burned, along with the Richmond

courthouse, during the Civil War. What is known, however, is that Grace was not executed as a witch, which is likely because she was never accused of harming or causing the death of another human being and because belief in malicious witchcraft was on the wane by the end of the seventeenth century. She may have been jailed, but if so, she was free by 1714, when she again appears in court records. She lived until 1740. Accusations against Grace abated, although legends surrounding her survive to this day. The spot where she was ducked is still known as Witch Duck Point, and local folklore hints that Grace conjured a storm that drenched those who witnessed her ordeal. Other tales tell of her leaving her jail cell and flying with the Devil and taking an overnight trip to England and back in an eggshell to procure some rosemary. Thus, in both fact and fiction, Grace Sherwood stands as the Chesapeake's most notable accused witch.

SICILY

In Sicily, both ecclesiastical and civil authorities conducted trials for witchcraft and superstition, but as the archives of most courts await closer investigation, the present survey is based exclusively on inquisitorial cases judged by the Spanish Inquisition. A Spanish possession from 1282 to 1713, the island had a tribunal of the Spanish Inquisition in Palermo from 1487. Even after Spain relinquished Sicily in 1713, the Inquisition continued to function with a Spanish staff; in 1782, under the government of Naples, it was abolished and its archives were burned. However, summaries of its cases have been preserved in the so-called *relaciones de causas* (reports of cases) sent to the *Suprema* (supreme council), whose archives remain today in Madrid's Archivo Histórico Nacional. Among 3,188 cases known from the *relaciones* (between 1547 and 1701), 456 were concerned with "superstition," involving sorcerers, diviners, astrologers, necromancers, and witches, none of whom were burned. These cases resemble those from other Mediterranean regions, with one exception: They featured Sicilian magicians whom the inquisitors misleadingly called witches (*bruja*s). To understand this problem, we must place Sicily within the Mediterranean geography of witchcraft.

Like the Iberian Peninsula, Italy can be divided into a northern region with both witchcraft and sorcery and a southern one with sorcery only. In southern Italy, “evil people” did not fly to nightly gatherings, turn themselves into animals, or visit the houses of their neighbors to suck their children’s blood. Witchcraft was totally absent, and misfortune was explained there in terms of sorcery. But unlike Spain, southern Italy and Sicily had special kinds of magical agents—“the women from outside” (*le donni di fuora*, translated by Spanish inquisitors as *donas de fuera*). These women had the power to transform themselves into animals, to fly, to heal, and to predict. However, they differed greatly from evil witches in other regions. They were, in fact, highly appreciated by the local population because they served as mediators between humans and fairies. Since Sicilian fairies were also called *donni di fuora*, the term actually signified both fairies and fairy doctors.

This Sicilian fairy belief was documented by the mid-fifteenth century in a vernacular manual for confessors, in which the priests were advised to ask their penitents “whether they believe in the women from outside [*donni di fori*] and that they walk by night [*e ki vayanu la nocti*]” (Bonomo 1959, 65). However, the Holy Office only became aware of the phenomenon a century later. In November 1587, the inquisitors of Palermo wrote to the council of the Spanish Inquisition, describing the confessions of an old woman, a poor fisherman’s wife in Palermo named Laurea de Pavia, who had been arrested because she boasted of having permission from the Holy Office to cure sick people. But this was not the reason why members of the tribunal wrote to their superiors in Madrid. The inquisitors, who included the famous Ludovico a Páramo, were perplexed by her confessions. “If what this woman says is true,” they wrote, “a new sect of witches [*brujas*] has come into being” (Henningesen 1997, 174).

Their conclusion is understandable from their summary of her confessions: She described a kind of witches’ Sabbat—but without devils or any of the usual nasty details; everything that Laurea de Pavia described was beautiful and delightful. She and her company, with their “ensign” at their head, rode on billy goats through the air, about half a meter above the ground, to

a place called Benevento that belongs to the Pope and lies in the kingdom of Naples. There was a great plain there on which stood a large platform with two chairs. On one of them sat a red young man and on the other a beautiful woman; they said she was the queen and the man was the king. The first time she went there . . . the ensign and the other women of her company said that she must kneel and worship this king and queen and do everything they told her, because they could help

her and give her wealth, beauty and young men to make love with. And they told her that she must not worship God or Our Lady. The ensign made her swear on a book with big letters that she would instead worship . . . the king as God and the queen as Our Lady, and promise them her body and soul. . . . After she had worshipped them like this, they set out tables, ate and drank and danced, and then the men lay with the women and with her and made love to them often in a short time. (quoted in Henningesen 1990, 196–197)

The fisherman’s wife told the inquisitors that all this seemed to her to be taking place in a dream, for when she awoke, she always found herself in bed. She went on to say that she did not know in the beginning that the activity was diabolical, until her confessor explained to her that it was the Devil’s work and forbade her to go. However, she continued doing so until her arrest. She added that she went out joyfully because it gave her carnal pleasure (*el gozo*) and because the king and queen gave her remedies to cure sick people so that she could earn a little money, for she had always been poor (Henningesen 1990, 196–197).

Because it was unusual for Sicilian fairy healers to attend the Sabbat at Benevento, the confessions suggested influence from inquisitorial questioning. In Sicily, a typical Sabbat was said to involve a company of fairies and human beings going around town at night and entering houses invisibly, “like a breath of air.” If there was a party, they would eat and drink without being seen. In houses of rich people, they would open chests and dress up in the clothes they found. If there were small children, they would take them from the cradle to play with them and put them back again with their blessing (unlike witches, fairies and their human associates were fond of children).

Sometimes, the company included a fairy doctor who took them to the house of a sick person, where a special table had been prepared with delicacies to induce the fairies to cure the patient by taking away the fairies’ curse. When they came into a house with their songs and music and fine clothes, their greeting would be “With God’s blessing, let the dance grow.” And when they left to go somewhere else, their departing remark was “Stop the dance and may prosperity grow.” Clients were advised in advance to make their houses tidy when the fairies were coming at night, for otherwise, they might not bestow their blessings on the households. When going to some other place or town, the fairies rode through the air on goats. Like witches, they had regular days for their nocturnal activities, but they usually went on a Tuesday, Thursday, or Saturday, avoiding Friday (the day the Lord died) and Sunday (God’s day). Instead of the Devil, they met a fairy, who was given different names in their narratives: Queen of the Fairies (*Reina de las Hadas*), La

Matrona, La Maestra, The Greek Lady (La Señora Griega), Señora Gracia, Doña Inguanta, Mandatta, Doña Zabella [Isabella], or The Wise Sybil (La Sabia Sibila). She was described as a beautiful woman dressed in black or white, but her supernatural origin was revealed by her feet, variously said to be cat's paws, horse's hooves, and so forth. Fairies and human beings were organized in companies with different names according to their districts, such as *Compañía de los Romanos, Compañía de la Matrona, Compañía de Palermo, and Compañía de Ragusa.* The archaic traits and the rich variation in the narratives indicate that a so-called white Sabbat must have existed in Sicilian popular imagination—a beautiful image that was soon distorted by demonologists into the horrible witches' Sabbat (Henningsen 1990, 208; 1991–1992).

Under inquisitorial interrogation, some of the accused were forced to admit that their fairy cult was really demonolatry, and a few of them were encouraged to produce “authentic” descriptions of black Sabbats. But whenever the Holy Office seized one of these alleged witches, the inquisitors had to begin all over again. Several of the accused individuals declared that they never knew there was anything wrong in their activities, until their confessors or the inquisitors explained this to them. Some of the accused even tried to exculpate their fairies from the serious accusations by pointing out that they were not, like demons, afraid of the cross or holy water. The position of these women as mediators with the fairies was deeply rooted in Sicilian tradition, and the inquisitors were outraged to see that the fame of the fairy doctors was so great that people continued to frequent the women after they had been condemned and were serving their sentences of imprisonment in the Grand Hospital of Palermo; even there, their clients looked them up and consulted them.

SIENESE NEW STATE

The activity of the Sieneese tribunal of the Roman Inquisition, among the very few of this Inquisition's forty-five branches with virtually intact records between 1580 and 1721, is illustrated in Figures 1 and 2. Figure 1 charts the frequency of all cases involving any kind of magic except *maleficium* (harmful magic)—therapeutic magic, love magic, treasure hunting, divination, superstition, and necromancy. Figure 2 registers only *maleficium* cases. It seems evident from our sources that this period saw no decline in magic, although prosecutions for *maleficium* disappeared. The information in the first figure offers little that is new to historians, who are now fully aware of how vigorously magical practices persisted even well beyond the early eighteenth century. But the second figure, showing *maleficium* cases vanishing while magic continued to flourish, poses intriguing problems that still await explanation.

The Roman Inquisition tribunal in Siena had jurisdiction over the old Sieneese Republic, which was absorbed after 1559 into the Medicean regional state, the duchy (later, Grand Duchy) of Tuscany. The population of the so-called New State (*Stato Novo*) remained almost stationary between 1580 and 1720 at slightly over 100,000; the population of its capital, Siena, fluctuated between 15,000 and 17,000. Its inhabitants clustered in 132 nucleated villages divided in two contrasting zones: There were 46 in the Maremma—a marshy area, plagued by malaria, where mostly migrant laborers practiced pastoral farming and extensive cereal cultivation—and 86 outside it. However, witchcraft accusations show no clear division between the area's developed and underdeveloped zones. The religious organization of the New State included six small bishoprics governed by the archbishop of Siena.

A Franciscan inquisitor, a doctor of theology, carefully supervised inhabitants' consciences throughout the region. Defending Catholic orthodoxy through a *familia* (household or family) of forty-eight persons living in Siena and through a net of vicars, mostly parish priests, the father inquisitor wielded considerable power over the faithful through a web of co-opted confessors. The Holy Office attempted to use confessionals as bugging devices for detecting all local unorthodox beliefs; parish priests could not absolve parishioners from sins concerning “magic” until they had channeled such penitents to the Inquisition. As soon as a crime was confessed or reported, a preliminary inquiry was carried out locally, and the case was eventually sent to Siena, where the inquisitor there

Magic cases (maleficium excluded).

began a fresh examination of witnesses and culprits. Sentences were decided at a congregation, with a representative of the archbishop and nine high-ranking ecclesiastics assisting the inquisitor. Though all forms of so-called magic fell within the competence of the Inquisition, secular justice also claimed theoretical jurisdiction over harmful sorcery. Two witchcraft trials begun in secular courts were in fact recovered by the inquisitors after some negotiations, and both defendants underwent fairer, new proceedings.

In the Sieneese countryside, trials of individual witches were endemic but rare between 1580 and 1660. As elsewhere in Catholic or Protestant Europe, “the popular fear of *maleficium* . . . provided the normal driving force behind witch prosecution” (Thomas 1971, 548). No particular set of internal or external factors triggered formal indictments. Although a parish priest reading an inquisitorial edict against magical healers and witches tried to persuade parishioners to denounce them, most trials for *maleficium* lacked this connection; other evidence shows that villagers ignored edicts and avoided making denunciations.

It must be underlined that demonic witchcraft is utterly marginal in this Sieneese evidence. Although 198 women were investigated for *maleficium* between 1588 and 1657 and 31 of them were tortured as suspected witches, only 6 women confessed to participating in a Sabbat—5 of them under harsh torture and the other spontaneously. One woman was probably burned in 1588. Sieneese sources confirm a widespread European feature: Witchcraft was a neighborhood crime, fostered by an atmosphere of malevolence and suspicion that was all too rife in early modern villages. Victims searched their memories to recall episodes that might have sparked off an evil eye, and they quickly discovered the culprit. However, it is difficult to ascertain why suspicions converged upon one particular person among several local candidates. In 1605, a woman complained that “fifteen or more people like me go a round here and there healing. But now whenever an infant dies, everybody says that they all have been wasted [*guasti*]. And they blame me as well as the others. I don’t know why they are hunting me [instead of] the others” (Di Simplicio 2005, 179).

Maleficium cases only

Two coincidental Sieneſe realities complicate our hiſtorical understanding. Firſt, by a proceſſ of lexical aſſimilation, the word *ſtrega* became a ſynonym for *healer* as well as for *harmful witch*. Second, in the Sieneſe ſtate, *all* 198 witches were women. This regional peculiarity is ſtill to be explained. The Sieneſe witches were not univerſally very old, unmarried, widowed, or poor—but all were women. Like their counterparts elſewhere in Europe, theſe *malefiche* (maleficent witches) ſuppoſedly had the power to heal people they had “waſted.” The topmoſt hierarchy of Sieneſe healers (male and female), in terms of personal power and knowledge, were men: the *ſtregone* (male witch) or *indovino* (ſoothſayer; cunning man). However, no maleficent action by a *ſtregone* was ever reported to the inquiſitors.

Sieneſe *maleficium* caſes concerned only humans, particularly infants; no weather-making witches were ever reported, and cattle bewitching ſeems to have been rare in this agrarian ſociety. “Binding” (ligature, tying a knot) to cauſe impotence was a common type of ſpell practiced eſpecially by urban prostitutes. Although infant mortality remained very high in this region, the nexus between infant deaths and charges of *maleficium*, ſo common among all ſocial claſſes, diſſolved there long before 1700.

Apparently, different ſocial relationships accelerated changes in ideas of cauſation in late-ſeventeenth-century villages, eventually leading to the diſappearance of infant *maleficium* caſes. Throughout Europe, the quality of interpersonal relations among villagers provided the crucial context behind witchcraft accuſations. Bewitched people ſought other ſolutions—ſome orthodox (exorcism), ſome illegal (*ſtreghe* and *ſtregoni*—female and male witches), or ſometimes even confronting the witch directly—before uſing a court to denounce their enemies. A cloſe examination of Sieneſe witness depositions confirms the now-venerable conclusion that blaming a witch ſimply reduced personal miſfortune to interpersonal terms. Unſurprisingly, the concept of the vendetta was deeply embedded in Sieneſe witchcraft trials, as proven by the eagerness of the parents of bewitched children to take revenge. Judges, witnesses, victims, and defendants continued to interpret the world according to the categories of friend and enemy.

Sieneſe trials for magic fall into two different phases. In the firſt (from 1580 to 1660), collective experience defined ſome diſeaſes as unnatural. This period was characterized by long trials, during which villagers’ opinions were marſhaled on each caſe. Elements eſtablishing *maleficium* were always reported with the expreſſion *tocco* (touched) or *maneggiato* (handled) by witches. A dark purple color on the victims’ bodies as well as tooth marks, finger marks, ſcratches, and bruises ſcattered all over the little corpeſes offered proof of a witch’s attack. Witnesses of all ſocial claſſes emphasized this obſeſſive

clinical picture of *putti guasti* (rotten children) through the language of *maleficium*. In the ſecond phase of the Siena trials, from the mid-ſeventeenth century onward, deſpite the virtual diſappearance of *maleficium* caſes, the ſources ſtill enable us to hear ordinary Sieneſe people diſcuſſing malevolent magic. But now, we find very ſhort trials, with examinations limited moſtly to the victim’s parents, and we note a change to an agnoſtic ſtance toward “unnatural” diſeaſes. On cloſer analysis, we diſcover that in theſe trials, identical clinical deſcriptions of ſick or dead children elicited a very different verbal diſcourſe—or even none at all. Although infant mortality remained extremely high, it ſeems that the nexus between infant deaths and charges of *maleficium*, previously common among all ſocial claſſes, faded away in the late 1600s. How ſhould we decode this new language of depositions? Was it a ſign of cultural change, a barometer that the explanation of miſfortune in personal terms had become unſatisfactory?

The early modern Sieneſe New State became a more complex ſociety as its local communities were integrated into two higher ſystems, the Grand Duchy of Tuscany and the poſt-Tridentine Church. This integration affected the quality of interpersonal relationships, diminished recourse to vendettas, and eventually helped to modify the idea of cauſation among uneducated people, thus reducing “the area where personalized explanations in terms of human will were thought” (Macfarlane 1999, 205).

SIGHT, POWERS OF (SECOND SIGHT)

Clairvoyance, generally termed *second sight*, is the psychic ability or power to see objects and visions or to gain information regardless of distance. The term often refers to prophetic visions and dreams, occasionally even of past events; it can occur in normal states of consciousness but also can be induced by drugs, fasting, illness, or scrying (crystal gazing). Telepathic descriptions are universal in written and oral lore. Tribal societies such as the Australian Aborigines accept clairvoyance as a human faculty, while more sophisticated societies consider second sight a special ability belonging to mystics, soothsayers, healers, and witches, nowadays known as mediums or psychics. In antiquity and medieval times, the term *intuitive divination* was preferred, and virgin boys or pregnant women were often used as mediums. While in a trance state, such people were thought to have the ability to see hidden things or discover thieves.

Christianity has always opposed such practices. In his treatise *De Divinatione Daemonum* (On the Divination of Demons, 406), St. Augustine explained that, while evil spirits lacked truly prophetic knowledge of the future, they could make conjectures that were informed by keen perception, the ability to move quickly, and a rich store of experience, and these conjectures were then communicated to human beings through divination. As early as the fifth century, synodal legislation repeatedly condemned *specularii* (scryers), who gazed into mirrors, bowls, polished fingernails, and so on, claiming that marvelous things were revealed to them, assimilating scryers to *phitones* (trance-diviners) who could see the future while possessed by a spirit. Later, in witchcraft trials, all forms of divination, including clairvoyance, were considered demonic.

ANTIQUITY

In antiquity, the belief that an alien voice spoke in the first person through the lips of the Delphic Oracle, the Pythia, was almost universal for more than a millennium. The onset of her trance was said to be induced by such ritual acts as sitting on the god's holy seat, touching his sacred laurel, and drinking from the holy spring. In her normal personality, the Pythia was a perfectly ordinary woman, but when she became possessed (*entheos*), she spoke in riddling symbols, which had to be interpreted by the priests—not unlike many modern trance mediums.

The Pythia was unique in her status but not unique in kind. The girl in the Acts of the Apostles who had a pythonic spirit made great profits for her masters. Apart from the official oracles in classical Greece, there is also evidence for persons who claimed to possess the gift of automatic speech. They were known as belly-talkers,

because they were believed to have a *daemon* (a being intermediate between the gods and humans and with a body made from a substance such as air) in their bellies that spoke through their lips and predicted the future. Apparently, like modern mediums, they spoke in a state of trance. In the Middle Ages, such individuals were more respectfully known as *pythones*. The possession state of both the Pythia and the pythons was, as far as we know, autosuggestively induced. But in the Egyptian papyri, we find spells by which a magician could induce it; one gives an elaborate recipe for summoning a god to enter into a child or adult and speak through that person.

MEDIEVAL AND EARLY MODERN CLAIRVOYANTS

Medieval theologians were especially fascinated by *pythonica divinatio* or *divinatio per pythones* (divination by means of a spirit); Berthold of Regensburg (d. 1272) condemned them as heretics. Three centuries later, they were considered impostors. In 1584, Reginald Scot studied the phenomenon in his *Discoverie of Witchcraft*; in chapter 16, he mentioned “pythonists,” describing them as clairvoyants able to prophesy by a familiar spirit. Apparently, he knew them from personal experience because he referred to a woman practicing ventriloquy who lived not too far from his own home.

Mother Shipton (1488–?) became one of the most famous seers of her time and was slandered as a witch for supposedly prophesying scientific inventions, wars, and so forth. Fabulous stories surround her life and that of her mother. Ursula Shipton was born near Knaresborough (Yorkshire), England, to a mother famous for her healing powers, second sight, storm raising, and bewitching. Shipton reputedly inherited her mother's powers, being involved in poltergeist phenomena at a tender age. The book of predictions ascribed to her is a later compilation. Elsewhere in England, John Dee obtained clairvoyance by the art of scrying, employing his polished “shewstones” (crystal balls).

Fortunetellers and healers (so-called rural cunning folk) survived until almost our own time, plying their trade through long-established methods. By the end of the nineteenth century, new trends in pseudoscience and supernatural belief developed and circulated in urban culture. Practitioners calling themselves phrenologists, mediums, or clairvoyants tried to modernize such ancient divinatory practices. One reason for adopting new practices and identities was to elude the laws against fortunetelling. A good symbol for the new development was the crystal ball, which recovered its popularity in the mid-nineteenth century and has remained the stereotypical tool of the fortuneteller until the present. Although scientifically unproven, telepathy continues to be studied in psychic research.

SILESIA

Silesian territories had a relatively high rate of witchcraft persecution. Part of the Kingdom of Bohemia, the region was divided into several small *Standesherrschaften* (lordships) under Habsburg sovereignty. As elsewhere in the Holy Roman Empire, Silesian territories were affected by the Little Ice Age; by population growth; and by famine, plague, and religious uncertainty during the Thirty Years' War. Most persecution here occurred between 1580 and 1680, peaking in the Neisse area around 1651 or 1652; it mainly affected German-speaking areas on the left shore of the Oder River, primarily the principalities of Neisse (Nysa), Glogau (Glogow), Jägerndorf (Polish Karniów, Czech Krnov), Troppau (Opava), and Oppeln-Ratibor (Opole Racibórz).

Silesia was divided into immediate and mediate principalities and lordships (those directly subject to the emperor versus those subject to some intermediate authority). Until 1621, the Margrave of Brandenburg-Ansbach had possessions in Jägerndorf, and the house of Württemberg had possessions in Oels after 1648. The Habsburg emperor was the territorial sovereign (*Landesherr*), in most areas, but Silesia's local lords retained the right of high justice and could therefore conduct witchcraft trials to prove their relative independence. The Habsburgs governed through bailiffs and county-captains (*Landeshauptleute*), who possessed considerable autonomy. The actions of *Landeshauptmann* (governor) Georg Maximilian von Hoditz in Neisse showed clearly that neither the Holy Roman Emperor nor the bishop of Breslau intervened significantly in these trials, let alone directed them. In fact, the bishop of Breslau tried to moderate Hoditz's activities.

Silesia's first sorcery trials took place in 1456 at Breslau, where executions were still carried out by drowning, not by burning. Eight of the ten known trials in fifteenth-century Silesia took place in Breslau. The situation was similar during the first half of the sixteenth century, with nine of thirteen known trials taking place in Silesia's largest city. Although Breslau

remained calm thereafter, two pursuits took place in 1535 and 1581 in the Protestant town of Jägerndorf, belonging to Brandenburg, with at least twelve people executed.

Silesian witchcraft trials show both similarities and differences when compared with those in other territories within the empire. As in many other territories in the Reich, accusations of harmful magic predominated. With the trials of 1639, heresy, blasphemy, copulation with the Devil, and participation in the witches' Sabbath became dominant. Some Silesian local authorities, primarily the *Landeshauptmann* of Neisse, were responsible for promoting these witchcraft trials. Because the majority of the judges had no juridical training, they sought legal advice from the university jurists (*Schöppenstuhle*) of Breslau (Wrocław) and Löwenberg (Lwówek Śląski). The latter were notorious for their hard attitude; sometimes, in order to get a recommendation for an execution, local judges consciously went first to Breslau and then to Löwenberg. Occasionally, they even sought advice outside Silesia, at the *Schöppenstuhl* of Frankfurt an der Oder, Leipzig, or Wittenberg. However, Bohemia's appellate court, the Chamber of Appeals in Prague (not created until the 1680s), was consulted only in a few cases. Appeals to the emperor came primarily from husbands of prisoners, not necessarily to obtain the release of their wives but rather to restore their family's honor and sometimes their goods.

In Silesia, 444 single trials for witchcraft, resulting in 593 executions, can be proved; only 111 defendants escaped this fate, often after heavy torture. The fate of another 246 who were arrested remains unknown; most may have been executed (Lambrecht 1995, 345–346). With 40,000 square kilometers, Silesia was about as large as the current *Land* (state) of Bavaria (38,000 square kilometers), where 671 trials with 717 executions took place (Behringer 1988, 40–41). Over 90 percent of the victims were female. The majority of the 317 victims were killed during six waves of 20 or more victims between 1606 and 1669. During the trials at Neisse in 1651, almost one-fourth of the people condemned whose ages are known were children under fifteen; two-thirds of these 21 were under six years of age, including newborns and toddlers (Lambrecht 1995, 169, 404).

Although many victims were elderly poor women, several also came from a group of rich clothing merchants. This mainly Protestant group, which kept important positions within local government, stubbornly opposed the Counter-Reformation their Habsburg rulers enforced. These victims were affected not only by the trials but also by the confiscations, despite the fact that they were forbidden in such cases by the Carolina Code.

In seventeenth-century Silesia, the shift of persecution waves from west to east is remarkable: The trials at

Freiwaldau, together with those at Neisse, in 1622 produced the first expanding chain of accusations (*Besagungen*). For these trials, the exact number of victims is unknown, and traditional charges of harmful magic remain in the foreground. During the second wave, between 1639 and 1641, which principally affected the city of Neisse (Silesia's second-largest city) and its area, this was no longer the case. Only twenty-seven executions can be proved, but the number of victims must have been substantially higher. Moreover, this wave created an almost unique phenomenon, known otherwise only in Franconia: use of the witch furnace. Despite initial resistance from craftsmen in Neisse, the bishop of Breslau, Balthasar Liesch of Hornau, desiring to lower costs and accelerate the executions, ordered the building of such a furnace. Its form probably corresponded to a baking oven made from clay bricks. The witches were placed into the furnace, bound to chairs, in order to be burned.

The Swedish occupation of Neisse in 1642, combined with the authorities' resolve, brought the witch hunt to an almost complete end; however, a new outbreak of witch hunting followed Sweden's withdrawal in 1651. During the largest Silesian witch hunt, lasting from February 1651 until March 1652, probably more than 250 persons were executed. This time, it was primarily the environs of Neisse that were affected, particularly Freiwaldau (Jeseník) and Zuckmantel (Zlaté Hory). The wave began with a confession by an eight-year-old boy. Spreading from the region around Neisse, relatives of the witches were arrested as far away as Poland, Prague, and other parts of Bohemia. Owing to further confessions, forced by torture, but above all to the unbroken will of *Landeshauptmann* von Hoditz, which the bishop of Breslau slowed but could never stop, these trials finally ended in March 1652 after having caused enormous damage. Not just the high number of victims but especially the burning of pregnant women as well as children under six years of age and even babies was a singularly ghastly procedure, as Hoditz himself noted. Afterward, only isolated executions marked the second half of the seventeenth century. Witch hunting ended at Neisse in 1715 when a woman suspect was sent to the lunatic asylum.

The other major witch hunt occurred in Lower Silesia's Grünberg and the surrounding villages in the principality of Glogau, reaching its high point between 1663 and 1665 with over seventy executions. In this area, unlike in Neisse where witchcraft trials were led primarily by the *Landeshauptmann*, the trials were promoted by local landlords with "blood jurisdiction" (High Jurisdiction, the right to administer justice over serious crimes) who could therefore conduct trials on their own; they sometimes consulted the jurists of Löwenberg, well known for their harsh attitudes.

Almost parallel with activities in Neisse, further witch hunts took place in Jägerndorf, now given to the Catholic house of Liechtenstein, in 1638, between 1653 and 1654, and in 1662; they claimed at least twenty-five lives. There, unlike in Neisse, the *Landeshauptmann* tried to stop the trials, particularly during the largest wave from 1653 to 1654, while the landlord, Karl Eusebius of Liechtenstein, was interested in the executions. He wanted to use witchcraft trials both to secure his rule over this formerly Protestant territory and to demonstrate his right of high jurisdiction against the *Landeshauptmann*.

Individual trials also occurred in other parts of Silesia, in German-speaking rather than Polish-speaking areas. Particularly in Oppeln-Ratibor, which was pawned from 1645 to 1666 to the Crown of Poland, a wave of trials began in 1663, increasing sharply after the Habsburgs returned and lasting until 1668. More than thirty-four victims came from Polish-speaking villages in the east of Oppeln; others came from Gleiwitz, where the official language was Czech. We should not forget that witchcraft trials in Poland could also lead to pursuits in Silesia, as can be proved for some places in Lower Silesia.

The last executions occurred at Oels (governed by a branch of the house of Württemberg) in 1701, at Schweidnitz in 1703, at Oppeln in 1725, and finally at Breslau in 1730, claiming eleven lives in all.

For most of Silesia, witchcraft was no longer a punishable crime after the Prussian occupation of 1742. In the remaining Habsburg areas of Silesia, the Theresiana finally replaced the Carolina Code. Witchcraft and superstition remained crimes, although after 1755 or 1756, physicians had to be consulted and torture was forbidden in connection with witchcraft. Until 1780, the government primarily attacked the still-widespread faith in *Wiedergänger* (revenants, dead people with material bodies who return to the world of the living); afterward, nothing connected with witchcraft was punishable in Austrian Silesia.

SIMON, JORDAN (1719–1776)

Simon was known for his attack on beliefs in witchcraft and for his involvement in the Bavarian War of the Witches. Although Jordan Simon was mentioned in most biographical dictionaries around 1800, his biography remains patchy. Born in Neustadt an der Saale, a subject of the prince-bishop of Würzburg, Albanus Simon (his birth name) joined the Augustinian Hermits, received his monastic name of Jordan, and was sent to their monastery at Mainz in 1737 to study philosophy and theology. In 1742, after being consecrated a priest, he became professor of philosophy at Constance. Dissatisfied with monastic life, he left his convent that very year, traveling through Italy, France, Spain, the Netherlands, and parts of Russia. According to later accounts, Simon was particularly impressed by the works of enlightened Italian theologians such as Ludovico Muratori or philosophers such as Scipione Maffei (Strüber 1930, 28–30). In 1745, Simon returned to Germany, where he was named parish priest at Erfurt after taking his doctoral degree in theology at the local university; he subsequently became professor of theology there. He moved to Würzburg after quarreling with the prince-archbishop of Mainz, but after that man's death, Simon returned to teach canon law in Erfurt, where he published mainly between 1755 and 1759.

Although supposedly forced to flee once more because of quarrels and an alleged fraud, Simon, according to printed sermons, preached again at Erfurt in 1763 and 1766. Between 1760 and 1771, when he lived in nearby Münnerstadt, most of his works were published at Augsburg or Würzburg, although others were still printed at Erfurt as well as Munich, Ingolstadt, Frankfurt, and Leipzig. From 1772, Simon served as professor at the University of Prague and as councillor to the king of Bohemia, the enlightened Emperor Joseph II.

Contemporary biographers listed more than fifty publications by Simon, including a textbook for learning Italian (Erfurt, 1755), numerous Latin dissertations, and several translations from French. *A Moral Philosophy*, taken from the enlightened Italian theologian Muratori (Würzburg, 1764), indicated that Simon had embarked on the difficult business of Catholic enlightenment. However, many other publications—such as booklets on the life of Augustine, his *Refutation of Materialism* (separate editions at Augsburg and Würzburg, 1761), an apology for the veneration of saints (Augsburg, 1768), and his defenses of

Catholicism against libertines including Jean-Jacques Rousseau, Voltaire, and their followers (Augsburg, 1772) and against Epicurean philosophy (Würzburg, 1772)—clearly demonstrated the limits of toleration on his part. Simon reportedly published on the 1749 Würzburg witchcraft trial (Strüber 1930, 144, 204), but no traces of this work have survived.

One reason for Simon's quarrels with the prince-archbishops of Mainz may have been his position on witchcraft. Under the pseudonym Ardoino Ubbidente dell' OSA (*Ardoino* was an anagram of Iordano [Jordan], *OSA* an abbreviation of *Ordo Sancti Augustini* [Order of St. Augustine]), he published his first full-fledged attack on witch beliefs at Würzburg in 1761: *Das grosse Welt-betrügende Nichts oder die heutige Hexerey- und Zauberkunst* (The Great World Deceiving Nothing, or Today's Art of Witchcraft and Sorcery). Five years later, he published an updated version at Frankfurt, entitled *Die Nichtigkeit der Hexerey und Zauberkunst* (The Inanity of Witchcraft and Sorcery), developing his ideas for almost 600 pages.

Coincidentally, the Bavarian War of the Witches, one of the major debates of Catholic enlightenment in Europe, began the same year. Pushed by her son Joseph II, Empress Maria Theresa published a decree on witchcraft in November 1766, designed to terminate the endless series of witchcraft trials in Hungary; Jordan Simon immediately published a commented version of this edict at Munich. Its first 128 pages assailed Angelus März (1727–1784), another Augustinian from Munich. In December 1766, März had attacked an enlightened Theatine, Ferdinand Sterzinger, who had tried to terminate any attempt at further witchcraft trials in October. The second part of Simon's version was a reprint of the 16-page Austrian decree. In a third part, Simon spent 154 pages refuting the arguments of those who defended belief in witchcraft, abundantly paraphrasing his previous publications as well as those of such Italian luminaries as Maffei or Muratori.

Contemporaries considered Simon a vital contributor to the Bavarian War of the Witches; at least, he was mentioned several times in the local newspaper (*Churbayrisches Intelligenzblatt*) in July and August 1767. In his refutation of Jordan, März rightly pointed out that the royal decree had not categorically denied the existence of witchcraft but merely tried to prevent further local trials. However, Simon (1767, 237–238) maintained his idea that the witches' confessions were exclusively a product of torture and of Inquisition trials. He thus touched the core issue of the Catholic Church's guilt. Simon said, more articulately than Sterzinger or Joseph II, that *all* convicted witches were innocent.

After Simon's contribution, Bavarian luminaries changed their strategy and began ridiculing their opponents. It is unclear whether Simon authored two further small publications that contained stories of

witchcraft. In one, a pair of trousers flapping in the wind scared local people. The mayor imprisoned the trousers, and some monks exorcised them, until a carpenter reached the town hall and demanded his trousers back.

SIMON MAGUS

Simon Magus, also known as Simon the magician, possibly a Samaritan by nationality, makes his first appearance in Acts 8.9–24. There, we are told that he had acquired a great popular reputation as someone who either possessed divine power or could mediate with it. When Peter and John went to Samaria and began baptizing people, Simon took this to be a special technique for transmitting a power that could work miracles, and he offered to buy their secret from them (hence the later term *simony*, referring to the sale of or traffic in spiritual things). The Apostles sternly rejected his offer and urged him to pray for forgiveness.

Simon then disappeared from the canonical Bible, but in the apocryphal *Passion of the Apostles Peter and Paul*, he undertook a magical contest with St. Peter in the presence of the Emperor Nero. The emperor was impressed that Simon had been credited with resurrecting a man who had been beheaded, but on being challenged to read Peter's thoughts and secret conversation with Nero, Simon became angry and created the illusion of several big dogs that, on his instructions, bound forward with the intention of eating Peter. Peter, however, blessed them, and they disappeared. Then, Simon said he would fly up to heaven on a particular day. So Nero had a tall tower built, and Simon launched himself off the top and began to fly. But Peter saw that he is being borne up by demons and ordered them to let him fall. This they did, and Simon crashed to his death on the Sacred Way in the center of Rome.

Other accounts of Simon's magical abilities were given in the *Acts of Peter*, with further details, including his apparent creation of a human being by combining a body of air with the soul of a murdered boy, appearing in the *Clementine Recognitions* and *Homilies*, where we also hear about Simon's heretical teaching, which seemed heavily influenced by Gnostic theology. Not surprisingly, perhaps, a religious sect (the Simonians) based on his person and his doctrines was active for a while, because the *Acts of Peter* told us that on a certain occasion, Simon flew over one of the gates of Rome in a shining cloud and people worshipped him as God or Christ. According to the sixteenth-century skeptic Johann Weyer, in *De praestigiiis daemonum* (On the Tricks of Devils, 1563, book 2, chap. 3), Simon was a seedbed of all kinds of heresies, a suggestion he probably picked up from the Church Father Irenaeus.

But usually, Simon has been depicted as a blasphemous rival to Jesus, working his wonders with satanic help, wonders that were, in fact, merely clever illusions. The details afforded by the apocryphal writings were further expanded during the Middle Ages. The fifth- to sixth-century *Acts of Saint Nero and Saint Achilleus*, the later *Golden Legend* of Jacobus da Voragine, and the thirteenth-century Dominican John of Mailly all elaborated on an incident (also illustrated in several pieces of medieval art) when Simon tied a huge mastiff to a gate with the intention that it would devour Peter, who released the dog without being harmed. The more spectacular business of Simon's magical flight was used by the fourteenth-century St. Vincent Ferrer to underline the difference between the genuine miracles worked by St. Peter and the illusory, demon-based magic of Simon, which led only to spiritual and physical destruction, as witnessed by his falling to his death.

Simon thus represents type of arrogant magician aspiring to be God but reliant upon demonic help to create extraordinary illusions in the eyes of the beholders. At a stroke, therefore, he could be and was used to

criticize and condemn both ritual magicians and, by implication, the workers of that simpler but malevolent magic known as witchcraft.

ŠINDELÁŘ, BEDŘICH (1917–1996)

A Czech Marxist historian and witchcraft specialist, Šindelář wrote two monographs and several studies treating the persecution of witchcraft in both Habsburg central Europe (Bohemia, Moravia, and Silesia) and France. Šindelář's research spread across four other fields as well: Czech labor movements from 1860 to 1930, nineteenth- and early-twentieth-century emigration from Czech lands, the political history of early modern western Europe, and eighteenth-century Freemasonry.

Born in Bosnia, he attended the University of Brno before and after World War II, reading history and German and earning his PhD in 1946 with a thesis on the history of witchcraft trials in Czech lands. He taught at Brno from 1953 until his retirement in 1990, becoming professor of history (in 1963) and serving as dean of the philosophical faculty (from 1976 to 1980). From 1952 to 1986, he was editor in chief of the *Časopis Matice moravské* (*Journal of the Moravian Association*), the oldest and most important Moravian periodical. Throughout his time as a university teacher, Šindelář never broke off his political activities as a dogmatic Communist. He took an active part in the politically motivated purges after the Communist coup d'état in Czechoslovakia in February 1948, which resulted in the dismissal of many non-Communist teachers at the University of Brno and the expulsion of hundreds of students. He played the same role during the so-called normalization following the Soviet invasion of Czechoslovakia in 1968.

As a specialist in the history of witchcraft trials, he formulated an extremely problematic, ideologically manipulative, and anti-Western interpretation of the European

witch hunt (Šindelář 1980). He maintained that Orthodox eastern Europe (particularly Russia) was not at all less civilized and less humane than western Europe because Orthodox regions had much less witchcraft persecution and far fewer trials during the late medieval and early modern periods. According to his moralizing interpretation, the Orthodox east showed "greater moderation [in persecuting witches] than western Christianity, which allowed these trials to become a terrible mass hunt and a cruel horror, making an inextinguishable blemish on the face of western European culture and civilization. Nevertheless, certain of its defenders are prone to boast that Western culture and civilization were both in the past and present . . . more humane than the East" (Šindelář 1980, 87–88). He produced one of the last but simultaneously one of the most distinctive attempts by dogmatic Marxist historiography to use the phenomenon of European witchcraft trials as a tool of anti-Western and anticlerical propaganda.

This thesis subsequently influenced the conception of his large monograph about the history of the witch hunt, published in 95,000 copies (Šindelář 1986). Besides its numerous tendentious anti-Western and anti-Catholic passages, the work neglected the results of the western European and American renaissance of witchcraft studies since 1970 the work done particularly by H. C. Erik Midelfort, William Monter, and Gerhard Schormann, who brought the work of the SS (*Schutzstaffel* [protection force]) *H-Sonderkommando* (special unit H [*Hexen*—witches]) to light in 1980. Consequently, Šindelář's monograph remains a widely read but scientifically obsolete relic of the Warsaw Pact era.

SINISTRARI, LUDOVICO MARIA (1632–1701)

Sinistrari was an Italian Franciscan demonologist and jurist. Students of witchcraft know his *De delictis et poenis* (On Crimes and Punishments, 1700), wherein Sinistrari analyzed (4.13) the concept of *daemonialitas*, or copulation between humans and incubi. In 1876, a French bibliophile, Isidore Lisieux, published a Latin manuscript entitled *Demonialitas expensa, hoc est de carnalis commixtionis hominis cum daemone possibilitate, modo, ac varietate dissertatio* (Demoniality, that is a Dissertation on the Possibility, Means, and Variety of Human Sexual Contact with Demons), attributing it to Sinistrari; Lisieux subsequently printed French and English translations of the work. In 1927, the occultist Montague Summers reworked Lisieux’s English translation as part of his program to make the major texts of witchcraft available, intellectually respectable, and, if possible, credible to a modern mass audience. (Summers claimed that incubi and succubi were probably identical with fairies, leprechauns, kobolds, and other folkloric creatures, and he characteristically declared his unhesitating belief in their existence [Summers, in Sinistrari 1989, xxxix].) Comparing the Lisieux text with two Latin manuscripts in Italian libraries, a recent Italian translation (Carena 1986) was based on a manuscript in the Biblioteca Ambrosiana of Milan (*Daemonialitas Expensa, Hoc est de Carnalis Commixtionis Hominis cum Daemone Possibilitate, Modo, Ac Varietate Dissertatio* [Demoniality, That is a Dissertation on the Possibility, Means, and variety of Human Sexual Contact with Demons]). Sinistrari apparently intended all 121 sections of *De Daemonialitate* as an entry for *De delictis* before deciding to include only the final 6, leaving the remaining 115, which developed his historical and philosophical proofs, in manuscript form (Carena 1986, 16–17).

Sinistrari’s lengthy title reflected his main contention: Incubi and succubi existed and copulated in various ways with human beings. He posited that incubi and succubi differed fundamentally from the evil demons of Judeo-Christian tradition because they were not disembodied *daemones* but *animalia* (bodies intrinsically animated by souls), just like people; they had natural bodies of an airy substance that were born and died, not the artificial bodies that Aquinas theorized for angels and demons. Incubi and succubi could be saved or damned when they died, and Jesus atoned for their sins along with our own. Therefore, “demoniality” with an incubus or succubus differed ethically from copulation with an evil demon.

Whereas demons copulated with humans in order to procure our damnation, incubi and succubi simply enjoyed sex because of their genuine corporeality. They required no pact or *maleficium* (harmful magic): Thus, demoniality was no more serious than bestiality, which degraded human nature, whereas sex with incubi or succubi exalted human nature (humans and incubi or succubi had equal spiritual dignity, but the latter had nobler bodies).

As heir to centuries of speculation on human–demon copulation, Sinistrari quoted authors from Michael Psellos (d. 1078) through Francesco Maria Guazzo, along with numerous biblical, patristic, and scholastic texts, with particular interest in the incubi St. Augustine mentioned in his *City of God*. Sinistrari’s purpose was novel: Instead of merely invoking copulation as proof of suprahuman beings, he wanted to salvage a form of copulation with them that was, if not laudable, only venially sinful.

However, Sinistrari sabotaged his revisionist program by conceding that incubi and succubi were as difficult to discover as evil demons because their airy bodies were so subtle and because, like evil demons, they normally appeared only to their paramours. Thus, persons who copulated with incubi or succubi necessarily believed they were voluntarily sinning with evil demons. Because sin was defined by intention as well as act, demonialists had to be punished exactly as witches were. Witchcraft was deplorable but legally provable; demoniality was neither.

Sinistrari’s postmodern heirs are the self-styled victims of alien abduction and the therapists who encourage them. Like Sinistrari, alien abduction enthusiasts seek to confirm corporeal, especially sexual, encounters between human beings and higher, “more spiritual” beings, yet they oppose Christian criminalization of such behavior. Indeed, proponents of alien abduction now denounce or dismiss Christianity as an irrational oppressor, superseded by an allegedly more evolved outlook offering “scientific” proof that “we are not alone” (Mack 1994, 387–422; Stephens 2002, 367–369).

SKEPTICISM

Skepticism about witchcraft can be defined as attitudes doubting the reality of some or even all of the principal crimes attributed to witches: the pact with the Devil, participation in the Sabbat, and the ability to fly and to injure others magically. Skepticism varied from moderate (questioning the reality of some components of witchcraft or simply the ability of the judicial system to detect “true” witches) to radical (denying the truth of witches’ confessions or even any possible interaction between humans and demons, though rarely denying the existence of demons). Historically, a variety of different approaches—philosophical, theological, medical, or judicial—were incorporated, often in combination, in the skeptical opinions of leading critics of witchcraft.

Skeptical views on deeds attributed to witches were expressed throughout the entire period in Europe, starting with the early tenth-century (ca. 906) Carolingian law, the *Canon Episcopi*, and continuing through the age of the witch hunts. However, it was only under the influence of Renaissance humanism and its revival of classical skepticism that critics of witchcraft objected openly and articulately to the theories of demonologists; opinions questioning the very foundations of the witch hunts do not occupy center stage until the mid-seventeenth century. The excesses of the largest witch panics, combined with the rise of Cartesian rationalism, produced irreparable cracks in the walls of belief. Thereafter, believers in witchcraft found themselves on the defensive, as skeptics gradually but irresistibly demolished the entire edifice of witchcraft theory, asserting that the witch hunters’ claims were impossible physically, unsound both philosophically and theologically, and unprovable legally.

The *Canon Episcopi*, purportedly issued by the Council of Ancyra (314), was a crucial document in the history of both belief in and criticism of witchcraft. The *Canon* distinguished harmful magic and divination, concrete and very real threats that had to be eradicated, from the deluded visions of some “wicked women” who gave themselves over to the Devil and then, “seduced by the illusions and phantasms of the demons,” believed themselves to be part of the goddess Diana’s retinue and to ride at night “upon certain beasts” for long distances. The author of the *Canon* called the women’s claims a “false opinion” because the Devil could trick the imagination of such “miserable little women” (*mulierculae*), producing visions and making them believe that such actions took place truly and corporeally (Kors and Peters 2001, 61–63). By dismissing the whole matter as an illusion, blamed on Satan’s powers over the human

intellect and the low social status of the supposed witches, the *Canon* anticipated most of the objections that skeptics would subsequently raise against the affirmations of witch hunters.

The inclusion of the *Canon Episcopi* in Gratian’s collection of canon law, or *Decretum*, around 1140 gave it widespread authority (Kors and Peters 2001, 72–77). Simultaneously, possibly under the influence of the *Decretum*, John of Salisbury, an English philosopher and prominent churchman, expressed an analogous skeptical view in his *Policraticus* (The Statesman, 1159), stressing the illusions of the witches’ experiences, which only “poor old women and the simpleminded kinds of men” could mistake for reality (Kors and Peters 2001, 77–78).

Developments in philosophy between the twelfth and the thirteenth centuries, chiefly the rediscovery of Aristotle’s works and the rise of Scholasticism, brought a heightened interest in the natural world, including the need to redefine, through purely “physical” investigations, the essential characteristics and influence of demons. Thomas Aquinas proved that demons could interfere with natural phenomena and could also create a “virtual” body and have bodily contacts with humans. His conclusions had a decisive effect on theories of witchcraft. Such was the case with the Florentine Dominican theologian Jacopo Passavanti, whose popular handbook for confessors—*Specchio della vera penitenza* (Mirror of True Penitence, ca. 1354)—mentioned some women who believed they participated in the *tregenda*, a collective night ride under the guidance of Diana or Herodias, to a place where “dishonest things” were carried out (Kors and Peters 2001, 110–111). Although Passavanti stressed that most of these things were simply delusions caused by demons, he did not completely deny the reality of the *tregenda*, because he maintained (following mainstream Scholasticism) that the Devil had the power to carry people physically from one place to another. His opinion, which supported the *Canon Episcopi*’s view of the Sabbat as an illusion while leaving room for exceptions, marked an important transition toward a less skeptical stance.

During the fifteenth century, discussions about the reality of witchcraft entered a decisive phase. Belief in the diabolical sect of the witches as a new form of heresy found complete expression first, without altogether eliminating skepticism. In fact, even fully orthodox theologians and inquisitors seldom subscribed to the witchcraft paradigm without a prior examination of its foundations, and they often rejected some of them. For example, they almost universally dismissed the witches’ ability to transform themselves (and others) into animals as a sensory illusion provoked by the Devil, because only a divine miracle could truly change the nature of creatures. Despite a general

consensus about the diabolical origin of the witches' power to harm, several key authors—Johannes Nider, among others—admitted the possibility of *fascinatio*, that is, the “natural” malefic effect of a witch’s poisonous glance on impressionable people (Lea 1957, 1: 265–272). The most controversial topics remained the reality of the witches’ Sabbat and the possibility of physical contact between demons and humans. A kind of moderate skepticism on these issues could be found among several theologians (for example, Nider, Alphonso de Spina, Martin of Arles, and Giordano of Bergamo), who agreed that such experiences were largely delusions, diabolically induced visions. However, the tone of the discussion changed sensibly over the century: A growing number of influential authors, while conceding the theoretical possibility of illusions, stressed that Sabbats and related phenomena normally took place in reality and corporeally. After 1450, the boundaries between the two opposing factions in the debate became more sharply defined. Those on one side, mostly Dominican inquisitors, tried to neutralize the *Canon Episcopi*, either by stating that present-day witches constituted a new heretical group (Jean Vinet) distinct from “sect of Diana” or by explicitly undermining the *Canon*’s authoritative status (Nicolas Jacquier). The skeptics, more heterogeneous but frequently lay jurists, upheld the *Canon*, insisting on the ability of demons to deceive human senses.

Particularly significant for its viewpoint was a work from the 1460s by an Italian jurist, Ambrogio Vignati, entitled *Quaestio unica de lamiis seu strigibus* (Investigation on Witches, part of his *Tractatus de haeresi* [Treatise on Heresies]). The author argued that most feats confessed by witches were simply impossible because the Devil’s incorporeal nature prevented him from having physical contact with humans. Furthermore, Vignati reversed mainstream legal tradition by arguing that in capital cases such as heresy, standards of proof should be higher than for other crimes: Thus, testimonies from confessed witches could not provide sufficient ground for torturing people they accused because the whole matter was delusional and therefore impossible (Lea 1957, 1: 299–301). Even a prominent Italian monk, the Florentine Guglielmo Becchi, master general of the Augustinian order, affirmed in the 1460s that demons could delude the senses and the intellect but could not interact corporeally with humans (Thorndike 1934, 4: 298–299). In 1489, an Austrian jurist, Ulrich Molitor (von Müller), discredited the Sabbat and animal metamorphoses, which he considered both impossible and delusional; however, he believed that the witches’ harmful powers were certainly real and very great, and he demanded the death sentence for those delusional women who had abandoned God for the Devil (Lea 1957, 1: 348–353). The issue acquired an important new dimension with

the publication of Symphorien Champier’s *Dialogus in magicarum artium destructionem* (Dialogue in Destruction of Magic Arts, ca. 1500), in which this French humanist physician speculated that beliefs in the reality of diabolical gatherings and the wicked deeds committed there may have resulted from a disease of the imagination, requiring a medical treatment for alleged witches (although he conceded that demons might have been responsible for the disease) (Thorndike 1941, 5: 117–118).

This debate reached its peak in the early sixteenth century, when it became a major controversy to which authors on opposing sides devoted entire works. The polemical exchange between the Franciscan Samuel de Cassini and the Dominican Vincenzo Dodo in 1505 and 1506 revolved around the theological argument of divine justice; Cassini denied that God would allow the demonic transportation of witches—possible in principle—for such wicked purposes as injuring innocent creatures. In those years, skeptics continued to use both logic and law to weaken the arguments of believers. For example, Giovanni Francesco Ponzinibio, a lawyer from Piacenza (Lombardy), composed the *Tractatus subtilis, et elegans, de lamijs, et excellentia utriusque iuris* (Subtle and Elegant Treatise on Witches and the Excellence of Both Civil and Canon Law, 1519–1520), the most articulate and systematic criticism of the belief in witchcraft of the time. Ponzinibio advocated the superiority of canon and civil law over theology, even on matters pertaining to faith. Using the *Canon Episcopi*, he also ruled out any possibility of the Sabbat, questioning the trustworthiness of the witches’ confessions as well as the testimony of their accomplices—all uncouth and wicked people, easily falling prey to the Devil’s delusions. Ponzinibio provoked a massive response from believers in witchcraft. He was vociferously opposed by a Dominican inquisitor from Pisa, Bartolomeo della Spina, author of a *Quaestio de strigibus* (An Investigation of Witches, 1523) and a *Quadruplex apologia de lamiis contra Ponzinibium* (Fourfold Defense on Witches against Ponzinibio, 1525), both of which demolished the *Canon Episcopi* as much as they confuted Ponzinibio (Zambelli 1991; Stephens 2002).

The growth of skepticism is further illustrated by Gianfrancesco Pico della Mrandola’s dialogue, *Strix* (The Witch, 1523), in which the influence of the witchcraft critics—represented by one participant, Apistius (“the Unbeliever”)—deserved an attack based on an impressive display of classical learning (Burke 1977). A significant passage from the famous Italian jurist Andrea Alciati about the reality of the Sabbat explicitly rejected the opinion of theologians, employing a wealth of classical authors as well as legal sources. Alciati questioned why one would believe that supposed witches had attended a demonic gathering if their husbands swore that they were in bed with them;

it made more sense to regard the Sabbat as wholly delusional, a vision induced by the Devil, and to consider that women who believed in it needed to be cured, not punished (*Parergon iuris* [On the Accessory of Jurisprudence], 1544, but the passage discussed dates to the early 1520s; see Lea 1957, 1: 374–376). Alciati's immense prestige added weight to his opinions, which, for the first time, combined legal considerations with medical explanations to question the theories of the witch hunters.

Interestingly enough, in these years, very few influential Neoplatonic philosophers, who advocated a learned, licit version of “natural magic,” publicly defended the so-called witches, both because they believed in the reality of demons and demonic magic and because they were trying hard to avoid accusations of dealing with the diabolical side of the supernatural world. One remarkable exception was the famous philosopher-magus and physician Heinrich Cornelius Agrippa von Nettesheim, from Cologne, who, in the draft of his *De occulta philosophia* (On Occult Philosophy, written 1509, published in 1531 and 1533), blamed the beliefs of the “witches” on senility and, in a now-lost manuscript *Adversus lamiarum inquisitores* (Against the Inquisitors of Witches) accused the Inquisition of being moved by cruelty and greed in handling witchcraft cases (Nauert 1965). It was, however, an Aristotelian philosopher, Pietro Pomponazzi, author of *De naturalium effectuum causis sive de incantationibus* (Of the Causes of Natural Effects, or of Incantations, written 1520, but not published until 1556), who first radically denied the existence of disembodied spirits (both angels and demons) and attributed even the most extraordinary phenomena to the hidden powers of nature, ruling out the possibility of magic (Zambelli 1991).

While positions as extreme as Pomponazzi's remained isolated, a more selective type of skepticism emerged during the second half of the sixteenth century among several humanist physicians, who continued to express belief in the existence of demons while dismissing most of the witches' supposed crimes as the result of a disease of the imagination. In 1557, Girolamo Cardano, a famous astrologer and mathematician with a medical degree from the University of Padua, published *De rerum varietate* (On the Variety of Things), a work that included an attempt to analyze witchcraft beliefs from a medical viewpoint. Cardano blamed the fantastic confessions of night rides and diabolical orgies on the melancholic nature of poor mountain women, who suffered from a meager diet responsible for an excess of black bile and therefore experienced hallucinations. But it was another physician, Johann Weyer, working in Cleves, who first systematically attacked the witchcraft paradigm with his massive treatise *De praestigiis daemonum* (On the Tricks of Devils,

1563), employing a variety of conceptual tools. Weyer admitted that devils may intervene physically in the world and commit horrible crimes, but he argued that they needed no human accomplices. While it was true that demonic male magicians existed and were to be punished harshly, he said, it was ridiculous to suppose that poor, old, simple women could perform supernatural operations. Their belief in such things could only be explained in medical terms as a disorder of the humors in their bodies, just as natural diseases accounted for most illnesses blamed on harmful magic. Besides using his medical competence, Weyer was also the first skeptic to draw on philological arguments to deny the scriptural foundation of witch hunting by showing that the supposedly relevant passages in the Bible did not refer to the witchcraft of his days. Finally, he used legal discourse to undermine the essence of the witches' crime—their pact with the Devil, which he showed to be juridically not binding on humans who entered it (Valente 2003).

Weyer's work enjoyed considerable editorial success, although it was attacked by a Swiss professor of medicine at Heidelberg, Thomas Erastus, with his *Repetitio disputationis de lamiis seu strigibus* (Repetition of the Disputation on Witches, 1578), and by the famous French jurist Jean Bodin, who devoted a good portion of his *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580) to its confutation. It is noteworthy, however, that certain arguments raised by Weyer—for example, the possibility that melancholy caused witches to confess imaginary crimes—were accepted even by such influential supporters of witch hunts as Peter Binsfeld, suffragan bishop of Trier and author of the *Tractatus de confessionibus maleficorum et sagarum* (Treatise on Confessions of Sorcerers and Witches, 1589) (Valente 2003).

Perhaps the most coherent and implacable sixteenth-century assault on the witch hunters' theories came from an outsider, both geographically and professionally: the English country gentleman Reginald Scot, whose *Discoverie of Witchcraft* (1584) called into question the very foundations of the belief. Scot drew upon Weyer's work in arguing for the mental illness of the self-confessed witches but surpassed him by denying the Devil any physical power. He therefore concluded that, since no human being could really inflict harm save through natural means (in which case, the crime became poisoning), witchcraft was an impossibility (Thomas 1971, 572–573). Although he had some influence on later English skeptics, Scot's position remained marginal, especially since it was based on a heterodox theology that largely reduced Satan to a metaphor for human imperfection and sinfulness (Wootton 2001).

Meanwhile, additional ammunition for those doubting the reality of witchcraft came from a new

philosophical trend of systematic skepticism, based on the recovery of the works of the ancient Greek skeptics, best expressed in the celebrated French philosopher Michel de Montaigne's *Essais* (Essays, 1580). Without addressing the issue of witchcraft in great detail, he emphasized the limited and imperfect nature of human knowledge, stressing that in matters as obscure and controversial as witchcraft, one should proceed with care and moderation, explaining the witches' actions in human rather than supernatural terms, and refrain from inflicting severe punishments. Montaigne prepared the French philosophical movement of *libertins érudits*, the intellectual avant-garde of the early seventeenth century. The movement's most relevant expression for the issue of skepticism was Gabriel Naudé's *Apologie pour les grands hommes soupçonnés de magie* (A Defense of the Great Men Suspected of Magic, 1625). Naudé did not attack the foundations of belief in witchcraft and other supernatural phenomena directly but rather insinuated his disbelief through the use of irony and mockery, and he suggested that the educated few had to take a critical stance toward "superstitions" blindly accepted by fanatics and the ignorant populace. Although confined to a very limited group of thinkers because of its atheistic implications, this attitude had a significant underground influence and resurfaced at the beginning of the Enlightenment (Popkin 1979).

By the late sixteenth century, an attitude of caution and doubt became the standard approach of the most important courts devoted to the repression of heresy in the Mediterranean: the Spanish and the Roman Inquisitions. While this attitude was already apparent in Italian witchcraft prosecutions in the late sixteenth century, the most important Spanish documents detailing this intellectual change came early in the following century. A Spanish inquisitor, Alonso de Salazar Frías, wrote sharply critical reports about a large-scale witch hunt in the Basque Country (1611–1614), blaming the authorities' imprudent support of popular credulity and condemning the procedures followed by local inquisitors; afterward, the Inquisition practically stopped prosecuting witches in Spain (Henningson 1980). The Roman Inquisition adopted analogous guidelines, the *Instructio pro formandis processibus in causis strigum, sortilegiorum et maleficiorum* (Instruction for Conducting Trial Procedures Against Witches, Sorcerers, and Evildoers, 1620s), asserting that witchcraft was difficult to verify, both because of the inconstant nature of the offenders—women—and the role played by the Devil, the master of illusions. Local inquisitors were therefore urged to proceed with extreme care in order not to exceed the limits of legal propriety (Tedeschi 1991).

This type of skepticism, aimed mostly at making judicial procedures for prosecuting witchcraft more accurate and fair, produced a sizable cluster of works

between the end of the sixteenth century and the early seventeenth century. Several came from men who had witnessed the horrors perpetrated by witch hunters in the territories of the Holy Roman Empire, including law professors (Johann Georg Goedelmann and Ernst Cothmann), Protestant ministers (Johann Matthäus Meyfart [Meyfahrt] and Johann Greve), and Jesuits (Adam Tanner, Paul Laymann, Friedrich Spee). These critics denounced the general lack of solid proof to convict or even to arrest or torture people accused of witchcraft, arguing that the nature of the crime—always difficult to ascertain because it was linked to the diabolical power to delude—required judges to weigh evidence more carefully than in other types of cases. These authors accused the courts of bad faith, inhumanity, and abuses in torturing suspected witches; such excesses, by eliciting forced confessions, falsified the criminal procedure entirely and inevitably led to condemnations of innocent people. This body of critical legal literature grew during the century, reaching its fullest maturity in the books of Christian Thomasius, professor of law at the University of Halle: *De crimine magiae* (On the Crime of Magic, 1701) and *De origine ac progressu processus inquisitorii contra sagas* (On the Origin and Continuation of the Inquisitorial Trial against Witches, 1712). Expanding on Spee's *Cautio Griminalis seu de processibus contra sagas liber* (A Warning on Criminal Justice, or A Book on Witch Trials, 1631), Thomasius expressed his firm conviction that the witches' deeds, above all participation in the Sabbat, were impossible to prove legally and thus should no longer be prosecuted (Lea 1957, vol. 2; Levack 1999).

Although limited in scope, judicial skepticism proved extremely effective in reducing—and often stopping altogether—witch persecutions in most of western Europe by the end of the seventeenth century. But changes in attitude among a large portion of European jurists and judges cannot be explained solely in terms of a shift in the prevailing legal paradigm; it clearly mirrored a more general transformation of the dominant mental outlook among educated Europeans. The root of this shift lay in their acceptance of a secularized, mechanical philosophy, which, by stressing the separation of the realms of spirit and matter, made the existence of such incorporeal "substances" as angels and demons highly problematic, thus undermining the cornerstone of Scholastic theories on witchcraft. Individual positions among the followers of the "new philosophy" were, however, varied. René Descartes never explicitly denied the existence of demons, but in his *Leviathan* (1651), the materialist Thomas Hobbes reduced supernatural phenomena to products of past ignorance and superstition; his radical interpretation of Scripture made demons into metaphors for humans' evil thoughts and intentions (Porter 1999). Similar

ideas were intrinsic to the rationalistic pantheism of Benedict (Baruch) Spinoza, a Dutch Jew banned from his Amsterdam community whose philosophy assumed the existence of only one substance of divine origin in the universe and who simply ruled out the existence of evil and therefore any possibility for supernatural events such as witchcraft (Israel 2001).

Because the rejection of the diabolical paradigm by both Hobbes and Spinoza was the consequence of a radical philosophical outlook that implicitly denied traditional conceptions of a personal deity, their ideas were generally condemned as atheistic. They nevertheless exerted a powerful influence on less extreme witchcraft critics, such as the Dutch Calvinist pastor Balthasar Bekker. In his four-volume *De Betoverde Weereld* (The World Bewitched, 1691–1693, which was soon translated into French, German, and English), Bekker launched what became, in many respects, the final onslaught on the entire belief complex related to harmful magic and satanic power. From a theological point of view, Bekker argued that witch hunters had impiously underestimated God's sense of justice and love for humankind in supposing that he allowed the Devil unlimited freedom to torment his creatures. Influenced by Descartes, Bekker believed that nature worked with uniform regularity, with which a purely spiritual devil could not interfere. Using Spinoza's devastating principles of biblical exegesis, Bekker then turned to Scripture, interpreting its passages about magic or dealings with demons as referring either to natural phenomena or to deceit and accusing believers in witchcraft of having senselessly exceeded both reason and Revelation. Bekker exemplified the new confidence of skeptics in that age, who combined the critical usage of human intellectual faculties with a new, optimistic theology to overturn centuries of demonology (Israel 2001). Pierre Bayle, the controversial French Calvinist intellectual heir to the *libertins érudits*, also helped spread a new critical approach to the issue of magic and witchcraft. His *Dictionnaire historique et critique* (Historical and Critical Dictionary, 1697) and *Réponse aux questions d'un provincial* (Answer to the Questions of a Provincial, 1703), although characteristically oblique and never openly denying the existence of witches, stressed how frequently witchcraft (and such allied beliefs as demonic possession) simply resulted from false accusations, excessive imagination, deceit, or fraud. Such ideas both reinforced and mirrored the spread of an attitude of mocking disbelief among French elites, which had already incited King Louis XIV to issue an edict in 1682 that decriminalized witchcraft de facto, reclassifying it as "pretended magic" along with sorcery and other such "superstitions" (Porter 1999; Levack 1999).

The impact of these intellectual changes on the witchcraft debate is best gauged in Great Britain, where

the principles of the "new philosophy" were widely disseminated among educated men, the "new science" made its most spectacular advances, and discussions about supernatural phenomena ranged most widely in the late seventeenth and early eighteenth centuries. In the English debate, many skeptics tended to uphold a belief in spirits, while believers used some new scientific principles to prove that the Devil could operate in the physical world. Most critics (for example, Robert Filmer, John Wagstaffe, John Webster, and Francis Hutchinson) attacked the foundations of demonology through following the traditional Protestant rejection of "popish superstitions," arguing that Catholic witchcraft theories had no basis in the Bible. While usually maintaining the possibility of supernatural events (in order to preserve Jesus's miracles from doubt), they stressed that most such occurrences were best explained in purely natural terms. They did not rule out the existence of the Devil but limited his sphere of action to the spiritual realm. Their less and less influential opponents tried to show that disbelief in witches entailed doubting everything supernatural, including the principles of Christianity, and would necessarily lead to atheism. Joseph Glanvill, a Fellow of the Royal Society who tried to prove the existence of witches on a scientific basis that would withstand the test of skepticism (*Sadducismus Triumphatus* [Sadducism Conquered], 1681), showed that adopting the new mental outlook did not automatically mean rejecting traditional theories. In fact, increasingly latitudinarian religious attitudes and rejection of fanaticism among elite Englishmen, combined with the rise of the new science, best account for the dismissal of traditional ideas about witchcraft in the space of two generations; they were replaced by the vision of a benevolent and omnipotent deity ruling a well-ordered universe in which there was no room for such absurdities. This outlook, expressed by John Locke in *The Reasonableness of Christianity* (1695), became the establishment view (Thomas 1971; Porter 1999; Clark 1997).

These changes in the mentality of educated people both in England and on the Continent opened the way for the final, radically skeptical opinions of the Enlightenment *philosophes*. In the eighteenth century, however, the atmosphere was very different: The great majority of thinkers simply excluded witches and their deeds from serious philosophical research. By 1750, skepticism with respect to supposed supernatural events reached new levels of daring with David Hume's essay "On Miracles" in his *Enquiry Concerning Human Understanding* (1748), in which he argued that all miracles, including those of Jesus, could never be demonstrated satisfactorily (Gay 1966). Hume's analysis of the psychological mechanism through which humans bring themselves to believe in clearly impossible phenomena shed a powerfully critical light on belief

in magic and witchcraft, although this last issue had already become peripheral among most advanced discussions. The Enlightenment's renewed approach to the knowledge of nature entailed the rejection of the entire occultist tradition (that is, natural magic, astrology, alchemy, and so forth) and reduced witchcraft to an antiquated belief typical of bygone ages of darkness, prejudice, and fanaticism. Voltaire tirelessly accused Christianity of fostering superstition, including its doctrines about the Devil and his human accomplices. With matchless irony, he ridiculed popular credulity, stressing that witchcraft should be beneath contempt for the state or educated people.

Witchcraft had not yet become the laughingstock of all educated elites, however; as late as 1749, a moderate Italian Enlightenment intellectual, Girolamo Tartarotti, devoted a meticulous work, *Del congresso notturno delle lammie* (On Nocturnal Gathering of Witches), to the now-outdated issue of the reality of the crime (Parinetto 1974). Tartarotti's selective skepticism, which denied witchcraft but conceded the efficacy of magic, was opposed by the most reactionary tendencies within Roman Catholicism. His book did not arouse the last significant controversy of the century, though: Around the same time, several death sentences for witchcraft were carried out in Bavaria, sparking what became known as the Bavarian War of the Witches (Behringer 1997). In this heated debate, which reached its climax between 1766 and 1767, Catholic clergy were on both sides, as enlightened authors and as traditionalists. The victory of the former, due to the climate of modernization that the reform-minded Empress Maria Theresa and her son Joseph II had created, heralded the end of witchcraft trials in the Holy Roman Empire. It also signaled the transformation of witchcraft from a source of universal concern and a hotly debated topic among leading thinkers into an object of scholarly historical analysis, disappearing from the mental horizons of both intellectual elites and political establishments.

SLANDER

Throughout much of Europe—particularly in regions where accusatory procedure endured, as in Scandinavia or the British Isles—witchcraft slander often led to witchcraft trials. Research has therefore been interested in the motives for slandering someone as a witch and also, with regard to the libeled persons suing for damages, in the chances of avoiding a witchcraft trial by filing a defamation suit.

Even though further research is necessary, especially in European regions using accusatory procedure, we can outline some conditions as well as some patterns of behavior in this regard. Robin Briggs (2002) examined the reactions of people defamed as witches in late-sixteenth- and early-seventeenth-century Lorraine. Rainer Walz (1993) undertook case studies of witchcraft persecutions in the German county of Lippe and also compared several behavior patterns. Both showed how witchcraft slanders were often used to manage conflicts in everyday life in early modern villages and towns.

TYPES OF WITCHCRAFT SLANDER

Many day-to-day conflicts provided occasions for witchcraft slander. Walz considered those practices as basic elements of behavior in economically stagnant societies with limited goods. An analysis of German witchcraft slander cases shows that enraged people often cried out words such as *zaubersche* (witch), *hure* (whore), or *dieb* (thief) one right after another. It seems such words were sometimes spoken without any intention of expressing a concrete suspicion. The defamers tried to hurt their enemies with words and to state publicly that they were evil people. In several territories of the Holy Roman Empire, struggles of honor through mutual slander can also be observed as conditional insults (Tschalkner 1997). The enemies challenged each other to continue the defamation until one of them revoked his or her offending words.

In other cases, a witchcraft slander was expressed verbally only after an evil reputation had long existed. Sometimes, several years of suspicion preceded concrete accusations of *maleficium* (harmful magic), articulated in face-to-face-situations.

Many times, witchcraft slander was reciprocally exchanged between two persons, and people often

believed that upbraiding the offender was a legitimate form of resistance. Even contemporary jurists discussed whether retorts (*retorsiones*) should be exempt from punishment. But sometimes, duels involving mutual exchanges of witchcraft slanders resulted in witchcraft trials against both parties, thus emphasizing the dangers of slander even for persons who had originally made the allegations. Knowledge of possible negative consequences led many people to control their own impulses or to prevent others from making public accusations. Of course, another reason that led people to be careful was fear of magical revenge if their enemy truly was a witch.

In conclusion, people handled witchcraft suspicions in very different ways. There were forms of spontaneous and more aggressive behavior and forms of restraining behavior. It is beyond doubt that people usually learned to be cautious, realizing that witchcraft slander could escalate out of control.

BEHAVIOR AFTER WITCHCRAFT SLANDER

For a person who had been insulted and called a witch in public, there was no foolproof way of averting a witchcraft trial. We can trace a wide range of behavior patterns in responses made to slanderous accusations. Passive toleration of witchcraft slander constituted an attempt to downplay it. Aggressive forms of behavior included threats, verbal retorts, or even physical violence. Paradoxically, either manner of response could be interpreted as affirming the original accusation: A lack of resoluteness to defend oneself implied guilt and a fear of investigation, whereas aggressive behavior gave proof of an evil character. Even opening a legal complaint of defamation was dangerous because it spread one's bad fame and provoked one's enemies to prove their allegations.

However, this does not mean that witchcraft trials were inevitable consequences of witchcraft slander. Neighbors of the warring parties assessed conflicts and the characters of the protagonists based on the rank and honor they had within their village or town. Law courts considered aspects of honor in defamation suits by obliging neighbors to testify as witnesses (Fuchs 1999). Judicial fights against witchcraft slander were undertaken in many German territories and towns and in other regions as well; for example, cases before the Church courts in England can be found as early as 1435 and as late as 1675 (Sharpe 1980, 12–14; Rushton 1982). In the Holy Roman Empire, legal acts against witchcraft slander were brought before several judicial authorities. Witchcraft slander was often handled within summary proceedings and punished with fines. More severe forms of witchcraft allegations could be brought before higher courts, including the *Reichskammergericht* (imperial chamber court), as defamation suits (*actio iniuriarum*). Most legal proceedings of this type

involved lawyers. The records of these lawsuits show that there was a chance for the plaintiffs to prove they were innocent. But further studies will have to show which legal and social requirements were necessary for filing a defamation suit and, ultimately, for succeeding in witchcraft cases. It seems significant that most defamation suits in the Saarland occurred outside—and often shortly after—periods of extensive witchcraft persecutions (Labouvie 1991, 74–78).

In the American colony of Virginia, a widow, Grace Sherwood, who had lost two defamation suits was formally tried for witchcraft in 1706. We know that she lived until 1740. Many of her predecessors were less fortunate.

SLOVAKIA

For nine centuries (from 1018 to 1918), what is today's Slovak Republic formed part of the Kingdom of Hungary. Most sorcery cases were heard in Slovakia by town courts between the sixteenth and eighteenth centuries; other cases can be found in the records of ecclesiastical courts and district courts (*župní soud*).

The first reliably proven case of burning a witch on the territory of modern Slovakia occurred in 1506 at the small town of Štítňik (Hung. *Csetnek*) in south-central Slovakia. The first witchcraft trials known directly from sources, in which no death sentences were passed, took place in 1517 in the royal town of Košice (Germ. *Kaschau*, Hung. *Kassa*) in southeastern

Slovakia. Until the mid-seventeenth century, only individual witchcraft trials can be found in Slovakian territory, among which only a handful ended with the execution of the accused: at Banská Štiavnica (Germ. *Schemnitz*, Hung. *Selmecbánya*) in 1581, at Komárno (Germ. *Kommorn*, Hung. *Komárom*) in 1589, at Bratislava (Germ. *Pressburg*, Hung. *Pozsony*) in 1602, and at Bardejov (Hung. *Bártfa*) in 1629.

The greatest number of witchcraft trials in Slovakia took place in the town of Krupina (Germ. *Karpfen*, Hung. *Korpona*) in central Slovakia, between 1662 and 1744. At least 49 people were judged for witchcraft (maleficent sorcery), and at least 42 of them (almost all women) were executed, sometimes in large clusters: specifically, 6 persons in 1662 and 14 more in 1675. Another mass witch process was held in 1691 in the royal town of Šamorín (Germ. *Sommerein*, Hung. *Somorja*) in southern Slovakia. According to the record, 21 women were judged for sorcery; most of the sentences passed are no longer extant, but the majority of these women probably were not sentenced to death.

Slovakia's last witchcraft executions took place in the 1740s—involving 3 women at Krupina in 1741 and individual women at Trenčín (Hung. *Trenčsén*) in 1742 and 1745. The last known witchcraft trial in Slovakia was held in 1747 against Countess Susanna Esterházy, who was finally freed by the district court.

With the exception of the witch hunt at Krupina (Matjánová and Majtán 1970), the history of witchcraft persecution in Slovakia has not been systematically researched. One cause, among others, is that the sources describing witchcraft trials were written, depending on the place and time, in four languages (Latin, German, Hungarian, and the local Slavonic dialect overlaid by Czech). The number of victims currently known from sources in the territory of present-day Slovakia is approximately 150–250, most of whom were executed. Given the substantial losses of source material (particularly from the sixteenth century), the actual number of victims of the witch hunt in Slovakia between the sixteenth and eighteenth centuries could have been twice as high.

SLOVENIA

Like its Habsburg-ruled neighbors in modern Austria or Croatia, present-day Slovenia first experienced witchcraft trials in the mid-sixteenth century. The trials reached their peak between 1660 and 1700 and lasted deep into the eighteenth century. According to the documentary evidence, a total of 495 people were tried for witchcraft in Slovenia. The records show that 265 of them were beheaded and burned for witchcraft (a few were burned alive), while only 54 received milder penalties; 41 others died in prison, and 6 succeeded in breaking out of jail. For over a fourth of these cases (131 people), the outcome of the trials remains unknown (Košir 2001, 165). Slovenian witches were overwhelmingly female. Omitting 94 cases in which a prisoner's gender is unknown, women accounted for 341 defendants, or 85 percent (Tratnik and Košir 1995, 188).

The Slovene language has two different concepts for witchcraft/witch. The first encompasses *coprnica* (sorcerer) and *coprništvo* (sorcery), more general terms indicating magic and harmful witchcraft. The second concept for witch and witchcraft includes *veščica* and *veščarija*, terms that are connected to diabolical witchcraft and can be found in the trial records. The word *veščica* (pyramid moth) conjures the images of night flights and covens. Its semantic nuances are interesting, as the word also is used for the night butterfly.

CHRONOLOGY OF SLOVENIAN TRIALS

Diabolism did not appear in Slovenia's earliest sorcery trials—in 1427 at Celje against Veronika of Desence and in 1513 at Ljubljana, in which a middle-class woman accused of sorcery with a wax doll was executed. But once the region's lay judges (*Bannrichter*) began applying the Carolina Code, the imperial criminal code of 1532 (its procedures having been adapted for Carniolan courts by a decree of Archduke Ferdinand I in 1535), witchcraft trials involving diabolism reached Slovenia at Maribor in 1546, where several people, perhaps ten, were burned for witchcraft. They were accused of raising storms and committing other evil deeds, flying in the air, and consorting with the Devil. Shortly afterward, the first Slovene printed book, a

1550 Lutheran catechism, also described Catholic rituals as witchcraft.

After four women were tried at Celje in 1579, a major witch hunt broke out at Maribor (Hrastovec and Vurberg courts), with at least twenty trials from 1580 until 1586. But from then until the mid-seventeenth century, as witchcraft trials peaked in western Europe, Slovenia had none. They revived between 1648 and 1650, when several people were tried at Gornja Radgona for practicing sorcery; soon afterward, in 1651 and 1652, a series of trials were held in the area between the Mura and Drava Rivers, beginning at the Vurberg domain but also conducted at the court in Ptuj. Witchcraft trials became even more frequent: In 1652, two women were burned at the stake for witchcraft in Škofja Loka and two others in Ribnica; stakes were also lit at three places (Ljutomer, Ormož, and Ptuj) in 1660. A year later, one judge (Lovrenc Lampertič) ordered more than twenty witches burned, over half of them at Hrastovec, six more at Gornja Radgona, and three (a mother and her two daughters) at Maribor; many others suspected of sorcery were also imprisoned. Other courts also burned women for witchcraft at Ljubljana (in 1662), Zavrč (in 1665), and Kranj (in 1669). In the 1670s, Ljutomer came first in the number of trials. In 1671, more than forty people were imprisoned on the suspicion of sorcery. In 1675 alone, the court judge Janez Wendtseisen sentenced sixteen people to death for witchcraft in Ljutomer. In 1676, a witch was again brought to trial in Škofja Loka.

In the 1670s, witchcraft trials were held before local courts Ormož, Hrastovec, Gornja Radgona, Maribor, Celje, Šoštanj, Podgrad (Šentjur pri Celju), and Poljane (Predgrad pri Kolpi). In the 1680s, further trials took place in Celje, Laško, Ljutomer, Hrastovec, Gornja Radgona, Hložce, Maribor, Borl, Slovenska Bistrica, Bizeljsko, Lož, and Snežnik. In the 1690s, trials occurred in Laško, Ljutomer, Celje, Ptuj, Ljubljana, Pobrežje ob Kolpi, Poljane (Predgrad ob Kolpi), Rupečvrh—Mehovo, and Krško; several of these places had previously been unaffected by witchcraft trials. The first major witchcraft trial in Carniola's capital, Ljubljana, started in 1691 and lasted through 1692, then resumed in 1694; overall, some thirty people were executed. Murderous hunts also began in 1691 at Poljane pri Kolpi, lasting until 1699 and producing dozens of victims.

At the beginning of the eighteenth century, a major trial was held in Krško. Stakes were still burning there in 1714 or even longer. According to some estimates, as many as forty people were burned on that occasion. This, however, was Slovenia's last major witch hunt; the Inner Austrian government became increasingly skeptical toward witch hunting after 1700. But in 1700, courts in four places (Borl, Hrastovec, Ormož, and Ribnica) sentenced people for practicing witchcraft;

Ribinca's last witch was allegedly burned at the stake in 1701, accompanied by five at Borl and one at Haloze. As late as 1711, at Kostanjevica, two women and a man were burned for witchcraft, another woman was imprisoned, and a man succeeded in fleeing.

The hunts died down slowly in the eighteenth century. After 1711, the outcomes of the trials were increasingly milder, and the penalties were usually pecuniary, for example, at Slovenske Konjice (in 1728), at Legen pri Slovenj Gradcu (in 1731), at Ortnek (in 1733), and at Ptuj (in 1740). In 1744, three people were jailed on the charges of witchcraft in Gornja Radgona. The court released them in September 1744, but the local authorities in Veržej jailed them again and, with the help of the judge in Celje, reopened the procedure against them. One person died in jail, and two were freed. The last witchcraft trial in Slovenia occurred one year later when the witch Margareta Kukerca was arrested at Metlika. When the peasants held her responsible for a hailstorm and demanded that the court burn her immediately, Habsburg authorities sent troops to Metlika to suppress the peasant revolt and end the trial.

SLOVENIAN MAGIC AND WITCHCRAFT

Judges accused the witches primarily of consorting with the Devil, while the majority of the peasants believed that they raised hailstorms. In their decisions, the judges relied on the 1532 imperial criminal code and the 1535 provincial laws for Carniola, both of which listed witchcraft among capital crimes. The municipal statutes of the coastal towns associated witchcraft with poisoning (as, for example, in the Statute of Piran of 1307 and 1384).

For their part, the peasants believed that witches were mostly women who cast evil spells to cause bad weather. Already in 1515, at a mass meeting near Konjice, rebellious peasants drafted a complaint addressed to the emperor; its fourth point accused the authorities of freeing witches and thieves for money. Subsequently, a number of seventeenth-century records narrated the reactions of angry peasants who, after hail had destroyed their harvest, lynched or burned people with reputations for practicing witchcraft, holding them responsible for the hail.

Printed in 1689, Valkard Valvasor's *Ehre des Hertzogthums Crain* (Glory of the Duchy of Carniola) offers an important source for Slovenian witchcraft trials. This work probably played a role in shaping the images of witchcraft in Carniola. Under the circumstances, Valvasor was courageously skeptical about several points that were crucial for the conduct of mass witchcraft trials. Besides providing the usual witchcraft imagery, Valvasor also described related visions, for example, the struggles of phantoms between the so-called *vedomci* and *šentjanževci*; the former sucked the blood of children, while the latter protected them.

These apparitions are similar to those known as *kresni-ki*. Chiming of the church bells was believed to ward away storms, and if the parish priest or the parish clerk failed to do this, he was exposed to the wrath of the peasants. Valvasor narrated the case of a parish priest who had to leave his parish in order to escape from the angry peasants. He also reported that the entire Inner Carniolan village of Bočkovo had been burned in the 1670s because of witchcraft.

Accusations of witchcraft were frequent in rural areas, but they did not always end with a trial. Secular courts that were also competent for other criminal offenses conducted witchcraft trials. Most witches were not convicted individually. If and when a witchcraft trial began, the judge, on the basis of forced confessions, might expand the indictment to include numerous other people, especially if he believed in a witch conspiracy. Such a trial could result in dozens of victims. The single trials were frequently instigated by the peasants' accusations, while the major trials were invariably driven by the judges' zeal. Such zealous witch hunters included Volk Lovrenc Lampertič and Jan ez Wendtseisen, particularly prominent in Styria, and Dr. Jan ez Jurij Hočev ar, who marked a decade of trials (from 1695 to 1705) with his cruel judgments in Carniola. Hočev ar was a talented jurist and a knowledgeable man, a composer, an astronomer, and a member of both Ljubljana academies.

Slovenian witchcraft trials included many typical features, including torture. Usually, they also looked for the Devil's mark on the bodies of the accused, although there is no evidence that the swimming test (the cold water ordeal) was used in Slovenia. The questions that the accused had to answer under torture were formulated in such a way that the expected answers were clearly suggested. The confessions thus extracted were so uniform that the trials conducted by the same judges were often almost identical. The prime accusation was always the same—consorting with the Devil at a secret gathering, which was allegedly held at a crossroads or at witch mountains (Slivnica, Klek, Donačka Gora, or Rogaška Gora, Grintavec).

Whenever the trials multiplied, their costs soared accordingly. For this reason, feudal lords were rarely enthusiastic about such trials. Catherine Elisabeth, Countess of Auersperg (Turjak) and the owner of the manor court of Krško, ran into serious financial trouble in the early eighteenth century because of the high number of witchcraft trials held before that court. The owners of the Ljutomer court encountered similar problems. In several trials during the eighteenth-century and occasionally even earlier, certain skeptical judges pronounced milder penalties and even acquittals, primarily in cases that concerned fortunetelling and minor sorcery rather than diabolical witchcraft.

SOCIAL AND ECONOMIC STATUS OF WITCHES

Were witches characterized by specific social and economic traits? Before sketching any sociological classification, it seems necessary to state that any such

attempt is hampered by three factors. First, sources on the matter are extremely vague. It is rare for the occupation of a defendant to be recorded. Second, in many countries, women amounted to some 80 or 90 percent of the accused people, and identifying their specific roles in past agrarian societies becomes anachronistic. And third, any typological reconstruction is doomed to collapse in regard to large witch panics, when hundreds of suspects became involved. When we look at the almost random pieces of information available on this issue, we are reminded of the dodge of early modern cartographers, who filled in the blank spaces on their maps with *hic sunt leones* (here there be lions). Our European map is indeed full of lions, and it is likely to remain so. Only a few very tentative conclusions seem possible.

OLD AGE AND MARITAL STATUS

In many individual witchcraft trials that went on throughout the sixteenth and seventeenth centuries, accusations were first aimed at stereotypical "witches": old women, often isolated widows. All statistics about ages should be reconciled with the fact that people tried as witches had often been suspected for many years, even decades, and advanced age certainly helps account for the overrepresentation of widows among accused witches. Large samples from western Europe show almost one-third of suspected witches were widows: some 37 percent of 582 cases from Switzerland, France, and Essex (Monter 1976); 30 percent from a larger sample of 1,019 women from Basel, Geneva, Scotland, Salem, and Sweden (Levack 1995), versus 56.8 percent married and 13 percent single. H. C. Erik Midelfort (1972) suggested that the very factor explaining the vulnerability of widows to accusations was probably the fact that they had lost the protection of their husbands. But most women accused as witches were married, and the role of their husbands in the trials was ambiguous. Robin Briggs (2002) pointed out that when men actively defended their wives, it reduced the chance that their cases would go to court. In Tuscany, as well as Lorraine, some husbands obviously tried to obstruct the trials—but a few apparently encouraged their prosecution.

OLD WOMEN, MATERNAL CARE, AND HEALERS

Were these postmenopausal women a risky category? A few late-seventeenth-century Augsburg witchcraft trials resulted from accusations made by newly delivered mothers against older, poorer, often widowed postmenopausal women who had helped them as lying-in maids, charging them with harming the mothers, their babies, or both. In such cases, envy explains the *maleficium* (harmful magic): Relying on Melanie Klein's psychoanalytic assumptions, Lyndal Roper (1994, 214) maintained that "circumstances conspired to make the lying-in maid appear a likely sufferer from envy and

Ein weis in heyligert sein geyst / Glaub noch mein wort-Cantore frort

A female witch tempts two noblemen, as the sword and caparisoned horse indicate. While most accused witches were poor, but not the worst off, some were from upper social groups, especially in Germany. (Anonymous, Eine Zauberein versucht zwei Männer, 1531. From Hexen: Analysen, Quellen, Dokumente. Directmedia Publishing GmbH: Berlin, 2003)

hatred.” Should the role of these helping women and, to a greater extent, the position of midwives be considered closely associated with the crime of witchcraft because of the social organization of birthing practices? Contemporary demonologists, beginning with Heinrich Kramer (*Malleus Maleficarum* [The Hammer of Witches], 1486), created the myth of the midwife-witch. Premature claims that a majority of women accused of witchcraft were “lay healers serving the peasant populations and their repression marks one of the opening struggles in the suppression of women as healer” (Ehrenreich and English 1974, 4) have been demolished by more careful research showing that no statistical evidence supports them (Harley 1990).

But there were some geographic variations. In England, only 1 percent of people accused of witchcraft were midwives; however, in late-sixteenth- and early-seventeenth-century Aragon, an amazing 23

percent of women tried for witchcraft in episcopal courts appear to have been midwives (Tausiet 1996, 259). But in another Mediterranean region, the Siennese state, just 4 of the 229 women accused of infanticide in the same period were midwives of well-established local reputation.

Throughout Europe, healers and cunning folk featured generally among the most persecuted people, but their numbers are difficult to determine, and their gender distribution would probably show considerable regional variations. Being a cunning man or woman was never a full-time profession, and our available information is too uneven to detect many meaningful patterns for this widely practiced second occupation—with the possible exception of Catholic clerics, who seem very well represented until the mid-seventeenth century, at least in France, Spain, and Italy.

MATERIAL CONDITIONS AND PROFESSIONS

Contemporary observers often touched directly on the theme of the economic conditions of accused people. In Massachusetts, Rev. Josiah Cotton summarized a century-old common wisdom by observing that witchcraft charges seemed to fall disproportionately “on the poor.” As a matter of statistical probability, members of the underclass (persons at the bottom of the social scale) were many times more likely to be accused and persecuted than their counterparts at the top (Demos 1982, 285–292). It is tempting to generalize these New England findings and to project them back to Europe.

However, the bulk of available evidence suggests that witches were not usually the “poorest of the poor”—destitute, marginal members of their local village communities; most of them resembled their neighbors and were generally well integrated into communal life. In Scotland, where over 1,000 witches were executed from 1560 to 1700, we know that only 3 witches in 20 were male. Many of the Scottish male witches had close links (usually by marriage) to recognized female witches; others were folk healers; still others were notorious criminals (Goodare 1998, 290). This was a peasant society; few Scots lived in towns. Here, the average witch was overwhelmingly a middle-aged or elderly woman, the wife or widow of a tenant farmer, toward the bottom of the social and economic ladder but nevertheless from the settled rather than the vagabond or outcast poor.

ENGLAND

The impression given by Scotland differs slightly from the English scene, where it is clear that witches were even more exclusively women (93 percent versus 85 percent in Scotland) and even further down the social ladder, being wives or widows of wage laborers, or on the poor law, or beggars. But not all of the 102 women executed for witchcraft at the Home Circuit assizes between 1563 and 1682 were older or poorer than those who accused them. There were some marked

regional variations. In the southeastern county of Kent, the social background to witchcraft accusations frequently differed from that of Alan Macfarlane's county of Essex. In Kent, many accused women were well integrated in local society; denial of alms is entirely absent, and Macfarlane's paradigm (whereby charity denied a neighbor, followed by misfortune occurring in the household of the person who refused to offer charity, resulted in the neighbor being blamed for the misfortune and possibly accused formally of witchcraft) is even reversed in some disputes between neighbors (Gaskill 1996). In Sussex, accuser and accused were similar in terms of power: "The rare accusations of witchcraft seem to express ongoing competition rather than guilt or anger" (Herrup 1987, 33). The same dynamic of local, internecine competition emerged clearly in early seventeenth-century Rye, a small coastal town in economic decline and disrupted by internal factions. Cases from northern England suggest that witchcraft accusations could polarize communities along preexisting fault lines, as happened in Yorkshire (Sharpe 1997).

GERMANY

In Germany, where most witchcraft trials occurred, recent research largely confirmed Midelfort's findings: During major panics, the traditional stereotype of the old woman witch tended to dissolve, and people accused of witchcraft even tended to be somewhat wealthier than the average citizen. Bavaria in 1590 could serve as an early model (Behringer 1997). The social expansion of the persecution occurred in the third cycle of arrests, following two collective executions. As denunciations increased, the social standing of those arrested improved: Persecutions were no longer confined to outsiders and those near the bottom of the social scale but now affected the urban and rural middle class. Denunciations struck especially hard at those in trades and occupations that had some associations with magical practices (midwives, cowherds, apothecaries) or were in contact with foodstuffs (tavern keepers, butchers, bakers). As the persecution progressed, the witch hunters targeted their enemies among members of local elites, persons of wealth from patrician families. These social dynamics were repeated whenever persecutions were held, often up to the final batches of suspects in the 1630s.

In a general way, German statistics suggest that richer peasants provided a larger share of accused witches by the mid-seventeenth century. In the Saarland, accused female witches were predominantly poor: Some 43 percent of them owned no property or were beggars; the rest were evenly divided between villagers of very slender means and members of lower-middle-class households possessing modest incomes (Labouvie 1991). But not far away—and slightly later—almost 40

percent of accused witches (9 of 24) in the village of Winnigen between 1640 and 1660 came from the top social spectrum.

In Protestant northern Germany, a social analysis of the pattern of accusations made by village committees in the county of Lippe has demonstrated that most of the charges were against community members with relatively high local status, brought by members of middling status to resolve internal village conflicts (Walz 1993). As in parts of England, witchcraft accusations could arise between households of relatively equal social and economic status out of competition for resources and influence within their communities. Whenever local elites got deeply involved in witchcraft accusations, their actions seem motivated by vested interests. Therefore, they could be seen as witches endangering traditional communal norms.

Throughout the francophone Jura region, well-off people seem far less frequently represented among accused witches than were their peers in southwestern Germany or in Alsace. Even its most extensive panics did not resemble German panics: During Geneva's 1571–1572 plague-spreading and witchcraft panic, half of the hundred suspects were unskilled laborers or their wives, while the rest came from artisan families—but local elites were conspicuously absent (Monter 1976).

FRANCE

We know little about the social and economic status of female witches in France, partly because no large clusters of them have been uncovered in French archives. However, in northern France, men were unusually prominent in witchcraft trials (as in eastern peripheral areas such as Finland or Russia). According to William Monter (2002), two unusually prominent occupational groups emerge from the sources: clerics and shepherds. From Aix (in 1610) to Louviers (in 1647), a series of well-publicized scandals across France involving the demonic possessions of groups of nuns ended with trials and executions of priests. Louis Gaufridy and Urbain Grandier, the priestly magicians executed at Aix and Loudun, were only the best known among a good number of French priests condemned for witchcraft and black magic. At least fourteen French clerics were executed for sorcery before Grandier was burned; afterward, two more priests were executed for illicit magic in Brittany and another in Normandy in the 1640s.

Shepherds formed by far the largest group of France's male witches. They were accused of various acts of poisoning and sacrilege (many stole Hosts from churches to use in protecting their flocks). The largest cluster came from Normandy, a cheese-producing region: More than sixty shepherds were tried for witchcraft by the *Parlement* (sovereign judicial court) of Rouen between 1590 and 1635; over twenty of them and two of their wives were executed. Unlike the women

accused of witchcraft, shepherds were almost never charged with putting spells on people; instead, they were said to employ magical paraphernalia ranging from stolen Eucharists to toad venom in order to protect (or harm) livestock. This tradition had a long life: The *Parlement* of Normandy sentenced six more shepherds to death between 1684 and 1700, and the supposedly enlightened *Parlement* of Paris kept pace with five convictions between 1687 and 1691. As late as 1713, three shepherds were executed at Rouen for stealing Hosts, a practice that had begun in 1540 (Monter 2002, 40–43).

NETHERLANDS, NORTHERN

Before the early-seventeenth-century moderation in prosecuting witches, the Netherlands was affected by small hunts, and scattered sociological data suggest patterns similar to those in southeastern England. For instance, three villages in Peelland (northern Brabant) were hit by a series of witchcraft trials, where we have reliable sociological information about the twenty-three persons arrested (Caspers 1991). All were stable residents, belonging to all social classes; the fifteen women (all sentenced to death) included some well-off villagers. A feud that took place in the little rural community of Nijkerk in 1550 and involved people of substance showed accusations of witchcraft being manipulated to settle conflicts over property rights or social status (Wardt 1991).

SPAIN

A large occupational spectrum of an agrarian, semi-mountainous society emerges from the scarce sociological information related to the wild Basque craze in which some 2,000 witches were examined. From upper Aragon, some scattered but interesting data are available. Out of 140 people accused (83 males, 57 females), 59 men charged with sorcery had a second profession and 41 were unmarried (including 23 clerics) (Gari Lacruz 1991, 220–223). Interestingly, a disproportion has been noticed between the main occupational groups of the area (shepherds and peasants) and the fragmentation of the thirty-two occupations reported. In most of Spain, not social class but ethnicity and religion influenced the choice of suspected witches. Being a foreigner (especially a French Protestant) was an additional aggravating circumstance in Catalonia. Elsewhere in Spain, being a Morisco (before the 1609–1614 expulsion) or a Gypsy was a worsening factor. No sociological data exist for the dozens of women killed in Spain's worst witch hunt in Catalonia between 1618 and 1620. In the Canary Islands, male and female slaves comprised the most numerous category of people accused of sorcery, followed by artisans and sellers. Portugal seems to have been the country where the least is known about the occupations of cunning folk and healers.

ITALY

A cluster of trials carried out between 1611 and 1615 by an itinerant court in the sub-Alpine valley of Non involved 140 suspected witches (120 women and 20 men). Unfortunately, the socioeconomic evidence for drawing a profile of these witches is limited to 1 woman who was surely a healer and to 6 men who were soothsayers (*crivellatori*). In the Sienese state, few among the 229 Sienese malefic witches (all females) were very old, unmarried, widows, or beggars. Out of 36 cases with adequate information, spinning turns out—unsurprisingly—to have been the most common occupation (6 cases), apart from the prostitutes residing in Siena or larger villages (10 cases). In Malta, mainly male Muslim slaves residing in the harbor area practiced witchcraft.

PERIPHERIES

In Denmark, for lack of sources, the socioeconomic position of witches in rural areas is hard to evaluate. In the towns of Elsinore in Seeland and Ribe in southern Jutland in the first half of the seventeenth century, a clear pattern emerges: It was the moderately poor who accused the absolute poor. Some trials can be seen as an expression of a struggle to avert the slide from poverty into destitution. In Sweden, the status of witches between 1668 and 1676 shows that none lived on the margin or outside the community. Dalarna's witches stood squarely in the middle rank of parish taxpayers. In Finland, peasants and burghers were prominent in the available statistics. In Hungary in a polarized community, it was always the more prosperous witch that accused the weaker one. There is little available evidence about the socioeconomic status of witches in Poland.

RUSSIA

In seventeenth-century Moscow and a few provincial centers, there were some 100 cases concerning magic. According to W. F. Ryan (1998, 69), a “clear pattern of the status of the person accused cannot be discerned, apart from the fact that about half were peasants; of the non-peasant component there is a noticeable presence of persons connected with church or state, and a prominent number of foreigners.”

MOBILE GROUPS

Were witches socially oppressed rebels fighting against a feudal society? In a way, Jules Michelet's great historical imagination opened the way for future sociological interpretation, either because some connections might exist between peasant uprisings and witch hunts or because diabolic witch belief served as the mythical counterpart of popular revolts.

One of the recurrent themes of witchcraft persecutions was that these conflicts rarely opposed people at opposite extremes of the social spectrum. Social

mobility, more often than not, appeared as a threat to traditional values. Would not defining mobile people as witches be a way to defend society itself? In his reflections on New England witchcraft, the Reverend Cotton Mather blamed the refusal of men to accept their own social condition: "It is not irrational to ascribe the late stupendous growth of witches among us, partly to the bitter *discontents* which affliction and poverty has filled us with" (Mather, quoted in Demos 1982, 177); he also referred to social conflict and human envy in his *Memorable Providences Relating to Witchcraft and Possessions*: "when persons, through discontent at their *poverty* or at their *misery*, shall be always murmuring and repining at the providence of God, the Devils do then invited them to an agreement ... [and d]ownright *witchcraft* is the upshot of it" (Mather, quoted in Boyer and Nissenbaum 1974, 208).

Research based on social conflicts within Salem village has shown that families in decline resorted to witchcraft accusations: a class war caused by social and economic mobility. Can this interpretation be projected backward on the European stage? In fact, the hardening of the social and economic situation during the "iron century" has eventually led researchers to focus on mobile groups within villages. On close analysis, an interpretation of continental and British or Scandinavian witch hunts as expressions of social strains arising in peasant societies undergoing a crucial transformation from a self-sufficient peasantry to an agrarian and protocommmercial capitalism founders against insurmountable difficulties.

SOCIAL CONTROL

In Old Régime Europe, religion and politics, state and church were structurally linked, thus affecting the entire social system and jointly forming the central axis of both state and society. In the foreword to the 1563 Heidelberg Catechism, Elector-Palatine Frederick III stated: "Due to Our natural duty and inclination, we have recognized and undertaken to fulfil Our divinely ordained office, vocation, and governance, not only to keep peace and order, but also to maintain a disciplined, upright, and virtuous life and behaviour among our subjects, furthermore, and especially, to instruct them and bring them step by step to the righteous knowledge and fear of the Almighty and His sanctifying Word as the only basis of all virtues and obedience" (Frederick, quoted in Hsia 1996, 367). This system, which historians now call "confessionalization," was pioneered in Germany (the epicenter of witch hunting) and reached its peak during the age of the great witch hunts. However, most historians are reluctant to view these methods of social control as sufficient or even necessary explanations for the rapid acceleration of witch prosecution in the late sixteenth and early seventeenth centuries.

Both the Protestant and Catholic Reformations attempted to implement their respective programs to enforce doctrinal purity, moral control, and social discipline. Good subjects were godly Christians. Confessionalism proceeded unevenly throughout Europe and had strong regional variations, but everywhere, its campaigns for moral purity and for law and order ostracized deviants, including "masterless men," vagrants, rabble, and other marginal populations. Witches occasionally fell into such categories. In regard to the Catholic southern Netherlands, Robert Muchembled (1984) emphasized the social disciplinary effect of witchcraft trials as tools to acculturate a rural population. And in regard to Protestant Scotland, Christina Larner (2000) highlighted the witch as a threat to specific individuals, apart from the political implications of some famous cases.

Throughout Europe, from Calvinist Scotland or Lutheran Finland to the major Roman, Spanish, and Portuguese Inquisitions, confessional states provided institutional mechanisms for the widespread prosecution of unofficial (and thus forbidden) magic. A complex relationship among state, religion, gender, and magic emerged almost everywhere. In the Catholic duchy of Bavaria, a prominent feature of social legislation was a fear of propertyless people; between 1550 and 1599, Bavaria proclaimed no fewer than thirty-four decrees against beggars and rabble. A new and extremely pious

generation of Bavarian princes was looming, vividly exemplified by the "blood pact" made by Dukes Maximilian I (ruled 1597–1651) and Ferdinand Maria (ruled 1651–1679) with the Virgin of Altötting—a sort of antitype to the witches' pacts with the Devil. Such princes blamed their unworthy subjects for most kinds of misfortunes such as harvest failures and diseases, which were interpreted by contemporaries as God's punishments, and they bombarded them with laws and decrees on their morals (Behringer 1997, 107–108).

In the Sieneese New State, a 1575 apostolic visitation introduced the Medicean version of "Catholic confessionalization" (Di Simplicio 1997). Archbishops' vicars fought vigorously to domesticate their clergy and root out concubinage. A systematic policy of moral cleansing was enforced with the confinement of prostitutes to ghettos. The steady deepening of a parochial structure had a similar moral impact on villages. Systematic introduction of parish registers and the enforcement of Tridentine marriage procedures, with vigorous opposition to prenuptial copulations, clandestine marriages, and bigamy, affected the categories of thought of early modern villagers. Social disciplining of ecclesiastics was paralleled by the imposition of stricter norms to the laity. Parishioners listened as fears of witchcraft and sorcery were increasingly condemned from the pulpit. Here, the process of confessionalization implied strong support of Medicean rule, through an effective cooperation of local officials (captains of justice). The occasional cases of seventeenth-century witchcraft trials dealt with by secular officials eventually recovered by the Inquisition must be seen as signs that Sieneese agencies of social control were marching in the same direction, despite potential conflicts of jurisdiction.

SOLDAN, WILHELM GOTTLIEB (1803–1869)

The son of a Lutheran pastor in Alsfeld (Hesse), Wilhelm Soldan was a well-educated historian and language scholar (having earned a PhD in 1831). A professor after 1853, he married the daughter of a capitalist in Darmstadt, who owned both a newspaper and a chocolate factory, and belonged to the liberal faction of the Parliament of Hesse-Darmstadt. In 1861, Soldan was elected to the Parliament as a member of the Progressive Party (*Fortschrittspartei*), serving for a time as president of the House of Commons. He remained a Hessian Member of Parliament (MP) until his death.

The publication of Soldan's *Geschichte der Hexenprozesse* (History of Witch Trials, Stuttgart, 1843) revolutionized witchcraft research. In striking contrast to contemporary scholars such as Etienne-Léon de Lamothe-Langon, Jules Michelet, Jacobus Scheltema, Sir Walter Scott, or Jacob Grimm, Soldan did not investigate (or invent) fantasies but confined his presentation to straightforward historical facts, firmly based upon written sources. Soldan's was the first serious scholarly publication on the history of European witchcraft, or "witch craze" (*Hexenwahn*), as he preferred to say. With its liberal bias and the related attitude blaming both church and state for the atrocities of the witchcraft trials, Soldan embodied the rationalist approach in witchcraft research. His interpretation, which basically combined the spirit of Enlightenment with Leopold von Ranke's historical method, dominated entries in international dictionaries up to World War I and was certainly more reliable than subsequent entries written for the *Encyclopedia Britannica* by Margaret Murray.

Soldan's *Geschichte der Hexenprozesse* provoked two influential updates. The first, written by his son-in-law Heinrich Hepe (1820–1879), a professor of Protestant theology at the University of Marburg, amplified the original book with more recent findings. This edition, known as *Soldan-Hepe* (Berlin, 1880), published posthumously by Soldan's daughter Henriette Hepe, injected a strong Protestant bias, implicitly siding with the Prussian party in the German *Kulturkampf* (culture war) and supporting Chancellor Otto von Bismarck in his struggle against the Catholics. The journalist Max Bauer provided a third enlarged edition at the beginning of the twentieth century. He tried to reduce Hepe's bias and included scores of new examples, as well as referred to contemporary persecutions in Mexico and Russia, and he added a good number of illustrations. This final edition, known as *Soldan-Hepe-Bauer* (Hanau, 1912), has been reprinted up to the present day, usually without editorial comment. Although still a valuable resource, it already had fallen short of contemporary research when it was first published, because Bauer did not manage to

incorporate the more sophisticated approaches of Joseph Hansen or Sigmund Riezler.

SOMERSET WITCHES

The ample documentation for the study of witchcraft in the county of Somerset, England, for the period from 1500 to about 1900, has led it to be relatively well studied. However, most interest in the county's witches focuses on the cases investigated by Robert Hunt between 1657 and 1665. Republished in Joseph Ganvill's *Saducismus Triumphatus* (Sadducism Conquered, 1700), this material offered the most elaborate descriptions of English Sabbats and dealings with the Devil apart from those stemming from the Matthew Hopkins witch hunt in East Anglia (from 1645 to 1647).

Somerset witchcraft is documented in rich collections of both church and secular court records during the early modern period; local folklore and newspaper reports have also been studied for the late eighteenth and nineteenth centuries (Davies 1999). The sources reveal a typical English mixture of supernatural damages to crops, animals, and people (especially children) done largely by women, together with several other supernatural offenses, including a substantial number of cunning men and women offering their services and some possession-type cases. As in other parts of southwestern England, the frequency of witchcraft trials increased after the Civil War; they continued into the early eighteenth century, although all known verdicts after 1664 were acquittals. None of Somerset's trials attracted pamphlet attention, but some chapbooks and ballads report cases of possession, attacks by the Devil, or apparitions. However, Somerset gained notoriety in the late-seventeenth-century debate on witchcraft through publications by three writers from the county: Joseph Glanvill, Richard Bovet, and John Beaumont. Beaumont was a natural and civil historian from the Mendips, and in his *Historical, Physiological and Theological Treatise of Spirits* (1705), he followed Glanvill's predominant interest in spirits and apparitions rather than witchcraft. However, his Platonism led him to question whether diabolical pacts provided a necessary explanation for preternatural phenomena.

Bovet, a radical Whig, published a series of cases, mostly from his neighborhood at Wellington, in *Pandaemonium* (1684), which was consciously modeled on Glanvill's example. But Bovet was interested primarily in the work of the Devil, which he linked to idolatry, attacking popery overtly and the restored monarchy covertly. Intellectually and socially, both Beaumont and Bovet were peripheral figures compared to Glanvill.

As rector of Frome Selwood from 1662 and of Bath's abbey church from 1666, Glanvill met Robert Hunt. Hunt's notes on witchcraft cases he had encountered as a justice of the peace (JP) in Somerset between 1657 and 1665 became critical evidence for Glanvill. He dedicated his first book on the subject to Hunt, and Glanvill cited Hunt's evidence at length in his revision of *Saducismus Triumphatus*, which was published posthumously in 1681. Both men died in 1680, but they apparently had lost contact after 1665. We know that Glanvill ignored a 1667 case of possession involving Hunt's own daughter, recorded in a letter of December 1667 to a relation named William Bull, according to which one Alice Knight was forced to visit and pray for the afflicted (Bristol University Library, Special Collections, Bull Papers, DM 155, no. 103). The fate of Hunt's book of examinations is unclear. Extracts were published in 1837 (*Gentleman's Magazine*, pp. 256–257), and two other versions survive: one, previously owned by the Dorset writer William Barnes, in a contemporary hand (sold by Sotheby in November 2003, catalog L03412, "Witchcraft and the Occult," lot 343), and the other in a transcript of October 1906 (Somerset Record Office, DD/DT 28). All three versions had close similarities to Glanvill's text, but minor variations and extra details in each suggest that none was his original source, which referred to a "fairly written" version of Hunt's book of examination of witches.

We do not know why Hunt's interrogations of Somerset witches produced such sensational confessions compared to most English cases: He never commented directly on demonology, though Glanvill described Hunt as thinking critically about the meaning of the events he witnessed. Born around 1608 and educated at Cambridge and the Middle Temple, Hunt was a substantial figure in Somerset. A member of the Long Parliament, he became a royalist and only returned to public life in 1654, serving two years as sheriff. Subsequently, he was an active JP from 1657 until his death, also representing Somerset in Parliament in 1659 and Ilchester thereafter. A moderate Protestant who was hostile to Quakers, Hunt protected royalists before 1660 and parliamentarians after the Restoration. In examining for witchcraft, he worked closely with his fellow JP John Cary of Castle Cary. Clearly, Glanvill regarded Hunt as the kind of unimpeachable and respectable witness whose evidence for the reality of demonic witchcraft would carry conviction

both locally and nationally. However, Hunt and Cary were obviously challenged by higher officials who blocked the major trial developing between 1664 and 1665, involving twenty-five witches named in two covens. In the end, only Elizabeth Styles, who had been acquitted in 1636 by the assizes and allowed to bring suit against her prosecutors, was tried and found guilty. She died in jail, probably the last Somerset resident to die as a convicted witch.

SORCERY

Sorcery and witchcraft must be conceived as distinct phenomena. While sorcery exists in every culture and at all times, the concept of European witchcraft was fully developed only in the fifteenth century, emerging from trials for both heresy and sorcery. Sorcery can be defined as an attempt to control nature to produce good or evil results. The Latin word for harmful sorcery, *maleficium*, originally meant an evil or harmful deed performed through magic. Practitioners of harmful sorcery have presented a problem socially and legally to all societies that believe in the real efficacy of magical acts. Throughout the Middle Ages, sorcery was generally regarded as suspicious and often criminal. The development of the "complete" or cumulative concept of witchcraft in the late Middle Ages incorporated sorcery, and aided by widespread anxieties, this enormously increased prosecutions and executions for frequently diabolized forms of *maleficium* throughout early modern Europe.

ANTIQUITY

In the ancient Mediterranean world, magic was considered a morally neutral act that a person could undertake toward either beneficial or harmful ends. The Greco-Roman world condemned only harmful sorcery as illegal. Literary and nonliterary sources cast some light on the figure of the classical sorcerer.

In both Greek and Latin, a wide array of terms were used to denote sorcerers. In Greek, they were called *epodoi* or *epaoidoi*, as well as *goetes*, *magoi*, and *pharmakis*; their craft was called *goeteia*, *mageia*, and *pharmakeia* (magical knowledge). Each term and craft had a distinct meaning. It has been argued that *goetes* were originally shamans, who, in an ecstatic state, conveyed the spirits of the dead on their perilous journey to the other world. Another meaning for *goeteia*, as used and understood in medieval and early modern times, was the summoning up of corpses, that is, necromancy. The term *magos*, a loan word from Persian, usually referred to a type of priest. In the ancient world, sorcerers were present in cities of any size, but they were not part of a community. They represented a type of person difficult to describe in ordinary terms because they were often traveling practitioners of magic, wandering from community to community.

The Hebrew Bible is replete with sacred magic. Legend has it that sorcery stopped with the birth of Jesus, but in the first few centuries after his death, an extensive literature developed about Simon Magus, a magician and contemporary rival to the Apostle Peter. As Rome became Christian, however, an important change took place. Classical daemons (*daimones*), supernatural spirits upon whom magicians often called to perform acts of sorcery, were gradually transformed into Christian demons. While daemons were ambivalent spirits, demons were considered evil, the legions of Satan battling against the Church and all Christian society. Thus, early Church Fathers, especially St. Augustine and, later on, Thomas Aquinas, condemned any magic that involved dealing with demons, regardless of its apparent effects. This new Christian conception of magic as operating often via demonic agency produced an interesting effect on official views of practitioners of magic after Rome became Christian. In the late antique world, the sorcerer involved in the performance of *maleficium* was no longer deemed important because Satan was the real author of the evil involved. This de-emphasis on the human agency in sorcery helps explain the Church's centuries-long hesitation, verging at times on outright disinterest, in persecuting practitioners of magic.

NORSE AND CELTIC SORCERY

Apart from occasional references to very early customs by such Roman historians as Tacitus and condemnations by early medieval monks, we have few written sources about Nordic or Germanic sorcery. Most important are the Norse runic inscriptions found throughout Scandinavia, Iceland, England, and even parts of Europe where Scandinavians and Anglo-Saxons traded. We have narrative sources from the postconversion period that still reflect the customs and mentality of the pre-Christian era, the thirteenth-century

Icelandic sagas being the most important Norse literary sources. It is not always possible to ascribe precise magical intent to runic inscriptions, but sometimes, the intent is indubitable. The sagas preserved many ancient beliefs and often referred to ancient magical practices. In both, the role of sorcery was evident.

The magicians of the sagas were almost always sinister characters who had learned their magic from teachers. There is no hint that magical rituals or practices formed part of pagan Norse religion, although Christian missionaries had battled against these as the Devil's work. While the sorcerers' magic sometimes made reference to the gods, it rarely involved appeals to them. Sorcery and heathen worship were conceived as essentially different things, although Christian writers conflated them. There is also evidence for non-Germanic beliefs, and some Lapp and Arctic influences can be traced. Icelandic magicians were depicted as trance diviners and trance mediums much like shamans.

Celtic literature from the twelfth and subsequent centuries, handed down to us in later medieval versions, also contained magical themes, and its pagan elements were remnants of an earlier culture. Fairies are prominent protagonists with magical abilities in the Irish tradition. Celtic literature was full of battles or duels between druids, looked upon as practitioners of demonic sorcery, and their Christian adversaries, often well-known saints.

SORCERY IN THE MIDDLE AGES

Throughout the Early Middle Ages, sorcerers were generally depicted not as powerful agents of evil but as unfortunate victims of the deceptions and temptation of the Devil. Therefore, the Church treated them with correction and penance, rather than calling for severe persecution. By the thirteenth century, however, clerical authorities began to take magic and its practitioners far more seriously. One main factor behind this shift was the rise of various types of learned magic, including astronomy, alchemy, and spiritual and demonic magic, among the educated elites of western Europe. Taken from Arab, Greek, and Jewish texts, learned magic aroused much interest among scholars and intellectuals. Especially in Spain—at Toledo, Salamanca, or Seville—there were rumors about universities teaching the magical arts.

The Church remained convinced that demonic power lay hidden behind even apparently innocuous magical practices. The darkest aspects of magic, involving explicit demonic invocations, were actually practiced by a "clerical underworld of necromancy" (Kieckhefer 1997). Medievalists have long noted how the rise of demonic sorcery contributed to the idea of witchcraft in the early fifteenth century (see, for example, Peters 1978). Although the concept of witchcraft was partly

rooted in learned sorcery, witches were not just sorcerers with a few diabolical features added. The nature of their power and their interaction with demonic forces were different.

Clerical minds conflated two quite different magical systems. By the end of the thirteenth century, clerical authorities were generally familiar with the essential system of learned magic. But there also existed in Western Christendom a widespread and diffuse system of common spells, charms, blessings, potion making, talismans, and amulets employed by many people at all levels of medieval society, including many clerics. Learned demonic sorcery was a highly structured variety of magic limited to a small clerical elite; necromancy operated though very complex and detailed invocation of demons, sometimes lasting for days and focusing on the right time, season, and requisites. These summoning formulas, often derived from Arabic or Hebrew magical concepts and usually grounded to some extent on Church rituals, were laid out and transmitted in books of spells written in Latin. Thus, only those with the prerequisite ritual training and Latin literacy could perform this magic. Though clerical authorities seemed to ignore that they were dealing with two different systems, a desire to fit common, everyday magical practices into the “diabolized” intellectual framework established by learned necromancy, laid the foundations for constructing the concept of witchcraft.

FROM SORCERY TO WITCHCRAFT

Although witchcraft and sorcery have similar characteristics, they are not identical. Sorcery involves the practice of magic through some sort of mechanical or manipulative process; it is a skill that one can acquire. It can be distinguished from witchcraft on two possible grounds. First, it can sometimes be considered beneficial; second, maleficent acts of witchcraft require no special techniques or tools. Maleficent acts can be committed through the innate powers of a witch, for example, by using the evil eye.

In the early years, while witchcraft theory was gradually being formulated, some inquisitors and judges were unsure of this distinction. By the mid-thirteenth century, papal inquisitors were already probing facets of sorcery and divination. The confusion between the two magical traditions became evident in the early fourteenth century, during the Avignon “Babylonian captivity” pontificate of John XXII. The reign of John XXII (1316–1334) was marked by deep and growing concern over sorcery at the uppermost ecclesiastical levels. Throughout this period, the papal court and the pope were obsessed by fears of demonic sorcery. The cardinal of Santa Sabina wrote to the inquisitors of southern France at Toulouse and Carcassonne, ordering them, in the name of the pope, to take action against

any sorcerers who engaged in demonic invocations or bound themselves to demons in order to perpetrate harmful sorcery.

Six years later, in 1326, Pope John XXII issued the bull *Super illius specula* (Upon His Watchtower), condemning all sorcerers who made a pact with devils; they were said to sacrifice to demons, adore them, summon them, and even enclose them in a ring, a mirror, or other object in order to bind them magically to answer their requests and help them achieve their desires. Anyone engaging in such activity would be excommunicated and punished appropriately. The type of sorcery to which these documents refer is clearly learned necromancy. This is most obvious in the bull, where the pope mentioned rings, mirrors, and phials made for magical purposes while ignoring the herbs, stones, and simple charms of illiterate sorcerers. By that time, major courts often had resident magicians, mainly astrologers, alchemists, and physicians who practiced ritual magic for the amusement, health, and political advantage of their employers.

The Dominican Bernard Gui (made famous in Umberto Eco’s novel, *The Name of the Rose*) was actually an inquisitor in Toulouse for almost twenty years before writing a handbook, the *Practica inquisitionis heretice pravitatis* (The Practice of the Inquisition of Heretical Depravity, ca. 1324), which was widely copied and influenced future inquisitorial practice. In Gui’s handbook, one can see the beginnings of the confusion on the part of Church authorities between elite necromancy and more common forms of sorcery that would later feed into the idea of witchcraft. His handbook did not deal with necromancy, but it did devote some space to popular forms of sorcery. Gui emphasized the inquisitor’s responsibility to ask sorcerers whether they cured diseases by conjurations or incantations, inquiring about using hair and nails, organic materials such as fruit and herbs, or girdles and similar objects; the rings and polished mirrors of ritual demonic magic were never mentioned (medical magic almost never figured in necromantic practice, while common sorcery was primarily concerned with healing or, conversely, inflicting disease). Gui did briefly mention baptized images of wax or lead and various other devices that were also tools of learned necromancers. Elsewhere in his *Practica*, he included several sections directed against clerical sorcerers and the charges that involved necromancy and diabolism. And elsewhere, Gui also advised inquisitors to ask sorcerers about women called “the good ones” who flew at night.

In 1376, the Dominican Nicolas Eymeric, formerly inquisitor of Aragon, completed his *Directorium inquisitorum* (Directory of Inquisitors), a vast manual that became even more influential than Gui’s. Among its many topics, it dealt with the question of whether sorcerers and diviners were heretics, and it subsequently

condemned all forms of demonic sorcery. Although still focusing on learned necromantic practice, its arguments formed an important foundation for later notions of witchcraft. Familiar with the learned black arts, Eymeric mentioned *grimoires* (magicians' books for invoking demons) such as the *Key of Solomon* and the *Sworn Book of Honorius* that he had obviously seized from magicians whom he had tried. He excluded certain forms of magical practice (for example, chiromancy and astrology) as not demonic and therefore not heretical. Sorcery that involved demonic invocation, however, was always heretical. Eymeric distinguished three levels of demonic sorcery: The first and most horrible involved summoning demons and showing them adoration; in the second method, the sorcerer showed demons certain signs of veneration that were due only to saints; and the third method involved tracing a circle in the earth and placing a boy in it, with the necromancer holding a book and reading it to invoke a demon.

But there were no further developments, either in theory or in courtroom confessions, until much later. If complex forms of ritual magic—necromancers performing complex rites and invocations designed to compel an essentially unwilling and dangerous demonic agent to come and serve them—concerned Pope John in 1326, over a century later Pope Eugenius IV feared uneducated men and women who could allegedly perform terrible demonic sorcery by a mere word, touch, or sign. The cumulative concept of witchcraft, involving, among other things, the complete absorption of commonplace sorcery and performance of *maleficium* as essential ingredients, emerged clearly in the 1430s in several treatises, connected in various ways with Alpine sorcery and heresy and filtered through clerical preconceptions. One of the most important of these witchcraft treatises was the section devoted to witches and their deceptions in the *Formicarius* (The Anthill), written around 1437/1438 by the Dominican theologian Johannes Nider. Employing the distinct notions of heretical witchcraft and the earlier conception of demonic sorcery, the *Formicarius* presented witches as members of an organized sect, performing the most evil kinds of magic, although the author did not believe in the corporeal flight of the witches. Well-educated minds (the first treatises on cumulative witchcraft were composed by both laymen and clerics) convinced themselves that certain simple people seemed to hold such complete and easy mastery over powerful demons, while even the Church's own exorcists engaged in complex rites that still often failed to command demons. The difference lay in the now-ancient notion of a pact between the sorcerer or witch and the demon, going back at least to Theophilus. But witches went far beyond offering demons limited acts of adoration: They apostatized, formally denying Christianity and surrendering themselves

body and soul to the Devil. They were able to perform malevolent sorcery with the aid of powerful demons with just a few words or gestures—but only because they had already become servants of Satan.

Three generations after the cumulative notion of witchcraft had been created, the influential jurist Paulo Grillando devoted many pages of his 1525 *Tractatus de haereticis et sortilegiis* (Treatise on Heretics and Sorcerers) to determining exactly when sorcery became heresy. God allowed the Devil certain powers, said Grillando, such as tempting people to sin, knowing the nature of things, predicting the future, and even curing diseases. Asking help of the Devil to do these permitted acts constituted sorcery. Asking the Devil to do other acts, which God reserved for Himself, constituted heresy. For example, asking the Devil to help in seducing a woman was not heretical because this ability came within the Devil's province. Yet the manner of asking was very important: If a person *ordered* the Devil to do the evil permitted by God, he was not a heretic, but if he *implored* the Devil with the same request, he became a heretic. If a person who had made a contract with the Devil asked in any way even for a permitted act, he or she became both a witch and a heretic.

SOURCES FOR WITCHCRAFT TRIALS

Historians acquire information about witchcraft and witchcraft trials from a variety of published and unpublished sources, ranging from judicial records of the courts where witches were tried to scholarly accounts written by contemporaries and modern scholars.

PUBLISHED WORKS

1. The most accessible published works that provide information regarding witchcraft trials have been written since the eighteenth century, that is, during the era when witchcraft had been decriminalized in Europe and its former colonies. The works in this category comprised a large majority of the references used in this encyclopedia, including such subgenres as folklore collections. The absence of any direct need either to combat or to justify the persecution of witches gave them a degree of relative detachment, although depriving them of the sense of immediate relevance that informed most earlier publications. Obviously, their numbers have mushroomed since Rossell Hope Robbins painstakingly combed British and American libraries to amass the 1,140 printed works he used to compile his *Encyclopedia of Witchcraft and Demonology* in 1959. Currently, the number of available works may well be ten times as large. The most helpful bibliographic guides can now be found online; probably the best starting point is the compilation begun by Jeffrey Merrick, continued since 1996 by Richard Golden, and maintained by Jonathan Durrant beginning in 2005, which concentrates on relatively recent items, predominantly in English (available at <http://www.witchcraftbib.co.uk>). To get an idea of how large modern witchcraft bibliographies can be, consider that merely for the Belgian province of Flanders (which has no separate entry in this *Encyclopedia of Witchcraft: The Western Tradition*), the Web site bibliography's list contains over 125 entries—none of them originally published in English.

Usually, the great advantage of modern publications is their relative accessibility, and they occasionally preserve valuable references to original documents that were completely destroyed during Europe's twentieth-century wars. For example, a nineteenth-century German monograph (Lilienthal 1861) about a small coastal city in what was then Prussia provided information about more than 120 witchcraft trials held there between 1534 and 1772; nearly half of those tried (fifty-eight people) were executed between 1605 and 1686.

2. The number of published works from the age of "cumulative" witchcraft (1420–1750), harder to find on electronic lists, can also be dauntingly large. For example, the unusually broad bibliography offered in a major synthesis on the intellectual history of witchcraft (Clark 1997) contained nearly a thousand pre-nineteenth-century titles, making it approximately

as large as the selection of more recent titles. More than 775 different authors wrote these pre-1800 works; about 7.5 percent of the works were anonymous or pseudonymous.

This category contains some interesting subgroups. For example, a few regions published pamphlets describing witchcraft trials. The earliest ones came from Germany, the home of both printing and witch hunting, starting with a sensational pamphlet describing the remarkable witch panic of 1562 that caused sixty-three deaths in the small territory of Wiesensteig. However, the richest and most reliable group of such pamphlets came from England. Beginning in 1566, England produced about twenty pamphlets describing individual English witchcraft trials before the Civil War erupted in 1640; only three of the authors are known. After the monarchy was restored in 1660, England held few witchcraft trials but instead produced multiple pamphlets about them; for instance, three different accounts appeared about a Bedfordshire case of 1682, and the last known British conviction of a witch spawned five printed pamphlets in 1712—all of them still anonymous.

A general rule for readers of such early pamphlets is that the greater the distance separating the printers from the events they described, the less reliable the printed evidence becomes; for example, the *News from Scotland*, printed at London in 1591, provided an inaccurate and misleading account. German pamphlets abound with such distant, excited, and generally exaggerated misinformation. In France, with most printing done at Paris or Lyons, one finds no such pamphlets until the seventeenth century; however, the trial of Urbain Grandier generated more than three dozen pamphlets between 1634 and 1636, dwarfing other individual European cases. Spain offers an interesting example: Before 1800, only one pamphlet described its witchcraft trials, but it helped fan the largest witch panic in Spanish history, and specific details from it have been traced in witchcraft confessions from Spanish America a decade after its appearance.

At the opposite end of the publications spectrum from pamphlets, Europe's first multivolume publication about witchcraft came from Eberhard David Hauber, who also published the first history of cartography (in 1724). An Enlightened Calvinist pastor in the north German county of Schaumburg-Lippe, where hundreds of witches had been burned only two generations earlier, Hauber edited the *Bibliotheca sive acta et scripta magica* (Library of Magical Stories and Writings) between 1738 and 1745; although published as a three-volume series, it began as a magazine with between four and six issues per year.

Apart from some works published by critics such as Hauber, mostly during the eighteenth century, the enormous majority of pre-1700 publications upheld

the reality of witchcraft and, by extension, the necessity to prosecute it. A reasonable estimate is that barely 10 percent of all published works that discussed witchcraft during the sixteenth and seventeenth centuries could be classified as skeptical in their approach. But then, too, historians of science have pointed out that barely 10 percent of all astronomical publications published before 1650 supported Copernicus's theory. Legal codes mentioning witchcraft were seldom published, and statutory law was not an important guide to legal practice in most of Old Régime Europe. It seems symbolic that the most elaborate and fierce criminal code condemning witchcraft and magic, a Bavarian edict of 1611, had no visible effect on local legal practice.

ARCHIVAL SOURCES

Most witchcraft trials occurred in the German heartlands of the Holy Roman Empire, which was divided into literally hundreds of autonomous states. (Curiously, the most valuable general inventory of its archival sources, which eventually located nearly 30,000 individual witchcraft trials, was made under the Nazi regime, the only government of twentieth-century Europe to pose as an official champion of witches.) In order to get an idea of the problems faced by researchers wishing to acquire original archival information about witchcraft trials, consider the situation of four small territorial clusters (today in the German provinces of Baden-Württemberg and Bavaria) that formerly comprised Swabian Austria: the districts of Hohenberg, Nellenburg, the *Landvogtei* (provincial government) of Schwaben, and Burgau. Between 1493 and 1711, they experienced more than 520 witchcraft trials; about 90 percent of accused witches were women, and about three-fourths of those tried as witches were executed—reasonably typical of southwestern Germany. The first general investigation of the documentary sources for Swabian Austria (Dillinger 1999, 28–32) noted that serious lacunae had been mentioned as early as the mid-seventeenth century, with subsequent losses afterward through fire and theft. When Austria lost these territories during the Napoleonic era, in 1806, Habsburg officials at Innsbruck (the Tyrolean capital, from which the territories had been governed) sent the original documents from these exclaves to the new German authorities in Württemberg and Bavaria. Records for Nellenburg were soon transferred again, to Baden. Every transfer entailed further losses. By the late twentieth century, the remaining original trial records from Swabian Austria were thus located primarily in regional archives at Augsburg, Stuttgart, and Karlsruhe. However, the original administrative correspondence that had accompanied them remained with the archives of the Tyrolean government at Innsbruck, together with archives from hospitals that occasionally yielded useful

information. Similarly, the financial records from Swabian Austria remained in Tyrol, although scattered documentation about confiscations and trial costs was included with the original trial records. Apart from a few documents in the four district seats and one other town (Horb), local municipal archives had little to offer. A rhyming pamphlet, printed at Innsbruck in 1596 and preserved at Stuttgart, claimed to offer a *Wahrhaftig geschicht und eigentliche Beschreibung von den Hexen Weybern, so man zu Rottenburg am Neckar und in Westfahlen, Prissgre und anderstwo verbrand hat, dises 1596 Jar in Reimen weiss verfast* (Truthful . . . Description of the Women Burned as Witches at Rottenburg on the Neckar, Westphalia, Breisgau, and Elsewhere in This Year 1596, Put into Rhyme). Unexpectedly, the most valuable guide to the overall dimensions of witch hunting in Swabian Austria came from remarks scattered through a nine-volume manuscript chronicle kept between 1573 and 1604 by a Tübingen antiquarian, Martin Crusius, published in an abridged version between 1927 and 1961.

Of course, reconstructing the history of witchcraft trials within a particular region is generally less difficult than in Swabian Austria, but most of the problems encountered here apply to European witchcraft generally. The first documents historians usually look for are any available judicial sources of various kinds: German *Hexenakte* (witch trial document), French *Procès criminels* (criminal trials), and so on. They come from every level of court, beginning with seigneurial tribunals. For example, the richest family of sixteenth-century Germany, the Fuggers of Augsburg, acquired a block of estates stretching north as far as the Danube; around 1590, during the first wave of persecution in this region, witches from throughout their estates were burned at their two small capitals, but these persecutions have yet to be adequately explored. Many such seigneurial records have never been donated to public archives and remain in private hands.

Many trial records survive from municipal courts (and are often extremely well preserved), particularly from the imperial free cities of the Holy Roman Empire. Larger towns generally have better records. Self-governing towns such as Rottweil that ruled over several rural villages seem to have been especially prone to endemic witchcraft persecutions; there, as in the Republic of Geneva, most of the witches accused and executed came from rural districts. Outside Germany, other records slumber in a few municipal archives of eastern France (Toul, Besançon) or Swiss cantons. Even in England, some borough courts could impose death sentences for witchcraft; for example, at least seven women witches were sentenced to death in the small Essex town of Harwich between 1601 and 1619 (Macfarlane 1970, 75–76), while Newcastle executed fifteen witches in 1650 (Sharpe 1997, 218).

Trial records from higher-level courts are usually better preserved than those from lower courts; France, Europe's largest kingdom, is an extreme case because its local court records are nonexistent. Two major problems confront researchers. First, officials often preserved such documents randomly, primarily in order to establish precedents or prove their right to pronounce and execute capital punishments. Second, even when apparently preserved in relatively good order, the documents are difficult to use because they lack topical indexes; investigators have no alternative to exploring them serially in order to locate witchcraft trials among vast piles of other criminal cases. Official sentences from French appellate courts (which always specify the punishment but often do not specify the crime) can sometimes be supplemented by their *plumitifs*, shorthand records of prisoner interrogations. It required several years of research for an expatriate American to locate over a thousand witchcraft cases in the records of the *Parlement* of Paris (Soman 1992). Similar situations exist with national appellate courts in Scandinavia. The Holy Roman Empire, where most of Europe's witchcraft trials occurred, offers an unusual problem: The records of its principal appellate court, the *Reichskammergericht* (imperial chamber court), were split up after German unification and sent to three dozen different locations (a few of them outside present-day Germany), while those from the emperor's appellate court, the *Reichshofrat* (imperial aulic court), remain together at Vienna but have been little used.

Another little-used judicial source, the sale of pardons (a practice largely confined to French-speaking Europe), also offers occasional information about witchcraft. Witchcraft belonged to a small category of "unpardonable" heinous crimes; only one partial exception is known—a woman who had endured torture without confessing and whose banishment was revoked years later (Muchembled 1989, 378). The homicide of a suspected witch was a pardonable offense, and scattered examples (most of them apparently lynchings) can be found among the thousands of pardons preserved from the Kingdom of France, the Low Countries, or the duchy of Lorraine. In 1603, in the tiny southern enclave of Châtillon-sur-Saone in the duchy of Bar, subject to the appellate jurisdiction of the distant *Parlement* of Paris, local financial records suggest a reluctance to torture and convict arrested witches, and a ducal pardon suggests a readiness to lynch them instead. One general rule is that all such sources must be explored serially, concentrating on periods when witchcraft trials are known to have occurred.

Other administrative records discussing witchcraft trials are abundant. A great recent exploration of witch hunting (Behringer 1997) made excellent use of the rich series of deliberations by Bavaria's central government, sampling them during periods when other

sources suggested that witchcraft trials were occurring. In this *Encyclopedia of Witchcraft: The Western Tradition*, the entry on Bavaria concludes that "as far as serial analysis is concerned, . . . Historians possess an ocean of sources, which they have so far only explored in part," mentioning court council records since the early 1600s, trial records, official reports, special files for witchcraft trials, legal opinions, and official correspondence. Such official sources have proved particularly helpful when exploring the hotly debated topic of whether witchcraft trials originated primarily "from beneath," through popular pressure on local authorities, or "from above," by governments intent on punishing deviants.

Information about witchcraft trials lurks in some other administrative records rarely explored by historians. A thousand witchcraft trials from the present-day Swiss canton of Vaud between 1580 and 1620 have been located through the council minutes of the Republic of Bern, which governed Vaud until 1798 and had to approve all death sentences there. One local scholar carefully collected almost 1,700 references to witchcraft during the sixteenth and seventeenth centuries in the provincial council minutes for the duchy of Luxemburg; most of them were petitions complaining of irregular procedures in witchcraft trials, thus offering an upside-down view of "sanitized" official versions. Another kind of administrative source, the abundant and well-preserved correspondence between the Spanish Inquisition's governing council, the *Suprema*, and its local tribunals, has proved especially useful for understanding the dynamics of the single most important episode in Spanish witchcraft, the 1609–1614 Basque panic.

The opinions about witchcraft cases issued by various German universities (whose archives are usually well preserved) constitute a different kind of specialized source. Through so-called document dispatching (*Aktenversendung*), courts sent the files of a pending procedure to a legal faculty to seek advice. Beginning in the sixteenth century, *Aktenversendung* applied to both civil and criminal trials in the Holy Roman Empire because local lay assessor courts usually needed the advice of professionally trained authorities. However, unlike the practice in French appellate courts, German law professors examined only the written trial records and had no opportunity to question defendants under oath afterward. In northern and northeastern Germany, their legal opinions sometimes provide our most important source of information about witchcraft trials: About a thousand of them survive from the duchy of Mecklenburg alone, while the situation is somewhat similar for electoral Saxony, where such legal consultations were required by central governments. Legal opinions have been studied from several of Germany's two dozen universities, with mixed results. Some law

professors clearly saw witchcraft as a *crimen exceptum* (the excepted crime) and were extremely severe: At Rinteln, 347 decisions in witchcraft trials include only 19 judgments favoring the accused.

Financial records mentioning witchcraft trials are relatively abundant, since Old Régime governments generally took great care to preserve them. Bavaria, for example, has expense records from virtually every district court from the fifteenth century onward, as well as from some of its central prisons. However, they, too, are generally difficult to search because they contain no index of any kind—and they may even be preserved in a different country from the area being studied, as, for example, with both with Swabian Austria and the duchy of Luxembourg. Financial sources are frequently older than judicial records and seem to be especially helpful for identifying early witchcraft trials—especially those ending with executions, for central governments were less willing to pay costs of trials that did not result in convictions. For instance, in the Belgian province of Flanders, all but three of the three dozen cases known before 1560 are documented exclusively by financial records, while only three of the last fifty (all of them also found in judicial records) can be traced this way (Monballyu 2002, 302–313). Some countries—Norway is a good example—have relatively few surviving court records but preserve an almost complete series of their financial records for the late sixteenth and seventeenth centuries, providing a solid basis for estimating their witchcraft executions. Another very important example comes from the duchy of Lorraine, where virtually all records that mention its numerous witchcraft trials (more than 1,700 can be traced, over 300 of which include partial trial records) have been preserved among its unusually rich series of annual local financial reports. At the same time, financial records from the duchy of Bar, permanently united with Lorraine after 1506 but administered separately, are so incomplete as to be practically useless for this purpose.

A few general rules may be extracted from this rapid and obviously incomplete survey of archival and printed sources available for studying witchcraft in early modern Europe. Concerning published materials, there are a few major specialized library collections about witchcraft; the one at Cornell University, formed in the late nineteenth century, is probably the richest (available at <http://historical.library.cornell.edu/witchcraft/index.html>). However, just as no major specialized scholarly journal is devoted to this subject, no library holds anything like a complete series of works about witchcraft, although many libraries have the readily available primary source collection, “Witchcraft in Europe and America,” containing 1,196 items on 95 microfilm reels (available at <http://microformguides.gale.com/BrowseGuide.asp?colldocid=3058000&Item=&Page=1>).

This impression of incompleteness is reinforced and deepened when we consider archival sources. None of them from the early modern period is ever complete. Perhaps more important, none provides a direct record of the words of accused witches (the vast majority of whom were women with no knowledge of writing). The early-fifteenth-century trial records, even those from secular courts, were often kept in Latin; afterward (for instance, in the Spanish case between 1609 and 1614 or the Bernese in Vaud), the people who compiled the records could not even speak the same language as the accused witches. Moreover, with extremely few exceptions, preserved documents do not record the exact words of the witnesses who testified against the witches but instead provide a version rearranged by the recording scribe.

When it comes to discourse about witchcraft, post-modernism is actually very old. Ever since the sixteenth century, the sources of witchcraft have been deconstructed or “unpacked” by intellectuals who could “think outside the box.” Few areas of historical research demonstrate more convincingly that so-called authentic documents are not truthful documents: Like the historians who study them, witches cannot fly.

SPAIN

Spain's experience of witchcraft was substantially different from that in many other areas of Europe. No real "witch crazes" happened there, although sporadic persecution of witches occurred throughout the peninsula. The total number of executions was comparatively small but larger than in other Mediterranean countries with effective Inquisitions, such as Portugal or Italy after 1542.

In the traditional legal systems of the Iberian Peninsula, where the dictates of Roman law had penetrated imperfectly, witchcraft was not formally considered an offense. At various times in the medieval period, people were tried and condemned for practicing *maleficia* (evil acts, harmful magic). When alien diabolical help was involved, the crime was also called sorcery (*sortilegium*). In 1370 and 1387, the laws of Castile declared that sorcery was a crime involving heresy, for which laypeople would be punished by the state and clergy by the Church. The medieval Inquisition, both in France and in the Crown of Aragon, left such questions largely in secular hands. Around 1500, when the Spanish Inquisition began investigating the heresy of witchcraft, repression of the offense was still normally in the hands of the state courts; a Castilian decree of 1500, for example, ordered an investigation into sorcery by the civil courts.

Church authorities in medieval Spain seldom took vigorous action against superstition. As elsewhere in Europe, Spanish popular culture, especially in rural areas, sought unorthodox cures for daily afflictions. Spanish villages had their wise men or women (*curanderos*) who offered medicinal ointments, found lost objects, healed wounded animals, or, like *La Celestina* (a procuress and enchantress, protagonist of a famous Spanish novel), helped lovers win the affections of the ones they loved. Cures might take the form of potions, charms, spells, or simply advice. This subculture coexisted with and did not try to subvert official Catholicism, though in certain "New Christian" areas (that is, areas with Christians of Jewish and Muslim origin), the Christian content of the spells was doubtful. In rural areas, the world of magic even entered the Church, with many clergy incorporating folk practices—rites, prayers, offerings, dances—into the normal liturgy.

The mountainous provinces of northern Spain, from Galicia on the Atlantic coast to Catalonia on the Mediterranean, were the regions most identified with a prevalence of superstition. All this was stamped on firmly in the sixteenth century by reforming bishops, post-Tridentine clergy, and the Inquisition. In the process of contrasting the dark world of primitive superstition with the illuminated world of the Gospel, preachers and learned men unduly simplified the forces at work and helped to create fears of "witchcraft."

Late medieval Spain produced several treatises about witches, mostly by theologians who helped give credence to the notions of a Sabbat and a compact with the Devil. A special meeting of the council of the Inquisition held in the city of Granada in 1526 ruled by a narrow majority that the notion of the witches' flight was impossible, claiming that "the majority of jurists in this realm agree that witches do not exist" (Kamen 1997, 271). The effective origin of prosecutions must be sought principally in social tensions and conflicts. In small communities across northern Spain, denunciations for witchcraft often arose simply from family and communal tensions. There were occasional state-sponsored witch hunts, particularly in Navarre, from a very severe one in 1525 until the 1580s. The most intensive outbreaks of persecution occurred in times of agrarian disaster, when local communities blamed the evil influences at work among them. When Spain's worst witch panic was affecting rural Catalonia in 1621, a bishop reported that "the barons and lords of the villages, on seeing the loss of crops and the clamoring of the people, have supplied a cure for the ills by punishing these women" (quoted in Kamen 2000, 68).

People accused of witchcraft were generally from the lower levels of rural society. Denunciations of witches, like denunciations for heresy, arose out of antipathies and grievances within the local community. Petty suspicions, jealousies, and gossip led to the victimization of individuals and eventually to their prosecution. In a changing society, the disappearance of traditional neighborly charity and mutual help might give rise to resentments. The fear of retaliation by witchcraft forced villagers to keep dispensing favors to those who were suspected of being witches or who, to exploit the situation, claimed to be witches. In times of crisis, such persons were persecuted and denounced to the courts. But documented cases range far beyond examples of "charity refused." Malice between neighbors was a universal phenomenon in witchcraft cases.

Medieval practice had been that witches should be burned, and the Spanish tribunals followed suit. The Spanish Inquisition, however, played no significant part in these prosecutions; it was guided by the policies laid out at the special meeting in 1526, when it decided to act with caution in cases concerning witchcraft. With few and brief exceptions, prosecution of the offense reverted to civil courts. At Barcelona in 1549, local justices and inquisitors collaborated in the punishment and execution of a handful of women accused of sorcery. The *Suprema* (the supreme council of the Inquisition) reaffirmed its attitude by punishing the inquisitor responsible; thereafter, the Inquisition in Catalonia punished few witches and burned none.

A similar case happened in the Pyrenees in 1610. Basque refugees from a frenzied witch hunt conducted just across the French border entered Spanish Navarre,

soon leading to a number of witches being executed at an *auto de fe*. The inquisitor Alonso de Salazar Frías was sent to inquire into the circumstances and came to the conclusion that “there were neither witches nor bewitched until they were talked and written about” (Henningsen 1980, ix). Another result of the 1610 episode was that the Inquisitor General commissioned a report (in 1611) from the scholar Pedro de Valencia, who suggested that there was a strong element of mental sickness in the Navarre events and that exceptional care had to be taken to prove offenses. “The accused must be examined first to see if they are in their right mind or possessed or melancholic,” he stated, finally advising that “one must look for evidence, according to law, of an offence having been committed” (quoted in Kamen 1997, 275). A curious feature of this episode was the role of children. When inquisitor Salazar Frías visited Navarre in 1611, 1,802 people came forward as self-confessed witches; 1,384 of them were children under fourteen. In 1614, the council issued instructions reaffirming the policy of 1526. They remained the principal guide to the future policy of the Inquisition, advising caution and leniency in all investigations. As a result, the Inquisition never again executed witches.

Had all Spanish tribunals behaved in this way, the prosecution of superstition in Spain would have become what the Inquisition intended it to be: a means of disciplining people into orthodox Christianity. However, the control of much jurisdiction over witchcraft by secular authorities meant that witches continued to be executed in many parts of Spain. In the Kingdom of Aragon, for example, the civil authorities continued in full possession of their jurisdiction over witchcraft, and the Inquisition seems to have made only sporadic efforts to assert jurisdiction. Many witches were tried before local courts in upper Aragon in the early and mid-seventeenth century. Witches in Aragon were hanged and burned; the total number of those executed is not known.

In Catalonia, likewise, executions continued. In the jurisdiction of Vic alone, the civil authorities sentenced forty-five witches to death between 1618 and 1622. Dozens of witches were hanged in other towns throughout Catalonia, including some in the Pyrenees. The rector of the Jesuits in Barcelona, Pere Gil, begged the viceroy to intervene but with little result. Royal courts could not control the local and baronial jurisdictions in which the executions took place.

Such incidents, provoked in some measure by bad harvest conditions, declined in number after 1627. Further research may reveal many cases of persecution of witches throughout Spain, for popular superstitions on the matter remained deeply ingrained for centuries, and local authorities were usually responsive to complaints. There is no way to know how many witches were executed in Spain because we do not have

adequate information on this, but 300 is a reasonable guess. We also cannot be sure of the dates of the last execution for witchcraft and the last witchcraft trial, because various jurisdictions continued informal executions and trials well into the seventeenth century. Consciousness of witchcraft as a historical phenomenon remained in folk memory for generations after active persecution had ceased. In the early nineteenth century, the great Aragonese painter Francisco de Goya produced the best-known artistic representations of witches in the Spanish countryside.

As in nearly all of Europe, the overwhelming majority of those accused in Spain were female. Most cases were tried before the secular courts as a consequence of popular pressure, and even the interventions of the Inquisition in Barcelona in 1549 and Navarre in 1610 were a consequence of secular prosecutions. Spanish authorities, while tolerant of so-called diabolic witchcraft, initiated a firm campaign against popular superstitions in the later sixteenth century, but that campaign faded away a generation later. One must also bear in mind that if Spaniards needed scapegoats in times of crisis, they did not have to pick witches but could frequently find them in their resident cultural minorities, the New Christians of Jewish origin (*conversos*) or Muslim origin (*Moriscos*); this alternative was not available in other European countries.

SPANISH AMERICA

Witchcraft and sorcery developed special characteristics in colonial Spanish America, merging European and

indigenous American concepts into new, hybrid notions. In addition, Spanish notions underwent cultural changes in the New World. Jurisdiction over witchcraft cases in Spanish America was supervised by the *Suprema* (the supreme council of the Inquisition) in Spain, which generally took a cautious position on witchcraft, urging its American inquisitors to punish witches and sorcerers less severely than heretics. Consequently, the *Suprema* never allowed death penalties for cases of witchcraft or sorcery to be executed in Spanish America.

While most Spanish American trials dealt with sorcery, witch hunts seldom occurred during the more than three centuries of colonial domination; they were confined to short periods of time and to small geographic regions in the viceroyalties of New Spain (Mexico) and New Granada. The majority of those prosecuted were women, overwhelmingly in sorcery trials involving magical healing, divination, or love magic. Sorcery techniques came primarily from Spanish models, with small variations in witchcraft and sorcery occurring principally through the use of native American plants and materials or occasionally through adopting indigenous practices. In Spanish America, witchcraft remained an individual phenomenon, with one person harming another; evidence of collective assemblies of witches is extremely rare and unreliable, with the exception of the Cartagena tribunal, where some cases were reported.

DISTRIBUTION OF WITCHCRAFT MODELS IN SPANISH AMERICA

Three different notions of witchcraft converged in Spanish America, incorporating Spanish, Amerindian, and African concepts of witches and sorcerers. The conquistadores carried contemporary Spanish ideas on witchcraft and sorcery to the New World. Missionaries and educated men were familiar with the demonological witch concept, while most colonists understood popular traditions about sorcery (*hechicería*) and harmful magic. Because frequent communication of Spaniards with Native Americans and Africans usually occurred among lower social strata, mostly concepts from popular Iberian tradition were transmitted. In the African population, several concepts of witchcraft were present. The Africans serving Spanish colonists were Christianized and generally familiar with Spanish ideas; African witch concepts seldom surfaced among them. However, slaves who came from Africa preserved their native concepts on witchcraft in America. Finally, Native American societies had their own specific notions of witches, different from those of Europeans and Africans but with some similarities to the European model.

The European concept of witches and sorcerers was generally confined to urban spaces. Spanish colonial

policy usually excluded Europeans from Amerindian settlements. Therefore, the vast majority of Spaniards and Creoles lived in colonial towns, explaining the strong concentration of European witchcraft/sorcery notions in urban centers. Trial records reflect an image of witches that was almost identical with contemporary Spanish notions. At the same time, regions with a high-density Amerindian population reveal a strong influence of Native American ideas and practices. Generally, the Iberian model of witchcraft and sorcery dominated urban colonial centers, while Amerindian concepts prevailed in rural areas.

In some regions, the Amerindian population declined dramatically during the sixteenth century after the Spanish Conquest. As Native American ideas on witchcraft faded, the popular European model of the witch became dominant. African influence was strongest in regions with economies based on slave labor, for example, in the mining centers of New Granada or the *haciendas* (estates) of the Peruvian coast. On the whole, the concept of the witch recorded in historical sources, even in regions with a strong African presence, was basically a hybrid European model with some African influence.

If we could draw a map of indigenous witchcraft beliefs in Spanish America, at least two different regional models would emerge: one centered in Mexico, in the core of the former Aztec state, another centered in highland Peru, the core of the pre-Conquest Inca Empire. In both regions, where the great majority of the population was Amerindian, indigenous elements penetrated the witchcraft and sorcery beliefs of the colonial population.

SPANISH AND CREOLE CONCEPTS OF WITCHCRAFT

Early modern Spanish distinctions between witchcraft (*brujería*) and sorcery (*hechicería*) were maintained in Spain's colonial possessions. In the learned tradition, witchcraft required an explicit pact with the Devil, but sorcery usually involved only an implicit pact. A further distinction involved the faculties attributed to witches and sorcerers. Adherents of both the learned and the popular traditions believed that witches could fly through the air, transform themselves into animals, and command the weather. Sorcerers, by contrast, were thought usually to lack such supernatural capacities but use spells, magic potions, and certain stones, plants, or other elements in their magical procedures. A third distinctive feature involved *maleficium* (harmful magic). Inquisitorial trials typically related it to witchcraft. Although sorcery occasionally inflicted harm on a victim, it was rarely associated with *maleficium*. Thus, the Inquisition characterized a magician as a sorcerer, if he or she had not employed *maleficium*, even though accused of metamorphosis, magical flight, and similar

deeds typical of witches. Some minor variations in these two categories can be observed in the historical material from the colonial era, principally due to changes over time or to the idiosyncratic views of some inquisitors about witchcraft and sorcery.

In urban centers where Spanish-Creole inhabitants were dominant, witchcraft and sorcery beliefs showed great similarity to the Iberian model characterized by a famous literary figure, *La Celestina* (a procuress or enchantress). Sorcery was practiced far more frequently than witchcraft. The predominant type of magician in colonial Spanish America was a sorceress engaged in love magic, divination, propitiatory rites, and magical healing. In general, *hechiceras* were women of low social status, unmarried or widowed, and without the protection and support of a husband or male relative. Consequently, they were poor and lived in difficult circumstances. Sorcery provided them with income and a means of gaining respect, at least locally. A few of these women were courtesans of somewhat higher social standing. Their clients came from different social strata.

Techniques employed in colonial sorcery corresponded closely to Iberian models, with some native American plants and materials added. Love magic included invocations, especially of St. Martha, who, as in Spain, was believed to be most helpful in love affairs. Conjuring demons, especially the "limping devil" (*diablo cojuelo*), tracing magical circles, and using special items such as earth from a graveyard or pieces from a rope used to hang someone completed the procedure. Colonial Spanish magicians also used indigenous materials, for example, feathers and skins of certain birds, plants, seeds, and (especially in the Andes) coca leaves; the Lima Inquisition accused several Spanish and Creole women of chewing coca and using it for divination.

Although the Spanish American sorceress more frequently acted as a magical healer and diviner, she could also inflict harm. Love magic could require *maleficium*, for instance, to remove a rival. Male Spanish and Creole sorcerers generally engaged in seeking treasure or conjuring luck when gambling by invoking the Devil or specialized demons and offering to make a pact in order to fulfill their desire. Throughout the colonial period, witches and sorcerers of the Spanish and Creole strata acted almost exclusively as individuals; extremely few assemblies of witches were reported in trials, and even these were probably invented by defendants hoping to inspire respect or else were misinterpretations of testimony by the judges.

AMERINDIAN CONCEPTS OF WITCHCRAFT

The Amerindian witch may be characterized as a person who inflicts harm magically on others. Indigenous witches were often thought to be capable of flying, with or without the help of a supernatural entity, and of transforming themselves into such animals as birds or

felines. It is difficult to describe pre-Columbian indigenous witch concepts, as we lack written sources for most of the American continent. Only in Mexico and parts of Central America are written texts available from the pre-Conquest period. Even there, European concepts were superimposed on indigenous beliefs and gradually obscured them. Besides, Europeans frequently misunderstood the religious concepts of the Amerindians. As a consequence, different cultural elements were jumbled together and only gradually formed a new belief system.

This transformation is evident in the Mexican *nabual*. In pre-Columbian times, *nabual* described persons, usually religious or political leaders, with special capacities to transform themselves into animals—jaguars, birds, and the like. Their capacity for shape shifting was considered evidence of their great inherent powers. When Spanish missionaries confronted the *nabual* belief, they identified the *nabual's* supernatural power with characteristics ascribed to witches. The European concept of the witch thus gradually obscured the original notion of the *nabual*, which never inflicted harm by magical means. Sixteenth-century historical sources show that the *nabual* probably also merged with other indigenous notions that were more like European witches. The resulting colonial Mexican witch could become an animal, fly through the air at night in this shape, and enter houses to harm their victims, often by sucking their blood. Injuries could be noticed on the body of a witch who was hurt while transformed into an animal; if the animal-witch was killed, the witch would die instantly. The evil, blood-sucking *nabual* was a colonial creation that eventually also became a synonym for *witch* among the indigenous population, at least in some areas of colonial Mexico.

Belief in individuals with supernatural capacities who used their magical power to inflict harm on other humans existed in pre-Columbian and colonial Peru as well. As in the Mexican case, the idea of the witch in ancient Peru was not linked to the moral category of evil used in early modern Europe. Nevertheless, witchcraft was much feared in the Inca Empire, and special care was taken to prevent witches from acquiring clothes, hair, fingernails, or personal belongings of the Inca ruler, lest these things be used for bewitching the Inca and eventually killing him. Witchcraft was severely punished in the Inca state by executing the witch and her entire family. Witches harmed other persons by inflicting illnesses that eventually killed their victims. Witchcraft was essentially performed by individuals; only one assembly of witches was reported, a case from the north coast of Peru in the early seventeenth century. Spanish ecclesiastical judges discovered what they considered a congregation of witches similar to their gatherings in the Spanish Basque Country. The Peruvian witches supposedly gathered at a special place

at night where they adored the Devil and held a banquet, consuming blood previously extracted from their victims. These witches not only flew to their gathering through the air but also used a powder that allowed them to enter the houses of their victims and make them fall asleep or else unable to move. Once the witches had sucked some blood from their victims, they went to their assembly and cooked the blood in enormous pots. Although Spanish accounts of the Peruvian witches' Sabbat clearly owe much to demonological perspectives and to reports on Basque witchcraft, we know from indigenous testimonies that the local population greatly feared these witches. Spanish colonial reports on Peruvian witchcraft distinguished its few adepts from the many sorcerers actively engaged in divination, propitiatory rites, and similar activities.

WITCHCRAFT AND MAGICAL HEALING

Amerindian notions of witchcraft as a principal reason for illness matched almost perfectly with Spanish colonial concepts of disease; both Spanish and Creole populations often attributed illness to witchcraft. Both believed that harm inflicted by magical means could only be removed by magical procedures. Therefore, throughout the colonial population (Spanish, Amerindian, and African), magical healing practices were considered necessary to counteract the effects of witchcraft. Especially at popular levels in colonial society, healers from different sectors of the population were consulted interchangeably: African healers would be consulted by indigenous or Creole patients and vice versa. This situation led to a fusion of their different notions of witchcraft as well. In consequence, we find a Spanish friar invoking an entity he thought was a Native American demon in order to conjure its help or an African dressed up with a Mexican feather costume performing an Amerindian shamanic ritual. Similar cultural exchanges can be noted in the incorporation of Christian prayers or paraphernalia (especially the crucifix) into African or Amerindian magical rites.

Amerindian magic, by contrast, introduced the use of hallucinogenic substances into magical healing. Sorcery trials against healers reveal the importance of hallucinogenic drugs in inducing ecstasy or becoming "possessed" in order to communicate with supernatural powers that would eventually cure their patients. Hallucinogenic drugs also conferred particular clairvoyance on healers to diagnose the cause of an illness.

In Spanish America, witchcraft could induce illness basically in two ways: by introducing an object (hair, a stone, and so on) into the victim's body or by abducting his or her soul (or part of it). In either case, the victim would slowly fade away unless the healer could discover the cause and either extract the pathogenic object or return the soul to the patient. Thus, in colonial Spanish America, magical healers—persecuted as sorcerers—

were adversaries of the witches, trying to unravel and counteract their spells. If the healer revealed the identity of the witch through divination and clairvoyance, countermagic was usually performed to kill the witch with his or her own weapons.

SPECTRAL EVIDENCE

This hotly disputed type of evidence was used in a few seventeenth-century French witchcraft prosecutions but more often (and more successfully) in seventeenth-century England and New England. It derived from a belief that the witch, through a voluntary covenant, would permit the Devil to use his or her apparition, or "specter," to afflict others. Crucial to this form of evidence was the complementary belief that those who were afflicted in this manner had a special ability to see and identify the spectral representation of the person attacking them. In the best-known trials that made extensive use of spectral evidence—the Salem witchcraft prosecutions of 1692 and the trial at Bury St. Edmonds in England in 1662—victims came forward in court to identify as witches the people whose otherworldly likeness or specter was tormenting them.

What made spectral evidence so forceful as testimony against witches was the youth and perceived vulnerability of the afflicted victims, combined with the highly graphic manner in which they exhibited their suffering. The victims were overwhelmingly female but considerably younger and far more often unmarried than female accusers in other witchcraft trials. In New England, some victims of spectral assault were only 7 years old, with most aged between 13 and 20, compared to the other accusers who were clustered between the ages of 20 and 49. Typically, the initial signs of an "affliction" were manifested by what contemporaries called fits or convulsions, often consisting of screams and complaints of choking, burning, and pinching sensations. These cries in turn were often accompanied by vivid displays of pain and suffering, particularly unusual physical contortions in which heads were twisted at what appeared to be impossible angles or tongues were distended beyond what seemed physically tolerable. Before spectral evidence could be introduced in the courtroom during a trial for witchcraft, the victim's afflictions had to be attributed to supernatural causes and then to the malevolent action of a witch, rather than to the Devil acting alone. Once these hurdles were cleared (or overlooked), spectators witnessed live demonstrations of these horrifying effects of witchcraft as supposedly afflicted young women writhed in pain while crying out the names of the suspects whose specters were attacking them. Such evidence was vastly more dramatic than the more usual

narratives of ancient quarrels and disputes purportedly resulting in various *maleficia*, or acts of harmful witchcraft.

Translating fits and convulsions into lawful evidence was highly controversial; in France, such "demonic" testimony was attacked sharply by 1600, and after a few show trials, it had become completely discredited by 1650. England was not far behind. Such guides as John Cotta's *Tryall of Witchcraft* (1616) urged caution in the diagnosis of bewitchment after some recent scandals in which children who had acted as "demoniacs" had later confessed that their symptoms were counterfeit. Like most early French skeptics, with their famous diagnosis of "something to illness, much faked, and nothing diabolical," Cotta was a physician. For him, the proper evaluation of early signs of fits and fevers required the expert judgment of a skilled physician to separate what was caused by illness or other natural causes from what was caused by witchcraft. Likewise, Thomas Ady's later treatise, *A Candle in the Dark* (1656), expanded the list of natural causes that would have to be ruled out before arriving at a judgment of bewitchment. Whether or not such works were in part inspired by a need to assert medical over lay authority in such matters, they represented a growing skepticism about the validity of accounts of possession and bewitchment.

Paradoxically, the more serious challenge to the credibility of the afflicted came from within theology. Even if one accepted that their symptoms originated with the Devil or his representatives, there still remained the vexing question of whether the victim was truly gifted with the ability to see the specters that were hidden from the sight of ordinary people or merely an instrument of Satan's subtle and evil design. Were the afflicted somehow enabled to identify the malefic witches who tormented them? Or were their senses fooled by a devil who, with God's permission, could impersonate virtuous and innocent persons? Increasingly throughout the seventeenth century, Protestant theologians cast doubt on the availability of divine will to human understanding, thereby undermining the confidence that could be placed in the perception of those who claimed access to the invisible world. As applied to spectral evidence, the result of these misgivings was that it was impossible to be sure on theological grounds whether the accusations of the afflicted were true identifications of witches and witchcraft or a product of Satan's deceptions.

By the end of the seventeenth century in England and on the Continent, the combined effect of theological doubt and medical skepticism was apparent in the weight accorded spectral evidence by the more influential published legal guides that were intended to assist in the trial of witchcraft. Lawyers, of course, were more cautious than theologians and physicians. Continental jurists, trained in Roman law, ignored this problem of

spectral evidence. In England, Richard Bernard's *Guide to grand-jury men* (2nd edition, 1630), followed by later texts, regarded spectral evidence or "an apparition of the party suspected whom the afflicted in their fits seems to see" (p. 206) as presumptive rather than convictive, that is, it sufficed to bring an indictment for witchcraft but was not sufficient to convict.

SPECTRAL EVIDENCE IN THE SALEM WITCHCRAFT TRIALS

Among their other noteworthy features, the Salem witchcraft trials of 1692 represent a dramatic finale to use of spectral evidence. In less than a year after the initial proceedings, the special court that decided these cases altered its position from an almost-unqualified acceptance to an unqualified rejection of this evidence. It is hard to say which aspect is more remarkable: the lateness of the acceptance or the rapidity of its abandonment.

At the outset of the trials in February 1692, spectral evidence formed the basis for virtually all of the approximately 140 complaints that preceded the arrests of suspects on charges of witchcraft. The accusers consisted mostly of girls and young women between the ages of nine and twenty, who cried out against the suspects whose specters they claimed were attacking them. Everyone tried for witchcraft during the Salem trials was indicted on charges that mentioned spectral evidence alone: The standard form of an indictment specified the name of the afflicted person and charged the accused with practicing "witchcrafts and sorceries" on the victim, who was alleged to have been "tortured, afflicted, pined, consumed, wasted, and tormented" by these acts, although there is no standardized order in which the harms of affliction are listed in the indictments. Contemporary accounts and surviving records make it clear that live demonstrations of spectral evidence in the courtroom, testimony of witnesses confirming spectral assaults on the victims, and testimony of victims about torments at other times and other places formed the major part of the prosecution's evidence. It was primarily on this basis that the juries returned verdicts of guilty against twenty-six persons, of whom nineteen were executed by hanging.

To be sure, the Puritan ministers who were consulted for advice on the use of spectral evidence were unanimous in recommending that the court exercise extreme caution in interpreting this evidence and (like Bernard) insisted that no one should be convicted on the basis of such evidence alone. In fact, the special court endeavored to collect other evidence of witchcraft that might support the "spectral" accusations; with a few exceptions, it is equally apparent that only persons against whom there were other types of evidence, in addition to spectral evidence, were brought to trial.

Nevertheless, when a new court was convened in January 1693, with explicit directions to give less

weight to spectral evidence, juries did not even bring indictments against a majority of the accused; the vast majority of those who were indicted (eighteen out of twenty-one) were acquitted. Three were found guilty on the basis of their confessions, but even they were later released. The difference in outcomes between the court of 1692, which convicted virtually all persons who had been indicted, and the court of 1693, which acquitted or discharged virtually all persons who had been indicted, reflected the different weights attached to spectral evidence in each time period. Acceptance of the validity of spectral evidence was a necessary condition for conviction during the Salem trials.

What happened to change the opinion of the court and the political leadership between October 1692 and January 1693? For one thing, by autumn of 1692, the afflicted began to accuse persons of ever-greater prominence within Massachusetts Bay. When they cried out against one of the most respected ministers in the province, Samuel Willard, the magistrates rejected the accusation, and they did not issue warrants against others of similarly high repute who were accused. For the first time in the proceedings, the allegations of the afflicted were treated as fallible. Another important event was the publication of Increase Mather's *Cases of Conscience Concerning Evil Spirits* in 1693. The work of one of the most esteemed ministers in the province, endorsed and signed by fourteen other ministers, it forcefully discredited spectral evidence on theological grounds and demonstrated clear pastoral opposition to any continuation of the earlier policy. Finally, it is apparent that as arrests and accusations increased, public criticism escalated from dissatisfaction with individual cases to collective mobilization through petitions and resolutions questioning the entire proceedings. Whether prompted by one or more of these developments, the court that convened in 1693 reversed the policy of its predecessor of 1692.

For all its promise as a spectacular demonstration of the workings of the invisible world and for all the sympathy that might be won through the appearance of a struggle between a young innocent and the specter of a malefic witch, spectral evidence over the long run helped to undermine the credibility of witchcraft prosecutions wherever it was introduced, whether in Catholic France, Protestant England, or Puritan New England. After the Salem trials, there were no further legal executions for witchcraft in any of these places.

SPEE, FRIEDRICH (1591–1635)

Friedrich Spee von Langenfeld (usually, although not quite correctly, called Friedrich von Spee) was Germany's most important critic of witchcraft trials in the seventeenth century due to his treatise *Cautio Criminalis seu de processibus contra sagas liber* (A Warning on Criminal Justice, or A Book on Witch Trials, 1631). In fifty-two short chapters, Spee asked rhetorically why Germany was *tot sagarum mater* (the mother of so many witches) while more superstitious peoples such as Italians and Spaniards found and burned very few of them. He soon found his answer: excessive torture. His target was not the existence of witchcraft but excesses in legal procedure, especially the gruesome tortures that German judges employed to convict innocent people; as Spee remarked, "No German nobleman could bear to see his hunting dog mangled like this" (Spee 2003, 87). There is evidence that he did not believe in witchcraft but conceded its existence merely for tactical reasons.

Descended from an old noble family of the lower Rhineland, as of 1601 the young nobleman "Junker Friedrich" attended the famous Jesuit grammar school *tricornatum* (with three crowns) at Cologne, before going to Trier in 1608 to become a novice in the Jesuit establishment there. This decision was opposed by his parents and motivated by his desire to become a missionary in India. His superior turned down his application in this regard, telling him that Germany would be his India. Completing education in his order to become a professor of moral theology, Friedrich Spee was transferred frequently, often because of attacks of plague. Eugen Drewermann (1991) pointed out that Spee's incessant encounters with death during epidemics of plague became a basic experience marking his further life and work. He died of the plague at the early age of forty-four at Trier, having infected himself while caring for the souls of the dying.

Spee wrote much more than his powerful Latin polemic against torture, creating a new genre of literature (Battafarano 1995). He was a prolific lyricist, writing around a hundred hymns that appeared anonymously between 1621 and 1637 (the exact total remains unknown, but Spee probably has more hymns than any other author in modern Catholic hymnals). He also composed two other works in German, both published posthumously in 1649; a pioneering effort in another literary genre, his *Trutz-Nachtigall* (Defying the Nightingale) offered a collection of devotional poems that provide Christianized versions of classical pastoral poems, while his *Güldenenes Tugend-Buch* (Golden Book of Virtues) was a catechism for women written in dialogue form between confessor and penitent. At the very end of the *Cautio*, Spee lamented that he was too overwhelmed to translate his treatise into German, "which would not be without its uses" (Spee 2003, 221). However, others soon did so, in 1647 and 1649, with a Dutch translation following in 1657 and a French version in 1660 (no English translation appeared until 2003).

In contrast to previous opinions, we now may assume that the *Cautio Criminalis* must have been written during the author's sojourn at Paderborn between the end of 1629 and spring of 1631, after he had been seriously wounded by a murderous assault. At the time, Spee held a professorship of moral theology, but he was soon dismissed for his offensive remarks. He was certainly provocative; for example, he began with an ironic observation that "I wrote this book for the rulers of Germany, at least for those who will not read it, not those who actually will read it" (Spee 2003, 7). Several times, Friedrich Spee was fortunate to have backing, by turns, from the Jesuit order's general in Rome and from the provincial superior, so that his unorthodox opinions did not have disadvantageous consequences.

For Spee, the core of the witchcraft trial was torture. He once argued that if one invented any horrible crime whatsoever by which the people believed they were being harmed and then used the same techniques as were being used to convict suspects in witchcraft trials, the number of culprits who would be convicted of this imaginary crime would equal or exceed those being burned in the witchcraft trials of his day; he claimed he would throw himself into the fire if this should prove untrue. In other words, the legal process was unable to distinguish between guilty and innocent and was therefore senseless. He discredited the most common mode of diagnosing witchcraft by observing events before, during, and after some damage or magic ritual by objecting that *something* always had to happen before, during, and after a certain event. His principles of argumentation followed the Jesuit mainstream: *ratio recta* (right reason) and *ius naturae* (natural right), both in a sense prefiguring the Enlightenment's objections to torture.

In summarizing his treatise (Question 51), Spee blamed almost everyone in Germany for the scandals of the witchcraft trials. In at least two ways, he foreshadowed contemporary research into German witchcraft. First, Spee began by stressing the malice and superstition of ordinary people, Catholics in particular, who “shout with great passion that the authorities should investigate the witches, of which they themselves have created so many with their own tongues,” thereby pressuring their rulers into conducting trials (Spee 2003, 214). Second, he anticipated H. C. Erik Midelfort’s argument that once begun and employing the system of denunciations wrung out under torture, Germany’s major witch hunts would continue indefinitely until a belated “crisis of confidence” undermined the process followed in witchcraft trials. “No one of any sex, fortune, condition or rank whatsoever who has earned himself even one enemy or slanderer can be sufficiently safe in these times” (Spee 2003, 221).

Besides its elaborate and eloquent denunciations of the multiform abuses of torture, Spee’s *Cautio Criminalis* pours withering scorn upon the testimony used to arrest suspected witches, but we should note that a few horrors were largely unknown. For example, he hinted darkly that “judges have even been found who want to arrest and torture on the testimony of the possessed” (Spee 2003, 211). He ridiculed the “testimony of beggar boys . . . who, when they are asked about wonders, they narrate wonders” (Spee 2003, 212) and so uncannily presaged Germany’s *Zauber-Jäckel-Prozesse* (Sorcerer-Jack-Trials) in Salzburg two generations later.

It is remarkable that Spee insisted rhetorically on his personal experiences—for example, to have been father confessor to countless witches, although there is no evidence that he ever accompanied even a single witch to her place of execution (Jerouschek 1995). Here, as elsewhere, Spee made use of the pious lie (another Jesuit specialty) in order to save innocent people from death. From a Catholic point of view, his canonization by the Holy See is overdue.

SPELLS

Both in common speech and in scientific literature, the word *spell* is used synonymously with *charm*, *incantation*, and *enchantment*. Etymologically, all these terms mean the powerful magic word, whether spoken or sung. Nonetheless, the words nearly always were accompanied by gestures and the manipulation of magical objects. We will keep to this definition and deal with spells as a type of oral and written tradition, though *spell* can also signify the action of casting a spell by other means (for example, invoking the *malocchio* [evil eye]) and the bewitching effect of such actions (as with the long-standing suspension of all movement in the fairy tale *Sleeping Beauty*).

Long ago, the tradition of these formulas was entirely oral, and thus, all spells must have existed in countless variations. We know only what has, by chance, been conserved by writing. Nonetheless, an inexhaustible richness of spells has already been transmitted in antique sources, both literary and in the form of practically used lead tablets, epigraphic inscriptions, papyri, and the like.

Many medieval Latin and vernacular manuscripts contained incantations, the literature of the Anglo-Saxons being especially rich. The most famous (because most studied) early examples are, however, the two *Merseburger Zaubersprüche* (Merseburg Charms) in the Old High German tongue. There are also many Scandinavian inscriptions in runic characters on wood, stone, and metal. From the late fifteenth century onward, many *grimoires*, small printed books of magic containing spells and the pertinent rites, have been preserved or at least recorded, culminating in the seventeenth, eighteenth, and nineteenth centuries. Nobody will be surprised to learn that nowadays, rather simplistic spells may be obtained from mail-order bookshops (for instance, Lexa Roséan’s book, *Easy Enchantments*) and the Internet (“By the powers of earth, fire, and water, May love come to me. / By the powers of 1, 2, and 3, / Let no harm be. / So let it be!”). Obviously, some people still believe in their practical value, which could be real insofar as their recitation may have a positive autosuggestive effect.

Spells consist of a single word, a group of words, or formulas of several pages; they may be in prose or verse or a mixture of the two. Often, the narration of a situation or an action *in illo tempore* (at that time) is added, functioning as a pattern, the structure of which

should be repeated by virtue of the magic words. So, an Old English spell spoken to find lost cattle runs: “Bethlehem high the borough / in which Christ was begotten, it is far-famed throughout all the earth: So may this deed before men be known through the holy rood of Christ. Amen” (Cockayne 1865, 3: 60–61). Here, the “epic” element is a simile and offers an example for something widely known—as it should become known to the speaker also—in this instance, the place to find the animals. Many spells included allusions to what Jesus, Mary, or a saint did according to the Gospels or apocryphal sources. Consider, for example, this fourteenth-century German blessing to stop bleeding, which contained a reference both to a holy prophet and the founder of Christianity: “Saint Elias sat in the desert and the blood ran out of both his nostrils. Then he began to cry to god and said: ‘Lord god, now help me master this blood, as you have mastered the river Jordan before Saint John baptised you therewith.’ Say three *Pater Noster* and three *Ave Maria*” (Holzmann 2001, 206).

The simplest spell contained only a single word. When Gregory Florentius (538–594), who later became a saint and bishop of Tours, wanted to help his sick father, he put a sliver of wood with one word, the name *Joshua*, under his pillow, and his father recovered (so he told us in his *De gloria confessorum* [The Glory of the Confessors], chap. 39). Sometimes, a single word is repeated; it may be written as an “ephesian sequence,” that is, with the word losing one letter at each repetition, until only one letter is left, such as:

INA
NA
A

(Lecouteux 1996, 71). Incomprehensible words were sometimes inserted to enhance the spell’s mysterious fascination; this was also helpful in communicating spells under the seal of secrecy.

Spells could be used to help or protect the user. In fact, the majority of the material falls into this category (including love charms and spells against maladies, for stopping bleeding, against slow birth, to disable an enemy’s weapon, to keep away thieves, to free a prisoner, to secure a safe voyage, to drive away a dwarf, and to win a legal case). But spells were also applied to bring harm and injury (for instance, killing spells and spells causing impotence). One group of spells concerns not human beings but animals (spells to heal wounds and diseases, to keep away beasts or vermin, to bring back a lost swarm of bees, and to catch fish) or even inanimate objects (spells to stop fire, to prevent rain or hail, and to make good butter). There literally seems to have been a spell for everything.

Spells have been used by people of all social layers for a long time; the huge number of pagan Anglo-Saxon items transmitted in manuscripts with Christian contents demonstrates how interested in them even members of the clergy and especially monks must have been

in the Early Middle Ages. Christianization brought adaptations and substituted saints for the old gods but often did not change the basic structures. Indeed, there is no sharp distinction between a Christianized spell and a Christian blessing. It was probably only after the Reformation and Counter-Reformation and even more because of the Enlightenment that these forms of trying to solve everyday problems became part of what educated elites now call folklore superstitions.

Of course, there were specialists in that business, too. Medieval Spanish sources declared, as one would expect, that *los moros* (Muslims) had a habitual affinity for this form of magic; elsewhere, it was Gypsies, heretics, or witches and always the “simple country-folk.” There is, however, no reason to think that professional sorcerers usually sang their spells much differently from those used by other people, at least if they did not form part of a satanic circle. In the 1428 trial of Matteuccia di Francesco, the witch of Todi, we find a great many spells asking help from Jesus, the Virgin, and the saints, and also some diabolic spells sung to summon a “phantasm,” or Lucifer, the greater demon (Mammoli 1972, 32–33). But it seems there is no answer to the question of whether accused sorcerers used only the “everyday spells” everybody knew, applied demonic spells modified in the current Christianized formulas of folk medicine, or invented these demonic spells under torture. The case of Gostanza, the witch of San Miniato in 1594, suffices as a warning: Questioned without torture, she admitted many acts of healing through the invocation of God and the Virgin only; as soon as she was put on the rack, she confessed to doing everything with the Devil’s help; when again interrogated without torture, she said she had invented everything out of fear, basically by combining folk belief with ecclesiastical teaching. However, it seems extremely unlikely that the interrogators invented all the spells for making hail or killing a victim that were reported in trial records.

Such evil spells even found their way into the polite literature of Europe. Just as stirring as the all too famous song of the witches in Shakespeare’s *Macbeth* is a much less well-known example from an Old Nordic text of the thirteenth or fourteenth century, the end of the “prayer” of the sorceress Busla in the imaginative *Boses* saga: “Here will come seven churls, tell me their names! But first solve the riddle—if you cannot do that correctly, then the dogs shall gnaw at you in the underworld and your soul shall sink into that hellish home.” Then follows an unexplained magic formula, which has also been found on older runic stones: “*Ristil, aistil, pistil, kistil, mistil, vistil*” (Grambo 1984, 93–94).

SPIDERS

For its venom as well as for its manner of hunting by laying traps, the spider has long been seen in Christian culture as an image or symbol of Satan. Both have the same nature; just as the spider awaits its victims poised in the middle of its web or in a dark corner, so the Devil spreads all of the nets and snares he can to capture the souls of humans and seek their perdition. Within Christianity, the spider's web represents not only the ingenious ruses that the Devil uses to ensnare sinners but also "vain works," which have no worth before God. Its extreme fragility also represents the scant security of impious and even heterodox doctrines in which some souls become entangled, dangerous doctrines from which it can be very difficult to extricate oneself. Such symbolism was spread in the Catholic world principally during the period of the Protestant Reformation, although it would remain for centuries—for example, in Georgette de Montenay's book of religious emblems, where the spider's demonic associations appear condensed in four illustrative verses: "The spider, an odious insect / surprises flies with its fragile web / thus every doctrine that is frivolous and gauzy / spreads deceitful webs for weak spirits" (Montenay 1571, 32).

From ancient times, the Christian imaginary tended to exaggerate the gravity of the spider's venom. The most notable case is that of the tarantula spider, associated with the southern Italian locality of Taranto, whence its name derives. It was supposed that anyone stung by a tarantula would experience acute sufferings, which could only be relieved through dance and music, particularly by playing musical pieces called "tarantellas." The phenomenon known in Apulia, Italy, as

tarantism goes back to the ancient Middle East; with intense popular participation and under various mythical ritual guises, it lasted until the end of the eighteenth century, gradually declining thereafter until the beginning of the twentieth century. This complex ritual—although associated principally with Apulia, where its symbolic range underwent its fullest development—could also be found in other areas of the Mediterranean, from the rest of southern Italy to Sicily, Sardinia, southern France, Spain, Albania, and Greece.

After the earliest attempts at symbolic interpretation by Leonardo da Vinci and Giovanni Pontano, natural scientists of the seventeenth and eighteenth centuries tried to reduce tarantism to an illness, a poisoning caused by the sting of the tarantula of Apulia, as well as a form of melancholy. More recently, following Ernesto de Martino's excellent study of the anthropology and history of religion (1961), scientific interpretations of tarantism have been replaced by investigations emphasizing its eminently cultural character, as a manifestation of ancient conflicts between paganism and Christianity in southern Mediterranean societies.

De Martino understood the tarantula as a "mythical monster," an imaginary construct that incorporated not only one concrete species of corpulent and shaggy spider (which modern zoology designates as *Lycosa tarentula*) but also another species, one more terrifying and without doubt more harmful, the *Latrodectus tredecimguttatus* (the Mediterranean Black Widow spider). However, despite the greater frequency of these species in the symbolic elements of this myth, other venomous species such as scorpions and snakes and even harmless spiders have also been called tarantulas.

The spider's venom is less important than the symbolism of venom and its effects: the sting or bite of the spider as a representation of unresolved regrets, frustrations, and conflicts. Tarantism, a therapeutic rite capable of alleviating certain unutterable sufferings by means of a long rosary of ceremonial lamentations, is now considered a form of musical, choreographed exorcism, whose cultural rather than biological character seems confirmed by annual repetition and the predominance of women among its victims. For many women, enveloped in oppressive southern Mediterranean surroundings, the supposed sting of the spider presents a unique occasion for putting aside inhibitions and permitting liberties usually prohibited to them, as with those (primarily women) thought to be victims of demonic possession.

**SPINA, ALPHONSO
(ALPHONSUS, ALFONSO)
DE (D. CA. 1491)**

A mid-fifteenth-century Spanish Franciscan, confessor to Juan II of Castile, and bishop of Orense, Alphonso de Spina spent a good part of his life preaching in the towns and villages of Castile. Hence, he had a personal and intimate understanding of popular beliefs and folklore.

In 1459, he produced a polemical work, *Fortalitiū fidei contra fidei Christianae hostes* (The Fortress of Faith

Woodcut of Alphonso Spina persecuting Jews, blindfolded because they do not see the truth. On the right are demons, linked in the Christian mind to Jews. (Topham/The Image Works)

against the Enemies of the Christian Faith), which thereafter ran into several editions. It was divided into five books, the fifth of which dealt with the warfare between demons and human beings, the Church, and God. Strongly reminiscent of St. Augustine's *City of God*, the book envisaged human history as a state of open hostility between the world of God and the world of the Devil. There is a hierarchy of demons, said Spina, mirroring the hierarchy of heaven and of the Church, and each demon has been allotted a particular sin over which he exercises special charge. Moreover, every human being is attended by at least one evil spirit who is responsible for his or her spiritual downfall. Demons are thus, at base, a source of sin rather than simply of misfortune; they not only raise storms in the physical world, but far more seriously, they excite Jews and heretics to attack the Church and thereby bring Christian souls into grave danger. But why do demons exist at all? Because, said Spina, they act as dark contrasts to the goodness and beauty of creation and thereby throw these into greater relief, after the manner of antitheses in a beautiful poem.

When Spina discussed demons in detail, his knowledge of popular beliefs became apparent immediately. He wrote of incubi and succubi; of spirits who press upon folk while they are asleep and make them think they are being suffocated; of demons attendant upon witches as their familiars; and of *bruxae*, spirits who cause old women to imagine they can fly through the air as attendants upon Diana or Herodias. This latter notion, he said, is a delusion, and yet one should not dismiss as merely foolish or superstitious those women who claim such things. They may be deluded, but their delusions are criminal and therefore deserve punishment. Certain spirits are harmless. Spina told the story of how he and three companions were asleep in a room one stormy night. When the storm subsided, they heard noises from the other side of their locked door and then sensed a small spark of light beside them. One of Spina's companions, more experienced in these matters than the others, recognized the phenomenon. It was a demon, *Dueño de casa* (owner of a house), who played silly tricks but did no one any real mischief.

Spina thus illustrated very well a dichotomy in contemporary attitudes toward magic. As a cleric familiar with the *Canon Episcopi*, he dismissed the whole business as futile and censured anyone who used it. But as an individual in touch with popular beliefs, he seemed to accept that magic could actually work and that its practitioners therefore represented a real rather than a deluded threat to the safety of the Church and the whole body of orthodox Christians.

SPINA, BARTOLOMEO DELLA (1475/1479–1546)

Author of three short works on witchcraft, Bartolomeo della Spina was born in Pisa to the ancient and noble Spina family of Sarzano. He joined the Dominican order in 1493 at the local convent of St. Catherine and studied theology at the University of Bologna under Silvestro Prierias. From 1518 to 1520, Spina served as deputy to Inquisitor Antonio da Ferrara at Modena, where a witch, Chiara Signorini, was tried in 1519. Three years later, he wrote a treatise against witches.

At the University of Bologna, where Spina obtained his baccalaureate in 1525 and became a master in 1530, he taught in the College of Theology, serving three years as rector of the Dominican *Studium Generale* (house of studies). He also held numerous positions in his order: assistant to the general master, with the honorific title of "governor of the Holy Land," from 1530 to 1532; vicar-general of the order in 1531; and provincial and inspector of convents in Calabria for two years beginning in 1534. In 1536, Spina became a professor at the University of Padua, a position he kept until 1545. In 1542, Pope Paul III nominated him as papal theologian (*maestro del sacro palozzo*); he and other members of the theological commission contributed to opening the Council of Trent. He died in Rome.

Beyond serving his order, Spina also did considerable academic writing, including commentaries on Aristotle, a defense of the philosophy of Thomas Aquinas, and arguments against the nominalism of Duns Scotus, plus original theological works. Between 1519 and 1535, his writings were published at Venice in three volumes. Spina dedicated some polemical tracts to the problems of witchcraft and magic. He also published two short vernacular essays to guide the laity: *Regola del felice vivere de li christiani del stato secolare secondo diversi gradi di persone, e massime delli maritati* (Rules for Living a Happy and Christian Secular Life, Adapted to People of Different Conditions and Principally for Married People) and *Breve regola della vita spirituale delle persone religiose* (Concise Rules for the Spiritual Life of Nuns), both published in 1533.

Spina's three short works about witchcraft were almost always published together. The first rare editions, probably printed at Venice, comprised *De strigibus* (On Witches) or *Quaestio de strigibus* (An Investigation of Witches, 1523) and two tracts against the skeptical

jurists, Giovanni Francesco (Gianfrancesco) Ponzinibio: *Tractatus de praeminentia sacre Theologie super alias omnes scientias et precipue humanarum legum* (Treatise on the Supremacy of Sacred Theology over All Other Sciences) and *In Ponzinibium de Lamjis Apologiae* (Defense from Ponzinibio's On Witches), both with a first publication date of 1525. These three essays fill only thirty-nine pages: three unnumbered pages, then the *Quaestio* (1–18), *De praeminentia* (19–26), and *In Ponzinibium* (27–36). There were numerous reprints of these works, sometimes in Germany and France. The best-known edition is that of Spina's collected works, published in 1576 as *Quaestio de strigibus una cum tractatu de Praeminentia Sacrae Theologiae et quadruplici Apologia de Lamjis contra Ponzinibium* (An Investigation on Witches with a Treatise on the Supremacy of Sacred Theology and a Fourfold Defense from Ponzinibio's on Witches).

The importance of Spina's essays about witchcraft lies in his attempt to abolish the distinction between ancient and contemporary witchcraft and to deny the credibility of the *Canon Episcopi*. Spina observed that the *Canon's* origin is obscure: We do not know who convened the Council of Ancyra in 314 (almost certainly, it was heretics), nor do we know if it was a general or a provincial council. The insertion of the *Canon Episcopi* in the *Decretum Gratiani* (Gratian's Concord of Discordant Canons, known as the *Decretum*, 1130; revised in 1140) does not give it validity because the Church never officially approved Gratian's work. Spina's essay, written in the detailed Scholastic style of *Quaestio* and *Responio*, demonstrated that the flight of witches to the Sabbat was real and not fantasy or diabolical illusion. His most cited source is the *Malleus Maleficarum* (The Hammer of Witches, 1486, by another Dominican, Heinrich Kramer), supplemented by examples from Spina's personal experience as an inquisitor. The other two works are polemics, refuting principally Ponzinibio's recent *Tractatus de lamjis et excellentia utriusque iuris* (Treatise on Witches and on the Excellence of Civil and Canon Law) of 1520. Ponzinibio maintained that civil law overrides canon law even on theological questions and manifested skepticism about the reality of the flight of the witches. In *De Praeminentia*, Spina reasserted the traditional superiority of theology over other sciences and reduced law to an ancillary position; *In Ponzinibium* affirmed that it is presumptuous to refute a theological question, such as the flight of witches, with merely judicial arguments.

ST. MAXIMIN, PRINCE-ABBEY OF

From 1586 to 1596, in 1637, and in 1641 and 1642, approximately 500 alleged witches were executed in the territory of the imperial abbey of St. Maximin, situated just outside the city walls of Trier and containing about 2,200 persons according to a 1563 census. This extended outbreak of witchcraft persecution ranked among the very worst anywhere in the Holy Roman Empire.

Mentioned in a 1590 pamphlet, *Erueyterten Unholden Zeyttung* (Further News of Witches), these witchcraft trials were triggered by agrarian and economic crises and by the already ongoing witch hunts in the duchy of Luxembourg and electoral Trier, showing the St. Maximin authorities how to handle the problem. In the relatively small and compact territory of an imperial abbey, the organization of witchcraft persecution attained a deadly level of perfection. Severe persecution had begun in 1586, by which time *Hexenausschüsse* (local witch-hunting committees) were active. At least 400 people were executed for witchcraft between 1586 and 1596. The severe effects of the trials on the affected villages, combined with high trial costs, brought persecution to a standstill by 1596. Another sizable witch hunt, involving at least thirty-two trials, occurred between 1637 and 1642, until a partial occupation of St. Maximin's territory by French troops hindered persecution.

Around a third of all witches tried by St. Maximin authorities were men, often from the wealthier part of their respective villages. Inadequate evidence makes it harder to identify the social status of the executed women, although poor widows were in a minority: Many women came from households whose heads held such positions in village government as *Meier* (stewards), *Zender* (village officials), or *Schöffren* (court assessors).

Before the actual trials began, the identification of witches lay mainly in the hands of *Hexenausschüsse*, which were so highly organized and influential that they attained quasi-official status in St. Maximin territory. These village witch hunters worked very closely with St. Maximin's *Amtleuten* (local magistrates), *Schultheissen* (bailiffs), and *Schöffren* and thereby exercised a kind of tyranny over their own communities. In the name of the village officials and inhabitants, the *Hexenausschüsse* usually gave the relevant authorities a list of accusations made against suspected witches in their community, copies of damaging statements made against suspects in confessions of already executed witches, and a list of witnesses for each case. A local magistrate or court assessor of St. Maximin then questioned the witnesses in the presence of a clerk, who kept a record of the proceedings.

All preliminary paperwork was, in accordance with the Carolina Code, submitted to St. Maximin's *Oberhof* (central court), which drew up legal summaries of the arrest, interrogation, and torture of suspects. Decisions to investigate accusations of witchcraft *ex officio* and to arrest suspects were made by the abbey's officials investigating the case, as were subsequent decisions on trial procedure. Trials were very rapid; some required only one or two days from arrest to execution. No recorded evidence suggests that any suspected witch enjoyed the luxury of a defense lawyer. A few suspects submitted pleas for mercy to the abbot, but there is no evidence of appeals to the *Reichskammergericht* (imperial chamber court). Individuals tried as witches were almost always executed: Very few cases ended with the release of the suspect. Authorities recouped the trial costs from surviving relatives of those executed, rather than by confiscating their goods.

The mass burnings between 1586 and 1596 were encouraged by fear of the threat from a sect of witches whose persecution was perceived as immensely urgent. As the "Witch-Register of Claudius Musiel" shows, the denunciation of alleged accomplices by suspected witches acquired paramount importance in St. Maximin trials; from 1586 until 1594, this register collected over 6,300 denunciations against approximately 1,380 people from ninety-seven places. Like the *Hexenausschüsse*, St. Maximin authorities demonstrated great energy in promoting witchcraft trials. The abbot and his officials intended that these carefully documented and archived trial records would serve as proof of their independent exercise of criminal justice and territorial sovereignty, an issue of considerable importance because of St. Maximin's ongoing dispute with electoral Trier over its political and judicial autonomy. One can thus conclude that the St. Maximin authorities recorded their witchcraft trials carefully for essentially political purposes.

The cooperation between *Hexenausschüsse*, local officials, and the abbot of St. Maximin had a

devastating impact on his subjects between 1586 and 1596. After the death of *Amtmann* (chief magistrate) Claudius Musiel in 1609 and the removal of the witch-hunting abbot Reiner Biewer in 1613, accusatory zeal waned markedly. Subsequent abbots and officials continued to uphold the abbey's political and legal autonomy, but they no longer saw promoting witchcraft trials as the best method for defending it, especially as St. Maximin's financial problems and wartime circumstances rendered it virtually impossible to prosecute witches. Popular thirst for persecution appeared unquenched, however, and *Hexenausschüsse* continued to submit accusations against witches to the authorities. The new, cautious attitude of local officials meant that very few of these charges resulted in formal prosecution, a fact about which the *Hexenausschüsse* complained bitterly. Finally, it is noteworthy that St. Maximin's witch persecutions were carried out without any formal intervention by the electors of Trier.

ST. OSYTH WITCHES (1582)

An extraordinary outbreak of witchcraft prosecution in Elizabethan England was noteworthy for illustrating the development of theological ideas and legal methods.

Ursula Kemp was a midwife, nurse, and healer at the parish of St. Osyth in the county of Essex, but she did not have a good reputation among her neighbors. In 1582, she was refused work caring for the child of Grace Thurlow, a servant of a local magistrate, Brian Darcy. Soon afterward, the child fell from its cradle and broke its neck, and Ursula's witchcraft was suspected. Nonetheless, Ursula's help was accepted when Grace herself began to sicken, but a quarrel erupted when she refused to pay the healer. Her sickness returned, and Ursula was carried before the justices of the peace. Magistrate Darcy examined Ursula's eight-year-old son, who reported that his mother fed diabolical imps called "Tyffin," "Tittey," "Piggen," and "Jacket." Promised "favor" by Darcy, Ursula broke down and confessed that what her son had said was true and that she used these familiars to cause illness and even to kill. She took her examiners through her crimes step by step, and she named other witches who had committed similar crimes. At least ten women from St. Osyth and neighboring villages were apprehended and tried at Chelmsford in February 1582, although it seems from the trial records that only two were actually hanged.

At that time, Essex was undergoing rapid economic transformation, which inevitably created significant differentials of wealth within communities that increased competition, suspicion, and resentment. These conditions, together with a witchcraft statute and an endemic belief in the supernatural, comprised essential preconditions for accusations of witchcraft. Essex was the English witch-hunting county par excellence. Three years before the St. Osyth outbreak, there had been numerous executions at Chelmsford following confessions similar to those of Ursula Kemp. What the suspects at Chelmsford and St. Osyth had in common was poverty and poor local reputations. They lacked the moral and political authority with which to resist the accusations made against them, and beyond that, their accusers and examiners saw in their wretched condition a compelling motive to use diabolical means to improve their fortunes and undermine those of more privileged neighbors. Ursula Kemp was a "poore and needie woman"; her son was illegitimate; and she had little credit among her neighbors, being held in deep suspicion because of the methods she used to heal people—always a danger if relations between practitioner and healer happened to deteriorate.

Grace's employer, the magistrate Brian Darcy, had read continental authors on the subject of witchcraft, and he published a substantial account of the St. Osyth incident shortly after the executions in 1582. He may have had more than an academic interest as well: It was rumored that his father had died as a result of being bewitched, and he sought revenge when rumors of witchcraft started to circulate among his tenants. Not only did Darcy pick up ideas about

diabolic pacts from his books, he also apparently learned about subtle but persistent techniques of interrogation. Ursula Kemp was not alone in her confession. Elizabeth Bennett, a poor wool-spinner, initially denied all knowledge of witchcraft, just as Ursula had originally confessed only to cunning magic, but coaxed and cajoled by Darcy, she eventually began revealing all the terrible crimes she had committed using diabolical familiars.

Unlike Matthew Hopkins sixty years later, Darcy did not use torture to extract these confessions; rather, he offered a means of escape to women who feared for their lives—and with good cause. Margery Sammon did not persist with her denial of the charges after her sister took her to one side and whispered in her ear, probably to advise that confession was her only hope. Of course, confession was actually the most damning evidence, and Darcy's promises of favor were empty ones. Reginald Scot, the skeptical writer from neighboring Kent, took the St. Osyth trials as the main inspiration for his *Discoverie of Witchcraft* (1584), which contained some withering criticism of Darcy's peritrial methods. Hearsay, false charges, and the unreliable testimony of children and people of poor reputation were all amassed for the purposes of the prosecution, bearing out the belief, which held for at least a generation, that the Devil was cunning and that extraordinary types of proof should be admissible against witches as a consequence. A century after the St. Osyth trials, it was exactly this argument—the vagueness of evidence—that contributed more than anything else to the decline of witchcraft prosecutions in English courts.

STEARNE, JOHN (D. 1671)

Stearne is best known in witchcraft history as the associate of Matthew Hopkins during the mass witch hunts between 1645 and 1647 in eastern England. Like Hopkins, Stearne was an obscure figure, a member of the petty gentry living in Manningtree in northeastern Essex. Stearne was involved in this witch hunt from the

outset, giving evidence against the Manningtree witches before accompanying Hopkins on his witch-finding journeys through the eastern counties. Although overshadowed by Hopkins in older accounts, Stearne also had a considerable impact as a witch finder.

Whatever his input into the actual trials, Stearne contributed to our knowledge of them by publishing his *Confirmation and Discovery of Witchcraft* (London, 1648). The printer, William Wilson, also published John Davenport's account of the Huntingdon trials of 1646, as well as John Gaule's *Select Cases of Conscience Touching Witches and Witchcrafts*, also in 1646. Stearne's *Confirmation and Discovery*, the main text of which covered sixty-one pages, was among the rare books written by a self-confessed witch hunter. Much of its text was devoted to discussing some major themes of English demonology; in fact, these passages were heavily plagiarized from Richard Bernard's *Guide to Grand Jury Men*, first published in London in 1627. Stearne offered his reader a fairly standard list of biblical references to witchcraft and such standard justifications of witch hunting as the fact that the laws of all nations encouraged it, that there were so many reports of cases involving the trial of witches, and that both England and other nations had experienced the effects of witchcraft in the recent past (citing the case of the Warboys witches and other well-known English episodes). Witches, Stearne argued, addressing another theme common in demonological works of the period, still existed despite the spread of the Gospel because their works were linked to the Devil. Stearne also developed the theme, very common among English demonologists, that "good" witches, the cunning folk to whom the population at large so readily resorted, were as worthy of censure and extirpation as the malefic witches whom the populace feared. Stearne also discussed familiars and the witch's mark in what were, by then, very conventional terms.

Besides discussing such fairly familiar themes, Stearne's tract provides us with a substantial body of information about the mass trials in which he was so heavily involved. There were details of his and Matthew Hopkins's investigative techniques, names of a number of witches, and details about the accusations against them that cannot be found elsewhere or that complemented other sources. Intriguingly, Stearne also attempted to justify his actions, and at least some of his statements cannot simply be dismissed as special pleading. His answer to criticisms of the investigative techniques he and Hopkins used, notably "watching" (a process involving sleep deprivation), will not convince the modern reader, despite his interesting justification of the practice on the grounds that the investigators were waiting for the witch to be visited by her familiar. Stearne denied taking any bribe or gift in the course of his witch-hunting activities, except whatever was given

him openly in public; he also insisted that he and Hopkins were often responding to a demand for witch hunting within eastern England's townships, a useful correction to the traditional view that the witch hunts were simply stirred up by the two witch finders.

Stearne was living at Lawshall in Suffolk when he wrote *A Confirmation and Discovery*. Malcolm Gaskill (2005) has suggested that by the 1650s, Stearne was apparently experiencing financial problems, and at the time of his death, he was earning his living as a scribe or scrivener, suggesting a decline in fortune for one who had once described himself as a gentleman.

STERZINGER, FERDINAND (1721–1786)

Sterzinger was a theatine monk who initiated the dissipation of witchcraft trials and superstition in Bavaria and promoted enlightenment in southeastern Germany. Born at Lichtenwörth in Tyrol, he took his vows at Munich in 1742. Beginning in 1747, he studied theology and canon law at Rome and Bologna. Between 1750 and 1759, he taught moral philosophy and Canon law at Prague and Munich. He remained in Munich for the rest of his life, holding several high offices as professor of theology, canon law, and Church history and head of his monastery (from 1762 to 1765). A member of the new Bavarian Academy of Sciences (founded in 1759), he headed its historical section from 1769 to 1779 and was entrusted with Bavarian censorship. He fought against superstition and the belief in witchcraft until his death. Sterzinger published several books and papers with the intention of disproving the existence of witchcraft. He was also a leading spokesman in the controversy surrounding the exorcist Johann Joseph Gassner. In four books (from 1774 to 1783), Sterzinger attacked Gassner, exorcism, and superstition in general very strongly. He unmasked Gassner's exorcism and wonder cures as frauds and transgressions against Catholic orthodoxy of the official *Rituale Romanum* (Roman Ritual, 1614). As a historian, he wrote about early Christianity and initiated a discussion on the origins of the early medieval *Lex Baiuvariorum* (Law of the Bavarians). In 1774, he published Johannes Trithemius's Renaissance treatise *Unterricht wie ein*

Priester wohlanständig leben solle (Lessons on the Appropriate Way of Life for Clerics).

With the publication of his *Akademische Rede von dem gemeinen Vorurtheile der wirkenden und tätigen Hexerei* (Academic Speech Against the Prejudice of Effective and Active Witchcraft) in 1766, Sterzinger opened a controversy about witch hunting known as the *Bayerische Hexenkrieg* (Bavarian War of the Witches), which lasted until 1770. In his *Academic Speech*, written under the influence of Jordan Simon (Ardoino Ubbidiente Dell'Osa, an Augustinian), Scipione Maffei, and Girolamo Tartarotti, Sterzinger defined witchcraft as a pact between man and the Devil. Using Simon's arguments and proofs of the destruction of the Devil's power by Jesus's self-sacrifice, Sterzinger pronounced an alliance between man and the Devil to be impossible (although he never denied the existence of the Devil). He pointed out that the belief in the witches' Sabbat contradicted canon law (as in the *Canon Episcopi*). He ridiculed witchcraft as an evident illusion, because there was no reference to sorcerers or witches in the Gospels or the prayers of the *Rituale Romanum*. Sterzinger claimed that "unprejudiced" investigations and examinations by physicians would soon end the belief in witches and demonic possessions.

Sterzinger's speech provoked harsh criticism from all strata of Bavarian society, led by two other monks, the Augustinian Agnellus Merz and the Benedictine Angelus März. In 1767, Sterzinger answered them in his *Betrügerische Zauberkunst und träumende Hexerei* (Deceitful Sorcery and Dreaming Witchcraft). Within four years, various authors published some forty pamphlets for and against Sterzinger.

To understand the Bavarian War of the Witches, we must consider its wider political background. In the 1760s, Bavaria experienced Enlightenment politics and social reforms. The *Hexenkrieg* was part and parcel of a controversial process, in which a new place for the Catholic Church in Bavarian society was defined. Polemics against witchcraft belief became a weapon in this battle against the Church in order to legitimize the secularization of Church property and the nationalization of education.

Sterzinger further elaborated his arguments in four more books. Under the name Francone dell'Amavero, he published *Katechismus von der Geisterlehre* (Catechism on the Doctrine of Spirits, Munich, 1775) and followed it with two other harsh attacks on the belief in demonic possession and witchery: the enlarged edition of *Geister- und Zauberkatechismus* (Catechism of Spirits and Magic, Munich, 1783) and *Don Ferdinand Sterzinger's Bemühung den Aberglauben zu stürzen* (Don Ferdinand Sterzinger's Effort to Defeat Superstition, Munich, 1785). In his final book, *Die Gespenstererscheinungen, eine Phantasie oder Betrug . . .* (Apparitions of Ghosts, an Imagination or Deception . . ., Munich, 1786), he

attempted to disprove the existence of apparitions of dead people.

Sterzinger's arguments were often self-contradictory. He tried to avoid open clashes with Catholic traditions and with secular law. He did not admit that the victims of witch hunts had been innocent; they had deserved death because of their blasphemy, devil worship, and infanticide.

STICKS

Various kinds of sticks, especially cooking sticks and broomsticks, played a prominent role in the practices of witchcraft. Witches frequently were said to travel through the sky on sticks, often smeared with an ointment made from the fat of cooked children. Sticks were also related to the wands magicians used in sorcery rituals to create storms, bring injury and death, or effect metamorphosis.

In their night rides and processions through the sky, witches allegedly rode a wide range of everyday implements, as well as goats and other animals. The implements included broomsticks, cooking sticks, distaffs, pitchforks, threshing flails, reeds, wicker nets, baskets, sieves, stools, and shovels. In early-fifteenth-century witchcraft treatises, witches were usually described as riding sticks to their assemblies (Sabbats or synagogues). In a witchcraft treatise of around 1436, the Dauphiné judge Claude Tholosan first described them riding on brooms; two years later, a trial confession from the same region first referred to an accused witch riding a stick to

the Sabbat. One protagonist in Martin le Franc's long allegorical poem, *Le Champion des Dames* (The Defender of Ladies, 1440–1442), attacked the deeds of shameless women called sorcerers who traveled through the air on sticks to their "synagogues." And in a 1451 manuscript copy of this work, an unknown illuminator created the first images of such riding women (if we exclude two wall frescos in the cathedral of Schleswig in northern Germany that were probably misdated): One rides a simple stick, another a broom.

For the next century and a half, pictures of witches riding broomsticks were largely limited to France and the Low Countries. Broomsticks appeared in a series of illuminations to a work by the Walloon theologian Johann Tinctor in the 1470s, in a number of female *Dances of Death* printed at Paris in the 1490s, in a 1526 painting of the witch of Endor by the Dutch artist Jacob Cornelisz van Oostanen, in Pieter Brueghel's drawings of the magician Hermogenes from 1565, and in an illustration to a 1579 Genevan edition of a dialogue on witchcraft by Thomas Erastus. The last two examples depicted witches riding brooms out through

Earliest illustration of witches flying on broomsticks, marginalia on a manuscript copy of Martin Le Franc's *Le Champion des Dames* (The Defender of Ladies), 1440–1442. (Snark!Art Resource)

domestic chimneys, a motif that subsequently became very common in the iconography of witchcraft. The motif also appeared in a 1593 engraving depicting the curious practices of witchcraft in the region of Trier, and it featured in many early-seventeenth-century images by Frans Francken the Younger and David Teniers the Younger.

In German-speaking Europe, however, the most commonly depicted instrument on which witches rode through the air was a cooking stick (or cooking fork). The first such cooking stick appeared in Ulrich Molitor's *De Laniis et Phitonicis Mulieribus* (Concerning Witches and Fortunetellers), originally published around 1489. Although Molitor's text only referred to witches riding on "sticks," illustrations featuring cooking sticks appeared in more than twenty editions of the work during the next two decades, establishing the cooking stick as the ordinary instrument for witches to ride. Hans Baldung [Grien]'s famous 1510 woodcut of a group of witches seated in a triangle of cooking forks consolidated the role of the cooking fork in witchcraft iconography throughout German-speaking Europe over the next two centuries. Apart from a broomstick and a cooking stick appearing together in Jacob Cornelisz's 1526 painting, German artists would not accept the broomstick of French and Flemish tradition until the 1590s, while French or Flemish artists ignored German-style cooking sticks.

Cooking sticks were commonly depicted in contemporary iconography as instruments used near a fire to hang food or vessels from, turn food, transport pots, or simply stoke the fire. In this way, cooking sticks helped identify witchcraft as a female activity, linking it to a woman's task of food preparation around a cauldron. The use of the besom, or broom, by contrast, seems less clear. Though commonly linked to female domesticity and house cleaning, the besom seldom appeared in representations of domestic scenes before the seventeenth century. But given the association of besoms with domestic interiors and the gradual sixteenth-century identification of interiors as female space, riding a broom could have signified escaping from the domestic sphere with its attendant social and moral roles. However, riding brooms might be linked to ancient agricultural fertility rites, as in Jean Bodin's claim (1995, 120) that witches danced with brooms in their hands at the Sabbat, raising them to worship the Devil in imitation of the worship of God.

In witchcraft accounts, sticks also took on functions similar to those of the wands of ritual magicians, especially in various images of the classical witch Circe, who used a wand to transform humans into animals and maintain control over them. Sticks were often given to witches by the Devil at Sabbats. In Pierre de Lancre's *Tableau de l'inconstance des mauvais anges et demons* (Description of the Inconstancy of the Evil

Angels and Demons, 1612), rods and switches were given to child-witches to look after toads, a detail clearly depicted in Jan Ziarnko's accompanying etching. But as described by Henri Boguet in his *Discours des sorciers* (Discourse on Witches, chap. 29), a wand could also become an extension of the hand with which witches touched their victims to cause injury or death.

Another frequently described form of maleficence that included a wand or rod in its ritual was a type of weather sorcery. As outlined by Boguet or Bodin and described at greater length by Nicolas Rémy (1974, 514), witches would beat water with black wands provided by a demon while chanting spells in order to make heavy rain or hail. Witches could also use the same ritual to fly through the air, soon making it thick enough with dense vapor and smoke to carry them up. However, Martín Del Río, in his *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599–1600), referred to creating hailstorms by striking a stone with a stick.

STOECKHLIN, CHONRAD (1549–1587)

In 1578, Chonrad Stoeckhlin, a horse wrangler in a mountain village of the Allgäu Alps, made a revenant

contract with another herdsman: Whoever died first was to return from the otherworld in order to answer questions. The other man died soon after but indeed returned from the otherworld, foretelling the advent of an angel. Around the Ember Days (four groups of three days of abstinence and fasting in the Western Church), the angel appeared and initiated Stoeckhlin to the “phantoms of the night” (*Nachtschar*), who had to leave their bodies on certain nights and fly to certain places. Stoeckhlin’s stories open a window to some fantasy worlds of popular beliefs in the central Alps. By joining the phantoms of the night, Stoeckhlin participated in supernatural abilities such as healing and divination. Furthermore, he served as a witch doctor. In this capacity, he involuntarily triggered a major witch hunt in the southernmost parts of the prince-bishopric of Augsburg in 1586 because the authorities were fascinated by his stories and exploited them for their own purposes. During the course of the witch hunt, he was the only man burned at the stake.

STRASBOURG, DIOCESE OF

Alsace was divided into three dioceses at the time of witch hunting: Speyer, Basel, and Strasbourg. The diocese of Strasbourg included two parts, mostly located in present-day France (Alsace), with a smaller part located east of the Rhine in present-day Germany (Lahr, Offenburg, and Ottersweier). The diocese of Strasbourg covered a large part of modern Alsace, where about a thousand witches were executed between 1570 and 1650. Several of them died in places where the bishop of Strasbourg was also the territorial prince; expelled from Strasbourg after the Protestant Reformation, he established his capital at Saverne, dividing his political possessions into eight *bailliages* (bailiwicks), all but one of them west of the Rhine. However, most Alsatian witches died in places outside the bishop’s political control. From an ecclesiastical standpoint, this bishopric included many lands under controlled by various landholders, making its borders somewhat difficult to establish. For instance, the valley of Lièpvre on the eastern side of the Vosges, located in the center of Alsace near Sélestat, belonged partly to the dukes of Lorraine, but for religious purposes, it belonged to the diocese of Strasbourg rather than the diocese of Toul, which included most of Lorraine.

Historians have raised the question about geographic and political divisions in this diocese for a long time.

Around 1830, J. Theiler wrote a short notice about witchcraft in the bishopric of Strasbourg, in which he affirmed that different sixteenth-century demonologists believed that the diabolical sect observed strictly delimited and distinct boundaries. In Theiler’s opinion, the archives proved that there were exactly four specific places where Sabbats took place in the bishopric of Strasbourg: The witches from the *bailliages* east of the Rhine went to Knibis hill; those from the *bailliages* of Obermundat gathered at the Schauenberg; those from the *bailliages* of Benfeld, Marckolsheim, Wantzenau, Dachstein, and Schirmeck met at a hill near Bischoffsheim, called the Bischenberg; and those from the *bailliages* of Kochersberg and Saverne held their meetings on the Büchelberg. But many other places in addition to these four were mentioned in trial records, and such precise geographic and political distinctions seem pointless.

There was no uniformity in the witchcraft cases in the diocese of Strasbourg. All spatial divisions appear to be artificial when witchcraft is concerned, and precise limits become important only when we consider questions of legal jurisdiction. Alsatian witches were frequently in contact with other witches who lived under different jurisdictions, which was no obstacle to their coming together. For instance, witches from the valley of Lièpvre claimed to attend Sabbats in the Alsatian plain, well outside the area of jurisdiction in which they lived. Only the real-life experience of each witch determined her living area and sphere of influence. The population of the diocese at that time was quite mobile, and contacts between different communities were numerous. It was not rare that a witch claimed to have witnessed a Sabbat as a young girl in one region before she subsequently moved to another.

STRIX, STRIGA, STRIA

Strix (of which *striga* and *stria* are variants) is the Latin word meaning “screech-owl,” but it quickly developed a number of associations linking it to malevolent women who practiced magic—hence its use in

medieval and early modern demonologies as one synonym for *witch*.

In Classical Latin usage, *striges* were birds of ill omen that ate people's entrails and drank their blood. Several authors, including Silius Italicus, Plautus, and Propertius, mentioned them. They were associated with practitioners of maleficent magic by Horace (*Epodes* 5.20) and Albius Tibullus (*Corpus Tibulliquum* 1.5.52). In a lengthy passage of Ovid's *Fasti* (6.131–168), they were described as birds of prey that flew during the night, attacked children in the cradle, ripped open their flesh, and drank their blood. Petronius used a derivative of this word, *striga*, in his *Satyricon* (63.4–8). There, he told us that while certain people were sounding the death lament for a young boy, *strigae* began to shriek; not long afterward, the mourners discovered that the *strigae* had managed to carry off the child's dead body, leaving a bundle of straw in its place. The second-century C.E. grammarian Festus defined *strigae* as evil-doing women (*maleficae mulieres*) who were able to fly (*volaticae*). Thus, many elements of the later image of the witch were already in place in classical literature: night flying, shape changing (metamorphosis), child murdering, child substitution, and sinister magic.

The Middle Ages betrayed a certain unease about Christians' continuing belief or trust in people who still claimed to work pagan magic and foretell the future. In *A Letter to Charlemagne*, Cathalpus listed various kinds of magical operators—those who used poisons, those who raised storms, those who used incantations, and so on—including *strigae*, adding that all such evil works came from the Devil. The *Synodus Patricii et Auxentii* (Synod of Patrick and Auxentius) declared that any Christian who believed in the type of divinatory witch known as a *striga* should be excommunicated. The association of *strigae* with anthropophagy was unnervingly brought out in chapter 5 of Charlemagne's capitulary for the conquered Saxons, which announced that anyone who had been deceived by the Devil into believing that a man or a woman was a *strix* and ate people and had therefore been led into cannibalism should be put to death. The *Pactus Legis Salicae* (Pact for the Salic Laws), however, was milder and merely said that if a *stria* had eaten someone and the fact had been proved against her, she was simply to be fined. The *Lex Salica* (Salic Law) hinted at a belief in witches' Sabbats, since it declared that anyone who called someone else a "carrier of poisons," that is, a transporter of witches (*strio-porcium*), and either could not or did not wish to prove it had to pay a fine; meanwhile, the Lombard Laws also provided protection against slander by saying that a free, married woman who had been unjustly accused of being a witch (*striga*) could either return to her relatives or seek refuge with the king.

Early modern demonologists, by contrast, well read in the classics, tended to exhibit their familiarity with

that tradition in particular. Gianfrancesco Pico della Mirandola, for example, began his dialogue *Strix* (1523) with an exchange between two interlocutors, which played upon the two meanings of the word—screech-owl and witch—and drew attention to the tradition that *striges* were women transformed into owls by evil spirits. The Jesuit Martín Del Rio claimed that *striges* derived their name "from an accursed night-bird which is believed to bring death to infants" (*Disquisitiones Magicae libri sex* [Six Books on Investigations into Magic], book 1, chap. 2). In 1553, Pedro de Cieza carried the European concept to the New World when he observed that Peru used to contain many *striges* who sucked out blood from small children (*La crónica de Perú* [The Chronicle of Peru], part 2, chap. 196). Through the use of Latin by scholars, therefore, ancient ideas continued to imprint themselves on later concepts of the witch. And, of course, the modern Italian term for witch, *strega*, derives from *striga*.

SUICIDE

Suicide has a twofold relationship with witchcraft in early modern Europe, both through the deed itself, often committed by suspected witches to escape the cruelties of inquisitorial procedure, and more fundamentally through the association of self-murder with temptations of the Devil. Throughout Europe, accused witches killed themselves in jail during their trials, usually by hanging. Presumably, their actions were motivated by a genuine fear of the extremes of judicial torture applied in cases of witchcraft as a *crimen exceptum* (the excepted crime; a crime so serious and frequently hard to prove that it was excepted from the usual legal procedures). However, contemporaries (for example, Heinrich Kramer and Nicolas Rémy) ordinarily assumed that self-murder in prison while on trial for witchcraft was tantamount to a confession of guilt and reinforced suspicions that the accused had been in league with the Devil. Ecclesiastical prohibitions against suicide had been in place since the Middle Ages, and it was commonly presumed that, like Judas, desperate suicides acted at the prompting of the Devil. Having died in a state of apostasy, they were regularly forbidden an honorable burial in hallowed ground throughout Europe until the end of the eighteenth century.

Legally, committing suicide, like practicing witchcraft, was a heinous crime. The leniency of the 1532 Carolina Code (article 135), which permitted the punishment of suicides only in cases where they had killed themselves in order to escape prosecution (as in the case of accused witches), was never uniformly applied. However, it does seem that prosecution in France and especially in Flanders was harsher than in the Holy Roman Empire. The physical dishonor associated with the crime meant that only the executioner could handle a suicide's corpse. The body was removed by digging a hole under the threshold to drag it from a house, thereby protecting the portal from reentry by the ghost of the self-killer, which was popularly feared to haunt the place of death as a revenant spirit. The body might then be publicly dragged to the place of execution, hung from the gallows or upside-down from a fork (*furca*), and either left to rot as carrion or disposed of in a cesspit or other disgraceful grave in a so-called ass-burial. In some parts of Europe, a suicide's home was then ritually pillaged ("ravaged"), and the estate might be officially liable to confiscation.

Most interesting for historians of witchcraft were the similarities between popular beliefs concerning witches and suicides. Because suicide was ostensibly committed at the behest of the Devil, there were presumptions of some tacit understanding or even a pact with the Devil. Furthermore, given the demonic nature of the deed, a number of popular beliefs arose regarding the corpse of a suicide, beliefs that were closely related to problems of agricultural fertility. It was known that witches commonly practiced weather magic to destroy crops, and witch persecutions often coincided with natural catastrophes that had caused crop failures. Similarly, the populace generally assumed that burying a suicide in hallowed ground profaned the communal cemetery and would result in inclement weather, especially hailstorms, that damaged crops and killed livestock. This belief was so deeply embedded in the early modern consciousness that communities sometimes rose up in armed revolt against attempts by authorities to exercise leniency in their decisions about such burials.

However, this belief was no mere superstition. Evidence shows that the rates of suicide tended to increase during times of crises, as desperate persons faced with starvation, plague, or terminal illness took their lives to escape their suffering. The popular perception was therefore not altogether mistaken, although it inverted cause and effect: Crop failures and famine increased the incidence of suicide, not vice versa. Apparently, oral village culture lost sight of this nuance over many generations, leading communities to fight against honorable burials right up to the end of the Old Régime, when suicide was finally decriminalized and secularized during the judicial reforms of Emperor Joseph II of Austria and later in the French Revolution.

The last region of Europe to decriminalize suicide fully was Britain, where attempted suicide was punishable until the passage of the Suicide Act in 1961.

SUMMERS, MONTAGUE (1880–1948)

An eccentric Catholic man of letters with a keen, not to say obsessive, interest in the occult, Montague Summers made two distinctive contributions to the history of witchcraft. He translated key Latin texts, most famously the *Malleus Maleficarum* (The Hammer of Witches, 1486), into English. He also wrote extensively on the subject, developing his own version of the idea that a heretical sect of witches had really existed.

In his youth, Summers embraced the decadence of the 1890s, with Oscar Wilde and Algernon Swinburne as early heroes. He made a hesitant start as an Anglican curate in his native Bristol, but in 1908, he was charged with pederasty; although he was acquitted, his church career was finished. The following year, he converted to Catholicism—a religion in which he felt fully at home, having a deep love of ritual and tradition and a commitment to the power of the sacraments. He attended a Catholic seminary and sought the priesthood but was barred because of his homosexuality. However, he claimed to have obtained irregular ordination (one of the numerous aspects of his life on which he was evasive) and acted as a priest after 1913, though he never obtained a benefice. From 1911 to 1926, he was a schoolmaster; later, his literary earnings supplemented his private income from his wealthy banking family.

Between 1919 and 1925, he promoted the revival of early English drama, producing some genuinely scholarly editions of Restoration comedies. Later, he wrote on the Gothic novel, on vampires, and on werewolves.

His publications on witchcraft began in 1926 and 1927 with *The History of Witchcraft and Demonology* and *The Geography of Witchcraft*. The latter was a compilation of witchcraft cases from printed sources, including extensive quotations. The former expounded Summers's view of witchcraft as a genuine movement of devil worshippers. He traced its origin to the Gnostics, early Christian heretics who he claimed were influenced by pagans. He also made energetic criticisms of Margaret Murray's recent "anthropological" theory that the witches had practiced a benign pagan fertility cult. "Anthropology alone offers no explanation of Witchcraft," he announced: "Only the trained theologian can adequately treat the subject" (Summers 1926, 45). Yet he accepted aspects of Murray's theory, such as the coven of thirteen—which, he shrewdly pointed out, had to be a borrowing from Christianity rather than a survival from paganism.

Like Murray, Summers believed in a real witch cult. He too endeavored to interpret witches' activities in naturalistic terms and to explain away reports of flight and animal metamorphosis (but he ultimately accepted their possibility). Both the Devil and the pact had certainly existed and indeed continued to exist: "Commerce between human beings and evil spirits . . . is the very core and kernel of Witchcraft" (Summers 1926, 51), he said, arguing that the contemporary spiritualist movement proved the possibility of such commerce. Summers cited demonological writers of the fifteenth, sixteenth, and seventeenth centuries as authoritative.

However, he made his most enduring contribution to witchcraft scholarship with his translations of demonologies. He translated two himself—Ludovico Maria Sinistrari's *De Daemonialitate* (Demoniality) and the *Malleus Maleficarum*—and edited several other translations. He felt that if such texts were made accessible, their self-evident truth would be perceived. As a translator, his florid literary style was unsuited to the language of Latin Scholasticism, and some of his renderings have been questioned, including his much-quoted "All witchcraft comes from carnal lust, which is in women insatiable" (Kramer 1928, book 1, vi). Nevertheless, Summers's labors have proved vastly beneficial to scholars who have ignored his interpretations.

Although Summers perpetrated romantic and untrue stories about his personal life, his weakness as a scholar was not the systematic distortion practiced by Murray; rather, it was an excessive reverence for ancient authority. He proclaimed the *Malleus* one of the great books of Western civilization. Summers repeatedly asserted that his sources, especially Catholic sources, were wholly

trustworthy. As a result, he swallowed even the most bizarre legends, some from chroniclers writing over a thousand years after the events they described. He condemned some of the excesses of witch hunting—the Protestant Matthew Hopkins, for instance, was depicted as an impudent charlatan. But the witch hunt as such he wholly and explicitly approved. He also gave the persecutions a contemporary spin, attacking Bolshevism as a modern equivalent of witchcraft.

In later life, he lived in Oxford, where the students reported that one might see Summers with his dog, Summers with his secretary, or the secretary with the dog—but never all three together. It was an appropriate story for someone who had written on shape shifting, but it reminds us that folktales are not always taken literally or even seriously, even by the tellers.

What was Summers's motivation for writing on witchcraft? His fascination with the occult was mixed with horror. In his early years, he had sometimes participated in diabolic rituals, notably a Black Mass in 1913; he knew their powerful attraction from personal experience. In studying witchcraft, Summers may have been staring into the dark side of his own nature.

SUPERSTITION

The Latin term *superstitio*, whose exact translation is disputed, was adopted by the Romance languages and English; in German, it became *Afterglaube* (backward or obsolete faith) or *Aberglaube* (contrary of the right faith); in Dutch, it became *bijgeloof* (beneath the right faith); and in the Scandinavian languages, it became *overtro* (overly strong belief). All these terms refer to religious beliefs, and all share negative connotations.

From antiquity to the present, various beliefs and behavior patterns have been characterized as superstitious. The specific content of this invariably pejorative term depends on the religion of the definers, their social standing and education, and their own cultural practices. So the ancient Greek *desidaimonia* and the

Latin *superstitio* both implied an excessive fear of numinous powers or the mentality of an alien religion: Thus, right-thinking Romans qualified Christianity as superstitious (Tacitus, *Annals* 15.44), while the Christians expressed the same opinion about Judaism (Acts 25.19). Early modern Reformed theologians denounced many elements of Catholic faith and piety as superstitious; a French Catholic priest, J.-B. Thiers, compiled four volumes of superstitions in 1679, grouped according to sacraments.

From the time of the Church Fathers onward, types of Christian religious belief and ritual not approved by the official theological hierarchy were condemned as superstitions. Superstition was irrational and untrue. Often—but not always—we find among the “standard” objects and practices of superstition such things as reliance on amulets, dreams and visions, charms, fortunetelling, magic, necromancy, prodigies, portents, soothsaying, and spells. Many of these were survivals of pagan beliefs and rites, and the clergy condemned them as such. Superstition, therefore, is that set of beliefs and practices that functionaries of the official or established religion (*religio*) single out as unacceptable within the entire cosmos of factually practiced religion. A superstitious mind was generally ascribed to uneducated laypeople, especially the country folk or “rustics,” but often, these same so-called superstitions existed among the literate upper classes as well. Until the second half of the twentieth century, folklorists and historians unhesitatingly used this term to designate the same canon of popular imaginations and customs that theologians had dubbed superstitious for centuries. Currently, however, a growing sensitivity to the clearly negative connotations and implicit cultural arrogance connected with the term prevents many scholars from discussing superstition. Given also that cognate terms such as *popular religion* or *popular Christianity* are not without problems, perhaps the best alternative is *parallel religion* (a set of beliefs and rites coexisting with but disapproved of by the official religion).

Over the course of two millennia of Christian dogmatics, many teachings of an earlier age have become obsolete and are thus considered superstitions. For example, in the Early Middle Ages, several Church councils endorsed the practice of ordeals, but after their abolition by the Fourth Lateran Council in 1215, major theologians such as St. Thomas Aquinas classified ordeals as superstitions.

Carolingian theologians including Archbishop Agobard of Lyons regarded several aspects of witchcraft as superstitious. Agobard condemned the belief that certain people, in collaboration with cloud-riders, were guilty of making hail and thunder. The better-known *Canon Episcopi* severely criticized beliefs about the nightly ride of women to a certain kind of Sabbath. About 1100, King Coloman of Hungary decreed that

witches did not exist and that, therefore, nobody should prosecute them. However, such imaginings of witchcraft practices formed part of the standard accusations against sorceresses during the late Middle Ages and the early modern epoch. Theologians now affirmed that denying their reality could lead to an accusation of heresy; in 1453, Prior William Adeline (Edeline) of Saint-Germain-en-Laye was tortured because he denied that witches could ride. Heinrich Kramer, the author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), also interpreted such skepticism as a sign of heresy. After the Enlightenment, the situation again returned to the position of a thousand years before: The superstitious person was one who believed in the existence of witches. This notion remains the prevalent opinion in the Western world today, although a small minority are still convinced that witches exist. There is also the semierne effort of some radical feminist groups to reinstall this belief by declaring that hexing is not a superstition but rather an ancient and effective knowledge. These modern-day Western witches have not been prosecuted; in parts of postcolonial Africa, however, some of their counterparts have been.

SWEDEN

Sweden experienced a wave of large-scale witchcraft trials between 1668 and 1676 that resulted in approxi-

mately 300 people being executed. Two major sets of trials ran simultaneously. In the Blåkulla trials in northern Sweden (from 1668 to 1676), the main charge brought against the defendants was the supernatural abduction of children to the witches' Sabbat. Meanwhile, a series of witchcraft trials were also held in the county of Bohuslän between 1669 and 1672. Though these events are deservedly famous, the usual prosecution of forms of witchcraft in early modern Sweden was very different. Most cases were concerned with minor offenses involving nonharmful magic. The prosecution of witches was characterized by leniency, rarely resulting in death sentences. Apart from the major witchcraft trials in Bohuslän and the Blåkulla trials, no more than 100 people were executed for witchcraft in Sweden from 1550 to 1750. Moreover, a great number of these trials, perhaps a majority, took place during the eighteenth century.

MEDIEVAL PROLOGUE

In medieval Sweden, the provincial law statutes concerned with harmful witchcraft were occasionally supplemented by rulings regarding nonharmful magic. The national law codes from the fourteenth century (*Magnus Erikssons Landslag* [the National Law of Magnus Eriksson]) and the fifteenth century (*Kristoffers Landslag* [the National Law of Kristoffer]—a slightly modified version) provided no clear guidelines for dealing with nonharmful magic. Few medieval sources preserve the activities of Swedish courts. The oldest recorded witchcraft trial occurred in the town of Arboga in 1471.

In the sixteenth century and the first half of the seventeenth century, a broader legal definition of witchcraft caused the more lenient punishments for maleficent witchcraft to be applied in cases of nonharmful magic. In addition, biblical law was consulted when passing sentences for serious cases of witchcraft. Various forms of consorting with the Devil were gradually placed on par with maleficent sorcery. As late as the eighteenth century, punishments following biblical law were still meted out in Swedish law courts.

OLD AND NEW WITCHCRAFT

Not until the sixteenth century did Swedish court records become sufficiently extensive to allow for realistic assessments of the extent of witchcraft cases. The number of trials increased markedly at the end of the sixteenth century, and interrogation techniques foreign to Swedish legal traditions, such as torture and ordeal by water (the swimming test), began to be employed. At the same time, a more elaborate conception of witchcraft appeared, with witches making pacts with the Devil and participating in Sabbats. Acts of nonharmful magic were also prosecuted, although more traditional forms of witchcraft, that is, *maleficium*

(harmful magic), still dominated the legal agenda. Generally, however, the courts tended to be lenient, condemning to death only one in ten of the defendants on average, while acquitting over 60 percent (Ankarloo 1984, 340–342). A particular form of oath taking known as *värjemålsed* formed an important part of Swedish litigation; it was used in court to repudiate accusations, often when people wished to defend themselves against gossip and slander.

During the first half of the seventeenth century, High Courts were established in various parts of the Swedish kingdom. In principle, they had to approve all death sentences, including those for witchcraft. Gradually, an extensive praxis of submitting all types of cases of witchcraft to the High Court emerged. Sweden's judicial system was based, at least formally, on accusatorial procedure; it required a plaintiff for each case. After 1600, royal officials increasingly assumed the role of public prosecutor in local courts in order to prosecute crimes that lacked a plaintiff. At the same time, the secular courts gradually acquired the sole right to punish witchcraft of all sorts. The Church had, by then, gained support for its far-reaching demands that measures be taken against relatively innocuous forms of magic. Sweden's medieval laws, now obviously outdated, attracted the attention of reformers. In 1665, a royal statute was published (renewed in 1687) dealing explicitly with nonharmful magic. The statute signaled a concern by the authorities with witchcraft and magic, just a few years before the outbreak of the great witch hunt. Other disciplinary regulations applicable to unacceptable religious practices were also introduced.

The reformed legal system of the seventeenth century had both constraining and stimulating effects on witchcraft trials. The use of torture exemplifies this fact. After the High Courts were established, only they could grant permission for a lower court to use forcible methods. But in exercising this power, the High Courts appear to have been passive. On the one hand, they were prepared to reject applications for the use of torture, which no doubt constrained some local officials. On the other hand, they accepted the method when confronted with its use. The explosive situation that resulted in the large-scale witchcraft trials of the 1660s and 1670s can partially be attributed to the High Courts' behavior. These courts did not sanction the coercive measures applied in the initial stages of these proceedings, but neither did they disallow them.

THE WITCH HUNTS

Although trials mentioning the witches' Sabbat first appeared in Sweden toward the end of the sixteenth century, no major outbreaks of witch hunting occurred until the second half of the seventeenth century. The Blåkulla proceedings and the Bohuslän trials displayed significant differences, the latter being relatively

straightforward. The province of Bohuslän had been transferred from Danish to Swedish rule ten years earlier, but trials were still supposed to follow Danish law. Accusations of traditional, that is, maleficent, witchcraft appeared alongside charges of consorting with the Devil and participating in the witches' Sabbat, with little or no mention of the abduction of children.

The northern Blåkulla trials departed from established practice on a number of points. Courts treated rather skeptically the stories of Blåkulla journeys that first appeared around 1600. This attitude changed drastically when children began to accuse alleged witches of abduction. Concern for the welfare of these children was felt to justify departures from the normal legal procedures and rules regarding evidence, creating a potentially volatile situation. Frightened adults encouraged their children to tell the authorities how they had been spirited away to Blåkulla, thereby providing the courts with the names of numerous suspects. The children could make these accusations without fear of self-incrimination, as they were perceived largely as victims.

In Sweden, children's testimonies were formally inadmissible. Nevertheless, they were used and given credibility. Further, quantity outweighed any qualitative shortcomings. The accumulated mass of children's evidence was judged sufficient grounds for conviction. Statements from convicted witches were also accepted as evidence in court. Torture was occasionally employed, although confessions could be elicited without it. All means of persuasion were permitted. A significant factor favoring confessions was that a refusal to admit guilt could lead to the death sentence, while a contrite confession might well result in a pardon. Those who refused to admit their guilt were clearly under Satan's power, while penitent women demonstrated that they had the courage to reject evil. Several hundred adults were accused of witchcraft, and several thousand children were involved.

The great witch hunt that started in Dalarna in 1668 was possibly preceded by a popular religious revival. The stories told about the witches' Sabbat were clearly interwoven with religious visionary tales of heaven and hell. A number of local circumstances in the diocese of Västerås, to which the province of Dalarna belonged, appear to have forced the clergy there to take an active role in curbing activities considered indicative of an undisciplined lifestyle, particularly among children and adolescents (Lagerlöf-Génétay 1990). Starting in Dalarna in 1668, the witchcraft trials then spread to most of the northern provinces, and by 1675, they had even reached central Sweden, including Stockholm. In addition to the regular courts, special witchcraft commissions were appointed to lead the hearings. The state regularly appointed commissioners to investigate unsatisfactory conditions and discontent in the provinces, not just in connection with cases of witch-

craft, thereby enabling the authorities to legitimize their actions in the eyes of the populace. Thus, as the Blåkulla trials began to increase in number and cause concern, the authorities made use of well-tried methods. However, temporarily delegating power in connection with the witchcraft commissions turned out to be a serious mistake. Members of lower courts with no juridical training were sometimes given decisive roles in the administration of justice. A structure strongly centralized in theory came temporarily under local influences. Year after year, the appointed commissioners failed to control the rising hysteria of witchcraft. In fact, the attention the commissions drew to the situation increased rather than allayed the general sense of unrest.

The witchcraft trials finally came to an end in Stockholm in 1676. The influential role in putting a stop to the trials that has been attributed to Urban Hjärne, a doctor, has been overestimated (for example, see Robbins 1959, 350). Moreover, Hjärne professed belief in the existence of trolls.

FROM WITCHCRAFT TO SUPERSTITION

While the large-scale hearings undoubtedly represent the culmination of Swedish witchcraft, they can also be seen as the start of a process that dominated the succeeding period. The relation between the seventeenth and the eighteenth centuries is of great interest in the history of Swedish witchcraft. Of the more than 500 known witchcraft trials heard in the Göta High Court in southern Sweden from 1635 to 1779, around three-quarters took place in the eighteenth century (Sörlin 1999, 20). Gaps in the records of the Svea High Court, covering central and northern Sweden, and the unique features of the Blåkulla trials complicate comparisons with the Göta High Court. We do not know how often cases of witchcraft and magic failed to reach the higher courts or how legal customs varied geographically or chronologically. There is no doubt, however, that witchcraft trials were numerous throughout Sweden during the eighteenth century.

Most of these eighteenth-century cases involved nonharmful magic, while the importance of other cases steadily diminished. Few accusations now concerned *maleficium*, or maleficent witchcraft, in contrast to the situation in the sixteenth-century trials. However, from the end of the seventeenth century onward, Blåkulla cases recurred at regular intervals. Several rather extensive witchcraft trials were held until quite late in the eighteenth century. Nonharmful witchcraft was probably still brought before the Swedish courts in the nineteenth century, while Blåkulla stories continued to appear well after 1850. In 1858, children in Gagnef in Dalarna once more began to tell tales of journeys to Blåkulla (Tegler Jerselius 2003). This time, however, ecclesiastical and medical officers, not the law courts, conducted the inquiries.

The reform of the judicial system with the establishment of the High Courts clearly defined levels of instance. The influence of the High Courts is apparent in cases in which the legal situation was very unclear, which applied in particular to crimes of witchcraft. The records of the Göta High Court show considerable discrepancies between the sentences passed by courts of first instance and subsequent High Court decisions. The Göta High Court overruled a large number of the decisions by lower courts, usually reducing or amending their sentences (Sörilin 1999, 68). Though the lower courts proclaimed the death penalty almost as frequently in the eighteenth century as in the seventeenth century, the High Court stopped upholding this penalty almost entirely after the turn of the eighteenth century. With the exception of the major witchcraft trials in Bohuslän and the Blåkulla trials, no more than 100 individuals were executed for the crime of witchcraft from 1550 to 1750.

The growing importance of court cases involving nonharmful witchcraft reflected changes in legislation. Prior to 1734, more innocuous forms of witchcraft were not explicitly forbidden in Swedish law. However, the National Code of that year dealt comprehensively with acts of nonharmful witchcraft for the first time. Though changes in legislation in the latter half of the seventeenth century had prompted the desired effect, the code of 1734 eliminated any remaining doubts about whether non-harmful witchcraft should be punished. In other respects, this code was quite conservative, as it retained the death penalty for witchcraft. The difficulties of proving such a crime, however, meant that the courts did not enforce the strict letter of the law. The paragraph on witchcraft was mainly applied in certain cases of demonic pacts in lower courts. Gustav III abolished the death penalty for witchcraft in 1779, and in the same year, pacts with the Devil were placed on par with ordinary nonharmful witchcraft. However, witchcraft did not completely disappear from Swedish records. Although the concept of witchcraft was in a process of dissolution, individual elements of a criminal nature continued to be prosecuted under other suitable legislation. One such example was blasphemy; poisoning might also be included here. Nonharmful witchcraft followed the same process of dissolution when Sweden's Penal Code of 1864 allowed such crimes to be prosecuted as fraud, even though the legislation about acts of superstition had been repealed.

HOW CASES REACHED COURT

Cases involving witchcraft became increasingly common in Sweden at a time when secular and ecclesiastical authorities were strengthening their hold over both the judicial system and village life: Historians often consider Sweden to be the most thoroughly "confessionalized" Protestant state in Europe. Although relatively few trials took place on the direct instigation

of secular authorities, many cases of witchcraft came to light in connection with other criminal acts. Most of the accusations and denunciations of maleficent witchcraft originated among the populace. The time, place, and character of the witchcraft were often determining factors in its discovery; in many cases, magic had been performed in public, thus enabling its disclosure. Clergymen played a key role in the events preceding the trials, often as informers, and they were far more active concerning nonharmful magic than maleficent witchcraft. If individual acts, such as informing on people or making denunciations and accusations, are taken into account, the level of private initiative remained approximately constant despite the growing influence of the state.

THE ACCUSED

In Sweden, while both men and women were accused of the different types of witchcraft, there were distinct sex-linked differences among these crimes. Accusations of diabolism, generally in the form of alleged journeys to Blåkulla, were almost exclusively restricted to women, whereas men dominated in cases of written demonic pacts. Perpetrators of nonharmful witchcraft exhibited the greatest degree of sexual parity. Over the years, the sex ratios shifted considerably, with the proportion of men accused rising constantly. During the eighteenth century in the Göta High Court, equal numbers of men and women were charged, a consequence of the broadened definition of witchcraft (Sörilin 1999, 120). The increase in the number of trials was mainly accounted for by trials pertaining to nonharmful witchcraft, the category with the highest degree of symmetry between the sexes. Records from the Svea High Court show that, in fact, more men than women were accused of offering magical expertise (Oja 1999, 139).

During the great witch hunt, middle-aged or somewhat older farmers' wives or widows tended to be the most represented among the accused (Ankarloo 1990, 310–312). Among the innumerable minor cases, the most marginalized group of the accused were "wise" men and women (cunning folk). More surprisingly, in the cases of denunciations and accusations submitted by private individuals, the defendants often seemed to lack negative attributes; many did not seem to be at all "witchlike" (Sörilin 1999, 121–126).

NONCONFLICT WITCHCRAFT

Trials initiated by private individuals concerning nonharmful witchcraft did not constitute an appropriation of the negative view of such activities propagated by officials. On the contrary, what occurred was not a passive acceptance of new values but rather a selective use of new opportunities provided by the official assault on magic of all sorts. In this way, the non-

harmful magic used by others could be exploited as a weapon in local conflicts. However, in the case of maleficent witchcraft, people often made accusations based solely on the fact that the defendant had performed actions that could be interpreted as acts of harmful magic. The suspicion of being afflicted by witchcraft was, therefore, to some extent divorced from a social context; it did not need to be directly connected to any concrete conflict between the parties. This fact explains why the accused had so few negative social attributes: They were not taken to court because of negative behavior, such as making threats, but because they had practiced acts of magic that were often wrongly assumed to be of evil intent.

SWIETEN, GERARD VAN (1700–1772)

The Dutch-born dean of the Faculty of Medicine in Vienna and personal physician to Maria Theresa since 1745, Gerard van Swieten made a study of so-called posthumous magic on behalf of the empress in 1755. Her hereditary lands of Moravia, Bohemia, and Hungary were experiencing several prosecutions during the 1750s in which corpses of presumed vampires were exhumed, after which their hearts were pierced, their heads shattered, their bodies burned, and their ashes dispersed to prevent their eventual return. Moreover, Hungary was experiencing heavy witch hunts at the same time.

Van Swieten recoiled at the Gothic belief in vampirism. His memorandum, written in French and entitled "Remarques sur les vampyrismes de Silesie de l'an 1755" (Remarks on the Vampirisms of Silesia) was never published in the original French version but appeared in German and Italian translations in 1756. He outlined beliefs about vampires that affected a large part of Moravia at the time, proving they had no scientific foundation. Innocent people, victims of ignorance and superstition, were being terrorized by impostors. He thought that such ideas might have been imported from the East by "Greek schismatics," quoting an extract from the *Relation d'un Voyage du Levant* (An Account of a Journey in the Levant, 1717) written by the French botanist Joseph Pitton de Tournefort (1656–1708), who had observed vampirism in Hungary earlier in the century. In any case, van Swieten denounced forcefully the episcopal authorities in Olmütz for encouraging such nonsense: Superstition was the enemy not only of the *philosophes* but of all intelligent men! (Brecht 1970, 131–132). According to van Swieten, customary laws were also sources of unnecessary distress; a general reform of criminal justice was needed.

To sum up, van Swieten took three positions regarding witchcraft. First, he stated that many accusations of witchcraft were products of fantasy, imagination, or some form of mental illness. Second, he asserted that the pact with the Devil had no basis in reality. And third, he argued that many phenomena attributed to

socery had natural causes. He did not say that all aspects of witchcraft, especially maleficent magic, were impossible. A devout Catholic like the empress, van Swieten believed in the existence of the Devil and stated that the Protestants were correct when they did not deny that heathen people could be possessed by demons from which they could be delivered only by baptism. Nevertheless, van Swieten was much more skeptical toward witchcraft than his fellow countryman and successor as a personal physician to Maria Theresa, Anton de Haen (1704–1776). In 1744, the latter had stated in his tract *De Magia* (On Magic), published in Lutheran Leipzig, that witchcraft and diabolical magic really existed and that witches were able to fly

The impact that van Swieten's memorandum had on Maria Theresa was immediate. When she heard that a Bohemian peasant had been sentenced to death for socery, she pardoned him, saying: "It is certain that witches can only be found where there is ignorance. This man is no more capable of witchcraft than I!" (quoted in Venturi 1969, 380). Already in 1753, she had issued a decree on socery, followed in March 1755 by a decree about so-called posthumous magic. Finally, on August 6, 1756, the empress promulgated a general edict on witchcraft, superstition, and magic that marked a decisive moment in the decline of witch hunting throughout the entire Habsburg Empire. After 1756, all such cases were required to be submitted to her conciliar appellate court for confirmation before sentences could be carried out. This edict greatly reduced the possibility of prosecutions, and it virtually ended all executions: It forbade the use of torture, warned against searching for the Devil's mark, and forbade the use of the water ordeal (swimming test). The number of witchcraft prosecutions and executions immediately sank to minimal levels and definitely stopped in 1777, the year after torture was abolished. A decade earlier, in 1768, the empress had issued the official prohibition of witch hunting in Austria-Hungary (Ankarloo and Clark 1999, 68–70).

SWIMMING TEST

One of the most frequently used ordeals of the Early and central Middle Ages was the cold-water ordeal. This legal test consisted of putting the accused in fetters and throwing him or her into a pool or very large container filled with cold water. If guilty, it was believed the pure element would not accept the witch but would keep the individual floating at the surface; if innocent, he or she would be able to stay submerged for some time without drowning. Many churches in medieval Europe possessed such pools and had an episcopal privilege to use the technique; the priest had to be present in order to fulfill the religious ceremonies (blessing the water, singing the paraliturgical formulas), for which he received a fee.

Swimming of witches was attested from the late eleventh century onward, but the practice remained uncommon before the sixteenth century. When the Fourth Lateran Council forbade all ecclesiastics to participate further in ordeals in 1215, this method of finding the truth came into disuse and was replaced by torture. Nevertheless, the water ordeal either survived better than other forms or was revived in the second half of the sixteenth century, when it became quite common in many parts of early modern Europe (especially western and northern Germany, France, England, the Netherlands, and Hungary) and was extended to the New World (Virginia, Connecticut) and even some Asian colonies (East India); because the crime of witchcraft was regarded as extraordinary, it required extraordinary means of detection. In English, the practice was called ducking or fleeting; in German, *Hexenbad*, *Hexenschwemmen*, or *Wasserprobe*. Not infrequently, as, for example, in the 1595–1596 Geldern witchcraft trials, the test in question was followed by torture if the accused failed to sink. It seems to have been customary to strip the suspect naked and bind each thumb to the opposite-side toe and vice versa.

Despite being widely practiced, this ordeal was usually illegal. According to mainstream learned discussions of that period, especially by almost anyone trained in Roman or canon law, the swimming test was to be prohibited as fallacious evidence—although one celebrated authority, King James VI of Scotland, recommended it in his *Daemonologie* (Demonology, 1597, Book 3, chap. 6). An overwhelming consensus among jurists and theologians of all major confessions

The swimming test (cold-water ordeal), called "ducking" in England, involved placing an accused witch, tied and bound, in water. If the water rejected the accused, the witch was guilty; if the person could remain submerged for a while, the accused was deemed innocent. (Fortean Picture Library)

led to a series of official condemnations of this proof: For the Spanish Netherlands, King Philip II declared this test illegal in 1595; in France, the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) forbade it in 1601; and in 1603, the bishop of Bremen abolished it for his dioceses. Nonetheless, it was reported to have been practiced locally into the eighteenth and even the nineteenth centuries; as late as 1636, the magistrates of Osnabrück declared it to be a valid juridical custom and as helpful a device for unmasking witches as torture, and their English counterparts at Faversham officially sanctioned it a few years later. In 1644, the Bavarian commander in chief, Hans von Sporck, had many of the women accompanying his troops thrown into the Kocher River at Schwäbisch-Hall in order to discover the witches among them.

Much later, the Holy Roman Empress Maria Theresa had to forbid the continuation of this ordeal twice, in 1740 and in 1766. In 1751, it was still used in England (which had abolished the crime of witchcraft in 1736) before lynching a witch. Two very late instances of its extralegal use by European lynch mobs, suspecting a man to be a sorcerer or a woman to be a witch, are recorded at Deldenerbruck in Holland (in 1823) and Hela near Danzig (in 1836). A reminiscence of this practice is the name Witch Pool, given to a portion of the Bay of St. Andrews in Scotland.

Some extra-European peoples employed identical methods to discover sorcerers: The famous Babylonian Code of Hammurabi (ca. 1700 B.C.E.) describes the ordeal of plunging the suspected person into a river. For ancient Greece, there are some vague references to magicians who floated when thrown into water, but it is

not clear whether an ordeal or a punishment was implied.

SWITZERLAND

In the territory of present-day Germany, more witches were executed than in the rest of Europe combined, yet the history of Europe's witchcraft trials both began and ended in the region we now know as Switzerland. The Swiss Confederation, which was already independent of the Holy Roman Empire of the German nation long before these trials started, has the unenviable record of executing many more witches per thousand population than any other contemporary European nation. Of course, exact figures will never be known, but we can be reasonably certain that at least 5,000 witches were put on trial between 1420 and 1800 in what is now Switzerland (a region that probably contained under 1 million people around 1600), and that over 3,500 of them were convicted and executed. For a land that presents itself as a peaceful working democracy in the heart of Europe, filled with cheese, chocolate, ski resorts, and private banks, this is indeed a dubious distinction.

In absolute numbers, of course, the area that is currently Germany burned far more witches, perhaps seven times as many as Switzerland. But Germany's population today is almost fourteen times greater than Switzerland's, and this disparity was equally great or even greater four centuries ago. Authorities in this venerable, multilingual democracy (70 percent German-speaking, 20 percent French-speaking, 10 percent Italian-speaking) probably burned witches twice as often, on a per capita basis, as their modern German neighbors to the north, ten times as often as their present-day French neighbors to the west, and almost a hundred times as often as the Italians to the south.

Switzerland also has other unenviable distinctions in this respect. It executed witches over a longer period (from 1427 to 1782) than any other European country. In addition, relative to its size, the present-day Swiss Canton of Vaud was the worst witch-hunting region anywhere in Protestant Europe (Scotland was probably its closest rival) and in French-speaking Europe (where Catholic Lorraine was likely its closest rival). For that matter, the modern Swiss Canton of Ticino may well have been the worst witch-hunting region of Italian-speaking Europe. There are few aspects of European cultural history in which this small yet multicultural country seems so important as in the history of witchcraft.

Most of the places where the early forms of the witches' Sabbath were brought together and the first witch hunts were held soon after 1425 can be found in present-day Switzerland—and the others usually lie in the neighboring French Alps (Savoy and Dauphiné) or Italian Alps (the Val d'Aosta). The single most important event for diffusing the new blend of sorcery and heresy symbolized by the diabolical witches' Sabbath occurred in 1439, when the schismatic Council of Basel elected the former Duke Amadeus VIII of Savoy to become pope under the name of Felix V. Geographically, this event connected the southwestern corner of Switzerland around Lake Geneva with its northwestern border at Basel. It is deservedly unimportant in the history of the Roman Church, since Felix V quickly joined the ranks of antipopes from the Great Schism that began in 1378 and the ensuing conciliar age; the Council of Basel finally disbanded a decade later, in 1449.

But what made this forgotten footnote of ecclesiastical history so central to the history of European witchcraft was that many events and writings related to the creation of the Sabbath occurred in Amadeus VIII's large Alpine duchy or right along its borders—including its borders with the Swiss Confederation—and the new doctrines of the Sabbath received considerable attention across large parts of Christendom because the former Savoyard duke had been elected pope. Various Swiss towns played important roles in shaping and spreading the new doctrine: Lausanne (where the duke-pope's personal secretary settled in a rich benefice and composed a long epic poem containing a vivid description of witches); Sion (an Alpine prince-bishopric that apparently lay at the center of Europe's first major witch hunt around 1428); Fribourg (where the Dominican inquisitor Ulric de Torrenté investigated heretics in the 1420s and witches a decade later); and, of course, Basel (where a prominent Dominican reformer composed a popular treatise containing an extensive and detailed account of witches' activities during the council). Many of these places lie in French Switzerland, and recent scholarship clarifying this topic has come primarily

from Lausanne, including a useful critical edition of the major early texts on Sabbats (Ostoreo, Bagliani, and Utz Tremp 1999). However, the important Swiss landmarks in developing a full-blown doctrine of witchcraft were not confined to French-speaking regions. For example, the French word for “witch,” *sorcière*, cannot be traced to fifteenth-century Switzerland, but the modern German noun for “witch,” *Hexe*, was first recorded at Lucerne in German Switzerland in 1419.

Switzerland continued to be disproportionately important in the history of European witchcraft after the mid-fifteenth century, as the Sabbat and related concepts spread across much of western Europe. Its rhythms of persecution were obviously quite irregular, though the difficulties we face in documenting this are compounded by the erratic conservation of fifteenth- and early-sixteenth-century records. Nevertheless, we know that no fewer than thirty-seven people were tried for witchcraft by secular officials in Switzerland’s northernmost Italo-Phone Alpine valley, Val Leventina, from 1457 to 1459, and twenty of them, including five men, were burned (Schatzmann 2002, 139–142). A German-Swiss woman tried for witchcraft in 1459 at Andermatt, deep in the Alps, reportedly not only could transform herself into a wolf but also had the ability to provoke avalanches. More important, we know that a cycle of witchcraft persecutions affected the Swiss Confederation during the decade between 1477 and 1486, with twenty witchcraft trials by secular authorities recorded at Bern, Fribourg, and Lucerne and another dozen by inquisitors in the diocese of Lausanne. This cluster, which exactly coincided with the trials in Austria and south Germany that produced the *Malleus Maleficarum* (The Hammer of Witches, 1486), also saw intensified “feminization” of witchcraft in French Switzerland, where, in 1481, a male witch who had named only men as “accomplices” was asked specifically if he had seen any women at the Sabbat.

In Switzerland, it took almost a century for the number of witchcraft trials to surpass the totals recorded between 1477 and 1486, the decade following the Confederation’s defeat of the Burgundians. During the ensuing age of Swiss military prominence, when the Confederation expanded its borders to the modern limits in the west and south, witchcraft trials continued to be held in various parts of modern Switzerland, especially in places such as Lausanne or Lucerne, which had prosecuted witches since the mid-fifteenth century. For example, we know that sixty witches, almost all of them women, were tried at Lucerne in thirty different years between 1490 and 1550; twenty-six of them were burned (Jäggi 2002, 145–146). There is evidence that no fewer than thirty-six female and eighteen male “heretics,” most if not all of whom were witches, were taken to Geneva and burned there between 1463 and 1500 (Binz 1997, 577–578). Between 1500 and 1550, the city-state of Basel tried eight witches and

executed six of them; Bern compiled a comparable record. This process seems to have been unaffected by the outbreak of the Protestant Reformation, which deeply divided the Confederation after the 1520s; at most, it meant the end of witchcraft trials by inquisitors in some parts of modern French Switzerland, where they were immediately replaced by secular officials, often Protestants. Ulrich Zwingli’s Zurich had tried witches for generations and resumed executing them after his death in 1531. At the other end of Switzerland, Geneva executed witches both before and after the Reformation; John Calvin encouraged Geneva’s magistrates to “extirpate the race [of witches]” from a rural parish in 1545. Some of Switzerland’s Catholic regions also continued to prosecute witches during this period.

Starting in the final third of the sixteenth century, recorded witchcraft trials multiplied dramatically in most parts of Switzerland. Although the necessary local studies do not exist for a few of Switzerland’s two dozen cantons, enough is known to provide a reasonably clear overall picture of witchcraft trials in the old Confederation during their peak phase, which lasted for approximately a century after 1570. After a long hiatus, witchcraft trials began to be recorded in such central Swiss cantons as Obwalden or Schwyz in 1571. In that same year in the west, they also began in what is now the recently created canton of Jura; immediately to the south, in the canton of Neuchâtel, recorded witchcraft trials resumed in 1568 after an interval of almost eighty years. In eastern Switzerland, trials apparently began slightly later: For example, Appenzell executed very few witches until the 1580s, while St. Gallen’s recorded witchcraft trials began only after 1600. The large separate confederation that occupied Switzerland’s southeastern corner, the Grisons, similarly began its recorded witch hunts in the seventeenth century. However, the Grisons—a region of mixed Protestant and Catholic, German-speaking and Italian-speaking populations—compensated for the late start with considerable activity, recording over 500 witchcraft trials and over 250 executions for witchcraft in the seventeenth and early eighteenth centuries.

When one divides Switzerland into Protestant, Catholic, and mixed-religion cantons, no clear patterns of witch hunting emerge (see Table S-1).

The numbers in this table (taken mainly from Bader 1945) suggest that throughout most of the Swiss Confederation, anywhere from half to two-thirds of the people tried as witches were executed, although they were seldom executed in large groups. Cantons without an urban capital, such as Schwyz or Appenzell, seem to have been relatively severe, but recorded trials were not especially numerous in such places. By contrast, Switzerland’s few urban cantons apparently were relatively skeptical in this respect: At Geneva, witchcraft executions ended comparatively early (with only one death after 1626), while Basel abolished torture in witchcraft trials in 1643.

TABLE S-1

| <i>Catholic cantons</i> | <i>Trials</i> | <i>Executions (%)</i> |
|---------------------------|---------------|-----------------------|
| Lucerne (1550–1675) | 505 | 254 (51%) |
| Solothurn (1550–1660) | 122 | 55 (45%) |
| Schwyz (1571–1682) | 50 | 35 (70%) |
| Jura (1571–1670) | 191 | 100 (52%) |
| St. Gallen (1600–1723) | 38 | 24 (63%) |
| <i>Protestant cantons</i> | <i>Trials</i> | <i>Executions (%)</i> |
| Zurich (1533–1714) | 220 | 74 (33%) |
| Bern (undated) | 124 | 40 (32%) |
| Geneva (1527–1681) | 337 | 68 (21%) |
| Neuchâtel (1568–1677) | 360 | 243 (68%) |
| <i>Mixed cantons</i> | <i>Trials</i> | <i>Executions (%)</i> |
| Appenzell (1579–1691) | 91 | 62 (69%) |
| Grisons (1600–1750) | 545 | 246 (43%) |

These samples, drawn from most of the best-documented cantonal examples, offer few clues about why Switzerland was Europe's most intensive witch-hunting region. Explanations should be sought less within Switzerland's thirteen original self-governing cantons (seven of them included in these samples) and more within their "colonial" possessions, the mostly French- or Italian-speaking territories the Swiss had conquered during their period of expansion after 1475. Certain situations that maximized local autonomy seemed to have provoked intensive but extremely local witch hunts in a few corners of present-day Switzerland. One was de facto independence from a remote overlord outside the Swiss Confederation. For example, the micro region inhabited by fewer than 2,000 French-speaking Protestant subjects of the former prince-bishop of Basel (who still refused to join Switzerland's new French Catholic canton) lived under Bernese protection in two fully autonomous legal districts, which together recorded about 120 executions for witchcraft between 1607 and 1667 (Monter 1976, 107). At the opposite, eastern end of Switzerland, the German-speaking Catholic peasants of the Prättigau Valley liberated themselves from Austrian authority in 1648 and joined the Grisons; becoming fully autonomous, they immediately began a witch hunt, the *groos Häxatöödi* (great witch killing), that claimed over 100 victims by 1660.

Even worse was a Swiss "colonial" possession with lax supervision from its cantonal overlords. The Italoophone Val Leventina (Ticino), a high Alpine valley governed by canton Uri and the scene of serious witch hunting in the mid-fifteenth century, held over 250 witchcraft trials between 1610 and 1687 (Scanni 1997). The present-day French-speaking canton of Vaud, governed since 1536 by the Protestant Germanophone canton of Bern, provides a much larger and even more gruesome illustration of this situation. Although the exact number of witchcraft

executions in Vaud remains unknown, a remarkable survey (Kamber 1982) counted 970 of them during the forty years after 1580. Extrapolating from this base, we must also recall that witchcraft executions had persisted in this region from the period before the Bernese conquest until 1580; we know that over 100 witches were burned in Vaud during the 1629–1630 plague and famine and that significant numbers of witches were being burned in this canton, as in neighboring Neuchâtel or Fribourg, until at least the 1670s (for example, there were forty witchcraft trials dated between 1647 and 1671 in one *bailliage* [bailiwick], Moudun). The likeliest total of witches for the canton of Vaud would therefore approach 1,700, the majority of them being burned under Bernese rule. Many more witches died there than in the eleven cantons tabulated earlier combined; Vaud probably accounted for over 40 percent, perhaps almost half, of the entire Swiss total. An unusually high number of Vaud's witches were male: Men, who had outnumbered women among fifteenth-century witches in this region, still accounted for over one-third of Kamber's sample.

How did Vaud compile such an unenviable record? We know that two factors usually reduced witch hunting by the seventeenth century: careful religious indoctrination at the local level and scrupulous supervision of local judges by an appellate court. In Vaud, the Bernese failed miserably on both counts. As early as 1543, its German rulers expressed official worries about the extent of witchcraft in their recently conquered, French-speaking *welschland*, but they produced no effective educational remedy until they issued a special catechism against witchcraft in 1665; furthermore, they never established an appellate court for criminal cases. Kamber's survey showed that Bern routinely approved all but a tiny handful of death sentences handed down for witchcraft, regardless of who pronounced them. About half of the 1,000 executions surveyed occurred in the ten *bailliages* governed directly by Bern, while the other half were scattered across 91 of the region's 142 autonomous seigneurial jurisdictions.

All Vaud's witches were Protestants, and they provided a total at least equal to that of the entire Kingdom of Scotland, a proverbially witch-ridden but vastly larger and more populous place. By itself, Vaud guaranteed that Switzerland's Protestants executed more witches than its Catholics did. However, certain other aspects of witch hunting in Switzerland suggest that some "superstitious" behaviors lasted longer in Catholic regions. An examination of two particular problems associated with witchcraft and witchcraft trials in Switzerland—hailstorms and the Devil's mark—will help illuminate these contrasts.

In this Alpine region, grain and wine harvests were extremely vulnerable to sudden and severe hailstorms during the growing season. Consequently, fifteenth-century Swiss witches were almost invariably accused of causing them. This belief seems to have been intact when witchcraft trials resumed on a greater scale in several

parts of Switzerland after 1560. One finds accusations of making hail at Geneva in 1567 and occasionally at Zurich even after 1600 (7 instances in 86 preserved witchcraft trials), but such charges had almost disappeared from witchcraft trials in Protestant Switzerland by the seventeenth century. Meanwhile, this dangerous form of *maleficium* (harmful magic) endured throughout Catholic Switzerland's witchcraft trials until the end of the seventeenth century. Switzerland appears to confirm the schema for southwestern Germany (Midelfort 1972, 36–56), wherein Protestant theologians promoted a “providentialist” interpretation of hailstorms that reduced the role of demons—and thus of witches—in provoking them.

Searching a suspected witch for the Devil's mark, however, soon became a local Protestant specialty. This practice was unknown in fifteenth-century Switzerland, but it had become standard practice by the mid-sixteenth century at both Geneva and Vaud, where Protestants placed greater emphasis on the witch's pact with the Devil. Searching for the mark spread to other parts of Protestant Switzerland only around 1600 but took far longer to be adopted and taken seriously in Catholic Switzerland. For example, Devil's marks were described in all thirty witchcraft confessions in Protestant Moudun (Vaud) from 1647 to 1670, but they were found on only about half of a comparable sample of accused witches examined in neighboring Catholic Fribourg from 1644 to 1683.

In the area of present-day Switzerland, witchcraft trials began extremely early and ended comparatively late. Although witches were rarely hunted in most other parts of western Europe (England, France, Spain, Italy) after about 1670, some regions of the Swiss Confederation were still holding numerous witchcraft trials, and a few continued to do so far into the “enlightened” eighteenth century. Most parts of western and northern Switzerland, like Louis XIV's France, had abandoned witch hunting well before 1700. Yet one finds a witchcraft trial in a mountainous Protestant corner of the Jura in 1706, while the patriciate of Catholic Fribourg used witchcraft as a legal convenience to execute a female troublemaker as late as 1731. In the present-day canton of Valais, the scene of Europe's first large-scale witch hunt in 1428, two witches were burned more than three centuries later, in 1730, and still others were put on trial even afterward.

Witchcraft trials lasted even longer in the central and eastern Alps, particularly in Switzerland's original “forest cantons.” In Zug, spontaneous denunciations by a teenage girl who claimed to transform herself into an animal, make hail, and fly to the Sabbath triggered a small panic in 1737 that ended with five burnings; a sixth prisoner survived after being tortured twelve times. In 1753, witchcraft trials occurred in both the Italophone Grisons at Poschiavo and in the canton of Schwyz, where two suspects died under interrogation

and were buried in unconsecrated ground. The final legal execution of a witch anywhere in Europe occurred in the Protestant part of the canton of Glaris, after a maidservant named Anna Göldi was arrested for causing her employer's daughter to become demonically possessed. Because her accuser was a doctor, the indictment avoided terms such as *witchcraft* or *magic* in favor of a new crime called *Kunstkraft* (artificial power). But Anna Göldi was nonetheless beheaded for this offense in June 1782, and her fiancé, who was arrested with her, hanged himself in prison. Interrupting the age of Mozart and Goethe, the Glaris affair—replete with the futile gesture of a cantonal executioner burning some pamphlets ridiculing the local authorities—scandalized enlightened opinion in central Europe.

SYMPATHY

Poorly understood in its early modern context, this fundamental concept of natural philosophy originated in Greek cosmology and science, but it is usually presented as a superstitious form of sorcery, known today as sympathetic magic. Whichever definition one focuses on—the former deeply rooted in Aristotelian physics, the

latter in the Hermetic tradition of Renaissance Neoplatonism—sympathy was essential to early modern European cosmology, as it explained the functioning of the universe in terms of a dynamic relational force. Our modern psychological understanding of sympathy (connoting compassion and a motivation to philanthropy) emerged only gradually during the eighteenth century, in bourgeois sentimental literature, philanthropic philosophy, and even in the works of political economists.

THE DOCTRINE OF SYMPATHY

Etymologically, *sympathy* (συμ and πᾶδος) meant “to be affected together” in Greek and was first employed in a consistent manner by the ancient Stoics (Kranz and Probst 1998). According to the prevalent theory of the affects, it embraced the commonality of emotions among people but in a material and biological fashion that also encompassed physical attractions between planetary bodies and their influence on society, culture, political events, and individual health. By the sixteenth and seventeenth centuries, the doctrine was hegemonic, representing the generally accepted basis for a cosmological interconnectedness of all things physical and metaphysical (hylomorphism), thereby offering grounds for causation in an otherwise unchanging universe. However, as sympathy (juxtaposed to antipathy, its exactly opposite force) lacked any materially observable basis, its universal power was ascribed to occult forces, generally proved inductively on the basis of experience or simply through introspection. As an Aristotelian worldview became systematized during the Renaissance, the doctrine of sympathy achieved its greatest influence. With sympathy considered the occult force behind the Hermetic mechanics of the universe, the doctrine was easily adapted to clarify incongruities in an otherwise logically consistent system based on philosophy rather than empirical deduction. The doctrine of sympathy permeated nearly all fields of knowledge, including Neostoicist political theory (in which it was rendered in social terms of *concordia/discordia*, concord or sympathy and discord or antipathy); astrology/astronomy; alchemy/chemistry; and perhaps most of all medicine. There, it was employed within the framework of Galenic humoral pathology by Girolamo Fracastoro to explain infectious diseases. During the sixteenth-century renaissance of *De Anima* (On the Soul, Aristotle’s work that served as the basic Western psychology text well into the eighteenth century), the doctrine of sympathy was much discussed in relation to the mind–body problematic. Another important proponent of the doctrine of sympathy at that time was Rudolf Goclenius the Younger (who, incidentally, introduced the term *psychology* in the first published work on the subject).

The eighteenth-century German encyclopedist Johann Heinrich Zedler defined sympathy as “a teaching in natural philosophy of a hidden agreement

between two bodies and the tendency of the one toward the other, juxtaposed with antipathy.” Briefly, the doctrine of sympathy proposed the existence of unseen forces of attraction in the universe that affected relationships among planets, plants, animals, metals, stones, and so forth. In this sense, sympathy performed the same epistemological function as gravitation or René Descartes’ theory of vortices. In essence, sympathetic attraction can be simplified either in Aristotelian terms of microcosm and macrocosm or in atomist terms as the attraction of the four basic and universally present elements—earth, water, air, and fire. Because the human body was composed of all four, it was subject more than most to the exigencies of sympathy/antipathy. The endogenous balance of elements not only defined the individual temperament (melancholy, phlegmatic, sanguine, and choleric, respectively) but also left humans emotionally affected by exogenous factors, such as the position of the stars or certain types of magic. Based as they were on natural philosophy, these holistic perceptions were highly influential in contemporary understandings of disease and witchcraft, and they help explain the popularity of common forms of healing, for example, the astrological medicine practiced by Richard Napier in early-seventeenth-century England or the more famous theories of Robert Burton in his *Anatomy of Melancholy* (1621).

SYMPATHETIC MAGIC

The high level of active interplay between learned opinions on the doctrine of sympathy and popular belief structures becomes apparent through an examination of sympathetic magic. One of the most comprehensive descriptions of this particular form of magic (as related to but distinct from other forms, such as apotropaic and somatic magic) derived from the first significant chapter of James Frazer’s *The Golden Bough* (1922). Frazer differentiated between two forms of sympathetic magic—homeopathic, or imitative, magic and contagious magic. The former (based upon the Law of Similarity) presumes that “like produces like, or that an effect resembles its cause”; the latter (based on the Law of Contact or Contagion) supposes that “things which have once been in contact with each other continue to act on each other at a distance after the physical contact has been severed” (Frazer 1993, 11). Zedler offered an exhaustive list of substances that exerted sympathetic attractions upon each other. Common examples of sympathetic magic include the use of a victim’s hair in image magic (for example, the voodoo doll), urine in love potions, dead-body parts obtained from the executioner, or magical diagnoses made through the examination of a victim’s clothing (see, for instance, Thomas 1971, 183–185). One of the most famous examples of a sympathetic cure was the so-called *Pulvis sympatheticus* (Powder of Sympathy), also known as the weapon

salve. In the early seventeenth century, numerous authors debated the substance's occult power to cure battle wounds even at great distances, an ability attributed to certain powders or ointments dipped on a sword. Although not properly regarded as "magic" by contemporaries, this cure nevertheless illustrates the close practical relationship between popular sympathetic magic and the learned doctrine of sympathy.

DECLINE, TRANSFORMATION, AND HISTORICAL SIGNIFICANCE

Although Kenelm Digby's 1630 treatise on the weapon salve went into twenty-nine editions and Zedler still felt obliged to enter it uncritically into his *Universal Encyclopedia* in 1744, the scientific doctrine of sympathy was long on the wane. Apart from a fierce polemic conducted between Goclenius and his opponents, the Flemish Jesuit Johannes Roberti and the Dutch Paracelsian, chemist, and physiologist Jan Baptist van Helmont, the doctrine was fundamentally undermined by the greatest empiricist of Digby's day, Francis Bacon. At the beginning of the seventeenth century, Bacon condemned the doctrine as "idle and ignorant conceits," noting that "what are called occult and specific properties, or sympathies and antipathies, are in great part corruptions of philosophy" (quoted in Kranz and Probst 1998). The epistemological dilemma posed by the doctrine of sympathy in the Baconian age is compellingly explored in Umberto Eco's novel *The Island of the Day Before* (1994). By the eighteenth century, the debate over the doctrine of sympathy in the natural sciences had been largely supplanted by an analogous one over the properties of magnetism. A cornerstone of the wonder cures employed by Franz Anton Mesmer, the occult power of his fluid doctrine of magnetism was discredited in 1784 by a French commission composed of the chemist Antoine Lavoisier, Paris mayor Jean Bailly, Dr. Joseph Guillotin, and the American Benjamin Franklin (ironically, Lavoisier and Bailly were both later beheaded by the device named after Guillotin).

However, the doctrine of sympathy was transformed and survived, first in the English moral sense-philosophy of Anthony Ashley Cooper, the Earl of Shaftesbury, and subsequently in eighteenth-century sentimental lit-

erature and early writings on psychiatry, which was then beginning to assume its modern contours. Other survivals can still be found in medicine (especially the homeopathic variant) and psychology. Sympathy also formed a significant aspect of the philanthropic philosophy of David Hume and of theories of political economy propounded by Adam Smith and others (Van der Lühe 1998). Nevertheless, in historical terms, an understanding of the older, early modern usage of sympathy is crucial to any understanding of Enlightenment luminaries' contemporary epistemology. Indeed, sympathy can be viewed as a critical component for the explanation of universal interconnectedness and unity in the era prior to the emergence of what Michel Foucault called a new "order of things" in the discourse of human knowledge.

T

TÁLTOS

The *táltos* was a shamanistic magician active in Hungarian village communities until the nineteenth century. Through his ability to attain a state of trance, a shaman enabled his soul to leave his body and thus fulfilled the role of mediating between this and the otherworld. Researchers (Diószegi 1958; Róheim 1961) considered the mythology and rituals of the *táltos* as legacies from a pre-Christian Hungarian shamanism and found his closest counterparts in the shamans of Altaic peoples, thus placing the *táltos* in the context of classic Eurasian shamanism, originally connected to a hunting culture. This eastern connection is substantiated by the Finno-Ugric and Turkic origin of the Hungarian word *táltos* as well as the verbs *révül* and *rejtezik*, both of which refer to a state of trance.

There is no medieval information about the *táltos*. Its mythology and rites can be reconstructed from seventeenth- and eighteenth-century witchcraft cases and from nineteenth- and twentieth-century folklore collections. Such data connect the *táltos* to other traditions and practices of so-called European shamanism related to agricultural fertility. The closest parallels to the *táltos* are the *benandanti* (dogooders) of Friuli (Ginzburg 1983) or the magicians still active in the Baltic in the early modern times and much later in the Balkans, who, at the start of the agricultural season, conducted soul fights on storm clouds against demons and dead people who would try to destroy the harvest with hailstorms. They existed alongside other, usually female, seers whose community functions included healing, questioning the dead, and locating treasure through various occult “seeing” techniques or divination procedures (chiefly mirror divination). These two types offered alternatives of the same system, a sort of “double shamanism” (Ginzburg 1991). The seventeenth- and eighteenth-century Hungarian *táltos* represent both types of double shamanism; the twenty-seven mentions contained in the documents of Hungarian witchcraft persecution between 1626 and 1750 refer on rare occasions to a *táltos* whose magic was aimed at the weather, but more frequently they refer to treasure-seeking *táltos*.

The various types of central European magicians can be distinguished through their unique guardian spirits,

their “soul animals” (dragon, eagle, snake, dog, horse, and so on), as well as through the otherworldly spheres they visited and their mythological enemies. Despite these differences, almost all types (including the *táltos* found in witchcraft trials) communicated with the dead, in their role as guarding spirits. The dragon and the dead relatives appeared among their guardian and calling spirits, and horses, bulls, and snakes appeared as helping or soul animals. In every case with detailed documentation, the *táltos* also claimed a Christian dimension: Their guardian and calling spirit was God, Jesus, or the Virgin Mary. “Heavenly” shamans also had some werewolf traits that appeared at birth (being born with a caul, with a wing or bristles, or with two lines of teeth), and their capacity for trance was closely connected with their werewolf nature. The underworld type displayed many characteristics of *mora* (a pressing night demon or someone with a capacity for communicating with the dead in trances).

The activities of the seventeenth- and eighteenth-century Hungarian *táltos*, like those of other central European shamanistic magicians, were closely intertwined with those of the village witch. Identifying the witch and remedying her damage ranked among the *táltos*’ most important communal functions. The clearest example of a double *táltos* in Hungarian witchcraft trials appeared in the 1728 case of Erzsébet Tóth, a woman from Jászberény, who displayed both “heavenly” and “underworld” traits. She was born with a double line of teeth characteristic of Balkan werewolf-magicians and was then initiated by Jesus, exchanging one of her teeth for the medicine she used for healing. In court, she claimed she was the “daughter of Christ,” who helped her during battles fought in storm clouds and who gave her the keys to heaven. She protected the crops from hail raised by spells of the evil ones (evil dead, witches) and also had a dragon as a helping spirit. Once she had even saved all of Hungary from an earthquake. Erzsébet Tóth was also a seer who knew “all in the world that is in the ground” and who identified thieves, predicted fire and death, and, helped by *mora* soul animals, communicated with an earthly otherworld. She cured spells and identified witches, but she could also lay spells herself.

Another detailed example comes from the 1741 trial of three *táltos* (Suska Kőmives, György Tapodi, and

Judit Szöcs) held at Miskolc (Borsod County, Hungary). It focused on various forms of fighting. During their “journeys” at Whitsun and St. John’s Day, these *táltos* went in groups structured by gender and age, to fight in a state of trance, taking the shape of a dove, fish, or fox.

The communal activity of the *táltos* had vanished by the twentieth century, but its memory haunts even today’s folklore. Stories still mention their birth traits (being born with teeth or occasionally with birds’ wings), their weather magic, and their battles in the shape of a bull or a horse to ensure good weather for their village. Occasionally, a *táltos* born with the traits of a snake, dragon, or eagle or using such helping spirits also appears in late modern legends, as does the notion of *táltos* fighting in groups. Such traits relate the *táltos* to south Slavic and Italian magicians, but being born with teeth (but not with a double line of teeth) remains a uniquely Hungarian characteristic.

TANNER, ADAM (1572–1632)

One of Germany’s most highly esteemed Catholic theologians, Tanner was also an important critic of

witch hunts. Born at Innsbruck (Tyrol), he became a Jesuit in 1590. After studying rhetoric and theology at Dillingen and Ingolstadt (Bavaria), Tanner became a professor of scholastic theology at Ingolstadt in 1603. Apart from short periods at the universities of Vienna and Prague and at the Jesuit convent of Hall in Tyrol, he taught at Ingolstadt for the rest of his life. When the Thirty Years’ War reached Bavaria in 1632, Tanner tried to flee to Tyrol but died en route.

Tanner published twenty books, most of them harsh attacks on Protestantism and on all adversaries of the Jesuit order. One of his major achievements was the reception of Spanish Molinist theology north of the Alps. In one of his two treatises on astronomy, Tanner applauded Galileo as a mathematician, even though he apparently rejected the idea of a heliocentric universe. A crater on the moon, Tannerus (latitude 56.4 south, longitude 22.0 east), was named in honor of the Ingolstadt professor.

Witchcraft played a minor role in Tanner’s writings. He often avoided the subject deliberately, never mentioning witches when discussing such things as false miracles, idolatry, or the magical power of church bells. However, Tanner broke this silence on several occasions. Even though he was a pupil of Gregory of Valencia and knew the Bavarian Jesuit Jacob Gretser, both outspoken advocates of witch hunts, he distanced himself from their ideas very early in his career. During a public disputation with Protestant theologians in 1601, Tanner attacked the Protestant Jakob Heilbronner, who had denounced the cabbalist Johann Pistorius (Niddanus) as a witch. In his *Astrologia sacra* (Sacred Astrology; Ingolstadt, 1615), he rejected astrology as blasphemous nonsense while defending Johannes Trithemius against allegations of magic. In doing so, he openly contradicted two other prominent Jesuit scholars, St. Robert Bellarmine and Martín Del Rio.

At the height of his career, Tanner included a critical discussion of witchcraft trials in his most important work, *Universa theologia scholastica, speculativa, practica* (Complete Scholastic Theology, Speculative and Practical; Ingolstadt, 1626/1627), a monumental commentary on Thomas Aquinas. This text was based on a now-lost consultation on witch hunts that he had written in 1602 for the Bavarian government. Tanner presumably returned to the topic because witch hunts of unprecedented vigor had started north of Bavaria in 1626. Friedrich Spee quoted Tanner’s text on witchcraft trials extensively. Whereas Spee’s brilliant polemics were bitter and full of personal sentiment, Tanner’s criticism was distanced and meticulously erudite. Both were skeptical about the discretionary powers of judges, and both rejected the idea that God would not allow innocents to be condemned as witches.

Tanner admitted that witches' Sabbats did happen, but he was skeptical about "spectral evidence" because demons could assume anyone's outer appearance (that is, he believed that judges could never be sure that a person allegedly seen at a witches' Sabbat had really been there). Nevertheless, Tanner basically accepted denunciations of accomplices by condemned witches as circumstantial evidence. However, suspects should be investigated only if three witches, who had been condemned and who honestly repented of their crimes, denounced the same person freely and independently and if there was corroborating evidence against that person. Denunciations against persons with a good reputation should be ignored. Tanner was extremely careful, but he did not arrive at Spee's total rejection of denunciations as evidence.

Tanner urged princes not to punish any witches who truly repented and revoked their pact with the Devil before criminal proceedings against them had started. His ideas about the repression of witchcraft obviously contradicted those of the demonologists and witch hunters. Tanner believed that spiritual means were much more effective than criminal procedures: prayers, processions, and the use of relics and blessed amulets were sufficient to ward off demons. The best way to extirpate witchcraft was to strengthen public order and morality. Tanner tried to respiritualize the crime of witchcraft: Witches should be won back to the Church, not killed. His fellow Jesuit Spee still paid lip service to demonology, but it is very likely that Spee no longer believed in witches. This is probably the reason why he ignored Tanner's "spiritualization" of witchcraft.

TARTAROTTI, GIROLAMO (1706–1761)

After a long preparatory period of research and difficulties with censorship, the Italian historian and writer Girolamo Tartarotti published *Del congresso notturno delle lammie* (On Nocturnal Gatherings of Witches) in three volumes at Venice in 1749. As a supplement, he wrote two epistolary dissertations on the magical arts. Touched by a human piety for all the victims of the

prosecution, which was still continuing in several parts of Europe after several centuries, Tartarotti tried to prove that the superstitious belief in witchcraft was completely groundless. In his first volume of *Del congresso*, a long journey through the world of horror, he rewrote the history of witchcraft belief from its origin until his day, concluding by identifying modern witches with the adepts of Diana, whom the *Canon Episcopi* (ca. 906) had considered victims of diabolic illusions. Thus, Tartarotti was glad to confirm the opinion expressed by Ludovico Antonio Muratori in *Della forza della fantasia umana* (On the Strength of Human Phantasy, 1745) that witches had never existed. But, contrary to Muratori's optimism about the absence of any contemporary witch belief, Tartarotti provided evidence of ongoing beliefs and prosecutions in Germany.

In the second volume, Tartarotti included a definition of the social and psychological character of the witch, who was according to him a poor and undernourished person in an impoverished countryside, geographically isolated, and susceptible to fantasies and hallucinations due to her melancholia and hypochondria. In volume 3, he severely criticized the Jesuit demonologist Martín Del Rio, whose *Disquisitionum magicæ libri sex* (Six Books on Investigations into Magic), first published in 1599/1600, remained popular in Tartarotti's days, having been reprinted at Venice as recently as 1746. Besides Tartarotti's denial of the existence of witches and witchcraft, a second statement about the historical genuineness of magicians also made Tartarotti's *Del congresso notturno delle lammie* famous. According to Tartarotti, magicians had all belonged to the world of Renaissance humanism and were men who intended to violate God's law by using demonic powers. It started a discussion among the Italian intelligentsia about magic and witchcraft.

Among fourteen others, Gianrinaldo Carli (1720–1795) and Scipione Maffei reacted to Tartarotti's statements: Neither of them believed in the historical reality of magic. Carli saw no difference between magicians and witches: Both, in his view, were swindlers and had to be punished. In 1751, the Franciscan Benedetto Bonelli severely attacked Tartarotti: He saw both magic and witchcraft as diabolically inspired arts that really existed. In his response, *Apologia del congresso notturno delle lammie* (Apologia of the Nocturnal Gatherings of the Witches; Venice, 1751), Tartarotti admitted that his distinction between the genuineness of magic and witchcraft was strategic: He feared that denying both would compromise his fight to liberate the so-called witches, because prosecutions and executions still continued. Tartarotti really was concerned for the victims of witchcraft trials. In 1749, he had tried—in vain—to influence the judges who wanted to burn a sixteen-year-old girl at the stake in Salzburg.

One year before his death in 1755, Maffei wrote his final response to Tartarotti. In his *L'Arte magica annichilata* (The Magical Arts Annihilated; Verona, 1754), he was really annihilating Tartarotti's distinction between witchcraft and magic. Maffei claimed that on theological, philosophical, or even ethical grounds, Tartarotti's position was untenable: How could judges distinguish a poor witch from a diabolical magician? And how did Tartarotti know that the harm caused by a witch was less serious than the harm caused by magic? Tartarotti was impressed by Maffei. In his anonymous response to yet another attack by the tireless Bonelli in 1755, Tartarotti often based his answers on Maffei's statements. Contrary to fanatically blind polemicists like Bonelli, Tartarotti wrote, he and Maffei were enlightened Catholics who wanted their society to benefit from their erudition. Indeed, Maffei and Tartarotti each tried in his own way to liberate eighteenth-century people from superstitious belief in witches and magicians.

TASSO, TORQUATO (1544–1595)

Italian poet and author of a dialogue on demonology. By 1575, Tasso had completed an epic on the First Crusade, in defense of Counter-Reformation sacraments and theology. A committee of literati and a theologian helped him revise the poem, but the struggle to satisfy his critics damaged his mental health, provoking violent and erratic behavior. The duke of Ferrara imprisoned Tasso for madness in 1577 and again from 1579 until 1586. While imprisoned, Tasso allowed his epic, already circulating in pirated printings, to be published as *Gerusalemme liberata* (Jerusalem Delivered) in 1581, and he composed philosophical and literary dialogues.

Tasso's epic contained scenes of witchcraft (especially cantos 13, 16, and 18); his prison dialogues demonstrated his familiarity with theories of Gianfrancesco Pico della Mirandola and Jean Bodin. In his dialogue *Il messaggero* (The Messenger), begun in 1580, Tasso presented a conversation between himself and a supernatural being, apparently a Neoplatonic *daemon* (a being

intermediate between humans and the divine and with a body composed from a substance like air). This "messenger" provided theological, cosmological, ontological, and epistemological evidence that angels and *daemons* (including "demons") are not imaginary but real. The first argument is inductive: *Daemons* "save the appearances," or provide causal explanations of observed phenomena. If sorcerers, witches, and possessed persons exist, then *daemons* exist; because every age records examples of them, then *daemons* exist.

Tasso's second argument was deductive: Nature is by definition both complete and hierarchically graduated. Souls ascended stepwise from sponges and shellfish to man. However, Renaissance Neoplatonists (such as Marsilio Ficino and Giovanni Pico della Mirandola) erroneously called man the perfect microcosm, or knot of the universe. True, man's soul mediated between brute beasts' and angels' souls, but man's body was mortal and corruptible, like beasts' bodies. Angels, including Aristotle's "intelligences," were incorporeal, immortal, and exempt from suffering. If the universe were truly complete, there logically existed a daemonic body that was immortal but subject to suffering and passion, thus separating human from angelic being. Tasso opposed the demonological consensus by defining daemonic bodies as real rather than fictive.

Certain *daemons*, Tasso held, could copulate with women, impregnating them with semen stolen from men. (He seemed unaware that this idea implicitly contradicted his contention that *daemons* had real bodies.) Copulation was a third, empirical proof of suprahuman reality. *Daemons'* paramours were called witches (*streghe*) and gave birth to magi. Women with magical powers were *maghe*, but not necessarily *streghe* (Stephens 1994).

Tasso's idiosyncratic demonology reflected a severe crisis in his religious faith between 1575 and 1580. In 1577, he begged the Inquisition to examine him for heresy, then reacted angrily when he was absolved as suffering from melancholia. In 1579, a month after being incarcerated, Tasso confided to a friend his failure to believe in a personal God, divine providence, the Incarnation, hell, purgatory, papal authority, the sacraments, or the immortality of the human soul. In a letter to Scipione Gozaga on April 15, 1579, Tasso made a painfully unconvincing claim that he had overcome his doubts. Ironically, he had carefully organized *Gerusalemme liberata* as an implicit, polemical defense of exactly the doctrines he confessed himself unable to believe (Stephens 1991, 2000). His *Il messaggero* thus appears to be Tasso's attempt to reconstruct Catholic belief through philosophical persuasion, just as *Gerusalemme liberata* employed poetic persuasion for the same end.

TEARS

Today we know that the shedding of tears can be blocked, especially under stressful physiological and psychological conditions. From the fifteenth century onward, however, most witch hunters were convinced that a woman who could not weep when interrogated and tortured was very probably a worshipper of the Devil, who was hindering this natural manifestation. The *Malleus Maleficarum* (The Hammer of Witches, 1486) explicitly instructed inquisitors to observe whether or not a suspected person would shed tears in this situation, because a witch would be unable to do so even if constrained and most heavily pressed. The judge, it noted, should earnestly entreat her by Jesus's tears of love and Mary's tears of fire and all the tears shed by the saints to cry if she was innocent. Whether or not she could do so under other circumstances was of no importance (*Malleus Maleficarum*, book 3, chap. 15, 11).

The influence of this manual and the fact that its teachings were incorporated into later tracts, such as that of Silvestro Prierias, guaranteed the widespread observation of tears or lack thereof during later witchcraft trials, though the Roman Inquisition never acknowledged tears as an indication. There were some variants of this belief: Jean Bodin, for example, wrote that only three tears may fall from a witch's right eye.

To understand this evaluation of a physiological process, one must remember that according to the Gospels, Jesus never laughed, but he did cry several times. The most important scriptural basis is Luke 6:21: "Blessed are ye that weep now: for ye shall laugh." This was, of course, interpreted within an eschatological frame: Weeping in this world, the "vale of tears," would be rewarded in the otherworld. Therefore, the *Mssale Romanum* contained a formula for praying for tears, and all spiritual enthusiasts craved the "grace of tears" (*donum lacrimarum*). Indeed, this faculty is a commonplace in Catholic hagiography, dating back to the desert fathers. In the later Middle Ages, the gift of tears was recorded more often about women than about men, because for women tears were not only a form of imitation of Jesus but also an *Imitatio Mariae* and an *Imitatio Mariae Magdaleneae*, who both had wept under the Cross.

The person most famous for her tears was the English mystic Margery Kempe, whose fits, combined with her "well of treys," made her both famous and notorious in the early fifteenth century. Some considered her a living saint; others considered her a hypocrite or even worse. Her tearful devotion made her suspect of Lollardy, and more than once she was in danger of being burned. Elizabeth of Hungary is another example. Of course, men could also have the gift of tears. John of Bridlington (d. 1379), one of Kempe's confessors, was also well known for having this grace, which was particularly praised in his canonization process. But few men could match Ignatius Loyola. His fragmentary *Spiritual Diary* meticulously recorded approximately 2,000 fits of weeping over a span of thirteen months in 1544–1545, and his closest associates feared he would cry himself blind.

Thus, although the faculty of shedding tears was reckoned a sign of sanctity and was indispensable in penitence, it could be used negatively as a test to discover a witch.

TEMPLARS

A military-religious order established by Hugh of Payns in 1119 and dissolved two centuries later amid rumors

The burning of the Templars, from a late fourteenth-century manuscript. (Erich Lessing/Art Resource)

of sacrilegious and blasphemous orgies. The order's modern fame derives largely from mythologizing by eighteenth-century Freemasons. Its original purpose was the protection of pilgrims traveling in the Holy Land after the conquest of Jerusalem by the first crusaders in 1099. Members of the order took the monastic vows of poverty, chastity, and obedience, but unlike monks or canons regular, they served a military purpose. The king of Jerusalem allotted them space in what was then thought to be the Temple of Solomon, whence the name of the order, the Knights of the Temple of Solomon, or Knights Templar. Under the guidance and personal patronage of St. Bernard of Clairvaux, who recognized that they formed "a new type of order in the holy places" and described them in his work *In Praise of the New Knighthood* in 1136, the order received papal recognition at the Council of Troyes in 1129, established a Rule for its members, and placed them under the master of the order. Pious gifts of land and incomes in both the Holy Land and western Europe provided the order's support, and it recruited members in both places.

Although the novel combination of monastic discipline and military activity generated considerable criticism in the twelfth century, the Templars soon became a prominent and often independent military force in the Latin Kingdom of Jerusalem, receiving extensive papal privileges in three bulls issued between 1139 and 1145. The order also received the patronage of European nobles and rulers, established Templar communities in much of western Europe, and constructed a series of strong, virtually autonomous castles in the Holy Land. The order became so powerful that it could act independently of the monarchy of the Latin Kingdom. At its greatest extent in the thirteenth century, the vast Templar network of 870 castles and preceptories housed 7,000 members of the various grades of knights, sergeants, and chaplains, 2,500 of whom served in the east, with the remainder organized into territorial provinces in western Europe. In his romance *Parzival*, written early in the thirteenth century, the great German poet Wolfram von Eschenbach (d. 1225) idealized the Templars in his description of the order of custodians and protectors of the Holy Grail, the *Templeisen*.

In addition to their religious, military, and political prominence, the Templars also became a powerful financial institution, serving as bankers to both crusaders and pilgrims, who could deposit funds with Templar houses in France and elsewhere and withdraw them as they needed from Templar houses along the route to Jerusalem. Templar financial expertise also served the rulers of Europe, particularly the kings of France, whose treasury was located in the Paris Temple.

Because the order was so closely identified with the Latin Kingdom, the fall of Jerusalem to Saladin in 1187, the loss of Acre (the last Christian-held territory in the east) in 1291, and the relocation of the Templars' headquarters to Cyprus led to renewed heavy criticism of the Templars and to proposals for reform of the Templars and for their merger with other military-religious orders, notably that of the Knights of the Hospital of St. John, or Knights Hospitallers. Under Grand Master James of Molay (who was master from 1293 to 1314), the Templars resisted this and other reform proposals, insisting upon their distinctive responsibilities for the defense of the Holy Land and criticizing from long experience the tactical shortcomings of contemporary proposals for a new crusade.

Although the order had maintained good relations with King Philip IV of France (ruled 1285–1314), he turned against it in 1307; historians still debate his reasons. Several years of expensive warfare with England and in Flanders, the progressive debasement of the royal coinage, Philip's long and destructive struggle with Pope Boniface VIII (ruled 1294–1303), the strong influence of Philip's ministers, and the fear that the kingdom was polluted by the presence of Jews, heretics, and sorcerers all appear to have combined in Philip's determination to purify the kingdom, and, in Philip's mind, that purification came to include the destruction of the Templars.

On October 13, 1307, Philip arrested all of the order's members in France, around 2,000 men, confiscated their property, and urged the kings of England and Aragon and Pope Clement V (ruled 1305–1314) to do the same. His charges against the order included the practice of sacrilegious initiation rites for new members, the denial of Christ, apostasy, idolatry (the worship of an idol named "Baphomet" or "Mahomet"), simony, and sodomy. These charges were not only brought against individual members in trials that included the use of judicial torture but were also publicized widely throughout the kingdom and beyond by Philip's servants. The trials resulted in graphic and horrifying confessions, including that of Grand Master James of Molay (later retracted), whose details were also widely publicized. Outside of France and the territories it controlled, the Templars were usually found not guilty. But inside France and its territories, many Templars were convicted, and many who were deemed

impenitent or relapsed were executed. Those who had been reconciled to the Church or found not guilty were pensioned off or dispersed among other monastic congregations. The scandal led Clement V to dissolve the order in 1312. After retracting his confession, James of Molay was burned at the stake on March 8, 1314. Upon the papal dissolution of the order, its properties, wealth, and archives were turned over to the Knights Hospitallers after Philip's expenses for the trials had been deducted.

The details of the confessions and the papal dissolution of the order were received throughout Europe with both hostility and praise. Dante condemned Philip IV, Clement V, and Boniface VIII in the *Divine Comedy*. However, since the order had long held its chapter meetings in great secrecy, had devised some forms of secret internal communication, and had regarded itself as an elite organization within Christendom, subordinate only to the grand master and the pope, the charges made against its members seemed plausible to many, particularly to those who followed the publicists of Philip IV. The royalist account of the trials influenced the kingdom's quasi-official history, the *Grandes chroniques de France*, which further tainted the Templars with charges of treason, collaboration with the Muslims, and some elements of sorcery. Proroyalist writers in France continued to justify Philip IV's actions until the eighteenth century.

At the same time as the Templar trials, a number of cases of political sorcery also were tried in France, many involving figures around the royal court and stressing the vulnerability of kings, popes, and members of the royal family, especially to diabolical sorcery. Beginning in the early fifteenth century, new charges of political sorcery spread in England, France, and the Burgundian Low Countries, and the formal conceptualization of diabolical witchcraft between 1430 and 1450 in the region of the upper Rhine Valley led to a growing fear of both diabolical sorcerers and witches throughout much of Europe. The linking of the Templars with diabolical sorcery was begun by the chronicler Guillaume Paradin in the mid-sixteenth century, although outside France learned opinion was generally more favorable than hostile to the memory of the Templars.

During the eighteenth century, however, Freemasonry, a secret ethical society prominent initially in France and Scotland, developed for itself a fictitious history that pressed the Templars into historical service as antecedents to the modern movement, thereby coloring Freemasonry's imaginary and remote past with both nobility and a place in the long chain of imaginary Freemasons whose traditions the eighteenth-century Freemasons professed to continue. The growth of Freemasonry and the increasing prominence of the Templars in its fable coincided with a general revival of

sentimental interest in the Middle Ages. In the case of the Freemasons' adoption of the Templars, the movement included the idea that the order had left behind ancient secret wisdom, magical powers, and great hidden wealth. In the late eighteenth and nineteenth centuries the vogue of secret societies like the Illuminati and the Rosicrucians and the concurrent fear of the political dangers they and others raised inspired several writers to compose extensive imaginary histories that attributed to the Templars all of the evils in the world.

The most notable of these was Joseph von Hammer-Purgstall's *The Mystery of Baphomet* of 1818. Both Templar sympathizers and Templar critics accepted the fabulous history, the former tilting it toward a favorable interpretation, the latter condemning it savagely, as did Walter Scott in *Ivanhoe* (1819). Through the nineteenth and twentieth centuries, Templar fantasies were worked over time and again, by novelists, esoteric groups, and individual writers of fantasies with or without an axe to grind, even linking the imaginary Templars to the Shroud of Turin. Umberto Eco's 1988 novel *Foucault's Pendulum* offers a witty and complex send-up of the Templar mythology that began with Freemasonry in the eighteenth century.

TENIERS, DAVID THE YOUNGER (1610–1690)

The Flemish artist David Teniers the Younger is best known for several thousand paintings of Flemish peasants, but he also depicted various demonological and occult themes in complete agreement with contemporary thinking about witchcraft in northern Europe. Among these themes were the practice of alchemy, the *Temptations of St. Anthony* (after 1640), and the activities of witches. Most of Teniers's approximately two dozen paintings of witchcraft show in a very straightforward manner what witches were believed to do. As such, his paintings tell us much about contemporary northern-European witch beliefs. Teniers's

Jacques Aliamet's reproduction of David Teniers's *Departure for the Sabbath*, depicting four witches, many demons, toads, and a goat. Sitting next to a demon bat at a table, an old witch concocts something while looking at a magic circle on the floor. (TopFoto.co.uk/Roger-Viollet)

paintings also depict the activities attributed to witches by contemporary demonologists such as Martín Del Rio and Francesco Maria Guazzo.

Teniers's witches are seen reading black books of spells, preparing ointments to enable them to fly, anointing themselves for flight, riding upon broomsticks, working with poisonous plants and paraphernalia such as the Hand of Glory (the hand of a corpse, supposedly with magical powers, especially that of making the possessor invisible), and consorting with devils and familiars. In most cases, his paintings showed female witches of varying ages. A painting entitled *The Evocation* (ca. 1635, owned by the Musée des Beaux-arts, Bordeaux) shows the rare exception of a male witch calling up demons.

Teniers was among only a small number of seventeenth-century artists who depicted the activities of witches. Although his witchcraft paintings make up only a small percentage of his massive output of about 3,500 works, he nonetheless produced a larger number of such works than did other seventeenth-century artists. Only one Dutch artist, Jacques de Gheyn II, rivaled Teniers in the number of depictions of witchcraft.

Teniers produced his witchcraft paintings throughout his long career. His works fall into a category of factual reportage and, with two exceptions, are neither humorous or satirical. His small panel *The Witch* (ca. 1640, in the Alte Pinakothek Schleissheim Gallery, Munich) is one of these exceptions. Herein a peasant witch is shown raising hell from the relative safety of a magic circle inscribed on her floor. But it is evident from her very frightened expression that she has raised more devils than she can handle.

Teniers's demons generally resemble those of Hieronymus Bosch and of Teniers's in-laws, the famous artistic family of Pieter Brueghel the Elder. In following Bosch and the Brueghels, Teniers used a number of zoomorphic (animal-shaped) and anthropomorphic (human-shaped) devils as well as witches. The images of the anthropomorphic devils are disturbingly quite human. For example, he frequently included depictions of his own wife, Anna Brueghel, the granddaughter of Pieter Brueghel the Elder, among his witches. In doing this, Teniers followed the contemporary belief that witches could be members of various social classes. Because he was the court painter to Archduke Leopold Wilhelm, ruler of the Spanish southern Netherlands, he and his family would have been considered almost as members of the nobility.

One of the most interesting of Teniers's paintings of witchcraft is his *Scene of Witchcraft* (ca. 1650, owned by the Staatliche Kunsthalle, Karlsruhe). In this painting, witches are seen at the foot of a gallows harvesting mandrake roots, which were believed to spring up in such places. Teniers's paintings show a wide range of knowledge about witchcraft lore and are quite interesting illustrations of contemporary thought. A number of artists working both during his own lifetime and in the eighteenth century imitated Teniers's occult paintings.

THEOPHILUS

Theophilus is the most famous of all ancient forerunners of Faust. According to legend, Theophilus administered a bishop's diocese for him in Sicily early in the sixth century. When the bishop died, the people of

the region asked Theophilus to be the successor, but he, in his humility, refused because he did not feel qualified. He expected to continue as administrator, however. The new bishop, influenced by envious persons, discharged Theophilus as a counselor. Out of offended pride, Theophilus consulted a Jewish sorcerer and made a pact with the Devil in which, in writing, he renounced allegiance to Jesus and Christianity. Theophilus fulfilled the first part, but he never ceased to pray to the Virgin. After a short time, he was reinstated in the diocese. Driven by remorse, he begged the Virgin for help. After chastising him for his impiety, the Blessed Mother took pity on him, and eventually even Jesus forgave him. Mary retrieved Theophilus's pact from Satan and put the scroll on his chest as he slept. When he awoke, he loudly proclaimed his guilt and praised the Virgin for her loving assistance. Three days later, he died peacefully.

The central drama of the legend of Theophilus is the idea of a pact with the Devil, which derived from

Theophilus enters into a pact with the Devil and then repents before the Virgin Mary. From the Psalter of Queen Ingeborg, ca. 1210. (Réunion des Musées Nationaux/Art Resource)

Christian demonology. St. Augustine assumed that any kind of magic depended on a pact between a magician and a *daemon* (a being, aerial in body, intermediate between God and humans). Theophilus needed an intermediary—and a Jewish one at that. In almost every such case, the pact with the Devil was made not only or even primarily to gratify physical desires; instead, persons desired access to “secret” knowledge through the Devil or some other supernatural power. Subsequently, the diabolical pact reappeared as a key element in the witchcraft trials, which helped explain the Devil’s powers.

The Theophilus legend was important in another way: Its portrait of the Holy Mother as an adversary of the Devil and an even stronger force made this story a promotional pamphlet for medieval Marianism, thereby greatly aiding its popularity. The oldest extant Latin version of his story is a ninth-century translation, by Paul the Deacon, of an earlier Greek version. One of the most important early renderings is *Lapsus et conversio Theophili vicedomini* (The Fall and Conversion of Theophilus the Archdeacon) by the Alsatian nun Hrotswitha of Gandersheim (935–1000). Many similar accounts circulated subsequently, and the story became a favorite among preachers after Jacobus de Voragine (ca. 1230–1298) included it in his *Legenda aurea* (Golden Legend, ca. 1275). The French poet Rutebeuf (1255–1280) wrote the oldest miracle play version, *Le Miracle de Théophile* (The Miracle of Theophilus, 1264). In the late sixteenth and early seventeenth centuries, the Jesuit poets Wolfgang Schoensleder’s and Matthäus Rader’s miracle plays on this theme were performed in Munich, Freiburg, Dillingen, Lucerne, and Graz. The drama even served as vehicle to make members of the nobility, always suspicious of sympathizing with heresy, rethink their positions.

After the thirteenth century, many German poets and playwrights adapted the story. The first Middle High German version was an “oration on faith” by the poet called Der Arme (“Poor”) Hartmann. A hundred years later, Brun von Schönebeck wrote *Wie Theophilus wart irlöst* (How Theophilus Was Saved, ca. 1250), a version that mentioned for the first time a blood compact with the Devil. By the fifteenth century, the legend had spread across Europe to France, Sweden, the Netherlands, Spain, and northern Germany. After the seventeenth century, the legend of Theophilus and his pact disappeared from central European literature, swallowed up by the Reformation and superseded by the more recent Faust legend. The legend remains alive in Greece, as modern Greek folktales prove; moreover, numerous transcriptions of its original Greek version are stored in the famous Greek monastery on top of Mount Athos.

THOLOSAN, CLAUDE (D.–CA. 1450)

Originally from Dauphiné in southeastern France, Claude Tholosan obtained his licentiate in civil law and served as chief prosecutor (*judex major*) of the Briançonnais from 1426 to 1449. After ten years of repressing witchcraft in remote valleys of the French Alps, he summed up his experience in a treatise known by its opening quotation from St. Augustine: *Ut magorum et maleficiorum errores* (So That the Errors of Magicians and Sorcerers . . . , 1436). It is one of the major texts in the early history of the witches’ Sabbat.

At Briançon, his function was to judge cases involving high justice and appeals from lower and seigneurial courts; as such, he was an agent of the penetration of royal power in Dauphiné (Paravy, in Tholosan 1999, 358). Tholosan first encountered witchcraft cases in the western Alps around 1420–1430. Although in the duchy of Savoy (Pays de Vaud, Val d’Aosta), Dominican or Franciscan inquisitors organized the repression of witches, in nearby places like French Dauphiné or Swiss Valais, this responsibility fell mainly on secular courts, occasionally in collaboration with local inquisitors. In Dauphiné, prosecutions for witchcraft came very early and on a large scale. From 1426 to 1436, Tholosan conducted more than a hundred witchcraft trials. Because he remained in charge until 1449, he probably sentenced many more people. Nearly all the proceedings have been lost. Yet the *Quintus liber factuweriorum* (Fifth Book of Sorcerers), a register of Dauphiné’s treasury (Chambre des Comptes), lists the possessions confiscated from the convicted sorcerers, as well as their names, the dates, and the reasons for their sentences. Married women or widows formed a large majority of culprits.

UT MAGORUM ET MALEFICIORUM ERRORES

Like the Savoyard inquisitor who wrote the *Errores Gazariorum* (Errors of the Gazars [Cathars—a common term for heretics and later for witches], ca. 1437) at the same period, Tholosan described a new heresy, that of the witches. In 1436, after a decade of prosecuting them, he wrote *Ut magorum et maleficiorum errores* (Paravy 1979; Paravy, in Tholosan 1999). Its purpose was to demonstrate the gravity of the new crimes of the witches and to affirm the competence of secular courts to pursue such heretics. The treatise was composed of four parts. The first described the doctrine and practices attributed to sorcerers and witches. Like the author of the *Errores Gazariorum*, Tholosan held that sorcerers belonged to a sect or synagogue gathered around the Devil and that they had renounced God and had given themselves body and soul to demons. Tholosan mentioned that the members of the sect thought they rode through the air on sticks and animals. Familiar with canon as well as civil law, Tholosan referred to the *Canon Episcopi* (ca. 906), that is, to the principle that night flight was an illusion. However, he described the ceremonies of the witches' Sabbat in detail, as if he believed in its reality. According to Tholosan, the sect came from Lombardy as healers and from Lyons, as ruffians. In the second part, he defined the competences of secular and ecclesiastical jurisdictions over this new crime of witchcraft. As members of a sect, witches were heretics; they were also apostates. Tholosan's third part inserted a consultation from French jurists of the House of Anjou and Provence, confirming his statements.

In his last part, Tholosan asserted the necessity of close collaboration between secular and ecclesiastical courts, but he underlined the importance of the secular judge. First, he held that the secular arm was essential in order to apply the death penalty. But he went further: According to Roman law and to the decretal *Vergentis in senio* issued by Pope Innocent III in 1199, the crime of the witches was a crime of *lèse-majesté*. In his concluding paragraphs, Tholosan affirmed the primacy of the prince (whom Tholosan represented) to have both the initiative and the profits of the proceedings against witches. Whereas Nicolas Eymeric, in his *Directorium inquisitionum* (Directory of Inquisitors, 1376), stressed the power of the inquisitors, Claude Tholosan underlined the importance of the secular judge. As a representative of the state and the ruler, the judge had a mission to destroy this *infernal palace* (Paravy 1993, 797–800; in Tholosan 1999, 428–431).

Tholosan's treatise remained practically unknown for over 500 years, but it was representative of a current of thought in the first half of the fifteenth century: the "new heresy" of the witches as a sect of night-flying,

cannibalistic devil-worshippers who desecrated Christian rites. Similar ideas were expressed at almost the same time by the anonymous *Errores Gazariorum*, by Martin Le Franc's *Le Champion des dames* (The Defender of Ladies, 1440–1442), and by the report of the Swiss chronicler Hans Fründ.

THOMAS, KEITH (1933–)

Keith Thomas, with his *Religion and the Decline of Magic* (1971), brought the history of early modern witchcraft into the mainstream of British social history, demonstrating both the possibility and the value of the study of popular magical beliefs. Together with his doctoral student Alan Macfarlane, Thomas introduced to the study of English witchcraft the insights of British social anthropology on the functions and meaning of witchcraft in modern Africa. He used retrospective ethnography to place post-Reformation English witchcraft within the context of the Weberian debate on the "disenchantment of the world" and to reconstruct its meaning both for those accusing others of witchcraft and, to a lesser extent, for those accused. Through emphasizing the malefic focus of English accusations while denying both the reality of continental witch cults and the view that elites imposed witchcraft accusations, Thomas's work reinforced a sense of English exceptionalism; more recently it has been seen as applicable to much of those parts of Europe where large-scale witch hunting was absent.

Thomas is inextricably associated with the rise of social history in Britain, above all in his *Religion and the Decline of Magic* and *Man and the Natural World* (1983). His career has been a highly orthodox Oxford progress, culminating in the presidency of Corpus Christi College and of the British Academy, not to mention knighthood in 1988. Like that of his Balliol

tutor Christopher Hill, Thomas's work draws upon a prodigious mastery of the printed output of early modern England, supplemented in Thomas's case by an extensive grasp of the social sciences and humanities, reflecting his belief that history requires a constant dialogue with other disciplines committed to a holistic understanding of human society. Thomas's particular debt to the social anthropology of Edward E. Evans-Pritchard's work on witchcraft drew him into debates between functionalist and hermeneutic anthropologists, pioneering the shift of social history from economic or social-structural explanations toward cultural history (Geertz and Thomas 1975–1976). Considering himself a historical ethnographer, Thomas read available sources until he could locate people of all classes speaking on every aspect of thought and living; his studies pioneered recent social historical analysis by gender, age, and culture instead of class. Yet Thomas's primary historiographic debt is to R. H. Tawney, who sought to introduce English historiography to the analytic insights of both Marxist and Weberian social science. The title of Thomas's greatest work is surely a deliberate echo of Tawney's *Religion and the Rise of Capitalism* (1938); the core theme of both of Thomas's books is the Weberian "disenchantment of the world" in the post-Reformation centuries. Fundamentally, Thomas retained the Tawney–Hill view of the Protestant Reformation as implicitly revolutionary in its effects, although followed by a transitional century that sought to control such forces. This historical schema remains implicit in Thomas's work, which characteristically emphasizes the complexities and paradoxes of historical development by focusing on the anxieties and dilemmas of human behavior and choices.

Thomas's discussion of witchcraft in *Religion and the Decline of Magic* must be read in this wider context. Its key argument is often taken to be that the Reformation removed the protective magic of the Catholic Church, leaving anxious people to turn for protection against *maleficia* (harmful magic) both to countermagic and to the prosecution of witches, and that accusations of witchcraft often arose out of guilt for refusing charity to the dependent poor, who thus formed the major category of those accused in England. This model has been rightly questioned on many fronts, including its applicability to wider European witchcraft, its neglect of ideological and gender issues, and its tendency toward a form of functionalism. However, most of these criticisms are anticipated elsewhere in the book itself, and they ignore the historiographic setting of 1971, when it was the models of Margaret Murray and Hugh Trevor-Roper that dominated discussions of English witchcraft (Barry 1996).

THOMASIIUS, CHRISTIAN (1655–1728)

The most important German representative of the early Enlightenment, Christian Thomasius was also the first eighteenth-century critic of the witchcraft trials. Frederick II the Great of Prussia claimed that women could now grow old and die in peace because of him. Born at Leipzig, Thomasius was the first son of a professor of philosophy and rhetoric, Jacob Thomas, who Latinized his name to Thomasius. Enrolling at Leipzig University in 1669, Christian wavered between philosophy and law; finally, his study of Samuel Pufendorf tipped the scale toward law. As a student of the famous jurist Samuel Stryk at the University of Frankfurt am Oder, he modified his Protestant orthodoxy and sympathized with the new fashion of natural law. Because of his unorthodox opinions, Thomasius fell into official disgrace, left Leipzig, and moved to nearby Halle, where he became a pioneer of its newly founded Prussian university. The first dean (*Ordinarius*) of the law faculty was his former mentor Stryk, whom Thomasius succeeded after his death in 1710.

Thomasius soon turned his attention toward such controversial academic topics as torture, the law of evidence in inquisitorial trials, and the connection of both to cases of witchcraft and sorcery. He demonstrated that the origin of the *processus inquisitionis* (inquisitorial procedure) could be traced to the Roman Church's canon law, but he also realized that without the *processus inquisitionis*, state administration of justice would not work. The same ambivalent but realistic attitude recurred in his remarks about the law of torture; it was his pupil Martin Bernhardt who was the more critical of the law of torture.

Concerning legal procedures on witchcraft and sorcery, Thomasius at first followed the Saxon oracle, Benedict Carpzov, whose rules of procedure were set out in his *Practica nova imperialis saxonica verum criminaliam* (New Rules in Criminal Cases for Imperial Saxony) of 1635. Accordingly, as Thomasius wrote, he requested mild torture from the law faculty, when he had to propose a decision in a case of witchcraft presented by a lower court, and his faculty colleagues overruled him with Stryk in the chair. Only this “Damascus experience” and the reading of Friedrich Spee’s *Cautio criminalis* (A Warning on Criminal Justice, 1631) opened his eyes to the injustice of witchcraft trials and made him a sworn enemy of Carpzov.

Unlike Spee, whose approach was theoretical, Thomasius flatly denied the existence of witchcraft in his famous dissertation *De crimine magiae* (On the Crime of Magic) of 1701. He assumed that Spee did not believe in the existence of witchcraft either but had preferred to limit himself to criticizing procedural errors for strategic reasons. In practice, Thomasius seemed to judge witchcraft less consistently than in theory. Moreover, during his lifetime the great witch hunts had almost become extinct in the Holy Roman Empire, so his contribution to the abolishing of witchcraft trials should not be overestimated.

**THORNDIKE, LYNN
(1882–1965)**

Thorndike was an outstanding American historian of magic. The son of a Methodist minister, Thorndike was born in Lynn, Massachusetts, received his PhD from Columbia University in 1905, and held teaching posts at Northwestern University (1907–1909), Western Reserve University (1909–1924), and Columbia (1924–1950). Thorndike’s brothers were also academics; when Thorndike accepted a professorship at Columbia, he joined the educational psychologist Edward Lee

Thorndike and Ashley Thorndike, a professor of English literature, who were already members of faculty. With pertinacious attachment to the original manuscript and printed sources, Thorndike maintained a lifelong pursuit of the history of magic, from 1902–1903, when he began work on a dissertation considering the study of magic in medieval universities, until 1964, the year before his death, when he published his last monograph, a biography of the magician Michael Scot.

It has become fashionable to belittle Thorndike’s historical accomplishment, for his works were written before the impact of anthropological approaches to nonwestern magic in the 1970s and the postmodern sensitivity to texts and the politics of liminality in the 1980s. However, Thorndike understood his own strengths, and he demonstrated remarkable fortitude in ignoring his critics to pursue his own scholarly goals. He recognized early in his career that the disorder of European manuscript sources posed an impediment to more advanced scholarship, and he made a major contribution to clarifying this unwieldy body of writing for the benefit of an English-speaking audience unfamiliar with Thorndike’s predecessors such as August Bouché-Leclercq or Pierre Duhem.

In addition to the eight-volume *History of Magic and Experimental Science*, completed in 1958 and still in print, Thorndike prepared scholarly editions of medieval Latin scientific and magical works, wrote several well-regarded undergraduate textbooks, edited a still-useful collection of documents on the history of medieval universities, and produced in 1963, with Pearl Kibre, the *Catalogue of Incipits of Mediaeval Scientific Writings in Latin*, an often-updated guide to manuscript sources relating to medieval magic and science. It may prove his most lasting monument; Linda Voigts is currently preparing an electronic version as well as an updated and corrected edition with Peter Murray Jones.

Thorndike’s peers acknowledged his achievements only grudgingly. The publication of his first two volumes of *Magic and Experimental Science* provoked a long and withering review by George Sarton, who considered the whole project fundamentally misguided and dismissed it as an “elaborate parody of the history of medieval science” and a “depressing recital of unprogressive and hopeless activities” (Sarton 1924, 83, 88). Thorndike replied with an article on “The True Place of Astrology in the History of Science,” affirming the need to assess past societies and cultural practices on their own terms and not simply as precursors to contemporary science. Yet Thorndike did not provide a value-free account of the history of magic and its relation to science (Durand 1942). He delighted in undermining the reputation of some “great men of science,” insisting on the extent of their indebtedness to medieval sources and concepts. He was equally adept at locating lesser

lights from the medieval period whose contributions to knowledge had been neglected.

In 1955, Thorndike was honored by being elected president of the American Historical Association. His presidential address, "Whatever Was, Was Right," constituted a personal manifesto on the need for historians to consider the past on its own terms, particularly in evaluating the place of magic and other occult sciences in European history.

Within the generous span of Thorndike's scholarly interests, witchcraft held only a minor place. However, the number of references to witchcraft rose steadily throughout the volumes of the *History of Magic*, with chapters on illicit magic and the literature of witchcraft appearing in the final two volumes on the sixteenth and seventeenth centuries. Like much of Thorndike's writing, these chapters provided summaries of his reading across the sources and archives that were as lightly burdened with references to the secondary literature as they were by speculation and synthesis. Yet his brief discussion of witchcraft affirmed his prescript that the advance of knowledge did not depend on proscribing inquiry in such fields as divination, astrology, or witchcraft, or, it might be added, the history of these disciplines. Instead, Thorndike considered that modern ways of thought emerged from the tradition of thoughtful investigation of contemporary problems in the course of which erroneous notions were discarded. A radical opponent of simpleminded and anachronistic theories of progress, Thorndike made a lasting contribution to the serious study of the past in all its complexity and difference.

THOTH

In the Egyptian pantheon, Thoth was usually represented as a man with the head of an ibis, holding a pen

and a scribe's ink palette. These two instruments signified his roles as the inventor of writing, the secretary to the rest of the gods, the reckoner of time (since he was the god who fixed a life span not only for humans but also for the deities themselves), and the lord of wisdom, medicine, and magic. Sometimes he appeared as a baboon, an ibis, or the moon, sometimes in purely human form, and sometimes in a mixture of any of these elements. Thoth was always present when the heart of the newly dead was weighed in the balance against the feather of *Maat* (Truth), and he recorded the result. He also acted as a messenger for the gods. There does not seem to be any plausible etymology for his name.

Plato recorded a number of these traditional associations. In his dialogue *Philebus*, he said that "Theuth" was the first to notice that sound could be divided into categories, and so he invented letters as phonemes; and in the *Phaedrus*, he told us that this same Theuth also invented numbers (and therefore the disciplines of arithmetic, geometry, and astronomy) and the games of draughts and dice. Greeks visiting or settling in Egypt quickly identified Thoth with their own god Hermes, largely because in their tradition Hermes too was associated with the moon and the dead and brought messages from the gods. Because of this identification with Hermes, Thoth became known as "twice greatest." Then, in the second century B.C.E., Thoth–Hermes was further assimilated to Moses and so became "thrice greatest" (which translates into Greek as Hermes Trismegistus) because he combined the wisdom, ingenuity, and attributes of all three archetypal figures.

Thoth was believed to have written forty-two books that contained the wisdom of the world. In the Greek magical papyri, he was described as one who knew everything hidden beneath the vault of heaven and underneath the earth, so it is not surprising that his forty-two books included several tomes on magic, which was considered an occult (that is, "hidden") science. A corpus, called the *Hermetica* after Hermes Trismegistus, was known to Byzantine scholars and to a number of the Church Fathers. It consisted of eighteen books of theosophical philosophy that treated astrological and alchemical themes as well as religious ones, and it included a treatise known as the *Asclepius* and a number of fragmentary excerpts taken from a Byzantine scholar, Joannes Stobaios. Unfortunately, the *Asclepius* caught the unfavorable attention of St. Augustine, after which the Latin West seems to have lost interest, although Muslim scholars did much to preserve and extend the corpus. By the twelfth century, however, Hermes Trismegistus began to appear again in Western scholarly literature. Then, in 1471, Marsilio Ficino published his translation of several key Hermetic texts. To Ficino, Hermes Trismegistus was older than Moses and in consequence could be counted as "the first

author of theology,” foreseeing among other things the death of paganism and the rise and triumph of Christianity. A seventeenth-century German scholar even tried to claim him as the founder of Germany.

Pictures of Hermes Trismegistus tend to show him as an elderly bearded man dressed in what the Middle Ages or early modern period conceived as oriental costume. He appears thus in a famous inlaid floor panel of the pavement in the cathedral of Siena, and the accompanying inscription calls him “Hermes Trismegistus, the contemporary of Moses.” He is shown handing an open book to two men, and the image is accompanied by the words “Egyptians, receive the teachings and the laws.” A column painting in the Vatican Library, however, depicts him as a Greek Hermes and calls him “Mercurius Thoth who composed sacred letters [that is, hieroglyphs] for the Egyptians.”

THUMM, THEODOR (1586–1630)

One of the leading Lutheran theologians and polemicists of early-seventeenth-century Germany, Theodor Thumm was also an opponent of witch hunting and published a demonology at Tübingen in 1621, written from a skeptical perspective, entitled *Tractatus theologicus, de sagarum impietate, nocendi imbecillitate et poenae gravitate* (Theological Treatise, of the Godlessness of Witches, the Feebleness of Their Ability to Work Harm, and the Severity of Their Punishment). In this work, Thumm distinguished between three categories of witches: Those who suffered from melancholy and had been deceived by the Devil into imagining that they had done impossible things, such as metamorphosing into animals; those who had been duped into making a pact with the Devil against their will but had committed no harm; and those who had made a pact with the Devil and who had harmed people and livestock. Thumm argued that witches in the first two categories were victims of the Devil’s cunning and their

own lack of proper faith. They should be given better spiritual guidance; those who refused to renounce the Devil should be banished. Witches in the third category were to be executed because of the harm they had caused, but not because of their pact: Thumm was insistent that no one should be put to death for the spiritual crime of apostasy. Thumm’s tract was characterized generally by compassion for those individuals who fell into his first two categories, by his strong emphasis on human susceptibility to the Devil’s trickery, and by his assertion that territorial rulers should make the proper religious instruction of their subjects a higher priority than the persecution of witches.

The son of a pastor, Thumm was born in Hausen an der Zaber in the southwestern German duchy of Württemberg. He studied theology at the University of Tübingen from 1604 to 1608 and held various ecclesiastical posts at Stuttgart and Kirchheim unter Teck between 1608 and 1618, when he became a professor of theology at the University of Tübingen. After 1620 Thumm was also dean of the collegiate church and superintendent of Tübingen’s Lutheran seminary. His demonology continued the “spiritualizing” or “providential” view of witchcraft, whose theological home was the Lutheran University of Tübingen and whose most famous early proponent was the Württemberg reformer Johann Brenz (Midelfort 1972). In a sermon preached in 1539 after severe hailstorms had damaged crops in Württemberg, Brenz argued that God inflicted bad weather on his flock as a test of their faith or as a punishment for their sins. Brenz preached against the widespread popular idea that witches caused bad weather by magical means: They might be deluded by the Devil into believing that they could raise storms, Brenz said, but in reality they were powerless to interfere with God’s providential control of the world. The real crime of the witch was thus not the causing of *maleficium* (harmful magic) but the spiritual crime of consorting with the Devil.

Like Brenz, whom he cited in his *Tractatus*, Thumm denied that witches could cause bad weather. He also denied that they could have sex with the Devil, metamorphose into animals, enter locked houses through tiny holes, or cause harm at a distance from their victims by means of image magic—all activities beyond the capabilities of humans to perform. Witches could harm people and livestock, but only by mixing poisons into food, drink, or salves or by blowing it into the faces of their victims. For such crimes, they, like other poisoners, deserved the death penalty.

Thumm differed from Brenz in one crucial respect, however. Whereas Brenz and his successors at Tübingen had asserted that witches deserved death for renouncing God, even if they caused no physical harm, Thumm maintained that no one should be executed for apostasy alone. In adopting this line of argument, Thumm

acknowledged the influence of such earlier skeptics as Johann Weyer, Hermann Witekind, and Johann Georg Goedelmann. In fact, Thumm essentially copied from Goedelmann the threefold division of witches into those who made pacts and caused real harm, those who made pacts without causing harm, and those who confessed to impossibilities. Stuart Clark has argued that this way of distinguishing between different categories of witches became part of a general Lutheran orthodoxy on witchcraft during the seventeenth century. On the one hand, Clark suggested that the distinction was important because it “enabled pastors opposed to popular intolerance to break down the assumption that witches were always responsible for actual harm done” without abandoning entirely the notion that witches might be responsible for some instances of harm done to their neighbors. On the other hand, however, Clark suggested that this schema also illustrated the limits of the effectiveness of skeptical demonology in challenging the intellectual basis of witchcraft belief, because it still allowed for the possibility that humans could make pacts with the Devil (Clark 1997).

It is hard to assess the impact of Thumm’s work on his contemporaries. The spiritualizing Tübingen tradition of thinking about witchcraft, to which Thumm made a significant contribution, probably helped shape the relatively low level of witch persecution in the duchy of Württemberg, emphasizing as it did the powerlessness of witches and the idea that it was more important for good Lutherans to repent their own sins than to accuse their neighbors of witchcraft. Moreover, Tübingen University was the main center of theological ideas for southwestern and southeastern German Lutheranism. For example, the spiritualizing tradition influenced pastors in nearby Schwäbisch Hall and Hohenlohe, and it helped influence the very restrained pattern of witchcraft trials in the imperial free city of Rothenburg ob der Tauber (Midelfort 1972; Rowlands 2003). There is also evidence of the direct influence of Thumm’s work on a specific trial in Rothenburg: In 1627 Thumm’s *Tractatus* and his assertion that no one should be executed for a spiritual crime were cited explicitly at the trial of a self-confessed child-witch. This opinion, also citing such other Lutheran skeptics as Goedelmann, helped secure the acquittal of the imprisoned girl and also influenced the moderate way in which the Rothenburg city council handled other cases involving self-confessed child-witches. Finally, as the theological faculties of the universities of Tübingen and Wittenberg were important sources of the ideas on which Protestant demonology in other Lutheran parts of Germany and Scandinavia were based, Thumm may also have contributed in some small way to this wider discourse, which Clark has tentatively suggested may have had a moderating impact on the scale of the witch

persecutions in these areas (Clark 1990). A second edition of Thumm’s *Tractatus* was published in 1667.

THURINGIA

Together with neighboring Franconia (Bamberg, Würzburg), southern Thuringia formed a principal zone of German witch persecutions. In early modern times, this area was larger than today’s federal state of Thuringia, extending further especially in the northeast and south (Sachsen-Coburg). In this enlarged area, more than 1,500 cases of witch persecution are known to have occurred from 1526 until 1731 (Füssel 2001, 89–94). Although many sources have been lost, the overall state of what we know about Thuringia seems quite good, because numerous cases can still be found in almost all state archives. Many cases have also been described in the older literature, both before and after 1900.

After a very slow beginning, with only scattered individual trials in the early decades, the records show a sharp increase in witch persecutions around 1590. Between 1598 and 1631, Thuringia experienced a large, though repeatedly broken, wave of persecution. Its peak came in 1629, shortly before the persecutions were suddenly stopped by the Thirty Years’ War, which affected Thuringia in 1631 with the battle at Breitenfeld, near Leipzig. After the war had cost Thuringia over half of its population, the hunt for witches remained in abeyance for some years. But in 1656, witchcraft trials resumed, and a second massive wave of persecution lasted until the end of the century. After 1700 only a few individual cases can be found in the records, and the accusations in those cases contain increasing elements of superstition.

Over 60 percent of all cases came from the areas of Henneberg (about 750 trials) and Coburg (about 230) in southern and southwestern Thuringia, bordering the prince-bishoprics of Bamberg and Würzburg, both areas of intensive witch persecutions. There were numerous cases also in two imperial free cities: Mühlhausen (66 trials between 1624 and 1731) and Nordhausen (30 trials between 1599 and 1644). Especially after 1656, numerous cases also occurred on the other side of the Thuringian forest, in the Georgenthal jurisdiction of Sachsen-Gotha. The center of persecution thus covered the hilly Thuringian forest and the Thuringian Rhön, whereas only a few witchcraft trials occurred in the flat Thuringian basin.

We have the decisions of 1,200 of the more than 1,500 known Thuringian witchcraft trials. Of these 1,200, about 75 percent, at least 900 persons died (800 in executions and 100 in prison). (In actuality, more than 900 persons died because the extant court records do not specify the outcomes of some of the trials.) Half of all prisoners executed were burned; another 11 percent were granted the “grace” of previous beheading. About 8 percent of all prisoners did not even live to see the end of their trial but died from the effects of torture or from miserable prison conditions. On the other hand, every fourth person tried for witchcraft got off with banishment or acquittal (Füssel 2001, 62–64).

LEGAL PROCEEDINGS

Despite its multitude of autonomous governments, inquisitorial proceedings in witch cases throughout Thuringia were relatively uniform. Apart from the question of legal expenses (invariably paid by defendants, even if they were released) and some extraordinary sentences of banishment and *absolutia ab instantia* (acquittal with reservation)—that is, the proceedings could be recommenced—the *processus ordinarius* (ordinary procedure) of the Carolina Code was closely followed everywhere by local authorities, who duly consulted law faculties and princely *Schöppenstuhl* (benches of jurists). Procedural irregularities were censured and were mostly remedied; in Thuringia, the crime of witchcraft was not regarded as a *crimen exceptum* (the excepted crime), that is, a crime so serious and frequently hard to prove that it was excepted from the usual legal procedures.

After 1572, the Carolina Code, the imperial law code, with its basic focus on *maleficium* (harmful magic), was supplemented in much of Thuringia by the new law code of electoral Saxony, which decreed the death penalty for diabolical pacts even without harmful *maleficia* (evil acts). Its regulations were gradually accepted by most Thuringian dominions, except the jurisdictions belonging to Nordhausen, Mainz (Erfurt and the Eichsfeld), or Hesse (Schmalkalden), or to the

Franconian judicial districts in southwestern Thuringia. In practice, this difference was minimal, because almost every Thuringian witchcraft trial investigated both harmful sorcery and the diabolical pact, and most defendants confessed to both (Füssel 2001, 27).

As recommended by article 219 of the Carolina Code, local courts throughout Thuringia did not decide cases without receiving opinions from law faculties, which their respective sovereigns required. These scholarly bodies thus became the decisive level of central decision making in witchcraft proceedings, unlike the situation in many other German territories, where local courts often made their own decisions. So far as we can trace, the *Schöppenstuhl* at Jena was consulted in approximately 57 percent of the Thuringian witchcraft cases, that of Coburg in about 20 percent, and another 15 percent consulted the electoral *Schöppenstuhl* at Leipzig. Occasionally, other bodies were consulted, mostly as additional authorities in questionable cases (Füssel 2001, 31–33).

WHO WERE THE WITCHES?

Although no profile of a “typical Thuringian witch” can be recognized (anyone could be tried), they were overwhelmingly female: About 87 percent of all prisoners were women, most of them married and between twenty and fifty years of age. Children and old people were rarely mentioned. Most prisoners came from rural villages, although their trials were often held in local or provincial seats of jurisdiction (Füssel 2001, 107–112). As elsewhere, most evidence against the accused concerned *maleficium*, harmful sorcery originating in rural or domestic conflicts. Most *maleficia* involved the illness or death of people or animals. In addition, people were often attacked by lice or suffered lameness in their arms or legs. When cows no longer gave enough milk, suspicion fell on “milk thieves,” especially in the early-sixteenth-century cases. Later, the term for a (usually female) “milk thief” was extended to witches in general.

Regional differences existed with respect to accusations of harmful sorcery. Sorcery with *Eben* (“bad things,” parasitic insects, reputedly begotten by the Devil and witches, that infiltrated the body of a human victim and harmed it from within) was limited to northern Thuringia, mainly to the hilly area of the Harz in Sachsen-Anhalt. Central and especially southern Thuringia was home to the dragon, sometimes called “fiery dragon,” that played a big part in popular belief of the region. One saw it normally at night, on the roof of a house or entering and leaving its chimney; it was said to bring its owners, the so-called dragon holders, a variety of benefits, above all in the form of food. On the other hand, accusations of misdeeds such as misusing the Host could be found all over Thuringia and were typical in other German regions as well.

When an investigation began with an accusation by another witch, the ensuing trial was focused first on participation at the witches' Sabbat, where the two witches must have seen each other dance. Questions about the other participants at the dance were standard at each hearing, and sooner or later all prisoners who confessed also named their supposed accomplices. When broken by torture, they also confessed the other relevant elements of the crime of witchcraft. But the fully developed idea of witchcraft cannot be found in Thuringian evidence before the end of the sixteenth century (Füssel 2001, 65–73).

THYRAEUS (THRACE), PETRUS (1546–1601)

A Jesuit doctor of theology and for several years a professor at the University of Würzburg, Petrus Thyraeus published several books of theological controversy, but his principal interest lay in apparitions, ghosts, and invading demons who infested both places and people. From 1582 until his death, he produced several books on these topics, especially on demonic possession, most of which had more than one edition and most of which are in effect variants of a single treatise.

A translation of the full title of the best known of these, published in Cologne in 1598, gives a very good notion of the thrust of his work. It runs: *Infested Places: That is, a single volume dealing with places that are infested because of the spirits of demons or dead people causing distress and annoyance; wherein are discussed and explained the types of infesting spirits, their characters, their power, the distinctions between them, and the things they do that bring evil to the living; along with explanations whereby they may to some extent be recognized and to some extent outlawed; and finally, the methods whereby the places molested by them may be delivered from them, and information of a similar kind; to which is added a small volume on terrifying things that appear during the night and usually foretell the death of human beings.*

Thyraeus was interested in various aspects of this whole subject. He distinguished between evil spirits who simply infested places or who vexed the living and tried to do them harm, on the one hand, and the souls of those who were suffering the pangs of purgatory and returned to trouble the living or offer them a warning about their behavior, on the other. He discussed the motives of invasive demons, whether they appeared frequently or rarely, and whether they always appeared as they actually were. Were all places equally infested, or did some suffer more than others, and if so, why? Were all human beings equally subject to vexation by spirits, and if not, why did some suffer from them more than others? Precisely what kind of things did molesting spirits do? Could they inflict blows, death, or any other physical harm on human beings? And what kind of things should be attributed to angelic spirits, even though they may have seemed to arise from human agency?

Thyraeus went on to tell his readers how to distinguish between ghosts and evil spirits and to suggest that different places—sacred or profane, waste or cultivated, blighted by past death or crime or not so tainted, Catholic or heretical—were more or less likely to attract certain types of spirits. This was followed by much detail about the appearance and behavior of the various kinds of spirit, and finally, in the third part of the book, he gave advice about how to deal with the problem of spirit infestation, including admonitions about the wrong ways to go about exorcising spirits according to their different types and intentions, ending with a detailed discussion on “things that went bump in the night”—largely the actions of ghosts and inferior demons.

Thyraeus was pursuing themes that also interested such near contemporaries as Pierre le Loyer and Ludwig Lavater, both of whom published books on ghosts and spirits during the last years of the sixteenth century. One was the confessional point of purgatory: Did it exist or not, and if not, whence did certain kinds of ghost come? Indeed, without purgatory, could ghosts return at all? Another was the much-debated question of how best to deal with invasion from the spirit world and whether it was permissible to use countermagic to fight, say, magically induced possession. A third point, however, was less confessionally based and had troubled theologians for a very long time: Because spirits were by definition noncorporeal, how could they interact physically with human beings? It was a question that touched upon many aspects of witches' behavior—the possibility of their sexual intercourse with Satan and with incubi or succubi, for example—and the proposed answers were various and ingenious. Thyraeus's treatise was thus directly relevant to some of the foremost intellectual speculation of his period.

TINCTOR, JOHANN (CA. 1405/1410–1469)

The theologian Johann Tinctor (Johannes Tinctoris; Jean Taincture), who was born and died at Tournai in the southern Netherlands, ranks among the most important early contributors to the dissemination of major elements of the new, learned science of demonological witchcraft within the boundaries of present-day Belgium. He was a former professor, rector, and dean of the Faculty of Arts in Cologne from about 1440 to 1460 and a canon at the Cathedral of Notre Dame at Tournai after 1456. Sometime about 1460, he wrote a short tract entitled *Contra sectam Valdensium* (Against the Waldensian Sect), in the context of the famous trial of 1459 against the Waldensians in the city of Arras. Tinctor's book is also known by a variant title, *Speculatio in secta Valdensium* (Speculation on the Sect of the Waldensians).

In this treatise, Tinctor vehemently attacked the crime of demonic sorcery, which he characterized as being even worse than adherence to paganism, heresy, or Islam. He elaborated on the malevolent powers of the Devil and described the activities (including *maleficium*—harmful magic) done by the Waldensians in Satan's name. According to Tinctor, not only could the Devil work magic with snakes, rain, wind, and storms, but he could also open locks, lead humans into temptation, and so on. Tinctor's evidence for such crimes came from the trials in Arras, where fifteen people were burned at the stake as witches after having admitted taking part in obscene Sabbats and performing homage to a black goat.

Tinctor's tract became increasingly influential during the following decades. We know of five Latin manuscripts of the *Speculatio* and another four of a French translation. Both Duke Philip the Good of Burgundy (ruled 1419–1467) and the important humanistic patron of Bruges, Lodewijk van Gruuthuse (ca. 1422–1492), possessed illuminated copies of the French manuscript, entitled *Sermon contre Vaudois* (Sermon Against the Waldensians), in their rich libraries. Their manuscripts contained a miniature in which one can discern some demonological themes: a man in a kneeling position kisses the arse of a male goat, while in the background of the miniature there are flying men and women, seated on monstrous beasts. Some years later, about 1477, the famous printer of Bruges, Colard Mansion, printed Tinctor's tract. This printed representation of the Waldensians as an organized sect of demonological witches was soon followed by regular trials in the French-speaking parts of the southern Netherlands, where the labels *vauderie* (heresy

of Waldensians) and *sorcherie* (sorcery) were indistinguishable synonyms. Tinctor provided powerful assistance in disseminating the new "cumulative" witchcraft concept in his region.

TOADS

Initial evidence of the toad's central role in witchcraft comes from language. In German dialects, for example, *Hexe* signifies both "toad" and "witch," and in many Italian dialects, the toad is defined as *strega*, "witch," or *fata*, "fairy." The Spanish *bruja*, "witch," the old French *brusche*, and the Sardinian *bruscia* all derive from the Vulgar Latin *bruscus* (Plomteux 1965). This toad–witch connection points to the even closer relation between toad and woman that can be observed in the figures of the witch's body, although in Normandy, because of their venom, toads were connected to male witches. The relationships between the toad and female bodies are structured in various contexts of meaning that cut across fields of knowledge and practices of witchcraft, including the status of the witch's body and the animal components of the witch's "person," representations of female physicality in European Christian knowledge and practices, and the bodily figures and animal metaphors of ecstasy, possession, and dream.

Beyond the distinctions between "high" culture and "low" culture, the toad is one of the most frequent animal metamorphoses of the witch. Throughout Europe, a popular practice for discovering a witch in the guise of a toad was to brand the animal with a red-hot nail so that later a burn on a woman's body could be considered an identifying mark. Similarly, in inquisitorial trials for witchcraft, evidence of guilt was constituted by the privileged relationship that the defendant was believed to have with a batrachian, sometimes raised in the home as a "magic" spirit. Moreover, both in popular representations and in stereotypes of the witches' Sabbat created by the inquisitors, the identification of the witch came about through the discovery of an image of a small toad or toad's foot in the pupil of the left eye of the defendant:

The mark that the Devil painlessly impressed on the body of the witch (Henningsen 1980, 80; De Graaff 1991, 111–128; Charuty 1997, 82–94). These diabolical “marks” highlighted the animal components of the witch’s person, which were also evident in the ecstasy of the dream experience: In the phenomenology of witchcraft, the emergence of animals from the mouth or sex organ of sleeping women provided further proof that the woman was indeed a witch. Stories of this kind were widespread throughout Europe, and toads (along with spiders) figured prominently in them as animal components of the person that revealed her bewitched nature (Lixfeld 1972).

Toads appeared in many early modern witch narratives and in art, as in Jan Ziarnko’s famous depiction of the Sabbath and in the work of the elder Pieter Breughel, where they appear as familiars. In the Basque country, toads provided poison, flying ointment, and familiars. The Devil sometimes appeared in the form of a toad, and toad venom was a common ingredient in witches’ potions. People cooked toads (substituting for witches) as a form of countermagic.

Carlo Ginzburg analyzed the toad’s presence in the context of witchcraft through ethno-pharmacological studies suggesting that the skin of this batrachian has psychotropic effects that explain its importance both in witches’ “recipes” and in the experience of ecstatic mediation. The pharmacological qualities of toad skin led Ginzburg to locate the genesis of the witches’ Sabbath in shamanic ecstasy (Ginzburg 1991, 306). But

when his analysis of the Sabbath addressed the question of dream representation, the toad took on a different symbolic meaning in relation to the physiology of the female body, the dual and plural character of the witch’s person, and figures of spirit possession.

A study of representations of the “alter ego” in animal form (or images of the “double” that in the dream experience emerged from the body in the form of an animal) indicated a thread of variants in which the alter ego was represented as a toad (or as a spider) that exited the body through the sex organ (Lixfeld 1972). The toad’s exit through the sex organ was described as an “extraordinary” but real event in the first book of the well-known treatise, published in 1599 and 1600, by the Spanish Jesuit, Martín Del Rio, *Disquisitionum magicae libri sex* (Six Books on Investigations into Magic), which recounted the apparition of a toad jumping out of the belly of a young woman in labor, who is thus finally able to give birth to her baby.

The symbolic relationship between the toad and the female body is also central to another series of practices and representations. In a vast area of western Europe from Alsace to the Tyrolean Alps, phenomena of spirit possession resulted from a toad’s bite or its penetration into the body of the possessed (Charuty 1997, 82–94). Such phenomena appear to have been the source of practices of intercession based on votive offerings in iron or wax representing the woman’s uterus in the form of a toad. In such cases, the toad was both the uterus and the instrument of possession, which, using an expression reported by ethnographers, “bit” the woman’s sex organ (Andree 1904). Museums in Alsace conserve numerous examples of these toad–uterus votive offerings. In the Middle Ages, wax or iron toad votive offerings were made in the cave of St. Vitus as a cure for St. Vitus’s dance (Andree 1904). The identification of the “bite” with the uterus was based on an age-old representation of the female sex organ, which, according to a tradition running through Greco-Roman, Renaissance, and baroque medicine, was endowed with a mobility that made it similar to an animal, and in this form it “possessed” the female body. In Christianity, this “hysterical” quality of the female body continued to be identified with the toad, whose “bite,” in medieval allegories, represented the sin of lust. In Christian iconography, the toad served the function of demonizing sexual desire (Pizza 2003).

The relationship between the toad and the female body suggests, therefore, a connection between the interpretations of stories recounting the entrance and exit of animals into and out of the body of a sleeping woman and symbolic physiologies of the female body. These elements appear to be integrated, for example, in Sicilian versions of the *matrazza*, the female malady that presented all the traits of possession and witchlike

Toad-demons, according to Hieronymus Bosch’s depiction of Hell. A panel of his painting, *The Seven Deadly Sins*. (Art Archive/Museo del Prado Madrid/Dagli Orti)

aggression, whose agents were the *donni di fuora* (women from outside), witch figures who, by transforming themselves into toads, invaded women's bodies (Henningesen 1990; Charuty 1997, 82–94; Pizza 1998, 69–74; Guggino 2004).

TODI, WITCH OF (1428)

The trial and confession of Matteuccia di Francesco, the witch of Todi, reveal far more clearly than other surviving documents of the early fifteenth century (when European witch hunting began) how "notions of diabolism were superimposed on earlier charges in the

course of judicial interrogation" (Kieckhefer 1976, 73).

Around 1430, when the doctrine of the witches' Sabbat was being developed through trials and treatises in the southwestern Alps in present-day France and Switzerland, that doctrine was also present in essentially similar form in early Renaissance Italy. Although we possess many fragments of trials from places like Dauphiné or Valais in these Alpine districts, our single richest record of an early witchcraft trial involving a Sabbat comes instead from Todi, a small town in central Italy. This record provides extremely suggestive information about the ways through which popular magical practices came to provide evidence of witchcraft. It offers tragic proof of the effects of revivalist sermons in spurring witchcraft prosecutions. But unlike the accused in Alpine cases from this period, the witch of Todi was never questioned about any "accomplices" seen at Sabbats: She died alone.

Todi, lying far north of Rome on the Tiber River, belonged to the Papal States, but the judge of the special court that tried Matteuccia di Francesco was a layman, not an inquisitor. The record of Matteuccia's trial is divided into two radically different parts. Almost three-fourths of it consists of a lengthy recital of her numerous illicit magical practices, related (as the trial record repeatedly insists) "not by malignant and suspicious people" but instead by "honest and truthful citizens." Most witnesses appear to have been former clients who had paid for her services. Most of Matteuccia's magical cures involved herbal healing; many were done in response to requests from abused wives. The final instance in this part came from a priest's concubine, for whom Matteuccia had provided a method to prevent pregnancy: burning the hoof of a she-mule, and drinking the ashes dissolved in wine.

Immediately after describing Matteuccia's contraceptive remedy, the trial record shifts abruptly and without warning. "Furthermore, not content with these things, adding evil to evil and aided by an infernal spirit, she attempted to ruin [*stregatum*] the health of children, at many times and in many places, by sucking their blood." The next sentence described how, "in the company of other witches, she often went to the walnut tree of Benevento and to other walnut trees, anointing herself with an oil made from the fat of vultures, the blood of bats, the blood of babies, and other ingredients" (Mammoli 1972, 36). We are even told, in the vernacular, the "prayer" she repeated on such occasions, and we soon learn the exact schedule of these 200-mile flights to Benevento. Five specific cases were documented (including relevant names, dates, and places), in which Matteuccia, disguised as a large fly, murdered babies by sucking their blood. The record states that she confessed, "saying that she has no defence" (Mammoli 1972, 38). An official notary verified that she was indeed burned for such crimes on March 20, 1428.

Matteuccia's trial record clearly demonstrates the importance of inflammatory antiwitchcraft sermons preached at Todi between January and March 1426 by the Franciscan friar and future saint, Bernardino of Siena, reinforced by his suggested reforms of Todi's penal code, which were adopted before he left. These new laws included provisions that anyone responsible for carrying out "spells or acts of witchcraft" should be burned, and they permitted the use of torture "according to the nature of the crime." Although the records of Matteuccia's trial emphasized that she confessed "spontaneously," there is good reason to suspect that she had in fact been tortured (Mormando 1999, 72–74).

Unfortunately, this was not the only witch burning connected with Bernardino's sermons. Two years earlier, in 1426, another instance had occurred while he was preaching in Rome (Mormando 1999, 54–66). Two details stand out: Unlike Matteuccia, the Roman witch was recorded in no fewer than six different sources, three Italian and three transalpine, but no trial summary exists. The sources agreed about her name, and they all suggested that she was a folk healer like Matteuccia. Interestingly, all three northern European sources (but no Roman source) insisted that this Roman witch turned herself into a cat when attacking babies, instead of a horsefly as Matteuccia did. None of the six sources mentioned anything like a Sabbat.

**TORRENTÉ, ULRIC DE
(D. –1444/1445)**

Inquisitor for the western Swiss dioceses of Lausanne, Geneva, and Sitten around 1420–1440, Ulric de Torrenté belonged to the Dominican monastery of Lausanne, serving as its prior in 1419 and from 1439 to 1444. He began his career as an inquisitor by prosecuting a heterodox preacher, Nicolas Serrurier, an Augustine monk from the Low Countries, who had been condemned at the Council of Constance in 1418 before arriving in Lausanne in 1423. Pope Martin V (reigned 1417–1431) made Torrenté inquisitor for the dioceses of Besançon, Geneva, Lausanne, Sion, Toul, Metz, and Verdun, but without approval from either

the bishop of Lausanne or Duke Amadeus VIII of Savoy (the future Pope Felix V).

The Inquisition had existed on paper in these dioceses as early as 1269. The first recorded trials in the diocese of Lausanne took place against a Beguine house in 1375, followed by trials against approximately fifty Waldensians in 1399; both ended by releasing the defendants. Torrenté held his first witchcraft trials in 1428 and 1429 in Lower Valais and in Fribourg, although he was not admitted into episcopal Valais, where a large-scale witch hunt was then beginning (Andenmatten and Utz Tremp 1992, 71, 74–77, 78–82; Ostoro, Paravicini Bagliani, and Utz Tremp 1999, 63–98). In 1430 Torrenté also led a mixed tribunal carrying out Fribourg's great Waldensian trial, which contained some early traces of charges of witchcraft (Utz Tremp 2000, 106–119). His Dominican brothers in Geneva summoned him from Freiburg in the summer of 1430 to conduct a trial against another heterodox traveling preacher, the Italian Benedictine Baptista de Mantua, whose sermons had impressed Duke Amadeus VIII.

From 1432 to 1438, Torrenté may have studied at a university, but we do not know whether he studied at all and at which university. He did become a master of theology before being made professor in 1440. In 1438 and 1439 he conducted witchcraft trials at Dommartin (north of Lausanne) and Neuchâtel. The defendants were men, such as Pierre de la Prelaz, of Dommartin, and Jaquet dou Plain and Enchimandus le Masseler, of Neuchâtel; Masseler was characterized as "heretical." Within twenty years, Torrenté was thus able to make the inquisition in western Switzerland into a permanent and adaptable institution (Andenmatten and Utz Tremp 1992, 77–78, 93–102) that conducted some of the first witchcraft trials and lasted until the late fifteenth century (Paravicini et al. 1997, 247–258). However, Torrenté's activities were limited to the dioceses of Lausanne, Geneva, and Sion; apparently he never visited Besançon, Toul, Metz, or Verdun.

In May 1440 Torrenté finally received from Pope Felix V (the earlier Duke Amadeus VIII of Savoy) the succession to a benefice, which he never occupied. In 1442 Torrenté simultaneously held the titles of vicar-general to Pope Felix V, inquisitor, and prior of Lausanne's Dominican monastery. He died between December 1444 and November 1445 (Andenmatten and Utz Tremp 1992, 104–105; Zimmer 1999, 447–448). He probably did not compose the *Errores Gazariorum* (Errors of the Gazars or Gazarii [Cathars—a common term for heretics and later witches]), one of the earliest descriptions of the witches' sect, even though one of the two known manuscripts of the *Errores Gazariorum* (Basel University Library, A II 34, folios 319r/307r)–320v/308v) contains a text that bears a striking similarity to some proceedings against a

young man from Epesses (east of Lausanne), whom Torrenté reconciled to the faith in 1438. However, this treatise probably came from the Aosta valley and was most probably brought to Lausanne by Georges de Saluces, bishop of Aosta from 1433 to 1440 and of Lausanne from 1440 to 1461 (Ostorero, Paravicini Bagliani, and Utz Tremp 1999, 330–343).

TORTURE

In many European jurisdictions, judicial torture was used to extract confessions from accused witches. Torture was also used in many cases to obtain the names of witches' alleged accomplices. The administration of torture served the additional function of confirming the beliefs of judges and theologians regarding the alleged activities of witches.

Judicial torture, the infliction of pain in order to obtain evidence in the prosecution of crime, should be distinguished from penal or punitive torture, which is administered as punishment for crime after conviction. Judicial torture had been applied to slaves in ancient Greece and Rome, and during the Roman Empire even free men were tortured in the prosecution of treason and other heinous crimes. The practice, however, fell into general disuse during the Early Middle Ages. In the thirteenth century, after the adoption of inquisitorial procedure, torture was reintroduced into European courtrooms. It was first used in the secular courts of Italian city-states and the Holy Roman Empire in the late 1220s, and by 1252 it had come into use in the ecclesiastical courts, mainly in the trials of heretics.

The main purpose of judicial torture was to obtain the confessions of individuals suspected of concealed

crimes. When inquisitorial procedure was adopted, judges assumed responsibility for determining guilt on the basis of a rational evaluation of the evidence. In order to prevent the conviction of innocent people, the courts adopted a very demanding standard of proof: A person could not be convicted of a capital crime without the testimony of two eyewitnesses or a confession. In concealed crimes, such as conspiracy or murder, it was usually difficult to obtain evidence from eyewitnesses. The same was true for heresy and witchcraft. The virtual impossibility of obtaining testimony from eyewitnesses in those situations therefore placed a legal premium upon confessions, and when confessions were not forthcoming, torture was used to elicit them.

When torture was adopted, jurists recognized that the procedure might easily lead innocent persons to make false confessions in order to stop the pain. To prevent this from happening and to make the evidence obtained from confessions more reliable, jurists formulated a set of rules regarding the proper administration of torture. These rules required, first of all, that a certain amount of evidence of guilt be produced before torture could be administered. Either the testimony of one eyewitness or a specified amount of circumstantial evidence became the official prerequisites for torture to proceed. In order to prevent prosecution on trumped-up charges, there also had to be evidence, known as the *corpus delicti*, that a crime had actually been committed. Other rules governed the duration and intensity of torture, and another specified that all confessions obtained under torture had to be repeated outside the torture chamber. Yet other sets of rules were intended to restrict or deny the prosecution of a criminal's alleged accomplices on the basis of confessions obtained under torture.

These rules did not serve as a rationale for the system of torture, but they did attempt to limit its arbitrary potential and made judges more confident that it would serve its intended purpose. The problem arose when those rules were either relaxed or completely ignored in the interests of obtaining convictions from persons who were assumed to be guilty but for whose guilt there was little tangible evidence. Relaxation of this sort was very frequent in trials for witchcraft, since witchcraft was widely regarded as a *crimen exceptum* an "excepted crime," in which the usual standards of proof did not apply. In these cases torture was often administered barbarously, and it could be repeated indefinitely until the accused confessed. While relaxation of the rules governing the use of torture became the norm in courts administered by trained judges, the complete ignorance or suspension of the rules occurred frequently in trials conducted by legally untrained laymen or clerics in small jurisdictions.

The instruments of torture were designed to extract information from prisoners without killing them. The

devices therefore compressed or extended the extremities; it was forbidden to apply torture directly to the torso. The thumbscrews, which were often the first devices used during an interrogation, were vises that squeezed and crushed the fingers. Wooden instruments known generally as the boots (the *brodequin* in France) used wedges to crush the legs against boards that encased them. A metal box fitted with a screw mechanism, known as the Spanish boot, served a similar purpose and could be heated to cause additional pain. The strappado, a pulley that raised prisoners to the ceiling by their arms while their wrists were tied behind their backs, served the opposite function of extending the arms. The cruelest use of the strappado took the form of squassation, in which the prisoner was dropped from the ceiling, only to be yanked up again just before hitting the ground. Weights as heavy as 660 pounds could be attached to the ankles of the prisoner in order to increase the pain. Yet another form of extension was the rack, which gradually stretched the arms and legs by means of ropes on ratchets. A less brutal but no less effective means of torture was that of forced sleeplessness, the *tormentum insomniae*.

All European countries allowed the use of torture under certain circumstances, but only in some jurisdictions, especially those that had adopted inquisitorial procedure, did it become an ordinary instrument of judicial interrogation. In Germany, France, Switzerland, the Dutch Republic, the Italian states, and the Spanish kingdoms, torture was accepted as a legitimate procedure. Even in these areas, however, it was administered in varying degrees. Within Germany, for example, the territories of Würzburg, Bamberg, and Eichstätt exhibited little moderation in using the procedure against witches, whereas towns like Rothenburg ob der Tauber exercised much greater restraint. Similar differences can be found in Switzerland. In the Pays de Vaud, where witch hunting was as intense as in any region of Europe, it was applied with great severity, but in neighboring Fribourg, local authorities used it in much greater moderation. Of 159 people imprisoned for witchcraft in Fribourg between 1607 and 1683, 75 survived the administration of torture without confessing, whereas only 49 confessed under its pressure and 35 were never tortured at all (Monter 1976, 106–107).

In many European countries, central judicial authorities took steps to regulate the use of torture, and in some cases, they were able to enforce their directives. In the Holy Roman Empire, the law code known as the *Carolina Code*, promulgated in 1532, set down strict rules for the administration of torture. In France the provincial *parlements* (sovereign judicial courts), especially the *Parlement* of Paris, took steps to gain a monopoly over the administration of torture and to

*The strappado, a torture instrument whereby a victim, wrists tied behind the back, was lifted by a pulley and then dropped without allowing the feet to reach the ground. Often iron weights were attached, thus increasing pain and dislocating joints. (John H. Langbein, *Torture and the Law of Proof: Europe and England in the Ancient Regime*, Chicago: University of Chicago Press, 1977, plate XLV)*

punish judges of the lower courts who tortured prisoners without permission. In Spain, Portugal, and Italy, the administration of torture was strictly regulated by the Inquisition, which in each country was a centrally controlled judicial institution.

In England, where the courts of common law were prohibited from employing torture, juries could convict on the basis of circumstantial evidence and therefore had no need of torture. The Privy Council, however, could issue special warrants authorizing the application of torture to identify persons who had threatened the state. These warrants were never issued in witchcraft cases. The only time torture was used in English witchcraft prosecutions was during the witch hunt directed by Matthew Hopkins and John Stearne in 1645–1647. Without effective central governmental control, Hopkins was able to subject suspected witches to the *tormentum insomniae*, keeping suspected witches awake on the grounds that their hungry imps or familiar demons would eventually appear in order to obtain nourishment.

In Scotland, the law of torture was similar to that which prevailed in England: Torture was not allowed unless it was authorized by a warrant from the Privy Council. Those warrants were issued more frequently than in England, but only in a few witchcraft cases. Large numbers of Scottish witches were, however, subjected to torture by local authorities, especially during the great witch hunt of 1661–1662. Torture in these instances often took the form of repeatedly piercing the skin while searching for the Devil's mark. The royal government made sustained efforts to control the application of torture by local authorities, but it did not succeed in this regard until the late seventeenth century.

In Sweden, torture was not allowed in ordinary criminal proceedings, but it was permitted in witchcraft cases, sometimes by royal decree, as occurred during the great witch hunt of 1668–1676. In Denmark and Norway, sixteenth-century legislation forbade the use of torture prior to the sentencing of criminals. This strict regulation of torture was generally observed, although in ten Norwegian trials witches were tortured before sentencing in order to obtain information regarding the worship of the Devil (Naess 1990, 375).

In Hungary, the use of torture in witchcraft cases did not become widespread until the late seventeenth century. The main foundation for its use, apart from some vague references to it in a statute book of 1517, was the *Practica nova imperialis Saxonica verum Criminaliam* (New Rules in Criminal Cases for Imperial Saxony) compiled by the Saxon jurist Benedict Carpzov in 1635. This guide, which has demonological as well as procedural significance, was adopted as the law code for Austria and Bohemia in 1656 and was subsequently incorporated into the Hungarian code of 1696. It is probably no coincidence that its adoption was followed by the intensification of witch hunting in Hungary. The procedures that Carpzov prescribed, however, especially those concerning torture, encountered opposition from jurists, especially Mátyás Bodó in his study of criminal jurisprudence published in 1751.

The use of torture in witchcraft cases served three main functions in the development of European witch hunting. First, it facilitated the fusion of different witch beliefs into a composite notion of witchcraft by forcing persons accused of magic to confess to worshipping the Devil. Torture enabled theologians and jurists to secure the confessions they needed to prove that those whom their neighbors had accused of *maleficium* (harmful magic) had made a pact with the Devil and worshiped him. Second, torture was more responsible than any one factor for high conviction and execution rates in witchcraft cases. Courts that did not regularly use torture, such as the English common law courts, or used it with moderation and caution, such as the tribunals of the Roman Inquisition, almost always had lower rates of conviction than those that applied torture with little

restraint. Torture was not necessary to convict witches, because a voluntary confession on the Continent or a guilty verdict by an English or Danish jury could send a witch to her death. The need to force a confession in most witchcraft cases, however, placed a premium upon torture and led to its widespread use. Third, torture was an essential tool in the conduct of large, chain-reaction witch hunts, in which convicted witches were forced to name their accomplices. Some large witch hunts grew as the result of other factors, such as the testimony of children who imagined they were being carried away to the Sabbat, as in the great Basque witch hunt of 1609–1614, but most large witch hunts, especially those in German and Swiss lands, developed mainly as the result of torture.

In the seventeenth and early eighteenth centuries, the administration of torture in all criminal cases, and particularly in witchcraft cases, came under attack, resulting ultimately in the prohibition of torture in all European jurisdictions. The most famous of these attacks on the use of torture was written by Friedrich Spee of Langenfeld, a Jesuit professor of moral theology at the University of Paderborn. Spee's treatise *Cautio Criminalis seu de processibus contra sagas liber* (A Warning on Criminal Justice, or A Book on Witch Trials, 1631) condemned witchcraft trials for having brought about the death of thousands of innocent persons. Two other Jesuits, Adam Tanner and Paul Laymann, wrote large works on moral theology that included sections on the use of torture in witchcraft trials. From the Protestant side came works by Johann Matthäus Meyfart (Mayfahrt), a Lutheran professor from Erfurt whose work betrayed a heavy reliance on Spee, and Johann Greve, a Dutch Arminian theologian who condemned the use of torture by Christians for any purpose whatsoever.

This body of critical work on torture continued to grow in the late seventeenth century. In 1682 the Burgundian judge Augustin Nicolas wrote a closely reasoned assault on the practice. Christian Thomasius, a jurist from the University of Halle in Saxony who is known mainly for his earlier work, *De crimine magiae* (On the Crime of Magic, 1701), also published a devastating critique of torture in 1705. Thomasius drew heavily on the earlier works of Spee, Tanner, and Meyfart, but he also gave his treatise a distinctly Protestant flavor. A Pietist known for his anticlericalism, Thomasius argued in the manner of Greve that torture was an unchristian means of extorting the truth, that it was never mentioned in Scripture, and that the papacy had used it to strike down its enemies under the pretext of heresy and witchcraft.

The main criticism of torture in all these works was not so much that the procedure was inhumane but that the evidence obtained by means of its administration was unreliable, because innocent persons would make

false admissions in order to stop the pain. The criticism possessed more than mere academic significance. In jurisdictions where torture was routinely administered in witchcraft cases, these treatises contributed directly to a reduction in the number of convictions and executions and ultimately to a decline in the number of trials as well.

The critics of torture, writing in the context of witchcraft trials, made four specific points. The first was that torture should not be allowed on the basis of mere ill fame or insufficient circumstantial evidence. The rationale for torturing witches on the basis of such limited or unsubstantiated evidence was the claim that witchcraft was a *crimen exceptum*. Beginning in the 1620s, which was a particularly intense period of witch hunting in Germany, a number of jurists, most notably Ernst Cothmann, argued that witchcraft was not a *crimen exceptum*. If that were the case, trials for witchcraft would have to conform to the more exacting legal requirements spelled out in the Carolina Code. Soon after the appearance of Cothmann's decision, Paul Laymann argued that in cases of witchcraft and heresy, the circumstantial evidence upon which the decision to apply torture was based must be stronger than in other criminal cases. This meant that judges for all intents and purposes had to be persuaded of the guilt of the accused before resorting to torture and that the confession was needed simply to establish the technical requirements of full proof.

A second criticism, closely related to the first, was directed against the excessive use of torture, a practice that once again had been justified by the exceptional nature of the crime. Extreme cruelty was by far the most widespread abuse of the system, and the criticism of such excesses, on both moral and legal grounds, became the most powerful and enduring argument against the practice. Those who accepted the procedure under certain circumstances, such as the Spanish and Italian inquisitors who drafted instructions for its use in 1614 and 1623, respectively, often voiced the same criticism of torture. The Roman instructions prohibited the administration of torture by jerking the ropes in the administration of strappado, by attaching weights to the feet, and by applying it for longer than one hour. Repetition was to be forbidden except in the most serious cases, in which the court was required to consult with their superiors before proceeding.

The third criticism of torture, which may have done more to reduce the number of prosecutions than any other single factor, was directed at the practice of torturing those who were named by confessing witches as their accomplices. The use of torture in this way had become routine in areas where belief in collective devil worship was strong, and in some German bishoprics, such as Trier, Bamberg, and Würzburg, it had resulted in hundreds of executions. The practice raised two legal

questions. The first was whether witches whose torture had led to their conviction could be tortured a second time to extract the names of accomplices. The second was whether those persons whom the convicted witch named as accomplices could themselves be tortured without any other supporting evidence. On both legal questions, learned opinion was divided, although it is important to note that the most widely read demonologist of the seventeenth century, the Jesuit Martín Del Rio, had defended the practice in unequivocal terms, and had even claimed that the judge's suggestion of names during the administration of torture was legal. The torture of the persons named had been deemed necessary in order to confirm the testimony of the witches. The first scholar to engage Del Rio on this issue was his fellow Jesuit Adam Tanner, who objected that mere denunciation, even by more than one confessing witch, did not justify either torture or condemnation of those who had been of good reputation prior to their denunciation. The danger was that, under torture, innocent persons would confess to crimes they did not commit, the same danger that Spee identified in his *Cautio Criminalis*.

The final criticism of torture was a rebuttal of the claim that God would intervene in the process in order to protect the innocent. This same argument had served as a defense of the medieval ordeals before their abolition in 1215. Tanner, Greve, and even the French jurists who drafted the *Grande ordonnance criminelle* of 1670, which identified torture as an archaic practice similar to the old ordeals (but did not abolish it), had exposed the weakness of this defense. Tanner was particularly eloquent in destroying this argument, claiming that if God had permitted martyrdoms, wars, and massacres, there was no assurance that he would not permit the execution of innocent persons named as witches by allowing them to incriminate themselves under torture.

Although restrictions on the use of judicial torture helped reduce the intensity of witchcraft prosecutions, the abolition of torture in most European jurisdictions came only after the effective end of witchcraft prosecutions and sometimes even after formal decriminalization. Only in two countries, Scotland and Hungary, did abolition take place before the last witchcraft trial. Most prohibitions of torture should be seen as part of a broader reform of criminal procedure that many continental European states undertook in the last quarter of the eighteenth century and first quarter of the nineteenth century. The first country in continental Europe to abolish torture was Prussia in 1754, forty years after King Frederick William I had issued an edict against witch hunting. The last European territory to follow suit was the Swiss canton of Glarus, which took the step in 1851, long after the last legal execution for witchcraft in that territory (and in all of Europe) in 1782.

Moreover, the abolition of torture in Europe was in large part inspired by humanitarian concerns that had not been prominent in earlier critiques. The decline of witch prosecutions therefore had much more to do with the regulation and limitation of torture than with its formal elimination.

**TOSTADO, ALONSO
(D. –1455)**

Tostado was a Spanish theologian and Bible commentator, an early theorist of witches' "flying," or transvection. Author of a massive commentary on the Hebrew Bible and the Gospels that was reprinted several times in the sixteenth century, Tostado discussed several activities that became commonplaces of witchcraft mythology. He attended the Council of Basel (1431–1440) and could have exchanged information there with such contemporaries as Johannes Nider, Nicolas Jacquier, and Martin Le Franc about the exciting new alleged heresy that soon became known as witchcraft.

In his commentary on Genesis, Tostado discussed the witches' ointment and questions regarding incubi and succubi; while commenting on the Gospel of Matthew, he returned to both topics. Although at first reading, Tostado's two sets of opinions may appear inconsistent or contradictory, they are coherent and complementary. Throughout his commentary, Tostado's uppermost concern was not the social and moral dimensions of human behavior but, rather, the demonstration that human experience and the facts of nature were consonant with events mentioned in the Bible. Tostado was an important influence in the trend that began in the fourteenth century toward maintaining the literal truthfulness of the Bible (Allen 1963, 75–77).

While discussing the creation of Eve, Tostado wondered how God could have kept Adam from feeling pain from his amputated rib. He answered that God would have had no problem, because anesthesia was possible even by natural means. This was clear from the ointments used by certain women called *maleficae* (female witches). The ointments induced anesthesia, a profound stupor, and vivid illusions of flying. To illustrate this contention, Tostado recorded one of the earliest examples of experiments performed to ascertain whether women who used such ointments traveled "in the body" or merely underwent dreams or hallucinations. The anecdote Tostado cited as evidence appeared to portray witches' flying as an illusion, yet Tostado supported the reality of their flying when he discussed the Gospel story (Matt. 4:1–11) of Satan's carrying Jesus to the pinnacle of the temple and onto a high mountain. In both cases, Tostado invoked witches as evidence that phenomena mentioned in the Bible should be interpreted as literally true, rather than fabulous, fictional, or symbolic (Stephens 2002, 146–153).

Tostado was also reluctant to abandon the idea that the "sons of God" who sired the giants of Genesis (Gen. 6:4) were fallen angels, as a literal reading of the Vulgate Bible suggested, rather than mere men as St. Augustine claimed (Stephens 1989, 75–92). Using Aquinas's incubus theories, Tostado proposed that demons could have sired the giants artificially, using semen stolen from men. He returned to the topic in his commentary on the Sermon on the Mount (Matt. 5), propounding a bizarre theory that incubi and succubi could cause a man to commit adultery and sire bastards by proxy, by collecting semen ejected during masturbation. Thus masturbation was a sin against nature, because a man could sire children without intending to (Stephens 2002, 69–70).

**TREVOR-ROPER, HUGH
(LORD DACRE OF GLANTON,
1914–2003)**

A pioneer in bringing the study of European witchcraft persecution into the mainstream of historical interest, Hugh Trevor-Roper was Regius Professor of Modern History at Oxford University (1957–1980), then Master of Peterhouse, Cambridge, until his retirement in 1987. His major contribution was a stimulating if relatively brief essay of around 100 pages, published first in his collection *Religion, the Reformation and Social Change* (1967), then as a separate book in 1969 under the title *The European Witch-Craze of the 16th and 17th Centuries*.

At this time, the documentary basis for such a study was distinctly limited; there were some collections of texts (such as those gathered by Wilhelm Gottlieb Soldan, Joseph Hansen, Henry Charles Lea, and C. L'Estrange Ewen), alongside the contemporary works of the demonologists and some relatively obscure local monographs. Trevor-Roper had the acuity to present the persecutions as an important aspect of European religious, intellectual, and cultural history, an aspect that needed to be related to more general trends in the early modern period. His own view was decidedly Whiggish, not just in refusing to concern himself with “elementary village credulities” (Trevor-Roper 1969, 9), but also in depicting the persecution as a prime example of misplaced clerical zeal fed by confessional strife. The essay remains a brilliant piece of writing, studded with intelligent and provocative remarks, raising a host of important issues. Many of its claims, however, now appear outdated or erroneous in the light of massive later research on the subject, which this striking early synthesis did much to encourage.

Although the author insisted that his own chief concern was with the ideas and motives of the persecutors, his study sketched the whole history of persecution between the fourteenth and the seventeenth centuries. Although he offered no overall figures for the number of trials, his wide range of examples created an impressive literary effect, a vision of much of Europe between 1560 and 1630 covered by pyres for burning witches. Although Trevor-Roper included numerous caveats, these were largely submerged beneath the sheer exuberance of his style as he built up a picture of the witch craze sweeping all before it, citing numerous terrible examples with obvious glee.

This picture of Europe and witchcraft persecution was a serious misapprehension with which more sober accounts of the persecution still struggle to compete: A story becomes much more exciting when told with verve and disregard for inconvenient facts. Trevor-Roper's presentation of zealous witch hunters such as Jean Bodin, Peter Binsfeld, or Henri Boguet as enjoying some kind of intellectual hegemony in their own times was significantly at variance with the messages found in their own writings and greatly underestimated the strength of their opponents. At a more general level, the whole explanatory mechanism proposed seems defective, because he showed the persecution as being essentially top-driven, the work of misguided clerics and judges terrorizing rural populations. He did not wholly ignore the sharp divisions within these groups, but he allowed such counterexamples far too little weight. Above all, he included only a few sketchy comments on the crucial interface between local societies and various official agencies.

The essay remains very interesting in historiographic terms, because it illustrates so well what an experienced and talented scholar could make of the subject in the 1960s, working from what by today's standards was an almost derisory bibliography. If one reads with care and tries to avoid being seduced by the rhetoric, one finds many impressive points, both in detailed comments and in the broad recognition that the intellectuals of the day were virtually compelled to confront the issues of diabolical power and witchcraft. Although his anticlerical tone grates at times, Trevor-Roper correctly identified the link between witchcraft and the religious concerns of the Reformation as a crucial area for study, alongside the question of how the decline in trials related to changes in worldview. It was unfortunate that Trevor-Roper wrote before Norman Cohn and Richard Kieckhefer detected the major forgeries involving early trials in Languedoc and northern Italy, because these discoveries demolished his claim that the inquisitors had simply moved on from the pursuit of heretics to that of witches. The idea that the mountain communities were inherently more superstitious than those of the plains now seems merely quaint. Despite its grave failings, Trevor-Roper's pioneering essay remains a landmark in the serious study of the subject and a lesson in how to communicate with a wide public.

TRIALS

Witches were tried in many different types of courts during the late medieval and early modern periods, and the procedures employed in their trials varied extensively from one jurisdiction to another.

It is a persistent misconception that ecclesiastical courts, especially the papal Inquisition, tried most witches. It is true that during the early years of witch hunting (from about 1425 to about 1550), inquisitors appointed by the papacy played a leading role in the prosecution of witches. Moreover, several authors of witchcraft treatises composed during those years, including the most famous one, the *Malleus Maleficarum* (The Hammer of Witches, 1486) of Heinrich Kramer, were themselves papal inquisitors. Even during these early years, however, witches were sometimes tried by other ecclesiastical courts (those of bishops), and were very often tried by secular courts of princes or cities. After 1550, secular courts clearly dominated the prosecution of witches.

A bewildering variety of tribunals judged witches during the early modern period. They included village courts in France; courts in more than 400 German territories, including both local and appellate courts of various duchies and principalities; circuit courts such as the English assize courts, in which royally appointed judges tried witches in the localities; and ad hoc tribunals commissioned by central governments, such as Scotland's commissioners of justiciary, appointed by the Privy Council. In France, the sentences of lower courts could be reviewed by provincial *parlements* (sovereign judicial courts), and in Germany cases could be appealed to the *Reichskammergericht* (imperial chamber court). During the period from 1580 to 1630, which was the most intense period of witch hunting, ecclesiastical courts continued to claim jurisdiction over witchcraft, although they generally adjudicated only noncapital cases of magic and superstition. The great exception to this pattern of increased secular jurisdiction after 1550 occurred in the Iberian kingdoms and the Italian territories, where the Spanish Inquisition (established 1479), the Portuguese Inquisition (definitively established in 1536), and the Roman Inquisition (established in 1542) tried most though not all cases of witchcraft. Moreover, the regional tribunals of all three Inquisitions reported to a central authority. Even in Spain and Italy, secular courts executed more witches than did inquisitorial courts.

Each of the courts that claimed jurisdiction over witchcraft had its own procedures and traditions. Ecclesiastical courts had much greater uniformity than secular courts, although Protestant church courts usually followed somewhat different procedures from those of Catholic tribunals. The most salient procedural differences separated those courts that followed accusatorial procedure from those that adhered to inquisitorial procedure. According to accusatorial procedure, which was followed in England, the Scandinavian countries, and to a lesser extent in Scotland, parts of the German empire, and Hungary, prosecution was undertaken at least theoretically by accusers acting either in a private capacity or as representatives of the community. According to inquisitorial procedure, which became the norm in most continental European countries after 1500 and in all ecclesiastical courts, court officials controlled the entire prosecution, from initiation to sentencing. Even among those courts that followed either system of criminal procedure, there were significant variations in the methods used to begin prosecutions, the deposition of witnesses, the methods of interrogating the accused (the prerequisites for applying torture varied enormously within Germany's 400 courts), the determination of guilt, and the process of appealing verdicts or reviewing sentences. The claim that all witchcraft trials were identical has no foundation in reality.

INITIATION

The legal process began with the arrest and formal charging of the witch. The community's suspicion of a person for witchcraft could be made known to the court in a number of ways. In England and other countries that followed accusatorial procedure, it was necessary for someone to enter a formal complaint against a suspected witch. That charge was submitted to a grand jury of laymen, which would then draft an indictment of the accused. In countries following inquisitorial procedure, which included secular as well as ecclesiastical courts in most continental European countries, the process of initiation was more open-ended, since witches could be accused by their neighbors (including other witches), denounced by local officials or clergy, or arrested by the authority of the judge (*ex officio*) on the basis of ill fame or rumor.

In many jurisdictions, an official of the court, known variously as a fiscal, procurator, public prosecutor, or the attorney or advocate of the ruler, was entrusted specifically with the process of identifying and charging suspected criminals, including witches. In Scotland, which did not have a grand jury, the Lord Advocate could issue an indictment on the basis of accusations brought to his attention. Alternatively, local communities, after arresting a suspected witch and searching for the Devil's mark, could request a warrant from the

Privy Council to try the witch in their community. In many jurisdictions, a person could be arrested for witchcraft on the basis of claims by one or more confessing witches that the person was their accomplice. This identification of a witch's confederates was often demanded under torture. The practice of inducing witches to name accomplices, which could happen at any stage of the judicial process, was in large part responsible for the massive chain-reaction witch hunts that occurred during the period 1580–1630.

DEPOSITIONS OF WITNESSES

Almost all witchcraft trials involved the examination of witnesses and the recording of their testimony. These depositions were usually taken after the witch had been arrested and occasionally after she had been interrogated. They usually focused on the *maleficia* (harmful magic) that the accused witch had allegedly perpetrated. In courts that followed inquisitorial procedure, these depositions were taken by an official of the court and became part of the dossier upon which the trial (and any subsequent appeal) was based. In England, justices of the peace took such depositions after 1554, but the witnesses delivered their testimony orally in court, and therefore, written depositions did not usually become part of the official court record.

INTERROGATION OF THE ACCUSED

Central to all witchcraft trials was the interrogation of the accused, often under torture. The goal of all interrogation was to secure a confession, which was regarded as the “queen of proofs.” The desire for a confession was just as strong in England and Scotland, where a conviction could be obtained without a confession, as in countries that insisted upon either a confession or the testimony of two eyewitnesses (the Romano-canonical law of proof) for conviction. The interrogation of the accused might occur right after arrest, or it might be undertaken after the deposition of witnesses. In many cases, interrogations took place on a number of different occasions—first by the authorities who arrested the witch and later by officials of the court. In jurisdictions that allowed torture, courts were required first to provide sufficient evidence that the procedure was warranted. The traditional requirement was the testimony of one eyewitness or the accumulation of circumstantial evidence that, on the basis of contemporary jurisprudence, was considered the equivalent of one eyewitness. Great disparities prevailed among European jurisdictions regarding the frequency, duration, and intensity of torture. English and Scottish courts could administer torture only with the explicit approval of the Privy Council, although Scottish communities often tortured suspects shortly after arrest. Torture administered in this manner was illegal, and hence its application did

not become part of the judicial record. Technically, any confession made under torture was juridically invalid and had to be ratified afterward before it could constitute legal proof of guilt.

DETERMINATION OF GUILT AND SENTENCING

The core of any witchcraft prosecution—the trial in the technical sense of the word—was the determination of guilt. In the early and high Middle Ages, this process usually involved the submission of the accused to an ordeal or one of the “nonrational” proofs, such as trial by battle. After 1215, responsibility devolved on human beings to make such a determination of the basis of evidence. In countries following inquisitorial procedure, where recorded depositions became part of the trial's dossier, the weighing of this written evidence was undertaken either by a judge or a panel of judges. In these jurisdictions the accused was entitled to legal counsel, who was usually referred to as an advocate. In practice, however, most witches were too poor to afford such legal assistance, and lawyers were often reluctant to defend witches. In many German jurisdictions, local courts were required to seek legal advice regarding the handling of witchcraft cases from the law faculties of universities, which would issue nonbinding opinions regarding the case before its final determination. In England, a jury consisting of laymen determined the facts of the case on the basis of evidence presented orally in court. The accused was not entitled to legal counsel during the presentation of evidence, but the prisoner could obtain the assistance of lawyers on matters of law, such as the nature of the charges in the indictment. In Scotland, where criminal procedure included elements of both inquisitorial and accusatorial justice, witches were entitled to counsel, and much of the trial was taken up with the consideration of the relevance of the written evidence to the libel, which was the proposition stating the guilt of the accused. In all European courts, the trial ended with the sentencing of the accused, unless of course the accused had been acquitted or the trial had been suspended.

REVIEWS OF SENTENCES AND APPEALS

Sentences given in witchcraft trials were not always carried out immediately after conviction. A number of jurisdictions required that a death sentence in a witchcraft trial be submitted to a higher court for review. This obligatory reconsideration of witchcraft convictions was most common in seventeenth-century France, where death sentences for witchcraft were routinely referred to one of the nine provincial *parlements*. After 1614 the supreme council of the Spanish Inquisition also reviewed the sentences of lower tribunals and mitigated the severity of a number of

witchcraft sentences. Similar reviews of capital convictions for witchcraft were undertaken in the Scandinavian kingdoms in the seventeenth century and in eighteenth-century Hungary. Within the Holy Roman Empire there was no obligatory appeal of sentences, but cases could be appealed to the *Reichskammergericht*, which sat at Speyer. In cases that were reviewed by higher courts or heard on appeal, the appellate process became in effect a second trial rather than a continuation of the original proceeding. The legal dossier was sent to the higher court; advocates were often appointed to defend the accused, and witnesses could be examined again. There was no appellate process in England or Scotland, although English judges could grant pardons or reprieves to mitigate the severity of harsh jury sentences.

TRIER, ELECTORATE OF

Evidence survives for about 800 witchcraft trials in the electorate of Trier, mostly from the late sixteenth century. The total number of executions for witchcraft may have been more than 1,000, but this is highly speculative and reaches beyond available documentation. But even the known figure of 800 executions speaks to the intensity of witchcraft trials, because the population of the electorate prior to the Thirty Years' War might have been 75,000 (including 6,000 in the city of Trier and about 5,000 in Koblenz).

As one of the German prince-electors (*Kurfürsten*), the archbishop of Trier was the sovereign of a territorial

state, the electorate (*Kurfürstentum*) of Trier, ruling over territories scattered from the Saar River to the Westerwald Mountains. His jurisdiction was riddled with disputed borders, numerous enclaves, and condominiums. The persecutions began here in the 1480s, peaking around 1590 and again around 1630. One archbishop-elect, Johann VII von Schönenberg (ruled 1581–1599), had the dubious distinction of having the political responsibility for the first massive witch hunt in the Holy Roman Empire, one in which hundreds of witches were executed in the 1580s.

In Trier, mass persecutions that even disregarded rank began relatively early, and Trier Catholic territories moved to the forefront of witch hunting in Germany; these two facts turned Trier into an often-cited paradigm of witch persecution in the Holy Roman Empire. Accusations of witchcraft were leveled not only at criminals, foreigners, and vindictive persons who violated social norms but even at ruthless careerists and corrupt officials. Several members of Trier's upper class, including some priests, were executed as witches. The trial against Dietrich Flade, a magistrate and onetime vice-chancellor of the University of Trier, became a cause célèbre in demonology. And the demonological treatise published in 1589 by Trier's suffragan bishop Peter Binsfeld attracted further attention, although it had no direct influence on the witchcraft trials of the territory and was ignored by the elector's legislation.

After early indoctrination by Heinrich Kramer and local clerics, the popular witchcraft imagination conformed to the demonological stereotypes. A massive number of trial records have been lost, but according to the surviving sources, only 11 percent of the defendants were male; about 70 percent of the male and 87 percent of the female accused were executed (Dillingner 1999, 97–100).

The driving force behind the Trier persecutions included ordinary townsmen and villagers. In the electorate and its surrounding territories, town meetings traditionally elected committees charged with undertaking specific local tasks. In the form of communal witch-hunting committees, self-government turned into the motor of a persecution "from below." These committees usurped various state functions: They organized the investigations, collected evidence and denunciations, accused suspects collectively, and sometimes even employed their own lawyers. The courts and the elector's local officials cooperated with the committees in order to avoid difficulties with them. The committees financed themselves by confiscating a part of the defendants' possessions. Witch hunting provided committee members, their lawyers, and court personnel with significant additional income. These local networks of witch hunters defied every attempt of the badly organized electoral government to control them. The archbishop-electors Johann VII and Philipp Christoph promulgated

witchcraft acts in 1591 and 1630 designed to reinforce the regulations of the Carolina Code and to subject the committees to the control of the High Courts of Trier and Koblenz. However, neither of the witchcraft acts had any perceptible effect.

Trier's witch hunts were triggered by epidemics in connection with an agrarian crisis caused by poor wine harvests in the Moselle region. The persecution gained a momentum of its own. Communities learned about "successful" investigations and soon imitated the activities of other villages' committees. The committees and officials of the electorate exchanged information about suspects with their counterparts in neighboring states, especially the enclave belonging to the imperial monastery of St. Maximin, near Trier. Here, close cooperation between the abbot, his officials, and the village committees led to about 400 trials.

Not only did the Thirty Years' War end the persecutions of the early 1630s in the electorate, but it also destroyed the traditional structure of its rural communities. When Elector Karl Kaspar initiated a reform program in 1652, he successfully outlawed witchcraft trials, regarding them as a serious menace to public order.

TRITHEMIUS, JOHANNES (1463–1516)

Trithemius was one of the best-known magicians of Renaissance Germany. Born into a wine-growing family named Heidenberger from Tritenheim (whence his Latinized name), Trithemius studied at Trier and Heidelberg, became a Benedictine monk at Sponheim near Bad Kreuznach, and was elected abbot eighteen months later. Trithemius dedicated himself to reforming his monastery, whose library soon became a center of early German humanism and whose history he wrote. However, his frequent absences, together with

his passion for books, generous hospitality, and rumors of his occult inclinations, ultimately led Trithemius to exchange Sponheim for the rather unimportant monastery of St. Jacob.

His most inventive and influential studies, *Polygraphia* (Many Forms of Writing [Cryptography], 1518) and *Steganographia* (Secret Writing, written ca. 1499, published 1606), are encrypted treatises on ciphers. About 250 of his letters to many contemporary humanists are known, often through the publication of *De scriptoribus ecclesiasticis* (About Clerical Writers) in 1494 and the *Catalogus illustrium virorum Germaniae* (Catalogue of Famous German Writers) in 1495. Besides having an excellent command of Latin, he learned Greek and Hebrew with the help of famous teachers, Conrad Celtis and Johann Reuchlin. A lifelong interest in history produced his *Chronicon Sponheimense* (Sponheim Chronicle, 1508). But Trithemius was clearly capable of falsification, proved by his invention of two chroniclers, Hunibald and Wastald, in a work for the Holy Roman Emperor Maximilian I.

Trithemius called himself a *philomagus*, a friend of magic. He identified magic with philosophy, with wisdom dealing with the divine, humanity, and nature. He considered legitimate natural magic to be utterly distinct from the superstitions of demonic sorcery and witchcraft. His autobiographical *Nepiachus* (1507) listed his teachers in the art of natural magic, including Albertus Magnus (Albert the Great) and Gianfrancesco Pico della Mirandola. Trithemius, however, also professed to have secret knowledge through revelation: While he was resting, an unknown visitor instructed him.

In 1502 Emperor Maximilian requested a list of Trithemius's magical skills from his close friend Conrad Celtis, a list that unfortunately has not survived. Three years later, Trithemius met Emperor Maximilian for the first time at the diet at Cologne. Afterwards, the abbot was allowed to call himself a chaplain of the imperial court. At their meeting, the emperor asked Trithemius eight questions, which he first answered orally and then in writing as *Liber octo quaestionum* (Book of Eight Questions, 1515); version appeared in 1515. One question asked why unholy people like witches could command demons, whereas good people could not. Another asked why miracles were possible outside the Church. In reply, Trithemius emphasized the powers of the Devil and demons who aided the magicians and the witches. Whereas magicians had informal but implicit pacts with the Devil, witches signed a formal pact and were consequently entirely subject to him.

In the second book of his *Antipalus maleficorum* (Testimony of Witches, 1508) Trithemius denounced witchcraft and surveyed the methods permitted by the Church to treat bewitchment, especially the healing

power of exorcism. In sixty-one pages, he described a procedure, lasting nine days, called the antiwitches bath. First, the bewitched person had to confess his or her sins and then attend a Mass of the Holy Trinity. The bath had to be in a secret place and the tub had to be filled with clear spring water, to which consecrated soil, ashes, salt, and nine different blessed herbs were added. A piece of dough, formed from consecrated salt and water, was wrapped in a cloth that covered the afflicted part of the person. While the bewitched was praying, the ritual of exorcism took place. The priest, while conjuring the demons, circled the tub twice, first with his back to the tub and then turned toward it. Using a freshly cut frond, the priest sprinkled the sick person with consecrated water and then blessed some wine, which the patient was to drink for nine days. A mixture of consecrated wax, thirty-eight powders, red coral, and holy water was shaped into a cross, put into a walnut shell, sealed, and sewn into a cloth that the patient was to wear around his neck. Additional crosses were formed and put on his doors, bed, and table. The patient was to attend Mass every day. Trithemius claimed to have applied this procedure successfully to several patients.

Trithemius intended to write a systematic treatise on demons, but the outline of *De demonibus* (On Demons), written between 1507 and 1514, only gave its table of contents.

TYROL, COUNTY OF

Throughout the early modern period, trials for witchcraft remained relatively infrequent in the Alpine county of Tyrol, located west of most Austrian Habsburg hereditary lands. Their total number and intensity never came to rival those of neighboring lands in southwestern Germany. Trials for witchcraft throughout Tyrol appear to have reflected the ethnic, social, and political diversity of the county. Although a thorough, systematic analysis of the prosecutions is still lacking, available scholarship suggests that at least seventy-two trials, involving some 200 or more accused witches, took place; of those suspects whose gender is known,

approximately 72 percent were women. Executions remained relatively infrequent in many parts of the county, particularly to the west, where the earliest burnings took place only in 1623. In the Italian- and Ladin-speaking areas of the county around Brixen and Trent (today part of Italy), executions were more frequent (Byloff 1934; Dienst 1987a, 286–289; Tschalkner 1992, 231).

In the late Middle Ages, a total of four trials occurred at Enn (1296 and 1433), Brixen (1371), and Meran (1436–1437) (Dienst 1987a, 286–289). At Innsbruck, a noteworthy trial involving some fifty suspects was prosecuted in 1485 by Heinrich Kramer, the author of the *Malleus Maleficarum* (The Hammer of Witches, 1486); but the bishop of Brixen and Archduke Sigismund arranged for the release of all seven imprisoned suspects and drove the Dominican inquisitor from their territory (Dienst 1987b). In comparison, the sixty-seven subsequent trials in the county remained limited in scope, but they occurred in increasing numbers during the sixteenth century and the first half of the seventeenth century, although they never generated a territory-wide witch hunt. Few trials occurred after 1650, the last being an isolated case in 1728. Therefore, witchcraft trials in Tyrol followed the typical chronological pattern of western European territories, with prosecutions peaking between 1580 and 1640, a pattern applicable as well to the contiguous Habsburg territory of Vorarlberg (today Austrian) and in Swabian Austria (Schwäbisch-Österreich, today part of Germany). In contrast, the dynasty's eastern lands experienced a different pattern of trials, with a high point between 1660 and 1690 (Dienst 1987a; Tschalkner 1992, 230–231).

Accusations stemming from fears of simple sorcery or *maleficia* (harmful magic) seem to have been central in most Tyrolean cases. Trial records reveal that the inhabitants of Tyrol feared debilitating illnesses for themselves or their animals, bad weather and crop failures, or other types of misfortune, just as did rural populations elsewhere in Europe. On occasion, such anxieties translated into suspicions of either neighbors or outsiders. Only sixteen of seventy-two trials included significant evidence of diabolical activity, though a few featured elaborate tales of the witches' Sabbat. Local magistrates exercising their own discretion, it seems, introduced such elements. Only in 1637 did the Innsbruck government introduce diabolical elements into its regulations for conducting witchcraft trials—but it did so in order to limit their influence upon court proceedings. Throughout the entire period of the witchcraft trials, the Tyrolean government sometimes acted to mitigate the effects of overzealous prosecution of accused witches, even if it did not eliminate the practice entirely.

U

UKRAINE, WITCHCRAFT

According to popular stories collected by Ukrainian ethnographers of the nineteenth and early twentieth centuries, Ukrainians did not explicitly differentiate between witchcraft and sorcery. The term most frequently used to describe all magic practices in both popular stories and trial records was *chary*. The difference between witchcraft practitioners was more essential. A sorceress, *charivnytsia*, was rarely mentioned in popular stories; their main character was a witch, *vid'ma*. Ukrainians, however, distinguished between two types of witches. The first was a "natural-born witch," *rodyma vid'ma*; the second was a "taught witch," *vchena vid'ma*. Both were female witches, but the origin of their power was different.

The natural-born witch, as her name suggests, was born as a witch. She could be recognized by physical characteristics: She was supposed to have a short tail and a strip of dark hair going down her back. Sometimes she might lack one breast. She was often described as an unfortunately fated being who did not want to do evil but who was unable to change her nature. Among her unavoidable responsibilities were teaching the learned witches magic and attending the witches' Sabbats. This latter activity was more abhorrent to her, because she could not refuse the duty. Yet it was the natural-born witch who helped people, practiced white witchcraft, and could undo the evil done by other witches.

The taught witch, on the other hand, who practiced low magic as opposed to high or learned magic, was the embodiment of evil because she had consciously decided to become a witch. Because any woman could become a taught witch, it was impossible to recognize her by natural means. However, such a woman had to perform an initiation ritual such as the act of sacrilege, usually late at night, on the border of a village, on the bank of the river. This ritual was free of the Devil's involvement. After she had performed such a ritual, a natural-born witch would teach her.

Another important character, *kyjiv's'ka vid'ma*, or "the witch of Kiev," was mentioned not only in Ukrainian but also in Russian, Belarusian, and Polish folklore. Witches from Kiev were thought to be the most powerful, dangerous, and knowledgeable of all witches in the region.

Male witches were rarely mentioned in popular stories. They were mentioned as either a "male witch," *vid'mak*, or a "vampire," *opyriaka*. A male witch wore his hair long in order to hide a small horn. He was mentioned as the head of the witches' gatherings, and he was able, as a natural-born witch, to undo the evil done by other witches.

The repertoire of Ukrainian witches was similar to that of witches in other parts of Europe. Their most popular activity was stealing milk from their neighbors' cows. Witches were especially attracted to milk and were able to extract it from such creatures as dogs, cats, rats, and frogs and even from some trees. Ukrainian witches could rule the elements of nature. They stole clouds from the sky and then turned them into frogs, which they hid in pots to cause a drought. They called locusts and sparrows to the fields to spoil the harvest or made special magic knots in grain crops for the same purpose. Sometimes a witch in popular stories was referred to as a "star-grasper," *zirokhvatka*, because she enjoyed stealing stars and the moon from the sky and hiding them in pots and wells in order to spoil important Christian holidays. They could steal babies from cradles at night or scare lonely passers-by, but rarely were they mentioned, at least in popular stories, as causing illness or death to people.

In order to move to the stage of crime at night unnoticed, the witch had to be able to shapeshift. The most common metamorphosis was into a dog or a cat. Sometimes such an animal was mentioned as having a female face. Other examples included a mouse, a frog, a horse, a fly, a haystack, a wheel, a needle, a wall, bread, and a sieve. There are many stories in which a man returning home late at night meets a suspicious animal or a moving object. He strikes it with a sharp knife or a saber, and next morning he discovers that a woman in a village (most often his close relative) has lost her hand, has fallen ill, or has been severely wounded, and so he discovers that she was a witch.

Resistance to witchcraft is an important part of many stories about witches. Because in many cases it was difficult to distinguish between a witch and nonwitch, it was first necessary to identify a witch. There were numerous methods. The swimming test (water ordeal) was used only in cases when a witch represented a

danger to the whole village community. When a witch was stealing milk from somebody's cow, that person had to take care of his or her own interests. All methods of recognizing a witch could be divided into two main groups: (1) Rituals that made an alleged witch come to the house of an offended person and propose to remedy the harm; and (2) rituals that allowed the recognition of a witch when she was among other women (most often she would appear with a milking bucket on her head).

Once a witch had been recognized, it was recommended that she be seized and punished (beating her up was the most widespread method of punishment). This was considered a dangerous enterprise, so those who could pay were advised to go to a healer, *znakhar*, for assistance. Anyone who had once succeeded in seizing a witch was considered a healer. However, those who could not afford to pay a healer had to face the witch in person. Because that was a dangerous procedure (performed at night and at the risk of being frozen until morning by the witch), one could not fight a witch with bare hands. The best weapon against a witch was a magic rope, *ochkur*. In addition, a certain type of dog was able to seize a witch. Such a dog was born only once in three generations and was called *iarbuk*, but the owner of this valuable dog had to take care when it was a puppy because local witches would try to steal and kill it. Some people, such as the seventh son of a seventh son, could also resist witchcraft. Such plants as poppies, hemp, and nettles were supposed to protect a house from witches.

Ukrainian witches regularly gathered for Sabbats. Prior to their journey, they had to come to the house of a local natural-born witch; there, they prepared for the journey. Popular stories mentioned about two methods of flying to the Sabbat. One was the traditional method of using a flying salve; the other involved somersaulting over a knife. The main gathering place for Ukrainian witches was in Kiev on the Bald Hill, *Lysa Hora* (scholars disagree about which of four alleged Bald Hills in Kiev was the authentic one). The Devil was not mentioned as being present at such gatherings; instead, a male witch sometimes headed them. According to the popular stories, during the Sabbats witches danced, played with dolls, and attacked each other with wooden swords.

Several stories described the horrible death of a witch. In order to reduce her suffering, she had to pass her knowledge on to someone. She could do this merely by touching someone or passing any object from hand to hand. Because of this belief, people were afraid to approach an alleged witch on her deathbed. Some stories claimed that relatives sometimes had to make a hole in a ceiling in order to make the witch's death less painful. Such a hole allowed the soul of the witch to leave her body easily.

UKRAINE, WITCHCRAFT TRIALS

Ukraine has only recently come to be included among the countries traditionally perceived as part of the history of European witchcraft trials. Its witchcraft trials were mentioned never as a separate phenomenon but only in connection with Russian or Polish trials. In either case, Ukrainian trials were regarded as something foreign: To Polish witchcraft experts, Ukrainian trials were different because of the influence of the Orthodox tradition in its southeastern crown lands; from a Russian perspective, Ukrainian trials showed Polish characteristics and indirect German and thus Western legal and cultural traditions in these lands.

Such confusion was compounded by insufficient study of Ukrainian witchcraft trials. A Ukrainian historian of Polish origin, Vladimir Antonovich (1830–1908), produced the first detailed study of Ukrainian witchcraft trials in 1872. His study contained materials about Ukrainian witchcraft trials from 1700 to 1768 taken from the Kiev central archive; it was soon published as a separate book (Antonovich 1877). Although a pioneering researcher, Antonovich did little to analyze his information, apart from emphasizing the entire lack of torture and death sentences in Ukrainian trials and claiming that Ukrainians never connected witchcraft with the Devil and demons. Afterward, Ukrainian witchcraft was studied mainly by ethnographers, who produced much fruitful work (Kurotshchkin 1991–1992). Historians recycled Antonovich's materials, comparing them favorably to western European trials (because Ukraine had relatively few witchcraft trials and executions), while adding ethnographic evidence. The only new angle to the problem was a short study of 1903 about the "drowning of witches," the swimming test or water ordeal (used in Zguta 1977a).

The information we possess remains limited to about ninety Ukrainian witchcraft trials, almost 70 percent of

which come from the palatinates of Podolia and Volhynia, with a few from the palatinates of Bratslav and Kiev and from a hetmanate (the domain of the hetman, the leader of the Ukrainian Cossacks of the Dnieper River region). Materials from the Ruthenian Palatinate, although well preserved, have not yet been researched. Magistrates' courts in Podolia treated witchcraft accusations more leniently than in Volhynia. Judicial torture was used rarely in Podolia but more often in Volhynia; all death sentences, except for one 1667 trial, also come from Volhynia. At least eleven people were executed during the seventeenth and eighteenth centuries. The most notorious trial occurred at Hadiach in 1667, where six witches accused of an attempt on the lives of the local hetman and his wife were burned.

The first recorded Ukrainian accusation of witchcraft took place in 1578 in Volhynia against Princess Maria Kurbskaia. To date, only a handful of seventeenth-century cases have been studied; the vast majority (85 percent) come from the eighteenth century. The last known trial occurred in 1829 at the town of Lypovets', where Kateryna Martynivska, a lawyer's wife, was accused of bewitching a local priest.

Ukrainian witchcraft cases were almost entirely under secular jurisdiction; only in the late eighteenth century, when witchcraft was labeled a superstition, did the Spiritual Consistory of Kiev hear a few cases. Charges were usually brought to the magistrates' courts, but cases involving the *szlachta* (nobility) were taken to the *hrodskyy sud* (castle court). The diversity of legal codes used in Ukrainian lands created a certain flexibility in legal approaches to witchcraft. The two most frequently cited sources for dealing with witches—the Magdeburg law (introduced in Ukrainian cities at different times since the fourteenth century) and the 1588 statutes of the Grand Duchy of Lithuania—both prescribed execution by burning for convicted sorcerers. In practice, burning was often replaced with beheading, although the judges invariably stressed that the culprit should have been burned. They warned prisoners who received more lenient sentences for practicing witchcraft (defamation by whipping, "public torture," or banishment) that a second conviction would lead to their being burned alive. The most frequent punishments were merely fines and church penances, and many trials ended by acquitting the alleged witches and punishing their accusers for slander, imposing a fine and requiring a public apology.

An important feature of the Ukrainian judicial tradition affecting court attitudes toward alleged witches was that in the majority of cases, courts were not interested in the previous criminal history of the accused. Therefore the questions asked during such trials were strictly connected to the conflicts that had occurred at a certain time between the two parties

involved; witnesses who could testify about a defendant's past witchcraft were not usually summoned.

This lenient attitude has traditionally been attributed to the influence of the Orthodox Church, which allegedly failed to create a significant demonological tradition or to establish any connection between the Devil and witches. Such an explanation is unsatisfactory for two reasons. First, the treatises, pamphlets, and sermons of seventeenth-century Ukrainian Orthodox theologians, for example, Antonij Radyvilov's'kyj and Ioanikij Haliatov's'kyj, demonstrated that both devils and *charovnitsy* (witches) were very popular subjects. *Bogi poganskia* (Pagan Gods), a demonological pamphlet by Haliatov's'kyj published in 1686, made a clear connection between the deeds of witches and sorcerers and the Devil's involvement. Second, the Ukrainian towns in which the majority of the known witchcraft trials originated were ethnically and religiously heterogeneous, melting pots of Orthodox, Uniates, Roman Catholics, Monophysites, and Jews, places where the influence of Catholicism was quite strong. However, it is true that the concept of a diabolical witch sect was absent from Ukrainian lands.

Death sentences persisted far into the eighteenth century, often in cases where there were accusations of witchcraft in conjunction with other crimes. In 1720, during some epidemics in the small town of Krasyliv, Proška, a peasant woman (reportedly 120 years old!), was accused by a soothsayer from a neighboring village of causing epidemics and was burned. Later, the victim's relatives, considering the decision unfair, appealed to higher authorities to punish the local court for sentencing an innocent woman to death. Ten years later, another peasant woman was accused of bewitching her master's family and was sentenced to beheading by the magistrates' court of Kremenets'. In 1748 the same court sentenced a servant to beheading for employing sorcery and fraud against his master; in 1753 and 1755 the court sentenced two women to death, primarily for infanticide but also for witchcraft.

Gender analysis of Ukrainian trials shows that almost equal numbers of men and women were accused of witchcraft. But a closer examination reveals that many men were accused on behalf of their wives and that most actual witchcraft practitioners were in fact female, although a substantial minority of male practitioners remains.

Ukrainian witchcraft trials were predominantly urban; only a handful of peasants participated. Most accusations occurred among craftsmen and town-dwellers of middling status. Another distinct professional category of participants included Orthodox priests and their wives. A third group consisted of soldiers; the remainder included various marginal groups, such as beggars, Jews, and other minorities, who received harsher treatment in court. For conviction for the same crime, craftsmen paid

finer and performed public penance whereas members of marginal groups were usually imprisoned, whipped, and exiled. In most cases that ended with a death penalty, the person convicted of witchcraft and executed was socially inferior to his or her accuser.

The urban character of the trials is also reflected in the nature of the accusations: no cases of stealing milk from cows, turning milk sour, or causing storms and droughts appear in court records. However, after 1700, courts investigated cases when local village authorities illegally organized water tests during droughts. Many accusations were based on actual magical practices. Craftsmen often accused each other of attempting to achieve business success by magical means. Although one finds numerous cases of love magic, accusations of maleficent magic predominated. Fears of bewitchment plus familiarity with magical practices explained the high percentage of preventive accusations, made before any actual harm had been done but after witnessing suspicious rituals or the cooking of strange concoctions.

Night flights and witches' Sabbats were mentioned in only one Ukrainian trial. Investigating a case of infanticide in the village of Shchurovichi in 1753, the magistrates of Kremenets arrested Orzyszka Liczmanicha, accusing her of witchcraft. Under torture she confessed that she belonged to a group of witches. She was the least experienced among them, so they had to teach her everything—how to fly, milk cows magically, spoil crops, and cook concoctions. During her first flight to a neighboring Ukrainian territory, she had an accident at the border and fell down, wounding her nose and knees. Because she never reached her destination, we still have no description of a Ukrainian Sabbat.

UNIVERSITIES

Universities played a central role in the history of witch hunts. This applies both to the belief in witches and to witchcraft trials. Numerous proponents as well as opponents of witch hunts worked as professors in faculties of theology, law, and medicine. Academic theology made an important contribution to the fusion of the individual components of the cumulative concept of witchcraft in the early fifteenth century. Medieval scholastic theology busied itself with questions of satanic pacts, human sexual intercourse with the Devil, and the reality of nocturnal secret meetings of witches in remote places. Because of the universities' teaching activities and through the clergy's sermons, elements of the scholarly belief in witches also influenced the general public's concept of witches and witchcraft. In Estonia, which had perhaps 100 parishes, Tartu University, created in 1632, educated 242 clergymen between 1625 and 1720 and thus disseminated Swedish official ideas about witchcraft. The well-known seventeenth-century Swedish witch hunters Nils Psilander and Johan Gezelius had studied at Tartu University.

However, past assumptions that academic theology bore the main responsibility for witch hunts have proved untenable. Theological faculties did not directly influence witchcraft trials, particularly the large-scale witch hunts starting in the late sixteenth century. Previously, university statements had provided authority for witch hunters. In the *Malleus Maleficarum* (The Hammer of Witches, 1486), Heinrich Kramer (Institoris) cited the condemnation of ritual magic by the University of Paris theological faculty in 1398.

Discussion within theological faculties about the nature of witchcraft became livelier in the seventeenth century; an impressive example was the skeptical professor Adam Tanner of Ingolstadt. The second edition (1510) of Ulrich Tengler's *Layenspiegel* (A Mirror [of Law] for Laymen) clearly indicated the transmission of issues concerning witchcraft from the realm of theology to then-contemporary jurisprudence. The publisher of *Layenspiegel*, Ulrich's son Christoph

Tengler, wrote that although the Church did have a certain right to conduct witch hunts, it was not appropriate to burden the clergy with this responsibility because of the cruel punishments required by the crime of witchcraft. This was in keeping with the usual trial practice in early modern Europe. Therefore, in any discussion of the role of universities in witchcraft trials, the main focus falls upon faculties of law.

After a short overview of the establishment and spread of universities, this entry will discuss three further aspects: the integration of law faculties into the court system, the jurisdiction of universities in the matter of witchcraft, and scholarly literature written by university professors.

ESTABLISHMENT AND SPREAD OF UNIVERSITIES

The oldest European universities date from the High Middle Ages, centuries before witch hunts began. Those of Bologna and Paris were established before 1200, followed by Oxford, Cambridge, and Montpellier a short time later. Most early universities were in southern Europe; the first universities in central Europe (Prague, Vienna, Heidelberg) were established in the fourteenth century. Theology and jurisprudence, as well as medicine and philosophy, were the dominant fields at medieval universities. Important areas for the field of witchcraft research are the development of jurisprudence through the reception of Roman law and the development of the doctrine of witchcraft within theology. The work of Bologna's school of law was trailblazing, beginning with Irnerius, who revived Roman law, and Gratian, who first compiled canon law in his *Concordantia discordantium canonum* (Concord of Discordant Canons), known as the *Decretum*, around 1130 (revised 1140). Professors of civil law adapted common law (*ius commune*), while canonists concerned themselves with canon law (*ius canonicum*). Civil law concentrated mainly on interpretation of the Roman *Corpus juris civilis* (Body of Civil Law), the compilation issued in 530 by the Byzantine emperor Justinian. Criminal law did not develop until later and is often attributed to Albertus Gandinus's *Tractatus de maleficiis* (Treatise on Crimes) of 1298. Historically, researchers distinguish different epochs of scholarly jurisprudence. The glossators, whose specialty was describing and explaining Roman law texts, were active up until the time of Accursius (d. 1263). The commentators wrote long treatises on individual legal questions. In the Holy Roman Empire, in contrast to Italy and southern France, reception of Roman law did not develop fully until around 1500. At the time of the witch hunts, the *Usus modernus pandectarum* (The Modern Use of the Pandects—the *Digest*, one of the three parts of Justinian's code) prevailed, a mixture of standard Roman-Italian juristic traditions with traditional

Germanic law, for which David Mevius (1609–1660), Benedict Carpzov, and Samuel Stryk (1640–1710) are best known. In Switzerland, a main zone of witch hunting, universities played only a marginal role in the witch hunts. Only the law faculty at the University of Basel (founded in 1460) taught Roman law. The regional witch hunts in the Swiss cantons for the most part occurred without relation to scholarly discussions of witchcraft.

INTEGRATION INTO THE COURT SYSTEM

Faculties of law became involved in witchcraft trials particularly through so-called *Aktenversendung*—the practice of sending the files of a pending procedure to a legal faculty to seek advice. Beginning in the sixteenth century, *Aktenversendung* was a typical manifestation in the early modern court system and applied to both civil and criminal trials. In the Holy Roman Empire, where most witch hunts took place, *Aktenversendung* was based on two late medieval models: traditional trial procedure rooted in imperial and lay assessor courts, and Italian jurists with consultative responsibilities. Local fifteenth-century lay assessor courts usually turned for advice to another court, which was staffed by legally trained but nonacademic local dignitaries. This court then suggested a decision of the case in question, which the lower court normally accepted and pronounced as its own verdict. The scholarly-consultative activity, the second root of *Aktenversendung*, dates from fourteenth-century Italy. At the time, individuals as well as courts often consulted distinguished professors for legal advice, either generally or concerning an individual case. Unlike traditional courts, university jurists based their decisions on standard Roman law and contemporary scientific literature. Older literature falsely attributed a testimonial calling for burning witches to death to the famous fourteenth-century jurist Bartolo of Sassoferrato (d. 1337), a consultant who never actually encountered witchcraft trials.

In the Holy Roman Empire, the connection between the traditional courts and scholarly *consilia* (juridical advice) is clearly visible in Emperor Charles V's Carolina Code, the criminal-law ordinances of 1532. This code often referred explicitly to advice from legal scholars, including in article 109, sentence 2, concerning benign witchcraft. Article 219, the last clause in the Carolina Code, described whom a court should consult for advice and when. Here, imperial law differentiated between accusatory trials and inquisition trials. In accusatory trials, lower courts were either to consult higher imperial courts or to turn to their local government for legal advice. However, in inquisition trials, judges in doubt were advised to turn to a qualified faculty of law. In practice, the distinction between high courts, lay assessor courts, and law schools was minimal

by the mid-sixteenth century, as the first two were increasingly filled with university-trained legal scholars, some of whom also taught at universities. For example, Carpzov was simultaneously senior lay assessor of Leipzig, chairman of the law faculty of Leipzig's university, and a member of Leipzig's appellate court.

The integration of the universities into the court system was appropriate for several reasons. First, the empire possessed no supraregional supervisory bodies comparable to France's *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France). Second, the *Reichskammergericht* (imperial chamber court) had been forbidden to hear appeals in criminal cases by a law of the Holy Roman Empire in 1530. The nullification of verdicts and individual trial procedures was thus only possible in special circumstances, so-called trivial cases and mandate trials. Third, urban and sovereign courts often remained staffed by untrained laymen well into the early modern period. *Aktenversendung* thus involved university-educated, professional judges with individual witchcraft trials. In such proceedings, advice was given purely on the basis of a written criminal trial (*quod non est in actis non est in mundo* [what is not kept in records does not exist—Roman law]). All nonjudicial trial procedures were documented in files, which the court formally locked (called *inrotulation*) and sent to a faculty of law. There were usually at least two *Aktenversendungen* in the course of a criminal trial. The first concerned the question of whether sufficient circumstantial evidence existed to justify the use of torture. At the trial's end, jurists had to reach a final verdict and determine whether there was enough evidence to justify a severe sentence.

Written trial records and the involvement of impartial, distinguished academic jurists led to a professionalization of criminal trial procedures. Because documentation was the responsibility of lower courts, a danger existed that the defendant's defensive possibilities could be deliberately impaired. If conviction depended on the contents of documents, overly zealous judges in witchcraft trials could distort those contents to achieve their goals. Sovereigns faced another problem with *Aktenversendungen*. If foreign lawyers decided local criminal trials, a judge's duties as head of his local court could be greatly impaired. There were two possible ways to escape this situation. Sovereigns either founded their own universities or created independent public authorities or ministries of justice, which took over the task of consultation from lower courts. Thus, in 1551, the duke of Württemberg ordered that all criminal courts, when in doubt, must seek advice from the college of law in Tübingen; *Aktenversendungen* to foreign universities was prohibited.

In Sweden, the law faculty at the University of Uppsala was likewise involved with witchcraft trials. In

1672 a member of the law faculty served on a commission to investigate legal procedures a local court employed in witchcraft trials in Hälsingland.

Outside the Holy Roman Empire, *Aktenversendung* to law faculties was common. The University of Basel in the mid-seventeenth century consulted for the French-speaking canton of Vaud and demanded compliance with the *processus ordinarius* (ordinary procedure). In 1718, during the Hungarian witch hunts, the city magistrates of Nagyszeben (Hermannstadt) requested opinions of the law faculties of the universities of Vienna and Leipzig regarding the credibility of confessions extracted under torture. The Hungarian University of Nagyszombat was noticeably influenced by the doctrines of Carpzov, professor of law at Leipzig.

The practice of *Aktenversendung* did not exist in England, where legal procedures were based on common law, even though the law faculties of Oxford and Cambridge taught only Roman law. The universities' teachings therefore had limited practical relevance for witchcraft trials, although some faculty, especially in Cambridge, authored demonological works.

JURISDICTION IN WITCHCRAFT TRIALS

How much influence universities had on witch hunts remains open to controversy. Some claim that universities perpetuated witchcraft trials into the second half of the seventeenth century (Schormann 1977), but large parts of the legal community are said to have constantly demanded adherence to the *processus ordinarius*. The following differentiation is probably correct: Judgments by faculties of law always took place in certain trial situations. In every case, legal scholars answered only those questions the lower courts asked. Their decisions were based primarily on weighing circumstantial evidence to permit torture and on evaluating evidence for punishment; statements about individual aspects of witchcraft rarely appear in their opinions. Concentration on procedural law as well as on criminal law led to a further decisive criterion: Whether an individual faculty of law favored or opposed persecution depended crucially on whether its professors considered the *processus ordinarius* the relevant principle for witchcraft trials. If, instead, they followed common legal principles from Roman law, the rules designed to protect defendants could be ignored in severe criminal offenses (*in delictis atrocissimis more propter criminis enormitatem iura transgredi licet* [in atrocious crimes or on account of the enormity of the crime, it is legal to transgress the law]). This latter viewpoint had serious consequences for evaluating circumstantial evidence, particularly for determining whether a prisoner could be tortured because of indicting testimony alone. The defense possibilities of suspects also depended on whether law colleges demanded *processus ordinarius* in

full or whether witch hunters had been granted broader powers.

Further differentiation is necessary because of the large number of individual sources of law. The common criminal law teachings prevailed at universities, but because of certain clauses it contained, the Carolina Code was often considered secondary to local penal codes. In such cases, the lower courts determined the relevant legal code to be applied by the universities in reaching their decision. Different evaluations of evidence by various scholars and schools usually reflected the varying individual standards of the court of inquiry. For instance, Professor Carpzov of Leipzig considered the satanic pact worthy of the death penalty, according to electoral Saxony's 1572 constitutions. What seems like an aggravation of common legal theory and deviation from article 109, sentence 2 of the Carolina Code only proves Carpzov's connection to locally valid Saxon law.

At the time of the witch hunts, central Europe contained twenty-three universities. The decisions of several law schools in witchcraft trials are well known and seem to indicate that rulings before 1570 equated witchcraft with the concept of *maleficium* (harmful magic), which appeared in article 109, sentence 1 of the Carolina Code. Toward the end of the sixteenth century, a more elaborate concept of witchcraft gained general acceptance within German universities, even among professors, such as Johann Georg Goedelmann of Rostock, who maintained that the guidelines of the *processus ordinarius* should be adhered to even in witchcraft trials. For a full century, every legal scholar fully followed the *communis opinio* (common opinion). Christian Thomasius was the first jurist to overcome the concept that witchcraft is real—and older colleagues such as Samuel Stryk outvoted him in his university's faculty. During the main phase of the witchcraft trials, university scholars fully shared the dominant concept of *crimen magiae* (crime of magic).

In procedural questions, numerous universities upheld strict standards. The law colleges in Lutheran Rostock and Greifswald spoke out as early as the turn of the seventeenth century for maintaining the *processus ordinarius* in witchcraft trials. Not only Goedelmann but also his colleague Ernst Cothmann (d. 1624) expressly rejected Jean Bodin's proposed easing of criminal trial procedures. Beginning in 1654, the faculty of law in Catholic Mainz upheld the *processus ordinarius* in witchcraft trials, explicitly disagreeing with the looser trial procedures of canon law in cases of heresy. By then, the high point of witchcraft trials had already passed. Previously, the Mainz faculty of law—like many others—had still permitted torture based on gossip, extralegal confessions, and allegations of having attended Sabbats with other witches.

The universities of Helmstedt and Rinteln seem to have largely preferred the theory of *crimen exceptum*

(the excepted crime). At Rinteln, 347 decisions in witchcraft trials include only 19 judgments in favor of the accused. The doubts expressed by Professor Hermann Goehausen in 1630 concerning the too-generous acceptance of denunciation as evidence were not widely shared by his colleagues. At Tübingen, however, *processus ordinarius* became the general guideline in witchcraft trials after the mid-seventeenth century. Erich Mauritius (d. 1691), a professor in Tübingen at the time, showed an attitude generally critical of persecution after becoming a professor at Kiel (1665) and then assessor at the *Reichskammergericht* in 1671. Many universities also gave advice about the details of torture, for which the Carolina Code only contained a recommendation (article 58). Following Italian jurists, many universities differentiated between the threat of torture and its actual execution, which they further divided into three degrees. The questions of whether a revoked confession permitted torture to be repeated or whether particular tortures could be repeated up to three times were sharply debated. The answers depended on whether a specific faculty of law followed the *processus ordinarius* or the *crimen exceptum* theory. We must not forget that large numbers of the accused were executed despite *Aktenversendung*, although this practice probably inhibited even larger-scale persecutions. For suspects, university involvement at least gave hope of an impartial judgment.

SCHOLARLY LITERATURE

Apart from their involvement in individual witchcraft trials, universities also produced some important scholarly literature about witches, both general academic treatises, and literature oriented toward practical decision making. Both kinds of works played a central role in contemporary debate. Most major demonologists were not university professors, but scholarly treatises and manuals on witchcraft came from both Protestant and Catholic theologians. They range from the Tübingen theologian Jakob Heerbrand (d. 1600), who used the Bible to deny substantial elements of scholarly witch theory, to Cologne professor Peter Ostermann, who wrote a commentary on the Devil's mark in 1629, and they culminated in the theses of Mauritius and Thomasius. The universities' published appraisals and decisions were, however, decidedly more important for the legal process. The medieval Italian counselors had already collected their legal opinions (*consilia*), which reached a larger audience with help from the printing press. Literature oriented toward practical decision making reached its apex in the early modern era. Many professors published their own collections of decisions or published verdict collections on behalf of their colleges. Depending upon the author's reputation, his viewpoint could have notable influence on witchcraft trials. The University of Mainz, for example, referred

during a witchcraft trial in 1654 to a 1597 decision by Rostock professor Ernst Cothmann. This was no isolated case, but followed the usual practice that lawyers and universities supported their *rationes decidendi* (reason for the decision) in significant decisions with examples from previous literature containing decisions. Individual jurists could attain almost canonical authority in this way. Used regularly by universities as well as appellate courts, academic jurisprudence thus influenced various levels of the legal system during witchcraft trials.

**URBAN VIII, POPE
(1568–1644)**

The pope best remembered for persecuting Galileo had few connections with witches but many intimate dealings with learned magicians and astrologers, principally the well-known Dominican utopian Tommaso Campanella.

Born Maffeo Barberini, the future pope belonged to one of Florence's most prominent and wealthy mercantile families. Educated by the Jesuits, he attended their Roman College and studied law at Pisa. Greatly influenced by humanist thought, he developed a keen interest in history, art, and classical antiquities. Throughout his pontificate, he continued his youthful practice of devoting an hour each day to composing his own brand of Baroque poetry, in Latin, Greek, and Italian. Moreover, he developed a very strong belief in the efficacy of astrology.

Barberini's legal acuity made him a rising star within the papal Curia after 1592, and an enormous legacy from an uncle in 1600 made him wealthy. Barberini took holy orders in 1604, swiftly becoming papal nuncio in Paris. He was made cardinal in 1606 with emphatic French support. Returning to Rome in 1614, he amassed an enormous personal library and built a palatial residence that remains a Roman landmark. After an extremely acrimonious enclave, Barberini emerged as the strongest candidate and was elected pope on August 6, 1623. Significantly, he chose to name himself after the great French pope Urban II (reigned 1088–1099), who unified all of western Christendom against the Turkish invaders of the Holy Land. The new Urban VIII clearly viewed himself as a modern crusader whose mission was to heal the breach caused by the Protestant Reformation and to convert all the peoples of the world to Roman Catholicism, uniting them within one all-embracing church. A Dominican monk and magician, Tommaso Campanella, who soon came to Urban's notice, encouraged this ambitious ideal.

Astrology preoccupied the pope. He had horoscopes cast for many cardinals resident in Rome and made a habit of openly predicting the dates and circumstances

of their deaths. But Urban's Spanish foes turned this technique back on him: From 1626 onward, rival astrologers were predicting the date of the pope's demise. Consequently, he turned increasingly to Campanella's expertise in order to prolong his life. Throughout 1628 there were frequent reports of Urban VIII and Campanella meeting together in order to practice magic and necromancy. In particular, the lunar eclipses predicted for January 1628 and December 1630 were thought to pose direct threats to the pope's health and well-being. At these critical junctures, the pope confined himself in a sealed room with Campanella; they attempted to restore harmony to the heavens through elaborate rituals, sprinkling the floor with herbs and re-creating the light of the seven planets (shut out by the eclipse) with the flames of candles and torches. The pair surrounded themselves with servants whose own horoscopes were not affected by the eclipse; music was played and spirits were drunk in an attempt to stimulate the properties of the good planets (Jupiter and Venus) and dispel the effects of such hazardous ones as Mars and Saturn. Campanella and the pope relied on Neoplatonic philosophy, not unbridled superstition (Walker 1958, 207).

A relieved Urban VIII emerged unscarred after each eclipse. He was quick to employ Campanella's talents again when the son of his nephew fell seriously ill. However, the pope's favor did not ultimately help the magus in fulfilling their dream of making the Roman Church universal, especially after Campanella drove Urban to a state of rage by publishing an account of his magical pursuits in *Astrologica* at Lyons in 1629. High (learned) magic may well have been a fitting and necessary private pursuit for them, but the pope felt it was not something to be openly propagated. Indeed, Urban VIII published his own bull (*Inscrutabilis*) against astrology in 1631. In it, he specifically forbade speculation about the deaths of popes and princes and the members of their families on pain of death, damnation, and the confiscation of property.

Reassured by Campanella's rites, Urban VIII lived until July 1644, criticized mainly for indulging the breathtaking graft of his nephews. His faithful magus received permission to found a new college in Rome, the Collegio Barberino, in order to train missionaries. Few of the earnest young men schooled there knew about the secret world of magical incantations that lay behind the college's creation.

URBAN WITCHCRAFT

Although the vast majority of European witchcraft trials began in rural villages, a not insignificant share originated in cities; one even finds a few urban witch panics in places as widely separated as Arras in northern France (the mid-fifteenth-century *Vauderie*) and Salzburg (the late-seventeenth-century *Zauberer-Jackl-Prozesse* [Sorcerer-Jack-Trials]). However, trying to isolate any specifically urban dimensions within European witchcraft is an extremely difficult task.

The existence of "urban witchcraft" as a separate category cannot be assumed. But if we define witchcraft as a doctrine or system that requires both evil and benevolent witches, pivoting around the crime of *maleficium* (harmful magic), then urban and rural witchcraft might differ noticeably. When we compare rural with urban witchcraft, the scattered research about specific cities suggests the existence of a lame or abridged urban "system." In fact, we cannot tell to what extent any "natural control" (Lerner 2000) of witchcraft operated within European cities.

How should we define a city? A most ancient symbol representing it was a cross within a circle. But walls alone are an insufficient criterion, even if the feeling of safety they provided distinguished town-dwellers from peasants in Old Régime Europe. For contemporaries, the possession of specific political and economic privileges was probably more important. However, for our purpose, simple demographic factors were probably the single most important separator affecting the practices of witchcraft, because the relative anonymity of larger agglomerates of people created circumstances quite different from those of small-scale villages with respect to a neighborhood crime like *maleficium*.

A summary of the demographic pattern of early modern cities is thus indispensable. The percentage of Europeans living in cities at the end of the seventeenth century (about 15 percent) was no higher than it had been a century earlier. At the end of the sixteenth-century demographic expansion, western and central Europe were dotted with some 200 cities of over 10,000 inhabitants, a number that remained substantially unchanged a century later. Europe was also swarming with towns of only 2,000 to 3,000 inhabitants. But a significant demographic change was occurring: Larger cities grew at the expense of smaller ones. In the seventeenth century, the number of

metropolitan centers of over 100,000 inhabitants increased from eight to thirteen. Because aggregates can be misleading, we must distinguish between Mediterranean areas, where both Spain and Italy experienced a marked urban decline, and some centers in northwestern Europe, which saw demographic explosions in Paris, London, and a cluster of cities in the province of Holland.

European towns required a steady influx of peasants immigrating from the countryside throughout the preindustrial period. The half-hidden agrarian roots of early modern urban centers weakened the impact of other demographic factors. Ties of kinship and godparentage, not to mention weekly markets, often linked villagers with towns. Such short-distance migrants generally maintained significant contacts with the moods and minds of people in their home villages. But at the same time, we must also ask to what extent the impact of a new urban way of life stimulated the process of "modernization," overcoming the tyranny of traditional agrarian societies. Did a specific demographic threshold erase or erode some of the circumstances connected with a specifically neighborhood crime like *maleficium*? Were even "relatively small urban populations . . . just sufficiently mobile and anonymous to discourage the long build-up of hostility characteristic of witchcraft accusations in tight-knit rural societies" (Briggs 1996, 265)? This assertion badly needs further research, because contradictions abound.

On the one hand, there are plentiful examples in which an urban district might have created exactly the same malefic atmosphere of envy, backbiting, and calumny typical of small-scale village communities. On the other hand, why is there no trace of any large witch persecution in very large cities like Amsterdam, Hamburg, London, Vienna, Venice, Paris, or Madrid, sociological "monsters" where traditional ways of living and thinking were likely to be quickly altered and where practitioners of various types of magic proliferated? The crucial question seems to be this: At what point did early modern cities become centers of innovation and creativity, where their size and "culture" affected everyday life strongly enough to transform the attitudes of their inhabitants toward such basic issues as love, birth, and death? City-dwellers inhabited a milieu where the opportunities available for better worship, schooling, medical care, and policing made a difference. Historians have yet to ask how far such factors contributed to shaping an entirely different frame of mind, undermining a belief system that included spells and countermagic.

We take the example of Holland as a starting point. In Johann Weyer's time, the Low Countries ranked among Europe's most active witch-hunting zones. But after 1590, executions abruptly ended first in Holland, then in Utrecht, Groningen, and Gelderland (where the last

witch hunt occurred in 1603). "The Dutch *zonderweg* in witchcraft trials was celebrated early and often, centuries before such scholars as [Johan] Huizinga labelled it as one aspect of the triumph of a bourgeois spirit in the heavily-urbanized northern Netherlands" (Monter 2002, 35). Although Huizinga has followers, Marijke Gijswijt-Hofstra has questioned the idea of considering Holland's high-seventeenth-century prosperity, and especially the predominance of towns over countryside and the victory of an urban culture, as the crucial factors in ending witchcraft trials. It is certainly an intricate task to verify how different social classes thought about witchcraft over time. But if the central focus of the historian "is on the evolving conception of witchcraft of various socio-cultural groups and their interactions" (Gijswijt-Hofstra 1991, 9), then the impact of a possible "modernizing" urban factor cannot be dismissed so easily. For instance, using sources from seven Dutch towns, Hans de Waardt has shown that the belief in witchcraft could still be found among broad strata of Dutch society, although certain categories of people had stopped participating in the discourse about witchcraft. For example, university-trained doctors and lawyers admitted that witchcraft was possible, but in the course of the seventeenth century, they became less inclined to recognize it as a cause of illnesses. It also seems that deficiencies in food production were no longer associated with *maleficium*, a change attributed to economic development. The Dutch area also seems to show a connection between a decline in witchcraft accusations and a rise in slander cases for being called a witch (Waardt 1991).

Unfortunately, no other European state enjoyed the stimulating Dutch coincidence of social, economic, and cultural primacy with an early dwindling away of witchcraft prosecution. Therefore, the workability of the impact of an urban factor should be approached randomly, guided by H. C. Erik Midelfort's now-venerable methodological remark that witchcraft cannot be considered a monolith. William Monter's equally venerable Genevan evidence serves the purpose. Demonstrating that villagers dwelling near Geneva accounted for about half of all witches tried in the city (a common feature: for example, a large number of Scottish cases said to come from Aberdeen, Dumfries, Stirling, or Edinburgh were merely tried there), he argued that "in Geneva, as in many other places, witchcraft was not static but dynamic. The typical form of this crime changed considerably between 1527 and 1652, [mostly] in the form of the witch's *maleficia*" (Monter 1976, 56). The changes consisted mostly in simplifications that eliminated such details as orgies at Sabbats, while Geneva's most common *maleficium* after 1605 became demonic possession, a phenomenon that occurred first in the city itself.

The phenomenon of demonic possession was not unique to Geneva. Though no general synthesis of

witchcraft in France has yet replaced Robert Mandrou's anticipatory *Magistrates et sorciers en France au XVIIe siècle* (1968), the phenomenon of urban possession that he emphasized remains a relevant French feature. Cases of collective possession took place mostly in nunneries and hospitals. Demoniacs, mostly women and children, blamed witches as the cause of their possession and attracted crowds of spectators. The cases of Loudun and Aix spread across the kingdom and became food for intellectual debate; however, in the capital at Paris, highly publicized exorcisms like that of Marthe Brossier in 1599 apparently failed to convince. Although the impact of such widely publicized urban exorcisms on the popular classes is difficult to assess, in the short run we should probably view them as a strong antidote to urban "modernization." The actual diffusion of French exorcisms is difficult to reconstruct because, unlike witchcraft trials, they rarely left written traces (Walker 1981). This remark applies equally to seventeenth-century Italy, where this phenomenon was certainly rife but where we presently have no way to assess its relative urban-versus-rural intensity beyond copying the assertion, referring mostly to sixteenth-century Germany, that "the Devil was equally active in towns and in the countryside" (Midelfort 1989, 120).

It has been maintained that "First or reasons which remain obscure, the urban milieu does not seem to have generated many witchcraft cases in most parts of Europe. The obvious exceptions are the pandemics which afflicted some German towns and the more routine persecutions found in parts of the southern Netherlands, the latter an exceptionally urbanized region suffering from severe economic dislocation" (Briggs 1996, 305). Witchcraft in early modern Germany, even more than elsewhere, was an unstable mixture of maleficent magic and devil worship. Because the roles played by these two components differed, extracting any particularly urban trends from studies that almost never addressed this problem is no easy task, both despite and because of the impressive proliferation in recent German witchcraft research. For example, if the cumulative demonological concept of witchcraft was certainly strongly contested in southwestern and Bavarian areas, as Midelfort and Wolfgang Behringer have demonstrated, was it, after all, "principally a construction which was (or could be) called upon during judicial interrogations, but which did not play a significant role in the context of daily life" (Gijswijt-Hofstra 1999, 164)? We know that many of Germany's numerous free cities (for example, Nördlingen, Rottweil) conducted relatively frequent witchcraft trials, and some of the largest and most important among them (for example, Augsburg, Strasbourg) continued to execute witches long after 1650. But we lack specific research about whether such modernizing factors as better schooling, worship,

medical care, or policing affected German urban milieus sooner and more strongly than rural zones.

For instance, granted that accusations of killing livestock or raising hailstorms through witchcraft were extremely rare in urban environments, it could be meaningful to compare data linking charges of witchcraft with infanticide in urban and rural settings. It has been shown recently that the judicial reclassification of charges against accused witches "involved the judicial abandonment of the general word for witchcraft (*hexerei, sorcellerie, brujeria, stregoneria, toverij, trolldom, hekseri, trolldom, noitus*) and its replacement with more specific terms" (Levack 1995, 81). A clear illustration of this "modernization" of witchcraft concerns infant mortality. Between 1550 and 1750, did a greater proportion of town-dwellers view the sudden and strange death of a baby as a less reasonable cause for charging a suspected person with *maleficium*? We note that "the central government of Württemberg in the eighteenth century dealt repeatedly with cases of simple poisoning. Similarly, infanticide came to be detached from its association with witchcraft" (Midelfort 1972, 83). But more information of this kind is needed in order to assess whether such "modernization" was more relevant in an urban milieu—where, admittedly, infant mortality was also higher. Similarly, in the late-seventeenth-century German cities, it became "increasingly common for persons to be found guilty of casting charms (*Segensprechen*), fortune telling (*Wahrsagen*), and magical treasure hunting (*Schatzgräberei*)" rather than being accused of devil worship (*ibid.*, 82). Because such magical activities are known to be equally widespread in villages, such a trend might appear to confirm the "simplification" theory already noted in Geneva. We know that in Augsburg, one of Germany's largest imperial free cities and a place where trials for witchcraft remained sporadic, a tycoon like Jacob Fugger dabbled in crystal-ball gazing, but we have no idea how widespread this recourse to supernatural economic information was among his fellow urban merchants.

In regards to Poland, further research may clarify whether any particular urban tonality lies hidden behind the statistic that 19 percent of the people accused of witchcraft lived in urban areas in a land where city-dwellers comprised only 5 percent of the population.

In Mediterranean cities, the activities of revealing the future, telling fortunes, finding lost objects, and attracting lovers were rife. Love magic was a typically urban phenomenon in Castile and southern Spain, as in larger Italian towns. Unfortunately, except for Venice, no thorough research on urban witchcraft has been done to date. To generalize from a single example is always a risky procedure, and in the case of Venice, these dangers multiply because the city was so gigantic (140,000 inhabitants), because it was so extraordinarily

cosmopolitan, and not least because its policy fostered a specific type of inquisition. Still, the wide range of the available information tempts one into venturing a few speculations. As the papal nuncio reported in 1580, these Venetian cases “did not arise from any inclination towards heresy; rather they were directed towards two ends, love and gain, which wield great power over empty-headed people” (Monter 2002, 47). Infant deaths and deliberately diabolical forms of witchcraft attracted scant attention here. Instead, Venetian witchcraft activity centered on money. Necromancy concentrated on treasure hunting; conjuration, divination, and many charms and incantations were employed for gambling (Martin 1989). About 70 percent of the persons accused of witchcraft were women, not infrequently courtesans, while among the men, some 40 percent of the accused belonged to the clergy. Charms and incantations for love magic were mostly practiced by women, either as a trade or by unmarried or immigrant women. Though the city must be seen as a sprawling collection of smaller communities likely to reproduce the neighborhood crimes of rural environments, the extent to which superstitious remedies were practiced was perhaps limited both by the concentration of opportunities for medical care in Venice and by agencies of control (the Inquisition, police); one provided alternatives for witchcraft, the other brakes upon it.

How far this possible Venetian evolutionary pattern could be extended to other Italian cities remains an open question; sheer lack of information makes it impossible to say anything about long-term changes. A similar profile of illicit magic probably proliferated between 1580 and 1660 in every major Italian city. We know that the number of trials conducted in Reggio Emilia for such illicit and diabolical magic in the decade 1595–1604 surpassed 200. How many of those accused lived in cities? Wherever witchcraft trial papers have survived and a concentration of urban opportunities such as those described above was present, it is worth trying comparisons. The interpretative speculation suggested for Venice seems to find some confirmation at Siena, where a long series of trials suggest that town-dwellers stopped accusing witches of causing strange illnesses or deaths of infants a half century sooner than did the *contado* (peasantry). Could these remarks be extended to all Mediterranean cities?

Most recently, this Venetian evidence has produced the hypothesis that the word “witch” was and is an interpretive category that may not be useful and could, in fact, obscure historical investigation and understanding. The noun *strega* is rarely used in the trials surveyed and never by the prosecutor or defendant: it designates a trade, like “baker” or “prostitute,” not an identity. It is vocational, occasional, and external, not an internal, dominant, and determining characteristic. The witch is an identity constructed, not even by contemporaries,

but by subsequent historians. A career option rather than a fate or destiny, witchcraft may be considered as having a place alongside labor and family studies, rather than being an exotic or aberrant growth of the social body (Scully 1995, 865, 857).

Such recent opinions evoke echoes of Jacob Burckhardt’s nineteenth-century suggestion that the Italian witch, like her famous fifteenth-century Spanish literary counterpart, La Celestina, practiced a real job and needed money and mostly self-awareness. Sometimes ancient insights still hold a measure of truth.

V

VADUZ, COUNTY OF

In the early modern period, today's principality of Liechtenstein consisted of the county of Vaduz and the dominion of Schellenberg, both governed in personal union since 1507 first by the counts of Sulz and later by the counts of Hohenems. Vaduz and Schellenberg experienced intense witchcraft prosecutions; those of 1679 and 1680 rank among the most extensive witch hunts in German-speaking countries in the late seventeenth century.

As in many other nearby regions, numerous witchcraft trials occurred in both small territories (probably containing no more than 5,000 people together) from 1595 to 1600, again in the 1630s, from 1648 to 1651, in the mid-1660s, and from 1678 to 1680. The first episode claimed between ten and twenty victims; the second, in the 1630s, led to some arrests but no death sentences. The quantitative peak of witch prosecution in Vaduz and Schellenberg was reached from 1648 to 1651. Several series of trials, emphatically demanded by the territorial estates, claimed about 100 casualties. It seems that the prosecutions finally stopped when the accusations of witchcraft reached the upper strata of local society. Approximately fifteen years later, in the mid-1660s, further witchcraft trials took place, causing the execution of at least nine people.

These and the next prosecutions, at the beginning of 1678, are poorly documented. More exact source material exists for the last phase of witch hunting, in 1679 and 1680. In spring 1679, the *Landvogt* (governor), Dr. Romaricus Prügler, conducted witchcraft trials in Vaduz that resulted in the execution of twenty people. Although the court, in accordance with the law, had submitted its documents of inquisition to a lawyer, the trials soon encountered broad resistance. Because of his assumed abuse of authority, the *Landvogt* made a spectacular escape. The conflict between the representatives of the people and the count was then settled by an arrangement whereby the deeply indebted count left his income to the estates in return for the payment of interest on their debts and repayment of the credits they had taken for him. Henceforth, the representatives of the people would also receive the income from further witchcraft trials. Under these conditions, former critics of the trials became proponents of fresh prosecutions.

So in 1680, the estates made no protest against the trials under a new *Landvogt*, Joseph Andreas Walser, which claimed twenty-five victims altogether.

A first step to prevent further witchcraft trials was taken by Maria Eberlin of Planken after she escaped from the castle of Vaduz, where she had been imprisoned on the charge of assumed witchcraft, and found assistance from a notary in Feldkirch, in Habsburg Vorarlberg. Soon thereafter the parish priest of Triesen, Valentin von Kriss, also argued against witchcraft trials. However, his objections saved only one woman from burning, in December 1680; others were executed. Shortly afterward, the priest and five other people, who had fled from the county of Vaduz because of the witch prosecutions, contacted the Holy Roman Emperor in Vienna through the Habsburg government at Innsbruck. Their petitions incriminated the count, already in a precarious political situation. Soon he was forbidden to continue the inquisitions and trials. A commission appointed by the emperor sent the Vaduz documents to the law faculty of the University of Salzburg, which declared in its report that all cases from 1679 and 1680 were to be regarded as illegal and therefore invalid.

Nullification of the judgments and prohibition of further trials did little to resolve the conflict between supporters and opponents of witch persecutions at Vaduz. Although no new legal proceedings were begun against witches, suspicion and agitation persisted. Local conflicts continued generations-long enmities between the families of the victims and those of former prosecutors or informers, who were ostracized as *Tobelhocker* (people banished into a wild ravine) until the end of the twentieth century. Altogether, witch hunting in the regions that became Liechtenstein after 1719 claimed about 200 casualties.

VALAIS

Like other regions of the western Alps, such as the duchy of Savoy, the Dauphiné, and the diocese of Lausanne, Valais was one of the first regions where persecutions started as the “new” heresy of the witches took form around 1430. The present canton of Valais, located in the southwestern Swiss Alps, is bilingual (called Valais in French, Wallis in German). Beginning in the tenth century, it was a diocese led by the bishop of Sion, who was also the temporal lord (the count) of Haut-Valais (Upper Valais). He led an assembly, or diet, representing the nobility, the clergy, and the rural communities, or *Dizains*. In the west, Bas-Valais (Lower Valais) belonged to the territory of the duke of Savoy. In episcopal Valais, the repression of sorcerers or witches was mostly handled by secular courts controlled by the bishop, whereas in the Savoyard part, Dominican inquisitors judged heretics. At the beginning of the fifteenth century, the Valais was already well Christianized. Like the nearby Simmental valley, the Valais was highly developed economically, with some political tensions (Borst 1988, 267–270).

HANS FRÜND'S REPORT AND THE FIRST WITCH HUNTS

The first important testimony about witchcraft and diabolical sects in Valais comes from the chronicler Hans Fründ of Lucerne, who, around 1430, reported the first persecution of witches, which had taken place in Valais from 1428 to 1430. He gave a detailed account of how witches and sorcerers gathered around an evil spirit—one of the first descriptions of the witches' Sabbat. According to him, these *sortilegi* (sorcerers), both men and women, were discovered first in 1428 in the Val d'Anniviers and in the Val d'Hérens, two French-speaking valleys of Lower Valais, and then in the eastern, German-speaking regions of Upper Valais. Fründ claimed to have based his account on trial records.

Part of those proceedings and related evidence (local accounts, death sentences, and so on) have been found in the local archives by Chantal Ammann-Doubliez (Fründ 1999, 23–98). Her evidence confirms that this first witch persecution began in 1428 and lasted until 1436 throughout all of Valais, leading to the death of nearly 100 men and women. Fründ did not invent anything; for example, in 1428–1429, Agnès Lombarde and Pierre Chedal were accused, respectively, of being familiar with wolves and of riding on their backs, exactly as Fründ had said (ibid. 86–89).

During this persecution, local assemblies decreed rules for judicial procedure in cases of witchcraft, specifying the sharing of jurisdiction among various courts and authorities. In 1428 in Loèche (Leuk), the Patriots (that is, the diet) defined how to handle denunciations or specific accusations, how to open a case, when and how torture was to be used, how confiscated goods were to be shared, and so on. Communal statutes of Moerel in 1430 and of Rarogne in 1434 specified further rules of procedure. Witchcraft gradually came to be seen as a collective crime, perpetrated by a sect. Consequently, some adaptation of traditional legislation was necessary. However, during the witchcraft trials, frequent conflicts of jurisdiction occurred between the prince-bishop of Sion or his bailiff and the mayors or the local communities, each claiming competence over the proceedings and the right to confiscate the goods of the culprits. Witchcraft trials played a major role in the competition for both judicial and political power, above and beyond economic interests.

The novel phenomenon of the witch hunts in Valais progressively spread throughout Switzerland. Sometime between 1444 and 1450, Felix Hemmerlin (Malleolus), a canon from Zurich, wrote in his *Dialogus de nobilitate et rusticitate* (Dialogue Between a Noble and a Peasant) that the diocese of Sion was an accursed land, where a great many people, both men and women but mostly rural people, had been burned after publicly confessing their crimes (Hansen 1901, 111).

1450–1500: PROCEEDINGS AND CONFLICTS OF JURISDICTION

After the first Valais witch hunt of 1428–1436, persecutions continued in the second half of the fifteenth century; more than fifty cases are presently known. Among these is that of Françoise Bonvin, a rich widow who was accused of witchcraft in the spring of 1467. Her lawyer, Heyno Am Troyen, petitioned the prince-bishop of Valais, Walter Supersaxo (ruled 1457–1482). Using a list of fourteen questions, Troyen interrogated sixty-seven witnesses in order to establish the innocence and respectability of his client, who had been denounced by three “sorcerers” who had been burned a few months before. This petition offers a highly skeptical contemporary view of the witchcraft theory propagated by the local courts and authorities (Strobino 1996). In 1484, the next prince-bishop of Sion, Jost de Silenen (ruled 1482–1490), started proceedings against Peter Eschiller, who had fled Valais a few years before in order to escape arrest at a time when his predecessor, Supersaxo, was leading a witch hunt. When Eschiller returned home, he was incarcerated and questioned by the prince-bishop of Sion, acting simultaneously as inquisitor and overlord (with *merum et mixtum imperium*, “mere and mixed power”—the highest kind of jurisdiction and competence

in medieval Roman law). At the end of the inquisitorial procedure, after being forced to confess his participation in many diabolical “synagogues,” Eschiller was handed over to the secular arm and burned at the stake (Ammann and Chantal 1996).

In this period, the prince-bishops of Sion increasingly claimed jurisdiction over witchcraft trials, which had previously been handled by lay courts, leading to numerous conflicts. Around 1488, a general inquiry into the beneficiaries of the culprits’ goods during the fifteenth century showed some abuses in jurisdictional rights.

WITCH HUNT FROM THE SIXTEENTH TO THE EIGHTEENTH CENTURIES

Although at present the historical research remains very incomplete for this period, it appears that a reduction in the witch craze occurred in sixteenth-century Valais. Repression was no longer a collective phenomenon, and there were no further massive trials like those of the fifteenth century. In the seventeenth century, witchcraft trials resumed, perhaps because of the troubles caused by the Reformation, which tried to establish itself in Valais, and maybe sparked by serious outbreaks of the plague. Between 1590 and 1654, in Lower Valais, the lands governed by the abbey of St. Maurice held witchcraft trials with more than forty victims. The synodal constitutions of the diocese of Sion, promulgated in 1626 and published in 1635, explicitly forbade all forms of superstitions and magic and urged the priests to control the faith of their flock. The last sorcerers convicted in Valais were burned at Bagnes in 1730. Other proceedings were reopened afterward, but none ended with a death sentence. Nevertheless, in 1790 the penal code of Lower Valais still contained a chapter punishing magic spells and still followed the Carolina Code, the imperial criminal code of 1532 (Bertrand 1920–1921, 180–194).

VALENCIA, PEDRO DE (1555–1620)

Valencia was a Spanish humanist whose skeptical commentary on the confessions of witches at the *auto de fe* (act of faith) in Logroño in 1610, several of whom had been executed, helped reestablish the Spanish Inquisition’s almost century-old practice of not burning witches.

From a wealthy family in Zafra in southern Spain, Pedro de Valencia studied with the Jesuits at Cordoba, but when he matriculated in theology at the same university to become a priest, his parents sent him to Salamanca, where he studied classical languages and literature. He worked closely with the priest and philologist Benito Arias Montano, who taught him Hebrew and biblical exegesis. At the age of thirty-two, he was granted a papal dispensation to marry a cousin, and they had four children. In 1607 he was appointed royal historiographer (*cronista*) by Philip III, and he later became a censor at the Council of Castile. In this capacity, he asked the Spanish Inquisitor General in 1611 for permission to comment on a written account of the confessions of the witches at an *auto de fe* in the northern Spanish town of Logroño the previous year, where several of them had been burned. The account was published in 1611 by the Logroño printer Juan de Mongastón and described the rituals of the abominable witch sect down to the minutest detail. The Inquisitor General not only granted Valencia his permission but explicitly ordered him to offer his comments.

The learned humanist called his *Discurso acerca de los cuentos de las brujas* (Concerning the Tales of the Witches); he commented on the printed account and criticized the Inquisition for allowing this matter to become public knowledge. For, as he argued in the “First Discourse of Pedro de Valencia,”

although on the whole it must be assumed that the witches have confessed to the truth, some of the

things they have admitted are so improbable that many people will refuse to believe them and instead would consider the whole story to be something the witches have dreamed up. For such things have never been heard of before, except in poems and fairy tales [*libros fabulosos*] which are written to entertain and terrify children and simple folk. (Valencia 1997, 257)

In his analysis of the printed account, Valencia tried to view the witches' Sabbath in the context of the history of religion, pharmacology, and theology. He posited three hypotheses: (1) The witch meetings took place in reality, and the participants abandoned themselves to frivolous and depraved activities. The journey to the Sabbath was made on foot, and the Devil was only one of the participants disguised with horns and a gruesome mask. In this guise he had intercourse with the women, either in the normal fashion or with the use of an artificial phallus. (2) The meetings took place in dreams. The witches anointed themselves with a certain kind of ointment in order to fly to the Sabbath, but they did not really go anywhere. Instead they fell into a deep sleep during which the Devil made them experience the delights of the Sabbath in dreams. He saw to it that the individual dreams corresponded to one another, so that when the witches awoke they were convinced that what they had experienced had actually happened. It was even possible, added Valencia, that the dream experiences were caused entirely by the ointment, which affected everyone in the same way so that their dreams agreed and did not need to be coordinated by the Devil. (3) The Devil sometimes transported people to a Sabbath, so that they were present there in person, and at other times he deceived them and caused them to dream the whole experience.

Valencia discarded the first hypothesis because he considered it impossible to conceal an activity involving so many people. Nor could he accept the third hypothesis, which was generally accepted among theologians: that the Devil sometimes took people to the Sabbath body and soul, because the same theologians asserted that this happened extremely rarely, whereas the Sabbath journeys in this specific case had taken place several times a week. Valencia therefore ended up with a compromise between the second and third hypothesis: The Sabbath was an illusion produced either by the witch's ointment or by the Devil, but in either case it was a dream phenomenon. His long discourse to the Inquisitor General ended with the recommendation that in every concrete witch case, it was always necessary to search for a palpable corpus delicti in order to ensure that no person was sentenced for actions or injuries that had never been committed or that could be explained as natural occurrences or accidental misfortunes.

Valencia's prudent *discurso* remained unprinted until the twentieth century, but it circulated in manuscript within the closed circle of the Holy Office.

VALLÉES, MARIE DES (1590–1656)

The so-called saint of Coutances, Vallées was a charismatic Norman laywoman who experienced her lifelong possession by demons as a sign of divine favor.

Marie des Vallées was born into a peasant family in Saint-Sauveur-Lendelin, in the diocese of Coutances in western Normandy. As a teenager she experienced the symptoms of demonic possession, related to sexual attraction to a young man. Her state of possession lasted for over forty years, during which time she developed her own brand of holiness, which emphasized the virtue to be found in the pains of possession. She became known as a local visionary, miracle worker, and mystic. Vallées never aspired to a life in a religious order and spent most of her adult life as a housekeeper for two priests. She is widely cited as an influence on the reformer St. Jean Eudes.

Marie des Vallées's father died when she was twelve. As a teenager, Marie left her mother and violent stepfather to live as a domestic. She began to experience the symptoms of possession by demons in 1609, after a passing encounter with a young man on a religious holiday. She suffered violent physical contortions, wailing, and—a classic sign of possession—an inability to fulfill her devotional duties. In 1612, after three years during which Vallées said she did not sleep, relatives took her to the bishop of Coutances. But his exorcisms did not deliver her. In 1614 Vallées accused a nobleman (not the original suitor from 1609) of causing her continued afflictions by demons. He in turn reputedly had her arrested as a witch. She came to interpret the injustice of the accusation, and her pain when being tested for physical indices of witchcraft, as part of a martyrdom planned for her by devils.

Unlike such prominent demonically possessed *dévote* (devout, a Catholic known for great piety and

anti-Protestantism) noblewomen as Jeanne des Anges or Elisabeth de Ranfaing, Vallées never tried to distance herself from her initial state of possession. Instead, she absorbed her possessed state into a more or less routinized alternative form of devotional life. In particular, her suffering whenever demons kept her from confession and Communion became, paradoxically, the source of her greatest claim to sanctity. She did not take Communion or confess for over thirty years, remaining possessed from 1609 until 1655, one year before her death. Vallées's apparent decision to avoid the Church's traditional channels of grace smacked of spiritual arrogance, particularly given her peasant origins, and her distance from the sacraments and the ministrations of the Catholic clergy became a source of vulnerability. In 1651, she faced a tribunal of local clergy, who suspected that she had been deceived by the Devil; they ordered her to comply with the requirements of the Church. After her death in 1656, one of the same priests continued to attack her conduct, trying to prevent others from following her example and stifling a thaumaturgic cult that had developed around her. He also wondered whether her devil had ever left her, which implied that possession was a diminished rather than an elevated spiritual state.

Notwithstanding the hostility she sometimes faced, Vallées was consulted by members of Normandy's reforming religious elite: Her close friends included *dévo*t nobleman Baron Gaston de Renty and Jean de Bernières, and she is particularly remembered as the friend and inspiration of St. Jean Eudes, founder of the Congregation of Jesus and Mary (the Eudists). Her own spiritual influences included Angela of Foligno, Benet of Canfield, St. Teresa of Avila, and the Jesuit Pierre Coton, whose *Occupation Intérieure* (Inner Pursuit, 1608) influenced her controversial choice to "exchange her will" (as she described it) with that of God in order to avoid sin. Renty and Eudes each wrote biographies of her, based on their conversations with her.

Almost twenty years after her death, enemies of Eudes used his association with Vallées to undermine his credibility, implying she had been tainted with witchcraft. Eudes defended Vallées, replying that it was no crime for her to have been possessed. Investigations in 1869 preceding Eudes's canonization in 1925 considered his relations with Vallées and clearly found in their favor, placing Vallées among the significant woman mystics of her era.

VAMPIRE

Belief in vampires blood-sucking demons, still survives in some areas and in some modern ritual practices, particularly in southeastern Europe. Words for "vampire" exist in Polish (*wampir*, *wapierz*, *upiór*), Czech (*upír*), Ukrainian (*opyriaka*), Bulgarian (*upír*), and Albanian (*dhampir*); words originally denoting werewolves in southern Slavic languages (*vukodlak*, *vrkolak*, *valkodlak*), Greek (*vrkolakas*), or Albanian (*vrvollak*) have come to signify primarily vampires in modern times. Among Slavic peoples, traces of the vampire concept have existed since the Middle Ages, and the concept probably spread to their neighbors. Following fourteenth-century Polish, Moravian, and Serbian vampire cases came vampire trials in Russia, various southern Slavic regions, Albania, Silesia, Germany, Armenia, and Greece.

The shared characteristic of all variants of vampires is their aggressive behavior, especially their practice of sucking blood, bringing sickness or death to the victim. The vampire usually attacks a local community (family, tribe, or village); its victim can be a single person, a whole family, sometimes even an entire village (in the seventeenth and eighteenth centuries, epidemics were often considered consequences of the action of vampires). Its two main subtypes are a living person (a vampire since birth through inheritance) and a corpse rising from its grave. Living vampires attack either personally or (in archaic variants) through a spiritual double separated from the body; as such, they can also take animal form.

Notions of corpses rising from their grave derive from the idea that the earth rejects certain dead bodies, which do not perish. These dead bodies, which retain their vital fluids and do not dry out, are revived (usually forty days after burial) either by the dead person's soul, which lingers among the community of the living, or by the Devil. Because this "dead vampire" appears in formal variants similar to living ones and their activities are identical, the two types seem interrelated. Both Slavic and Romanian people believe that a person who is a vampire when alive will remain a vampire after death.

Beliefs and rituals related to vampires seem quite homogenous throughout eastern and southeastern Europe wherever vampire belief has remained intense in modern times. Marginal people (the illegitimate, those conceived on feast days, people excluded by the community or excommunicated by the Church) become vampires, as do dead people without clear

status in the otherworld (those who died a violent death, who remained unburied, or who died unbaptized or excommunicated). If an animal walks across a corpse before burial, the dead person will also become a vampire.

Some antivampire rites try to prevent a person from becoming a vampire after death (this applies particularly to people suspected of being vampires while alive). The usual procedure is to guard the corpse until burial, placing sanctified objects in its body crevices (to prevent the Devil from inhabiting it). In many places, people customarily protectively “fence in” a dying person with lighted sacred candles or place an iron object on the body or in the coffin. Such practices as cutting the sinews or piercing the heart (or nailing the body to the ground by a wooden pole), as well as that of laying people face down in the coffin, occurred during the burial of people suspected of being vampires during their lifetime.

Another large group of antivampire rituals of the past tried to render dead vampires harmless. According to vampire trials that became widely known, suspicion of vampirism peaked after epidemics or other serial deaths. Antivampire rituals responded by exhuming the corpse of a suspected vampire, mutilating its body, piercing its heart, and finally burning the corpse and reburying it, thus completing the death of a body that had not “fully” died. According to early data, the Pravoslav church willingly cooperated in reburying such corpses as well as resanctifying both the graves and the graveyard, until nineteenth- and twentieth-century debates about handling cases of suspected vampirism ended with prohibitions. In the Balkans, the Serbs have preserved a number of church regulations for curbing antivampire rituals into the nineteenth and twentieth centuries. In cases of suspected vampirism, Bulgarian and Macedonian villages frequently used the services of vampire-seers, who could see and chase away vampires because they were born on a Saturday.

Beginning in early modern times, vampire belief expanded rapidly, particularly in southeastern Europe, transforming figures of popular beliefs not previously associated with vampirism. This expansion was related to the demonization of belief in ghosts, witches, and werewolves. The great affinity between these figures of popular belief and vampires had the effect of coloring belief systems, particularly in southeastern Europe. Death demons and “pressing” night-demons known as witches, werewolves, and the unbaptized demons of *mora* all assumed vampire traits; this is why words originally denoting werewolves in southern Slavic languages, Greek, or Albanian have come to signify primarily vampires in modern times. Similarly, modern Polish *strzyga* and Romanian *strigoi* mean both “vampire” and “witch”

(with werewolf characteristics). Throughout eastern Europe we find close connections between vampirism and witchcraft.

Vampire belief sometimes played a similar social role to that of witchcraft cases in attributing responsibility for unexplained misfortunes. By the late eighteenth century, Hungary and particularly Transylvania had become notorious throughout central Europe for their vampirism. Romantic novels, particularly Bram Stoker’s *Dracula*, reinforced Transylvania’s association with vampirism. The most notorious cases occurred not among Hungarians, but among the Serbian, Romanian, and Ruthenian population of the Austro-Hungarian Empire, in connection with the great epidemics of the mid-eighteenth century. Holy Roman Empress Maria Theresa ordered investigations, while the press spread the fear of vampires to western Europe (Calmet 1751). After the persecution of witches had ended, “vampire-epidemics” burst out precisely in reaction to Enlightenment rationalism exemplified in medical and scientific literature (for example, by Maria Theresa’s Dutch physician, Gerard van Swieten) and the consequent prohibitions of Habsburg rulers.

VAUD, PAYS DE

The heartland of French-speaking Switzerland, the Pays de Vaud was not only the scene of some of Europe's earliest witchcraft trials, but also one of the regions where witch persecutions were most intense in early modern Europe. The best estimate is that at least 1,700 witches were executed here over the course of about 150 years, in a population estimated in a 1558–1559 census to have been between 70,000 and 80,000. On a per capita basis, nowhere else in Protestant Europe were anywhere near this many witches tried and executed. Until about 1680, when the trials stopped, there were continual small-scale panics, which resulted in up to seventy-four people being sentenced to death in 1599. There were several smaller peaks, with fifty or more witchcraft executions per year, between 1580 and 1665, for which data are available (Kamber 1998, 249).

A peculiarity of the witchcraft phenomenon in the Pays de Vaud was the high rate of men sentenced, amounting to one-third of all witchcraft cases. The most frequent explanation offered relates to the fact that in the Pays de Vaud, the persecution of witches started with the Dominican Inquisition well before 1450, a time when the witch stereotype was not yet clearly dissociated from the archetypical heretic, who was more often male than female.

A FRAGMENTED JUDICIAL FRAMEWORK

During the ancien régime, the Pays de Vaud consisted of the old Savoyard possessions north of Lake Geneva and the lands of the former prince-bishopric of Lausanne, both of which came under the rule of the city-state of Bern after a short military campaign in 1536. In the same year, Bern forcibly introduced the Reformation. Bernese rule also led to an administrative and judicial reorganization of the Pays de Vaud. The degree of interference in judicial matters, however, varied. Possessions that had been ruled directly by the duke of Savoy or the prince-bishop of Lausanne were administered by the Bernese *baillis* (bailiffs) and their local castellans; however, Savoyard vassals accepting Bernese overlordship retained their judicial prerogatives, including that of high justice.

The consequent atomization of high justice provides a key factor for understanding the remarkably high intensity of witch hunting in the Pays de Vaud: Between 1581 and 1620, there were no less than ninety-one different courts sentencing suspected witches to death (Kamber 1982, 22–23). As suggested for the village of Gollion during the 1620s (Taric Zumsteg 2000, 88–89), it can be assumed that witchcraft trials were instrumental in firmly demonstrating a seigneur's judicial rights when others contested them. Similar

coincidences between witch hunting and unsettled rights had preceded the Bernese conquest: In Dommartin in the 1520s, for instance, they were concomitant with the retreat of the Dominican Inquisition (Choffat 1989, 145–164).

In this context, one question requires further research: whether and to what extent witch hunting was also instrumentalized by both the local seigneurs and the Bernese authorities in the context of the centralization of jurisdictional matters. In fact, *Leurs Excellences de Berne* (the city fathers of Bern), already alarmed by the number of executions in their newly acquired possessions, published a mandate in 1543 forbidding any of their vassals to execute a person for witchcraft before the sentence had been ratified by the city council. Two years later, this measure was extended to all capital punishments in the Pays de Vaud (Von der Mühl 1960, 66). Accordingly, the Bernese council registered all death warrants for witchcraft in Bern's French-speaking territories. In spite of these steps, the rate of death penalties remained high, because Bern rarely overturned them. Peter Kamber counted about 1,700 death sentences between 1580 and 1655 (Kamber 1998, 249). He based his research on the short entries in the city of Bern's records, the *Ratsmanuale*, which are often our only available source, as transcripts of trials are comparatively rare.

Further attempts to reduce the ongoing witch persecutions were made in 1600, 1609, 1616, 1634, 1651–1652, and 1664. Without denying the existence of witchcraft, the authorities tried to check the proliferation of denunciations and to regulate the use of torture. Yet these measures had almost no noticeable effect.

THE CONJUNCTURE OF PERSECUTION

Before the persecution ended around 1680, the Pays de Vaud experienced endemic witch hunting with numerous peaks. If one were to graph the numbers of witchcraft trials, the high points would coincide with rising prices and plague years, when lingering social tensions culminated in specific accusations. The year the persecution reached its climax, 1599, when seventy-four people were burned as witches, was also a plague year in the Pays de Vaud. In 1629 and 1630, when forty and sixty-three putative witches were burnt, both plague and an economical crisis were raging at the same time (Kamber 1998, 248–252). By contrast, the repeated threat of war against the duke of Savoy and the ensuing mobilizations resulted each time in a decline in the number of trials (Kamber 1982, 27).

ALLEGED CRIMES

Unlike the medieval persecution in the diocese of Lausanne, early modern witch hunts in the Pays de Vaud have not yet received a thorough microanalysis,

except for a recent study about the village of Gollion (Taric Zumsteg 2000). That study showed that the stereotype of the witch, as it had been inherited from the fifteenth century, survived with minor changes into the first half of the seventeenth century. Manifestly new developments included the insistence on the Devil's mark, echoing Protestant preoccupation with the diabolical pact, and the sober, almost sanitized descriptions of the Sabbat, which contrast with the lurid accounts of earlier trials. In Gollion at least, the Sabbat was merely an occasion for nocturnal singing and dancing, a fact that should be seen in the context of the strenuous attempts by Reformed clergymen to ban such forms of popular entertainment. Throughout the entire period, we find great importance placed on evil spells against people or livestock and a particular terror of alleged spreaders of the plague (Taric Zumsteg 2000, 126–146).

VAUDOIS (WALDENSIANS)

The question of how Waldensians became witches has long interested scholars. Although it has not played a prominent part in the historiography of Waldensianism, historians of witchcraft have shown a long-standing interest in the subject. The liberal historian Joseph Hansen, the leading scholar of the rationalist school (which held that witchcraft was a nonexistent crime) and head of Cologne's municipal archive, promoted the idea that rustic Waldensians were forced into witchcraft confessions by the intellectual and physical coercion of the Inquisition. Hansen became a precursor of the so-called labeling theory, because he believed that Waldensian heretics were simply labeled—by the populace as sodomites and by Catholic theologians as witches—without having themselves given their accusers any reason for doing so. Hansen's explanation is still widely accepted—with some modifications—by several recent publications (for example, Cohn 1975; Monter 1976; Blauert 1989).

This theory, however, remains unsatisfying because it cannot explain why Waldensians, who would have been burned anyway as heretics, should have also been labeled as sorcerers, and specifically as having been capable of flying through the air. An explanation for the equation of Waldensians and witches cannot be logically derived from the range of absurd interpretations characterizing the so-called romantic approach (which emphasizes the importance of women, seeing them as incarnations of popular culture or of popular resistance) in the historiography of witchcraft. Although Carlo Ginzburg (1991) opened new paths to "decipher" the witches' Sabbat with his emphasis on ecstatic experiences, he was unable to integrate Waldensians into his concept. As a prelude to the revival of popular myths, he reconstructed the scapegoating of lepers and Jews in fourteenth-century France to explain why Jewish terms like "synagogue" or "Sabbat" played such a prominent part in early witchcraft terminology.

Indeed, Ginzburg could point to a 1409 letter of Pope Alexander V that confirmed to the inquisitor Ponce Feugeyron: "We have recently and sadly heard that some Christians and perfidious Jews within the boundaries of your jurisdiction have founded new sects and perform rites that are repugnant to the Christian religion. They also often teach hidden doctrines, preaching and affirming them" (quoted in Kors and Peters 2001, 153). The Jews and Christians in this strange new sect, which operated in the Dauphiné and other parts of the French Alps and in southeastern France, used sorcery, divination, and devil worship (Hansen 1901, 16–17). The letter with its mandate was confirmed twice for the same inquisitor in the same region, in 1418 by Pope Martin V and again in 1434 by Pope Eugenius IV. Within five years, however, a decisive change in the perception of this enigmatic new

sect occurred. In 1437 Eugenius IV issued a general decree to all inquisitors about devil worshippers, who committed *maleficia* (harmful magic) through words, touches, or signs (Hansen 1901, 17–18). Three years later, the same pope issued a bull, *Ad perpetua rei memoriam* (For Eternal Remembrance of the Thing), against the former Duke Amadeus VIII of Savoy (ruled 1416–1451), who was elected by the Council of Basel as Felix V (ruled 1439–1449), and subsequently was known as an anti-pope or counter-pope to the legitimate pope. The bull connected the council's new pope with all the heretics in his former duchy, devil worshippers and sorcerers, “who are now commonly called *stregule* or *strigones* or *Waudenses*” (Hansen 1901, 18, 408–415). This finally became the name for the new sect: They were neither Christians nor Jews, but Waldensian witches.

The papal bull used this terminology for the first time in 1440, explicitly maintaining that it was the popular terminology of a specific region, namely the duchy of Savoy. This label was no mere invention but was based on something resembling subjective perception, as trial records demonstrate. It was precisely this region, including the Swiss dioceses of Geneva, Sion, and Lausanne, where the term *Vauderie* (Waldensianism) was being used for witchcraft by the early fifteenth century and remained predominant throughout the sixteenth century. Monter recognized long ago that “the lands which used ‘heretic’ or ‘Waldensian’ as a synonym for witch after 1425 formed a contiguous geographical zone,” and he concluded that “these conciliarist and Savoyard dioceses were the geographical center of the first popular fusion of heresy and sorcery, which would later be cemented into accepted theory” (Monter 1976, 22–23).

If we turn away from official documents to examine demonological treatises, we find almost no connection between Waldensianism and witchcraft before 1435, although earlier inquisitors included chapters about sorcery in their handbooks; the *Practica inquisitionis heretice pravitatis* (The Practice of the Inquisition of Heretical Depravity; circa 1324) of Bernard Gui contained such a chapter. In a much larger chapter about Waldensian heresy, however, Gui never mentioned magical rituals or spiritual fantasies. Devil worship was an exception, for its practitioners adored the Devil in the form of a cat. This form of *latria* (the honor due to God) assumed enough importance to generate the term for heretics in several languages, for example, the German *Ketzer* (from *Katze*, “cat”) or the Italian *Gazzari* (from *gatto*, “cat”). However, although sorcery had potentially implied devil worship ever since the time of St. Augustine, the influential *Directorium inquisitorum* (Directory of Inquisitors) of 1376 by the Spanish Dominican inquisitor Nicolas Eymeric still lacked this detail.

As far as we know, not until the 1430s was worship of the Devil in the form of an animal transferred to the “new sect” of witches. The connection between Waldensianism and witchcraft in learned demonology began with the anonymous treatise *Errores Gazariorum* (Errors of the Gazars or Gazarii [the term *Gazarii* was a synonym for Cathars or Waldensians]). Presumably written by an inquisitor in the duchy of Savoy around 1435, it gave the first elaborate description of a witches’ Sabbat. In late-fourteenth-century Savoyard heresy trials at Pinerolo, a small town in the Piedmontese mountains, a Dominican inquisitor, Antonio di Settimo, forced a Waldensian named Antonio Galosna into confessions in which nocturnal gatherings, devil worship, and sorcery played an important role (Hansen 1901, 118–122). It has been suggested that George de Saluces, bishop of the Savoyard valley of Aosta in the Italian Alps from 1433 to 1440 and then bishop of Lausanne from 1440 to 1461, played an important role in importing the ideas of “synagogues” of the “Gazzarii” into parts of French-speaking Switzerland belonging to the duchy of Savoy. But even earlier Dominicans, such as Ulric de Torrenté, inquisitor for the diocese of Lausanne (circa 1420–1445), preferred to use the term *Vaudois* during his investigations, at least since the early 1430s. The soil for the fusion of witchcraft and Waldensianism may have been prepared by the Dominican preacher Vincent Ferrer (ca. 1350–1419), whose apocalyptic sermons between 1399 and 1409 had excited exactly the region where the fusion took place: Piedmont, Lombardy, Savoy, Dauphiné, and parts of Switzerland including Lausanne, Geneva, and Fribourg. As in later descriptions of Sabbats, devil worship and sexual orgies played a prominent role at early “synagogues.” This is not surprising, since Gui had already made these deviations necessary ingredients in charges against Waldensianism.

However, a new and decisive requirement in the linkage of heresy to devil worship and the Sabbat was the heretic’s ability to fly through the air. Martine Ostorero and colleagues connect this idea to a specific inquisitorial trial, mentioned only in the Basel manuscript of the *Errores Gazariorum*, conducted by Ulric de Torrenté at Vevey in 1438, whose records survive at Lausanne (Ostorero et al. 1999, 348–351). But it seems rather unlikely that the original fusion occurred in this trial; the idea of night-flying female *streghe* had certainly been a traditional ingredient of Alpine and other folklore. This can be demonstrated from early-fifteenth-century demonology. While the inquisitors in the diocese of Lausanne imagined witchcraft as the modernized version of Waldensianism (*modernorum hereticorum Waldensium*), other authors, such as Alonso Tostado, were already suggesting that the majority of the new sect were females, whom Tostado labeled with the popular Castilian term *bruxas* (Hansen 1901,

105–109). During the same years, the local Swiss term *Hexen* rose to prominence in German-speaking areas. Although this connection was not yet implied in contemporary papal bulls or in the earliest treatises about the new sect, its members tended to be portrayed as predominantly female. And the illustrator of one manuscript felt clearly attracted by this interpretation of Waldensianism. He sketched witches riding through the air on sticks and broomsticks. Although they could have been called *streghe*, the traditional term in Italy, *Hexen* in Switzerland, or *bruxas* in Spain, the scribe identified them as *Vaudoises* (Hansen 1901, 101).

Certainly, the use of the term *Vaudois* irritated and confused contemporaries: The chronicler Enguerrand de Mōnstrelet mentioned that he could not explain why these witches were now called *Vaudois*. Some conservative theologians deliberately chose not to equate witchcraft with Waldensianism: Nicolas Jacquier, who participated in the famous persecution of the *Vauderie* at Arras and was convinced that a new sect of witches existed, preferred to call them *haeretici fascinarii*, “bewitched heretics” (Hansen 1901, 124–130, 133–145). Nevertheless, between 1430 and 1460 a more general fusion of witchcraft and Waldensianism predominated in French-speaking Europe. Following the Savoyard paradigm, a whole series of trials against Waldensian witches took place in eastern Switzerland (Blauert 1989, 36–50) and France. Even a distinguished theologian, Dr. Guillaume Adeline, confessed under torture at Evreux (Normandy) in 1453 that he had flown on a broomstick to the “synagogue” of the “Waldensians,” where he had worshipped a he-goat (Cohn 1975, 230). At Arras in the duchy of Burgundy, the campaign against the *Vauderie* reached its climax between 1459 and 1461 (Singer 1975). Former participants at the Council of Basel tried to frame their experiences in terms of demonological theory. An anonymously written *Recollectio casus, status et conditionis Valdensium ydolatrarum* (Record of the Case, Status, and Outcome of the Waldensian Idolatries, 1460), a defense of the persecution from May 1460, simply equated witchcraft and Waldensianism without further explanation and blamed *Valdenses* for all the *maleficia* of the witches (Hansen 1901, 149–183).

Another participant at the Council of Basel, Johann Tinctor, canon at Tournai and later professor at the University of Cologne, summed up his perception of the new heresy in a sermon *Speculatio in secta Valdensium* (Speculation on the Sect of the Waldensians, ca. 1460). For him, the sect was more terrible than paganism, Islam, or simple heresy: It implied apostasy, the destruction of Christianity, and the end of the world. Several copies of his sermon survive in French, Belgian, and German libraries; there was even a contemporary translation into vernacular French, unusual for fifteenth-century demonological treatises, and his

Traité de Vauderie (Treatise on the Waldensians) was printed at Bruges as early as 1477 (Hansen 1901, 133–195). One of its manuscripts was illustrated with a famous early representation of the witches’ Sabbath, with men and women flying through the air, supported by devilish monsters.

Another echo of events at Arras was a manuscript entitled *La Vauderye de Lyonois en bref* (Waldensianism in Lyons, in Short), describing the *dyabolica synagoga* (diabolical synagogue [Sabbat]) of the witches. Ironically, it located the “synagogue” in the very region where the Waldensians, the “Poor of Lyons,” had originated centuries earlier (Hansen 1901, 191–195). This genre of demonological literature apparently ended with a similar treatise on night-flying “*Vaudois*,” *De haeresi Valdensium seu pauperum de Lugduno* (The Heresy of the Waldensians, or the Poor of Lyons), written by an anonymous Carthusian in 1485—just one year before the publication of the *Malleus Maleficarum* (The Hammer of Witches, 1486). Heinrich Kramer ignored the association of Waldensianism with witchcraft, although (or because) he had been engaged in an inquisitorial trial against the Waldensian bishop Friedrich Reiser. Presumably overshadowed by Kramer’s *Malleus Maleficarum*, the confusing term *Vauderie* was no longer used in learned demonological discourse as a synonym for witchcraft. It persisted in some regions as a popular term, for example, in the southern Netherlands until the seventeenth century and in southwestern Switzerland until the present day.

Historians of Waldensianism simply deny any connections with witchcraft. With its biblicism, antipapalism, antifeudalism, and pacifism, Waldensian theology in no way resembled witchcraft. On the contrary, many examples showed the *pauperes Christi* (the poor of Christ) denying the wonders of the saints, the power of relics and of holy water and salt, or the efficacy of pilgrimages. In other words, they actively opposed superstition. As a persecuted minority trying to revive the apostolic spirit of the early Christians against the Roman Church, the Waldensians aroused the sympathy of many researchers as “enlightened” evangelical precursors of the Reformation. And this is why historians of Waldensianism have made few useful contributions to the debate. Waldensians were certainly not supporters of exotic folk beliefs, much less founders of ecstatic cults.

Nevertheless, it seems appropriate to ask what elements in Waldensianism could have stimulated or legitimized its identification with witchcraft. For instance, was it suspicions that this religious movement opposed any form of killing, even the execution of sorcerers? Waldensian masters came and left at night, as believers readily admitted (Kurze 1975, 97), because of the risk of suppression. Nocturnal gatherings with non-Roman rites were certainly one *tertium comparationis* (the third

[part] of the comparison, that which two things have in common) with witchcraft. Secrecy automatically aroused suspicion (it characterized rebellious peasants, secret lovers, and robber gangs), but it was obviously insufficient to provoke papal inquisitors to invent a new crime. On the other hand, popular magic in itself could never challenge the machinery of suppression. Its rites were well known, having been classified in penitentiaries. Even if its *maleficia* was approximated to devil worship, it remained separate from traditional heresies. A Celestine monk and inquisitor, Peter Zwicker, though pointing to the Waldensians' devil worship in his 1395 treatise *Cum dormirent homines* (While Humans Sleep), explicitly admitted that they were not "Luciferans," and he did not confuse Waldensianism with witchcraft (Biller 1989, 223–225).

Most Waldensians came from the lower orders, and their persecution resulted in the so-called marginalization of Waldensianism as it became increasingly strong among peasants and herdsmen in mountainous areas. It is thus unlikely that the average Waldensian was any less superstitious than his Catholic neighbor. If suspicions of sorcery played an important role in trials against Waldensians even in towns like Bern or Fribourg, what was to be said about the peasants in the high Alpine valleys of Piedmont, Dauphiné, Valais, or the Pays de Vaud? These are exactly the places where preachers in the high and late Middle Ages, sixteenth-century reformers, seventeenth- or eighteenth-century rationalists, and nineteenth- and twentieth-century folklorists would all expect to find the most exotic forms of folk beliefs. And there is certainly historical evidence to support this stereotypical assumption. From the Cathar village of Montailou in the Pyrenees, we learn about love magic, harmful magic, belief in spirits, and the charming tale of an ecstatic experience: a soul leaving the body in the form of a snake, walking over a silvery bridge, and visiting a castle in a mountain. Although historians of Waldensianism carefully try to keep witchcraft and Waldensianism separate by treating them in separate chapters to avoid any interrelations, numerous trials for magic and sorcery were held in the Waldensian valleys of Dauphiné. And magic and divination were practiced by Waldensians as well as by other mountain farmers and herdsmen.

Therefore, it seems worth reconsidering the role of Waldensian spiritual leaders: the *barbes* (brothers), who, like the Cathar *perfecti* (the perfect ones), managed to establish a peculiar spiritual elite outside the Latin Church. These brethren were trained by each other. Despite all attempts to reconstruct their training and the customs of their secret society, we know little about either. What we do know is that they had to be accepted voluntarily by their communities. This suggests charismatic abilities that could meet the specific spiritual demands of their followers. At least some of them

managed to demonstrate their spiritual superiority by establishing contacts with the "other world." Although evangelically trained Waldensian theologians, like many of their Catholic counterparts, rejected the idea of ecstasies, at least in some areas spiritual contacts with paradise, prophets, angels, or even God himself were thought to be peculiar to Waldensians.

Arnauld Gélis established contact with the deceased, with revenants, around 1312, and he could eventually see the dead not only in dreams but also while awake. His inquisitor Jacques Fournier (1285–1342), who became pope Benedict XII in 1334, reported that Gélis served as a courier for the deceased and received orders from the living before visiting the realm of the dead. This Waldensian worked as an intermediary between the living and the dead, and he was well known for his abilities in the region, serving clients who wanted to get into contact with the otherworld. His spiritual qualities far exceeded those of local Catholic priests and met the demands of the common people in a very singular manner. Maybe this was especially interesting for Waldensians who denied the existence of purgatory and could therefore do nothing to benefit their deceased relatives. On the other hand, the beings of the otherworld could help the living, and Gélis was commissioned to ask them about past and future events. Gélis was not the only Waldensian with these abilities, even within his own family. He was continuing the custom of his cousin, thus suggesting that this ability was hereditary within his lineage. As he explained during his trial in March 1320, his cousin had been able to "walk" (of course, this meant fly) with the dead, sometimes going with them for three or four days. Finally, Gélis acquired the same ability himself. After a while he began to "walk" with the "good women and the souls of the deceased" ("*bonis dominabus seu animabus defunctorum*"), who visited the cleanest houses, ate there, and drank good wine in the cellars, but without any loss (Utz Tremp 1994, 125–134).

Most historians of Waldensianism would claim that Gélis had no connection with it. But there is other evidence of his association with Waldensianism. During an inquisition in Austria between 1312 and 1315, the interrogatory protocol summarized some typical Waldensian errors: Two "brothers" had to go to paradise every year to receive the priestly power of binding and loosing (Matt. 18:18), which they could afterwards transmit to their followers (Maleczek 1986, 36). Many witnesses elsewhere in Europe claimed that their "masters" possessed this power (Merlo 1977, 43–44, 48–49). Further reports of otherworldly experiences by Waldensian brethren were also made three generations later, during Zwicker's extensive campaigns in Bohemia and Austria. In Zwicker's records from Brandenburg and Pomerania (today in Poland) between 1392 and 1394, where nearly half of the 450 original protocols

survived (Kurze 1975), one standard answer to questions about the teachings and religious practice of the Waldensian “masters” was that they went to paradise to receive their power from an angel. There were, however, differences about whether the brethren actually entered paradise or only stayed at the gates, and about what exactly happened there or what they could actually obtain from God. For instance, Claus Walther answered in February 1393 that the masters acquired their wisdom there. We can conclude from the bulk of evidence that whenever Waldensians touched upon the special relation between their masters and God, they meant far more than merely reading the Gospel. They hinted at ecstatic experiences, raptures, or spiritual journeys of the soul (if not a physical one of the body) through the air to the gates of paradise. In northern Germany, Richard Kieckhefer has correctly concluded, ecstatic experiences were commonly considered a Waldensian affair (Kieckhefer 1979, 63).

The Waldensian masters’ journeys to the otherworld are indisputable. There were, however, many variations in detail regarding the circumstances of the travels, their frequency, and their purpose. This probably suggests some debate among *credentes* (believers) about such things. Perhaps different masters told different stories about the supernatural origins of their spiritual power. Historians should be aware of the possibility that within the oral culture, these stories would have been much more elaborate than they were in inquisitors’ protocols. But even the protocols offer hints. One elaborate story was told by Aley Takken from Baumgarten in the Polish diocese of Poznan. In March 1394 she confessed

that she had heard from a certain woman, that two of their apostolic and heresiarch Brethren went to Hell, and heard the pitiable cries and saw the devils attacking the souls in Hell and saying, “that one was an adulterer, that one a usurer, that one a tavern-haunter,” and so on of all the other sorts of vice-laden souls; and afterwards they came to Paradise and heard the voice of the Lord God giving them wisdom and learning, with which they were to instruct the people committed to their care on earth. (Kurze 1975, 241)

Such stories sound familiar to historians of witchcraft. Some of the most aggressive witch hunts in European history were launched after confessions by witch doctors with otherworldly experiences. Around 1500, Hans Tscholi from Kriens (between Lucerne and Bern in Switzerland) had to “walk” (that is, fly) with the souls of the deceased. From their revelations he derived his authority as a witch doctor. Like Gélis, Tscholi was not the only member of his family with this kind of ecstatic experience. Another example is

Zuanne delle Piatte, a wandering witch doctor in the Italian Alps, well known in many villages of the Dolomites, who claimed to visit regularly the Venus Mountain (Venusberg; *mons veneris*), where the fairy queen lived; his confessions led to a witch hunt around Cavalese in the Val di Fiemme. Another example is Diell Breull (d. 1632), who visited Frau Holle (or Holda, leader of women who traveled at night, who lived on Venus Mountain; Frau Holle is the title of a fairytale by Jacob Grimm) in her mountain castle and was able to foresee the future. His tales caused a large witch hunt that claimed almost 200 victims in the small Calvinist county of Isenburg-Büdingen. Finally, Chonrad Stoeckhlin, a herdsman from Oberstdorf in the German Alps, provoked a similar persecution with his stories about the *Nachtschar* (phantoms of the night) with whom he traveled to paradise (Behringer 1998). All of them visited the “other world,” and their peculiar position as messengers between the living and the dead was an obvious precondition for their ability to heal and foretell the future.

Despite lacking medical training, the Waldensian brethren were expected to cure diseases. As reported in fifteenth-century Dauphiné, they provided clients with recipes and herbs, using prayers that might have been understood (or misunderstood) as magical spells (Biller 1982, 55–77). In healing their clients, the *barbes* probably thought they were fulfilling an evangelical mission (Matt. 10:8), but in the view of the common people, this ability aided the brethren’s reputation for holiness. One of their characteristics was an asceticism that contrasted sharply with the comportment of their Catholic counterparts. This stimulated some peculiar forms of veneration and unusual expectations: The *barbes* were reported to be *sancti viri* (holy men). The Passau Anonymous, writing around 1315, mentioned their “great appearance of holiness.” Bernard Gui noted the term “holy men,” a phrase confirmed by Waldensian believers in trial records from Pomerania, Bohemia, Austria, Alsace, Piedmont, and Dauphiné.

Of course, the phenomenon of “living saints” was well known in the Roman Church, where people like St. Francis advertised the power of Catholicism. On the other hand, the phenomenon is also well known to social anthropologists outside Christianity. They describe “religious specialists” who remind us of people like Arnaud Gélis, Hans Tscholi, Zuanne delle Piatte, or Chonrad Stoeckhlin, who served their communities as healers, diviners, and messengers to the otherworld. These kinds of superior spiritual qualities are characteristic features of shamanism. And although this might have been contrary to the intention of the Gospel, at least some Waldensian brothers were treated as, and seem to have worked as, shamans. Gabriel Audisio (1999) has pointed out that some narratives about the *barbes* have been amplified

with additional popular beliefs concerning the liminal experiences of fear, pain, or death, experiences that resemble typical initiation rites of shamans.

Waldensian brothers, as living saints, were called *boni homines* or *bons hommes* (good men) by their followers. This seemingly harmless term, mentioned approvingly by distinguished scholars of heresy, requires further interpretation. *Good men* or *good people* are exactly the same terms used for certain supernatural beings in contemporary folk belief: *good ladies*, *good men*, and *good people* were ambivalent terms, describing, for instance, fairy people or powerful benign spirits opposed to demonic beings. Such terms were also applied to the deceased, who according to popular belief visited the houses of people whom their neighbors then called “blessed.” Great ambivalence lurked behind terms like *good people* or *good men*; they could even be euphemisms, because any supernaturally powerful being could be dangerous, able to harm as well as heal. We can see this ambivalence as early as 1241, when a Waldensian believer admitted that Master Petrus de Vallibus, who also served as a healer, was “loved like an angel of God” (Biller 1982, 66).

In conclusion, the association of witchcraft and Waldensianism goes far beyond a mere labeling process. Beyond the “heresy-topos,” with Waldensians kissing devil-cats under their tails, the secrecy of their nocturnal gatherings suggested associations with negatively connotated animals like bats or toads and could be linked to evil behavior, sexual deviance, or evil itself. The importance of women in the Waldensian movement—some “sisters” acted as equivalents to the brothers, and women frequently substituted for *Magistri* (masters) during their absence—suggested associations with the importance of women in popular magic. Some believers, like Galosna in Pinerolo, even confessed that magic was taught at Waldensian “synagogues,” and that women exercised it. Finally, and most important: Not only for inquisitors but for the Waldensians’ neighbors and maybe even for themselves, the holiness of the masters and their supernatural abilities and shamanistic qualities, especially the brethren’s journeys to the otherworld, provided the missing link between Waldensians and witches.

VERONIKA OF DESENICE (D. –1425/1428)

The second wife of Frederick II, Count of Celje, Veronika of Desenice was murdered on October 17, 1425 or 1428, after being accused by Frederick's father, Herman II, of attempting to kill him with poison and of bewitching his son into marriage.

Family interests had driven Frederick II (1365–1454) into an unsuccessful marriage with Elisabeth of Frankopan (Elizabeta Frankopanska), but the couple had allegedly lived separately since 1415. Frederick either killed Elisabeth or ordered her murdered in 1422. Three years later, in 1425, he secretly married Veronika of Desenice, whose origins were noble but significantly lower than those of his first wife. They settled in the castle of Friedrichstein, newly built by Frederick.

Frederick's father Herman was greatly displeased by the news of the wedding, which did not remain concealed for long. Frederick asked the Venetian Republic for sanctuary, but the Venetian Senate refused. Following an order by Emperor Sigismund of Luxembourg, Frederick was captured and brought back to Herman, who imprisoned him in the castle of Upper Celje (Zgornje Celje), destroyed his castle at Friedrichstein, and dispossessed him of all other castles and estates that Herman had previously given him. Veronika fled to Frederick IX of Ptuj, who hid her in Vurberk, but Herman soon discovered the fugitive and captured and imprisoned her.

Herman brought Veronika before his court, accusing her of witchcraft and attempted poisoning, but she was allegedly acquitted. Herman then locked her up in Ojstrica castle and later had her drowned. Because Emperor Sigismund was Herman's son-in-law and his most reliable protector, Herman did not fear reprisals for the act that he had committed. The emperor had previously pardoned Frederick after he had been accused of having murdered his first wife Elisabeth. The witchcraft trial was undoubtedly a result of Herman's anger with his son. Following the murder of his first wife, Frederick had married a lower-class noblewoman and thereby disgraced family honor. After Veronika's death, Frederick was released from jail. (He later had Veronika's corpse transferred to the Carthusian monastery at Jurklošter). The story of Veronika of Desenice remains one of the most popular historical motifs in Slovene literature.

VERVAIN

Not all "magical" herbs associated with sorcery or witchcraft are poisonous or malignant. Such is the case with the herb *Verbena officinalis*, commonly known as vervain,

a perennial that produces lilac-colored flowers at the tops of long stalks. Other common names for vervain are herb of grace, *herbe sacrée*, and *herba veneris*. These names are suggestive of its long-standing traditional usage in magic and medicine. Other common names that reveal the plant's traditional uses include enchanter's plant, herb of enchantment, holy herb, and simpler's joy.

The word *vervain* is derived from a Celtic word, *ferfaen*, meaning to "drive away a stone." This name may be related to its traditional herbal-medicine use as a diuretic to treat calculus and other bladder afflictions. The word *verbena* derives from the Latin word for plants used on an altar. Christian herbal lore held that vervain grew on Mount Calvary and that it was used to staunch Jesus's wounds. Certain species of *Verbena* do have astringent properties. In more modern times, the herb was employed to treat neurological diseases, but this practice seems to have ended by the middle of the nineteenth century.

Like many medicinal and "magical" herbs, vervain lore is included in many old herbals. For example, it is included in the 1814 *Culpeper's Complete Herbal and English Physician Enlarged*. This famous book drew upon a number of much earlier works. Culpeper noted that vervain was an herb of Venus and that it was excellent for treating the womb. He further pointed out its traditional use for bladder disorders, such as calculus.

The Druids may have used vervain in magical and hallucinogenic concoctions. One reads this information rather commonly in modern books dealing with herbal lore, although the magical uses of the plant do not seem to be associated particularly with satanic witchcraft. But the supposed magical and hallucinogenic uses of vervain by the Greeks, Romans, and Druids have caused this plant to appear in the occult pharmacopoeia of modern times. Vervain is held to be a "compelling" plant by those who practice the religions of Santeria, Voodoo, and Wicca. Its alleged magical effects include bringing good fortune, health, money, good dreams, and even everlasting youth to its users. One may compound incenses, liquids, or contents of herbal pouches using vervain in order to help produce happiness, peace, and joy. A recipe for protective incense will suffice as an example: One compounds vervain, galagal, peppermint, rue, and cinnamon into a powder used according to the formulary to protect against hexes. Some modern Wiccans believe vervain capable of bringing visions of the future, enabling its user to foretell whether someone who is ill is going to die or recover and to assist in finding stolen property. It also may protect one's home from lightning and bad storms, and one may use it to invoke spirits. Such beliefs repeat the traditional ancient folk usages of vervain, such as those attributed to the Druids.

VICENTE, JOAN

Vicente was a cleric tried by the Inquisition in Saragossa (Zaragoza) in 1511 for heresy, witchcraft, and necromancy. Although settled in Saragossa as a beneficed priest of the church of San Pablo, Joan Vicente came from Perpignan (then part of Catalonia). Many men subsequently tried in Aragon for crimes related to witchcraft or necromancy were also immigrants, often from southern France and particularly from regions like Béarn or Gascony, ill-famed for their abundance of witches. The inquisitorial trial against Vicente provides very early and rich evidence of the effervescence in Spain of magical practices associated with invocations of demons that filled the pages of the *grimorios* (*grimoires*), or magic books, frequently found in the hands of clerics. Unlike feminine magic, whose practitioners, like the fictional Celestina (a procuress and enchantress), were mainly illiterate persons of humble social status from Mediterranean coastal zones, masculine magic in sixteenth-century Aragon was practiced principally by secular and regular clergy, like Vicente, accustomed to dealing with infernal spirits.

As opposed to the erotic character of the majority of feminine spells, whose final aim was to secure the love of or the seduction of a desired man, the principle objective of masculine necromancy was the acquisition of material wealth that would permit one to live well without effort. The most elaborate and thorough method for this magic was to perform certain ceremonies for invoking demons. These rituals required a number of ingredients, detailed in early manuals of magic. A good example of the complexity of these ceremonies is the conscientious preparation that the priest Vicente and his three accomplices (a weaver and a notary and his servant) carried out, beginning in 1509, with a view to tracing a great magic circle (*cercos generales*), where they intended to conjure various spirits "so that they would come and bring them money" (Tausiet 2000, 505).

Like their Italian or German counterparts, these Spanish necromancers used magic circles to perform the most sophisticated form of spirit invocation. The magic virtue of the circle acted as a bulwark to whoever was inside it, protecting them from every type of evil

attack. But meticulous preliminary preparations were required before such magic circles could be drawn. First, the participants (whose number could not exceed four) undertook purification rituals that included baths, fasting, and participation in confession and Holy Communion. Next, unless the building intended to house the circle was new, it had to be exorcised to eliminate any possible negative influences from its previous owners. Finally, certain objects and substances were necessary to complete the ceremony.

Following the *Clavicula Solomonis* (the Key of Solomon), a book of incantations for summoning demons, Vicente and his accomplices first procured a wardrobe (white clothes, underclothes, and shoes), which had to be new. The garments were marked with certain magical characters and figures, using a plume taken from the right side of a large goose, the plume sharpened with a knife with a black and white handle that had been previously tempered with the blood of the same goose. The ink used to mark their garments had to have been previously exorcised. All other essential objects had to be fabricated specially, sometimes from unborn animals or by the hands of a pure virgin. They included four knives (which would be used, after sharpening the plumes, to draw the circle and would then be thrust into it), four swords (which also had to be stuck into the circle), a magic ring made of silver (made an hour or two after noon, the period during which Mercury reigned), some rods and canes (to flay the skins that would be used as parchment), candles of holy wax, aromatic substances (incense, aloe), new coals, parchments on which to draw small circles made from the skin of aborted animals (pups, kids, and calves), and—last but not least—a holy water shaker, with which to shake holy water over all of the participants and each one of the objects present in the ceremony of invocation.

From testimony in Vicente's trial in 1511, we know that these objects were collected in the cleric's house; he told the judges he had previously hidden them in a cabinet in the church of San Pablo, where he kept his clerical garments. But the experiment of the circle, for which the four men had so carefully prepared, was never consummated. Two participants quarreled fiercely over economic issues and "because each one pretended to better understand this art of necromancy" (Tausiet 2000, 512). One of them finally informed the Aragonese Holy Office, which proceeded to arrest, try, and condemn all four would-be necromancers to death, "relaxing" them to the secular authorities.

Two prisoners (the priest and the notary) managed to escape from jail, so their executions could only be carried out in effigy at the 1511 *auto de fe* (act of faith) where the other two were burned. Vicente managed to lower himself from the window of the high tower of Saragossa's old Muslim palace of the Aljafería, which

served as the Inquisition's prison, leaving a note in his cell filled with threats against the inquisitors.

Vicente's revenge did not end with these threats. His path led him to Rome, where, after three years, he secured a papal pardon and retained his benefice. Not content with this, he returned to Aragon and sued the inquisitors of Saragossa (who had obtained permission from King Ferdinand to confiscate his property), winning a judgment (which they ignored) ordering them to pay him the sizable sum of 500 ducats as restitution.

VIENNA

Although few trials for witchcraft occurred in the capital of the Austrian Habsburgs, the city is best remembered for the so-called Plainacher trial of 1583, a notorious episode put to use in service of the Counter-Reformation.

Early in 1583, a sixteen-year-old girl named Anna Schlutterbauer was transferred to the city hospital in Vienna, where her condition soon drew the attention of the local bishop and even of the Holy Roman Emperor Rudolf II. Although exorcists had already sought to cure her fits (perhaps caused by epilepsy) at both the monastery of St. Pölten in Lower Austria and the pilgrimage site of Mariazell in Styria, it was not until her arrival in Vienna that the Jesuit Georg Scherer was able to drive 12,652 demons from her. He described the process in detail in a sermon published in 1584, *Christliche Erinnerung, bey der Historien von jüngst beschehener Erledigung einer Junckfrawen* (A Christian Recollection of the Tales of the Recently Completed Exorcism of a Young Woman). The story and its aftermath were widely reported throughout Catholic Europe, becoming a telling example of the power of the Church and a warning to Protestants drawn away from the "true" faith.

Although the girl emerged from the episode unharmed, her grandmother Elsa Plainacher was not so lucky. Although the seventy-year-old woman repeatedly denied her granddaughter's claims that she had surrendered Anna to the Devil some twelve years earlier, after the death of the girl's mother, she was unable to

withstand the judicial torture to which she was subjected. Elsa Plainacher ultimately confessed to making a pact with the Devil and to murdering her own husband and their long-deceased children. She was burned at the stake in September 1583, an event witnessed by large crowds.

Although the term *Plainacher* became a common insult among the Viennese in subsequent years, few other cases of witchcraft occurred in the Austrian city. Besides two late medieval episodes in 1425 and 1498, incomplete records reveal six more trials, in 1588, 1601–1603, 1643, 1695, 1706, and 1708. Overall, these early modern trials involved at least three women, three men, and two whose gender is unknown. At least one man was executed (in 1695), another suspect committed suicide (in 1601), and another died in prison (1603). In the early-eighteenth-century trials, one woman and one man were fined, publicly beaten, and exiled. Nine of the ten additional trials took place in nearby Wiener Neustadt in the sixteenth century, but Vienna never experienced a large-scale witch panic (Dienst 1987, 286–289). As the seat of the Habsburg government, Vienna was home to the eighteenth-century rulers and officials who brought witch hunting to an end throughout the Habsburg monarchy.

**VINET, JEAN (VINETI, JOHANNES)
(D. CA. 1470)**

A Dominican inquisitor working in Carcassonne, Jean Vinet composed a *Tractatus contra demonum invocatores* (Treatise Against Demon Invokers) around 1450. His text was among the first to provide a theological and doctrinal approach to the possibility of the witches' Sabbat. Together with Nicolas Jacquier, Johann Tinctor, and Petrus Mamoris, Vinet represented the current of French thought that inserted the early doctrine of the Sabbat, formulated in Alpine regions, into the larger doctrinal framework of demonology.

Little is known of Vinet's life. In 1435, this French Dominican graduated from the faculty of theology at the University of Paris, where he taught between 1436 and 1438. Appointed inquisitor of heretical depravity for Paris in 1443, he subsequently carried out this function in Carcassonne from 1450 to around 1470. We cannot describe his specific activities as inquisitor of the faith. Three manuscripts of Vinet's *Tractatus contra demonum invocatores* have been preserved (in the Bibliothèque Nationale in Paris, in the Bibliothèque Royale in Brussels, and in the Stadtbibliothek in Trier), as have five incunabula. Vinet composed one of the first treatises on demonology to integrate new reflections on sorcerers who consorted with or summoned demons, analyzing the new phantasm of the Sabbat from the perspective of Scholasticism and proposing an acceptable doctrinal framework for witchcraft trials. He was convinced of the reality of demons.

His treatise on demon conjurers contained four parts. Vinet first defined the nature of demons and their different names, relying principally on Augustine and Thomas Aquinas. Next, he described apparitions and the abilities of demons to intervene in the earthly world, discussing both contractual and carnal relationships between humans and demons. He devoted a long third section to the magic arts, their effectiveness, and demonic participation in such acts. Vinet ended by describing physical damage inflicted on men and animals by evil spirits, most notably demonic possession and its remedy, exorcism.

The Sabbat does not occupy a central place in his treatise, but it appeared several times during discussions of specific issues, notably in the second part. Here Vinet investigated the possibility of sexual relations between women and demons. He then examined the question of sorcerers' magical flights to demonic assemblies, or "synagogues of demons." Vinet was one of the first authors to distance himself explicitly from the authority of the *Canon Episcopi* (ca. 906). He clearly differentiated "women who aspire to ride in the night with Diana, goddess of the pagans" from these "new idolaters" (*moderni ydolatre* or *heretici*), whom the *Canon Episcopi* never mentioned. As Vinet described them, these "new idolaters" summoned demons, worshiped them by sacrificing newborn babies, rendered homage to them, and paid them tribute. He believed such heretics should be killed without mercy.

In the section devoted to the magic arts, Vinet carefully distinguished natural magic from devilish magic through lengthy discussions of the opinions of Augustine, Thomas Aquinas, and Albertus Magnus (Albert the Great). This section is notable for its range of topics, including necromancy, astrology, divination, enchantments, visions, and spells. Following Aquinas, Vinet condemned all arts practiced with the assistance of evil spirits or through pacts concluded with them.

Vinet submitted the Sabbat to the test of Thomism by searching principally in the works of the “Angelic Doctor” (that is, Thomas Aquinas) for answers to questions about the practices confessed by sorcerers during their trials. Vinet contributed to defining and qualifying the crimes committed by these devil-worshipping “new heretics.” Drawing on Scholastic demonology, Vinet redrew the boundaries between the possible and the impossible and between the acceptable and the unacceptable. Instead of depicting himself as an unrelenting defender of the struggle against these “modern heretics,” he adopted a critical position. Faithful to Scholastic training, his arguments aimed to discover the “truth” among different propositions.

Vinet stressed human free will, which rendered people responsible for their acts. He held people to be capable, through reason and will, of resisting demonic temptations, although the powers of the spirits were immense. For Vinet, any human being must ultimately be judged by his acts. Having demonstrated the possibility and existence of demonic assemblies, however, Vinet supplied some much-needed doctrinal and theological justification necessary for carrying out fifteenth-century witch hunts.

VINTLER, HANS (D. –1419)

A member of a leading south Tyrolean noble family, Hans Vintler became a legal official in a territorial court and by 1416 was an official in the administration of Duke Friederich of Tyrol. He is best known as the author of a long didactic poem, *Buch der Tugend* (Book of

Virtue), a discussion of virtues and vices, which he completed in 1411. In the poem he described many popular magical practices, including conjuration, divination, love magic, and weather sorcery, and he also referred to a particular group of sorcerers called witches (*unholten*).

The *Buch der Tugend* was published at Augsburg by Johann Heidegger of Blaubeuren (commonly called Johann Blaubirer) in 1486; it also survives in six manuscripts written both before and after this date. Modeled on a widely disseminated Italian treatise of ca. 1300, the *Fiori di virtu* (Flowers of Virtue), Vintler’s work examined seventeen different virtues and their corresponding vices as part of his call for moral improvement. He devoted a substantial section to the vice of superstition (*unglauben*), drawing on a Latin confessional translated by Martin von Amberg in the late fourteenth century. Vintler complained about the widespread contemporary belief in magic and sorcery, more general beliefs about signs of misfortune, as well as a range of popular magical practices and maleficent sorcery. Healing and protective magic received particular attention, as did storms, invisibility, stealing milk, and impotence, nor did he overlook such forms of learned magic as divination and necromancy. All manner of plants, animals, and body parts were used in this magic, as well as verbal spells, blessings, ecclesiastical objects, and wax figures. Although Vintler generally called the effects of such magic “imagination” or “deception,” he occasionally presented the Devil and other figures drawn from folk literature as authors of or collaborators in such human delusions.

The considerable attention given to magic and sorcery in Vintler’s original text was further emphasized in the printed version of 1486, which included 236 woodcuts spread over its 214 pages, no fewer than fifty-two of them illustrating its relatively short section devoted to superstition (Schramm 1943, figs. 487–719). Most images are similar to the illuminations in a richly illustrated Gotha manuscript of circa 1500 that seems to have used the same now-lost model. The significance of this unusually large and varied visual compendium of contemporary magic clearly suggests that by the 1480s printers such as Blaubirer believed that images of popular sorcery, magic, and superstition would sell.

The Vintler woodcuts do not represent actual magical practices but instead offer us an educated author’s view of the world of popular magic. One key characteristic is the close relationship they posit between popular magic and the natural world. Animals feature frequently as portents of fortune and misfortune, instruments for fortunetelling, objects of special blessing, or symbols of village inequity and strife. The astrological powers of the heavens—sun, moon, and stars—also fill important roles, as do herbs, plants, earth, water, and fire.

A second significant characteristic of the woodcuts is the gendering of magical practices in a manner reflecting traditional divisions of labor. Women figure as both castrators and general healers, who dealt in body parts and protect domestic animals, whereas men charm weapons, search for treasure, and heal horses.

A third characteristic is the minimal references to diabolical association and influence, which appears unambiguously only in two woodcuts: one a scene of diabolical invocation, the other an act of sorcery identified as idolatry. The large compendium of magical acts contains only one reference to witches, female sorcerers who drink wine from other people's cellars—a reference to traditional stories about people of the night with their wild and destructive night rides and processions. It is puzzling that the accompanying illustration introduce a case of shapeshifting, possibly an indication of contemporary popular beliefs about *unhollen* in 1486. Although both text and images represent a world of magical forces and practices that are being condemned as vice, they largely ignore the widespread demonization of such practices that occurred around 1500.

VISCONTI, GIROLAMO
(HIERONYMUS VICECOMES)
(D. CA. 1478)

The Milanese scholar Girolamo Visconti participated in the debate about the existence of witchcraft practices with two brief treatises written around 1460, the *Lamiarum sive striarum opusculum* (A Brief Work on Lamia or Witches) and the *Opusculum de striis* (A Brief Work on Witches). An outside observer of the witchcraft trials that were increasingly numerous in

Lombardy during this period, he discussed the validity of the charges imputed to witches and demonstrated why they should be judged as heretics.

Descended from the noble Milanese family of the Visconti, he was ordained a friar while young and spent most of his life in the Dominican monastery of Sant' Eustorgio in Milan, where he taught logic after 1448. He served as provincial of Upper Lombardy from 1465 until his death around 1478. Aside from these works, he also wrote a *Compendium quaestionis de obligatione papali* (Summary of the Question of Papal Obligations) around 1470. Visconti's two brief treatises on witchcraft were published as a single volume at Milan in 1490. Three manuscripts of both treatises (in the Biblioteca Casanatensis in Rome, in the Biblioteca Universitaria in Pavia, and in the Cornell University Library in Ithaca, New York) have transmitted versions of these two texts on witchcraft that differed from the incunabulum of 1490.

Visconti dedicated his first treatise to Francesco Sforza, duke of Milan. It might have been written around 1460, a time when witchcraft trials were becoming more frequent in Lombardy. In the years from 1418 to 1422, nearly twenty trials for bestiality, sorcery, and witchcraft took place in his own monastery of Sant' Eustorgio. The imprecise procedural and legislative framework of that time allowed contradictory positions, sometimes favoring abuses or displaying great tolerance toward the accused. Having attended numerous trials, Visconti tried to provide a doctrinal structure for such proceedings. After presenting arguments for and against the existence of witchcraft, demonstrating the liveliness of the debate, he sought to synthesize such a priori irreconcilable elements as the *Canon Episcopi* (ca. 906) and the reality of nocturnal flight. Visconti certainly considered it possible that witches actually went to the "game" (that is, the Sabbat), because demons were capable of transporting them. On the other hand, if persons merely dreamed of attending a Sabbat, their bodies could not actually be found there, because they could not occupy two different places at the same time.

Like most Italian authors, Visconti distinguished vampire-witches (*striges*) from less dangerous kinds (*lamiae*), and he described the Sabbat as a "game" (*ludus*) where ghouls came to dance, drink, and eat and to find ways to harm their enemies by worshipping the "lady of the game" (*dominam ludi*). In his first treatise, he seemed to present the "lady" as retaining the beneficent character associated with the goddess Diana; the Sabbat still contained traces of some ancient beliefs in ghouls and Diana, which Visconti progressively helped transform.

In his briefer second treatise, the *Opusculum de striis*, his tone became more incisive and peremptory. Visconti primarily addressed the judges responsible for

determining if witches were heretics. This time, the “lady of the game” was clearly likened to Satan, the great protagonist of the ceremony. Christian demonology had transformed ancient beliefs. There was no doubt: Witches were manifestly heretical because they acted in reality, not dreams, and in full conscience. The “sect” of devil worshippers, to which they belonged, especially attracted women, but men, even noblemen, who had their own familiar demons, were also drawn to it. Several of their acts proved that this sect was heretical: Its adepts were apostates who had renounced their faith and baptism, who worshiped the Devil and offered him sacrifices. Consequently, they had to be punished.

While during the same period French authors such as Nicolas Jacquier or Jean Vinet tried to distinguish clearly between followers of Diana and the “new” heresy of devil worshippers, Girolamo Visconti, like such other Italian authors as Bernardino of Siena, John of Capistrano, or Jordan of Bergamo, transformed the old beliefs in *lamiae* and Diana by twisting them toward the witches’ Sabbat, thus reinterpreting ancient folkloric legacies in terms of Christian demonology.

VISIONS

A vision may be defined as an extranormal psychosomatic experience, the feeling of being transported bodily and spiritually into another space while the body actually lies in a catalepsy, trance, ecstasy, or deep sleep. As a

rule, these spaces are parts of the religious imaginary (heaven, hell, purgatory, or symbolic rooms). An apparition, on the contrary, is the sudden emergence of a person, animal, or something usually not found in the same space where the seer’s body is located. In this case, space does not change, but its content does (apparitions of Jesus, Mary, the Lamb, saints, and so on); the seer usually remains conscious and in control of his bodily functions. Today both phenomena would be called psychic hallucinations, illusions, or fantasies experienced during altered mental states.

Visions formed a typical part of the model of mystic sanctity, which predominated especially among spiritual women in late medieval and early modern Catholicism. Every famous saint of that epoch—Elizabeth of Hungary, Bridgit of Sweden, Catherine of Siena, and Teresa of Avila—experienced ecstatic revelations. Impostors like Sybilla of Marsal (thirteenth century) or Anna Laminit (fifteenth century) pretended to receive visions regularly, because otherwise they had no chance to be recognized as holy women. A vast corpus of religious writings, vision literature, developed from the Early Middle Ages onward, comprising both travels to the other world—like the famous *Visio Tnugdali* (The Vision of Tnugdalus [an Irish knight]; 1148/1149) or St. Francesca Romana’s ecstatic voyages through hell and purgatory—and mystical visions such as the revelations of Henry Suso or Julian of Norwich. As late as the eighteenth and nineteenth centuries, a rich corpus of mystical visions was produced by Emanuel Swedenborg, Anna Katharina Emmerick and others. The fine arts were often influenced by visionary texts upon which some iconographical innovations were based, namely, the scene of the Nativity following a revelation of St. Bridgit. The detailed hell paintings of Simon Marmion, Hieronymus Bosch, Pieter Brueghel the Elder, and others derived many elements from vision literature.

It seems indubitable that the witches’ records of encounters with the Devil and the ride to the Sabbat in reality were to some extent the consequences of visions, trances, and dreams. Heinrich Kramer, the author of the *Malleus Maleficarum* (The Hammer of Witches, 1486) and many other demonologists were convinced that the details of the Sabbat could be experienced *imaginaria visione* when sleeping on the left side (*Malleus Maleficarum* I, 17), though many authorities thought real flights with a witch’s broom possible. There was, however, a marked difference between the experiences of women saints and those of the witches: Whereas the former entered an appropriate psychic state through ascetic techniques such as self-flagellation, insomnia, fasting, and meditation, but never through the use of drugs, the latter reversed the preparatory procedure by swallowing hypnotic substances or anointing the body with hallucinogens.

For contemporaries, the same problem arose as with miracles: Who caused these visions a woman claimed to see? If the content of the vision was unmistakably diabolic, matters were clear. But how should they judge the numberless revelations where God or a saint appeared to command some act or give judgment on someone? The case of Joan of Arc, who was executed as a sorceress, is only the best known of many similar dilemmas. Her defenders held her apparitions of angels and saints to be authentic and her military mission to be the fulfillment of God's explicit order; her enemies denounced them as devilish fantasies, guided by merely political and personal interests. The complex theological literature on the discernment of spirits shows how difficult it was to find out whether God or his adversary produced such visions.

VOLTAIRE (1694–1778)

Though François-Marie Arouet, better known as Voltaire, was not the most vocal critic of witchcraft prosecutions in the eighteenth century, his fame as a *philosophe* (forward-looking thinker) made him a symbol of the Enlightenment's rejection of witch beliefs and condemnation of witchcraft trials.

During the seventeenth century, witchcraft prosecutions intensified in many European areas. But the most famous among the philosophers of that age, those now seen as the formulators of the new rationalism, such as René Descartes, Baruch Spinoza, and Gottfried Wilhelm Leibniz, stood silent about this phenomenon, perhaps because they considered the belief in witchcraft too contemptible and misguided to warrant comment. The rejection of witch beliefs and the condemnation of the trials came mainly from theologians like Balthasar Bekker and jurists like Christian Thomasius.

After witch hunting had entered a period of decline in the eighteenth century, some Enlightenment thinkers,

such as Laurent Bordelon, Ludovico Muratori, and Girolamo Tartarotti, became openly critical of "superstitions" and witch beliefs. Others, like Francis Hutchinson, Scipione Maffei, Montesquieu, and—above all—Voltaire, not only dismissed witch beliefs but also condemned the prosecutions themselves.

In his *Dictionnaire philosophique* (Philosophical Dictionary, 1764), where 25 of the 600 articles concern magic, Voltaire ridiculed witchcraft as the fantasy of poor and ignorant women, deceived by some crooks and even more by their feeble minds. These women, according to Voltaire, thought they were able—after saying the magical word *abraxa* and putting horrid unguents all over their bodies—to fly to the Sabbat, where they met and worshiped the Devil in the shape of a goat. Voltaire also dismissed the books supposedly meant to help the magicians practice their rituals: the so-called *grimoires*, which Voltaire claimed were absolutely meaningless, full of indecipherable signs. The manuals written by inquisitors and witch hunters were just as silly as the *grimoires*. Voltaire chose Martín Del Río's *Disquisitiones magicae libri sex* (Six Books on Investigations into Magic, 1599/1600) as his main example of this genre, probably because Del Río was a Jesuit, and Jesuits had become a main target of Enlightenment thought.

Voltaire estimated that more than 100,000 witches had been condemned to death all over Europe (a figure currently accepted as a plausible number of trials, but not deaths). The only way to stop this carnage, he wrote, was for *philosophes* to teach judges that "they should not burn idiots at the stake." As for magicians, Voltaire wrote, "Nothing is more ridiculous than condemning a real magician to burn at the stake; because we should assume he would be able to extinguish the fire and twist judges' necks."

In his *Commentaire sur le livre des délits et des peines* (Commentary on the book concerning crimes and punishments, 1766 [Caesare Beccaria's *Dei delitti e delle pene*, 1764].), Voltaire discussed a trial that occurred in Geneva around 1652. A peasant woman named Michelle Chaudron was condemned to death for making a pact with the Devil, who had ordered her to bewitch two girls. Voltaire gave a short but moving description of how she was forced to confess under torture, but once again his explanation of the phenomenon went no further than the usual binary opposition between idiocy-ignorance on one hand (including both victims and persecutors) and philosophy-rationalism on the other.

VORARLBERG

In the sixteenth and seventeenth centuries, officials on behalf of the Habsburgs administered most parts of today's Austrian federal state of Vorarlberg. A few territories were self-governing members of the Holy Roman Empire, ruled by the counts of Ems and the abbots of Weingarten (Baden-Württemberg) and Einsiedeln (Switzerland). Neither clerical possession held any witchcraft trials. However, between 1528 and 1657 at least 170 people (approximately 80 percent of them women) were put on trial for witchcraft in the Austrian territories and in autonomous territories, and at least 130 (or over two-thirds) of them were sentenced to death.

The first victim of witch hunting who came from Vorarlberg was a shoemaker's wife in Bregenz; she died in a dungeon in Constance in 1493. Five years later another woman from Bregenz was imprisoned for a long time after having been identified as a sorceress by fellow citizens, who had practiced magic themselves in order to "discover" her. The first witchcraft trial in Vorarlberg took place at Bludenz in 1528; a woman from a nearby village was suspected of being a witch but was finally set free. There were a few more individual trials in the following decades, but these did not lead to executions. By the mid-sixteenth century, however, whole groups of witches were being prosecuted, first in the region of Bregenzerwald and then in other parts of the dominions of Feldkirch as well as Bregenz. The judicial prosecutions ended in spring 1551 when the Habsburg government at Innsbruck forbade the local

courts to torture prisoners on their own. It also demanded more comprehensive evidence before making further arrests and claimed the right to make all final decisions in witchcraft trials. This first series of trials may have led to thirty or more executions.

The next witchcraft trial took place at Bludenz in 1570; the victim was a woman from the valley of Montafon. Five years later, four women from Altenstadt were probably burned as witches, and three women were executed in Bludenz at that time after a professional witch expert from Urseren in Switzerland had convicted them on testimony obtained through harsh tortures. In 1585 a woman was burned in Dornbirn; in 1586 and 1588 trials involving four people from the valley of Klostersal ended with one execution at Bludenz.

After 1595, witch hunting in all counties of Vorarlberg reached a second peak, as in many other areas of central and western Europe. There were numerous connections with extreme agrarian crises. In 1597 and later, witch hunting in the dominion of Feldkirch led to a number of sharp conflicts between some local inhabitants and officials, especially at Dornbirn, where unofficial committees tried to circumvent the regular court and take control of both interrogations and torture procedures. There, the persecution of witches caused endless difficulties: When local authorities carried out the persecutions requested by large parts of the population, they violated legal instructions or financial restrictions of the Innsbruck government. If they refused persecutions because of legal orders from Innsbruck, they provoked bitter reactions from local people, sometimes even rebellions. On the one hand, this conflict saved the lives of many people; on the other, almost all executions were carried out after trials regarded as problematic by the Innsbruck government.

The largest witchcraft trial in southern Vorarlberg was conducted at Bludenz in June 1597: Five women lost their lives, and a man was burned some months later. In 1604 two more women were executed in Bludenz. The most extensive series of trials in the history of Vorarlberg took place at Bregenz in 1609: From April through July, sixteen people from the surrounding region were burned as witches or sorcerers. The trials obviously started with the capture of Melch Schnell, a healer from Ammenegg near Dornbirn. The government had already recommended his arrest in 1602 because of his activities. During the second largest series of witchcraft trials, ten more people were sentenced to death at Bregenz in 1615.

But the years following saw only individual trials. In Vorarlberg, four executions were recorded during the whole of the Thirty Years' War. A man from Hohenems was put on trial for magic at Bregenz in 1622—the only prosecution in Austrian Vorarlberg that can be regarded as social disciplining by the authorities (the magician

was the only person who was not a Habsburg subject, although he was not actually a foreigner). When the local population complained about evil sorcery, the authorities usually did nothing or reacted with moderation. But when crimes like abortion or the murder of a child were suspected, the authorities also took vigorous action regarding sorcery. Such circumstances led to the execution of a woman from Scheffau in 1626.

Unlike the dominion of Bregenz, where witchcraft trials continued after 1615, the south of today's federal state of Vorarlberg was apparently free of further trials after 1604. Nevertheless, women and men were still suspected of witchcraft and ostracized as witches or sorcerers there. In 1642, the supreme official of Bludenz was even forced by threats against his person to bring a woman from Bürserberg to trial, notwithstanding all legal regulations, after a possessed woman had called her a witch.

In the mid-seventeenth century, Vorarlberg experienced a third cycle of witch hunting. Executions now took place only in those territories where local authorities had considerable autonomy, particularly the city and dominion of Feldkirch, then governed by Karl Friedrich, Count of Hohenems. Under his rule, the last recorded death sentences in witchcraft trials in Austrian territories were pronounced in 1651 against eight women by the court of Rankweil-Sulz. In the same year, an old woman died during interrogations in Bregenz. There the last witchcraft trial conducted by an Austrian court ended with acquittals for all defendants in 1656–1657. In the following decade, however, the authorities faced further attempts to start prosecutions. These were still possible in the county of Hohenems, including Lustenau, where the first known judicial proceeding occurred in 1631. From 1649 to 1653, no fewer than twenty-three people stood trial for sorcery. Eighteen of them were put to death. In 1677 the last witchcraft trials on Vorarlberg soil took place in Hohenems and Lustenau, claiming four women's lives.

The last known sorcerer from Vorarlberg was in Schaan, a parish priest who came from the neighboring village of Frastanz. Arrested and investigated as a

sorcerer-priest for three years at Chur and Milan, he was finally found innocent and vindicated by papal authority. Nevertheless, his former parishioners did not tolerate his reinstatement.

One of the main reasons for the relatively early end of witch hunting in the Austrian dominions in Vorarlberg was the particular structure of administration that complicated and hindered the prosecutions. In Habsburg lands, the state did not inhibit trials, but its legal procedures were controlled more strictly. The last "successful" witchcraft trials, therefore, occurred in territories beyond the reach of the government in Innsbruck.

Numerous slander trials showed that many people felt threatened or damaged by witches, even long after the last witchcraft trials. In Vorarlberg, it also becomes apparent in the context of everyday conflict strategies that an accusation of women as witches represented the counterpart to accusing men of bestiality. Whereas men were regarded as having positive magical abilities like healing, women were overwhelmingly represented as practicing damaging magic. Such damages dominated the confessions in Vorarlberg. References to witchcraft as a satanic cult are rare and rudimentary. In some very early testimony, there appear connections to pagan beliefs concerning fertility cults or the journey into the world of the dead, similar to the beliefs of the *benandanti* (do-gooders) of northeastern Italy.

W

WAGSTAFFE, JOHN (1633–1677)

Wagstaffe is author of *The Question of Witchcraft Debated* (1669, with a second expanded edition in 1671). We know little about Wagstaffe's life, except that he was educated at St. Paul's School and Oriel College, Oxford. Anthony à Wood claimed in his *Athenae Oxonienses* (An Exact History of All the Writers and Bishops who have had their Education in the University of Oxford from 1500 to 1690, 1691–1692) that Wagstaffe was a drunkard. In 1660, Wagstaffe wrote the antipapal *Historical Reflections on the Bishop of Rome*, and he also contributed a Greek poem to a volume, *Britannia Rediviva*, celebrating the restoration of Charles II.

In the *Question of Witchcraft Debated*, Wagstaffe nowhere acknowledged any previous attacks on belief in witchcraft (for example, those by Johann Weyer, Reginald Scot, or Thomas Ady), although we can assume he had read at least some of them. The only skeptical author he mentioned was Girolamo Cardano, whose skepticism was extremely cautious. Wagstaffe's good classical education had acquainted him with major works defending belief in witchcraft; in this regard, he mentioned Johannes Nider, Bartolomeo della Spina, Paulo Grillando, and Martín Del Rio. He had evidently read a contemporary defense of belief in witchcraft, Joseph Glanvill's *A Blow at Modern Sadducism* (1668), from which he took the story of the demon drummer of Tidworth. Among modern authors, Wagstaffe showed the most respect for the Venetian historian and propagandist Paolo Sarpi, on whose *History of the Inquisition* he drew freely, using the 1639 English translation.

Wagstaffe's private beliefs are hard to ascertain. He denied Glanvill's central claim that skepticism about witchcraft implied skepticism about the existence of spirits and even of God—although his attack on witchcraft might have been intended to encourage his readers to start down the slippery slope Glanvill identified. It has been argued that Wagstaffe was indebted to Thomas Hobbes, whose materialism certainly extended to skepticism about witches and spirits and was generally thought to imply atheism; Wagstaffe's arguments are certainly compatible with Hobbesism.

His core arguments were, first, that the Bible was mistranslated when taken to refer to witchcraft; second,

that belief in witches derived from pagan superstition; third, that Catholicism encouraged this belief in order to extend its power, while introducing new elements (the pact with the Devil, flight through the air, the Sabbat); and fourth, that belief in witchcraft was internally inconsistent because it presented witches as powerful, though they were penniless, and devils as omniscient, although God alone was omnipotent. Wagstaffe insisted that he believed in spirits (meanwhile noting that someone who did not believe in spirits would be foolish to deny their reality) and thus accepted the stories of poltergeists that Glanvill and others reported. But in the first edition of his major work, Wagstaffe claimed that belief in spirits who played "mad pranks" (1669, 60) and "malicious tricks" (63) and who were "frolick and gamesome in doing us mischief" (63) in no way implied belief in a demonic pact between witch and demon.

It is hard not to suppose that Wagstaffe expected his readers to adapt his arguments against witches into attacks on belief in spirits and on religion itself. He ridiculed the argument that one should believe in witches because "so many thousands of wise men in the world have believed," for "the various religions that have been in the world, are more than enough to convince one, how absurd and ridiculous the wisest of men are in matters of opinion and belief" (67–68). And while ostensibly rejecting the view that religion was the result of irrational fear, he held that this was indeed the origin of belief in witchcraft and that this belief was fostered by "wise politicians" (70)—a line of argument he developed through a general survey of pagan religion, attacking Platonism in particular (though he acknowledged that Platonism was much admired by the first Christians). He concluded that attacking belief in witchcraft could help to save the lives of those tortured into false confessions and that "under this side Heaven, there is nothing so sacred as the life of man, for the preservation whereof, all policies or forms of government, all laws and magistrates, are most especially ordained" (80), an argument that seems straightforwardly Hobbesian.

Despite the denials and equivocations, it seems probable that Glanvill's insistence that denial of witchcraft led straight to atheism inspired Wagstaffe to write an

attack on belief in witchcraft that surreptitiously inculcated atheistical principles. It is surely no coincidence that the first edition was accompanied by a translation of a dialogue by Lucian of Samosata, widely understood to be opposed to all religious belief; in the second edition of his work, Wagstaffe acknowledged that “there are some who wonder that I would offer to annex unto my book, a Dialogue of Lucian, who as they say was a known atheist” (1671, 151). His response to the charge of atheism was that “the assertors of witchcraft do frequently object atheism unto those that deny it. But I am still of the opinion, that such a ridiculous slander is not worthy to be answered” (1671 preface, A3rv). How influential Wagstaffe’s views were is hard to assess. They were quickly attacked by R. T. in *The Opinion of Witchcraft Vindicated* (1670). Yet Wagstaffe’s work was translated into German in 1711, and his arguments reappeared in William Pittis’s *The Impossibility of Witchcraft* (1712).

WALPURGIS (WALPURIGS) NIGHT

In popular belief, Walpurgis is the night between April 30 and May 1 when all witches meet at the top of the Blocksberg (now called Brocken) in the Harz Mountain Range in central Germany.

The occasion is named for the Anglo-Saxon princess Walburga, who was the niece of St. Boniface and abbess of a nunnery at Heidenheim in Germany, where she died in 777. On May 1, 870, her corpse was transported to Eichstätt, and this date became her feast day. In most parts of Sweden, people used to light bonfires on Walpurgis Night (*Valborgmaessoavond*) to welcome spring. Traditionally, May 1 was the first day of the year when the cattle and the sheep were driven out of their stables to graze in the meadows and woods. Bonfires and noise would, it was believed, protect the livestock against wild animals or evil powers. It is quite possible that the custom of the *Freinacht* in southern Germany (when young people play tricks on everyone) is connected with this traditional moment of driving out the cattle.

Today, so-called modern witches try to relate Walpurgis Night to witchcraft through the Celtic feast of Beltane, a fertility celebration to welcome spring. They claim that Christian doctrine tried to extinguish the memory of this feast or at least reduce its popularity by encouraging the distribution of scary tales about witches coming together on this special night to dance and to worship the Devil. In fact, historical sources provide no evidence that any pagan spring festival survived beyond the Early Middle Ages. Records of witchcraft trials dating from the age of the great European witch persecution (that is, in Germany from the middle of the fifteenth to the middle of the seventeenth centuries) reveal that the investigators always inquired about the exact locations where the so-called devil’s dances (the term *witches’ Sabbat* occurred very rarely in the sources) took place. Yet even under the cruelest tortures, the suspects did not name Walpurgis Night as a special occasion for meeting the Devil.

Instead, they confessed that the Devil’s worshippers danced almost every week. They could meet on any day of the week, at any time of night or day, and in any place inside or outside the town or village. However, they clearly preferred Thursday to other days and darkness to daytime. Most of the places they chose for dancing were situated on the tops of hills or mountains or in clearings or meadows. Consequently, ordinary people imagined that witches met either on elevations or in spots that served as dancing places for local villagers. The confessions contained no hint of any specific witch festival on Walpurgis Night. In the context of witchcraft trials, even the Blocksberg (or Brocken) was seldom referred to as the site of witch meetings. The same is true for another mountain called Blocksberg in the Black Forest. Like its counterpart in the Harz Mountains, it was said to be a place where witches flew and gathered in order to celebrate. A witchcraft trial in Cologne in 1653 was the only case in the city when a beggar confessed that the Devil himself had taken her through the air to the Blocksberg.

The second half of the seventeenth century brought about a change in the scenario for witch dances—the “discovery” of Walpurgis Night. Hans Jacob Christovon Grimmelshausen did not connect the scenario of the witches’ Sabbat that he depicted in his novel, *Abentheuerlicher Smplicissimus* (The Adventures of a Simpleton, published in 1668), to any particular date or location. But Johannes Prätorius, in his book *Bockes-Berges Verrichtung* (The Blocksberg Performance, also published in 1668), was the first to determine that Walpurgis Night was the time and the Brocken was the place where all the witches gathered. Although Gottfried Vogt followed Prätorius’s example in his *De conventu sagarum ad sua sabbata* (On the

Gatherings of Witches at the Sabbat), published in Wittenberg in 1678, the notion of Walpurgis Night as a witch festival did not become part of general German lore until after 1800, when Goethe published his *Faust*, containing a highly influential “*Walpurgisnacht*” scene. Basing his witch-dancing fantasies on Prätorius, Goethe contributed a great deal to establishing Walpurgis Night as the exclusive time for witches to meet.

WANN, PAULUS (CA. 1420–1489)

Wann was a noted preacher who opposed the early persecution of witches. Born in the Upper Palatinate, he studied theology at the University of Vienna after 1441, receiving his master’s degree in 1448 and starting to lecture. After Wann took his doctorate in 1460 at Vienna (then part of the large diocese of Passau), Bishop Ulrich III of Passau appointed him as his cathedral preacher and also made him a canon at the cathedral chapter of Passau in 1477. By then, manuscripts of Wann’s sermons were already widely spread among Bavarian and Austrian monasteries. Some of his sermons had been printed as early as 1460; several others were often published afterward. Acknowledged as a leading Church official during his lifetime, Wann is still remembered at Vienna for his foundation of a scholarship, the *Bursa Pauli*; Catholics know him for his defense of the Immaculate Conception, and historians of witchcraft know him for his early opposition to this new concept.

Wann had seemingly been invited by Bishop Georg Golser of Brixen to serve as an external witness in Golser’s attempt to terminate the inquisition conducted by Heinrich Kramer, author of the *Malleus Maleficarum* (The Hammer of Witches, 1486). Wann was appointed a member of the tribunal that assembled at Innsbruck on October 29, 1485. After three days of intensive discussions with Kramer and the inquisitor’s assistants, the bishop’s vicar, Christian Turner, nullified the trials and ordered the liberation of all imprisoned women. Kramer suggested in the *Malleus* that these trials had been successfully completed and had the bishop’s support. That exactly the opposite was the case and

that Kramer’s persecution of witches was universally rejected in Tyrol becomes clear from a letter of October 21, 1485, from Paulus Wann to Konrad Airimshmalz (1425–1495), prior of the Benedictines at Tegernsee in Bavaria. Wann pointed out that the women were accused without reason and suggested that these inquisitions had severely damaged the pope’s reputation. A series of sermons, which Wann promised to design, would be necessary to restore confidence. Although we do not know whether these sermons were ever delivered, the experienced preacher’s announcement strongly suggests that preachers in Tyrol and Bavaria may have spread the ill fame of Inquisitor Kramer—and possibly of witch hunting in general—even before the Reformation.

WARBOYS, WITCHES OF (1593)

The affair of the witches of Warboys, resulting in the execution of three people in 1593, ranks among England’s most important witchcraft cases. In many respects, it set a pattern that would often recur in later witchcraft episodes, most famously at Salem, Massachusetts, in 1692.

The case centered on the sufferings of the children of Robert Throckmorton, a gentleman living in the parish of Warboys (Huntingdonshire). In November 1589, his daughter Jane, almost ten, developed strange symptoms, including violent sneezing, trances, and bodily contortions. Two doctors based in nearby Cambridge were consulted, and being unable to find natural causes for young Jane’s sickness, they suggested witchcraft as the cause: At an early stage in her sufferings, Jane had indeed called a village woman named Alice Samuel, a visitor to the Throckmorton household, a witch. Two other of Throckmorton’s daughters (he had seven children in all) fell ill and also accused Alice Samuel of bewitching them. A little later, yet two more daughters, the oldest being fifteen, developed the same symptoms, as would various household servants thereafter.

The girls’ sufferings lasted well over three years, attracting considerable local attention. A relative, Gilbert Pickering, supposedly the girls’ uncle, played a leading role in confirming that their sufferings were

attributable to witchcraft; it is probably no accident that he was member of a rising Northamptonshire Puritan gentry family. The parish rector, Dr. Francis Dorington, also became convinced of the reality of Alice Samuel's witchcraft. Members of the Cromwell family were lords of the manor of Warboys, and Lady Susan Cromwell was supposedly bewitched to death by Samuel after forcing a confrontation with the supposed witch. Alice Samuel was more or less kept prisoner in the Throckmorton residence and put under heavy psychological pressure until she was induced to confess to Robert Throckmorton. She subsequently retracted this confession but was tricked into repeating it before hidden witnesses. She, her daughter Agnes, and her husband John were eventually sentenced to death for witchcraft at the Huntingdon assizes in April 1593.

Research has demonstrated that Warboys, a small village of some seventy families, was essentially run by the more successful farming families and that the arrival of a gentry family such as the Throckmortons upset the parish's political balance. The Samuel family was well established in the area, and John Samuel, although a troublesome and possibly violent man, had served as a juror on the manorial court of Warboys. Perhaps the context of the case was provided by differing visions of how a village community should function, with the incoming, well-connected, and possibly Puritan gentleman opposing the more relaxed view of an established farming family.

The case was described in a fairly lengthy tract, probably coauthored by a number of people with firsthand experience of the events. It gave lengthy descriptions of the girls' sufferings, providing a model for similar later cases in which children and adolescents demonstrated alarming symptoms that allegedly resulted from witchcraft. Moreover, in the Warboys case, as in many later ones, the bewitched claimed to have been troubled by spirits sent into them by witches, thus allowing for a conflation of bewitchment with demonic possession. Interestingly, both William Somers, who was allegedly schooled in being possessed by John Darrell, and Anne Gunter, who was at the center of a witchcraft case between 1604 and 1606, had read the tract describing the Warboys case and modeled their simulated sufferings on those of the Throckmorton girls.

The Warboys affair did not end with the execution of the three supposed witches. It was commemorated by annual sermons, delivered into the nineteenth century, on the evils of witchcraft, preached at All Saints Church in Huntingdon every Lady Day (March 25) by a doctor of divinity from Queens College, Cambridge.

WARFARE

Warfare and witch persecution were both defining features of the early modern period; thus, historians have examined the connection (if any) between them. To what extent and in what ways did warfare provide a context of "crisis" in which popular anxiety about witchcraft rose and the likelihood of witch hunts increased?

Warfare was commonplace in early modern Europe as the religious divisions produced by the Reformation added another cause for conflict to the traditional factors of dynastic rivalry and territorial disputes. In western Europe, the early sixteenth century was marked by the Habsburg–Valois wars in Italy; after the Reformation, religious conflict provoked the German Schmalkaldic Wars (from 1546 to 1547 and in 1552), the French Wars of Religion (between 1562 and 1598), and the Revolt of the Netherlands against Spain (from 1566/1567 to 1609). In the seventeenth century, civil war affected Spain (in 1640), France (from 1648 to 1653), and England, where civil war after 1642 culminated in the execution of Charles I in 1649. Germany became the theater of devastating European religious and political conflict in the Thirty Years' War. Religious conflict calmed down thereafter in western and central Europe, but warfare remained endemic in the early modern world, with Poland and New England suffering especially in the late seventeenth century. In fact, Europe was free from international wars for only a handful of years in the seventeenth century.

Witch hunts were, in fact, rare during periods of actual warfare, because people were too preoccupied with saving their own lives and livelihoods to worry about witches and also because war disrupted the community networks necessary for effective legal prosecution of witchcraft. Communities were more likely to prosecute witches in the aftermath of war, because the long-term psychological effects of the experience of war could increase the communal anxieties that were an essential, if intangible, factor in witch hunts. Probably for this reason, witchcraft trials intensified in parts of early modern France, Hungary, and Poland shortly after a war or internal uprising had ended (Levack 1995).

Threats of war also had a psychological impact on early modern communities that might stimulate witch hunts. The increased scale and frequency of troop movements (which not only represented the imminence of war but also spread disease and caused death)

likely contributed to the exceptionally severe episodes of witch persecution that devastated some Catholic ecclesiastical territories of southeastern Germany during the Thirty Years' War. In the prince-bishopric of Würzburg, for example, as many as 900 individuals were executed for witchcraft between 1625 and 1630. Here, however, the threat of war was the final straw for a population already adversely affected by plague epidemics and inflation since 1606 and by harvest failures during the 1620s; moreover, the people had already experienced one prewar episode of severe witch hunting in 1616 and 1617. Anxieties caused by the vicissitudes of the Thirty Years' War up to 1635 also contributed to some outbreaks of witchcraft trials in parts of western Germany, including the city of Cologne (Irsigler 1996).

Even if warfare increased popular anxieties about witches and the desire to make witchcraft accusations, the crucial factor dictating whether witch hunts would occur was the willingness of judicial elites to acquiesce to communal demands for trials. For instance, fears about witchcraft did intensify for some members of the lower orders of the German imperial free city of Rothenburg ob der Tauber and its rural hinterland in the aftermath of the Thirty Years' War. The conflict's devastating impact had made them more anxious about their ability to survive; it had also created a mentality of "every household for itself," weakening the bonds of good neighborliness that usually helped restrain witchcraft accusations. In addition, new ideas about witchcraft and magic had been spread in this region by the many troops who had marched through it or been quartered there. Because the Rothenburg city council maintained a legally restrained approach to witchcraft trials, however, popular anxiety never translated into large-scale witch panics. Nonetheless, we should be wary of overgeneralizing about the psychological impact of warfare: For some Rothenburg peasants, simply surviving the Thirty Years' War increased their piety and trust in God rather than their anxiety and fear of witches (Rowlands 2003).

Two (in)famous episodes of witch persecution for which a strong causal link to warfare has been suggested were the largest to occur in their respective countries: the 1645–1647 East Anglian witch hunts, instigated by England's self-styled "Witch-Finder General," Matthew Hopkins, and the Salem witchcraft crisis of 1692 in America, which saw 20 executions and over 150 accusations of witchcraft. The East Anglian witch hunts, vastly larger than anything else of the kind in English history, claimed at least 100 and possibly as many as 200 lives; the witch hunts occurred during the English Civil War and would no doubt not have escalated so far if they had not taken place at a time of such political, religious, and social upheaval. The distractions of war meant that the usually restraining influence of the assize court judges was absent in the crucial early months of the

trials: Many cases were left to local justices of the peace, who were unable or unwilling to resist popular pressure to act against witches. The activities of Hopkins and his partner, John Stearne, in fanning the flames of popular witch-hunting zeal would have been quashed much more rapidly by the central authorities in peacetime. The removal of press censorship also helped increase anxiety about the threat of witchcraft. In fact, many pamphlets on this and related themes were published as "witchcraft and ancillary popular beliefs now came to be recognised as a useful means of promoting political or religious issues" by the opposing sides (Valletta 2000, 217). The Civil War may also have caused a crisis of masculinity. Men whose fears of losing control over their own lives increased as a result of the threat of war or the experience of battle, it has been argued, used actual or fantasized acts of violence against witches as a way of reasserting normality and their masculine identities (Purkiss 1997). This thesis seems plausible to an extent, but it was surely the case that the terror of powerlessness that was so marked in wartime was far from gender specific.

Mary Beth Norton has maintained vigorously that the scale and intensity of the Salem crisis was due to the fact that Puritan New England experienced two devastating wars in the late seventeenth century—the First and Second Indian Wars (from 1675 to 1676 and from 1688 to 1699, respectively), during which previously prosperous settlements along the coast northeast of Massachusetts were ravaged by the Wabanakis, often acting in alliance with the French. These wars, Norton has asserted, had a psychological impact on various key groups involved in the Salem crisis. Some of the afflicted accusers were girls and young women who were refugees from the wars. Their stories of being attacked by witches' specters thus represented a way for them to articulate their own guilt at having survived the Wabanaki attacks that had killed their families. That their accusations against men such as the minister George Burroughs or the wealthy Jersey-born merchant Philip English were taken seriously can also be understood in the context of the wars: Burroughs generated suspicion that he was in league with the Devil and thus the Wabanakis, in part because he had an uncanny talent for surviving the latter's attacks unscathed, while suspicion that English may have been in league with the enemies of Puritan New England was raised because he was a native French speaker with many trading links to the French. New England's judicial and clerical elites were (at least initially) willing to lend full support to the witchcraft trials as a means of compensating for their failure in dealing effectively with the Wabanaki threat, and the idea that there was a large, organized group of witches in the process of attacking New Englanders in spectral form made sense to people who already felt themselves under siege at the hands of their visible

enemies (Norton 2002). Norton's work has been criticized for overemphasizing the Indian Wars as the only relevant explanatory context for the Salem witchcraft trials (Karlsen 2003). However, the work that Norton and others have done on the links between warfare and witch hunts in New England, England, and Germany demonstrates both how important it is to contextualize these episodes as carefully as possible and the extent to which psychological factors need to be integrated into explanations of specific witchcraft trials.

WARS OF RELIGION (FRANCE)

In the second half of the sixteenth century, France, like most other western European countries, intensified the pursuit of witches. Between 1562 and 1596, France was torn by bitter and often brutal civil and religious wars between Catholics and Protestants (Calvinists, known as Huguenots). Religious allegiances merged with a struggle for power among the great nobles. Sectarian violence escalated into organized warfare early in 1562, and a pattern of open warfare followed by short-lived peace treaties persisted until early 1596. The monarchs generally tried to act as peacemakers, and French *parlements* (sovereign judicial courts) stopped trials for

heresy. But over time, royal administration broke down, plunging France into virtual anarchy.

Starting, like the religious wars themselves, in 1562, executions of witches began spreading across the kingdom. They escalated after 1580, especially in the appellate courts of northern France. Meanwhile, the first major French demonology, by Jean Bodin, appeared. Catholic propagandists argued, stridently and insistently, for an underlying connection between religious warfare and the simultaneous spread of diabolic witchcraft in France. While the military wars sputtered on and off, the propaganda war was ceaseless. Very early in the religious wars, Catholic polemicists adopted the view that the Protestant heresy was the work of the Devil. In turn, they argued, the heretics helped the Devil in his attempt to lead humankind to damnation. The religious turmoil and violence were seen as signs of the presence of Antichrist; the Apocalypse was near. These propagandists often conflated heresy and witchcraft in their sermons and tracts. The battle against witches and the battle against heretics became the same fight.

These themes first surfaced with the "Miracle of Laon" in 1566. Dramatic public exorcisms ended with the successful expulsion of the demons possessing Nicole Obry, and her demons revealed themselves to be leaders of the Protestant heretics. Reports of the incident depicting the successful exorcism as a great victory for Catholicism circulated throughout France. From that time on, Catholic demonology in France was directed against the existence of Protestantism as well as the eradication of witches.

Another significant development followed the Peace of St. Germain in 1570, which the Protestants seemed to win at the conference table despite losing every major battle. In this troubled atmosphere, the Jesuit Juan Maldonado, professor of theology at the University of Paris, gave a long and very popular series of lectures. Maldonado, who described himself as a soldier in the war against heresy, regarded witchcraft ideas as orthodox and also emphasized the close relationship between the Devil and the heretics. Among his auditors were several men who later became authorities in demonological matters, including Martín Del Rio, Pierre de Lancre, Louis Richeome, and Jean Boucher. Maldonado's lectures, which demonized the Protestants, might have contributed to the fury of the St. Bartholomew's Day Massacres in 1572.

One of Maldonado's pupils, Jean Boucher, became a founding member and active participant in the Sixteen, the group of men who ran Paris from 1588 to 1594. During this time, priests preached violently against heretics and witches and threatened anyone who seemed to be insincere in their commitment to Catholicism. Throughout this period, the number of witchcraft cases appealed to the *Parlement* of Paris

stayed fairly level, at eight to ten per year. But during these years, the rates of death penalties the court meted out rose. Over the six or seven decades that the *parlement* applied the death penalty for witchcraft, fewer than one-tenth of the witchcraft cases that were heard ended in the application of capital punishment. During the years of the Catholic League, however, this rose to over one-quarter of the trial cases. This percentage of death penalties in witchcraft cases was still fairly low in a European context, but it represented a sharp increase in the court's usual approach to this crime. (Meanwhile, witchcraft cases actually dropped sharply in the *Parlement* of Rouen, also staffed by Catholic zealots, because few people obeyed the zealots.)

The last major incident pertaining to witchcraft—the demonic possession of Marthe Brossier in 1599—occurred shortly after the wars had finally ended. Catholic zealots hated the settlement imposed by King Henry IV. Brossier's exorcisms, performed in a very tense Paris during the quarrels over the Edict of Nantes (which had granted legal recognition to Calvinists in 1598), were a clear attempt to repeat the Miracle of Laon and to prevent a religious truce. The king, recognizing the danger, intervened. After a medical inquiry found Marthe to be a fraud, the exorcisms were suppressed, and she was sent home.

WATCHING AND WALKING

Many suspected witches were forced to confess not by being physically tortured, but through types of brainwashing. Sleep deprivation was the most frequently used means to that end. In England, the self-styled witch finder Matthew Hopkins applied this mental pressure with considerable success in the 1640s. Through sleep deprivation, immersion in water, continuous questioning, and prolonged solitary confinement, a witch was, to quote Hopkins, "brought into a sad condition . . . and knowing the Devil's malice and subtle circumventions, is brought to remorse and sorrow for complying with Satan for so long, and disobeying God's sacred Commandments, doth then desire to unfold her mind with much bitterness" (quoted in

Macfarlane 1970, 20). The procedure was clearly aimed at exhausting the witch so that she or he was no longer able to deny the accusations.

"Watching and walking" was not the only psychological expedient to break a witch's will. Exorcism was used long before the Reformation to sever all connections between the suspect and her or his demonic accomplices, and it remained a standard procedure in many Catholic regions. Suspects were sprinkled with holy water (or even forced to drink it) or sacred objects were hung around their necks while priests read elaborate anathemas to expel their devils. The psychological effect of such actions in a culture intensely convinced of the effectiveness of sacred rituals can hardly be underestimated. This observation also applies to practices such as searching for the Devil's mark. Several demonologists claimed that the Devil clawed out God's mark placed on the foreheads of the faithful during confirmation. The Devil was then supposed to replace it with his own mark, which could be located anywhere on a witch's body. As a result, it was deemed necessary to shave suspects all over their bodies and then look for the Devil's mark; the suspects were often blindfolded, and they were searched by pricking conspicuous spots to see if they were numb. Such actions, certainly if applied in combination, caused the accused individuals to lose all sense of reality: The techniques broke their resistance and made them ready to confess.

Not every hangman or executioner was familiar with this technique, and as a consequence, it took this skill some time to spread. This process has been analyzed in detail for the northern Netherlands. In 1491, the magistrates of Zutphen, a town in the eastern province of Gelderland, asked their colleagues in Cologne for practical information. They had submitted three women to heavy torture and exorcism but to no avail. The outcome of this trial is unknown, but a few years later, the executioner of Zutphen had become an acknowledged expert in such matters and was hired by other courts farther west to extort confessions. In 1513, the authorities of the city of Nijmegen asked the hangman of Cleves to probe three women, and six years later, "master Symon" was again employed to that end by Nijmegen and also by the city of Utrecht. In 1528, the new technique was first applied in the coastal province of Holland by a Gelderland executioner. The town court of Amsterdam employed the secretary of Utrecht and a Franciscan friar named Geryt of Zutphen to help them force a witch to confess in 1541. A year later, the bailiff of the small town of Schoonhoven asked his colleague in Utrecht for similar advice, as did the city magistrates of Haarlem in 1549.

The Protestant Reformation did not immediately end exorcistic practices. In 1585 and 1586, two small towns in Holland, Schiedam and Goedereede, were advised by a Flemish lawyer named Frasinus Zoetius to

shave the suspects; exchange their clothes for vests sprinkled with holy water; and add blessed salt, wax from a blessed candle, and a fragment of a priest's stole to their food. Afterward, they were to be kept awake and then finally submitted to torture. Later, Protestant countries discarded exorcism, but Protestant ministers still exerted psychological pressure on incriminated parishioners. In northwestern Germany, for instance, Lutheran pastors pressured suspected witches to confess, and in Scotland, Calvinist ministers played a similar role.

WATER, HOLY

Standard monographs on witchcraft and demonology (see Thomas 1971, 25–77 and passim; Clark 1997) provide numerous examples and anecdotes about the use of holy water against witchcraft and other operations of demons.

A rich and systematic contemporary source is book 3, chapter 4 of Francesco Maria Guazzo's *Compendium Maleficarum* (A Summary of Witches, 1608; 2nd ed. 1626). Guazzo listed holy water as the ninth of twelve "divine and supernatural remedies" against witchcraft and praised its "wonderful efficacy." He distinguished between holy water intended for baptism and "lustral" holy water, which "is consecrated at Prime on every Sunday" and "is avowedly for repelling the attacks of the devil and for averting other dangers" (Guazzo 1988, 179). He gave a short history of its use, claiming that

since Christian antiquity, "those possessed by devils are delivered when sprinkled with it; and . . . this miracle is often renewed today among the Indians" (180). Like witches, Indians were often considered the intimates and confidants of demons; citing the sixteenth-century *Historia Mexicana* (Mexican History) of Francisco López de Gomara, Guazzo affirmed that "among the Indians there are three chief remedies against the illusions and apparitions of demons"—consecrated hosts, the sign of the cross, and holy water—and he added that "the cacodemons themselves have confessed as much to the Indians more than once" (202).

In a related chapter, Guazzo gave examples of baptism driving away demons that tormented Peruvian Indians, Japanese, and Jews, and he described a monstrous child born to the Armenian wife of a Tartar king. When baptized at his Christian mother's behest, "by a miracle, [the boy] at once became so exceedingly comely and beautiful that the King and many others were moved wholly to turn to God, and the Christian cause was very greatly advanced in the land" (182). In another story, a cautious demon warns a boy "to abstain from the use of Holy Water and from adoring the Consecrated Host (which he contemptuously called 'The Little Cake')" (185).

As with other sacraments and sacramentals, explanations were periodically required when holy water failed to produce the desired result automatically. Guazzo quoted from Peter the Venerable (d. 1156) to explain why holy water could not cure a monk tormented by a demon. As a punishment for mortal sin, Guazzo said, his torment could not be cured by holy water, a merely "external sacrament[al]," until the monk had performed an internal sacrament by confessing his sins, "and after he had confessed he at once ceased to be tormented" (186).

The basic idea behind the use of holy water as a demonifuge (a charm against evil spirits) is the opposition between afflictions as the works of the Devil and sacramentals as the works of God. Thus, other sacramentals—such as the sign of the cross, the *Agnus Dei* (a disk of blessed wax), blessed salt and palm leaves, and sacramental materials, particularly the consecrated eucharistic Host and chrism oil—are often described or proposed as demonifuges (Guazzo gave examples in book 3, chap. 4 of his *Compendium*). The *Malleus Maleficarum* (The Hammer of Witches, 1486) also recommended making accused witches drink holy water in order to break their demonically induced refusal to confess (Kramer 1971, 230). Reginald Scot, among other Protestants, mocked the entire complex of Catholic beliefs in *The Discoverie of Witches* (1584, book 12, chap. 10).

Water as a holy element was also important in the ordeal by cold water, also called "swimming the witch." It was assumed that a person bound hand and foot and

thrown into water would sink if innocent or float if guilty because water, as a pure element (which was sometimes blessed by an ecclesiastic for the express purpose of this test), would “accept” an innocent person (at the risk of drowning). Likely deriving from pre-Christian rituals and closely related to the symbolism of baptism, this ordeal was used on suspected heretics centuries before the invention of demonic witchcraft. Usually illegal, it continued to be employed here and there in Europe into the eighteenth century (led by the bishopric of Münster, which had more than 200 such ordeals from 1590 to 1650) as a test to determine the guilt or innocence of supposed witches. During the first half of the nineteenth century, use of this ordeal persisted in the Netherlands, Ukraine, and England.

WEATHER MAGIC

Since ancient times, weather magic has been the most common form of both benevolent and harmful witchcraft in all societies. In preindustrial societies all over the world, weather and climate have been of vital importance for the growth of crops. It has always been vital for people to know what kind of weather they can expect, and throughout history, we find stories of diviners who could predict the weather. Besides their need to know something in advance about the weather, people have always sought to influence and control meteorological conditions. Indeed, trying to exercise magical

influence over the weather is as old as the tradition of weather prophecies.

Incantations and rites affecting the climate have usually been practiced with good intentions—in order to call forth favorable winds and good weather on land and sea. Folk culture commonly used protective weather rituals, that is, magical practices intended to prevent inclement or dangerous weather. Furthermore, the general population often believed that sudden changes in the weather and unseasonal weather conditions were caused by magic. It was this latter belief that found expression in the age of witchcraft trials. There is, in other words, a rich and varied folklore surrounding various ways of influencing the weather. Cultural traditions show that this phenomenon has had a long and significant effect on common opinion in European farming and fishing communities.

FOLK BELIEF AND LEARNED VIEWS OF WEATHER MAGIC

European elite culture long interpreted folk reliance on local weather magicians as primitive superstition. Medieval canons asserted that neither demons nor humans could control the weather. In the Middle Ages, canon law punished those who believed magicians could call forth or calm storms. And for a long time, the Christian Church condemned those who believed in the reality and efficacy of weather witches. Belief in

Witches place a cock and a snake in a brew in a cauldron to cause a hailstorm. From Ulrich Molitor, *De Laniis et phitoniciis mulieribus* (*Concerning Witches and Fortunetellers*), 1489. (Glasgow University Library, Department of Special Collections)

the efficacy of magic could itself be dangerous, as it was considered an affront to God. Learned clerics such as Bernardino of Siena found many folk beliefs they could ridicule, including the following: “To chase away a storm that might threaten your crops, you must bare your bottom to the approaching clouds. . . . There was a certain woman in Genoa who, seeing the bad weather coming and wanting to chase it away with a spell, raised up her skirts from behind and pointed her rear end toward the bad weather. Just at that moment lightning struck and killed her, because she had faith in such foolishness” (cited by Mormando 1999, 97).

But from time to time, learned treatises appeared that agreed with some popular beliefs. Adam of Bremen, an eleventh-century German bishop, claimed that wild, ravenous women lived in the Nordic mountains, in a land occupied only by females (*terra feminarum*). Beautiful women turned out to be monstrous witches, and the whole natural world appeared to be populated with demonic females possessing extraordinary abilities to control weather conditions. Menacing natives, who could call up evil weather, hid in the rocky cliffs and mountains. Without the slightest warning, these terrible gluttons could conjure forth horrendous storms. Nordic women’s magical conjuring was reputedly strong enough to control the forces of chaos; in other words, they could control or raise the sea at will. According to Adam of Bremen, even the most skillful sailors had few remedies for the northerners’ satanic tampering with nature. Nautical sorcery was a specialty of witches and sorcerers from the north.

After 1480, when the Church accepted the view that weather witches existed, accusations of weather magic ranked among the most important charges in European witchcraft trials. Heinrich Kramer, the author of the infamous *Malleus Maleficarum* (The Hammer of Witches) of 1486, devoted an entire chapter to informing readers that, beyond doubt, witches could easily make hailstorms and cause thunder and lightning. Kramer had weather witches burned at the stake during his mission to Ravensburg in the mid-1480s. He related the story of a weather witch named Agnes (which reads like a popular tale spiced with a bit of priestly demonology) primarily to show that witches could not cause storms of their own accord. First, Agnes dug a little hole in the ground and poured water into it. Then, she stirred the water with her finger but in the name of the Devil and of all her other devils—at which point, the water disappeared and the Devil rose up into the air to produce the hailstorm (*Malleus Maleficarum*, part 2, Question 1, chap. 15; see also Broedel 2003, 64).

WEATHER WITCHES OR WEATHER DEMONS?

During the sixteenth and seventeenth centuries, questions about what weather magic really was and what

witches and demons were capable of achieving with the weather became important topics of debate in intellectual circles. Belief in this kind of magic took various forms. The main dividing line was whether or not one believed that certain people could influence the weather for better or worse by performing a particular ritual. Within folk culture, there was a belief in a direct connection between the *tempestarii* (witches who raise storms) and weather conditions. The other tradition focused on a more indirect link: No human could influence the natural elements, but people could summon up demons that, in turn, could influence the course of nature. In other words, demonological teaching held that no direct link existed between witches and their rites and changes in meteorological conditions. Evil people could, however, influence the weather indirectly through a pact with Satan, who was often described as a prince of the air. Satan and his demons were “airy figures” and hence experts in manipulating the elements. Indeed, devils were the power of motion. Sorceresses could also make demons produce rain, storms, lightning, thunder, and hail and thus destroy crops or drown people at sea.

According to the learned view, all types of weather magic were ineffective by themselves. Their rituals could, however, be construed as signals to demons to take action. Thus, it was important in the trials to look for signs that could be interpreted as invocations of Satan and his demons. Witness testimony from ordinary people about suspicious threats, rituals, and behavior was taken seriously, but it was not interpreted as the direct connection the accuser tended to see between witches and their weather rituals and subsequent storms. The reason why only Satan, not human beings, could produce stormy weather was that the Devil could “bring hailstorms precisely because they have natural causes and because all natural phenomena are at his command. No accompanying ritual can physically affect this; it merely symbolizes the demonic entanglement of its performers” (Clark 1997, 196).

THE IMPORTANCE OF WEATHER MAGIC IN WITCHCRAFT TRIALS

The element of weather-related magic was quite substantial in witchcraft trials all over Europe. Accusations of magical manipulation of weather conditions were among the most important charges brought against suspected witches. Storms and bad weather at sea, cold summers, frosty nights in spring, floods, thunder and lightning, unusual quantities of snow, and extreme hailstorms that destroyed crops all provided important triggers for many important European witchcraft trials. Wolfgang Behringer (1995, 25) wrote of a “fundamental social-historical correlation” between accusations of witchcraft and dangerous weather caused by witches. Other scholars, too, have pointed to a general overlap

in the time periods of the witchcraft trials and segments of the Little Ice Age period.

Popular ideas about climatic conditions reflected social and living conditions in various parts of Europe. People living along the seaboard tended to focus on wind magic. In typical farming districts, the notion that magic could cause frost damage, lightning, and hailstorms that would damage grain crops and grapes was more widespread. Charges of causing intense hailstorms that ruined crops in early summer were prominent in many brutal witchcraft trials in Germany and other parts of central Europe. A common feature of these trials was that accusations were presented as coming from the entire local community. Witness testimony at such trials thus had a collective stamp and differed from the many cases of individual testimony directed against one particular individual. When weather magic affected the whole community, it was easy to express suspicions of a dangerous conspiracy. Weather magic therefore often appeared in conjunction with so-called chains of cases, in which accusations were made by a community and tended to be scapegoating reactions directed at a group of witches suspected of conspiracy. Weather making and storm raising were regarded as offenses against the whole community and were associated with the plotting of witches' covens.

In addition to cases from central Europe, we find weather magic in a wide range of trials from northern European coastal communities, including the east coast of Scotland, the Channel Islands, and the Nordic countries. Accusations of inclement weather from coastal communities and fishing villages had a slightly different character from those originating in the continental interior of Europe—focusing less on causing damage to agriculture and more on provoking stormy weather at sea, resulting in shipwrecks and death. But other accusations from fishing villages accused witches of destroying people's livelihood; for instance, witches were charged with causing storms that drove the fish away. Further south, a frequent accusation against witches in Catalonia was that flying women hurled hail and fog from the sky, destroying fruit crops, killing livestock, and damaging buildings. In 1621, a Catalan witch explained how she and some other witches went to a lagoon and threw some powder onto the water, after which clouds suddenly rose up and great pieces of hail fell to cause damage (Knutsen 2004, 94–95).

Raising enough wind to cause sailing ships to founder was a specialty of female Norwegian witches. Wind magic appeared frequently in the widespread sorcery trials in the far northern county of Finnmark; through diabolical conspiracies, sorcerers reportedly conjured storms that sank fishing boats and sailing ships. Synnøve, from the fishing community of Vadsø, was convicted of using evil weather magic and was burned at the stake in 1632. Along with other witches,

she had tied three knots in a piece of cloth, then untied them while spitting on them “in the name of the evil man.” Late one evening, the women threw the bundle into the sea, shouting the names of the men who had infuriated them. Several fishermen drowned in the storm that arose in the wake of the witches' curses.

The day before Christmas Eve in 1653, Marit Andersdatter pleaded guilty to charges of unleashing the autumn storm that had caused so much damage in Vardø, another fishing village in northeastern Norway. She admitted doing this in the company of other women. The witches had carried wind in a bag, which they then untied; according to court records, the storm was unleashed immediately. Marit confessed that they had sent a storm across the island in order to settle an old score with the district governor (Lilienskiold 1998, 163). Today, the inhabitants of Vardø still describe sudden changes in the weather by referring to winds being let out of a bag.

GOOD AND BAD WINDS FOR SAILING

One story, taken from a witchcraft trial on the Norwegian coast, shows some elements that are quite typical of such cases. In this story, we encounter a man known to be able to call up a good sailing wind for fishermen. The fishermen believed in his art and often approached him to get help in traveling quickly at sea. But one day, something went wrong. The wind maker lost control of his powers, a sign that external forces—that is, demonic powers—played an important role in the conspiracy.

On May 9, 1627, the local court was in session at Hasvåg, a little fishing village in Arctic Norway. The bailiff questioned a Sami shaman, Quiwe Baarsen, about what he had done when he had made sailing wind for Niels Jonsen two years earlier. Quiwe explained that Niels approached him eight days before All Saints Day, in 1625, and asked for a benevolent and favorable wind to get him to Hasvåg, saying that he would pay him well on his return. Quiwe agreed to this, took off his right shoe, and washed his bare foot in calm sea waters, saying, “Wind to land, wind to land!” Niels and his fishermen then got a good wind for sailing.

On the Saturday before All Saints Day, a woman called Trine went to Quiwe and asked him to make a sailing wind so that her husband, who had sailed with Niels Jonsen, might come home soon. She promised to give him a keg of beer if he would raise the wind. Again, Quiwe agreed, and this time, he took a piglet and threw it into the sea, invoking the winds with the words, “Wind to sea, wind to sea!” But the piglet squirmed too much in the sun, and the wind became too strong. Quiwe said to Trine: “God have mercy on them. I am afraid that they have left prematurely and that the wind will be too strong. If they sailed at the beginning of the storm, may God have mercy, or they will not return.”

Niels Jonsen and four other fishermen perished in that storm. The bailiff asked if Quiwe had raised the wind on other occasions. Quiwe replied: "Yes, I have often made wind for people. Four years ago I made wind for a ship from Nordlandene which was at Karcken, because the men on board requested that I make wind for them. So I washed my foot and stirred a gentle south wind."

In May 1627, Quiwe was burned at the stake for his weather magic. This case shows that it was the *abuse* of weather magic that caused him to be taken to court. When the sellers of wind magic ended their lives at the stake, it was usually because something had gone wrong with their magic.

A FAMOUS WITCH STORM

Wind magic of the kind just mentioned also played a major role in a trial concerning one of the most famous storms in the annals of European witchcraft trials. Scots presumed to be witches threw cats into the ocean in order to raise a storm against a sacred monarch, the Scottish Stuart King James VI. The 1589 wedding between the Danish and Scottish royal houses had to be moved because North Sea witches conspired against the Stuart monarchy. During later witchcraft trials in both Denmark and Scotland, it emerged that a coven of Scottish, Norwegian, and Danish witches had been trying to prevent the marriage of James VI to the Danish princess Anna by causing a huge storm in the North Sea. The extreme winds of this storm prevented Anna from crossing the sea, and the couple was forced to marry in Oslo in November 1589. The storm was considered a treasonable plot to sink the royal Danish fleet as it sailed from Copenhagen, bound for Edinburgh.

James VI reacted by proclaiming himself the mortal archenemy of Satan. In 1597, he wrote a book on demonology describing how to combat sorcery, based on his own painful experiences. Because of this book, King James became the foremost expert of the early modern era on the connection between sorcery and meteorology. He had much to say concerning the plague of northern witches. The Devil's worst havoc occurred in "such wild parts of the world, as Lapland and Finland," the monarch wrote with great pathos, mentioning also the horrible roar of the oceans, the demons of the air, and storm-making witches (James VI 2000, 414).

THE WOODCUTS

Such artists as Hans Baldung [Grien] and Albrecht Dürer are important in regard to the visual representation of weather magic. Their many woodcuts depicting weather witches of different kinds became stereotypical representations of witches during the late fifteenth and early sixteenth centuries. Other variations on the same

theme include images of half-naked women standing outdoors around a cauldron, stirring up a terrible storm. In a famous 1555 woodcut by Olaus Magnus, we see a woman dumping the vile contents of her cauldron into the sea to raise harsh winds.

WEBSTER, JOHN (1610–1682)

Webster, a former chaplain and surgeon to the Parliamentary armies during the civil war, published his *The Displaying of Supposed Witchcraft* in 1677. Back in 1654 he had attacked the universities and defended empirical science in his *Academarium Examen*. After the Restoration, he became a country physician in Lancashire. In 1671, he published *Metallographia: or, an History of Metals*. During the Civil War he had maintained that the Devil, hell, witchcraft, and the Antichrist were all essentially metaphors for evil within man—views echoing those of Reginald Scot in his *Discoverie of Witchcraft* (1584). In *The Displaying* he still wanted us to fear the devil within, but in other respects, his arguments were more orthodox than previously.

At the heart of *The Displaying* was the experience of the apostle Thomas, who was convinced that Jesus had risen from the dead only after placing his fingers in his wounds. Thomas's experience provided convincing proof of the Resurrection, because angels and devils could not fabricate a tangible reality; they could deceive sight, but not touch. It followed that *incubi* and *succubi*, familiars who sucked blood from witches, and similar tangible demonic presences must be entirely mythical. To believe in witchcraft as conventionally described was, Webster asserted, to doubt the unique importance of the Resurrection, when Jesus's tangible body gave incontestable proof that he was no mere spirit. Webster's argument did not require that spirits were incorporeal, merely that their bodies were ethereal, and this was his line of argument.

In order to dismiss the evidence advanced by demonologists, Webster developed a sophisticated view of testimony, dismissing the testimony of single witnesses or of many interested witnesses as unreliable. He was more cautious when considering the (supposedly disinterested) evidence produced by Joseph Glanvill to support the existence of spirits (well-attested poltergeists), and was prepared to accept further reliable evidence of the existence of "apparitions." Webster even accepted that certain spells or charms could be efficacious (perhaps because of the purely natural rhythmic impact of their sounds), and argued that the ethereal spirit of humans (composed of body, soul, and ethereal spirit) lingered long enough after death to cause such phenomena as corpses bleeding in the presence of their murderer. However, he disputed at length Johann Baptista van Helmont's view (a matter of lively debate ever since Johann Weyer in the late sixteenth century) that objects were often found within human beings that could only have been introduced by demonic means. Webster denied that there was any reliable evidence for witchcraft; he insisted that devils were of necessity limited to natural actions, and therefore that transmutation into cats, dogs, or other animals could safely be dismissed as impossible—familiars, almost ubiquitous

in English court cases—must always be fictitious. The true working of the Devil in the world (here Webster's argument rejoined his more radical position during the Civil War) was within our minds, tempting us to sin.

Webster's argument contained subtle equivocations. For example, he denied that he rejects the existence of witches, but he believed there were none, except those who pretended, or were deluded into believing, they had powers they did not have. He treated devils as corporeal, while insisting that their bodies had none of the qualities that ours had, because they could not deceive the sense of touch.

For modern commentators, Webster's book formed one side of a debate on witchcraft conducted among supporters of the Royal Society, the founding institution of modern experimental science. His book was published with the *imprimatur* of Jonas Moore, Vice-President of the Royal Society. The fact that eminent scientists like Robert Boyle defended belief in demons and spirits undermined traditional accounts of the supposedly antagonistic relationship between modern, scientific rationality and witchcraft belief. Webster's *Displaying* was partly a response to the theologian Meric Casaubon's *Of Credulity and Incredulity* (1668), but his target was also the clergyman and scientist (a member of the Royal Society) Joseph Glanvill, whose *Some Philosophical Considerations Touching Witches and Witchcraft* (1666) had become a best seller. The posthumous, revised and expanded version of Glanvill's *Saducismus Triumphatus* (1681), edited by Henry More, contained an extensive attack on Webster; Benjamin Camfield's *Theological Discourse of Angels* (1678) also contained an appendix attacking Webster. A German translation of *The Displaying of Supposed Witchcraft* appeared in 1719.

WENHAM, JANE

Jane Wenham, from Walkern in Hertfordshire, enjoys the dubious distinction of being the last person known to have been convicted for witchcraft in England, at the Hertford assizes in 1712. She had a long-standing reputation for witchcraft, although her troubles really began when a local farmer, John Chapman, thought she had destroyed £200 worth of his cattle through witchcraft; he was also convinced that Wenham had bewitched one of his servants who refused to give her some straw she had asked for. Chapman waited for a suitable occasion to prosecute, but events moved forward when Anne Thorne, a maidservant of the vicar of Walkern, Godfrey Gardiner, began to show strange symptoms, which local opinion attributed to bewitchment.

Wenham was committed to prison, and on March 7, 1712, stood trial before Sir John Powell, a judge who was obviously unconvinced of the reality of witchcraft. Powell was clearly unimpressed when Thorne fell into fits in court, and he disparaged some of the materials produced in court as evidence of witchcraft. He also bullied prosecution witnesses. There is also a tradition that claims that at this trial, Powell, on being informed that Wenham was able to fly, cheerfully commented that there was no law against flying in England. Despite the judge's best efforts, Wenham was convicted, but Powell rapidly secured her a reprieve.

The Wenham case is interesting on several levels. First, it demonstrated how witchcraft was still a very live issue in the village life of the period. Wenham had a well-established reputation for witchcraft, and had been a focus of local fears for many years. These fears prompted various forms of countermagic. At one stage Chapman had burned a bundle of sticks thought to have magical properties, believing that this would force Wenham to reveal herself as a witch. Wenham was also brought before Anne Thorne to be scratched, in the expectation that drawing a witch's blood would bring relief to her victim. One of the pamphlets prompted by the case said that Wenham, hoping to clear her name, voluntarily offered to submit herself to being searched for the witch's mark, or to the swimming test (water ordeal), repeating the latter offer when she was brought before a Justice of the Peace. He refused, because the test was illegal and unjustified, but a clergyman who was present, a Mr Strutt, asked her to repeat the Lord's Prayer. She was able to do this until she came to the 'forgive us our trespasses' passage, a place where witches were generally thought to stumble. Belief in Wenham's status as a witch was not limited to what could be described as ignorant villagers. Anne Thorne's employer, the vicar Godfrey Gardiner, and two other clergymen who examined Wenham were convinced of her guilt, as were the justice involved in the case, Sir Henry Chauncy, and his son Arthur, who took the lead in employing several traditional "proofs" against

Wenham. The knowledge that such solid local authority figures thought Wenham to be a witch might have influenced the trial jury in deciding to convict.

More unusually, the case became enmeshed in contemporary elite politics. In 1712 the "rage of party" between Whig and Tory was in full swing. Among other issues, the two parties differed in their conceptions of the Christian commonwealth and, unexpectedly, a witchcraft case gained prominence as a political issue. The case prompted at least eight pamphlets (the one offering the most detail about Wenham's witchcraft and her trial is listed below) that split along party lines, with the Whigs taking a skeptical line and the Tories (notably the high church pamphleteer Francis Bragge) arguing for the reality of Wenham's witchcraft and of witchcraft more generally. It is no accident that Wenham finally died on the estate of a Whig magnate.

WESLEY, JOHN (1703–1791)

Usually regarded as the most influential believer in the reality of witchcraft in eighteenth-century England, John Wesley was the leading figure in the founding of the Methodist movement from the mid-1730s onward. His personal belief in witchcraft, apparitions, and spirits, reflected in the journals of his life that he published contemporaneously, would have influenced his many followers; so would the numerous accounts of such phenomena, past and present, published in the periodical he founded in 1778 (called the *Arminian Magazine*, later the *Methodist Magazine*) and in other Methodist publications. Wesley thus played a key role in maintaining traditional arguments for the reality of witchcraft and legitimating continued belief in it among his followers and other ordinary people. In practice, like many other eighteenth-century intellectuals, Wesley showed no interest in particular witchcraft cases; he judged the usefulness of the spirit world by evangelical standards and as part of his defense of scriptural religion against infidelity. Contemporary critics and subsequent historians have portrayed him as strengthening the credulity and enthusiasm of his followers,

with witchcraft providing a classic instance of his old-fashioned fundamentalism.

Wesley's belief in witches arose directly from his belief in the authority of the Scriptures, upholding earlier interpretations of Christian theologians and traditional views of Christian history as showing the existence and activity of the Devil, witches, and spirits. Wesley believed that deists and atheists satirized belief in witches and spirits as a means to undermine belief in the Bible, and he scorned Christians who accepted this contemporary fashion and compromised their beliefs. Thus, he found himself concurring closely with post-Restoration apologists for witchcraft and the spirit world.

Like these writers, however, Wesley also believed that he was defending an empirically open attitude to nature, as well as confirming religious truth, by providing well-attested cases of witchcraft and the spirit world and rejecting claims that such instances must necessarily be impostures because witchcraft was theoretically impossible. Wesley's favorite argument was that he had never personally seen a murder, any more than a case of witchcraft, although he believed the weight of evidence that murder occurred; it was skeptics, not believers, who dogmatically refused to accept facts. Whether any particular case was explicable by natural or supernatural causes was an empirical question for each person to decide, and Wesley could himself be neutral or equivocal, as when witchcraft was suspected at the Lamb Inn at Bristol in March 1762 (*Works* 21: 352). Judging from his journals, he never actively investigated or treated a case of witchcraft. There is no evidence that he ever sought to provoke fears of or action against witches, although his followers may have used his comments to justify their own fears.

Wesley was more directly connected with cases of convulsions during conversion experiences, which both preachers and laity sometimes interpreted as the struggles with and eventual expulsion of devils. He was clearly reluctant to reject this view but not particularly upset when such ecstatic phenomena became less common: Unlike other evangelicals, he always emphasized the subsequent piety and activity of his followers, not the drama of their conversion. Clergymen (both Anglican and dissenting) linked to Methodist circles were far readier to carry out exorcism with the biblical means of prayer and fasting than those who felt bound by the canons of 1604. Wesley's direct influence in this regard is not obvious. He was directly involved in reporting ghosts and spirits warning of deaths or other future events, for example, the experiences of Elizabeth Hobson recorded in his *Journal* in May 1768 (*Works* 22: 135–146). His family background included a ghost that haunted his father's rectory at Epworth when young John was away at Charterhouse School in 1716 and 1717. If Wesley was convinced of its reality and

satanic origins, this episode reflected his primary interest in the reality of a spirit world, rather than an interest in witches. Finally, Wesley shared with his followers a providentialist concern to document God's direct intervention in his daily affairs.

Wesley was not a propagandist for witchcraft beliefs but a religious leader who expressed (when many others remained silent) a widespread attitude among those who feared the effects of abandoning traditional authorities supporting such providentialist beliefs as witchcraft. Insofar as these attitudes coincided with popular beliefs and fears of the supernatural, they may have helped to spread the appeal of Methodism; in turn, Methodist preachings and writings sustained such attitudes in their followers. After Wesley's death, mainstream Methodism tended to emphasize the cautious aspects of its founder's attitude, leaving the appropriation of supernatural phenomena to primitive Methodism.

WESTERSTETTEN, JOHANN CHRISTOPH VON (1563–1637)

Known for his persistent witch hunting, Johann Westerstetten represents the fundamentalist type of Counter-Reformation German ecclesiastical prince. First, he initiated a long-running persecution in the territory of the prince-abbey (*Fürstpropstei*) of Ellwangen, which he ruled from 1603 to 1613, with no fewer than seventy-five days of execution (in which groups of four to twelve people were burned). Then, he added another sixty group burnings in the prince-bishopric of Eichstätt, which he ruled from 1613 to 1637. If Jonathan Durrant's revisionist figures (2002) are accurate and Westersetten's reign saw "only" 240 executions in Eichstätt, he would still be responsible for about 550 burnings, including the Ellwangen

persecutions. However, the surviving sources probably do not represent the entire persecution; the number of victims in Eichstätt could rise to 400 or more, and perhaps 700 were executed in both ecclesiastical principalities. Undeniably, Westerstetten ranks among the most bloodthirsty witch hunters in European history.

Born into the minor Franconian nobility, the son of Wolfgang Rudolf von Westerstetten and Ursula von Riedheim, Johann Christoph was dedicated to a clerical career early on, like other members of his family. Originally clients of the counts of Helfenstein, they had managed to rise in importance, taking their name from a small castle near Ulm. Johann Christoph's father served as an official and district judge at Wasseralfingen, one of seven districts of the Benedictine prince-abbey of Ellwangen. The son received an ambitious education, entering the University of Dillingen at age ten, before moving to Ingolstadt in 1581 and to Dole in Burgundy in 1584, without taking a formal degree. His ecclesiastical career began when he was appointed canon of the cathedral chapter of Ellwangen in 1575; subsequently, he was made canon of the cathedral chapter of Eichstätt in 1589 and of Augsburg in 1600. Residing first at Ellwangen, Westerstetten had moved to Eichstätt by 1589, where he served as a dean of the chapter from 1592 to 1602. By then, he had been elected coadjutor of the prince-abbot (*Fürstpropst*), Wolfgang von Hausen (who ruled from 1584 to 1603); he succeeded von Hausen in 1603. Ruling the small ecclesiastical territory until 1613, Westerstetten also became a councillor to the prince-bishop of Eichstätt, and in December 1612, the cathedral chapter elected him as prince-bishop Johann Christoph I of Eichstätt. After Pope Paul V confirmed the election in January, the prince-bishop of Augsburg, Heinrich V von Knöringen, consecrated Westerstetten bishop in March 1613.

In both Ellwangen and Eichstätt, Westerstetten began a determined policy of state building and confessionalization, utilizing the decrees of the Council of Trent to discipline the clergy as well as his lay subjects. More than an instrument, the Counter-Reformation became the motor of Westerstetten's political agenda: He was among the founders of the Catholic League of the Holy Roman Empire, and it was within his diocese that Prince Wolfgang Wilhelm von Pfalz-Neuburg, Count Gottfried Heinrich von Pappenheim, and the Upper Palatinate were converted to Catholicism.

Westerstetten's career was lit with witch burnings. At age ten, he witnessed the first serious trials within the prince-bishopric of Augsburg at Dillingen in 1575. In that same year, he also inherited his seat as a canon in Ellwangen from Johann Egolf von Knöringen, the late prince-bishop of Augsburg, whose death was reportedly caused by witchcraft; because this prebend provided Westerstetten's financial basis for studying, one could claim that witchcraft had launched his career. At

Dillingen, the young canon must have received instruction from the Jesuits dominating the theological faculty, Petrus Canisius and Gregory of Valencia, both ardent supporters of witch hunting. From then on, Westerstetten was a close ally of the Jesuits, whom he introduced in both Ellwangen and Eichstätt.

As a canon, Westerstetten experienced Ellwangen's first witchcraft trials in 1588 and the first serious witchcraft trials in the prince-bishopric of Eichstätt in 1590; because both cases are poorly documented, it is impossible to discover whether he was already actively involved. Clearly, witch hunting did not dominate the prince-abbot's agenda; it was simply part of a universal struggle against diabolical sins and heresies. In the eighth year of his rule at Ellwangen, a major scandal during Easter Mass triggered serious suspicions of witchcraft against an old woman, Barbara Ruefin (1541–1611), who had had a sinister reputation in her village of Rindelbach for many decades. Westerstetten promptly launched a massive witch hunt. He appointed an old friend, Carl Kibler, who had already gained a reputation for conducting witchcraft trials in Swabian Austria, as his court councillor and witch commissioner. Kibler was entitled to bypass the traditional judicial structures of the prince-abbey (which by 1802 counted roughly 20,000 inhabitants and possibly had that many before the Thirty Years' War). Westerstetten knew from his father how cumbersome these structures were.

Supported by Westerstetten, Kibler centralized the trials in the capital, hired foreign executioners for torturing from the prince-bishopric of Augsburg, and by May 1611 assembled a task force of lawyers in order to conduct the trials as effectively as possible. In practice, the trials were shortened by a massive use of torture. Barbara Ruefin was imprisoned on April 7 and executed on May 15; most later trials were shorter. Confessions became so standardized that the commissioner found it easier to replace the names of the suspects with numbers. Except for one man who managed to flee from prison, not a single suspect survived these Ellwangen trials. Some died in prison after massive torturing, and some committed suicide, but most of them lost their lives at the stake—as far as we know, an unprecedented conviction rate. Every fortnight after July 1611, a new group of convicted witches, usually more than 10, was ready for a collective burning. In the second half of 1611, about 126 persons were burned, as at least 143 were in 1612. By February 1613, when Westerstetten was elected prince-bishop of Eichstätt, a minimum of 280 people had been burned in thirty-six bonfires.

Westerstetten managed to find an appropriate successor at Ellwangen, and it seems likely that witch hunting was by then the main criterion. Johann Christoph I appointed Dr. Carl Kibler, chancellor of the prince-abbey and witch commissioner; conducting severe witch hunts was his main qualification. The new

abbot, Johann Christoph II von Freyberg und Eisenberg (who ruled from 1613 to 1620), was almost a clone of Westerstetten, appropriately calling himself Prince-Abbot Johann Christoph II, thus underlining the continuity of government. And there was indeed continuity: After a pause of five months, the new abbot resumed the burnings in the summer of 1613. He continued collective witch burnings, although with smaller groups put on the stakes. By 1618, at least 75 collective burnings can be proven in Ellwangen's sources.

When Westerstetten arrived in Eichstätt in 1613 to govern a territory of about 50,000 to 60,000 inhabitants, his reputation preceded him. The Jesuit Jacob Gretser had celebrated his successful Ellwangen burnings in 1612 in the dedication to his book *De festis Christianorum* (On Christian Festivals). As at Ellwangen, witch hunting was not the top priority on Westerstetten's agenda. Only in 1616 and after simultaneous demands from the population did witch hunts begin simultaneously in the Franconian prince-bishoprics of Bamberg, Würzburg, and Eichstätt, all clearly modeled on the Ellwangen example. This was particularly true in Eichstätt, where Westerstetten started a permanent witch hunt. Although the persecutions eventually stopped in Bamberg and Würzburg and even in Ellwangen in 1618, Westerstetten kept on burning witches until Swedish troops were about to invade his prince-bishopric during the Thirty Years' War.

By then, witch hunting had become a symbol or even a benchmark of Catholicity in Westerstetten's eyes, an opinion not shared within the Catholic League. Bavarian politicians saved Eichstätt's chancellor, Dr. Bartholomäus Richel, after his wife, Maria, had been accused and burned in 1621. Richel was soon promoted to vice-chancellor in the prince-electorate, and his insider knowledge certainly added to the hesitation about witch hunts in Bavaria. Bavarian Jesuits even dared to challenge the prince-bishop's conduct publicly, in Ingolstadt as well as in the Eichstätt Jesuit College. Kaspar Hell, SJ (1588–1634), in particular, preached so sharply from his pulpit in 1625 that the Jesuit general Claudius Aquaviva felt obliged to intervene and silence him. Although Hell courageously continued his campaign against the Eichstätt killings, he was never punished within his order but instead was appointed rector of the new Jesuit College in Amberg (Upper Palatinate). Possibly in reaction to Hell's attacks, the Bamberg suffragan Friedrich Förner dedicated his collection of sermons, *Panoplia Armaturae Dei* (The Splendid Armour of God, Ingolstadt, 1625), on witchcraft to Bishop Westerstetten.

As in Ellwangen, Westerstetten appointed witch commissioners in Eichstätt, and one of them, Dr. Wolfgang Kolb (commissioner from 1624 to 1628), boasted in 1629 of having examined 274 witches, all of whom were subsequently executed. Another Eichstätt

witch commissioner, Dr. Schwarzkonz, was transferred to the service of the prince-bishop of Bamberg for witch hunting in 1628. The Eichstätt persecution had first realized the somber dream of unconditional persecution, of persecution without regard for political, social, or humanitarian obstacles. Numerous new tortures were devised, and some victims denounced more than 200 accomplices. Because no taboo prevented the trials from reaching into the upper classes, one finds burgomasters, councillors, priests, and even the wife of the governing chancellor among those executed. However, there was still an uneven gender distribution, with the share of female victims close to 80 percent, as in Ellwangen. The last documented witch burning in Eichstätt took place on July 30, 1630, presumably because Westerstetten decided to flee shortly afterward, fearing an imminent Swedish invasion. In his final years, Westerstetten remained in the fortified Bavarian town of Ingolstadt, and he never again exercised power as he had before his flight; until his death, it seems that his prince-bishopric was actually ruled by administrators.

WEYER, JOHANN (1515–1588)

In the second half of the sixteenth century, Johann Weyer, a physician to the duke of Cleves, became the first major advocate of Europe's witches—the first who opposed the witch hunt with a combination of philological, philosophical, scientific, and legal arguments and who dared to expose his ideas in print. Sigmund Freud saw Weyer as a forerunner of modern psychiatry, a physician affirming his right to cure his patients

Johann Weyer, physician, skeptic, opponent of witch hunting, and author of *De Praestigiis Daemonum* (On the Tricks of Devils), 1563. (TopFoto.co.uk)

rather than burn them. This assessment was not greatly inaccurate: Weyer indeed wanted to end what he considered a bloodbath of innocent people.

Weyer was born in an area of mixed German and Dutch culture (his surname was variously spelled Weyer or Wier). His interest in demons began early, when he lived with his family, which, according to him, was protected by a *daemon* (a spiritual being intermediate between God and humans). Living in one of the most Erasmian corners of Europe, Johann was educated on the principles of *devotio moderna* (modern, or new, devotion); his younger brother Matthias became a Protestant mystic. At age fifteen, Johann became an apprentice of the great Renaissance magus and physician Heinrich Cornelius Agrippa von Nettesheim. For three years, he studied with this famous (and, to him, beloved) teacher, who moved frequently because of his unconventional behavior and controversial publications. The most important thing Agrippa taught him was the model of an Erasmian man imbued with Renaissance ideals (Midelfort 1988, 238).

Like Agrippa, Weyer wanted to defend the innocence of witches on the basis of physical evidence, supplemented by scriptural exegesis. He differed from Agrippa

and from his contemporaries in his belief that demons can act in the physical world. After this training period, Weyer studied medicine at the University of Paris, arriving in 1533 and taking his degree in 1537. He was subsequently employed as a town physician, first at Ravenstein and then in Arnhem. In 1550, he was appointed personal physician by the tolerant (and later, mentally disturbed) Duke William V of Cleves, Jülich, and Berg, whose father had progressively reformed religion in his duchy under the influence of Erasmus. In these territories, some attempts were made to improve the laws on witchcraft, as Weyer emphasized.

A very important and still open question in Weyer's profile involves his religious creed and views: Scholars disagree on this point because of Weyer's contradictions. H. C. Erik Midelfort (1988, 238–239) saw him as an Erasmian Lutheran, although Weyer's last words in *De praestigiis daemonum* (On the Tricks of Devils) seem an appeal to the Catholic Church, while in the German translation he praised the Lutheran Reformation. Hans de Waardt proposed the hypothesis of Weyer's adherence to the Family of Love, which could explain his refusal to take part in an increasingly confessionalized society (Valente 2003).

In 1563, Weyer published his most important work, *De praestigiis daemonum, ac incantationibus* (On the Tricks of Devils, Incantations, and Poisoners), choosing as his publisher Johann Oporinus, a well-known Basel printer as well as a former pupil of Paracelsus. Until 1583, there were six Latin editions of the work, with enlargements and other significant changes. In 1568, he added a sixth book. Meanwhile, there were three editions in French and two German translations. In 1577 came an abridged version, *De lamiis* (Concerning Witches), aiming at a larger readership.

Weyer actually assigned more power to the Devil than his adversaries ever had, as his title emphasized. The extent to which his work participated in traditional demonological discourse is clearly indicated by both his readers and his opponents. His style of argument was original, and as Gerhild Scholz Williams has underlined, his work formed a demonological trilogy with Jean Bodin's later *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580) and Heinrich Kramer's earlier *Malleus Maleficarum* (The Hammer of Witches, 1486). Like Bodin and Kramer, Weyer employed a large mass of widespread popular and cultural anecdotes to enrich his analysis, although he reversed the causal relationship between demonic activity and witches. He subverted Scholastic tradition by incorporating challenges to the authority of the *Malleus* into an often fundamentally traditional demonology (even borrowing the *Malleus's* explanations for gendering witchcraft). Weyer did not deny the Devil's powers, so adversaries such as Bodin found his arguments weak and tried to demolish his contentions. According to

Weyer, the world was a set of contingencies depending only on God's will in order to keep the Devil's power at a lower level: Everything depended on God's will, and devils acted without trespassing against divine providence. Witches were not responsible because they were weak, ignorant, ill, poor, and sometimes melancholic; the Devil had persuaded them they could do things that were impossible and against natural and divine law. Even if some witches were guilty, Weyer denied that they should be punished with death, because they were essentially victims. Magicians, by contrast, freely tried to subvert natural laws because they made a pact with demons.

Weyer led an assault on superstition and ignorance by maintaining that witches were not possessed by the Devil but instead suffered from mental illness and needed medical treatment. Because of such statements, Gregory Zilboorg long ago considered Weyer "the founder of medical psychiatry." However, this interpretation was excessive: Weyer merely tried to establish that madness and melancholy could explain some witches' confessions. He was undeniably the most thorough opponent of witch hunting in his century. Yet he believed deeply in demonic activities, which seems a contradictory feature. Weyer was neither temperamentally nor intellectually suited for denying the Devil's interference in the world, as Balthasar Bekker would do a century later, because Weyer continued to share the common worldview of his contemporaries.

Weyer's defense of the essential innocence of witches fit with his larger goal of refuting and rejecting any kind of magic as a product of superstition in order to establish a new kind of religion without credulous features. His progressive use of philology linked him to the best humanistic tradition. His defense was based on a new biblical hermeneutics: Against this, all his opponents struggled because Weyer asserted that God had ordered Christians to prosecute magicians but not witches. His works, quickly opposed by such adversaries as Bodin, King James VI of Scotland, and his fellow physician Thomas Erastus, aroused a storm of controversy, lasting until the second half of the nineteenth century. His opponents included the most forceful advocates of punishing diabolical witchcraft. Weyer became notorious as a *sagarum patronus* (defender of witches), as Dudith Sbardellati, an imperial ambassador in Poland, defined him.

Weyer was among the first to approach witchcraft with skepticism and originality. Andrea Alciati and Giovanni Francesco Ponzinibio had made previous attempts, but Weyer was radically different because of his originality; he was the first to marshal four different perspectives (philosophical, legal, natural-scientific, and theological) in support of his goal. His book laid a foundation for later skeptics such as Michel de Montaigne, who opposed executing alleged witches

because the evidence against them was never sufficient to justify their death; Weyer agreed with the idea that the only infallible tribunal was that of Jesus. He followed the Erasmian tradition, and in fact, Erasmus's role among the most important sources of *De praestigiis* was remarkable. Weyer borrowed a large section from one of Erasmus's own works, *Apologia adversus monachos* (Defense Against Monks, 1528), to assert that witches and heretics needed better religious instruction, not death sentences.

Throughout his life, Weyer practiced medicine, and in his own lifetime and during the century after his death, his medical works found appreciative readers (his *Medicarum observationum* [Medical Observations, 1567] was republished). His medical training provided him with cultural and scientific material pertaining specifically to witchcraft. In his treaty on anger, *De ira* (1577), he attempted to prove that Europe's contemporary political and religious troubles derived from anger, and he recommended Senecan stoicism. Erasmian themes also proved useful in Weyer's fight against Satan. It is well known that medicine faced dramatic challenges after the publication of Paracelsus's complete works (also by Weyer's publisher, Oporinus), although Weyer opposed Paracelsian medicine and defended Galen to the point of naming his son Galenus.

Weyer's mission was not successful in his lifetime. Toward the end of his long reign, Duke Wilhelm V of Cleves reinstated torture in witchcraft cases. Protesting against the Spanish invasion of the Netherlands, Weyer retired to his estates and died in Tecklemburg, although his son inherited his position. After his death, his complete works were published in Latin at Amsterdam in 1660, but otherwise, there were no reprintings before a French translation appeared at Paris in the late nineteenth century (in 1885), edited by a pupil of Jean Martin Charcot, D. Bourneville. Not too long afterward, Sigmund Freud ranked Weyer's *De praestigiis daemonum* of 1563 among the ten most important books he had read.

WIESENSTEIG

Wiesenstein, the major city of the small county of Helfenstein in southwestern Germany, was the site of the first known Reformation-era witch panic in the Holy Roman Empire, a hunt that consumed sixty-three victims between 1562 and 1563. Although the actual trial records are no longer extant, contemporary pamphlets and chronicles provide sufficient information for a general overview.

The Wiesenstein panic originated when religious conflict intersected communal agricultural disaster. Unlike their more powerful neighbor, Duke Ulrich of Württemberg (d. 1550), the Counts of Helfenstein, Sebastian (d. 1564) and Ulrich (d. 1570), had resisted reformation impulses until 1555, when they invited Lutheran ministers into the county. Their flirtation with the Reformation, however, was hampered by disputes between proto-Reformed (Calvinist) and orthodox Lutheran preachers and by considerable Catholic pressure. In 1567, Count Ulrich succumbed to his family's urging to return Helfenstein to Catholicism. Religious discord, combined with ongoing efforts to neutralize anticlerical sentiment, worries about large Anabaptist meetings, and an apparently sudden deterioration in the weather, sparked increased fears of demonic activity.

According to Dionysius Dreytwein (1498/1504–ca. 1585), a chronicler from Esslingen (Württemberg), weather in the region was indeed worsening in the 1550s and 1560s. In 1560, a horrible famine formed the backdrop to the trial and burning on July 13 of two witches who confessed to making diabolical pacts and performing much weather magic. In 1562, hailstorms ravaged the area, with a pre-Easter one inspiring the arrest of two accused witches in the county of Helfenstein, who had used magic to kill the younger woman's husband.

Then, in early July 1562, a large, nocturnal forest meeting of Anabaptists was discovered in a wooded ravine near Katzenbühl Castle outside Esslingen, leading to a series of investigations throughout July and August that required the assistance of neighboring authorities. Lutheran and Catholic preachers had long warned authorities of the demonic threat of even a small remnant of Anabaptists, and Count Ulrich frequently attended their interrogations. During this revived governmental anxiety about secret meetings of Anabaptists, a ruinous hailstorm destroyed the wine harvest across much of the region on August 3. This time, angry people pressured their authorities to arrest suspected witches and appease God's wrath. News of the nocturnal Anabaptist gatherings apparently blended with popular belief in weather magic, escalating into a hunt for a large, diabolical conspiracy. Only after the July 1562 arrests did Dreytwein begin recording stories of large groups of witches attending diabolical dances.

One of those convinced by such rhetoric was Count Ulrich, who at this moment was searching for confessional truth. He rejected the orthodox Lutheran position of Johann Brenz—which dominated Württemberg. Brenz opposed capital punishment for heretics and argued that even assisted by demons, witches could not alter the weather. Instead, Ulrich listened to the unconventional pastor of Esslingen, Thomas Naogeorgus (1508–1563), whose enthusiastic witch-hunting sermons had earned him a reprimand from Esslingen's magistrates. Ulrich immediately arrested a number of women in the region of Wiesenstein, whose initial protests of innocence were soon broken down in the torture chamber. When Duke Christoph of Württemberg asked his neighbor for further information, he was told the count had already executed six witches, some of whom had confessed to seeing Esslingen citizens at their Sabbath. The duke arrested three people but later released them.

Count Ulrich ultimately approved the execution of sixty-three accused witches who apparently confessed to murdering twenty-nine older adults and robbing a number of children of their "holy baptism," the latter being a crime strongly associated with Anabaptists. Enduring horrible imprisonment, interrogations, and torture, the accused conformed their confessions to the traditional stereotype of demonic witches: making pacts with the Devil, renouncing God and their baptism, taking demonic lovers, attending witches' Sabbats or dances, making horrible blasphemies against God, and, of course, performing *maleficia* (harmful magic) that included infanticide and weather magic.

The Wiesenstein mass trials raised expectations of demonic, conspiratorial witchcraft across the empire. In the wake of Wiesenstein's mass executions, witchcraft trials spread across the German southwest, affecting fifty separate locales in the 1570s, with larger clusters

replacing individual trials as the norm. Wessensteig experienced another panic in 1583 that saw twenty-five witches executed; fourteen more died around 1605 and five others in 1611.

DUKE OF BAVARIA
(1548–1626, RULED 1579–1597)**

Wilhelm was a zealous witch hunter and Counter-Reformation absolutist duke. The son of Duke Albrecht V of Bavaria, who ruled from 1550 to 1579, and his wife, Anna of Austria, the daughter of the Holy Roman Emperor Ferdinand I, Wilhelm was educated within the confines of post-Tridentine Catholicism. In 1568, he married Renée of Lorraine (1544–1602), daughter of Duke Francis I of Lorraine and Christina of Denmark. The young couple held an illustrious court at the Bavarian castle at Landshut, but in 1575, the prince suffered from a severe disease, leading him to a conversion experience and a decision to alter his life fundamentally. Not long afterward, he succeeded his father, who had defeated the Bavarian Protestant Estates in the 1560s and who had begun a vigorous Counter-Reformation, thus moving Bavaria toward a relatively early confessional absolutism.

Wilhelm not only continued his father’s policy but also devoted his country’s fate even further to Catholicism by sacrificing all his revenues to an ambitious foreign policy. In 1583, he sent troops in order to depose the Cologne archbishop and Prince-Elector Gebhard Truchsess von Waldburg, who had converted to Protestantism, in order to prevent the Holy Roman Empire from becoming Protestant, for Cologne’s electoral vote would tip the next emperor’s election in favor of a Protestant candidate. After the Cologne War,

Wilhelm managed to install his younger brother, Ernst of Bavaria (1554–1612), who had previously become prince-bishop of Freising, Hildesheim, Liège, and Münster, as the new archbishop and prince-electoral of Cologne. Together with several prince-bishoprics and prince-abbeys, Cologne was ruled by younger brothers of the Bavarian dukes (*Sekundogenitur*) from then until 1756, securing the Lower Rhine region for the Roman Catholic Church.

Religious considerations guided Wilhelm’s foreign and domestic policies. Killing heretics at home complemented the destruction of Protestant enemies by war *à* re. In the 1580s, several Anabaptists were burned or drowned because the main lines of Anabaptist migration to Moravia—from Swabia via the River Danube and from Tyrol via the River Inn—crossed Bavarian territory. Ingolstadt renewed its propaganda against Anabaptism, until an even more dangerous enemy was discovered: the witches. It may have been coincidence that the first recorded witch burning in the Bavarian capital of Munich occurred in 1578, the same year when the Marian Congregations were founded there. Infected by a wave of persecution farther west in the neighboring prince-bishopric of Augsburg, Bavaria’s western district courts experienced a rising number of witchcraft accusations in 1589. Duke Wilhelm and his zealous chancellor Ottheinrich von Schwarzenberg (1535–1590) consented to a massive witch hunt, conducted largely by district judges with little support from the Court Council, quite an extraordinary procedure by Bavarian legal customs. The importance Wilhelm gave to witch hunting can be guessed from the fact that he asked Gregory of Valencia to take his son and future successor Maximilian, then a sixteen-year-old student at Ingolstadt, to the torture chambers to instruct him about witch hunting.

Some resistance in his duchy seems to have led to Wilhelm’s April 2, 1590, decree on witchcraft, justifying the hunts while asking for an official opinion from his councillors. Four days later, they explained that the existing discourse on witchcraft, based largely on Johann Weyer and Johann Brenz, was irrelevant for Catholics, and they suggested on April 6, 1590, that a more general opinion should be commissioned from the University of Ingolstadt. The joint opinion of its theology and law faculties, issued three weeks later and stretching over fourteen pages, justified the recent Bavarian persecutions because an extraordinary crime required extraordinary measures. Its authors (including Gregory of Valencia) recommended the *Malleus Maleficarum* (The Hammer of Witches, 1486) and the recent demonology of Peter Binsfeld as guidelines for witch hunting. A few weeks later (between May and June 1590), the faculties’ recommendations were transformed into a general instruction to all judges detailing how to handle suspicions of witchcraft. In 1591, a Bavarian lawyer published a German

translation of Binsfeld's *Tractatus de confessionibus maleficorum et sagarum* (Treatise on Confessions of Sorcerers and Witches, 1589), which was reprinted the following year. However, some leading members of Bavaria's Privy Council, as well as representatives of Conventional to the Bavarian estates, remained dissatisfied with these persecutions and opposed the idea that religion took precedence over customary law. In the spring of 1590, Hans Georg Herwarth von Hohenburg (1553–1626), chancellor of the estates and a correspondent of Johannes Kepler (whose mother had been accused of witchcraft a few years earlier), replaced Schwarzenberg as lord chancellor; the skeptics gained the upper hand. This faction managed to interrupt the “exceptional” hunts and return to ordinary Bavarian legal procedures. Furthermore, they used the duke's weakness after his defeat to urge him into an early resignation.

Wilhelm V “the Pious” overstretched the patience of his subjects and his estates, as well as their financial capacities, by waging religious wars, thus bringing Bavaria close to bankruptcy. In 1594, he agreed to hand over political administration to his son Maximilian, then age twenty-one; three years later, Wilhelm resigned. For another thirty years, the former ruler lived a pious life in a new residence bordering the large complex of Munich's Jesuit College, which he had commissioned. Wilhelm continued to participate actively in such forms of Jesuit piety as Marian Congregations, Jesuit plays, and Corpus Christi processions, and he indulged himself in such extravagant religious rituals as washing the feet of twelve poor men on Good Friday and self-flagellation. But at least he was no longer dangerous to others. It is quite unlikely that any of his constant rituals of repentance included the hundreds of victims he had condemned to the stake as Anabaptists or suspected witches.

**WILLIAM V, DUKE OF CLEVES
(1539–1592)**

Ranking among the most prominent territorial princes in the Holy Roman Empire in the confessional era,

William V of Cleves did not persecute witches, in part because of his personal physician, Johann Weyer, the famous skeptic of witchcraft trials. William's extremely large territories extended from the Netherlands to the west German hill country, playing a key role in the power structures of the old Reich, a fact that determined the duke's unusual political and religious policies. Defeated by Emperor Charles V in 1543, William was compelled to restrict himself to territorial policy. Toward the end of his long rule, he suffered from mental debilitation, though (unlike his son and successor) he was never diagnosed as bewitched.

William V had the benefits of a humanistic education; his tutor, Konrad von Heresbach (d. 1576), admired both Erasmus of Rotterdam and Philip Melancthon, and William's Church policy was consequently moderate. The complicated dynastic situation in his territories permitted an expansion of Lutheranism and later of Calvinism, both of which the duke tolerated. In the confessional conflicts after 1555 between Lutheran territories and those loyal to Rome, his duchies remained unaligned. Until around 1567, he pursued a policy of denominational concession toward Protestantism. After the uprisings in the Netherlands, his policy became more repressive.

Against this background, one finds several humanist—and officially Protestant—scholars at his court in Düsseldorf, including the philologist Andreas Masius and the cosmographer Gerardus Mercator. The most famous of them was undoubtedly Weyer, who lived and worked in Düsseldorf from 1550 until his death in 1578 and wrote his famous work against the persecution of witches there. Because of these men, there was consistent opposition to witchcraft trials in the united duchies of Jülich, Cleves, and Berg. Apart from the electoral Palatinate, William V ruled the only large block of lands in the western parts of the empire where no witches were executed before 1600. Not until after the duke's death did sporadic witchcraft trials occur, in the early seventeenth century.

The example of Johann Weyer and William V reveals how strongly personal relations at court could influence a territorial ruler's record on witchcraft trials. However, Weyer's impact could not prevent the subsequent prosecution of witches in William V's various territories in later generations, although no major panics ever erupted there. Moreover, William's personally motivated tolerance certainly provided Weyer with the opportunity to fight the persecution of witches through his writings even beyond the boundaries of the sizable territory of Cleves.

WIND KNOTS

The magic of tying and untying knots is known throughout Europe, and it is not confined to particular regions or to weather magic. Three knots were known to have been tied during French wedding ceremonies to make the husbands impotent. By the mid-sixteenth century, symbolic fears of castration became so widespread that couples even got married secretly outside of their local church to avoid this affliction. Leading French intellectuals at the time, such as Jean Bodin, feared population decline as a consequence of this diabolical art.

Nonetheless, the magic of knots is best associated with wind force and fishing communities. Skills designed to raise destructive winds or sometimes to prevent them by knot magic have been known since ancient times. In European coastal areas, where sea transportation, fishing, and trade were important, witches could undo knots to raise storms, frighten off the fish, and sink fishing boats and larger trading ships. We know, for instance, of the story of Aeolus—the king of winds—who gave a bag filled with wind to Ulysses in Homer's *Odyssey*. The knot on the bag was to be opened when Ulysses needed fair sailing winds. Bodin told about a Sardinian captain who bought a rope with three wind knots. There were fifty vile ways of using them, he added. Wind knots were widespread in Iceland and other coastal parts of northern Europe. In his world chronicle, *Polychronicon*, a fourteenth-century English monk, Ranulph Higden, described a barren island west of Denmark, whose inhabitants sold wind in knotted ropes to sailors who arrived there. For centuries afterward, the northern peoples were renowned throughout Europe for their mastery of wind magic. Numerous reports circulated about foreign traders who had purchased wind from the natives.

Two authors, in particular, played a part in giving the Nordic peoples a reputation for sorcery related to wind magic: the Danish chronicler Saxo Grammaticus (ca. 1150–ca.1220) and the Swedish Olaus Magnus, an exiled Catholic bishop. Their accounts of the tenacious beliefs in sorcery among the Sami and Nordic peoples spread through Europe during the sixteenth century, simultaneously with the golden age of European demonology. Saxo told how some northern peoples, such as the Finns and the

Biarmians, controlled the elements of nature and used magic instead of weapons to defend themselves. Saxo wrote about weather magic as primarily a Nordic specialty. As examples of Nordic sorcery, Olaus Magnus mentioned wind magic, spell casting, the ability to foresee the future, signing, and the brewing of witches' stews that reportedly brought good fortune. Both insisted that Nordic peoples could interpret and affect the weather. Olaus described how the inhabitants of the far north attached wind knots to straps and used their magical powers to protect themselves against harm. Olaus claimed that "the entire world is irresistibly fascinated by this devilish art. Sailors are forced to buy wind because of the wind conditions in the north, and for a little money they get three bewitched knots tied to a strap. Bad things happen to those who doubt the power of the knots, who are thus forced into seeking advice from sorcerers" (Magnus 1996, 173–174).

The Sami conjured weather and wind by hocus-pocus, wrote the Norwegian poet, vicar, and fire-and-brimstone preacher Petter Dass (1647–1707) in *The Trumpet of Nordland*. If a countervailing wind kept your ship from sailing, he wrote, you could find a Sami to buy a pliant wind through his secret knowledge. His wind magic would be fixed by three knots on a cloth. To untie one knot meant unleashing adequate wind for sailing, but when untying the second knot, "the sail must be pulled down to half mast." And if you untied the third knot, "then she goes too quickly—and with the pump you must bail" (Dass 1954, 72). The opening of a rag's third knot brought on a destructive storm to overwhelm those dealing with the agents of the Devil. Stories of knotted ropes and wind sorcery were retold again and again.

Ever since Olaus Magnus, there has been a close connection between wind knots, witchcraft, and the northern peoples. In a 1616 treatise on witchcraft, Alexander Roberts, the militant Protestant vicar of King's Lynn in Norfolk, described many of Olaus Magnus's stories about northern witches and their weather magic as "meere fictious, and altogether incredible" at first sight. However, he went on to say that these stories could be trusted because "by the experience of our owne Navigators, who trade in Finland, Danmarke, Lapland, Ward-house (Vardøhus), Norway, and other countries of that climate, and have obtained of the inhabitants thereof, a certaine winde for twenty dayes together, or the like fixed periode of the time, according to the distance of place and strings tied with three knots" (Roberts 1971, 20–21). Roberts added the well-known story of what would happen when the knots were untied, using it to convince his readers of the reality of witchcraft and to justify the execution of a local witch called Mary Smith who was hanged in January 1616.

WINTER, ANTON (D. 1633/1634)

An imperial lawyer, Anton Winter was commissioned by the Holy Roman Emperor Ferdinand III to curb the Bamberg witch hunt. Born in a Protestant territory of southwestern Germany, Winter received his doctoral degree from the University of Tübingen in 1605, where he later became a professor of law. In 1621, he was appointed councillor to the Lutheran duke of Saxe-Coburg, where he rose to become president of the high court. In 1627, Winter converted to Catholicism and was appointed councillor by the neighboring prince-bishop of Bamberg, who designated him vice-chancellor.

The opponents of witch hunting in Bamberg, particularly the chancellor, Dr. Georg Haan, expected Winter's support and were responsible for his appointment. However, the Bamberg witch hunts gained momentum and swallowed up a good number of the opponents of witch hunting, including even the chancellor and his family. When the Bamberg witch hunts began to attract the attention of a wider public, a formal hearing took place during a meeting of the imperial electors at Regensburg in August 1630. Winter—to the great dismay of his prince-bishop, the bishop's witch commissioners, and the hard-liners in the Bamberg government—testified against the illegal persecutions. In 1631, he was appointed imperial commissioner to end the Bamberg witchcraft trials and release the remaining detainees. Soon afterward, Swedish troops approached Bamberg. The prince-bishop fled to his estates in Carinthia, and the witch commissioners withdrew to the fortress of Forchheim. Winter now became de facto ruler of the prince-bishopric and advised unconditional

surrender. On February 1, King Gustav II Adolf of Sweden entered the capital. However, a month later, Catholic troops drove the Swedes out, and the returning witch commissioners accused Winter of treason. He was arrested and remained in prison until December 1632. While the commissioners continued to collect evidence against witches, Winter protested against their investigation. His name disappears without a trace in 1633, when a second Swedish invasion led to major changes in Bamberg's regular administration. We do not know whether he was formally indicted, or tried, or liberated by the Protestants. But if he was not executed in early 1633, Winter most likely died during the bubonic plague of 1634, when almost half of Bamberg's people perished, their bodies thrown into mass graves.

WITCH AND WITCHCRAFT, DEFINITIONS OF

According to E. E. Evans-Pritchard (1991, 234), "The notion of witchcraft is a function of misfortunes and of enmities." It assigns responsibility for misfortune to human agents perceived as enemies by the afflicted party. Witchcraft as a concept is universal or nearly so among human societies. As Evans-Pritchard and others have shown, the notion of witchcraft arises in settled societies in which people are compelled to live together under all circumstances, rather than opting to solve conflicts by moving away (Macfarlane 1970; Briggs 2002). Notions of what precisely witchcraft is and of what differentiates it from the related concepts of magic and sorcery vary considerably from society to society. Evans-Pritchard's study of the African Azande people indicated that they thought of witchcraft as an inherited tendency, which could even take the physical form of a substance discoverable by autopsy. One could be a witch and perform witchcraft consciously or—so those accused of witchcraft often argued—unconsciously and involuntarily. "A witch performs no rite, utters no spell, and possesses no medicines. An act of witchcraft is a psychic act" (Evans-Pritchard 1991, 1, quoted by Sharpe 1996, 13).

Sorcerers, by contrast, both among the Azande and in other contexts, employ rites, verbal formulas, and the

manipulation of symbols and substances in order to work magical effects. Necromancers use techniques resembling sorcery in order to consult demons or spirits of the dead. Sorcerers are generally thought to be maleficent, though agents whose actions resemble sorcery, often called “white” or good witches, have in many times and places been considered beneficent and been sought out as prophets and healers, rather than dreaded or avoided. Cunning folk (cunning men and cunning women) are thought to be able to remove witchcrafts, find lost articles, and perform certain acts of healing; they may be referred to as witches, as witch doctors, or, if male, as wizards (Thomas 1971, 177–252).

Most important, the semantic distinctions among sorcerers, necromancers, cunning folk, and witches (both beneficent and maleficent) are often blurred or obliterated in everyday usage and nonspecialist writings. Both in English and in other modern European languages, the term *witch* is often used indiscriminately for all these agents; conversely, one of the other terms may subsume the concept of the witch (for example, the French *sorcier* and *sorcière*). Another shift in semantic values has occurred since the 1970s, as groups of

In a dream, a woman conceptualizes standard elements in diabolical witchcraft: flight with a stick to the Sabbat (and hence apostasy) on a goat/devil, a cauldron, maleficium (weather magic), winged demons, death, invocation from inside a magic circle, and a serpent.
(Anonymous, *Die Hexenvorstellung als Traum*, 1716. From *Hexen: Analysen, Quellen, Dokumente*. Directmedia Publishing GmbH: Berlin, 2003)

religious and political dissidents, particularly in English-speaking countries, have reclaimed the witch as a positive figure to be imitated and reinterpreted in daily life; this “good witch” expresses a Neo-Pagan, non-monotheistic ideal of nature worship and “holistic spirituality.”

However, the definitions of witches and witchcraft that evolved in western Europe from the early 1400s until the end of organized prosecutions around 1700 have determined the shape of modern European and American ideas. Early modern witch mythology was not medieval but a product of the Renaissance and Enlightenment; it was not ignorant or plebeian but was produced by the educated elites. Witchcraft was a miscellany of slanders, stereotypes, and paranoid fantasies, mostly inherited from previous ages, but seasoned with contemporary anxieties. For centuries before 1400, the illiterate and semiliterate strata of society had attributed paranormal or supernatural powers to certain persons. During this period, both secular and ecclesiastical elites had denounced many of the witches’ supposed powers as superstitious, sinful, and contrary to reality. But rather suddenly, about 1400, the skeptical attitude toward witchcraft in literate culture was replaced by a new attitude of credulity.

Between 1430 and 1470, increasing numbers of literate European men, both clerical and secular, convinced themselves that such phenomena were actually possible. But the power to perform such wonders (*mirabilia*) could not be inherently human or natural, as common folk believed; rather, it must be demonic. Whereas illiterate culture had defined witchcraft as either good or evil, the new definition implied that it was always evil in origin, even when its effects seemed beneficent or neutral. Moreover, witches had to be the dupes or slaves of demons, not their masters, as the learned concept of necromancy presupposed. Witches’ power was a *praestigium*, or demonic illusion: Any actual wonders were performed by demons, and even illusory feats derived from demons’ manipulation of reality or human perception. Collectively, these phenomena were labeled by a variety of Latin words (*maleficium*, *veneficium*, *sortilegium*) and vernacular terms (*sorcellerie*, *Hexerei*, *brujería*, *stregoneria*, and so forth; often—as in French, German, or Spanish—with more than one term per vernacular) that English now translates as *witchcraft*. These labels had major shared aspects.

CHARACTERISTICS OF THE WITCH STEREOTYPE

APOSTASY Learned opponents of witchcraft imagined witches as renegade Christians. Throughout the early development of the learned myth, witchcraft was defined as a terrible new heresy, deriving not from a

person's ignorance or deception by others but from willful abandonment of orthodoxy. Thus, witches were condemned as apostates or defectors from the Church, who had formally transferred their allegiance from God, Jesus, the Virgin, and humanity to Satan, the archrival of God, and his demons, the archenemies of humanity. The common goal of witches and demons was to overthrow both Church and society.

MALEFICIUM Witches subverted society by inflicting mysterious harms or destruction on adults, children, livestock, and crops. Whereas folklore attributed mysterious power for both good and evil to witches or to their occult rites and words, intellectuals insisted that such great power, real or illusory, could only come from a supernatural—and thus demonic—source. In fact, witches' apparent power for good was presumptive proof of a demonically bestowed power to perform evil.

FEMININITY A large majority, roughly 80 percent, of persons tried for witchcraft were women, despite occasional majorities of male defendants. This imbalance partly reflected illiterate accusations of *maleficium*, whether spontaneous or solicited by literate judges and inquisitors. *Maleficium* largely affected "women's work," from childbirth and caregiving to food preparation, folk medicine, and many kinds of farm labor. Prejudice, literate and not, contributed: *Maleficium* was performed secretly and was, therefore, considered appropriate for persons lacking physical or economic power. Literate and illiterate stereotypes about women's secrecy, deviousness, and sexual insatiability were already codified in proverbs and literature, and they inflected all the characteristics attributed to witches.

PHYSICAL INTERACTION WITH SATAN AND DEMONS Apostasy implied that a witch did not operate in isolation but had necessarily defected to a rival organization structured like the Church. But unlike induction into the Church, initiation into apostasy happened through personal, even physical contact with the head of the organization: Satan appeared "in person" to wavering Christians to tempt them. Alternatively, he might order a veteran witch to tempt a prospective initiate (a particularly frequent feature during the fifteenth century). All formal initiations into the organization were personally conducted by Satan, not delegated to priests or other representatives. As confirmation, the Devil might demand body parts or other tokens from the initiate or bestow his own tokens or proprietary marks. In contexts where literacy was relatively common, the Devil supposedly required initiates to sign a formal written contract (or, alternatively, a collective "Book of Death"), often in blood, surrendering body and soul in exchange for initiation and the power to perform *maleficium*.

The Devil could take sexual possession of the initiate at initiation or other times. Copulation with Satan or demons was possible for both male and female witches, but women were imagined performing this activity more often than men.

ATTENDANCE AT MASS MEETINGS Initiating adepts into Satan's antisociety required collective gatherings. This stereotype derived from earlier commonplaces about heretics. Over time, the numbers of participants increased, reaching thousands during the sixteenth century. Religious vocabulary designating the imagined meetings expressed their anti-Christian nature: *Sect* frequently referred to the society of witches, but *synagogue* and *Sabbat* (sabbath)—terms implying an analogy with Jewish refusal to accept Christianity—prevailed for describing their meetings.

Aside from initiations, mass meetings provided privileged settings for other imagined witch activities. The most common are described in the following passages.

DESECRATION Sabbat mythology imagined witches as antithetical Christians, performing rituals that inverted Christian ritual interactions with the deity. Catholics imagined that crucifixes and Eucharistic Hosts were debased, not exalted—trampled, besmirched with excreta, or insulted verbally rather than elevated and adored. Beginning around 1590, desecration evolved into the myth of the Black Mass, a systematic inversion of the Roman Catholic Mass performed by or in honor of the Devil. Protestants, who rejected the sacraments that Catholics imagined being desecrated at the Sabbat, frequently denounced the Catholic sacraments as witchcraft, an imposture invented by Satan.

INFANTICIDE AND CANNIBALISM Folkloric mythology imagined witches causing the death of children. In most learned scenarios, dead witches disinterred children after burial and took their corpses to the Sabbat to be cooked and eaten. An analogy with the Eucharist was usually implied or explicit. Children could also be killed at the Sabbat as a sacrifice to Satan, implying a travesty of the Mass as Eucharistic sacrifice.

BANQUETING The Sabbat menu could feature dishes other than roasted or boiled children, reflecting the fantasies of malnourished accused witches, of their learned interrogators, or a combination of both. Defendants imagined everyday or festive cuisine; interrogators suggested disgusting or terrible dishes or that normal dishes lacked flavor: Salt was used to prepare holy water, and both substances supposedly repelled demons.

METAMORPHOSIS Folkloric witches (and occasionally their victims) could become wolves, cats, or other

animals. Learned witchcraft writers declared that only God could effect true metamorphosis; witches merely appeared to be transformed, thanks to a diabolical illusion. The illusion was, however, absolutely convincing to anyone besides authorities familiar with demons' deceptive power. Like ordinary people, witch-hunting advocates imagined that pseudometamorphosis allowed witches to disguise their supernatural *maleficia* (evil acts), particularly infanticide, as the natural destructiveness of animals. Ignorance of such demonic deceptions was invoked to refute opponents of witch hunting.

THE CAULDRON Witches were imagined cooking disgusting or horrifying ingredients: serpents, toads, boiled children, and sacramental materials. The cauldron was also essential for preparing the products discussed in the following sections:

THE INITIATES' POTION A kind of anti-Eucharist, this potion granted witchcraft knowledge and, in some versions, bound the initiate's soul, preventing reconversion to Christianity

OINTMENTS When smeared on witches' private parts or on brooms, pitchforks, and the like, greasy residue from the cauldron allegedly signaled demons to transport witches. Alternatively, it could be smeared on victims, summoning demons to attack them.

POWDERS Powders struck victims with illness or death. There were two varieties, one confectioned by witches, the other by the Devil or other demons. Like the ointment, powder made by witches summoned demons to harm victims. Powder supplied by devils was apparently lethal in itself.

FLYING OR TRANSVECTION Centuries before witch stereotypes solidified, wise women and herbalists apparently used hallucinogenic ointments. Fifteenth-century clerics reinterpreted women's hallucinations of rapid travel as actual flight. Literate culture found flight ideologically useful: First, it argued for the reality of demonic power, because it could not have human or natural causes; second, it explained the elusiveness of the Sabbat and precluded skeptics' empirical investigation.

INFLUENTIAL DEFINITIONS OF THE WITCH

About 1350, the Dominican Jacopo Passavanti used the term *strega* in a vernacular sermon to designate women who claimed nocturnal rambles with the goddess Diana and other godlike females (Kors and Peters 2001, 111). *Strega* (from the Latin *strix*) became one of the standard terms for witches over the next century. Passavanti's term for nocturnal rambling was *tregenda*, which later designated the Sabbat in Italian. However, Passavanti implied that the *tregenda* might be an empty masquerade

put on by devils to deceive simple people, including the *streghe*.

In the fifteenth century, five treatises sketching elements of the witches' Sabbat, often composed by people who had attended the Council of Basel in the 1430s, appeared almost simultaneously, alongside well-documented trials in Dauphiné, the Valais, and the diocese of Lausanne. Such accusations of diabolic witchcraft may indirectly have reflected anxiety over actual religious dissent: The Hussite heresy presented a major challenge to Western orthodoxy in this period and was discussed worriedly by several early witchcraft authors, especially Johannes Nider. Some actual groups were persecuted under names linking them to major medieval heresies: for instance, *Vaudois* or *Valdenses* (Waldensians) or *Gazarii* (Cathars).

Simultaneously, in northern and central Italy, St. Bernardino of Siena popularized similar notions and claimed to have discovered two Roman women in 1424 who had killed numerous children, using an herbal ointment that made them seem to be cats. The women were burned (Kors and Peters 2001, 133–137).

Between 1437 and 1455, two clerics, Johannes Nider and Alonso Tostado, described the same night-rambling women as Passavanti, employing terms (the German *Unholda* and Latin *malefica*) later commonly used for witches. Both writers described the women's failed attempts to convince others that their traveling was real. However, each author claimed or implied elsewhere that magical night traveling was sometimes possible in reality.

Meanwhile, papal decrees in the first four decades of the 1400s mentioned new "sects" of Jews and demon-worshipping heretics who practiced *maleficium* and magic, desecrated sacraments, flew, and caused bad weather. By mid-century, treatises describing the new sect and its gatherings multiplied in Germany, Italy, the Low Countries, and Spain. Most shared a major strategy of separating modern witches from the dreaming women mentioned by the *Canon Episcopi* (Stephens 2002, 20–26, 134–137).

From the 1450s through the 1470s, treatises on witchcraft phenomena became increasingly Scholastic. Alonso de Espina (ca. 1459/1460) classified witchlike heretics along with Jews, Muslims, and devils as enemies attacking the "Fortress of [Christian] Faith." He specified that demon-worshipping women called *xurguinae* or *bruxae* were deluded about their supposed powers but were and should be prosecuted. Treatises of this period defended the reality of witchcraft, the Sabbat, and even demons themselves, by peremptorily refuting pagan and Jewish skepticism about the reality of spirits.

With the 1486 publication of *Malleus Maleficarum* (The Hammer of Witches), witchcraft mythology attained systematic theoretical consolidation, despite

ignoring the witches' Sabbat. The *Malleus* argued formally for a predominance of women among witches, and it dated the origin of the "sect" to around 1400, when, it claimed, women began voluntarily fornicating with incubus demons for pleasure, rather than being molested by them; demonic copulation was considered widespread among witches (Stephens 2002, 32–55). The *Malleus* devoted two books to historical and theoretical treatment, and its entire third book focused on practical legal procedures for discovering, entrapping, prosecuting, and executing witches, all of which applied to secular as well as ecclesiastical justice.

Subsequent definitions of witchcraft evolved less rapidly in their broad outlines, yet witchcraft progressively separated itself from conventional forms of heresy. By the Reformation, witchcraft had become a practically self-standing phenomenon in the literate imagination, so socially dangerous as to subsume other varieties of religious deviance. A group of related northern Italian treatises from the early 1520s strikingly illustrates this consolidation. About 1521, Silvestro Prierias coined the neologism *strigimaga*, or "witch-sorceress," to argue that witchcraft was a new phenomenon, inadequately defined by the ancient terms *strix* and *magus/maga* (child-attacking vampire and magician). To define the *strigimaga*, Silvestro Mazzolini explored the origins and meanings of other terms, Latin and popular, pagan and Christian, ancient and modern. *Maga/magus* is a vernacular synonym of *malefical/maleficus*; *masca* is a vernacular synonym of *larva*, referring to the ease with which ghosts (and hence witches) evade detection, as if "masked." The Latin *lamia* and *strix/strigia* and Italian *stregal/strigal/stria* show that witches victimize children. The *strix* is a screech-owl, believed to suck sleeping infants' blood, the *lamia* a monstrous humanoid beast that devours its own children. All these terms refer metaphorically to witches' deeds (Stephens 2002, 279–280).

In his *Quaestio de strigibus* (An Investigation of Witches, 1523), Prierias's pupil Bartolomeo della Spina maintained that everything witches confessed was true and real, though not always in the way that witches and common people thought. Only inquisitors were qualified to decide in what manner witches' experiences were real; most happened "in the body," but some were demonic illusions. Yet all witchcraft phenomena were enabled and overseen by demons.

Gianfrancesco Pico della Mirandola, who had personal contacts with both Prierias and Spina, extended their conclusions in his *Strix* (The Witch, 1523). Witchcraft and particularly the Sabbat featured a mixture of ancient and modern perversions, attested by ancient Greco-Roman terms such as *strix* and *lamia* (Pico gave an even fuller catalog of such terms than Prierias); other abominations, involving heresy, were new (Elmer, Webb, and Wood 2000, 378–380).

Between Pico's *Strix* and Jean Bodin's *De la démonomanie des sorciers* (*On the Demon-Mania of Witches*, 1580), witchcraft was little discussed (mainly by critics such as Johann Weyer), and persecutions declined, while Western Christians coped with the overt doctrinal conflicts of the Reformation and Counter-Reformation, with their related social upheavals (Peters 2001, 240–243).

The second wave of witchcraft treatises, beginning with Lambert Daneau and Bodin, was more systematic and often even more virulent and extreme in its assertions than writings of roughly between 1430 and 1530. For example, the *Malleus* named only four crimes that were characteristic of all witches (Kramer 1971, 20–21), whereas Bodin's work enumerated fifteen (Kors and Peters 2001, 291–294). Bodin did not imagine completely new crimes; rather, he exploited rhetorical effects, such as lengthy numbered lists. Bodin, a political theorist, strongly emphasized witchcraft as *lèse-majesté* against God, enumerating seven benefits obtained by punishing witches, especially "to appease the anger of God" and obtain his blessing on the state (Kors and Peters 2001, 291).

Martín Del Rio's *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599–1600) related witchcraft to the history of heresy from Hussitism to Calvinism, giving five reasons why "magic regularly accompan[ied] heresy" (Kors and Peters 2001, 332–334). Del Rio named eleven separate stages in the solemnization of the witches' pact with Satan at the Sabbat; these stages, like much else in Del Rio's treatise, were copied by Francesco Maria Guazzo in his *Compendium Maleficarum* (A Summary of Witches, 1608, 2nd ed., 1626) and synthesized with information from Nicolas Rémy's *Daemonolatriae* (Demonolatry, 1595) and other earlier works.

With Guazzo and Pierre de Lancre (*Tableau de l'inconstance des mauvaises anges et démons* [Description of the Inconstancy of Evil Angels and Demons], 1612), the stereotype of the witch reached encyclopedic proportions. Not coincidentally, editions of these two works contained the most complete pictorial illustrations of witches' activities, especially at the Sabbat, found anywhere in witchcraft treatises.

WITCH CRAZE

Until the mid-twentieth century, the term *witch craze* was a common descriptor for large witchcraft trials and was often applied to the European witch persecution in general. Subsequent scholarship has preferred to replace this value-laden term with the more neutral *witch hunt* or *witch panic*, defined as "any hunt resulting in 20 or more executions in one year" (Midelfort 1972, 9). However, in 1980, *witch craze* was redefined as an "explosive amplification of witchcraft caused by a temporary syncretism of the traditional witch beliefs of the common people with those of the more specialized or educated classes" (Henningsen 1980, 391), for instance, the demonological theory of European intellectuals or the elaborated witchcraft mythology of African witch doctors. The two phenomena may be distinguished by a series of opposed characteristics:

1. *Witch belief* is transmitted by long-term oral tradition in the local community, uninterrupted and continuous. *Witch craze*, by contrast, is a short-lived phenomenon and exists only momentarily as local rumors and propaganda.
2. Socially, *witch belief* has several functions within the local community. It is part of a cognitive system (for example, explaining individual misfortune) and of a moral system (most societies do not tolerate envy, and envious people are therefore thought to be witches). Moreover, belief in witchcraft may function as a safety valve for latent aggression that cannot be expressed otherwise because society forbids it. For instance, if your mother-in-law lives with you, you must endure her caprices, but if you can convince your family and your neighbors that

she is a witch, you can throw her out of your house. *Witch craze*, by contrast, is totally dysfunctional, both cognitively and morally, and any function as a safety valve takes such explosive forms that it tears local society into pieces.

3. *Witch belief* is characterized by an unsystematic mythology, while *witch craze* has an abundant and elaborated superstructure.
4. In *witch belief*, harm to individuals (*maleficium*) is necessary for initiating a trial, but in a *witch craze*, this aspect becomes insignificant; the primary thing is to identify someone as belonging to the witches' group because he or she, for instance, was seen at the Sabbath or was found to have a Devil's mark.
5. In *witch belief*, the compact with the Devil or other supernatural beings is unimportant or even totally missing. In a *witch craze*, it is overwhelmingly important, as the accusation is concentrated on this point.
6. In *witch belief*, the usual suspects are individuals who do not fit into the community: old people, widows, cripples, and beggars. In a *witch craze*, all sorts of people may be accused, including even children.
7. Finally, in *witch belief*, usually only one or two people in each village are accused. In a *witch craze*, up to half the population may be branded as witches.

In other words, the witch craze was not just a reinforced form of witch belief but rather a sort of mutation, whereby witchcraft was prosecuted as a heresy, instead of being treated as an ordinary crime along with theft and homicide. Most trials of the European witch persecution were *maleficium* cases and belonged to the category of witch belief. By contrast, the witch craze was a rather rare phenomenon. The largest outbreaks occurred in Sweden, Germany, and in the Alpine and Pyrenean regions. Postcolonial Africa has experienced occasional epidemics of witch craze in the shape of the so-called witch-finder movements.

While witch belief has disappeared from most Western societies, witch craze also tends to return there in new disguises. An example of this was the wave of trials for satanic child abuse that started in the last decades of the twentieth century with a sort of demonology developed by psychotherapists and social workers, with obscure techniques for identifying the child victims, and with the same flaws in judicial procedure as in the historical witchcraft trials.

WITCH FINDERS

Witchcraft is normally understood as damage of a mysterious or supernatural nature caused by another person's ill will or evil intent. There is often a fundamental uncertainty about the real identity of a witch. Therefore, the belief in witchcraft includes ideas about how the identity of witches can be revealed. Individuals who fulfill this function of revealing the identity of witches are called witch finders. In the same way that witchcraft is, in itself, a multivariuous phenomenon, differing types of witch finders display no uniform characteristics. In the endemic form that witchcraft takes at the village level, the witch finders had their allotted place in the system, not just to expose witches but also to provide countermagic. Extreme forms of finding witches appeared in connection with extensive witch hunts, wherein witch finders temporarily played an important role in initiating and, in a spatial context, communicating witchcraft. The appearance of witch finders may help explain the disparate occurrence of the witchcraft trials in the sixteenth and seventeenth centuries.

However, in a society where witchcraft has a prominent place as an explanatory system, it is not always necessary (in the case of minor damage, for example) to disclose the identity of the witch. Similarly, in some cases, the witch may be seen as an external enemy rather than an internal one, as is usually the case, and could therefore be banished by countermagic, thus dispensing with the need to disclose an identity. In some situations, the need to find the witch through a witch finder is considered unnecessary, for instance, when a conflict arises in which one of the parties is threatened and fears immediate reprisal. The occurrence of an accident in these circumstances means that a witch is undeniably exposed. The village witch, a classic figure who was already surrounded by rumors of witchcraft, had every reason to be wary of making threats or using a sharp tongue. Similarly, in the case of a person performing magic or sorcery—that is, ritualized, externally observed behavior—it might seem evident who was responsible for an accident, even if the person seen carrying out suspicious acts by the victim of the witchcraft was not expressly an enemy of the victim.

Somewhat ironically, one could say that when a traditional witch finder was employed, it was quite

likely that the witch would remain anonymous and not be exposed before he or she succumbed to the witch finder's countermagic. Naturally, the expert in magic could claim to know the name of the witch, but equally, it was better not to be too explicit regarding his or her identity, as this could lead to an outcry or major conflict between the parties involved and might even attract the attention of the clergy or the civil authorities. In the cases where individuals were identified, it was in the interest of the witch finder to ensure that the accused was at a safe distance and not in direct conflict with the victim.

The term *witch finder* does not always imply a human agent but can also be used to refer simply to a method. Methods such as beating *fuligo septica* (believed to be the vomit left by witch familiars after stealing milk from the cows on a farm) or burning straw as a way of forcing the witch to disclose him- or herself are well known in folklore. The use of oracles is slightly different in that it requires the names of the suspects to be presented to the oracle. It should be emphasized that certain witch finders could also operate unconsciously by putting themselves in a trance in order to be able to detect and expose witches. An institution could also act as a witch finder. The judicial system supplemented or even competed with the traditional witch finders. However, while the latter meted out symbolic punishment, the former executed those found guilty. Thus, the work of the witch finder was not exclusive to magical experts but could equally well be carried out by the victim of witchcraft, an impersonal technique, by an institution, or even by the witch himself or herself. Antiwitch movements studied in traditional communities have sometimes been shown to produce self-confessed "witches," but this is a secondary development in relation to the "normal" witch finder's initial measures in the process of inducing people to refrain from witchcraft. The use of violence to achieve these ends should not be overlooked, nor should the fact that blood has been shed in the grim persecution of witches in postcolonial contexts. In Europe in the early modern period, spontaneous confessions were unusual but hardly surprising in view of the punishment involved. In the major witch hunt at the beginning of the seventeenth century in northern Spain, however, spontaneous confessions were surprisingly common. This finding is probably related to the generous granting of pardons that characterized the Inquisition (Henningsen 1980).

Concurrent with the traditional witch finders, a more sensational and dangerous type of witch finder was sometimes seen in connection with major witch hunts. This figure was the witch finder proper. In contrast to most of the traditional witch finders, such individuals were not concerned with counteracting witches but only with exposing them. Similar witch finders and movements, known as antiwitch

movements or witch-cleansing movements, have existed in various communities with a belief in witchcraft, in widely differing eras and locations. These movements have the aim of freeing their communities from witchcraft once and for all. In this respect, they are not retrospective, as in the normal case of trying to discover who is responsible for having caused particular damage, but are, on the contrary, more concerned with the future. The witch finder here is not operating in the service of an individual but on behalf of the whole community, even though the dynamic role of the witch finder should not be underestimated. The recurrent nature of this type of movement suggests that it is not necessarily related to deep social upheavals, which might easily be assumed in the case of African communities in a colonial or postcolonial context or in relation to early modern Europe. The witch finders often show creativity in adapting new methods to fit traditional conceptions and attitudes. They are entrepreneurs who know how to satisfy demands and take advantage of the situation to gain prestige or financial rewards. This, in turn, makes witch finders dependent on a continuing witch hunt.

Witch finders existed all over Europe. The most famous of these was probably Matthew Hopkins, "Witch-Finder Generall," as he is titled on the frontispiece of his book *The Discovery of Witches* (1647). Hopkins was a relatively insignificant gentleman who lived in Manningtree in northeast Essex, England. In the 1644–1645 winter, he apparently became very concerned about the presence of witches in the neighborhood, and it seems likely that 19 witches were put to death in the summer of 1645 as a consequence of the trials resulting from his fantasies. The persecution of witches spread rapidly to neighboring counties. In total, some 250 suspected witches were brought before the authorities in the East Anglian trials between 1645 and 1647, the majority in the first intensive months of the witch hunt (Sharpe 1996, 237–238). Hopkins and his less well-known colleague John Stearne were active in Essex and in other counties. They traveled around looking for witches, were paid for their services, and took part in the trials. Methods such as pricking, searching for strange excrescences, swimming, and sleep deprivation were included in Hopkins's repertoire. Even though no one can deny the personal importance of Matthew Hopkins, research has often focused on the contemporary social climate that provided the necessary conditions for his success as a witch finder (Macfarlane 1991; Sharpe 1996).

There are also references to witch finders in France in connection with the outbreak of local witch hunts in the 1640s and 1670s. It is reported that higher authorities frowned upon their activities. In January 1644, in the vicinity of Toulouse, such a man, who was supposed to be skilled in the art of disclosing "the Devil's mark," was

summoned to Eauze. He had also previously been operating in Gascogne. It is worth noting that complaints about suspected witches had been made before the arrival of the witch finder. His investigations, for which he was well remunerated, showed that only two of ten elderly women lacked the numb spot that was the distinguishing mark of a witch. In the spring of 1671, a fourteen-year-old youth named Jean Parrabère, from Chalosse, was operating in the vicinity of Condom, disclosing witches by looking them “in the eye.” In Mezin, the youth’s activities resulted in almost 60 of the 200 people gathered there being identified as witches. Jean Parrabère claimed that he had been taught the art by his wet nurse, who had taken him with her to a witches’ Sabbath as a young child (Mandrou 1968, 373, 441).

Children made up a special category of witch finders that gradually increased in significance. As early as the first half of the sixteenth century, in fact, children were referred to as witch finders in Navarre in Spain. In 1527, two girls, aged eleven and nine, appeared before the councillors of Pamplona and made the following claim: “Sirs, the truth is that we are witches like many others, who do so much evil. And if you want to punish them we will point them out to you, for we have only to look at their left eyes to be able to recognise them, since we are of their kind. Anyone not of their kind could not do it” (quoted in Caro Baroja 1965, 145). In the persecution that allegedly followed, the girls’ services were called on to disclose many witches. This story is reported from an unreliable source, but it could possibly be based on a real witch hunt that took place in 1525 (Monter 1990, 262–263).

In Sweden during the infamous Blåkulla trials, from 1668 to 1676, children identified witches in various ways. The abduction of children meant that they could both identify the witch that had carried them off to the witches’ Sabbath and recognize others who had taken part. Other children were acting as witch finders, basing their judgments on the physical appearance or clothing of the women. Vanity and pride were abominations. In the small town of Söderhamn on the coast of northern Sweden, this was taken so seriously that the townswomen demonstrated their good intentions by ceremonially burning their hats on a fire (Wall 1989). Children with second sight were often involved at a later stage of the process than children who had been abducted, implying that the witch hunt actually preceded “witch finding,” which thereby acted as a confirmation of guilt.

Satisfying the need for methods of verifying witchcraft led to the use of these supposedly clairvoyant children. From a contemporary perspective, identifying witches in return for financial remuneration, which was the role of these children in the witchcraft investigations, appears cynical. That the clergy and parish administration sent elsewhere for clairvoyant children

who could expose witches was not due to a shortage of such children in their own parishes. Their value lay in their ability as outsiders to distinguish more easily good people from evil, thereby achieving an apparent objectivity. However, bribes and blackmail flourished in these circumstances, and the original aims were thwarted. Central civil authorities condemned these practices, and the local clergy was censured. The great confidence people placed in the evidence given by these children is demonstrated in a case from the province of Medelpad. When it was proved that one of the boys giving evidence had contradicted himself, instead of denouncing the use of these children as witnesses a replacement was sent for. To prove his innocence of any involvement in witchcraft, a man from the same province produced a certificate of denial signed by clairvoyant children from Ljusdal in the neighboring province of Hälsingland (Sörlin 1997).

WITCH HUNTS

Witch hunts were an early modern phenomenon. Geographically, they occurred most often in some parts of the Holy Roman Empire that were extremely fragmented legally: Franconian ecclesiastical territories; the Saar and Mosel regions; the electorates of Trier and Cologne, including the duchy of Westphalia; the duchies of Luxembourg and Lorraine; the prince-bishopric of Münster; Schleswig-Holstein; and Mecklenburg. Elsewhere, they occurred on the peripheries of France (for example, Navarre and Languedoc), in the Swiss Confederation, the Spanish Netherlands, the Austrian Habsburg patrimonial lands, and western Poland. Witch hunting was generally less intense in both Mediterranean and northern Europe, with Catalonia from 1618 to 1620 as a notable exception in the former area and lowland Scotland, eastern England, in 1645, and northern Sweden from 1668 to 1674 as exceptions in the latter area. Even in areas affected by severe witch panics, trials occurred in unequal numbers everywhere. There was a great deal of regional variation in persecution; some areas experienced endemic, others epidemic, episodes of witch hunting. Witch hunts had many different causes: Current witchcraft scholarship acknowledges that no single factor explains all early modern witch hunts.

LEARNED WITCHCRAFT AND THE CHRONOLOGY OF PERSECUTION

Witch hunts were clearly not a medieval phenomenon, but ideas about witchcraft had roots in medieval belief systems. By 1400, it was generally accepted that individuals could work harm (but also effect cures) by means of magic. During the fifteenth century, a far more terrifying belief developed that a witch sect met secretly in order to plot harm to the rest of society. This new concept was an "invention" of the late medieval learned elites, created from several different sources, including confessions elicited by inquisitors from Cathar and Waldensian heretics, in which flight through the air, devil worship, and the sacrifice of children were already mentioned. Anti-Semitism also played a role, as the witches' gathering was called a "synagogue" (or Sabbath), where witches, like Jews, supposedly desecrated Christian rites and indulged in the ritual murder of infants. Human pacts with the Devil had been discussed since St. Augustine and renewed by

St. Thomas Aquinas. Ancient beliefs about the efficacy of magical and demonic powers, harmful magic, the evil eye, and the ability of certain people to change themselves into animals and to fly at night existed alongside these learned ideas.

These ideas converged in the 1430s. The Dominican Johannes Nider systematically summarized these ideas in his *Formicarius* (The Anthill), written in 1437 and 1438 after he attended the Council of Basel, the nexus from which the previously unknown crime of witchcraft spread to a sizable proportion of Europe's learned elite. The new medium of printing sped this process. Such demonological texts as the infamous *Malleus Maleficarum* (The Hammer of Witches), first published in 1486 by Heinrich Kramer, found their way into Europe's universities, courtrooms, monastic libraries, and private households, wherever Latin was understood. Uneducated contemporaries learned about the new sect of witches through sermons.

The earliest recorded witch hunts—some with over a hundred executions—come primarily from lands near Lake Geneva around 1430: the duchy of Savoy, the Val d'Aosta, Dauphiné, and today's Swiss cantons of Valais and Vaud. Here, the belief in an alleged secret sect of witches and inquisitorial techniques (often applied by laymen) mutually reinforced one another to create chains of trials, in which confessions forced from suspects under torture confirmed the fantasies of court authorities. Moreover, confessions of weather magic and other harmful magic appeared to explain genuine crises (such as harvest failure or illness) afflicting contemporaries.

Witch hunts soon spread south into the Italian-speaking Alps and as far north as the Low Countries, as in the trials in Arras in 1459. They also moved northeast into German-speaking Switzerland, the regions bordering Lake Constance, and the upper Rhineland, where many people were executed for witchcraft before 1500. The activities of Inquisitor Kramer and the impact of his particularly misogynistic demonology, the *Malleus Maleficarum*, promoted clusters of trials in Alsace, the city of Metz, and the area between the Rhine and Mosel Rivers. Witch hunts petered out temporarily in west-central Europe after 1520 or 1530, probably because of the impact of the Protestant Reformation, but they resumed again after 1560, often in conjunction with severe agrarian crises. They continued (with significant regional variations) until the second half of the eighteenth century, with the worst witch hunts occurring between 1580 and 1650.

SECULAR AND ECCLESIASTICAL COURTS In the early phase of the witch hunts before 1500, secular courts rather than inquisitors were already taking the leading role in persecuting alleged witches. In countries where the prosecution of witches remained entirely or largely

in the hands of the Inquisition (Spain, Portugal, and Italy), witch hunts were largely prevented, and accusations of witchcraft made against an alleged “accomplice” by a confessing witch did not constitute valid evidence. Death sentences for witchcraft were very infrequent; in Portugal, the Inquisition ordered only perhaps ten such executions. Between 1610 and 1614, the Spanish inquisitor Alonso de Salazar Frías brought the witch hunts in Spanish Basque lands to an end, after secular judges had executed many French Basque witches. In areas influenced by the Roman Inquisition, witchcraft trials were also pursued with moderation. In Poland, witch hunting was relatively restrained, while the crime remained under ecclesiastical jurisdiction but gradually increased in the sixteenth century when secular courts, which allowed burning at the stake, took control of witchcraft persecution.

NUMBERS EXECUTED AND CENTERS OF PERSECUTION

The idea that 9 million people were executed during the early modern witch hunts has long since been refuted (Behringer 1998). Estimates now put the total number of executions in Europe between 30,000 and 60,000. The attempt to arrive at exact statistics for particular regions almost invariably fails because of the incomplete survival of sources. Moreover, in order to calculate the intensity of persecution in a particular area, one must compare the number of executions with the overall (adult) population. And when counting “victims” of the witch hunts, we must be careful to include not just those who were executed. Suspected witches who were released after refusing to confess were often physically and psychologically severely damaged by their ordeal and subsequently led a precarious existence on the margins of society. Some areas with low “execution rates” experienced many lynchings and unofficial executions of reputed witches or released witch suspects: Hundreds of people were murdered in this way in the French Ardennes in the seventeenth century. Our statistics on the total number of executions given previously must therefore be adjusted upward to include other kinds of victims of witch hunts.

Territories that we can categorize as centers of the most extreme witch hunts include all three of Germany’s Catholic archbishop-electoralates: Trier (with at least 1,000 trials), Mainz (with around 2,000 trials), and Cologne (with over 2,000 trials). The witch hunts in Franconia’s Catholic ecclesiastical territories were equally intense: Around 900 witches were executed in the prince-bishopric of Bamberg, while around 1,200 met this fate in the prince-bishopric of Würzburg. More than 4,000 trials occurred in Lutheran Mecklenburg. Overall, Germany probably saw nearly 25,000 executions for witchcraft. On its western edges, persecution of witches was very severe in the Catholic duchies of Lorraine and Luxembourg (both with

around 3,000 trials). But the Protestant Pays de Vaud, in French Switzerland, had perhaps the highest known per capita execution rate of any region, with over 50,000 people (at least 1,700 deaths, over 20 per thousand) during the early modern period.

Territories on the periphery of Europe experienced a more restrained pattern of witch hunting. There were around 2,000 executions for witchcraft in all of Scandinavia (half of them in Denmark), although the region was much less densely populated than west-central or southern Europe. There were not more than 500 executions—and perhaps even significantly fewer—in England; Scotland, by contrast, was less than one-fourth as populous but executed 1,000 witches. In France, the *parlements*, or sovereign judicial courts, provided a strongly centralized administrative structure that exercised control over local courts: Here, fewer than 500 people out of a population of 16 to 20 million royal subjects were legally executed as witches. Eastern Europe also experienced some witch hunts, though later than in the west. Poland’s witch hunts occurred mostly between the mid-seventeenth and mid-eighteenth centuries, but exact statistics are impossible, and no more than seven witches are ever known to have been executed in one place in one year.

THE ROLE OF RELIGION The religion of the authorities in any particular territory played only a subordinate role in determining the willingness to hunt witches. In Germany, Calvinist authorities in the Palatine electorate systematically quashed every attempt to instigate or pursue witch hunts (Schmidt 2000), while the rulers of such Lutheran imperial free cities as Nuremberg also demonstrated a marked reluctance to persecute witches. However, other German Protestant areas (such as Mecklenburg or Lemgo) experienced extremely severe episodes of witch hunting. Not the religion but the degree of political and judicial fragmentation of an area had the greatest influence in shaping the severity of witch persecution. Such small ecclesiastical territories as the imperial abbey of St. Maximin or the Mergentheim Chapter of the Teutonic Knights, with only a few thousand subjects, experienced truly devastating witch hunts. Similar developments affected some small secular lordships, especially where the right to exercise criminal jurisdiction was in dispute, particularly along some western edges of the German Empire such as Luxembourg or the Saarland—or in Silesia, near its eastern edge, after 1650. Larger, less fragmented territories, where local courts were answerable to central courts staffed by professional jurists, as in France or the duchy of Bavaria, usually avoided witch hunts.

THE GENDER AND SOCIAL STATUS OF ACCUSED WITCHES A large majority of those who fell victim to witch hunts were women, even if in a few regions, such

as Finland or Normandy in France, more men than women were executed. Kramer focused solely on women as susceptible to the temptations of the Devil in his misogynistic *Malleus Maleficarum*, and in many places, popular opinion supported him. Generally speaking, confessionalism affected witch hunting only marginally in comparison with juridico-political issues. In much of Protestant northern Europe (Sweden, Denmark, the Netherlands, England, and Scotland), women constituted 80 to 90 percent of those executed, a notably higher rate than in most parts of Catholic Germany (Schulte 2001). But in fervently Catholic Poland, 96 percent of all executed witches—the highest rate known in Europe—were women, while in Calvinist Vaud, almost 600 men—more than anywhere in Catholic Germany—were executed as witches; moreover, Iceland, where more than 90 percent of witches were men, was Lutheran.

The stereotype of the witch as a poor, old, widowed woman was emphasized in the writings of both Protestant and Catholic demonologists and by such opponents of witch hunting as Johann Weyer and Friedrich Spee. However, this stereotype consistently broke down, both in the earliest witch hunts and especially in the large-scale witch hunts of the late sixteenth and seventeenth centuries. Young, married women; children and teenagers; and men (including some holding political or religious office) became increasingly caught up in chain trials during major hunts. Midwives were not singled out for persecution as witches, even though this idea is still emphasized occasionally.

FACTORS INFLUENCING THE OUTBREAK OF WITCH HUNTS Despite the many reasons behind the witch hunts that struck different parts of Europe at different times, certain common factors increased the likelihood for multiplying witchcraft trials. Not all these factors needed to be present at the same time and with the same intensity in any particular region to trigger witch hunts.

THE ACCEPTANCE OF THE CUMULATIVE CONCEPT OF WITCHCRAFT Nearly all cultures believe in the efficacy of harmful magic and the existence of individuals who practice it: These beliefs constitute anthropological constants. But belief in blasphemous witches, who carry out evil deeds with the Devil's help, was specific to Latin Europe and the Americas. The five components of the so-called cumulative concept of witchcraft (the pact with the Devil, sex with the Devil, flight, attendance at Sabbats, and the performance of harmful magic) were not, however, accepted with equal enthusiasm and speed. Throughout northern Europe and Scandinavia, the cumulative concept of witchcraft was adopted very slowly and imperfectly; most witches were tried for the traditional crime of harmful magic,

and only far in the seventeenth century did attendance at Sabbats feature in charges leveled at suspected witches. Wherever belief in the Sabbat remained weak, mass persecution was almost impossible because there was no reason to force the names of supposed accomplices from alleged witches under interrogation.

THE CONTEXT OF CRISIS From 1400 to 1700, various radical changes and crises affected many different aspects of life. Climatic deterioration—which earned for the period the name Little Ice Age—caused long-term inflation in the prices of essential foodstuffs, and in many regions, intensive witch hunts coincided with periods of bad weather, harvest failure, and rapid inflation. This “crisis scenario,” emphasized by Wolfgang Behringer (1995), was often made worse by epidemics and warfare. In addition, the Reformation and Counter-Reformation caused acute uncertainty among early modern Europeans; religious change also encouraged territorial lords and churches to try to impose ever-stricter codes of discipline on their subjects. Sixteenth- and seventeenth-century demonologists repeatedly evoked apocalyptic images of the imminent end of the world in a final battle between good and evil, with the Devil and the witches on the side of evil. Ordinary people shared this vision as well; as a result, as Behringer has argued, a general “darkening” of people's worldview occurred.

DISCOURSES AND DISSEMINATION OF DEMONOLOGICAL “IDEOLOGY” The general shortage of material resources, the struggle for survival, and religious uncertainty provided fruitful ground in which belief in and fear of the secret powers of a large-scale witches' sect could grow. However, no simple causal connection existed between crisis phenomena and witch hunts. Rather, crises helped create a climate of fear, envy, resentment, greed, and anxiety about daily survival, a context in which witchcraft trials were likely to occur. In order for the new beliefs about witchcraft to take root, channels of communication—the most important of which were sermons and printed literature—were necessary. In late sixteenth-century Trier, for example, popular pressure for witch hunts was repeatedly aroused through sermons preached by Jesuits.

Once a personal misfortune or devastating hailstorm (both of which could be blamed on witchcraft) had triggered the first witchcraft trials in a region, beliefs about witchcraft were disseminated and strengthened as the judges, commissioners, local committees, and witnesses involved in the trials traveled to various courts, spreading fears as they went. It often happened that witchcraft trials in one area stimulated a desire for witch persecution in a neighboring territory that had experienced no particular misfortunes or crises.

Density of population played an important role here: Beliefs about witches spread much more slowly throughout the thinly populated parts of northern Europe than they did in west-central Europe. For example, it was probably not until the 1640s that soldiers returning from the Thirty Years' War took beliefs about the witches' Sabbat and witches as devil worshippers back to Sweden with them. The large-scale Swedish witch persecution between 1668 and 1676 (which affected its very thinly populated northern provinces) in turn spread to Finland, where severe witchcraft trials affected the Swedish-speaking population. Finland, where the cumulative concept of witchcraft surfaced for the first time only in the 1660s, was the last Scandinavian land to be affected by witchcraft trials. The man largely responsible for disseminating it, the judge Nils Psilander, had come into contact with German-influenced ideas about the crime of witchcraft while studying at the new University of Turku.

As this example illustrates, the role of universities in influencing the dynamics of witch hunts should also not be underestimated. In these institutions, generations of jurists and lawyers who became judges and assessors in witchcraft trials or provided legal advice in witchcraft cases received their training. These witchcraft trial legal specialists could offer their services in several territories or regions, thereby playing a significant role in stimulating the beginning, escalation, or end of such trials.

PERSECUTION "FROM BENEATH" Witchcraft trials usually began after pressure was exerted by a populace suffering from one or more of the aforementioned crisis scenarios and influenced by antiwitch propaganda. Witch hunts were rarely initiated by authorities against the wishes and without the cooperation of their subjects, because witchcraft trials needed evidence from those supposedly affected by harmful magic, supported by testimony from witnesses about the allegedly bad reputation and suspicious behavior of the accused. This desire to hunt witches "from below" varied in intensity. In many western parts of the Holy Roman Empire and the duchy of Luxembourg, witch-hunting committees (*Hexenausschüsse*) were organized. These committees were groups of men appointed by the local community to gather evidence against suspected witches in order to bring formal charges against them. In other parts of Germany and the Spanish Netherlands, this type of popular initiative took the form of surprisingly unified demands for witchcraft trials from entire villages. No witch-hunting committees existed in most parts of Europe. Here, however, the lower orders could demand that the authorities take action against witches who had allegedly caused bad weather, disease, and harvest failure in forms ranging from peaceful petitions to almost open revolt. Before the desire to hunt witches from

below could translate into an episode of mass persecution, however, at least one other factor was necessary.

ELITE WILLINGNESS TO HUNT WITCHES AND THE USE OF TORTURE Witch hunts could occur only when the authorities were willing to make the full apparatus of the criminal law available for the pursuit of witchcraft trials. Territorial lords seeking greater centralization and unity by developing more efficient bureaucracies usually demonstrated little interest in hunting witches. The exceptionally severe witch hunts that took place in the ecclesiastical territories of the German region of Franconia in the early seventeenth century constitute rare examples of witch persecutions instigated, fostered, and condoned by the authorities. Where a territorial government consistently suppressed popular desires for witch hunts, for example, in the Palatine electorate, no witchcraft trials took place. By contrast, one finds enthusiastic promoters of witch hunts among minor secular and ecclesiastical lords holding rights to exercise criminal jurisdiction at local courts.

With few exceptions, the crime of witchcraft was tried before secular courts. However, northern Europe, including the British Isles, never adopted inquisitorial legal procedure—which was based on Roman law and which allowed the use of torture—in criminal cases. In these countries, chains of trials linked by denunciations of so-called accomplices extracted by torture were impossible, and true witch hunts were accordingly extremely rare.

As the example of common-law Europe shows, the use of torture played a decisive role in predicting whether witchcraft trials escalated into large-scale witch hunts. Criminal legal procedure based on Roman law accepted torture as a legitimate part of the process for obtaining a confession, which was necessary in order to convict the accused. The Carolina, the 1532 code of criminal-law procedure for the Holy Roman Empire, left decisions about the frequency and severity with which torture was to be applied to the discretion of the presiding judge. Almost every area that experienced massive witch persecution classified witchcraft as an "excepted crime" (*crimen exceptum*), whereby the restraints of normal legal procedure could be ignored, and proceeded to inflict tortures of the most horrifying and gruesome type on suspected witches.

WITCH HUNTERS Witchcraft trials required input from a large number of "specialists": jurists, judges, court scribes and notaries, beadles, and executioners. All large-scale European witch persecutions included, among these specialists, prominent men who sought to promote witchcraft trials and manipulate them for personal advantage. In this way, the witch hunts in Franche-Comté are linked to the judge and demonolo-

gist Henri Boguet, the French Basque witchcraft trials with Pierre de Lancre (also a judge and demonologist), and the endemic persecutions in the duchy of Lorraine with *procureur-général* (public prosecutor) Nicolas Rémy (and his son, who inherited his position). The witch hunts that began in the English region of East Anglia in 1645 were driven by the ambitious “Witch-Finder General” Matthew Hopkins (who died in 1647), while trials in Iceland after 1650 were directed by Sheriff *piorleifur Kortsson*.

The number of executions in the prince-bishopric of Bamberg would certainly have been lower without the fatal influence on proceedings of its suffragan bishop and demonologist Friedrich Förner; they abated after his death in 1630. Other men who exerted a fateful personal influence on large-scale German trial episodes were Witch Commissioner Berend Nobis in Schleswig in 1626, his colleague Heinrich von Schultheiss in electoral Cologne, “witches’ judge” Balthasar Nuss or Ross (hanged in 1618) in the prince-abbey of Fulda, and jurist Daniel Hauff in Esslingen. All these men claimed to be crusading against a sect of witches that deserved extermination, and they showed their victims no mercy. They were also driven by a desire for self-promotion and disseminated their witch-hunting experiences in published form, thereby retrospectively legitimating their actions. Rémy, for example, published his essay on the persecutions in the duchy of Lorraine, *Daemonolatriae* (Demonolatry), in 1595; Lancre published a demonological work, *Tableau de l'inconstance des mauvais anges et démons* (Description of the Inconstancy of Evil Angels and Demons) in 1612. In the 1620s, Förner published a collection of sermons against witchcraft, with one for every day of the year, while in 1634, von Schultheiss published a handbook on conducting witchcraft trials correctly. Other jurists, commissioners, and court personnel often obtained significant promotions through their involvement in witch hunts, which sometimes also brought financial advantages—although increasing social capital was at least as important to such men as making an economic profit.

THE PURSUIT OF WITCH HUNTS IN PRIVATE AND POLITICAL INTERESTS Fears of witchcraft occasionally led to genuinely panic-stricken persecutions of alleged witches in rural areas and sometimes also in small towns. Contemporaries were, however, aware that accusations of witchcraft were not always leveled at “real” witches but knew that innocent people could inadvertently find themselves dragged into witchcraft trials. Early modern people, deeply ensnared in contemporary witchcraft beliefs, also used witchcraft accusations and witchcraft trials in their own interests. Such “instrumentalization” of witchcraft accusations and trials can be seen at every level of the persecution

process and in every group who participated in it. Neighbors used suspicions and accusations of witchcraft to resolve social conflicts, while local court officials obtained social and financial advantages from witch hunting.

Minor lords with the right to exercise high criminal justice used witchcraft trials to exert and affirm this right, which helps explain why severe witchcraft trials usually occurred in small and middle-sized territories where a climate of persecution, hermetically sealed against external interference, could develop. Such minor but independent rulers clung ever more tenaciously to their “old” legal right to try serious crimes the more this right—and thereby their autonomy—was challenged by major territorial lords; as part of the early modern state-building process, they sought to wrest control of high criminal justice from local courts and centralize it in their own hands. Witchcraft trials acquired a significant political role against the background of such judicial conflicts: They were used and sometimes even deliberately staged by the lords involved in such conflicts. For example, the fifteenth-century Swiss witchcraft trials that occurred around Lucerne, Basel, and Fribourg, in the Val Leventina, and in the Pays de Vaud served political purposes, demonstrating claims to political authority. Around 1600, similar political motivations underlay many witchcraft trials in parts of Silesia, Mecklenburg, Schleswig-Holstein, and the prince-bishopric of Münster. In particular, the territory between the Meuse and Rhine Rivers was characterized by a patchwork of territorial rulers holding different political and legal rights, a situation that frequently produced witchcraft trials resulting from deliberate attempts by local lords to assert their power and authority (Voltmer 2002).

OPPOSITION TO AND END OF WITCH HUNTS

Early modern opinion about witchcraft trials was by no means unanimous. Some regions (for example, Ireland) experienced almost no witchcraft trials, while others experienced mass persecutions. Meanwhile, critical voices—from all major religions and from various social groups—were raised against belief in witchcraft and the persecution of witches throughout the entire witch-hunting period. Legal records from the highest courts of appeal show that the individual elements comprising the cumulative concept of witchcraft were rarely accepted without opposition. Moreover, as the example of Ireland shows, people who believed in witches did not necessarily become hard-line advocates of persecution. In the supplications and suits brought before various appellate courts, such as the *Grand Conseil* (Great Council) in Malines, the *Reichskammergericht* (imperial chamber court) and *Reichshofrat* (imperial aulic court) in the Holy Roman Empire, and the *parlements* in France, we find many

individuals who believed themselves innocent of the witchcraft accusations brought against them and who described in detail the cruel, often fanatical, and sometimes cynical behavior of witch hunters pursuing their private social, economic, and political interests. Familiarity with such legal records led some contemporaries to deny the belief in witches completely (although almost never saying so in public); others called for moderation in—or even stopping entirely—the persecution of witches, using arguments resembling the criticisms by such opponents of witchcraft trials as Johann Weyer, Reginald Scot, Cornelius Loos, and Friedrich Spee.

However, because of official censorship, advocates of witchcraft trials held a quasimonopoly on publications during the early modern period. Therefore, most surviving printed sources (pamphlets recording trials, demonological tracts, and sermons) reflected the conventional line favoring witch hunting, supported alike by official political power, by faceless public opinion, by those who supported witchcraft trials from self-interest, and by those too frightened to dare criticize witch hunting. The rare examples of people willing to risk making more or less open criticism of witch hunts are thus all the more valuable, showing that there were always alternatives to zealous persecution, that fear of witches was never present with the same degree of intensity throughout Europe, and that some contemporaries understood and loathed the terrible legal mechanisms fostering witch hunts.

Large-scale outbreaks of witch hunting always required several interrelated factors. Attempts to explain why witchcraft trials became fewer and fewer in the late seventeenth and early eighteenth centuries and why they eventually ceased altogether are equally complex. Mass witch hunts not only confirmed the plausibility of belief in witchcraft; they also provoked the interest of critics who doubted their legality and suspected that innocent people were being unjustly executed as witches. Mass trials also produced all manner of scandals and illegal procedures, causing some people to rethink their support for witch hunting. Skeptical attitudes became more common in the wake of the Enlightenment and increasing religious tolerance. Even though witchcraft remained a crime in some countries into the nineteenth century, trials declined alongside the gradual abandonment of judicial torture, the increasing subordination of local courts to centralized systems of justice, and the implementation of territorial decrees prohibiting witchcraft trials. In electoral Trier, for example, witchcraft trials were unofficially prohibited in 1652; in France, Louis XIV abolished them officially in 1682; in the Habsburg lands, Maria Theresa effectively prohibited them after 1750.

However, although many critical voices were raised among Europe's learned and ruling elites, belief in

witchcraft remained very much alive among the lower orders, although there were some opponents of persecution even at this social level and despite the fact that courts no longer satisfied popular desire for trials. Witchcraft trials did, in fact, continue far into the eighteenth century; the last legal execution for witchcraft in Europe occurred in the Swiss canton of Glarus in 1782. In the long term, improving economic, political, and social conditions, together with better levels of education, medical provision, and state poor relief, contributed to the gradual cessation of witchcraft trials. The belief in the ability of certain individuals to work either harmful or helpful magic has nonetheless remained until today.

WITCH HUNTS, MODERN POLITICAL USAGE

One of the more visible legacies of the European witchcraft prosecutions that ended in the late seventeenth and mid-eighteenth centuries is the use of the term *witch hunt* as both symbol and metaphor for persecution and injustice. If the decline of witchcraft prosecutions after this period is often celebrated as a benchmark of social progress, the invoking of the witch hunt as a metaphor for comparing the past and the present challenges this claim. To refer to contemporary events as witch hunts is to imply that the same methods and controls once deployed against alleged witches have been and are still, in the twentieth and twenty-first centuries, used against different targets with results that can be no less devastating, even if no one is hanged or burned. It also suggests that the modern secular state and its bureaucracies may be no less susceptible to eruptions of unjustified official violence against individuals and groups than were the societies that flourished before the rise of science and before the separation of church and state.

A survey of the *New York Times* and the *Times* of London between 1985 and 2002, using the search index *Lexis-Nexis*, testifies to the continuing vitality of the term *witch hunt* as a metaphor for contemporary social phenomena; more than 1,000 articles appeared during this period in each of these major newspapers in which the term was invoked to characterize selected current events. Moreover, a canvassing of world newspapers (relying on the same source) during the same period revealed a similar usage of the term in Malaysia, Singapore, and Thailand, as well as in other countries throughout the world. There are, in addition, dozens of published books in English alone that use *witch hunt* when commenting on present events—further evidence of its widespread cultural significance.

The events to which the category is applied are as varied as the societies and the times in which they occur. False accusations of child abuse in England, the

prosecution of a British nanny in Massachusetts on charges of murdering an infant in her care, attempts to remove gay clergy from Australian pulpits, the court-martial of U.S. military officers engaging in extramarital relations, and proposed antiterrorism legislation in Australia—these are just a few of the recent events that journalists and other commentators have compared to witch hunts. Yet through this welter of phenomena, several common themes emerge. First and most transparently, invoking the category is almost invariably pejorative; to refer to an event as a witch hunt is, by definition, to invite moral condemnation by implying that it is unfair or malicious or both. Second, the actions described as witch hunts are almost always those of public officials acting under the authority of the state or some other powerful organization, often in the form of a prosecution but usually involving some form of aggressive interference in the lives of private citizens. Third, the targets of actions defined as witch hunts tend to be persons who are marginal or nonconforming, religiously or politically or behaviorally. Finally, the witch hunt is perceived as an intervention that is either grossly disproportional to the wrongdoings that preceded it or a complete miscarriage of justice that results in the punishment of the innocent. These features reveal both what witch hunts mean to contemporaries and what characteristics contemporaries have come to associate with witch hunts.

MODERN WITCH HUNTS?

For no events in recent history has the metaphor of the witch hunt been elaborated quite as vigorously as for the congressional hearings into the presence of Communists in the late 1940s and early 1950s in the United States and for prosecutions for ritual child abuse that occurred in the late 1980s through to the late 1990s, mostly in the United States but also in Canada and England. Not surprisingly, given their Anglo-American bias, the exemplar for this search for correspondence has been the Salem witchcraft prosecutions of 1692.

The parallels that have most impressed contemporaries are the power of the human imagination to give human form to its deepest fears and the capacity present even in modern states committed to the rule of law and to empirical science to create conspiracies of their own making. In particular, commentators have suggested broad similarities in the process by which suspicions were generated and then elaborated into full-fledged accusations that in turn generated more accusations and convictions. Just as the Salem trials were propelled by a form of evidence that placed defendants at an impossible disadvantage, so also were both the allegations that triggered the House Un-American Activities Committee (HUAC) in the mid-twentieth-century United States and the allegations of ritual abuse some

forty years later, which could not be refuted no matter how improbable or unfounded. “Spectral evidence” in 1692 was based on the belief that victims of witchcraft had a special gift to see the specter or otherworldly likeness of the witch who was tormenting them. No matter how accused persons comported themselves and no matter how they behaved, the testimony of the victim proved their guilt in the eyes of the juries and magistrates who returned verdicts of guilty and imposed penalties of death according to the law. Only through confession and by implicating others could persons suspected of witchcraft delay or mitigate the punishment of death by hanging. Persons who criticized the proceedings were at risk of being accused. The result was a process in which the web of suspicion was rapidly and continuously amplified until its sudden cessation a year later.

The congressional investigations into “un-American” activities likewise loosened the criteria for active subversion of the U.S. government by placing under suspicion not only persons who had been members of the Communist Party at any time but also members of any organization perceived as sympathetic to the Communist Party; any authorship or participation in films that endorsed values that were perceived as compatible with those of the Communist Party; and anyone who associated with someone in the preceding categories. To come under suspicion was to risk severe repercussions, especially loss of employment and loss of reputation. To rehabilitate one’s reputation and to protect one’s livelihood, it was necessary to confess one’s misdeeds and to implicate others. Refusal to testify or refusal to give the names of one’s confederates was taken as equivalent to a statement of guilt. To criticize the proceedings was to risk being placed under investigation. Just as in the Salem trials, the search for Communist infiltrators into the core of American institutions generated more and more suspects until it too was dismantled.

The mass prosecutions that resulted in the conviction and subsequent acquittal or overturning on appeal of hundreds of persons charged with the ritual abuse of young children have also been viewed through the prism of the Salem trials, albeit from a different vantage point. Here, what has most struck contemporaries has been the validation of children’s testimony no matter how improbable and completely unsupported by physical evidence, while ignoring the unacknowledged responsibility of therapists, police, social workers, and others in actively shaping the children’s testimony. Through aggressive interrogation and fear of worse punishment, many false confessions were generated that in turn generated more accusations and convictions. Only after the mounting of costly appeals backed by experts who challenged the findings of the courts did appellate courts throw out most of the incriminating

evidence as lacking in credibility and as irrevocably tainted by the leading questions of adults in authority. Journalists and academics who have written about these trials have focused on what they identified as parallels between the use of evidence in these cases—child witnesses coached by adults with preconceived ideas—and the use of child witnesses to give spectral evidence during the Salem trials and its validation by magistrates, clergy, villagers, and others. Just as in the Salem trials, when official pressure was removed, confessors recanted their confessions.

That each of these official initiatives was able to generate evidence to confirm the worst fears of their respective communities can be taken as a further point of similarity. Through the testimony of confessors, members of the Massachusetts Bay colony learned of a conspiracy of witches consisting of otherwise respectable members of the church that sought to destroy Salem village and to replace it with a kingdom presided over by the Devil. The hearings into un-American activities produced revelations of a vast Communist conspiracy that had penetrated into the very core of U.S. military and political institutions. The mass prosecutions of the 1980s and 1990s resulted in confessions that spoke of secret associations of otherwise law-abiding adults who engaged in extreme acts of sexual violation of young children as part of a satanic or cultlike ritual.

For some commentators, the use of the witch hunt as a metaphor is misplaced and anachronistic. For others, it is a sobering reminder of the fragile boundaries separating the present from the barbarities of a past that was certainly not the “good old days.” But if, as Norman Cohn (1975, 225) has written, the witch hunt “illustrates vividly the power of the human imagination to build up a stereotype and its reluctance to question the stereotype once it is generally accepted,” then it is no wonder that it continues to be useful as a tool of analysis and as a reference point for contemporary phenomena.

WITCH-BISHOPS (HOLY ROMAN EMPIRE)

Although it is no longer possible to sustain the assertion that witchcraft persecutions were extremely severe everywhere in Catholic lands because several Catholic states—for example, Portugal, Spain, Venice, Naples, Austria, and Bavaria—executed relatively few witches, it remains true that witch hunts in some German prince-bishoprics were indeed horrifying. The bishops were responsible for these hunts as secular princes in their territories, but still, there seems to be a striking difference between the sheer numbers of people burned by bishops in contrast to those burned by most secular lords, whether Protestant or Catholic. This situation was partly due to the bishops’ personal qualities as rulers but also to their role as princes of ecclesiastical territories. Although it was usually relatively minor secular rulers who permitted witch hunts, it was the most prominent archbishops and bishops (except the greatest of all, the pope) who allowed or even supported witch hunting. Within the Holy Roman Empire, the core of witch-hunting Europe, these bishops were responsible for the most terrible witch hunts.

The highest-ranking princes of the Holy Roman Empire, its three ecclesiastical archbishop-electors, also ranked among its worst witch hunters. The archbishop of Mainz was by far the most powerful ecclesiastical prince north of the Alps: His archdiocese extended almost from Hamburg to Milan, comprising the dioceses of Hildesheim, Paderborn, Strasbourg, Worms, Augsburg, Eichstätt, Constance, and Chur. Moreover, this archbishop was of great political importance. He held the first vote among the seven electors; he crowned emperors and elected kings; and he served as imperial chancellor, the most prominent office in the empire, exercising influence over imperial officials in Prague or

Vienna. Furthermore, he ruled a territory of his own, the electorate of Mainz (*Kurfürstentum Mainz*, or *Kurmainz*), scattered geographically across the middle of the empire, with a large portion in the Rhineland, another portion stretching east of Frankfurt in upper Franconia, and a third patch in Thuringia around the town of Erfurt (where Martin Luther received his university education), as well as further tiny particles of land elsewhere. Altogether, his territory encompassed about 8,300 square kilometers, held nearly 400,000 people, and generated an annual income of 1 million gulden. The archbishops were elected by the cathedral chapter and usually came from the minor regional nobility. The witch craze in Mainz started during the short reign of Johann Adam von Bicken (1601–1604), a man of fragile health who saw about 650 burnings. Persecution slowed under his successor, Johann Schweikhard von Cronberg (ruled 1604 to 1626), a powerful imperial politician, but 361 people were nevertheless executed as witches. Witch hunting then accelerated rapidly under Archbishop Georg Friedrich von Greiffenklau (ruled 1626 to 1629), with 768 witches killed within just four years. Overall, about 1,800 people were legally killed as witches under the rule of these three prince-bishops (Pohl 1998).

Recent research enables us to provide a ranking of the major witch-hunting bishops, as presented in Table 1.

In many cases, bishops engaged in major episodes of witch hunting had similar personality traits. They belonged to the first generation of bishops educated in the spirit of the Counter-Reformation and thus possessed fanatical severity that could be turned inward or against others. Such a mental hardening resulted from a somber worldview, with occasional chiliastic expectations. Their perception of living in an exceptional historical situation encouraged exceptional solutions, some of them violent. One cultural historian (von Pölnitz 1934, 395) described the reforming bishop of Würzburg, Julius Echter von Mespelbrunn, a key figure of the German Counter-Reformation, in terms reminiscent of psychoanalysis: “[His] whole generation . . . was dominated by a spirit of extreme austerity, directed partly against religious enemies and partly against

TABLE 1 WITCH BISHOPS

| <i>Victims</i> | <i>State</i> | <i>Ruling bishop</i> | <i>Persecution dates</i> |
|----------------|---------------------|------------------------------------|--------------------------|
| 2,000 | Electoral Cologne | Ferdinand von Bayern | 1624–1634 |
| 900 | Bishopric Würzburg | Philipp Adolf von Ehrenberg | 1626–1630 |
| 768 | Electoral Mainz | Georg Friedrich von Greiffenklau | 1626–1629 |
| 650 | Electoral Mainz | Johann Adam von Bicken | 1602–1604 |
| 600 | Bishopric Bamberg | Johann Georg II Fuchs von Dornheim | 1626–1630 |
| 550 | Ellwangen/Eichstätt | Johann Christoph von Westerstetten | 1611–1630 |
| 361 | Electoral Mainz | Johann Schweikhard von Cronberg | 1616–1618 |
| 350 | Electoral Trier | Johann VII von Schönenberg | 1581–1599 |
| 300 | Bishopric Würzburg | Julius Echter von Mespelbrunn | 1616–1618 |

opponents in their own camp, but foremost against their own ego, and everything that could be perceived as sinful within themselves.” In his famous *Cautio Griminalis* (A Warning on Criminal Justice, 1631), Friedrich Spee interpreted the witch hunts as “the disastrous consequence of Germany’s religious zeal.”

It fits neatly with this interpretation that the most terrible witch hunters of the Holy Roman Empire, at least of its German-speaking parts, were prince-bishops—*Hexenbischöfe*, or “witch-bishops,” according to a term first coined for Johann Georg II Fuchs von Dornheim (von Lamberg 1835, 17). Like his colleague in Würzburg, this witch-hunting bishop of Bamberg was a nephew of Julius Echter, who sponsored their education and prepared their careers. But witch hunting was more a matter of education than a family affair. Many of these zealots had been educated in the same institutions and by the same academic teachers at the Universities of Dillingen, Ingolstadt, Freiburg-im-Breisgau, or Dole (Franche-Comté). A study of witch-bishops (and their advisers, councillors, and confessors) as members of the same age group, molded by similar key experiences, moods, or mentalities (Mannheim 1928, 157–158), has not yet been attempted. Religious fundamentalism was buttressed by confessional strife, and it is no coincidence that Germany’s most terrible witch hunters all belonged to the Catholic League. Their inclination toward violent solutions led in the case of witchcraft trials to the theory of “extraordinary” trials (*processus extraordinarius*) for an “excepted” crime (*crimen exceptum*) and climaxed before the 1629 Edict of Restitution, the Catholic party’s attempt to regain all territories lost to Protestants since the Peace of Augsburg in 1555. However, this was not the official policy of the Catholic Church; Pope Urban VIII (ruled 1623 to 1644) looked with contempt upon Germany’s religious zealots (Bireley 1975, 226).

Nineteenth-century scholars were eager to attribute these persecutions to Counter-Reformation zeal and to Catholicism in general. Recent research has demonstrated that assigning responsibility is more complicated. Nevertheless, the attitude of the ruling princes played a decisive role, as the example of the prince-bishopric of Bamberg illustrates. Under Prince-Bishop Johann Philipp von Gebsattel (ruled 1599 to 1609), a pre-Tridentine bishop who indulged in the Renaissance joys of loving music and women (he had half a dozen children), there were few witchcraft trials and executions. After Gebsattel’s death, the Catholic League installed an ardent reform bishop, Johann Gottfried von Aschhausen (ruled 1610 to 1622), already bishop of Würzburg. His new suffragan bishop, Friedrich Förner (1568–1630), a theologian whose views resembled those of the demonologist Peter Binsfeld, began forming new alliances and immediately lashed out against witches. A witch hunt started in

1612 but stopped in 1618, when politicians utilized the outbreak of the Thirty Years’ War as an argument for reducing expenses. The hard-liners lost out until the election—organized by suffragan Förner—of Bishop Johann Georg II Fuchs von Dornheim (ruled 1622 to 1633), another candidate of the Catholic League. Chancellor Georg Haan remained in office while his enemies carefully prepared to take over. In 1625, Förner delivered a series of thirty-five sermons on magic and witchcraft, entitled *Panoplia armorum Dei* (The Splendid Armor of God, Ingolstadt, 1625), dedicated to the prince-bishop of Eichstätt, Johann Christoph von Westerstetten. The most prominent victim of Bamberg’s witch hunts, now guided by Förner, was Bamberg’s leading politician, its chancellor Dr. Haan, who had served the bishops of Bamberg and the Catholic League for many years; his entire family was burned.

Bamberg represented the “ideal type” of a massive witch hunt, although its victims were outnumbered by those in the electorate of Mainz (*Kurmainz*). Both were surpassed by the prince-bishopric of Würzburg, where about 900 people were burned at the stake during the same five years (1626 to 1631), including a number of noblemen and a good number of clergy (Schwillus 1992). This followed an earlier persecution around 1616 or 1618 in the same territory under the famous reforming bishop Julius Echter von Mespelbrunn (ruled 1573 to 1617), the German counterpart of St. Carlo Borromeo in Milan, when about 300 witches were burned during his long reign.

The burnings under Philipp Adolf von Ehrenberg (ruled 1623 to 1631) gained a proverbial reputation. When persecutions started in the electorate of Cologne (*Kurköln*), a town councillor about 500 kilometers further northwest predicted, “*Es wird Wirtzbürgisch werck werden*” (“It will work out like in Würzburg” [Behringer 2001, 265]), and his forecast was anything but exaggerated. In the duchy of Westphalia, subject to Ferdinand, elector-archbishop of Cologne (ruled 1612 to 1650), about 2,000 people were burned for witchcraft between 1626 and 1634. Ferdinand was responsible for the most terrible witch hunt in the German parts of the Holy Roman Empire. This was not due to any “centrally implemented program of eradication” or “War against Witches” (Schormann 1991, 169–171) prepared by earlier legislation against witchcraft in 1607, when Ferdinand served as coadjutor for his uncle Ernest of Bavaria, his predecessor as archbishop-elect of Cologne.

Describing the prince-elect as a predecessor of the Nazi “War against the Jews” (Davidowicz 1975) would explain these developments elegantly, and moreover, Ferdinand had been educated in Trier during the great witch hunt of the 1590s. However, evidence for such parallels is surprisingly weak. Ferdinand had already

been appointed coadjutor in Cologne in 1594, and during the first twenty years of his rule, no witchcraft persecutions occurred. Clearly, Ferdinand was more interested in religion than was his uncle Ernest of Bavaria, bishop of Freising, Hildesheim, Liège, and Münster, who had become archbishop of Cologne as the candidate of the Counter-Reformation party to replace his heretical predecessor after the Cologne War. Although one of the most powerful Catholic rulers in Europe, Ernest was interested primarily in the worldly pleasures of an aristocratic life: hunting, music, dancing, and feasting in the company of women. He had even terminated the witchcraft trials in his prince-abbey of Stavelot, but obviously, he did not prevent his zealous nephew and successor Ferdinand from starting such trials. Even after 1612, the new archbishop saw no reason for launching inquisitions in electoral Cologne or Westphalia, nor in any of his other sees—Hildesheim, Liège, Münster, or Paderborn.

Scrutinizing the protocols of the electoral court council in Bonn demonstrates that these persecutions had not started “from above,” as Gerhard Schormann (1991) claimed, and they were not at all centrally planned or implemented (Becker 1992). At the root of the problem lay the agrarian crisis of the mid-1620s, with devastating crop failures, unusual diseases, and an urgent demand “from below” putting pressure to punish witches on the noblemen in charge of the criminal courts. Moreover, the elector’s central government would have been incapable of launching a witch hunt because most of its criminal courts had been pawned to the nobility and because there was no obligatory system of reporting to the court council, unlike such contemporary secular territories as Württemberg, the Palatinate, or Bavaria, where court councils (*Hofrat*) tightly controlled district courts (*Landgerichte*). In most ecclesiastical territories, central authorities were only sporadically informed about cases, when the owners of their courts sought advice or when subjects tried to appeal to a higher court. Such patchy references enable us to reconstruct when and where these persecutions developed in the electorate of Cologne.

After the persecution had gained momentum, Archbishop-Elector Ferdinand tried to assert control over the movement. He appointed witch commissioners, possibly hoping to recover some of his pawned criminal courts. However, these appointed commissioners soon began implementing their own agendas, terrorizing entire regions in order to gain money and reputation, using their arbitrary power extensively and in anarchical fashion, much like the English “Witch-Finder General” Matthew Hopkins during the Civil War. The Thirty Years’ War had created a similarly anarchical environment in central Europe, loosening normal legal administrative practices. Due to the sheer size of the Cologne witch hunts but also because the

imperial free city of Cologne was a university town full of independent monasteries and printers, these persecutions spawned a number of publications both for and against witch hunting. Friedrich Spee published the famous *Cautio criminalis*, the most powerful attack on illegal procedures of the archbishop-electors’ government, anonymously in 1631. The author, then a member of the Jesuit College at Paderborn, had intimate knowledge of developments in Ferdinand’s electorate; although he formally disguised all names, contemporaries could easily decode his text to understand his allusions to particular actors and events.

WITCH'S MARK

The witch's mark, or English teat, was a protuberance or nipple on a witch's body that personal demons (known as imps or familiars) sucked for nourishment. According to British folklore, certain groups of people could command spirits, goblins, and minor demons, which they could induce to perform magical services for them. These creatures generally took the shape of animals (cats, dogs, toads, mice, butterflies, insects) and fed like vampires on their masters' blood, which they sucked from a bulge or a nipple that was sometimes located in proximity to the genitals. By the time of England's witchcraft trials, the signs left by these vampire-animals were associated with the continental Devil's mark, and the possession of a 'familiar' was consequently deemed a sign of a prior pact with the Devil. (This change is also evident in many English treatises of the period.) Devils could thus appear in the shape of animals and confirm the pact with the witch by sucking the witch's blood. In order to ascertain the presence of bulges on the bodies of the accused, the judges sometimes employed special juries of midwives and matrons, thereby enabling women to participate in witchcraft trials as legal experts parallel to male surgeons.

Accusations of possessing a familiar played an important role in England. Witches' marks were first mentioned in a trial in 1566, and the search for them was systematically encouraged by 1579. In 1604, a new law against witchcraft explicitly declared the guilt of those who were found to have fed animals with their own blood. Subsequently, witches' marks became a crucial proof in many witchcraft trials and played a central role in the great witch hunt led by Matthew Hopkins (from 1645 to 1647). Witches' marks were also considered pertinent in the witchcraft trials that took place in the American colonies; one encounters juries of women at the Salem panic of 1692. According to James Sharpe, the widespread belief in the existence of familiars and in witches' marks challenges the position of Keith Thomas, who assumed that in

England, accusations against witches were mostly based on general fears of evil spells and only in exceptional cases motivated by the idea of a pact with the Devil, which Thomas considered a "continental import" typical of the elites.

The witches' mark is often confused with the Devil's mark (common in Scotland and on the European Continent). The belief that the Devil imprinted a mark on his followers has an important foundation in the Apocalypse (Rev. 13:16): "And [the Antichrist] causeth all, both small and great, rich and poor, free and bond, to receive a mark in their right hand or in their foreheads." Tertullian and Irenaeus also spoke of diabolical marks. Hence, the idea that there ought to be a tangible mark that would allow human judges to recognize witches seemed, in the early modern period, to be confirmed by both Scripture and subsequent tradition. The biblically driven Protestant Reformation was conducive to searches for the Devil's mark.

The mark acted as a sinister counterpart to the rites of baptism, circumcision, or feudal homage; it was almost the reverse of saintly stigmata, a symbol of debasement and submission to the Devil. The search for the *punctum diabolicum* (the Devil's spot or mark) subjected the accused to an ordeal, which many accepted voluntarily in the hope of proving their innocence. In fact, it was believed that, when the Devil concluded a pact, he imprinted a mark of varying form and consistency (a mole, bulge, or mark), perhaps shaped like an astrological sign or the footprint of an animal, that could be recognized because it was insensitive and did not bleed (like a piece of dead flesh). Although many Catholic demonologists downplayed its importance by assuming that not all followers of Satan had such a mark, it often provided decisive evidence in witchcraft trials by 1600.

Surgeons participating in the search for these marks shaved the entire body of the accused in order to discover the insensitive spot. According to common belief, this spot was often hidden among the most intimate parts of the human body: breasts, anus, armpits, and genitals. The investigation therefore proceeded by probing moles, scars, and birthmarks, often with needles that were forced deeply into the body and caused terrible pain. The discovery of the marks did not provide sufficient proof for conviction; rather, it allowed the trial to proceed and torture to be administered. In many cases, judges and surgeons cheated and employed dubious stratagems, which were severely censured in 1631 by the German Jesuit Friedrich Spee, who also denounced their scandalous and shameless probing of the naked bodies of accused witches.

Witches' marks were never mentioned in the *Malleus Maleficarum* (The Hammer of Witches, 1486). The situation changed, however, during the latter half of the sixteenth century, and by the late

seventeenth century in a significant part of Europe and the New World, the *punctum diabolicum* was considered a decisive element in witchcraft trials. According to William Monter, this early belief in the Devil's mark was a consequence of the association between witchcraft and heresy, especially in Reformed regions of Switzerland, which pioneered the search for marks as a definite proof of a culprit's guilt. Yet some Lutheran theologians such as Johann Brenz ridiculed the belief in marks, and some Catholics were no less ardent than Protestants in the search for the Devil's signs. During a case of demoniac possession at Aix-en-Provence in 1611, the chief exorcist, Sebastien Michaëlis, demanded that tangible proofs of witchcraft be found on the body of the suspected priest; a physician, Jacques Fontaine, who took part in the trials and wrote a treatise on the subject, supported his position.

As the witch hunts peaked around 1630, Catholic experts were bitterly divided over the issue. In 1629, a German Catholic counselor of the archbishop of Mainz, Peter Ostermann, published an extensive commentary in favor of searching for diabolical stigmata. Johannes Jordanaeus immediately rejected this position in 1630, as did the Roman Paolo Zacchia, an eminent legally trained physician, who in 1635 referred to the Roman Holy Office's skepticism about the Devil's marks in order to support his position. Despite this overall tendency, an official of the Roman Inquisition, Cesare Carena, claimed during the same decade that the Devil's mark existed and constituted a proof. Jesuit theologians were also divided: While Spee denounced the searches in 1631, a French Jesuit, Théophile Regnault, published a favorable treatise in 1647, entitled *On Stygmatism*. Europe's most prestigious Catholic court systems, the great inquisitions and the major French *parlements* (sovereign judicial courts), never searched for it, although most Protestant court systems did. Probing for the Devil's mark became especially frequent in Scotland, Switzerland, and much of the Holy Roman Empire.

WITEKIND, HERMANN
(1521/1522–1603)

This Reformed professor at the faculty of arts in Heidelberg can be counted among the most important opponents of the persecution of witchcraft in Germany, second to Johann Weyer, mostly because of his 1585 treatise *Christlich bedencken und erinnerung von Zauberey* (Christian Thoughts and Memories About Sorcery).

Born as Hermann Wilcken (Wilchen), he registered at the University of Frankfurt an der Oder in 1546 and in 1548 at Wittenberg, where he became a friend of Philip Melancthon. Later, Witekind was called to the Latin, or cathedral, school at Riga. In 1561, he joined the University of Rostock, but was soon called to the University of Heidelberg, where he taught (with a short intermission) from 1563 until his death.

Witekind's treatise against witchcraft persecution, published at Heidelberg under the pseudonym Augustin Lercheimer, was the first really successful attack on persecution ever conceived in the German language. A second, enlarged edition (Strasbourg, 1586) was followed by a third (Basel, 1593); the last edition, worked on by the author himself (Speyer, 1597), included major additions. It was reprinted in 1627 and probably in 1654 as well. His treatise was also included in the *Theatrum de veneficis* (Theater of Poisoners, 1586) and other collections.

Obviously, Witekind witnessed no witchcraft trials in the Palatinate, but news about persecutions in his native Westphalia motivated him to write his treatise. In addition, he wanted to refute Weyer's most prestigious opponent, Jean Bodin (who had been translated into German by Johannes Fischart). Deep compassion for the victims and strong resentment against their persecutors brought Witekind to demand an end to witch burnings. His arguments were based primarily on the New Testament, which for him was normative in all things. Although the traditional tone of the confessional age dominated, Witekind's arguments included empirical evidence from natural science, in a way that sometimes resembles the early Enlightenment. They also appealed to the common sense of his readers, asking them not to believe the nonsensical accusations against sorcerers.

Witekind's book was aimed mainly at rulers and lay judges, who had decisive influence on the trials. For this reason, he chose a style that was decidedly unscientific and picturesque and wrote in strong, blunt German. While the number of printings suggest that Witekind reached a larger audience, his language and style meant he was seldom cited in learned discourse. Nevertheless, for Johann Georg Goedelmann and Anton Prätorius, Witekind was of crucial importance.

Witekind was one of those skeptics who attacked the idea of the witch at its core by emphasizing God's omnipotence. He believed that everything in the world happens by divine providence alone. As God's law is the law of

nature, witchcraft accusations had to pass the tests of natural science. Harmful magic, the flight of witches, and the witches' Sabbat were therefore usually impossible. Even though Witekind occasionally got entangled in contradictions, he agreed with Weyer that what female witches experienced were only fantasies created by the Devil. However, for Witekind, the witches' apostasy from God and their pact with the Devil were real. But not even these major sins could be punished by humans; that was God's right alone. In a way that was radical for his time, Witekind rejected the persecution of heretics and attributed to every Christian the right to turn away from God. The Hebrew Bible's rules for punishment were set aside in favor of the New Testament, which explicitly prohibited the persecution of heretics. In an age of confessionalization and social discipline, Witekind evicted only those who would never repent. Even though, in his opinion, criminal justice had no place in treating the offense of witchcraft, he covered the topic in the light of current witchcraft trials. He wholeheartedly supported the *processus ordinarius* (ordinary procedure) and rejected the opinion that witchcraft constituted a *crimen exceptum* (excepted crime).

Witekind, who as a rule did not name other authors of his time, was obviously influenced by Johann Weyer and doubtless by the opposition to persecuting witchcraft in electoral Palatinate, whose position resembled that of Weyer. Obviously hoping to export this rather mild Palatine position to the rest of Germany, Witekind became its most important literary representative.

Although deeply rooted in tradition, Witekind's treatise remains original. This assessment holds true especially for his critical social approach, which was stronger than that of any of his predecessors. According to Witekind, witches were driven to the Devil's embrace not so much through their own faults as by social circumstances. Proceeding from the profile of the witch as a poor woman outside society, he mainly blamed social grievances and failures of the authorities for their situation. On the one hand, women lacked the spiritual armor to resist the Devil because the authorities and the Church continually failed in the religious education of a nearly heathen populace. On the other hand, however, the social circumstances of a materialistic, egotistical world—their economic misery and their social isolation—drove poor women to seek help from the Devil. Sometimes, even simple hunger made them lose control, leaving them in a state of unsound mind, ready to accept the Devil's pact. In this case, Christian charity was the cure. Although accepting the traditional idea of women's natural weakness for seduction, Witekind twisted this cliché into a different perspective.

WITNESSES

Witnesses, in the sense of character witnesses rather than eyewitnesses, generally played a vital role in formal legal proceedings against accused witches that was an extension of the informal role they had played in the formulation of suspicions that had led to the accusations. Most trials progressed according to more or less rigorous legal procedures, and the suspect's general reputation, together with evidence of past incidents suggesting witchcraft, were important in determining whether to proceed, particularly to torture. In a sense, witnesses framed the accusatory process: After an accusation was lodged, their role was to confirm it by establishing that the offense was part of a pattern of behavior. Trials therefore involved members of the suspect's community who testified about her or his general reputation or who knew of specific incidents related to the current charge. Reputation was, by definition, collective opinion, built up gradually from numerous incidents in the small communities where most accusers and suspects lived. Both the formal and informal roles of witnesses have long posed problems of interpretation for historians, the former because of the difficulty in determining the amount of embellishment and retroactive invention their stories contained and the latter because it is difficult to explain why one incident precipitated a formal accusation while earlier incidents had not.

THE PROBLEM OF WITNESSES IN THE LEGAL PROCESS

The use of character witnesses and evidence of past wrongdoing originated in ancient legal practice. They were important because many proceedings involved little hard evidence and came down to deciding which

of the several accounts to believe based on the credibility of the sources. This problem was particularly acute—and reliance on reputation and past history was particularly pronounced—in judging crimes that were surreptitious, such as infanticide and burglary. Witchcraft was doubly obscure, since both *maleficium* (harmful magic) and diabolism were necessarily occult offenses. In the case of *maleficium*, harmful rituals and malign thoughts were at least as likely to be concealed as manifested overtly, and the meaning or intent of overt acts was often unclear. In the case of the diabolical pact, physical evidence was almost never available, and eyewitness testimony, most frequently to participation in a witch dance, was generally tainted by coming from tortured suspects or from children. Trials therefore generally focused as much or more on the reputation of the suspect as on specific evidence about the incident(s) precipitating the investigation.

SUSPICIONS AND ACCUSATIONS Long before any arrest was made, witnesses generally played a vital role in solidifying suspicions into a formal accusation. A bad reputation was not absolutely necessary for having an accusation lodged, and suspects in mass panics were tortured and executed on the basis of coerced testimony alone. Yet in most instances, accusations, especially those likely to lead to convictions, represented the culmination of a series of incidents that created a reputation stretching back many years. Witnesses were, first, people who felt they had been victims of witchcraft, who knew people who had been, or who had observed something suspicious in the past.

These witnesses may not have stepped forward earlier for many reasons. One was the element of risk: If a prosecution failed, there could be legal or informal penalties for the person bringing the charges. In inquisitorial trials, widely used in Europe by the sixteenth century, the formal accuser was the state rather than an individual, so plaintiffs no longer risked an automatic penalty if their charge was not sustained, but there was still the legal risk of a countersuit. Perhaps worse, once the magistrates had gone, accuser and vindicated suspect would remain neighbors—but in a poisoned atmosphere of heightened tension.

The power of the accusation did not rest solely on the power of the accuser, however; it also depended on the nature of the allegation. Certain types of perceived harm both called for and had stronger potential than others to sustain prosecution. Accusations that precipitated trials were more likely to concern lethal illnesses or open attacks that injured people or valuable property, whereas less serious or less tangible suspicions generally remained dormant. A person had to be desperate, powerful, or confident to bring charges, otherwise, his or her story faded into the background of village suspicions. As such stories accumulated, though,

the probability that an accusation would be successful increased.

People who suspected that someone had manifested powers related to witchcraft had other reasons to hold back. Witchcraft was a capital crime, and a person had to be convinced that a suspect really deserved death to bring an accusation. If the spell was not life threatening, if the evidence was ambiguous, if the illness had gone away, or if there was reason to believe the suspect's actions were at least partially justified, a potential accuser might well be reluctant to bring charges. Furthermore, many small communities were hesitant to involve the state in local affairs.

INTEREST, MEMORY, AND VERACITY In addition, one must ask why so many witnesses *did* come forward once a witchcraft trial began and why they said what they said when they did. Two major differences separate these questions from those raised by the accusations that precipitated trials: Unlike the primary accusers, most witnesses had no immediate impetus to testify; moreover, their testimony usually included a temporal dimension, which raises issues about the nature and functioning of memory.

There are two possible reasons why witnesses would have come forward when a trial was under way. First, they might have seen the proceedings as an opportunity to strike at someone they wanted to get rid of for other reasons and then consciously fabricate their allegations. Second, they might have become convinced that they “remembered” an incident they had, for one reason or another, held back. There is no question that some witnesses, like some accusers, acted cynically, either for personal advantage or in order to rid their community of an unwanted member. In such cases, the issue of memory became irrelevant. But most witnesses, like most accusers, appear to have spoken sincerely. Why they came forward would in many cases have been related to why they held back: If their evidence had seemed too weak to initiate proceedings, the standard was lower for this sort of testimony; if they did not want to risk confrontation with the suspect, someone else had now taken the major risk; if they had been uncertain whether the person deserved to be punished, the fact of a trial put a new perspective on their experience or information.

Another reason why a witness might have come forward only when a trial had started was because until then, the person did not “remember” the incident about which he or she would testify. Discussion of the trial may have caused the witness to fabricate the memory without realizing it, pasting together some combination of stories she or he had heard with stock elements of local witch beliefs. Or the witness might have reshaped her or his memory of an actual event,

transforming it from an inconsequential encounter into a sinister incident. Clearly, this process operated to some extent in a considerable number of cases and to a considerable extent in some cases. Memory, like perception, is a slippery thing, and there is no doubt that people mold what they say to the expectations of their audience.

However, it would be a mistake to proceed, as some recent historians have, from this realization to the position that *all* testimony was shaped by this process; the evidence simply will not support that conclusion. First, the number of witnesses with old stories generally corresponded to the suspects' general reputation; it was very unusual for a person held in high regard by the community to have a whole slew of allegations made about the past, even though they had just been denounced for witchcraft. Second, independent witnesses corroborated some of the incidents recounted. Third, some incidents had left a public record, possibly even a previous trial. A witness's testimony was not simply memories constructed to fit one set of circumstances, nor was it simply the product of cynical calculation or a simple remembrance of reality. Instead, it was generally and in most particular cases a mixture of all three.

WORDS, POWER OF

The idea of the magical power of words—that they can provoke physical effects merely by being uttered or inscribed—is found in many cultures. It has often been attributed to a belief that language and reality are so closely related that words have a real bond with the things they signify, so that utterances may be used instrumentally to affect or exploit the power of those things; as the anthropologist Bronislaw Malinowski once said: "To know the name of a thing is to get a hold on it" (cited by Clark 1997, 283). Before him, Sir James George Frazer (1978, 321), consistent with the cultural evolutionary theory of his time, assumed that "primitives" were "unable to discriminate clearly between words and things." Stanley J. Tambiah dismissed this assumption in 1968, arguing that, on the contrary, magical rituals demonstrate sophisticated uses of language and figures of speech. He contended that analogy and metonymy verbally transfer properties from a substitute or complement to another thing, and this transfer in thought and word may be given added realism by the simultaneous use of action or objects (Tambiah 1985, 32–37). Both metaphoric and metonymic transfer are expressed, respectively, in Frazer's categories of "homoeopathic magic" (manipulating similarities) and "contagious magic" (exploiting bonds of possession or contact) (1978, 14–63), but these rhetorical strategies are far more complex than a simple confusion of words and things.

RITUAL, RHETORIC, AND REALITY

Tambiah's reservations are relevant to the study of medieval and early modern European charms. Though we know little about folk practitioners' understandings of the relationship between ritual words and their effects, surviving texts show much sophistication in the use of rhetorical devices. Analogy was commonly employed. In reducing charms, the successive diminution of a phrase or word, such as *Abracadabra*, was analogous to the ritual's aim of reducing the patient's affliction (Storms 1948, 153). Verbal formulas often followed the pattern "just as α is, so let β be" (Roper 1997, 22). Matteuccia di Francesco, executed at Todi in 1428, combined such a formula with manipulation of a metaphoric object in a spell she recommended to a thwarted lover: To inflict impotence on his rival, he was to bend a lighted holy candle while saying, "As this candle bends in this heat, so let the bride and groom never come together in this love" (Mammoli 1972, 33).

Metonymy was also widely used. Garments were measured to diagnose patients' ailments, and enemies could be harmed through rough handling of items belonging to them, such as thatch from a witch's house (Thomas 1971, 184–185, 544). Patients might be progressively represented by a metonymic list of parts: Healing charms often commanded the affliction to

depart from each part of the body from head to toe (Storms 1948, 222). Whether such figurative utterances and gestures were understood as rhetorical devices establishing imaginary correspondences or as the exploitation of a real bond between things would vary from one person to another. As Stuart Clark suggested, the power of ritual words may have been construed differently by charmers and their patients, as also by priests and their congregations (Clark 1997, 283).

Modern fieldwork also cautions against assuming that performers of spells, charms, and prayers or even their clients attributed the efficacy of rituals solely to the words, despite the claims of medieval and early modern writers that people commonly did so (Clark 1997, 284). Though anthropologists have encountered informants who state that a ritual worked because the words were spoken, performance analysis usually reveals that other factors were also essential, especially the context; the simultaneous use of action, substances, or objects; the response of spirits or other entities; and the faith or will of participants or performers (Tambiah 1985, 18–21, 29–30). What performance details survive of medieval and early modern charms and spells indicate that settings, medicines, material objects, and actions accompanying verbal formulas were no less important than in modern rituals—for example, in Anglo-Saxon medical charms (Storms 1948) or the elaborate spells in a fifteenth-century necromancer's manual (Kieckhefer 1997). The difficulty of separating the communicative and instrumental uses of language in rituals has also been emphasized (Clark 1997, 282). The words may be addressed to the participants or even the performers themselves (Roper 1997, 24); many rituals employ intelligible, everyday language, and the effects may be subjective. They might also address gods, demons, or spirits, invoked to perform the effects. Foreign words and nonsense were commonplace in charms and spells, but even unintelligible utterances might still communicate, since demons could understand gibberish (Tambiah 1985, 21). Moreover, extraordinary language (poetic, archaic, and the like) and unusual modes of speech (such as whispering or chanting) are in themselves markers of the transition from everyday matters to another level of reality, and in rituals aimed at change, linguistic difference expresses that aim by analogy: Just as the words are altered, so let things be different.

According to the cultural theory of language prevalent since the eighteenth century, words are humanmade signs with conventional meanings; they have a purely abstract relationship to the things they signify, serving only to communicate our *ideas* of those things; they cannot provoke physical effects simply by being uttered (Clark 1997, 286–287). This separation between language and reality has a long history, from Plato and Aristotle to the empirical scientists of the

seventeenth century, including Francis Bacon, Thomas Hobbes, John Locke, Daniel Sennert, and many others (Vickers 1986). But before the eighteenth century, cultural accounts of language coexisted with another theory that words and other signs had a natural relationship to the things they denoted. Early modern occult philosophers considered that the essential nature of things was embodied in their names, which could be used to perform marvels, and they consistently blurred the distinction between figurative and literal uses of language, taking analogy for identity, a real connection between a figure and the thing referred to (Vickers 1986, 105–108, 122–130). This natural theory of language rested primarily on the concept of “Adamic,” the divinely inspired language of Adam, who named all the animals according to their nature and thus encapsulated their essence in words, God-given words that were inherently powerful and would work wonders—if they could be identified after Babel (Clark 1997, 285–286; Vickers 1986, 107–108).

SACRED WORDS

The widespread idea of the creative power of divine words is often allied to traditions that the language system was divinely instituted and transmitted to human beings to accomplish transitive effects (Tambiah 1985, 27–28). God's creative word, affirmed in the Hebrew Bible, was confirmed in the New Testament with Jesus as God's Word incarnate in the opening verses of St. John's Gospel: “In the beginning was the Word and the Word was with God, and the Word was God. . . . And the Word was made flesh and dwelt among us.” St. John's words were commonly inscribed on talismans worn against a variety of evils, including witchcraft (Jolly 2002, 49). Holy names, phrases from the Church's liturgy, and Christian prayers were employed in both verbal and written formulas for protection and healing, especially for invisible threats and afflictions attributable to demons or spirits (Jolly 2002, 35–56). An Anglo-Saxon charm against “Elf-Sickness” included the words “aius, aius, aius. Dominus deus Sabaoth. Amen. Alleluiah,” to be sung over the patient (Storms 1948, 222). Diseases, often personified as intrusive entities, were adjured and banished from the body in God's name, and healing charms often referred to biblical or apocryphal stories of Jesus or the saints performing analogous cures (Kieckhefer 1989, 71–75). Catholic objections to such uses of sacred words centered on the observances and ceremonies that usually accompanied them, such as a concern with the precise recitation of formulas or the shape of inscribed objects (Kieckhefer 1989, 70), which the Church regarded as superstitious. The words' virtue lay in their meaning, not in the actual letters. St. Thomas Aquinas accepted that passages of Scripture could be worn on talismans, so long as the words were not expected to work effects

by themselves (*Summa theologiae*, 2.2.96.4, cited by Thomas 1971, 30). Around 1600, the Jesuit Martín Del Rio (2000, 59) echoed this opinion: “Provided one places no reliance on the written words as such, . . . it is pious and holy to wear round one’s neck, out of simple reverence, the relics of saints, the wax images of the Agnus Dei, the Gospel of Saint John, [etc.]”

However, the late medieval Church unintentionally did much to foster such expectations through many of its rituals, especially its teaching that sacramental formulas worked automatically: By virtue of the priest’s ordination, the words of consecration *Hoc est corpus meum* (“This is my body”) transformed bread into the body of Jesus (Jolly 2002, 43; Walker 1958, 151). The Reformed churches later rejected this doctrine as no less superstitious than charms (Thomas 1971, 51–52).

INVERSION, STRANGE SIGNS, AND SIGNALS TO DEMONS

Inversion is common in magical formulas everywhere. Reversibility is the key feature of the ancient device SATOR AREPO TENET OPERA ROTAS, usually inscribed as a magic square, which had many different uses (Ryan 1999, 302–304). Standard prayers such as the Paternoster were also recited in reverse for malevolent purposes, while many curses were similar in form to charms and blessings but with inverse, harmful intent (Kieckhefer 1989, 19, 82). Curses often sought divine retribution for a wrong suffered; they were partially justified by the medieval Church’s practice of anathema, and a belief (considered blasphemous by many Protestants) long persisted that God heeded the curses of the poor and innocent (Thomas 1971, 502–512). Necromancers’ spells to conjure demons also borrowed heavily from Christian ritual and vocabulary, invoking divine protection and power while summoning dangerous spirits to perform tasks (Kieckhefer 1989, 167–168). Theologians condemned not only such explicit invocations but also, especially from the late thirteenth century onward, the use of verbal formulas containing unintelligible words or strange characters, for these could also, even unintentionally, send signals to demons.

According to Aquinas, words had no power to produce the effects of magic; they were only signs communicating thought: “As to the letters that form an inscription on an image, and other characters, nothing else can be said of them, but that they are signs: wherefore they are directed to an intelligence only” (*Summa contra gentiles* 3.2.106, in Kors and Peters 2001, 94–95). Such effects as unlocking locked doors or revealing hidden knowledge, which Aquinas believed were real and unnatural, could only be produced by an agent able to understand the signs. Magicians were unable to do these things; neither could the stars, nor the materials on which inscriptions were written.

Because the effects were often evil, they could not come from God or angels. Therefore, they must have been caused by demons in response to the signals. Magical words were thus evidence of a tacit pact with demons, the logically necessary intermediary between the real effects of magic and the powerless magician’s words.

RENAISSANCE MAGIC AND DEMONOLOGY

The Renaissance revival of ancient Hermeticism and Neoplatonism, which promoted the concept that signs and characters captured the essential nature of things and had transitive power, renewed intellectual support for a natural theory of language. These and the idea of Adamic prompted occult philosophers to seek God’s own, powerful words in Hebrew (Kieckhefer 1989, 148–149). Giovanni Pico della Mirandola (1463–1494) sought them in the Kabbalah, a Jewish mystical tradition that held that God created the universe using the twenty-two letters of the Hebrew alphabet (Walker 1958, 68–69). The Florentine Platonist Marsilio Ficino (1433–1499) saw correspondences and sympathies everywhere. A cosmic spirit vivified the universe and connected the stars with the earth, the macrocosm with the harmoniously proportioned human microcosm who, like a string vibrating in sympathy, was affected by celestial influences. Appropriate songs could channel these influences toward the singer or hearer, bestowing the virtues of particular celestial bodies: Those affected by Jupiter, for example, became more jovial (Walker 1958, 12–16). Ficino claimed that his incantations worked through the imagination, making people receptive to natural astral emanations and provoking subjective effects but not directly affecting the body or things elsewhere. His critics, however, saw them as dangerous because demons might overhear them (Walker 1958, 44).

Early modern writers supporting the prosecution of magicians and witches generally agreed that words had no power except as signs; the effects were often real but caused by demons responding to witches’ signals, according to their pact (Clark 1997, 290). As Henri Boguet (1929, 79) wrote: “[Words] are no more than a symbol of the pact between the witch and Satan; for it is certain that words have no other purpose than to denote the thing for which they were ordained and to express the passions of the soul and the affections of the spirit.” Besides, if words had the power to harm, they would do so whenever anyone inadvertently uttered them.

MALEFICIUM AND LOSS OF THE POWER OF WORDS

Curses and threats were important in forming witches’ reputations, providing circumstantial indications of their guilt, while written spells and objects with strange inscriptions provided weighty material

evidence at law. Witches' intentions and desires, however, were more important than their words: Their gaze ("overlooking") or malevolent thoughts ("ill-wishing"), whether overtly expressed or not, provoked the same effects as curses and "forespeaking" (Thomas 1971, 187). Nor was it only harsh words that were harmful. On the contrary, praise could bewitch. Boguet (1929, 78–79), evidently puzzled, asked: "How are we to account for the fact that even when they praise you and compliment you, they injure you?" While there is no knowing how much sarcasm and irony was expressed by (or projected into) bewitching kind words, praise itself was dangerous unless delivered with a blessing because it expressed the speaker's envy or made something stand out, exposed to the envious yearnings of those who would "take" its productive potential, as the evil eye did.

Witches also took their victims' power of words. Loss of voice is a symptom of the nightmare (attributed to a witch riding on the sleeper's chest) and a common motif in witch narratives. In 1672 and 1673, the Northumbrian witch finder Anne Armstrong claimed that after the witches abducted her to their meeting and forced her to sing, she could not talk about her experience until her vocal power was restored on St. John the Evangelist's day by a piece of cheese, enabling her to name the witches (Oates 2003, 213–214). In a modern French region, the deadly silence of witchcraft resonates in belligerent verbal acts of witchcraft where "words wage war" (Favret-Saada 1980, 10). No one talked of witchcraft unless implicated in the conflict, and suspects could not talk about it at all. Bewitched people verbalized their misfortunes to an "unwitcher" who identified the witch, usually a neighbor presumed to have uttered spells learned from bad books or bewitching words during a crisis, in order to increase his or her power at the victim's expense. Unwitchers engaged in retaliatory magical combat to return the spell to the witch, while the bewitched were required to cease communication with the suspect; failing that, they must talk without saying anything and always have the last word. If witches strengthened their hold over their victims by controlling conversation, silence weakened it, allowing victims to regain some control while the unwitchers counterattacked the witches, depriving them in turn of the power of words.

WÜRTTEMBERG, DUCHY OF

Between 1497 and 1700, over 350 investigations and trials for witchcraft were conducted in the duchy of Württemberg. Over 600 people were investigated, charged, and imprisoned. At least 197 executions are known from trial records, so roughly one-third of those accused were sentenced to death. In comparison with other jurisdictions in southwest Germany (the present-day state [*Land*] of Baden-Württemberg), where over 3,200 people were put to death for witchcraft between 1561 and 1670, the duchy of Württemberg conducted

a relatively moderate witch persecution. Its record reflected, on the one hand, a smoothly functioning judicial apparatus, which kept firm control of witchcraft trials, and, on the other hand, the attitude of Württemberg's religious leaders, who opposed popular wishes for persecution through sermons and theological tracts.

Although the largest realm in territorially fragmented southwestern Germany, at around 9,500 square kilometers, the duchy of Württemberg ranked among the smaller middle-sized states in the Holy Roman Empire. The first Protestant territory in the region following the Reformation of 1534 under Duke Ulrich, it was forged by Duke Christoph (1550–1568) into a cohesive Lutheran confessional state. Around 1600, approximately 450,000 people lived in its fifty-eight administrative districts. Each district included a town that served as the district seat as well as a number of villages. The capital, Stuttgart, had around 9,000 inhabitants, while the university town of Tübingen had 4,000.

Most accused witches were women (85 percent); the men were often herders who practiced incantations and herbal remedies. The women accused of witchcraft were most commonly old and from the peasant underclass; they were poor, propertyless, and often widows deprived of familial support. "Honorable" and propertied women from the urban upper class were less frequently suspected of witchcraft and better able to exploit the judicial possibilities of defense and appeal to get through unharmed, to buy better accommodations in jail, or even to escape with the help of town officials. Eight of the women executed as witches were midwives (7 percent, an unusually high percentage). Children, who became increasingly involved in witchcraft trials in the second half of the seventeenth century, were never sentenced to death in Württemberg; their punishment combined a spanking with religious instruction by a minister or schoolmaster.

Württemberg's first recorded witch burning occurred in 1497, when "Fiends" (the usual term for witches in contemporary records) were burned to death in the town of Brackenheim. In 1505, after a woman was burned at the stake in Tübingen, the theologian Martin Plantsch preached a number of sermons opposing credulous and superstitious witch beliefs. A relatively mild phase ensued until 1560, during which thirty trials for magic and witchcraft ended with banishments or acquittals. In 1529, the widow of a Stuttgart citizen accused of witchcraft even lodged a complaint with the *Reichskammergericht* (imperial chamber court) against the prefect of Stuttgart for excessive torture.

After 1560, concern about witchcraft increased. In August 1562, a bad hailstorm, an early symptom of the Little Ice Age, devastated large areas of Württemberg, totally destroying the harvest in some districts and sparking a substantial wave of persecutions that swept

across the land and quickly spread to neighboring regions. In 1562 and 1563, eleven women accused of witchcraft were executed. In the neighboring Protestant county of Helfenstein, over sixty people were burned at the stake. In Stuttgart, the preachers Matthäus Alber and Wilhelm Bidembach spoke against the witch superstition and opposed the fury of people who had quickly identified the witches responsible for their misfortune and demanded their rigorous prosecution. Following the position of Württemberg's great reformer Johann Brenz (1499–1570), the preachers urged the judicial officials to be cautious and disregard popular clamor.

After 1590, a new wave of persecutions started, lasting until 1630 and reaching a peak in the period between 1626 and 1630. Despite the large volume of activity, though, single trials rather than mass panics predominated. A "witch newspaper" printed in Tübingen in 1616 reported that the regent of Württemberg insisted his officials follow legally correct procedures against witches. The most famous witchcraft trial in Württemberg took place in 1620 and 1621, when Katharina Kepler (1547–1622), mother of the imperial astronomer Johann Kepler (1571–1630), was accused as a witch and tortured but eventually acquitted.

After the Battle of Nördlingen in 1634, when the Thirty Years' War swept over the duchy and devastated it, almost no witchcraft trials took place. Witchcraft accusations revived in the 1650s. Now children were often involved, either accusing others or denouncing themselves. In the last great witchcraft trial, which occurred in Calw between 1683 and 1684 and resulted in two death sentences, over forty children were involved. However, this trial marked the beginning of the end. The ducal government sent a commission to stop the "lamentable witch business, which," it said, was rooted "mainly in fantastic illusions." Witch accusations continued until the end of the eighteenth century, but they only led to criminal prosecutions in exceptional circumstances and increasingly were handled as slander.

LEGAL PROCEEDINGS

The Carolina Code (*Constitutio criminalis Carolina*), issued in 1532 by Holy Roman Emperor Charles V, contained penalties for magic that included, in article 109, death by fire for harmful magic. In Württemberg, the wave of trials in 1562 gave the impetus for a legal definition of the crime in the Sixth Provincial Ordinance of 1567. Württemberg was the first territory that put a pact with the Devil on par with harmful magic as an essential feature of magic and, diverging from imperial law, made it punishable by death. The law remained on the books without modification throughout the seventeenth century.

In Württemberg, witchcraft was considered an offense against the state and, like every other criminal offense, was handled exclusively by secular courts. The prefect, the ducal representative in each district, led the investigation and brought charges before the district seat's municipal court in what amounted to an inquisitorial trial. The prosecution tried to determine the material facts and establish the objective truth. Because incontrovertible evidence could be found only in exceptional circumstances, the proceedings had to rely on circumstantial evidence, and torture was included as a means of determining guilt. In general, neither the prefect nor the judges of the municipal court, who came from the urban elite, had formal legal training. In order to compensate for their limited legal knowledge, prevent crass miscarriages of justice, and hold the courts to uniform procedures, prefects could not conduct criminal trials on their own authority but had to report to the ducal chancellery. Thus, the decision to start a witchcraft trial lay with the central administration, and the ducal High Council directed such criminal trials according to legally correct procedures. Municipal courts were often required to send trial documents to the jurists at the University of Tübingen for expert legal counsel. These consultations and the reports to the High Council put a heavy responsibility on the central administrators, who made the actual decisions in witchcraft trials. The High Council also had to approve a death sentence, which, following contemporary criminal law, meant burning alive. However, repentant witches were beheaded as an act of mercy, and their corpses were burned afterward. Confiscation of property from convicted offenders was not allowed in Württemberg, so direct financial interests of the prosecuting elite played no role in witchcraft trials.

Witchcraft accusations almost always originated from ordinary subjects, and *maleficium* (harmful magic) invariably stood at their center. Poisonings, diseases, and the death of people and animals were supposedly caused by harmful magic, often after a conflict between perpetrator and victim that the ducal government was expected to resolve through a witchcraft trial. In the majority of cases, charges were usually not brought on the basis of a confession by the accused but rather on the basis of circumstantial evidence: rumors, suspicions, and accusations. Legally defined (Carolina, art. 44) and reliable evidence was needed to justify an indictment, incarceration, or torture. Württemberg's High Council based a decision to begin a witchcraft trial on concrete and demonstrable injury, the *corpus delicti*, as well as the moral and religious reputation of the suspect, supplied by the local clergy. Testimony of witches who had confessed only to a pact and intercourse with the Devil did not suffice as grounds for bringing charges.

Torture could not be undertaken without the approval of the High Council. Torture was the decisive

instrument in witchcraft trials, for whether and how it was administered generally determined the outcome. Württemberg's law provided for torture by hoisting (strappado) for at most a quarter hour, but the honor of the executioner and of the court personnel generally induced them to compel the suspect to confess by any means at their disposal, often in violation of the law. The needle probe to determine imperviousness to pain played a limited role in Württemberg witchcraft trials; tests such as "swimming" were unknown. Confessions extracted by torture contained the usual, well-known components: harmful magic, pact and intercourse with the Devil, and magical flight to a witches' Sabbat.

Without questioning the basic belief in witchcraft, the clerical and secular elites in Württemberg conducted witchcraft trials on a thoroughly scrupulous basis. The fact that only 30 percent of them ended with executions is attributable to the moderating influence of the government. Württemberg suffered no "witch-hunts from above"; instead, the early modern territorial state, with the consolidation of its central administration, maintained a certain amount of legal order that prevented virulent witch persecutions.

WÜRZBURG, PRINCE-BISHOPRIC OF

During the first thirty years of the seventeenth century, the Catholic prince-bishopric of Würzburg, along with four other Catholic ecclesiastical principalities situated in Franconia in southeastern Germany (the upper part of the prince-bishopric of Mainz, the prince-bishoprics of Bamberg and Eichstätt, and the prince-abbey of Fulda), experienced some of the most severe witch hunts ever seen in the early modern world. These Franconian persecutions “were among the worst excesses of European history,” fulfilling “the sombre dream of unconditional persecution, of persecution without regard for political, social or humanitarian obstacles, but only for the logic of the persecutions themselves” (Behringer 1997, 24, 228). In Würzburg, 300 people were executed as witches in 1616 and 1617 during the rule of Prince-Bishop Julius Echter von Mespelbrunn (1544–1617; episcopate 1573–1617); 900 executions occurred between 1625 and 1630 under Prince-Bishop Philipp Adolf von Ehrenberg (1583–1631; episcopate 1623–1631). Survival of trial records from Würzburg is incomplete, and research on the witch hunts there has been patchy: No book-length study of these hunts exists.

Little evidence of witchcraft trials in Würzburg prior to 1590 remains. Scattered trials, some of which ended in executions, occurred under Echter between 1590 and 1603. The rate of persecution accelerated markedly between 1616 and 1617, however. It is impossible to ascertain the exact numbers of those executed because many trial records are missing, but it is clear from contemporary comment that this witch-hunting episode was severe. On June 11, 1617, for example, Würzburg cloth shearer Jacob Röder recorded in his diary that, according to an announcement made on the bishop’s orders from the cathedral pulpit, 300 witches had been executed in the prince-bishopric over the past year. Trials continued under Echter’s successor, Johann Gottfried von Aschhausen (1575–1622; episcopate 1618–1622). Although there is no evidence on the number of people executed, it appears that the severity of the persecution declined. Under Aschhausen’s successor, Ehrenberg, trials began in 1625, gained momentum between 1626 and 1628, peaked in 1629, and stopped in 1630.

Some historians have regarded the total of 900 executions between 1625 and 1630, first publicized in a contemporary pamphlet, as an exaggeration. However, recent work based on witch-trial material gathered by the *H-Sonderkommando*, the special research team organized during the Nazi regime by Heinrich Himmler, suggests that this total is reasonably accurate (Behringer

1997). Regardless of age and status, no one was safe from the witch persecutions under Ehrenberg. Lists of victims of the first twenty-nine of the forty-two mass burnings that occurred in the city of Würzburg between 1627 and 1629 detailed a total of 160 individuals executed, including a mayor’s wife, the wife of the former chancellor, a councillor, three councillors’ wives, and seventeen children whose ages were specified as fifteen and under. Forty-three canons and vicars were also executed between 1627 and 1629. These persecutions were so savage that Germans coined a new term for excessive witch hunting: *würzburgisch Werk* (Würzburg work). A mandate issued by the *Reichskammergericht* (the imperial chamber court), prohibiting Ehrenberg from further witch hunting, probably stopped the trials in 1630 (Oestmann 1997). The mandate was likely triggered by a complaint brought before the *Reichskammergericht* by jurist Johann Friedrich Burckhardt, who had escaped from the city’s special “witch prison” after being imprisoned on witchcraft charges in 1628. Ehrenberg may also have deemed it politic to end the persecution after he and his chancellor had also been denounced as witches.

Echter, Ehrenberg, and their advisers doubtless believed in the reality of witches who made pacts with the Devil, committed acts of *maleficium* (harmful magic), and attended witches’ Sabbats: These beliefs had been Catholic dogma since 1590. They also treated witchcraft as a *crimen exceptum* (the excepted crime), a crime so heinous that normal safeguards on the use of torture could be ignored in its prosecution. Consequently, once witch hunts started, they were certain to escalate, as suspects were forced into confessing their “guilt” and denouncing others as Sabbat attendees. Moreover, the persecution process was accelerated (particularly under Ehrenberg) by the fact that all trial records were submitted to the episcopal chancellery for examination and advice.

Both Echter and Ehrenberg were also zealous reformers, a factor that contributed significantly to the enthusiasm with which they eradicated alleged witches. The son of a councillor of Mainz, Echter was born in Mespelbrunn Castle in the Spessart region in 1544; he studied law and theology at the Universities of Mainz, Louvain, Douai, Paris, Angers, Pavia, and Rome. After his election at Würzburg in 1573, he began a vigorous program of Counter-Reformation in 1585, organizing visitations throughout his diocese, forcing many Protestants to convert to Catholicism or leave, founding new parishes, and disciplining lax priests. He also increased his power at the expense of rival institutions by issuing mandates regulating the social, economic, and religious life of Würzburg; pursuing legal and administrative reforms; and reducing the influence of the Würzburg cathedral chapter. The witchcraft trials of 1616 and 1617—some of which

he oversaw personally—can thus be seen as a product of his Counter-Reformation zeal to eradicate heresy and ungodliness while increasing his own power. Echter also founded a hospital for the sick, aged, and orphaned in Würzburg in 1576 and a university in 1582, both named after him. Echter's charitable acts and his persecution of witches were all motivated by a desire to do what he believed improved his subjects' physical and spiritual well-being, even if this meant burning some of them at the stake for the good of their eternal souls.

Philipp Adolf von Ehrenberg was Echter von Mespelbrunn's nephew. Born into the family of the Imperial Knights of Ehrenberg near Heinsheim am Neckar in 1583, Ehrenberg may never have become bishop of Würzburg had his Protestant father, Hans Heinrich, not died in 1584. Hans Heinrich had wanted his son to be raised a Lutheran, but after his early death, his widow's brother, Julius Echter, took over his young nephew's guardianship and (Catholic) education. After studying theology at the Universities of Rome, Salamanca, Valladolid, and Paris, Ehrenberg was elected bishop of Würzburg in 1623. He continued his uncle's Counter-Reformation efforts, reforming a further 200 villages according to the principles of post-Tridentine Catholicism. In overseeing the persecution of so many witches in his prince-bishopric between 1625 and 1630, Ehrenberg doubtless acted on impulses similar to those of his uncle in 1616 and 1617: first and foremost godly zeal but also a desire to affirm his own power as territorial ruler.

It seems, however, that there was greater popular pressure on Ehrenberg to hunt witches than there had been on Echter. The prince-bishopric's inhabitants had suffered from periodic plague epidemics and creeping inflation between 1606 and 1617; these misfortunes almost certainly helped create a climate of anxiety conducive to the persecution of witches under Echter in 1616 and 1617. But conditions deteriorated markedly during Ehrenberg's episcopate. As a result of harvest failures, coinage devaluation, and increasing troop movements through the area, the years between 1624 and 1629 constituted a high point of dearth, inflation, and plague in Würzburg. In 1626, unseasonal frosts destroyed harvests and prompted popular demands for action against those believed responsible for the bad weather: witches. Two women suspected as witches were stoned—one to death—in rural Würzburg. In this context, Ehrenberg probably regarded witch persecution as a way of quelling potential popular unrest and of appeasing the wrath of God, who was visiting such Job-like disasters on his territory. In his confiscation mandate of 1627, Ehrenberg pointed out that God wanted to scorch Würzburg as he had Sodom and Gomorrah with sulfur, fire, war, hunger, and pestilence because of the number of witches it contained (Dürr 1931). Ehrenberg seems also to have been even more zealous

and intolerant than his uncle; one historian described him as “an energetic person, who could not be shaken in his intentions, who knew exactly what he wanted to do and who pursued all of his goals with immense doggedness” (Dürr 1931, 65). There may even have been a financial motive in Ehrenberg's sustained witch persecution. In 1627, he issued an ordinance allowing him to confiscate the property of executed witches, a measure that generated around 79,000 Gulden by 1629, helping to offset the great indebtedness into which his prince-bishopric had fallen since 1623.

Würzburg experienced no mass witch hunts after 1630. There were no witchcraft trials during the Swedish occupation of Würzburg (from 1631 to 1634) during the Thirty Years' War and only a few trials during the latter part of the episcopate of Ehrenberg's successor, Franz von Hatzfeldt (1596–1642; episcopate 1632–1642). Hatzfeldt's successor, the enlightened Johann Philipp von Schönborn (1605–1673; episcopate 1642–1673), refused to bow to popular pressure for further hunts. In 1669, he issued an ordinance for Würzburg and his other territories of Mainz and Worms that rendered further witch persecution almost impossible by threatening those who spread “superstitious” belief in witchcraft with punishment. Schönborn's moderation stemmed from the influence of Friedrich Spee, the Jesuit critic of excessive witch hunting, and from close contacts with Paris, where the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) in 1624 implemented automatic appeal in all witchcraft cases and in effect ended death sentences for witchcraft.

A late burst of anxiety about witchcraft resulted in the execution for witchcraft of Maria Renata Singer, subprioress of the convent of Unterzell bei Würzburg, in 1749. This was the last execution for witchcraft in Franconia and one of the last in Germany.

Y

YATES, FRANCES AMELIA (1899–1981)

One of the greatest Renaissance scholars of her time, Frances Yates wrote numerous valuable studies on the history and culture of the Renaissance that shed light on many obscure aspects of the period, especially in the field of Hermeticism, magic, and other occult beliefs. Yates was certainly aware of witchcraft's negative associations with research interests. For example, her last work, *The Occult Philosophy in the Elizabethan Age* (1979), employed the example of Jean Bodin's attack in his *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580) on Heinrich Cornelius Agrippa von Nettesheim and Johann Weyer for using Kabbalah in defense of witches to show how witch hunts could be useful in the destruction of one's cultural enemies.

Born in Southsea, England, Yates graduated from University College, London, in 1924. She continued her research privately while doing some teaching at the North London Collegiate School from 1926 to 1939. Her intellectual biography is best traced in her *Autobiographical Fragments*, in which she sought to examine herself and her research through intense and colorful self-scrutiny. Her academic isolation was always expressed with feelings of pride and sometimes regret.

Yates published her first book, *John Florio*, in 1934; like her subsequent works, it was widely reviewed. She received a prize from the British Academy and in 1941 joined the staff of the Warburg Institute. Although Warburg's method of reading images and symbols as historical events shaped her interdisciplinary approach to research, she preferred to be considered independent of any institutional tradition: Indeed, Sir Ernst Gombrich defined her attitude as lying outside the academic mill, although she was elected a Fellow of the British Academy in 1967 and awarded an Order of the British Empire in 1972. Association with the Warburg Institute encouraged her to go beyond conventional academic boundaries; as Sidney Anglo remarked, "No boundaries . . . were allowed to limit [her] research" (cited in Gombrich 1982, 26). The main outcome of this breakdown of traditional subject barriers was her decision to study Giordano Bruno, whose *Supper of the Ashes* she started to translate. This interest led to the

publication in 1964 of her single most famous book, *Giordano Bruno and the Hermetic Tradition*, subsequently translated into several languages.

Yates wrote another acknowledged classic, *The Art of Memory* (1966), in which she tackled an original subject. Together with *The Theatre of the World* (1969) and her book on Bruno, her trilogy on the Shakespearean world in Elizabethan England was complete. She tried to investigate how a new cultural tradition took root in England. Although her books were sometimes harshly criticized, the significance of her work was recognized by everyone in her field and gave rise to new areas of research. Yates also turned to the French Wars of Religion in order to underline the importance of ceremonial rites in such works as *The French Academies of the Sixteenth Century* (1947) and *The Valois Tapestries* (1959). In *The Rosicrucian Enlightenment* (1971), Yates explored the same theme, the adaptation of the Renaissance Hermetic heritage, this time amid the turmoil of central Europe during the Thirty Years' War. A collection of essays, *Astraea: The Imperial Theme of the Sixteenth Century* (1975), developed her iconographic approach to the idea of power and kingship. In her last work, *The Occult Philosophy in the Elizabethan Age* (1979), she investigated what Eugenio Garin has called the "dark face" of Renaissance culture and combined two important themes of her works, which she herself outlined at its end: the story of the Hermetic and Kabbalistic movements and the iconographic approach.

Yates, along with Garin in Italy, ultimately managed to create a new field of specialization. Hermeticism and magic, finally freed from the rationalist paradigm, were considered important and noncontradictory features of Renaissance culture. The great enthusiasm for and fierce criticism of her books revealed her enormous impact on academic culture. Yates's interest in Renaissance magic was often misunderstood. Even though she declared that her work on Bruno did not deal with the history of science, some scholars reduced her claim to consider Renaissance magic as an early phase of science. An Italian scholar, Patrizia Delpiano (1993) has shed fresh light on Yates's cultural plan to detect some mysterious features of the Renaissance and reassessed how successful her attempt was. According to

Delpiano, Yates's adherence to the history of ideas appears in contrast with the historiographic revolution of the French *Annales* school; her works reflect the fall of illusions typical of her era and demonstrate that any historical reconstruction is relative, a personal result of reading R. G. Collingwood's idea of history.

Z

ZIARNKO, JAN (CA. 1575–CA. 1628)

Jan Ziarnko (“Jean Le Grain” in French) was a Polish engraver and painter who spent most of his career in Paris; his importance for European witchcraft is a large etching of 1613 providing a very detailed visual account of the Sabbat. After completing his apprenticeship in Cracow, he spent a short time as a painter in his native Lwow, traveled to Italy, and reached France perhaps as early as 1601. All his surviving works are engravings, many reflecting his close association with the courts of Henry IV and Louis XIII.

Ziarnko created his etching to illustrate the description of the Sabbat by the French magistrate Pierre de Lancre in his *Tableau de l'inconstance des mauvais anges et demons* (Description of the Inconstancy of Evil Angels and Demons). Originally published in two Paris editions in 1612, the book was based on Lancre's four-month experience in 1609 with a royally appointed commission investigating the activities of witches in the Pays de Labourd, the Basque region of southwestern France, enriched by materials from witch hunts on the Spanish side of the border. One of Lancre's colleagues attended, in disguise, the famous 1610 *auto de fe* (act of faith) at Logroño (Henningsen 1980, 174–175). Ziarnko's etching, accompanied by a detailed key, appeared in a slightly revised 1613 edition by Nicolas Buon, at the head of book 2, chapter 4, which describes the Sabbat; it has been reproduced with an English translation of its key (Robbins 1959, 300–301).

At top right, Ziarnko's Devil sits on a golden throne in the form of a “stinking and bearded” goat with five horns, the central one a light from which all the black pitch candles and false fires of the Sabbat will be lit. On his right sits the crowned Queen of the Sabbat, his special consort, with the next in charge on his left, each holding a fistful of snakes. A young witch and devil kneel before them, presenting a child as part of their admission ceremony into this infernal society.

Lancre's text describes the scene as a counterliturgy, adding many features from Labourd's wild and raucous fairs, through which pass crowds of disorderly and disheveled people, plying their wares and depravities. At bottom right, a group of witches with their demon

paramours enjoy flesh from those who have been hanged, the hearts of unbaptized children, and the meat of unclean animals. Reinvigorated, the key claims, they continue their disgusting rites with lascivious dancing around a cursed tree. At middle left, another group of younger and naked women indulge in back-to-back dancing to the sounds of a musical consort, which de Lancre compares to the lewd and obscene movements of various current dances. Below them are members of the wealthy and powerful nobility who also participate, masked to ensure their anonymity.

Cutting through the whole scene is a vast swirl of smoke, in which can be seen witches on sticks, brooms, and dragons; bones and body parts; winged devils; and obscure shapes. A wild, disheveled, and naked witch rides a goat with two infants, while below her, a phantom passes through an imaginary fire. Smoke belches from a huge cauldron in which witches boil up their poisonous ointments and liquids; two of them prepare its main ingredients—snakes and skinned, decapitated toads—while a third fans a fire in which bones and a skull are visible. At bottom left is a scene peculiar to Basque witchcraft. A group of children use rods and switches to prevent toads escaping from a small stream. As alluded to by the toads that adorn the thrones of the Devil's two consorts, these animals played a key role in Basque witchcraft: They not only provided a critical ingredient for witches' poisons but also doubled as witches' familiars.

Ziarnko's iconography drew especially on Jacques de Gheyn the Younger and was later ridiculed in Jean Crépy's illustration to Laurent Bordelon's 1711 parody of witchcraft. The only other of Ziarnko's works with demonological themes were his engravings of St. James and Hermogenes.

ZUGURRAMURDI, WITCHES OF

The trial of the witches of Zugarramurdi is, beyond all comparison, the most famous in Spanish history and was already a "media event" at the time. Its verdicts were pronounced at an *auto de fe* (act of faith) at Logroño on November 7–8, 1610, in the presence of 30,000 people from all over northern Spain. Soon afterwards, one could read about the sensational revelations in the Logroño printer Juan de Mongastón's pamphlet, which was translated into French and incorporated in Pierre de Lancre's *Tableau de l'inconstance des mauvais anges et demons* (Description of the Inconstancy of Evil Angels and Demons, 1612, chap. 5.3). Mongastón's account was later reprinted by Francisco de Goya's friend Leandro de Moratín (in 1811 and 1824). Not until the twentieth century did the whole truth about the trial come out.

Zugarramurdi and Urdax are two Basque villages on the northern side of the Pyrenees, close to the French border. In those days, Zugarramurdi was a daughter-parish of Urdax, and its church was served by a Premonstratensian monk from the convent at Urdax. The combined population of the two villages hardly exceeded 600. The abbot at Urdax had jurisdiction over the spiritual and secular affairs of both villages; the inhabitants of Zugarramurdi were peasants and shepherds, while those of Urdax were farm laborers working on the abbey's lands.

Twenty-six of the thirty-one witches on trial in 1610 (ten men and sixteen women, from twenty to eighty years of age) came from these two villages. Together, they must have comprised a substantial part of the adult population. At the *auto de fe*, they were presented as the inner circle of the witch group that the Inquisition had exposed in these remote mountain communities. An eighty-year-old shepherd's wife, Graciana de Barrenechea, was "Queen of the Sabbat"; the second most senior witch was an octogenarian

farmer's widow, Estevanía de Navarcorena; and the third-ranking witch was a fifty-two-year-old carpenter's wife, María Chipía de Barrenechea. She was also the aunt of the young María de Jureteguía, the inquisition's star witness, who during the trial incriminated both herself and her relatives. Graciana's "co-father-in-law" (*consuegro*), the shepherd Miguel de Goiburu, was "King of the Sabbat," and he and another old man also held the office of "the Devil's robe-bearer." Miguel's son, Juanes de Goiburu, who was married to one of Graciana's daughters, Estevanía, was "bass drummer at the Sabbat," while his cousin, Juanes de Sansín, who was a basket weaver and unmarried, was the "side drummer." As drummer, Miguel had to join the procession whenever his mother-in-law led his wife, Estevanía, to the Devil and be present with the band and play while the Devil enjoyed her. The inner circle also included two priests who assisted the Devil at the Black Mass. These men were a thirty-four-year-old curate in Fuenterrabía, Juan de la Borda, the son of a rich farmer in Zugarramurdi, and his slightly older cousin, Fray Pedro de Arburu, a monk in the Urdax monastery and the son of the monastery's hospital superintendent.

The description of the rituals of these witches surpassed most other Sabbat accounts in its inventiveness and wealth of detail. It is therefore surprising that ordinary people in Zugarramurdi did not appear to have heard of the witches' Sabbat before the panic broke out. There had been occasional instances of bewitchment, and it appears from their confessions that the accused were considered responsible for several deaths among infants, illnesses among adults, losses of cattle, and destruction of crops. However, there had been no open accusations; people preferred to keep their suspicions to themselves or blame their misfortunes on "the witches" generally. The result was an atmosphere rife with old and unresolved suspicions. To spark an explosion in such a community, it was only necessary for someone to succeed in convincing people that he or she had proof. This happened at Zugarramurdi.

At the beginning of December 1608, a young village girl returned after living for some years in Ciboure, a nearby coastal town on the French side of the border. María de Ximildegui, who was now twenty, told interesting things about her stay in France. For eighteen months, she had belonged to a witch group, but an experience during Lent in 1608 had reconverted her to Christianity. After a profound crisis and seven weeks of illness, she visited a learned priest in Hendaye, who heard her confession and gave her powerful remedies with which to resist the Devil until he could obtain permission from the bishop to absolve her. At the end of July, the priest finally gave her Communion. María (who in many respects resembles the so-called survivors in twentieth-century trials for satanic child abuse) was

able to talk not only about her own case but also about the new witch panic that had broken out in France and about vigils held in the church at Ciboure to prevent witches from taking children off to the Sabbat. However, the most interesting thing was that during her time as a witch, María had also attended a Sabbat at Zugarramurdi and accordingly knew who its witches were. When she proceeded to mention individuals by name, protests were soon heard. The first to speak out was the peasant Esteve de Navarcorena, who, along with his relatives, called her to account for her accusations against his wife, the twenty-two-year-old María de Jureteguía. The French girl replied that if she could speak to Esteve's wife, she would certainly get her to confess. When the two women confronted each other, a lengthy exchange took place. María de Ximildegui described everything she had seen at the Zugarramurdi Sabbat, while the other woman denied each accusation as soon as it was uttered and swore that they were all lies. But the French girl recounted the details so vividly that her listeners gradually felt convinced and began to put pressure on María de Jureteguía to confess. When the young wife realized she had no means of escape, she fainted; shortly afterward, when she had recovered, she confessed and admitted that everything the French girl had stated was true. She confessed to having been a witch since she was a child, and she named María Chipía de Barrenechea, her maternal aunt, as her instructor in the evil art. María de Jureteguía was now brought before the parish priest Fray Felipe de Zabaleta, where she repeated her confession. Fray Felipe urged her to make a public confession in the Zugarramurdi church and beg forgiveness from the congregation for all the damage she had caused. During the next few days, various other people denounced by the French girl followed María de Jureteguía's example and made public confessions.

Meanwhile, María began to feel that the witches were pursuing her. Shortly before Christmas, the Devil and his witches invaded her house and tried to abduct her, but they were prevented from doing so by the neighbors who were holding a vigil with her family. Day by day, the witch panic spread. Shortly before New Year's, a dozen people broke into the houses of those neighbors who were under suspicion in order to look for their "toads" (that is, their familiars). They went to Miguel de Goiburu, to Graciana de Barrenechea, and to Estevanía de Yriarte. The next day, Estevanía's husband, the shepherd Juanes de Goiburu, went to the priest at the monastery to complain about what had happened. Fray Felipe told him to fetch his wife. When he returned with her, the priest declared that she had already been exposed as a witch. When Estevanía denied the charge, Fray Felipe laid his stole and a certain relic on her head, exhorting her to tell the truth. Eventually, after being threatened by the priest and by

others present, Estevanía confessed and admitted that she was a witch.

Some other people under suspicion were dragged to the priest by force; when threatened with torture, they too confessed. By January 1609, a considerable number of people had made confessions in this way, and afterward publicly asked pardon in the church of Zugarramurdi. We do not know the names of everyone who proclaimed themselves witches and asked for pardon, but except for the two priests, all the persons mentioned here were definitely included. It is also clear that the accused came from particular intermarried "witch families." However, the dividing line between witches and nonwitches cut through marriage and sibling ties. It is understandable that the inhabitants of Zugarramurdi, faced with this fact, chose to reconcile with their witches. If the Inquisition had not been alerted, the story of the Zugarramurdi witches would have ended in this admirable manner.

But unfortunately, the Inquisition *was* informed. Ten of those who had made public confessions were the first to be arrested. Once the inquisitors had used a kind of brainwashing to pry confessions out of them, they identified sixteen more witches in Urdax and Zugarramurdi and had them arrested along with five from other towns in the border region. When the new prisoners were placed together with the old ones, the following episode occurred. One night, the warden kept watch secretly over two women in his prison, María de Jureteguía and her aunt, María Chipía Barrenechea. He heard María Chipía tell her niece that she could not confess to what the inquisitors were asking her in the audience chamber because, in fact, she was not a witch nor did she know that anyone else was; further, she said, everything they had confessed previously was untrue. Her niece replied that she would never be able to leave prison until she had made a confession even if false, and this was what she, María de Jureteguía, had already done (Henningsen 2004, doc. 14.15).

By the time the *auto de fe* was held, thirteen of the original thirty-one prisoners had died in prison of typhoid fever. Of the survivors, ten who had confessed were pardoned, including María de Jureteguía and her aunt, María Chipía. The rest were sentenced to the stake as *negativos*, or "stubborn deniers." Both clerical "witches" were, however, pardoned at the last moment, after they had been interrogated under torture without confessing. But six other *negativos*, including both of their mothers, were sent to the stake without this chance to clear themselves. Four years later, the supreme council of the Inquisition admitted that the trials had been a terrible mistake and exonerated the victims posthumously.
