FOREWORD

The *Encyclopedia of Witchcraft: The Western Tradition* is an indispensable resource at the dawn of the third millennium. Above all, it provides reliable answers to satisfy the sharp curiosity of our contemporaries, who are surrounded by an atmosphere that is softly but strongly tinted with magic—the magic of dreams, of successful books such as *Harry Potter*, and of innumerable films and television series featuring witches, werewolves (**lycanthropy**), and **vampires**. This new work will be both necessary and extremely useful in bringing order to an often incomprehensible flood of information and misinformation and providing meaning for a vast river of symbols, emotions, and ideas that carry some truths but also a great many errors. It will also help readers locate the elements of truth within the vast **literature** devoted to diabolical sensationalism by distinguishing between hysterical fantasy and historical truth, enabling them to understand better the ways in which magic and witchcraft have left a profound cultural imprint on today's Western world.

Moreover, this encyclopedia appears at an appropriate moment to fill a huge void. In its breadth of subject matter, its international and collective character, and its completeness, it has no equivalent. A few dictionaries of diabolism and magic exist in various languages; in 1959, for example, **Rossell Hope Robbins** published the 570-page *Encyclopedia of Witchcraft and Demonology*. But until now, no multivolume survey, bringing together contributions from 172 specialists representing twenty-eight countries, has ever been attempted. Like Denis Diderot's famous eighteenth-century *Encyclopédie*, this work offers mature collective wisdom about the topics it surveys. The time has finally come to consider carefully and seriously the greatest enigma of Western civilization between the 1420s and 1750: the **executions** of witches, whose flamboyant traces still haunt our imaginations in both Europe and America. We know today that there were not 100,000

executions, as **Voltaire** claimed, but barely one-third as many. Most of them occurred within the boundaries of present-day **Germany**, and most witches died in western Europe between 1560 and 1630.

Witchcraft and magic are universal human phenomena; they can be found on any continent at any time. However, only the West has ever burned great numbers of witches, after legally constituted **trials** that were approved by political authorities and fully accepted by established churches. Women generally constituted around 80 percent—at times more—of those accused and condemned, although there were exceptions to this rule in places such as **Finland** or the French province of **Normandy**. This astounding imbalance between the genders makes the mystery even more impenetrable, because at that time, witchcraft (along with **infanticide**) became the female capital crime par excellence; generally, women accounted for only a very small minority of all defendants in courtroom trials, rarely exceeding 20 percent.

The past is not dead. It weighs on those living today—and not just in vivid sensations that remain deeply embedded in our memories or in museum collections such as those at **Salem**. It endures more subtly through the impact of strong images, which I prefer to call cultural matrices, that carry their symbolic baggage from century to century. One of the most powerful of these images, the great European enigma of the witch at the stake, drives this encyclopedia. No one person can resolve this enigma in such a short space. I simply want to direct readers' attention to some paths of research and give them a desire to sample this work in the same way that Voltaire tried to guide readers of his *Dictionnaire philosophique* (Philosophical Dictionary, 1764): Here also, one article refers to another, and readers can best absorb their ultimate meanings by linking together multiple entries.

The problem at the heart of these volumes is enormously complicated, and no single answer or approach can resolve it. But like any great question, it can be simplified by seeking its most basic core: The **witch hunts** were so terrible and so intense that simply retelling their history reveals something fundamental about the mentality of the western Europeans who conducted them. And without any general consensus among historians for explaining the persecution of witches, I hope to enrich its significance by placing it among the formative myths that slowly but profoundly shaped the cultural and social foundations of early modern Europe.

Attempts to explain the persecution of witches have multiplied since the end of the witchcraft trials. Obviously, the judges and most other people believed purely and simply that witchcraft demonstrated the unleashed power of the **Devil**, a kind of prelude to the **Apocalypse**; in their eyes, the witches constituted a secret society of deviant devil-worshippers, paying homage to Satan and fornicating with him at their **Sabbats**. Those who dared to express doubts on this topic, as **Johann Weyer** did, were few. The eighteenth-century *philosophes* tried to eradicate such **superstitions** by talking about madness or, more cleverly, about diabolical suggestion; skeptics such as **Daniel Defoe** argued that the Devil had no physical power but simply insinuated his venom into human minds. Nevertheless, a residue of **demonology** has survived at various intellectual levels; it ranges from today's abundant overtly satanic literature to historical accounts and theological discussions, with each genre serving the specific needs and cultural conventions of its special audience. Until 1960 (and sometimes later), the dominant explanation in the Anglo-Saxon world came from the works of the Egyptologist **Margaret Murray**, who saw the witches' Sabbath as a very real but secret ceremony demonstrating the clandestine survival of a cult of a pre-Christian horned god. Without going that far, **Carlo Ginzburg** followed a parallel path when investigating the *benandanti* of Friuli and suggested, unconvincingly, that **shamanism** profoundly influenced the witches' Sabbath.

A major turning point occurred in the 1970s. Influenced by events such as opposition to the Vietnam War or the French student uprising of 1968, some researchers followed smoke signals from the Devil's grass (cannabis or peyote) and explained the experiences of witches as **hallucinogenically** induced dreams. Others took more novel paths. In **France**, **Robert Mandrou** explained the end of witchcraft persecutions long before the **Enlightenment** through increasing **skepticism** among the ruling classes. In **England**, **Alan**

Macfarlane and **Keith Thomas** built an anthropological model, in which witches were often accused of casting **spells** on people who had previously refused them charity. For these British scholars, neighborhood and a sense of guilt seemed more important than the Devil, whose presence was never elicited through **torture**, as it was on the Continent. A response followed quickly from **H. C. Erik Midelfort**, who used massive statistical information from an epicenter of persecution in **southwestern Germany** to build a highly useful model describing the variations in witchcraft persecution within a region where confessional rivalry appeared to multiply witch burnings. With youthful enthusiasm, I devised a two-sided **acculturation** model, using witchcraft trials from the Spanish-ruled **southern Netherlands**. One part merged the British/anthropological explanation with a then-fashionable type of Marxism, stressing that the richer inhabitants of villages encouraged their overlords to persecute poorer residents by offering to pay the costs of witchcraft trials. The other part described how confessional churches and emerging absolutist states targeted witches as prime and particularly dangerous transmitters of an outdated oral culture, heavily charged with what these authorities called superstitions. My model proved too schematic to apply successfully throughout Europe, but it contained some still-valid elements, including an explanation for the predominance of women among witches.

While the effervescent intellectual climate of the 1970s led to some intellectual collisions, other researchers working in the Jura region, **Scotland**, the Spanish **Basque Country**, and **New England** patiently collected information that enabled us to gain a better overall grasp of the dimensions of the witch hunt in some widely scattered places. However, too much archival work of the 1970s was carried out in parts of western Europe other than Germany—the “mother of so many witches,” in **Friedrich Spee's** evocative phrase. A major revival of interest in witchcraft trials occurred in West Germany only after 1980, when the amazing collection made by the Nazi *Hexenkommando* finally came to scholars' attention. Subsequently, this material has been used to shape some fresh and persuasive interpretations of the phenomenon in its heartland, most prominently **Wolfgang Behringer's** correlations between climatic disasters, famine, and major witchcraft persecutions.

The years since 1990 have marked a new stage in the journey down this long road. Several general accounts of the witch hunt have been published, usually without privileging any single interpretation. Even the outstanding **Lorraine-based** investigation empha-

sizing quarrels within villages (Briggs 2001) offers “many reasons why” when trying to explain witchcraft persecutions throughout Europe. But if a historian’s most fundamental task is to establish some hierarchy for the information he or she provides, then a multiplicity of explanations, each of roughly equal weight, ultimately remains unsatisfactory. Moreover, some recent developments have significantly clarified our knowledge of this topic, including works highlighting the idea that witchcraft persecution had a center with several peripheries, the specificity of **demonic possession** in convents such as **Loudun** and its hidden connections to witchcraft prosecutions, and especially the fundamental importance of **gender** for comprehending this theme.

The **geography** of witch hunting now seems clear: The phenomenon was centered in the German-speaking **Holy Roman Empire** (plus **Switzerland**). This core region also produced the **Protestant Reformation**, pioneered the system of confessionalism, and endured Europe’s bloodiest religious war until 1648. But there were also various types of “witchcraft peripheries,” three of which should be noted in particular. Most of Protestant northern Europe, apart from **Scotland** and northern **Sweden** after 1668, seems to have been relatively immune to extensive witch hunting; one exceptionally prosperous region, the United Provinces of the **Netherlands**, abandoned witch hunting much sooner than any other area. Another little-affected region comprised the solidly Catholic lands of southern Europe (**Spain**, **Italy**, and **Portugal**), where Inquisitions avoided putting witches to death, and France, whose appellate courts permitted relatively few executions for this crime. Finally, eastern Europe constituted a very different sort of periphery. There, trials and executions of witches occurred much later than in western Europe, but they were confined to Latin Christianity; **Orthodox** Christendom remained almost entirely impervious to this phenomenon, and **Islamic** regions were completely so.

It is abundantly clear that witch hunts were very unevenly distributed throughout Europe. The heartlands of witchcraft persecutions lay mostly in parts of west-central Europe, which were sharply disputed between Protestants and Catholics between 1560 and 1630, and there were later prolongations in eastern Europe during the post-1650 Catholic reconquest and in a few overseas colonies such as New England. Major outbreaks of witchcraft trials were distributed widely among both Protestants and Catholics during the apogee of confessionalization, but few obvious subpatterns emerged along confessional fault lines. Europe’s

very worst witchcraft **panics** tended to cluster between 1585 and 1630 in Germany’s Catholic **ecclesiastical territories** (principalities), especially those, such as **Cologne**, ruled by electoral prince-archbishops. Meanwhile, the most intensive (per capita) and regular (per annum) witchcraft trials in western Europe afflicted the Protestant **Pays de Vaud**. The best general rule one can discover is a negative correlation: The lay judges who burned most of Europe’s witches were usually the furthest removed from the centers of political power in major monarchies such as France or Spain.

The theme of witchcraft probably requires the sort of multilayered approach pioneered by Fernand Braudel (Braudel 1980). At the short-term or “conjunctural” level, we must identify the local circumstances: Sometimes, the most serious outbreaks of witch hunting were prompted by climate changes and harvest failures, and at other times, they were triggered by the actions of unusually zealous judges, among them **Pierre de Lancre** or **Henri Boguet**. At a multigenerational intermediate level, they developed against a background of prolonged confessional rivalry and strife, which seems to have been most intense in the Holy Roman Empire. The lion’s share of the prosecutions occurred in regions ruled by Catholics, who, in one sense, had a head start because the **papacy** had apparently endorsed the *Malleus Maleficarum* (The Hammer of Witches, 1486) a century before the worst outbreaks began; after the Council of Trent, **Jesuits** including **Juan Maldonado** rediscovered and emphasized the profound links between **heresy** and diabolical witchcraft. The purely Catholic phenomenon of demonic possession in nunneries led to some spectacular dramas: For example, at least two nuns from the convent of the Verger in Artois were burned as witches around 1614 (Muchembled 2003a, 250–263), after which Catholic authorities made a much stronger separation between witches and “possessed” women.

At the deepest, long-term level of explanations for witchcraft, the subject of gender relations in Europe between the fifteenth and eighteenth centuries—and beyond—deserves very close attention, not just because books on the subject seem to multiply, giving one the impression of a passing fashion, but also because if the overwhelming majority of convicted witches were women, it is impossible not to ask why. Back in the 1970s, a few male scholars, myself included, made timid allusions to this problem, without attracting much attention. Only recently has feminist scholarship emphasized the strongly feminine character of the crime of *lèse-majesté divine* or treason against god—and some current defenders of this approach have not

improved its credibility by talking about “gynocide” or grossly exaggerating the **numbers** of women killed for this crime at a time when religious massacres, not to mention famines and **plague**, truly decimated European populations.

My own reading of European cultural and social history in the early modern period suggests a slow and subtle modification, at the very deepest level, in the relationship between the sexes. The onset of witchcraft persecution at the end of the Middle Ages, which has been analyzed less thoroughly than its peak, coincided with what feminists describe as the development of a “paternalist-misogynist” model. One might just as easily call it a reinforcement of masculine privilege, an attempt to confine women more strictly than before within the bounds of “propriety,” meaning, first and foremost, the control of their sexual impulses. Except for a handful of princesses and fashionable courtisans, women of that period were subjected to a more intensive and intrusive surveillance of their sexual behavior, which was insistently defined as naturally malevolent and sinful. Any woman found guilty of disposing freely of her own sexuality suffered extreme consequences. Extramarital sexual activity enhanced a man’s reputation, but it invariably had tragic consequences for any woman unlucky enough to be caught concealing her pregnancy; for example, in France, following a royal edict of Henry II in 1557, women were fifteen times likelier to be executed for this crime than burned as a witch in the vast district of the *Parlement of Paris*.

Moreover, only during the sixteenth and seventeenth centuries did the consensus of European thinkers agree that a **pact with the Devil** could not be broken. Instead of the famous medieval miracle of **Theophilus**, who outwitted the Devil, the dominant motif became the pact of Dr. Faustus (**Johann Georg Faust**), who was eternally damned (Muchembled 2003b). Although both Theophilus and Faustus were men, the consequences of the change weighed overwhelmingly on women. The ultimate metaphor became the one-sided and unbreakable pact between an old woman and the Devil, confirmed not in writing but by an act of sexual intercourse, which male authors and judges invariably described as painful.

Of course, no single explanation can cover a phenomenon so important, so spectacular, and so terrifying as witchcraft persecution, which has left indelible traces on Western civilization. But we must not shrug our shoulders in defeat or retreat behind a confusing multiplicity of causes. In fact, European witchcraft between the fifteenth and eighteenth centuries offers an excel-

lent terrain for attempting a total history, at every level from local to global. The *Encyclopedia of Witchcraft* thus comes at the right time to shine a spotlight on many things, especially two notions that have been too often neglected recently: first, the essential role of Christianity in encouraging the persecution of witches, and second, the reinforced legal subordination and surveillance of women in early modern European society. The evidence for both phenomena is so overwhelming that they have all too often remained hidden in plain view, obscured by multicausal approaches and thus minimized by even the best specialists. The deepest reason for this neglect probably lies in the ways in which great cultural myths usually work: They touch essential matters but without drawing attention to them because a myth that is too easily understood has little effect on any given society.

I believe that Western witchcraft from the 1420s to around 1750 carried the cultural baggage of one of our greatest myths: male supremacy, powerfully reinforced at that time by a religious ethic that placed increasing emphasis on a man’s duty to supervise his female companions, whose cold and damp natures were inclined toward evil and were dangerous for the collective salvation of humanity. A witchcraft trial involved a woman, frequently widowed or otherwise unsupervised by male kin, who was accused of giving herself—in both body and soul—to the Devil. This fact cannot be understood without setting it in the religious context of that age, as different confessional churches rivaled each other in increasing supervision over the female **imagination** (including a stronger indoctrination of **children**). Burning a witch in public concealed a veritable forest of symbols, the most essential being the relationship between genders. The idea of the evil woman was one of the most fundamental Western myths until the eighteenth century—and beyond. Myths die hard. Imaginative cinematographers such as Alfred Hitchcock or David Lynch re-created an image of the dangerously perverse blonde, capable of the very worst sexual transgressions, closely resembling the figure of the witch punished by early modern European males.

Have we reached a crossroads? In this millennium, the social and cultural importance of Christianity is declining at an accelerated rate in Europe, although much more slowly in the United States, while in both places, women are increasingly demanding their place in the sun. After more than five centuries, the myth of the witch as the sexual slave of Satan, eating babies and raising hailstorms, seems to be disintegrating. Radical and profound mutations in gender relations, including marital relations and **family** values, have surely played a

major role in this disintegration. When civilizations shift at their deepest levels, fundamental myths shift with them. In both Europe and the United States, now safely insulated from infant mortality and food shortages, the old myth of a happier life after death is increasingly challenged by the contemporary myth of immediate and total individual gratification: I want it here, I want it now, I want it all . . .

For anyone seeking reliable information about this basic Western myth, the *Encyclopedia of Witchcraft* provides exactly that: We have it here, we have it now, and we have it all.

ACKNOWLEDGMENTS

This encyclopedia entailed more work than I could have imagined and required more help than I had expected. So many people have assisted me over these past six years that I fear I will omit someone here; if I do, I hope that person will forgive me. Those I must thank comprise three groups: scholars, ABC-CLIO staff, and family.

I have been fortunate indeed to have had a superb editorial board consisting of excellent scholars: Wolfgang Behringer, Gustav Henningsen, Brian P. Levack, William Monter, James Sharpe, and Merry Wiesner-Hanks. The members of the board helped me develop the initial lists of entries by correspondence and in two meetings at the University of York in April 2001. They wrote entries themselves, provided advice, and answered questions. I and at least one member of the editorial board read each entry in the encyclopedia. While I did the final editing, the comments of the board members proved invaluable, and they will see much of their handiwork when they read the published encyclopedia.

Three historians provided me with exceptional help and saved me from innumerable missteps. Bill Monter read every entry, and he did so quickly, week to week, month to month, and year to year. He was, as he likes to say, my *éminence grise*. He is a master of comparative history, and he frequently improved entries by calling my attention to issues that contributors might well include in their articles. Bill more than once volunteered to write entries when contributors reneged or when I could not locate suitable authors. Finally, after declining to be editor himself, he had the wisdom or folly to recommend me to ABC-CLIO. Wolfgang Behringer put his enormous knowledge of witchcraft at my disposal; whenever I had a question, often arcane, he responded immediately and correctly. He is, in large part, responsible for the blanket coverage of Germany in our encyclopedia

and for the multiplicity of Germans who wrote entries. In addition, he authored more entries than anyone else. My fellow Texan Brian Levack also served as a sounding board, contributed entries when I despaired of locating authors, and settled many witchcraft matters in long telephone conversations. His expertise in legal history proved invaluable. He, along with Bill Monter, even helped by reading some of the page proofs.

In my career, I have found that historians of Europe have been friendlier and kinder than most other groups of people I have encountered. My work on this encyclopedia confirmed that view. The contributors to the encyclopedia have been affable and cooperative. Certain contributors warmed my heart with their eagerness to help and their supreme kindness. These *Menschen* include Michael Bailey, Robin Briggs, Carmel Cassar, Yossi Chajes, Jane P. Davidson, Oscar Di Simplicio, Johannes Dillinger, Sarah Ferber, Julian Goodare, Rune Hagen, Tamar Herzig, Valerie Kivelson, David Lederer, Victor Matthews, Georg Modestin, Caroline Oates, Martine Ostero, Edward Peters, Alison Rowlands, Will Ryan, Jürgen-Michael Schmidt, Walter Stephens, Michaela Valente, Dries Vanysacker, Rita Voltmer, and Charles Zika. Edward Bever gave me extraordinary help throughout but especially by writing some difficult entries on short notice during the final stages of production.

Numerous were those who did not write entries but who patiently answered my questions, suggested contributors, and helped me in other ways: Guy Chet, Harvey Chisick, Geoffrey Dennis, Chad Gunnoe, Tom Kuehn, Dan Magilow, Alfred Mierzejewski, David Nicholas, Carles Salazar, Jonathan Schick, Laura Stern, John Tedeschi, Carmen Terry, and Martin Yaffe.

Many at ABC-CLIO have participated in this extensive project. Todd Hallman, acquisitions editor, approached me about editing the encyclopedia after

speaking to Bill Monter. I have worked closely with Allison Miller, assistant developmental editor, and then Patience Melnik, developmental editor. Both have been utterly professional, smart, and efficient. Martha Whitt and Anna Kaltenbach, production editors, have been on top of their jobs. Cisca Schreefel, associate production editor, gave great help, as did production editor Martha Gray. The copy editors caught some mistakes and often rightly asked for more information: Silvine Farnell, Anne Friedman, Beth Partin, Kathy Delfosse, and Joan Sherman. Ellen Rasmussen, media editor, facilitated my selecting the encyclopedia's illustrations. Elaine Vanater in marketing did her job extremely well. Terry Buss and then Wendy Roseth handled contributor relations after Patience Melnik. Art Stickney and Don Schmidt, editorial directors, watched over this project. Ron Boehm, chief executive officer of ABC-CLIO, has been gracious and supportive in my conversations with him.

I am grateful to the University of North Texas for giving me a semester's Faculty Development Leave to work on this encyclopedia.

Finally, I owe—I really do—gargantuan amounts of gratitude to my family. My wife, Hilda, allowed me to withdraw to my upstairs office days, nights, and weekends to work on the encyclopedia. The house deteriorated somewhat during my seemingly ceaseless and grinding work, but she rarely called upstairs for me to do a chore or to come up (down) for air. She demonstrated great marital wisdom by never asking me when I would finish or when we could go on a decent vacation. Love is never having to badger. My children, Davina, Irene, and Jeremy, also never complained (about the encyclopedia, anyway), and while they did not stop making demands on my time, they did show greater forbearance. I owe all of my family much time, which I shall duly repay with interest.

INTRODUCTION

Witchcraft is a topic of enduring interest for a variety of reasons. Many and probably most human societies, from primitive bands through civilizations, have practiced and still practice forms of witchcraft (and its close relations magic and religion) and/or believe in the concept of a witch, defined as someone who uses supernatural means to cause harm or misfortune. When beneficent as well as malevolent power is subsumed in the definition of witchcraft, then the concept of witchcraft is universal, historically and geographically.¹ For societies or segments of societies that mistakenly believe only “the Other” employs witchcraft, the topic may have interest as an entrée into the minds and behaviors of the backward, the superstitious, or the ignorant. Witchcraft, a part of the occult, fascinates, perplexes, and offers vicarious experience with the dark, deadly, and dangerous. Thus, in Western civilization, some skeptical Romans, medieval and early modern peoples, and the transoceanic societies that comprise the contemporary West have expressed their feelings of superiority as well as their fascination and fear of witchcraft, perceived to be joined to its Siamese twin, evil. The perception of witchcraft can function to mark cultural and religious boundaries, to label or cleanse a society of the socially and/or the religiously indigestible, and to distinguish the good from the bad, offering a partial theodicy to cope with humankind’s Hobbesian lives.

All topics are on the scholars’ table, although they do not always realize the seemingly endless varieties of approaches and subjects—hence, historiography and spectacular alterations in scholarship that can often bewilder those more comfortable with static knowledge and with understanding through faith in authority. Our comprehension of perceptions of witchcraft—historically and culturally—and witchcraft itself changes temporally and geographically. The *Encyclopedia of Witchcraft: The Western Tradition*, approximately six years from conception to publication, reflects these

fast-paced changes in research, knowledge, and approach. Indeed, in editing the 757 entries, I found that articles often had to be reworked because contributors did not and frequently could not know results of new research that has appeared in a wide variety of languages and that subsequently has been incorporated into different entries.

Scholars, to be sure, have studied witchcraft across the planet and from prehistory to the present. However, since the eighteenth century, arguably more research on witchcraft (and related subjects) has been done in the West than elsewhere. Such research and writing has taken place in Western societies, spread now over the world, because the West is where the more than two dozen democracies exist and thus where relative freedom of expression and research is possible. The twenty-eight nations represented by the 172 contributors to this encyclopedia are all in the West—and not only because the volumes deal with the Western tradition. An encyclopedia of witchcraft that covers the globe would doubtless have Westerners as the overwhelming majority of contributors.

Witchcraft interests the academic world partly because it is extraordinarily interdisciplinary: Anthropologists, ethnologists, folklorists, historians, linguists, philosophers, political scientists, sociologists, and scholars of literature, medicine, religion, and theology have contributed to this encyclopedia. The central focus of the encyclopedia is the European witch hunts that occurred between the early fifteenth century and the late eighteenth century. These centuries encompassed those developments that make the Western witchcraft experience unique: the emergence of the so-called cumulative concept of witchcraft and the prosecution of upwards of 100,000 people for witchcraft, most of them for diabolical witchcraft—meeting with the Devil (sometimes at Sabbats, which witches usually

traveled to by flight), signing a pact with the Evil One, and subsequently working *maleficium* (harmful magic) in a revolt that aimed to topple Christian civilization.

Many scholars have come to the period of the witch hunts to investigate persecution and religious intolerance, linking the pursuit of witches in the “persecuting society” that was late medieval and early modern Europe to the maltreatment of Jews, lepers, homosexuals, and those Christians labeled as heretics by other Christians. In fact, there was little persecution of diabolic witches, for those prosecuted as serving the Devil did not (and could not) do so. There is absolutely no evidence of a devil-worshipping sect in late medieval and early modern Europe, but empirical evidence, of course, is irrelevant to faith (or prejudice). Yet diabolic witches, like the Islamic Ottoman Empire entrenched in southeastern Europe and often expanding into central Europe, instilled great fear in Latin Christendom as threats that could literally destroy Christian society. Somewhere between 35,000 and 50,000 accused witches were executed or lynched; we will never know the exact number. Anyone, even a pope, could be accused as a witch, though in this, as in all of life, probability counted: People were more plausibly denounced as witches if they were women, related to another accused witch, old, single, and possessed of a quarrelsome reputation. But there was no certain safety; many entries in the *Encyclopedia of Witchcraft* detail exceptions to the familiar image of the witch and note the urban and high social status of some of those executed. Given these fears, superimposed on the omnipresent structural threats of hunger and cold, scholars have lately wondered why many more witches were not killed. After all, the numbers of individuals who were institutionally or extralegally killed as witches pale in comparison to the millions of victims of twentieth-century genocides.

The issue of the persecution of women as witches has attracted feminist scholars (not to mention Neo-Pagans) to the topic, and they have significantly increased our knowledge of gender relations and sexuality, even though women were not prosecuted simply for being women, unlike Jews victimized for being Jews, lepers for having leprosy, or homosexuals for behaving as homosexuals. Nevertheless, the prosecution of thousands for concluding a pact with the Devil, kissing his anus, flying to his Sabbath, and having frigid and painful intercourse with him explains much of the attraction of the subject of witch hunts because the prosecutions and the lynchings were of people judged guilty of an impossible crime. While Jews, heretics, and homosexuals were guilty of being Jewish, heretical, and

homosexual—common enough states and sometimes chosen voluntarily—no one can meet or mate with a concept such as the Devil. Thus, scholars have sought to understand the exotic, neurotic, and erotic mind-sets of Europeans, so seemingly different from those among our contemporaries influenced by the Enlightenment.² Along with trying to comprehend the mental structures of Europeans in the fifteenth to eighteenth centuries, historians and others have researched legal, political, social, and cultural systems in order to explain the playing out and representations of early modern belief systems.

The *Encyclopedia of Witchcraft's* entries investigate the origins of the beliefs and practices of the early modern witch hunts; thus, many entries, certainly important in their own right, cover antiquity (the Hebrew Bible, Greece, and Rome); primitive Christianity; and the Early, central (High), and late Middle Ages. Some articles provide comparative perspectives (for example, “Africa, Sub-Saharan,” “Native Americans,” and “Islam”), but this is definitively not an encyclopedia of worldwide witchcraft, which would have required many more entries and would have taken several more years to finish. I dismissed the idea of such an encyclopedia because it would have turned the focus away from Europe’s witch hunts, leaving several peripheries in search of a core. This encyclopedia excludes modern witchcraft, except for entries necessary to understand the period of the witch hunts (such as “Nazi Interest in Witch Persecution,” “Halloween,” and “Contemporary Witchcraft [Post-1800]”) and for coverage at the end of some entries of the modern West.

There are diverse types of entries: biographies, elements of folklore, religion and theology, art, music, film, literature, theater, gender and sexuality, law, politics, institutions, and geography (cities, regions, states). The geographic entries usually include the dates of the first and last witchcraft trials and executions, the total number of accused witches executed, the gender of the accused or executed, and the population (in order to measure the intensity of prosecutions). However, the sources necessary to provide these types of information may not be extant, and the sources available do not always answer the questions scholars pose; thus, many entries could not incorporate all these data. There were inevitable limitations to the list of entries: Some subjects or areas have not been researched; for other topics, I could not locate contributors. To give one example, there are several entries on drama (England, Spain, and so forth), but other regions did not find their contributors.

The starting point for this encyclopedia was Rossell Hope Robbins's 1959 *Encyclopedia of Witchcraft and Demonology*. This magnificent, single-authored work reflects the scholarship current in the 1950s, is Anglocentric, and, as we know currently, is often incorrect. Research on the age of the witch hunts has rendered Robbins's encyclopedia obsolete, but it remains useful as a source of some factual information and as a good read. Subsequent encyclopedias in English have been less ambitious than Robbins's. The *Encyclopedia of Witchcraft: The Western Tradition*, however, contains both broader coverage geographically and historically on the witch hunts and more entries than any previous encyclopedia or dictionary of witchcraft. For instance, it more than triples the number of entries in Robbins's *Encyclopedia of Witchcraft and Demonology*, which, moreover, omits most of Europe behind the Iron Curtain. Rosemary Eileen Guiley's *Encyclopedia of Witches and Witchcraft* (1989) has 416 entries, but it offers as much if not more on modern witchcraft as on the era of the witch hunts. Two fine recent works are also limited by size and by being single-authored: Michael Bailey's *Historical Dictionary of Witchcraft* (2003) has brief entries on fewer than 200 pages, while William E. Burns's *Witch Hunts in Europe and America* (2003) is less than one-fifth the size of our *Encyclopedia of Witchcraft: The Western Tradition*, and does not have its range of entries.

Robbins's 227 entries provided the starting point for the six members of our editorial board and for me as editor. We then went to indexes in major books on witchcraft and compiled a list of possible entries, from which we selected those we thought appropriate. We added other topics. Finally, many contributors suggested entries. In actuality, the selection of entries continued while time permitted. Like early modern political absolutism, the encyclopedia seemed always to be in the making.

Germany, known famously as the heartland of the witch hunts, is the subject of the most entries (both geographical and biographical)—127. There are 70 entries covering England and Scotland; 62 on France; 50 on Italy; 24 on the Iberian Peninsula; 20 on eastern and southeastern Europe (Poland, Russia, Hungary, the Balkans, Slovenia, Croatia, Ukraine, Estonia, Latvia, and Lithuania); 20 on Austria, present-day Liechtenstein, the Czech Republic, and Slovakia; 18 on today's Low Countries; 17 on Switzerland; 17 on Scandinavia (including Iceland); 15 on the Americas; 2 on Ireland; and 1 on Malta. There would have been additional entries on eastern Europe and some other of Europe's islands had I been able to locate scholars to make those contributions.

While the bulk of entries covers the late Middle Ages and early modern Europe, the idol of origins will be appeased by the 25 entries on antiquity and 17 on the Early and High Middle Ages. These numbers significantly underplay the scope of the coverage of the periods prior to the witch hunts because numerous thematic and geographic entries discuss the ancient and medieval background.

Beyond exploring the subject matter contained in the entries, readers of the *Encyclopedia of Witchcraft: The Western Tradition* should appreciate the type of questions scholars now ask about the field of witchcraft studies, see what areas recent scholarship has examined, and hopefully perceive what topics and areas still need to be researched. This encyclopedia is very much a product of the first years of the twenty-first century; many cities and regions in the West need to be explored, new sources consulted, and coverage of wide-ranging topics expanded beyond the scope of a single scholar's expertise. The encyclopedia reflects the areas of expertise of its contributors, who (without false academic modesty) represent most of the leading experts in the Western world professing this specialization. Of course, solid experts on a subject in one geographic area, say France, England, or Germany, were often reluctant to venture beyond those boundaries to make entries truly Continent-wide. Their reluctance is understandable, given the explosion of contemporary scholarship, the difficulty in keeping abreast of research in any topic, and the rightful and well-considered hesitation of academics to discuss areas in which they lack significant knowledge grounded in their personal research. One can contrast this humble realization of limitations with the eagerness of talking heads, movie stars, politicians, "the person on the street," letter writers to newspapers and magazines, and random citizens to offer opinions on just about any subject, regardless of their knowledge. A truly ignorant person is one who does not know his or her own ignorance.

This encyclopedia has great value not only in showcasing witchcraft scholarship at one point in time but also in allowing anyone to compare rather quickly the skills, approaches, methodologies, and contributions of most of the best witchcraft scholars in the West. Such comparison was previously possible only through great and time-consuming efforts, if at all. It is my hope that the *Encyclopedia of Witchcraft: The Western Tradition* will bridge the gap between scholars and the general public by making the vast scholarship on witchcraft readily accessible. This encyclopedia offers a means for enjoyment, a singularly instructive (if mostly pessimistic)

exploration of the human condition, and a milepost for our successors to see where they can now advance the field of witchcraft and witch-hunt studies.

Notes

1. Ronald Hutton, reviewing recent anthropological and historical studies on witchcraft, has constructed a model of a witch that has the following characteristics: a person who employs nonphysical means to bring misfortune or injury; harms neighbors or kin, not strangers; reaps social disapproval; works within a tradi-

tion; and can be opposed by others. Hutton did not consider “good” witchcraft, which is discussed in numerous entries in the *Encyclopedia of Witchcraft*. See his “Anthropological and Historical Approaches to Witchcraft: Potential for a New Collaboration?” *Historical Journal* 4, no. 2 (2004): 413–434.

2. While witchcraft scholars do not discuss the possibility of the Devil’s existence in history (at least in this encyclopedia), polls in 2004 indicated that 70 percent of Americans believed in the Devil and that 78 percent believed in angels. See *Dallas Morning News*, July 3, 2004, G1.

A

ABERDEEN WITCHES

One of the fullest collections of sixteenth-century Scottish source material relating to witchcraft, the Aberdeen shire records, cover a period from 1596/1597 to 1598 and contain a commission (authority to hold a trial), documents from pretrial investigations, formal indictments (*dittays*) listing the charges against various individuals, and the confession of one accused male. An entry in the Aberdeen burgh accounts tells us that executing two of the women cost £7. 14s. 0d., roughly speaking the equivalent of nine days' wages for a mason and his boy at the same period. Despite what is often said, the incident was almost certainly not set off by the publication of James VI's witchcraft treatise, *Daemonologie* (Demonology, 1597), which was probably published after the prosecutions started.

The charges against those concerned, who included men as well as women, were varied. The Wishart family, living in Aberdeen, consisted of Janet, married to John Leis, one son (Thomas), and three daughters (Elsbeth, Violet, and Janet). There were thirty-one charges listed in Janet Wishart's dittay. These included hens dropping dead, cows falling sick, humans contracting illness, unexplained and frightening noises in a house, and prolonged attacks by a dog that entered someone's bedroom. Janet Leis was further accused of raising storms, inflicting diseases that ended fatally, and being able to foretell the future. The period covered by the accusations was twenty years and more. Thomas Leis, described as a common witch and sorcerer, was imprisoned with his mother. The Devil came to the window of their cell and told them to deny everything in court. Meanwhile, he and his sister Violet collaborated in a magical operation to banish an evil spirit from a house. For this, Violet had to go to the city gallows at midnight, cut down the corpse hanging there, remove parts of the body, and burn the rest. Janet Wishart was convicted of eighteen of the thirty-one charges against her and executed. Execution of witches in Scotland took place by strangulation, after which the dead body was burned, and the person's movable goods were confiscated. Thomas, too, was executed. The rest of the family was banished.

Most of the accused came from elsewhere in Aberdeenshire. Helen Fraser had twice been charged

with charming by a session held under the auspices of the Kirk, as the national church of Scotland is called, before she came to a criminal trial. Charges there alleged magical cures, love charms, and inflicting death upon humans and animals. Isobel Cockie killed horses by touching them. Marjorie Mutche destroyed cattle and made people sick. Both were also accused, with others, of dancing with the Devil. Andrew Man, however, was different from the rest. He claimed that he had a sexual relationship with the fairy queen and had several children by her. In return, she gave him the gift of foreknowledge and the ability to cure almost any kind of illness. Andrew also had highly unorthodox religious views and spoke often of his attendant spirit Christsonday—not a familiar in the English sense, but an angelic companion. (This spirit was also claimed by another of the accused, Marion Grant.) Like many of the others, Andrew was convicted of some of the items on his dittay and acquitted of others. He too was executed.

Twenty-three women and two men were executed for witchcraft during this episode. Six others, five women and one man, were acquitted altogether, and in the case of three of these, the principal witness against them was arrested and charged with malicious prosecution. The use of torture is recorded in only one case, and its use in that case may have been illegal. Over thirty others were formally named as witches, but we do not know what happened to them subsequently. It is difficult to know why this series of prosecutions broke out when it did. There was a constant undertow of magical dealing in society as a whole during the medieval and early modern periods. Local tensions and fears might easily reach the breaking point at any time and burst into a flurry of witchcraft charges, with each suspect being encouraged to name her or his accomplices. Individuals within the church or state might also feel called upon to initiate witchcraft proceedings for personal, religious, or political reasons. It may be no coincidence that between 1596 and 1597 violent confrontation was seen between James VI and the Kirk over who should govern whom. It is fruitless, however, to seek a single explanation for any outbreak of witchcraft prosecution; what is clear is that the role of torture in witchcraft trials in Scotland has often been overplayed.

Witches were also brought to trial in Aberdeenshire, as elsewhere in Scotland, during the seventeenth century, under different religious, social, and political circumstances. Modern scholarship strongly suggests that each episode of witchcraft, wherever it happened, needs to be studied as a discrete, local event before attempts are made to relate it to outbreaks elsewhere.

ACCULTURATION THESIS

The concept of acculturation has been employed to tie in witchcraft persecutions with allegedly fundamental changes in European culture. The term *acculturation* began its life when anthropologists coined it to describe the effect of Western culture on the American Indians; later it was applied to other cultural relationships between so-called "advanced" and "primitive" peoples. It implies a model of cultural change in which a dominant culture appears in an aggressive role, operating through a mixture of direct force and seduction to induce major changes in a subordinate culture. The scheme has naturally been influential among historians seeking to understand witchcraft persecution, because one possible explanation for this phenomenon is as an attack on vital aspects of popular culture. In practice, attempts to apply the idea directly have not proved very convincing, but it has generated some valuable insights into the broader context in which both beliefs and persecution might flourish.

In the 1970s the model was applied to early modern Europe, most notably by the French historian Robert Muchembled, to describe an allegedly all-pervasive form of modernization. He linked the development of the state, religious reform, and socioeconomic trends, then sought to describe a cultural revolution in which older forms of popular culture were repressed and fragmented. Lawyers and clerics appeared as the main agents of this change at the local level, with the village elites cowed or shamed into a rather half-hearted compliance. Muchembled laid out the theory in a distinctly schematic fashion in a 1978 book, later translated into English as *Popular Culture and Elite Culture in France, 1400–1750*. In later works, such as *L'Invention de*

l'homme moderne (The Invention of Modern Man) and *Le Temps des supplices* (The Time of Tortures), he modified his original position substantially. It is regrettable that these more sophisticated and plausible versions of the modernization thesis have remained little known outside France, in comparison with a first statement with which the author has made his own dissatisfaction plain. In terms of the Catholic Reform movement more generally, the extensive writings of Jean Delumeau represent a similar interpretation, with pastoral techniques built on fear allegedly instilling powerful feelings of guilt among ordinary believers.

Where witchcraft persecution is concerned, Muchembled has always insisted that so widespread a phenomenon requires a large-scale European explanation, that it cannot be adequately dealt with through a series of piecemeal local analyses. Alongside Christina Larner, he has proposed a crucial link to processes of state formation, themselves a prime example of modernization, and has naturally embraced Heinz Schilling's thesis of confessionalization (the alliance of religion and state to reform morals and impose social discipline) as an additional support for his view. The most formal expressions of his arguments about witchcraft can be found in *Le roi et la sorcière* (The King and the Witch) and in his contributions to the collective volume he edited, *Magie et sorcellerie en Europe du Moyen Age à nos jours* (Magic and Witchcraft in Europe from the Middle Ages to the Present, 1994), where there was some discordance with his own coauthors.

In practice, the acculturation model requires extensive qualifications and exceptions in order to achieve a plausible match with the historical record. It has to be recognized that the most powerful centralizing monarchies in early modern Europe, in France, Spain, and England, saw relatively low rates of persecution, with the higher authorities tending toward skepticism and looking to control judicial irregularities. Muchembled argued that persecution was highest in regions agitated by religious divisions, or where less effective rulers faced determined local resistance when they sought to increase their power. He drew attention to several important writers around the end of the sixteenth century and the beginning of the seventeenth, such as Jean Bodin, Martín Del Río, Henri Boguet, and Pierre de Lancre, to establish a theoretical link between concepts of sovereignty and the campaign against witches as the ultimate enemies of both divine and royal power. Many of these points are well taken, but so many exceptions and counterexamples remain that the specific force of the argument is greatly weakened. It is only through the use of some impressive rhetorical tricks and elisions that a multicausal model incorporating many local variables can be presented as if it were a powerful unified interpretation.

Ultimately, the acculturation model has been very heavily modified, as historians have found more and

more examples in their detailed studies of the process that the French historian Roger Chartier called appropriation. This was the tendency for different subgroups to adapt orthodoxies to their own purposes, frequently subverting them in the process. The effect of this work has been to change our picture of acculturation, so that it now looks like the history of a heroic failure rather than the history of a brutal success in imposing elite views on the masses. In addition the clear division between elite and popular has increasingly come to appear as a misdescription of a much more complex reality. The process of change in early modern Europe did include a trend for educated minorities to define themselves against the popular, but this is better seen as the progressive internal division of a shared culture, rather than as the clash of two distinct cultures. The effort to impose new standards of belief and behavior on the people at large can then be seen as a secondary effect of changes that were primarily directed toward the internal concerns of the elites. Above all, they were striving to distinguish themselves from their inferiors by asserting their own superiority, a point well made by Muchembled. What can also be said is that for many sophisticated observers at the time, as well as for later historians, witchcraft persecution looked alarmingly like a surrender to popular belief rather than an attack on it; it is the protection rather than the persecution of suspected witches that alerts us to a real clash of cultures, when some lawyers and clerics attacked the whole way of thinking that sustained belief in witchcraft.

ACCUSATIONS

Although many thousands of people were convicted and often executed as witches across Europe, most people who were suspected of practicing witchcraft were never brought to trial. Most available historical sources greatly underreport people in this category, simply because no trial ever ensued. It is quite unusual for scholars to possess large amounts of evidence about the total number of people who were formally accused of witchcraft in any particular region. In this respect, the best available evidence comes from places as widely scattered as the archbishopric of Trier, the Canary Islands, and Massachusetts, and from legal systems as different as those involving German district officials, the Mediterranean Inquisitions, and English colonial authorities. But each of these extremely diverse systems tells a similar statistical story. In each instance, anywhere from one-third to one-seventh of the people formally accused of witchcraft were eventually arrested and put on trial (in the Salem panic of 1692, the ratio was less than one in three). Many additional scraps of evidence about “accomplices” seen at the witches’ Sabbats lie buried in the preserved confessions of numerous continental witches. But most law codes and demonologists required at least three such denunciations before an arrest could be made without other corroborative evidence, and these rules seem to have been generally observed.

A huge list of “accomplices” named by confessing witches was compiled in the archbishopric of Trier around 1590, during the first true mass panic in the Holy Roman Empire. It was the first of many similar lists drawn up during nearly every major witch hunt in Germany, and several minor ones, until the 1630s. Known as the “Musiel Register,” it is now available in a critical edition (Votmer and Weisenstein 1996). It includes most—but certainly not all—names of accomplices identified by 306 people executed as witches between 1586 and 1594, primarily from the district of St. Maximin, where Claudius Musiel was a high official (*Schultheiss*), active in witch hunting from the mid-1580s until he became governor (*Amtmann*) in 1594. On average, each witch offered about 20 names of accomplices; one man named 150 of them. Overall, the “Musiel Register” included, about 6,300 denunciations against almost 1,400 people living in almost a hundred different villages.

Some accusations were obviously taken far more seriously than others. The “Musiel Register” put crosses in front of some names, but not others. Parallel lists identify more accomplices named by some of the confessing witches, but these names were omitted from the register, for reasons we will probably never know. However, the vast majority of these 1,400 suspected witches, even most of those with crosses in front of their names, were never arrested for witchcraft by

Musiel or his successors. One name, cited eight different times as an accomplice seen at Sabbats, often with copious details about what went on there, was certainly never put on trial—it was Musiel himself, who did not personally compile this register (Voltmer and Weisenstein 1996, 70, n. 228).

Throughout the worst German witch hunts, when over 90 percent of all witchcraft trials ended in executions, the pattern observable at Trier continued to hold: Most people named as accomplices by confessed witches were never brought to trial—although the ratios were seldom as low as the one in five suggested by the “Musiel Register.” Two long lists of people denounced as witches in December 1628 from the small territory of Mergentheim in southwestern Germany reveal that barely one-fourth of them (77 of 301) were ever put on trial (Midelfort 1972, 147–148). Even among the 17 people named on a separate list as being most often denounced as witches, 4 were apparently never tried.

At the opposite extreme from the major German hunts stood a few very small places where most accusations resulted in witchcraft trials and executions. In the very worst scenarios, about half of those accused of witchcraft were tried and executed. A recent study of nine Alsatian hamlets in the Vosges Mountains counted 174 people accused during the 1620s, with at least 83 executed (Thurston 2001, 111). The worst known example comes from Gollion, a tiny Swiss village of 50 households that was terrorized by its unusually zealous and sadistic overlord. Between 1615 and 1631, almost 40 adults were accused of witchcraft in this village; over two dozen of them were burned, while only one was released after trial (Taric Zumsteg 2000, 153). Incomplete trial records identify another 12 villagers in Gollion who were accused as accomplices but never arrested; the only person fortunate enough to be released after being tried was accused again within a year, but she was not tried a second time. Such situations, fortunately, were extremely rare.

With regard to the ratios between accusations of witchcraft and arrests for witchcraft, the major Mediterranean Inquisitions offer remarkable materials for comparison with the major German witch hunts. More than 20,000 witches were burned in Germany and fewer than 50 by the Mediterranean Inquisitions. The proceedings in the Mediterranean regions resembled those that resulted from the German panics to the extent that few of the people denounced to the Inquisitions as witches were ever brought to trial. An extraordinarily well-documented example comes from the Holy Office tribunal for Spain's Canary Islands, where illicit magic was by far the most frequently denounced type of heresy (Fajardo Spinola 1992). Here a total of 2,808 denunciations against 1,245 people, scattered across three centuries, resulted in only 200

full-scale trials for *hechicería* (witchcraft) and no executions, although one woman was lynched in 1691 after performing her public abjuration (Ibid., 470–472). In the second half of the seventeenth century, when about 80,000 people lived in these islands, over 4 percent of the entire adult population were sufficiently upset about being bewitched that they formally denounced someone to the Inquisition for witchcraft. However, the ratio of 7 persons accused of practicing witchcraft to each person tried for practicing witchcraft was even lower in the Canaries than in Trier's “Musiel Register.” Evidence from the Portuguese Inquisition confirms this impression: In the 1740s, the tribunal of Coimbra recorded 1,420 denunciations for illicit magic, but arrested only 87 people on such charges (Paiva 1997, 208–209). Information from branches of the Roman Inquisition in Friuli or Siena, for example, suggests a similar situation, with hundreds of accusations of *maléficio* (harmful magic) resulting in extremely few full-scale trials (Di Simplicio 2000).

In common-law regions employing accusatory procedure, including England and America, most people suspected of practicing “white,” or harmless, witchcraft were never brought to trial. Because prosecution was expensive for accusers in common-law courts (unlike German courts or the Inquisitions, where the state paid all prosecution expenses), and convictions (which could enable an accuser to recoup the cost of a trial) were far from certain, even people vehemently suspected of practicing harmful witchcraft often escaped prosecution. Some of the best evidence on this score comes from the well-documented Salem Village witch hunt of 1692, in which 185 people were publicly accused as witches, but fewer than 60 of them were actually put on trial (Thurston 2001, 117).

Lack of evidence usually makes it impossible to measure how often people were suspected of witchcraft but not put on trial in most parts of Europe. Our closest approximation probably comes from suits for defamation, which existed throughout Europe, but seem to have been relatively more frequent in places like England or Sweden. Unfortunately, little comparative work has yet been done on this problem.

ACCUSATORIAL PROCEDURE

Accusatorial procedure is the system of criminal prosecution in which persons acting in a private capacity or as representatives of the community formally initiate a criminal action and undertake its prosecution. Jurisdictions that employed accusatorial procedure generally did not experience the same intensity of witch hunting as those that used inquisitorial procedure.

During the Early Middle Ages, accusatorial procedure was the dominant form of prosecuting crime, both in the secular and ecclesiastical courts. At that time it possessed four main features. First, criminal cases were initiated by a private accuser, that is, by the victim of the crime or his kin, acting in a private rather than an official capacity. Second, this private person actually prosecuted the crime by engaging in a contest against the accused party. The contest often took the form of an ordeal, in which the accused was subjected to a test that would indicate guilt, such as holding a hot iron for a period to see whether the flesh was burned. Alternatively the two parties could engage in a duel, known in England as trial by battle, in which the victorious party was vindicated. Yet another alternative, which likewise did not involve a systematic examination of the evidence, was compurgation, in which the accuser and the accused solicited neighbors who would swear to their honesty. Third, the entire procedure, from the original accusation to the conclusion of the trial, was conducted publicly. Fourth, the person who brought the charge was liable to prosecution if the innocence of the accused was proved. According to the law of the *talion*, which had been used in ancient Rome, the accuser's punishment in those circumstances would be the same as the accused would have received if found guilty.

Between the thirteenth and the sixteenth centuries, many continental European countries abandoned accusatorial procedure and adopted inquisitorial procedure in its place. According to inquisitorial procedure, criminal actions were initiated and prosecuted by judges or officers of the court on the basis of rumor or reputation, rather than by a private accuser. Criminal proceedings became secret, and the judge assumed a much greater role in the process, interrogating witnesses and determining guilt on the basis of a systematic, rational evaluation of the evidence. A person could still initiate a criminal action by making a private accusation against a person suspected of a crime, but the liability of the accuser was reduced to a fine, the amount of which was offered as a surety at the time of accusa-

tion, and in many jurisdictions the liability of the accuser was entirely eliminated. Even more important, the state superintended the entire process of accusation and assumed responsibility for the prosecution if the accuser dropped the charges or reached a settlement with the person accused.

In those jurisdictions that did not introduce inquisitorial procedure, the accusatorial system underwent a significant transformation. The determination to prosecute crime more effectively and the abandonment of the ordeal after the Fourth Lateran Council in 1215 led these countries to introduce new methods for determining guilt, all of which relied more on human judgment than had the ordeals. These methods also reflected a European-wide recognition that crime was a concern to the entire community, not simply a dispute between parties. The main change was the assumption of the accusatorial role by representatives of the community. In England this reliance upon local elites to initiate a criminal action developed into the jury of presentment, later known as the grand jury. Likewise, the determination of the guilt or innocence of the accused was entrusted to another group of neighbors, who became the trial jury. Other European countries, such as Scotland, Sweden, Denmark, and Hungary, also continued to use a modified form of accusatorial procedure. In all these countries the prosecution of crime retained the adversarial character it had acquired earlier in the Middle Ages. In these countries the proceedings continued to be held in public, and judges continued to exercise only limited control over the prosecution of the crime. At least in theory the accuser still acted as prosecutor. Those jurisdictions that continued to employ accusatorial procedure introduced some of the features of inquisitorial procedure, such as the taking of written depositions before the trial (in England), and the debating of the relevancy of the charges to the libel (in Scotland), but these newly acquired features did not alter the fundamental accusatorial character of the process.

Accusatorial procedure generally made it more difficult for courts to prosecute and convict witches than did inquisitorial procedure. As long as the principle of the liable accuser was in effect, potential accusers were reluctant to bring charges against their neighbors. Even more important, courts using accusatorial procedure lacked the power to initiate criminal proceedings against suspected witches, to interrogate them, or to declare them guilty. Conversely, inquisitorial procedure, which allowed the court to bring charges on the basis of rumor or ill fame and which allowed judges to interrogate witches directly, was especially designed to prosecute crimes like heresy and witchcraft. The most intense witchcraft prosecutions took place in those countries where courts utilized inquisitorial procedure.

Inquisitorial procedure facilitated the prosecution and conviction of witches, but accusatorial procedure could achieve the same results. Judicial authorities might have been hampered in their ability to prosecute witches on their own initiative, but when the community wished to take action against witches, they had the necessary tools to bring formal charges and secure convictions. In England up to 500 witches were convicted and executed, on the basis of indictments issued by juries of presentment, and convicted by trial juries composed of lay judges. In Scotland, where the accusatorial system of criminal procedure resembled its inquisitorial counterpart in a few more respects, the results were far more devastating. Somewhere between 1,000 and 1,500 Scottish witches were convicted and executed between 1550 and 1727. In Sweden, Denmark, Norway, and Hungary, all of which resisted the adoption of inquisitorial procedure, the percentage of witchcraft cases ending in executions corresponded roughly with that for Scotland. Moreover, as witchcraft prosecutions declined, those countries that employed accusatorial procedure found it more difficult to bring an end to prosecutions. When the men who controlled the judicial machinery of the state decided that witches could no longer be proved guilty at law, the communities did not always agree with those officials and continued to bring charges against their neighbors. Popular witch beliefs and accusations continued well into the eighteenth century, and accusatorial procedure facilitated popular pressure to bring witches to trial.

As witchcraft prosecutions were coming to an end, and as the courts began to view witchcraft accusations with suspicion, judges contemplated the reintroduction of the principle of the liable accuser, which had been one of the main features of accusatorial procedure during the Middle Ages. In 1716 Hermann Meinders, a Prussian judge, recommended to King Frederick William I that individuals no longer be allowed to use the accusation process against witches unless they would first agree to be subject to the law of the talion. Meinders complained that most witchcraft trials were the product of personal hatred, envy, and revenge. In Meinders's view, the miscarriages of justice that had become common in witchcraft cases could be attributed to the malice of private accusers, not the procedural abuses of judges who investigated the crime and interrogated the accused. His recommendation provided further evidence that the medieval form of accusatorial procedure made it difficult to prosecute witches.

ACQUITTALS

Scholars writing about witchcraft trials have often been imprecise when describing the fate of many thousands of accused witches who were tried but not convicted. Some such instances occurred everywhere throughout the age of witch hunting. The legal systems under which people were tried for witchcraft varied widely across Europe, and the term *acquittal* applies properly only to systems such as that of the common law in England in which juries either acquitted or convicted defendants. But the overwhelming majority of European witchcraft trials—and almost all of those taking place outside England, Scotland, and Scandinavia—occurred in Roman law courts, which did not use juries and ignore the term *acquitted*.

In order to bring a clearer focus to this problem, it is necessary to establish the different levels of punishment to which persons accused of witchcraft could be subjected, and also to recognize the difference between an acquittal at common law and releasing a prisoner in a Roman law court. Continental judges often released prisoners accused of witchcraft without physical punishment but without employing any legal terms that can be correctly translated as "acquittal." The schema proposed here, nevertheless, for purposes of simplification, assumes a functional equivalence between acquittal under common law and release under Roman law. It is based on the increasing degree of physical discomfort and deprivation of freedom endured by the large numbers of people accused of witchcraft but not sentenced to capital punishment.

- A. Persons formally accused of witchcraft but never arrested.
- B. Persons tried for witchcraft and released without further punishment at the local level.
- C. Persons tried and convicted at a local level, but eventually released without physical punishment by an appellate court.

- D. Persons forced to undergo some form of torture (almost always in Roman law courts) on charges of witchcraft, but who endured it successfully and therefore “purged” themselves of the accusation without further punishment.
- E. Persons neither fully convicted nor discharged, but given intermediate forms of punishment, most commonly temporary or permanent banishment.

ACCUSED BUT NOT TRIED It is likely that most people formally accused of witchcraft were never arrested, even during the worst major German witch panics where official “acquittal rates” among those who were tried rarely reached 10 percent. For instance, in the small German territory of Mergentheim, only 10 of the 136 people arrested as witches between October 1628 and February 1631 were eventually released. In some localities, the situation could be even worse; the 4 percent “acquittal rate” (1 of 26) in the tiny Swiss village of Gollion from 1615 to 1631 was lower than that at Mergentheim (Taric Zumsteg 2000, 70–71). However, the most important difference between these situations is that barely one-fourth of everyone accused of witchcraft were put on trial during the Mergentheim panic, whereas two-thirds were arrested during a cycle of six small-scale persecutions at Gollion.

At Gollion, five men fled before they could be arrested. Frightening an accused witch into leaving her or his community was an easy victory for the local enemies of the accused. It frequently saved them the time and expense of a formal trial, which might not even lead to a conviction. In many cases, flight was temporary, and the accused person returned as soon as relatives or friends assured them they were safe from arrest. If such people did not return after several months or a year, local authorities sometimes prosecuted them. However, they tended to prosecute in absentia only those suspects who left behind sufficient assets to make confiscation profitable. In the agricultural villages of western and central Europe where most witch hunts occurred, such cases were uncommon; flight entailed destitution and vagabondage, especially difficult for older people.

TRIED AT LOCAL LEVEL BUT NOT CONVICTED Across Europe, historical evidence is usually less abundant at this level than at upper-level, appellate courts. Nevertheless, randomly preserved documents about two dozen prisoners from the very first major witch panic, in the Swiss Alpine district of Valais (1428–1436), suggest that suspected witches were almost as likely to be released as to be burned; a thick dossier explains how a widow survived two trials for witchcraft, including one bout of torture, without any official punishment (Ostorero, Baglioni, and Tremp 1999, 74–75; Strobino 1996). Elsewhere, enough

evidence survives to offer some useful glimpses into some widely varying situations in both common law and Roman law Europe.

Rare indeed were regions where most witchcraft trials ended without punishing the accused, but scattered examples can be found. In the small Calvinist principality of Sedan in eastern France, quite unlike neighboring areas, 15 of the 18 witchcraft trials held before 1607 ended by liberating the accused without punishment (Dupont-Bouchat 1978, 127, 132). In the great imperial free city of Augsburg, at this time possibly Germany’s largest city, almost two-thirds (64 of 101) of all witchcraft trials between 1581 and 1653 ended by releasing the accused, and only three prisoners were burned (Behringer 1997, 43). In Ostrobothnia, a Swedish-speaking district in western Finland, local courts acquitted 57 percent of the 152 people tried for witchcraft; however, these trials were held relatively late, between 1665 and 1685 (Heikkinen and Kervinen 1990, 335). If about one-fourth of the 932 witchcraft trials in the Kingdom of Hungary ended without punishment of prisoners (Klaniczay 1990, 222), we must again realize that most of them also occurred after 1660. More common were situations like Calvin’s Geneva, where only 15 percent of the 321 witchcraft trials between 1536 and 1660 ended by liberating the accused. However, records of acquittals and releases seem to have been even less common in many other places. Or they might happen quite late. For example, Scotland’s Court of Justiciary, an agency of the central government but not an appellate court for witches, approved the executions of a dozen witches as recently as 1678, but then reversed its record by acquitting 19 of the 20 witches the court examined over the next six years (Larner, Lee, and McLachlan 1977, 42–46).

Local courts throughout Europe avoided putting people on trial for witchcraft unless they were reasonably certain of obtaining a conviction. This explains why one frequently encounters “acquittal rates” far below 10 percent in many different locations in western and central Europe. If no conviction resulted, whoever prosecuted them—either an individual or local officials, often both—had wasted a great deal of time and money during a perceived emergency. In the duchy of Lorraine, which has some of the most extensive local financial records in western Europe, local officials mentioned witchcraft trials that ended with releases only when they expected (often in vain) to have their legal expenses reimbursed, as they almost invariably were whenever witches were convicted. Outside times of intensive witch hunting, there were usually strong counterincentives against beginning a possibly unsuccessful prosecution for witchcraft at the local level. Even when they did occur, trials ending with liberation of the accused were seldom recorded; we often learn about such prosecutions only because the accused witch was

subsequently rearrested and convicted, with some mention of a previous arrest included in the final summation.

CONVICTED AT LOCAL LEVEL BUT ACQUITTED OR RELEASED ON APPELLATE LEVEL In both common law and Roman law Europe, the largest share of known cases where accused witches were released without physical punishment occurred in these situations. The explanation for this phenomenon is twofold. First, these courts were physically and psychologically far removed from local village environments where most witchcraft trials originated; appellate courts existed in order to correct the shortcomings of undereducated local magistrates whose sentences they were reviewing. Second, appellate courts, staffed with high-ranking and relatively well-paid state functionaries, were far more likely to preserve at least some of their records than were most local court systems.

With respect to the Anglo-Scandinavian regions, one may truly speak of “acquittals,” and the historical record is encouraging. Almost everywhere, during the sixteenth and seventeenth centuries, acquittals for witchcraft at such midlevel courts outnumbered executions. Much northern European evidence comes from such judicial bodies as the English Assizes, or appellate courts at the county level in Denmark, or the regional and national level in Scotland. Each sample includes hundreds of witchcraft cases scattered over several decades. At the Danish County Court of Jutland, almost half of all seventeenth-century witchcraft trials ended in acquittals (Johansen 1990, 350). Even in Scotland, infamous for several brutal witch hunts between the 1590s and 1660s, the kingdom’s upper-level courts acquitted many seventeenth-century witchcraft defendants. Assize courts on England’s Home Circuit were considerably more lenient than the Danes or Scots, acquitting 56 percent of the 474 people whom they tried for witchcraft between 1563 and 1700 (Sharpe 1997, 111). Every appellate court system in northern Europe ended up releasing large numbers of suspected witches, although each of them also confirmed many death sentences for witchcraft.

How different were things on the Roman law Continent, with an inquisitorial rather than accusatory system and authority to employ torture? Not surprisingly, in a system where defendants were presumed guilty, instances of outright release at the appellate level of prisoners charged with witchcraft were generally far less common than in northern Europe. Nevertheless, some continental appellate courts released a sizable share of prisoners charged with witchcraft. For example, in the Lutheran duchy of Brunswick-Wolfenbüttel, ruled by a reputedly ferocious prince, almost half of the 104 witchcraft trials recorded between 1590 and 1620 ended with the liberation of

prisoners or the dismissal of charges (Schormann 1977, 47–50). In a nine-year sample (1608–1616), the Hofrat, the highest tribunal of the Roman Catholic duchy of Bavaria, similarly released almost half of its 200 arrested witches (Behringer 1997, 53–54). Farther west, the *parlement* (appellate court) of Spanish-ruled Franche-Comté freed 26 percent of its 700 prisoners accused of witchcraft between 1590 and 1666 (Rochelandet 1997, 63).

The most important case is, of course, the *Parlement* of Paris, the chief judicial body of France, whose appellate district covered about half of Europe’s largest kingdom and encompassed approximately 10 million people in about 1600. Here the painstaking work of Alfred Soman shows that almost 30 percent of the 1,123 people in appealing convictions for witchcraft between 1564 and 1640, including 15 percent of those appealing a death sentence, were released without any physical punishment. After 1610, the percentage of prisoners charged with witchcraft who were released rose to almost half, 47 percent (Soman 1978, 34–36). Europe’s most prestigious secular court compiled an early and remarkable record in this respect, even before it enforced a system of automatic appeals in all witchcraft cases around 1624.

During the kingdom’s final major witchcraft panic in 1643–1645, other French appellate courts surpassed the Parisian record of releasing prisoners. By then, the *Parlement* of Toulouse, France’s second-largest appellate court, also required automatic appeals of all witchcraft trials, and the results were extraordinary. Almost two-thirds of the 641 prisoners convicted of witchcraft whom it judged on appeal during this panic were either dismissed or released provisionally because of inadequate evidence; most of the remainder were ordered banished, usually for five years or less (Vidal 1987, 518, 520, 522).

“PURGED” CHARGES BY SURVIVING TORTURE Understandably, this category often includes only a small portion of people tried for witchcraft in Roman law regions. Every government in the Holy Roman Empire that burned large numbers of witches employed torture so unscrupulously that extremely few imprisoned witches ever survived it. In present-day Saarland, for instance, only 11 of 331 imprisoned witches earned their freedom this way (Labouvie 1997, 44–45). An “acquittal rate” of less than 10 percent invariably means that official imperial rules and limits on torture prescribed in the Carolina Code (*Constitutio Criminalis Carolina*), the famous imperial law code of 1532 (which was not obligatory or binding on the thousand autonomous governments in the empire) were being ignored or circumvented through various legal ruses.

However, places in the empire that observed these limits scrupulously ended up releasing a significant

share of their arrested witches. In the Austrian Alpine province of Vorarlberg, ruled by the Habsburgs and thus quite careful about following the rules of the Carolina Code, about one-third (47 of 142) endured torture without confessing and were therefore released (Tschalkner 1992, 212). In the Swiss canton of Fribourg, prison registers enable us to observe the results of torture applied in full but precise legal measure to suspected witches. Here, most prisoners did not confess under torture: If 21 men confessed and 24 successfully purged the accusations by withstanding torture, women did even better, with 28 confessing under identical methods of torture and 51 successfully surmounting it (Monter 1976, 106–107).

The chances of a prisoner to “purge” charges through withstanding torture therefore varied considerably, not only from one district to the next, but even within a particular district, depending on whether or not a major witch hunt was occurring. For example, over one-fourth (35 of 124) of the prisoners accused of witchcraft in the most heavily afflicted district of the duchy of Lorraine managed to regain their freedom in this manner (AD Nancy, B 8652–8742).

To the north, in two contiguous districts (Mirecourt and Dompain), only 8 of 50 prisoners tortured on charges of witchcraft during a 1629–1630 witch panic withstood it, whereas during the previous thirty years, two-thirds of all prisoners tortured on charges of witchcraft in these same districts (28 of 42) had purged the accusations by successfully enduring torture (AD Nancy, B 7065–7145 [Mirecourt]; B 5497–5573 [Dompain]).

PARTIAL CONVICTIONS AND BANISHMENTS In many European regions there were only two normal outcomes of a witchcraft trial, conviction or release; intermediate solutions were relatively uncommon. Nonetheless, almost every court system in western Europe made occasional use of such punishments as exile or banishment, when suspected witches had not been fully convicted, but the evidence against them seemed too great to allow them to return home unpunished. A few cities employed banishment extensively against accused witches. For example, in Augsburg, Germany’s largest city, one-fourth of the 101 people tried for witchcraft between 1581 and 1653 were banished (Behringer 1997, 43). Calvin’s Republic of Geneva clearly preferred this intermediate punishment; here, only seven of almost a hundred suspected witches who endured torture without confessing were freed, while nearly all the remainder were banished. Although relatively few rural regions seem to have followed this practice, suspected witches were more often banished than liberated in two Walloon provinces of the Low Countries, Namur and Artois. Usually, it was the other way around. If, north of Geneva, the Catholic free city

of Besançon showed comparable instincts, banishing most of those tried for witchcraft who were not executed (Monter 1976, 79), in the surrounding province of Franche-Comté, liberations outnumbered banishments for witchcraft by 182 to 105 (Rochelandet 1997, 63).

ADY, THOMAS

Thomas Ady's *A Candle in the Dark: or, a Treatise concerning the Nature of Witches and Witchcraft: being Advice to Judges, Sheriffs, Justices of the Peace, and Grand Jury Men, what to do, before they passe Sentence on such as are arraigned for their Lives, as Witches*, was published in London in 1656 and reissued in 1661 as *A Perfect Discovery of Witches. Shewing the divine Cause of the Distractions of this Kingdome, and also of the Christian World*. The book, usually cited under its original title, is regarded among English witchcraft historians as a major work of skepticism.

Ady is an obscure figure, who is not known to have published any other work. He was almost certainly the Thomas Ady who matriculated at Emmanuel College, Cambridge, in 1624, earning his MA in 1631. His *Candle in the Dark* was a well-constructed and fluent book, showing an unrelentingly skeptical line against witchcraft. In his preface, Ady made it clear that he anticipated considerable hostility to his arguments, comparing his struggle against entrenched belief to that of David against Goliath. Yet he claimed (perhaps fictitiously) that he had talked his ideas through with acquaintances, and that he was generally able to convince them of the problems with scriptural references to witchcraft. Interestingly, Ady at this point suggested that if convinced of the bankruptcy of supposed scriptural references, believers would then either fall back on Jean Bodin "or some such popish vain writer," or cite such cases as the Lancashire trials of 1612, or else claim that they had heard witchcraft narratives "credibly reported from men of worth and quality." Ady dismissed all these tactics as "monstrous impossibilities" and stressed the centrality of scripture (Ady 1656, 5).

At the beginning of the work, Ady asked where scriptural justification could be found for many of the existing notions about witches and witchcraft. Thus, Ady asked, among other queries, where scripture said that witches were able to kill or cause disease or injury, where it was written that witches had imps that sucked at their teats, where scripture justified the swimming test, and, perhaps the most crucial question, which caused problems for all demonological writers, where the scriptural references were for the satanic pact. He then addressed the problem of translation, going back to the original Hebrew texts and also reviewing what he regarded as the best Latin translations, notably those of Junius and Tremellius. He used a technique already familiar among skeptical writers, demonstrating that

the rendition of scriptural terms as "witch" in English is a mistranslation, and hence the "witches" of the Bible, and the scriptural passages dealing with them, have no relevance for witches as they were understood in seventeenth-century England.

Ady agreed with Reginald Scot (whom he frequently cited with evident approval) that the witches in the Bible were simply cheats. Later in the work he lambasted Roman Catholic writers, whom he called "popish blood-suckers" (139), and also criticized English demonological writers. For example, he dismissed Thomas Cooper, author of a witchcraft tract published in 1617, for having fallen into "popish" errors, as well as John Gaule and George Gifford, even though he gave them rather more polite treatment. Interestingly, William Perkins's demonological tract caused Ady considerable problems. He apparently found it hard to believe that such a great Protestant theologian could advocate witch hunting, and made a number of rather fanciful suggestions about the origins of the work, supposing variously that it was a copy of some Catholic tract that Perkins had among his papers with the intention of refuting it, or that it had been planted in Perkins's study after his death as part of a Catholic plan to discredit him.

Ady's work is important in reminding the modern reader that it was possible to hold a thoroughly skeptical line about witchcraft after 1650 without recourse to modern rationalism. Ady was clearly a convinced Protestant, who regarded the witch beliefs of his period as a massive mistake that depended upon a faulty understanding of scriptural texts and that perpetuated much because of the massive ignorance of the Roman Catholic Church. His book was dedicated to "the Prince of the Kings of Earth," Jesus Christ, in the hope that enlightenment about witchcraft would spread through his influence; Ady added a second dedication to "the more judicious and wise, and discreet part of the clergie of England."

AFFAIR OF THE POISONS (1679–1682)

The greatest court scandal of the reign of Louis XIV of France erupted in the fall of 1678 after Nicolas de la Reynie, lieutenant general of the Paris police, received word of a plot to poison Louis XIV. La Reynie's subsequent investigation uncovered a criminal magical

underworld with clientele who extended from the bottom to the very top of the social scale. The inquiry further suggested that a score of Louis XIV's female courtiers, including his official mistress Madame de Montespan, had purchased poisons to rid themselves of their rivals and commissioned ceremonies of love magic in their attempts to win the affections of the king. While La Reynie's investigation eventually exonerated Madame de Montespan from the crime of poisoning, he concluded that she had probably participated in a series of demonic conjurations, or amatory masses, intended to maintain her hold over the king.

Louis XIV's initial response to the growing scandal was swift. He immediately appointed a special judicial commission to try all suspects implicated in the affair, regardless of rank. By 1682, when the king finally dissolved the *Chambre de l'Arsenal* (named after the building in which the commission met), its judges had investigated over 400 of his subjects, sending 36 to their deaths, 4 more to the galleys, and 34 others into exile. Nevertheless, approximately 60 suspects were never tried at all; Louis XIV considered their testimony regarding his mistress's patronage of the notorious sorceress La Voisin too inflammatory to be heard even by his handpicked judges. These suspects were instead placed in solitary confinement, usually in remote fortresses, for the rest of their lives.

While bringing the Affair of the Poisons to a close, Louis XIV issued a royal edict, the first of its kind in Europe, that restricted the sale of poisons. The edict further declared all magical practices to be fraudulent and ordered anyone who claimed to perform "so-called acts of magic" to be banished from his kingdom. Louis XIV, in effect, forbade his subjects to believe in magic at the same time that he inaugurated state regulations on "controlled substances."

The members of the criminal magical underworld that Louis XIV sought to eradicate peddled spells for almost every conceivable desire. While charms that promised success at the gaming table or balms that protected one in battle proved popular, Parisians sought out love magic beyond all else. The city's sorceresses therefore offered their clients an extensive range of love charms that can be grouped into three general categories. The first included potions composed of such substances as menstrual blood, cauls, and Spanish fly, which were believed to possess supernatural properties as aphrodisiacs.

Rituals of love magic, held over a potion to increase its strength, fall into the second category. Invoking heavenly aid to fulfill the client's desires, these ceremonies drew upon the common magical tradition of the Middle Ages and coopted the practices, imagery, and sacraments of the Catholic Church. Voisin, for example, commissioned rituals in which the sorceress lit candles that had been burned during a mass, intoned prayers to the Trinity in Latin, and then inscribed the names of the would-be lovers in wax before throwing them into an open flame to be literally and figuratively melted together.

The final and most potent category of love magic available involved elaborate demonic ceremonies, drawn from the medieval tradition of learned magic, celebrated with the assistance of a renegade priest. An ordained priest could, it had long been held, divert the sacerdotal power that allowed him to perform the miracle of the Mass for magical ends. The priests arrested during the Affair of the Poisons, however, confessed that they had developed a uniquely sacrilegious ceremony of love magic. Their amatory masses, celebrated over the naked stomach of a living woman, allegedly lured forth demons with the sacrifice of an infant for the purpose of establishing control over another's thoughts, emotions, and actions.

La Reynie's investigation into the Affair of the Poisons revealed not only the sacrilegious activities of the members of the criminal magical underworld, but their murderous ones as well. Would-be lovers seeking to rid themselves of rivals or spouses, he discovered, could hire Parisian magical practitioners to perform spells or rituals that promised to bring death to those who stood in the way of their passions. If murder by magical means failed, clients of Paris's sorceresses could readily purchase a variety of poisons, including hemlock, vitriol, and arsenic. However, the *secrè du crapaud* (secret of the toad, a solution allegedly composed of salt, arsenic, and toad venom) was reputed to be the most toxic and undetectable poison.

AFRICA (SUB-SAHARAN)

Witchcraft in sub-Saharan Africa forms an interesting contrast to witchcraft in the West, and some of the scholarly work that has been done on African witchcraft

has influenced important scholars working on witchcraft in the West. Beliefs in witchcraft and the regular use of measures to diagnose and control its influence have formed a persistent element in sub-Saharan African cultures and societies. Missionary and governmental efforts to suppress them have proved largely ineffectual, and recent social changes, including increased urbanization, sometimes appear to have been accompanied by more popular anxiety about witches rather than less.

Anthropologists have studied African witchcraft intensively since the 1930s, when Edward Evans-Pritchard published his classic study on the Azande of the Sudan. Such work not only threw much light on witchcraft within Africa, but it also exercised considerable influence on perceptions of the subject in early modern Europe, especially through the works of Keith Thomas (1970) and Alan Macfarlane (1970). Evans-Pritchard firmly established what Max Gluckman (1960) called the "logic" of African witchcraft beliefs, superseding earlier notions that they represented a prerational mentality, and later work illustrated how such beliefs and accusations arising from them could be understood only in the context of the system of social relations in which they were embedded. It was also clear that witchcraft beliefs and accusations were a regular feature of everyday life in African societies, in addition to their heightened levels during more turbulent episodes of organized witch hunting, such as those in Zambia and Tanzania in the 1930s and in several areas since then (Abrahams 1985; Richards 1972; Willis 1970).

The term *witchcraft* has come under close scrutiny in Africa. In an extension of early modern European connections between witchcraft and the Devil, Christian missionaries and others have sometimes mistakenly used the word to refer to indigenous religious beliefs and practices in general, apparently on the assumption that the worship of any but the true god must involve the Devil to some degree. A narrower and more suitable approach stresses the believed mysterious power of human beings to cause life-threatening harm to each other by evil thoughts or the use of magical rites and substances. However, the fact that most European commentators do not believe in witchcraft, whereas it is a "fact" of everyday experience for many Africans, has caused some concerns, particularly with regard to the official legal systems of most colonial and postcolonial African states. Because legislation has been largely aimed at suppressing accusations rather than at witchcraft, many citizens of such countries consider their government to be the "witches' friend." In some places, such as the Maka area of Cameroon, a more positive legal approach to indigenous beliefs and practices has been adopted to deal with this problem, though there is evidence that relatively rich and influential individuals have sometimes turned this new approach to their

advantage by bringing successful accusations against less prosperous and allegedly envious villagers (Fisiy and Geschiere 1990, 2001).

It has also become clear that the single term *witchcraft* may not do justice to the diversity of beliefs in so many different cultures or even to the complexity of the concepts of a particular African society. For example, Azande distinguish between harm caused by psychic processes (*mangu*—glossed by Evans-Pritchard as “witchcraft”) and harm caused through the use of materia medica (which Evans-Pritchard calls “sorcery”). Zande *mangu* is typically inherited, and it is a purely psychic, not always conscious act, though nonetheless lethal unless counteracted. In contrast, “sorcery” is learned, conscious, and involves physical manipulation of materials. Comparable ideas are found elsewhere, for instance, an “evil-eye” power to harm by simply looking at a victim or harming victims by using their hair or nail cuttings. However, not all societies divide such different powers conceptually with the same sharpness as the Azande. In some cultures, individuals are believed to possess a general power to harm others—sometimes thought of as a “snake” in their belly—which may be manifested in different ways. This power is not always thought of as necessarily evil in itself. Sometimes it can be used for the public good, by respected elders against persistent wrongdoers, for example, but it is often seen as being used for evil, as a result of ambition, greed, or envy. In some cases, there is a gender division, with male witchcraft generally seen as positive, while that of women is considered reprehensible and evil. Sometimes “ordinary” day-witchcraft is distinguished from night-witchcraft, which is considered especially evil and deadly.

Sub-Saharan African witches are often said to have familiars—cats and hyenas are commonly cited, and owls are not infrequently associated with witches—but there is considerable variation on this and in beliefs about other details of witches’ activities. In an article originally published in 1951, Monica Wilson (1972) showed how such variation may also be connected with local social structures. Among the Pondo of South Africa, for instance, witches are said to work through a familiar—often a hairy creature known as *tikoloshe* with exaggerated sexual characteristics, but sometimes a baboon or cat or other animal. The familiar can transform itself into a sexually attractive person with light skin color and is always of the opposite sex to the witch, with whom it has sexual relations. Among the Nyakyusa of Tanzania, however, the main emphasis is upon witches’ lust for milk and meat, and they are thought to suck the udders of cows until they die and also to love human flesh. Wilson related these differences to the structure of local communities. Among the Nyakyusa, villages are made up of largely unrelated

neighbors with a strong ethical emphasis upon good neighborliness, including sharing food. Among the Pondo, in contrast, villages consist largely of groups of close or distant kinfolk among whom sexual relations are considered incestuous. Also, at the time of the study, they lived in a racially divided society in which interracial sexual relations were strictly forbidden. Again, unlike the Nyakyusa, they have a keen interest, in part through the possibilities of inheritance, in the maintenance of the well-being of each other’s herds. Wilson related the Pondo emphasis on sex to the forbidden sexual attraction between neighboring kinfolk and suggested that the light-skinned familiar symbolized the prohibition on sex between different racial groups.

Witchcraft beliefs in Africa commonly provide an explanation of misfortune, though not simply a mechanical one. While many Africans might claim that a person who was crushed beneath a falling granary was a victim of witchcraft, they are also clearly aware that the structure may well have collapsed as a result of termite damage to its supports. The question remains for them, however, why the granary collapsed at the time when the victim was sitting there, and witchcraft is commonly cited as the reason for this. The evil power of other persons is thus brought into account, though it is additionally recognized that a victim may have behaved in such a way as to antagonize the witch in question. In the modern West, such occurrences are usually seen as impersonal coincidences or “acts of God,” despite an increasing tendency to hold owners or builders legally responsible for negligence in such cases. The explanation of the event through witchcraft constitutes a part of African theodicy (the attempt to understand the presence and significance of suffering and evil in the world). However, there are usually limits to the customary use of such explanation. A potter whose pots regularly crack is more likely to be judged a poor craftsman than a victim of witchcraft. Similarly, pleas that criminal or other bad behavior is due to the bewitchment of the perpetrator are unlikely to be treated sympathetically.

The incidence of witchcraft accusations is rarely random. Cultural stereotypes of witches exist in most African cultures—people may assert that a witch is typically a woman or an old cripple (or both), or that witches typically have red eyes. However, with the exception of some victims of more general witch hunts, those accused may well not fit such stereotypes. In such cases, it becomes necessary to inquire into the relationship between victim or accuser and accused, because the accuser may be different from the victim; for example, a parent may bring an accusation on behalf of a bewitched child. Especially within the field of kinship and family ties, some relationships may be particularly subject to strain and more likely to be marked by

accusations of witchcraft. Competition for a husband's favor and for resources for their own children is a common feature of relations between the wives of a polygynist, and the jealousy of a childless co-wife may be particularly feared. Accusations of witchcraft are especially common in such cases, though not always as frequent as some men assert. Accusations are also common between certain cousins or between uncle and nephew in family systems where such persons are inevitably brought into competition and conflict by the nature of the ties between them. Max Marwick (1970) has suggested in this context that witchcraft accusations can serve for the observer as a gauge of social strains in certain structurally defined relationships.

Witchcraft is more likely to be a major concern in some kinds of social system than in others. Witch beliefs are not subject to strictly logical proof or disproof—even a fraudulent witch finder may still believe that there are others who are genuine—and Western notions of coincidence and accident do not offer a demonstrably more convincing explanation of misfortune. Such beliefs about the powers of human beings are held or abandoned not because they are demonstrably right or wrong, but because they make good or poor sense in the context of the believer's experience of social life. In a society where communities are tied to the land through agriculture, where many hands make light work, and where villagers are bound to each other by strong links of kinship or mutual dependence between neighbors, the idea that people may have power over each other's well-being makes much sense. Conversely, Paul Baxter (1972) has argued that in pastoral nomadic societies, where people are freer to move away from each other and from the tensions involved in their relationships, witchcraft fears and accusations are of relatively slight importance. In the same vein, evidence suggests that witchcraft fears and accusations tend to increase when scattered populations have been forced to live in more compact settlements, whether for protection against raiding or by governmental decree.

Despite the immense pain and disruption that they can clearly cause, African witch beliefs and accusations may also serve some useful functions. In societies where people are afraid to antagonize each other, high standards of interpersonal behavior and generosity may be maintained in an attempt to avoid being either accused as a witch or a victim of a witchcraft attack. Also, in situations where fission within kinship groups is fraught with tension but is structurally inevitable, accusations of witchcraft, with their implications of behavior which is beyond the pale and the opposite of that expected between kinfolk, may serve as a justifying catalyst in the process. More generally, the ascription of problems to the evil activities of witches can divert attention away from the structural problems of the social system onto the alleged evil of individuals.

A diagnosis of witchcraft is usually conducted by consultation of oracles or expert diviners. The familiar image of the all-powerful and evil African "witch doctor" is, however, largely a fiction of Western writers and filmmakers. Often the diviner, or witch doctor, is merely a member of a village community who has special skills. He (or she) may have been called into divining after a misfortune. This misfortune may be diagnosed as being sent by an ancestor who was a diviner, who thus indicates a wish for the descendant to follow the same path, and the future diviner would then be apprenticed to a practicing expert and eventually take on the role him- or herself. Much of the necessary skill may be learned less through formal instruction than through observation or claimed revelation in dreams. The diviner generally lives largely like other villagers, as a family man or woman engaged in the annual cycle of production. Only people living in fairly close proximity consult most diviners, but some gain special reputations and may receive visits from clients who live at a distance. In some special cases, a well-known diviner and ritual expert may be summoned from a great distance to provide help in the investigation of misfortune, or the protection of a new house from misfortune. Some even have international reputations. In some places, any death is usually followed by a diagnostic séance held by a group of local diviners.

Divinatory techniques vary widely from place to place. Poison may be administered to a chicken, and its reaction indicates the involvement of a witch and the witch's identity. Observations of the way in which bones or even sandals fall, or how objects move in stirred water, are common. So too is the examination of the entrails of a slaughtered animal or the configuration of the feathers on a bird killed for the occasion. Some diviners specialize in "smelling" out the information they require from a twig or other object obtained from the sick or deceased person or the person's representative. Ordeals involving exposure to boiling water or hot metal have also been historically reported from some areas.

Despite important local and historical variation, social and political change has always been a significant element in African life. New ideas about witchcraft and new techniques for diagnosing it and dealing with it have entered different areas at different times, and labor migration and urbanization, coupled with developing transport facilities, have facilitated their spread. Nonetheless, significant regional variations still occur. In Tanzania, for example (Green 1994), some southern areas have developed well-organized techniques and complex social institutions for identifying witches and for peacefully cleansing them of their witchcraft. At the same time, village vigilante groups, known as Sungusungu, have emerged in other areas of the country (Abrahams 1998, chap. 2; Bukurura 1994). These groups have devoted themselves to maintaining

order in the presence of perceived state inefficiency in this regard. Their main targets have been cattle theft and brigandage, on the one hand, and witchcraft on the other, and they have sometimes been responsible for maltreating and occasionally killing suspected witches. In the same region, a large number of more private murders, allegedly instigated in some cases by the relatives of suspects, have also been reported. The suspected witches are often older women, and many have fled to urban areas for protection. Slightly over 3,000 such witchcraft-related killings, mainly of women, are said to have occurred in the Shinyanga and Mwanza regions of the country (population ca. 3.5 million) between 1970 and 1988 (Mesaki 1994). Murders of suspected witches have also begun to reach high levels in South Africa, where they appear to be connected with political and economic tensions (Niehaus 2001).

In much of Africa, as elsewhere, witchcraft is said to be particularly associated with women. Such stereotypical perceptions of female witchcraft among the Nupe of Nigeria have been interpreted as expressions of male–female conflict in a society with a poor fit between women’s “ideally” subordinate position and the realities of their economic power; deep-seated psychosexual antagonisms may also be involved (Nadel 1954). On the basis of her research among the Gonja of Ghana, Esther Goody (1970) suggested a more general theory. Unlike men, Gonja women have no legitimate channels to express aggression, and attributing evil mystical power to them seems a corollary of this. Both arguments make sense in other areas of Africa, including Tanzania. Among the Nyamwezi, where witches are stereotypically women, female violence and aggression are strongly disapproved of. At the same time, men are uncomfortably conscious of the power that women wield in several contexts, including, significantly, the control of food, despite their jurally subordinate position in the household and society. Polygyny is also a source of anxiety for Nyamwezi men, both as a source of conflict between wives and as evidence, for some, that women must outnumber them. It may also be significant, both there and among other groups, that a common story of the origins of death ascribes it to conflict between co-wives (Abrahams 1994).

The persistence of African witchcraft beliefs, despite a wide variety of social, economic, and political changes, shows that such ideas are both deeply rooted and adaptable. New situations bring new uncertainties, anxieties, and problems in their train, and witchcraft beliefs continue, sometimes with a shift of emphasis or with new elaborations, to provide some explanation. Economic development with the inequalities that commonly accompany it, and even the greater impersonality of urban life and modern, bureaucratic institutions still provide favorable environments for powerful

fears that others may have both the motive and the witchcraft power to harm. Those who are successful sometimes fear the jealousy of others in an increasingly competitive world, and sometimes the successful themselves are believed to have enhanced their prosperity through witchcraft, for example, through bewitching others and using them as members of a secret zombie labor force. Some modern institutions may be feared as locations of witchcraft activity, as occurred in Uganda in the 1950s when there were reports that the Fire Service was involved in a mysterious and sinister trade in human blood. It appears at least initially that such persistence is at odds with arguments that tie belief in witchcraft to traditional social systems. The adaptability of such beliefs and the fact that most urban dwellers still have close structural and cultural links to rural communities are no doubt important factors here. It has also been suggested (Sanders 2001) that increasing involvement in an expanding commercial world, where everything imaginable appears to be for sale, tends to enhance the fear that those who seek the power to harm others can readily obtain it.

AGE OF ACCUSED WITCHES

Ask people to describe the typical victim of an early modern witchcraft trial, and most will probably reply that she was an old woman. Although relatively little research has in fact been done by historians on the ages of accused witches, the limited data gathered thus far suggests that there is an element of truth in the "witch as old woman" stereotype: In many areas, and particularly in the sixteenth century, women aged fifty and above were overrepresented among accused witches in relation to their proportion of the overall population in early modern Europe. Their greater vulnerability to accusations of witchcraft has been explained in different ways. Some scholars link it to the effects of menopause; some link it to older women's economic and marital status; still others see advanced age at the

time of trial primarily as a reflection of the fact that a woman often lived for many years in her community as a reputed witch before her neighbors accused her formally of witchcraft.

The idea that older women were somewhat more vulnerable to accusations of witchcraft than other age or gender groups tells us only part of the complex story of the reasons for and the targets of witchcraft accusation in the early modern period, however. A closer look at the data available on the age and gender of those tried for witchcraft shows that contemporaries were capable of imagining people of both genders and all ages as witches. The belief was that witchcraft was an evil art that could be learned by anyone, and witchcraft accusations could emerge from a wide variety of situations of social conflict between individuals or households. The age of an alleged witch was thus just one of a combination of factors, including gender, as well as social, economic, or marital status, that one must take into account when seeking to explain the vulnerability of specific individuals to witchcraft accusations. The overemphasis on the "witch as old woman" stereotype in witchcraft historiography has been shaped to a large extent by the work of such skeptical early modern demonologists as Johann Weyer and Johann Georg Goedelmann, who emphasized this stereotype as a means of criticizing the persecutory zeal of the witch hunters.

GATHERING AND PRESENTING DATA ON THE AGES OF ACCUSED WITCHES

Gathering data on the ages of accused witches is a difficult undertaking. Judicial authorities who tried alleged witches rarely recorded their ages; even during the seventeenth century, when recording ages became more common, it was not standard procedure. We can sometimes estimate a suspect's age from indirect clues offered in trial testimony, from references to the number of times they had been married, for example, or the number and marital status of their children, or the length of their reputation as a witch. This is very painstaking work, however, which helps explain why relatively little systematic research has been done on the correlation between age and vulnerability to witchcraft accusation. Figures published on this theme are usually based on suspects for whom age is known with the highest degree of certainty from trial records.

This approach can be problematic for two reasons. First, it probably skews the picture in favor of the youngest and oldest alleged witches, as their extremes of age were most likely to have been regarded as noteworthy by court scribes. Second, suspects of explicitly or roughly known age usually constituted only a tiny fraction of the total number of people tried for witchcraft in any particular area. For example, of the 314

people tried as witches at the Assize and Quarter Session Courts in Essex, England, between 1560 and 1680, Alan Macfarlane was able to establish the ages of only 15 tried in 1645 (all of whom were female): Two were aged forty to forty-nine, and the rest were fifty and above (Macfarlane 1999, 161). This small sample has been used to suggest that 87 percent of Essex witches were aged fifty and above (Bever 1982, 181). We cannot, however, be sure that the other 299 suspects (95 percent) tried in Essex had the same age profile as those 15 women, making such conclusions tentative at best. For the Jura region, the ages of witchcraft suspects were recorded reasonably frequently only in Geneva, yet William Monter concluded that the median age of sixty for accused witches in Geneva seemed typical of the rural Jura regions as well (Monter 1976, 122–123).

Although he did not categorise by gender, Bever (1982) used the figures in Table 1 to argue that women

aged fifty and above were particularly vulnerable to witchcraft accusations. However, when known ages of accused witches are sorted by gender and presented in narrower age-ranges (see Table II), we can see that, while middle-aged and older women were overrepresented amongst witchcraft suspects, female and males of all ages were vulnerable to witchcraft accusations.

OLDER WOMEN'S VULNERABILITY TO WITCHCRAFT ACCUSATIONS: EXPLANATORY MODELS

Historians have offered various explanations for the overrepresentation of women aged fifty and above among accused witches in early modern Europe and America. Some have suggested that it was the lowly economic and social status of older women that rendered them more vulnerable to witchcraft accusations. In the early 1970s, for example, Alan Macfarlane and Keith Thomas argued that English witches were more likely to be older women because such women were more likely than other age-gender groups to be poor and thus reliant on their neighbors for material assistance. They were thus more likely to become involved in tension-ridden verbal exchanges over requests for assistance with wealthier neighbors, who were increasingly unwilling to give it because of increasing population pressure on resources during the early modern period. According to Thomas and Macfarlane, wealthier villagers might then use an accusation of witchcraft against a poor, old woman in order to legitimate their own lack of charity toward her and as a means of loosening the bonds of neighborly obligation that had traditionally existed within their community.

For Thomas, the poverty of older women was often linked to widowhood: Old, poor widows were most likely to be reliant on neighborly assistance and thus were at greatest risk of being accused of witchcraft. Erik Mdelfort also emphasized the significance of marital status in explaining a woman's vulnerability to witchcraft accusation. He suggested that widows (and single women) ran a higher risk of being accused of witchcraft because they lacked the social and legal protection a husband afforded; women who lived beyond the reach of patriarchal control were automatically regarded as suspect. Widows were also overrepresented among the women accused of witchcraft in the duchy of Lorraine, around half of the total (Briggs 2002, 228), and in the nearby Saarland region of Germany at 64 percent (Labouvie 1991, 173).

Other historians (e.g., Bever 1982; Roper 1994, 199–225) have argued that the life-cycle event of menopause, rather than (or in addition to) a woman's economic, social, or marital status, provided the crucial catalyst in rendering certain women more susceptible to accusations of witchcraft. Bever, for example, asserted that women aged fifty and above, because of the mental and physical changes experienced as a result of menopause, were more likely than other age-gender groups to display the hostility and aggression that their neighbors regarded as characteristic of witches. Increased irascibility of this sort was exacerbated in poor women, who suffered most from the socioeconomic problems caused by demographic pressure on resources. Lyndal Roper, however, argued that it was

not their behavior but their bodies that rendered postmenopausal women vulnerable to being perceived in this way, because their shriveled breasts and barren wombs were regarded with particular fear and loathing in early modern culture, which held fertility in extremely high esteem. The body of the postmenopausal woman was conceptualized by early modern medical theory as literally poisonous, because it no longer regularly expelled its supposedly poisonous menstrual blood. However, too little research has been done on its cultural perception and representation in early modern Europe to permit any firm conclusions.

OLDER WOMEN'S VULNERABILITY TO WITCHCRAFT ACCUSATIONS: LENGTH OF REPUTATION

The explanations for older women's vulnerability to witchcraft accusation discussed above may indeed apply in certain cases, but they can also be criticized on various grounds. The Thomas-Macfarlane explanatory model, for instance, implies both that the targets of witchcraft accusation were almost invariably old, poor women and that witchcraft accusations almost invariably arose from situations of social conflict in which a wealthier neighbor had refused a poorer one material assistance. More recent research done on witchcraft trials, however, has shown that accusations of witchcraft emerged from a wide variety of different conflicts within communities, and that the range of suspected witches was therefore much larger than the "poor old woman" stereotype suggests. In certain English, Swiss, and German communities, for example, accusations of witchcraft were not made by the wealthy against poorer neighbors, but rather by those of lower social and economic status against their wealthier neighbors. Such accusations expressed the envy felt by the less well off and offered a means to redistribute power within a community: In such cases, relatively wealthy, socially integrated, married women (and men) could become targets. Although poverty might, therefore, increase the likelihood of an individual's involvement in situations of social tension from which suspicions of witchcraft might arise, so might wealth, as well as a variety of other factors that had little to do with the individual's economic status.

Obviously, a very unpleasant strain of misogyny was directed against old women in the early modern period, but it is not clear if this resulted simply from a particularly negative perception of their bodies. It is also not clear how this misogyny became a direct "cause" of witchcraft accusations against specific older women. Moreover, it is by no means the case that suspected witches necessarily behaved in a hostile and aggressive manner, as Bever implied. Trial records show that many tried to conduct relations with their neighbors in as amicable a fashion as possible, although these amicable

social exchanges could be given a sinister meaning by neighbors who already feared the suspect as a witch. On the question of widowhood, the lack of a husband's protection did render a woman more vulnerable to a formal accusation of witchcraft by her neighbors. However, widowhood by itself was not enough to cause such an accusation, which would only be deemed plausible if the accused woman had already been involved in conflict-ridden social relationships with another household, or was already reputed a witch in her community. Many women who were formally accused of witchcraft once widowed had probably first gained their reputations as witches while married.

A growing body of evidence suggests that many people tried for witchcraft in early modern Europe and America had acquired reputations as witches many years before being formally accused. In Lorraine, the Saarland, Scotland, and the German city of Rothenburg ob der Tauber, for example, over half of the women tried for witchcraft had preexisting reputations as witches (Rowlands 2002, 178), and in the county of Lippe, such women constituted a majority of those accused of witchcraft (Walz 1993, 300–302). Some reputations for witchcraft apparently stretched back as far as forty or forty-five years; in Rothenburg, the average length of reputation as a suspected witch was around eighteen years (Rowlands 2002, 178). Women and men could acquire such reputations from a surprisingly young age through association with older reputed witches. Aside from being born into a family of reputed witches, someone might become the stepchild of a reputed witch, or a servant in a household of reputed witches, or marry into such a household, which would render such individuals potentially vulnerable to witchcraft accusations for most of their lives. Comparatively young women and men, especially biological children of reputed witches, could plausibly be accused of witchcraft.

As long as communities did not suffer large-scale witch panics, reputed witches could be tolerated within their communities for long periods of time. Their neighbors had a variety of nonlegal methods for coping with witchcraft and tended to see formal accusation as a last resort against a reputed witch—and reputed witches were rarely defenseless against their neighbors' suspicions. Moreover, a witch's power was believed to increase with age, perhaps peaking between the ages of 40 and 60, and may possibly have been linked to the cessation of childbearing for women. Women arrested for witchcraft were therefore often middle-aged by our standards or old by their standards, simply because their neighbors had waited years, or even decades, before deciding to take legal action against them. When the sources permit, historians investigating the connections between age and vulnerability to witchcraft accusation need to ask not only why someone was formally

accused of witchcraft at a particular point, but also when, and how, that person first acquired a reputation for performing witchcraft. Ideally, historians should also try to establish the ages of the accusers and witnesses who testified against alleged witches, in order to establish how often intergenerational conflict in families and communities played a role in witchcraft accusations.

A WIDE RANGE OF SUSPECTS: CHILD WITCHES AND MALE WITCHES

Too great a focus on women aged fifty and above as stereotypical witches overlooks the fact that women and men of all ages were prosecuted and convicted as witches during the early modern period. The wide range of potential witchcraft suspects can be seen both in Rothenburg ob der Tauber (Rowlands 2002) and in the adolescent-driven Salem witchcraft trials (see table A-I). This wide range of suspects should not surprise us: Witchcraft accusations could emerge from a variety of situations of social tensions between neighbors, while almost anyone could fall victim to an accusation of witchcraft forced from a suspected witch during interrogation under torture. Moreover, the belief that witchcraft was an evil art that could be taught by experienced witches to the as yet uninitiated was so flexible that it could be applied to a person of any age, gender, or social status, either in the role of teacher or pupil. This was why it was fairly easy for an individual to gain a reputation as a witch by association with a household containing others who were already reputed witches: The assumption was that the evil art of witchcraft would be passed on among the household's members. It was partly for this reason that the idea of child witches was taken so seriously by contemporaries: it made perfect, if terrifying, sense to imagine that children had been corrupted by adult witches.

Anxiety around the figure of the child witch increased dramatically during the early modern period as a result of the significant number of often voluntary confessions made by children and teenagers regarding either their bewitchment or seduction into witchcraft by older witches. The proportion of children involved in witchcraft trials increased significantly in the course of the seventeenth century in Germany, for example. Of the 133 suspects executed in the course of the *Zauberer-Jackl* (Sorcerer-Jack) trials in Salzburg between 1675 and 1681 (which constituted the last of the large-scale south German witch persecutions), two-thirds were under age twenty-one and over one-third were fifteen years of age or younger (Schindler 2002, 238). The fact that most of these youngsters were boys also reminds us that males as well as females were vulnerable to witchcraft accusations in early modern Europe. The proportion of men accused of witchcraft varied greatly throughout Europe, ranging from a meager 5 percent

in the bishopric of Basel to 92 percent in Iceland; according to Rolf Schulte's figures, the average percentage of men tried for witchcraft in early modern Europe was around 30 percent (Schulte 2000, 86). In Germany it was 24 percent, with the proportion of men tried for witchcraft increasing in the seventeenth century, particularly in Catholic areas (Schulte 2000, 81, 88–89).

Although little research has been done on the correlation between age and vulnerability to accusations of witchcraft among men, the available samples (Demos 1970; Labouvie 1991; Rowlands 2002) suggest similarities between the genders: If men of all ages could plausibly be accused of witchcraft, those aged fifty or above seem overrepresented in proportion to the overall male population. As was the case with older women, older men could become vulnerable to witchcraft accusations for a variety of reasons: because they were poor and had to beg, or on the contrary because their wealth excited envy; because they were antisocial, particularly quarrelsome, or verbally aggressive; because they were married or otherwise related to suspected witches; or because they had subverted communal norms in any number of ways and contexts. Like accused female witches, they too often had long-standing reputations within their communities for practicing witchcraft.

AGOBARD OF LYONS (CA. 779–840)

Auxiliary bishop, then archbishop of Lyons (816–835, 837–840), Agobard was a politically active cleric and theologian during the reign of Louis the Pious (814–840), and his treatise against the belief that hail and thunder could be made by skilled humans is a frequently cited example of Carolingian clerical skepticism in the face of popular belief and practice related to witchcraft.

In 815 or 816, Agobard encountered a group of people near Lyons who were planning to execute three men and a woman who, their captors claimed, had fallen out of a ship in the clouds. The ship and its crew, they said, came from a land called Magonia, spreading hailstorms that destroyed the local crops and then, after negotiations with intermediaries paid by the local farmers whose crops had been damaged, taking the crops and sailing away. Agobard described the episode in his treatise *Against the Absurd Belief of the People concerning Hail and Thunder*. In an appendix to the treatise, Agobard criticized another belief that enemies of Charlemagne had spread a magical dust across the fields, killing cattle. Agobard was concerned about the widespread prevalence of the general belief that natural disasters could be caused or repaired by human agency rather than by God alone. But his perspective is that of the critical outsider; nowhere does he describe the entire belief system, traces of which he discovered in the case of the weather makers from Magonia.

Agobard was also addressing a topic of common concern in Carolingian Europe, in which cereal agriculture and pastoralism lay at the base of the economy and the failure of one or both had widespread consequences. People also believed that natural phenomena were caused by human agency. There is a considerable legal and penitential literature from the period prohibiting not the belief in but the practice of various kinds of weather magic, either causing natural disasters or taking action to prevent them when others caused them. There is earlier evidence of such beliefs and prohibitions in Roman literature as well as in sixth- and seventh-century Visigothic legal collections. A major theme in the work of Agobard and his contemporaries was the discrediting of certain

kinds of power that people believed to exist and that some people professed to possess. Reforming clerics dismissed as superstition those kinds of power that they wished to discredit. Although Agobard used rational arguments against belief in the weather makers and grain thieves of Magonia, he used these only instrumentally, in an attempt to impose a new religious orthodoxy that reserved certain kinds of power for God alone and regulated access to that power through the Christian clergy by means of special prayers and liturgical rituals. God, too, might exact his vengeance by sending storms or pestilence, and the prayers and rituals of clergy might also mitigate divine vengeance. From the ninth century to the present, Christian liturgy has contained particular prayers and ceremonies for aid against natural disasters.

Agobard also complained that the money paid to people who defend crops and animals against weather makers was taken from tithes that should have gone to the Church. Several scholars have suggested that the belief and practices condemned by Agobard were being used to avoid the often heavy exactions of grain from peasants by clerical and lay lords, by concealing harvested grain and claiming that it had been destroyed or taken by the alien weather makers.

Read carefully, the unusual and dramatic episode recorded by Agobard throws light on contemporary aspects of the Carolingian rural economy, peasant beliefs and practices in the face of an increasingly normative kind of Christianity, and the mind of a reforming cleric during a period of acute sensitivity toward the need for reform and energetic attempts to enforce it.

AGRARIAN CRISES

Agrarian crises reveal the interdependence of meteorological disaster, subsistence crises, and popular demand

for witch hunting. Agrarian societies are extremely responsive to agrarian fluctuations, the difference between annual harvests depending on the climatic conditions. During the medieval and early modern periods, European society was largely agrarian. Around 1600, only capitals like Istanbul, Naples, Venice, Milan, Paris, and London counted more than 100,000 inhabitants; even major commercial centers like Amsterdam or Lyons were smaller. In the Holy Roman Empire, the largest imperial free cities, such as Augsburg, Nuremberg, and Cologne, had merely 40,000 inhabitants. Most English towns had less than 4,000 inhabitants, and the same was true for France, Germany, and Spain. Except for parts of the Netherlands, the Rhineland, and northern Italy, less than 10 percent of the population was living in towns; rural life dominated throughout Europe, and the larger towns depended on food supply. At the same time, yield ratios on grain sown were low; shortfalls in production were sometimes caused by war, but more frequently by problems in the agrarian sector. A decline in agrarian production posed the greatest danger to this kind of subsistence economy.

In 1935, Wilhelm Abel first defined *agrarian crises* as periods characterized by a sharp drop in agrarian output and consequently in feudal rents, by desertion of individual farms or even entire villages, and by a steep decline in prices for farmland. His definition was modeled on the major crisis of the fourteenth century, when European population numbers collapsed under the impact of the Black Death, the return of the bubonic plague after more than 700 years. Abel’s definition, however, conflates two entirely different phenomena: a crisis in production and a crisis in consumption. It is true that an enormous crisis affects both consumers and producers, both townsfolk and villagers, both landlords and peasants, in a vast downward spiral. But in short-term crises, known to economic historians as *crises de l’ancien type* (crises of the old kind) (Labrousse 1933)—just the opposite is the case. Crop failure causes an increase in prices, but only those who have to buy food (day laborers and urban craftsmen, e.g.) suffer, whereas producers and sellers of agrarian products (lords, peasants, and merchants) benefit from the situation.

Short-term crises therefore increase social tensions within the society by creating poverty, malnutrition, and diseases among consumers and abundant wealth for producers and distributors. Because malnutrition makes people more vulnerable to certain kinds of diseases (for instance, typhus, tuberculosis, influenza, and possibly smallpox), the longer the food shortage lasts, the more vulnerable consumers become. Some age groups, primarily small children or old people, are more likely to be affected by high mortality than others. It makes sense to replace the term “agrarian crisis” by “subsistence crisis,” because those who benefited from

the hardship of others were obviously not part of any crisis, except insofar as highly infectious diseases like bubonic plague also endangered even the well-fed, or the bitterness soared until the lower classes turned rebellious or even revolutionary.

In agrarian societies like Old-Régime Europe, as we have seen, subsistence crises were ordinarily triggered by harvest failure, which in turn was most often caused by climatic anomalies: central Europe, for example, experienced an increasing number of years, during the period of the Little Ice Age of prolonged winters, late frosts, cold and wet summers and autumns, early snowfall, and severe winters. In these years, the wine harvest was endangered, and so was the harvest of cereals. Wine turned sour, and the amount of grain available to eat fell far below normal levels. The proverbial “daily bread” was in danger; the specter of hunger and epidemic diseases frightened the average household. Because weather determined the harvest, climatic anomalies triggered questions about causation—“who did it”—in a society lacking the concept of contingency. This was particularly the case in the 1480s, the 1560s, the 1580s, and the 1620s (Behringer 2004).

The resumption of witch hunting in the 1560s was accompanied by debates about weather making, because this was often the single most important charge against suspected witches, especially in central Europe. Trial records show that while individual “unnatural” accidents resulted in individual accusations of witchcraft, in cases of “unnatural” weather and collective damage, entire peasant communities demanded persecution. Unlike individual accusations, which usually triggered trials against only individual suspects, such collective demands for persecution—when accepted by the authorities—often resulted in large-scale witch hunts. The links among meteorological disaster, subsistence crisis, and popular demand for witch hunts were apparent in the largest witch hunts of sixteenth-century Europe, affecting regions as widely separated as Switzerland, Scotland, electoral Trier (Kurtrier), and Lorraine in the later 1580s, or even more clearly with the largest wave of witch hunting of the seventeenth century, which occurred between 1626 and 1630, mainly in ecclesiastical territories of the Holy Roman Empire, and was the climax of European witchcraft persecutions. Short-term subsistence crises reinforced and exacerbated some long-term developments, such as the rising tension between an increasing population and decreasing yield ratios during the “long sixteenth century.” At times and places when the witchcraft persecution climaxed, social tensions may have been similar to those in the fourteenth century, when famine and epidemics ravaged European societies, with social insecurity accompanied by spiritual uncertainties and all kinds of anxieties. In this sense, witch hunting can be interpreted as part of the scenario discussed under the

commonly used heading “Crisis of the seventeenth century.”

The mechanisms detected in the background of witch persecutions—the search for mystical causation of unusual hardship in an agrarian society—can be applied not only to all massive witchcraft persecutions in traditional Europe, but also to large-scale persecutions in Africa, Asia, or America. European society, however, found an escape from the misery of agrarian crises. By the sixteenth century, its economic life was already molded by the mechanisms of early capitalism, and its trading links had already created what Immanuel Wallerstein called a European “world system.” The increasing frequency of agrarian crises created a rising demand in food supply in urban centers, and the merchant class managed to develop trade links with more remote agrarian zones like the Baltic, or even North America. Improvements in shipping and storage enabled these capitalists to supply grain from these remote areas, as soon as price increases made it profitable. Therefore the upper echelons of the European society usually profited directly from subsistence crises, while entire regions like the Netherlands, where the international grain trade from the Baltic was based, became virtually independent from traditional agrarian crises. The agricultural revolution of the late seventeenth and eighteenth centuries, as well as the invention of insurance companies, made these urbanized centers of northwestern Europe less vulnerable. Yield ratios were increasing slowly from the seventeenth century, primarily in parts of Italy, England, and the Netherlands, which became virtually independent from agrarian fluctuations. It does not seem coincidental that these were the same areas where the witchcraft paradigm first lost its grip on the minds of the people, and where witchcraft trials were terminated first.

**AGRIPPA VON NETTESHEIM,
HEINRICH CORNELIUS (1486–1535)**

A dominant magical thinker of the Renaissance, Agrippa was constantly cited (positively and negatively) along with Paracelsus for the next two centuries as a founder of magical philosophy. Erasmus thought him learned, and Juan Luis Vives called him “the wonder of letters and literary men” (Nauert 1965, 323). François

Rabelais lampooned him as “Herr Trippa” in his *Tiers Livre*. Christopher Marlowe’s demonic Faust also cites Agrippa, and even in the nineteenth century, the black dog in Johann Wolfgang von Goethe’s *Faust* derives from a legend about him. Although modern scholarly opinion of Agrippa’s work has been predominantly negative, Agrippa’s skeptical and magical thought had a major influence on later Renaissance philosophy, from John Dee and Giordano Bruno to Michel de Montaigne and René Descartes.

LIFE

Born in Cologne in 1486 to a family of the minor nobility or upper bourgeoisie, Agrippa received the *magister artium* at the University of Cologne in 1502, a university he later criticized. Between 1507 and 1509 he traveled in France and Spain, and also formed or joined a secret society of students of the occult.

Late in 1509, Agrippa visited Johannes Trithemius; shortly thereafter, Agrippa sent him the juvenile draft of *De occulta philosophia* (On Occult Philosophy), of which Trithemius largely approved. Agrippa also lectured on Johannes Reuchlin’s Kabbalistic *De verbo mirifico* (On the Wonder-Working Word) at Dôle, but was denounced as a “judaizing heretic” (*Opera* 2.509). In 1510, Agrippa was in London, where he studied the writings of the apostle Paul with John Colet and began a commentary on the Epistle to the Romans, now lost. Agrippa spent most of 1511 to 1518 in northern Italy serving Emperor Maximilian, but also teaching Plato’s *Symposium* and the Hermetic *Pmander* (Shepherd of Men) at Pavia.

In 1518, Agrippa became legal advisor to the city of Metz. Here he became embroiled in a witchcraft trial, his extraordinary legal efforts leading to the acquittal of an accused woman. After living next in Cologne, Geneva, and Fribourg, Agrippa moved to Lyons in 1524 as physician to Louise of Savoy. Unfortunately, they disagreed intensely, Agrippa being offended by Louise’s demands for astrological prognostications. When Louise left in 1525, the royal treasurers stopped Agrippa’s salary, and in 1528 he took a position in Antwerp with Margaret of Austria.

In September 1530, Agrippa published *De unitate* (On the Vanity of the Arts and Sciences). Concerned about the work’s orthodoxy, Margaret had it sent for secret review to the Faculty of Theology at Louvain, who denounced it in March 1531. In early 1531, Agrippa published Book 1 of *De occulta philosophia*, dedicated to Hermann von Wied, archbishop-elect of Cologne, where Agrippa moved the next year. Here he began the process of publishing the complete work, which the inquisitor of Cologne soon denounced as heretical. When the final version of *De occulta philosophia* appeared in 1533, Agrippa had moved to the archbishop’s capital at Bonn.

Then, suddenly, Agrippa vanished from the historical record—no correspondence is extant, and his last years remain almost unknown. According to his student Johann Weyer, Agrippa took a third wife, repudiated her in 1535, traveled to Lyons, where he was briefly imprisoned by French King Francis I, and died that same year in Grenoble.

After his death, stories of Agrippa’s traffic with demons began circulating, leading to his reputation for black magic. In one story, an anonymous boarder entered Agrippa’s study, read aloud from a mysterious book, and was killed by a demon. Agrippa returned and commanded the demon to enter the corpse, making the unfortunate man appear alive; the possessed body then appeared in public, diverting suspicion. Stories about Agrippa’s dog, a demon in disguise, resurfaced in the Faust stories as a form taken by Mephistopheles; Weyer remarked that the dog was a pet, named Monsieur, which Weyer himself often walked.

WORKS

Agrippa was a prolific writer of orations, treatises, and letters. Most important among his many minor works were *Declamatio de nobilitate & praecellentia foeminei sexus* (Declamation on the Nobility and Preeminence of the Female Sex, 1529), which argued the theological purity and superiority of women; and *De triplici ratione cognoscendi deum* (On the Threefold Way of Knowing God, 1529), based on Agrippa’s 1509 lectures on Johann Reuchlin, which argued for a Christian synthesis of pagan philosophy, Kabbalah, and Christian theology.

Agrippa’s two greatest works were undoubtedly his *De incertitudine et vanitate scientiarum et artium* (The Uncertainty and Vanity of the Sciences and Arts, known as *De unitate*, 1530), a scathing satire on knowledge and its professors, from theologians to magicians to whores; and his *De occulta philosophia libri tres* (Three Books on Occult Philosophy, 1531–1533), a monumental attempt to synthesize all magical knowledge into a coherent whole.

DE INCERTITUDINE ET VANITATE SCIENTIARUM ET ARTIUM

Agrippa’s best-known work was a major statement of Pyrrhonist skepticism, at times gracefully written, at others heavy-handed and inelegant. The book was extremely influential for later thinkers, notably Montaigne, Descartes, and even the young Goethe. It has been compared to Nicholas of Cusa’s *On Learned Ignorance*, to praises of the ass such as in Apuleius’s *Golden Ass*, and especially to Erasmus’s *Praise of Folly* (1509). Erasmus himself commented positively on *De unitate*, although he considered it too vicious and disapproved of Agrippa’s war upon monks.

After a satirical letter to the reader listing everyone criticized and what they will think of the author,

Agrippa moved on to 102 chapters, each of which gave a brief account of a particular art and then attacked its professors. The work ended with a lengthy discussion of the word of God as the sole certain truth and an encomium of the ass.

De vanitatè's argument was not simply that all knowledge was worthless, as has sometimes been maintained, but rather that no knowledge can have value unless guided by faith. *De vanitate* belonged to the skeptical and satirical reformist literature of the period; Agrippa's main contribution to this literature was his early use of Pyrrhonist skepticism and his comprehensive survey of all human knowledge. Because of its antiecclesiastical bent, *De vanitate* has sometimes been interpreted as Protestant, but there is no evidence for such sympathies in Agrippa.

DE OCCULTA PHILOSOPHIA LIBRI TRES As its title indicated, Agrippa's masterpiece was divided into three books: Natural Magic, Mathematical Magic, and Religious or Ceremonial Magic. Natural magic here included magnetism, signatures, and other odd natural properties of objects, as well as those objects' astrological ascriptions; mathematical magic comprised geometry, proportion, harmony, numerology, *gematria* (numerology of Hebrew letters), sigils, and the like; ceremonial magic included everything from meditation to ecstasy to prophecy to ritual demonology.

Its nearly 200 chapters predominantly contained discursive lists of data, with occasional more theoretical discussions, usually buried within longer chapters. This structure made the work as a whole seem incoherent; in fact, however, *De occulta philosophia* was a subtle, erudite, and complex presentation of a magical philosophy that if practiced led the magician to a kind of intellectual mystical union with God.

It was in *De occulta philosophia* that Agrippa most clearly demonstrated his iconoclasm. Not only did he cast aside the traditional division between natural and demonic magic, but he even suggested that ritual invocation of demonic forces might be necessary to legitimate natural magic. His opinion of alchemy was equally confusing: *De occulta philosophia* ignored the issue, apart from occasional general remarks in a mostly positive vein, although his *De vanitate* presented an extended and devastating assault on the art, which nonetheless hinted at the possibility of a legitimate and even supremely valuable alchemy.

This apparent disagreement pointed to a constant difficulty in scholarship on Agrippa, an inability to find coherence between *De occulta philosophia* and *De vanitate*. In a way, the solution was simple: where *De vanitate* argued that knowledge was worthless in the absence of faith in Jesus, *De occulta philosophia* attempted to link all philosophical knowledge to Christian revelation, thereby transmuting the search for knowledge into a magical exploration of divinity.

Agrippa was a philosopher and magician of considerable originality and importance. *De occulta philosophia* remains a landmark work in the history of magical thought, while *De vanitatè*'s influence on later generations of skeptics can hardly be dismissed. Despite the unpleasant legends and general aura of charlatanry which still adhere to his name, Agrippa must be recognized as one of the key figures in the occult Renaissance.

AITKEN, MARGARET

The “great witch of Balwearie (in Fife),” as Margaret Aitken was known, became the single most important figure in the great Scottish witchcraft panic of 1597. Accused of witchcraft, she tried to save herself by claiming an ability to detect other witches by looking in their eyes; she may have been responsible for hundreds of deaths.

A contemporary chronicler, Patrick Anderson, described the 1597 panic:

Much about this tyme there was a great number of witches tried [found] to be in Scotland, as the lyke

was never heard tell of in this realme; specialle in Atholl both of men and women ther was in May att one convention upon a hill in Atholl to the number of 2300 and the Devill amongst them; a great witch of Balwearie told all this and said she knew them all weill enough And what marks the Devill hade given severallie to everie one of them. Ther was many of them tryed by sweiming in the water by binding of ther two thumbs and ther great toaes together for being thus casten in the water they fleded ay above. (Anderson n.d., 2: fol. 266v).

A second source of information, Archbishop John Spottiswoode, wrote an ecclesiastical history in the 1620s. In 1597 he was a parish minister in Midlothian, but already involved in national affairs.

She [i.e., Aitken] was so readily believed, that for the space of three or four months she was carried from town to town to make discoveries in that kind. Many were brought in question by her delations, especially at Glasgow, where divers innocent women, through the credulity of the minister, Mr John Cowper, were condemned and put to death. In end she was found to be a mere deceiver (for the same persons that the one day she had declared guilty, the next day being presented in another habit she cleansed), and sent back to Fife, where first she was apprehended. At her trial she affirmed all to be false that she had confessed, either of herself or others, and persisted in this to her death; which made many forthink their too great forwardness that way. (Spottiswoode 1847–1851, 3:66–67)

The collapse of Aitken's career was linked to a proclamation of August 12. The chronology thus suggests that Aitken was exposed about August 1. Since "for the space of three or four months she was carried from town to town," this must have begun some time in April. Aitken's initial success inspired local imitators: one Agnes Ewing was active in detecting witches in her native Kirkcaldy and elsewhere in Fife.

The Aitken affair was notable for the subjection of witchcraft suspects to the water ordeal. No reference to the swimming of Scottish witches has yet been found for any other period, but the evidence for 1597 is clear. Anderson's account was corroborated by King James VI's *Daemonologie*, published later in 1597, which mentioned the water ordeal along with pricking for the Devil's mark as tests for witchcraft.

These distinctive proceedings suggest that a special commission, using special procedures, was established to carry Aitken around the country. James evidently took an interest in the commission and approved of its activities. He may even have pressed later for its special procedures to be adopted by statute. But once Aitken

was exposed as a fraud and executed, the trials ended abruptly. The proclamation of August 12 cancelled many trial commissions and announced that new commissions would be issued only to three or more commissioners jointly, in order to prevent abuses. The issuance of the proclamation did not stop the panic—prosecutions continued into October, with the king's support—but it marked an important stage in its decline.

An act of parliament in December created a commission to make recommendations about acceptable evidence in witchcraft trials. There was disagreement on the subject between the king, who hoped to legitimize Aitken's testimony, and the general assembly of the Church, containing leading ministers who in August had protested against the use of one witch's testimony to convict others. The commission never reported. Meanwhile, there were public recriminations in Glasgow. The presbytery made John Morrison do penance for circulating a written libel containing Aitken's depositions, which had slandered the ministers as responsible for the executions. The presbytery did not claim that the executions had been justified, but that they were the ministers' fault. Witch hunting had backfired, and nobody wanted to take responsibility.

AIX-EN-PROVENCE NUNS

The case of Madeleine Demandols de la Palud, which opened late in 1609 and concluded with the execution of Father Louis Gaufridy in April 1611, was one of a number of widely reported and discussed cases of demonic possession in France in the late sixteenth and early seventeenth century. The earlier cases of Nicole Obry and Marthe Brossier, which reflected the tensions of the French religious wars, as well as group possessions in Germany and Italy, had already made this aspect of the Devil's work well known to the French public. However, this case introduced an important new element into the possession–exorcism scenario with important implications for future cases.

Madeleine, a young woman from a noble Marseilles family, was a nun in the Ursuline convent in Aix-en-Provence. She had a history of depression and

emotional problems, and was diagnosed as possessed early in 1610. Other nuns became possessed as well. Madeleine and one of her colleagues, Louise Capeau, soon accused Louis Gaufridy, a parish priest in Marseilles and friend of the Demandols family, of being a witch and causing their possession. Madeleine also accused Gaufridy of taking sexual liberties with her.

Because attempts to exorcise her in Aix did not go well, she was transferred to papally controlled Avignon, where she was put into the hands of the local Grand Inquisitor, Sebastien Michaelis. He was a recognized expert on witchcraft, having published an account of his experiences in a large-scale prosecution of witches in the Avignon area in 1582. He brought her to St. Maximin in Provence to the grotto where, local legend had it, Mary Magdalene had lived. Large crowds attended the public exorcisms held there.

In February 1611, the *Parlement* (sovereign appellate court) of Provence arrested Gaufridy. All this time, Madeleine continued to accuse him. He was subjected to degrading treatment and eventually confessed to gross sexual misconduct, blasphemy, and witchcraft.

Jacques Fontaine, Professor of Medicine at the University of Aix, examined Gaufridy for the Devil's mark during his interrogation. Fontaine found several of these incriminating marks on Gaufridy, providing important evidence against him. Fontaine then published a short treatise arguing that the Devil's mark was one of the best ways to detect witches. Although not much had been published on the Devil's marks, according to Fontaine, he asserted that they were widely believed in by the general public and that these views were undoubtedly of divine inspiration. He stated that any good physician could easily distinguish between ordinary scars and the Devil's mark and that only a willing and knowing witch could be marked.

These claims, as well, of course, as Gaufridy's confession, led to his execution in Aix-en-Provence on April 11, 1611. The exorcist Michaelis soon published a massive *Admirable History* (1614) of his triumph over the magician who had caused Madeleine's possession, making the case widely known and mentioned in many works and correspondence. It provided a clear model for the even more famous 1634 case in Loudun involving the priest Urbain Grandier.

ALBIZZI, FRANCESCO (1593–1684)

Originally as an assistant judge and after 1654 as a cardinal, Albizzi was a major figure in the Roman Inquisition whose published views on witchcraft expressed those of the papacy. After the early death of his wife (with whom he had several children), Albizzi, who had legal training, joined the clergy; he entered the Roman curia's diplomatic service in 1628 at Naples, and was soon entrusted with supervising the Catholic Church's business dealings. His first encounter with witch hunting, which Albizzi still remembered decades later, occurred during a journey through Germany in 1636 and 1637 while serving in the diplomatic mission in Cologne: "innumerable stakes had been erected outside the walls of several villages and towns, attached to which, poor and exceedingly pitiful women had, as witches, been devoured by the flames" (Albitius 1683, 355 § 179).

After returning to Rome, Albizzi made his reputation as one of the Roman curia's hardline opponents of Jansenism, considerably influencing its rejection under popes Innocent X (1644–1655) and Alexander VII (1655–1667). A strong advocate of papal sovereignty and supremacy, Albizzi refuted Venetian attempts to interfere in the Church's jurisdiction and Spanish demands for a veto at papal elections. In 1654, he became a cardinal. Subsequently, Albizzi played an important part in the Vatican's decision to rescue fifteen children facing execution in a witch hunt in the Swiss canton of Graubünden and bring them to Milan. This experience, among others, led to the church's decision in 1657 to publish its instructions for witchcraft trials (hitherto available only in thick manuscript handbooks) as a brochure, which was then distributed to Catholic authorities, particularly those outside Italy in Switzerland or Germany.

Cardinal Albizzi's views on witchcraft appeared in the first volume (*De inconstantia in iure admittenda vel non; When is Inconsistency Permissible in the Law, When Not?*) of an extensive canonical work, published in 1683 under a fictitious place and publisher. His comments about witches in this "unofficial" book reflected contemporary Vatican positions, sometimes illustrating them with examples based on his own experiences. From a dogmatic viewpoint, Albizzi (like his Jesuit predecessors Adam Tanner and Friedrich Spee) was conservative: To claim that harmful spells are unreal was heretical. Witches' ability to fly and the witches'

Sabbat were also possible, but extremely rare. He also believed in the reality of witches' stigma (the Devil's mark), but admitted that serious opinions to the contrary existed within the Inquisition.

Like the Roman Inquisition, generally, Albizzi was very cautious about evaluating evidence surrounding the offense of witchcraft. Before assuming a harmful spell as a person's cause of death, physicians first had to be able to exclude natural causes. As an assistant judge, he had seen many cases of alleged spells, which the consulted doctors almost always attributed to physical illnesses.

Albizzi claimed that local clerics were considerably likelier to believe in witchcraft than Roman authorities: "Since the evidence of *Corpus delicti*, which must be fully proven, especially in cases of infanticide and harmful spells with alleged fatal results, has been violated by [local officials] responsible for witchcraft trials, the Suprema [the Holy Office in Rome] has had [its] directions printed for the instruction of the judges and has supplied these to them in circular letters" (Albitius 1683, 350).

Albizzi also sharply criticized the practice of building chain trials from statements of alleged participants in Sabbats: "The Suprema has established several times, especially in 1594 and 1595 [. . .] that the witches who swear they have seen specific persons at the witches' Sabbat, should not be believed to their detriment, as it is regarded as illusion. Hence, the practice of the secular and clerical courts in Germany has always been rejected, according to which a witch hunt can be started simply because a single witch claims she has seen others at the Sabbat, and that she can be found guilty if two witches claim the same; Father Tanner objects to this practice in a commentary devoted to this matter, and an unknown author, a Roman theologian, in the book *Cautio Criminalis* [. . .] [A Warning on Criminal Justice] printed in Rinteln in the year 1631" (Albitius 1683, 355 § 177–178).

Cardinal-inquisitor Albizzi was indeed acquainted with the Rinteln first edition of Friedrich Spee's *Cautio Criminalis*, although its author remained unknown to him. He had also discussed Germany's witch hunts with Christina, ex-queen of Sweden, who had resided in Rome since 1655. She told him that her 1649 edict had largely stopped witchcraft trials in Bremen and Verden in northern Germany. She and the cardinal agreed "that what the witches confess comes as a result of their uterine state [*ex effectibus uterinis*] or diabolical pretences" (Albitius 1683, 355 § 180).

Albizzi also mentioned Rome's opposition to Inquisitor Pierre Symard's witch hunt in Franche-Comté in 1659: "The Inquisitor of Besançon had . . . surrendered several men and women into the arms of worldly justice, whose trials would later be considered invalid and unjust by the Suprema; therefore, they were

released as innocent and the inquisitor was dismissed" (Albitius 1683, 355 § 179).

ALCHEMY

Alchemy is the art of manipulating the hidden powers of nature in order to achieve a number of different physical effects. These effects may be simple, such as gilding or staining or producing chemical changes in certain materials; complex, such as producing the reddish powder known as the philosophers' stone, which will transmute a metal considered to be low-ranking in nature's hierarchy into one thought to be of higher rank, the most notorious example being the attempt to change lead into gold; or medicinal, such as the endeavor to produce a liquid called "the elixir of life" (from Arabic *al* = "the," and *iksir*; from the late Greek *xerion*, "powder to be rubbed into wounds"), which will cure all ills and prolong human life. In later times there was added to these another possible operation, the spiritual transformation of the alchemist together with (or even instead of) the transformation of the materials experimented on.

Almost from the start, alchemical writings were full of technical terms and shrouded in complex metaphors and symbols that rendered their practical meaning impenetrable to all men who had no master to guide them. (There were female alchemists, but not very many.) The reason for this secretiveness was that alchemy was believed to be both a privileged and a dangerous art, which must not fall into the hands of the unlearned or unworthy. The Jesuit Martín Del Rio said bluntly that alchemy was an occupation for the rich, not the poor. Charlatans—and there were many—took full advantage of this knowledge to dazzle and fool their clients. But serious alchemists—and there were, and still are, many—practiced the art with an almost religious intensity. Alchemy, moreover, is not exclusively a

Two alchemists working, from an early sixteenth-century woodcut. (Fortean Picture Library)

Western art. Both India and China have their own long alchemical traditions, and both Islamic and Jewish scholars also explored and developed the art in important ways.

THEORY

Like any other manipulators of nature, alchemists worked with the four elements from which everything was constructed: earth, air, fire, and water. The aim was to change the proportions and combinations according to which these were naturally composed, in order to effect fundamental changes in the composition of the material with which the alchemist was working. Each element had certain characteristics that make it easier or more difficult to change, according to their mutual affinities or lack of rapport. Thus, earth is cold and dry; air is hot and moist; fire is hot and dry; water is cold and moist. Fire and air are therefore in tune with each other because they share the same quality of “hotness,” whereas earth and water are both “cold.” Everything is undergoing a slow process of change through natural “cooking,” or concoction by different degrees of heat. The alchemist can speed this process by subjecting his material to physical operations that will reduce it to its essentials, change one element into another where necessary, and recreate this altered matter as the new form he desires.

Basically, alchemical theories depended on Aristotle. However, they included a crucial idea from works

attributed to the eighth-century Sufi scholar and alchemist Jabir ibn Hayyun, known in the West as Geber, and the eleventh-century Arab physician and scholar Ibn Sina, known as Avicenna. These scholars claimed that in addition to material elements, there were philosophic elements, namely “sulphur” and “mercury,” neither being the substance usually indicated by its name. To these was later added a third basic principle, “salt” (again, not the physical substance of that name). From about the thirteenth century onwards, these became what Paracelsus (Theophrastus Bombastus von Hohenheim) called the three first things in any alchemical process.

The typical alchemical process took the following general form, although there are wide differences in the various accounts over the centuries. First the alchemist took his basic matter (*prima materia*)—and what this was (dew, horse dung, etc.) varied considerably according to alchemical treatises—and purified it. This stage was called “blackening,” as the matter broke down and degenerated. Next, the resulting material was separated into its constituent parts and joined together again in altered form. This stage, in fact, consisted of several steps, as the material was subjected to a series of operations including purifying, heating, distilling, and fixing, each sequence repeated as many times as necessary. Changes in the color of the matter indicated whether or not the operation was proceeding successfully. From black to white to red were agreed by everyone. Others added intermediate stages, green and yellow and blue, including a brilliantly colored stage known as “the peacock’s tail.” Because these procedures involved such concepts as “exalting” and “ennobling” the material, it is easy to see how the notion arose that the alchemists themselves might undergo spiritual changes while engaged on what they called the Great Work.

APPARATUS

Alchemical procedures needed special apparatus. The *athanor* was a furnace shaped like a tower, heated by charcoal, and intended to maintain a constant heat. Its heating action was often referred to as “incubation,” and so the apparatus was sometimes called “the house of the chick.” The *balneum* was supposedly invented by an early Jewish alchemist, Maria the Prophetess, and consisted of a basin surrounded by heated water—hence the *bain-marie* (the French term for a double boiler) of modern cookery. The *alembic* was either a kind of still or (more properly) the head of a still that conveyed vapors to a receiver. The shape of other vessels mainly connected with distillation reminded people of animals or birds; hence, there was a “pelican,” a “stork,” and a “bear.”

HISTORY

Alchemists claimed an ancient heritage stretching back to Adam himself, and fathered their art (as well as many of

their writings) on such figures as Moses, King Solomon, Albertus Magnus (ca. 1200–1280) and Ramon Lull (ca. 1235–1316). In fact, Western alchemy seems to have emerged from Hellenistic Egypt—hence its name, *al-kemīa*, “the Black Land,” referring to the dark soil of Egypt—from which came collections of chemical recipes such as the Leiden and Stockholm papyri. During the Early Middle Ages, alchemy evolved into a genre of medical, culinary, technical, and magical anthologies known as Books of Secrets. Many alchemical texts reached the medieval West via Arabic scholars. The contribution of Geber and Avicenna has already been noted, and to these names should be added the ninth-century Al-Razi (Rhazes) whose works illustrate the immense range of laboratory equipment available to the alchemist.

Thereafter, a huge alchemical literature was generated in both verse and prose, much of it exquisitely illustrated but concealed in language that was purposely difficult to comprehend. Several stages of the process, for example, were described as the marriage, copulation, and death of a king and queen. The art remained popular throughout the Middle Ages and the early modern period, with rulers great and small keen to hire the services of alchemists, in the hope of adding substantially to their own riches. Inevitably such materialistic expectations encouraged charlatans who provided matter for literary exposure in, for example, the Canon’s Yeoman’s Tale from Chaucer’s *Canterbury Tales*, or Ben Jonson’s play, *The Alchemist*.

An important secret society, the Rosicrucians, grew out of the notion of spiritual as opposed to practical alchemy, announcing itself in 1614 by a manifesto, *Fama Fraternitatis* (Account of the Brotherhood). They claimed that their brotherhood had been founded by a fourteenth-century German monk, Christian Rosenkreutz, the discovery of whose tomb had released all kinds of secrets that might now benefit humankind. A second manifesto, *The Chemical Wedding of Christian Rosenkreutz* (1617), announced its alchemical basis even more openly. Whether the secret society ever really existed remains open to scholarly debate.

In the seventeenth and eighteenth centuries, alchemy became a popular diversion in many European courts, as alchemists were invited to demonstrate their art in front of noble spectators who tried to catch them out in fraud. Specimens of transmuted gold from some of these demonstrations exist in various European museums. Finally, in the twentieth century, there was a continuation of practical interest in alchemy. The Frenchman Jean Dubuis, the Czech Vladislav Zdobílek, and the Englishman Archibald Cockren are only three of the best-known examples. Many other contemporary practitioners exist in both Europe and North America. The spiritual side of alchemy was explored in several books by the Swiss psychologist Karl Jung, who saw a parallel between the world of

alchemical symbols and preternatural dramas, and the dream world of his patients.

ALCIATI, ANDREA (1492–1550)

Although the Italian jurist Alciati, one of the foremost legal authorities in the sixteenth century, discussed witchcraft only marginally, his undisputed prestige made his selectively skeptical opinion a significant element in the debate on the reality of the crime. While convinced of the existence of evil sorcery, he argued that the Sabbath was a delusion created by the tricks of the Devil and by the imagination of those who believed they participated in it. Alciati was among the very first to call for the medical treatment of the supposed witches, predating Johann Weyer’s views by several decades.

Born in Milan (or maybe in Alzate, near Como) in 1492, Giovanni Andrea Alciati (or Alciato) studied law between 1507 and 1514 at the universities of Pavia and Bologna, earning his doctorate in civil and canon law in 1516 at the University of Ferrara. He enjoyed a brilliant career as professor in the universities of Avignon, Bourges, Pavia, Bologna, and Ferrara, soon becoming the most prestigious jurist in Europe. Favored by kings (Francis I of France, Philip II of Spain), praised by Desiderius Erasmus, he renewed legal studies in the light of humanistic principles, and also composed the most successful book of emblems (*Emblemata*, 1531). He died at Pavia in 1550.

Alciati’s first encounter with witchcraft dates from 1516 or 1517, when he was asked for advice on the actions of an inquisitor who had reportedly burned

more than a hundred witches “in the subalpine valleys.” Many of them, wrote Alciato in book 8 of the *Parergon iuris* (On the Accessory of Jurisprudence; first edition, which includes book 8, dated 1544), “seemed to need cures based on hellebore rather than on fire” (“helleboro potius quam igne purgandae”: Alciati 1557–1558, 2:406). He conceded that some witches really had renounced God and killed infants by means of spells: The judge should sentence these women to death because their crimes had been committed “not in dreams.” But there were also women accused simply of having danced under a tree in the Valtelline (Valtellina, a valley in northern Lombardy) and having attended a Sabbat (“ludum”). Firmly skeptical on this point, Alciati rejected the opinion of the “most recent theologians” (from Thomas Aquinas to Silvestro Prierias and Gianfrancesco Pico della Mirandola), who thought that the Devil really transported witches to the Sabbat, while demons in their shape remained in bed with their husbands. Explicitly following the tenth-century *Canon Episcopi* and the “mainstream opinion of the jurists,” Alciati believed the Sabbat to be simply an illusion created by the witches’ deranged minds. These persons should be treated with peony (likely its seed), a remedy Pliny the Elder suggested for the mentally disturbed; but because they are all poor ordinary women (“pauperes et foemellae omnes sunt”; Alciati 1557–1558, 2:407), they lacked the means to be cured.

The author’s universal fame made this passage a strong argument for skeptics. Johann Weyer, in fact, quoted a long excerpt of it in his *De praestigiis daemonum* (On the Tricks of Devils, 1563) in support of more lenient treatment for women accused of witchcraft. An echo of Alciati can also be found in Michel de Montaigne’s *Essays* (1580), where the author recalled meeting a group of detained witches, to whom he would have “prescribed rather hellebore than hemlock” (Montaigne 1958, 792). Meanwhile, the advocates of persecution of witches sought to undermine the validity of Alciati’s statement. Jean Bodin, in his *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580), suggests that the Italian jurist’s skepticism on the reality of the Sabbat had been dictated by his displeasure with the excessiveness of an inquisitor in Piedmont. Martín Del Río, in his *Disquisitiones Magicae libris sex* (Six Books on Investigations into Magic, 1599), blames Alciati’s “wrong” ideas on the uncertainties still surrounding the issue of the Sabbat at the beginning of the century, and claims that not only the opinion of theologians, but also that of other learned men and the confession of the witches had since proved its reality.

Alciati also mentions witchcraft briefly in his *Commentaria* on papal decretals (1538), arguing that accusations of participation in the Sabbat should not suffice to condemn a witch, because the whole matter is the product of demonic illusions. On this point, his

ideas closely resembled those of Giovanni Francesco (Gianfrancesco) Ponzinibio, a contemporary fellow jurist who also stressed the illusory nature of such demonic gatherings, and claimed the superiority of canon and civil law against the pretensions of theology with respect to this issue.

ALLOTRIOPHAGY

The term *allotriophagy* refers to the practice, particularly common to girls and young women who claimed to be bewitched, of regurgitating a variety of objects, such as pins, nails, and feathers. Onlookers often were led to believe that witches with the connivance of the Devil had inserted these things into their bodies. Allotriophagy (oddly omitted from the *Oxford English Dictionary*) derives from Greek words meaning “to eat” and “strange.” Medical dictionaries define it as “a depraved appetite.”

The practice, which could strike awe into bystanders, illustrates the tendency of persons claiming to be bewitched to duplicate behavior that they had learned was associated with such a condition. Skeptics on occasion were able to expose frauds, but such exposures, of course, fell short of demonstrating conclusively that others displaying similar behavior were not authentically bewitched.

The first English exposure of trickery took place in 1574 when Agnes Briggs and Rachel Pinder, eleven and

twelve years old, were discovered inserting pins into their mouths and then claiming, when they spat the pins out, that they had been bewitched. They had to stand before the preacher at St. Paul's in London and acknowledge their deceit.

Thirty years later, in 1604, Anne Gunter sneezed, vomited, and voided pins, and pins were said to have exuded from her breasts and fingers. She was dispatched to the home of Henry Cotton, bishop of Salisbury. He marked the pins in his house, and later identified them as the ones that Anne vomited. She confessed the fraud. Edward Jordan, a physician who conveyed details of the ruse to King James I and thereby reinforced the king's emerging doubts about claims of bewitchment, had suspected her duplicity.

A variety of ingenious explanations were offered to explain allotriophagy. The sixteenth-century German physician Johann Weyer found no traces of hard or angular substances in the stomachs of those saying they were bewitched before they vomited such materials, nor any trace of food on what they regurgitated even if they had eaten recently. Weyer concluded that the Devil, with astonishing quickness so that the human eye could not follow his motions, placed the objects in the mouth of the bewitched person, who never actually swallowed them.

The highly credulous Peter Binsfeld, the suffragan bishop of Trier, declared in 1591 that the Devil put people to sleep, inserted objects through a hole he made in their body, and then closed the hole. Ignatius Lupo Da Bergamo, an Italian inquisitor writing in 1648, asserted that the Devil introduced such materials into a body as powder and then recomposed them as they were discharged.

In more recent times, the swallowing of an astounding variety of articles has been reported in cases of severe mental illness. A pathological swallower was found to have ingested 258 items, including a three-pound piece of metal, 26 keys, 3 sets of rosary beads, 16 religious medals, 9 nail files, and 88 assorted coins. Inmates in women's prisons also have been reported to engage in orgies of swallowing safety pins and pieces of glass as well as batteries and bedsprings.

Most episodes of allotriophagy said to be produced by witchcraft were probably bogus. Persons palmed or otherwise secreted the materials in their mouths and then regurgitated them. The act nonetheless had a powerful impact. In a famous 1696 Scottish case, eleven-year-old Christian Shaw displayed the wide array of behaviors associated with bewitching: rigidity, fits, delirium, pantomimes of fighting off invisible enemies, and a stomach that expanded and contracted like a pair of bellows. She spat out balls of hair of various colors which she said had been thrust down her throat by devilish assailants and vomited straw, cinders, coal, and hay. Based on Shaw's actions and testimony, six persons were burned to death for witchcraft while a sev-

enth was found hanged in jail, supposedly by the Devil.

Today, allotriophagy is often referred to as *pica*, a term derived from the Latin word for magpie, a bird known for its voracious and indiscriminate appetite. The primary emphasis is on the eating of strange substances, not their regurgitation. The syndrome is most commonly diagnosed in women, though both genders and all groups provide some cases. The cause of pica, medical texts note, is poorly understood, though the most common explanation links it to a deficiency of iron in the body. Zinc deficiencies, mental retardation, developmental delays, and genetic factors also have been blamed for pica.

ALSACE

Generally neglected by twentieth-century scholars, the history of witchcraft in Alsace remains very much a work in progress. Still 70 percent German-speaking, even though it has belonged to France for most of the time since the late seventeenth century, this region included many different governments during the age of major witch hunting in the Holy Roman Empire. Much of southern or Upper Alsace belonged to the Austrian Habsburgs, as did the large northern *Landvogtei* (district) of Hagenau in Lower Alsace. The prince-bishop of Strasbourg, who usually resided at Saverne, was a major landholder in the center. Alsace included many small autonomous fiefs, both noble and ecclesiastical, some of which conducted a hundred or more witchcraft trials. It also contained ten self-governing imperial free cities. Some of these cities, like Strasbourg, owned several rural villages, and all ten conducted some witchcraft trials; Strasbourg conducted trials in at least nine different years between 1630 and 1644.

In all probability, in Alsace there were many fewer witch burnings than in the German state of Baden-Württemberg, which lay directly across the Rhine;

nevertheless, witch hunting here had a long and gruesome history. Heinrich Kramer, the Alsatian-born author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), reported witch burnings here in the 1470s and 1480s, and there were scattered trials in the earlier sixteenth century. During the peak of witch hunting in western Europe, almost a thousand people were executed for witchcraft in Alsace between 1570, when burnings were recorded at Séléstat (Behringer 1995, 154), and the campaigns of the Thirty Years' War, which devastated much of Alsace in the 1630s. All major Alsatian governments recorded numerous witchcraft trials. The Austrian capital at Ensisheim, which supervised the large southern Sundgau region, recorded about 90 witch burnings in the half-century before 1622, while the northern Habsburg center at Hagenau saw almost as many (Reuss 1898, 106). The smaller southern *vogtei* (administrative jurisdictions) of Thann recorded 152 of them during the same period (Behringer 1995, 154).

Scattered evidence suggests that Upper Alsace and the thinly populated western mountains held more witchcraft trials than its northern parts; the eastern edge of the Vosges, from Saverne south to Thann, seems to have been badly afflicted, with some exceptionally heavy concentrations in the wine-growing regions between Obernai and Colmar. As in Baden-Württemberg, several of the worst Alsatian episodes seem to have happened between 1615 and 1630. Governments of various sizes were affected. At Saverne, capital of the prince-bishop of Strasbourg, 15 witches died in 1614–1615 and 19 more after 1628 (Reuss 1898, 107). In the nine villages of the Steinthal in the Vosges, ruled by the princely house of Veldenz, more than 80 witches were burned in the 1620s (Thurston 2001, 104–116). Farther south, the prince-abbot of Murbach burned 54 of his subjects in 1615, and another 17 witches died at nearby Guebwiller between then and 1623 (Reuss 1898, 106).

Individual villages in Upper Alsace burned sizable numbers of witches. At St. Hippolyte, a wine-growing village owned by the dukes of Lorraine, eighteen witches died between 1617 and 1622 (AD Nancy, B 8917–8918); the even smaller village of Gerstheim, near the Rhine, burned 19 of them in two months in 1630 (Reuss 1898, 106–107). Larger towns produced even larger numbers of witches, particularly during the 1620s; Hagenau, for example, burned 21 witches in three months in 1627. Two centers of Jesuit presence in Alsace, Séléstat, and Molsheim, compiled the province's worst records after 1620 (Klaits 1982, 156): the first convicted at least 90 witches between summer 1629 and February 1642; the second recorded more than 100 witchcraft trials in its "Blood-Book" (*Blutebuch*) between 1620 and 1625 (Schaeffli 1993).

After the Thirty Years' War ended and much of

Alsace came under French control, witchcraft trials resumed in some places. A valuable survey of witch hunting in Alsace after 1640 counts almost 100 people accused and 64 executed as witches, overwhelmingly in areas not under French control (Klaits 1982, 154–155). The two final large persecutions, in 1659 and 1671–1673, occurred in Protestant villages; the Protestant metropolis of Strasbourg sentenced a witch to death as late as 1660. Although Louis XIV, who then governed all of Alsace, had reputedly decriminalized witchcraft in 1682, his regional appellate court—created in 1658 and normally unconcerned with witchcraft—upheld and implemented a death sentence for witchcraft, while also reducing a second death sentence and releasing three other prisoners (Klaits 1982, 161–163).

AMSTERDAM

Very few people were ever executed for witchcraft in Amsterdam, and such trials had already ended here in the 1560s. All of them occurred when the municipal government was controlled by the so-called "sincere Catholic faction," which came to power after a group of Anabaptists had attacked Amsterdam's city hall in May 1535, hoping to turn the town into an annex of the New Jerusalem their coreligionists had founded a year earlier in the German town of Münster. Prior to this attack, some members of the governing oligarchy had shown sympathy for the Anabaptists. But because these oligarchs had failed to keep the Anabaptists under control, the central government in Brussels forced this group to leave office. The new magistrates were chosen because they claimed to be true Catholics.

In 1578, a Protestant faction replaced them when Amsterdam joined the revolt against King Philip II of Spain.

In December 1541, a woman named Engel Dirckdr was arrested on suspicion of witchcraft. The aldermen dispatched two members, Joost Buyck and his brother-in-law Sybrant Occo, to The Hague to ask advice of the court of Holland and Zeeland. Occo was well acquainted with modern demonology. As a law student, he had visited Ingolstadt in 1529, when several trials took place there and in nearby places. In Amsterdam, his father was the representative of the famous trading house of the Fuggers, who provided a steady stream of information about events throughout Europe. In 1526, Jacob Cornelisz van Oostsanen, an artist living next door to the Occo family and employed repeatedly by them, made a painting depicting Saul's visit to the witch of Endor, a work clearly influenced by the south-German artists Albrecht Dürer and Hans Baldung Grien.

The court in The Hague referred the two aldermen to the town magistrates of Utrecht, which sent two specialists to Amsterdam who successfully broke the defendant's will. On January 10, 1542, Engel Dirckdr was burned on Amsterdam's main square. A year later Amsterdam again employed one of these specialists to help interrogate a woman. In her case, the judges concluded that she was not a witch, but was guilty of counterwitchcraft, for which crime she was banished. They put the cunning man (a practitioner of beneficent magic) who had accused her in the pillory, had his tongue pierced, and banished him also.

A first cluster of trials occurred in 1555 when four women were executed. In February, a maidservant, Meyns Cornelisdr of Purmerend, was arrested. Her dossier is almost completely preserved. She told her interrogators that about twenty years earlier two cats had appeared to her and had danced round her paw in paw. Since then she had been harassed by specters and demons who threw her off the stairs and stole her savings. At one point the Devil had appeared to her in the form of a handsome young man wearing a velvet Spanish hat and a silver sword, asking her to become his lover and offering her money. When she refused, he attacked her and tore her clothing into pieces. He disappeared but returned after seven years, when he forced Meyns to accept him by cutting the sign of her confirmation out of her forehead. After the aldermen decided to torture her in order to discover whether she was not only the Devil's mistress but also a witch, she finally confessed witchcraft. She was sentenced to the stake and executed a few days later. That same year, a mother and her two daughters were also burned.

In the next nine years, only one trial took place. In 1560, a woman was banished; she had been accused of witchcraft, but had convinced the aldermen that she

had procured the magical utensils found in her house in order to ward off attacks from one of the witches who had been executed in 1555. The trials resumed in 1564, when international political problems blocked trade with the Baltic and England. Only one trial took place in Amsterdam, but at least three and probably five or more women were executed in a region directly north that was economically dependent upon Amsterdam. In the city, a delirious woman was arrested who had raved about the Devil during an attack of fever in the town hospital. She was arrested and confessed under torture that she had caused several shipwrecks and other calamities. One of the ships she reputedly destroyed belonged to her own brother. To do so she had flown with the devil to a large meeting of demons and other women that had taken place high in the air above a strait through which all ships to or from Amsterdam had to pass. Together they had raised a huge storm. Her execution was the last in Amsterdam; afterwards, all trials there ended in acquittals.

Six executions among a population numbering about 30,000 in the 1560s are not very many. Amsterdam's magistrates were anything but overzealous witch hunters. They did not show great zeal in suppressing heresy either; in this respect, even the "sincere Catholic faction" often neglected instructions from the central government in Brussels. The city magistrates found it difficult to prosecute religious dissenters from their own communities as long as these fellow citizens caused no public trouble. In matters of witchcraft, the Catholic faction had its own reasons for caution: Twice, their political opponents had used witchcraft accusations to weaken their position. In 1547, Marie Holleslooten was accused by a cunning man named Jacob de Rosa, who acted at the instigation of a man belonging to the faction that had been driven from power ten years earlier. Marie's two sons and her son-in-law Sybrant Occo were prominent members of the ruling Catholic faction. Of course, she was never indicted and even managed to get De Rosa convicted despite his flight. In 1548 he was caught in the province of Gelderland, and at the request of Marie Holleslooten, the provincial court sentenced him to be flogged and banished.

Almost two decades later, Marie's daughter Jacoba Bam was accused. Members of the city council sympathizing with the rapidly spreading Calvinist movement orchestrated the charges. In 1566 a large number of children from the Amsterdam orphanage were possessed by demons. The orphans repeatedly divulged secret decisions of the city council. Presumably they received their information from members of the city council who wanted to undermine the ruling oligarchy. The orphans also did all sorts of things that were thought to be impossible for normal human beings. Finally they climbed up the bell tower of the city's main church and shouted that they would come down only

after Jacoba Bam had been burned at the stake. Of course the magistrates did not comply with their demand and declared that Jacoba was innocent. They did arrest another woman, who was released when she refused to confess despite undergoing torture. The orphans were then separated from each other and lodged with private families, after which the tumult ended. Both incidents taught Amsterdam's "sincere Catholic" magistrates that witchcraft accusations could be turned against them.

After 1578, Amsterdam officially became a Calvinist city, but its magistrates soon allowed freedom of worship not only to other Protestant denominations but also to Jews and Catholics, who were only expected to be discreet. Priests who exorcised bewitched or possessed people in private remained untroubled. The fear of witchcraft did not disappear among the population, but only rarely did it lead to public incidents like the lynching that occurred in 1624, when a group of young men used a tax riot to drag a reputed witch out of her home and throw her into one of Amsterdam's many canals, then prevented attempts to rescue her and kept her under water until she drowned. Cunning folk could, however, still be prosecuted, and occasionally one of them was put in the pillory and banished. In this regard there was little difference between the Calvinist magistrates and their pre-Reformation predecessors.

AMULET AND TALISMAN

The terms *amulet* and *talisman* are roughly synonymous, and the basic definition can be simply stated: an object, or group of objects, natural or manufactured, with magical powers, usually protective. Amulets and talismans are related to witchcraft in that they may be created, activated, or sold by witches, or used by witches in rituals. Possession of amulets could therefore be incriminating in witchcraft trials.

The English word *amulet* derives from Latin *amule-tum*, which denoted a variety of protective magical objects (see, for example, Pliny's *Natural History*, 29.26 and 30.24, respectively, for apotropaic bat and dog's gall as antidotes to poison). The word *talisman* was unknown in classical literature but is thought to have been used first in Spanish (the usual etymology is Arabic *ṭilsam*, from late Greek *telesma*, an initiation, a

consecrated object). In most European languages, both terms have commonly been used interchangeably both in popular and scholarly literature. Attempts to establish a distinction (e.g., an amulet is a protective talisman worn somewhere on the body; or an amulet is an object with inherent magical powers, whereas a talisman is an object that has been endowed with magic power by some magical or demonic process or ritual; or a talisman is an amulet bearing a magical inscription) have not met with general agreement. In common usage, the word *charm* (from Latin *carmen*, "incantation"), which originally meant "incantation," may be used in the sense of "amulet."

The lack of a precise definition is old. A contemporary French translation of Andrea Alciati's Latin emblem book (*Emblemata*, 1531) gave "contre-poison de Venus" (i.e., "counterpoison," or antidote), for "amuletum Veneris" in the original. Some writers, such as the German Jesuit and scholar Athanasius Kircher in

Amulets and talismans are objects with magical powers, and they provide protection against harmful magic, witchcraft, disease, the evil eye, demons, and fairies. (TopFoto.co.uk)

the seventeenth century, have used the word *amuletum* for an artifact such as a ring, seal, or gem that bears an inscribed or engraved sigil (a magical inscription or character, such as a pentagram or astrological figure), or an inscription or figure inscribed in a manuscript (e.g., in *grimoires*—magicians’ manuals for invoking demons—and other books of learned magic). These are, however, more commonly called talismans, especially if employed for a malefic purpose.

The belief that objects can have magical powers of attraction, repulsion, protection (especially from diseases, malefic magic, demons, fairies, witches, or the evil eye), healing, and conferring great strength, wisdom, wealth, invisibility, or success and general good luck, is probably common to all cultures, and ranges from folkloric to high magic, as the object involved ranges from a simple root to an elaborate and costly engraved gem. Such objects may be worn or placed near the person or location for which protection is desired (houses, fields, cradles), or they may form part of a magic ritual. Amulets, which are natural objects, draw their power either from the special conditions under which they are collected (e.g., at midnight, midsummer, in a cemetery) or from rituals (e.g., in Christian communities, by secreting them on a church altar). Commonly, amulets are thought to derive their power from a blessing by a cleric, or a spell by a witch, or by demonic assistance. In many cases the imagined effect of the amulet depends on the association of ideas (magnets attract, locks hold fast, keys open, knots cause impotence, teeth protect from toothache, cowrie shells and stones with holes resemble genitalia and are recorded both as fertility charms and as protection against the evil eye and witches). Amulets are often worn around the neck, sometimes more than one together, possibly sealed in a small bag; some may be worn on the head or arm.

The objects to which amuletic or talismanic powers may be attributed cover a wide range; the most common objects fall into certain basic categories. Widely used are minerals, such as gemstones (for which there is a very long history of supposed amuletic virtues), crystals, stones with natural holes and curiously shaped stones, coal, magnetite, meteorite, quicksilver, fossils, and graveyard dust. Animal amulets may be whole animals (e.g., toads, bats, snakes), eagle talons and bear’s claws, cowrie shells, pearls, coral, fish, wolves’ teeth, narwhal (“unicorn”) horns, bones, cauls, and parts of human bodies taken from graveyards. The most common vegetable amulets are various plants and roots with supposed magical properties, such as the nine or twelve herbs gathered on St. John’s Day, and amber.

Artifact amulets include knots, nets, red threads, belts and girdles (especially for pregnant women), keys, locks, knives, spoons, bells, coins, iron nails, horseshoes, scarabs, engraved gems, rings and seals (with or

without inscriptions or figures), and mirrors. This category includes items of religious practice: crosses, relics, medallions, icons, incense, church candle wax, blessed water, pendants such as the Hamsa or “hand of Fatima” (daughter of the Prophet Mohammed)—an amulet with an incised shape of a hand, with an eye in the middle, widely used in the Middle East and North Africa as protection from the evil eye, now much promoted in the West by jewelers and traders in “magical” goods—blue beads, and miniature figures of all kinds attached to neck pendants or charm bracelets.

Amulets may also be texts: prayers, apocryphal works such as the *Sunday Letter*—also known as the *Letter from Heaven* or the *Jerusalem Scroll* (Ryan 1999, 300–301), quotations from the Bible or Koran, diminishing spells such as ABRACADABRA, the SATOR/AREPO magic square, charms, or medical formulas, which may be worn, or eaten if written on paper or on foodstuffs such as bread or apples.

The commercial production of amulets and trading in them, widespread in the early twenty-first century, has a history going back to classical antiquity at least; for example, Egyptian scarabs have been found in medieval grave goods in Scandinavia and northern and eastern Russia.

In the West, the wearing or other use of amulets has been regularly condemned as a harmful superstition from ancient Roman law to Christian canon law (both Catholic and Orthodox). It is also forbidden in Islam and Judaism, but is just as prevalent in communities practicing those religions as it is in the Christian or pagan worlds. In the period of the European witchcraft trials, this condemnation was important. Because the possession of items that were, or could be, seen as amulets was probably almost universal, anyone making an accusation of witchcraft did not have to look far to find some supporting evidence.

ANABAPTISTS

Anabaptists, members of the most radical of the sixteenth-century reformation movements, rejected fully the Catholic sacramental system, and were mercilessly persecuted until the revival of major witch hunting around 1560. Arising in 1525–1526 out of the movements of social protest and religious reform of the early Reformation that also sparked the German Peasants' War of 1524–1525, Anabaptists initially hoped to reform society in complete conformity to the gospels, insisting especially on baptizing adults instead of infants. Many described pedobaptism as a baptism in the Devil's name. In 1529, the imperial Diet of Speyer declared rebaptism a capital crime, making conviction of suspected Anabaptists much easier.

The Anabaptist movement's presumed association with rebellion seemed confirmed by the Anabaptist Kingdom of Münster, Westphalia (1533–1535), which not only defended itself by force of arms, but also adopted community of goods and eventually polygamy. After Münster's fall in June 1535, almost all Anabaptists, including Mennonites, Swiss Brethren, and Hutterites, openly rejected any form of political activity and violence. Even so, the supposed connection between heresy, sedition, and sexual license led many authorities, including Emperor Charles V, to secularize heresy trials and hunt Anabaptists down as threats to public order, thereby setting important precedents for subsequent witch hunts.

PERSECUTION OF ANABAPTISTS AS A PRECURSOR TO THE WITCH HUNTS

It is estimated that over 2,000 Anabaptists were executed across Europe between 1525 and the 1560s, many of them burned at the stake. Catholic princes proved the harshest persecutors; most Protestant princes and magistrates preferred exile to executions for recalcitrant Anabaptists, although Zwinglian Bern and Lutheran Saxony proved exceptions in this regard. These waves of persecution nearly eliminated Anabaptism in several regions, although some groups survived by going underground or finding refuge in more tolerant regions such as Moravia. The worst persecution in the Holy Roman Empire and Switzerland occurred in the 1520s and 1530s, while the Habsburg government of the Netherlands continued its program of bloody suppression much longer, executing hundreds of Anabaptists well after mid-century. With the start of the war of independence against Spanish dominance (ca. 1566), those provinces and cities siding

with the Dutch Republic immediately ended heresy persecution, although the southern provinces, which remained largely in Spanish hands, continued to execute Anabaptists, along with other religious dissidents, into the 1590s, when witch hunting became fashionable. Other regions ceased serious persecution of Anabaptists around the time that they began hunting witches.

Meanwhile, revived concerns about secretive, nocturnal gatherings of Anabaptists in the 1550s and 1560s may have contributed to fears of conspiratorial witch Sabbats. In the County of Wiesensteig, the first major Reformation era witch hunt in 1562 was immediately preceded by the discovery of a large, nocturnal forest meeting of Anabaptists in neighboring Württemberg. In this respect, Anabaptists and witches shared a common fate, acting as scapegoats for the punishment that God seemed to be meting out to Europeans for their sins. In the Anabaptists, the authorities found heretics who openly rejected their original baptism, who met at night in fields or woods, and who seemed to allow women considerable religious authority. There was some projection of beliefs about Anabaptists onto witches, particularly with respect to the connections between heresy and sedition, nocturnal meetings of heretics, and the rejection of "Christian" baptism. After the growth of Anabaptism, diabolical rebaptism became a much more prominent element of witch confessions, and the concept of the witches' Sabbat generally became more believable. Many writers, in fact, viewed the rise of Anabaptism and other reform heresies as precursors of diabolical witchcraft, which was seen as the Devil's final, apocalyptic assault on Christendom.

ANABAPTIST ATTITUDES TOWARD WITCHCRAFT

Prior to the crushing of the Anabaptist Kingdom of Münster in 1535, many Anabaptists cultivated an intense apocalypticism and paid attention to visions and wondrous signs, while simultaneously condemning Catholic devotion to saints and sacramentals (such as holy water) as superstitions, describing the consecrated Host as mere baker's bread and pedobaptism as a Devil's bath. After the deeply disillusioning destruction of their New Jerusalem, however, most Anabaptists renounced the visionary aspects of their past and became intensely wary of ecstatic forms of religious experience, preferring instead a strict biblicism.

Having suffered horribly at the hands of the authorities as supposed agents of the Devil, Anabaptists became understandably skeptical of efforts to revive fears of diabolical conspiracies and witchcraft. In keeping with their intense anticlericalism, Anabaptists characterized Catholic priests and Lutheran pastors as the true sorcerers, and they understandably viewed the

state church and governmental authorities who persecuted them as the ones in league with Satan. Their rejection of transubstantiation and of Catholic ritual as magical nonsense led them to associate belief in diabolical witchcraft with Catholicism.

When witch hunting became popular again after 1560, no known Anabaptists published works supporting the activity, and a few spoke out against it. Most Anabaptists simply ignored the event, seeing it as merely one more oppressive effort of state churches to enforce conformity of belief and practice. A few attacked belief in diabolical witchcraft indirectly, by sharply reducing the importance of the Devil in their theology at a time when other Protestant and Catholic theologians were increasing it. In this way, Dutch spiritualists and Mennonites became the most important Anabaptist critics of witch persecution. As early as 1540, the spiritualistic Anabaptist David Joris had diminished the Devil to little more than the inner vices of individuals and was already condemning fears of witchcraft and the Devil. Menno Simons (ca. 1496–1561) wrote little on the subject, although he too minimized the Devil's power, emphasized human responsibility for evil, and condemned infant baptism as an anti-Christian ritual and "bewitching sin."

Anabaptists elsewhere in Europe, however, have left few hints of their opinions about witchcraft. This is not surprising, for their main concern was to survive as a godly remnant in a hostile and persecuting society. If nothing else, the authorities' fixation after 1560 on witches provided Anabaptists with some relief from the severe persecution that marked their early history.

ANGELS

Throughout the history of religion there has been a belief in spiritual beings or powers linking our world to some transcendent realm. In the Western world, spiritual beings of this kind that are seen as good are called angels, while those that seem evil are known as demons or devils. Although it may seem paradoxical, testimonies and confessions given at the time of the great witch hunts sometimes contain references to the presence of angels, in addition to witches and Devils, at the witches' Sabbat. Naturally, at that time, the presence of heavenly beings could be explained as a trick of the Devil. Given, however, the principle of contrariety that characterized the conception of the world—that is, the belief that good and evil presuppose one another—it is perhaps not entirely surprising that angels appear in these stories.

The Guardian Angel, by Pietro da Cortona. In the West, good spiritual beings, angels, stand in opposition to evil spiritual beings, demons. People supposedly had guardian angels and guardian demons (sometimes known as familiars). Authorities often had difficulty discerning between the two. (Araldo de Luca/Corbis)

The word *angel* derives from the Greek word for “messenger.” Therefore, it relates more to the function fulfilled by the spirit than to the nature or essence of the spirit: what angels do is more important than what they are. In the Jewish and Christian traditions, their primary function has always been seen as performing God’s will and also as enabling human beings to establish contact with him. Furthermore, they can assist human beings through special favors and services. Executing the divine will sometimes means that they intervene in the lives of humans to reward, punish, or save them. Many angels are believed to act as guardians to entire nations or to individuals, particularly children. They also guide the souls of the deceased on their journey to the afterworld. Their presence emphasizes the importance of remarkable events, and they proclaim great news, such as the birth of people of great significance.

Although the function that angels fulfil has been of primary importance, a great deal of attention has also been paid to their characteristics. Regarding their appearance, the dominating picture has been of a figure with human features and with wings, which symbolize the angels’ heavenly nature. The Bible describes different sorts or categories of angel, such as archangels, cherubim, and seraphim. Beside those, angel-like beings are found in various other shapes in folklore, for example, as nature spirits such as fairies.

In the early modern period, theoretical discussions regarding angels and their relationship to witchcraft were usually part of more general discussions of all things heavenly or demonic and the difficulty involved in correctly distinguishing between different categories of spirits. We also find occasional references to angels in trial records. In the 1590 case against Anna Absalons, at Bergen in Norway, her maid testified that her mistress rode on her servant’s back to a meeting of witches. The meeting dispersed when a man in white appeared and struck the group of witches with his staff, declaring that God had not given permission for such a meeting (Alver 1971, 97; Levack 1995, 208–209). This angelic figure appears somewhat unexpectedly in the story.

However, other cases from the same time establish even clearer connections between the accused and “angels” and help explain why angels could sometimes be found at the witches’ Sabbath. Men and women with special spiritual gifts and abilities that they used for healing were believed to be in close communication with angel-like spirits. Chonrad Stoeckhlin, a shepherd from the Bavarian Alps, claimed in 1587 to be accompanied by a guardian angel on his spiritual journeys (Behringer 1998, 17). In northeastern Italy, people known as *benandanti* (do-gooders, who were often healers) claimed in 1580 that angels summoned them and that their souls then went out to combat witches. In 1580 Paolo Gasparutto gave an account of a shining golden figure that had appeared to him during the

night and commanded him to go out as a *benandante* (Ginzburg 1985, 9).

The clearest references to angels are found later, in the large-scale witchcraft trials in Sweden in 1668–1676, centered in the village of Mora. Some scholars believe that these persecutions were based on distortions by the authorities of a religious revival movement. The accounts are full of religious references similar to those found in Christian visions and legends. Blåkulla, the place where the witches met for their Sabbath, is not portrayed in a totally negative manner; the overriding first impression is of a merry peasant feast. Only after the children confessed in court that they had been forcibly abducted to Blåkulla did their stories emphasize the negative aspects of the experience. They explained that, fortunately, there were angels standing by to save them when the horror reached its culmination. The children were then rescued and taken to the safety of the angels’ chamber, and sometimes even delivered to their homes by these beings. In the security of the angels’ chamber, the children sang hymns and said their prayers in a proper, God-fearing manner. However, these heavenly beings are by no means homogenous. Sometimes, they refer to “the white man,” and there are even a few references to black angels. The children also claimed to have been protected by white birds, lambs, and other children. Occasionally, the children even met God, Jesus (who appeared as a fifteen-year-old youth), or deceased relatives.

Throughout sixteenth- and seventeenth-century Europe, these stories of angels met with skepticism from both lawyers and clerics. In the sixteenth century, Stoeckhlin was burned, and the *benandanti* came to be seen as witches. Swedish authorities found it strange that angels protected children from eating unsuitable food at the Sabbath, but not from fornication with devils. The food that the children were offered was really transformed abominations such as reptiles or excrement, but the children always discovered this in time, thanks to angels who appeared at the right moment to prevent them from tasting the food. Certain features in the appearance of some angels were also suspicious. They wore “linen clothing, short jackets and tight, short breeches; others were clad in long white robes and bore white hats with black brims.” Moreover, they had “claws on their feet, hairy knees and also claws on their hands” (Sörlin 1997, 137). These latter features were reminiscent of Satan’s practice of appearing as a heavenly angel in order to seduce careless people.

The Lutheran authorities concluded that the angels who had “helped” the children were in fact demons. The official explanation of witchcraft was that God had given Satan a free rein in retribution for the sins of the people. It was thus the duty of Christian leaders to employ all possible measures to avert God’s wrath and avoid further satanic visitations. Through the efforts of the authorities, Satan would be routed, the witches

would be justly punished, and the children saved. The children saw it differently. They had not been abducted to Blåkulla to be saved by angels, but to save others. They claimed that the angels had commanded them to denounce the witches. God had allowed the children to be abducted in such large numbers in order to increase their credibility in their task of witnessing against the adults who flew to Blåkulla. Moreover, the children claimed that, should the authorities neglect to make a serious investigation and mete out punishment, great hunger and famine would ravage the land.

Introducing angels was, however, not a particularly dramatic addition if one considers the sort of place Blåkulla was. In his autobiography, Bishop Jesper Svedberg (1653–1735), the father of Emanuel Swedenborg, tells of a dream that he had as a thirteen-year-old (in 1666), a dream with a setting that was strikingly familiar. He thought that he was in a beautiful open place. There he saw a house with two rooms, joined by a little hall where Jesus was standing dividing up the souls of the dead into the blessed, who passed through the door on the right, and the damned, who were shown to the door on the left. Svedberg was shown both rooms. The room on the left was reminiscent of Blåkulla after the children confessed in court and its true, dark nature emerged. The room to the right was similar to the angels' chamber. It was light, shining white, and filled with people praising the Almighty in the highest. Blåkulla and the angels' chamber seem to represent places to which the souls of the dead make their journey. Thus the children who introduced angels into their Sabbath stories were simply opening the door on the right to the angels' chamber. A skeptical account from this time tells, with Protestant irony, how people who had been dead for many years were seen in both the white room and in the cauldron in the great hall of Blåkulla, "so now the locations of both Purgatory and Hell have been found, which must interest each and every curious person" ("On the White Angels at Blåkulla," anonymous, quoted in Sörlin 1997, 147)

ANHORN, BARTHOLOMÄUS (1616–1700)

A late Swiss defender of the belief in the reality of witchcraft, Anhorn published a voluminous work about many different aspects of magic, called *Magiologia*, at Basel in 1674.

Anhorn was born on January 16, 1616, in Fläsch, a small village in Graubünden (or Grisons), the son of the local minister of the Reformed Church. His grandfather, Bartholomäus Anhorn the Elder, was a reformer, a historian, and a minister.

In 1632, Bartholomäus the Younger completed his studies in Basel, which he had begun in Zürich four years before. In 1634, at the age of eighteen, he became minister of Grüşch and Seewis in the valley of Prättigau. Soon afterwards he moved to the parish of Hundwil (Appenzell-Ausserrhoden). From 1637 to 1649 Bartholomäus worked as a pastor in the city of St. Gallen, where he was soon granted citizenship. He was promoted to city minister in 1638.

After encountering some problems in St. Gallen, Anhorn moved to the German Palatinate in 1649. Eleven years later he tried unsuccessfully to return to St. Gallen. Finally, in 1661 he was granted the parish of Bischofszell in Thurgau, where he wrote, following the publication of several other works, his most important book. Anhorn's *Magiologia* is subtitled *Christliche Warnung für dem Aberglauben und der Zauberey* (A Christian Warning Against Superstition and Sorcery). In the following years he published numerous further writings, mainly sermons for funerals and other occasions, as well as works on ecclesiastical history. Anhorn's writings not only offer proof of his wide reading and enormous erudition, but also reveal his tendency toward distortion and spitefulness.

Although Anhorn was elected in 1676 to a higher regional ecclesiastical office, he had to leave the mixed confessional city of Bischofszell two years later under pressure from Roman Catholic episcopal officials, who condemned him for acting too aggressively and polemically against the town's Roman Catholics. Thereupon, Anhorn moved to Elsau (east of Winterthur), where the octogenarian finally died on July 6, 1700. He had traveled to Holland and England, and three wives had borne him thirteen children.

Anhorn's *Magiologia*, printed at Basel by Johann Heinrich Meyer in 1674, comprised about 1,200 pages, including the register. The author understood his book as an antidote to contemporary society, which he saw as dominated on one hand by atheism and Machiavellianism and by superstition and sorcery on the other hand. Reacting to his disapproval of atheism, Anhorn tried to defend the belief in the effectiveness of magic and witchcraft against skeptics. In this context, he opposed their

reports of experiences. For Anhorn it was quite out of the question to understand witch flights only as an illusion; he was convinced of the real physical movement of witches through the air, guided by the Devil. In such matters, as well as in the case of witches' Sabbats, his position was based on confessions made during witchcraft trials and on the doctrines of theologians, jurists, and physicians.

Concerning witchcraft trials, Anhorn rejected various practices that he considered superstitious, such as water tests, cutting off all hair, or judging someone to be a witch on the basis of inability to shed tears. The fact that someone was denounced as a participant in Sabbats was not sufficient evidence to him, because the Devil could assume the shape of innocent people. He encouraged judges to resort to preaching as the best way to make the criminals confess, but he also recommended torture. However, he demanded caution here too, because torture could also overcome innocent people due to their physical condition. Nevertheless, torture was effective in discovering truths that would otherwise remain hidden. With torture, however, it was necessary to proceed very carefully and to have sufficient other evidence of the crime. For the correct use of torture and correct legal procedure, Anhorn referred his readers to the Saxon jurist Benedict Carpzov, a supporter of extremely rigid procedures against witches. Like Carpzov, Anhorn regarded a pact with the Devil as a crime to be punished by death, even if the accused had not caused physical damage through sorcery, and he ignored objections that witches were weak old women, unable to defend themselves against the seduction of the Devil, or suffering from melancholy illusions and therefore not to be held responsible.

ANIMALS

The roles of animals in sorcery and witchcraft beliefs are extremely varied. Sometimes demons take the shape of animals, sometimes the witches and sorcerers have the alleged ability to transform either themselves or their souls into animals. Furthermore, animals played a very important part in witchcraft accusations. Witches were often tried for allegedly having bewitched domestic animals such as cows, poultry, pigs, and geese. Casting a disease on cows and stealing their milk were frequent accusations. England and Scotland invented the concept of a demon in animal shape, the familiar, a sort of assistant. The popular books about an apprentice sorcerer, J. K. Rowling's *Harry Potter* and its sequels, obviously included this concept.

FAMILIARS

The terms *familiar*, *familiar spirit*, and *imp* reflect an almost exclusively English contribution to the theory of

witchcraft. Continental handbooks rarely discussed the concept; for example, Heinrich Kramer's infamous *Malleus Maleficarum* (The Hammer of Witches, 1486) offers no instructions concerning familiars for judges interrogating witches.

The belief was that the Devil, having made a pact with the witch, gave her a low-ranking demon in the shape of a small domestic animal to advise her and perform for the most part small malicious errands—though some errands included murder. A witch might also inherit a familiar from another witch. The little creature was in constant attendance on its mistress (male witches rarely kept familiars), who was responsible for its care and feeding. The animal servant must therefore be distinguished from the occasional visitations of the Devil in the guise of a small animal, such as a dog, cat, goat, or owl.

Reginald Scot in his *Discoverie of Witchcraft* (1584) first used the term *familiar* in this restricted sense. From that time on, English reports were packed with imps (apparently seen as the evil equivalent of guardian angels) to explain and illustrate the presence of supposedly diabolical creatures found in houses or farms to assist the witch in performing *maleficium* (harmful magic). The witchcraft statute of 1604 made it a felony to have a familiar. This obsession with familiars remained mostly confined to England and Scotland, where they are mentioned in numerous trial records, especially those related to Matthew Hopkins, England's great seventeenth-century witch hunter. A witch could have several familiars; Elizabeth Clark, Hopkins's first victim, confessed to having five of them. Familiars followed English colonists overseas, and one finds them in early American witchcraft trials. Outside of witchcraft trials, more benevolent familiars served English "cunning folk," the village wise men and women who were magicians or healers. These familiars helped diagnose illnesses and the sources of bewitchment and also helped to find lost objects and treasures. Magicians conjured them in rituals, then locked them in bottles, rings, and stones. The famous magical thinker Heinrich Cornelius Agrippa von Nettesheim was even rumored to keep a familiar in the shape of a black dog.

METAMORPHOSIS

Since ancient times, witches, sorcerers, and magicians have been believed to transform themselves and other humans at will into animals, birds, and even insects. The concept of metamorphosis, to give this kind of transformation its technical name, was accepted in antiquity. The following well-known examples all have important applications for later European witchcraft. The sorceress Circe transformed Odysseus's companions into pigs. In Arthurian legend, both the sorceress Morgana, King Arthur's sister, and the famous magician Merlin were able to transform their enemies into animals. Two millennia later, some European witches

were believed to do the same. In Hungarian witchcraft accusations, the witch's victims were turned into horses and bridled, or struck with a bridle, a narrative element favored in folk legends.

Apuleius of Madaura's widely read *Golden Ass* illustrated some important details of the night-flight (*transvection*) concept. The sorceress anointed herself with a magic salve and transformed into an owl. The curious protagonist Lucius, who was watching the spectacle, was eager to experience the same metamorphosis, but used the wrong ointment and changed into an ass. Apuleius himself was subsequently charged with sorcery. His notion of night flight reappeared in the tenth-century *Canon Episcopi*: Women riding on certain beasts reputedly traversed great distances under the leadership of the heathen goddess Diana. The belief in night flights, with the participants either riding on animals or transformed into animals, was rejected as superstitious at that time, but afterwards it was often reported, in confessions and by witnesses, that witches smeared themselves with certain ointments to become cats or other animals before flying to the Sabbat. Transvection became integrated into the full-fledged witchcraft concept by the fifteenth century, and those witches who used hallucinogenic drugs surely believed in the flight, if not in the transformation.

In his *Eclogue* 8.64-109, Virgil mentioned herbs with which he claimed to have seen someone transform himself into a wolf. In the age of European witchcraft trials, transformation into a wolf became the most feared type of metamorphosis. Man-eating wolves that terrorized villages reinforced links between werewolves and witch beliefs.

During the early modern period, it was sometimes believed that witches transformed themselves into beasts in order to torment their victims. It was not uncommon to find witnesses testifying that accused witches had appeared before them in animal form, transforming themselves not only in order to torment their victims, but also to escape captors. In various trial accounts, witches were alleged to appear in the guise of almost all small animals and birds. This transformation was believed to serve the practical purpose of allowing the witch-animal to crawl unseen into a room; behind this belief lurks the ancient concept of the soul wandering about in the shape of a small animal, a bird, a butterfly, or a snake. Often witches became pigs, or despised black or three-legged animals; but one also finds a witch described as becoming a bear, bee, goat, lizard, duck, owl, fly, fox, goose, hen, dog, cat, beetle, raven, toad, cow, mouse, rat, moth, horse, seal, spider, wolf, wasp, or weasel. Riding on a human being in animal form was another characteristic element in European witch beliefs and remained one of the most typical motifs of witch legends.

The most common transformations were into cats, dogs, and hares. Isobel Grierson was burned at

Edinburgh in 1607 for entering a house in the form of a cat, a common allegation in Scottish trials. Cats hold a very important place in sorcery, principally black cats, which were, and still are, regarded as demons incarnate or transformed witches. It is on this latter count that in recent centuries peasants all over Europe slaughtered black cats, in order to destroy the witches they accused of having bewitched them.

Despite the folk belief in the ability of transformation, demonologists disagreed on the topic. Jean Bodin and Joseph Glanvill accepted metamorphosis, whereas Heinrich Kramer and many subsequent demonologists (including almost all Protestant authors) followed St. Augustine's concept that they were demonic illusions.

SHAMANISM AND WITCHES' ANIMAL DOUBLES

In shamanism and individual totemism, the notion of metamorphosis, or shape shifting, is essential. Shamans are held to be able to transform themselves into their guardians, which are often animal spirits. The transformation is generally believed to be a spiritual one, rather than an actual physical transformation, although something close to a physical transformation is suggested by the fact that stories are told of shamans who are actually killed or wounded while lying in trance when the animals to which they have transformed themselves are killed or wounded. The life of the animal is bound to the life of the shaman, just as the life of the animal who is a guardian spirit is bound to the life of the shaman. This concept of the guardian spirit is strongly tied to shamanistic initiation, and transformation into the so-called animal-mother is reached by employing some ecstatic technique (Buddruss 1987, 45-78; Paulson 1968, 138).

In most regions of the witchcraft trials of early modern Europe, the most significant variations of the physical or spiritual alter egos of witches were a variety of animal shapes. The "proof" that an animal was more than a mere cat, or whatever shape the witch took, was that the same injuries inflicted on the animal's body reappeared on its human counterpart, providing another parallel with the concept of a totemistic guardian animal. Some sources maintained that, during executions, flames could not touch the witch as she attempted to escape in the form of a toad, her alter ego. However, when the toad was killed, the flames would destroy the witch. (Observed in Styrian witchcraft trials; Byloff 1929, 119-121.)

A rich variety of "witch animals" were reported to occur throughout Europe, Africa, and Asia, with many regional differences and varying prevalence among animal types. The belief in a guiding and helping animal of diabolical character has permeated both the writings of the educated who have believed in witchcraft and

shamanism and seen the hand of the Devil in them and popular belief from medieval times until now.

ANIMISTIC AND MAGICAL THINKING

Popular beliefs about witchcraft reflect many of the ideas found in the religions of nonliterate peoples. These popular beliefs are characterized by a dualistic worldview, in which everything in the material world has its double in a nonmaterial soul world. Accordingly, the soul of a witch could travel around, leaving the body behind like an empty shell, and when the witches on their out-of-body expeditions "ate" flesh of their victims, it was not their actual flesh but the "soul" of their flesh; however, this form of eating sufficed to make their victims sicken and die. A similar concept lay

behind the narratives told about sixteenth-century Italian witches, of animals being eaten and later restored from their bones and skins, just like the goats drawing the cart of the god Thor, which frequently were eaten and afterward restored from skin and bones (Bertolotti 1979). Such ideas contain an element of shamanism; but because witches used no shamanistic techniques to prepare themselves for their soul journeys, it seems preferable to call it *animistic thinking*—without the context of a belief in the evolution of religion in which the nineteenth-century anthropologist Edward B. Tylor elaborated the term *animism*, designating a "primitive" stage of religion with belief in spirits inhabiting the surrounding world of natural objects and phenomena (Lessa and Vogt 1958, 11–13).

Another fundamental concept was the witch's power, which was seen as at once her strength and her weakness. If a cow had been bewitched so that its milk had become full of blood, the traditional remedy was to boil some of the bloody milk and then spill it over the red-hot hearth. The guilty person would then be scalded all over her body. Or one could take some of the spoiled milk and sprinkle it over an anthill: The ants would then go and torment the witch terribly. Behind both cases lay the idea that the victim was permeated with the witch's power, and what harmed the victim could be made to backfire on the witch. This power or force had no name but was closely associated with "envy," which in popular tradition was not just a bad feeling but a dangerous magical force that acted involuntarily; one must never get into a state where one felt envy. On the other hand, "luck" was not an abstract concept in popular tradition; it was something concrete. Depending on whether people had luck with their horses, sheep, pigs, geese, or corn or milk production, they were said to have "horse luck," "sheep luck," "pig luck," "goose luck," "corn luck," or "good milking." In Danish dialects, words meaning "benefit," "crops," or "the good" were used synonymously with "luck," and in a witchcraft trial from 1670 a smallholder's wife was accused of taking "the good" from her neighbors' milk, with the result that the milk, even at the best season of the year, was so bad that not even pigs would drink it.

Luck was furthermore a finite asset, or "limited good." In the trial of a cunning woman (a practitioner of beneficent magic) from Jutland in 1610 it was stated that she "swept luck from one to another," and therefore bore the nickname "Anne Sweeping-woman" (Henningesen 1991, 20). Interestingly, Ireland's first recorded witch, Alice Kyteler, in 1324 "swept the streets of Kilkennie" around twilight, "raking all the filth toward the doore of her sonne William Outlaw, murmuring to herself, 'To the house of William my sonne / Hie all the wealth of Kilkennie towne'" (Davidson and Ward 1993, 81–82). Around 1680, a rich ship owner in

the Jutland town of Ebeltoft was said to have “seven men’s luck,” which explained why there were so many poor people in the town (Henningsen 1991, 20). Misfortune and accidents were often explained as the loss of one or several of the above-mentioned kinds of luck, which had been taken away by the witchcraft of envious people. Archaic beliefs of this sort, more in agreement with the religions of nonliterate people than with the rationality of early modern European intellectuals, continued to exist in popular culture into the twentieth century.

ANTHROPOLOGY

The treatment of witchcraft commonly ranks among the most successful accomplishments of the functionalist school of British social anthropology, founded by Bronislaw Malinowski but achieving its richest formulation under the guidance of Edward Evans-Pritchard and Meyer Fortes. This approach argued that most aspects of social life helped to maintain the social group. The practice of witchcraft, then—or more precisely, a society’s acceptance that individuals practiced malevolent magic and could be accused and punished for doing so—had to be understood, from this perspective, as an activity that helped the group function more effectively.

The work that came out of this school (Middleton and Winter 1963; Middleton 1967; Marwick 1970; Douglas 1970) suggested that the cultural system of witchcraft accusation works as a “social strain gauge,” as Marwick put it. In the societies these anthropologists studied (usually African), people were more likely to accuse other people of being witches when their relationships became socially strained, although they did so only if they had experienced some misfortune, like death or illness, that could be attributed to witchcraft. These accusations helped to make private tensions public and enabled the community, in effect, to manage them before they deteriorated into violence. For the

most part, these scholars pointed out, such accusations did not, in fact, lead to the death of the witch: Instead, those accused were more likely either to move out of the community or to behave with greater circumspection. Indeed, in many communities, people risked being called witches if they were selfish, withholding food or drink from passing strangers, or had acquired more wealth than others.

Middleton’s study of the Lugbara was a classic example of work in this mode. The Lugbara were an East African society, based when they were studied in Uganda and the Congo. They were primarily cultivators, using roughly three kinds of fields: fertilized fields near their home for “demanding” crops like sorghum; unfertilized fields farther from the house under a system of shifting cultivation for a variety of crops; and irrigated high fertility fields for sweet potatoes, maize, sugarcane, or bananas. These divisions were important, because there was a presumption that a man should have fields of equal types and equal fertility for each of his wives, and there was a relatively fixed relationship between the number of wives in any group and the extent of that family’s territory. The basic social and political unit was the family cluster, a collection of adult men, their wives, and their unmarried children, each with separate huts but under the general authority of the genealogically senior male of the group. This man was not only the senior authority in the group, but also the primary intermediary between the living and the dead and the most important officiator in the ancestor cult (the primary form of religious worship). He was thought to maintain his authority by invoking the dead and by so doing sending illness to those who disobeyed a husband or a senior kinsman.

Witches, men or women who caused sickness when motivated by envy or jealousy, were thought to exist in Lugbara communities. They would strike when they passed a house and were not invited in for dinner, or not offered beer; they might envy a man who seemed to own more than another man, or whom they thought to be at the center of all eyes. Wise people avoided such risks—but they also understood that witchcraft was an improper use of power, while the elder of the family cluster used his magic appropriately, as an expression of his authority.

The rub, Middleton argued, was that the invocation of a ghost took the same form as a witch’s invocation to send illness. The most common pattern for witchcraft accusations emerged as a family cluster grew in size and its demand for land increased. As young men matured, they began to need more land and to express more independence. The elder would invoke the ghosts to keep them in line—and when a member of their family fell sick, the community would first understand this as an appropriate expression of the elder’s need to keep control. At first, Middleton argued, public opinion sided with the elder. But as the group grew, public

opinion could shift, seeing the elder as inappropriately demanding more power than he ought, and might label him a witch. When this happened, the younger man who made the accusation might well leave the cluster, taking his family and others with him and seeking more land elsewhere. As a lineage grew, it became increasingly unmanageable, both ecologically and politically. Lugbara witchcraft accusations both expressed the tensions inherent in this inevitable but disturbing process and helped to make it work more efficiently.

This analytic approach became the hallmark of the British functionalist approach to witchcraft, which understood witchcraft accusations as expressions of social tension that indicated the kinds of serious pressures within the group. Anthropologists (in particular Mary Douglas) argued that accusations were clustered in areas of ambiguous social relationships, either because such relationships were usually competitive and unregulated or because a new and anomalous group had emerged. Where social relations were well defined and tensions could be easily resolved, witchcraft accusations were uncommon, a conclusion supported both by classic ethnography and by quantitative analysis of accusation patterns. The possibility of accusation, however, had a normative effect on behavior.

British functionalist anthropology has had a profound influence on the study of early modern witchcraft in America as well as in England, although less so on the study of witchcraft in continental Europe (Middelfort 1972; Cohn 1975). Perhaps its most famous application was through the work of Keith Thomas (1971), in a magisterial analysis of the emergence of the English witchcraft trials, but a similar influence can be seen in Paul Boyer and Stephen Nissenbaum (1974), in Thomas's student, Alan Macfarlane, and others. These historians pointed out that fantasies about witchcraft were common in agrarian societies, including medieval Europe. In such fantasies, witches were creatures, often women, who flew at night, ate human flesh, violated moral precepts about fertility and sexuality, and practiced malevolent magic on those they envied. Although such ideas had existed in an officially Christian peasant society for centuries, few people had been killed until the late medieval period, when such folk beliefs were overlaid with an account of a specifically Christian evil, in which the so-called witch became bound to the Devil and participated in Satanic masses. Hundreds of witches were hanged in England and thousands burned elsewhere in explosions of anxiety as they were located, tried, and executed. Thomas and Macfarlane explained the salience of witchcraft accusations in England as reflecting an unresolved conflict between the neighborly conduct required by the ethical code of the old village community and the increasingly individualistic behavior that accompanied the economic changes of the sixteenth and seventeenth centuries.

The classic anthropological literature on witchcraft produced another famous book that proposed an argument different from those discussed above: Evans-Pritchard's *Witchcraft, Oracles and Magic Among the Azande* (1937). Witchcraft seemed to pervade every aspect of the Azande's world in the southern Sudan. Witches were thought to exercise their power unconsciously, without ritual or speech, and when a misfortune occurred, the Azande often attributed it to the unintentional malice of a person who might not even know what he or she had done. If the misfortune was significant and the victim still suffering, he looked around for those who might bear a grudge against him, and consulted a "poison oracle" to determine who it was. (He also consulted the oracle to determine whether misfortune would occur if he embarked upon a journey.) This poison oracle was a chicken that was fed a quantity of poison. Whether the chicken lived or died provided the answer to the client's question. Having determined the witch, an intermediary (if necessary) approached the accused aggressor, who then "blew water" over the wing of the chicken that died in naming him witch and asserted his good intentions toward the harmed man and his determination to "cool" the witchcraft in his belly.

Evans-Pritchard argued that concepts about witchcraft in Azande society played the role that the concept of chance played in his own: They explained the peculiarity of events. The man died when a rotten granary fell upon him: He died because the granary was rotten, but why he should happen to be under it when it fell—that was due to witchcraft. Evans-Pritchard insisted that apparently strange statements made by members of a different culture did not imply that their mental capacities were similarly strange. In fact, he says that he had no problem living as if witchcraft and magic existed when living among these people. This approach became part of a philosophical and anthropological debate between two positions, one that held that magical practice was based upon mistaken belief (the intellectualist position: magic is a pre-scientific form of explanation and action) and another that explained away the magic by showing how little it had to do with explanatory belief (the symbolist position: magical symbols are really expressions of anxiety or some other emotion, not an attempt to explain or alter reality). Arguments about apparently irrational belief took the Azande case as their template from that point on.

More recent work within anthropology carries forward both of these lines of discussion. Tanya Marie Luhmann (1989) presented the ethnography of a group of middle-class English people who called themselves witches and magicians, describing the ways by which apparently reasonable people came to hold such apparently unreasonable beliefs. Peter Geschiere (1997) described the way witchcraft remains a visible presence

in modern Africa (in Cameroon) as a response to modern political reality. Although the great functionalist studies—as well as that of Evans-Pritchard—were set in colonial Africa, whose European overlords had decriminalized witchcraft, anthropology continues to explore witchcraft in the postcolonial world, hoping to inspire other fields that also seek to understand this occult but irrepressible phenomenon.

ANTICHRIST

The Antichrist is a negative figure of Christian mythology, a demon-like fiend in human form, both the adversary (anti) of Christ and his forerunner (ante), as he will appear immediately before the latter comes back into this world to judge the quick and the dead at the end of time. Though there is little or nothing in the way of a direct link between Antichrist and witchcraft, the renewed focus on this fiend in human form in the late Middle Ages and early modern period can only have encouraged the fear of the Devil's power that lay behind the witchcraft trials.

THE LEGEND

What one may call the medieval standard tradition about Antichrist can be summarized as follows:

Antichrist is to be born in Babylon as the fruit of an incestuous relation in the Jewish tribe of Dan. Already in his mother's womb, bad spirits will have power over him. Magicians and sorcerers will bring him up. Grown up, he will persuade the Jews that he is the longed-for Messiah. However, many Christians will also adore him as God and receive his sign on their bodies. Those who do not follow him will be cruelly persecuted. For three and one-half years the fight between this monster and the true Christians is to endure, while the strange races of Gog and Magog, the Red Jews, even the Amazons, arrive from the ends of the earth to help the Antichrist. Finally, he will kill the prophets Enoch and Elias, whom God has kept in reserve in Paradise for this eschatological struggle. For the very same span of time (or sometimes for thirty-two years), the adversary of Christ will then be allowed to reign over the world. At the end, when Antichrist will try to lift himself into heaven, Jesus or the angels will throw him down into hell.

The basis of the Antichrist tradition was, of course, biblical. In the letters of John (1 John 2:18–22; 2 John 7), the enemies of Christ's teachings were called Antichrists (plural!). Paul did not use the term *Antichrist*, but he expected a great opponent of Christ to appear before his second coming (2 Thess. 2:3–12). Exegetes declared that the false messiah and the false prophet spoken of by Jesus in the Gospel of Matthew (Matt. 24:5, 11) was the Antichrist, identifying him also with the seven-headed apocalyptic beast from the sea (Rev. 13, 1–10).

Until the central Middle Ages, it was almost exclusively theologians who dealt with this figure, and they did so in Latin treatises, the most important of which was the *Libellus de Antichristo* (Booklet on Antichrist), a "biography" of Antichrist written by the Benedictine abbot Adso of Montier-en-Der about 954. Most later writings on this mythical personage, such as the works of the virulent reformer of the canons Gerhoh of Reichersberg (twelfth century), the prophetic theologian of history Joachim of Fiore (about 1200), and the enthusiastic Dominican preacher Vincent Ferrer (1350–1419), were based on Adso's treatise. From the twelfth century onwards, however, more and more laymen were confronted with this figure; Antichrist plays quite a remarkable part in the new vernacular literature written for them, such as the *Linzer Entekrist* (Linz Antichrist, twelfth century) and similar Middle High German pious works, or the *Tournoiement Antéchrist* (The Antichrist's Tournament, 1234–1240) by the French poet Huon de Méry, describing an allegorical battle between God and the monster.

The late Middle Ages saw the heyday of Christian obsession with this figure. Numerous theologians published treatises about him; the less orthodox ones such as Arnaud de Villanova, the famous Catalan master of medicine (d. 1311), discussed the forbidden theme of

the date when he might appear. In several European states, a number of theatrical representations of the Antichrist legend could be seen. In 1604, the relevant traditions were collected into a single extensive work, *De Antichristo libri XI* (Eleven Books on Antichrist) by the Dominican Tomás Malvenda, a collaborator of the Roman Index of Prohibited Books. The Catholic preacher Dionysius von Lützenburg wrote one of the most voluminous elaborations of the myth, the romance-like *Leben Antichristi* (Antichrist's Life, 1716). As late as 1916, the Low German poet Karl Wagenfeld revived these medieval traditions with his epic *De Antichrist* (The Antichrist).

The legend of Antichrist was also transmitted through painting and xylography, especially in manuscripts of the Apocalypse and commentaries on that text. From the twelfth century onwards, we find illustrated lives of Antichrist inserted into religious-didactic picture books such as Herrad of Landsberg's *Hortus deliciarum* (Garden of Delights, late twelfth century), the Welislaw Bible (ca. 1350), and the printed *Vita Antichristi* (Life of Antichrist) of 1472. Among the numerous Reformation images equating Antichrist with "popery," the works of Lucas Cranach remained unrivalled. Several Gothic fresco paintings of Antichrist have been preserved. At Karlstein near Prague, the main castle of the Holy Roman Emperor Charles IV, Antichrist appears in antithesis to this sovereign; in the dome of Orvieto, Luca Signorelli integrated Christ's opponent into his depiction of the Last Judgment (1504).

In the nineteenth and twentieth centuries, several famous authors from Russia to Portugal used Antichrist as a metaphor for the materialistic worldview, including Dostoyevsky in *The Brothers Karamazov* (1879–1880), Russia's Vladimir Solov'ev in *Kratkoi powesti ob antichriste* (A Tale of the Antichrist, 1899), Portugal's António Duarte Gomes Leal in *O Anti-Cristo* (The Antichrist, 1884–1886); Sweden's Selma Lagerlöf in *Antikrists mirakler* (The Miracles of Antichrist, 1897); and Germany's Joseph Roth in *Der Antichrist* (The Antichrist, 1934). Friedrich Nietzsche's *Der Antichrist* (The Antichrist), however, written in 1888, remains the most radical transvaluation of the Christian tradition. Criticizing this religion because of its detachment from the world, Nietzsche did not hesitate to proclaim himself as the "superhuman" Antichrist. In Catholic regions, many nineteenth-century folktales have been recorded that described Antichrist with a wealth of odd details.

ANTICHRIST AND POLITICS

Again and again, the figure of Antichrist has been employed to defame political opponents. It is difficult to decide how far those who called their enemies by

such a name were indeed convinced that the Biblical prophecies had now been fulfilled, and how far they used this reproach merely as a convenient propaganda weapon. A catalogue of all the persons and groups in public life that have been suspected to be the incarnated Antichrist would fill a sizable book. Let us mention only the Holy Roman Emperors Henry IV and Frederick II, both of whom the papacy called Antichrist during their struggle for supremacy within Western Christianity. The famous liturgical *Ludus de antichristo* (Play of Antichrist, ca. 1160), the first play to bring this character on the scene, also showed clear political implications, as the Germans triumphed over the French and reformers within the Church were attacked. Later, John Wyclif in his treatise *On Christ and his adversary Antichrist* had an easy task identifying the pope with Antichrist, simply contrasting the lifestyle of Jesus with that of his successor. Both Hussite and Lutheran polemicists subsequently adopted this tactic. The Schmalkaldic Articles of 1538, Luther's official confession of faith, equated the papacy and Antichrist (2, 4). In the same year, the German humanist Thomas Naogeorg published his allegorical drama, *Tragoedia nova Pammachius* (The New Tragedy of Pammachius). Its protagonist, Pammachius (i.e., Antichrist), stood for the papacy, which, during its long history, succumbed to such typical vices as abuse of power and immorality. In the nineteenth century, it suffices to note that Napoleon Bonaparte's less educated Christian opponents identified him with the apocalyptic antihero.

ANTICHRIST AND MAGIC

It seems that Antichrist never appeared in confessions made by people accused of witchcraft, nor did he appear in any recorded magical formulas or incantations. Nevertheless, in the texts that purported to tell the story of his life, he was regularly depicted as a kind of sorcerer, whose success was based on the magical tricks he played. In the aforementioned *Ludus*, the German emperor was the only Christian ruler who triumphed over Antichrist, but eventually even he was convinced by his miracles. For example, Antichrist made the roots of a tree flower, brought the sea on the top of mountains, caused snowfall and hail, changed day into night and night into day—all proofs of his magic powers, through which many were seduced into believing him to be the real messiah.

Therefore, occasionally connections were drawn between Antichrist and other sorcerers. The historian Adam of Bremen (late eleventh century) imagined Norway to be full of soothsayers, augurs, sorcerers, and enchanters, as well as other satellites of Antichrist (*History of the Archbishops of Hamburg-Bremen*, 57 [55]). Heinrich Kramer's infamous *Malleus Maleficarum* (The Hammer of Witches, 1486) also

compares the “miracled” wrought by demons to those done by Antichrist (1.1.9). Many early modern experts, including the Jesuit Martín Del Rio, reckoned that an increase of sorcery and witchcraft was one sign of the approach of the Apocalypse and of Antichrist. Nevertheless, direct references to Antichrist in connection with witchcraft were only peripheral in nature.

APOCALYPSE

In Christianity, the expectation of the world’s end coming soon created a complex of fears and hopes, often called apocalypticism. Its major components may be evoked by the key words Antichrist, millenarianism (or chiliasm), second coming (*parousia*) of Christ, and Last Judgment. Connections between the fear of the apocalypse and witchcraft are rather marginal. It is possible, but has not been proved, that apocalypticism did play a part in the rise of the witch persecutions.

The biblical basis for Christian eschatology was supplied mostly by the prophecies of Daniel, supplemented by such New Testament texts as the Revelation of John and several statements of Jesus in the Gospels, especially in Mark 13. He himself expected the end of times would occur soon after his death, when the divine would descend to earth (Mark 9:1). After this prophecy

failed to happen, a complex theology of “the last things” was created and dogmatized during the following centuries. On a popular level, a tradition of (mostly fifteen) signs of the approaching final catastrophe was developed. As the Bible often underlines the impossibility of knowing the exact time of the Last Judgment, traditional Christianity existed in an ambience of fear, which grew more acute during specific crises (e.g., the much discussed “terrors” of the year 1000 or 1033, the years of the Black Death around 1350, the appearance of Halley’s comet in 1531, etc.). During the religious crisis of the sixteenth century, the most intensive apocalyptic fears were probably seen, clearly perceptible in such events as the Anabaptist movement at Münster in 1534–1535, but also manifested in learned theological writings, especially those of Martin Luther. Apocalyptic currents reappeared during the religious wars of the seventeenth century and even in the epoch of Enlightenment, and have continued to reappear in the twentieth and twenty-first centuries. It goes without saying that some people interpreted the two world wars as the beginning of the Apocalypse. Apocalypticism has, however, been eliminated from the teachings of the main Christian churches because of the usually insignificant place eschatological expectations left to the hierarchies, so that this tradition has become restricted to fringe Protestant sects or denominations such as the Shakers, Latter-day Saints (or Mormons), Seventh-day Adventists, and Jehovah’s Witnesses.

As one of the signs appearing before the end of the world would be the apostasy of many Christians (Matt. 24: 4–6.), it was certainly logical to interpret the rise of the witch-“sect” as a token of the approaching Apocalypse. Therefore, Heinrich Kramer, in the *Apologia*, which he prefixed to the *Malleus Maleficarum* (The Hammer of Witches, 1486), put the persecution of the “heresy of the witches” into the eschatological context of the “twilight and evening of the world,” characterized by an increase of human wickedness (16). The Devil, argued the Dominican inquisitor, knowing he had but little time left to do evil, had recently seduced many people, mainly females, into perpetrating works of sorcery. The Lorraine witch-prosecuting judge Nicolas Rémy, in his treatise *Daemonolatriae* (Demonolatry, 1595), saw the current conflict between witches and demons, on the one hand, and judges such as Rémy and Christianity generally, on the other hand, as the battle of evil against good that would usher in the Second Coming. John Stearne, the English witch hunter, in *A Confirmation and Discovery of Witchcraft* (1648), wrote “For it is undeniably true, that there was, is, and shall be Witches, till Christs conquest there spoken of, agreeable with that in *Revel.* 20.1, 2, 3(60).” While other witchcraft theorists had similar views linking the heresy of witchcraft to the approaching

Apocalypse (e.g., Abbot Johannes Trithemius in his *Liber octo quaestionum* [The Book of Eight Questions, 1515] for the Holy Roman Emperor Maximilian I), this connection seems to have remained mostly theological speculation, without becoming a concrete stimulus to the persecutors of witches.

APPEALS

Almost everywhere in Europe, appellate courts were responsible for slowing the pace of witch hunts, although they lacked the audacity or legislative authority to bring them to an end. There were no appellate court systems operating in the Alpine regions where witch hunting began in the fifteenth century, but it did not take long before an appellate court first intervened in a witch hunt: in 1447, the recently restored *Parlement* (sovereign judicial court) of Toulouse revised some sentences passed in 1444 at Millau in northern Languedoc. Here, as later, the appellate court's primary purpose was to censure miscarriages of justice by overzealous, partisan, or corrupt local justices. Often, as in this instance, the court intervened too late to save the lives of many accused witches (three women had already been burned and two others had died, probably after being tortured), but they practiced damage control; the woman who made the appeal had her conviction overturned, and a corrupt judge and notary at Millau were suspended from their offices and fined heavily.

The most far-reaching intervention by a fifteenth-century appellate court was undoubtedly the

overturning of many verdicts from the famous series of witchcraft trials known as the *Vauderie d'Arras* (because these trials were directed at the heresy called *vauderie*, "Waldensianism," seen as associated with witchcraft) by the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) in 1491, more than thirty years after the original events, when almost everyone directly involved had died. The rehabilitative decree of the Paris court was read out with great pomp at the very spot in Arras where the original sentences had been pronounced; the heirs of the prosecutors were fined and ordered to erect a memorial cross on the spot where the witches had been burned. Obviously, appellate justice could not raise wrongly convicted witches from the dead, but it could and did improve their posthumous legal status and restore their family's reputation. By the following century, during the most intensive phase of witch hunting, appellate courts began to intervene in time to save the lives of accused witches.

During the most intense phase of witch hunting, systematic intervention by appellate courts began in 1576, when, after a few notable scandals, the Kingdom of Denmark required that all local-court sentences in witchcraft trials be automatically submitted for review to upper-level county courts. The history of appellate-court intrusions ended almost two centuries later, with Maria Theresa's interventions in her Hungarian kingdom. She finally issued an order forbidding further witchcraft trials in 1766, after the royal appeal court had overturned a series of local sentences against witches and acquitted all defendants during the previous decade (Klaniczay 1990, 235, n. 41). These effective interventions are the positive side of the picture; the negative side is that the ordinary witchcraft prisoner's chance of gaining access to some form of appellate justice was generally remote, just like an ordinary prisoner's chance of gaining access to the Supreme Court in today's United States.

Nowhere was the role of appellate justice in limiting damage from witch hunting more important than in France, which was Europe's largest kingdom and boasted a network of appellate courts (the *parlements*), that were responsible for correcting judicial errors among the approximately 20 million French subjects. Although an appellate court system also existed for the Holy Roman Empire, within whose spacious borders the vast majority of executions for witchcraft occurred, it was tragically unable to imitate the success of the French in curbing the excesses of local witch hunters. In northern Europe, using customary law, every appellate court system reduced punishments in most of the witchcraft convictions it heard, although none of them ever managed to stop prosecutions (or even executions) for witchcraft entirely. The British Isles, including the Kingdom of Scotland, lacked appellate courts in the

technical sense; however, itinerant judges appointed by the central government managed to have much the same effect of greatly reducing, although not eliminating, executions for witchcraft. There is no comparable history of appellate-court intervention in Mediterranean Europe, largely because the various state-run Inquisitions filled their essential function of removing most witch hunting from the control of local zealots. What all these systems—the Inquisitions, itinerant judges in the British Isles, the Roman law appellate courts in France or Germany—shared was a far more rigorous attitude than most local courts toward what constituted admissible evidence of witchcraft and therefore provided satisfactory legal proof of a defendant's guilt.

One finds several instances, starting in 1593 when the High Court (Hooge Raad) of the province of Holland quashed a witchcraft indictment and effectively ended prosecution in the heartland of the United Netherlands, in which appellate court intervention indirectly brought witch hunting to an end. Elsewhere in Europe, subsequent interventions by appellate courts were responsible for stopping witch hunting at least temporarily. In 1676, for example, firsthand interrogations by top-level judges in Sweden's capital finally brought an end to a long-running panic that had intermittently terrorized several of the kingdom's northern provinces for eight years; however, Sweden's Court of Appeal subsequently upheld a few death sentences for witchcraft, until a smaller panic erupted in the 1720s, whereupon it not only overturned every lower-court sentence but also punished the principal accusers.

In the French legal system, people arrested for witchcraft who managed to reach their appellate court (*parlement*) frequently saw their sentences reduced. Even its most severe branch, the *Parlement* of Rouen in Normandy, released 20 percent of its 270 prisoners charged with witchcraft, even during its most intensive phase of witch hunting between 1580 and 1622, and reduced the sentences of another 25 percent. When one looks elsewhere in the French appellate system, these figures increase. But it must not be forgotten that, in France as elsewhere, many prisoners failed to take advantage of the opportunity to appeal a death sentence for witchcraft. In the only sixteenth-century French local witch hunt for which we possess a complete trial dossier, only two of the five men sentenced to death chose to appeal to the *Parlement* of Paris, which in this instance upheld both condemnations (Jacques-Chaquin and Préaud 1996).

Despite this particular incident, the meticulous and painstaking research of Alfred Soman (1992) enables us to appreciate how Europe's most prestigious secular court, the *Parlement* of Paris, compiled an early and remarkable record in reducing punishments for witchcraft. The *Parlement* of Paris, with a *ressort* (jurisdiction)

that covered almost half of France and encompassed nearly 10 million subjects, was consistently skeptical when evaluating evidence about witchcraft. Although Jean Bodin's famous *De a démonomanie des Sorciers* (on the Demon-mania of Witches, 1580) enjoyed many editions, translations, and imitations, it never convinced the *Parlement* of Paris to regard witchcraft as an "exceptional" offense that justified otherwise unacceptable methods of proof. Instead, the Parisian judges took vigorous action in 1588 to quash illegal witch-hunting methods in northeastern France, not far from the place where Bodin worked as a royal prosecutor. They intervened again in 1601 by arresting the hangman of Rocroi, a notorious witch finder responsible for the deaths of more than 200 people; although only eight of his victims were French subjects, the *Parlement* ordered him to the galleys for the rest of his life. They subsequently intervened in the same region in 1623 by punishing local judges who approved the custom of "ducking" witches, and followed up in 1624 by ordering that all condemnations for witchcraft throughout their vast district be automatically appealed to Paris (Soman 1992).

Although Europe's premier secular court had condemned over a hundred people to death for witchcraft or magic between 1568 and 1625, this figure represents less than one-fifth of the death sentences appealed to it for such offenses. It ordered 58 such executions between 1587 and 1610, but never more than six in a year. Between 1611 and 1620, its ratio of executions for witchcraft fell to only 4 percent of cases appealed, while one-sixth of such defendants were released without punishment (Soman 1992, II, 35). (This was the time when Pierre de Lancre, a judge at the *Parlement* of Bordeaux, similarly failed to persuade his skeptical colleagues to change their approach to witchcraft cases, despite publishing two books on the subject.) Apart from one extremely late incident, the *Parlement* of Paris stopped sentencing witches to death after 1625, exactly when it also required that all witchcraft trials be appealed before it. As Soman has emphasized, this date marked the de facto decriminalization of witchcraft in the Kingdom of France.

During the final French witch panic, which affected much of southern and eastern France between 1643 and 1645, other appellate courts had adopted the Parisian practice of automatic appeals in witchcraft cases, although they still imposed a few death sentences. In some ways, the *Parlement* of Toulouse compiled an even more impressive record than Paris during this episode, releasing almost two-thirds of the 641 accused witches whom it judged during this period, banishing most of the remainder, and confirming only a handful of death sentences (Vidal 1987, 520, 522). In these years, it actually sentenced more people to death for lynching suspected witches than for practicing witchcraft.

Another smaller French appellate court, the *Parlement* of Dijon, behaved in a similar fashion during the same panic: it executed exactly 3 of the 114 convicted witches it judged between 1643 and 1645, while reducing the overwhelming majority of lower-court rulings and subsequently investigating numerous cases in which accused witches had been lynched.

Appellate justice also played a role in moderating witch hunting even in that political labyrinth, the Holy Roman Empire. The newer imperial aulic court, or *Reichshofrat*, sitting at Vienna since 1559, complemented the empire's original appellate court, the *Reichskammergericht* (imperial chamber court), sitting mostly at Speyer since 1495. Like other major European courts, the *Reichskammergericht* insisted on clearer standards of proof than those used by local witch hunters, and it invariably opposed abuses of torture. No general assessment of its overall record on witchcraft trials has been attempted until recently (Oestmann 1997), because its archives, unlike those of the *Reichshofrat*, were dispersed long ago to almost forty different locations (Schormann 1991, 157–166; 1992). Although witchcraft trials made up less than 1 percent of the *Reichskammergericht's* caseload, this court intervened in these trials more often than previously believed, and its rulings had some positive effects. For example, when a goldsmith's wife in a small Alsatian town sued her overlord, the bishop of Strasbourg, at Speyer in 1620 for illegally arresting and torturing her daughter, the emperor gave the bishop four weeks to send him a report on this subject. Although the lawsuit dragged on, her daughter was released a few months later; the goldsmith sold his house eight months after that and moved to Protestant Strasbourg. After the mother finally withdrew her suit at Speyer, she refused to pay any of the legal costs in their former home (Schaeffli 1993, 35–39). Other Alsations were still appealing to the *Reichskammergericht* against charges of witchcraft as late as 1661.

The greatest weaknesses of the *Reichskammergericht* were that it was distant, expensive, and cumbersome for nonexperts, although it probably saved the lives of some very ordinary plaintiffs. Contrary to its reputation, it could make rulings surprisingly swiftly in witchcraft cases (Oestmann 1997, 520); but its decisions could be impossible to enforce. For example, in 1611 a plaintiff from the duchy of Sachsen-Lauenburg appealed to it, but his mother was convicted and executed before it could nullify her trial. Even highly placed plaintiffs suffered similar consequences. In 1627, during the worst of Bamberg's witch hunts, the episcopal chancellor traveled to Speyer in order to protect his wife and daughter, who had been arrested for witchcraft; he returned with a ruling to liberate them, but they had both been burned in the interval. The furious bishop immediately imprisoned the chancellor and his son (who had also gone to Speyer), tortured

both of them on the basis of accusations made by his wife and daughter until they confessed, and burned them as well. Three years later, an appeal to the *Reichshofrat* by the city of Nuremberg on behalf of a prominent refugee from Bamberg, followed by three imperial orders and pressure from the College of Electors, culminated in the evocation of all Bamberg's witchcraft trials to the emperor in 1631. Bamberg's bishop protested vigorously, but no longer dared imprison witches in the special prison he had built for that purpose.

Next year, the *Reichskammergericht* sharply censured the elector of Cologne when ruling in favor of a plaintiff accused of witchcraft, but it could not curb Cologne's "extirpation" program. The *Reichshofrat* was not asked to intervene in Ferdinand's electorate until 1639, when its actions proved as decisive there as they had in Bamberg. Only ten days after learning of Vienna's decision, Cologne flatly refused a local petition to renew witch hunting. Such examples suggest that the newer imperial appellate court could act with somewhat greater effect than its predecessor, but it had different shortcomings. Because the *Reichshofrat* had been created in order to arbitrate disputes between autonomous imperial governments, individual subjects could not appeal to it directly against witch hunting zealots. In order to involve the *Reichshofrat*, the imperial free city of Nuremberg had to bring a formal complaint against the bishop of Bamberg, or the free city of Cologne had to bring a similar action against the archbishop-elect of Cologne. Moreover, because the emperor was a partisan Catholic, Protestant governments were often reluctant to appeal to it. But each appellate court did what it could to curb the worst excesses of witch hunting in the empire.

The peculiar history of how a small Alpine district, nestled between the Swiss Confederation and Austrian Vorarlberg, became the principality of Lichtenstein, illustrates how appellate justice could still play a decisive role in the history of witch hunting in the Holy Roman Empire. Witch hunting began in Vaduz around 1648. This first hunt ended in 1651, but an even more severe burst of witchcraft trials erupted there a quarter-century later. By 1680, nearly 300 people—approximately one-tenth of the entire population of the county of Vaduz—had been executed as witches since 1648. When prominent families among the count's victims (whose confiscated properties helped pay his huge debts) complained to Habsburg officials in Tyrol, Emperor Leopold I appointed the prince-abbot of Kempten to investigate their accusations. Supported by the University of Salzburg, the prince-abbot successfully pressed charges of extortion and sadistic tortures in witchcraft trials against Franz Karl von Hohenems, the count of Vaduz, before the *Reichshofrat* in Vienna. In 1684 the aulic appellate court declared him deposed.

His accuser, aided by soldiers from the Tyrolean government, thereupon captured the count of Vaduz and kept him prisoner at Kempten until Franz Karl died sixteen years later. At that time, his lands were forfeited to his accuser. After the count's death, the prince-abbot sold Vaduz to the distinguished Austro-Moravian house of Lichtenstein with the blessing of Emperor Leopold I, who raised it to a *Fürstentum* (principality) in 1712. The house of Lichtenstein has ruled in Vaduz ever since, outlasting even the Austrian Empire. Thus a late and unusually brutal Alpine witch hunt and a Viennese appellate court helped to create one of the smallest sovereign states in contemporary Europe.

All appellate courts had the right to increase as well as reduce the punishments decreed by local courts. Appeals could be made *a minima* by the prosecution as well as by the defendants if prosecutors found the original sentence overly lenient. Moreover, appellate court judges were completely free to revise a sentence in any manner they wished, without explaining their reasons. The *parlement* serving the Habsburg province of Franche-Comté, for instance, sentenced to death just over half (53 percent) of the accused witches it judged, compared with 83 percent in seignorial courts and 74 percent in lower-level *bailliage* courts. Nevertheless, the *parlement* actually increased the severity of lower-court sentences in about 10 percent of the witchcraft cases it judged (Rochelandet 1997, 66–67). Henri Boguet, a regional judge in Franche-Comté, reportedly asked his publishers to stop reprinting his 1602 demonology when he sought to be promoted to the province's *parlement*, a goal he finally achieved shortly before his death in 1619. Seven years earlier, that court had revised three of Boguet's final four decisions in witchcraft trials; although two death sentences were overturned, one sentence, which had been appealed by Boguet's prosecutor, was actually increased (Monter 1976, 70, 74). In these cases, as in almost everything else ever done by any appellate court in revising witchcraft sentences, we lack any precise explanations for their decisions.

APULEIUS OF MADAURA (B. CA. 125; FL. CA 155–60)

Apuleius authored the seriocomic romance dealing with magic and shape shifting, the *Metamorphoses* (better known as *The Golden Ass*), as well as the *Apologia*, Apuleius's speech to a Roman court in his own defense against charges of practicing magic. In different ways, these two works offered considerable information about ideas of popular and learned magic in late antiquity, and they influenced later European thought about these subjects, and thus, of course, European thought about witchcraft, after being edited and translated in the late fifteenth and sixteenth centuries.

Born at Madaura (in modern Algeria) in Roman North Africa, Apuleius was well educated at Carthage and Athens (in Athens, possibly by a nephew of the great biographer Plutarch) and became interested in philosophy, natural science, and magic. Little is known of the details of his life, except for Apuleius's falling ill at the home of an old school friend, Scinius Pontianus, in the town of Oea, near Alexandria, being nursed back to health by the friend and the friend's widowed mother, Aemilia Pudentilla, and later marrying Pudentilla. The marriage, the death of Scinius Pontianus, and other complications arising from Apuleius's inheritance of the estate led to some of Pudentilla's relatives laying a charge of magic against Apuleius and to a trial before the proconsul Claudius Maximus at Sabratha in North Africa. In Roman law, the penalty for the crime of which Apuleius was accused was death. The *Apologia* was a revised version of his speech to the court in his own defense and offered an extensive and important survey of learned and popular ideas of magic in the mid-second century Roman world. The *Apologia* told that Apuleius had inherited and wasted considerable wealth, had long been interested in philosophy and scientific experimentation, and regarded the accusations against him as inspired by

jealousy and based on his accusers' misunderstanding of philosophy and natural science.

Apuleius's best-known work was his *Metamorphoses*, popularly known as *The Golden Ass*. Although Apuleius borrowed much of the plot from earlier writers, his own literary and intellectual skill created a remarkably popular novel. It told the tale of a lazy young man named Lucius, whose fascination with magic, particularly erotic magic, while on a journey to Thessaly, long reputed to be a center of magic and sorcery by the Greeks, led to his transformation into an ass and a series of seriocomic adventures before his return to human shape under the auspices of the goddess Isis. The final book told of Lucius's initiation into the cult of Isis; it has been interpreted as a serious meditation on religion, and the entire work as a figurative autobiography of the author, because it was narrated in the first person by the character Lucius. *The Golden Ass* also contained other tales of magic, including the religious fable of Cupid and Psyche, which obviously fascinated both Apuleius and his audience, because it was no less a figure than St. Augustine who transmitted the popular title of the work, *The Golden Ass*.

Apuleius and his wife eventually settled in Carthage, where he lectured on philosophical subjects. Some of

his talks were collected in two works, *Florida* and *On Plato and His Dogmas*. These and other works, including the treatise *On the God of Socrates*, make Apuleius an important representative of the philosophical movement known as Middle Platonism, but his interest in magic certainly equaled his interest in philosophy.

Early Christian thinkers, including St. Augustine, were highly suspicious of Apuleius, considering him a wonder-worker, particularly when they read *The Golden Ass* in conjunction with Apuleius's philosophically religious works, although other Christians regarded at least the Cupid and Psyche episode as an allegorization of the soul's development. *The Golden Ass* was translated by Ermolao Barbaro in the fifteenth century and printed frequently in that century and the next, often with illustrations that echoed sixteenth-century concerns, thus turning the second-century philosophical comic romance into a justification of contemporary ideas of sorcery and witchcraft. This translation, print, and illustration history made *The Golden Ass*, with several other works of Roman antiquity, an important reference in Renaissance discussions of witchcraft and sorcery.

AQUINAS, ST. THOMAS (CA. 1225–1274)

This Dominican monk and professor of theology, the greatest thinker in that form of medieval theology known as Scholasticism, ranks among the most significant authorities affecting the origins, formation, and perpetuation of the early modern image of witches. As with some other prominent theologians, it is important to distinguish between his intentions and later interpretation of his works. Thomas lived and taught at a time when witchcraft prosecutions were unknown, but when the foundations were partly laid for the future criminalization of witchcraft. The evolution of a standardized ecclesiastical legal system (known as the Inquisition), which Rome had been shaping since the Fourth Lateran Council in 1215, played an important role in gradually creating a systematic classification and persecution of various types of heretics.

Scholasticism was particularly concerned with systematic theology. All branches of contemporary theology were cross-linked to form a network of traditional requirements, permitting cautious advancement. Aquinas was not alone; all dogmatic systems had to grapple with the issues of demonology and magic within a vast spectrum of possible interpretations. Thus the significance of Thomas Aquinas resides less in his particular statements about demonology or magic than in his new theological approach and its philosophical background, based on his interpretation of Aristotle. This background is particularly obvious in Thomas's relationship to his teacher Albertus Magnus (Albert the Great), who was considered not only a universal theologian, but also an expert in all fields of science, including the borderline between empirical science and magic. One can assume that Thomas was acquainted with the whole spectrum of magical practices, so far as they were known in academic circles. Of course, Thomas's theological background included the fourth-century Church Father St. Augustine and his statements on demonology, particularly to the extent to which these acquired legal status through Gratian's *Concord of Discordant Canons*, known as the *Decretum* (1130), or formed the foundation for the study of theology in Peter Lombard's *Sententiae* (1148–1151). As a result, Thomas's *Commentary on the Sentences of Peter*

Lombard offers an important source for resolving certain issues.

The subject of demonology was, of course, also dealt with systematically in Thomas's *Summa Theologiae* (*Summa of Theology*) (1.1, Q.51 f.). It is particularly interesting that Aquinas considered demonology within the context of his doctrine of angels. He approached problems on a purely ontological level, in relation to the doctrine of creation, with no reference to practical life. On the other hand, *The Summa Theologiae* and other works also discussed individual issues concerning witchcraft and magic, and these were later consolidated to form certain lines of argumentation. His view of *maleficium* (harmful magic) was traditional, but he added the detailed notion of an *impotentia ex maleficio* (impotence from evildoing) (*Commentary on the Sentences*, Bk 4, D. 64, Q. 21, Art. 3), one of the questions that was later discussed intensively in relation to the impact of witches. In accordance with Augustine's doctrine of demonology, he assumes the real possibility of sexual relations between demons and humans. In his *Scriptum super libros sententiarum Magistri Petri Lombardi* (*Commentary on the Sentences of Master Peter Lombard*) and *Summa Theologiae* (I, Q. 51, Art. 3), Aquinas systematically formulated his doctrine of incubi and succubi and provides a plausible explanation: By nature, demons could not conceive children with humans, but they could take the form of a woman and absorb a man's sperm through a sexual encounter, then take the form of a man and inseminate a woman with the stored sperm.

The scholastic logic of this idea had fatal consequences in the future, as it implied "real" sexual relations between devils and humans. The same applied to the notion of men forming pacts with demons. Augustine's statements were made within the context of Greek and Roman demonology, but Thomas interpreted them in terms of scholastic and systematic theology, resulting in the idea of everyday social relations between humans and demons. In the light of the already ongoing systematic persecution of heretics, a transfer of this aspect of "reality" to supposed witches became relatively easy.

Thomas's theology did, however, contain certain aspects that clearly inhibited the outbreak of witchcraft persecution: For example, Aquinas (in agreement with traditional canon law) rejected the idea of humans being physically transported by demons, the issue that eventually led to the notion of witches flying; moreover, he was certain that harmful magic was possible only with God's permission (*permissio Dei*), and he gave no indication that superstitious practices should be punished or prosecuted as heretical. Nevertheless, his new methodology could be interpreted in a far more radical way, leading to a criminalization of magic. The interpretation of Aristotle that characterized his new

school of thought entailed an entirely new understanding of the causal interrelation between events in heaven and those on earth. Thomas's doctrine of causality attributed greater significance than previous philosophical and theological traditions, which were mainly Platonic, to the so-called *causae secundae* (secondary causes). Consequently, the late medieval doctrine of witchcraft could easily use Thomas's authority to emphasize not only the power of the Devil but also that of his servants, the witches. They reduced the *permissio Dei* from the original claim that nothing evil occurs outside of the divine will, to a general authorization from the divine for the actions of the Devil and his witches. The Devil, sorcerers, and witches became protagonists who were seen as acting independently and with effect. Thomas never expressed this development, but it is a logical consequence of his fundamental ideas.

Thus the tradition of Thomist theology is of particular interest. Venerated as the "Angelic Doctor," by far the most significant theologian produced by the Dominican order, Aquinas became the greatest authority of the papal Inquisition, which had already been primarily entrusted to the Dominicans during Aquinas's childhood. To what extent such Dominican inquisitors as Heinrich Kramer really found support in Thomas is irrelevant in this context; they used (or misused) his authority, thus associating Thomas's name with the whole aspect of witchcraft and the persecution of witches. Particularly during the Counter-Reformation of the late sixteenth century, the Roman Catholic Church officially considered St. Thomas (who had been far from the only recognized authority in the late Middle Ages) the most significant Catholic theologian. Consequently, it became extremely difficult for Catholics to argue against any of Aquinas's positions affecting demonology.

Thus it is not surprising that, after the era of witchcraft trials ended, essential elements of Aquinas's doctrines concerning witchcraft and demonology were maintained by Catholic theology far into the nineteenth century, aided by the fact that in 1879 Pope Leo XIII declared Thomas Aquinas to be the "normal theologian" for Catholics. In the German *Kulturkampf* (culture war) and its disputes about witchcraft, Thomas Aquinas suffered a fate similar to Martin Luther: The confessional opposition degraded him to a propagandist of relentless witch persecution, which was of course historically untrue. Despite any precise implications for individual issues, Thomas Aquinas's statements remain essentially theoretical and lack any direct relation to the subsequent persecution of witches.

ARAGON

During the sixteenth and seventeenth centuries, many different authorities prosecuted the offense of witchcraft in Aragon (in Spanish, Aragón). In addition to seigniorial justice and so-called "popular justice" (lynchings performed on the margins of legality), the three most active judicial institutions were those of inquisitorial, episcopal, and royal justice.

The Holy Office, known as the Inquisition, created especially for the eradication of heresies in the thirteenth century and restored within the crown of Aragon in 1483, based its persecutions upon accusations of apostasy, because it was supposed that the implicit or explicit pact that every witch must have made with the Devil implied an abjuration of the Christian faith. Despite the Inquisition's reputation for cruelty (owing primarily to the "Black Legend," the defamatory depiction of the Spanish national character), however, trials for witchcraft became fewer and fewer in Aragon as the sixteenth century wore on, until they all but disappeared. The last condemnations to death for witchcraft pronounced by the inquisitorial tribunal of Zaragoza took place as early as 1535, against two women from villages situated in the Pyrenees. Inquisitorial skepticism as to the reality of the *maleficia* (evil acts, harmful magic) attributed to witches grew

after the famous proceedings in Logroño in 1610, when the rationalist intervention of the “witches’ advocate” Alonso de Salazar Frías provoked a decisive turn away from further prosecutions for witchcraft by the Holy Office throughout Spain. This shift reflected the interests of an institution whose principal concern was not so much to investigate mentalities as to control groups considered dangerous from a sociopolitical viewpoint. Given the increasing disbelief among the inquisitors about the reality of crimes attributed to witches, these soon began to be considered as minor questions that would reasonably have belonged to the *ordinario*, the ecclesiastical judge who represented the local bishop.

Episcopal tribunals in Aragon, on the other hand, increased their prosecutions for witchcraft and other forms of superstition in the last decades of the sixteenth century, along with prosecution of other behaviors considered fundamentally irreligious and threatening to proper supervision of the faithful, including common-law marriage, homosexuality, usury, and acts of physical aggression against the clergy. This disciplinary turn coincided with the imposition of other decrees approved at the Council of Trent and copied by provincial synods throughout Spanish territories. The Kingdom of Aragon was divided into seven dioceses (Zaragoza, Huesca, Teruel, Jaca, Barbastro, Tarazona, and Albarracín). Each had its own episcopal jurisdiction, which was delegated to the so-called *Vicario General*, who performed the functions of judge in the name of the bishop, as did such other episcopal ministers and officials as the *Visitor* (a judge delegated in places where he made an annual visit), the fiscal procurator, the public defender (*el abogado de Pobres*) and various notaries, bailiffs, constables, or jailers. Like the Inquisition, episcopal judges used procedures based on canon law in search of evidence. They required the presence of many witnesses, for the prosecution as well as the defense, and, frequently, they ultimately suspended cases for lack of evidence. When the defendants were declared guilty, the sentences were usually light and consisted principally of paying the costs of the proceedings, and sometimes exile or flogging.

Unlike the relative benignity displayed by its ecclesiastical judges with regard to witchcraft, Aragon’s secular tribunals, whose jurisdiction was confined to a municipality or region, pronounced summary judgments based on statutes that constituted authentic “states of exception” to the laws of the realm and were designed to prosecute certain kinds of criminals (such as witches or bandits) on the social margins of a particular jurisdiction. Thus, although the laws of Aragon prohibited the application of torture, the secular tribunals authorized it without limit for such “exceptional” offenses. Though Aragonese law required a formal accusation before a criminal trial could begin, secular tribunals allowed the opening of “exceptional” trials at the simple

will of the judge. He could convene such trials on festival days, at any hour of the day or night, at any place of his choosing, with or without the presence of legal counsel. Under “exceptional” procedures, the liberty of an Aragonese secular judge reached such extremes that he could even pass judgment without bothering to begin a trial. Most extraordinary of all is the fact that a judge who presided in accordance with newly minted laws about “exceptional” offenses could (and was in fact obliged to) apply them retroactively—that is, against defendants who had broken these laws before they existed.

These local magistrates regarded witchcraft as primarily a problem of public order against which it was considered necessary to fight in the most expedient way possible. True “witch hunts” in Aragon took place exclusively in small mountainous and isolated settlements. Because of the extreme rapidity of this method (many victims were hanged before legal proceedings against them had even begun) and because only a few widely dispersed local records have been preserved, we know little about local justice. However, we do know that women were the primary victims of secular prosecutions in Aragon. This was partly due to prosecutions that were not based on real deeds (as opposed to those carried out by ecclesiastical courts, or for that matter “exceptional” justice carried out against Aragonese bandits), but even more to the need to find a scapegoat, someone who could be blamed for all sorts of misfortunes and who could be sacrificed with impunity. In Aragon, as elsewhere in Europe, women, considered since antiquity the living incarnation of evil, perfectly personified diabolical dealings.

Despite the unevenness in our recorded evidence, we may divide Aragonese witchcraft prosecutions into two major categories: prosecutions for witchcraft (*brujería*), which included some mention of collective participation in witchcraft and an implicit pact with the Devil, and prosecutions for sorcery (*hechicería*), in which, rather than some demonic power of the accused, certain forms of conduct or practices considered superstitious were prosecuted. Witchcraft prosecutions constituted a minority, mostly because they were mainly initiated by local secular judges and the records have been lost—or they were never even convened and conducted as formal trials.

Most of the prosecutions for which the records have been preserved concerned defendants accused of evildoing by their neighbors because of certain quarrels or conflicts, or defendants who were authentic “magical professionals,” that is, men and women paid to resolve the problems of their clients; prominent among these professionals were those who specialized in curing ill health, divination of future events, location of treasure or lost objects, and, above all among women professionals, seduction of a desired man.

Aragonese witchcraft prosecutions enable us to establish a clear delimitation between masculine and feminine magic. Men dedicated to magic, as well as necromancers and a few members of the clergy, often came from southern France (or at least had contacts beyond the frontier). They were almost always associated with literate culture in general and in particular with *grimorios* (*grimoires*—magicians’ books for invoking demons), which they brought from neighboring France. On the contrary, the women devoted to magic tended to have much more humble backgrounds. The majority were illiterate, prostitutes or procuresses, often from Mediterranean coastal regions, and their methods were heavily influenced by the remnants of Morisco culture, long established in the Aragonese region.

ARDENNES

Several witchcraft trials are recorded from the Ardennes region (which includes parts of present-day France, Belgium, and Luxemburg), ruled by various territorial lords during the sixteenth and seventeenth centuries. The southwestern part of the region was characterized by a large number of unofficial lynchings of witches. Because few records from the Ardennes have survived, we do not know how many trials and executions for witchcraft took place. The figure of 20,000 executions, given in the older historiography, is certainly a complete exaggeration. Moreover, the history of the witchcraft trials from the region as a whole has not yet been comprehensively researched.

Although nearly all the inhabitants spoke Walloon, a French dialect, the Ardennes region was fragmented

politically, juridically, and religiously in the sixteenth and seventeenth centuries. Its northwestern part included the prince-abbey of Stablo-Malmédy, which belonged to the Holy Roman Empire and therefore used the 1532 imperial criminal code, the Carolina Code (*Constitutio Criminalis Carolina*). The largest state in the Ardennes region was the duchy of Luxembourg, a province of the Spanish Netherlands. In Luxembourg, legal procedure followed the criminal ordinances issued by the central Habsburg government in Brussels, supplemented by ordinances from the provincial administration in Luxembourg. The southern Ardennes included the duchy of Bouillon, divided after 1559 into two autonomous ministates: a small portion (including the town of Bouillon) under the prince-bishop of Liège and the southern principality of Sedan under the dukes of Bouillon. The southwestern area of the Ardennes belonged to France. In Bouillon, the ducal council supervised criminal legal procedure, while the French part of the Ardennes answered to the distant *Parlement* of Paris, the most important court in France.

Except for the principality of Sedan, whose rulers were Calvinist until 1635, the Ardennes region was Roman Catholic, but also fragmented religiously. Stablo-Malmédy belonged to the diocese of Liège and thus to the archdiocese of Cologne; the eastern administrative districts (*Propsteien*) belonging to Luxembourg formed part of the archdiocese of Trier, while the western administrative districts belonging to Luxembourg as well as the duchy of Bouillon formed part of the diocese of Liège. The French-owned Ardennes territory was subject to the archbishop of Reims.

Every territory and lordship in the Ardennes held witchcraft trials, and each subregion offered special particularities. In the northeast, large-scale witch hunts affected the prince-abbey of Stablo-Malmédy after 1585: at least 30 people from the villages of the prince-abbot had been executed for witchcraft by 1638. The sensational trial of Jean del Vaux, a monk from Stablo, who was suspected of having poisoned many of his fellow monks by means of witchcraft, began in 1592. Initially pursued by the Church authorities, it ended with his beheading in 1597. In his extensive, extremely detailed, and largely voluntary confession, the monk claimed to be a pupil of the (in)famous Dietrich Flade of Trier, and Del Vaux accused more than 200 other people of being witches. The wave of trials that resulted from his confessions and accusations lasted until 1598, when Stablo’s territorial lord, the prince-abbot Ernst of Bavaria, who was also prince-bishop of Liège, issued a decree prohibiting people from defaming others as witches. The Jesuit Martín Del Rio discussed the case in his well-known demonological treatise, *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599/1600). Stablo-Malmédy endured another cluster of witchcraft trials in the 1620s, when Aegidius

Dormael, a judge renowned for his severity as a witch hunter, pursued allegations of witchcraft against several prominent people in Stablo, including mayors of the town. A few of those accused of witchcraft managed to bring countersuits before the *Reichskammergericht* (imperial chamber court) in Speyer, alleging that due legal procedure had not been observed in their trials. Aegidius Dormael's brutal and corrupt machinations emerged all too clearly from the *Reichskammergericht* records: He pursued witchcraft trials primarily in order to increase his own power and to make a financial profit.

In the eastern and central Ardennes, the exact number of witchcraft trials and executions in the duchy of Luxembourg remains in doubt, although historians agree they were numerous. Marie-Sylvie Dupont-Bouchat (1978) presented the following statistics for witchcraft trials in the Walloon-speaking administrative districts of the Ardennes region that belonged to the duchy of Luxembourg; the statistics are based on regional account books that are unfortunately incomplete and thus provide only a partial picture of events. In Bastogne between 1550 and 1670 there were only 13 recorded trials with 2 executions; Chiny-Etalle recorded 26 trials with 16 executions between 1509 and 1670; and there were 23 trials and 11 executions recorded in Virton-Saint-Mard between 1518 and 1645. No reliable figures exist for the La Roche district. In the German-speaking district of Arlon, on the other hand, there were 39 trials between 1553 and 1687, all but one of which ended in execution. While these statistics are based only on the account books of the relevant *Proposteien* (administrative district) and omit the trials that took place in the legally autonomous lordships of the duchy of Luxembourg, they show a clear contrast between the relatively scattered and mild persecution of witches in the Walloon-speaking districts and the much larger-scale witchcraft trials that took place in German-speaking districts and lordships.

The theory that witchcraft trials occurred with particular severity in small lordships is supported by the events in the lordship of St. Hubert-en-Ardenne. Although part of the duchy of Luxembourg, it retained legal autonomy and thus could try witches without any external supervision. With only a few exceptions, the 21 witchcraft trials in St. Hubert-en-Ardenne took place during the rule of Abbot Nicolas de Fanson between 1611 and 1652 (Dupont-Bouchat 1999). A former pupil of the Jesuits, filled with counter-reforming zeal, Fanson was an enthusiastic champion of Tridentine reforms. Convinced that St. Hubert was infested with adulterers, demonically possessed people, and witches, Abbot Fanson wanted to establish a new moral order in the territory during his lengthy rule. All transgressions that were regarded as violations of the new Counter-Reformation order were policed with severity: blasphemy, sorcery, soothsaying, and sexual

offenses. Violations of sexual norms also became evidence against people suspected of witchcraft. During the peak of the witch persecution in St. Hubert between 1615 and 1630, witchcraft trials also increased in two neighboring territories, the duchy of Bouillon and the Luxembourg district of Bastogne. The inhabitants of St. Hubert-en-Ardenne had already been sensitized to the alleged activities of the Devil even before the seventeenth-century witchcraft trials, because the abbey was a well-known place of pilgrimage, where people possessed by the Devil went to be exorcised, and where those who had been bitten by wolves (or allegedly by werewolves) or who suffered from rabies and epilepsy came to be healed. In the late sixteenth century, Peter Binsfeld, the suffragan bishop of Trier, had dedicated an edition of his demonology to Abbot Jean Balla, who ruled St. Hubert between 1585 and 1599. Counter-Reformation influences affected other nearby territories in the Ardennes region as well as St. Hubert-en-Ardenne. A lengthy economic crisis increased the fear of witches, whipped up further by the activities of the Jesuits, who constantly warned against the destructive power of the Devil in sermons and catechisms.

In the southern Ardennes, only a few trials (the number is still unknown) took place in the principality of Sedan under its Huguenot dukes (De la Marck and La Tour d'Auvergne) before they turned Catholic in 1635. Meanwhile, in the northern part of the duchy of Bouillon (including the city of Bouillon), which had belonged since 1559 to the prince-bishop of Liège, Catholic officials recorded 73 trials (Dupont-Bouchat 1978), but only 15 executions (21 percent) between 1564 and 1685 (Bodard 1964). However, the parts that belonged to the Kingdom of France were characterized by many unofficial lynchings of witches (Soman 1988). Here, the *Parlement* of Paris tried to assert its legal authority in the face of opposition from local officials. Because the *parlement* maintained a relatively restrained approach toward the legal treatment of witchcraft, the local inhabitants resorted to a series of lynchings against suspected witches. Perhaps as many as 300 people were drowned or burned in this part of the Ardennes and in the neighboring French territory of Argonne without proper trials.

ARRAS

The series of witchcraft trials and appeals known as the *Vauderie d'Arras* began in this Burgundian city in 1459 and ended in Paris in 1491. The trials actually lasted less than a year, from November 1459 until October 1460; the appeals process, however, extended over thirty years. From this well-documented series of trials and appeals emerged our most complete description of late medieval witchcraft anywhere in Europe, including material on the connection of witchcraft with heresy via the Waldensians. Religious, social, economic, and political factors all played roles in the *Vauderie d'Arras*. Despite the sensation caused by the events in Arras, their subsequent influence on the development of witchcraft beliefs, practices, and prosecutions was soon overshadowed by the appearance of the German-based *Malleus Maleficarum* (The Hammer of Witches, 1486), by Heinrich Kramer.

The trials at Arras stemmed from a Dominican chapter-general held at Langres in ducal Burgundy earlier in 1459, attended by the inquisitor of Arras, Pierre le Broussart. One event then taking place at Langres was the heresy trial of a hermit formerly from the county of Artois, with Arras as its capital. Armed with the names of other heretics gathered at Langres, le Broussart returned to Arras determined to root out the menace. The crimes with which the defendants were charged were known collectively as *Vauderie* (because these trials were directed at the heresy called *Vauderie*, “Waldensianism,” seen as associated with witchcraft) and the criminals themselves as *Vaudois* (Waldensians). Whether or not the confusion between Waldensianism and witchcraft was deliberate, by this time the defini-

tion was fixed: The Waldensians were heretics, and their practices were witchcraft. A manuscript copy of Martin Le Franc's *Champion des Dames* (The Defender of Ladies) made at Arras in 1451 already incorporated the witchcraft–Waldensian–Vaudois confusion. In a marginal illustration two women were shown flying, one on a broomstick and the other on a staff, while the rubrics said “des Vaudoises” and “passe martin.” (The latter referred to the eve of Martinmas, November 11, a time when witches traditionally held their assemblies). While other contemporary tracts were devoted to condemning Waldensians as heretics, descriptions of their practices were now attributed to witchcraft.

The first arrest was made on November 1, 1459, the Day of All Saints. Four vicars-general, acting in the absence of the bishop of Arras, Jean Jouffroy, began the proceedings. Jacques du Bois, the dean of Notre Dame d'Arras, who quickly took charge, soon joined them. The second person arrested was Jean Lavite, a well-known local painter and poet, on February 25, 1460. Lavite was soon forced to confess and incriminated many others. Six more people were arrested by early April, including Huguet Amery, formerly in the service of Bishop Jouffroy. While the four vicars-general grew uneasy with the way events were unfolding, Pierre le Broussart and Jacques du Bois, now joined by the suffragan bishop, the Franciscan Jean Fauconnier, forced them to continue.

On May 8, a general assembly of the clergy of Arras decided the fate of seven of the eight prisoners (the other having been found hanged in his cell the previous night). On the following day, Jean Lavite, five women, and the body of the dead prisoner were led to a high scaffold that had been erected in the courtyard of the episcopal palace; only Huguet Amery, who was resisting torture, was not present. The inquisitor's sermon repeated all of the charges: these *Vaudois* flew to their assembly in the woods, where they found the Devil in the form of a man or an animal and adored him; then they spat upon the cross; then after feasting they engaged in the sins of sodomy and buggery, plus others that the inquisitor dared not mention before innocent observers. Amid considerable unrest in the crowd, six of the defendants were sentenced to die at the stake. Meanwhile, ten more people were arrested.

A further round of arrests, beginning on June 22, 1460, reached the city's rich and powerful, including two wealthy citizens and Payen de Beaufort, a nobleman. While these new prisoners were being interrogated, the previous group was prepared for the second *sermo generalis* (general sermon) on July 16. Seven more victims were sent to the stake, although two were spared and imprisoned. The citizens grew restive, but that very evening another series of arrests began; one of the town's richest men, Antoine Saquespée, was arrested after dark and conducted to prison. On the following

day two more arrests were made, while three other men fled as far as Paris. After this, only two more people were arrested on accusations of *Vauderie*, one on July 27 and the last on August 13.

With some wealthy and powerful men now behind bars, the prosecutions took a new turn. Relatives of the prisoners launched appeals to their overlord, Philip the Good, duke of Burgundy, who summoned an assembly of scholars in Brussels. Although they reached no conclusions, Duke Philip sent the first herald of his Order of the Golden Fleece to observe the proceedings in Arras and quell any rumors that the duke favored them. Inquisitorial zeal waned after the Brussels convention, yet a third *sermo generalis* was held on October 22, 1460, where the Seigneur de Beaufort was sentenced to prison and fined an enormous sum, most of which was earmarked for Duke Philip's proposed crusade against the Turks. Of the two others arrested with Beaufort, one was sentenced to prison, the other to the stake as a relapsed heretic. Finally, after withstanding torture, Huguet Amery was sentenced to thirty years on bread and water—in absentia, after he had escaped from jail. During the final months of 1460, the remaining prisoners were released after a series of formal hearings.

The effect of the trial of Waldensians in Arras was immediate. Sources, using the words *sorcherie* (sorcery) and *Vauderie* (Waldensian heresy) as synonyms, describe witchcraft trials in the French-speaking southern regions of the Burgundian Low Countries in a similar way. Thus, at Nivelles, a woman was banished in 1459 on suspicion of being a *Vaudoise* or *somière*. Sorcery became intertwined with fifteenth-century demonology, which now included the pact with the Devil and his sect of worshippers. Short-term effects of the trials at Arras also included the initiation, in 1460, of large-scale inquiries about possible witches at Tournai, Douai, and Cambrai, and the publication of books (most notably by Johann Tinctor) and the preaching of sermons about the new dangers of the conspiracy of the Devil and his servants, the witches.

Even before the trials ended, appeals were made to both ecclesiastical and civil authorities. The success of several appeals had a calming effect on the citizens of Arras, and popular opinion soon placed the inquisitors on the defensive. Popular ballads attacked those who had fostered the trials, especially Jacques du Bois, Jean Fauconnier, the vicars-general, and their lawyers. Although ruled by Burgundian dukes, the province of Artois fell under the appellate jurisdiction of the French *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France), which began an official review of appeals from Arras on May 21, 1461. Political and diplomatic considerations influenced the appeals; they concentrated on judicial procedure, not on the substance of the charges, although the *parlements'* official records also contain considerable

details about them. In 1468, the plaintiffs received a favorable decision from the *parlement*, but it could not be enforced. This finally happened in July 1491, over thirty years after the *Vauderie d'Arras* had begun. Only one of the original victims of the tragedy remained—the extremely durable Huguet Amery.

ART AND VISUAL IMAGES

An iconography and visual language for witchcraft developed in the last decade of the fifteenth century and the first decade of the sixteenth. It was primarily the work of Hans Baldung Grien and other south German artists, apparently stimulated by the increasing attention given to this subject in proceeding decades in treatises, sermons, and other literary publications. Experiments in printmaking by artists and the inclusion of woodcuts in the new print media by printers eager to attract a broader readership also played a key role in the visual elaboration of this new subject. Although witchcraft scenes were also depicted in drawings and paintings, the overwhelming majority of images produced prior to the seventeenth century were prints. Through frequent reproduction, these images served initially to link witchcraft to themes of sexual and moral disorder, and from the mid-sixteenth century they emphasized the dangers witchcraft posed for a Christian society. From the later seventeenth century, such images frequently became an object of parody and ridicule because of growing skepticism concerning witchcraft beliefs.

Few images of magic, sorcery, and witchcraft have survived before the 1490s. A gradual demonization of sorcery, which laid the basis for a new iconography of witchcraft, can be found in images of milk stealing in many fifteenth-century wall paintings in northern German and Scandinavian churches, and also in the appearance of the "new vice" of sorcery, as in the second redaction (1355) of the popular allegory of Christian life by Guillaume de Deguileville, *Pèlerinage de la vie humaine* (Pilgrimage of Human Life). In the English verse translation of this work by John Lydgate (Pilgrimage of the Life of Man, 1426), a character called Sorcery was depicted as learning her craft from

the Devil as part of a group of women shown preparing ointments and herbal potions with sieve, mortar, and pestle. Sorcery was also directly linked to the Devil through its identification with the Waldensian, or *Vaudois* heresy. In Flemish miniatures of the late 1460s and early 1470s from three French versions of the *Contra sectam Valdensium* (Against the Waldensian Sect) by the Cologne theologian Johann Tinctor, Waldensians were shown worshipping the Devil in the form of a goat and riding animals, brooms, and other implements through the sky. This association was consolidated later in the century by illustrations of the so-called witch of Berkeley being carried off by the Devil on a black horse in the five editions of the *Nuremberg Chronicle* published between 1493 and 1500.

A radically new iconography of witchcraft began with a series of six woodcuts, which appeared in more than twenty illustrated editions of Ulrich Molitor's *De laniis et phitonicis mulieribus* (Concerning Witches and Fortunetellers, 1489) before 1510. It would be difficult to exaggerate their importance for the iconography of witchcraft. The same scenes were recycled numerous times with only slight changes. They included witches laming a man with a poisoned arrow, embracing a devil, riding a wolf or sticks through the sky, enjoying their meal and conversation in the countryside, and creating a hailstorm around a cauldron. The significance of this last scene, which achieved considerable prominence through its reproduction as a title page in at least seven cases, was that for the first time witchcraft was represented as the group activity of women gathered around a cauldron.

During the first two decades of the sixteenth century, such south German artists as Hans Baldung Grien, together with Albrecht Altdorfer, Albrecht Dürer, Hans Schäufelein, and Urs Graf, successfully consolidated and extended the new iconography of witchcraft. This iconography found its most influential form in Baldung's 1510 single-leaf, chiaroscuro woodcut, usually entitled *Witches' Sabbath*, but more appropriately called *A Group of Witches Around a Cauldron*. The woodcut was critical in establishing the image of women gathered around a cauldron as a widely recognizable visual code for witchcraft. Baldung borrowed the key image of the witches' night ride from Albrecht Altdorfer's pen-and-ink drawing of 1506, *Witches Riding Animals Through the Air*, and the idea of witchcraft as social, political, and religious inversion from the earlier engraving of his master, Albrecht Dürer, *Witch Riding Backwards on a Goat* (ca. 1500). Baldung's image of a group of witches seated within a triangle of forked sticks also established the cooking stick as one of the most common signifiers of witchcraft, especially among German artists, for the next century and beyond; while his emphasis on the naked bodies of witches and sexual

allusions in the cooking of sausages helped emphasize the sexual and gender threat of witchcraft as fundamental to its link with moral disorder. Baldung continued to develop such ideas over the next three decades, and his images continued to be influential throughout Europe for the next century and more.

The many copies produced by German artists over the following decades demonstrated contemporary interest in Baldung's work. The most significant image modeled on his work was a woodcut, probably designed in his workshop and first published as an illustration to a collection of sermons by the Strasbourg cathedral preacher, Johann Geiler von Kaysersberg, entitled *Die Eneis* (The Ants, 1516). It depicted a witches' night ride with strong sexual overtones, and helped consolidate Baldung's sexual interpretation of witchcraft, achieving widespread circulation in five different editions of Joann Pauli's popular work, *Schimpf und Ernst* (Humor and Seriousness, 1522). Different versions of this woodcut continued to be reproduced until the 1580s, as title pages to works by Johann Weyer, Reinhard Lutz, Ulrich Molitor, Paulus Frisius, and Abraham Saur.

Key elements from Baldung's iconography were quickly incorporated into the witchcraft images of artists in Germany and also beyond. A woodcut by a former fellow apprentice in Dürer's workshop, Hans Schäufelein, *The Evils of Witches*, which included riding witches and cauldrons, was published in the 1511 edition of Ulrich Tengler's *Der neu Layenspiegel* (A New Mirror for Laymen), a revision of Tengler's 1509 *Layenspiegel*. Two woodcuts featuring cauldrons were included in the second (1518) edition of Thomas Murner's *Narrenbeschwörung* (The Exorcism of Fools), to illustrate the relationship between sorcery and sexual desire. A woodcut depicting milk stealing by sorcery in Geiler's *The Ants* also featured a cauldron among the expected iconography. The 1526 painting by the Dutch artist, Jakob Cornelisz van Oostsanen, *The Witch of Endor*, made a radical break from traditional representations of the biblical story by including a group of witches around a grill, seated on goats, cooking sausages and drinking. Lucas Cranach used the imagery of naked witches brandishing cooking sticks and distaffs while riding animals through the sky in his four *Melancholia* paintings (1528–1533), in order to represent a night procession of witches and spirits, the so-called Furious Horde of popular Germanic folklore, and identify the powers associated with the melancholic imagination as diabolical.

Why Baldung and his contemporaries developed such a strong emphasis on a gendered and sexual understanding of witchcraft remains unclear. It has been suggested that it was the result of humanist interest in the classical world rather than a response to contemporary concerns about witchcraft. But more research is necessary to

explore the links between witchcraft images and contemporary discussion concerning not only witchcraft, but also related themes such as gender, the body, cosmic order, and diabolical agency. It needs also to be recognized that this new iconography did not wholly displace older traditions of depicting sorcery as the work of an individual. The Augsburg artist, Hans Burgkmaier, chose an old and hunched female figure with a devil on her shoulders to represent the “black arts” in a woodcut he completed ca. 1514 for the book project, the *Weisskunig* (The White King). The most widely disseminated representation of witchcraft in the sixteenth century was a woodcut condemning healing by sorcery, which was created by Jörg Breu and first published in Johann von Schwarzenberg’s *Memorial der Tugend* (Memory Prompts to Virtue, 1534). The woodcut featured individual healers of both genders as representatives of witchcraft, while also introducing a small yet significant visual cue of a spewing cauldron and hailstorm.

By the second half of the sixteenth century, images of witchcraft had significantly increased in number and also changed in emphasis. Its centers of production moved north, with Flemish and Dutch artists playing a greater role. The new emphases can be usefully grouped under seven headings:

1. *The crimes and punishments of witches.* Such images fed the market created for sensational news in the later sixteenth century. Erhard Schoen and Lucas Mayer from Nuremberg, Lucas Cranach the Younger from Wittenberg, and Georg Kress of Augsburg were just a few of those who created these visual news reports of witchcraft. Broadsheets also satisfied the sixteenth-century interest in providential signs. The Swiss pastor, Johann Jakob Wick, between 1560 and 1588 gathered an extremely rich collection. Among the mass of correspondence, reports, pamphlets, and broadsheets, his collection also included many colored pen drawings that Wick inserted into his texts; more than twenty of these depicted the crime of witchcraft. For Wick and his readers, they were visual signs of the terrible state into which a sinful European Christendom had fallen; witches were instruments of the Devil in his unrelenting struggle against Christ’s church.
2. *The long history of witchcraft.* In the 1560s, Pieter Brueghel the Elder created two very influential drawings that depicted the struggle between the apostle James and the ancient magician Hermogenes. In 1565, they were engraved by Pieter van der Heyden, and subsequently copied or adapted by later artists. Witchcraft, represented by riding women and a series of belching cauldrons, was simply one of the many diabolical arts over which this pagan magician was believed to have exercised control. The longer history of witchcraft was also

stressed when artists depicted such classical sorcerers and witches as Palaestra, Me roe, Pamphile, Medea, or Circe. These ancient figures sometimes took on such characteristics of contemporary witches as wild hair or the riding of domestic instruments, as in the woodcuts of the Monogrammist NH for the 1538 German translation of *The Metamorphoses* (or *The Golden Ass*) of Apuleius of Madaura; at other times, they reflected contemporary discourse about the witch’s power as diabolical or sexual, as in the many images of Circe produced for editions of Ovid, Virgil, or Renaissance emblem books. The witch was also given a biblical past, primarily through illustrations of the story of the necromancer or witch of Endor (1 Sam. 28:3–20). Jakob Cornelisz van Oostanen radically changed the traditional iconography of this subject by inserting elements from Baldung’s work into his painting of 1526. Then, in Wittenberg in 1572, the subject was included for the first time in a Luther Bible, in a woodcut probably by Johann Teufel, which was meant to encourage secular rulers to eliminate witches from their territories. Illustrations in Bibles continued into the eighteenth century, with the emphasis firmly on the figure and techniques of the witch.

3. *A link to non-Christian peoples in the present.* In the *Historia de Gentibus Septentrionalibus* (History of the Northern Peoples), a richly illustrated and immensely popular account of Scandinavian culture by the Swedish archbishop Olaus Magnus, first published in Rome in 1555 and often republished in various European languages, a series of woodcuts depicted Scandinavian magic and sorcery and imputed them to the power of the Devil. One woodcut even presented the well-known, and by this time also frequently illustrated, story of the witch of Berkeley, in order to highlight the relationship between the pagan sorcerers of Scandinavia and the witches of Christian Europe. A similar relationship was created between contemporary witches and the Indians of the New World. The Dutch artist, Crispin de Passe, in a late sixteenth-century engraving based on a design by his Flemish collaborator, Martin de Vos, depicted Amerindian cannibals and European witches as children of a common father, Saturn, the planetary god whose rule was based on violence, namely the castration of his father and the devouring of his children. Witches were thereby identified as savage and alien, and could be more easily imagined as castrators and cannibals. Surviving prints of the same subject by Henri Leroy and Jan Sadeler the Elder suggest that the comparison enjoyed considerable currency.
4. *Witches as savage and cruel.* The Dutch artist, Jacques de Gheyn the Younger, who created a large number of drawings of witchcraft in the first decade of the

seventeenth century, exemplifies this tendency. His witches cook up body parts, suck blood from a child, disembowel a male cadaver, and nail a frog to the floor. They represent a theater of cruelty analogous to contemporary images of cruelty and atrocity associated with religious conflict, martyrdom, and the colonization of non-European peoples, and reflect the more brutal and uncompromising values of confessionalized Europe, whereby the different Churches aligned with the state to control all aspects of religion and daily life. In the 1608 edition of Francesco Maria Guazzo's *Compendium Maleficarum* (A Summary of Witches), the most profusely illustrated witchcraft treatise published, one finds among the largely routinized images of witchcraft a new image of two witches basting a child they are roasting over a fire. Violence was certainly a part of witchcraft imagery earlier in the century, nowhere more powerfully than in a large engraving by Agostino Veneziano, usually entitled *Lo Stregozzo* (The Witches' Procession, 1518–1530?), which depicts a wild female figure crushing the life out of small children at her feet. But from the 1550s, and especially from the 1590s, such violence became more frequent and intense. The Flemish artist, Frans Francken the Younger, who painted at least six immensely complex scenes of witches' assemblies in the first decade of the seventeenth century, always included graphic references to the violence of witchcraft, whether through dismembered body parts, or in the case of his Vienna painting, through the decapitation of a victim.

5. *The stereotype of the witch as an ugly crone with sagging, dried-up breasts.* The predominant image of the witch as a postmenopausal figure who denied life and nurture marked a significant change from the sexually seductive figure of the early sixteenth century. This shift was a direct consequence of the emphasis on the witch's cruelty, and probably also marked the influence of the literary stereotypes created by the new demonological treatises. The younger, attractive female figure did not wholly disappear, as is clear from the work of such artists as Frans Francken the Younger, David Teniers the Younger, Matthäus Merian the Elder, and Adrian Huberti. But younger female figures remained exceptional, often the center of attention by a group of older women who prepared them for the night ride and demonic copulation.
6. *Witchcraft as a mass phenomenon characterized by vast Sabbats.* The earliest surviving illustration of a witches' Sabbat is a drawing from Johann Jakob Wick's collection that illustrated a text of 1570. The number of witches depicted was small and the range of their activities limited, just as in a title-page woodcut to the 1591 Munich edition of the

Hans Sebald Beham's Three Witches and Death depicts the charged sexuality/pornography (note the robust nudity and the right hand of the middle witch), the ultimate effect of the working of magic (death), and the social and moral disorder personified by witches and witchcraft. (Hexen: Analysen, Quellen, Dokumente. Directmedia Publishing GmbH: Berlin, 2003)

Tractatus de Confessionibus Maleficorum et Sagarum (Treatise on Confessions of Witches and Sorceresses, 1589) by the suffragan bishop of Trier, Peter Binsfeld. But just two years later, in 1593, an unknown artist produced a detailed engraving of the various Sabbat activities said to have occurred in the diocese of Trier as an illustration to an Erfurt pamphlet by Thomas Sigfridus. This image depicted large numbers of witches engaged in varied activities, including dancing, playing music, feasting, drinking, preparing potions and powders, riding animals and various implements, and cavorting with demonic partners. The engraving marked the beginning of a new iconography of the Sabbat and was reproduced in slightly different versions over following decades. Sections of it were also copied, not least by the Nuremberg artist Michael Herr, who designed a vast and spectacular witchcraft scenario that was etched by Matthäus Merian the Elder in 1626. This work influenced the woodcut that

accompanied the various editions of Johann Prätorius's work (1668) on the mountain known in Germany as the Blocksberg, and other copies and versions into the eighteenth century. Another famous Sabbath to exercise considerable influence was the 1613 etching by the Polish artist, Jan Ziarnko, used to illustrate the work of the French magistrate, Pierre de Lancre.

7. *Witches' assemblies indoors*. The moving of witches' assemblies from the wild forest landscapes indoors is especially marked in the work of David Teniers the Younger, the Dutch painter who became the most prolific illustrator of witchcraft scenes in the mid-seventeenth century. Probably influenced by Pieter Brueghel, Frans Francken, and also by de Gheyn, who began to locate some witch scenes in domestic interiors, Teniers succeeded in domesticating the activities of witches as no other artist before him. As in the paintings of his later copyist, Jacques Aliamet, and other artists such as Jaspar Isaac, Teniers's witches gather in kitchens, around chimneys and hearths, where they engage in their evil rituals. They appear as everyday figures within the familiar domestic space of the household, which was fundamental in this period to the proper functioning of church and state.

From the mid-seventeenth century, an increasing number of voices began to be raised against the credulity of witchcraft beliefs, and trials for witchcraft became fewer or even ceased in western Europe. Satire, parody, and ridicule began to be expressed more frequently in witchcraft images. The Neapolitan artist, Salvator Rosa, for instance, created a series of eerie witchcraft tableaux in Florence during the 1640s, filled with horror, parody, and burlesque. A French printmaker, Jean Grépy, directly ridiculed witchcraft in an etching (possibly based on a lost painting by Bartholomäus Spranger), which illustrated the 1710 edition of the comic parody by Laurent Bordelon, *L'histoire des imaginations extravagantes de Monsieur Oufle* (The Story of the Extravagant Imaginations of Monsieur Oufle). It was not only Bordelon's fool (in French, *le fou*, whence Oufle) whom Crépy had in his sights; his etching was also a visual parody of Ziarnko's Sabbath of a century earlier. His countryman, Claude Gillot, another early eighteenth-century artist influenced by Bordelon's work, also produced a significant parody of a witches' Sabbath, relegating such beliefs to the world of fantasy and illusion. Likewise, William Hogarth's brilliant satirical cartoon of 1762, *Credulity, Superstition and Fanaticism: A Medley*, represented witchcraft as a puppet manipulated by a preacher-puppeteer.

After the mid-eighteenth century, much witchcraft imagery had abandoned the traditional discourse of witchcraft. Artists as varied as Johann Heinrich Füssli,

Francisco Goya, Félicien Rops, Anton Wiertz, Alfred Kubin, and Ernst Barlach used witchcraft to explore other topics, such as the artistic imagination, superstition and enlightenment, decadence and eroticism, nature and destiny. As belief in witchcraft disappeared, the fantasy witches of popular literature and film began to proliferate.

ASTROLOGY

As late as the mid-seventeenth century, astrology played a role in helping those who feared they might be victims of witchcraft. In some areas, it still does. Astrology is literally defined as the “word of the stars,” as distinct from astronomy, the “law of the stars.” Thus, while astronomy deals primarily with the measurement of the stars’ positions, and hence with their motions, astrology is concerned with the significance that human beings attach to those celestial movements in relation to their own affairs. The discipline of astrology is thus so broad that it is often necessary to talk of “astrologies” rather than of one monolithic astrology to which all astrologers subscribe.

The fundamental philosophical debate in astrology distinguishes belief in real planetary influences, which themselves may be conceived as either physical or metaphysical in nature, from an astrology of “signs” and “omens” in which a divine force communicates with humanity via the stars. An additional debate pits an astrology in which the stars reveal a predetermined future against one in which the future is negotiable, either because planetary influences are only tendencies or because the omens sent by the gods may be withdrawn if suitable supplications are made. A common distinction in the Middle Ages distinguished “natural astrology,” in which the planets might be the cause of general influences (for example, Mars causes heat, while the Moon brings rain) from “judicial astrology,” in which an astrologer uses a horoscope (a map of the heavens at a particular moment) to make specific judgements about particular events such as wealth, health, family happiness, and professional success. Judicial astrology is divided, in turn, into four branches, genethialogy (modern natal astrology; the interpretation of birth charts), revolutions (modern mundane astrology; the study of history and politics), interrogations (modern horary astrology; the use of horoscopes to answer precise questions), and elections (the selection of auspicious moments to inaugurate new enterprises). In its simplified form, using only the Sun and Moon, electional astrology provides the rationale behind most religious calendars, including the Jewish, Christian, and Islamic. Although most astrological texts since classical times have dealt with the interpretation of celestial alignments, the practice of astrology has frequently involved the active manipulation of the future. From this is derived an astrological magic, including the creation of planetary amulets at auspicious

moments, which survived in the West until the Renaissance, when one of its prime advocates was Heinrich Cornelius Agrippa von Nettesheim.

HISTORY

Complex systems of astrology developed independently in three regions: in central America, perhaps as early as two thousand years ago; in China, probably in the first millennium B.C.E.; and in Mesopotamia (modern Iraq), prior to 2000 B.C.E. (the form from which Western astrology is derived). The earliest fragments of astrological tablets in Mesopotamia date back to ca. 2200 B.C.E., and the first complete set of omens, based on the planet Venus, occurred in the so-called Venus Tablet of Amisaduqa of ca. 1646 B.C.E. Assyrian emperors made extensive use of astrologers. Their patronage stimulated further innovation: The modern twelve-sign zodiac appeared in the sixth century, and the first known birth chart dates to 410 B.C.E. Encouraged by the conquests of Alexander the Great in the 330s, the techniques of Mesopotamian astrology spread east to India and west to Egypt, where they fused with Egyptian religion and Greek philosophy (especially Plato and Aristotle) and mathematics to create an astrology that is both philosophically and technically recognizably modern. By the first century C.E., we can recognize all the competing philosophical distinctions outlined above, including astrologies that favored signs or influences, materialism or spirituality, and predestination or freedom of choice. We also see the introduction of daemons, supernatural entities that St. Augustine confused with demons. A combination of the collapse of the Roman Empire and literacy in western Europe, and hostility from Christianity in Eastern Europe and the Near East, then moved its focus to Persia and India. The Islamic rediscovery of ancient learning led to astrology’s reintroduction to the Near East and Moslem lands in the Mediterranean. From there it was reintroduced into western Europe in the twelfth century and became an accepted part of alchemy, medicine, and political prognostication. Its application to individual lives always remained controversial, however, because of the suspicion that it denied the freedom to make moral choices and hence to achieve salvation. A further influx of Greek mystical material (Plato and the *Corpus Hermeticum*) in the fifteenth century reinforced astrology’s credibility. There was, however, substantial scholarly criticism of astrology in early modern Europe, together with attempts to reform it, notably by Jean Bodin and Johannes Kepler.

By the late seventeenth century, astrology had lost its credibility in educated circles in the West. The ancient tradition has continued unbroken until the present day in India, while in the West it survived initially only in popular almanacs, partially recovering in the early

twentieth century under the aegis of the Theosophical Society and the New Age movement.

ASTROLOGY AND WITCHCRAFT

Keith Thomas noted that astrology and witchcraft are essentially rival explanatory models, because to suspect one's neighbor of a malign influence was to rule out possible astral causes (1971, 757). Although there was no reason that a witch might not be the intermediate agent of some misfortune which had a celestial origin, Thomas described a client of the astrologer Richard Napier in 1635 who "feared he was bewitched *or* blasted by an ill planet," as if the two possible causes are mutually exclusive. Because astrologers were frequently consulted by clients who believed they had been bewitched, they were obliged to create tests to ascertain this: The sixteenth-century English astrologers Richard Saunders and Joseph Blagrave asserted that astrology offered the only certain means of discovering witchcraft. The surviving casebooks of William Lilly, who acquired an international reputation in the 1640s–1660s, contain well over fifty cases of suspected witchcraft, twenty-three of which date from 1654 to 1656, the highpoint of Cromwellian rule in England (Thomas 1971, 756–757).

An astrologer testing for witchcraft would most likely cast an "interrogation," a horoscope set for the moment of the asking of a question such as, "Is the subject bewitched?" If the subject was sick and witchcraft was the suspected cause, an alternative would be to cast a "decumbiture" (literally, "lying down"), a horoscope set for the moment that the diseased individual took to their bed. Lilly, whose 1647 text *Christian Astrology* provided the first major compendium of medieval astrology to be published in English, set out the rules for establishing whether witchcraft was a cause of illness or distress, advising on treatment and assessing whether it might be overcome (Lilly 1985, 56, 250, 464–466, 640–642). In the horoscope, witches were indicated by the "twelfth house," the sector of sky immediately above the eastern horizon, and by the planet ruling the sign of the zodiac in which the house cusp (its beginning, in this case its uppermost point) was placed. For example, if the uppermost point of the twelfth house was in Leo, the ruling planet would be the Sun, Leo's "ruling planet." Lilly defined six rules for the positions of house rulers in which he had "found more certain (the) suspicion of Witchcraft." For example, if the twelfth house ruler was in the sixth house (i.e., immediately below the western horizon), witchcraft was likely. Saturn and Mars were likely both to reveal the presence of witchcraft and indicate the subject's vulnerability to it, while Venus and Jupiter might suggest the opposite. Only five of the horoscopes in Lilly's casebooks included a judgment, and all of those were negative.

Other astrologers are known to have diagnosed witchcraft. For example, in 1654, Christopher Hall, the

Norfolk astrologer, declared that the cause of a client's disease was one of three witches in her home village. Thomas noted that the very existence of such astrological work confirmed the existence of witchcraft at a time when its reality was openly challenged (1971, 757). Lilly certainly believed that "people are troubled with witches . . . in many places of this Kingdome" (1985, 465). The same applied to astrological palliatives: If witchcraft had not been believed to be real, then there could be no reason for such remedies. These treatments, which could be adapted for cattle, were not explicitly astrological but worked according to the principles of sympathetic magic. For example, if the horoscope established the presence of witchcraft, then it might be overcome if a tile from the witch's house was heated in a fire, then had the urine of the bewitched person poured on it, and was finally returned to the fire until it was very hot.

Although such practices had disappeared by 1700, at least from educated circles, the twentieth century saw a number of interesting developments. In the United Kingdom and the United States, most contemporary Wiccans pay great attention to the Moon as the embodiment of the mother goddess, in a conscious evocation of what are believed to be ancient traditions, and some also study the psychological astrology that has developed, largely under the influence of the theosophists and the psychologist C. G. Jung. Meanwhile, in Latin America, where belief in witchcraft is strong, astrologers are still consulted in cases of suspected witchcraft and in some instances still use the traditional rules.

AUGSBURG, IMPERIAL FREE CITY OF

Few other towns offer a documentation as rich as the imperial free city of Augsburg. The sheer number of handwritten and printed chronicles, the quality of court records (*Urgichtenakten*, *Strafbücher*), council minutes, account books, tax records, and other sources

render it almost impossible for any capital punishment between 1400 and 1800 to escape scholarly attention; between 1580 and 1650, when witch hunting climaxed in central Europe, the documentation is virtually complete, and all court trials can be studied in detail.

Founded by the Romans in 15 C.E., Augusta Vindelicum became the capital of the Roman province Raetia secunda. The inhabitants became Christians in the third century, and the cult of the female martyr St. Afra survived the Dark Ages. When bishops were again recorded in the eighth century, they had become lords of the town. However, the Holy Roman Emperor Friedrich I Barbarossa stripped them of their legal rights in 1167, and already in 1250 the citizens rose up against their bishop in an insurrection. Augsburg became an imperial free city, and adopted its own law in 1276. With its favorable legal position, and a location midway between Venice and Antwerp, Augsburg became an attractive business center, and in the early sixteenth century Jakob Fugger of Augsburg was considered the wealthiest banker in Europe. Emperor Maximilian I was ridiculed as burgomaster (mayor) of Augsburg, because he enjoyed her riches so frequently. His successor Charles V held his most important imperial diets there, at which the Protestants defined their belief (in a document known as the *Confessio Augustana*) and secured Lutheranism's legal recognition at the Peace of Augsburg in 1555. However, later in the sixteenth century, Augsburg's textile industry declined, while its bankers and patricians joined the landed nobility of neighboring territories, or became lords or even princes themselves, like the Fuggers.

Although Augsburg became central to the European postal communication system, the last imperial diet was held here in 1582. A city of about 40,000–50,000 inhabitants around 1600, its population declined sharply during the Thirty Years' War as a consequence of severe epidemics in the 1620s, 1630s, and 1640s. At the same time, the export industries lost their markets and never recovered after the war. Although Augsburg remained an important place for printers, artists, and silversmiths, with roughly 20,000 inhabitants in the second half of the seventeenth century and throughout the eighteenth century, it had lost its former importance. In 1806, Bavaria sacked the imperial free city.

From the 1520s, Augsburg was a biconfessional town, mainly Protestant, but with a Catholic minority supported by the bishop, the dukes of Bavaria, and the Habsburg emperors. Despite the confessional frictions, Augsburg remained throughout the sixteenth century a town of urban civility, relatively tolerant of religious dissidents and Jews, and moderate in its attitude toward *crimina excepta* (the excepted crimes).

The frequency of witchcraft accusations closely followed the ups and downs in neighboring territories. In 1590, when witch hunts were conducted in Bavaria, the

prince-bishopric, and the Fugger lordships, Augsburg tried eight women, and in 1590–1594 witchcraft trials climaxed with no less than twenty-one court cases. However, although witchcraft and sorcery were prosecuted persistently, with roughly two court cases per year, the judges (*Strafherrn*), deputies of the town council, considered none of these “witches” dangerous. Rather they were treated as stupid members of the underclass, and sometimes their interrogations resemble ethnographers' interviews, leading the scholar Lyndal Roper to develop in 1994 the idea that witchcraft trials were generally based upon negotiations between the accused and the judges. Despite scores of trials, which provide detailed insights into the local magical underworld, throughout the sixteenth century nobody ever received capital punishment for witchcraft in the imperial free city of Augsburg. The authorities knew about the “witches,” but witchcraft was only prosecuted on demand from neighbors, who were usually as deeply involved in sorcery as the accused.

The mood in Augsburg changed as radically as the economic situation following the Thirty Years' War. In 1625, for the first time, the town court condemned a woman to the stake, mainly because of the accusations of her young daughter, who claimed to be a child witch. This case was quite extraordinary, and Augsburg did not respond to the waves of mass persecutions throughout the region in the later 1620s. It was only after the war that urban self-confidence collapsed. The quality of the documentation declined as much as the education of the city's lawyers and theologians. Even Protestant superintendents like Gottlieb Spitzel were by then ready to conduct exorcisms; he reported approvingly one of the most scandalous local witchcraft trials, and compared it to contemporary events in Sweden and New England. Although there were far fewer witchcraft trials after 1650, even in correlation to the declining population, the number of capital punishments rose sharply. Between 1654 and 1699 no less than sixteen witches were convicted and executed, all of them female, and many of them either child witches, or accused by young girls. It cannot be confirmed, however, that lying-in-maids were particularly targeted, as Lyndal Roper claimed from the case of Anna Ebelerin in 1669. Nor can it be proved that incestuous fantasies or sexual deviance played a major role, as Roper claimed from the case of Regina Bartholome in 1670.

Augsburg trials gained particular notoriety through contemporary media hype from the local printing industry, but the city's upsurge in witch executions fits well into the regional pattern of declining imperial free cities seeking refuge in finding scapegoats. Whereas Catholic territories and even the persecuting prince-bishoprics became more cautious after the Thirty Years' War, Protestant imperial free cities like Nuremberg or Memmingen started executing witches

in considerable numbers. Only around 1700 did they suddenly stop such executions, presumably due to changes in the education of the Protestant elites, who increasingly did their legal studies in the Netherlands, or at Halle and Göttingen, were influenced by the philosophy of Christian Wolff, and reacted to the antiwitchcraft trial campaigns of Christian Thomasius.

AUGSBURG, PRINCE-BISHOPRIC OF

The prince-bishopric of Augsburg played an important role in the history of witchcraft, because witch hunts in this territory sparked witch hunting in the larger region in the 1580s, serving as a model for neighboring lordships and the duchy of Bavaria. The diocese of Augsburg was founded in the fourth century, belonging to the archdiocese of Milan. After the collapse of the Roman Empire, the Christian cult survived in the region; with the rise of the Frankish empire, Augsburg became subject to the archbishops of Mainz. When the citizens of Augsburg acquired the status of an imperial free city, the city's bishops had to retire to their landed property, stretching from the river Danube to the Alps. They tried to form a territorial state, the prince-bishopric of Augsburg, whose capital was no longer Augsburg, but Dillingen on the Danube, the bishops' new residence, although the bishops' see, cathedral, and cathedral chapter remained in the imperial free city. The prince-bishops of Augsburg were early Counter-Reformers, with the University of Dillingen, founded in 1544, serving as a bridgehead of Jesuit education. In 1600, and again in 1800, the prince-bishopric had roughly 100,000 inhabitants. In 1803 it was sacked by Bavaria.

It is not coincidence that Prince-Bishop Otto Truchsess von Waldburg (ruled 1543–1573), who had studied in Tübingen, Dole, Padua, Bologna, and Pavia, and had joined the papal diplomatic service, witnessed the first serious witchcraft trials in this territory. He was a pioneering Counter-Reformer, ardently supporting the Catholic hard-liners at the Council of Trent. He founded the first post-Reformation Catholic university, and invited the Jesuits to serve as teachers. Waldburg appointed Peter Canisius as his councilor; as cathedral preacher in Augsburg, the famous Jesuit, beginning in

1563, amazed his audience with incredible stories of a witches' conspiracy. Suspicions of witchcraft flared up under the next bishop, Johann Egolf von Knöringen (ruled 1573–1575), who was sick throughout his short time in office, and the first two witches were executed at Dillingen in 1575. Under Prince-Bishop Marquard vom Berg (ruled 1575–1591), another ardent Counter-Reformer, witchcraft trials remained endemic; they reached a first climax between 1586 and 1592, when witch hunts shook the southern district courts.

Curiously enough, a local witch finder, Chonrad Stoeckhlin, sparked these large-scale persecutions. His confessions, obtained by illegally severe torture in 1586, enabled the district judge of Rettenberg-Sonthofen to investigate several dozen suspects. The persecutions spread to neighboring districts of the prince-bishopric, creating the most extensive witch hunt ever in the region, with more than 100 victims, 68 in the district court of Markt Oberdorf alone, and dozens more in the district of Schwabmünchen. The populace supported these witch hunts because of a series of unfavorably cold and wet years, when crops were damaged and mortality soared. The government had to hire foreign hangmen and construct new prisons in order to have sufficient capacity for this large-scale hunt. Part of this wave of persecutions was the famous case of Walpurga Hausmännin at Dillingen, a midwife held responsible for the bishop's death. Local printers utilized her case, which the Fugger newsletters also reported. Midwives, however, were not the main targets of this campaign, but rather women working in the food industry, such as innkeepers. Except for Chonrad Stoeckhlin, the witch finder, all the victims (i.e., over 99 percent) of this persecution were female.

Local judges were largely in charge of this persecution, but some legal supervision came from the bishop's court council (*Hofrat*) at Dillingen, although its intervention was obviously not obligatory. The records kept by this council reveal that these lawyers were literally borrowing from the German translation of Jean Bodin's famous *De la démonomanie des sorciers* (on the Demon-Mania of Witches, 1580), because they used the term *Hexenreichstag* (Imperial Diet of Witches) invented by Bodin's Strasbourg translator Johann Fischart. Concerning the mechanism of witch hunting, a local observer concluded that first the prosecutors arrested ugly women, then prettier ones, then wealthy innkeepers, concluding that if they continued to hunt witches, they would eventually have to use golden chains for the nobility. However, it served as a warning that, in 1587, a member of the Dillingen patriciate, Margarethe Kellerin, was executed for witchcraft. In this region her case was quoted as a precedent, alongside the spectacular execution of Dr. Dietrich Flade in Trier.

The authorities seemingly became more cautious afterwards. But witchcraft trials flared up repeatedly in

the prince-bishopric, providing a source of continuous concern for such neighboring territories as the imperial free city of Augsburg and the duchy of Bavaria. As the debates within the Dillingen court council demonstrated, the atmosphere under Prince-Bishop Heinrich V von Knöringen (ruled 1599–1646) was hopeless, in that the councilors were unable to put aside their stereotypes. Unlike Bavaria, there were no objections in principle to witchcraft trials, although, like the Bavarian council, this one was split between a moderate and a more zealous faction. In fact, the prosecution of witchcraft slowed, and the prince-bishopric did not participate in the witch hunts of the late 1620s, despite a particularly unfavorable climate, crop failures, and war. Although a general inquisition was launched in 1629, and witches were punished in several ways (sometimes with banishment), there were no executions. During the later seventeenth century there were few witchcraft trials, which seems particularly strange, because witchcraft then became a major issue among the region's Protestant imperial free cities. In the eighteenth century, however, the picture was reversed: Protestants stopped executing witches, while there was another upsurge of trials in the prince-bishopric, with several executions in the 1720s. Reports of a very late execution in 1766 cannot be confirmed in the sources; the last execution apparently occurred under Bishop Joseph von Hessen (ruled 1740–1768), when Barbara Zielhauserin was executed in Dillingen in 1745. Overall figures are difficult to estimate, but the number of executions in the prince-bishopric of Augsburg probably approached 200.

AUGUSTINE, ST. (354–430)

A prime authority for the doctrine of witchcraft that developed in the later Middle Ages, Aurelius Augustine was the most influential, wide-ranging, and independent of the Latin Church Fathers. The effects of his teaching can be traced throughout the Middle Ages, during which he was undoubtedly deemed the most authoritative among the Church Fathers. His works and ideas—including his comprehensive reflections on demonology—were reviewed extensively by all the

Protestant reformers and by the Jansenists, continuing his influence into the modern period.

The first major reason behind his extraordinary influence was the understanding of demonology in late antiquity. Augustine's rhetorical training and teaching experience provided him with an excellent knowledge of classical Latin literature. In this context he acquired insight into classical demonology, which distinguished between gods and demons and between good and evil demons. To approach the issue of the origin and effects of evil in the world, the pagans made qualitative distinctions; Augustine's reflections begin at this point.

A second and probably more important aspect stemmed from Augustine's youthful inclination toward Manichaeism. Manichaeism emphasized a strictly dualistic view of the world, classifying all events in light of the polarity between good and evil forces. Even after his conversion to Christianity, Augustine's views on this issue remained ambivalent. He undoubtedly disapproved of the Manichaean enmity against the world and thus its rejection of the divine creation as described in the Hebrew Bible, but the issue of good and evil in the world remained largely unresolved. Obviously, as a Christian bishop Augustine was a vigorous advocate of monotheism. However, his statements on the effects of the power of evil can easily be, and have been, misinterpreted.

Passages and quotations from Scripture form the third source for Augustine's understanding of demonology. Since no Biblical doctrine of demonology existed, Augustine employed these texts more to support convictions and ideas borrowed from classical literature and Manichaeism than to create a new theory. He also used Biblical texts to reflect about individual elements of demonology.

When considering Augustine's position in the history of witchcraft and witchcraft trials, a strict distinction must be made between Augustine himself and his subsequent influence on theology. During his lifetime, Augustine never had to confront the issues that led to witchcraft prosecutions in the late Middle Ages. His reflections were made when the expansion of Christianity was still limited, even though it was the state religion. Background remnants of classical pagan beliefs and other, mainly Middle Eastern, cults and religions (e.g., Manichaeism) were officially prohibited but still alive, and popular Christianity was not yet fully developed.

Most of Augustine's work must be understood in the context of his time and background, particularly his most famous work, *De civitate dei* (On the City of God). This appeared from 416 to 422, after the Visigoths had sacked Rome in 410, to refute the assertions of "heathens" that the fall of Rome was a consequence of the empire's rejection of the Roman gods. In response, Augustine developed a doctrine of demonology

based on Scripture (e.g., Ps. 96:5: "All the gods of the peoples are idols"), in which the demonic nature of the Olympian gods was exhibited systematically (*De civitate dei* 8–10). Augustine argued not only that the religious practices of the heathen (sacrifices, worship, and pagan festivals) implied the worship of demons rather than of the one true god, but also that in general, any classical conception that could accommodate or approve the existence of Jupiter or any other Roman god must be condemned as superstition and worship of false gods.

It was crucially important that Augustine never doubted the existence of demons. Heathen gods really did exist; their identity was compared to that of angels; but unlike angels, they sought glory for themselves rather than God. Pagan cults had arisen whenever demons claimed man's reverence, whether in a temple of Jupiter in Rome or of Zeus in Athens. Although it was not his intention, Augustine implicitly attributed a certain rank to demons, which they had not previously held. The overall conception of *De civitate dei* allowed demons to play a decisive role in the relationship between the *civitas diaboli* (city of the Devil) and the *civitas dei*, which were presented as contending with each other. Augustine created a dualistic impression, even though he strove not to. Instead of the evil spirits, which were driven out sporadically in the New Testament, he depicted a Devil, with followers and a hierarchy that borrowed its nomenclature from the classical pantheon and that was in direct conflict with the body of Christ, the Catholic Church. The apocalyptic fears and expectations in the age of the witchcraft trials found substantial backing in Augustine's ideas.

Augustine did not linger in the cosmological realm, but turned his attention to the relationship between these demons and their prince, the Devil (a hierarchical classification that was obviously possible without great reflection), and humans. He developed a plausible system with far-reaching consequences, based on the ontology of late antiquity and his own notions about the divine act of redemption: Demons are noncorporeal beings who are present in time and space. Being eternal, they have at their disposal a high cognitive perception and senses that enable them to learn and react more quickly than corporeal humans. In brief, they possess sufficient knowledge and capabilities to enable them to accomplish acts that men could plausibly but falsely interpret as miracles. They employ this knowledge to induce man to revere them (their final goal). In *De divinatione daemonum* (On the Divination of Demons, 406), Augustine eventually assumed a contractual relationship between humans and demons. He saw this contract as based on the fact that a person either purposefully sought contact with a demon through some specific ritual that the demon had communicated to him or her (*pactum explicitum*) or, from foolishness or curiosity, unconsciously communicated with a

demon through a certain act (*pactum implicitum*). Augustine developed an actual "sign theory," which, by analogy to the Christian understanding of the sacraments and godliness, explained the relationship between the will, the rite, and the result. Just as Christians confirm their covenant with God through prayer, sacraments, and worship, so do the "heathen" confirm their covenant with false gods (i.e., demons) through signs, words, and invocations, or unconscious gestures.

Augustine's theology of demonology eventually became authoritative within a context entirely incongruous with the context in which he developed it. Through early medieval mediators (e.g., Isidore of Seville), Augustine's central statements on demonology found their way into medieval legal texts like Gratian's *Decretum* (Concord of Discordant Canons, known as the *Decretum*, 1130), and of course into the standard dogmatic work of Peter Lombard (*Sententiae*, 1148–1151). Against the background of the High Middle Ages, Augustine's idea of the two *civitates* (cities) could be applied to over half a millennium of struggles between the established Christian religion and all kinds of dissenters and heretics. The abstract battle between Augustine's two realms was relocated into real life and interpreted in terms of a battle between the Church and witches. In addition, further aspects of Augustine's theology were reinterpreted: His remark that women are able to conceive children with the half-god Pan and "Sylvans" (*De civitate dei* 15, 23) became a standard citation for the real possibility of intercourse with the Devil; his opinion that backsliders could be brought back to the Church by force, expressed in an entirely different context, affected Church practice in the late Middle Ages and early modern times.

On the other hand, certain retarding aspects can also be found in Augustine's work. Close scrutiny of his argumentation about God's work of redemption reveals that he believed that any work of demons was ultimately possible only with God's authorization. Augustine never fully resolved the issue of magic and witchcraft in relation to God's mysterious purpose and the arbitrary acts of sorcerers and witches. Obviously, he never mentioned the central medieval notion of witches flying, nor did he specifically relate demons to gender. Up to the Enlightenment, the reality of demons and the whole preternatural worldview supported by Augustine's weighty arguments, were hardly questioned. Thus with regard to the history of witchcraft prosecutions, the differences between Augustine's intentions in his lifetime and his posthumous historical influence seem particularly significant.

AUSTRIA

With perhaps 1,900 executions in territories containing some 2,000,000 inhabitants, Austria experienced relatively moderate prosecutions for witchcraft. Less a state than a collection of principalities acquired over several centuries, the Austrian Habsburg hereditary lands (*Erblande*) constituted an informal union of central European territories. They were largely autonomous political units, such as the Bohemian and the Hungarian monarchies added by the Habsburgs in 1526 and the Burgundian and Spanish territories, acquired by the house of Habsburg in earlier years. All Austrian lands belonged to the Holy Roman Empire of the German Nation (to which the Habsburgs gave a long string of *elect*ed emperors), but remained distinct territories within it.

The core of the Austrian hereditary lands included several principalities situated along the Danube River. “Austria” (Österreich) proper included two duchies, Upper and Lower Austria (Ober- and Niederösterreich). To the south, “Inner Austria” (Innerösterreich) included three contiguous duchies: Styria (Steiermark), Carinthia (Kärnten), and Carniola (Krain), while the smaller prin-

icipalities of Gorizia and Istria extended to the Adriatic. To the west lay the Alpine county of Tyrol (Tirol). West of Tyrol was the county of Vorarlberg, part of “Further Austria” (Vorderösterreich, or die Vorlande), which included approximately a hundred scattered enclaves in Swabia (Schwäbisch-Österreich; the oldest ancestral Habsburg lands) and the territories of Sundgau, Breisgau, and Freiburg farther west. Although parts of the Austrian Republic today, neither the archiepiscopal principality of Salzburg (separating the eastern and western hereditary lands) nor the territory of Burgenland (in the far west of the Hungarian kingdom) belonged to early modern Austria, although they had significant political, social, and cultural ties to it. On the other hand, not only does Swabian Austria now belong to Germany (with a bit of Vorderösterreich now in France), but also the former Habsburg duchy of Carniola, part of Carinthia, and the southern third of Styria now belong to Slovenia.

The central feature of Habsburg rule over the hereditary lands was that it had a different constitutional basis in each. Each land was governed through traditional rather than centralized institutions, bringing each into a purely dynastic union with the others. Having a limited sense of shared purpose, every individual land preserved its own identity, political forms, legal system, and administrative practices. Thus, most lands had their own estates and territorial diets, along with separate laws, privileges, and customs, all confirmed by succeeding Habsburg rulers.

Given this diversity, witchcraft trials throughout “Austria” were a mixed lot. Each territory, along with Salzburg and Burgenland, experienced such trials, but they tended to ebb and flow with changing circumstances. Some territories saw many persons accused, others relatively few. For example, Swabian Austria experienced some of the worst witch hunts, like some nearby territories in southwestern Germany. Trials in Styria were also relatively numerous. However, in most modern Austrian territories—Vorarlberg, Tyrol, Carinthia, Upper and Lower Austria, as well as Salzburg and Burgenland—the numbers of trials remained limited, despite occasional instances of large-scale witch panics involving dozens or even hundreds of accused witches.

COMMON THEMES

It is difficult to generalize about witchcraft trials throughout the Austrian lands, but some common themes emerge—although exceptions must also be kept in mind. First, most trials remained rural affairs. Some notorious trials occurred in major urban centers, at Innsbruck (Tyrol), for example, in 1485–1486, conducted by Heinrich Kramer, the notorious author of the *Malleus Maleficarum* (The Hammer of Witches, 1486); at Vienna (Lower Austria) in 1583; and most notably at Salzburg, from 1675 to 1681. Likewise, the

vast majority of trials involved the prosecution of one or perhaps a few individuals. Most accused witches came from the lower levels of society; a large number were socially marginal individuals such as vagabonds or shepherds, though occasionally even nobles and clergy found themselves under investigation and sentenced to death. Especially in Swabian Austria and Vorarlberg, accused witches were usually women, but further east relatively high percentages of men were accused: 39 percent in Styria, for example. Except at Salzburg, execution rates tended to be higher among women than men. Few children were tried for witchcraft (or even involved directly in witchcraft investigations) in the Austrian territories, but several cases in Styria and Lower Austria illustrate that young girls were not immune. On the other hand, large numbers of adolescent boys were tried and executed during the notorious *Zauberer-Jackl-Prozesse* (Sorcerer-Jack—Trials) episode in neighboring Salzburg.

Austrian trials include accounts of magical activities common throughout Europe, and their records suggest that court personnel usually introduced such diabolical elements as pacts with the Devil and the witches' Sabbat. Initial accusations were frequently made by neighbors of the accused and involved such simple *maleficia* (evil acts, harmful magic) as causing illness, destroying crops, or starting fires. Summoning bad weather seems especially prominent. Most trials emerged when judicial administrations were able and willing to prosecute people on the basis of such commonplace magical beliefs. Their subsequent interrogations of suspected witches inquired about diabolical activities such as pacts or sexual liaisons with the Devil or attending Sabbats. Particularly common in larger trials, this development was visible even in smaller trials involving mostly female suspects. Trials of male suspects, whose relations with the Devil tended to be business-related rather than sexual, often introduced a diabolical element through suspicions of host desecration. Thus, most trials emerged from the nexus of commonplace magical beliefs, on the one hand, and judicial administrations able and willing to prosecute people on the basis of those beliefs, on the other.

Although several late medieval witchcraft trials in Austrian territories took place in ecclesiastical or inquisitorial courts, the vast majority were conducted by secular authorities, in accordance with Charles V's Carolina Code (*Constitutio Criminalis Carolina*, 1532) or later territorial codes promulgated expressly for the Austrian hereditary lands. In addition, accompanying Catholic reform after the Reformation, a worldview emerged in which witchcraft became one of many threats to church and state. Although no Habsburg ruler ever pursued witchcraft trials with excessive zeal, provincial Austrian law codes and police ordinances occasionally established direct links between prosecuting witches and political-religious values of seventeenth-century baroque Catholicism. Later, the enlightened eighteenth-century Catholic Maria

Theresa took steps to end witchcraft trials before her son Joseph II decriminalized witchcraft entirely.

STATISTICS

No detailed analysis of witchcraft trials based upon an exhaustive examination of source material has yet appeared covering all Austrian hereditary lands. An old work (Byloff 1934) remains the most complete survey; despite some strengths, its approach is impressionistic and its documentary base incomplete. Since then, systematic analyses have appeared for a few Austrian lands, most notably Swabian Austria (Dillinger 1999), Vorarlberg (Tschaikner 1992), and Styria (Kern 1994, 1995). For other hereditary lands, some work has been done on individual trials, or short series of trials, but our knowledge of the course of events in Tyrol, Lower and Upper Austria, Carinthia, and Carniola remains tentative. The same applies to Salzburg (not ruled by Habsburgs) and Burgenland (part of the Hungarian kingdom).

Except for a few scattered early trials, most Austrian witchcraft trials occurred between 1550 and 1750. Save for Swabian Austria and Vorarlberg, they peaked during the second half of the seventeenth century, well after most of western Europe. In some Austrian areas, prosecutions accelerated after 1580 and initially peaked around 1620, declining throughout the Thirty Years' War (1618–1648). The number of prosecutions increased dramatically between roughly 1670 and 1690, particularly because of a large number of trials in Styria and Salzburg's *Zauberer-Jackl* trials. Trials declined once again after 1690, leveled off to a few per year by 1720, and disappeared by 1750, after Salzburg's last trial ended. Estimates of the total number of witches tried in Austrian territories (including Swabia) range from 1,700 to considerably higher (Byloff 1934, 159), while a more recent estimate suggested a total of around 1,900 witchcraft executions (Behringer 2000, 61, 66).

One must still examine the courses of witchcraft trials in each Austrian territory, because they vary greatly. From well-researched regions (Swabian Austria, Vorarlberg, Styria) emerge data unlikely to be revised significantly. For Swabian Austria, some 788 victims (90 percent women) of witchcraft trials have been estimated, roughly 80 percent of them in the county of Hohenberg (Dillinger 1999, 353–357). In Vorarlberg, after two women were tried for sorcery in the late fifteenth century, at least 166 people were tried in the sixteenth and seventeenth centuries, with at least 105 executed, 80 percent of them women (Tschaikner 1992). In Styria, around 300 trials took place, involving at least 879 individuals. Of the 757 suspects whose sex is known, 463 were female (61 percent), 294 male (39 percent). At least 312 witches were executed, many of them in southern regions now in Slovenia (Kern 1995, 165–167). In other Austrian territories, only limited source material has been explored; much remains to be

done, and incomplete data permit only rough estimates (Valentinitsch 1987). For Lower Austria, we have records from 47 trials involving 120 people, two-thirds of them women (Raser 1989, 17–25); for Upper Austria, 35 known trials involved about 100 individuals, 77 percent of them men. From Burgenland, records of 13 trials have been found, involving fewer than 50 individuals (76 percent female). To the south, in Carinthia, 116 trials involved about 300 people (57 percent male). In Carniola, very fragmentary source material reveals only 12 trials in which 35 people, almost exclusively women, were executed (Vilfan 1987, 293). All told, nearly 500 persons were tried for witchcraft in territories found in present-day Slovenia, which includes areas that had once belonged to Styria, Carinthia, and Carniola. Farther west, in Tyrol, 72 trials involved perhaps 200 accused, 72 percent female (Dienst 1987, 286–289), while in neighboring Salzburg, which experienced at least 43 trials, the numbers were a good deal higher because of the notorious *Zauberer-Jackl* trials and related trials between 1675 and 1690 that involved at least 198 suspects and 138 executions. Of those executed, only 36 were women; 46 were adult men, the remaining 56 being adolescent boys between 9 and 16. Thus, roughly 59 percent of the individuals tried in Salzburg were men, a figure skewed by the exceptionally high number of male suspects tried in the late seventeenth century (Byloff 1934 *passim*; Dienst 1987, 286–299; Vilfan 1987, 293).

WITCHCRAFT AND THE LAW

Official policy toward witchcraft in Austria underwent several permutations during the medieval and early modern periods. The eighth-century *Lex Baiuvariorum* (Law of the Bavarians) prohibited the destruction of crops through *maleficiūm* (harmful magic) in Bavarian settlements, including the Austrian Alps. Earlier in the century, Pope Gregory II had informed his nuncio at the Bavarian court to forbid forms of oneiromancy (dream-interpretation), augury (the reading of portents), and the use of magical formulas, as well as soothsaying and the casting of lots. At the end of the century in 799, the Bavarian Synod of Reisbach decreed that investigations should proceed against those involved in soothsaying and weather magic. Early medieval prohibitions produced few known trials. Nonetheless, medieval sources (court records, chronicles, and customs) from later centuries in these Habsburg patrimonial lands indicate that both the nobility and municipal authorities occasionally punished harmful magic. As late as 1499, Maximilian I's penal code for Tyrol did not mention sorcery as a crime, although his 1514 ordinance for Lower Austrian courts prohibited it. Similar inconsistencies characterize much of the late medieval period.

Important changes in both the codification of law and the court system during the fifteenth and sixteenth

centuries dramatically increased criminal prosecutions for sorcery. A long process of centralizing, standardizing, and codifying the territorial laws of various Habsburg Austrian territories reflected the increasing influence of Roman law throughout continental Europe. After 1532, Charles V's imperial penal code, the Carolina Code, provided a legal basis for prosecuting harmful magic. In 1544, Archduke Ferdinand I issued a general mandate for his Lower Austrian *Erbländer* (including Styria, Carinthia, and Carniola along with Lower Austria, but excluding Upper Austria) calling for the arrest and trial of sorceresses and female fortunetellers.

The first territorial prohibitions against sorcery, explicitly codified, date from Archduke Charles II's 1574 Styrian penal code, modeled on the Carolina Code, and his 1577 police regulations for Styria. This code addressed sorcery and illicit magic in four relatively short sections. Two additional sections very briefly established sorcery as a capital offense by linking it to blasphemy and promised magistrates further police regulations in the future. These six sections were far more detailed than previous medieval customs, but mostly prescribed procedures magistrates should adopt, rather than defining the crime of maleficent sorcery, and they offered no detailed statements of witchcraft theory. At the same time, however, connections between the government's overt religious concerns and its exercise of justice emerged clearly in the duchy's 1577 police regulations, which established the religious nature of sorcery by linking this crime with blasphemy and enlisting all Styria's public authorities in a crusade against crime, immorality, and sin. Blasphemy and sorcery constituted crimes to be punished by secular territorial courts.

Later witchcraft decrees, issued by Ferdinand II for all Austrian hereditary lands in 1633 and by Ferdinand III for Lower Austria in 1656, contained similar Counter-Reformation rhetoric about sorcery. Ferdinand II's 1633 *Tugendsambe Lebens-Führung* (Guide to Virtuous Conduct) often copied previous Styrian regulations. Sorcerers and their accomplices were to be tried and punished in accordance with article 109 of the *Cardina*—which called for death by burning in cases involving genuine harm. Neither the Devil nor the diabolical nature of the three activities listed was explicitly mentioned. Despite their rhetoric of religious reform, Austrian prohibitions against sorcery ignored the “cumulative” concept of witchcraft until 1656, when Ferdinand III's *Land-Gerichts-Ordnung* (Territorial Court Ordinance) for Lower Austria (by then distinct from the Inner Austrian lands) explicitly mentioned the Devil and included questions about his role.

Ferdinand III's 1656 code represented the culmination of authoritarian religious reform in Habsburg Austria, in defense of orthodoxy and judicial reform. Its

sixtieth article, discussing the prosecution of sorcery, filled several pages. It repeated the basic procedures of earlier witchcraft statutes, but added detailed references to witches' assemblies, diabolical pacts, and the Devil's mark. It instructed magistrates to search suspects for objects described by demonologists: "magical objects such as oils, salves, evil powders, magical boxes, oats infested with bugs, human bones, magical lanterns, or wax dolls with nails stuck through them; or Hosts, crystals, mirrors for divination, written pacts with the Devil, books of sorcery, and similar things." It also mentioned other signs of diabolical magic, previously absent from official Habsburg legislation on sorcery: the witches' Sabbath, sexual relations with the Devil, flight, and apostasy. For the first time, the 1656 ordinance prescribed an inquisitorial method designed to produce complete and detailed accounts of suspected activities of witches. Section four of Article 60 instructed magistrates to inquire if the accused had made a pact with the Devil. It then listed over forty highly specific questions, in twenty subsections, designed to elicit information sufficiently precise to allow a magistrate to diagnose witchcraft. However, the article also distinguished those who practiced "genuine sorcery" through diabolical means, and who must be put to death by fire or sword, from mere "soothsayers, those who said superstitious adjurations, and card-dealers," who—if little harm was done—should be fined and exiled.

Throughout the Habsburg hereditary Austrian provinces, witchcraft trials peaked after the promulgation of article sixty of Ferdinand III's 1656 *Land-Gerichts-Ordnung*. The timing of these trials corresponds well with a model of the witch-hunting phenomenon that divides Europe into a central region and various peripheral areas away from the core. According to this center-periphery model, trials began the earliest, were the most severe (in terms of size, numbers, level of panic), and ended soonest in a core area centered on southwestern Germany and the Rhineland. Moving away from this area, into the "periphery," trials began much later, did not become as intense, and tended to last well beyond the European-wide high point between 1580 and 1640—sometimes far into the eighteenth century. In the western Austrian lands (Swabian Austria, Vorarlberg, Tyrol), most witchcraft trials occurred before 1650, while, excluding Styria, the eastern provinces (Upper Austria, Lower Austria, Carinthia, plus Salzburg) experienced more trials afterwards. In Styria, most witchcraft trials and over three-fourths of accusations against individuals occurred after 1660 (Kern 1995, 123, 167), thus placing Austria geographically in "peripheral" east-central Europe. The pattern of relatively higher numbers of trials after 1650 becomes even more extreme as one moves farther east in the Habsburg crown-lands to Bohemia and Hungary, where few trials took place before the end of

the Thirty Years' War (1618–1648), and their high point occurred only in the years following 1680.

As R. J. W. Evans remarked, "there is evidently a good fit [between witchcraft trials and] the Habsburg Counter-Reformation" (Evans 1979, 406). The correlation between Ferdinand III's 1656 decree and a measurable increase in the number of witchcraft trials in the eastern Habsburg lands (Austria, Bohemia, Hungary) suggests a link between the consolidation of baroque Catholicism and increasing pressure on suspected witches. It must be emphasized, however, that there was no directly causal relationship between Ferdinand III's code and the spread of trials for witchcraft—particularly in Lower Austria, the only province directly affected by this code, where 52 of 69 known trials occurred before 1656 (Raser 1989, 17–25). Moreover, in Lower Austrian witchcraft trials for which sufficient documentation is currently available, elaborate diabolical magic rarely appeared; most cases involved only charges of simple sorcery entailing such minor punishments as fines and time in the stocks. Thus, Lower Austrian trial records reveal diminishing concerns with diabolism after 1656. Of course, legal codes never account for the prosecution of alleged crimes, because they must be interpreted and applied by magistrates familiar with the specific circumstances of each particular case.

In a legal opinion of October 8, 1679 to the Lower Austrian government, Archduke Leopold I provided an excellent illustration of exercising princely discretion. This ruling applied directly to only a single case involving four suspects who had not yet been put to death, but it set clear precedents. While upholding the reality of witchcraft, confirming its status as a particularly reprehensible crime, and justifying its continued prosecution in Lower Austria, the ruling explicitly prohibited types and instruments of torture outside the customary law of the land (in this case, the bed of nails), and, more significantly, it also required magistrates hearing witchcraft cases to forward all preliminary decisions as well as final judgments to the Lower Austrian Government for review. The Lower Austrian 1656 code contained no such clause in its article on witchcraft, and Leopold may have wanted to remove authority from individual judges in favor of his government. In this ruling, Leopold ordered the release of four "still living" female prisoners, who had already undergone considerable torture, with their honor restored; the accusation of one girl was deemed "unmerited." Although ending the sufferings of these women, this ruling in no way undermined the general belief in the real dangers of sorcery. Ten years later, Leopold signed a general order for suppressing Gypsies in Upper and Lower Austria; it threatened particularly harsh treatment for those who practiced sorcery.

Throughout the Austrian lands, the discretion exercised by provincial magistrates in actually trying cases and government officials in frequently reviewing and

deciding them ultimately proved decisive for the actual course of witchcraft trials. Their numbers, the number of accused, and the number of executions suggest that the attitudes visible in Ferdinand III's 1656 Lower Austrian code probably stimulated an increased awareness of witchcraft theory among government officials and judges. Elsewhere in Habsburg Austria, Styrian trial records contain both direct references to the code and traces of its shaping influence during interrogations. Although the code remained inapplicable in Styria until 1721, judges and officials frequently cited it alongside precedents from Roman law, the *Carolina*, and the Styrian penal code. Still, it exercised no direct causal effect, because it did not introduce diabolical understandings of witchcraft. The Lower Austrian code's true significance was to represent the full creation of "cumulative" witchcraft beliefs among a great majority of policymakers throughout the Habsburg lands.

Yet the Habsburg archdukes never expressly used witchcraft trials to strengthen their own political positions or baroque Catholicism in their lands. Instead, for at least a century after the 1570s, their decrees created an ethos (though not an all-pervasive one) among government officials that construed witchcraft as one of many potential threats to good order, the Roman Church, and the dynasty. We have no evidence that any of the archdukes zealously prosecuted suspected witches, but much evidence that eradicating witches was one of the state's responsibilities.

By the beginning of the eighteenth century, fears of witchcraft began to dissolve among Austrian officials. This trend appeared clearly in the decline in the number of eighteenth-century trials throughout the Austrian lands, although trials continued in the eastern Habsburg kingdoms of Bohemia and Hungary. By mid-century, the government of Maria Theresa began taking steps to eliminate such trials. In 1766, the empress issued a government patent entitled *Artikel von der Zauberey, Hexerey, Wahrsagerey, und dergleichen* (An Article on Sorcery, Witchcraft, Divination, and Similar Activities) for all of her hereditary lands. Paradoxically, the patent both affirmed and denied the reality of magic. One decree highlighted the "special attention" state officials must give to distinguishing between "true" and "false" magical deeds. It called upon judges to determine if the accusation before them came from fraud, madness, or mere superstition, or if it represented genuine sorcery or witchcraft. The latter must be sent to a higher court, where another magistrate would make the same determinations. Ultimately, the code made clear, only the empress herself would decide cases of "genuine" diabolical activity.

But the patent also replaced state interest in eradicating witchcraft with state interest in eradicating superstition. In some sense, the patent remained similar to earlier prohibitions of witchcraft: If earlier codes saw magic as a threat to good order, this one saw supersti-

tion in a similar light. Its sections describing popular ignorance and credulity made this clear:

It is a well-known fact at present, however, how the mania of sorcery and witchcraft was grossly exaggerated in earlier times. Moreover, its basis was founded on the inclination of the simple and common populace toward superstitious things. Stupidity and ignorance—as the springs of astonishment and superstition, and from which gullibility without regard for truth or falsity emerges among the common people—have further promoted such things. All such incidents, which cannot be immediately comprehended and which originate only from natural consequences, actions or forces (even such natural events as thunder-storms, animal diseases or human illnesses, etc.), are attributed to the Devil and his agents, particularly the sorcerers and witches, etc.

These notions of untold diabolical hordes were implanted from age to age, even impressed upon children still in the cradle with terrifying stories and tales. Thereby this mania generally spreads, growing stronger and stronger, even corrupting genuine judicial standards to a large degree when settling cases of that sort. (Kern 1999, 171)

This article broke dramatically with earlier witchcraft legislation, because its overall effect was the suppression of witchcraft trials. Nonetheless, it resembled previous laws against witchcraft through the state's overt attempts to control the beliefs and activities of its subjects. With Joseph II's thoroughgoing reform of Austrian criminal law in 1787 and 1788, witchcraft ceased to be a crime in the Habsburg territories. But although the resulting Universal Law Code on Crimes and Their Punishments (*Allgemeine Gesetzbuch über Verbrechen und deren Bestrafung*) and Universal Ordinance for Criminal Courts (*Allgemeine Kriminalgerichtsordnung*) eliminated statutes against sorcery and witchcraft, magical beliefs remained a significant part of court proceedings for years to come.

AUSTRIAN WESTERN TERRITORIES

The western possessions of the Habsburgs consisted of two parts: the older Outer Austria (Vorderösterreich), including the territories of Alsace, Breisgau, Hagenau, and Ortenau, today in eastern France and Baden-Württemberg; and Swabian Austria, namely Hohenberg, Nellenburg, the Landvogtei Schwaben (Royal Province of Swabia), and Burgau, today in Baden-Württemberg and Bavaria. The Habsburg archduke of Tyrol and his government at Innsbruck administered all these territories. Vorderösterreich had its own government in Ensisheim in Alsace, whereas each of the Swabian Austrian territories was directly controlled by Innsbruck.

Although the Habsburg territories were homogeneously Catholic, the Church had hardly any influence on the witchcraft trials. Accepting the Carolina Code (*Constitutio Criminalis Carolina*, 1532) as a guideline,

the Innsbruck government was reluctant to persecute witches. In 1637, it promulgated a detailed procedural instruction for witchcraft cases that combined influences of the Carolina with Adam Tanner’s criticism of witch hunts. The conflict between the critical government and local witch-hunting groups was a salient feature of the witchcraft trials in the Habsburg territories. As their administrative structure was weak, local officials and the councils achieved a maximum of autarchy by not drawing the government’s critical attention to their witch hunts. When the victims of persecutions finally attracted the Tyrolean government’s attention early in the seventeenth century, that government ended the mass persecutions in the county of Hohenberg with a number of legal and administrative reforms. However, in Vorderösterreich, the persecutions were only stopped by the general breakdown of law enforcement during the Thirty Years’ War.

More than 1,100 trials took place in Vorderösterreich between 1479 and 1751, with the most severe witch hunts coming in the 1570s and 1620s. (All statistical data are found in Dillinger 1999, 93–96 and Schleichert 1994, 219–220.) Overall, about 85 percent of the defendants were women; about 80 percent of both male and female culprits were executed. Meanwhile, Swabian Austria witnessed a total of more than 520 witchcraft trials between 1493 and 1711. The first severe persecutions took place in 1530–1531 and 1558–1559, with the vast majority of accusations made between 1583 and 1605. Here, 90 percent of the defendants were women, and 79 percent of the female but only 51 percent of the male defendants were executed. Whereas all other parts of Swabian Austria experienced moderate witchcraft persecutions, Hohenberg witnessed severe witch hunts; 80 percent of all witchcraft trials in Swabian Austria took place in Hohenberg, although less than half of the region’s total population lived there.

In these areas, popular imagination had accepted the demonological stereotype and turned traditional fairy and ghost legends into witchcraft narratives. In fact, the driving force behind Swabian Austria’s and especially Hohenberg’s witch hunts was the peasant population. In Hohenberg, the villagers, especially winegrowers, demanded witch hunts from the authorities. Unlike other parts of Swabian Austria that enjoyed a more favorable climate or did not engage in viticulture, Hohenberg suffered from a rapid decline in wine production at the end of the sixteenth century, for which witches were supposed to be directly responsible. In contrast, the Landvogtei Schwaben benefited from the popular cult of Weingarten monastery that centered on the protection of vineyards against bad weather. This cult, supplemented by an unorthodox trade in blessed amulets, made it possible to deal with weather crises and witchcraft anxiety without having recourse to the courts.

The aggressive demands of the Hohenberg peasantry encountered no resistance from the councils of the rural towns. Although town councils in all other Swabian Austrian territories were smaller and staffed exclusively by the local elite, Hohenberg town councils had many members and were open to the middle class, which suffered directly from the economic crisis. In areas where the population had comparatively little interest in witch hunts, such attempts as there were to prosecute witches were rejected by town councils that feared social unrest and legal difficulties. In Hohenberg, the coalition between the council elites and the majority of the rural population forced reluctant local officials to take action against supposed witches. Denunciations by accomplices, especially by child witches, were considered serious evidence. Because of their ill-defined borders, Nellenburg, the Landvogtei Schwaben, and Burgau suffered from constant trouble, and they had become part of a close-knit communicative network of conflicts, complaints, and control that obliged them to be in close contact with the critical Habsburg government. Hohenberg, however, was comparatively isolated.

Persons in permanent conflict with their families or neighbors, as well as foreigners, poor people, and criminals, were suspected as witches. Members of the upper class who had violated the social consensus through corruption, careerism, or profit seeking were also accused of witchcraft: The rich, often male witch was the dominant figure in the Sabbath imagination. As such persons often were the agents of the Habsburg government, the witchcraft trials, largely led by members of the older local elites, became a means and a form of traditionalist localism.

AUXONNE NUNS (1658–1663)

In 1644, Burgundy experienced its final epidemic of rural witchcraft; fourteen years later, the nuns of Auxonne provided the final example of a demonically possessed convent in France. The case shared numerous features with previous ones from Aix, Loudun, and

Louviers: the nuns in all these cases (except at Louviers) came from the same order, the Ursulines; all were young and daughters of good families; all were exorcised unsuccessfully for several years; the exorcisms were spectacular, drawing large crowds; accusations of witchcraft were leveled against local residents; and all the cases had an impact on the entire kingdom. Whereas priest-sorcerers were blamed for causing the possessions at Aix and Loudun, nun-witches were accused at Louviers (Mother Françoise de la Croix and Madeleine Bavent) and at Auxonne (Barbe Buvée). Quite unlike the previous affairs, the Auxonne possessions encountered disbelief among a majority of the judges; in this sense, it marked a turning point in the history of the treatment of witchcraft in France, heralding (but not causing) the decriminalization of 1682.

The affair began in 1658, when about fifteen nuns from the Ursuline convent in Auxonne claimed they were haunted by demons; at first, with numerous exorcisms by chaplains inside the convent, the situation was kept secret. Only in 1660 did the inhabitants of Auxonne learn the truth about the possessions, when the epidemic first spread beyond the convent walls and affected the townspeople. Public exorcisms took place in the parish church, laywomen were sentenced to banishment by local judges, and two of them were even massacred by the population.

In October 1660, one Ursuline, Barbe Buvée (Sister Sainte-Colombe), much older than her possessed sisters, was indicated by the mother superior as being responsible for these disorders. Accused publicly, during a religious ceremony, of magic, witchcraft, and infanticide, she became a target of violence from other nuns and was chained inside a specially constructed convent prison. At the request of Buvée's family and other critics of these procedural irregularities, the *Parlement* (sovereign judicial court) of Dijon intervened. An investigation committee under judge Bénigne Legoux went to Auxonne, carried out nearly eighty interrogations, made evaluations, and concluded that the possessions were bogus. The *parlement* ordered the release of Barbe Buvée, who had been transferred to Dijon. Meanwhile, the spectacle of the exorcisms drew huge crowds from all over the kingdom to the parish church in Auxonne. A new investigation commission, created by the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) at the request of the municipality of Auxonne, arrived at the opposite conclusion from the previous commission and asserted the reality of the possessions. While the *Parlement* of Dijon officially restored the reputation of Barbe Buvée, the intendant (royal agent in the provinces) Claude Bouchu named two more investigative commissions; the first concluded that the possessions were fraudulent, the second upheld their authenticity.

These mutually contradictory developments and dissensions largely reflected rivalries between various influential families in Auxonne, as well as the conflict between the intendant and the *parlement*.

After several new judicial developments and a succession of lawsuits between the intendant and the *parlement*, the royal council intervened and transferred the dossier to the *Parlement* of Paris, which preferred to bury the case. The epidemic of possessions quickly died down after the nuns had been transferred to other convents and the exorcisms ended.

AVIGNON

Located on the Rhone in southern France, Avignon and its surrounding region, the Comtat Venaissin, belonged to successive popes from the fourteenth century (when they resided there) until the French Revolution. Avignon's key officials, including its governor (a papal legate) and archbishop, were directly appointed by and responsible to Rome; even its Holy Office belonged to the Roman Inquisition.

Although Avignon was not directly involved in the French Wars of Religion, the late sixteenth century saw intense religious controversy and violence in this region. After the conclusion of the Council of Trent (1563), Avignon and the Comtat became a regional flagship of Tridentine Catholicism, led by a devoted new archbishop and by the Jesuits, who became well established and very influential.

The area around Avignon had recorded only one trial for witchcraft in the first half of the sixteenth century, in 1506. But between 1581 and 1583, a witchcraft panic swept the Comtat Venaissin. It is impossible to explain its causes, but a few factors coincide in an interesting way at this point. In 1581, a serious outbreak of plague occurred. At the same time, a temporary peace calmed the region's religious conflict. The Jesuits,

dispersed by the plague, traveled to the countryside around Avignon to carry out a Catholic reconversion mission in areas that had seen serious penetrations of Protestantism. It is very possible that the intimate connection between heresy and the Devil, described by some important French Jesuits, played a significant role in the witchcraft panic that soon developed in this atmosphere of crisis and crusade.

The first two suspects were accused near Carpentras in June 1581, and one of them was executed six months later. From there, accusations spread to several villages in the area. By September 1582, the papal legate wrote to Rome that he had twenty accused witches imprisoned in Avignon. Ecclesiastical authorities dominated the entire legal proceedings, including investigations, interrogations, torture, and judgments. This is not surprising in a territory under direct papal rule, but it is very different from the way these cases were handled in neighboring France, where *parlements* (sovereign courts) had sole control over serious cases. At Avignon, inquisitors played a strong role in these cases, as experts and advisors to ecclesiastical and secular judges. The vice-inquisitor in these cases was Sebastien Mchaelis, who thirty years later became a central figure in the famous Gaufridy-Demandols case in Aix-en-Provence and wrote an account of it that cemented his reputation as an authority on witchcraft.

In November 1582, fourteen accused witches were executed (Michaelis later wrote that eighteen witches went to their deaths). Several of those accused were punished more mildly, or were released. This marked the end of executions, though accusations continued for some time thereafter. Although a few sporadic accusations and executions occurred in the following decades (1607 seems to have been the last), the wave of executions of 1582 was the crisis point for this region.

This brief panic involved an unusually large number of trials, at least for France. It probably was the most serious persecution of witches in France until Pierre de Lancre's foray into the Basque country in 1609. Like most other large-scale witchcraft trials in ethnically French areas, the restraining hand of a *parlement* was not present, and neither was the restraint of the Roman Inquisition, which adopted stricter rules about witchcraft later in the 1580s.

B

BADEN, MARGRAVATE OF

After 1535, Baden became divided between the houses of Baden-Baden and Baden-Durlach, which together executed a total of 281 witches. While the Protestant margravate of Baden-Durlach held only occasional witchcraft trials in the second half of the sixteenth century (6 victims), the Catholic Margravate of Baden-Baden experienced large witch hunts from 1560–1580 (44 victims) and especially from 1625–1631 (231 victims) (Schneider 2004, 215, 217–218). This difference is hard to explain, as religious opinions offer only one probable reason: The attitudes of the authorities influenced the methods they used in witchcraft trials. Only in Baden-Baden was denunciation by accomplices accepted as sufficient justification for torture, leading to its large witch hunts from 1625–1631. Baden's first witchcraft trial occurred in 1552, and the last trial and execution in Emmendingen in 1669.

MARGRAVATE BADEN-DURLACH

This margravate has very few documented witchcraft trials, just those in Pforzheim (1552), Prechtal (1562), Badenweiler (1570), and Hachberg (1579), none of which incited more extensive forms of persecution. In these trials, 9 women were accused of witchcraft. Of these, 6 were condemned to death and executed, 1 was put under surveillance; the fate of the remaining 2 women is unknown (Schneider 2004, 215). The last and probably only trial in the seventeenth century took place in Hachberg; 1 woman was found guilty of witchcraft and executed (Ibid.).

There are few written records of Baden-Durlach's trials. The only well-documented trial occurred in 1552, when 3 women were accused of witchcraft (Ibid.). These sources show a very cautious attitude of the authorities toward accusations of witchcraft. For example, after their preliminary investigation against an honorable widow who had been denounced by a woman already convicted, the margrave's councilors applied to the faculty of law at the University of Tübingen for guidance. Of specific concern was the question of whether the denunciation was itself sufficient reason to put the accused under torture. The Tübingen jurists denied that it was, and one supposes that the Baden-Durlach authorities followed this opinion. Only one year later,

Margrave Karl II of Baden-Durlach, upon coming into power, made sure he had the support of the Tübingen jurists for a policy of restraint in conducting witchcraft trials. Above all, these jurists emphasized that when torture was applied, procedures had to adhere to the regulations of the Carolina Code (the imperial law code, *Constitutio Criminalis Carolina*, 1532), and that denunciations were insufficient justification for the use of torture.

MARGRAVATE BADEN-BADEN

The first wave of persecution in Baden-Baden took place during the Bavarian regency for Margrave Philipp II. Until 1577, approximately 26 women had been found guilty of witchcraft and executed in the districts (*Ämter*) of Baden-Baden, Rastatt, Bühl, Steinbach, and Frauenalb. Afterwards, under Philipp II's reign, another 18 women from the districts of Rastatt, Baden-Baden, and Kuppenheim were put to death in 1580 (Schneider 2004, 217). This first witch hunt was characterized by the central authorities' control over all proceedings. Random prosecutions by individuals were strongly discouraged. Yet without the desire of the people to hunt down witches after making connections between crop failures or sicknesses and witchcraft, many accusations would have been left unspoken.

From 1594 to 1622, during the occupation of Baden-Baden's core areas by Margrave Ernst Friedrich of Baden-Durlach, no witch hunts took place. The situation changed, however, after Margrave Wilhelm of Baden-Baden succeeded in winning back his sovereignty in 1622. Only four years later, the largest witch hunt in the history of the Margravate Baden began. Between 1626 and 1631, at least 244 persons from the districts of Rastatt, Baden-Baden, Steinbach, and Bühl were accused of witchcraft; 77 percent were women, which corresponds with the average numbers in the Holy Roman Empire. Of these 244 people, all but 13 were condemned to death and executed; 2 were exiled, and 11 proclaimed not guilty (Schneider 2004, 218).

In this wave of persecution, it was a critical factor that a single denunciation sufficed for arrest and torture. Even appeals to the highest court in the empire (the *Reichskammergericht*, the imperial chamber court)

could not convince Margrave Wilhelm and his councilors to return to more traditional procedures. Contrary to customary legal procedures, these witchcraft trials were not headed by lower officials, but by a councilor whom Margrave Wilhelm had specifically appointed to this task. This way, the authority that had to be applied to for permission to torture was already present. The fact that merely the signed confessions (*Urgichten*) had to be presented to the Margrave speeded proceedings considerably.

Our sources offer few clues to explain what caused the end of this witch hunt in the fall of 1631. The ruler's readiness to bring alleged witches to trial seems to have lessened, and official accusations of witchcraft became fewer. Margrave Wilhelm recalled his councilors and left the last witchcraft trials in the hands of local officials. Then, in January 1632, Swedish troops moved in and temporarily rendered witchcraft trials impossible.

BALDUNG [GRIEN], HANS (1484–1545)

Hans Baldung [Grien] produced more images of witchcraft than any other sixteenth-century artist and was instrumental in establishing a new iconography that influenced its visual representations for over a century. Baldung was a south German painter, printmaker, and stained glass designer who spent most of his life in Strasbourg. From 1503 to 1507 he was an apprentice in Albrecht Dürer's Nuremberg workshop, where he adopted the nickname "Grien" (green). In

Hans Baldung Grien's Witches' Sabbath, but better entitled A Group of Witches around a Cauldron, 1510. (Réunion des Musées Nationaux/Art Resource)

1509 he returned to Strasbourg, married, acquired citizenship, became a master in the guild of goldsmiths, painters, printers, and glaziers (known as *Zur Steltz*), and established his own workshop. Baldung designed woodcuts for more than a dozen Strasbourg printers and received numerous commissions from the bishops of Strasbourg and Basel, the upper Rhenish nobility, wealthy Strasbourg families, and ecclesiastics. His works included religious and classical subjects, portraits, and heraldic designs, as well as such relatively novel themes as death, sexuality, and witchcraft.

Baldung's first and most critical image was a 1510 single-leaf woodcut, usually entitled *Witches' Sabbath*, but more appropriately called *A Group of Witches Around a Cauldron*. It was designed with the use of several blocks in differently colored tones, in order to create its richly layered, chiaroscuro effects. The central scene depicts three naked women in an eerie forest setting, grouped around a cauldron and symbolically united by a triangle of forked sticks. They are engaged in a ritual offering and focus their attention on a cauldron

billowing thick clouds of vapor. On the ground lie the instruments with which these women carry out their witchcraft: a convex mirror used for entrapping demons, a brush employed in rubbing on salves, a bundle of animal hair, and a bone commonly used in acts of sorcery. On the left, sausages are hanging over a forked stick and roasting on the fire; above a witch rides backwards on a goat, using her cooking fork to carry a small pot, her hair flying and legs spread-eagled, as though to emphasize the link between her destructive and sexual power. Baldung's woodcut proved critical in establishing the image of a group of women gathered around a cauldron as a widely recognizable visual code for witchcraft. For him, witchcraft was inextricably linked to women's bodies and women's labor. Baldung also developed the link between witchcraft and inversion: seen in the backward ride on the goat, or in the ladle and cauldron of the ritual offering, which replace the traditional accoutrements of male priestly ritual. The phallic sausages have been seen as alluding to witches' powers of castration and their appropriation of male power. And the wild, flying hair of his witches add to the general sense of moral disorder.

Although Baldung's adopted city of Strasbourg saw few witchcraft trials until the 1570s, the intense cultural life of this printing center promoted much discourse on the subject of witchcraft during his time there. In 1499 a Franciscan moralist and later critic of the Reformation, Thomas Murner, published his *De phitonico contractu* (Concerning the Witches' Pact). In 1508 Strasbourg's most popular preacher, Johann Geiler von Kaysersberg, delivered several Lenten sermons on the subject, which were published eight years later under the title of *Die Emeis* (The Ants). By 1510, seven editions of the *Malleus Maleficarum* (The Hammer of Witches, 1486), by Heinrich Kramer, had been published in the Holy Roman Empire, if not at Strasbourg itself. And through their common patron, Baldung was also likely to have known about the two works on witchcraft by the learned Abbot of Sponheim, Johannes Trithemius.

Baldung's 1510 scene may well have been suggested by a chiaroscuro drawing of 1506 by his fellow south German artist, Albrecht Altdorfer, while the backward ride of the witch on the goat was clearly modeled on a Dürer engraving completed between 1500 and 1507, which Baldung must have seen as an apprentice in his workshop. Baldung's images of witchcraft were further developed and disseminated in a series of intimate chiaroscuro drawings (on tinted paper with white ink highlighting) that were completed in 1514–1515 when he was in Freiburg im Breisgau fulfilling a commission to paint the cathedral's high altarpiece. Two drawings in particular, one now in the Louvre at Paris and the other in the Albertina at Vienna, were modeled on the iconography and composition of the 1510 woodcut.

Both depicted a trio of witches as the central scene, their naked bodies and streaming hair complementing the seething cauldron and its vapors. In the Louvre drawing, Baldung's central motif was a sacrificial offering, probably a parody of a priestly mass; the cauldron was replaced by a witch's body, and from its gas the witch lights a taper; the phallic sausages now occupy center stage. In the Albertina drawing, the focus is on the relationship between witches' trances and sexual pleasure, with suggestions of masturbation and orgasm.

Witchcraft was also strongly linked to the sensuality of female bodies in Baldung's other works. In a chiaroscuro drawing of 1514, which survives in a workshop copy inscribed with new year's wishes, virtually all reference to malefic activity has been removed, and the witches' bodies and wild hair are choreographed to create a wild and erotic display. Another chiaroscuro drawing of 1515, usually entitled *Witch and Dragon*, exemplifies contemporary interest in the erotic. It depicts sexual intercourse between witch and devil in the form of cunnilingus, while Baldung plays with the ambiguities of the body's orifices and the Devil's capacity to assume male or female form. In Baldung's only painting of witchcraft, *The Weather Witches* of 1523, two nude female witches communicate their sexual independence through their assertive poses and self-confident gaze. The wild weather they have unleashed is seen overhead, and a small demon in a flask probably represents its source. But the bodies of the witches themselves are also the source of upheaval, their disordered sexuality revealed by Baldung's use of visual cues such as a cross-legged stance, a fiery torch held high by a putto who is probably a demonic offspring, the wild hair flying out in contradictory directions, and the goat on which one of the women sits and which she ever so hesitantly reveals. As in his earlier images, the power of witchcraft oscillates between sensual attraction, seduction, and destruction.

Baldung's final image of witchcraft, a woodcut produced one year before his death and entitled *The Bewitched Groom*, differs markedly from his previous work. The focus is not on the witch but on the victim, the apparently lifeless body of a groom lying on a stable floor, his left hand near a currycomb and his right hand loosely holding a forked stick. The witch is now an old and clothed female figure, much closer to traditional representations of sorcerers than the iconography that Baldung developed thirty years earlier. Yet Baldung still alludes to her sexual powers by the breast that falls loose from her clothing and the flaming torch in her hand. The coat of arms hanging askew on the wall has been widely believed to refer to Baldung's family, which suggests that the groom represents the artist himself. The forked stick demonstrates that he has been bewitched, and his foreshortened body with its codpiece as focal point, identifies the bewitchment as

sexual. The horse positioned immediately above the groom's head, which with piercing eye and a swish of the tail displays its anus, also identifies sexual bewitchment as the subject. This woodcut has sparked numerous readings: It has been seen as an allegory of anger, a story of shape shifting, a version of traditional tales of a robber knight abducted by the Devil, Baldung's dream of his own death, and an embodiment of the artist's fears of his unbridled sexual appetites. Yet its creative power seems all the greater because it is so difficult to give it a single reading.

The four different copies of Baldung's 1510 woodcut and the five copies of his drawings that have survived demonstrate the considerable contemporary interest in Baldung's work. But it was a woodcut of 1516, modeled on Baldung's 1510 work and probably a product of his workshop, that proved the most important for the dissemination of Baldung's new iconography. It first appeared as an illustration in the two editions of Geiler's *Die Emeis* (1516 and 1517) and then in at least five different editions of Johann Pauli's collection of moral tales, *Schimpf und Ernst* (Humor and Seriousness). The scene depicted a group of three women—two of them naked and holding up flaming vessels, a third dressed and riding a stool—engaging in a wild and seemingly sexual ride. Versions were reproduced starting in the 1560s, as title pages to works by Johann Weyer, Reinhard Lutz, Ulrich Mblitor, Paulus Frisius, and Abraham Saur; the key elements of Baldung's iconography were later incorporated into the witchcraft images of such artists as Jakob Cornelisz van Oostanen, Lucas Cranach, and Jacques de Gheyn II.

BALEARIC ISLANDS

Despite the widespread practice of popular magic, only three accused witches were executed in the Balearic Islands. Conquered by the Catalan King James I, the Balearic Islands belonged to the Crown of Aragon from the early thirteenth century and became part of Spain under the Catholic kings, although its 100,000–150,000 inhabitants retained some legal and political autonomy until the eighteenth century. No records document witchcraft and sorcery practices in the Balearics until 1458, when the Majorcan Inquisition sentenced a man and a woman, accused of invoking and worshipping the Devil and of giving him their souls, to die at the stake. In January 1483, a Majorcan episcopal edict, subsequently confirmed in February 1499, punished *sortilegio* (sorcery, spell-casting) with excommunication.

Records become slightly more plentiful after the Catholic kings brought the new Spanish Inquisition to Majorca in 1488. In 1499, a woman was burned to death on charges of having invoked demons. Afterwards, others accused of dealing with infernal powers were only sentenced to reconciliation; for example, a knight of the Order of Saint John of Jerusalem in 1502; a woman in 1513; a man in 1531; and a woman as late as 1675. Their punishments included fines, exile, and lashes, sometimes the galleys, but never the death penalty. However, this handful of cases does not represent what was actually occurring here in the sixteenth and seventeenth centuries.

Two different sources now in the Inquisition section of the Archivo Histórico Nacional (Madrid) help us measure witchcraft crimes in those two centuries. A *Relación de Reconciliados y Relajados* (Register of Reconciled and Relaxed), which the inquisitor José Hualte sent to the Supreme Council of the Inquisition in 1693, covers the years 1488–1691; but it does not include crimes against morality, including those perpetrated by witches and wizards, which were always considered minor offenses. Far more useful is the *Relaciones de causas de fe de la Inquisición de Mallorca* (Register of the Trials of Faith of the Inquisition of Mallorca [Majorca]). They provide plenty of information, although only those from 1579–1617 have been published. The period is too short to offer a precise picture

of the Inquisition's persecution of illicit magic in the Balearic Islands. Of its 519 cases, only 35, or 7 percent, fall into this category; 14 defendants (40 percent of this sample) were men, a rather high proportion. The total number of cases for the period 1615–1700 was 783, out of which 138 were sentenced for witchcraft or sorcery (Contreras and Henningsen 1986, 119).

A third source is an anthology of superstitious prayers for benevolent magic, mixing invocations to saints with the most bizarre esoteric rites full of eroticism and greed, as well as reflecting the simple desire to recover one's health. Besides its seventy-two prayers (all obtained from seventeenth-century Inquisition trials), the anthology contains a description of each liturgy used by the officiating witch. Each prayer has important textual differences, even those addressed to the same saint (Riera i Montserrat 1979).

The Majorcan Holy Office did not begin transcribing such prayers until the seventeenth century. The most popular saints among Balearic witches were St. Helen (fifteen invocations), St. Anthony (seven invocations), and St. Martha (four invocations). No one else, including Jesus and his mother, was invoked more than twice. It is interesting to notice the evident parallelism between the magic practices on the Balearic Islands, as prayers addressed to saints as mediators seem similar to those used by witches on mainland Spain. Probably, the most active witches in the Balearic Islands were foreigners, even Gypsies, who were perceived as more gifted than the locals.

The eighteenth century offers less information than the seventeenth century, although there is evidence that the Holy Office of Majorca punished two women and one man for witchcraft in 1708, and two more women in 1724, with the aggravating circumstance that they were recidivists. In 1769, a young woman was imprisoned under the accusation of searching for hidden treasures.

Besides the Inquisition, diocesan bishops tried to control the opaque world of illicit magic. Practically all Majorcan synods of the sixteenth and seventeenth centuries (none were held in the next two centuries) emphasized that the sins committed by *sortilegi et incantatores* (sorcerers and enchanters) should be reserved to the bishop, and not absolved by ordinary confessors. In the final synod, summoned by Bishop Pedro de Alagón in 1692, the first chapter of title 18 was devoted to *sortilegi* and ordered that anyone using spells to cure the sick will be excommunicated. It stigmatized such ignorant people as “pravos homines et simplices mulierculas suae salutis immemores” (wicked men and silly women forgetful of their salvation). This text reveals in passing that much of the Balearic population remained attached to magic practices as they had been two centuries earlier, and were still reluctant to denounce such magicians despite clerical anathemas.

Undoubtedly, most white or black magic practiced in the Balearic Islands never reached either the inquisitors or the episcopal courts, but instead remained unpunished, protected by an impenetrable complicity between the sorcerer and his or her customer.

BALKANS (WESTERN AND CENTRAL)

In South Slavic regions under Ottoman rule there were no institutional witchcraft trials similar to those in western and central Europe, nor did the central authorities deal with the problem of witchcraft. Accusations, however, often shaped by traditional beliefs and oral customary law, were frequent among the common people and the local authorities.

The western and central Balkans include the ex-Yugoslav republics (Bosnia, Serbia, Montenegro, and Macedonia) as well as Albania and Bulgaria. Before the coming of the Ottoman Turks in the fifteenth century, Bosnia formed the borderland between the Catholic and Orthodox worlds in the Balkans. While the countries unconquered by the Ottoman Turks (e.g., Croatia) turned toward Latin Europe, the lands under Ottoman rule (the Balkans), mostly populated by Orthodox Christians, experienced a different turn of events.

During the early modern period, despite being ethnically diverse and divided by their official religion, traditional societies in the Balkans shared several common archaic beliefs and everyday practices. Although there were no witchcraft trials in the judicial meaning of the word, a strong shared belief in the existence of witches produced sporadic witch hunts, almost always in connection with natural disasters and from time to time characterized by mass hysteria. Some forms of legislation reflecting witchcraft beliefs can be found in both oral traditions and customary laws of the region. Witches were accused of killing children and cattle, of spreading disease, and of causing crop failures. Almost exclusively, elderly women were accused, interrogated, and sometimes punished according to “old customs.” There are almost no data about such persecutions before the seventeenth century, and the last executions in this region occurred in such mountainous regions as Montenegro in the second half of the nineteenth century.

HISTORICAL, ETHNIC, AND RELIGIOUS BACKGROUND

Due largely to their geography, characterized by impenetrable mountains, the Balkans in the early modern period continued to preserve a complex variety of cultural and ethnic groups. Because the creation of late medieval Christian states (e.g., Serbia) was disrupted by the Ottoman conquest between the fourteenth and sixteenth centuries, the entire Balkan region inhabited predominantly by Orthodox Christians never experienced institutional and juridical witch persecutions. This fact can be explained by a variety of causes, including the following: strongly preserved archaic beliefs, the development of Orthodox Christian theology; an underdeveloped state and juridical system; and a social structure of predominantly peasant and shepherd societies. Under Ottoman occupation, these Christian populations found themselves ruled by a central government with different political, cultural, and religious values. Nevertheless, the Christian population (with a very strong pre-Christian cultural substratum), who were organized in villages, clans, or tribes, preserved their own customary laws, implemented by the local chieftains or councils of elders. Therefore, Ottoman authorities rarely dealt with the problem of witchcraft; in fact, there are literally no institutional and juridical regulations nor any written documents about witchcraft trials from the Balkans. The only exception is the Principality of Transylvania (today part of Romania), which, although a vassal state of the Ottoman Empire, managed to preserve its inner autonomy. With a local governing class largely composed of urban Calvinist Hungarians and Lutheran Saxons, Transylvania presented a completely different cultural pattern from the central Balkans—and recorded numerous witchcraft trials, starting in the late sixteenth century.

Everywhere else in the mountainous western and central Balkans, despite the cultural and religious differences between ethnic groups, older and deeper cultural layers (and sometimes even ethnic kinship) united the Muslim population with their Christian neighbors. For that reason, even in places with a high percentage of Muslims (e.g., Bosnia or southwestern Serbia), the witchcraft persecutions conducted by local “Turks” differed little from those of their Christian neighbors.

The absence of any record of witchcraft accusations in the Balkans until a later date than in the lands to the north and west may not, in fact, mean that no such accusations were made, given the complete absence of documents of any kind from the earlier period, primarily because of constant unrest in the Ottoman borderlands. Because there were apparently no institutional trials, it seems that the documented persecutions represent the variations of popular witch lynchings practiced in other parts of Europe. The specific circumstances of social and economic underdevelopment of this region (its very late modernization) enabled longer survival of its societies based on oral tradition; understanding the oral “legislation” of these societies might help with the reconstruction of other older cultural layers lying beneath the educated tradition of western Europe.

THE FIGURE OF A WITCH

Although widespread, the belief in witches never became a dominant belief system throughout the Balkans; it coexisted with more archaic beliefs in fairies and other supernatural beings (Pócs 1989). In this region, the figure of a witch differed geographically from area to area. In Habsburg-ruled northwestern Croatia, what is known about the witches called *coper-nica* strongly resembles what is known of the Austro-Hungarian *Zauber* (from whom their name derives), with wizardry and weather making as dominant characteristics. Farther southeast, the main characteristics of the “witch” were different: the Dalmatian *striga* (from Italian *streggha*) preserved more archaic characteristics, being much more connected with killing children. Further to the east, from the Dalmatian hinterland through southern Bosnia and alongside the Dinaric Alps, the witch resembled a nocturnal demon that sucks blood from children or cattle. The remains of a demonic type of witch were also preserved in some parts of the Balkans as a belief in *mora* (etymologically related to *nightmare*), creatures who steal the life-giving liquids (blood and milk) from a sleeping victim during the night.

In general, in the western and central Balkans a witch often bears the name *veštica* (with many variations of the term), basically meaning the “one who is able, the one who knows.” This use of the term might be explained, at least on an etymological level, by its pre-Christian and perhaps shamanistic origin.

Regardless of its origins, data from the eighteenth and nineteenth centuries show that the prevailing idea of a witch was a woman who attacked sleepers during the night (whether some evil spirit left her body to make the attack or she did it herself), causing them either death or sickness. There was also widespread belief that the witch could turn into an animal or change her size so that she could pass through very small holes in order to attack her victims. The witch, as a mixture of evil spell caster, weather-controlling expert, and night-stalking demon, was most often accused of killing children and cattle. Because most of our data come from the mountainous regions populated by pastoral societies, it is understandable that almost all witchcraft accusations would involve attacks on humans and livestock, the two fundamental sources of life.

The data show that Balkan-area executions were far less frequent in regions where more archaic beliefs about fairies were better preserved. As a supernatural being, the fairy could not be persecuted, while a witch, a human being who integrated traditional fairy activities (e.g., causing bad weather), simple sorcery, and the demonic characteristics of a classical Greek-Roman *strix* (screech owl; term used for "witch"), presented an ideal scapegoat. The witch, who was almost without exception an elderly woman, could be made responsible for a broad range of natural disasters. Religious and ethnic diversity also affected witchcraft accusations. Constant unrest and war threats, along with permanent tensions between the ruling Muslims and subject Christians as well as between different ethnic groups, provided a sociological and psychological background in which a great number of evil deeds were constantly attributed to the "other side." Muslims often accused Christian women, while both Christians and Muslims accused Gypsies and Vlachs (an ethnic group of Romanian origin). Rich ethnological material shows the existence of strong prejudices among Christians about Muslims as practitioners of magic and sorcery (as well as vice versa). People in the Balkan borderlands sometimes believed that the "Turks" (as Muslims were called, whatever their ethnic origin) could turn into wolves or become vampires. Despite these divisions, sources occasionally mentioned Christians accusing their own women and surrendering them to the Turks to be executed. One such example is a trial held in Trebinje (eastern Herzegovina) in 1846, during which local Christians subjected 73 women to an ordeal before willingly surrendering 11 of them to the Turks to be executed (Maksimović 1979, 220).

PROCEDURE AND PUNISHMENT

The common belief was that witches were in the first place elderly women from the local neighborhood who could be recognized by such natural features as the evil eye, moustaches, hairy legs, and the like. Because of

beliefs that witches could turn into some kinds of animals, people often burned butterflies, birds, or cats, hoping to detect the witches afterwards by their burns or scars.

Along with these personal methods of identifying witches and everyday practices, in periods of major disasters the most common interrogation method was the swimming test (the cold-water ordeal), which was considered to be one of the "old customs." After a serious disaster (a massive death rate among children or an epidemic), a group of accused women were brought to a river or lake and thrown one by one in the water with their hands tied. Those who did not sink were considered to be witches. Data about individual trials are quite rare, but there are several examples of interrogations of entire groups, sometimes including all the elderly women from the area. One of the better-documented trials comes from Eastern Bosnia, conducted by Smail-aga Čengić, the *muselim* (a high Muslim official, a type of clerk acting sometimes as a judge) of Gacko, in the 1830s. According to one of the witnesses, all the elderly women from the area were brought to Lipnik, the tower of the *muselim*, where they were put to the ordeal in the local stream. Two Christians and one Gypsy woman would not sink; and, after being accused of killing the children, they were burned with a searing hot horseshoe. Interestingly, one of the participants stated that "the disaster (dying of the children) stopped immediately" (Lilek 1894, 470). Another similar trial was held in Trebinje in Eastern Herzegovina in 1857. In that case a large number of Christian women who were put to ordeal did not sink, so the local Muslims wanted to stone them. On this occasion, the families of the accused barely managed to save their lives, but they had to take an oath before the local monastery that they "will never eat children again" (Vrčević 1884, 13).

The fire ordeal was applied in some executions in Serbia as late as the beginning of the nineteenth century. In some cases, women were set on fire in order to make them confess their witchcraft; if they would not confess, they were simply burned to death. It seems that this method rested on the widespread belief that a witch who confessed her witchcraft lost her powers (the belief that a witch who confessed her witchcraft in public would lose her powers was also connected with the idea that confession in church could deliver the witch from the evil spirit that she was born with). Therefore, accused witches were sometimes burned not primarily in order to torture or kill them, but to remove their evil powers. From the existing data it can be stated that fire was used in various forms as an interrogation method as well as a measure of punishment, but it was applied only in Serbian cases from the late eighteenth and early nineteenth centuries. Such frequent (although it is hard to speculate about the numbers) and extremely late (beginning of the nineteenth century) burnings can

probably be explained by what has been called the periphery effect (the time lag between the diffusion of cultural developments from the European core to the periphery, in this case from the witch hunts in the Holy Roman Empire to the Balkans) and the growing central European influence in nineteenth-century Serbia. Such cases were reported from central Serbia during the first revolt against Ottoman rule (1804–1812). The leader of the rebellion, Đorđe Petrović (who had previously spent some time in Hungary), ordered a woman accused of witchcraft to be burned alive in the village of Žabari soon after 1805; about the same time, a local chieftain, Antonije Pljakč, burned an old woman in the village of Kraljevo.

In mountainous areas farther south (e.g., Montenegro, Albania) no such burnings were reported. However, until the second half of the nineteenth century, the customary laws in the mountainous Dalmatian hinterland and in some parts of Bosnia preserved a kind of “hot-water ordeal,” in the form of having the accused witch remove a piece of hot steel (usually a horseshoe) from boiling water. Although there are no data about actual witchcraft trials using this ordeal, it is reminiscent of some other persecutions that mention punishing witches with a searing horseshoe.

The oldest and most widespread way of executing witches in the Balkans was by stoning them and throwing them into pits. Punishment by stoning predates Ottoman rule. The fourteenth-century code of the Serbian tsar Dušan, whose terminology strongly resembled the contemporary Byzantine legal system, ordered that “magicians should be punished according to the law of the ancient Fathers,” in other words, by stoning, the practice found in the Hebrew Bible (Radošić 1950, 54). But the code’s connections with popular customs of stoning witches five centuries later have not been satisfactorily explained. The practice of stoning is especially well documented in eastern Bosnia, Montenegro, southern Serbia, and Albania, mountainous regions with prevalently tribal social systems. According to some witnesses, stonings took place sporadically even in the second half of the nineteenth century.

In highland tribal societies, an accused woman was sometimes released if she could bring a group (usually five) of her clansmen or other influential men to swear to her innocence. This practice, sometimes considered a legacy of older Slavic traditional laws, did not help widows and other socially unprotected women, who became ideal scapegoats and were often executed.

Along with such cases of following customary laws, there were also cases of pure lynching where literally no procedure was used. Such episodes occurred in Serbia around 1810, for example, when some women were shot or cut with knives without any interrogation.

Accusations appeared even in the second half of the nineteenth century; at that time, however, except for isolated highland areas, the penalties were less severe than a century earlier. Sources mention only flogging and beating; this change seems to have been the result of the introduction of legal penalties for prosecuting witches.

OFFICIALS AND THE LAST PROSECUTIONS

Witchcraft accusations in the Balkans, unlike those in central Europe, lacked any institutional support from either state or church. Available sources indicate that Ottoman authorities paid little attention to the problem of witches and also suggest that the higher Orthodox Church officials disagreed with the practices of their flock. Although we have little early information on this matter, in regions where executions occurred in the eighteenth century and later, high Orthodox Church officials opposed the practice. For example, in 1795 Metropolitan Peter I of Montenegro forbade “the ones who participated in the stoning” to take part in liturgical meetings and accused them as “deliberate killers”; another high Orthodox Church official, Archimandrite J. Pamušina, claimed that stoning had been “allowed by Ottoman judges as well as some ignorant priests” (Pamušina 1867, 52). It is possible that parish priests, often local people without higher education, sometimes participated in the brutalities and superstitions of their flock.

In Bosnia, the Austrian occupation in 1878 definitively abolished the already dwindling use of customary law. According to contemporary observers, the last ordeals took place in eastern Herzegovina after 1850. In Serbia, witches were occasionally interrogated by water and fire ordeals even after the criminal code of 1810, which forbade “searching for witches, and killing women,” took effect. However, some sporadic cases occurred even later, for example at the village of Brda in Kosovo, where Ottoman police officers almost beat to death four women accused by their neighbors of witchcraft. In some remote regions of Montenegro witches were still stoned even after the 1860s. Although the following of traditional methods (in the Balkans, distinctions between a “lynching” and a “trial according to customary law” remain problematic) definitely ceased during the nineteenth century, a few cases of killing women accused of witchcraft occurred even in the twentieth century.

BAMBERG, PRINCE-BISHOPRIC OF

The infamous reputation of this Catholic principality of the Holy Roman Empire for intensive witch hunting is justly deserved; Bamberg's witchcraft trials developed into some of early modern Germany's most savage persecutions. Abundant legal records have been preserved, primarily in the cathedral city's library, the Staatliche Bibliothek Bamberg, and the wealth of surviving primary source material makes it possible for historians to determine the extent of the territory's witch craze with some accuracy.

Bamberg's first known trial, in 1595, already contained specific allegations of demonic witchcraft, instead of the traditional offense of harmful sorcery (*Zauberei*). The defendant, Margaretha Böhmerin, admitted under torture that she had engaged in sexual intercourse with the Devil, promised him her soul, and attended a witches' meeting. She was executed; but no prosecutions followed until 1612–1613, when a small panic broke out that resulted in fifteen arrests. Between 1616 and 1619, a more intensive series of prosecutions took place, with at least 155 persons tried for participating in demon-worshipping witch sects (Gehm 2000, 57, 69).

A new spate of persecutions erupted during the 1620s, when many other ecclesiastical territories also

staged massive witch hunts. Between 1626 and 1630, approximately 630 persons were imprisoned at Bamberg on witchcraft charges, and most were condemned to death. Like other large witch hunts in southern Germany, the tendency to focus on poor, elderly, quarrelsome females, traditionally most apt to be considered witches, became much less marked as the search for greater numbers of suspected witches gathered momentum (Midelfort 1972). Under these circumstances, accusations were made against many atypical suspects, such as burgomasters and town councillors. The bishop's own chancellor, Dr. Georg Haan, was among those executed. Haan's arrest was mainly due to his desire to reform the increasingly irregular judicial procedures used to detect the bishopric's witches. Like his illustrious predecessor Dr. Dietrich Flade of Trier, Dr. Haan learned that questioning trial procedures was a dangerous undertaking and could lead to charges that obstructors of persecution were themselves witches, protecting their secret demonic coconspirators.

Sudden crop failures significantly provoked Bamberg's severe panic of the 1620s. Although peasant demands that action be taken against sorcerers who had harmed their crops triggered prosecutions, the principal responsibility for unleashing the large-scale witch hunt rested with the ruling prince-bishop and his advisors; after all, the governing elite conducted these prosecutions. Bamberg's outbursts of witch-hunting activity occurred under the rule of the prince-bishop Johann Gottfried von Aschhausen (1609–1622) and especially under Johann Georg II Fuchs von Dornheim (1623–1633), nicknamed the "witch-bishop" (*Hexenbischof*).

Recently, historians have paid more attention to the personalities and general psychological profile of German rulers who displayed a keen interest in the extermination of witches. Such princes usually held a resolute faith, and they were especially receptive to the kind of pessimistic, sin-obsessed, dogmatic mentality often found among sections of the social elite from the late sixteenth century onwards—an era characterized by extensive religious conflict and political turmoil. Bamberg's early-seventeenth-century prince-bishops regarded it as a divine mission to cleanse their lands of any evils that threatened to undermine the godly states they were attempting to establish. As well as witchcraft, Bamberg's overzealous rulers were especially concerned with policing manners and morals, attempting to eradicate a whole range of their subjects' behavior that could be defined as deviant: clerical concubinage, for example, or prostitution, or intemperate immoral conduct during popular festivities. Witch hunting should, therefore, be related to the wider aims of these pious prince-bishops, particularly with their efforts to impose social discipline on

their subjects and to inculcate conformist, authoritarian values.

In Bamberg, and in a number of other Catholic territories that witnessed mass trials in this era, the ruling princes were often advised and encouraged about matters of witchcraft by members of their court circle who were experts in demonological theory. Suffragan Bishop Friedrich Förner fell into this category; in 1626 he published a series of thirty-five antiwitchcraft sermons, helping to endorse and support his prince-bishop's persecutions. The suffragan bishop also provided Bamberg's ruler with aid of a more practical nature for his campaign against witches. It was mainly thanks to Förner's initiative that a special prison, the notorious Bamberger *Hexenhaus*, was built in the cathedral city in 1627 especially to house witches; the jail had room for about thirty prisoners. Suspects imprisoned in the

Hexenhaus were frequently given sadistic forms of torture in order to compel them to admit their guilt. The authorities tortured stubborn suspects by force-feeding them on herrings cooked with salt and pepper while depriving them of drink; by applying feathers that had been dipped in burning sulfur (*Schwefelfedern*) to sensitive parts of their bodies; by compelling them to kneel for long periods on the *Betstuhl* (a "prayer stool" fitted with piercing wooden pegs); and by confining such obstinate suspects as Jakob Krauss for nearly six hours in the *Bock* (stocks fitted with sharp-pointed pieces of metal).

Other German authorities, such as the governors of the imperial free city of Offenburg, utilized similar methods of torture. This city's council, as part of its program to discover witches, instructed a workman to make a spiked chair which could be heated, in order to

inflict the maximum amount of suffering on prisoners. Such brutal measures become more explicable if they are related to government adoption of particular judicial approaches to witchcraft. Bamberg's and Offenburg's judiciary concurred with the views of those demonologists who argued that ordinary procedures for determining guilt were not necessarily applicable in cases of witchcraft, because it was an unusually problematic offense, invariably perpetrated in secret. Many experts in demonology therefore maintained that witchcraft should be prosecuted as an extraordinary crime (*crimen exceptum*), a crime excepted from the usual legal procedures because it was so serious and frequently hard to prove. By resolutely following this advice, legal officials in some German states allowed a situation to develop in which the application of brutal, irregular methods to obtain confessions became standard procedure for detecting witches.

Bamberg established a special witch-finding committee (*Hexen-Kommission*) that was responsible for supervising and directing these prosecutions throughout the whole bishopric. The committee greatly facilitated the process of persecution. Its membership was mainly restricted to legal experts from the ruler's princely court-council (*Hofrat*) who were especially obsessed with the dangers of demonic witchcraft. Thus Bamberg's *Hexen-Kommission* included such jurists as Dr. Ernst Vasoldt, who frequently tortured suspects severely until they named scores of accomplices supposedly seen at witches' assemblies. This fanatical witch hunter left his mark not only on Bamberg's prosecutions but also on the contemporaneous witchcraft trials in Mergentheim. He was sent to this Catholic territory in September 1628, after the authorities had requested advice from Bamberg's prince-bishop on how to proceed further against recently discovered witches. Vasoldt's intervention in Mergentheim proved extremely productive in terms of suspects brought to the attention of the courts; by the time he left the area in December 1628, lists of over 140 denounced accomplices had been compiled (Midelfort 1972, 147).

It is indicative of the fanaticism of the prince-bishop, and the pro-witch-hunting lobby within the governing elite, that they did not experience the kind of crisis of confidence in the validity of the procedures in witchcraft trials that their counterparts in other German regions experienced after the "usual suspects" who fitted the old-woman witch stereotype had been exhausted. By 1628, witchcraft accusations in the episcopal city of Bamberg had started to gravitate significantly toward members of the social elite, but local authorities still persisted in searching remorselessly for more accomplices.

Some relatives of the growing number of wealthy imprisoned suspects complained bitterly about the judicial abuses perpetrated in the bishopric. They peti-

tioned Emperor Ferdinand II's *Reichshofrat* (imperial court) in Regensburg to intervene on their behalf. Eventually, the *Reichshofrat* responded decisively to the mounting criticisms of Bamberg's procedures; on June 12, 1631, it issued a binding imperial mandate ordering Bishop Johann Georg both to appoint a new president of his *Hexen-Kommission* and to undertake a complete revision of his panel of judicial experts within this committee. These measures were deemed necessary to ensure that jurists would, in the future, conduct prosecutions according to the orderly, regulated procedures prescribed in the 1532 imperial criminal code, the Carolina Code (*Constitutio Criminalis Carolina*). The prince-bishop had been outmaneuvered, and Bamberg's reign of terror finally reached its end. By the 1630s, the cultural climate of Counter-Reformation fervor and fundamentalism that characterized the worldview of such advocates of witch hunting as Bishop Johann Georg was falling from fashion.

BAPHOMET

Baphomet is the name of an alleged demonic idol that the Knights Templar were said to have venerated, when King Philip IV of France collected evidence to destroy this rich military order (1307–1314). But at no time, in antiquity, during the Middle Ages, or in the early modern period, was any deity or demon called Baphomet venerated, nor did an idol of that name exist.

Although the question of idolatry was a standing item of the written interrogatories used against this order from 1307 to 1314, only a very few of the hundreds of enforced confessions mentioned Baphomet. If

the veneration of a “heathen” or “demonic” idol was avowed, that idol remained anonymous in most cases. Obviously, the name Baphomet was chosen because of the Templars’ connection with the Saracens, who, according to medieval Christian propaganda formulated in written sources from the late eleventh century onwards (especially in many *chansons de geste*), venerated an idol called Baphomet or Bafumetz. This word, however, though it sounds somewhat similar to the name of the biblical monster Behemoth (Job 40, 10–19), is nothing but a Provençal transmutation of Mahomet, as he was called, the founder of Islam, into a demonic idol. Idolatry had been a standard accusation against all non-Christian religions since the time of the apostle Paul, who often condemned it in his letters, as it had been condemned in the Hebrew Bible.

If the name Baphomet evokes some mysterious associations even in our days, this is due to a legend woven around it, which apparently originated with the German occult society Klerikat der Tempelherren (The Templars’ Clergy), founded in 1767 by the Protestant (but secretly Catholic) professor of theology Johann August Freiherr von Starck. The ritual one had to fulfil in order to be initiated into this Masonic-like group included worship before an altar with a statue of Baphomet. Many other more or less occult groups have claimed (and still claim) to be the true heirs of the murdered knights and similarly transmit the name Baphomet; the leader of the Ordo Templi Orientis (Order of the Temple of the East), Aleister Crowley (1875–1947), even called himself “almighty Baphomet.” Baphomet entered the learned world via the sophisticated but completely untenable speculations of a famous poet and orientalist, Joseph Freiherr von Hammer-Purgstall (1774–1856). In 1818, he published a study on the mysteries of this figure, in which he alleged Baphomet to have been part of the Templars’ secret teaching, which according to him was a form of heretical Gnosticism. The main part of his paper, however, dealt with the sculptures of a Romanesque church in Lower Austria, Schöngrabern, which he interpreted as a cycle of images representing the clandestine doctrine of the order.

Much more popular were the fabulous but trusted “confessions” and “revelations” of a group of late nineteenth-century French writers. In their works, one could read “records” showing that a group of Satanists adored Baphomet as a palladium, wherefore they were also known as Palladists. The idol of the Templars, they stated, had been secretly preserved through the centuries, together with the skull of the last Grand Master of the Templars, burned in 1314. The sect allegedly had its centers in Charleston, South Carolina, in the United States, and later in Rome. One author, C. Hacks (publishing under the name Bataille), described Palladist and Freemason lodges, including descriptions of the

caverns in the great rock of Gibraltar, where prisoners fabricated Baphomets. Such stories had considerable success, especially in Catholic circles, as they seemed to present useful propaganda for the Church’s fight against Freemasonry. But in 1897, the main writer on this subject, Gabriel Jogand-Pagès, alias Léo Taxil (1854–1907), declared that the whole thing had been a mystification without real background, making fun of the credulity of some high-ranking members of the Catholic Church.

To the best of current knowledge, Baphomet was an invention of medieval anti-Islamic and anti-Templar propaganda. Rediscovered in the eighteenth century, the name became associated with various occultist groups claiming to uphold clandestine Templar traditions. As recently as 1965, the French writer Pierre Klossowski received the *Prix des Critiques* (Critics’ Prize) for his novel *Le Baphome* (The Baphomet), the story of a boy in the center of homoerotic Templar rituals.

BAR, DUCHY OF

Because of its exceptionally complicated political history, the French duchy of Bar (which contained more than 100,000 people around 1600) has yet to be studied as a separate unit, and its history of witch hunting has remained completely unexplored. Nevertheless, when contrasted with the larger duchy of Lorraine, Bar contains enough evidence to offer some useful lessons for historians of witchcraft trials in French-speaking Europe, confirming the importance of appellate tribunals and suggesting why many suspected witches were lynched in French-speaking Europe.

Beginning in the Middle Ages, the duchy of Bar, with its capital at Bar-le-Duc in eastern France, was always administered separately from Lorraine. The dukes of Lorraine owed feudal allegiance to the Holy Roman Empire for much of Bar, which after 1506 they had permanently joined to their larger duchy of Lorraine, lying directly east of it, but they also owed homage to the kings of France for a large share of Bar. Major legal differences separated Bar from Lorraine,

giving witch hunting a significantly different profile in each part of this federation. An extremely important division separated the *Barrois mouvant* (that area in the French sphere of influence), its southwestern parts (including the capital, Bar-le-Duc), from the rest of the duchy, known as *Barrois non-mouvant*. From the Middle Ages until France annexed the duchy in the eighteenth century, the *Barrois mouvant* remained subject to the appellate jurisdiction of the distant *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France). In reaction, the dukes of Lorraine created an appellate tribunal for the rest of the duchy at the small town of St. Mihiel on the Meuse in 1571. The larger duchy of Lorraine never contained a true appellate court; the opinions of the *Change de Nancy* [central legal tribunal in Lorraine], where the famous demonologist Nicolas Rémy sat from 1576–1591, were advisory, although consulting them was obligatory. Its smaller twin, Bar, however, was divided between two such courts, one of them very famous and prestigious but hundreds of kilometers distant.

As with Lorraine, our information about witchcraft trials in the duchy of Bar comes almost entirely from financial documents. Although Bar-le-Duc's records were severely damaged by fire as early as 1697, and fewer than half of them survive, enough evidence remains to suggest a few significant differences between Bar and Lorraine. For example, the earliest witchcraft trials preserved from the duchy of Bar (three episodes between 1473 and 1475, involving fourteen arrests and eight deaths) always included interventions by episcopal inquisitors, a tradition that continued here until 1545. However, expenses for witchcraft trials in Lorraine (which begin in 1477) never included inquisitors.

No judicial records survive from the *Parlement* of St. Mihiel, and the overall survival rate from Bar's two dozen financial districts during the probable apogee of trials between 1580 and 1630 was under 50 percent. However, a general panic reached this duchy in 1582–1583, moving east from the processions of "White Penitents" in Champagne: In those years, 10 witches were executed at St. Mihiel and 8 more at six different places. Later, our evidence is randomly scattered. After a poor harvest in 1594, the nuns of Juvigny had 6 witches executed by 1596 (Rigault 1988, 3–9). Only once—at La Mothe, in 1608—we were more than 10 witches tried in one district in one year. Overall, there is evidence of about 100 witchcraft executions in Bar, suggesting a probable total somewhere around 200–250. Calculating recorded witchcraft trials per financial district per year, the overall average for the duchy of Bar from 1580–1630 (0.29 for 305 district/years) was only one-fourth of those from the central duchy of Lorraine in the same period (1.2 for 936 district/years).

Meanwhile, all known lynchings of witches occurred in Bar, the only part of the duke's lands that used appellate courts. More than a dozen homicides of suspected witches were officially pardoned by the dukes of Lorraine and Bar, including three cases before 1500. Although Lorraine was three times as populous, every episode of lynching suspected witches occurred in Bar, most of them in the part under Parisian appellate jurisdiction, the *Barrois mouvant*. Very few witches were ever convicted in these regions, probably because of the enormous cost of appealing a death sentence to distant Paris (this situation actually happened a few times). In 1603, in the tiny southern enclave of Châtillon-sur-Saone, financial records suggest extreme reluctance to torture and convict arrested witches, and a recorded ducal pardon from the same place in the same year suggests a readiness to lynch them instead.

BARANOWSKI, BOGDAN (1915–1993)

Baranowski was Polish social and cultural historian, and author of a comprehensive survey of the witchcraft persecution, published in 1952, *Procesy czarownic w Polsce w XVII i XVIII w.* (Witchcraft Trials in Poland in the Seventeenth and Eighteenth Centuries), and other works on witchcraft. This work has been extremely significant, because subsequent historians have quoted Baranowski's statistics almost exclusively and repeated his explanation of the causes of the witchcraft persecution in Poland. The statistics he published of the number of deaths that happened as a result of the trials were taken from a French résumé, and Baranowski emphasized that these figures were an estimate. Despite this, they have become canonical among non-Polish-speaking authors of witchcraft studies.

Baranowski, the author of over 300 articles and 35 books, completed his first degree at Warsaw University, where he studied history and oriental studies. During that time he worked at the Central Archive of Old Records (Archiwum Głównie Akt Dawnych) and therefore had a thorough knowledge of Poland's central archival sources. During World War II, he was a member of the Home Army and took part in the Warsaw Uprising, one of the few to escape. After 1945 he

became a professor at the University of Łódź, where he taught until 1985. In 1988 he was awarded an honorary doctorate from the University of Łódź.

Baranowski estimated a total of 10,000 legally passed death sentences and 5,000 illegal deaths of both men and women (Baranowski 1952, 178). He based these figures on the territorial unit of Poland in 1952 (without Silesia), and reckoned 1,250 towns in Poland. He supposed that each town court tried an average of four cases for witchcraft during the period and sentenced two people to death from each trial. He then added to this figure of 10,000 death sentences, an arbitrary 5,000 deaths to reflect the illegal murders of people suspected of witchcraft, making a total of 15,000 deaths over the three centuries. In his opinion the peak of the persecution was between 1675 and 1725 (Baranowski 1952, 179), an opinion that has been borne out by other research. In 1963, Baranowski revised his figures down to a few thousand in the epilogue to the Polish translation of Kurt Baschwitz's work on witchcraft, *Czarownice* (Witches). Unfortunately, these more accurate figures have not been those usually quoted by subsequent historians.

Doubts have been expressed about the veracity of the original and much-cited figures, and they have not always been considered in the context of the varying geography of early modern Poland, which was substantially different from the postwar territorial boundaries of 1945. Despite the controversy over statistics, Baranowski's works provided references to many primary sources, and provided a good introduction to the subject. The majority of his references have been checked, but many was clearly inaccurate (Pilaszek 1998, 82). In short, Baranowski's conclusions in his main work was fine, but the statistics was not.

Baranowski adopted a multicausal approach to explaining the reasons for outbreaks of witchcraft trials. He saw them as the result of German influence, because the persecution appeared to have started earlier in the lands neighboring the German territories, and a German legal code, the Magdeburg Law, was used in many Polish towns. He also regarded the Roman Catholic Church as partially to blame. At the same time, Baranowski saw socioeconomic reasons behind the trials: He interpreted witchcraft as a means of revenge employed by otherwise powerless peasants against their masters.

Baranowski also published a collection of transcriptions of six trials for witchcraft from Kalisz between 1580 and 1616, as well as an article on a trial for love magic from Praszka and many other works on folklore and peasant culture in Poland. His work represented the first attempt to present a comprehensive portrait of the phenomenon of witchcraft persecution in Poland and as such remains the natural starting point for further research—especially if Polish and foreign

scholars use his revised estimates of 1963 rather than his pioneering estimates of 1952.

BASEL, COUNCIL OF

The Council of Basel (1431–1449) played a unique and important role as a center for the development and diffusion of the idea of witchcraft in Western Europe. The full stereotype of witchcraft, entailing not just harmful sorcery (*maleficium*) but also demonic invocation and devil worship, heretical gatherings, and apostasy, emerged in a clear form only in the first decades of the fifteenth century, and some of the earliest recorded witch hunts took place during these years in lands just south of Basel, in the diocese of Geneva, Lausanne, and Sion. Politically, most of these regions were under the dominance of the ducal house of Savoy, which enjoyed close connections to the council, to the extent that the council fathers elected its duke, Amadeus VIII (1383–1451; ruled 1416–1451), as anti-pope Felix V in 1439 (reigned 1439–1449). Given these proximities, and considering that Basel brought together a large number of churchmen from across Europe, it is perhaps not surprising that the council became a major center for the collection and codification of the new ideas of witchcraft emerging in the lands around the western Alps and the transmission of these ideas to the rest of Europe.

Several clerical theorists of witchcraft either attended the Council of Basel or were closely associated with the assembly in some way. Perhaps the most important of these men was the Dominican theologian Johannes Nider, whose long work *Formicarius* (The Anthill) contained the most extensive early accounts of witchcraft written by an ecclesiastical authority. Nider was an important member of this council from its inception until late 1434 or early 1435. Although he wrote the *Formicarius* after his departure from Basel, mainly in

1437 and early 1438 while he was in Vienna as a member of the university faculty, most of his accounts of witchcraft were set in regions of the western Alps, and he clearly collected these stories during his time in Basel. Another important author, Martin Le Franc, came to Basel as the secretary of Amadeus VIII (later Felix V) of Savoy, and was formally incorporated into the council in 1440. From 1440 to 1442, he wrote the long poem *Le Champion des Dames* (The Defender of Ladies), which contained an extended debate about witchcraft, here set in the context of the late medieval *querelle des femmes* (debate about the nature of women). Yet another critical early source on witchcraft, written probably in the mid-1430s, was the brief tract entitled *Errores Gazariorum* (Errors of the Gazars or *Gazarii* [Cathars—a common term for heretics and later for witches]). Although the author of this work remains unknown, its connection in some fashion to the Council of Basel appears strong, as both known manuscript copies of the tract exist within larger collections of material relating to the council.

In addition to theorists, several important persecutors of witches were present at the Council of Basel or, again, connected to the synod in some way. George de Saluces, bishop of Lausanne from 1440 to 1461, under whose overall direction numerous witchcraft trials were conducted, was present at Basel, and Ulrich de Torrenté, the diocesan inquisitor of Lausanne from the 1420s who actually conducted many of these early trials, may have spent time at the council. The most famous persecutor of witches to emerge from Basel, however, was Nicolas Jacquier, who attended the council from 1433 to 1440. Later, as an inquisitor in northern France, he wrote an important treatise on witchcraft, *Flagellum hereticorum fascinariorum* (Scourge of Heretical Witches), in 1458.

Despite much circumstantial evidence that Basel was an important crossroads for the development and transmission of the idea of witchcraft, there is no evidence whatsoever that matters of witchcraft or sorcery were ever a formal concern of the council. Although Basel dealt extensively with the Hussite heresy, and even to some extent with the heresy of the free spirit, there is no record of even a single session being devoted to the problem of heretical sorcerers or supposed cults of witches. Nevertheless, at least some direct evidence shows that informal discussions of witchcraft were certainly taking place there. The story of Joan of Arc, burned at the stake the year the council began, was carried to Basel by delegates from the University of Paris. At the council, Johannes Nider heard the story, and, although charges of sorcery did not actually figure in Joan's final condemnation, Nider included her supposed traffic with demons in his *Formicarius* as an example of witchcraft.

BASQUE COUNTRY

Basque country includes the Basque-speaking areas near the Bay of Biscay on both sides of the Pyrenees—the French department of Pyrénées-Atlantique and the Spanish Basque provinces and Navarre. Despite the central position of the Basque witchcraft trials in the history of European witch persecution, no scholarly overview of the subject exists. In particular, knowledge of the trials in the French Basque country is limited, because most archives have been lost. In the Spanish Basque country they have been preserved to a great extent, but remain far from adequately researched. The situation is best in Navarre, where material has been preserved from all three courts that prosecuted witches: the High Court of Navarre, the Pamplona Bishop's Court for Navarre with part of Guipúzcoa, and the tribunal of the Inquisition at Logroño, with jurisdiction that included all of the Spanish Basque country. The archives of the last of these courts were lost during the Napoleonic Wars, but its documents have been preserved in summary form in the so-called *relaciones de causas* (reports of cases) sent annually to the *Suprema* (Supreme Council of the Spanish Inquisition), now preserved at the Archivo Histórico Nacional in Madrid.

Inquisition sources for Navarre and the Basque provinces mention 410 cases between 1538 and 1798 against *supersticiosos*, which was the overall term used by the Holy Office for a wide range of “magical delinquents” from cunning folk, male and female (*hechiceros* and *hechiceras*) and learned magicians (*nigromantes*) to witches proper, male and female (*brujos* and *brujas*) (Henningesen 1993, 58, 71 ff.; Moreno Garbayo 1977, 117 ff.). Records also remain of several hundred cases from secular courts in the sixteenth and seventeenth centuries, and a score of cases prosecuted at the bishop's court in Pamplona between 1589 and 1728. From the latter two courts records also exist of several “witchcraft countersuits,” i.e., libel cases dealing with accusations of witchcraft or cases against witch hunters for assaulting innocent people. In the wake of the great Basque witch persecution of 1609–1611 the High Court of

Navarre, for example, sentenced some local officials to banishment for several years for abusing their power; the parish priest of Errazu was sentenced by the Bishop's Court to two months' confinement in the village church for acting as a self-appointed witch hunter and for withholding the sacraments from people suspected for witchcraft (Idoate 1978, 158, 166, 388).

By the fourteenth century, evidence exists of *maleficium* (harmful magic) trials in the Basque Country, both north (1393) and south (1329, 1332, 1370) of the Pyrenees. The accused, all female, were referred to as poisoners (*emponzoñadoms*), sorcerers (*faytillems* or *hechicems*), or evil herbalists (*herbolens malas*), but because they were also accused of infanticide and had to acquit themselves of the accusations through ordeals by fire, all these accusations probably reflected a popular belief in witchcraft (Lespy 1874–1875, 61; Idoate 1978, 245–248). The Basque word for witch, *sorguina*, first appeared in a libel suit from Pamplona in 1415, where two women were sentenced for calling another woman “sorguina, herbolera et faytillera” (Idoate 1978, 18). Not until almost a century later do we have reliable information about witch persecution in the Basque country: In 1466 the province of Guipúzcoa complained to Henry IV of Castile about the great harm being done by witches, but at the same time drew attention to the fact that there was nothing about witches (*sorguines y brujas*) in their ordinances, so it was impossible for local judges to prosecute them. This situation was promptly remedied by a royal ordinance of August 15 the same year (Orella Unzue 1983, 108–110). According to an old source, the first true witchcraft trial took place in Navarre in 1496, while the kingdom was still independent (Henningsen 2004, doc. 2.1).

According to the historian of the Inquisition, J. A. Llorente, the inquisitors for the diocese of Calahorra burned more than thirty witches in the town of Durango in Vizcaya in 1507. Recent research has cast doubt on this information (Monter 1990, 257), but since the trial of a woman who was burned by the Inquisition in the same place the next year has come to light, Llorente's information is hard to dismiss. The accused was a midwife from Munguia near Bilbao, and her trial mentioned the witches' Sabbath for the first time in Basque territory. María San Juan de Carón, as the woman was called, confessed to having given herself to the Devil Belcebub and having gone as a witch to his meetings and gatherings, where she had renounced Christianity, worshipped the Devil, and participated with other witches in the destruction of crops in the fields. In addition she had caused impotence in certain marriages and cast spells bringing illness and death on animals and people. She also said that the secular authorities had burned her mother as a witch “thirty

years ago,” that is around 1478 (Henningsen 2000, 355).

After the conquest of Navarre in 1512, the Inquisition was also introduced there, and although it was soon merged with the tribunal of Calahorra, its judges continued to call themselves Inquisitors of Navarre. It was, however, the newly established High Court of Navarre that took the lead in the witch hunting. In 1525–1526 a judge, Pedro de la Balanza, went on a punitive expedition against the witches in the valleys of Roncal, Salazar, and other places in northern Navarre, accompanied by twenty-five soldiers and an executioner. Balanza also made use of a local witch finder, a certain Graciana de Ezcároz, who on one occasion examined a group of 400 people. From these she picked out 2 men and 10 women on whom she had found the Devil's mark (Caro Baroja 1964). According to a specifically Basque notion, the witches could be known by a mark that the Devil placed in the iris of the left eye. In slightly older accounts one can read about a certain inquisitor, Avellaneda, who at about the same time gave an account in a letter to the constable of Castile of a similar punitive expedition, during which, among other things, he carried out an experiment with a witch, who after anointing herself with flying ointment flew out of a high window before the eyes of his soldiers (Caro Baroja 1964, 146). As several people have later demonstrated, though, this source was a forgery: There was never an inquisitor for Navarre by that name.

The secular trials of the 1520s included almost all the motifs that appeared in later Basque Sabbath narratives: the flying ointment prepared from flayed toads; the departure through the chimney of the house or open windows; the diabolical goat at the Sabbath, whom the witches must kiss below the tail; the eating, the dancing, and the fornication with the Devil; the return home before cockcrow; Wednesday and Friday as meeting days; the making of the witch powder to be strewn over the fields and of the deadly “green potion” (*potaje verde*), used to poison people (Idoate 1978, 23–57, 249–271). One special feature of the Basque witchcraft trials was the notion that the witches carried children and young people off to the Sabbath while they lay asleep in their beds, and thus recruited them to their evil sect. In other countries it was said that witches took their own children with them to the Sabbath, but the institutionalized abduction of other people's children to the witches' Sabbath is only known from one other place in Europe: the northern Swedish trials at the end of the seventeenth century, where the phenomenon was known as *barneföring*—“child-taking.” The Basque child witches first appeared at an *auto de fe* (auto-da-fé; literally, “act of faith”) at Pamplona in 1540 involving no fewer than thirty boys and girls aged ten to fourteen (Henningsen 2000, 356). They all came from the Salazar valley, where the secular authority

had instigated mass burnings in 1525, but thanks to the Inquisition they now all escaped with milder penitential punishments. Child abduction became a central element in the Basque witchcraft trials and continued to be so until well into the next century.

Basque witch persecution enjoyed strong local support. On several occasions we find Basque peasants in the Pyrenees taking up collections in their parish in order to raise the sum necessary to summon a commissioner from the High Court of Navarre to extirpate their witches (Henningsen 1980, 18). There is some uncertainty about the number of sentences at the secular courts of the Basque Country. As far as the Inquisition was concerned, the sentences ceased after new instructions were issued for witchcraft cases in December 1526. Because the tribunal in Calahorra now consistently demanded to have the witchcraft cases handed over to its jurisdiction, restrictions had also been imposed on the other two courts. From the subsequent period we know of only three witch burnings, all carried out by the secular authority in 1575 (Idoate 1978, 242, 328). During the great Basque witch persecution at the beginning of the seventeenth century, the Inquisition's witch burnings were temporarily resumed. At an *auto de fe* in Logroño, where the tribunal had now moved, four men and seven women were burned, and as late as 1621 the local authorities of Pancorvo succeeded in burning four women and one man as witches (Henningsen 1980, 199, 388). After this, no witch burnings are known from the Spanish Basque Country.

Although there were witch persecutions all over northern Spain, it was the Basque events in particular that gave rise to the shaping of the Spanish Inquisition's witch policy. In January 1526, the inquisitors for Navarre sent four trials for review by the Supreme Council of the Inquisition, and somewhat later they were returned with instructions to obtain evidence for the accusations. The alleged offenses were to be examined in more detail to establish whether they had in fact taken place, and whether a natural explanation could be found instead of witchcraft (Henningsen 2003, 595 f.). Later that year, the Inquisitor General called a meeting of experts in Granada, producing the new instructions mentioned above on December 14; these instructions were later also sent to other tribunals. These new regulations were much concerned with ensuring that the rule of law should apply in witchcraft trials: They mandated, among other things, that no one could be arrested solely on the basis of accusations from other witches; that, when the inquisitors received people accused of witchcraft, they must consider whether the prisoners had already been subjected to torture by the secular court; and that, by interrogating other members of the household, they must find out if the people in question really had been away on the nights when they claimed

to have attended witch meetings, or had remained at home all night without leaving the house (Henningsen 2003, 597 ff.).

The Inquisition was influenced by the strict neoscholastic tradition at Spanish universities, which made it difficult for the Neoplatonist-inspired demonology of northern Europe to gain a foothold in Spain. One exception was the Basque country, where two inquisitors of the Logroño tribunal in 1609 came under strong French influence, leading to a brief return to witch burnings. After scathing criticism of this witchcraft trial by the third inquisitor of the tribunal, Alonso de Salazar Frías, the almost century-old practice of the Holy Office of not burning witches was reestablished. The new set of instructions of the Supreme Council in August 1614 (much of it written by Salazar) ensured that witch burnings definitively ceased at all Spanish Inquisition tribunals.

THE GREAT BASQUE WITCH PANIC

The phenomenon known as the Great Basque Witch Panic began on the French side of the Pyrenees, in the Pays de Labourd, where some nobles and a few urban authorities made reciprocal accusations of witchcraft in the course of their local power struggle. In 1608, two nobles sent a complaint to Henry IV, alleging that the number of witches had increased so alarmingly during the previous four years that no corner of the Pays de Labourd was free of them. A royal decree of December 10 appointed two councillors of the *Parlement* (sovereign judicial court) of Bordeaux, including Pierre de Lancre, to investigate the matter. Accompanied by a president of the *parlement*, Jean d'Espaignet, he was sent to Labourd with the authority to interrogate under torture and pronounce summary death sentences. On July 1 they embarked on this punitive expedition. Their commission expired in December 1609, but because of other duties the judges ended their campaign a month earlier. It is not known how many witches were burned that summer; all the original records are lost. De Lancre's book, which is our main source, states definitely that 3 priests and 8 other witches were burned, but other prisoners were later transferred to Bordeaux, where their trials continued for several years; a few further executions may have occurred (Henningsen 1980, 25). Inquisitor Salazar, who appears to have been well informed of the persecution in the Pays de Labourd (probably by the bishop of Pamplona, who was in contact with his French colleague, the bishop of Bayonne), alleged in 1612 that the French judges had burned over 80 persons as witches during their summer campaign (Henningsen 2004, doc. 12.72).

When de Lancre came to the Pays de Labourd, witch hysteria was already high. People watched over their children in churches at night to keep them from being taken to the Sabbat, and local authorities had already

imprisoned many witches. The principal instigator of this local witch hunt was the lord of Urtubie, Tristan de Gamboa d'Alzate, one of the two noblemen who composed the complaint to the king. We know that he imprisoned some old women on his own authority and extracted an account of all the witches in the neighborhood from one of them (Henningsen 2004, doc. 7.1). This account formed the basis for the letter to the king, and the special commissioners worked closely with him and his ally, the magistrate Jean d'Amou, during their punitive expedition to Labourd.

In December 1608 the witch panic spread to Urdax and Zugarramurdi, two Spanish villages on the northern side of the Pyrenees. The Inquisition immediately stepped in and had ten of the suspects imprisoned (Henningsen 1980, 52–57). After seven months of brainwashing in the tribunal's jail in Logroño, all of them confessed. Furnished with detailed information on the witches' rituals and the names of their accomplices, the second inquisitor of the tribunal, Juan de Valle Alvarado, traveled to the northern border, and in September he made contact there through the local clergy with the French witch commissioners and even had copies of some of their trials sent to him. Valle was convinced that he was dealing with a secret sect of witches, spread throughout this part of the Pyrenees, which simply had to be exposed. In Urdax and Zugarramurdi things went as Inquisitor Valle expected, but in the so-called "five towns" of the Bidazoa valley all was calm; not a single person reacted to the Inquisition's edicts calling for people to give themselves up. Only after the priests, on the orders of the inquisitor, had fulminated against the witches from their pulpits, describing the abominable rituals of the sect in full detail, did people ready to confess they were witches show up. About the same time, the witch hysteria spread from France along the coast to Fuenterrabía and San Sebastián, where soon scores of children reported that they were taken to Sabbats every night.

So far, the panic remained confined to the northern border regions; in all other districts under the Logroño tribunal, peace reigned until autumn 1610, when preachers were sent into the mountains to convert anyone influenced by this evil sect. Shortly afterwards, in November, an *auto de fe* was held in Logroño with the first 31 witches; 30,000 people poured in to hear the sentences and see the witches burned (Henningsen 1980, 184, 198–200). The preaching crusade and the *auto de fe* caused an explosive spread of the witch craze.

In each village the same pattern can be observed. The panic would begin with an outbreak of dreams. Large numbers of people, mostly children and adolescents, reported that they were taken to the witches' Sabbats at night while they were asleep in bed. Night after night they had the same dream of being fetched to the Sabbats; the dreams were so vivid that people could

hardly distinguish them from reality. After the child witches recounted their nocturnal adventures, the witch panic got under way. But the dreams did not lead directly to accusations; only some time later did the children choose to reveal who came to fetch them at night. In Aranaz, in northern Navarre, the children kept dreaming for several months, but the witch craze did not get started until a father had wormed the information out of his little son that it was the cowherd Iricia who took him to the witches' Sabbat. The father went straight to Iricia and, pointing a dagger at his chest, asked him why he had bewitched his son. The following day, another 30 child witches confessed that the cowherd had taken them to the Sabbat too. However, after the local agent of the Inquisition had sent the cowherd to Logroño as a prisoner, the children agreed among themselves that they were now fetched to the Sabbat by a sixty-year-old woman. When she too was arrested, the children accused another woman (Henningsen 2004, 216–218).

Everywhere in the Basque witch craze there were the same three components: indoctrination, a dream epidemic, and induced confessions. The villagers resorted to every possible form of torture to force confessions from people: Some were tied to trees and remained outdoors in the cold winter nights; others had to sit with their feet in water until it froze around them. The violence among the mountain villages of Navarre claimed several lives during the winter of 1610–1611.

By March 1611 the Holy Office had the names of 1,946 people who had either made confessions of witchcraft to local agents of the Inquisition or were under suspicion. Overwhelmed by such "mass apostasy," the Inquisitor General chose to declare an amnesty for all members of the witches' sect who gave themselves up before a certain date. Salazar, whose turn it was to go on a visitation, was sent off to receive these voluntary confessions, but was simultaneously ordered by the Inquisition Council in Madrid to obtain proof that the alleged witch sect actually existed. After an eight-month journey through the entire Spanish Basque Country, Salazar returned to Logroño with a journal of his visitation containing over 11,200 manuscript pages, including the records of the 1,802 cases he had dealt with during his journey (Henningsen 1980, 407, 437 n.). Of these, 1,384 concerned boys and girls under the ages of twelve and fourteen, respectively (Henningsen 2004, 266). Both of his colleagues were now eager to begin punishing those who had failed to turn themselves in. But to their extreme indignation, Salazar concluded in his report to the Inquisitor General that he had found no proof of a single act of witchcraft. On the contrary, his travels had confirmed his suspicion that the witchcraft trials his colleagues had begun six months before Salazar's appointment had been a huge mistake. After a tug-of-war in the tribunal

lasting several years, the case was decided by the Inquisition's Supreme Council, which fully upheld Salazar's contention. The sentences from the *auto de fe* were set aside, all current cases were suspended, and to avoid similar mistakes in the future, the instructions of August 29, 1614, were sent to Logroño. By now, though, the whole region had already fallen calm; as a local report said, "People are sleeping peacefully and there is no news about comings and goings to the *aque-larres*" (Henningsen 2004, 396).

A NOTE ON ETYMOLOGY

Aquelarre is the Basque name for a witches' Sabbat. The word is traditionally explained as a compound of *aker*, "billy goat," and *larre*, "meadow." But this etymology, which can be traced back to the printed report of the *auto de fe* in Logroño in 1610, from which de Lancre took and translated it, has been questioned in recent times. The Basque anthropologist Mikel Azurmendi has claimed that *aker* cannot lose its *r*, and therefore suggested that *aquelarre* derives from *alkelarre*, or "meadow with *alka* flowers." *Alka* (*Dactylis hispanica*) is a poisonous plant that can make cows ill when they eat it. Probably there was some translation error during the interrogations, which went through a Basque interpreter, so that what was originally the name of a place in Zugarramurdi where the witches were thought to assemble was misunderstood by the inquisitors as a Basque name for a witches' Sabbat. In sources before 1609, witches' Sabbats were called *ayuntamientos* (assemblies), *conjuntamientos* (associations), and *conventículos del demonio* (conventicles of the Devil), or *congregaciones del cabrón* (assemblies of the goat). The word *aquelarre* first appeared in a letter from the Logroño tribunal to the Supreme Council in Madrid, dated May 22, 1609, when the inquisitors wrote that they were gathering information about the *juntas y aquelarres* (meeting and witches' Sabbats) from the witches of Zugarramurdi. The next year, the inquisitors asserted that the word was unknown in the Basque language, but that it was a secret term used only by witches. The invented word quickly became widespread; despite some uncertainty about its spelling (*alquelarre*, *aquellarre*, *aquerrlarre*), *aquelarre* soon won the day and was later absorbed into Castilian as a Basque loan word (Henningsen 2000).

BAVARIA, DUCHY OF

Because Bavaria was a leading power of the Counter-Reformation, the traditional perception has been that the Bavarian princes also ranked among the most severe witch hunters. Leading demonologists like Martín Del Rio dedicated their demonologies to Bavarian princes. These were not, however, the ruling princes of Bavaria, but rather younger brothers, serving as prince-bishops in northern German territories like the archbishopric-electorate of Cologne, or the prince-abbey of Stavelot. As leaders of the German Counter-Reformation, the dukes of Bavaria between 1580 and 1760 usually managed to secure a cluster of bishoprics for their younger brothers, including the ecclesiastical territories of Cologne, Münster, Hildesheim, Osnabrück, Paderborn, and Liège, as well as the abbeys of Stavelot and Malmédy, and sometimes the dioceses of Freising and Regensburg—enough places to form a "Bavarian Bishops' Empire." Some of these territories, especially Cologne and Stavelot, saw extensive witch hunts. In Bavaria, however, there were fierce debates but no massive persecutions; only once did witchcraft

prosecution threaten to get out of control, but the threat was stopped immediately.

Among the territories of the Holy Roman Empire, Bavaria was a special case, because the Bavarians considered themselves a nation rather than subjects of a ruler. “Bavarians” were first mentioned by the Lombard historiographer Jordanes around 550 C.E., and some kind of ethnogenesis (defining themselves as a people with a common history and language) must have taken place under the rule of the Ostrogoth King Theodoric the Great (ruled 474–526), who tried to defend the northern boundaries of the Roman Empire (Noricum). This province was soon taken over by the Franks, and “Bavaria” emerged as a province of the Merovingian Empire. Under the Agilolfinger dynasty, Bavaria became an almost independent duchy, first under the Franks, later one of the largest states within the Holy Roman Empire.

By 1600 Bavaria was divided into four provinces (Munich, Burghausen, Landshut, Straubing) and organized in roughly 100 district courts. The duchy was elevated to a prince-electorate in 1623, when Duke Maximilian I managed to annex the Upper Palatinate. When it recovered from its losses during the Thirty Years’ War, Bavaria counted close to one million inhabitants. It became a kingdom in 1806, after having annexed Franconia and eastern Swabia, formerly the most fragmented regions of the Holy Roman Empire. The Wittelsbach dynasty, which ruled Bavaria from 1180, fell in 1918, when a revolution terminated the constitutional monarchy and the parliament decided to join the Republic of Germany. Bavaria occupies the southeastern part of present-day Germany, roughly within its boundaries of 1806.

In contrast to the conduct of the Wittelsbachs in their ecclesiastical principalities, developments in Bavaria deserve particular attention, because the duchy had gained a position of supremacy among the Catholic estates of the Holy Roman Empire. The Counter-Reformation ideology served Duke Albrecht V (ruled 1550–1579) in his struggle against a Protestant faction in the 1560s. After defeating the Lutheran nobility and driving out his Protestant subjects, he introduced the regulations of the Council of Trent, imposed religious uniformity, and gave the country’s university to the Jesuits. Ingolstadt became a breeding ground for Counter-Reformation politicians, and many who later became witch hunters (including almost all of Germany’s notorious “witch-bishops”) were educated there. Although Catholic renewal was begun at least in part for political reasons, it seems that Albrecht V, as well as his successor Wilhelm V (ruled 1579–1597), underwent genuine conversion experiences. With the “Cologne War” of the 1580s, Bavaria’s princes assumed leadership of the Catholic party in the Holy Roman Empire, institutionalized in the Catholic League by

Duke Maximilian I of Bavaria (ruled 1598–1651). The Bavarian Wittelsbachs were closely allied with the leaders of the French Catholic League: Duke Wilhelm married Renata of Lorraine in 1568, and in 1595 Maximilian confirmed this dynastic link through his marriage to Elisabeth of Lorraine, daughter of Duke Charles III, a would-be leader of the French Catholic League.

It hardly seems surprising that Bavaria joined in the great wave of persecutions that spread eastwards from Catholic League strongholds in Champagne and Lorraine in the late 1580s, because Jesuit theologians at Ingolstadt, including Peter Canisius, Gregory of Valencia, and Jacob Gretser, enthusiastically supported the persecutions. Their attitude seemed sufficiently coherent to create the perception of a uniform “Jesuit party,” with the dukes of Bavaria firmly under its influence. Nevertheless, the first wave of persecutions between 1589 and 1591 remained confined to just a handful of Bavaria’s hundred district courts, and it was stopped after only a few months, when the central government abruptly interfered with the main persecution in the district court of Schongau, which was partly autonomous and governed by Prince Ferdinand (1550–1608), a younger brother of the ruling duke Wilhelm V. The Schongau witch hunt with its 63 victims remained the largest ever in Bavaria; but there were also several smaller trials in other district courts in 1590, including both the capital at Munich and the university town of Ingolstadt, where 22 women were executed as witches (Behringer 1987, 436 ff.). The Jesuits suggested Peter Binsfeld and the *Malleus Maleficarum* (The Hammer of Witches, 1486) as guides to interpret popular magic, and the remaining trial records demonstrate that this combination was an unfortunate one, because house searches indeed brought plenty of unguents and magical devices to light. Extensive use of torture fueled the trials in districts like Schongau and Ingolstadt. There was, however, some resistance from relatives, clergy, and magistrates, and a leading Bavarian lawyer, Dr. Kaspar Lagus, articulated his disgust. Altogether about 100 people—all of them women—fell victim to the witch hunts in Bavaria around 1590.

An analysis of Bavarian domestic policy reveals a power struggle lasting more than a generation, between two antagonistic factions with stable bases, disparaged by each other as *politici* (“politicians,” with Machiavellian overtones) and *zelanti* (zealots). The *politici* could be seen more appropriately as moderate politicians who tried to arrive at balanced judgements in the public interest, while the noblest aim of their rivals, the political hawks, was to promote the ideals of the Counter-Reformation. Most of the hard-liners of this faction, the *zealous ideologues*, were pupils of the first generation of Jesuits in Germany, as were the

witch-bishops of Franconia. In the Bavarian government they were represented by the chancellor of the court council, Dr. Johann Simon Wagnereckh (ca. 1570–1617), who, like his duke, had studied in Ingolstadt during the 1590 witch hunt, and whose ideological commitment compensated for his modest standing within Bavarian society. Similar motivations drove immigrants like Wagnereckh's ally Dr. Cosmas Vagh, a convert from northern Germany, and the secretaries of the privy council, Christian Gewold and Aegidius Albertinus (1560–1620). All of them kept in close contact with the Jesuit party, with Gregory of Valencia and Gretser, with the demonologist Del Rio, with the princely confessors and the Rhenish Jesuit Adam Contzen, as well as with the radical Jesuit court preacher Jeremias Drexel (1581–1638). Many "zealots" had experienced witch hunts during their education: Contzen, for instance, studied at the Jesuit College of Trier during Binsfeld's era; subsequently, at Munich, he maintained close contact with suffragan Friedrich Förner in Bamberg. Furthermore Gretser, Contzen, and Drexel dedicated their publications to prominent witch-bishops, such as Johann Christoph von Westerstetten in Eichstätt.

The social profile of the moderate politicians is quite different. Led by the chancellor of the privy council, Dr. Johann Georg Herwarth von Hohenburg (1553–1626), later chancellor of the Bavarian parliament, a group of councillors already articulated their opposition during the witch hunt of 1590. Herwarth was succeeded as privy chancellor by his ally Dr. Joachim Donnersberger (1565–1650). Unlike Wagnereckh, both came from urban patriciates, Herwarth from Augsburg and Donnersberger from the Bavarian capital, Munich. Both had received academic training at foreign universities, acquiring doctorates in France or Italy, and both had served as lawyers at the *Reichskammergericht* (imperial chamber court). The Herwarths were bankers, with Protestant branches in Augsburg, France, and England, while their Catholic branch entered princely service in Bavaria, eventually joining the landed nobility and becoming parliamentary leaders. Herwarth recruited officials from the Bavarian high nobility, as well as members of the imperial aristocracy, including members of the Hohenzollern and Wolkenstein dynasties. He personified an open Catholicism, maintaining international contacts even beyond confessional boundaries.

Herwarth supported the Protestant astronomer Johannes Kepler, for whom he found jobs at Graz in Inner Austria (Innerösterreich, the duchies of Styria, Carinthia, and Carniola, south of Austria proper) and subsequently at the imperial court of Rudolf II in Prague. In their long-standing correspondence, Kepler and Herwarth discussed scientific problems, and the Bavarian chancellor participated in the development of

the logarithmic tables. He also kept in close contact with radically skeptical Protestant jurists like Johann Georg Goedelmann, who not only denied that witchcraft was an "exceptional crime" (*crimen exceptum*), but also denied the reality of witches' flights and Sabbats. Goedelmann's publication on the legal procedure in witchcraft trials was translated into the vernacular during the witch hunt of 1590, which Herwarth had managed to curb in Bavaria.

These two parties clashed in 1600, when the zealots, thanks to the new government of Maximilian I, succeeded in launching an exemplary witchcraft trial against a family of vagrants. In an incredibly cruel trial, Wagnereckh and Vagh, backed by the Jesuit Gretser, extracted confessions, employing unlimited torture, with Del Rio's *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599/1600) literally on the desk. Unsurprisingly, these confessions resembled those of a monk from Stavelot three years earlier, used by Del Rio to describe the Sabbat. In July and December 1600, six people were burned alive at Munich in executions of unprecedented cruelty, accompanied by illustrated leaflets and printed songs (Behringer 1987, 442). Del Rio included some accounts of these trial records in subsequent editions of his demonology.

This episode was intended to signal the start of a general Bavarian witch hunt, similar to contemporary events in Mainz and Fulda. However, "cold and political Christians," (Behringer 1997, 230–320), as Wagnereckh labeled the privy councillors Herwarth and Donnersberger, managed to curb the persecution and to launch a political debate instead. Before further torture was conceded, the university had to consider the case, as the imperial law code known as the Carolina Code (*Constitutio Criminalis Carolina*, 1532) suggested. Surprisingly, the Ingolstadt law faculty, then dominated by Dr. Joachim Denich and Dr. Kaspar Hell, denied the legality of torture and sharply criticized the trial. Completely enraged, Bavaria's zealots suggested that the legal opinion had been commissioned by the privy council, requested more Jesuit control at the university (namely by Gretser), accused Dr. Hell of treason, and demanded further legal opinions. As a result, Duke Maximilian ordered reports from the universities of Freiburg, Bologna, and Padua, and, at the suggestion of the zealots, from two demonologists, Nicolas Rémy and Del Rio, as well as from two governments experienced in persecutions, Trier and Mainz. Predictably, Del Rio and Rémy supported the unrestricted witch hunt and accepted simple suspicion or denunciation as sufficient evidence for imprisonment and torture. However, the University of Bologna supported the Ingolstadt jurists, and even the governments of Mainz and Trier recommended caution, having become disillusioned with witch hunting by 1604.

Del Rio's opinion was taken very seriously, even leading to a correspondence between Del Rio and the duke's Jesuit confessor Johannes Buslidius, who demanded clarification on some points. Given the high reputation of Jesuits in Bavaria, Del Rio could only be trumped by another Jesuit. Now Herwarth played his final card: Adam Tanner, the famous Jesuit critic of witch hunts.

It is unnecessary to delve further into the details of this Bavarian power struggle, which lasted for more than a generation, and involved almost the entire political leadership and a good part of the spiritual elite. Bavaria's zealots continued to support their allies in other Catholic territories, but whenever they tried to launch a witch hunt in Bavaria, they failed. During the agrarian crisis of 1608–1609, they tried to exploit a panic in the small exclave of Wemding, less tightly controlled by the government in Munich. However, after a number of executions, the government became suspicious, intervened, and began an inquiry into the conduct of the trial, which soon led to the imprisonment and trial of the judge, Gottfried Sattler. The government decided to set an example by punishing his misconduct with the death penalty. The zealots in Munich fiercely opposed the sentence, trying to rally support among the ruling family and among the Jesuits, but the Ingolstadt law faculty twice confirmed the government's judgment. Sattler was decapitated in 1613, the first Catholic witch hunter to meet such an end, providing an important symbolic victory for the opponents of witch hunting. In his *Theologia scholastica* (Scholastic Theology, 1627, vol. 3, col. 1005), Tanner mentioned this capital punishment, together with the trial and execution of the Fulda witch judge Balthasar Nuss of 1618, another success of the Ingolstadt law professors. Both death penalties came to be extremely important because they proved that severe mistakes had occurred in Catholic witchcraft trials and that victims might be innocent. Borrowing their evidence from Tanner and Friedrich Spee, later opponents of witch hunting regularly referred to these cases.

Clearly Ingolstadt had become a bridgehead for the Bavarian moderates, whether lawyers or Jesuits. A younger Jesuit student of Tanner, Professor Kaspar Hell (1588–1634), was bold enough to challenge publicly the terrible witch hunts of Bishop Johann Christoph von Westerstetten in Eichstätt, attacking him so sharply that the Jesuit general, Mutius Vitelleschi (1563–1645), intervened repeatedly in favor of this dedicated Counter-Reformation prince-bishop and supporter of the Jesuit order. Bavarians knew only too well how to classify such Franconian events. But they did not need Tanner to enlighten them. Jesuits like Hell and Kaspar Denich were sons of Ingolstadt lawyers who had cut short the attempted general persecution in 1601, and their families were closely linked to such privy councillors as Dr. Kaspar Lagus. Some Bavarian "politicians," for instance court council chancellor Dr. Johann

Christoph Abegg, had relatives burned in Eichstätt. When Maria Richel, the wife of Dr. Bartholomäus Richel (1580–1649), chancellor of Eichstätt, was burned in 1620, Bavaria's privy councillors intervened to evacuate the rest of the family from the dangerous prince-bishopric, immediately appointing Richel vice-chancellor in Munich. Munich, the hothouse of Counter-Reformation Germany, became a safe haven for endangered Catholic politicians and their families. In 1628 the privy councillors offered a position to Chancellor Dr. Georg Haan of Bamberg, whose wife had just been burned. Haan failed to accept after the Bamberg government had assured the Bavarian prince-electoral (from 1623) Maximilian that Haan was in no imminent danger. This proved to be a terrible mistake; the bishop ordered his execution a few weeks later.

In the late 1620s, when the witch hunts in the Franconian prince-bishoprics reached their climax, Bavaria's zealot faction succeeded in launching another local witch hunt in the exclave of Wemding, in the vicinity of Eichstätt, costing the lives of another 40 women (Behringer 1987, 451 ff.). At this point, Tanner included his opinion on witchcraft, designed twenty-four years earlier, in his textbook of moral theology, thus serving as an anchor for future Catholic theologians. Tanner also made the internal Munich discussions of twenty-four years ago public. When Friedrich Spee published his *Cautio Criminalis* (A Warning on Criminal Justice) in 1631, Tanner was the only important Catholic authority he could use who relentlessly denied the legality of witchcraft trials, without getting enmeshed in debates on the existence of witches.

After the Thirty Years' War there were few executions for witchcraft in Bavaria. The population had collapsed because of several severe mortality crises, but there was also some disillusionment about witchcraft trials, at least at the level of the central government in Munich under Duke Ferdinand Maria, as a legacy of these long-standing debates and of the cruelties in the prince-bishoprics. Later in the seventeenth century, however, the central government's grip on the provincial governments loosened, and the number of trials increased again. Two minor panics affected the district court of Haidau in Lower Bavaria in 1689–1692 and 1701–1702, when Capuchins fueled the local hysteria with exorcisms of possessed children, eventually provoking the extinction of whole families. In the early eighteenth century, a number of small panics were seen, although they were usually tolerated by the provincial governments. No less than 15 people, mostly young male beggars, were executed in the 1720s.

A final chain of trials conducted between 1749 and 1756 in the neighboring prince-bishopric of Salzburg affected the Bavarian provincial capitals of Burghausen, Straubing, and Landshut. In almost all of these cases, accusations by children triggered the trials. The last

Bavarian witch was an orphaned fourteen-year-old girl, Veronica Zerritschin (1742–1756). She confessed voluntarily that the reason for her possession was her theft of some hosts, which she had used for sorcery. The court found the hosts, which had visibly been used for sorcery, so there was undeniably a *corpus delicti* and sufficient circumstantial evidence to prove the suspicion. The girl provided extensive narratives of seduction by the Devil, the witches' flight and Sabbat, and harmful magic; she had also learned to act as a sorcerer and could recite a rhyming weather spell of twenty verses. The harm she claimed to have caused had indeed occurred, although her victims had not been aware of her witchcraft. The judge found the case difficult, because this culprit was still quite young and cooperated willingly. But if the court would not convict a confessing witch, it would never again convict anyone for witchcraft. Therefore, the girl had to be executed, as *a matter of principle*, as the judge indicated. Because Bavaria had seen so many late trials, there was good reason to take decisive steps against these reactionary forces. A group of enlightened lawyers and theologians convinced the prince-electors Max III Joseph (ruled 1745–1777) that a public debate was the appropriate means for intimidating the religious orders and their allies. This debate was launched in 1766 and lasted four years; contemporaries labeled it the Bavarian War of the Witches.

In retrospect, Bavaria serves as a striking illustration of the development of European attitudes toward witchcraft. During the Carolingian period, it received a comprehensive common law, the *Lex Baiuvariorum* (Laws of the Bavarians), containing sanctions against specific forms of harmful magic to horses and grain. There were, however, few examples of prosecution for death spells and love magic throughout the Middle Ages, including the later centuries when sources become more abundant. Clearly death penalties were always possible, but were rarely enacted then. When Heinrich Kramer launched his witch hunt in Innsbruck in 1485, Bavarian theologians like the abbot of Tegernsee articulated their disgust and tried to interfere. In the early modern period, witchcraft trials become more frequent, but rarely led to large-scale persecutions.

An extrapolation of recent research projected that approximately 1,500 trials for witchcraft or sorcery could be expected to have taken place in Bavaria, but hitherto fewer than 200 death sentences have been detected in the sources, and it seems unlikely that any large trials have escaped scholarly attention. Most of those executed died during the few large-scale persecutions and panic trials. But as far as serial analysis is concerned, much remains to do: Historians possess an ocean of sources, which they have so far only explored in part. There are expense records from virtually every district court (from the fifteenth century onwards), as well as from some central Bavarian prisons; there are

court council records (since the early seventeenth century), trial records, official reports, special files for witchcraft trials, legal opinions, official correspondence, diaries, travel reports, and publications of all kinds. Witchcraft generated debate, but did not really bother the majority of the ruling elite. An extensive piece of legislation on witchcraft, *Landgebott wider die Aberglauben, Zauberey, Hexerey, etc.* (Law Against Superstition, Magic, Sorcery, etc.), was enacted in 1612; reissued in 1665 and 1746, it remained in place until 1813, but was not designed to lead to witch hunts.

BAVARIAN WAR OF THE WITCHES

The final debates about witchcraft in Catholic Europe were launched after a scandalous public speech given by the Jesuit Georg Gaar on the occasion of a witch burning in Würzburg. In 1749 the seventy-one-year-old subprioress of the abbey of Unterzell, Maria Renata Singerin, was decapitated and her body burned at the stake. In the background were, as usual in cases of possession, the group dynamics of the female convent and a mentally disturbed person who voluntarily accused herself. The authorities felt considerable unease about her case, as many acknowledged her disability, but her conviction was finally declared to be a matter of principle, and the hard-liners gained their victory.

However, the reaction was quite unexpected: Italian intellectuals took this occasion to start a major debate about witchcraft. Abbot Girolamo Tartarotti, a member of the Imperial Academy of Sciences at Rovereto (then under Austrian rule), ridiculed the barbarian German Jesuit Gaar in his famous *Del Congresso notturno delle lammie* (On Nocturnal Gatherings of the Witches, 1749), in which he interpreted witchcraft as an illusion. More radical intellectuals were not satisfied, feeling that Tartarotti had still made too many concessions to the Christian interpretation of magic. Scipio Maffei from Verona published three thick volumes on the subject, *L'arte magica distrutta* (The Magical Art Annihilated, 1754), denying the existence of magic and therefore of witchcraft, and urging a complete halt to all trials. Unexpectedly, a Franciscan provincial, Benedetto Bonelli (1704–1783), led the conservative Italian clergy in trying to refute Maffei's arguments.

Soon afterward the debate returned to Germany, when the historian Jordan Simon, a former Augustinian hermit, defended Maffei's arguments in a massive book, *Das grosse Welt-betrügende Nichts oder die heutige Hexerey-und Zauberkunst* (The Great World-Deceiving Nothing, or Today's Witchcraft and Art of Sorcery, 1761). At this point the Catholic realms of the Habsburg and Wittelsbach dynasties were suffering from a struggle between court and country. As in Protestant Europe, the rulers generally dismissed witchcraft as unimportant or ridiculous; but the internal balance of power was complicated because the Jesuits were in control of higher education, the bishops controlled the book market, and the religious orders were held in high esteem by the rural population, over whom they exercised considerable influence. The greatest problems occurred in relatively autonomous provinces, mostly administered by the regional higher nobility, who (often in alliance with the religious orders and the populace) tried to maintain the witch paradigm. This stalemate exacerbated the developmental gap between Catholic Europe and the more developed Protestant societies. From the second third of the eighteenth century, the Austrian and Bavarian privy councils therefore began to develop strategies to force their reform programs into their domestic peripheries. In Bavaria, the central government had tried to discourage further witchcraft trials by decree in 1727, but another chain of trials began in 1749 in the provinces and lingered until 1756. The Austrian Empress Maria Theresa (ruled 1740–1780) intervened directly to curb witchcraft trials in present-day Poland and Slovakia in 1756, and in present-day Croatia in 1758, but a new wave of trials occurred in Hungary in the 1760s.

As in England, the fight against witchcraft trials became a lever to break the power of conservatism. In Bavaria, the enlightened Prince-Elector Max III Joseph (ruled 1745–1777) and his advisers engineered a blow

to the conservative clergy by inviting the Theatine father Don Ferdinand Sterzinger, a member of the Bavarian Academy of Science, to discuss witchcraft on the occasion of the prince's birthday, October 13, 1766. His "Academic Lecture About the Prejudice that Witchcraft Can Produce Effects" provoked a debate labeled by contemporaries as the Bavarian War of the Witches, which lasted about five years. It became one of the largest debates of the Enlightenment in central Europe, with contributors coming from all over Germany, Austria, Bohemia, Switzerland, and northern Italy. Sterzinger's intent was clear from the onset, because he labeled the belief in witchcraft a "common prejudice," a matter of "the common rabble" rather than of the educated (Behringer 1997, 359–380). While openly acknowledging his debt to Tartarotti, Maffei, and "Dell Osa" (Jordan Simon's pseudonym), Sterzinger was not yet ready to mention Protestant authors like Christian Thomasius, Balthasar Bekker, or John Webster, although obviously sharing their ridicule of the concept that spirits could assume corporeal form. When Sterzinger mocked the ideas of Martín Del Rio, his irony was directed against the Jesuits who still dominated the Bavarian university and secondary schools; this Jesuit preponderance had in fact prompted prince-electors Max III Joseph to create an independent Academy of Sciences just seven years earlier, in 1759. And it was indeed the members of this academy, for instance Peter von Osterwald, who had presumably commissioned Sterzinger's speech. At the occasion of the prince-electors' birthday, the conservatives were certainly present as well, and Sterzinger was sufficiently prudent not to question the authority of the Bible, or the Bavarian penal code.

Nevertheless, the conservatives understood very well that this was a political move, and that Sterzinger's speech had launched an attack on traditional Catholicism by the Catholic Enlightenment. Contemporaries reported on the unusually excited reaction throughout the region: "There was no palace, hut, nor cell, no matter how sleepy, which did not raise its voice with enthusiasm, as if it was now up to them to decide the issue" (Behringer 1997, 362). Discussions were conducted in cafes and beer-halls. Charismatic preachers prodded peasants in the countryside. In Munich, sermons were delivered against the free-thinkers, for instance by the Jesuits at the major Marian pilgrimage site Altötting, and by the episcopal hierarchy at Salzburg; the administrator of the Bavarian province of Straubing, a high-ranking nobleman, Franz Xaver von Lerchenfeld, also commissioned a refutation. Dozens of theologians from the capital (Augustinian hermits and Paulinian monks in Munich), Bavarian monasteries (the Benedictines in Scheuern and Oberaltaich), and those from various ecclesiastical territories (Benedictines in Salzburg, Premonstratensians in

Würzburg) began writing defenses. These defenses included some cumbersome dogmatic books with more than 250 pages, which could have been designed in exactly the same way 300 years earlier, like that of the Benedictine Beda Schallhammer from Oberaltaich.

Others came up with remarkably ridiculous arguments. The Benedictine Angelus März, from the abbey of Scheyern, argued that his monastery was selling about 40,000 *Scheyrerkreuzlein* (little cross-shaped amulets made of silver) all over Bavaria, Swabia, Bohemia, Austria, Moravia, Hungary, Saxony, and Poland, which were meant to drive off the witches, and therefore would suffer considerable economic loss if this trade was stopped artificially. Oswald Loschert, from the Premonstratensian monastery of Oberzell near Würzburg, who had participated in the trial against Renata Singer in 1749, likewise employed practical arguments. Enlightened luminaries may indeed have shared the fear of the theological conservatism that the Augustinian reactionary Agnellus Merz displayed in print in December 1766, but they were delighted to discover the silly arguments of some of their opponents.

In January 1767, the first mocking satire appeared in print: Andreas Ulrich Mayer, the chaplain of an Upper Palatinate nobleman, published it under the telling pseudonym of “Bocksberger,” indicative because it used the name of the mountain where witches were traditionally supposed to gather. If Mayer claimed that he “laughed himself to death over [these] hare-brained fantasies,” he still revealed his fears by writing that luckily his tract would not “find its way past the porter in the contemporary world of the great free-thinkers: otherwise one could still hope that witch-burnings, now forbidden—unfortunately—in all places, would greatly add to the confidence of the faithful and might begin again” (Behringer 1997, 370). From January to April 1767, another twelve polemic tracts fueled the Bavarian War of the Witches, including some literal satires. Meanwhile, the members of the academy started to use the recently founded magazine *Churbayrisches Intelligenzblatt* (Chur-Bavarian Intelligence Sheet) to review every new contribution in print and ridicule the efforts of the country bumpkins, whom they labeled as “learned fools,” “pedants,” “foxy scholars,” “learned ignoramuses,” or “bewitched brains.” One of the journal’s editors, Peter Paul Finauer, eventually refused to compose any more satires against the conservatives, because “they have suffered enough by having their works printed.” In 1767 the Viennese imperial councillor Konstantin von Kautz contributed a remarkable Latin dissertation, *De cultibus magicis* (On Magical Cults), which contextualized that Bavarian debate with earlier debates in both Catholic and Protestant Europe (Italy, northern Germany, the Netherlands, and England). On the anniversary of Sterzinger’s speech, the academic who had presumably engineered the

debate, Peter von Osterwald, gave the next speech, using the occasion of the prince-electors’ birthday to summarize the debate and to deliver the decisive blow. Osterwald blamed the “useless form of scholarship” conducted over the past centuries and pleaded for a new science governed by reason alone. Unsurprisingly, some enlightened participants in the debate later became directors of the Bavarian education system, replacing the Jesuits after their order was dissolved in the 1770s.

However, if Osterwald intended to terminate the debate, he failed. In November 1766, the imperial government in Vienna issued a decree in order to stifle further witchcraft trials in Hungary, and this event was widely debated within Bavaria. And the subject of witchcraft remained useful in political struggles. More and more satires were written; the academics ridiculed their opponents by themselves publishing additional stories of ghosts and witches, stories written, for instance, by Heinrich Braun, a former Benedictine of Tegernsee, or Beda Mayr, a former Benedictine of Donauwörth and future follower of Immanuel Kant. In 1768 legal reforms proposed by Osterwald were initiated: The ecclesiastical council was now controlled by secular lawyers, monasteries were taxed, and censorship was removed from ecclesiastical hands and given to secular censors, who immediately made it a weapon against reactionary theologians. All these reforms were intended to erode the position of the clergy and to promote secularism.

The Bavarian War of the Witches marked the victory of the Bavarian Enlightenment over the representatives of a surviving social system at a moment when such a victory was probable or even assured, given the protection of the prince-electors. Nevertheless, the debate was more than just a symbolic struggle, because the last stakes in central Europe were still very recent. It was widely regarded by contemporaries as a milestone in the history of the Enlightenment, because the Catholic south had caught up with Protestant Europe. Major authors of the period, for example the poet Friedrich Klopstock in Hamburg or Friedrich Nicolai in Berlin, displayed their interest, and many enlightened journals commented on the progress in the Catholic south. The imperial councillor von Senckenberg wrote approvingly from Vienna of his pleasure at the destruction of superstition in the empire, playing on the book title of Scipio Maffei. At the same time, however, the enlightened scientists in Bavarian monasteries, for instance the Augustinian canons at Polling, felt increasingly uneasy because they were caught in the middle between secular reformers and dull monks.

The contributors to the Bavarian War of the Witches overlapped with those who had been part of the earlier Catholic debate, some authors still having participated actively in witchcraft trials. Its contributors also

overlapped with those who took part in later debates about the exorcist Johann Joseph Gassner, who linked all diseases to witchcraft, and Franz Anton Mesmer (1734–1815), considered a luminary in Germany but a charlatan in France. To their annoyance and embarrassment, the defenders of witchcraft had to notice that they were now treated as the rearguard of a defeated ideology, in the same class as witches, jugglers, tellers of fairy tales, and madmen. But even during the reign of the enlightened Emperor Joseph II (ruled 1765/1780–1790), it took courage to defend the end of the witchcraft trials. The mendicant orders remained powerful even after the dissolution of the Jesuits, as can be seen from Johann Pezzl's (1756–1838) satirical novel *Faustin, or the Philosophical Century*. Many contemporaries interpreted the end of the witchcraft trials—this became quite clear at the end of the debate—as the victory of light over darkness, as one of the biggest successes of the era of Enlightenment and maybe in the history of humankind.

BAXTER, RICHARD (1615–1691)

This prominent Presbyterian divine, prolific author, and widely influential preacher propagated the learned belief in witchcraft far longer and far more effectively than most of his near contemporaries. Baxter's fascination with witches, dreams, ghosts, and demonic possessions was not due to extreme credulity, but stemmed from his wholly rational desire to account for supposedly inexplicable phenomena and his need to underscore the peril that civil society faced from any inversion of the natural order. Consequently, the "devil's work [in] hurting and destroying" and the refusal of atheists, cynics, and modern Sadducees to acknowledge the efficacy of magic and malignant spirits attracted his particular censure (Baxter 1834, 51, 102, 107). "Sure it were strange," he wrote, "if in an Age of so much knowledge and confidence, there should so many score

of poor Creatures be put to death as Witches, if it were not clearly manifest that they were such. We have too many examples lately among us, to leave any doubt of the truth of this" (Baxter 1650, 261–262).

However, after the mid-seventeenth century, both England's judiciary and its social elites were requiring an ever-growing body of empirical proof before acting on allegations of witchcraft in their communities. As a result, Baxter was forced to move beyond simple citations of classical and Biblical sources to compile detailed eyewitness accounts of the devastation wrought upon innocent people by *maleficium* (harmful magic) in order to justify both prosecution of and belief in witchcraft. Thus, his works are crammed with first-hand accounts of apparitions, juvenile possessions (in which nails and pieces of flint were vomited up), and motifs drawn from rural folklore, like the "Corpse Candles" in South Wales, which were thought to presage an individual's death (Baxter 1834, 23–24, 31, 42, 45). Moreover, he also recorded evidence of the correlation between refusals of charity to the poor and immediate retribution through witchcraft. In this manner, a gentleman who refused to buy pins at the roadside was swiftly visited by a series of debilitating pin-pricks all over his body. Baxter also attempted to explain the location of witchcraft within the home and the fact that the damage done to property by magic was often quite petty by arguing that the corrupted spirits who worked on the vulnerable were themselves but "base spirits" and therefore more likely to be concerned with petty and greedy matters, centering around money, land, or revenge (Baxter 1834, 28, 90). Individuals, congregations, and ministers all sought out Baxter's advice and contributed valuable case studies to his archives because he was an acknowledged expert. Baxter believed that the detection of malignant spirits and operations of the Devil was a collaborative, rather than a solitary pursuit. His ideal was for a "godly" community of professionalized, specialist investigators to be permitted the authority to examine every case individually. This, he claimed, would rule out false or malicious claims and enable magistrates to detect and dispel evil spirits far more efficiently.

Well-educated and skilled in medicine, Baxter had witnessed his own cures hailed by country folk not as curing the symptoms of a disease, but as the casting-out of devils. Such simple superstitions troubled him deeply and strengthened his conviction of the need for specialist investigators. He recorded that even as he was writing in 1659, "I am put to dissuade a man from accusing one of his neighbours of witchcraft, because his daughters hath this disease, and cryeth out of her" (Baxter 1659, 184–185). Similarly, he could find no convincing proof for the efficacy of the touch of the English monarch in healing scrofula, known as the King's Evil, though he held a firm belief in the power and signifi-

cance of angels as messengers from God (Baxter 1834, 82–83, 97–100).

Baxter concluded that witches were far less dangerous to society than the invisible operations of spirits that corrupt us by encouraging pleasure, pride, and lust. Ultimately, Baxter managed to evolve a coherent argument for the existence of magic and witchcraft that continued to find some support among nonconformist communities into the nineteenth century, though by the time he died, the question of the reality and effectiveness of *maleficium* had moved to the outermost fringes of intellectual debate across most of Europe.

BEHRINGER, WOLFGANG (1956–)

Affectionately known to colleagues as the “witch master” (*Hexenmeister*), Behringer has been seminal in achieving international recognition for witchcraft studies as an independent field of historical research. Behringer was born and raised in Schwabing, the cosmopolitan university district of Munich, into a pedagogical family. While working part-time, he studied history, political science, and German at the Ludwig-Maximilians University of Munich, where he received his masters degree and, in 1985, his Ph.D. for a dissertation on Bavarian witchcraft trials under the supervision of the social and cultural historian, Richard van Dülmen. From 1991 to 1997, Behringer was a researcher and teacher at the universities of Augsburg and Bonn, simultaneously producing monographs on a freelance basis about several topics far removed from European witchcraft: the Thurn and Taxis family (founders of the imperial postal service), the almost equally venerable Lowenbrau and Spaten breweries, and the very modern Lufthansa. In 1997, the University of Bonn awarded him the *Venia Legendi* (authority to teach) for his *Habilitation* (a post-doctoral degree required in some nations for professional posting at a university) on the communications revolution in early modern Europe. He continued teaching at

Bonn until his appointment to a full professorship at the University of York. In 2003 he returned to Germany, accepting the chair of history previously held by his former mentor van Dülmen at the University of Saarbrücken.

Behringer’s dissertation, originally published in German in 1985, was translated into English by J. C. Grayson and David Lederer and published by Cambridge University Press in 1997 as *Witchcraft Persecutions in Bavaria: Popular Magic, Religious Zealotry and Reason of State in Early Modern Europe*. The German original has now gone into its third edition. This classic study reexamined an older treatment of the subject by Sigmund Riezler, incorporating considerable new information from a serial analysis of the seventeenth-century Bavarian Court Council protocols and the records of the infamous *H-Sonderkommando*, the Nazi group that researched archives for the persecution of witches.

Since 1986, Behringer has been a member of the Association for Interdisciplinary Witchcraft Research and coeditor of its monograph series. However, much of his seminal work has continued to appear in German and, like his work on communications theory or breweries, remains largely undiscovered by the English-reading public. For example, together with Swiss climatic historian, Christian Pfister, Behringer has energetically promoted research on the nexus between an ecological crisis lasting from 1565 to 1630, the so-called Little Ice Age, and related cultural phenomena such as confessional strife, social disciplining, suicide, and popular attitudes toward magic during the iron century. Some of his more significant book titles include his early study of Bavarian witchcraft legislation (1988); a widely used paperback collection of key documents and connected commentary on *Hexen und Hexenprozesse in Deutschland* (Witches and Witch Trials in Germany), now in its fourth edition; an extremely short but extremely meaty paperback called simply *Hexen* (Witches, 1998), which discusses worldwide witchcraft beliefs, persecutions, and publicity, and a richly annotated edition and new German translation of the *Malleus Maleficarum* (The Hammer of Witches, 1486), done with Günter Jerouschek (2000).

Among dozens of his other publications on the history and theory of early modern witchcraft, a few are available in English. They include Behringer’s brilliant monograph on nocturnal shamanistic ghost-riders who came to be thought of as witches, first published in German in 1994 as *Chonrad Stoeckhlin und die Nachtschar* and soon translated by H. C. Erik Midelfort as *The Shaman of Oberstdorf* (1998). They also include two brief statements of Behringer’s well-known theories about the connections between agricultural crises and the rise of mass witchcraft persecutions: “Weather, Hunger and Fear. The Origins of the European Witch

Persecution in Climate, Society and Mentality” and, more recently, “Climatic Change and Witch-Hunting. The Impact of the Little Ice Age on Mentalities.”

BEKKER, BALTHASAR (1634–1698)

A Dutch Reformed pastor influenced by Cartesian rationalism, Bekker became one of the most influential critics of belief in witchcraft and demonology in late-seventeenth-century northern Europe. His book, *De Betoverde Weereld* (The World Bewitched, 1691–1693), remained well into the eighteenth century one of the hallmarks of a tradition that prepared the way for the later Enlightenment rejection of belief in witchcraft and sorcery.

Born in 1634 in the northern Netherlands, Bekker was educated at the Universities of Groningen and Franeker, where he came under the influence of Cartesian ideas and thus also under the suspicion of conservative Reformed clerics. Bekker nevertheless was ordained a Reformed pastor and served several Dutch congregations before accepting a call to the ministry in the important city of Amsterdam in 1680. Here he developed his interest in witchcraft and sorcery, approaching these subjects from the fundamental perspective of questioning the nature and temporal power of the Devil and evil spirits.

Bekker’s interest in the Devil’s power began in 1688 when he wrote a commentary on the biblical Book of Daniel. He began to preach sermons on the topic, and friends urged him to expand his ideas into a book. Then Bekker read an account of an English witch at the time imprisoned in Beckington. He translated the account into Dutch and added his own commentary, which was quite skeptical of this supposed case of witchcraft. This short treatise became the foundation for Bekker’s further research into witchcraft and demonology, which led to the publication of his four-volume work, *The World Bewitched*.

Motivated in part by his Cartesian rationalism and in part by concerns regarding scriptural interpretation, Bekker rejected the operative role of the Devil in witchcraft and sorcery, undertook a wide-ranging critique of traditional beliefs regarding witchcraft and the Devil, and applied a method of biblical interpretation in harmony with his position.

The first volume of *The World Bewitched* provides an historical overview of popular opinion about spirits from antiquity to the present. Bekker argued that the roots of spirit belief lay in pagan antiquity, but these ideas had infiltrated the Catholic Church and had been perpetuated in the Christian tradition. Even his own Reformed doctrine was not free of such beliefs. But belief in the Devil and evil spirits, as well as in such things as fortune telling, sorcery, and witchcraft, were essentially pagan ideas founded upon ignorance, prejudice, and fear. According to Bekker, such ideas could be supported neither by reason nor by the Bible.

Volume two of his work was by far the most important, influential, and controversial. In this volume, Cartesian dualism influenced Bekker’s arguments. Following Descartes, he maintained that the material and spiritual worlds could not interact with each other (except in human beings). Thus spirits without bodies, such as the Devil, could have no effect on people. In fact, neither reason nor experience could prove that spirits without bodies even existed. Bekker did not deny God’s power to create such spirits, and he pointed out that the Bible did indeed prove the existence of both good and bad angelic spirits. His main concern, however, was with the Devil and evil spirits.

While reason could not explain how evil spirits could act on humans, the Bible testifies that the Devil did not in fact act on people on the earth, Bekker argued. Genesis told how the Devil and all of his evil angels had been cast by God into hell, where they were to remain chained for all eternity. How then, Bekker asked, could they wander the earth and torment people? Witchcraft and sorcery could not exist, he concluded, because the Devil was powerless on earth. But Bekker still had to deal with biblical passages that seemed, when taken literally, to speak of the earthly activities of the Devil.

In places where the Bible spoke of the Devil, Bekker contended that the Holy Spirit was merely accommodating its language to the limited intellectual abilities of the common people of biblical times who believed in evil spirits. When the Bible used the word *devil*, it was only speaking figuratively and really meant evil men or mortal enemies of God. When it used the terms *magician* or *sovereign*, it meant simple tricksters and frauds. To complicate matters further, later translators of the Bible, who themselves believed in the Devil and evil spirits, often mistranslated Greek and Hebrew words as “Devil” when they could have been more correctly rendered as “slanderer,” “enemy,”

or “opponent,” again referring to God’s mortal enemies. Bekker’s most difficult exegetical task was how to explain the various New Testament passages that spoke of spirit possession. According to the common interpretation of such passages, demons sometimes possessed people’s bodies, making them behave in strange ways or causing them terrible sickness, pain, or insanity. Drawing on the works of such earlier skeptics as the Dutchmen Johann Weyer and Jacob Vallick and the Englishman Reginald Scot, Bekker argued that these passages really describe cases of mental illness, again clothed in language the common people could understand.

In volume three of *The World Bewitched*, Bekker built upon his earlier foundations to reject all manner of witchcraft and sorcery as merely fraud and deception. Evil magic, conjuring, and fortune telling were supposedly done by people who had given themselves over to the Devil in order to use his power against others. But since it was clear that evil spirits could not have these kinds of interactions with humans, these magicians and witches were simple tricksters who seldom accomplished anything. The famous witch of Endor in the First Book of Samuel, chapter 28, was merely a ventriloquist, while other biblical stories of sorcery were really accounts of idolatry.

In volume four, Bekker argued that belief in the Devil, evil spirits, and sorcery was caused by ignorance and fear of the unknown, or by deception of the senses. Bekker then related a series of cases of supposed witchcraft, sorcery, and spirit possession, all of which, he asserted, had natural causes. People often faked spirit possession in order to make money, or else possessed people suffered from “melancholy” or physical illnesses. Bekker proclaimed other well-known cases of the supernatural, such as the miracle healing of Sir Kenelm Digby, the story of the bricklayer in Bolsward, the pied piper of Hamlen (usually spelled *Hamlin*), the devils of Macon and Tedworth, and the ghosts of Annenberg and Lausanne, to be frauds.

Bekker ended his work by decrying the cruelty and irrationality of witchcraft trials, arguing that foolish testimony had led judges to condemn innocent people. It was obvious, Bekker declared, that popular beliefs about sorcery and witchcraft were mistaken, because these things simply did not exist.

Despite the fact that trials for witchcraft had largely ended in the Dutch Republic almost a century before Bekker wrote, and despite the fact that by the 1690s many in the Dutch medical, legal, and intellectual professions shared Bekker’s views, *The World Bewitched* provoked an uproar within the Reformed Church. Its conservative wing, already angry with Bekker for many years because of his Cartesian views and exegetical position, rose against him with full force. His denial of demonic power contradicted Scripture, critics charged,

and would lead to a denial of belief in the divine mysteries and even to a rejection of belief in God himself. Bekker’s ideas were called heretical, scandalous, and slanderous to God. A long church process was started against him that ended by condemning his book, deposing him from the ministry, and even excluding him from Reformed communion.

Bekker’s ideas exerted considerable influence. *The World Bewitched* became an instant best seller, going through at least two printings in 1691, followed by several later Dutch editions. Bekker’s original publisher, recognizing the earnings potential of such a work, rushed the book to market even before the author had reviewed his entire text. It was soon translated into French, German, and English. Outside of the Netherlands, *The World Bewitched* had its greatest influence in Germany, where it could be found in many libraries, especially those of “enlightened” readers and collectors, far into the eighteenth century. Although it is an exaggeration to claim that Bekker almost single-handedly ended the witch persecutions in northern Europe, he was clearly a major figure among the late seventeenth-century authors who successfully opened the sustained assault on witchcraft and diabolical magic that the Enlightenment brought to completion.

BENANDANTI

In 1966, Carlo Ginzburg published a study on the previously unknown *benandanti* (do-gooders) of Friuli. In Ginzburg's view, the beliefs of the *benandanti* seemed to constitute a folkloric anomaly at odds with the "classic" paradigm of diabolical witchcraft, while also offering the most fully documented instance in early modern Europe of how the Inquisition repressed popular culture.

At first, the *benandanti* confidently maintained that they were opponents of witches, defenders of the Christian faith, and protectors of crops and people in their communities. The most detailed confessions made by *benandanti* to the Inquisition represent an extended narrative sequence that can be summarized as follows. Born with the caul (amniotic sac), which they preserved, *benandanti* believed that they were predestined to play a distinctive role. When they reached adulthood, they began to leave their bodies at night on Ember Days in order to do battle against opponents, whom they called *malandanti* (evil-doers), or to visit the otherworld. In the form of smoke, mice, butterflies, or cats, or riding on supernatural goats, roosters, or cats, they traveled in ecstasy to gatherings of their fellows. Wielding such beneficent ritual weapons as branches of viburnum and stalks of fennel, the "military" *benandanti* fought to defend the harvest against *malandanti*, who were armed with stalks of sorghum or sticks of firewood. "Funereal" *benandanti* interrogated the dead about what would happen in the future, and conveyed this information to the living after the *benandanti* returned. The myth of their nocturnal journeys gave the *benandanti* a context and justification for their everyday healing practices.

Between 1574 and 1749, Inquisition tribunals in the dioceses of Aquileia and Concordia and in Venice conducted eighty-five proceedings against *benandanti* (Nardon 1999, 136). More than half of these were denunciations that the Holy Office did not pursue; the rest were summary or full-fledged trials on charges including the practice of therapeutic or harmful magic, abuse of the sacraments, and participation in the witches' Sabbat. In the fifteen sentences issued, punishments ranged from simple admonition to formal abjuration, imprisonment, and banishment. According to Ginzburg, some inquisitors ingeniously managed to equate the innocuous agrarian and otherworldly beliefs of the *benandanti* with the witches' Sabbat, an only remotely related and basically learned construction. By the mid-seventeenth century, when inquisitors had succeeded in eliciting from *benandanti* confessions of involvement in diabolical witchcraft, the myth of the *benandanti* disappeared.

Since the appearance of Ginzburg's book, anthropological studies of types, motifs, and narrative functions of popular beliefs in Friuli, Istria, and adjacent

German-language regions have shown that the beliefs of the *benandanti*, particularly those involving contact with the dead and therapeutic activities, survived (albeit with modifications) until a very few years ago. A recent investigation focused on the later trials of *benandanti* has revealed that therapeutic functions were central to the beliefs of the *benandanti*. Their myth assumed relevance in the society in relation to their curative practices, which increasingly incorporated ideas, such as exorcism, drawn from the matrix of ecclesiastical ritual. In this new perspective, the *benandanti* seem to have been primarily healers, exorcists, and opponents of witches, and only marginally witches and causers of harm. Thus Ginzburg's notion of the *benandanti's* gradual "psychological conversion" to the negative model of the Sabbat and black magic appears difficult to sustain.

Indeed, reexamination of the inquisitors' and episcopal vicars' mode of operation shows that rather than the *benandanti* becoming witches, it was the judges whose attitudes changed. Intent on demonstrating their formal heresy, the first inquisitor who interrogated *benandanti* in the late sixteenth century was interested in nocturnal battles, which lent support to such a contention. In contrast, his successors in the mid-seventeenth century were much more concerned with curative practices. Placing little emphasis on nocturnal battles, some particularly zealous inquisitors—inclined, despite the skepticism of many cardinals on the Congregation of the Holy Office, to believe in the reality of the witches' Sabbat—induced some *benandanti* to admit to being witches during their trials. Whether the defendants' real convictions changed, however, is doubtful and undemonstrable.

The richness and puzzling character of the documentation about *benandanti* furnishes excellent opportunities for studying the interactions between learned and popular culture, as well as enabling a confrontation between historical and anthropological methods and the sources that they employ.

BENEVENTO, WALNUT TREE OF

Provincial capital of Campania, ancient Lombard principality, and part of the Papal States until 1860, Benevento is still legendary as a land of witches, who met under the walnut tree. For centuries it has been regarded as the principal location of Italian witches’ Sabbats, similar to Blocksberg (or Brocken) in Germany, Blåkulla in Sweden, and Mount St. Gellért in Hungary. Judicial records, demonological literature, and popular fables suggested Valtellina (Valtellina; Veltlin), Emilia, Val d’Adige, and Val Camonica as additional meeting places for Italian witches. No other place, however, could compete in notoriety with Benevento, the fame of which extended far enough to come to the attention of the celebrated demonologist Martín Del Río, who wrote of the *noce di Benevento* (Walnut Tree of Benevento) in his *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, on 1599/1600) (Cocchiara 1980, 193). Echoes of the diabolical legend are found in the works of numerous late medieval and early modern Italian authors such as Agnolo Firenzuola, Giambattista Basile, Tommaso Garzoni, Francesco Redi, Ippolito Neri, Lorenzo Lippi, Gerolamo Tartarotti, Ludovico Antonio Muratori, and Gioacchino Belli, and in comedies by playwrights such as Pietro Aretino, Anton Francesco Grazzini, and Nicolò Piperno, who wrote and produced the play *La noce Maga di Benevento Estirpata da San Barbato* (The Magical Walnut Tree of Benevento uprooted by St. Barbato) in 1665.

Among the most interesting descriptions of the Sabbat was a nineteenth-century poem, published in Naples, entitled *Storia della Famosa Noce di Benevento* (History of the Famous Walnut Tree of Benevento). This work definitively established the central nucleus of the diabolical legend of Benevento: a “large snake” twisting around a walnut tree of “immense size,” “in the shadows of its leaves, the witches’ Sabbats take place, with the participation of a great number of witches, wizards, and devils from hell,” dedicated to “*far del male*” (practice evil), and “unapproachable by the profane, bound by Satan” (Cocchiara 1980, 188). Among the principal elements of the legend, the walnut tree (*Juglans regia*) represents a constant of Italian Sabbats. Numerous medieval testimonials from both learned and popular sources documented the tree’s evil

reputation. Medieval tradition derived its assumed toxicity from the etymology of its name, supposedly taken from the Latin verb *nocere* (to harm). Popular tales contributed to spread its sinister reputation, such as the account of the poor Umbrian who awakened paralyzed after napping under a walnut tree and was then miraculously healed by Saint Francis. In particular, the tree was said to have the power to infect the brain of any person who might carelessly fall asleep under its damp shade. In his *Quaestio de Strigis* (An Investigation of Witches, ca. 1470), Giordano da Bergamo claimed that under the shadow of the walnut tree by the “virtue of the Devil the witch’s humors can become mixed-up and her fantasy can create illusory images,” because “being so damp,” the tree is “well-suited to our brain, which is very damp” (Abbiati, Agnoletto, and Lazzati 1984, 82–83).

A sacred tree (not a walnut tree) worshipped by the Lombards of Benevento was mentioned in a work written after the ninth century, the *Vita Barbati Episcopi Beneventani* (The Life of Barbato, Bishop of Benevento). Bishop Barbato uprooted the tree after obtaining a promise from Lombard duke Romualdo to renounce the pagan cult in exchange for victory over the Byzantine army that besieged Benevento in 663. The pagan rite consisted of a competition testing the abilities of knights, who were required to gallop toward the sacred tree, grab a small part of a snake’s skin hanging from it, and then “superstitiously” eat the skin. In the next few centuries, the myth of the evil tree was grafted onto the traditions of this tree-worshipping cult according to a typical pattern in which Christians associated preexisting religious traditions with the Devil. However, not all scholars agree that the legend of the walnut tree is tied exclusively to a distorted version of this Lombard rite. Other indications suggest multiple sources for the legend; for example, the cult of the snake, an intercultural element spread throughout other areas of Europe, or the cult of Isis, a goddess particularly venerated in Benevento, where a magnificent temple was erected to her under the Roman emperor Domitian. An urn of the cult of Isis with a lid adorned with images of the sacred serpent, discovered in 1903, convinced some scholars that the Beneventans worshipped snakes through the cult of Isis, and that this tradition was bequeathed to the pagan Lombards.

Among the first to discuss the Beneventan Sabbats was Mariano Sozzini in a letter of 1420 to the humanist Antonio Tridentone. Also in the 1420s, St. Bernardino of Siena spoke in his sermons of the witches’ assemblies in Benevento, but without mentioning a walnut tree. In the 1428 trial of Umbrian healer Matteuccia da Todi, which was connected to St. Bernardino’s sermons, we find the first description of the Sabbat under the *noce di Benevento*, preceded by the nocturnal flying brought about by anointing with a

magic salve and by the recitation of a spell that, with slight regional variations, recurred frequently in other late medieval and early modern trials and is found in the popular saying, “Salve, salve / Send me to the noce di Benevento / Over the water and over to the wind / And over all bad weather” (Mammoli 1969, 31). From this point forward, in the minds of inquisitors and demonologists and of their victims, the legend of Benevento as a diabolical place was consolidated, combining elements from the mythical Lombard *sacra arbor* (sacred tree) and the sacred snake of the cult of Isis. In demonological literature, the work of distinguished papal theologian Silvestro Prierias concerning the *noce di Benevento* is particularly noteworthy (Abbiati, Agnoletto, and Lazzati 1984, 226). Echoes of the Campanian Sabbat can also be found in the *Tractatus de haereticis et sortilegiis* (Treatise on Heretics and Sorcerers), written around 1524 by Paolo Grillando, which referred to the Sabbat under the “extremely cold noce di Benevento” (Grillando 1592, 111–112).

However, the definitive systematization of this legend came from Pietro Piperno, author of *De Nuce Maga Beneventana* (On the Magical Walnut Tree of Benevento, 1634), subsequently translated into Italian as *Della Superstiziosa Noce di Benevento* (On the Superstitious Walnut Tree of Benevento, 1640). In this tract, a true and proper demonological work, the Beneventan medical examiner not only identified the sacred tree venerated by the Lombards with the evil walnut tree, but also tried to demonstrate that its Sabbats were a product of diabolical knowledge that could make it appear illusively at any moment (Piperno 1640, 96). Piperno claims that witches did not gather under the diabolical tree in their dreams, but *in corpore* (physically), and thereby advises secular and religious authorities to guard more attentively against such gatherings. Requests for greater penalties against superstitious acts did not result in local witch hunts, except for a series of perhaps as many as 200 trials, mentioned in later sources, that were dispersed in 1860, and an event in which three women were reportedly handed over to secular authorities in 1506 (Di Gesaro 1988, 385).

BERKELEY, WITCH OF

The medieval story of a witch, or more precisely a sorceress, from Berkeley (Doucestershire) circulated widely in Europe from the twelfth to the sixteenth century. Probably of much earlier origin, the story was fully developed by William of Malmesbury, who included it in his *Gesta regum anglorum* (Deeds of the Kings of the English) of ca. 1142. William located the episode in 1065, just before his account of the Norman Conquest. He told the story as a warning that those who practiced sorcery with demonic assistance would find it impossible to protect themselves from the Devil's attacks at the time of death. The later popularity of the story was based on its clear message that sorcerers belonged to the Devil.

According to William's story, the Berkeley woman, whom he described as morally debauched as well as a practitioner of sorcery and augury, heard her pet raven chattering more than usual one day and believed it an omen that her own end was imminent. A message about the sudden death of her son and his family confirmed her belief. So she immediately took precautions to prevent the Devil from taking her body when death ultimately came. Summoning her remaining children, a monk and a nun, she confessed her demonic arts and entreated them that, when she died, they would sew her corpse in a deerskin, place it in a stone coffin, fasten the lid with lead and iron, and bind a stone to it with three massive iron chains. They should also arrange to have fifty psalms a night sung around her body for three nights, as well as three Masses a day for three days. Despite her detailed precautions, however, demons burst through the bolted doors of the church on the first two nights and broke two of the massive chains on her coffin. On the third night, the tallest and most terrible devil snapped the remaining chain like a piece of string and kicked off the coffin's lid. He then dragged the woman out of the

church, laid her on the iron barbs projecting from the back of his black horse, and rode off out of sight, while the horrified onlookers heard the woman's pitiable cries.

William's *Chronicle* became a major historical work and was widely cited both in England and on the Continent. This story reappeared virtually word for word in the *Eulogium historiarum* (Eulogy of Histories), written in Malmesbury abbey ca. 1367. More importantly, it appeared in slightly abbreviated form in Vincent of Beauvais' *Speculum historiale* (Mirror of History), the third part of Vincent's massive medieval encyclopedia (ca. 1244–1260), which circulated throughout Europe in numerous Latin and vernacular manuscript versions. After 1473, printed editions began; there were eight circulating by 1546.

From the late fifteenth century, woodcuts also popularized the story. An illustrated summary—little more than a commentary on the accompanying image of diabolical abduction—appeared in the five editions of the *Nuremberg Chronicle* between 1493 and 1500, a work profusely illustrated by the Nuremberg workshop of Michael Wolgemut and Wilhelm Pleydenwurff. For eighty years, this image became a model for illustrators—with the woman naked except for her shroud, her frizzy hair a testament to her evil, her open mouth giving terrified cries, the horse with the iron barbs, and

the lead cover of the coffin mangled like a piece of cloth.

A similar summary and illustration appeared in the popular *Prodigiorum ac Ostentorum Chronicon* (Chronicle of Prodigies and Curiosities), compiled by Conrad Lycosthenes (Konrad Wolfhart) and published in Basel in 1557 in both Latin and German editions. In 1555, a full version of the story drawn from Vincent of Beauvais was recycled in the encyclopedic work by the Swedish Bishop, Olaus Magnus, *Historia de Gentibus Septentrionalibus* (History of the Northern Peoples), first published in Rome and soon translated into Italian, Dutch, German, and French. In this case, the story supported the view that the Devil's work in pagan Scandinavia was similar to his activity in Christian Europe. Although this woodcut was somewhat more narrative in style, its main focus remained the violent reclaiming of a sorceress by the Devil.

BERMUDA

Between 1651 and 1696, the colony of Bermuda experienced twenty-one witchcraft trials and five executions, the largest number in English America outside of New England. Settled in 1612 and administered by the joint-stock Bermuda Company of London, the island took on a Puritan character as nonconformist ministers turned out of their benefices in London occupied Bermuda's parish churches. Fears of witchcraft and demonic influence were present from the start. Bermuda's second minister, Lewis Hughes, had supported the witchcraft claims of servant Mary Glover against her London mistress in 1602 and exorcised the girl. In 1623, the London company enjoined Bermuda's churchwardens to present "all Sorcerers, Inchanters, Charmers, Witches, Figure-casters or fortune-tellers, [and] Conjurers" to local courts for prosecution (Lefroy 1981, 1:320). Eleven years later, Governor John Winthrop of Massachusetts recorded that an unnamed

Bermudian minister exorcised a man “possessed with a devil” before his congregation (Dunn et al. 1996, 119).

Bermuda’s first witchcraft case was prosecuted in May 1651, when Jean Gardiner was accused of afflicting a mulatto servant woman. A female jury found a blue spot, or “mark of the Devil,” in Gardiner’s mouth, and she twice failed a water test in the sea, where she “did swyme like a cork and could not sinke” (Lefroy 1981, 2:602–603). Found guilty, she was hanged on May 26. A second woman, Anne Bowen, was accused at the same assize but acquitted, as were two more accused witches, planter Henry Ward and Elizabeth Middleton, in 1652. The next year, Middleton’s husband, John, a failed planter, was accused of malefic attacks on a Scottish indentured servant (probably a prisoner of war sent to Bermuda by Cromwell following the Battle of Worcester) while the latter was in the colony’s jail. After a host of suspicious marks were found on Middleton’s body and he failed a water test, he confessed that “I was a witch, wch I knew not before” (Lefroy 1981, 2:608). Before he was hanged, he implicated two other suspected witches, Alice Moore and Christian Stevenson, who were quickly tried, found guilty, and also hanged. Despite claims that there were additional undetected witches within the colony, Bermuda’s prosecutors prevented hysteria from seizing the island. Late the same year, Edward Brangman’s wife won damages from a neighbor who insinuated that she was a witch.

In January 1655, the *Mayflower* put into Bermuda with two English passengers strongly suspected of practicing witchcraft on the high seas, prompting another trial. Despite alleged past connections with Lancaster witches, Elizabeth Page was acquitted, but Jane Hopkins was not so lucky: She had several incriminating marks, was deemed guilty of conjuring, and was promptly hanged. Although several more men and women were accused of diabolically inflicting harm on livestock, property, and neighbors, Jane Hopkins was the last witch executed in Bermuda. In June 1671, Susan Cole was found guilty of “tormenting” Thomas Holt and sentenced to death, but Governor John Heydon pardoned her (Lefroy 1981, 2:630).

In total, four men and seventeen women, fifteen of them married, were accused (or defended themselves against informal accusations) of witchcraft. Bermuda appears singular in the weight it gave to accusations made by marginal members of society; enslaved black children, mulatto and Indian women, and Scotch-Irish indentured servants figured prominently among not only the victims but also the accusers in many witchcraft cases. The spate of cases in the 1650s had political causes. During the previous decade, Bermuda’s ministers and leading planters had bitterly divided over the issue of severing ties with England. The Separatists were exiled to the Bahamas in 1649, but returned to

Bermuda two years later amidst lingering tensions. The witchcraft trials of 1651–1655 allowed members of both groups to come together as jurymen to rid their island of demonic influences, facilitating a lasting rapprochement. Moreover, in 1651 Bermuda received Scottish war prisoners, with fresh memories of the massive witchcraft prosecutions in their homeland.

After 1671, Bermuda had no further convictions for witchcraft. Witchcraft of a different sort emerged in eighteenth-century Bermuda within the island’s slave population in a handful of accusations brought against slaves for attempting to poison or harm whites and other slaves by concealing suspicious mixtures about their houses or in their foods. Possibly linked to West African Obeah practices, poisoning scares broke out sporadically in the late 1720s and 1750s. The trial and burning at the stake of a mulatto slave, Sarah Basset, is confused in Bermudian lore with witchcraft, but the method of her execution was consistent with the *petit treason* against her master and mistress for which she was convicted.

BERNARDINO OF SIENA (1380–1444)

Franciscan friar, reformer, and saint, Bernardino was one of the most influential popular preachers of fifteenth-century Italy, second only to Savonarola. His many vehement, intransigent sermons and treatises against witchcraft, superstition, demonology, and heresy helped pave the way for the outbreak of witch hunts shortly after his death. Bernardino’s public instruction represented an important contribution to that gradual transformation within the collective European imagination that reshaped an inchoate body of disparate beliefs and vague notions regarding superstition, simple sorcery, pagan ritual, magic, and demonology into what has been called “The Classical Formulation of the Witch Phenomenon” (Russell 1972, 227), whereby the witch came to be understood

as a devil-worshipping, evil-working woman belonging to a massive, well-organized, international company of moral-social subversives who gathered regularly at Sabbats in remote parts of the countryside in order to engage in orgiastic rituals. Bernardino's sermons open an ample window onto what the Christian faithful believed about witches and their activities in an historical period for which written documentation is scarce. A vociferous adversary, as well, of Jews, sodomites, and religious dissenters, Bernardino was a conspicuous exponent of what R. I. Moore has termed the "persecuting society," the violently intolerant Christendom of the premodern era.

Born into a family of minor aristocracy in the Tuscan town of Massa Marittima, Bernardino Albizzeschi was orphaned of both parents by the age of six. At eleven he was sent to live with relatives in Siena where, hagiographic sources relate, he already began to show signs of his future sanctity. Child of wealth and social privilege, the pious and intellectually gifted Bernardino received the best education available in Siena; he began studying canon law, but discontinued it after two years. In 1400, the plague struck Siena, and Bernardino distinguished himself during the outbreak by his valiant, selfless service to its victims. In 1402, after a harrowing brush with death due to lengthy illness, Bernardino joined the Observants, the austere reform branch of the Franciscan Order. He soon rose to positions of authority within his order; he was offered the bishoprics of Siena, Ferrara, and Urbino, but refused all of them because he considered his primary role that of a preacher.

After a period of training and false starts, Bernardino's preaching career finally took off with a successful mission in Milan in 1417. From then until his death, he and his band of disciples and confreres crisscrossed northern and central Italy, preaching to ever growing masses of people. Bernardino's reputation wavered temporarily in 1426, when he was summoned to Rome to face charges of heresy for his "novel" cult of the Holy Name of Jesus. This Roman trial, however, resulted in the friar's acquittal and increased his fame. Bernardino resumed his preaching, writing, and social and moral activism until 1444 when, worn out by incessant labors, asceticism, and illness, he died in the Kingdom of Naples. Canonization followed, remarkably, only six years later.

Witchcraft and allied topics rank among the most frequent subjects of Bernardino's vernacular sermons (recorded live by scribes) and his manuscript treatises in Latin, the so-called *sermone latini*. Having encountered witchcraft or similar diabolical activity in nearly every place he visited, the friar condemned it as one of those especially heinous crimes for which God continually punishes states and kingdoms. He encouraged his audiences actively to seek out and destroy its practitioners. Among Bernardino's most important texts relating

to witchcraft are his sermons, "On the Three Capital Sins" (Siena; 1427), "Why We Must Not Believe in Fortune-Tellers and Diviners" (Florence; 1425), "On the Devil's Sowing" (*De seminatione daemonii*, 1423); and his treatises, *On the Cult of Idolatry* (*De idolatriae cultu*, 1430–1436) and *On the Army of Evil Spirits* (*De exercitu spirituum malignorum*, 1430–1444).

Bernardino's preaching and writing produced concrete, documented results, although never as radical as he demanded. After consultation with Pope Martin V, one mission in Rome concluded, he tells us in his Siena 1427 sermon, with a massive roundup of suspected witches and sorcerers, three of whom were eventually executed. Reports of this Roman episode were documented in contemporary Italian, Swiss, and German sources, thus confirming Bernardino's role in disseminating his antiwitchcraft hysteria. The preacher also played a crucial though indirect role in the witchcraft trial of Matteuccia Francisci, burned in Todi in March 1428; she had been arrested, as her extant trial record makes clear, because of local consciousness-raising by friar Bernardino. Another documented result of his influence was the promulgation of more severe laws against witchcraft and superstition in several of the towns he visited, including Siena, Perugia, and Todi.

BÉRULLE, PIERRE DE (1575–1629)

A leading figure of the French Catholic revival and a significant theorist of demonic possession, Bérulle (made a cardinal in 1627) is best known as the founder of the Oratorian order.

Trained at the Jesuit *collège* (secondary school) of Clermont and at the Sorbonne, Bérulle worked with some of the key spiritual figures of his day to implement major reforms of Catholic life in France's so-called "century of saints." Together with Madame Barbe Acarie, he helped establish in 1604 the order of Discalced Carmelites, on the model of St. Teresa of Avila's Spanish order. In 1611 he founded the Oratory of Jesus, for the training of priests. Bérulle encountered

cases of demonic possession several times in his career, most notably in the controversial 1599 case of Marthe Brossier, during which he defended Brossier and her exorcists from derision by providing a uniquely clear theological exposition of possession and exorcism.

A humanist mystic with a commitment to the humanity of Jesus, Bérulle wrote his first treatise in 1597, the *Bref Discours de L'Abnégation Intérieure* (Brief Discourse on Inner Renunciation). In June 1599, he wrote in defense of the demoniac Marthe Brossier and her exorcists. Militant Catholics had exorcised Brossier before Parisian crowds earlier that year, permitting her “demons” to harangue French Calvinists (Huguenots). In a time of religious division, such performances posed a threat to the implementation of Henry IV’s chief instrument for bringing about religious peace, the 1598 Edict of Nantes. Royal officials punished and humiliated Brossier and her exorcists, and the King asked one of his physicians, Michel Marescot, to satirize the exorcisms in print. Bérulle responded to Marescot’s jibes in a lively and highly learned defense of possession and exorcism, the twin texts *Traicté des energumenes, Suiuuy d’un discours sur la possession de Marthe Brossier: Contre les Calomnies d’un Médecin de Paris* (Treatise of Demoniacs, Followed by a Discourse on the Possession of Marthe Brossier: Against the Calumnies of a Physician of Paris). By defending the Brossier possession in print, Bérulle continued the learned rehabilitation of possession and exorcism in France that had begun with the 1566 story of Nicole Obry and the “miracle of Laon.” This trend arose out of the need of militant French Catholics to find public and spiritual, as well as military, ways to defeat the Huguenots. To protect himself from the royal displeasure that his friends had endured, Bérulle used the pseudonym “Léon d’Alexis” and had the works published in Troyes (his birthplace), without a royal privilege.

Bérulle’s *Traicté des energumenes* was a learned treatise, but his *Discours sur la possession de Marthe Brossier* had a vituperative edge. Together, the two works gave possession and exorcism increased credibility, endowing these largely performance-oriented phenomena with the authority of a clear, intellectually based theology. Bérulle worked within a humanist tradition, using mainly ancient texts to support his views; his originality lay in his view that the value of demonic possession and exorcism could be underscored by reference to the doctrine of the Incarnation. He sees demonic possession as the “shadow and idea of the singular possession which God took in our humanity in Jesus Christ: for in one [case] it is a god, in the other it is a demon, re-clothed by human nature” (Bérulle 1599, f. 38v). This argument paved the way for the increasingly respectable place of demonic possession in seventeenth-century French mystical life, lending dignity to a condition

often regarded as the result of the sufferer’s sin.

Bérulle argued that the doctrine of Incarnation also dignified exorcists. He maintained that the person of the exorcist was in a way an embodiment of the Catholic Church, the Church itself being the mystical body of Christ (as it is sometimes known). The Church provided “the living source from which flows forever the authority to remedy [possession]” (Bérulle 1599, f. 54r.). Within this framework, the exorcist’s position acquired a new significance: Christ cast out demons from the possessed in his time on earth, and his power was passed on to the Church that he both founded and embodied. Through the Incarnation, Christ elevated humanity to partake of the divine, and his power over demons was a signal aspect of his own divinity. It follows, Bérulle wrote, that “the illustrious title [of exorcist], which gives us jurisdiction above demons, is the appanage of our new dignity” (Bérulle 1599, fols. 54r–v). Bérulle then moved to a polemic point about the exclusivity of this role. Because the Church is Christ, Bérulle argued, no authority outside of the Church is appropriate to confront demons. In the highly charged political climate of the Brossier case, with church and state at loggerheads, Bérulle’s polemic thrust against the monarchy was clear.

Bérulle was involved in other similar, though less politically sensitive, cases. He was in the company of Madame Acarie when a young woman named Nicole Tavernier, who had ecstasies and made prophecies, spontaneously became “cured” of her apparent gifts. Bérulle concluded that Tavernier’s sudden change of behavior, her becoming “ignorant and idiotic,” meant that a demon had deceived her (Habert 1646, 97). Although Bérulle warned a superior in the Oratorians against involvement in cases of possession, his support of the possessed woman Elisabeth de Ranfaing in the late 1620s suggests his position relied on case-by-case judgments, rather than reflecting doubts over time. This mutability was something for which orthodox Catholic tradition provided by encouraging a degree of skepticism, but always allowing for true signs of God’s action.

BEWITCHMENT

Bewitchment is the occult action or power by which a person is thought to come under a witch's malign influence. The process may be thought to involve a deliberate ritual action or spell, what modern social scientists generally call sorcery, or a spontaneous act or even just a malicious thought, which they refer to as witchcraft. The form or consequence of bewitchment is most often a physical malady in a person or animal, although infatuation, despondency, accidents, and bad luck are also often ascribed to bewitchment. The motive may be revenge, rivalry, envy, or arbitrary maliciousness. Potential cures include getting the witch to remove the spell, countermagic, and punishing the witch, and many societies that believe in bewitchment have specialists or semispecialists who help people identify who has bewitched them and cure the bewitchment. Belief in bewitchment is widespread, and fear of bewitchment was a far more important reason commoners in early modern Europe participated in witchcraft trials than concern about the Devil.

Modern social scientists most often ascribe the experience of bewitchment to some form of psychological displacement in which the “bewitched” person ascribes his or her own hostility to the witch to shift the burden of guilt in an interpersonal conflict, to gain some advantage in a dispute or competition, or simply to explain the source of some otherwise inexplicable misfortune. A more recent approach, cultural analysis, attempts to place the idea of bewitchment in the context of the culture's symbol system, seeing it as a way of narrating certain events and processes in terms of social relationships rather than mechanistic causation. Social scientists explicitly regard the belief in bewitchment as a misperception caused by some cognitive malfunction, while cultural analysts tend to be more agnostic, but it is also possible to interpret the concept of bewitchment as a recognition of the real potential for disturbed interpersonal relations to cause or contribute to physiological problems and other maladies.

CAUSES, CONSEQUENCES, AND COUNTERACTIONS

Bewitchment is thought to manifest malice. People who believe in witchcraft attribute various motives to witches, most commonly the desire to get revenge, an attempt to get an advantage in some competition, envy, or some unprovoked maliciousness, a perverse

pleasure in inflicting harm. The means by which witches are thought to bewitch include sorcery—ritual acts such as incantations, curses, symbolic gestures, use of potent objects, and preparation and administration of potions—and witchcraft—spontaneous acts like threats, scowls, and piercing glances, or even malicious thoughts that are harbored but not expressed. Although most of the time acts thought to cause bewitchment are overtly hostile, in some cases, apparently friendly gestures are taken to be methods of bewitchment as well.

The most common consequence of bewitchment is generally thought to be some physical malady. Sometimes the bewitched person has symptoms that seem directly related to the incident or suspect, such as paralysis of an arm the suspect touched or stomach cramps after eating the suspect's food, but such an association is not necessary. In fact, a wide variety of symptoms are ascribed to bewitchment, and the most common characteristic is not their specific nature, but that they come on unusually suddenly, they linger unusually, or they cannot be explained in any other way. Psychological problems like depression and suicide can also be ascribed to bewitchment, as can other personal problems, such as accidents and runs of bad luck, and so can problems with animals such as disease, a cow's inability to give milk, or a chicken's inability to lay eggs. Although problems caused by severe weather or with processes like churning butter and brewing beer can be thought to result from witches' spells, the term *bewitchment* is less likely to be used in these cases, because it has connotations of exerting a power over living things.

There are a variety of measures available to counteract bewitchment. People who suspect they have been bewitched may try some remedies on their own, or they may consult a specialist, an “unwitcher.” One type of cure for bewitchment is to get the witch to remove it, which can be achieved either by (re)gaining the witch's favor or by threatening the witch with retribution. Reversing a spell is one technique offered by unwitchers, who may also redirect it some other way, or offer some sort of more passive treatment. Reversing a spell is one form of punishment, but other forms may also have curative power. In tribal societies, this punishment may be informal violence or a communal decision to drive out or kill the witch, while in peasant societies this can also include calling in the magistrates. However, because the early modern authorities generally evinced strong interest only when some egregious harm had been suffered, their intervention was more useful for getting revenge or preventing future attacks than in effecting a cure; calling on them was often a sign that more effective countermeasures had failed.

SOCIAL STRUCTURE, CULTURAL MEANING, AND INTERPERSONAL PSYCHOPHYSICAL INFLUENCES

Since the Enlightenment, educated Westerners have assumed that bewitchment was impossible, so belief in it needed to be explained as some sort of psychological malfunction. Social scientists have explained it as a way of explaining otherwise inexplicable events or a way of displacing social tensions. These lines of reasoning are generally combined, so that either an inexplicable event happens and people search for a culprit along social fault lines, or else people's need to assign fault in order to redirect social tensions generated by other, real conflicts leads them to create a scapegoat for problems with real causes that are unknowable and uncontrollable. In this view, the concept of bewitchment kills two birds with one stone, giving people the illusion of control over the uncontrollable while justifying the victimization of social undesirables.

Another, more recent approach that grows out of semiotics and literary theory is to treat witchcraft beliefs as part of a symbol system in which bewitchment is an element in a culturally structured narrative. In other words, people construct a story of what is happening to them from the narrative elements supplied by their culture, and bewitchment is one of the possible stories that can be constructed to explain certain kinds of misfortune. The decision to pick this story rather than one of the alternatives, in this interpretation, is determined not by any reference to "actual events" (with an uncertain original existence and with remembered details that are subject to constant reconstruction), but instead by its psychological, social, and cultural meaning. The task of the interpreter is therefore to deconstruct the narrative to reveal what its different elements meant; bewitchment can thus be a way of talking about conflicts in women's space in one narrative, and a metaphor for the adolescent desire to freeze time to avoid adulthood in another.

Although cultural analysts generally claim to be agnostic on the question of whether bewitchment can actually take place, some take the more radical position that any concept of a reality beyond peoples' concepts is illusory, or at least unknowable, making bewitchment no more, as well as no less, real than any other narrative device. Even in more moderate cultural analysis, bewitchment is implicitly treated as unreal, just as it is explicitly treated as unreal in social scientific explanations. An alternative understanding has recently been proposed that, while still relatively undeveloped, seems worth considering. It has long been known that some ailments ascribed to bewitching can be caused by psychological processes, that they are examples of what has been known as psychosomatic disease. It used to be assumed that psychosomatics worked through some complex psychodynamics, in which a belief in witch-

craft and magic played an essential role by generating the fear that disrupted necessary physiological processes or set in motion damaging ones. In recent decades, however, medical doctors have abandoned Freudian-style psychodynamics in favor of the more straightforward effects of the stress response, the flight-or-fight reaction in which the body shuts down some systems and boosts others in preparation for a short, intense physical exertion. These physiological changes are useful in coping with a brief physical emergency, but damaging when prolonged. Bewitchment seems to be what happens when, during an interpersonal altercation, or because of some unstated antipathy, over or subliminal signaling between people triggers the flight-or-fight reaction in one, but in the claustrophobic context of a small community there can be no quick resolution to the danger signaled. Consequently, the person remains in the kind of prolonged state of excitation that becomes damaging to health. Although culturally determined postures and words certainly play a role in transmitting hostility and threat, noncultural physiological changes such as constricted pupils, tension in the facial muscles, and pallor or ruddiness may be at least as important in the process. Similarly, no specific belief in magic or an innate power of hostility is necessary for the stress response to be triggered or maintained, although again, cultural beliefs can contribute to the intensity of the reaction and shape the specific symptoms manifested.

This approach is not fundamentally incompatible with the other two, just as they are not fundamentally incompatible with each other. Social science illuminates the social situations in which interpersonal conflict culminating in bewitchment often takes place. Cultural analysis shows how people conceptualize the process, which can amplify, dampen, or channel it into specific forms. Psychophysiology explains the process by which most bewitchments take place, illuminating their internal dynamics and showing the boundaries of what can occur. Together these approaches provide a richer and more nuanced understanding than any one alone.

BIBLE

The importance of the Bible for the formation of witchcraft doctrine in Christian Europe is impossible to overestimate.

HEBREW BIBLE

The religion of ancient Israel was exposed to many influences of polytheistic religions, especially those of Egypt, Canaan, and Babylonia. Egypt was regarded as the country of magicians par excellence. The reception of foreign cults and the official syncretism that the prophets so energetically denounced in the time of the kings of ancient Israel was a reflection of this cultural influence. An entirely separate aspect of popular religious belief among the peoples of ancient Israel and Canaan was their concern over the existence of destructive demons. Sorcerers and magicians who could control these demons were sought after and feared. Biblical books claim that these demons had been heavenly beings who were overpowered by YHWH, or they constituted a pantheon of minor gods under YHWH (Ps. 29:1, Ps. 89:6–8). The most common terms for these creatures are "hairy demons or satyrs" (*šē'irim* and *šē'dim*). Among the names associated with demons are Azazel, mentioned as part of the ritual in which the high priest sends a goat into the desert as an expiatory sacrifice (Lev. 16:7–10), and Lilith, associated with unclean animals in Isaiah 34:14, who is better known from later rabbinic literature and is considered a wilderness-dwelling demon of the night who was a succubus and a "child-stealing" creature.

Several types of magic developed either to provide protection against this world of demons or to seek their assistance. Prohibitions against these forms of magic, which correspond roughly to black and white magic, were enumerated in several catalogs of vices in the Hebrew Bible (e.g., Deut. 18:10–11; 2 Kings 21:6; Jer. 27:9). The passage in Deuteronomy is one of the most important; it mentions as practices of the native peoples that the people of Israel must not take up making a son or daughter pass through the fire, practicing divination (*qēsāmim*), and being an observer of times (*mē'ōnēn*, either an astrologer or a diviner who studies patterns in smoke or clouds), an enchanter (*mēnakhēš*), or a witch (*mēkaššēp*, feminine *mēkaššēpāh*). Other

terminology applied to magic practices included casting spells (*chōbēr*, *chāber*), from the Hebrew root for binding (*chābar*); consulting familiar spirits (*'ōb*, *weyid-dē'ōnī*); and necromancy (*dōēš el-hammētīm*). In the First Book of Samuel, divination (*qesern*) is compared to rebellion (15:23). In Jeremiah, the diviners and others are named together with false prophets, to whom one should not listen (27:9). Another form of magic was called whispering (*lachaš*), which means pronouncing spells. The term for sorcery and witchcraft, *kešep*, is related to the Assyrian word for witch (*kaššap*). In the famous magical competition between Moses and Aaron and the magicians of the Pharaoh, in which both sides changed rods into serpents, but the serpents of Moses swallowed those of the Egyptians, the magicians were called the wise ones (*qēsāmim*) and sorcerers (*mēkaššēpim*) (Exod. 7:11). *Chartōmim* (Exod. 7, 22; Dan. 1, 20) was another term used for magicians who made enchantments.

Familiar spirits and spirits of the dead (*yiddē'ōnī 'ōb*) are named together and associated with necromancy, because of the belief that the dead had occult powers and comprehensive knowledge. Therefore the spirits of the dead are described as whispering and murmuring (Isa. 8:19), their voices coming out of the earth (Isa. 29:4; compare 1 Sam. 28:7). In Leviticus we find this prescription: "A man also or woman that hath a familiar spirit [*'ōb*], or that is a wizard [has a *yid'ōnī*], shall surely be put to death: they shall stone them with stones: their blood shall be upon them" (20:27). Leviticus also reported these divine words: "And the soul that turneth after such as have familiar spirits [*'ōbot*], and after wizards [*yid'ōnīm*], to go a whoring after them, I will even set my face against that soul, and will cut him off from among his people" (20:6). In later times, *yid'ōnī* is no longer the spirit itself, but the soothsayer and the magician. In the Septuagint the term is often translated as *ēngastrimythos* (ventriloquist). The term *'ōb* suggests a connection (at least as one kind of explanation) with *'ab* (father), which would identify the spirits of the dead as the spirits of ancestors. The catalogs of prohibition were probably a reaction to the cult of ancestors, which was seen as inimical to the cult of YHWH.

The most famous witch in the Hebrew Bible, the witch of Endor (1 Sam. 28), who is never called a "witch" in the Biblical text ("witch" being a later Christian convention) was someone who consulted the dead, because she had an *'ōb*. She puts Saul in contact with the dead Samuel, and in the ritual she sees *elohim* (literally, "gods"; often translated as "God"). The King James Version of the Bible translated the passage thus: "I saw gods ascending out of the earth" (13). Women were regarded as more likely than men to practice sorcery (*kešep*). In Exodus, the death penalty is prescribed for the female witch (*mēkaššēpāh*) only (22:17 in the Hebrew Bible and the Septuagint; 22:18 in the

Latin Vulgate and in the King James version), although there is scholarly debate on this, whereas in Leviticus both man and woman are mentioned (St. Jerome's Vulgate translated the passage in Exodus using the masculine plural form: *Maleficos non patieris vivere* ("Thou shalt not suffer workers of harmful magic to live"). In the Talmud, sorcery was attributed to women; the Babylonian Talmud Sanhedrin (67 a) claimed that Exodus 22:17 referred to men too, but that they were not mentioned because women were the main practitioners of sorcery. Only women were mentioned in the practice of making magical wrist ties (Ezek. 13:18). Yet another kind of magic, the evil eye, did harm. Proverbs contained an admonition not to eat the bread of someone who had an evil eye (23:6), but in this example the description might simply have meant "envious" (compare Ulmer 1994, 3).

The crime of sorcery was sometimes enumerated in catalogs of other vices. It was, for example, named together with sexual crimes and the oppression of the poor. Malachi condemned sorcerers, adulterers, perjurers, and those who oppressed employees, widows, fatherless orphans, and strangers (3:5). Similarly, Exodus mentions enticing a maid, lying with a beast, and sacrifices to other gods together with sorcery (22:16–23). The Mishnah (Sota 9: 23) says that fornication and sorcery destroy everything, while the Second Book of Kings mentions both the whoring and the witchcraft of Jezebel, mother of Joram (9:22). Such examples suggest that witchcraft was perceived in connection with deviant behavior.

It is also striking that sorcery and divination were very important in foreign policy: Sorcerers and diviners traditionally lived at courts in the ancient Near East. In Egypt, this kind of specialist often practiced sorcery and cursing against the enemy in wartime. This explains why the prophet Isaiah (3:2) announced that the Lord would take everything vital away from Jerusalem—bread, water, warrior, judge, prophet, the old—and included its diviner (*qosem*) and conjurer (*neḇōn lacha ṣ*), and why King Manasseh was blamed for his political magic (2 Chron. 33:6; 2 Kings 21:6), or why Jeremiah associated false prophets, diviners, dreamers, enchanters, and sorcerers with a concrete foreign policy, speaking of them as assuring their king that his kingdom would not be subjected to Babylon (27:9). On the contrary, Jeremiah's political prophecy said that it was God's will that the Jews should become Nebuchadnezzar's subjects. In the Book of Nahum, Nineveh, the Assyrian capital city, was referred to as the well-favored harlot and mistress of witchcraft, who sold nations through her whoredom and families through her witchcraft (3:4). Overall, the political function of witchcraft seems to have been much more important in Biblical times than in the early modern European witch hunts.

According to the Talmud, the religious elite in Biblical times, the prophets, considered magic and witchcraft incompatible with the belief in YHWH and that belief in magic means denying the power of YHWH and those who serve him (Babylonian Talmud Sanhedrin 67 b). Certainly the passage quoted from Exodus above, usually translated "Thou shalt not suffer a witch to live" (22:17), an extremely important text for the persecution of witches in early modern Europe, prescribed the death penalty for witches. They were stoned in ancient Israel, unlike in Assyria, where they were burned. An actual persecution of witches was mentioned in the First Book of Samuel in connection with the witch of Endor. Because Saul had the *ōbot* and the *yid'onim* driven out, the soothsayer of Endor was frightened when the king approached her (the term usually translated "witch" [*mēkaššēpāh*] was not in fact used in this passage). A post-biblical legend told that Simon ben Shetah had eighty witches hanged or crucified in the second century B.C.E. (Mishnah Sanhedrin 6:4); the passage named only women in general, but the implication was that they were witches.

Black magic had to be distinguished from permissible rituals. Those who merely played tricks to deceive the eye were not regarded as guilty in Jewish law, or so the Mishnah, which dates from approximately 200 C.E., in the post-Biblical period, asserted (Sanhedrin VII 11). The distinction of black magic (although the rabbis never used this term) from miracles, which were performed by a genuine prophet, was also important. Miracles were sometimes regarded as ambivalent because of their relation to magic; when Elijah asked God for a miracle (1 Kings 18:37), later interpreters claimed that Elijah had asked God that the miracle not be regarded as witchcraft (BT Berakhot 6 b). Simon bar-Yohai, a great rabbi and Talmudic sage in the second century C.E., opposed witchcraft, but he was a miracle worker, who could change men into a heap of bones simply by looking at them (the evil eye; BT Shabbat 33 b). When the first-century B.C.E. Rabbi Honi Ha-Me'aggel wrought a rain miracle, the sage Simon ben Shetah said to him: "if you were not Honni, I would ban [excommunicate] you" (Mishnah, Ta'anyot 3:4). Because rabbis performed magical rituals, some of them were said to practice witchcraft. They could force witches to undo the evil they had caused. Amulets—frequently using the tetragrammaton, the name of God—were often employed against black magic and demons by rabbis from antiquity to modern times. Thus rabbis, after the Hebrew Bible was codified, no doubt integrated into Judaism some practices they considered superstitious because they could not prevent them.

If Jewish magic had been generally under control in biblical times, it became stronger in the Hellenistic period and even more so in late antiquity, so that Jews

were regarded as the people of sorcerers par excellence (Trachtenberg 1939). Many Greek magical papyri contained Jewish elements. In the time of Jesus, Jews knew and developed the demonology of the Hebrew Bible. Their demons, led by Asmodeus and Lilith, dwelled in places of impurity, in the air, the desert, or in ruins. They worked mainly at night. They were Satan's servants, but God gave them their power. In *Jubilees*, an apocryphal book of the second century B.C.E., diseases were attributed to demons (10:10–14). Their human allies were less important than the demons themselves. Josephus, the Jewish general and historian of the first century C.E., recorded that King Solomon was regarded as a great magician, to whom God taught the art of banishing evil demons for the protection of humanity; Solomon composed formulas for conjurations to drive out such spirits. Josephus reported an exorcism he had observed himself, in which the spirit was drawn from the nose of an obsessed person with the help of a root suggested by Solomon; in order to prove that it had left the person, the spirit had to overthrow a water basin (Josephus, *Jewish Antiquities* 8:45, p. 594). The Talmud and many other Jewish works are full of magical practices that rabbis used as white magic. Later, the Kabbalah became the main domain of Jewish magic.

NEW TESTAMENT

In the New Testament, witches are not mentioned in discussions of magic, and women had no special place in its conception of magic, as they did in later times. New Testament terms for magician include *mágos* (Acts), *góēs* (2 Tim. 3:13) and *pharmakeús* or *pharmakós*. In Revelation, this last term was connected with dogs, whoremongers, murderers, idolaters, and liars (22:15; compare Gal. 5:20). The *magi* originated in Medea; they interpreted dreams and omens and sold amulets. *Goēteía*, also mentioned by Plato, was connected with sophists, and *pharmakeús* probably referred to a shamanist rite (Symposium 202 e; Smith 1978, 70). The *góēs* was the practitioner of a lower form of magic than the *mágos*. In Josephus, he was a cheat who promised, for example, to divide the Jordan River, defeat the Romans, or overthrow the walls of Jerusalem (*War* 2:261 ff.; *Antiquities* vol. 20, 97, 167 ff., 188; vol. 9, p. 440 ff., p. 478 ff., p. 490). The three magi who came to Bethlehem to see the child were viewed as positive characters, probably astrologers.

Magical rites were very common in the time of the New Testament. A practice associated with witchcraft was the evil eye. The author of the Gospel of Mark mentioned *òphthalmós ponēros* (evil eye) in association with thefts, covetousness, wickedness, deceit, lasciviousness, blasphemy, pride, and foolishness (7:22). The apostle Paul uses the term *fascination* in the Epistle to the Galatians: "Who has bewitched you?" (3:1). (The verb is *baskatnein*; Latin *fascinare*.) Most important in

the New Testament was the ability to send and drive out (*èkbállein*) evil spirits. The belief was widespread that every heavy blow of fate, every disease, was either caused by a demon or sent by a god. The deaf and dumb were also thought to be bound by a demon (Mark 7:35). The *defixio*, a magical rite often used in those days, was a spell written on lead tables and shards, intended to deliver someone to evil spirits. One of its aims was to cause love or hatred (the so-called dividers).

The focus of the authors of the New Testament was not on the people who sent these spirits, but on the spirits themselves and those obsessed by them. Jesus himself appeared as a great exorcist. The extent of his fame in this respect can be seen in the fact that his disciples tried to forbid a man to exorcise in Jesus's name, but Jesus did not allow them to do this (Mark 9:38 ff.; Luke 9:49 f). After Jesus' death, some wandering Jews, sons of a high priest, exorcised in the name of Jesus, but the demon overpowered them (Acts 19:13–16). Jesus's enemies saw him as a *magus* who drove out devils with the help of Beelzebub, or who had an evil spirit (Mark 3:22; Matt. 10:25; Matt. 9:34; John 8:48). Jesus's sighing in Mark 7:34 might refer to the notion that the obsessed, tormented by a demon, used to sigh, which can also be found in the *Papyri graecae magicae* (Preisendanz and Henrichs 1973–1974, 1:118–27). In a famous exorcism, Jesus did not order the demons he was casting out of a man to enter into swine, but when they begged him, he allowed them to do so (Mark 5:13). It may well have been that active sending would have suggested black magic. It was common to send spirits into a person in his food; thus Morton Smith (1978, 110) interpreted Jesus's giving of bread to Judas during the last meal before the Crucifixion (John 13:26–27) as a magical act designed to bring about possession by a spirit. When Jesus made a fig tree wither (Mark 11:12–14 and 20–22), the words he speaks correspond to spells in Greek papyri. The instruction he gave to his disciples about how to curse a town that did not make them welcome (Luke 10:10–12) also corresponded with then-current magical practices. In his healing, Jesus used only prayer, the word, laying his hands on a person, or saliva. If Jesus was said to be the resurrected John the Baptist (Mark 6, 14–15), this probably means that he was regarded as a necromancer who worked through John's soul.

The disciples also exorcised and healed ill people, using the oil often mentioned in magical texts (Mark 6, 12–13). They also fasted before performing exorcisms. According to Jewish tradition, Jesus learned his magic arts in Egypt. His miraculous healings have been compared to those of the first century C.E. Pythagorean miracle worker Apollonius of Tyana, who similarly drove out evil spirits and appeared to his followers as a divine man, but to his opponents as a charlatan

(Smith 1978). According to Smith, Matthew and Luke tried to tone down the magical elements found in Mark.

It would certainly be wrong, however, to reduce Jesus to the role of magician: Other scholars (e.g., Garrett 1989) have rejected Smith's interpretation of Jesus entirely; David Aune (1980, 1539) asserted that Jesus's magical activities should be subsumed under his role of messianic prophet. As Samson Eitrem pointed out, Jesus worked less through charms than through prayer, nor was he a thaumaturge with magical training (1966, 40).

We can conclude from the great number of magical deeds associated with early Christians that human beings were thought to be the cause of evil, but nevertheless healing practices concentrated on the demons themselves, rather than on persecuting those who had sent them. St. Paul also worked as an exorcist (Acts 16:16–17). When he preached in Ephesus, many who had formerly practiced magic converted. They brought their magic books, worth 50,000 pieces of silver, and burned them in public (Acts 19:19). There was one famous case of Paul himself practicing harmful magic: addressing him as a child of the Devil, he inflicted blindness on the *mágos* Bar Jesus (Elymas), who wanted to turn the proconsul away from Christianity (Acts 13:6 ff.). Paul addressed Bar Jesus as the Devil's child. Paul's "blackest kind of magic" (Smith 1978, 110) was to give over some people to Satan ("for the destruction of the flesh, that the spirit may be saved"; 1 Cor. 5:5; also 1 Tim. 1:19 ff.). Simon Magus wanted to purchase their magical power from the apostles, and Peter cursed him for this (Acts 8:9 ff. and 18 ff.). Obviously, magic was not unusual among Christians, in a world where inimical groups often reproached each other with performing black magic. There were even Christian charms asking for revenge (Preisendanz and Henrichs 1973–1974, 2:224). All this illustrates that the New Testament was written in a magical context transmitted from Jewish sources and enlarged by Hellenistic influences. These developments proved to be very influential. In the late medieval and early modern periods, both the Hebrew Bible and the New Testament were interpreted literally and so offered strong arguments for the existence of demons and witches and for the execution of the latter. Enlightened opponents of persecutions were confronted with the biblical texts.

BIBLIOMANCY

The art of divination using the Bible or another sacred text is a subcategory of stichomancy, the art of seeking spiritual guidance through the written word, and was sometimes used to identify witches. In bibliomancy, passages found when the Scriptures are opened at random are believed to offer advice, disclose the future, or answer questions. Through such blind biblical selection, people have found relevant answers to personal and societal problems; many believe bibliomancy demonstrates the power of holy texts.

Similar divinatory practices have never been confined to Christians. Ancient Chinese culture used the *I*

Ching (The Book of Changes); Muslims opened the Quran for divinatory purposes; ancient Greeks used Homer's *Iliad* or *Odyssey*, Romans opened the Sibylline books or Virgil's works. In Christianity, the Bible became the only book used for divinatory purposes. Medieval Christians denounced divination with pagan books, but nevertheless sought answers for their questions from the Bible, even willfully altering the meaning of the Biblical texts encountered, if necessary.

Bibliomancy played a major role among clergy and laymen alike in early medieval times. This type of divination, known in Latin as *sortes*, was common in the Middle Ages. An elaborate example of a *sortilegium* (sorcery), the *Sortes Sangalleges* (sixth or seventh century), used a succession of dice throws to lead the inquirer through the texts. Christian authorities like Augustine, Jerome, and Gregory the Great opposed this superstition, and numerous Church synods denounced and prohibited *sortilegium* from the fifth century onwards. Charlemagne decisively forbade it in his capitulary of March 789. But church and state authorities fought in vain against this widespread and popular method of divination.

Folk belief could not be broken by force. Berthold von Regensburg, a famous thirteenth-century German preacher, attacked bibliomancy (also called thumbing) in his sermons. But Christians would never abandon the method; even St. Francis allegedly founded his order only after consulting the Bible three times in this manner. The Bible itself was looked upon as a magic object, and when put on a child's head, would bring about sleep. Reading the Bible to a pregnant woman would guarantee a safe delivery. In England, persons accused of witchcraft were weighed against the great Bible in church; anyone who weighed more than the Bible was guilty.

Even nowadays the custom still exists of opening the Bible at random on New Year's morning to learn the general topic of guidance for the coming year. Web sites on the Internet provide bibliomantic readings and a *Literary Book of Answers* to meet the needs of inquirers. On all occasions of importance one can ask God for guidance, such as before a journey or an important business meeting, on a church holiday, or after a christening to learn the future of the new Christian. Biblical oracles have been used to foretell death, interpret dreams, or determine guilt; bibliomancy has been especially popular during wars.

Among several known methods of bibliomancy, the thumb, the pin, and the key seem the most common. By the first method, the reader opens the Bible at random, and the verse the thumb points at will serve as an answer. People who were fond of precision chose the pin instead of the thumb and pierced through several pages. The very verse finally hit by the pin foretold the future. The key method was still used in Great Britain

in the nineteenth century. A key was put in the Bible. Pieces of paper containing the names of the accused were inserted in the hollow end of the key. When the paper with the name of the guilty person was inserted, the Bible fell from the grasp of the person holding it. A slight variant used for tracing a thief is to tie up the holy book and suspend it from a string. The key within the Bible is believed to point out the thief. By yet another method, when the Bible is attached to a piece of string affixed to the ceiling, and all names of the people living in a household are spoken aloud, the culprit's name is supposed to make the book turn. In German lands, people tried to learn the names of the witches who jinxed the cows by means of the turning book.

BILSON BOY

In 1620, a twelve-year-old boy named William Perry, of Bilson (now Bilston), Staffordshire, accused a female neighbor, "Jone Coxe," of having bewitched him. Perry suffered from what were later called extraordinary fits and spasms, his urine appeared black, and he vomited straw, feathers, rags and crooked pins—a sure sign of witchcraft. Coxe was accused of sending a spirit into his body to punish him for not having returned her greetings one day. She apparently had a poor reputation in the neighborhood, was considered to have a testy temper, and was already suspected of being a witch.

Coxe's subsequent trial at the Staffordshire Assizes in August 1620 would have proceeded with very little notice had it not been for the interest King James I had taken in a witchcraft trial conducted at Leicester four years earlier. Nine women were hanged on that occasion, primarily on the testimony of John Smith, a boy about Perry's age. Shortly after, James had personally cross-examined Smith and denounced him as a liar, declaring that a terrible miscarriage of justice had occurred. It was undoubtedly an awareness of royal interest in such cases that led the assize judges, Sir Peter Warberton and Sir John Davies, to examine Perry's testimony with particular care. The trial began in

dramatic fashion, with Perry falling into violent fits as soon as Coxe entered the courtroom. There are, however, two contradictory versions of the court's verdict on the evidence they saw and heard. According to Richard Baddeley's 1622 account of the trial, Perry was found an unreliable witness and the case against Coxe was dismissed, but later accounts (Wilson 1653; *Second Part of the Boy of Bilson* 1698) stated that she was found guilty and sentenced to death, though she was later acquitted following subsequent revelations.

After the trial Perry was committed to the care of the bishop of Lichfield and Coventry, Thomas Morton (1564–1659). Perry was brought to the bishop's home, Eccleshall Castle, where he continued his pantomime, patently enjoying the attention and sympathy his supposed bewitchment generated. Morton and his secretary Richard Baddeley repeatedly questioned the boy and applied a series of tests. On various occasions Perry was given six lashes with a rod, had needles thrust into his toes and fingers, and burning candles thrust so near his eyes that they singed his eyelids. Perry seemed insensitive to such pain, which further bolstered the claim that he was truly possessed. But despite Perry's impressive display of resilience and cunning, his deceptions were ultimately revealed in two crucial ways. First, one day, when Perry thought everyone had gone to church, a servant who was employed to watch him through a spy hole saw him pour some ink into his chamber pot and place a piece of ink-soaked cotton under his foreskin. Second, he failed a standard theological test for diabolic possession, by responding incorrectly when passages of the Bible were read out in ancient languages.

Confronted with his imposture, Perry finally confessed. He stated that an old peddler of pots and glasses whom he had met on the road one day had coached him. Seduced by the prospect of not having to go to school, he began to simulate the behavior as instructed. His parents, who were Roman Catholics, were then persuaded to employ several recusant priests to exorcise the boy. Morton interpreted these events as a propaganda ploy by the Catholic community in the region to promote the benefits of their Church. If such a plan really existed, it backfired; Perry refused to be successfully exorcised. He enjoyed the attention too much, and his parents apparently received much-needed charity because of his predicament. On July 26, 1621, Perry revealed all this before the assizes at Stafford. He begged Coxe's forgiveness and was pardoned by the court. Bishop Morton subsequently had Perry bound out as an apprentice.

BINSFELD, PETER (1546–1598)

Peter Binsfeld was suffragan bishop of Trier and a demonologist. Born at Binsfeld near Bitburg, young Binsfeld attracted the attention of Himmerod Cistercian monastery in the Trier region. The Cistercians accepted him as a pupil, even though he came from an insignificant peasant family. From 1570 to 1576, Binsfeld studied theology and philosophy at the Jesuit Collegium Germanicum in Rome, where he was consecrated priest and received a doctorate in theology. He became an ardent promoter of the Tridentine reforms. When Binsfeld returned to the Trier region, Archbishop Jakob III of Trier entrusted his protégé with the reform of Prüm Abbey, where he stayed until 1578. In 1578, Binsfeld was appointed provost of St. Simeon convent in Trier and nominated as suffragan to the archbishop of Trier. He received the prebend of Wasserbillig. In 1580, the Vatican confirmed Binsfeld as suffragan and made him vicar-general of the archdioceses of Trier. Further, he held office as vice-chancellor of Trier University in 1580, and as dean in 1582–1583 and 1587–1588. Binsfeld's personal letters reveal not only genuine zeal for orthodoxy but also dissatisfaction with his own achievements and world-weariness. He died in Trier during an epidemic in 1598.

DEMONOLOGY

In 1589, Binsfeld published in Trier the *Tractatus de confessionibus maleficorum et sagarum* (Treatise on Confessions of Sorcerers and Witches). Archbishop Johann VII had sought the advice of theologians at his university about the problem of the reliability of witches' denunciations; Binsfeld probably wrote his book to answer his patron's question. It has two parts: The first discussed the preconditions, possibilities, and limits of witchcraft; the second dealt with procedural problems in witchcraft trials.

The first part opened with fourteen *pmeludia* (preliminary thoughts) in which Binsfeld repeated the fundamentals of demonology: Witchcraft included heresy and harm done to innocents; therefore it was subject to both ecclesiastical and secular courts. He introduced the idea of God's permission and the doctrine of implicit and explicit diabolical pacts. Throughout his

book, Binsfeld used both ideas extensively to bolster his arguments. Binsfeld's Devil was incredibly powerful: All magic was by definition demonic; in other words, all magic was witchcraft. Every effect with no obvious natural cause was likely to be caused by witchcraft, especially if the use of signs or letters was involved. The Devil's power to deceive the senses knew hardly any limits; even to pious Christians, he could appear in the shape of Jesus himself.

After the *praeludia* Binsfeld treated the *causae*, "pre-conditions," of witchcraft: the sinful weaknesses of individuals who fell prey to Satan's temptations, as well as the shortcomings of church and state. Binsfeld openly criticized the secular authorities' apparent negligence in persecuting witches as well as the ineptitude of priests and their sometimes unorthodox practices, regarded from his Tridentine point of view.

At the end of the book's first part, Binsfeld described the abilities of witches and devils. *Maleficium* (harmful magic), sexual intercourse between humans and demons, and the bodily flight of the witches were all real; the *Canon Episcopi* was irrelevant. (According to Binsfeld, that work did not deal with the witches of his own day but with some other heresy.) For Binsfeld, the witchcraft trials themselves proved that the flight and the Sabbat really took place. Witches, as well as those who sought

their help, had to suffer the death penalty. Binsfeld rejected confiscations, however, and criticized judicial irregularities that left defendants or their heirs penniless.

In the book's second part, Binsfeld first discussed the question of whether the denunciations of accomplices by convicted witches were reliable. It was the duty of judges to question witches concerning their accomplices. Witchcraft was a *crimen exceptum* (the excepted crime), a crime so serious and extremely hard to prove that it was excepted from the usual legal procedures. Binsfeld therefore admitted children as witnesses—he was among the first to deal with this specific problem. He also stated that an inquisition might begin after a person had been denounced as an accomplice by only one convicted witch. If there were additional presumptions of any kind against a suspect, Binsfeld even stated that one denunciation sufficed for torture; two denunciations justified the use of torture even without further evidence. Although Binsfeld warned that the Devil could appear in any shape he chose, and therefore that people reportedly seen at a Sabbat might have been demons in their shapes, he argued that the persons denounced must be witches because demons could only assume the appearance of persons who have given them permission to do so. Binsfeld's argument was based on the axiom that God would never allow innocents to fall

victim to witchcraft trials. Suspects were not to be tricked into confessing, and penitent witches might receive the sacraments.

Binsfeld's book provided a theoretical basis and practical guidelines for witch hunts. Short, erudite, and well argued, it was reprinted in 1591, 1596, 1605, and 1623; German versions appeared in Trier, 1590, and in Munich, 1591 and 1592. In later editions, Binsfeld added various materials, mostly examples. In 1591, he also appended a commentary about magicians in general. After repeating his essential condemnation of all magic as satanic, Binsfeld examines the magical realm, using the *Codex Iustinianus* (the Justinian Code, as the great collection of Roman law done under the aegis of the sixth century C.E. Roman emperor Justinian was called) as his guide. Mathematics and astronomy were legitimate but were not to be abused for divination, which was vain and demonic. Alchemy was not per se magical but was highly questionable in both moral and intellectual terms. Love magic was a capital crime. All countermagic was forbidden.

Binsfeld also added more details about procedures at witchcraft trials. Even though he criticized negligent or overeager magistrates, his trust in torture and denunciations remained unshakable. He rejected ordeals, and held that the Devil's mark, deformity, or inability to shed tears should not be used as evidence. However, he accepted as evidence not only extrajudicial confessions and all *indicia* (circumstantial evidence) of witchcraft in the imperial law code known as the Carolina Code (*Constitutio Criminalis Carolina*, 1532), but also swearing, superstition, failure to defend oneself against accusations, and the suspect's apparent fear of arrest and condemnation. He added an appendix listing various ecclesiastical laws against magic.

In 1592, the theologian Cornelius Loos contradicted Binsfeld's book with the treatise *De vera et falsa magia* (On True and False Magic), in which he depicted witches as victims of dreams and illusions. Binsfeld became the driving force behind the ecclesiastical measures taken against Loos. His book was prevented from being published. Loos was arrested and had to revoke his theses in the presence of Binsfeld and the papal nuncio Octavio Frangipani. With Binsfeld's victory over his antagonist, opposition in German Catholic theology against witchcraft persecutions was silenced until the time of Adam Tanner in the early seventeenth century. Although Binsfeld failed to influence the secular legislation against magic in the electorate of Trier, he had considerable influence in Bavaria.

OTHER WRITINGS

Even though magic and witchcraft played almost no role in Binsfeld's numerous later publications, his book on witchcraft was in harmony with the rest of his work. His whole oeuvre centered on sin and discipline,

interweaving canonical and secular laws and promoting disciplinary measures. His handbook for priests, the *Enchiridion theologiae pastoralis et doctrinae necessariae sacerdotibus* (Handbook of Pastoral Theology and Doctrine Necessary for Priests, 1591) dealt with the theology of the sacraments, sins, the Decalogue, Church organization, and ecclesiastical law, as well as disciplinary measures and irregularities that prevented individuals from taking holy orders. His stress on discipline is obvious; christology and ecclesiology were neglected. His discussion of the First Commandment contained a lengthy and furious attack on magic and superstition reminiscent of Binsfeld's appendix to his book on witchcraft. In his *Commentarius theologicus et iuridicus in titulum iuris canonici de usuris* (Theological and Legal Commentary on Canon Law Regarding Usury, 1593), Binsfeld reviewed moral teachings as well as canonical and secular laws against usury, discussing profits and fair trade in general as well as the rules of international trade. Binsfeld allowed Jews to take moderate interest, as long as the state as a whole benefited from it. His dogmatic *Liber receptarum in theologia sententiarum et conclusionum* (Book of Sentences and Conclusions Accepted in Theology, 1593) dealt with the lost state of innocence, original sin and the perpetuation of sin, grace and free will, and justification and merits, as well as with the fate of the soul after death. Binsfeld discussed the canonical and secular laws concerning numerous kinds of injuries, damage, and restitution in the *Commentarius in titulum iuris canonici de iniuriis et damno dato* (Commentary on Canon Law Regarding Violations and Damage, 1597). Two of Binsfeld's works were printed posthumously by his Trier publisher, Heinrich Bock: *Commentarius in titulum iuris canonici de simonia* (Commentary on Canon Law Regarding Simony, 1604) and *Tractatus de tentationibus et earum remediis* (Treatise on Temptations and Their Remedies, 1611). The last work reintroduced the Devil as an omnipresent seducer who could corrupt anything that was seemingly good and attacked all the senses and functions of the mind.

BLACK MASS

Although this phrase has often been used extremely loosely to cover a multitude of bizarre rituals, in strictly technical terms a Black Mass is a sacrilegious imitation of a real Mass for purposes of illicit magic often in the service of witchcraft, performed by a properly ordained Catholic priest, preferably wearing clerical dress. Because only authorized priests can celebrate the Eucharistic miracle of a genuine Mass, only they can perform an "authentic" Black Mass. Supposedly, the Catholic Mass is said backwards, urine replaces holy water and water the wine, the cross is set upside down or trampled (or both), and noxious material or perhaps a black turnip or boot substitutes for the Host. Rarely is there any historical evidence that such actions actually occurred in western Europe.

Several partial approximations of the Black Mass occurred in Latin Christendom after the development of an "underworld of clerical necromancers" in the later Middle Ages (Kieckhefer 1989; 1997, chap. 7). Despite the abundance of lurid tales about witches' Sabbats, however, no surviving medieval document has yet been found that offers directions for performing a sacrilegious Mass for magical purposes. By the sixteenth century, fragmentary evidence about Black Masses, in the form of corroborated testimony from defendants obtained without torture, occurred in records of the Spanish and Roman Inquisitions. The most spectacular earlier examples of Black Masses were usually performed in order to find buried treasure. In 1586, the Sicilian Inquisition punished two priests and two students for conjuring the Devil by performing Masses in a cave, using three skulls and nine candles; on one occasion the priestly ringleader sacrificed a live dog, letting the blood drip into a burning dish while he recited a Latin prayer to Lucifer. The group had also sacrificed a goat, and on a third occasion two acolytes committed sodomy while a priest said mass, because, they said, "this sin was necessary in order to effect the invocation" (Henningsen and Contreras 1986, 103–104). In this instance, three defendants were sent to the galleys.

The Black Mass reached its most famous and fully developed form during the tumultuous scandal known as the Affair of the Poisons that took place in France from 1679 to 1682, during which accusations of witchcraft and the holding of Black Masses swirled around charges of poisoning and love magic. The largest documentary collection of evidence about Black Masses comes from the special court and the police investigat-

ing collaboration between aristocratic courtiers and the baroque Parisian descendants of those medieval clerical necromancers, a few of whom, like the abbé Guibourg, offered numerous titillating confessions about their sacrilegious Masses. Spurious accusations abounded and even reached King Louis XIV's mistress, Madame de Montespan, falsely denounced for attending Black Masses where newborn babies were sacrificed.

Although the Black Mass that ordained priests performed had a history until the time of Louis XIV, it had no future in the de-Christianizing Western world of the eighteenth century and beyond. Once blasphemy lost its power to shock and neither church nor state punished people for it, perverted religious rituals became banal. The Black Masses Sir Francis Dashwood, John Wilkes, and other members of the Hell-Fire Club performed in Medmenham Abbey in England in the eighteenth century aroused little public concern. The notorious Montague Summers (who claimed to be a Catholic priest, although no record of his ordination survives) performed probably the closest approach to a Black Mass in the twentieth century in 1916. Many such ceremonies were performed later in the century by another quasi-celebrity, Anton LeVey, founder of the Church of Satan, whose works (still in print) include directions for performing them; unlike Summers, however, LeVey never claimed to have been ordained (Medway 2001, 380–388). The difference between these examples suggests that, to a greater degree than Summers, LeVey inhabited a world where the Catholic priesthood had been marginalized. In a world where Satan has been thoroughly trivialized, Black Masses seem utterly irrelevant. Meanwhile, jaded sensation-seekers discussing animal and rumored human sacrifices and arguing about the reality of Satanic ritual child abuse in the contemporary Western world abusively multiply this phrase to mask the absence of the thing itself.

BLACKSTONE, WILLIAM (1723–1780)

The leading English jurist of his age, Sir William Blackstone expressed a belief in the reality of witchcraft

while at the same time criticizing witchcraft trials. He was the first professor of English law at the University of Oxford, serving in that capacity from 1758 until 1766, and owed his fame mainly to his lectures on English law, *Commentaries on the Laws of England*, published in four volumes between 1765 and 1769. The final volume deals with crimes. Unlike offenses that violated the rights or possessions of individuals, crimes were “public wrongs” committed against the entire community. Blackstone divided crimes into different categories, the first of which he labeled “offences against God and religion.” Within this category, which included apostasy, heresy, and blasphemy, he listed “witchcraft, conjuration, enchantment or sorcery” (Blackstone 1979, 4:60).

Like many eighteenth-century jurists and theologians, Blackstone admitted a belief in the reality of witchcraft, grounding his belief in the Bible. “To deny the possibility, nay, actual existence, of witchcraft or sorcery,” wrote Blackstone, “is at once flatly to contradict the revealed word of God, in various passages both of the Old and New Testament” (Blackstone 1979, 4:60). He cited the famous passage from Exodus, 22:18, “Thou shalt not suffer a witch to live,” as the “express law of God.” He also observed that Roman law endorsed this condemnation, punishing with death not only witches but those who had consulted them. English laws had restated these Biblical and Roman condemnations, linking the crime with that of heresy.

Even though Blackstone believed in the reality of witchcraft, he did not approve of witchcraft trials. In this regard he took the same position as the eighteenth-century French jurist and *philosophe* Montesquieu, who in *The Spirit of the Laws* (1748) demanded great caution in the prosecution of magic and heresy, because even the most moral persons were vulnerable to suspicion on these grounds (Montesquieu 1989, 192). Blackstone claimed that the “ridiculous stories” told about witches and the “many impostures and delusions” involved in accusations of witchcraft would be sufficient to demolish all faith in such a dubious crime if the evidence of its reality were not also extremely strong (Blackstone 1979, 4:60). He agreed with the argument of Joseph Addison in *The Spectator* in 1711 that, although there was such a thing as witchcraft, one cannot place credence in any particular modern instance of it. Addison observed that it was the ignorant and credulous who often believed in these stories and that those accused of witchcraft were often people of weak understanding and crazed imagination.

Blackstone clearly disapproved of English statutes against the crime of witchcraft. On the basis of these acts, which he claimed were a source of terror to all old women in the kingdom, “many poor wretches were sacrificed thereby to the prejudice of their neighbors, and their own illusions” (Blackstone 1979, 4:61). Blackstone expressed considerable relief that in 1736

the British parliament had repealed the act of 1604, thereby putting an end to all executions for this “dubious” crime. In taking this step, he observed that Parliament had followed the wise example of Louis XIV, whose edict of 1682 ended most witchcraft prosecutions in France. The British statute of 1736 provided support for Blackstone’s argument that English law had undergone a considerable number of “improvements” over the course of the centuries (Blackstone 1979, 429).

BLÅKULLA

Blåkulla is the mythical site of the witches’ Sabbat in Sweden. The literal translation of the name is Blue (*Blå*, which in earlier times meant black) Mountain (*Kulle*). “The distant blue mountains” have traditionally been referred to as the home of trolls. Tales of Blåkulla and what took place there combined elements from many different sources. Nevertheless, the original material for the tales has a common basis in Scandinavia. Most of the testimony about Blåkulla derived from witchcraft trials, especially the infamous trials in Sweden from 1668–1676 that involved several thousand people, mostly children or adolescents. Ever since, the abduction of children to Blåkulla has been a recurring theme in Swedish tales of the witches’ Sabbat.

The name Blåkulla appeared first in a story of a miracle from 1410. The story related that a ship bound from Lübeck to Stockholm found itself in distress in the straits between Öland and the Swedish mainland (Kalmarsund), but was saved near a place called Blåkulla. This place, associated with dramatic events, was no doubt the island known as Jungfrun. In the mid-sixteenth century, Olaus Magnus, the last Catholic bishop of Sweden, referred to it as the place where witches gathered to practice their magical arts. There were references to Blåkulla elsewhere as a place name. A church mural from the late fifteenth century depicts witches flying to the Devil on a rake, a broomstick, and a baker’s shovel. From the end of the sixteenth century, Blåkulla was expressly mentioned in witchcraft trials, but the Blåkulla referred to in the major seventeenth-century witchcraft trials was no longer the island in Kalmarsund.

Either the witches' Sabbat took place locally, or people believed Blåkulla to lie in some distant mythical landscape to the northwest.

The Blåkulla story is a variation of the depictions of the witches' Sabbat from other parts of Europe. Trying to isolate aspects of these stories that are originally Swedish from those originating elsewhere is almost impossible, as is trying to trace the time of their adoption in Sweden. The provincial law of Västergötland from the thirteenth century mentioned women who, in the shape of trolls, made nocturnal flights. Western Scandinavian fifteenth-century sagas described people flying to gatherings. A notable difference between these sources and fourteenth-century manuscripts is that the later tales and sagas tended to depict flying as a means of gathering information or attacking fiends. However, there is insufficient evidence to indicate an independent development of a uniquely Nordic witches' Sabbat.

Swedish folklore had a mystic belief that people could be carried off or spirited away to a distant place or a nether region inhabited by trolls. People could even turn into trolls, either during their lives or after their deaths. The idea of witches' abduction of children bears a resemblance to the belief that trolls sometimes exchanged their own children for human children as changelings. Tales of this type were then combined with stories of heresy, consorting with the Devil, and the witches' Sabbat. In addition to this link between folklore and the witches' Sabbat, there is a further aspect worth considering, namely the connection between tales of Blåkulla and medieval visionary tales, with descriptions of hell that are clearly reminiscent of the descriptions of Blåkulla.

This varied background helps to explain the marked contrasts in the descriptions of Blåkulla during the wave of persecution in the seventeenth century. One can discern a transition from an initial, relatively bright stage in the Sabbat stories to one that is far darker and more depressing. Some children gave seductively beautiful descriptions of Blåkulla as a means of explaining how they were tricked. When they were interrogated about witches' activities, however, a less agreeable picture emerged. Thus Blåkulla could be both a beautiful place and an evil one where the witches gorged themselves, fought, danced backwards, and fornicated under the table in the banqueting hall. This contrast was reinforced when Blåkulla took on its true character of darkness, after the children had confessed in court. The children perceived the agonies of the damned in Hell, whose strangled voices could be heard from the boiling cauldrons.

BLOOD

In all pre-Christian Western religions, blood was extremely important as an offering to the gods. And long after Christianization, blood remained a central component in all kinds of magic, as it was and is in most non-European cultures. Ancient Jewish, classical, Celtic, and Teutonic peoples sacrificed hecatombs of animals and men because the supernatural beings craved blood. For example, in about 1230, Snorri Sturluson described the heathen Drontheim sacrifices as follows: "To this festival, all the farmers brought cattle and horses, slaughtered them and collected their blood in vessels. Staves were made, like sprinkling bushes, with which the whole of the altars and the temple walls, both outside and inside, were sprinkled over, and also the people" (Sturluson 1968, 94). Official Christianity condemned this use of blood along with other forms of heathen survivals; it possessed its own, more spiritualized blood cult in the form of the transubstantiation of wine into Jesus's blood during the Mass and in the veneration of many miraculous relics of the Holy Blood. The life-bearing power of blood is, however, so obvious that its application for magical purposes was often spontaneously reinvented. This happened in orthodox Christian surroundings, as, for example, at Crossen (near Frankfurt an der Oder) in 1481, when the sacristy was saved from fire by slaughtering a calf and pouring its blood onto the flames. But one cannot deny a possible continuation with some local pre-Christian fire magic.

Generally, blood has been seen as having power to heal as well as destroy, but also has become itself an object of magical manipulations. Among its positive uses, a widespread half-medical, half-magical tradition

stemming from antiquity claimed that leprosy could be cured with the blood of innocent children. The twelfth-century tale of Ami and Amile, found in many Latin and vernacular versions, narrated that after one of these two close friends became a leper, the other helped him by sacrificing his sons and washing him with their blood. According to another medieval legend, Alexander the Great was healed by bathing in his children's blood; the plot of Hartmann von Aue's famous story *Der arme Heinrich* (Poor Henry, ca. 1215) was also based on this assumption. The high esteem for the blood of executed criminals suggests that, later on, the magical side of the concept of blood began to prevail.

Black magic had always found many uses for blood. Necromancers employed it in order to summon the dead from the other world. The master narrative is Lucan's *Pharsalia*, book six, in which the witch Erichtho revived a soldier's corpse by cutting into its breast, draining the contents of its veins, and pouring in warm menstrual blood mixed with the most extravagant poisons. Thereupon his cold body quickened and began to prophesy. Later, Isidore of Seville, Heinrich Kramer, in the *Malleus Maleficarum* (The Hammer of Witches, 1486), and many other authorities mentioned the use of blood as a sign of superstitious necromancers and hydromancers, who usually required it as an offering for blood-loving demons. Magical handbooks like the *Clavicula Salomonis* (Key of Solomon, which dates from antiquity) prescribed using the blood of a black cock to inscribe on virgin parchment the symbols necessary to conjure ghosts. According to the court physician and university professor Arnold of Villanova (ca. 1300), inscriptions written in bat's blood under a man's bed could make him impotent, but sprinkling the walls with some blood from a black dog would provide an antidote.

The witch's pact with the Devil was supposedly written or subscribed with blood. Similar sanguine pacts were already mentioned in French and German thirteenth-century versions of the legend of Theophilus. Goethe's famous scene in *Faust* (taken from earlier versions of this legend) cannot be dismissed as poetical invention. Several sources offer rich details about such blood pacts, including the famous confession of Magdalena de Cruce [1487–1560], the "devilish abbess" of Cordova), or the even more famous 1634 affair of Loudun, where no fewer than three official copies of Urbain Grandier's pact with Asmodeus (two in Latin, one in French) are contained among the preserved evidence, although the bloody originals were taken to hell. More bureaucratic Austrian and Hungarian devils commanded their adepts to write their names with bloody characters in a black book. In a pious reversal of this rite, extremely devout baroque Catholics practiced self-dedications to the Virgin, written in blood; the famous mystic Veronica Giuliani

(1660–1727) dipped her quill in her own blood, running from the letters IHS (an abbreviation for Jesus, taken from initials of corresponding Greek words) that she had engraved into her bosom, thereby making herself the spouse of Jesus.

Since the twelfth century, a recurring accusation, lasting into the twentieth century in Europe, charged Jews with killing Christian children in order to perform superstitious rites with their blood. But the "blood libel" could also work in reverse. In 1784, two women were executed at Hamburg, accused of killing a Jew in order to use his blood in their sorceries. Late medieval witches were thought to have a predilection for sucking blood from small children, making the witch into a kind of vampire. This stereotype became so strong that even Joan of Arc was condemned as a sorceress who thirsted for human blood. Of course, blood became an essential ingredient in many unguents and philtres. In 1428, Matteuccia di Francesco, the witch of Todi, confessed to mixing the blood of children and owls in the potion she used to fly to the walnut tree at Benevento. Even worse, sorceresses also abused Jesus's blood. According to the celebrated Austrian preacher Abraham a Sancta Clara, witches pressed stolen hosts until they issued blood, then used the blood to raise thunderstorms. On the other hand, one part of the witch test consisted in pricking the body of the witch in order to see whether the wound would shed blood. If this happened, the witch could do no more harm, and the blood worked as a remedy against bewitchment.

From Biblical prescriptions of ritual purity and from ancient medicine, a firm belief in the special danger of menstrual blood had developed. It was not only a topic for learned treatises like Heinrich Cornelius Agrippa von Nettesheim's *De occulta philosophia* (On Occult Philosophy, 1531, I, chap. 42), but also permeated popular belief. Women used this blood's toxic properties, as we learn from a French royal pardon of 1382, given to a wife who had tried to harm her husband by having him drink water into which a sorceress had boiled her bloodstained shirt. More often, women used their menstrual blood as a love potion. Already forbidden a millennium ago in such early penitentials as Burchard of Worms' *Corrector* (1015), this practice was mentioned again and again until the twentieth century. If used correctly, however, menstrual blood also had curative properties, as Agrippa von Nettesheim wrote. The ambivalent character of this fluid, both benevolent and destructive, seems obvious.

Finally, magical spells to stop bleeding were extremely frequent in folk medicine, frequently combined with the paradigmatic evocation of Jesus's redeeming blood. A typical formula, using a Norwegian source from 1777, runs: "Stand blood, stop blood, like Jesus Christ stood in Hell. And the three names of God the Father, God the Son, and God the Holy Spirit. Amen."

Sometimes such spells had to be written in blood. A late medieval German example, which could be multiplied, went: "If a woman's menstruation lasts too long, she should write this name with blood: 'on: on: on: inclitus milus'. This works."

BODIN, JEAN (1529/1530–1596)

Author of an extremely important and blood-curdling book on the evil nature of witches, Bodin's *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580) became a textbook for Europe's legal profession, probably cited even more often than the *Malleus Maleficarum* (The Hammer of Witches, 1486) for judicial practice in witchcraft trials. It was printed in twenty-three editions, including translations into German, Italian, and Latin, and the time of its popularity coincided with the worst persecution of witches in Europe.

One of the greatest thinkers in sixteenth-century France, Bodin was highly controversial in his lifetime, and his posthumous reputation remains somewhat dubious. He is regarded as a pioneer in education, economics, history, politics, and natural philosophy. Because the theology of his posthumous *Heptameron* displayed unprecedented tolerance and obvious ecumenical traits, scholars have depicted Bodin as a humane intellectual giant.

LIFE AND WORKS

Bodin was born in Angers, in midwestern France, in 1529 or 1530. He pursued his legal training in Toulouse during the 1550s. While there, Bodin wrote a book on educational methods, insisting on using French instead of Latin as the language of instruction. After leaving Toulouse, Bodin moved to Paris in 1562 to become a public attorney, an *avocat*, at the *Parlement* of Paris, a sovereign judicial court, with jurisdiction over approximately one-half of France. There he became involved in court intrigues at a time when France's Valois dynasty was torn by armed conflicts between the Catholic and Protestant fractions of the French nobility. Bodin tried to find a solution to this bitter conflict between the Huguenots and the Catholics in his writings.

Like most of Europe, France also experienced sharp inflation along with its religious wars in the second half of the sixteenth century. In 1568, Bodin explained this mysterious rise in prices by showing a connection between imported precious metals and inflation, thus launching a quantitative financial theory based upon political economics. At about the same time, Bodin also published a *Method for the Easy Understanding of History*, which sharply diverged from contemporary opinions. Bodin's view emphasized the necessity of a comparative approach to historical studies and stressed the decisive impact of such factors as climate, topography, and geography upon human behavior.

What has been hailed as Bodin's most important work was published in 1576. His *République*, called in English *Six Books of a Commonwealth*, offered an analysis of political power in which the term *sovereignty* had central importance. Bodin tried to justify the need for a strong French monarchy, and his views on power and government provided ideological foundations for later autocratic growth. The remedy for domestic chaos was a strong central government that combined the exercise of power with the establishment of religious freedom. Bodin's private religious views, developed in a dialogue that remained unpublished until the nineteenth century, were amazing in this age and have led some modern scholars to consider him as secretly Jewish. The monarch, according to these writings, should acknowledge all religious denominations.

Bodin died from the plague in June 1596 at Laon, a northern French town where he had served as royal prosecutor (*procureur du roi*) since 1587.

THE DÉMONOMANIE

Despite his exceptionally wide-ranging originality and humanitarianism, the same man wrote his second most popular book in order to attack witches and demons. His teachings on these subjects have bewildered his admirers for over 400 years. Many of them have tried to avoid discussing the book.

Because it struck at God, nature, and the social order, according to Bodin, witchcraft was the worst of all possible crimes. His main objective was to teach his fellow members of the legal profession how to fight such crimes effectively. But before Bodin could proclaim sorcery as an “exceptional crime” (*crimen exceptum*), the handling of which prosecutors could suspend ordinary rules of procedure, he first had to prove that witches and demons really existed. He tried to make demonology into a precise science. In a didactic manner, and with considerable intellectual arrogance, Bodin accused those who doubted the existence of witches of being atheists: such people were part of the same diabolical network as other sorcerers and should be burned at the stake along with them.

Bodin’s proofs for the existence of pacts with the Devil, the witches’ Sabbat, and maleficent sorcery began with his own experiences. Occasionally, he had sat in court and listened to the stories the accused witches had told. Their stories were based upon confessions that were not extracted by torture. Next, Bodin mentioned a large number of reliable officials from all across France who had told him frightful stories about the dangerous spread of sorcery. Then Bodin wrote of what he had found in the writings of his European predecessors concerning blasphemous witch Sabbats. His information from northern Europe about sorcery and Sabbats was in complete accord with similar stories from Mediterranean countries. To Bodin this proved that sorcery was a pan-European conspiracy against God and the public. To further convince his skeptics, Bodin could prove that the existence of witches and demons had thorough documentation in both the Scriptures and the works of the Church Fathers. His extensive use of biblical exegesis added weight to his arguments.

Nearly any means could legitimately be used when prosecuting crimes related to witchcraft and sorcery. Bodin, who had been educated in law, developed what were known as “exceptional” means by which to conduct legal proceedings in sorcery cases. Prosecutors could use surveillance, lies, provocation, or evidence from convicted criminals—all of which were normally prohibited in criminal cases. It was permissible to use the whole line of psychological and physical torture as well. Anesthetic marks left by the Devil could be found by poking needles into a suspect’s body. Other circumstantial evidence showed that it was difficult for witches to shed tears during interrogation; the Devil could tie witches’ tongues and thus prevent them from crying or confessing.

The procedures Bodin advocated became common in several European countries during the 1600s. Bodin cannot be blamed for the thousands of witches who were burned at the stake in Europe in the years when his *Démonomanie* was so widely read and cited. Nonetheless, he published his arguments at the right time and apparently fulfilled an urgent need; less origi-

nal French jurists, such as Nicolas Rémy, Henri Boguet, and Pierre de Lancre, imitated Bodin.

The notion of witches as an organized sect conspiring against church and state challenged both types of authority. The depiction of an organized, separatist, and satanic threat was central to Bodin’s demonological manual. When viewed in relation to his theory of sovereignty, which was meant to secure political conformity, a sect that aimed to encompass social disintegration had to be resisted by all means. Witches’ Sabbats turned the world upside down; they were construed as subverting all positive norms in politics, economics, and religion. Bodin’s cumulative description of the Sabbats made them sound similar to the growing peasant revolts in France at the end of the sixteenth century. The witch could be used—and was used—as a personification of revolt and divergent behavior. The belief that witches were all agents of the Devil occurred simultaneously with the implementation of an ideology based upon a paternal and central monarchy. Because of state consolidation, Bodin believed it necessary to prosecute those who impelled the breakup of the state by diabolical means. In other words, the ideological and divine legitimacy of state building rested on the existence of witchcraft. A powerful monarch, anointed by God’s grace, became the metaphoric archenemy of Satan. Thus there was an obvious inner connection between Bodin’s political interpretation of the 1570s onward and his theories on demonology from the 1580s, and the same was true of his religious tracts of the 1590s. In fact, one of Bodin’s major points was to show that all religious persuasions had something in common: the need to wage war on sorcery.

Although Bodin’s *République* was blatantly misogynistic, his evidence for witchcraft came more often from men than from women. French courts prosecuted more men than women for witchcraft when the *Démonomanie* was most popular. He can at least be exonerated from the charge that he attacked witchcraft simply because of his hostility to women. It can also be said as some palliation of his cruel demonology that at least he failed to influence the *Parlement* of Paris, his original audience; the *parlement* never viewed witchcraft as an exceptional crime.

The genre called political demonology saw a clear link between the body politic and the evil doings of demons. To this genre, witchcraft constantly invoked fears about destructive forces within the society, which threatened the safe integration of the body politic. Bodin’s teachings on sorcery can best be described as an extreme variant on the political demonology in which he seemed to lack the criteria for separating the truth from deception in his methodology.

BODY OF THE WITCH

A source of fascination to many people in the early modern period, the bodies of witches, above all female witches—their form, responses, and capacities—provided proof in the eyes of many that witches were traitors to Christian society.

The modern image of the witch—a hunched, wrinkled old woman, with a hooked nose sprouting a wart—derived from both “nonfictional” and artistic representations in the period of witch hunting. This stereotype, even narrower than the artistic images of the early modern era, draws attention to the reductive perception that physiognomy betrays a person’s moral state. For early modern people, imagining visible and tangible differences between a witch’s body and those of other people was partly a response to the worst fears of witchcraft, connected to its secrecy. Fear of the hidden nature of witchcraft is a functional reason why the bodies of female witches preoccupied those who sought to condemn them: The features and capacities of the witch’s body in captivity would display for them what otherwise remained hidden. A female witch was convicted partly on the basis of what her body suppos-

edly housed and hid, which revealed the state of her soul and “proved” claims about the evil of which she stood accused. The witch’s body was thought to be physically distinctive because of her perceived inability to display normal reactions and imagined capacity to be transformed and transported in ways ordinary people could not.

The so-called Devil’s mark was a bodily index of witchcraft separating the legal treatment of witches from that of other criminals or heretics. This scratch or mark on the witch’s body had supposedly been made by the Devil as a token of ownership, and was held to be insensitive. The Devil’s mark betokened renunciation of the witch’s will; it was inscribed when one gave one’s soul to the Devil, providing a “text” that was the functional equivalent of a written pact. Demonic pacts signed by witches in their own blood were seen similarly as embodiments of the will. An English variant of the Devil’s mark was the witch’s mark, the hidden teat, reportedly used for suckling of the witch’s familiar. (The Jacobean play *The Witch of Edmonton*, adapted

Albrecht Dürer’s engraving *Four Naked Women, or The Four Witches* (1497), depicts women who, while not as erotic as subsequent witches are portrayed in early modern art, still convey the sexuality of the Devil’s servants and their pornographic appeal. (SEF/Art Resource)

from the story of Elizabeth Sawyer, a convicted witch who in 1621 confessed to suckling a familiar in the form of a dog, dwells suggestively on the presence of a teat.) Routinely, witches were stripped, shaved, and searched all over for marks, including—and sometimes especially—in their mouths, genitals, and anal area. They were also pricked once marks were discovered, to test for insensitivity.

While searches for the Devil's mark and the use of pricking tests have been legitimately described as forms of torture, official torture was used during trials "so that the witch's integral, diabolic personality might be stripped away by the application of pain to uncover the truth" (Roper 1994, 203). Torture was supposedly not employed as a form of punishment, but to make the accused confess to disavowing Christian baptism, and to succumbing, body and soul, to the Devil. Some works of demonology warned that witches might resist torture; and the very hiddenness and heinousness of their crime justified for officials the use of harsher torture than for other crimes. Moreover, judges, who believed that many witches could not or would not cry in their presence, feared that witches might use magic to immunize themselves against the pain of torture.

"Swimming" a witch was a form of "immanent" justice, similar to an ordeal. If the witch floated, she was guilty, because the "pure" water (like the holy water of baptism) rejected her. Unlike some other tests of witch's bodies, in this case, a normal characteristic condemned the suspected witch, whereas ordinarily her apparently distinctive capacities condemned her.

While generally not considered able to fly unaided, witches were believed to use magic unguents, applied for example to a stick, to fly to Sabbats. The image of witches as riders was readily sexualized, her transports becoming a metaphor for sexual ecstasy. Witches were also accused of shape shifting, the spirit leaving the bed in the form of a mouse, for example, with the body remaining a mere husk, a kind of diabolic dummy. Some witches, drawing on their own folk traditions, appear to have believed they really had these capacities: Friulian *benandanti* (do-gooders), who were mainly men, easily confessed to going out to their night battles "in spirit."

Bodies of female witches were also implicitly defined by what they lacked in a community context: They were generally different from those of their alleged female victims, most notably, parturient mothers and their babies. Recent anthropological and psychoanalytic theories have contextualized the witch's body in relation to the bodies of other women around her, showing her caught in the psychic crossfire of primal fears regarding infancy, nourishment, and community (Roper 1994; Purkiss 1996). The image of the witch as

"anti-mother" (Purkiss 1996, 100) reappeared in her use of food as a form of seduction.

The fact that witches were stereotypically women reinforced conventional beliefs and prejudices about female anatomy in general. In Christian tradition, women's bodies were twice defective: physically, because made from Adam's rib, and morally, because Eve's appetite, understood literally, dictated her moral choice. Humoral medicine argued that melancholy, which probably affected both genders in equal numbers, made women more susceptible to the blandishments of the Devil.

In this context, it is also important to recall that some supposedly natural attributes and stereotypes of female witches, and indeed of all women, equally served skeptical arguments against witchcraft and the reality of witches' confessions. In this light, the female body was still condemned, even when seen as the reason she was *not* a witch. For example, Johann Weyer suggested that frailty made women susceptible to diabolical delusions, and made them confess things of which they were incapable. The skeptical Reginald Scot registered something close to disgust at those humble female bodies, so unsuitable for the sublime enterprise of flight. "What an unapt instrument is a toothless, old, impotent, and unweldie woman," he exclaimed, "to flie in the aier? Truly the divell little needs such instruments to bring his purposes to passe" (Kors and Peters 1972, 318).

Martin de Castañega, while deploring the witchcraft in many magical practices, nonetheless dismissed the evil eye, accounting for it by reference to all women's bodies, understood naturalistically. "To give the evil eye," he says, "is a natural act and not witchcraft," arguing that during menstruation "if a woman should stare closely at a tender and delicate child, she would imprint on him . . . poisonous rays and distemper his body in such a way that he would be unable to open his eyes or to hold his head up. Even her breath could harm him, because it is harsh and smelly at that time, which is a sign of the corrupt and indigestible humors" (Darst 1979, 309). Castañega associated the power of the evil eye in old women with their physical decrepitude, and implied that their capacity to use this natural magic resulted from their malice.

Early modern artistic representations of witches articulated and perpetuated beliefs about witch's bodies, emphasizing their diabolical power and moral weakness. The typical witch was depicted as old, and often naked (to display her sagging breasts, a sign of depleted and supposedly repellent femininity), with flying hair (a code for errant and uncontrolled sexuality). The cauldron—itsself a perversion of female domesticity—also connoted a powerful, almost volcanic vagina. Alternatively, artists (notably Hans Baldung [Grien] and Albrecht Dürer) depicted witches as youthful and

sexually alluring, but as similarly suspect, morally. Dürer's famous backwards-riding witch exuded elements of masculine power, echoed most famously by the witches in *Macbeth*, of whom Banquo said: "You should be women, and yet your beards forbid me to interpret that you are so."

BOGUET, HENRI (CA. 1550–1619)

Boguet is best known as the author of a handbook for conducting witchcraft trials, the *Discours des Sorciers* (Discourse on Witches, 1602). The work's title page boasted of two things: first, that Boguet based his work on his personal experiences as senior judge of the lands of the abbey of St. Claude in southern Franche-Comté, near Switzerland, since 1596. Second, the book stressed

its practicality by including "the procedure necessary to be a judge in trials for witchcraft" (Boguet 1929, title page). Boguet's *Discours* was mildly successful. It went through a second edition in 1603, which was reprinted six times in France; a third edition, in 1610, added six of Boguet's legal opinions for other nearby courts on matters related to witchcraft.

When he first published his treatise, Boguet had tried barely a dozen witches. His first-hand experience eventually included judging 35 known witchcraft defendants, all of them put on trial at St. Claude between 1598 and 1609 (Monter 1976, 71). Overall, Boguet condemned four-fifths of them to death; he even sentenced 8 witches to the unusual punishment of being burned alive. Four other accused witches died in prison before he could complete their trials; in chapter 45 of his *Discours*, he explains that "Satan often kills witches when they are in prison or inspires them to kill themselves" (Boguet 1929, 130). Boguet's decisions apparently influenced the appellate judges of the province of Franche-Comté, to which his rulings were sometimes appealed. From 1599 until the second edition of his *Discours*, in 1603, they pronounced only 2 clear death sentences in 14 witchcraft trials; but over the next seven years, until its third edition in 1610, they sentenced over half of all accused witches (25 of 48) to death. Boguet's local reputation as an expert on witchcraft grew. In 1604, the imperial free city of Besançon, the largest town in his province, consulted him about a particularly difficult witchcraft case; this prisoner—and 5 more women in the next six months—were burned as witches at Besançon.

Like several other writers on demonology, Boguet also exercised his erudition on other topics. In 1604, he published a learned Latin commentary on the customary law of Franche-Comté at Lyons, and five years later he added a biography of his local patron, St. Claude. However, his work on witchcraft soon became an embarrassment rather than an advertisement for professional promotion. In the three years after the third and final edition of Boguet's *Discours*, the *Parlement* (sovereign judicial court) of Franche-Comté pronounced only 1 death sentence in 20 witchcraft cases; more significantly, early in 1612 the *parlement* overturned 3 of Boguet's final 4 decisions in witchcraft cases, releasing 2 women whom he had sentenced to death. Boguet's work was never reprinted after 1611, reportedly because its author requested that his publishers not reissue it. After twenty years as head judge at St. Claude, Boguet finally applied for promotion to Franche-Comté's *parlement*. Letters patent admitting him were signed in May 1618, but he actually sat on this bench for only two months before his death in February 1619.

Boguet's importance as a demonologist was not very great. His book was never translated into Latin, but his treatise did fill a market niche in France because it was relatively short and had a useful final section, a

“Manner of Procedure for a Judge in Cases of Witchcraft” in seventy brief articles. A few of its features seem specifically local. For example, Boguet’s first five chapters all connected to a single case involving an eight-year-old girl “possessed of five devils and later delivered of them” (Boguet 1929, 1) and the old woman whom he imprisoned in 1598 for casting this spell. In his fifth chapter, Boguet remarked that “every day in our town we continually meet with large numbers of persons who, for the most part, impute their possession to . . . sorcerers” (Boguet 1929, 10); these Savoyards often traveled many miles in order to be exorcised near the body of St. Claude. Boguet learned from his early investigations that it was even possible for one witch to send demons into the body of another witch (chap. 6). And because his first “star witness” was only eight years old, he also emphasized how deeply children could be tainted by witchcraft.

Another specifically local aspect of Boguet’s *Discours* was his discussion of werewolves (chap. 47). “The people of this country ought to know as much as any others about were-wolves,” he asserted, “for they have always been known here” (Boguet 1929, 140). The heavily forested and witch-infested Jura Mountains had indeed spawned an unusually intense preoccupation with werewolves in Boguet’s district; he mentioned pictures of three werewolves executed in 1521 that were hanging in a local church. Boguet began his discussion of lycanthropy by naming 4 witches (3 of them women) arrested in his first roundup of suspects in 1598, all of whom admitted that they had killed and eaten children while in the form of wolves, but he complained that 2 other admitted werewolves, a father and son, “were hurried too quickly to their execution” before they could provide him with useful details on this subject (Boguet 1929, 138).

BOHEMIA, KINGDOM OF

Witchcraft and its persecution in Bohemia in the late Middle Ages and the early modern periods have not yet been systematically researched. Today part of the Czech Republic, Bohemia became a kingdom between 1198 and 1212. Although Bohemia was not formally part of the Holy Roman Empire, the Golden Bull of 1356

made Bohemia’s king one of the seven electoral princes who chose the emperor. The Bohemian crown (including Silesia, now part of Poland) fell to the Austrian Habsburgs in 1526; they governed it throughout the age of witch hunting. The number of victims of the witch hunt in Bohemia proven by sources may be provisionally estimated at roughly 400 (mainly executed). Considering the substantial losses of source material, particularly the records of the town criminal courts, the real number of victims of Bohemia’s witchcraft trials between the fifteenth and eighteenth centuries could have been more than twice as high.

Bohemia’s first laws prosecuting magical spells date from 1092 (Prince Břetislav II), in connection with attempts to eradicate remnants of heathenism. In Bohemian law, the offense of witchcraft (sorcery) was defined for the first time in article O.II of the Town Code by Pavel Kristián from Koldín, which came into force in 1579. Detailed legal regulation of this offense was also promulgated in 1707, in the so-called Josephina, the criminal code of Emperor Joseph I for Bohemia, Moravia, and Silesia. The papal inquisition operated in Bohemia with great intensity from 1318 up to the middle of the fourteenth century, when, especially in southern Bohemia, more than a thousand alleged heretics were burned at the stake. Bohemia adopted inquisitorial procedures by the fourteenth century, but used them for prosecuting serious criminal offenses; before 1650, there are practically no indications of their use in courts with authority over the whole kingdom. The first reliable data about persecution of practitioners of harmful magical spells date from the 1330s, but Bohemia has no records before the fifteenth century of any trials against such people. As a rule, Bohemian sorcery involved harmful magic, done mainly with the aim of poisoning people or cattle, causing illness, and causing damage to livestock or crops, as well as sometimes love magic. Apart from a few exceptions (including echoes from massive Silesian witchcraft trials in the 1650s), in Bohemia the offense of witchcraft rarely involved a compact with the Devil or participation in a witches’ Sabbat.

From the mid-fifteenth century until the 1760s, the primary base of Bohemian criminal justice remained the almost 400 town courts located in royal cities, patrimonial cities, and small towns. Municipal criminal courts heard the overwhelming majority of witchcraft trials in Bohemia between the fifteenth and eighteenth centuries; partial exceptions were patrimonial courts and ecclesiastical (consistorial) courts. Other courts, including those with authority over the entire kingdom (Land Court, Chamber Court, etc.), judged sorcery cases only sporadically. In the 1680s, Bohemia acquired its first appellate court, the Court of Appeal in Prague, with authority over the whole kingdom, empowered to sanction all death sentences passed by all lower courts in the kingdom (particularly the town and patrimonial

courts). This court acquired the same authority over Moravia in 1700.

The first trials against sorcerers and performers of harmful magic spells occurred in Bohemia during the second half of the fifteenth century, as isolated cases. The first known execution of a witch took place in 1498, when a woman was burned for harmful sorcery in Kutná Hora; later in the same year, at least four women were burned in Prague for the same offense (Macek 1999, 77). By or before 1502, death sentences for witchcraft and poisoning were almost certainly passed at trials against an unknown number of men and women at Vysoké Mýto, a royal town in eastern Bohemia. Another witchcraft trial resulting in a death sentence was registered in the 1520s in the eastern Bohemian patrimonial town of Náchod. After the 1540s, the number of Bohemia's witchcraft trials and the number of death sentences passed increased gradually.

Apart from a few exceptions, Bohemian witch trials from the fifteenth to the eighteenth century were almost always individual in character; one can hardly speak of mass witchcraft trials. The most outstanding exception occurred in 1598, when a nobleman named Mkuláš from Bubna ordered a total of 21 women either burned at the stake or buried alive for witchcraft in the eastern Bohemian patrimonial town of Žamberk (in German, Senftenberg) (Šindelář 1986, 247; Lambrecht 1995, 304, 477). This case was the worst known mass witchcraft trial in the Czech lands of Bohemia and Moravia. Another exception is the series of witchcraft trials held between 1602 and 1617 in the central Bohemian royal town of Nymburk; altogether, 20 people were interrogated, with 10 of them (3 women and 7 men) sentenced to death and executed (Kreuz 1997, 130–159). Around 1580, an unknown number of witch trials and several executions also took place in the northern Bohemian patrimonial town of Chomutov (Germ. Komotau).

We do not know when the last death sentence for the offense of sorcery (witchcraft) was carried out in Bohemia, but it is highly probable that it happened sometime in the first half of the eighteenth century. The last person sentenced to death for witchcraft, the shepherd Jakub Polák from the village of Jistebnice in southern Bohemia, was freed through the personal intervention of the empress Maria Theresa in July 1756. Afterwards, no cases of legal persecutions for witchcraft or magical spells were registered in Bohemia.

BOHUSLÄN

Between 1669 and 1672, a series of large-scale witchcraft trials were held in the province of Bohuslän, in southwestern Sweden. By the time they ended, twenty-nine people had been executed, two had committed suicide, and fifteen more had died, often as a result of unsanitary prison conditions and torture (Svenungsson 1970, 327 ff.). More than fifty other individuals had been accused or interrogated. The term "witch hunt" is applicable here, as the dynamics of the persecution clearly stemmed from the methods used by the court, including a routine use of torture and ordeal by water (swimming test). As a recently conquered area on the periphery of the Swedish kingdom, Bohuslän was in a sensitive position, which may have caused the authorities to overreact. Equally, local conditions played a significant role. The witchcraft trials in Bohuslän displayed the same contradictory praxis that one observes after the outbreak of the infamous Blåkulla trials in northern Sweden. Despite the High Court's official policy of exerting strict control over the lower courts, in the case of these witchcraft trials they often accepted the procedures and decisions of the local courts.

Sweden had only recently, in 1658, annexed the province of Bohuslän from Denmark; Danish law was still in force, and, unlike Swedish law, it permitted the use of torture in certain circumstances. Torture was employed after conviction but prior to execution, as it was felt undesirable even for witches to go to their deaths without first confessing their sins and thereby gaining redemption. Danish law also stipulated, however, that testimonies forcibly extracted from convicted persons were not admissible as the sole basis for arraigning and convicting potential accomplices. These provisions would have had a dampening effect on the progress of the Bohuslän witchcraft trials, but they were both disregarded, and local praxis was applied instead. The accused were tortured prior to sentencing, and

witnesses other than persons already accused of witchcraft were not always produced in court. Because deviation from formal legal procedure was explicitly justified by local praxis, witchcraft trials had probably taken place in this region earlier. In the preliminary stages of the trials, Governor Harald Stake sanctioned the use of torture by allowing local authorities to act as they thought fit. In practice, however, both torture and water ordeals had been used in the hearings from the very beginning.

Though the use of water ordeals had fallen into general disrepute by the middle of the seventeenth century, in Bohuslän they were conducted frequently. Here, the relatives of a suspect occasionally conducted officially sanctioned water ordeals to spare a mother or wife the ignominy of being handled by the executioner, who was considered "unclean." Water ordeals finally became subject to a popular crisis of confidence when people began to suspect that the method did not represent a miracle or sign, but that in fact everyone would naturally float. Ordinary people began testing each other, although when questioned in court they were quick to claim that, in contrast to the official tests, no one floated. Both men and women took part in the unofficial tests, where the persons being tested occasionally even had their arms and feet crossed and tied together.

There was no real need for the courts to use torture to raise the issue of the witches' Sabbath or to extract the names of the initial participants. Local conflicts and rumors combined with the popular conception, also found in Denmark, that witches operated collectively when harming others, ensured that plenty of suspects were available for further examination. The Bohuslän witch hunt started with an accusation of *maleficium* (harmful magic). Its first accused witch committed suicide "at the instigation of Satan" by hanging herself in prison, thereby confirming her own guilt and proving that Satan was at work in the town of Marstrand.

Fairly soon a second suspect began to implicate others. Voluntarily and in reply to questioning, she accused two women and a number of their companions of using witchcraft to keep fish away from the local waters. Recently, a drastic reduction in the number of fish off the Bohuslän coast had struck local fishermen severely. The court felt obliged to investigate the matter further, questioning the woman closely about how she knew that the women named were witches and the exact circumstances of their activities. Accusations cascaded; imprisonment and torture followed, until a hundred suspects were involved and almost half of them died.

BOOKS

Books had a central place in producing the image and recording the practice of witchcraft. They were used in cases of witchcraft both as magical objects and as sacred texts, either to invoke or repel demonic power. The Bible was especially important, particularly to Protestants, because they believed that Satan responded to it violently, but other works of varying holiness, size, and cost were also influential. Manuscript books and scrolls as well as printed books were read and used, either as texts or objects, in a variety of ways and for a number of reasons. Books were perhaps the most important medium through which literate people learned the supposed behavior of witches and devils; cheaper and easily read printed materials, particularly pamphlets or woodcuts, spread stories about witchcraft to a wide range of semiliterate people over long periods of time. Books were used in possession cases and as tools of dispossession, as protective charms, as objects to bring harm and to cast spells, and as aids to discover witches or hidden treasure. Demonologists wrote many books to help find witches, justifying the existence of their crimes and the need for their persecution. They also wrote some books that proved influential in movements to end the prosecution of witchcraft.

The images of the witch and the book were related but fluctuating. Whereas the scarcity and expense of manuscript books in the Middle Ages gave books a quasi-magical image, stimulating stories in which witches or evil magicians used books to cause harm, books printed after the development of movable type were commonly called upon to repel witches. In the eighteenth century, when witches became figures of entertainment, and in the nineteenth and twentieth, when children's books displayed pictures of witches casting spells, books helped to develop and sustain certain stereotypes about witches.

WITCHCRAFT AND PRINTING

Movable type was invented only a generation later than the witches' Sabbath. A sixteenth-century story associated Gutenberg's innovative technology firmly with witchcraft. Faustus of Mainz, the story went, among the first to print a book, had stolen the invention and headed to Paris to sell printed Bibles and make a profit. There he was condemned for sorcery and only reprieved when he told the authorities of his discovery. As with many other technological inventions, including today's word processors, Satan, commonly considered a great scholar, was thought to have played a leading role in the invention of printing from movable type. Only

the propaganda of Martin Luther and the reformers, who hailed the invention as a work of God with which they could spread the truth against the Devil in the shape of the pope, changed this image. Thus Cotton Mather wrote in his *Wonders of the Invisible World* (Mather 1693, 17) that Satan was responsible for delaying the invention of printing for so long.

Books were important in the experience of witchcraft. Medieval necromancers had often been associated with manuscript “books of secrets,” a handful of which have been preserved. In Reformation Europe, the experience of witchcraft was increasingly described as beginning with a pact in which the witch signed a book, often in blood, committing her to Satan’s service in return for increased power. Many basic images concerning witchcraft involved inversions: Signing the pact in a book was a Protestant inversion of the traditional image of the names of the elect being written in God’s book, to be used when everyone was judged at the Apocalypse.

Many witchcraft defendants were accused of possessing and using magical books and papers, including those by Heinrich Cornelius Agrippa von Nettesheim. Such heretical and seditious books, sometimes thought to have inherent demonic properties, could be burned along with their owners, as with Urbain Grandier at Loudun in 1634, because everything of his was believed to be demonic.

BOOKS AND IDEAS OF WITCHCRAFT

Books were important in spreading ideas about witchcraft. For those with a high degree of literacy, demonologies provided justification for witch hunting, and theological treatises demonstrated the urgency required in fighting the Devil. The most popular book of all, the Bible, and the aids for reading and learning its stories, showed the reality of the Devil and the importance of contemporary arguments about witchcraft. Printed demonologies occasionally influenced trials for witchcraft even across confessional lines between Protestants and Catholics, as at St. Osyth in England in 1582, where the official investigating witchcraft had apparently used Jean Bodin’s treatise, *De la démonomanie des sorciers* (On the Demon-Mania of Witches), first printed at Paris two years earlier. Demonologies also provided intellectual foundations upon which the edifice of the reality of witchcraft rested. Such internationally popular works helped account for many of the similarities in witchcraft cases.

At a more popular level, cheaper printed works, such as single-leaf woodcuts (enormously popular in Germany), broadsides and pamphlets such as Germany’s “devil books” (*Teufelsbücher*), spread stories of witches and witchcraft and the behavior associated with them across many parts of Christendom. Supposedly possessed young people sometimes learned

the recognizable symptoms of possession in this way, practicing symptoms they had read about from popular printed accounts, thus accounting for some remarkable similarities in behavior in seventeenth-century England. For example, a popular pamphlet of 1593 about the Throckmorton children in Huntingdonshire, *The Most Strange and Admirable Discoverie of the Three Witches of Warboys*, apparently inspired Anne Gunter, who simulated her symptoms of possession after reading it; in several other cases, the familiar spirits had the same names as in the pamphlet. Simultaneously, French-speaking nuns (and especially their exorcists) used printed accounts to copy symptoms of possession from the Mediterranean to Belgium.

After 1700, with literacy rates increasing throughout Europe, the abundance of printed material skeptical of witchcraft became significant in the decline of persecution, although it was offset by the proliferation of cheap guides for practicing magic.

HOLY BOOKS AS COUNTERMEASURES AGAINST WITCHCRAFT

We know that sacred books sometimes played an important role in countering witchcraft. Texts from the Quran, worn as amulets, protected Spanish Moriscos against witchcraft. For Protestants, the Bible was similarly thought to have properties that could render its user immune to the actions of Satan; an English clergyman told his parishioners that a Bible in the house would keep the Devil out (Thomas 1971, 590). Even particular parts of a sacred text had protective qualities. Some Catholic peasants wore the text of the Gospel of John around their necks to keep the Devil at bay, though demonologists such as Martín Del Rio found such practices demonic (Maxwell-Stuart 2000, 141).

Of course, reciting from sacred texts gave protection against harmful magic, or could be used to detect it. Biblically based countermeasures ranged from reciting particular passages like Exodus 22:18 (“Thou shalt not suffer a witch to live”) to repeating psalms against the Devil. Exorcists used the Book of Revelation to eject devils from the possessed. Reading the Bible among the family was among the few countermeasures recommended even by some Catholic demonologists (Bodin 1995, 147). For purposes of divination, Biblical texts were chosen randomly and then interpreted, although such popular practices were condemned by Protestant demonologists like William Perkins, who wrote that they “cannot be done without confederacy with Satan” (Perkins 1608, 107).

BORDELON, LAURENT (1653–1710)

This abbé, chaplain of St. Eustache in Paris, contributed one fascinating book to the literature of witchcraft and demonology. It was the first eighteenth-century book that dared to deal with the theme of witchcraft in a humorous and satirical fashion, and its use of illustrations about witchcraft was also remarkable.

Bordelon moved in the intellectual and noble circles of Louis XIV's Paris in the aftermath of the notorious "Affair of the Poisons" and the dawn of the Enlightenment. His literary output totaled more than thirty books, most of which were satires. Bordelon's works were popular enough to be translated into various European languages during the eighteenth century. His *La Langue* (The Tongue, 1705) was translated into English as *The Management of the Tongue*, or alternatively, as *Hints on Conversation*, and was republished frequently until the nineteenth century. Some chapter headings in *La Langue* give insight into Bordelon's humor; they include, "the babble," "the silent man," "the dissipater," "the opinionated man," "the promiser," "the instructor," and "the tongue of women."

Bordelon's contribution to the history of witchcraft literature was published in 1710 in both Paris and Amsterdam. *L'histoire des imaginations extravagantes de Monsieur Oufle: causees par la lecture des livres qui traitent de la magie, du grimoire, des demoniaques, sorciers . . .* (The Story of the Extravagant Imaginations of Monsieur Oufle, Occasioned by his Reading Books Treating Magic, the Demonic Arts, Demoniacs, Witches . . .) told the adventures of Monsieur Oufle—"oufle" being an anagram for "le fou," thus "Monsieur Le Fou" ("Mr. Crazy," or "Mr. Fool")—who believed firmly in all aspects of the occult, including witchcraft. Bordelon's Monsieur Le Fou encountered astrologers,

witches, werewolves, fairies, devils, and the like. *Monsieur Oufle* seems to have been an immediate success. It was reprinted several times in the eighteenth century, with French editions appearing as late as 1754; it was also translated into English and German as early as 1711 and 1712, respectively.

The edition published in Amsterdam in 1710, during the height of the Dutch controversy over the reality of the Devil, is most interesting because it contained an engraving showing Monsieur Oufle, accompanied by an allegorical figure of a Fool, attending a full-blown witches' Sabbath. The image, showing witches making storms, herding toads, eating infants, honoring the Devil, flying around, dancing, and having an orgy, was lifted directly from an earlier illustration by the Polish artist, Jan Ziarnko, that appeared in the 1613 edition of Pierre de Lancre's *Tableau de l'Inconstance des mauvais anges et demons* (Description of the Inconstancy of Evil Angels and Demons). This book by the great French witch hunter, Lancre, was by no means satire. Although—or because?—Lancre was still notorious for his persecution of witches in the Basque regions of France almost a century earlier, the Amsterdam publishers of *Monsieur Oufle* used Ziarnko's image to illustrate the ridiculous imaginings of Bordelon's character. The illustration in *Monsieur Oufle* was copied exactly from that of Ziarnko, with the only additions being the figures of the Fool and Monsieur Oufle. Such artistic transferences are not unusual in the history of witchcraft literature, but it is exceptional to find a print that was originally intended to horrify the reader with what witches "really" did being used a century later to amuse the reader of a raucous satire.

BORROMEO, ST. CARLO (1538–1584)

One of very few saints with the responsibility for holding a significant number of witchcraft trials, Carlo Borromeo (canonized November 1, 1611) was born in Arona. As the youngest of his brothers, he was destined to pursue an ecclesiastical career. The unexpected election of his maternal uncle Cardinal Gianangelo de' Medici as pope in December 1559 marked a turning point in his life. Pius IV summoned his nephew to Rome and, despite his age, appointed him cardinal on January 31, 1560.

Laurent Bordelon's early eighteenth-century satirical representation of the witches' Sabbat that ridiculed Jan Ziarnko's 1613 depiction of the Sabbat. (Brian P. Levack, ed. *The Witchcraft Sourcebook*, 2004, p. 312)

Through nepotism, young Carlo soon became one of the richest and most prestigious members of the Sacred College. The decisive event of his dazzling rise was his appointment as administrator of the archbishopric of Milan on February 17, 1560. By December 1563, he had been consecrated archbishop of Milan, and made his solemn entrance almost two years later in September 1565. Once settled in the archdiocese, which he no longer left except for brief periods, Borromeo dedicated himself to the rigorous application of the Tridentine decrees. Because of his reform efforts, the pope created him *legatus a latere* (a papal nuncio, literally "a legate from the side" [of the pope]) in 1565. When Borromeo lost this privilege after his uncle's death, two subsequent popes, Pius V and Gregory XIII, granted him numerous privileges that other bishops did not possess.

Borromeo had an almost medieval idea of the relationship between lay and ecclesiastical powers, but above all he believed in the unlimited exercise of episcopal jurisdiction, not only over clergy, but in some measure also over the laity, and in well-organized pastoral activity. His position provoked some serious disagreements with the Spanish authorities who governed the duchy of Milan, as well as with the inquisitor at Santa Maria delle Grazie, whose jurisdiction he challenged not only in cases of heresy, but also in those concerning magic, witchcraft, and superstition, which he tried to arrogate to the archiepiscopal tribunal. Despite hostility from Spanish governors, competition with Dominican inquisitors, and weaker relations with Rome after the

election of Pius V, Borromeo never wavered in his radical reform activities or in his jealous fostering of episcopal jurisdiction.

Milan, in Borromeo's view, needed to become the model for carrying out reform in the universal Church, a goal to which the archbishop dedicated himself completely until his death. He remained convinced that in order to combat heresy, which was a very threatening reality in his diocese, he must dedicate his efforts to eradicating the scandals that served the enemies of Catholicism. The task required swift and radical action.

Borromeo was as relentless in his determination to punish anything related to magic and superstition as he was against Protestants. This was evident in the severe sanctions established in his 1568 decree *De Magicis Artibus, Veneficiis Divinationibusque Prohibitis* (On the Magic Arts, Poisonings, and Prohibited Divinations), renewed eight years later under the title *De Superstitionibus* (On Superstitions). It held that anyone who practiced the magical arts was to be considered, tacitly or expressly, an accomplice of the Devil. Penalties varied from five years of imprisonment for magicians to seven years imprisonment for causing a storm. He also harshly persecuted harmless popular superstitions inherited from an ancient, syncretistic religiosity (Farinelli and Paccagnini 1989, 81). Convinced as he was that all magic was diabolical, the archbishop saw the witch, defined as the servant of the Devil by the theological and juridical thinking of the day, as a central problem, and the extirpation of

witchcraft as essential to the reform of Milanese religion. Increasing persecution against witches therefore became one of the most significant aspects of his pastoral activity. In Lombardy, superstitions had been linked to diabolical knowledge since the late fourteenth century. Practitioners of magic and popular medicine were considered dangerous religious subversives. Only their eradication could restore divine order on earth and thereby reestablish the Catholic Church's primacy throughout the world. According to Borromeo, bishops were obliged to "exterminate the practitioners of witchcraft" (Farinelli and Paccagnini 1989, 82); to this end, he arranged for priests with knowledge of the diffusion of superstition to send suspects systematically to the archdiocese. These inquiries served as preliminaries to the true and proper persecution, which was conducted in person by the cardinal.

Especially famous was the case of some women from Lecco, who were accused of witchcraft by the archbishop's tribunal in 1569 and became the center of a sharp controversy between the archbishop and the presiding cardinal of the Roman Inquisition. The disagreement that arose on this occasion between Borromeo, who wanted immediate punishment, supporters of the accused witches, and Rome, which instead requested a more prudent conduct founded essentially on investigation as to whether any substantial facts underlay the accusation, represented a watershed in inquisitorial practices (Prosperi 1996, 373). The letters that Cardinal Scipione Rebiba (1504–1577) sent to Borromeo in the name of the Congregation of the Holy Office (the Roman Inquisition) represented, essentially, the moderate line on the subject of witchcraft, subsequently affirmed in Italy in the last decades of the sixteenth century and culminating about 1620 in the famous *Instructio pro formandis processibus in causis strigum, sortilegiorum et maleficiorum* (Instruction for Conducting Trial Procedures against Witches, Sorcerers, and evildoers).

Even after this harsh conflict with Rome, Carlo continued to persecute witches with extreme severity. In Roveto, in Val Mesolcina, in 1583, he personally conducted the arrest and trial of about ten men and women, including the local parish priest, all accused of diabolical witchcraft, against whom the ecclesiastical court eventually issued eleven capital sentences (Farinelli and Paccagnini 1989, 92–96). After Borromeo's death, his harsh line against popular superstitions continued to distinguish the Milanese archbishopric. Appointed bishop in 1595, Borromeo's cousin Federico also denounced and repressed magic in all its manifestations, including the simplest thaumaturgical practices. Federico's own claim to have had personal encounters with the Devil increased the climate of fear that resulted in nine capital sentences against witches in Milan between 1599 and 1630. Although not directly

involved with the trials on the same level as Carlo, Federico believed that such death sentences were justified because they were inflicted "justly" (Farinelli and Paccagnini 1989, 103). Federico was responsible for unrealized plans for establishing a place where, after serving their spiritual and judicial penalties, witches would be confined to ensure that the "bad seed" would be eradicated completely (Bendiscoli 1957, 298).

BOUCHER, JEAN (1548–1644)

One of the most violent Catholic preachers in Paris in the late days of the Wars of Religion, Boucher's many writings attacked the Protestant heresy and connected it to the work of Satan as well as linked it specifically to the growth of witchcraft.

Born into a well-connected bourgeois family in Paris, Boucher rose rapidly in the Church. He was a student in Paris during the famous witchcraft lectures of Father Juan Maldonado and the St. Bartholomew's Day Massacre (1572). He taught at Reims, where he became rector in 1575. He returned to Paris, finished his doctorate of theology and became rector of the University of Paris. He was also the *curé* (chief parish priest) of St. Benoît, which became his platform for fiery sermons denouncing both Protestants and those *politique* (moderate) Catholics who were not supporters of the zealot cause. He did not hesitate to attack the French monarchy, reserving his special venom for Kings Henry III and IV.

Boucher was a founder of the Sixteen, the extreme group that dominated Paris in the name of the Holy League (the Catholic league, the extreme Catholic faction) in the late 1580s and early 1590s. He placed himself in the first rank in the armed procession of the League in 1590. In a city dominated by violent partisan preachers, Boucher stood out as particularly blood-thirsty. He was instrumental in drawing up a League party program for the meeting of the Estates General at Blois in 1588. This document included a good statement of the French Catholic zealot argument about the connection between Protestantism and witchcraft: "And because witches have a great affinity with heretics, and that both having the same father [the Devil] they have wasted and infected this poor kingdom . . ." (Pearl 1999, 88).

In 1594, when Henry IV finally occupied Paris, Boucher left the city with the retreating Spanish troops. He withdrew with them to the Spanish Netherlands, where he spent a half-century teaching and writing. Throughout his long career, Boucher poured out a stream of vitriolic political tracts, in which the Devil played a central role as supporter and benefactor of the Protestant heresy. Although not demonology strictly speaking, Boucher's work demonized heretics and attacked kings and judges alike for their lack of zeal in dealing with Protestants, witches, atheists, and magicians. He could only interpret their lack of zeal as coming from their alliance with the Devil. Boucher never accepted the sincerity of Henry IV's second conversion to Catholicism in 1593, seeing the Bourbon king as a follower of Calvin and thus a follower of the Devil. Boucher defended the Jesuits, who were blamed for Jean Chastel's 1594 assassination attempt on Henry IV and expelled from Paris. He pilloried those who opposed the Jesuits, especially the judges of the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) as tolerant of heresy and punishers of good Catholics.

Boucher's most explicitly demonological work was published in 1624. It follows the well-established tradition of his former teacher Maldonado, being filled with references to the Devil and to his intimate connection to Martin Luther and Jean Calvin. Boucher tied the growth of heresy, infidelity, and atheism to the flourishing of evil beliefs of a sad century, writing that magic and witchcraft were "the horror of horrors, the crime of crimes, the impiety of impieties . . . the consequence of atheism" (Boucher 1624, 536). For Boucher, the source of this evil was clearly the teachings of heretics. He discussed specters, goblins, witches and their Sabbats, and judicial astrology, considering all of them as aspects of a world corrupted by the growth of atheism.

Throughout his long exile, Boucher could not have been pleased when he observed the French scene, since Louis XIII's government continued to tolerate

Protestantism and witchcraft prosecutions became rare; in the year he died, however, France's worst witch hunts erupted in Languedoc and Burgundy.

BOVET, RICHARD

In a 1684 publication, *Pandaemonium or the Devil's Cloyster* (Bovet 1951), Richard Bovet conflated an anti-Catholic Whiggish diatribe with a collection of stories from the west of England, traditionally known as the West Country, about witchcraft and poltergeists. Bovet came from a Somerset clan who had become prominent parliamentarians during the interregnum; afterwards, many of them participated in Monmouth's rebellion in 1685. Borrowing its title from John Milton's *Paradise Lost*, *Pandaemonium* adopted the agenda of the two most influential late-seventeenth-century English defenders of witches and spirits, Joseph Glanvill and Henry More, by attacking atheistic denials of spirits, using authenticated cases from the West Country to demonstrate their reality. But its underlying message was much more radical, in that it labeled popery and monarchy as forms of diabolic idolatry and presented the seditious Bovets as respectable and credible witnesses during the Tory repression of Whig radicals. Although its text showed little interest in promoting the prosecution of witches, another branch of the Bovets was involved in a case of witchcraft tried at Exeter in 1696, accusing Elizabeth Harner, or Hörner, of bewitching their daughters, one of whom had died.

Montague Summers identified the author of *Pandaemonium* as Richard Bovet junior, born about 1641 in Somerset, who matriculated at Wadham College, Oxford, in 1657, and the likely author of two later anti-Jacobite congratulatory poems (both reproduced in Bovet 1951), praising the defeat of the French fleet in 1693 and William III's escape from an attempted assassination in 1695. Both of these poems shared *Pandaemonium's* deep-seated anti-Catholicism and its tendency to uncover Jacobite conspiracies animated by devilish powers. But its author could be his father or uncle Richard Bovet senior of Bishops' Hull, near Wellington (Somerset) who, together with his brother Philip, was executed in 1685 for playing leading roles in Monmouth's rebellion. Both had been prominent

parliamentarians in Somerset, where Richard briefly became MP for Taunton in the 1650s: His purchases of sequestered property included a mansion at Cothelstone, outside whose gates he was hanged in 1685.

After the Restoration, “Colonel Bove t” (or Buffet) was associated with numerous plots, frequently hiding and then reappearing; Philip remained a significant local figure, but was refused the title of gentleman by the heralds visiting Somerset in 1672. The Bovets retained ties with such powerful radical families as the Carys, and possibly with the earls of Pembroke: The author of *Pandaemonium* located one case at what must be Wilton House, the seat of the earls of Pembroke, where Milton’s nephew also worked, which may explain the extravagant praise the author gave to “the learned and profound Mr John Milton” (Bovet 1951, 9). *Pandaemonium* also reported the “Demon of Spraiton” in Devon, the account of which was also published separately in 1683 by Thomas Malthus (who published one of the two 1684 editions of *Pandaemonium*) and probably edited by Bovet from a letter by one of the Cary family.

This story was also known to such Somerset natural philosophers around the Glanvill–More circle as Andrew Paschall, who lacked direct contact with the radical upstart Bovet; their version revealed the dissenting links of the family at Spraiton, which the Bovet versions omitted. Devonshire witchcraft trials, such as those at Exeter in 1682, were heavily politicized, with Whigs seeking to embarrass Tory judges, who were skeptical about witch hunting’s Puritan associations but unwilling to deny the reality of a statutory crime. In the early 1680s, witchcraft offered one of the few opportunities for the Bovets to express their anti-Catholic views, an opportunity the conspirator and perjurer Titus Oates also took in his *Devil’s Patriarch* of 1683, and to attack indirectly the Restoration court. Despite dedicating his book to Henry More and frequently invoking that author’s *Saducismus Triumphatus* as his model, Bovet was not using witchcraft to vindicate Anglicanism against both radical dissent and Catholicism. *Pandaemonium* was aimed exclusively against Catholicism; it made a devastating contrast between the decadent and licentious Restoration regime that replaced proper religion with idolatry and priestcraft and the implicit virtues of the period before the Fall. *Pandaemonium* fortified its hidden radical message by borrowing Milton’s title for the court of the Devil in hell, because Milton was a known opponent of the restored monarchy.

BRANDENBURG, ELECTORATE OF

The prosecution of witches in Brandenburg, one of the four lay electorates of the Holy Roman Empire, reached its high point before 1580, unusually early for any large region in central Europe. This Protestant territory, with a population in 1565 that was between 300,000 to 400,000, increasing to 570,000 by 1756, experienced no particularly severe waves of persecution, although there were several cases in which people of different ages, primarily women, were accused of practicing magic and were either tortured or killed.

Documents from local courts and written legal opinions provide the most important sources. The picture they offer, however, is not only sketchy, but also highly confusing because of the many courts that claimed jurisdiction. The courts obtained legal opinions from experts both in Brandenburg and beyond. Besides the University of Frankfurt on the Oder, the Brandenburg *Schöffentuhl* (bench of jurists) was the most important authority within the electorate to which cases were sent for assessment. For the period between 1548 and 1680, the *Schöffentuhl* files list some 269 requests from different areas of Brandenburg under the heading of “magic” (*Zauberei*).

Two regions of Brandenburg, Prignitz and Uckermark, have been studied in great detail. According to the *Schöffentuhl* files and other sources, at least 268 cases dealing with magic were tried at Prignitz, in north-western Brandenburg, between 1509 and 1686 (Enders 2000, 610–622). The distribution of cases within this region was far from uniform: Only 107 of Prignitz’s 250 villages—and all but 1 of its 12 towns—were affected. Numbers for individual cities and villages also differ significantly (Enders 2000, 613). On one Prignitz estate, Plattenburg, roughly 40 cases of black magic came before the local court between 1559 and 1686. Of these, 10 resulted in executions, the last in 1635 (Peters 1998, 73). Another 40 trials were held between 1538 and 1697 in the Uckermark, another northern district of Brandenburg (Enders 1992, 270 ff.).

Brandenburg’s first known witchcraft trial took place in 1509. Persecution intensified after 1530, peaking in the third quarter of the sixteenth century. The number of trials fell in the seventeenth century, after the electors who ruled the area became Calvinist; there was a sharp decline in Brandenburg’s witchcraft cases during the most difficult period of the Thirty Years’ War. Legal activity resumed later in the war, though with less

intensity than during the sixteenth century, and finally abated in the late seventeenth century. Only a few cases are reknown in the eighteenth century. Roughly one-third of these legal opinions were issued between 1550 and 1580, with a corresponding number of recorded cases; this suggests that in Brandenburg, the persecution of witches culminated much earlier than in either Protestant or Catholic states in southeastern or northwestern Germany. On the other hand, Brandenburg's authorities executed more witches than their colleagues in another Protestant electorate, the Palatinate.

The second Prussian king, Frederick William I, put an end to persecution with his edict of December 13, 1714. He ordered that all witchcraft trials involving torture or death be submitted to him for confirmation. There are two subsequent cases on record, from 1721 and 1728, focusing on the charges of practicing magic and entering into a pact with the Devil. The first was dismissed, the second treated as a different offense, due to the changed legal view. In 1731, a last and unsuccessful attempt was made to institute legal proceedings for practicing magic.

In Brandenburg, cases usually centered on sorcery, and most suspects were accused of killing animals. Others were charged with poisoning people, killing unborn babies, spoiling food, or raising storms. Diabolism came relatively early to Brandenburg: Records going back to 1548 already include entering into a pact with the Devil and riding to the witches' gathering on the Brocken as additional offenses. The German term for witches, *Hexen*, first appeared here in the late sixteenth century.

In the earliest known case, five women in Perleberg in Prignitz were found guilty of sorcery and burned at the stake by order of the elector Joachim I. He had imposed the death penalty for the practice of sorcery, but recommended proceeding with care, as is shown by the city ordinance of Prenzlau dated 1515. The often incomplete court documents contain no precise information on the numbers of those tortured and killed. In many cases, the accused parties proved their innocence: in Hohenlandin in the Uckermark, one woman's accuser was burned in her place in 1552.

In most cases, it was the population that demanded prosecution of the suspected witches, in fewer cases the manorial lords or town authorities. In those places where the authorities believed in magic, there were more numerous trials and executions. Often the authorities simply gave in to pressure from the populace.

BRAZIL

Until 1822, Brazil formed part of the Portuguese empire. The Portuguese Inquisition did not establish a separate court in Brazil, but instead brought all major Brazilian witchcraft cases before its Lisbon tribunal; archives in Lisbon still hold the records from Brazilian witchcraft trials during three centuries of inquisitorial activities. There were two main periods of witchcraft prosecution: the sixteenth and seventeenth centuries on the one hand and the eighteenth century on the other. Whereas witchcraft accusations of the first period closely resembled contemporary Portuguese cases, those of the eighteenth-century reflected to a greater degree Brazil's colonial situation and the tensions of its slaveholding society. Although the Portuguese language (like Spanish) distinguishes between "witchcraft" (*bruxaria*) and "sorcery" (*feiticiaria*), the two terms were used interchangeably in the trials. No quantitative data are available for the whole period of inquisitorial prosecution, but there were apparently more witchcraft trials in Brazil during the eighteenth century than in either of the previous two centuries. None of the Brazilians tried for witchcraft were executed.

In Brazil, the Inquisition exercised control through a network of commissioners (*comissários*) and laymen. When accusations of witchcraft were reported to Brazilian commissioners, the defendants in the most serious cases were shipped off to Lisbon. During the Spanish occupation of Portugal (1580–1640), two inquisitorial visitations covered northeastern Brazil in the late sixteenth and early seventeenth centuries, resulting in several witchcraft trials. The third and last inquisitorial visitation reached northern Brazil in the 1760s, more than a century later, allowing comparison of the witchcraft accusations and underlying belief systems of the two periods. Witchcraft trials of the earlier period were characterized by a strong incidence of European witchcraft beliefs taken from both popular and demonological traditions. During the eighteenth century, however, elements from both native Brazilian

and African cultures became prominent in the configuration of witchcraft. A further significant distinction separated these two periods of witchcraft persecution: Most earlier witchcraft offenses were committed by individuals, but eighteenth-century witchcraft accusations were directed against groups of people, often of African descent, who were thought to be conspiring against their colonial masters.

At the core of the witchcraft trials of the sixteenth and seventeenth centuries was the sorceress or witch, a poor woman, specialist in love magic, divination, and magical healing. Her practices included magic potions and prayers to Catholic saints—Saint Mark of Venice, Saint John, or the Virgin—or to such cosmic forces as the Sun, the Moon, the stars, or the wind. She also invoked demons in order to obtain their help and use them as familiar spirits or servants. Witches were thought to have the ability to transform themselves into such animals as ducks, cats, or butterflies. Witches confessed that they could take people to distant places and fly at night. The destination of these witches' flights often lay in metropolitan Portugal, where they returned to settle the affairs of their clients.

Eighteenth-century magical practices centered more on relationships among the different cultural groups then living in Brazil. Especially among Brazilians of Amerindian and African descent, the use of protective magical amulets, so-called *mandinga* purses, had become widespread. Collective rituals of possession were also performed by Amerindians and Africans. The latter, named *calundus*, prosecuted by the Inquisition as witches' assemblies, eventually led to the formation of Afro-Brazilian cults that continue to thrive.

BRENZ, JOHANN (1499–1570)

Born in Weil der Stadt, Brenz became a prominent Lutheran theologian and Swabian reformer who made important contributions to witchcraft theory and legal practice in southwestern Germany. While studying theology at the University of Heidelberg, Brenz came into contact with the ideas of Martin Luther and soon became a follower, participating in the Marburg Colloquy in 1529 at Luther's side. From 1522 to 1548 he was pastor in the imperial city of Schwäbisch Hall, ranking among the most respected reformers. In 1548, during the Augsburg Interim, Brenz fled to become chief pastor of the most important church in Stuttgart, the Stiftskirche, from 1553 until his death in 1570, as well as the personal advisor to Duke Christoph of Württemberg. Brenz helped organize the duchy's reformed church along solidly Lutheran lines.

At Schwäbisch Hall, a severe hailstorm in 1539 inspired Brenz to deliver a sermon on the witch question. His *Homilia de grandine* (Sermon on Hailstorms), first published at Frankfurt in 1557 in both Latin and German versions, argued vigorously against the popular belief that witches' magical powers had caused the destructive hailstorm. Brenz interpreted natural disasters, harvest failures, and personal misfortune as the work of almighty God, who used them to punish sins and test pious believers like Job. The Devil functioned only when God permitted, and he therefore deceived his followers, the witches, by leading them to believe that they could cause storms or other kinds of supernatural harm through their magic. Brenz's position was close to that of Martin Luther, who always preached against popular fears of witches. Both regarded belief in a powerful Devil and evil-doing witches as an offense against the First Commandment, a superstition incompatible with Christian belief.

Brenz held that the Devil and witches were impotent and considered harmful magic to be a fantasy, but he regarded the crime of witchcraft as a spiritual offense (heresy) that should be punished. Basing his opinion on the Hebrew Bible (Exod. 22:18) and the *Lex de maleficis et mathematicis* (Law Concerning Magicians and Astrologers) of the Justinian Code, he maintained that the fall from God (apostasy), the pact with the Devil, and the intention to cause harm warranted death.

Similar evaluations of witch beliefs from a theological and providential perspective had already been formulated in southwestern Germany around 1500 by the Constance jurist Ulrich Molitor in his *De laniis et phitonicis mulieribus* (Concerning Witches and Fortunetellers, 1489), and by the Tübingen theologian Martin Plantsch. Dubbed the *Canon Episcopi* school

after the tenth-century legal ruling (Midelfort 1972), these scholars held a critical attitude toward individual aspects of the witch concept articulated in the *Malleus Maleficarum* (The Hammer of Witches, 1486), doubting in particular the reality of magic, but they nonetheless considered any attempt to practice magical arts—whether for good or bad purposes—as devilish.

Treating the pact with the Devil as a capital offense diverged from the imperial criminal code, the Carolina Code (*Constitutio Criminalis Carolina*, 1532), because its article 109 prescribed death only for harmful magic. Strongly influenced by Brenz, Württemberg's Sixth Provincial Law Code of 1567 was the first territorial law forbidding a pact with the Devil. Brenz firmly maintained the legality of burning witches in correspondence during 1565–1566 with the radical critic Johann Weyer, whose *De praestigiis daemonum* (On the Tricks of Devils, 1563) argues that the witch offense was nonexistent, and portrays the burnings as a blood-bath of innocents.

In 1561, at the beginning of the great witch persecutions in southwestern Germany, Brenz wrote an expert opinion on witchcraft for a preacher at Waldenburg (Brecht 2000), advising the preacher to save the soul of a young woman who had concluded a pact with the Devil through spiritual council. Punishment of the act would be left to secular justice. The body would not be spared secular sanctions, but at least the soul would be saved from Satan's clutches and eternal punishment.

In a sermon in 1562, the Stuttgart preachers Matthäus Alber and Wilhelm Bidembach opposed the aggressiveness of the people and championed the orthodox Lutheran position on weather magic, holding that God alone was responsible, in the tradition championed by Brenz. Further, without questioning the punishment of witchcraft, they urged the secular authorities to proceed carefully and to conduct witchcraft trials strictly according to the *processus ordinarius* (ordinary procedure) of imperial law.

Johannes Brenz cannot be considered an opponent of the witch persecutions, because he unequivocally supported the death penalty for witchcraft. Nevertheless, his admonition that “it is better to leave ten guilty people unpunished than punish one innocent person” suggests that the Protestant position promoted a moderate conduct of trials that helped to prevent the outbreak of major panics like those that afflicted some nearby Catholic territories in southwestern Germany.

BREU, JÖRG THE ELDER (1480–1537)

One of Augsburg's leading artists in the early decades of the sixteenth century, Breu's significance for European witchcraft rests on the fact that he produced the most widely disseminated image of witchcraft in the sixteenth century, even if he largely ignored the new iconography pioneered by such contemporaries as Hans Baldung [Grien]. Breu became a master and established a modest workshop in the city in 1502, gradually gaining important private, municipal, and imperial commissions over the following decades. His artistic production ranged over various media and included much work for a number of Augsburg printers.

Breu's woodcut was an illustration of healing by sorcery, which first appeared in 1534 in a work called *Memorial der Tugend* (Memory Prompts to Virtue), written by the Franconian diplomat, author, and supporter of the Reformation, Johann von Schwarzenberg. Printed in Augsburg by Heinrich Steiner, who often used Breu as an illustrator, it contained 129 illustrations by different artists. It was intended as a popular guide to a moral life and provided numerous examples of virtue from classical history and the Scriptures. Directed to a broad audience, it took the form of a picture book with short, often closely integrated, texts, drawing on the late medieval discourse of vice and virtue, a favorite theme of moralizing humanists.

The texts accompanying Breu's woodcut were meant to clarify the image and its message. The soldier in the left foreground, decked out in armor, helmet, sword, and stirrups, is charming a wound sustained by his horse; and the words printed above him read: “My word is embellished with holiness, so that your wound will neither hurt nor give you pain” (author's translation, here and below). On the right, a woman with flying hair that becomes enmeshed with a demon (thereby suggesting that she is a witch) makes a gesture of conjuration and casts a spell to relieve the pain in a man's

head. “Truly believe, my word is a magic spell,” she says, “so do I relieve you of the pain in your head.” And in order that viewers have no doubts that such magical cures were indeed the work of witches, Breu introduced a visual cue in the background: a spewing cauldron and a hailstorm. The primary aim of Breu’s woodcut was to communicate to the viewer that all forms of magic were forbidden, including white magic and Christian words used for healing. This was the function of the text below the woodcut. The second couplet left no doubt that both female and male healers were to be condemned, even when they used Christian words: “whoever believes in magic and sorcery / he will be deprived of Go d’s grace; / Place no trust even in good words / which are put to unchristian use.” Such magic provided an opportunity for the Devil’s mischief, from which serious sin and punishment must follow.

This woodcut became the most widely disseminated representation of witchcraft in the sixteenth century. This was especially the case in southern Germany, where Heinrich Steiner used it over and over again. Breu repeated it in the 1535 and 1540 editions of *Memory Prompts to Virtue*. In 1534, he also used it (minus the accompanying verses) in the first Augsburg edition of *Schimpf und Ernst* (Humor and Seriousness), the very popular collection of moral tales written by the Strasbourg Franciscan, Johann Pauli, and repeated it in the 1535, 1536, and 1537 editions. In 1537 and 1544 he reproduced it in a third work, the German translation of Polydore Vergil’s *De rerum inventoribus* (On the Inventors of Things). By the mid-sixteenth century Breu’s woodcut must have represented one of the most common ways in which German readers imagined witchcraft. In comparison to the new iconography of witchcraft developed by Baldung and others in the early sixteenth century, Breu’s depiction of individual and nongendered healing drew on an older tradition. Yet by introducing a number of “modern” visual cues, such as the flying hair, cauldron, and hailstorm, Breu was able to include even traditional white magic within Schwarzenberg’s condemnation of all magic as witchcraft.

**BROCHMAND,
JESPER RASMUSSEN (1582–1652)**

Brochmand was the foremost representative of orthodox Lutheranism in Denmark-Norway during its so-called golden age in the early seventeenth century and a leading advocate of the reality of diabolical witchcraft. Research on Danish sorcery has emphasized the orthodoxy of Brochmand’s demonological views. Unlike other parts of Brochmand’s dogmatics, they had limited influence; he tried to instigate a renewed witch hunt, but failed.

Born in Køge, Denmark, Brochmand studied theology, philosophy, and Greek at the University of Leiden in Holland. He became professor at the University of Copenhagen in 1610, serving several terms as its president. In 1639 he was made bishop of Sjælland, becoming the foremost representative of the clergy in the Danish-dominated territory of Oldenburg. Brochmand also served as a zealous tutor to the children of several high-ranking men, including Denmark’s king and chancellor, exerting considerable influence on his pupils. Often described as overly pessimistic, he was an ardent supporter of Church discipline and the betterment of the kingdom’s schools, and nourished a growing concern for the moral and religious state of Denmark-Norway.

Brochmand was the leading figure among the seventeenth-century Danish-Norwegian clergy, the champion of orthodox Lutheranism in its struggles against the papacy and crypto-Calvinism, and he eagerly participated in refutations of the Jesuits. Brochmand’s most important work, the *Universæ theologia systemata* (Universal Theological System) published in Copenhagen 1633, consisting of forty-nine parts in two volumes, argues for a diabolical interpretation of magic and sorcery. This book produced great acclaim for its author across much of Lutheran Europe; it became the most important Lutheran publication in Denmark-Norway, remaining required reading in dogmatics at Copenhagen’s institute of theology until the late eighteenth century.

His chapter on sorcery (vol. 2, chap. 19) provided an elaborate concept of demonology. In contrast to the rather moderate demonological views of Nels Hemmingsen, Denmark’s leading witchcraft theorist, Brochmand represented a more orthodox position. According to him, three causal factors explained the existence of witchcraft: God’s forbearance (divine consent), Satanic power (or demonic power), and mankind’s penchant to evil (human malevolence). Brochmand offered detailed depictions of how witches could fly rapidly through the air to remote places where

they indulged in debauchery. Pacts with the Devil, the nocturnal flights of witches, and their perverted Sabbats were all physical realities. Brochmand strongly detested magic of any kind and warned against visiting so-called holy springs, requesting the national clergy to supervise closely all instances of idolatry among the common people. His great collection of books included the works of such renowned Catholic demonologists as Martín Del Rio, Nicolas Rémy, and Peter Binsfeld.

As county governor of Finnmark, the northernmost outpost of the Danish-Norwegian realm, Jørgen Friis, a son of the kingdom's chancellor, conducted a massive witch hunt during the 1650s—shortly after the death of his childhood tutor, Jesper Brochmand. Under Friis, Finnmark's witch hunts were characterized by the standard demonological ideas of the European mainland, also found in Brochmand's works, including belief in witches' Sabbats and pacts with the Devil, all phenomena that Brochmand's pupil confronted in a region with a long tradition of persecuting witches.

BROSSIER, MARTHE (CA. 1573–?)

Marthe Brossier was the center of a widely publicized demonic possession case in Paris in 1599. Her possession and public exorcism became a clear attempt to re-create the "Miracle of Laon" of 1566, which had provided an important propaganda victory for zealous Catholics in the early phases of the French religious and civil wars, which had just ended. But the Brossier case proved to be a fiasco, and it demonstrated the limits of

a faction's ability to use witchcraft as a political tool. The case also stirred up a noisy controversy over the authenticity and role of demonic possession.

Marthe Brossier arrived in Paris in the winter of 1599, having been diagnosed as possessed a year earlier, in her home village of Romorantin, near Blois. The Capuchins of Paris embraced her plight and began to conduct public exorcisms, to which huge crowds of novelty-seeking Parisians flocked. At this time, Paris, which had been a stronghold of the Catholic League only a few years earlier, was in an agitated state, with political tensions running high. Early in 1598, King Henry IV had issued the Edict of Nantes, legalizing Protestantism in France and establishing mechanisms for Protestants and Catholics to live side by side. Not surprisingly, there was strong opposition to this edict; the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France), though hostile to Catholic extremism, resisted the edict's passage into law until January 1599, when the king appeared in person to compel its acceptance.

Catholic priests, some of whom continued to reject Henry's claim to the throne, preached violent sermons against the edict. When Marthe Brossier was exorcised, her demon identified himself as the same Beelzebuth who had possessed Nicole Obry at Laon back in 1566. "Beelzebuth" echoed the message of these preachers, delivering strong sermons against the Protestant heresy and the Edict of Nantes.

The bishop of Paris, concerned with threats to public order, asked a group of Parisian physicians to examine Brossier to determine if she were actually possessed. One of them, Michel Marescot, wrote an account of his experience that is one of the most interesting works in this field. He and his colleagues examined Brossier, questioned her, stuck her with pins, and concluded that there was nothing supernatural about her condition. Marescot became convinced that Brossier was a fraud and that she or her exorcists were taking advantage of popular credulity. His conclusion was, "Rien du diable; plusiers choses feintes; peu de maladie" (Nothing of the Devil, much fakery, a bit of illness). Warning that exorcists should exercise much more caution before declaring people possessed by demons, Marescot stated, "Often melancholics, lunatics and bewitched people fool the exorcist, saying they are possessed by the Devil. These always have more need of the remedies of a physician than the ministering of exorcists." This could be an echo of the sentiments of the German skeptic and physician Johann Weyer.

Marescot's arguments angered those who clearly had hoped to capitalize on Brossier's exorcisms. A sharp response, written by Pierre de Bérulle, later a well-known cardinal, called Marescot "an impertinent and malicious Physician" who spread poisonous lies against the Roman Catholic Church (Pearl 1999, 50).

Bérulle defended the authenticity of Brossier's possession and the importance of exorcisms as the primary route in curing possession. At this point, Henry IV ordered the exorcisms stopped. Brossier was sent home, and traveled to Rome, where she enjoyed a brief celebrity at the papal jubilee of 1600.

Quickly translated into English, Marescot's book was soon used as evidence in English arguments over the handling of demoniacs and witches. In a French work published in 1621, Claude Pithoys mentioned the Brossier case as an example of the prevalence of fraudulent possession and the dangers of being fooled through too easy belief in their claims.

BRUEGHEL,

PIETER THE ELDER (CA.1525–1569)

A Flemish painter and printmaker, Brueghel is best known for his paintings and engravings representing the activities of Flemish peasants. Brueghel dealt specifically with the theme of witchcraft only in two of his late engravings. But in the late 1550s, Brueghel also created a series of engravings depicting the Seven Deadly Sins; these engravings do not deal specifically with witchcraft, but they offer superb representations of contemporary beliefs about evil and the demonic.

Brueghel's favorite genre was so commonplace in his work that it even earned him the appellation "peasant Brueghel," and some nineteenth-century writers even thought he was a peasant himself. In fact, Brueghel belonged to the upper-class society of Antwerp; he was a wealthy man with powerful friends in both the government of the Southern Netherlands and the Catholic Church. Just as Brueghel was not a peasant, his output also contained a number of themes besides peasant genres. He is remembered for landscapes and paintings of moral allegories, such as *The Flemish Proverbs*, *The Blind Leading the Blind*, and *The Beggars*, a scene that

shows beggars with mental and physical disabilities who are being ignored by a rich man. Brueghel also produced allegorical prints such as *The Big Fish Eat the Little Fish*.

Brueghel's stylistic debt to Hieronymus Bosch is clearly shown in his themes in those of his works containing occult subjects such as witchcraft and demonology. In his series on the Seven Deadly Sins, he imitated the painted table on this theme Bosch had created for Philip II of Spain. But Brueghel went much further with his engravings, showing a whole range of Bosch-like zoomorphic and anthropomorphic demons assisting humankind in committing the sins. The sins are depicted in landscape scenes containing structures and rock formations obviously derived from those of Bosch. Brueghel's drawings, from which these prints were made, exist today in several collections.

Brueghel's two engravings dealing specifically with the theme of witchcraft are *St. James and the Magician Hermogenes* and *The Fall of Hermogenes*. Both prints were engraved after Brueghel drawings in 1565 by the Antwerp printmakers, Pierre Van der Heyden and Jerome Cock. *St. James and the Magician Hermogenes* contains a scene of thirteen witches—the traditional number of a coven, if one counts Hermogenes among the witches. Brueghel showed witches performing typical activities, such as flying on broomsticks, preparing brews, causing storms, using a Hand of Glory (the pickled hand of a corpse, believed to have magical powers), and working within magical circles. While the title of the engraving is taken from the apocryphal life of St. James the Apostle, the visualization is that of the world of sixteenth-century witch beliefs. Brueghel even included witches' familiars in the forms of rats, toads, and cats. The companion print, *The Fall of Hermogenes*, showed the magician's demon cohorts turning against him at the behest of St. James. Hermogenes is caught up in a virtual whirlwind of demons. Included in that whirlwind is a broom-riding witch. These two prints make it quite clear that Brueghel knew well the writings of the demonologists of his day, as well as the folk beliefs about witchcraft.

Brueghel's occult themes had a considerable impact on later Flemish and Dutch artists. Among those who were influenced by his work were David Teniers the Younger, Jacques de Gheyn II, and Brueghel's two sons, Jan Brueghel and Pieter Brueghel the Younger. Pieter the Younger depicted so many occult motifs that he acquired the nickname of "the Hell Brueghel." Each of these artists used motifs of witchcraft or the demonic that were clearly derived from Pieter Brueghel the Elder. In the case of David Teniers, for example, witches, demons, and the Seven Deadly Sins became motifs that Teniers used throughout his oeuvre.

BUIRMANN, FRANZ (CA. 1590–CA. 1667)

Commonly known as “the Witch-Seeker of Cologne,” court assessor at Bonn in the electorate of Cologne, Buirmann was responsible for the death of at least 300 people. He was known to exceed his authority in many cases. This tendency caused him reprimands by the government of the electorate; but due to his effective methods of witch persecution, he was repeatedly commissioned to investigate witches. Buirmann’s activity as a witch-hunting specialist began in 1629; his last such efforts date from 1647, although he still worked as assessor at the electoral High Court of Bonn for several years.

Buirmann was born around 1590 at Euskirchen in the duchy of Juelich. He registered at the University of Cologne in 1608 at the age of approximately eighteen years. Buirmann studied law, eventually obtaining doctorates in both secular and ecclesiastical law. On January 4, 1628, Buirmann was confirmed as assessor at the High Court of Justice of Bonn. In 1635, he married Katharina Walravens, the daughter of a wealthy Bonn family. His contemporary Herman Löher, who later published a book attacking witchcraft persecutions in the Rhineland, claimed that Buirmann, gaunt and ugly, could never have succeeded in courting a girl and therefore had to marry the daughter of a poor saltpetre digger. An American author (Gibbons 1931) used Buirmann’s alleged unattractiveness to explain his reckless actions against women, but Löher’s allegations were based only on rumor. Buirmann and his wife had at least two sons, Johannes, born in 1635, and Johann Adolph, born in 1636; one of them died in 1644. In 1652, Buirmann fathered an illegitimate son with a servant. The last evidence we have of Buirmann is that he sold a house in Bonn in 1667; the date of his death remains unknown.

As it is possible to trace the first witchcraft trials in Bonn back to 1628, it is reasonable to conclude that Buirmann was involved in witch cases from the beginning of his career as a court assessor in 1629. Between 1628 and 1630 these witch persecutions resulted in at least 50 death sentences. By 1630, Buirmann was considered as a specialist in witch persecution. Löher

described the methods Buirmann used; as assessor of the Court of Rheinbach, a small town near Bonn, Löher had watched him investigate accused witches in 1631 and 1636. Buirmann made extensive use of torture to force a confession from a suspect. When Christina Boeffgens, the widow of a local merchant, died under torture in Rheinbach, Buirmann convinced the assessors that the Devil himself had broken the suspect’s neck. Apart from Rheinbach, we have more reports about victims dying under torture in other places where Buirmann “worked,” always mentioning a broken neck caused by the Devil. Buirmann intimidated his colleagues by threatening to accuse them of sorcery themselves if they refused to cooperate. Several times he required warrants for somebody’s arrest without telling the assessors whom he wanted imprisoned. In this way, the oldest assessor of the Court of Rheinbach, Herbert Lapp, unknowingly sentenced himself to arrest and torture. He was burned together with Anna Kemmerling, the wife of the assessor Gottart Peller. As Löher tells us, Buirmann had tried in vain to seduce her beautiful sister. However, the story that Buirmann had this sister put under arrest and raped by the hangman’s assistant is a misreading of a passage in Löher’s book. Nevertheless, his reckless behavior and disregard of imperial law eventually led Buirmann into conflict with the electoral government. He was reprimanded and restricted to his duty as an assessor in Bonn for about five years.

In 1636, Buirmann reappeared as a witch commissioner at several places in the electorate of Cologne and even beyond. From 1636 to 1638, he was responsible for the death of at least 50 people in Siegburg, about 10 in Heimerzheim, and another 10 in the so-called Drachenfelser Laendchen (Drachenfelser Country). He murdered 135 people in Rheinbach and nearby villages. Together with the victims of Buirmann’s witch hunts in the preceding years, the number of people burned as witches or sorcerers under his authority comes to more than 300.

BULLINGER, HEINRICH (1504–1575)

Apart from Johann Brenz, Heinrich Bullinger was the only prominent German Protestant who wrote a tract on magic and witchcraft, *Wider die Schwarzen Kuenst* (Against the Black Arts), first published after his death in the *Theatrum de Veneficis* (Theater of Poisoners [witches]) of 1586. As the successor to Ulrich Zwingli in Zurich and a contemporary of John Calvin, Bullinger was a leading representative of sixteenth-century Reformed Protestantism. He not only exercised considerable influence on its church policy, partly through his extensive correspondence (12,000 letters have been preserved), but also played an important role in shaping and communicating Reformed religious life and thought.

For two reasons, Bullinger's very brief tract is remarkably interesting. First, he discussed only *maleficium* (harmful magic) and diabolical pacts, without mentioning witches flying, holding Sabbats, or having intercourse with the Devil. Bullinger clearly belonged to the *Canon Episcopi* tradition that described some magical beliefs as superstitious, because he described magic and witchcraft as more illusion than reality. It is thus particularly surprising that Bullinger seemed to favor severe punishment for witches at the end of his tract. However, his statements are difficult to interpret. He merely quoted the relevant verses (e.g., Exod. 22:18) of the Hebrew Bible and referred to other legal authorities such as the imperial law. He let the reader decide for himself, but it is unclear whether or not this was merely a rhetorical device that allowed him to condone the execution of witches without doing so explicitly.

Bullinger's catechistic writings underline how difficult it is to interpret his statements on witchcraft and magic. In all his theological statements, he endeavored to stay as close to Scripture as possible, while using a broad knowledge of theological authorities to support his arguments. In the thirty-ninth sermon of his *Hausbuch* (House book), Bullinger addressed the problem of demonology. He implicitly adopted the medieval idea of demons as spirit-like beings, decidedly rejected anthropologizing Epicurean notions that would explain the Devil merely in terms of evil people, and repeatedly emphasized the difficulties of discussing demons and the Devil systematically on the basis of Biblical evidence. Interestingly, his sermon ended with a brief remark that, according to biblical presentations, witchcraft could be harmful only to unbelievers, while believing Christians remained immune. In this context, he stressed the necessity of divine permission (*permissio dei*) in all workings of the Devil. In sending illness and adversities, he wrote, God used the Devil as a teaching aid, not as an independent force. Thus, Bullinger concluded that Christians need have no fear of the Devil. Such a clear position was unusual in the sixteenth century.

Bullinger also approached the problem of magic in his sermons on the First Commandment and in his *Summa Christenlicher Religion* (Sum of the Christian Religion, 1556), where he mentioned *maleficium* and the pact with the Devil. He considered such Catholic practices as the worship of saints and idolizing elements of creation as violations of the First Commandment, paying more attention to these than to witchcraft, and added that any kind of superstition, including the worship of saints, was equal to a pact with the Devil. A pact with the Devil did not justify prosecution.

Bullinger's demonology and attitude toward witchcraft was strongly marked by a Calvinistic "disenchantment" of the world. He constructed no theory of demonology, and he did not see Christianity as endangered by a "witchcraft sect." His statement that the Devil and witchcraft could only harm unbelievers reduced the problem from a universal, apocalyptic battle between good and evil to a personal matter. On the other hand, his tract made it clear that even theologians who devoted little thought to witchcraft and magic could still sound quite severe in their attitude toward the punishment of witches.

BURCHARD OF WORMS (CA. 965–1025)

Cleric of Mainz and later bishop of Worms (1000–1025), Burchard is best known as the author of the *Decretorum libri XX*, or *Decretum* (The Twenty Books of Decisions), a systematic (rather than chronological) collection of 1,700 canons compiled from earlier collections and the writings of the Church Fathers, which he completed in 1015. It provided one of the most successful and influential collections of canon law during the eleventh century and became a major source for later ideas about sorcery and magic.

An active and energetic churchman, Burchard reorganized the administration of the city of Worms. Widely experienced in ecclesiastical and imperial political life, he was appointed to his see by Emperor Otto III and knew the later emperors Henry II and Conrad II well. Burchard participated actively in contemporary ecclesiastical councils. He was dedicated to Church reform, especially in matters of the nature of the episcopal office, simony (the purchase of ecclesiastical office), and the relations between spiritual and temporal authorities. His canonical collection reflects both his experience and his ideals. Although Burchard's collection of canon law was authoritative only in his own diocese of Worms, it circulated widely elsewhere.

Book XIX of Burchard's *Decretum* is called the *Corrector*, or the *Physician*. It was a penitential, both a guide to confessors for assessing the sins of penitents and for imposing penance, as well as a list of tariff-based penitential practices. Penitentials had been very widely used throughout western Europe from the late sixth to the late eleventh century, before the emergence of more sophisticated penitential handbooks during the late twelfth century. Burchard's was the last, and one of the greatest of these, drawing on earlier Celtic and Anglo-Saxon penitentials as well as more recent collections, especially those of Halitgar of Cambrai (fl. 830, author of an important Carolingian penitential collection) and Regino of Prüm (fl. 906, author of an important collection of texts pertaining to ecclesiastical discipline). From Regino, Burchard took both the long and the short versions of the *Canon Episcopi* (a text that had first appeared in Regino's collection), which subsequently became one of the two or three key texts regarding magic and witchcraft in canon law. Written in the form of questions posed by the confessor to the penitent, it often circulated separately from the rest of the *Decretum*.

Book XIX, chapter 5, numbers 59–70, 90–104, and 149–181 dealt with magic and superstition. Numbers 70 and 90 was the short and long versions of the *Canon Episcopi* in the *Corrector* (both versions also appeared in the *Decretum*, the short in I:94 and the longer in X:1). The confessor's questions included the subjects of the practice of divination, therapeutic magic, weather magic, erotic magic, riding with other women at night with the goddess Diana, shape-shifting, preparing food for

ghostly visitors at night, the mutilation of the corpses of unbaptized children, and preventing the wakening of the unquiet dead. Many of the strictures listed by Burchard derived from much older sources, and it is not clear whether or not they reflected practices of his own day or were included simply for the sake of completeness. Others, however, did not occur in earlier collections and have been thought to reflect actual beliefs and practices of the early eleventh century. Comprehensively, all the relevant canons offered an exhaustive panorama of the concerns of a highly placed, pastorally minded, and extremely learned churchman in the early eleventh century. Ivo of Chartres adapted Burchard's collection a century later, and Gratian (later considered the founder of the science of canon law) used it extensively in the mid-twelfth century in his great collection of canon law, also popularly called the *Decretum*.

BURGUNDY, DUCHY OF

Apart from an isolated instance around 1470, when Burgundian ecclesiastical and secular authorities cooperated to burn three people for attending Sabbats, we have no evidence of fully developed witchcraft trials in this region until 1571 (Mandrou 1968, 155–156),

soon after this crime had reappeared in other French provinces from Languedoc to Normandy. All our evidence about the subsequent repression of witchcraft in Burgundy comes from the records of the *Parlement* of Dijon, the appellate court created in 1537 to cover the duchy of Burgundy. The picture of witch hunting that emerges from its records fits chronologically with general patterns in western Europe, but the severity—or rather lack of severity—shown by this relatively small French appellate court seems quite atypical. Even though it began systematically searching suspects for the Devil's mark in the early 1580s, it seems to have been even more lenient toward accused witches than its great neighbor, the *Parlement* of Paris, whose district surrounded it on three sides.

Apart from a gap between 1593 and 1611, we possess the Dijon *parlement's* rulings in criminal cases after 1581. Witchcraft generally occupied a very modest place, usually around 2 or 3 defendants per year, although witchcraft trials occurred almost every year until the mid-seventeenth century. Seigneurial judges had begun imposing death sentences for witchcraft by 1580, but the Burgundian *parlement* upheld only a few of them, starting in 1583. Throughout the entire period it was involved in judging witches, only once did the appellate court at Dijon pronounce more than 2 death sentences for this crime in a year. Overall, during fifty-one recorded years between 1582 and 1650, it sentenced only 6 men and 11 women to death for witchcraft, although it judged well over 200 who had been indicted for this crime (prorating the missing seventeen years gives an estimate of about two dozen legal executions approved by this court). In 1633, it examined 24 prisoners from Nantua, in the French Alps; all had been sentenced to death by a local judge, but the *parlement* upheld only 3 executions, including 1 carried out in effigy after a prisoner escaped. Two years later it took automatic control over every Burgundian witchcraft trial. The very next year, 1636, throngs of accused witches crowded the jail; although an old woman died in prison, none of these 36 prisoners were executed.

It is against this background that we must see this *parlement's* reaction when the last major witch panic in France struck Burgundy and the Ardennes in 1644 before petering out. It had been provoked by a severe hailstorm and late frost that ruined both the wine and grain harvests. This episode has been seen as a relatively early instance where a “junior” *parlement* imitated the example of Paris (Mandrou 1968, 385–390). It is, however, better understood in the context of the great Languedoc panic of 1643–1645; like Languedoc (and Essex in Puritan England at exactly this moment) Burgundy was afflicted by a local witch finder who spread this panic by identifying numerous suspects by looking carefully into the pupils of their eyes. When the Burgundian *parlement* finally got its hands on him later in 1644, it sent him to

the galleys. Although this *parlement* upheld the first 2 death sentences for witchcraft appealed to it in 1644, afterwards it approved only 1 of 13 other death sentences for witchcraft among over 100 imprisoned witches whom it judged between 1644 and 1646.

The court's monopoly of jurisdiction combined with its leniency toward accused witches caused considerable popular discontent. Burgundian villagers were accustomed to dunking accused witches to see if they floated. The Dijon *parlement* began investigating such illegal water tests in 1640, but could not prevent them from multiplying dramatically during the panic of June 1644. Worse still, the *parlement* uncovered at least nine instances during the mid-1640s where Burgundian vigilantes had lynched suspected witches, sometimes several at a time, usually with the complicity of village officials. Nearly all the ringleaders escaped. When the worst episode, at the village of Hully, was judged two years afterwards, only two defendants had actually been arrested: The *parlement* cleared a farmer accused of participating in the lynching of his wife, but sentenced another man to the galleys for life for his share in a collectively lynching of no fewer than 13 people. Twenty other defendants, including the village prosecutor and his son, escaped the *parlement's* clutches; half of them were sentenced in absentia to be hanged or broken on the wheel. Such episodes reveal both the depths of popular exasperation over the enlightened and skeptical attitudes of Burgundy's appellate judges and the looseness of their control over this province during a major witch panic.

A final defining episode in the Burgundian *parlement's* treatment of witchcraft came in the early 1660s with the well-known events at Auxonne. Outbreaks of demonic possession, apparently an outgrowth of the last major witch hunts after 1658 in neighboring Franche-Comté, afflicted the Ursuline nuns at Auxonne for many years (Mandrou 1968, 406–422). By 1660, exorcisms had produced the usual crop of denunciations against the witches who had caused their possession. The *parlement* at Dijon promptly reduced 4 death sentences based on evidence from exorcisms, banishing 2 women and freeing 2 others—although the 2 women whom it released were apparently lynched. A man, previously sentenced to death for witchcraft in 1645, was arrested next, but the *parlement* eventually released him in 1662. The possessed Ursulines and their exorcists meanwhile concentrated their accusations against one of the sisters, Barbe Buvée. Her arrest and trial became a cause célèbre, expanding into an elaborate power game that eventually pitted the intendant (royal agent) of Burgundy against the Dijon *parlement*, with both sides appealing to patrons at court. Buvée's case escalated up to the royal council, who finally handed it to the *Parlement* of Paris in 1664—which quietly buried it.

BURNING TIMES

The Neo-Pagan community employs the term *Burning Times* to refer to the period in which those accused of witchcraft were executed. The term implies that all witches were executed by burning, but in the British Isles witchcraft to which it is supposed to refer, this was not true; only in Scotland were the bodies of witches burned, and then only after strangulation, and in England and Wales all witches punished with death were hanged. This fact alone exposes the falsity of the term's claims to historical accuracy.

The term *Burning Times* was first coined by the British pagan and founder of Wicca, Gerald Gardner, who claimed that it was a secret term for the witchcraft persecutions used in the British Isles by traditional pagans (i.e., witches) themselves. Gardner, who founded the first Neo-Pagan witchcraft coven in Britain in 1947, claimed the term came from a text he called *The Book of Shadows*, intended to serve as a ritual handbook for witches in his group, a volume that drew heavily on Margaret Murray's account of the witchcraft trials in early modern Europe. Gardner may or may not have claimed the book was ancient, but he bound it in antique leather and seems to have deliberately soiled the pages to give an appearance of age. The term *Burning Times* was part of a preface Gardner added, purporting to be written by a witch in the time of persecution and painting a colorful and entirely fictional picture of her fear and concern for others of her religion. Some of Gardner's followers, however, mistook *The Book of Shadows* for an authentic document, and it has been used widely in the writings of contemporary witches such as Starhawk. A fantasy narrative grew up around the notion of the Burning Times that described witches as gentle Neo-Pagan herbalists and midwives, hunted relentlessly by a power-mad and usually Roman Catholic clergy. This is still the commonest narrative of witchcraft in children's books and historical fiction; hundreds of examples could be cited. But there is no evidence that cunning women or accused witches

practiced herbal medicine more than other women in Europe; midwives were more often on the side of the interrogators than their victims, and the Inquisition and clergy were, as a rule, milder than the secular authorities when handling witchcraft prosecution. There is no evidence that early modern witches practiced a religion anything like that of contemporary witches; those arraigned as witches were Christians, not Neo-Pagans.

The use of the term *Burning Times* has had the odious effect of encouraging comparisons between the witchcraft prosecutions and the Holocaust (since *holocaust* means burnt offering), thus devaluing the latter. Such comparisons are without merit, but have been made with depressing frequency by some feminist historians, notably Mary Daly. These comparisons are misleading, primarily because there was never any attempt to murder all early modern women as there was by the Nazis to murder all Jews; indeed, except in rare instances, women were not singled out for prosecution during the period of the witch hunts. Moreover, the events were very different both in nature and in size. Historians now estimate that approximately 35,000 to 50,000 men and women died in the witchcraft prosecutions (there was no massive persecution), while upwards of 6 million people died in the Shoah. Attempts to compare or, worse, conflate the two events deny to each its true power to move and its right to our mourning and regret, as do fictionalizations that falsify the real and dreadful historical experiences of those who suffered. These fictions should not be shrugged off or excused.

BURR, GEORGE LINCOLN (1857–1938)

Burr was one of the greatest early American historians of the European witchcraft prosecutions. Born in Oramel, New York, locally educated, and trained as a printer, Burr entered the new Cornell University in 1877 and graduated in 1881. He soon became both the private secretary and librarian of Cornell's president, Andrew Dickson White, and an instructor and examiner in modern history at the university.

White sent Burr to study in Europe, at Leipzig, Paris, and Zurich, from 1884 to 1886, as well to acquire books for White's library, which Burr later cataloged in

three volumes in 1889, 1894, and 1897. During his stay, Burr acquired the manuscript of the trial of Dietrich Flade for White's library; in 1886 he added the manuscript of Cornelius Loos's recantation. Burr spent another year in Europe in 1887–1888. Although he never took a doctorate (his research materials were stolen while in transit in Europe), Burr became a professor and held the chair in history at Cornell from 1892 to 1922. He was a popular teacher at Cornell until his retirement. His scholarly work was widely acknowledged, and Burr was elected president of the American Historical Association in 1916. He also served as White's assistant on the Venezuela–Guyana Boundary Commission in 1897. He wrote the chapter on the Carolingian revolution and Frankish intervention in eighth-century Italy for the *Cambridge Medieval History*, volume two (1913).

Burr engaged in an important scholarly controversy with George Lyman Kittridge of Harvard about the historical nature of witchcraft and magic, illustrated in Burr's essays "The Literature of Witchcraft" (1889) and "New England's Place in the History of Witchcraft" (1911). The former provided the most comprehensive study in English of the sources for the history of witchcraft in Europe and North America. Burr also edited *Narratives of the Witchcraft Cases, 1648–1706*, in 1914.

Burr's most important scholarship was devoted to the sixteenth- and seventeenth-century witchcraft prosecutions, chiefly those of Dietrich Flade and Cornelius Loos. Flade was the highest-ranking secular official ever executed for witchcraft; a few years later, Loos wrote a skeptical treatise *De vera et falsa magia* (On True and False Magic) and suffered terribly for his defense of Flade and his criticism of Flade's persecutors.

Besides his vast acquisitions and cataloging enterprise of the White Library, Burr's scholarship took the form of essays. His "On the Loos Manuscript" (1886) told the story of his discovery of the manuscript. One of Burr's greatest skills was his ability to track down manuscripts and rare books in both European libraries and bookstores; he offered some accounts of his successes in an essay on "A Witch-Hunter in the Bookshops" (1902). Burr knew the scribal hands of northern Europe in the sixteenth century better than anyone else in North America and better than most scholars in Europe.

Burr's most important and longest essay was a revision of his unwritten doctoral dissertation, "The Fate of Dietrich Flade" (1891), a vivid, scholarly, and entirely engaging account of the best-known witchcraft trial of the sixteenth century. The trial elicited contemporary opinions from Martín Del Rio and Peter Binsfeld about Flade, a jurist and high official in the government of the city of Trier and former rector of its university. Part of the case's importance derived from the judges' use of the testimony of persons convicted of

witchcraft, and part from the extraordinarily high social status of Flade.

Burr became a correspondent and friend of the other great nineteenth-century American historian of witchcraft, Henry Charles Lea. He also reviewed Lea's *History of the Inquisition of Spain* (1906–1908). From Lea's death in 1909 until 1928, Burr worked at editing Lea's reading notes, turning the project over to Arthur C. Howland in 1928; he wrote the introduction to Howland's edition of Lea's posthumously published *Materials Toward a History of Witchcraft* (1939), which appeared a year after Burr's death. Burr's long teaching and scholarly career at Cornell inspired his students and associates to publish a volume of essays in his honor in 1931.

**BURTON, BOY OF
(THOMAS DARLING, CA. 1584–?)**

The bewitchment in 1596 of Thomas Darling, from Burton-in-Trent (Derbyshire), a notable instance of demonic possession among British Protestants, was described in what is now an extremely rare contemporary pamphlet.

In February of that year, the "Boy of Burton," aged thirteen, was taken to hunt hares in Winsell Wood by

his uncle, Robert Toone. They became separated, and after Thomas was found again and had returned home, he became ill, vomiting, showing signs of suffering from ague, and hallucinating, in particular seeing green angels and a green cat. The symptoms then developed into the type of fits and contortions that were so often attributed to witchcraft or demonic possession at that time; one of those observing his sufferings noticed that the boy gained relief when he stopped praying or reading the Bible. He suggested that witchcraft might be the problem, upon which the boy told how, when lost in Winsell Wood, he had met an old woman, whom he had offended by breaking wind in her presence and who had therefore cursed him.

Suspicion focused rapidly on Alice Gooderidge, aged about sixty. When she was called into the room where Thomas Darling lay, he went into violent fits, and tried to gain relief by scratching her, an activity with which she complied. A local justice of the peace was informed about the suspicions of witchcraft against both Gooderidge and her mother, Elizabeth Wright. Sir Edmund Anderson, one of the few English assize judges to declare himself in favor of the active prosecution of witches, eventually tried Gooderidge for witchcraft in the summer of 1597. Gooderidge was convicted, but probably sentenced to the lesser penalty of a year's imprisonment and four appearances on the pillory. We know that she died in jail.

Although relatively little known, the Thomas Darling case is of considerable interest in demonstrating how one of the standard models of English witchcraft was developing. It seems very probable that Darling's family moved in advanced Protestant circles. The pamphlet describing the case was couched in terms of a battle between God and the Devil, with young Darling's body serving as a battleground between the forces of good and evil. Young Darling's sufferings fit within the context of several cases in which an adolescent or young adult was supposedly the victim of witch-

craft. As was becoming usual in such cases, a large crowd of observers, among whom ministers were prominent, including a Mr. Hildersham from nearby Ashby-de-la-Zouch, witnessed the victim's torments. The pamphlet made it clear that they were hostile to the popish concept of exorcism, but nevertheless came to pray around him. John Darrell, the great Puritan expert on bewitchment and possession, also came to observe Darling. The "Boy of Burton" had obviously internalized a fair measure of religious teaching, and could interpret his sufferings in terms of bewitchment and of the work of the Devil. The incident demonstrates another peculiarity of English witchcraft in this period, namely the conflation of bewitchment and demonic possession. Darling told those around him when he was being attacked by the Devil, had dialogues with him, and, at one point, gave an account of being taken to see hell. Among at least some circles in England, witchcraft was clearly being seen as a more complex matter than mere *maleficium* (harmful magic).

Another interesting feature of this case was that about a year and a half elapsed between Darling's first becoming ill, with its consequent suspicions that he was bewitched, and the actual trial of his supposed tormentor. Over that long period, Alice Gooderidge, taken into custody on various occasions, was brought to confront the boy, who usually went into severe fits on seeing her. She was subjected to harsh psychological pressure, and on one occasion to something very like torture when she was forced to wear shoes that had been heated over a fire.

C

CAESARIUS OF ARLES (470/71–543)

Saint, bishop, administrator, preacher, and theologian, Caesarius contributed substantially to disseminating the views of such major Christian Church Fathers as Augustine and Ambrose on superstition and magic.

Born at Châlons in Burgundy (France) around 470, Caesarius served as bishop of Arles from 503 to 542. He earned a reputation as a popular preacher, whose brief, clear, and simple sermons abounded in images and allusions drawn from daily life in sixth-century southern Gaul. In his sermons, Caesarius discussed issues that included the principles of Christian morality, divine sanctions, hell and purgatory, classes of sinners, and the principal vices of his day (adultery, concubinage, drunkenness, neglect of Mass, love of landed wealth). Caesarius insistently and repeatedly deplored the survival of pagan and superstitious elements in the religious practices of his flock. His struggle against the survival of numerous forms of paganism that had only recently been overcome was difficult because, Caesarius asserted, the Devil, a fallen archangel, inspired the ignorance of the people.

Manifestations of the survival of pagan and superstitious cults included sacrifices made regularly at sacred trees and wells (possibly without believing in any real presence of a god or goddess at such locations); consultations with sorcerers and fortunetellers; singing and dancing in front of churches; making the sign of the cross before stealing or committing adultery; and belief in the powers of witches (*malefici*).

In one of his sermons (number XIII), Caesarius condemned a popular belief connected with the moon, whose magical character was already familiar in ancient cultures. The bishop complained that many of his so-called Christians wished to prevent the eclipse of the moon, which they considered a possible source of *maleficium* (harmful magic), by crying and shouting. Caesarius claimed that any such effort to change the course of nature decreed by God amounted to blasphemy.

Another element of pagan and superstitious belief was to be found in the special respect shown to the day dedicated to the sky god Jupiter (Thursday). Inspired by the Devil, says Caesarius, several men and women

did not work on that day, because they did not want to disturb its solemnity. The bishop considered this honor paid to Jupiter by ignorant and superstitious people to be blasphemous, because they did not respect the day of the Lord. Only severe penitence could bring them back to the Christian community.

Caesarius's sermons against magic and surviving pagan practices circulated widely, either because of their false attribution to St. Augustine, or because they were quoted in the work of later writers, including those of the popular genre of saints' lives. Caesarius was a master in depicting the vigorous Roman life of Southern Gaul, where Greek was still spoken in Arles and Asian merchants still frequented the delta of the Rhone. Thus his sermons offer a valuable source for the study of ethnology as well as the history of canon law, dogma, Church discipline, and liturgy.

CAGNAZZO, GIOVANNI OF TAGGIA (OR TABIA) (CA. 1450–CA. 1520)

A Dominican theologian, Cagnazzo was active as inquisitor in northern Italy in the late fifteenth and early sixteenth centuries, notable for his zealous prosecution of witches. His widely read theological work, the *Summa summarum quae Tabiena dicitur* (The Summa of Summas, Known as the Summa of [Giovanni of] Tabia, 1517) dealt, among other issues, with the modern sect of witches and its horrendous crimes, and contributed to the escalating anxiety over diabolic witchcraft in northern Italy in the first three decades of the sixteenth century. His preoccupation with witches and their misdeeds, and his concurrent fascination with the supernatural experiences of living saints, were shared by other known members of the Dominican Congregation of Lombardy, to which he belonged.

Many biographical details about Cagnazzo's life remain unknown. Probably born around the mid-fifteenth century, he professed as a Dominican friar in Albegna in 1470 and arrived in Bologna around 1477. Having completed his theological studies, Cagnazzo taught in the Dominican *Studium Generale* (house of studies) in Bologna and was appointed dean of the Faculty of Theology of the University of Bologna in 1495, 1497, and 1508. He was inquisitor of Bologna for over twenty years (1494–1513) and also served as confessor to Duke Ercole I of Ferrara. At some point after 1513 he was summoned to Rome, where he may have served as inquisitor. He died in Bologna in the early 1520s.

In 1498, Cagnazzo was involved in the witchcraft trial of Gentile Cimitri (alias Cimera), who was eventually convicted and burned at the stake. Bolognese chroniclers and Cagnazzo's fellow inquisitor and demonologist Silvestro Prierias (Silvestro Mazzolini of Prierio) noted Cagnazzo's role in this trial. Cagnazzo was also present at Ferrara in 1500, and signed the certification attesting to the authenticity of the stigmata exhibited by Lucia Brocadelli of Narni. Heinrich Kramer, the Dominican inquisitor and author of the notorious *Malleus Maleficarum* (The Hammer of Witches, 1486), requested this certification. Cagnazzo may have become acquainted with Kramer, who visited Italy around 1500 and was in touch with Ercole d'Este regarding Lucia's mystical experiences.

Cagnazzo's only surviving work, the *Summa summarum*, was published at least four times from 1517 until 1602. Some of its alphabetically ordered entries dealt with witchcraft. The entries "Diana" and "Sors" (casting lots) expressed Cagnazzo's conviction that witches belonged to an organized heretical sect led by the Devil. In both entries Cagnazzo dismissed the contentions, based on the *Canon Episcopi*, that the witches' confessions of their fearful activities were only illusions, though he admitted that some might be illusory. He argued that the modern witches prosecuted by inquisitors in Lombardy and

elsewhere had nothing to do with the ancient cult of Diana, to which the *Canon Episcopi* referred. Relying on the *Malleus Maleficarum*, which he cited explicitly, Cagnazzo asserted that the sect of witches was a recent phenomenon and that inquisitors often heard testimonies of its existence and terrible crimes. He repeated Kramer's accounts of the bodily transportation of witches to places far removed from their homes in order to attend nocturnal meetings at which they worshipped the Devil, performed obscene, blasphemous rituals, and cause sickness or death in other humans through *maleficiū* (harmful magic). According to Cagnazzo, the severe danger that witches posed to Christian society justified inquisitors' attempts to prosecute and punish them harshly.

Cagnazzo's *Summa*, largely ignored by modern scholars, was among the first works published in northern Italy that relied on the *Malleus Maleficarum* to justify the persecution of witches. His discussion of the diabolic sect was, however, no mere repetition of the German tract. Whereas Kramer argued that witchcraft was essentially a female crime, Cagnazzo described the modern witches' sect as including both men and women. This characterization might reflect the high percentage of men among those accused in the witchcraft trials conducted in Lombardy and Emilia in the first decades of the sixteenth century. Cagnazzo also recounted testimonies given in those trials concerning the witches' assemblies, which he called their *ludus* (game), a term found in the writings of contemporary northern-Italian demonologists such as Bernardo Rategno of Como, Bartolomeo della Spina, and Gianfrancesco Pico della Mirandola.

CALVIN, JOHN (1509–1564)

The famous Genevan reformer remains one of the most influential figures of Reformed Protestantism, both in western Europe (France, the Netherlands, Scotland,

Switzerland) and in North America. Part of the second generation of reformers after Luther and Zwingli, this trained lawyer consolidated Reformed theology into a more comprehensive and systematic form in his *Institutes of the Christian Religion* (1559). In addition, Calvin compiled almost complete expositions of nearly every book of Scripture.

Calvin's prominence in Reformed dogmatics and biblical exegesis conveys a sense of the significance of witchcraft and its prosecution, but the results are notably meager. Neither his *Institutio* nor Calvin's catechisms contained anything closely related to the issue of witchcraft. His biblical exegesis painted a different picture, by relating such texts as Exod. 22:18 and Deut. 18:10 ff. to contemporary forms of magic. Calvin asserted that witches did exist and, commenting on Deut. 18, that men also practiced sorcery. He did not, however, use these texts to develop any extensive doctrine of witchcraft. Although he believed that witches can in fact perform harmful magic, he concentrated his attention on forms of false worship related to magical practices. He attempted to classify all the practices listed in Deut. 18 as divination, that is, harmless magic, thereby reducing witchcraft to a mere illusion that the Devil employed to mislead and punish unbelievers. Calvin's approach to witchcraft diverged from his generally Augustinian views by rejecting any notion of demons as physically superior to humans. Along with some other Reformed theologians like Heinrich Bullinger, Calvin marked a way to "unbewitch" the world through a radical understanding of the *permissio dei* (permission of God): the Devil had no power of his own, but operated under the will and sovereignty of God. Calvin completely ignored such elements of the contemporary doctrine of witchcraft as the diabolical pact, sexual intercourse with devils, flying, and Sabbats.

For the Calvinist tradition, it is important that, in accordance with his strong theocratic claims on the lives of believers and his desire to create a "Godly republic," the Geneva reformer considered the death penalty to be appropriate for practitioners of magic, powerless though it may be. He supported this conviction with citations of biblical verses rather than legal traditions. Within the framework of sixteenth-century thought, Calvin's position on witchcraft and magic concentrated on the aspect of apostasy and its punishment, including physical punishment. Calvin's demonology suggested a way to reject a supernaturalistic view of the world, which became a main argument of early Calvinists opposed to witchcraft trials.

A twentieth-century psychoanalyst called Calvin an avid "witch-hunter" (Pfister 1947), sparking a refutation from a Reformed clergyman (Pfisterer 1957) concerning Calvin's personal participation in witchcraft trials in and around Geneva in 1545, when about a dozen "plague spreaders" accused of sorcery were tortured and

executed. There is evidence that Calvin was involved. But it is difficult in retrospect to prove that these death sentences were pronounced primarily on the grounds of supposed sorcery. The fact that Calvin supported the death penalty fits with his general severity in issues of church discipline rather than any particularly intense interest in persecuting witches, who were executed in Geneva well before, during, and long after his ministry (Monter 1971). As with other influential theologians, Calvin's position on legal punishments for superstition and idolatry must be distinguished from his theological position on witchcraft—which must, from a historical viewpoint, be classified as progressive and modern.

CAMBRAI NUNS (1491)

This early case of mass possession in a convent offers many features that emerged later in the more famous scandals of the early modern era.

Two chroniclers, Jehan Molinet and Christiaan Massaeus, recorded a case of possession in 1491, which lasted four years according to Massaeus and seven according to Molinet. Several nuns of the large reformed Augustinian convent at Quesnoy-le-Conte (Le Quesnoy) near Cambrai displayed many symptoms typical of possession: they ran about like dogs, flew like birds, clambered up trees like cats, made grotesque faces and movements, uttered strange sounds, revealed other people's secrets, and made prophecies. The nuns said their devils were of the order of seraphim and had a hierarchy of princes, vassals, and servants.

Two local clerics, the dean of Cambrai and the Dominican prior of Valenciennes, came to the convent to exorcise the women; besides attempting to deliver the nuns from possession, they used the "devils" to satisfy their professional curiosity about the ways of their

deity. One asked the demons “if they had seen God in his essence” and was told that he had, “but not perfectly,” but enough to make him crave the sight evermore. Highlighting the ambiguous moral status of the possessed, a major theme of the early modern era, the priests also asked these devils, “Why do you not persecute men of war and others who live dissolutely, without troubling these poor nuns here?” The devils replied that they would not waste their time on people who were already theirs (Molinet 1889–1906, 484).

The clerics, joined by another Dominican and by the bishop of Cambrai, Henri de Berghes, met with only mixed success in their attempts to expel the demons. At one point the names of the women were sent to Pope Alexander VI, who read them out during Mass while promulgating the bull *In Coena Domini* (At the Lord’s Supper). Molinet reported that this technique proved unsuccessful—a rare admission of an apparently completely failed (although long-distance) exorcism, and more remarkably a failure by the pope himself.

In comparison to more famous later cases, it seems noteworthy that the Cambrai possession, long before the doctrinal challenges of the Protestant Reformation, included a small-scale diabolical derision of the host, a mode later made famous by Nicole Obry in 1566 during the French religious wars. Using the host to exorcise had been standard procedure since early Christianity, but the Cambrai devils mocked the doctrine of the “Real Presence” by chiming in unison, “Are you well armed? Have you taken the bread?,” but they nonetheless yielded to the spiritual force of the host and even preached that Christians ought to hold it in higher esteem. As in later cases, years of apparent failure to eliminate the devils allowed nuns to display their “obedience,” for example, by responding to the touch of a priest’s holy fore fingers to a nun’s silent and clamped mouth. However, this case had no polemical function; no crowds appear to have been involved, and local chroniclers merely reported it as notable.

Like other later stories, this one also had its tragedy. The convent’s afflictions were imputed to the sin of a forty-five-year-old nun, Jeanne Potière. She had voluntarily coupled with a demon that took the form of the convent’s former confessor, with whom (we are told) Potière had been in love. This accusation exposed Potière as a kind of witch. Though not explicitly accused of active *maleficium* (harmful magic) against her sisters, she was imprisoned, apparently to deliver the nuns from their demons. Molinet mentioned that Potière “died Catholically” shortly after she was imprisoned. Nonetheless, the sisters remained possessed for another four years.

This case was subsequently cited during the era of major possessions and intense demonological speculation. Martín Del Rio used it in his *Disquisitionum magicarum libri sex* (Six Books on Investigations into

Magic, 1599/1600) as an example of false prophecy (Book IV, ch. i, sec. ii), explicitly mentioning the miraculous power of the host and priestly fingers (Book VI, ch. ii, sec. iii, q. iii). Citing Del Rio, Pierre de Lancre, in *L’incrédulité et mescréance du sortilege* (Incredulity and Misbelief of Enchantment, 1622), used it to support his arguments against purely natural explanations for the symptoms of possession.

CAMPANELLA, TOMMASO (1568–1639)

A Dominican monk, late Renaissance magus, passionate astrologer, and utopian theorist, Campanella sought to reconcile Renaissance natural philosophy with a general reform of both the sciences and society.

Born at Stilo in Calabria, Campanella joined the Dominican order at the age of fourteen. He soon showed a deep distaste for the philosophy of Aristotle and his followers, preferring the new natural philosophy of Bernardino Telesio. His choice provoked outrage among Dominican defenders of Aristotelian and scholastic orthodoxy. In 1599, convinced by prophecies and astrological predictions that a period of profound social, political, and religious change was imminent, Campanella organized an anti-Spanish uprising in Calabria. An army sent by the Spanish government nipped the revolt in the bud. Accused of treason and heresy, Campanella narrowly avoided execution by feigning madness, but spent the next twenty-seven

years in prison in Naples. Finally released in 1626, he moved to Rome and then, in 1634, to Paris, where he died five years later.

Campanella wrote his most important works while in prison: first, his *Città del Sole* (City of the Sun), in which he outlined an ideal city based on communal ownership of both goods and women; second, the *Apologia pro Galileo* (Apology for Galileo), written in 1616, in defense of the right to abandon Aristotelian philosophy to read directly from the book of nature. In *De sensu rerum et magia* (On the Sense of Things and Magic), published at Frankfurt in 1620, Campanella expounded a vision of the natural world as a living organism, the individual parts of which have their own lives and sentience. Every natural entity, from rocks and plants to animals and the heavens, strives for its preservation and is endowed in varying degrees with “sense,”—the capacity to distinguish whatever helps maintain its life from anything harmful or destructive. In animal organisms, *spiritus* (spirit) is of primary importance: a vital warm breath, very rarefied and mobile, which gives rise to all passions and sensations.

Campanella based his conception of natural magic on these doctrines of *sensus* and *spiritus*. The magus knows the specific quality of the “sense” that inheres in all objects and can bring about changes and sensations in the “spirit.” He knows how to awaken the potentialities of life by suggesting food and drink, climates, sounds, and herbal or animal remedies that will increase the vital energies. He knows the secrets of generation and of ailments; he can explain strange phenomena such as premonitions in dreams. Thanks to the doctrine of *spiritus*, it is possible to understand the metamorphosis undergone by those bitten by a rabid dog or by peasants bitten by tarantulas: the changes derive from the fact that their vital regime has been modified by the spread in their organism of the *spiritus* of the animal that has attacked them. “Sense” remains in entities even after death, and their sensations, remaining latent in a sort of stupor, can be revived in certain circumstances. For this reason, the body of someone who has met a violent death bleeds in the presence of his murderer, and a sheepskin drum will break into pieces when a drum made of wolfskin is sounded. The “weapon salve,” believed to have the power to heal a wound when applied to the weapon that had caused it, owed its effectiveness to the fact that the air, which unites persons and actions even at great distances, communicates the healing from the weapon to the wound.

Campanella also wrote a treatise on astrology, published in Lyons in 1629 together with his small tract, *De siderali fato vitando* (Means to Avoid the Astral Fate), giving advice on remedies for avoiding negative astral influences. For anyone in a perilous situation, Campanella suggested shutting oneself up in a room to avoid all contact with “seeds” infected by the air outside

and purifying the air by sprinkling perfumes and by burning aromatic woods and herbs. In this closed and sequestered space, seven torches must be lit, standing for the two heavenly luminaries (sun and moon) and the five planets, symbolically reproducing the heavens. These pages described the astral magic recently performed by Campanella and Urban VIII when the pope believed that his life was in danger because of an eclipse in 1628 (Walker 2000).

CANISIUS, ST. PETER (1521–1597)

A principal supporter of exorcism and witch hunting, Canisius presumably infected a whole generation of young Jesuits with these ideas, to the considerable displeasure of his superiors in Rome.

Born as Pieter Kanijs in Nijmegen in the Netherlands, Canisius became one of the leading protagonists of the Counter-Reformation in the Holy Roman Empire. In the nineteenth century, Pope Leo XIII called him “the second apostle of Germany after Boniface.” Canisius was beatified in 1864 and canonized in 1925.

After studying theology at Cologne, Canisius joined the Jesuit order in 1543, shortly after its creation, and he soon participated in the first session of the Council of Trent. After Canisius received his doctorate in theology at Bologna in 1549, the founder of the Jesuit order, Ignatius Loyola, sent him to the Holy Roman Empire. He served subsequently as a preacher and teacher in several places: Ingolstadt (1549–1552), Vienna (1552–1554), Prague (1555–1556), Augsburg (1559–1566), and Innsbruck and Munich (1571–1577). From 1556 to 1569 Canisius headed the fast-growing German province of the Jesuits. Under his enormously successful leadership, the Jesuit colleges at Munich, Landsberg, Ingolstadt, Innsbruck, Augsburg, and Dillingen became the central training grounds for new cadres of an emerging Catholic elite. Canisius was in close contact with almost all the Catholic princes of his period, particularly in Austria, where Emperor Ferdinand I sought his advice, and in the prince-bishopric of Augsburg, and in the duchy of

Bavaria, where he served as an advisor to two dukes, Albrecht V and Wilhelm V. Canisius was present at every important imperial diet and religious colloquy. His lasting legacy was his *Catechism* (first printed at Ingolstadt in 1556), the Catholic response to Luther's catechism. Canisius supported or reintroduced pilgrimages, the veneration of saints and especially Mary, with Marian Congregations as a new form of organized veneration.

Although he had been influenced by the *dewtio moderna* (modern devotion) in his youth, Canisius never became a practitioner of the spirituality of the Spanish founders of the Jesuit order. Rather, his burning zeal for the Catholic cause led to explosive action, at least partly inspired by millenarian expectations. When working on restoring Catholicism in the tiny Protestant lordship of Wiesensteig, Canisius became acquainted with the first massive witch hunts in the German southwest in 1562. In his position as cathedral preacher in the imperial free city of Augsburg, he promoted his ideas regarding the growing power of the Devil from the pulpit during the following months. To the annoyance of the magistrates, he managed to excite the rabble and to infect members of the urban elite as well. Canisius developed an intimate relationship with Augsburg's leading banking dynasty of the period, the Fugger family, whose daughters and maidservants seemed to be favorite targets of diabolical attacks.

Canisius developed public exorcisms into a major instrument of Catholic propaganda. News sheets reported the victories of the Jesuit champion, who managed to drive out tens of thousands of demons in one afternoon. However exciting these performances were to the general public in Germany, at Rome his Jesuit superiors were not at all impressed. They regarded Canisius's activities increasingly as an embarrassment. Because he was unwilling to comply with their repeated admonitions, they eventually decided to relieve this stubborn zealot of his position in the Holy Roman Empire, viewing him as a liability to the Catholic cause in one of the most sensitive areas of political struggle. The Jesuit General Diego Laynez transferred Canisius to one of the most remote corners of Switzerland, the Catholic canton of Fribourg (Freiburg), where he could cause no further embarrassment. The "second apostle of Germany" lived in this quiet backwater for almost twenty years until his death.

CANNIBALISM

Cannibalism has become one of the fundamental characteristics of the witch in the popular culture of European societies. It marks the witch as "other" and signifies her relationship to all that is terrifying and taboo. It draws on widespread beliefs in many cultures that the practitioners of cannibalism acquire special power. While cannibalism was commonplace in demonologies from the fifteenth to seventeenth centuries, it occurred infrequently in visual representation.

The witch as cannibal occurred in several early accounts of witchcraft produced in western Alpine Europe during the late 1430s, such as Johannes Nider's *Formicarius* (The Anthill), Claude Tholosan's *Ut magorum et maleficiorum errores* (So That the Errors of Magicians and Sorcerers), and an anonymous treatise called *Errores Gazariorum* (Errors of the Cathars), which claimed that witches strangled children, removed their corpses from their graves after burial, and then cooked and ate them at their synagogues or Sabbats. Mixed with poisonous animals or even with liquids distilled from the corpses of those who had been poisoned, the fat or innards of children were made into ointments and powders used to bring illness or death to other human beings, or rubbed on staffs to help transport witches to their assemblies. A more detailed description occurred in Book 5, chapter 3, of Nider's *Formicarius*: unbaptized infants were ritually killed in their beds, as though from natural causes. The babies would then be removed from their graves, cooked until the flesh fell from the bones, and the liquid reduced to strengthen it. An ointment would be made from the solids, while the liquid was put aside to be drunk by those destined to be leaders of the sect. Nider's text also suggested that the ritual eating of children would help make the Devil appear.

Nider's account was incorporated verbatim into the *Malleus Maleficarum* (The Hammer of Witches, Part II, Q. 1, chap. 2), thus achieving widespread dissemination. Unsurprisingly, later Catholic treatises by Jean Bodin, Francesco-Maria Guazzo, and Martín Del Rio accepted cannibalism as one of the crimes of witches. Another belief, also found in the *Malleus* and common in early Italian sources, claimed that witches drank the blood of the children they murdered. Found in Gianfrancesco Pico della Mirandola's 1523 dialogue *Strix* (The Witch), this tradition of vampirism was probably related to notions of witches as *lamiae*, the night-flying and cannibalistic harpies of classical literature.

Although Jacques de Gheyn produced a drawing of a vampire-witch biting into a child's neck around 1600,

artists of the previous century generally showed little interest in cannibalism. Models for cannibalism were widely known, such as the child-devouring figures of Saturn, Jews, fools, and ogres, or the devouring hellmouth of Satan; but artists seemed content to hint at the cruelty of witchcraft through suggestions of cannibalism and dismemberment by scattering bones and skulls around witches' cauldrons. Only from the later sixteenth century, as witches become routinely depicted as older women, were children represented as innocent victims of these aggressive anti-mothers. This was especially evident in many of the images of Jacques de Gheyn, and in works by Frans Francken the Younger, Michael Herr, and Christoph Murer. Cannibalism was not depicted as anthropophagy, the actual physical consumption of a victim; but, as with many sixteenth-century images of Amerindian cannibals, this activity was suggested indirectly by depicting mutilated bodies and scattered limbs, or body parts prepared to be boiled. Only a few instances, like the 1613 etching of a

Basque Sabbat by the Polish artist Jan Ziarnko, dared to show a cooked child ready to be devoured by witches and devils at the Sabbat banquet.

CANON EPISCOPI

A ruling (*canon*), beginning with the word *Episcopi* (bishops), was first attested in the *Two Books of Synodal Causes* written by Regino of Prüm (ca. 840–915) in 906 and very likely created by Regino himself. The *Canon* was later erroneously attributed to the Council of Ancyra (Ankara, in modern Turkey), an ecclesiastical assembly held in 314, because Regino’s collection followed an authentic canon from Ancyra and was assumed to have come from the same source. Instead, the *Canon* appears to have come from two different earlier ninth-century texts that Regino combined. Regino’s work was a manual of canon law to be used in episcopal visitations of ecclesiastical establishments. It was requested by Regino’s archbishop, Radbod of Trier, and was dedicated to Archbishop Hatto of Mainz for use by him and his subordinate officials. It contains authoritative statements excerpted from earlier Church councils and works of the Church Fathers and bishops of Rome, applied to the practical questions that episcopal officials were expected to ask clergy and laity in their inquiries into ecclesiastical discipline. The *Canon Episcopi* became the most important statement in later Latin Christian canon law concerning sorcery and witchcraft, and occupies a central place in all discussions of the so-called witches’ Sabbat.

Book II of Regino’s collection dealt with the ecclesiastical discipline of the laity. Chapter 5: 42–45 dealt generally with “enchanters and sorcerers,” particularly in matters of illicit sacrifices, charms, or love magic. Chapter 5: 45 gave the “short version” of the *Canon Episcopi*, stating only that any woman who believed that she rode at night with demons was to be expelled from both parish and diocese. In Book II, chapters 354–375, Regino further elaborated on these, giving the “long version” of the *Canon Episcopi* at II, chapter 371. Although the *Canon Episcopi* was a single text, it appears to be a composite of two different ninth-century texts. The first part warned bishops that they were obliged to eradicate *sortilegium* (sorcery) and *maleficium* (harmful magic), which were invented by the Devil, and to expel the practitioners of these from their dioceses. The second part warned that there are women who believed that they ride at night across great distances with the goddess Diana and obeyed her

commands. Not only were they themselves deceived, but they had also led others into this belief, thus risking the salvation of more souls than their own. Preachers should teach that such beliefs were the result of demonic temptation and the demonic illusion that things that happened only in the imagination occurred in reality. Regino’s text contrasted these illusions with the true spiritual experiences of the prophet Ezekiel and the apostle Paul (2 Cor. 12:2–5). Regino’s central point was that there was no power except that of God, and that any belief that attributed the power of creation or of moral or physical transformation to any power than that of God was mistaken and heterodox.

Regino’s work applied only to the archdiocese of Trier, but some of its material, including the *Canon Episcopi*, was excerpted a century later in the similar work of Burchard of Worms, then a century after Burchard by Ivo of Chartres, and later in the twelfth century by Gratian, whose collection of canon law became the standard textbook for many centuries. Although sorcery played a small role in these works, the *Canon Episcopi* became the starting point for all later discussions of both diabolical sorcery and the witches’ Sabbat.

Canon Episcopi became especially problematic during the period of the formation of the classical image of the witch and the nature of witchcraft during the debates of the early fifteenth century. Then, its apparently categorical denial of physical transvection posed difficulties for those demonologists who firmly believed that witches did indeed fly at night on beasts, staves, or brooms (a 1450 manuscript of Martin Le Franc’s *Le Champion des dames* [The Defender of Ladies] contained the first known illustration of witches flying on broomsticks). The second version of the *Errores Gazariorum* (Errors of the Gazars or Gazarii-Cathars), written in 1438 or slightly later, insistently affirmed that such flight occurred in reality. Le Franc’s *Defender* denied transvection, however, by citing the *Canon Episcopi*, and Le Franc’s denial was supported by Johannes Nider’s agreement in the *Formicarius* (The Anthill, 1437–1438).

In the *Flagellum haereticorum fascinariorum* (The Scourge of Heretical Witches, 1458), Nicholas Jacquier, taking up an observation of Pope Alexander V in 1409, argues that contemporary witches were a new sect and that the *Canon Episcopi* therefore did not apply to them. Still, other demonologists, equally convinced of the reality and danger of witchcraft, adhered to the *Canon Episcopi* on the single point of transvection. The Spanish canonist Juan de Torquemada agreed with *Canon Episcopi*, but the biblical exegete Alfonso Tostado, citing the passage in Matthew (4:1–11) in which the demon transported Jesus through the air, stated that the gospel testified to such demonic power, that the *Canon Episcopi* referred only to a particular case, and that the illusion condemned by the canon was

only the women's belief that they flew with Diana. Ultimately, the text in Matthew served as a counterweight to the *Canon Episcopi* in the matter of transvection, but not in the unanimous opinion of all demologists.

Proving the reality of the Sabbat in later centuries required addressing the problem of the *Canon Episcopi*, and in this way the text took on new life in the fifteenth century and was debated until the late seventeenth.

CAPITALISM

Social stresses resulting from capitalism sometimes led to witchcraft accusations. Capitalism is an economic system in which production is organized by entrepreneurs employing wage labor, and wealth accrues to the entrepreneurs through profit. Capitalism grew significantly in parts of early modern Europe. It replaced feudalism in which production is organized by subsistence-farming peasants and self-employed artisans, and wealth accrues to landlords collecting rents.

Alan Macfarlane first made the link between capitalism and witchcraft accusations in 1970 in a detailed study of Essex, England. He identified a distinctive model of witchcraft accusations. A poor villager, typically an old woman, would come begging at the door of a prosperous neighbor. Traditional peasants felt solidarity toward the poor: one day that poor villager could be you. But the prosperous neighbor, with more modern capitalistic values, aspired to lift himself or herself above

the level of the peasants, and expected the state to relieve the prosperous of responsibility for the poor. So the neighbor sent the old woman away empty-handed; she left muttering unintelligibly, or even cursing openly. When the prosperous neighbor later suffered a misfortune, she remembered the denial of charity (for which the neighbor felt guilty) and assumed that the old woman had bewitched her neighbor in revenge. This model was adopted and incorporated into a broader framework of changing English values by Keith Thomas, who had supervised Macfarlane's PhD thesis. The model in which a witchcraft accusation is provoked by a denial of charity followed by misfortune is sometimes called the "Thomas–Macfarlane model."

Paul Boyer and Stephen Nissenbaum crafted a second model involving capitalism in their study of Salem Village in 1974. They showed that witchcraft accusations followed the pattern of the factions into which the village was divided. Some villagers, who supported the minister Samuel Parris, were attempting to maintain their traditional Puritan values against what they saw as more materialistic neighbors, linked to the burgeoning commercial world of nearby Salem. From within this pro-Parris faction, witchcraft accusations were directed against actual and symbolic members of the anti-Parris faction.

These two celebrated models thus present a contrast. In the English version, witchcraft accusations tended to come from supporters of emerging capitalism; in the New England version, they tended to come from its opponents. These were of course simply tendencies, and other more significant causal factors—not least a pervasive belief in maleficent witchcraft—were present in both cases. But witch hunting is best explained through complex models involving numerous factors; in these regions, capitalism can be recognized as one factor.

What of continental Europe? Scholars working on witch hunts there have been alert to the possibility of similar patterns of accusation, but they have not found them on any significant scale. There were certainly occasional cases of witchcraft accusations following a denial of charity, but most village quarrels that led to accusations were between social equals. Political factionalism was usually about other issues.

The most likely explanation for this at present might simply be that capitalism advanced at an uneven pace. Parts of England and New England advanced toward capitalism relatively early, but we do not know why such patterns of accusation did not seem to apply to areas on the Continent, especially the Low Countries, northern Italy, and parts of Lowland Scotland, where capitalism developed soonest during the period of witch hunting. As a force for socioeconomic transformation, capitalism was insignificant in much of Europe until after the period of witch hunting had ended. Venice, a decidedly capitalist place, saw little by way of witchcraft accusations, while the capitalistically

advanced and urbanized southern Low Countries (unlike the Dutch Republic) saw many. Thus the connections between capitalism and witch hunting are uncertain, although further research may uncover indirect links between witch hunting and the tensions of socioeconomic transformation. Augsburg, the largest capitalist location in the German heartland of witch hunting, offers an interesting case: witchcraft executions began there only after capitalist industry declined during the Thirty Years' War. Capitalism and feudalism are complex and controversial concepts that attempt to identify the key dynamic elements in society, while recognizing that society will always contain elements of different systems. Macfarlane went on to develop his ideas on capitalism—which he increasingly regarded as synonymous with “individualism”—in directions not always compatible with his witchcraft work. Simplistic socioeconomic explanations should be avoided, but sophisticated ones involving multiple and indirect causation should be encouraged.

CARDANO, GIROLAMO (1501–1576)

A Renaissance philosopher and physician, Girolamo Cardano (Pavia, September 24, 1501–Rome, September 20, 1576) devoted many works to various fields of knowledge, from mathematics to astronomy and astrology, from medicine to natural philosophy. He narrated his life in a famous autobiography, including the death sentence of his firstborn son who was convicted of uxoricide. Cardano's *De subtilitate rerum* (On the Subtlety of Things, 1550) and *De rerum varietate* (On the Variety of Things, 1557) were his most famous works of natural philosophy. Published in the mid-sixteenth century, they became very popular but also aroused lively controversy both from philosophers who were faithful

to a strict Aristotelian orthodoxy and from ecclesiastical critics.

These two works were full-fledged encyclopedias in which the author described all possible aspects of reality with an insatiable curiosity and admiration, paying particular attention to the most rare and unusual phenomena. Cardano believed that rarities must be investigated with subtlety in order to grasp the links, analogies, and sympathies among the various parts of the world, which are interconnected like the parts of the human body. Cardano was very interested in the divinatory arts, such as geomancy, chiromancy, physiognomy, and metoposcopy, and in rare and strange natural facts, such as prodigious recoveries, enchantments, oracles, dreams, and apparitions of “monsters.” He considered unusual events signs and *ostenta* (portents). Comets, floods, and births of monstrous animals symbolized and announced specific events of man's world such as wars, plagues, or the death of princes.

Astrology played a central role in Cardano's thought. He wanted to purge this discipline from the superstitions of Arab authors and present it as part of natural philosophy. Ptolemy's *Tettabiblos* (Mathematical Treatise in Four Books) was his preferred text, on which he wrote an ample commentary. Cardano acknowledged that astrology is not a science with absolute certainty and exactitude like mathematics and astronomy, but nevertheless it is not a superstition. Instead, astrology is a conjectural discipline dealing with a changeable human and natural world, which advances probable judgments about future events in much the same way as medicine, the art of navigation, or agriculture. Astrology is based on the physical principle of the celestial influences: while they are apparent only in the sun and the moon, by analogy they can be attributed to all other celestial bodies. Cardano complemented his theoretical speculations on astrology with a large body of experimental findings by publishing a great variety of horoscopes; some referred to unknown people, others to such famous people as popes, princes, or men of letters. He was sufficiently audacious to write Jesus's horoscope. Even though earlier authors like Albumazar (Abu-Mashar), Albertus Magnus, or Cardinal Pierre d'Ailly had already dealt with this topic, Cardano's horoscope of Jesus created a major scandal and gave rise to charges of impiety. In the majority of cases, Cardano tended to attribute the prodigious events to natural causes, but he did not rule out completely the intervention of demons, although he admitted that he had no direct experience of them, unlike his father who said that he had seen and spoken with supernatural creatures.

Cardano tackled the problem of witchcraft in a lucid and acute manner both in *De Subtilitate* (chap. 18) and *De Varietate* (bk. 15, chap. 80). He identified the various natural, medical, and social factors that contributed to an understanding of the phenomenon

without resorting to any demonic intervention. The so-called witches were mostly old and poor women who lived in solitary places eating grass and roots. As a consequence, their nutritional deficiencies made them mentally weak and stubborn in maintaining the reality of impossible things. They became an easy prey to excesses of black bile and melancholic humors. This pathology fostered their deliria of omnipotence and their hallucinations, in which they imagined they took part in dances, feasts, and night flights. Cardano did not deny that the so-called witches were often impious and superstitious old women, and that sometimes they were even dangerous because they really could perform horrible crimes. He did deny, however, that they were able to undertake the exploits they purported to do by virtue of the demonic powers of which they flattered themselves. Cardano linked the origin of the Sabbath to the survival of ancient pagan rituals that became marginal and clandestine because of persecutions and prohibitions.

CARO BAROJA, JULIO (1914–1995)

Julio Caro Baroja, a Spanish ethnologist, cultural historian, and painter, ranks among the unsung pioneers of recent advances in witchcraft scholarship. A nephew of the author and Nobel Prize winner Pio Baroja, he grew up in a highly intellectual circle. Despite interrup-

tions during the Spanish Civil War, he completed a master's degree in ancient history at the University of Madrid in 1940 and two years later obtained his doctorate in Spanish folklore. In 1943 Baroja became director of the ethnological *Museo del Pueblo Español* (Madrid). He conducted anthropological studies in the United States and Oxford in the early 1950s before doing fieldwork among the nomads of the Spanish Sahara. In 1957 Baroja resigned his directorship and during the next two decades he taught abroad, at Coimbra, Wisconsin, and Paris, and at Spain's national research council (*Consejo Superior de Investigaciones Científicas*). In 1975 a chair of philosophical anthropology was created for him at the *Universidad del País Vasco*. Despite extensive university contacts, Baroja was a true individualist who followed no methodological school and trained no students; but he maintained an extensive international network of professional contacts and was extremely helpful in advising other scholars. By the end of his life, Baroja received many honors and prizes, and despite his shy nature, he became one of Spain's most celebrated personalities.

His extensive written work—entirely handwritten, as he ignored the technological advances of his time—comprised almost 600 titles. Baroja's work on witchcraft, especially Basque witchcraft, held an important place in this corpus. It was the theme of one of his earliest articles, "Four reports on Basque witchcraft," the most important being a manuscript at the Biblioteca Nacional (MS 2031) by the inquisitor Alonso de Salazar Frías, summarizing his reports on the Basque witch craze that he had submitted to the Spanish inquisitor-general in 1612–1613 (Caro Baroja 1933, 131–145). The skeptical mind of this inquisitor fascinated Baroja throughout his life. However, when he wrote his pioneering *The World of the Witches* (1961), with part two almost entirely dedicated to Basque witchcraft, he had still not located Salazar's original reports that had vanished after the American Henry Charles Lea found them at the beginning of the century in the State Archives of Simancas. Baroja's famous book, subsequently translated into several languages, demonstrated his extraordinary learning, which embraced everything from ancient history through medieval legend to Renaissance philosophy and incorporated a wide spectrum of disciplines: theology, anthropology, psychiatry, art history, and literary history. Eight years later Baroja published a fresh contribution to the history of Basque witchcraft, almost simultaneously with my article in English announcing my rediscovery of Salazar's papers in Madrid's Archivo Historico Nacional (Henningsen 1969, 266).

His other relevant works on witchcraft included the two-volume *Magical Lives and Inquisition*, with essays on cunning folk and learned magicians mentioned in the archives of the Toledo Inquisition (Caro Baroja

1967), and a subsequent collection on *The Lord Inquisitor and Other Bureaucratic Lives* with suggestive essays on typical inquisitors and on the atypical Martín del Río. In that volume, published just as the international renaissance in Inquisition studies was starting, Baroja unfortunately remarks that “we know all we wish to know about [the Inquisition’s] origin, organization, procedures, real and supposed errors against those under its jurisdiction, its victims and its end” (Caro Baroja 1968b, 17).

Baroja was probably the first scholar to combine the anthropological theory of African witchcraft with the study of European witchcraft. In his analysis of the field notes from interviews at the beginning of the 1940s with an old Basque peasant living close to his uncle’s house in Vera de Bidasoa, Baroja introduced Evans-Pritchard’s famous distinction between *witchcraft* and *sovereignty*, but reversed the terms in his translation: “*Hechicería* is what in English is called ‘witchcraft,’ that is, an evil art, essentially antisocial, which one gets to learn by apprenticeship. *Brujería* is equivalent to ‘sorcery,’ an ability to produce evil, which certain persons are born with” (Caro Baroja 1957, 8). Baroja has been criticized for his mistakes and superficiality, which was in fact closely related to the rapidity of his working method and his impressionistic way of writing; but his extensive authorship is so rich in thought, ideas, and original observations that one never finishes with it.

CAROLINA CODE (*CONSTITIO CRIMINALIS CAROLINA*)

The Carolina Code was the criminal law code for the Holy Roman Empire, issued in 1532 during the reign of the Habsburg emperor Charles V, from whom it got its name. The *Constitutio Criminalis Carolina* remained the basic code of the empire, including official procedures for conducting witchcraft trials, for centuries. In its main parts, the Carolina Code contained rules of court procedures, into which were inserted definitions of crimes, mitigating circumstances like self-defense, accountability of defendants, and so on. In addition to the old accusatory trial, the Carolina Code dealt with inquisitorial trial procedures without determining the priority of the one over the other. The future belonged to the latter. Torture was sanctioned to extort confession, and the inquisitorial trial replaced the now-obsolete trial by ordeal, witness of reputation, and oath of purification.

The earliest efforts at reforming criminal law in the Holy Roman Empire date from the end of the fifteenth century when two imperial Diets or *Reichstage*, one held in 1496 at Lindau and a more important one two years later at Freiburg, elaborated a first draft. The ultimate version was modeled after the penal law of Bamberg of 1507 (*Bambergensis*), which is there fore called *mater carolinae*. Both codes are typical of so-called reception laws, because the modern *ius commune* (common law), that is, Roman canon law, was adopted in order to reform many traditional criminal law customs. As Winfried Trusen has convincingly determined, the authors of the *Bambergensis* must have been jurists such as Leonhard von Egloffstein and Sebastian von Rotenhan; the former prevailing opinion, which ascribed it mainly to Baron Johann von Schwarzenberg, must be modified. It took until 1532 for the last draft of the code to be accepted, when the resistance of three major conservative states was finally overcome by inserting the so-called *clausula salvatoria*, which sanctioned retaining old customs insofar as they were just.

Concerning witchcraft and sorcery, Article 109 of the Carolina Code followed Roman law with its distinction between harmful “black” magic and helpful “white” magic. Only those convicted of the former received the death penalty at the stake for heresy, whereas the second should be punished, if at all, less severely according to a juridical opinion. This article contained no evidence for the reception of demonological knowledge, disseminated by elaborations such as

Heinrich Kramer's *Malleus Maleficarum* (The Hammer of Witches, 1486) or similar theoretical literature. Indeed, its procedural rules gives a quite different impression. For example, Kramer's main types of circumstantial evidence reappeared in Article 44. Heading the list was how to proceed when harmful effects followed after having been threatened. Curses and swearing, very common when neighborhood squabbles degenerated into vendettas, carried the risk of being persecuted for witchcraft. The second type of evidence was close relationships with notorious and previously condemned sorcerers or witches, which could become a fateful assumption. A third type of evidence was the use of suspicious words, gestures, or objects. At the very least, a suspect of witchcraft had to be of ill repute in his or her community for being a sorcerer.

In practice, imperial jurisprudence and judicial decisions soon surpassed the restrictive wording of Article 109 and extended it to a more spiritualized concept, with the denial of God as the core element. The constitutions of electoral Saxony, issued in 1572, used the *clausula salvatoria* to broaden the scope of positive law into a much wider range of criminal persecution. Such examples show that the influence of the Carolina Code on the prosecution of German witches has often been overestimated; so, in a different way, has been Friedrich Spee's famous criticisms of 1632.

CARPI, POSSESSION IN A POOR CLAIRE'S CONVENT

In the mid-seventeenth century, a case of diabolical possession among several nuns in the convent of Corpus Domini at Carpi changed the way the Roman Inquisition treated such cases in female communities. This case was significant because the people involved, in and out of the convent, were eventually implicated in power struggles between ecclesiastical and state institutions, and finally, it affected the procedures of the Roman Inquisition's local tribunals.

The Pio family ruled the small Po Valley principality of Carpi for centuries. The family's political situation contributed in different ways to occasional conflicts in the small but lively city. The sensational cases of possession in the observant Franciscan convent of Corpus Domini of Carpi between 1636 and 1638 (only a few years after the well-known French events at the Ursuline convent of Loudun), emerged from a background of uneasiness created in the monastery following the acceptance (1608) and profession of vows (1611) of Eleonora d'Este, the daughter of Duke Cesare of Ferrara and sister of his successor, Duke Alfonso III.

The presence in the convent of this princess (and later her two nieces, Alfonso's daughters) greatly changed a convent that had prided itself on its devotional practices and its special cultivation of liturgical music, feast-days, and celebrations. It became a convent consumed by politics, divided between those loyal to the noblewomen of the Pio family and those who were not. The Este princess, now sister Angela Caterina, held the position of abbess from 1622 to 1629 and was again elected for the three years from 1633 to 1636. In this period, the cases of possession began. The first occurrence was in 1636 when Paolina Forni, the princess' companion, became so ill that medicine could not help her. She was therefore considered to be possessed. Alfonso III (who, after his wife died, had renounced his position as duke, became a Capuchin monk, and entrusted his daughters to his sister's convent for their education) invited exorcists to the convent to remove the evil spirits from the possessed. Such secular intervention in ecclesiastical matters provoked a reaction from Rome because the papacy had recently prohibited mixed jurisdictions.

The Roman Inquisition subsequently investigated all phases of this episode of possession through correspondence with the inquisitor of Modena. Jurisdiction over the convent belonged to the Franciscan order, but then passed (under Pope Urban VIII) to the archpriest of the Collegiata di Carpi. Duke Francisco I, the successor to Alfonso III (the Capuchin) and the nephew of the convent's governess (Angela Caterina), would not surrender his aunt for examination by the Inquisition. During the following years, the Observant Minorite friar, theologian, and preacher Angelo Bellacappa of Parma, who had been named confessor to the convent from 1633 to 1636 by Angela Caterina d'Este, played a significant role in an episode of possession.

The inquisition trial that shook the convent, and revealed the episodes of misbehavior and possession in 1636 and 1637, began with a denunciation to the inquisitorial vicar of Carpi made on April 24, 1638, by Fra Giovanni Battista Bignardi, the convent's current confessor. He told the vicar about participating in an exorcism of possessed nuns, during which he heard the devils address sister Dealta Martinelli as a witch, and also related that one of the possessed had accused

the confessor Bellacappa of solicitation during confession. After this declaration, Orazio Giudici, Carpi's inquisitorial vicar (a layman), interrogated the monks about the solicitation and also spoke with the nuns who were not possessed to confirm the accusation. Giudici questioned the other exorcists, who were convinced that there were evil spirits in the convent that had identified both Angelo Bellacappa and sister Dealta Marinelli, and that their wickedness was *ad amorem* (for love).

Informed in detail of these facts and about the local trials, Rome remained skeptical about the diagnosis of possession. In May 1638, the Holy Office ordered the inquisitor of Modena to conduct the investigation personally and to suspend all exorcisms. They also isolated sister Dealta Martinelli in a cell where no one could speak to her. The drawn out investigation continued with the arrest and interrogation of Brother Angelo Bellacappa. To Rome, the case became increasingly suspicious, as evidenced by the organization of the exorcisms, manipulated from inside by the head of the convent, supported on the outside by her brother and by their nephew, the duke. It is also noteworthy that all of the nonpossessed nuns were faithful servants of the princess; only Sister Martinelli openly disregarded the high status of Angela Caterina.

At year's end, the Roman Holy Office decided to suspend the investigation being performed by the inquisitor of Modena, and instead brought a new administrator to the cloister, someone with a different background and from a different region, the bishop of Adria, Germano Mantica. He immediately ordered a serious reform of the cloister, segregating the supposedly possessed nuns and prohibiting anyone from discussing the incidents. Mantica, acting as a special correspondent for the Holy Office, together with the inquisitor of Reggio, also had responsibility for resuming the investigation. At the end of January 1639, Rome closed the case, declaring it a case of "false possession" originating from "the strong experience of wickedness, and not [from] demons." Recognizing that the whole affair had been driven by "reason of state" and that it was necessary to close the investigation without branding the nuns as lunatics, the Holy Office told the inquisitor of Modena that "vehement suspicion of wickedness" was sometimes more convincing than actual possession; many times, Rome added, clerics had believed firmly that someone could be evil without recognizing their own power to harass or vex the inner spirit. The Vatican dealt with the false possession by removing the Franciscans from jurisdiction over the convent and by transferring sister Dealta Martinelli and her real sister, Ippolita Martinelli, to another convent. In the case of the possessed nuns of Carpi, the Roman Church applied the legal standards recommended in Cardinal Desiderio Scaglia's *Practica* manuscript

(ca. 1620) to guide inquisitors investigating cases of possession in convents and monasteries.

CARPZOV, BENEDICT (II) (1595–1666)

One of the greatest and most influential German jurists, Carpzov has an unfair reputation as a cruel persecutor of witches. Carpzov was born into a famous dynasty of Saxon jurists at Wittenberg; his father, Benedict (I), was professor at the university and chancellor of electoral Saxony. On a formative grand tour through Italy, France, and England, the younger Carpzov became acquainted with new tendencies in jurisprudence, especially in sixteenth-century Italian literature. At Jena in 1616–1617, he heard lectures from a professor of law named Theodoricus, whom he often quoted in his later works.

Carpzov became a member of the famous Leipzig *Schöppenstuhl* (in upper German, *Schöffentuhl*), a kind of court of appeal to which the court of first instance was obliged to submit a case and, subsequently, to accept its decision. For a time he was simultaneously professor of law at Leipzig University and judge at a Dresden appellate court. Until his death, he remained a *Schöppe* (in upper German, *Schöffe*—judge) in Leipzig nearly without interruption. His main achievement lay in penal jurisprudence, about which he published his famous *Practica nova imperialis Saxonica verum criminaliam* (New Rules in Criminal Cases for Imperial Saxony) in 1635, which became influential even beyond the borders of the Holy Roman Empire.

Although today one stresses his forerunners, such as Matthias Berlich, Carpzov has been styled the founder of German criminal jurisprudence, and he was certainly the first German criminal jurist with a European reputation.

Carpzov has falsely been blamed for sentencing 20,000 persons to death for witchcraft. This persistent legend can be traced to an envious note from a certain Philip A. Oldenburger in 1675, and it is still sometimes repeated. Although most of the sources have been lost, surviving documents give no indication that Carpzov ever sentenced *anyone* to death in a witchcraft case. Even if it were possible that Carpzov cooperated in imposing 20,000 criminal sentences during his extremely long career as a judge, one must consider first, that those sentences were imposed collectively by Saxon judges. Moreover, they included not only death sentences—or other final sentences imposing lesser punishments like banishment—but also numerous acquittals, minor corporal punishments and fines, as well as great numbers of so-called “interlocutory” sentences concerning the admissibility of evidence to permit torture or to initiate a formal trial.

In his *Practica*, Carpzov argued for using severe procedures and punishments against witches in accordance with the electoral Saxon law of 1572. His examples included such Catholic authorities as Heinrich Kramer, Jean Bodin, Peter Binsfeld, Nicolas Rémy, and Martín Del Rio. With respect to admissible evidence, Carpzov advocated the use of such circumstantial evidence as the incapacity to shed tears, which had by then become obsolete in many other parts of the Holy Roman Empire, especially in the south. Yet there is some evidence that Carpzov interpreted his own explanations concerning depositions and the law of torture in a restrictive manner. Although he probably imposed few if any death sentences for witchcraft, there occurred a serious witch hunt in Saxony between 1655 and 1665, during Carpzov’s tenure on the bench (Wilde 2003).

CASAUBON, MERIC (1599–1671)

Son of the famous classical scholar Isaac Casaubon, Meric Casaubon contributed to the revival of witchcraft theory during the Restoration period in England. Born in Geneva, Casaubon emigrated to England at the age of twelve, where his father had already settled. He received his BA, MA, and DD (Doctor of Divinity) degrees from Oxford University and was ordained a minister in the Church of England.

Casaubon’s ideas regarding witchcraft developed gradually during the 1650s and 1660s. In *A Treatise Concerning Enthusiasm* (1656), Casaubon, a royalist during the Civil War, attacked the religious radicals who flourished during the revolutionary period because they attributed natural phenomena, especially medical disorders, to either divine inspiration or demonic possession. In this work, Casaubon did not deal directly with witchcraft, and he took a moderately skeptical position regarding the possibility of the Devil’s intervention in the world. Three years later, however, in his edition of the papers of the Elizabethan magician John Dee, who claimed to have had commerce with spirits, Casaubon declared that the Puritan saints and religious radicals of his day were in league with the Devil.

These allegations of witchcraft set the tone for Casaubon’s affirmation of the reality of witchcraft during the early years of the Restoration, most notably in his *Of Credulity and Incredulity in Things Natural, Civil and Divine* (1668), which was reprinted in 1672 under the title *A Treatise Proving Spirits, Witches and Supernatural Operations by Pregnant Instances and Evidences*. Casaubon’s intention in writing this book was not to promote the prosecution of witches, which was in decline in England during these years, but to counter the claims of atheists and those who denied the existence of spirits. He also used witchcraft theory to define the boundaries of the ideal Christian society. Demonologists had long claimed that witches abjured their Christian faith, and Casaubon used these traditional accusations against witches to condemn the schismatics and religious fanatics of his day. In this way he defended the political and ecclesiastical order of Restoration England, in which religion and politics, the sacred and the secular, reinforced each other.

Casaubon grounded his belief in the reality of witchcraft in a common-sense empiricism and the widely held assumption that the Devil worked through nature. His work found support in the writings of Joseph Glanvill, another Anglican clergyman, who in *Philosophical Considerations Touching Witches and Witchcraft* (1666) and *Saducismus Triumphatus* (1681) collected accounts of preternatural phenomena, including prodigies, poltergeists, and bewitchments, to counter the claims of contemporary Sadducees, who denied the existence of spirits. Unlike Glanvill, Casaubon, who was hostile to the claims of the new

science, did not invoke the authority of the Royal Society to support his argument. Casaubon's belief in witchcraft was challenged directly by John Wagstaffe, who in *The Question of Witchcraft Debated* (1669) claimed that witchcraft was a deception imposed on the people by politicians and men like Casaubon. His other famous opponent was the physician and religious dissenter John Webster, whose treatise, *The Displaying of Supposed Witchcraft* (1677), accused Casaubon of using the arguments of Roman Catholics and divine-right royalists to defend their views. The debate between the Sadducees and their opponents, which dominated later seventeenth-century demonology in England, Scotland, and New England, attested to the strength and endurance of the anti-Sadducean position articulated by Casaubon.

**CASSINI (CASSINIS), SAMUEL DE
(CA. 1450–POST 1510)**

A Franciscan theologian, born near Montferrat (Monferrato) in the mid-fifteenth century, Cassini wrote several works but is most famous for his criticisms of Girolamo Savonarola and for his work on witch hunting, where he attacked inquisitors as heretics and tried to stop them from murdering innocent people on the pretext of rooting out witchcraft. Samuel de Cassini entered the Order of Friars Minor in the Province of Genoa, studied theology at Paris, and then taught in the schools of his Order.

In his attack on Savonarola, *Invectiva in prophetiam fratris Hieronymi* (Speech Against the Prophecy of Savonarola, 1497), Cassini tried to show that Satan had seduced the Dominican, although the bulk of Cassini's essay was a polemic against the concept of prophecy. Cassini denied the ability of prophesying and forecasting, and outlined the threats Savonarola posed for naive people. He condemned the reformer's claim not in its essence, but in the form Savonarola desired, arguing that nobody can enact reforms without express papal agreement. Cassini's criticisms were not original and can be understood within the long history of polemics between

Franciscans and Dominicans. Moreover, some scholars consider his *Speech* a pamphlet in support of Ludovico il Moro's desire to attack Florence. Cassini was therefore criticized by Gianfrancesco Pico della Mirandola with a *Defensio . . . adversus Samuellem Cassinensem* (Discourse and Defense Against Samuel Cassini), to which the Franciscan replied with a work in 1498. In the same year, Cassini also published a *Quaestio de immortalitate animi* (Inquiry on the Immortality of the Soul), dedicated to Ludovico il Moro.

For our purposes, Cassini's most important work was his *Quaestio lamiarum* (Treatise on Witches), published in 1505, in which he analyzed some beliefs to destroy superstitious elements that corrupted the real essence of true religion. The overwhelming number of witches and trials impelled him to dispute such superstitious and widely held beliefs. Although Cassini never doubted the existence of demons, he directly opposed the opinions Heinrich Kramer (like Savonarola, a Dominican) expressed in the *Malleus Maleficarum* (The Hammer of Witches). Cassini believed witches perform their evil deeds with the assistance of Satan, but he denied the pact as worthless. His argument was based on the concept of divine omnipotence that no one can contradict. The *Examen* was the first book to attack the identification of witchcraft as heresy, as defined in the papal bull *Vox in Rama* (A Voice in Rama, 1233). It is worth noting how strongly he affirmed the impossibility of a miraculous event to induce sins like witchcraft, because of his tendency to emphasize God's power. Cassini followed the *Canon Episcopi* in condemning the belief that women really fly at night; demons can deceive people, because their powers depend on the divine will. Hence, God cannot produce miracles against good men in order to satisfy evil men. Then Cassini pointed his finger at inquisitors, who, according to him, committed sin and even lapsed into heresy when they prosecuted charges against witches for deeds that Cassini held were fables. Because the *Canon Episcopi* condemned everyone who believed in those fables, such inquisitors themselves became heretics.

By adopting what he took to be correct scholastic theory, Cassini upheld the canonicity of the *Canon Episcopi* against all those who, like Nicolas Jacquier in 1458, had denied its value. After briefly summarizing his opinions, Cassini concluded that witches clearly did not exist and those who believed and prosecuted them were heretics. In fact, he suggested natural explanations for some events that demons could not perform. Then he devoted himself to defending papal authority against the conciliarists even in matters of witchcraft. The dispute between the Dominican and Franciscan orders spread to the demonological field. In 1506, Vincente Dodo (another Dominican) refuted Cassini in his *Apologia contra li difensori delle strie, et principaliter contra Quaestiones lamiarum fratris Samuelis de Cassinis*

(Apology Against the Defenders of the Witches, and Most of all Against the Treatise on Witchcraft Written by Samuel Cassini), to which the Franciscan replied the next year with his *Contra fratres Vincentius or praedicatorum qui inepte et falso impugnare nititur libellus de lamiis* (Statement Against the Dominican Vincente Dodo, Who Wrongly and Falsely Confuted the Book on Witches). In 1510, Cassini published a work against the Waldensians, *Victoria triumphale contra li errori de ualdesi* (Triumphal Victory Against the Errors of the Waldenses) and an *Expositio triplex librorum octo phisicorum Aristotelis* (Threofold Explanation of the Books on Physics of Aristotle). Afterward, his name and biography faded into obscurity.

CASTAÑEGA, MARTÍN DE

A Spanish Franciscan friar and preacher in the province of Burgos, Martín de Castañega is known primarily as the author of the first tract on witchcraft and superstition printed in Castilian, titled *Tratado muy sotil y bien fundado de las supersticiones y hechizierias y vanos conjuros y abusiones, y otras cosas al caso tocantes, y de la posibilidad y remedio dellas* (A Very Exact and Well Founded Tract on Superstitions, Sorcery, Vain Incantations, Witchcraft, and Other Things Touching upon Such Matters, and on the Possibility and Remedies of the Same, Logroño, 1529). Although this was his only known work, and we know little about Castañega (he held office at a Basque convent as late as 1555), he remains an important figure in the history of witchcraft and superstition. He was the first to publish a tract on witchcraft in a vernacular language and displayed a prudent and tolerant attitude in a climate of increasing animosity toward everything associated with witchcraft and related forms of superstition.

It is probable that Fray Martín—who was called a “preacher of the Holy Office” although the Inquisition had once arrested him (Muro Abad 1994)—witnessed the 1525 witchcraft prosecutions by the Inquisition in Navarre; he claimed to have seen an old man reconciled for this crime at an *auto de fe*. In accord with the new

inquisitorial guidelines of 1525 about witchcraft, Castañega’s skeptical attitudes offered a sharp contrast with the *Malleus Maleficarum* (The Hammer of Witches, 1486).

Castañega dedicated his work to the bishop of Calahorra, don Alonso de Castilla, who in turn required his parish priests to own a copy of the *Tratado*. Fray Martín’s task was to distinguish, in clear and didactic form, what was licit from what was superstitious. However, despite its indubitable merits, Castañega’s tract was overshadowed by the appearance, in the following year, of a longer work treating the same theme, written by one of Spain’s most famous theologians, Pedro Ciruelo. Although Ciruelo’s work was thereafter republished at least seven times, Castañega’s tract, which was in some respects more rational and skeptical, was not republished until 1946.

Castañega drew his doctrinal inspiration from many sources, including the Bible, Pliny, St. Augustine, Isidore of Seville, Thomas Aquinas, Bede, and above all the famous chancellor of the University of Paris, Jean Gerson, whose *De erroribus circa artem magicam* (Concerning Misconceptions About Magical Arts) provided a reliable guide to such delicate matters as the question of superstition. Castañega used these authorities principally in the first part of his tract (chaps. I–XI), concerning the Devil and his powers. It was there that Castañega seemed to admit the reality of the demonic pact and the possibility that witches flew to their gatherings, or even the existence of demonic excrements (a parody of the Church’s sacraments). Notwithstanding all this, Castañega’s more relativist and skeptical second part was dominated by his insistence on the Devil’s multiple traps and the many apparently real phenomena that were actually only illusions to ensnare men.

The last thirteen chapters (XII–XXIV), dedicated to the practices and practitioners of sorcery rather than philosophical ideas concerning possibility or impossibility, demonstrated a modern mentality which, without denying the possibility of demonic worship or possession, tried to seek a natural explanation for every apparently extraordinary or demonic phenomenon.

CATS

Cats remain a common representation of a witch's familiar and a widespread disguise of the Devil. Although ancient Greece and Rome, like Egypt, venerated cats as sacred, medieval Christianity distrusted them as unruly and lascivious animals. In the eighteenth century, shades of diabolization still burdened the reputation of this feline, nevertheless essential to the ecological balance of Old Régime Europe's agrarian economy. Torture of cats provided widespread popular entertainment throughout early modern Europe, but it is exaggerated to claim that ancien régime Europe witnessed any actual, long-lasting massacre of cats (Engels 1999). Interestingly, the phenomenon of trials against animals (locusts, rats) that by "virtue of Satan's obligation" were damaging victuals as grapes and grain shows a "frequency curve . . . similar to that of the witch trials, showing a maximum in the sixteenth and seventeenth centuries, . . . albeit . . . less frequent" (Dinzelbacher 2002, 410). But cats were not put on trial.

Medieval phobias about cats found an early expression in Guillaume d'Auvergne's depiction of Lucifer, who "may appear to his adepts and worshippers in the shape of a black cat or a toad, and is then kissed by them . . . under the cat's tail, . . . or on the toad's throat" (Bobis 2000, 198). The diabolization of felines seems closely linked with the fight against heresy. Pope Gregory IX's bull *Vox in Rama* (A Voice in Rama, 1233), attacking the "sect of the damned," depicted the horrible apparition to its novices and their masters "of a black cat about the size of an average dog, [that] descends backwards with his tail erect" (Kors and Peters 2001, 115–116), which everybody kissed on its hindquarters and adored. Two generations later, the crusading Order of the Templars was accused of doing this. In early fifteenth-century Rome, a cat was reported to have killed several babies until he was caught and blessed. He escaped but, because he was bleeding, left traces and was followed. He turned out to be an old woman, transforming herself into a feline and prolonging her life by sucking infants' blood.

The Dominicans played a pivotal role in consolidating the myth of the satanic cat as opposed to the faithful dog barking at heretics, an image found in the *Malleus Maleficarum* (The Hammer of Witches, 1486).

Both witches' familiars and the Devil took the form of a cat. Here a witch, with her cat familiar at her feet, urinates on her broomstick while holding a book of charms. (Cornell University Library)

In such other important fifteenth-century texts as *Errores Gazarionum* (Errors of the Gazars or Gazarii—Cathars was a common term for heretics and later witches) or Martin LeFranc's *Le Champion des Dames* (The Defender of Ladies), which helped to revolutionize witchcraft in the 1430s, cats began to assume additional roles, appearing when witches performed their *maleficia* (harmful magic) and providing transportation to Sabbats. The witch's feline associates were also widely reported to accompany *maleficia* with satanic noises: Jean Bodin mentions their devilish howling in a 1565 Moravian witchcraft case (Bobis 2000, 216).

However, no general European common pattern governs the witch's feline companions. Lorraine

witches, for instance, were never transported by cats, but Alsatian witches were. In Lorraine, among approximately 375 individuals tried as witches between 1580 and 1630, “wolves appear in thirty-six cases, . . . cats in thirty-four, and dogs in sixteen” (Briggs 2002, 13). Most villagers believed in shape shifting, but because of St. Augustine’s vigorous and authoritative opposition to the idea, the matter proved embarrassing for demonologists. Nevertheless, Pierre de Lancre reported how witches changed into cats in order to kidnap babies from their beds.

Despite such baroque sketches as Jean de La Fontaine’s *Puss in Boots*, the status of cats was slow to rise. In the Sieneese countryside, in 1705, after a witch attacked a baby in bed, “the very morning when he passed away, it looked as if all the cats in the world were roaring around the house” (Di Simplicio 2003, 88). In the late 1730s, Paris saw a mock trial “complete with guard, a confessor, and a public executioner” staged by workers of a printing shop; half-dead cats dumped in sacks were pronounced guilty and strung up for bewitching their boss’s house (Darnton 1984, 81). Still, general attitudes were slowly changing; in 1727, François-Augustin Paradis de Moncrief’s *Histoire des chats* (History of Cats) attempted to reverse medieval prejudices. But black cats have remained part of a witch’s entourage in popular folklore.

CAUL

Since the classical era, a host of supernatural properties have been attributed to the caul, or amnion, one of the two membranes that form the amniotic sac in which a fetus develops in the womb. On rare occasions, an infant is born with this thin membrane covering the

shoulders and head. In medieval and early modern Europe, cauls were associated foremost with protection; wearing a caul as an amulet offered its owner the same protection that the caul had provided the developing fetus. It could therefore ward off the evil eye, prevent death by drowning, and protect one in battle. A caul might also confer preternatural eloquence, guaranteeing lawyers success in the courtroom and even rendering a possessor’s declaration of love irresistible to whomever heard it.

In countries from Iceland to Russia, infants born “with a veil” (France), “with a shirt” (Italy), or “helmeted” (Germany) were furthermore believed to have been marked out for an auspicious fate. The caul destined its wearer for fame and fortune, as the seventeenth-century French proverb “happy the man who is born with the caul” suggests. In some countries, however, such blessings depended on the color of the caul at birth. While a white or red caul usually indicated good fortune, an English child born with black caul faced a lifetime of accidents and misfortunes—unless the caul was torn up and administered to the child in a drink.

In some European countries, the good fortune conferred by a caul could be inherited or even purchased. One seventeenth-century English knight willed his caul (set in a jeweled case, no less) to his daughter, and then specified that it be passed along to her male descendants. In ancient Rome, as well as early modern Denmark, Iceland, France, and England, the magical qualities of the caul could be purchased. As Europeans believed that cauls protected and brought luck to those born wearing theirs, it seemed logical to conclude that a caul would offer such advantages to anyone who possessed one, whether or not it had been theirs at birth. Consequently, Roman lawyers procured cauls from midwives for enhanced eloquence; in France, Louis XIV’s subjects bought cauls to serve as gambling charms; and as late as World War I, English sailors bought and sold cauls through advertisements in the London *Times*, believing that they prevented death by drowning.

Cauls might also confer supernatural powers on their owners. In Yugoslavia, a black caul indicated that the child would become a sorcerer or witch, unless the midwife took the precaution of either climbing up to the rooftop to announce the child’s birth or bringing the child to the door of the house and declaring three times that no sorcerer, but a baby, had been born within. Areas as distant as Iceland and New Guinea shared the belief that clairvoyants were born in the caul. The peasants of the Friuli region in northern Italy, made famous by Carlo Ginzburg, believed that infants delivered wearing a caul were destined to become *benandanti* (do-gooders), setting forth in their dreams to do ritual battle against witches and wizards who sought to destroy the harvest. It was common for a *benandante* to

have as many as thirty Masses said over his cauldron to heighten its protective powers, for its magical powers could be strengthened if an ordained priest consecrated it. This belief was widely held across Renaissance Europe, where it was common practice to baptize infants with their cauldrons.

During the early modern period, cauldrons could also serve as powerful ingredients of love charms. A distinct branch of magic drew its coercive power from material produced during the reproductive process, including not only cauldrons but also menstrual blood, sperm, and even afterbirths. A woman in Renaissance Italy who added either powdered cauldron or menstrual blood to a would-be lover's food, for example, would find him inflamed with passion, just as a German man carrying his cauldron would never find his affections unrequited. Hippomane, also considered a potent love charm, was similarly generated during the reproductive process, although not the human reproductive process. The equivalent of an equine cauldron, hippomane was a small, black, round, fleshy mass, found on the forehead of a newborn foal. It had been sought after as a love charm since classical times, and its powers were testified to as late as the eighteenth century.

CAULDRON

A cauldron is the pot or receptacle in which witches cooked their brews. Witches used these concoctions, either in liquid or powder form, to carry out harmful sorcery and to create the ointment that they rubbed on sticks or their bodies to be transported to distant places. Cauldrons were usually displayed over a fire, although they sometimes appeared as vessels on the ground or were held up high, spewing out powerful vapors. Smaller pots were also depicted in the fork of cooking sticks or hung from those sticks by their handles, as witches transported them through the air.

The association of the cauldron with witchcraft in European culture is ancient, going back to the cauldron's traditional role in magic and sorcery in ancient Greek mythology. Medea rejuvenated Jason by boiling his body parts and boiled drugs in a cauldron to restore the youth of Jason's father, Aison. In Teutonic and Celtic mythology, magical potions including blood were also

boiled or mixed in cauldrons for purposes of regeneration, divination, or the gaining of wisdom. Brass cauldrons appeared in the early sixth-century Salic laws, which mentioned men who carried those used by witches. Cauldrons used for boiling witches' brews reappeared in Johannes Nider's early account of the witches' Sabbath in Book 5, chap. 3 of his *Formicarius* (The Anthill), written in the late 1430s. Nider's inclusion of Peter of Bern's evidence of witches boiling the bodies of children in order to make magical ointments and powders was then copied into the *Malleus Maleficarum* (The Hammer of Witches, Part II, Q. 1, chap. 2) of 1486. From there, the skeptical Johann Weyer cited it in full in his *De praestigiis daemonum* (On the Tricks of Devils) of 1563 (Book III, chap. 1), thereby entering the mainstream of witchcraft literature.

While literary accounts of witchcraft emphasized the powders and ointments created in this cauldron, visual accounts often highlighted the cauldron itself. This visual emphasis on the cauldron originated with the woodcuts used in the more than twenty editions of Ulrich Molitor's *De laniis et phitonicis mulieribus* (Concerning Witches and Fortunetellers) published between 1490 and 1510. The image of two witches dropping a cock and a snake into a belching cauldron, and thereby cooking up a storm in the sky above, featured as the title page woodcut in seven of these editions.

In his famous chiaroscuro woodcut image of witchcraft from 1510, Hans Baldung [Grien] made the cauldron the central element around which his trio of naked women gather. His cauldron rests on the ground as a closed vessel, from which billowing vapors escape when the lid is lifted. In other images, a witch holds the cauldron aloft, like the flaming vessels held by Venus. This is how it appears in several of Baldung's drawings from 1514, as well as in the influential woodcut, possibly from Baldung's workshop, which first appeared in the collection of Johann Geiler von Kaysersberg's sermons published in 1516 and 1517 as *Die Emeis* (The Ants). That cauldron motif influenced many later illustrations of witchcraft, adorning works by Paulus Frisius, Abraham Saur, and Johann Weyer, among others. By the first two decades of the seventeenth century, when the Dutch artist Jacques de Gheyn the Younger and the Polish artist Jan Ziarnko incorporated cauldrons into their graphic images of witchcraft, they ranked among the most common and easily identifiable visual codes for witchcraft.

In various scenes of witchcraft, the cauldron serves to identify witchcraft as a female activity by linking it to the female task of food preparation, and through the link between food and sex, to female sexuality. The cauldron also offers a visual alternative to the vase or vessel, which was commonly used in sixteenth-century illustration as a symbol of the vagina or female sexuality. The small cauldrons held aloft by young witches

allude to the flaming vessels and torches that are attributes of Venus. The cauldron represented a complex and multivalent symbol of the sexual power of witches' bodies, their destructive sorcery, their involvement in the horrors of infanticide and cannibalism, and their capacity to create unnatural and wondrous effects.

CELESTINA, LA (1499)

Comedia o Tragicomedia de Calisto y Melibea (Comedy or Tragicomedy of Calisto and Melibea), better known as *La Celestina*, tells the story of a procuress and enchantress. Its author was the Toledo native Fernando de Rojas, and the work was first published in 1499. Critics often consider *La Celestina*, written in dialogue form in imitation of humanist Renaissance comedies, as the first Spanish novel, and probably the first European novel as well. It related the story of the ill-starred love of a noble couple, alongside the parallel tale of the intrigues and love affairs carried on by young Calisto's two servants with local low-caste women (*mozas*). Celestina, an aged prostitute and specialist in every art and artifice of love, shared the underworld in which these servants move.

As was suggested in the subtitle appended to later editions ("containing, in addition to its agreeable and sweet style, many philosophical dicta and very necessary advice for young men, demonstrating the deceptions to be found among servants and enchantresses"), the work came to be seen as a denunciation of the dangers of amorous passion taken to its ultimate

consequences, especially if one trusted intermediaries to approach the object of one's desire. In this sense, magic played a central role in revealing the moral implications of the events in the story—especially with regard to a particular form of love magic practiced by enchantresses since antiquity. A dozen years earlier, the *Malleus Maleficarum* (The Hammer of Witches, 1486) also spent several pages describing this form of magic and its supposed capacity to solicit such violent passion between enchanted people that they were powerless to exercise their own will. In this way, young Melibea, who at first rejected Calisto's amorous advances, fell madly in love with him after being seduced by Celestina, using a spell purchased by her suitor.

Celestina was described as an expert in her vocation, that of enchantment and procuring, with whom the law had previously dealt on more than one occasion. This fact has simply enhanced her prestige as a connoisseur of the secrets of love magic. She possessed a laboratory complete with the most varied ingredients with which to conjure her spells, equipped with a hangman's noose, a dragon wing, a bat's blood, and water from the first rains of spring (*agua de Mayo*). However, the most important ingredient for the spell to be cast upon Melibea was called "snake oil," a concoction of vipers cooked alive in a blend of wine and oil to refine the snakes' venom. The symbol of the serpent as representative of the Devil is clear, and the role of this animal also suggested itself in the entwined form of the oil-anointed yarn that Celestina managed to sell to Melibea. It was by means of this enchanted yarn that Melibea was subjected to a terrible passion that she later described as a sensation of "serpents eating my heart from inside my body."

The power of Celestina proceeded from her connivance with the Devil, as was demonstrated explicitly in her long incantation directed to the "master of the infernal depths" in which the enchantress urged the evil one to obey and grant her wishes. On this occasion she asked that Melibea buy the snake-oil-anointed yarn "and in such a manner . . . however much she sees him, so much more will her heart yield" and make her suffer "from a raw and powerful love of Calisto." Once during the spell Melibea met with Calisto and both were consumed by their desire, much to their mutual satisfaction. Nevertheless, their happiness immediately turned to ashes after the deaths of both of Calisto's servants, old Celestina, and, finally, the protagonists themselves, all of them victims of their own passions.

CERVANTES (SAAVEDRA), MIGUEL DE (1547–1616)

Cervantes was a world-famous Castilian writer (born and died near Madrid), known principally for his immortal novel *El ingenioso hildago don Quijote de la Mancha* (The Ingenuous Gentleman don Quijote de la Mancha, Madrid, 1605–1615). It described the adventures and misadventures of an elderly Castilian nobleman who, inflamed by books full of tales of chivalry, decided to live out his fantasies in the midst of the seventeenth century, much to the surprise, admiration, and ridicule of those who witnessed his exploits.

One of the principal features of chivalrous novels was the belief that the world was bewitched, abounding with enchanted persons suffering varied torments or metamorphoses from which they were unable to free themselves unless aided by a hero. Don Quixote, as a faithful follower of the knightly tradition, believed himself to be constantly surrounded by enchanters and enchantments. These were, of course, presented only as figments of his imagination; the celebrated episode of the "sham enchantment" that closed the first part of the book was nothing but a trick to make the protagonist return home. Given the constant tension in this work between that which was imagined and that which is real, it was not surprising that references to magic, enchantment, and the powers of the Devil appeared throughout, offering an interesting panorama of beliefs with regard to such matters in Spain during its Golden Age (*Siglo de Oro*).

Cervantes's profound skepticism regarding everything related to the world of magic and, more concretely, to witchcraft, manifested itself still more directly in some of his other works, as the *Novelas Ejemplares* (Exemplary Tales, Madrid, 1616), *Los trabajos de Persiles y Sigismunda* (The Travails of Persiles and Sigismunda), and the two surviving dramatic pieces of the twenty to thirty that Cervantes is believed to have written between 1583 and 1587, *La destrucción de Numancia* (The Destruction of Numancia) and *Los ratos de Argel* (The Works of Argel).

Cervantes treated magic and witchcraft at greatest length and most densely in the *Exemplary Tales*, partic-

ularly in the *Novela y coloquio que pasó entre Cipión y Berganza, perros del hospital de la Resurrección, que está en la ciudad de Valladolid, fuera de la puerta del Campo, a quien comúnmente llaman los perros de Mahudes* (Tale and Colloquy That Took Place Between Cipión and Berganza, Dogs of the Hospital of the Resurrection, Which Is in the City of Valladolid, Outside of the Puerta del Campo, Commonly Called "The Dogs of Mahudes"), a work with a title that was often abbreviated as *The Colloquy of the Dogs*. It offered a profound study of the relationship between life and fiction, presented in a small but masterly dialogue between the two canine protagonists. Its theme was the autobiographical remembrances of Berganza, which were interrupted now and again by bits of philosophical commentary from Cipión. The dog Berganza, like the protagonists in picaresque novels, went through many masters, but the central episode of his life and the one that he described at greatest length was that which he spent with an old witch named Cañizares.

Here, speaking through the character of a dog, Cervantes expressed his own opinions concerning the reality of the flights and metamorphoses attributed to witches, as well as those concerning their attendance at the Sabbath and their pursuit of demonic powers—that is to say, concerning the reality–imagination debate that, during the same period, a good number of theologians were working to clarify. Cervantes has the old witch say, "Some are of the opinion that we don't go to these gatherings except in our imaginations . . . others say, rather, that we actually go in body and soul; and both opinions I hold, for my part, to be true. For everything which happens to us in fantasy happens so intensely that there is no difference when we really and truly go." Cervantes's own clear vision concerning so controversial a theme was left for the end of the novel, when the wise and discreet Cipión, referring to the witch Cañizares, said, "Her words have to be taken in a sense that I have heard is called 'allegorical'; their literal sense I would not care to speak."

Throughout his works, Cervantes repeatedly made clear his attitude about the power of magic: from the viewpoint of a faithful Christian believer, nothing can compete with the liberty of the individual. For him, enchanters and witches were nothing more than simple poisoners lacking any type of supernatural power. In *El Licenciado Vidriera* (The Glass Graduate), for example, a student was the target of love spells from a woman who nevertheless did not manage to win him. ("She gave Tomás one of those things they call a charm, believing that the thing she gave would force him to desire her; as if there were in the world herbs, incantations or words sufficient to force free will.") In *La inglesa española* (The English Spaniard), his skepticism with regard to spells caused him to affirm roundly that "they are nothing but

tricks and frauds.” In *The Labors of Persiles and Sigismunda*, witchcraft was presented as a device with the capacity to make one ill, but without the power to constrain free will; an evil permitted by God, its effects were only temporary, as love and honesty would always prevail. In *The Destruction of Numancia*, Cervantes’s character Ma rquino represented the necromancers typical of his era, just as in *The Works of Argel*, he introduced a Muslim spell-caster named Fatima who specialized in love magic; but his message remained the same: regardless of its paraphernalia, deceitful magic can do nothing when faced with virtue.

CESALPINO, ANDREA (1519–1603)

Cesalpino was demonologist and the author of *Daemonum investigatio peripatetica* (Aristotelian Investigation of Demons), a report to the archbishop of Pisa, who had consulted him about apparent mass possessions of nuns in a Pisan convent in 1574–1575. Cesalpino was also an Italian botanist, Aristotelian philosopher, professor of medicine at Pisa and Rome, and physician to Pope Clement VIII after 1592. Historians of science praise Cesalpino for classifying plants according to reproductive organs and for his theory of pulmonary blood circulation. Historians of philosophy appreciate his Aristotelian account of the relation between God and the soul.

Cesalpino disputed the idea, which he traced to Galen, that natural explanations adequately explain all ailments: “[Galen] fell into these absurdities because he did not believe there was anything divine or immortal in this lower world” (Cesalpino 1580, sig. B1r). Cesalpino demonstrated on Aristotelian grounds that natural causes, including astrological influence and the force of the imagination, cannot sufficiently explain disease. Rather, demons truly existed and could cause physical and mental ailments. Cesalpino’s defense of supernatural causation required that he refute the idea, worrisome to theologians since Thomas Aquinas, that Aristotle did not support the reality of angels and demons. This notion is erroneous, Cesalpino said:

Aristotle never opposed the reality of angels and demons, but considered them outside the natural realm, as Christians do. Aristotle neither ignored nor contested theological speculations of previous philosophers and theologians, from the Egyptians to Plato. Christians can learn about demons most reliably from biblical revelation.

Like Aquinas, Cesalpino did not accept demons on faith: he interpreted *maleficium* (harmful magic) and demonic possession as empirical evidence of demonic reality. The Pisan nuns exhibited symptoms that implied the presence of demons: speaking languages of which they were ignorant, fleeing sacraments, and rebelling against holy rituals. The nuns and others like them ardently desired to partake of sacraments and ritual, but felt a foreign presence inside them resisting anything holy (Cesalpino 1580, sig. F3r).

Maleficium forcefully demonstrated the reality of a supernatural causation, which, because it was evil, must be demonic. Without acknowledging his source, Cesalpino copied much of the final eleven of his fifteen chapters from the *Malleus Maleficarum* (The Hammer of Witches, 1486), including its most grotesque anecdotes. He claimed that witches, generally either men of the lower classes or women, could teach scholars many things about demonic reality.

Cesalpino’s competitor in interpreting the Pisan possessions, as in much else, was the Pisan Platonic philosopher Francesco de’ Vieri, whose *Discorso intorno a’ dimonii volgarmente chiamati spiriti* (Treatise on the Demons Popularly Known as Spirits) reached similar conclusions about demonic reality. Vieri asserted that “Our faith is greatly augmented by witnessing possessed people and their liberation at the hands of the exorcist” (Vieri 1576, 73).

Both the physician Cesalpino and Vieri the philosopher stood in a tradition of writers reaching back to Aquinas. Disturbed by the idea that Aristotle opposed supernatural causation, they defended demonic reality by vindicating possession and witchcraft. Later exponents include Giovanni Lorenzo D’Anania (Anania), who, noting the skepticism of Epicureans and Peripatetics, asserted that “Philosophers and other experts among the ancients fought persistently over the question whether demons exist as something that God made in Nature, or rather as something that the human mind and inventiveness imagined for itself: nor was there ever any agreement among them” (Anania 1654a, 3; cf. Anania 1654b, 9). As a natural philosopher and physician celebrated for his very real and significant scientific discoveries, Cesalpino becomes a particularly ambiguous and interesting figure among early modern demonologists.

CHANNEL ISLANDS

Politically English but culturally French until the twentieth century, the self-governing Channel Islands off the coast of Normandy comprised the most intensive witch-hunting zone anywhere in Atlantic Europe. Recorded executions for witchcraft began by order of the royal court of Jersey in 1562 and by order of the *bailli* (chief officer of a local royal court) of Guernsey in 1563, although indirect evidence suggests that a man had been executed there for witchcraft as early as 1550. Despite some gaps in their records, we know that its two principal islands, Jersey and Guernsey, which together contained less than two dozen parishes and fewer than fifteen thousand adults, put at least 167 people on trial for witchcraft between 1562 and 1661 and executed at least 90 of them (43 on Jersey, 47 on Guernsey).

Economically and culturally, the Channel Islands should be seen as an offshore extension of Normandy. Although they have been under English suzerainty since the Norman Conquest, the islands continued for many centuries to use the customary laws of Normandy, supplemented by local privileges. Until Elizabeth I's reign, their parishes belonged to the Norman diocese of Coutances. Norman witch beliefs can be traced as far back as the execution of Joan of Arc. One finds women born in Normandy who were banished as witches from both Guernsey (in 1619 and 1622) and from Jersey (in 1626 and 1649). They were more fortunate than a notorious fortuneteller from the tiny island of Alderney who moved to the mainland and was burned for witchcraft at Rouen in 1617; a pamphlet about her, *La devineresse d'Aurigny* (The Fortuneteller of Aurigny) was mentioned ten years later (Monter 1997, 579).

The witches' Sabbat, apparently unknown in England until the seventeenth century, appeared in the very first recorded trials from the Channel Islands. Guernsey's witches reportedly gathered at a high rock on the island's southwestern coast, overlooking a small Benedictine priory and chapel on the tiny islet of Lihou, and defiantly challenged the Holy Virgin with untranslatable chants of "*Que hou hou, Marie Lihou*" (Uttley 1966, 18). The early acculturation of the witches' Sabbat directly contributed to occasional clusters of executions in the Channel Islands—for example, the five witches burned on Jersey in 1585 and the eight witches burned on Guernsey in 1617. However, no true witch-hunting panic involving ten or more suspects ever erupted anywhere in these islands at any time; even when one notorious witch (Collette Dumont, Guernsey, 1617) confessed to attending a Sabbat with sixteen other men and women along with their familiars (thus proving that the Channel Islands borrowed witchcraft concepts from England as well as Normandy), but she could identify only two of them. Sexual intercourse with the Devil, another key feature of continental witchcraft (including Normandy by 1600) also seems absent from confessions by Channel Islands witches, who, in sharp contrast to Normandy, were overwhelmingly female.

The single most important explanation for the exceptional severity of witch hunting in the Channel Islands is that they were simultaneously part of continental western Europe and completely self-governing. Channel Islanders earned their living from farming and livestock as well as fishing, making them vulnerable to the same forms of agricultural *Maleficia* (evil acts) that afflicted neighboring Normandy. The two main islands have always emphasized their differences, as the names of two major breeds of cattle still attest. During the age of witch hunting, their legal systems also differed greatly. Jersey used an elaborate, multilayered system of criminal juries, while Guernsey preferred a more centralized system of trial by nine *jurats* (municipal councilors) under supervision from its *bailli*. Unlike England, both systems allowed the use of torture. Jersey, with a slightly larger population than Guernsey, apparently brought fewer accused witches to trial than its neighbor, but convicted and executed about two-thirds of such defendants. Guernsey, with a simpler criminal court system, brought many more accused witches to trial (102) but executed fewer than half of them. Unsupervised by trained jurists in appellate courts, the farmers and fishermen of the Channel Islands put more witches to death than even the most witch-ridden English county, Essex, with more than 100,000 people, and they executed as many witches as Normandy, with nearly a million adults.

CHARMS

Charms are magical words, artifacts, chants, or incantations used to protect against or cure disease, or to counter witchcraft. Charms have been employed since ancient times. The etymology of the word, from Latin *carmen* or song, shows that in the Middle Ages it implied verbal formulas; in modern languages, it is more widely applied. There are spoken charms and those written on parchment, stone, wood, cloth, and so on, and sometimes worn on the body. There is a distinction between "charms" as traditional spoken formulas intended to bring good luck or good health and explicit prayers, which are "blessings." Items worn, carried, or displayed to bring good luck and success, or to avert misfortune and evil powers, are called lucky charms, or mascots. Certain objects used as healing charms are treated with special care and loaned out to those in need: for example, eaglestones were alleged to help women in labor, beads treated sore eyes, Irish stones and sticks helped against snakebites.

Another type of charm combines words with feats. The function of charms is very complex, because they are used to serve desires and purposes within every society: they can incite or ward off love; preserve virginity, but also enforce potency; and gain victory in war, making warriors invulnerable to defeat by enemies. In rural communities, charms can protect crops and farm animals, preserve food, and ward off parasites. Presumably, most charms function to preserve or restore health.

FORM AND FUNCTION

Generally speaking, in charms we can find elements of Christianity mixed with surviving elements of paganism, miracles, and magic: The Catholic liturgy joins folklore in a holistic view of the world where interdependent physical and spiritual realities intertwine. The distinction between a charm and a prayer was subtle; Christian charms often incorporated holy names or used phrases that were similar to those of the liturgy. A few charms came straight from the Bible, like one from Ezekiel 16:6, used to staunch bleeding: "And when I passed by you, and saw you weltering in your own blood, I said unto you in your blood, 'Live and grow up like a plant in the field.'"

More widespread were charms that recounted some pseudobiblical event, for example, Jesus miraculously stopping the flow of the river Jordan. A St. Peter charm was said to work against toothache and a St. George charm to ward off nightmares. All such cases assumed that the saint's power to resist or overcome some particular evil was available to heal the user. The formula contained words of command supposedly uttered at the original event, enhancing the healer's authority. Another charm to staunch blood was widely used in England, France, and Germany. A fifteenth-century English version illustrated the typical literary form of the charm, combining a reference to a biblical precedent for curing the sickness or injury with a petition that the sufferer will similarly recover:

When our Lord Jesus was done on the cross, Longinus came with his spear and pierced him in the side. Blood and water came out . . . through the holy virtue that God showed there. I conjure thee, blood, that thou come not out of this Christian man. (Robbins 1959, 85–86)

In the Early Middle Ages, a man named Adelbert claimed that the Archangel Michael had given him a letter from Jesus that had fallen from heaven. This was one of the earliest mentions of the so-called *Letters from Heaven*, a tradition of charms quite popular during the Middle Ages, lasting until the beginning of the twentieth century.

A charm known in many countries is among the few with pagan origins: It tells how to heal a horse's sprained leg with the words: *Bone to bone sinew to sinew vein to vein*. In an early medieval German version, it was Balder's horse that was hurt and the god Odin (Wodan, Wotan) who healed it. Here, and in many other cases, the crucial formula was made memorable by rhythmic phrasing, repetition in rhyme, or alliteration. A number of elaborate Anglo-Saxon and German verse charms have been preserved; a recent work (Schulz 2000) offered a scholarly edition of a corpus of German charms, the Dieterich Collection, made at the beginning of the twentieth century.

THEOLOGIAN AND DEMONOLOGISTS

Medieval Christianity encouraged the use of certain holy objects as charms. The most popular among them was (and still is) the *Agnus Dei*, a small wax seal bearing images of the lamb and the Roman emperor Constantine's flag. When blessed by the pope, it protected its wearer against many evils, including thunder, lightning, fire, drowning, or death in childbirth. St. Thomas Aquinas tolerated the use of amulets containing biblical texts, although he suggested refraining from it. The *Malleus Maleficarum* (The Hammer of Witches, 1486) offered seven rules to distinguish good

from wicked charms. A charm was approved if it contained no suggestion of any pact with the Devil; no unknown names; nothing that was untrue; no rituals except making the sign of the cross; no credence in the manner of writing, reciting, wearing, or using the charm; only phrases from the Bible in the original context; and assurances that the charm's efficacy depended entirely on God's will (Robbins 1959, 86).

However, some prayers used in exorcisms, or practices like the blessing of salt for animals, seem very close to pagan charms—especially to Protestant theologians, who regarded all charms as superstitious. Typically, William Perkins, in his *Discourse of the Damned Art of Witchcraft* (1608), defined the charm as a spell or verse used as a signal to make the Devil work wonders.

CHARMERS AND CUNNING MEN, LEECHES

Medieval charmers possessed a large repertoire. Certain men and women were thought to have the gift of healing a specific disease or injury in humans or farm animals. For some the gift was inborn, but more often it depended on a secret verbal charm or ritual learned from an older healer, usually a relative who was near death. Each charm cured only one trouble, and most charmers knew only one or two. Another group owned a material object such as a snakestone, to be loaned when needed.

Medieval literature provided numerous examples of charms and devices for magical healing. The famous Hildegard of Bingen provided healing charms together with proper remedies. Various methods were used. Many charmers stroked the injured area after wetting their hand with their own spittle; others blew on it; for warts, simply looking at them or counting might suffice. All these actions might be accompanied by prayer or by verbal charms.

Cunning men used magic to combat the effects of witchcraft. The Church approved their use of Christian prayers and Bible verses as cures or protection against evil, but disapproved of the closely related practices of many folk healers. "White" witches used traditional charms to help heal evil spells, reinforcing the properties of their herbs or amulets; consequently, charms sometimes appeared as evidence in trials for sorcery and illicit magic. In this context, the Roman, Spanish, and Portuguese Inquisitions acted almost as ethnographers, recording with minute accuracy the spells and charms used by hundreds of practitioners of what the Holy Office condemned as "superstitious" magic. Protestant authorities, of course, were equally severe toward such untrained healers; for example, a charm recited to cure a bewitched person became prosecution evidence in a Lancashire witchcraft trial.

The professional charmer, though barely surviving in extremely remote rural communities or animistic cultures, has resurfaced and gained fresh momentum in

such sophisticated contemporary circles as the New Age movement.

CHESAPEAKE

Belief in witches emigrated with the colonists from England to the North American colonies, but the accused witches of the Chesapeake differed from their Puritan New England counterparts. Whereas high numbers of accusations and executions occurred in the northern colonies, in the southern colonies, cases numbered fewer than forty (twenty-eight women, seven men, and two children) and involved few executions. Although belief in witches and legislation against witchcraft existed in the south, issues of survival and profit outweighed the need to identify, accuse, and try supposed witches, and acquittal was the usual outcome in these cases.

The first recorded witchcraft accusation in an English colony in North America occurred in 1626 in Jamestown. Joan Wright was accused of complicating a childbirth, prophesying, ruining crops, and bewitching animals. In this extremely rare case where the accused was a midwife, Joan's services were refused because she was left-handed, a supposed evil omen. Both the child and his parents fell ill soon after birth, and when the

infant died, suspicion fell on Joan, who was acquitted of the charges.

The first death associated with charges of witchcraft in the Chesapeake occurred at sea aboard a ship bound for Maryland in 1654. Panicked passengers threw Mary Lee, an elderly woman, overboard when bad weather threatened the journey. The storms did not abate with her death, and the crew and passengers were further plagued with sickness until the ship reached its destination. Two other women and a young boy suffered similar fates: Elizabeth Richardson (1658), Katherine Grady (1659), and Robert Charles (1662). When the ship on which Grady was traveling was plagued by violent storms, she was not thrown overboard but was hanged at sea. The report of her execution caused the captain of the ship to be called before the court in Jamestown to explain his actions. Chesapeake courts might convict and condemn a witch to death, as Maryland did with Rebecca Fowler in 1685, but they took a dim view of a ship captain acting as judge and jury.

These shipboard executions highlight in extremely concrete fashion that immigrants brought witchcraft beliefs across the Atlantic with them. Patterns in colonial America thus might be expected to match those that were occurring in England in the seventeenth century, with a high incidence of accusations against women and a focus on *maleficium* (harmful magic). Accusations in colonial America generally mirrored these trends, but varied regionally. As in England, the Devil was absent from most witchcraft cases in the Chesapeake and concern centered not on heretical behavior but on harm to people, crops, and animals.

On the other hand, the Jonah-like notion of pitching passengers overboard to calm the seas was unique to ships sailing to the Chesapeake. Moreover, several charges of “riding a person” are found in this area. This charge has European roots—cases can be found in England and in Scandinavian folklore—but was less common elsewhere. In addition to the riding charges, Virginia saw many suits in which plaintiffs sued to restore their good names after being called witches, following an act passed in 1655 by the General Assembly of Virginia that defined accusations of witchcraft as scandalous and slanderous. Unsubstantiated accusations could be punished with a fine of 1,000 pounds of tobacco.

Speech figured prominently in accusations as well as in slander suits. In one well-documented case, Eleanor Neale was accused of cursing her neighbor through fighting words and an ill tongue. Her case also illustrated a folk remedy, one of many in the Chesapeake, for dealing with witches: the victim found relief by nailing a horseshoe over his door and contriving to have Neale pass under it. The rest of the charges against Virginia witches were potpourri of allegations from harming

people or animals to prophesying. Only a handful of suspects, including the only documented case of witchcraft in North Carolina, were accused of using witchcraft to murder another person.

Accusations of witchcraft in the Chesapeake continued after 1700, with charges brought against a Virginia woman named Grace Sherwood for a variety of offenses, and against two Maryland women, but none of these women suffered severe punishment.

CHILDREN

From newborns to adolescents, children played significant roles in witchcraft trials, but these roles changed over time, from victims to accusers. At first, very young babies were favorite targets of witches and were even eaten at some early witches’ Sabbats. The role of very young children as major victims of witches continued throughout the phase of intensive witch hunting, but older children began taking on an important role as accusers and witch finders during the sixteenth century. By the beginning of the seventeenth century, children below the age of majority were being imprisoned and punished for witchcraft in parts of Europe, principally for attending Sabbats. In the final stage of witch hunting, some adolescent accusers were punished for perjury rather than witchcraft.

The earliest descriptions of witches’ gatherings in the fifteenth century revealed three different ways that witches allegedly attacked very young children. An Italian method, popularized in the sermons of St. Bernardino of Siena and found primarily in Umbria, featured elements of vampirism, with witches in the form of large insects sucking babies’ blood. Almost contemporaneously, early Swiss Sabbats (which conflated stereotypes about witches with those about medieval heretics, including horrifying parodies of the Eucharist) included descriptions of cannibalism, with witches not only killing but also eating the

flesh of very young children at their diabolical assemblies. Other early witches were accused of simply killing children through malevolent spells, without resorting to either vampirism or cannibalism.

Both the central Italian vampirism tradition and the Swiss cannibalism tradition continued deep into the sixteenth century, particularly in more remote rural districts, but they tended to disappear from accusations and trial records after 1600. Meanwhile, the role of babies and young children as principal victims of witches' evil spells or *Maleficia* (harmful magic) continued to hold a central place in accusations in several parts of Europe throughout the 1500s, and continued long after 1600. In a world where child mortality was extremely high by today's standards, it was obviously impossible to attribute most infant deaths to witchcraft; but corroborative evidence, especially threats by older women, made many accusations seem viable.

Meanwhile, a sinister new development involved older children in the business of finding witches. It is first traceable among sixteenth-century Basques. During the great Navarrese witch hunt of 1525, the traveling judge took along "two girl witches who identify other witches"; with their help—he lined suspects up, and the two girls simply looked directly in their eyes—he eventually hanged about forty witches (Idoate 1978, 268). Afterward, such witch finders reappear with depressing regularity in Basque witch hunts; "the presence of young girls, always as accusers with identifiable targets, was almost inevitable," notes a leading historian (Idoate 1978, 64, 128–130, 134). Two girls, aged nine and ten, testified against their parents and neighbors in 1539. Even younger children of seven and eight appear to have begun another major witch hunt in 1569–1570, but this time the Spanish Inquisition finally persuaded them to retract their accusations; the same thing happened again in 1575, when a ten-year-old girl denounced her grandmother for taking her to a witches' Sabbath. Seventy years after the great hunt of 1525, yet another Navarrese girl, aged twelve or thirteen, became a professional witch finder. Little wonder, then, that a Basque parish priest had little difficulty in keeping forty child-witches between the ages of six and twelve in his home in 1609, or that the famous Inquisitor Alonso de Salazar y Frias listened to confessions from 1,384 child and adolescent witches during his visitation of Navarre two years afterward.

As major witch hunts swept across parts of western Europe after 1580, children played a significant role in helping to convict witches, because they could spontaneously and without torture identify people who attended witches' Sabbats, without themselves suffering the full legal consequences. In Germany, an eight-year-old boy became an important accuser when the first great outbreak of witch hunting began at Trier in 1585. Peter Binsfeld, the suffragan bishop of Trier, first

broached the issues of the credibility and punishment of underage witches who accused adults of taking them to Sabbats in his 1589 demonological treatise (Behringer 1989, 33–34). The boy's example was soon imitated elsewhere; for example, a boy of fourteen began a chain of accusations in the prince-bishopric of Augsburg that led to the deaths of twenty-seven women in 1589, and other juveniles subsequently provoked a major hunt at Ellwangen in 1611. Binsfeld's preoccupations with juvenile witches were soon shared by other demonologists, who surpassed the bishop's recommendation of whipping them; in 1595 his Lorraine colleague, Nicolas Rémy, raised the question of reducing the legal minimum age for imposing the death penalty on witches (Monter 1993). Meanwhile, in eastern France, where diabolical possession played a more important role in witch hunting, Henri Boguet began his 1602 demonology with the case of a bewitched eight-year-old girl who uncovered many witches and whom the judge found "as believable as if she were thirty or forty." But, he also felt impelled to defend his leniency in punishing a girl of fourteen who admitted attending a witches' Sabbath with banishment rather than death.

The earliest known case where a preadolescent witch actually received capital punishment occurred in Rémy's Lorraine. In 1603, a twelve-year-old boy was condemned to death for witchcraft and the sentence was carried out. Once this threshold had been crossed, judges in the same district sentenced a nine-year-old boy to death in 1606, but the duke postponed his execution, and he was sent home two years later. Something similar occurred on a far larger scale in the Southern Netherlands, where the seigneurial court of Bouchain sentenced thirty-two minors to death for witchcraft between 1611 and 1615, together with almost 100 adults. Thirteen minors were executed, the five youngest being hanged secretly, until the archdukes forbade further executions of underaged witches. However, three other child-witches were subsequently put to death after reaching the age of majority (Muchembled 1987, 210–211).

The single worst episode occurred during a major German witch hunt. Between 1627 and 1629, the 29 groups of witches executed at Würzburg included 41 minors and 119 adults. Two-thirds of the juvenile witches executed for attending Sabbats were boys, many of them students, including a nephew of Würzburg's prince-bishop. The victims also included "a young girl of nine or ten, and a smaller one, her younger sister." Soon afterward a "New Treatise on the Seduced Child-Witches" appeared in Electoral Mainz. After the great hunts ended, one still finds children and juveniles at the origins of smaller German witch panics, although the habit of putting young witches to death dropped sharply after 1630.

The main role played by children in English, Scottish, and New England witch hunts was as demonically possessed accusers of other witches. Child demons in England identified numerous witches as the cause of their afflictions in the late sixteenth and early seventeenth centuries. The most famous of these demons were the five daughters of Robert Throckmorton, whose accusations led to the execution of three witches in 1593. In 1692 a group of teenage girls in Salem Village in Massachusetts initiated a major witch hunt when they identified a number of witches as the cause of their bodily fits and convulsions. Similar charges of witchcraft brought by an eleven-year-old Scottish demoniac, Christian Shaw, resulted in the execution of seven witches at Paisley in 1697.

A final twist to the question of what credit, if any, should be given to testimony by underage witches occurred during the great Swedish witch panic that began in 1668. Hundreds of children testified that their parents or neighbors had taken them off to large-scale Sabbats at Blåkulla. However, Swedish law disallowed testimony by anyone under age fifteen, and two witnesses were required to prove a defendant's guilt. On this occasion, Swedish judges arrived at an original way around this difficulty by weighing a child's testimony proportionately to his or her age, a boy of fourteen, for example, being worth half an adult, but a child of six or seven being worth a relatively small fraction; the fractions were then added until the sum reached two, whereupon the guilty person could be arrested. The panic lasted seven years and took close to 200 lives. Before it ran its course, it had generated 10,000 pages of testimony, much of it from juveniles. When it finally ended, the Swedish royal court judges sentenced a lad of thirteen, whose testimony had been instrumental in many arrests and convictions, to be hanged for perjury—a unique instance in the annals of European witchcraft.

Unfortunately, the sad story of the child-witch does not end there, or at Salem. For example, children were involved in a steadily increasing share of seventeenth-century witchcraft trials in the Duchy of Württemberg (Weber 1996, 103–104). Wolfgang Behringer has argued (1989, 39) that “in the late seventeenth and early eighteenth centuries a large share of those executed as witches were children,” pointing not only to the notorious *Zauberer-jackl* (Sorcerer-Jack) trials at Salzburg, but also to cases at Freising and Augsburg as late as 1720; the last witches to be executed in Bavaria, in 1754 and 1756, were girls of fourteen (Behringer 1997, 350–352).

The disquieting story of children and diabolical witchcraft did not end in Voltaire's day, as contemporary Satanic ritual child abuse trials have shown. The sad events of recent decades have influenced some scholars to allege that participation in the phenomena of diabolical witchcraft involved abuse of people below

the legal age of adulthood. While verbal abuse of inferiors (whether workers, women, or children) was undoubtedly common in Western civilization, we have no direct evidence that the minors who identified adult witches (whether or not they were demonically possessed) were physically or sexually abused; and psychological theorizing cannot suffice to demonstrate the presence of such abuse. Instead, when seen in a long-term perspective, the history of witchcraft accusations and trials involved considerable abuse of vulnerable adults by manipulative adolescents and children, who because of their age escaped the legal consequences of their accusations.

CHRISTIAN IV (1577–1648)

King of Denmark-Norway from 1588 to 1648 (including the regency of chancellor Niels Kaas during the king's minority until 1596), Christian IV was a firm believer in witchcraft, but time and time again he appeared to be restrained by earlier Danish rules concerning witchcraft trials and by his own sense of

upholding the rule of law. The sixty years of Christian IV's rule coincided chronologically with Europe's most extensive witchcraft persecutions. Denmark was no exception to this trend.

Denmark's most famous incident of witchcraft occurred during his minority, following the arrival in 1589–1590 of the Scottish King James VI in the Danish capital of Copenhagen to bring his bride, Princess Anne, the sister of the king, back to Scotland. A heavy storm forced the Danish fleet to seek shelter under the Norwegian coast. Suspicion arose that witches had masterminded this incident, and trials followed in East Lothian and Edinburgh, Scotland, as well as in Copenhagen. The trials showed that witches in the two countries had worked together; the North Berwick witches had thrown a black cat in the sea, and witches in Copenhagen had put eggshells into the water to raise the storm. Thirteen witches were executed in Copenhagen, but no pervasive witch hunt was launched in Denmark, whereas James VI had even more witches executed in Scotland and wrote his famous *Daemonologie* (Demonology) in 1597 after this episode.

Although it was a well-known fact that the Sami of Finnmark in the northernmost part of Norway dabbled in witchcraft, it was not until 1609 that the king ordered all Sami involved in witchcraft punished by death. However, the letter to his governmental officers must be seen in connection with the thwarting of Russian and Swedish plans to expand their influence into Finnmark. At the same time, the Danish king struck at the external as well as the internal enemies of the Danish-Norwegian kingdom.

Throughout his entire reign, Christian IV was preoccupied with Denmark's strained relations with Sweden. In 1611 he wrote from his military camp during the Calmar War that the Danes had found a large number of wax images buried in the ground. The Danes supposed that the Swedes had resorted to witchcraft to destroy the Danish army.

The king was well aware when the small town of Køge was shaken by the execution of eleven witches in 1612–1613. After the final sentence, he ordered one of them transferred to the castle of Copenhagen to be tortured. The *Køge Huskors* (The Nuisance of Køge) became one of the most important preludes to the promulgation of the Witchcraft Statute of October 12, 1617.

In 1625 a woman was accused of obtaining a hair from the king as well as from his son in order to kill the king and lead his heir into a sexual relationship with a noblewoman the king disliked. After a High Court judge acquitted her, the king dismissed him and continued to call the woman a witch. However, he could not compel the Council of the Realm to pursue the case further.

During the next year, while waging war in Germany during the Thirty Years' War, the king remarked in a letter about a number of cases in Elsinore that there were too many witches, and the best thing would be to get rid of them once and for all—but he did nothing more about it. Memories of the Køge witches fourteen years earlier remained sufficiently vivid in people's minds that the woman who had been transferred to the castle of Copenhagen was mentioned during the Elsinore cases.

In 1642, in the most notorious Danish witchcraft trial, Christian IV inexplicably had the wife of an innkeeper, Ma ren Splids, brought to Copenhagen from the town of Ribe in Jutland to interrogate her—probably using torture, which was against Danish law—although she had been acquitted of the charges in her hometown. However, cases where Christian IV interfered personally in witchcraft cases were exceptional.

During Christian IV's reign, the Danish High Court judges acquitted approximately half of all accused witches. The king must have been aware of this high acquittal rate, as he took an active part in the King's Bench (Denmark's Supreme Court), where the judges consisted of the Council of the Realm and the king. Christian IV was *primus inter pares* (first among equals) and took a great interest in all cases. When an ordinary case of witchcraft came to the King's Bench in 1630, Christian IV was not present, and the Council had to try to reach a decision. Three of the eight members of the Council proposed to ask the king how to handle this case, which must be considered a remarkable suggestion, as the Witchcraft Statute had been passed only thirteen years previously. Finally, the Council reached an agreement to let the case rest, until the king could be asked. In 1631, in the king's presence, the woman was finally acquitted.

This case epitomizes the enigma of Danish witchcraft trials. Although Christian IV was a firm believer in witchcraft, and a strong advocate of persecuting the perpetrators, he apparently never contemplated changing the basic Danish legal rules toward an inquisitorial procedure, which would no doubt have lowered the high acquittal rate.

CHRONOLOGY OF WITCHCRAFT TRIALS

European courts prosecuted witches from the early fifteenth century until the late eighteenth century, but the great majority of trials took place in the closing decades of the sixteenth century and the first thirty years of the seventeenth century. The number of trials in the various courts that tried witches followed different chronological trajectories; a period of intense prosecution in one jurisdiction sometimes coincided with a period of relative inactivity in another. The reason for such different chronological patterns is that witch hunts often arose in response to social, economic, or political conditions that were peculiar to a particular area. Another variable was the degree of determination by local officials to prosecute witches. Zealous witch hunters were naturally more likely to burn more witches during their tenure than those who had doubts regarding the guilt of witches or the possibility of their crime.

Despite these variations, it is possible to chart the rise and fall of witchcraft prosecutions throughout Europe and colonial America in very general terms. Except in some areas of eastern Europe, where trials did not reach their peak until the eighteenth century, a few broad patterns emerge. Witchcraft trials gradually increased as the crime of witchcraft became more clearly defined in the fourteenth and fifteenth centuries, leveled off or declined during the first half of the sixteenth century, reached epidemic proportions in the late sixteenth and early seventeenth centuries, and declined in the late seventeenth and eighteenth centuries.

EARLY WITCHCRAFT TRIALS, 1300–1520

Prior to the 1420s, the concept of witchcraft as a crime involving both *maleficium* (harmful magic) and devil worship was in the process of formation; therefore, it is problematic to speak of the prosecutions that took place during those years as witchcraft trials. Most such trials before the 1420s were prosecutions either for simple *maleficium* or for ritual magic. The trials that took place during these early, formative years can be divided into three shorter periods. From 1300 to 1330, most of the “witches” were ritual magicians who attempted to harm political rivals or to advance their careers. In the second period, from 1330 to 1375, the trial of politically related cases virtually ceased, but there were a substantial number of sorcery trials. Whether these trials were for simple *maleficium* or for ritual magic is difficult to determine, but in either case, the most noteworthy feature of the prosecutions is the absence of charges of diabolism. During the third period, from 1375 to the 1420s, not only did the number of prosecutions increase, but charges of diabolism also became more common, mainly in Italy. This development, which was facilitated by the adoption of inquisitorial

procedure in local courts, reflected the gradual assimilation of charges of diabolism to those of *maleficium* (Kieckhefer 1976, 10–26).

Beginning soon after 1420, the history of European witchcraft prosecutions entered a new and radically different phase. Not only did trials for sorcery increase in number, but also charges of diabolism were more frequently grafted onto them, and witch hunting began to assume the characteristics it maintained throughout the period of prosecution. During the 1420s, and 1430s, the full stereotype of the witch, complete with descriptions of the witches’ Sabbat, emerged, most notably in trials in the western Alps. For all intents and purposes, these fifteenth-century trials mark the beginning of the European witch hunt. It was during this period, moreover, that the first witchcraft treatises—most notably Johannes Nider’s *Formicarius* (The Anthill, written 1437/1438, published 1475), Heinrich Kramer’s *Malleus Maleficarum* (The Hammer of Witches, 1486), and Ulrich Mlitor’s *De laniis et phitonicis mulieribus* (Concerning Witches and Fortunetellers, 1489)—appeared. The publication of these works, which emphasized the diabolical as well as the magical dimensions of the witch’s crime, corresponded to an increase in the number of prosecutions.

THE PERIOD OF LIMITED PROSECUTIONS AND SMALL HUNTS, 1520–1560

At this point, the history of European witch hunting followed a somewhat surprising course. Instead of slowly accelerating and leading into the large panics of the late sixteenth and early seventeenth centuries, the number of trials leveled off during the early sixteenth century, and in certain areas actually declined (Hansen 1901, 68–262; Foucault 1907, 297–306; Midelfort 1972, 201–202). This decline did not escape the notice of contemporaries. In 1516, Martin Luther claimed that although there had been many witches and sorcerers in his youth, they were “not so commonly heard of anymore” (Levack 1995, 186). As one might expect, there were some areas where Luther might have heard much more about witches during these years. There were a number of trials in the Basque country between 1507 and 1539; in Catalonia in 1549; in the diocese of Como and in other parts of northern Italy in the 1510s and 1520s; in northern parts of Languedoc between 1519 and 1530; and in Luxembourg, Namur, Douai, and other parts of the Low Countries throughout the first half of the sixteenth century. There also were occasional prosecutions in places like Nuremberg (Kunstmann 1970, 39–73), but it is difficult to avoid the conclusion that the early sixteenth century was a period of relative tranquility as far as witchcraft was concerned.

This leveling-off or reduction in the intensity of witch hunting during the first half of the sixteenth century was reflected in, and to some extent possibly caused by, an interruption in the publication of witchcraft treatises and manuals. The *Malleus Maleficarum*, for example, while enormously popular between 1486 and 1520 and again between 1580 and 1650, was not reprinted between 1521 and 1576. Similarly, none of the other fifteenth-century witchcraft treatises found a market during these years. And after the publication of Paulo (Paulus) Grillando's (Grillandus), *Tractatus de Hereticis et Sortilegiis* (Treatise on Heretics and Sorcerers) in 1524, very little was written in support of witch hunting until the 1570s. In other words, if the production of witchcraft literature serves as a gauge of concern with hunting witches, there was definitely an early sixteenth-century gap, lagging a little behind the actual reduction in the number of trials. Instead of one continuous European witch hunt, there were really two separate campaigns: an early, geographically limited hunt in the late fifteenth century and a much more intense and widespread series of prosecutions in the late sixteenth and early seventeenth centuries.

The lull in witch hunting during the early sixteenth century can be attributed both to the development of skepticism among the learned elite and to the preoccupation of both ecclesiastical and secular authorities with the confessional disputes and prosecutions during the Protestant Reformation. This period witnessed the spread of Renaissance humanism throughout Europe, and although the humanists failed to undermine the cumulative concept of witchcraft, they did attack parts of it as well as the scholastic mentality that proved receptive to it. For a brief period, the critiques of witch beliefs and prosecutions that one finds in the writings of men like Desiderius Erasmus, Andrea Alciati, Pietro Pomponazzi, and Heinrich Cornelius Agrippa von Nettesheim, may have shaken the resolve of various authorities to pursue witches. Their insistence that magic could be performed naturally, without the aid of demons, and that witches were harmless creatures victimized by delusion had at least the effect of raising doubts about the practice of the crime. At the same time, Protestant Germany, especially through the work of preacher Martin Plantsch in Tübingen, developed a belief that God was directly responsible for many of the natural disasters like hailstorms that were mistakenly attributed to witchcraft. This early sixteenth-century skepticism found its most articulate and forceful expression in the work of the tolerant humanist physician Johann Weyer during the 1560s.

The role that the Protestant Reformation played in the early sixteenth-century reduction of witchcraft prosecutions was complex and problematic. There is little doubt that the combined efforts of the "confession-

alized" Protestant and Catholic Reformations did much to encourage witchcraft prosecutions in the late sixteenth and seventeenth centuries. Moreover, during the earlier years of the Reformation movement, the disputes between Protestants and Catholics (who considered each other heretics, but not the same type of heretics as witches) served to distract European elites from witch hunting. More specifically, the Protestant rejection of Roman Catholicism naturally led to a desire on the part of reformers to formulate their own theories of witchcraft rather than rely on the work of fifteenth-century Catholic demonologists and inquisitors. This rejection of Catholic witchcraft theory thus contributed to a decline in the demand for the older, fifteenth-century treatises. Finally and most important, the Protestant rejection of the Inquisition, its drastic overhaul of all ecclesiastical jurisdiction, and its transfer of much ecclesiastical jurisdiction to secular courts involved extensive alterations in the judicial machinery that was used to prosecute witches.

THE PERIOD OF INTENSE PROSECUTIONS AND LARGE HUNTS, 1560–1630

During the 1560s and 1570s there were many signs that Europe was poised on the threshold of a new outbreak of witch hunting, one that was much more intense and widespread than the initial assault of the late fifteenth century. In the southwestern German town of Wiesensteig, some 63 witches were executed in 1562, and during the winter of 1562–1563, the *parlement* (sovereign judicial court) of Toulouse heard on appeal about three dozen cases of witchcraft from the diocese of Couserans. A series of trials in the Low Countries offered further evidence that witchcraft was once again on the rise, as did the passage of witchcraft statutes in both England and Scotland in 1563. A number of small panics occurred during the 1570s in the wake of a serious agrarian crisis. The resumption of the printing of the *Malleus Maleficarum*, the appearance of Lambert Daneau's *Les sorciers, dialogue tres-utile et necessaire pour ce temps* (Witches, a Very Useful Dialogue and One Necessary for the Present Time) in 1574, and the refutations of Weyer's skeptical arguments by Thomas Erastus (1572) and Jean Bodin (1580) also signaled a renewal and an intensification of witch-hunting zeal.

Most European territories experienced the full force of the European witch hunt between 1580 and 1630. Large-scale prosecutions involving hundreds of victims occurred in scattered parts of western and central Europe, most notably in the diocese of Trier in the late 1580s and early 1590s, Scotland in 1590 and 1597, Lorraine in the late 1580s and early 1590s, the Pays de Vaud peaking in 1599, Ellwangen in the 1610s, and Würzburg and Bamberg during the 1620s. Without complete statistics, it is difficult to determine which

decade between 1580 and 1630 was the time of the most intense witch hunting. The 1580s seem especially bad in Switzerland and the Low Countries; the 1590s in the Low Countries, Scotland, and in many German territories; the 1600s in many other German states; the 1610s in Spain; while the late 1620s in Germany may well have been the worst of all.

This period of intense witch hunting between 1580 and 1630 was related, as both cause and effect, to the proliferation of witchcraft treatises. The well-known works by Peter Binsfeld (1591), Nicolas Rémy (1595), King James VI of Scotland (1597), Martín Del Rio (1599–1600), Henri Boguet (1602), Francesco Maria Guazzo (1608), and Pierre de Lancre (1612) were all written during these years, and a rapidly growing printing industry made them available to an increasingly large European reading public, which of course included virtually every man holding a judicial position. These treatises used evidence from very recent witchcraft trials to confirm the reality of witchcraft, deepen elite fears of the crime, and provide guidance for its effective prosecution.

The unprecedented intensification of witch hunting in the late sixteenth century reflected not only the resolution of learned doubt, but also the impact of both the Protestant and Catholic reformations. By this time, the Bible, with its literal death sentences for witches (Exodus 22:18), circulated widely in vernacular languages; preachers had heightened people's awareness of the immediacy of Satan; reformers had declared war on magic in all its forms; and the process of Christianization had helped to cultivate the feelings of both moral superiority and guilt that played such an important part in witch hunting. To make matters worse, the conflict between Protestantism and Catholicism on the one hand and between various forms of Protestantism on the other reached its peak, a development that reinforced a fear of the Devil and hostility toward witchcraft.

A final and perhaps decisive factor in the intensification of witch hunting in the late sixteenth century was the onset of one of the most economically volatile and politically unstable periods in European history. Between 1580 and 1630, Europe experienced unprecedented inflation, a series of harsh climatic changes, periodic famines (the worst coming in the 1590s), commercial depressions (especially in the 1620s), and a more general crisis of production. (Behringer 1995; Hobsbawm 1967). Real wages declined sharply, while the condition of the poor and unemployed reached critical proportions. These developments aggravated personal conflicts that often found expression in witchcraft accusations, and they also heightened the fears of many members of the ruling elite that witches were engaged in a diabolical campaign to cause dearth and famine to European communities.

THE PERIOD OF DECLINE, 1630–1770

The prosecution and execution of witches did not end in 1630, but entered a new phase marked by a general decline in the number of trials. There were notable exceptions to this pattern. In the Dutch Republic, the prosecutions came to almost a complete end shortly after 1600, while in Spain the Inquisition stopped executing witches in the wake of the great Basque witch hunt of 1609–1614. In France, the procedural measures introduced by the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) resulted in a dramatic reduction in the number of executions by the 1620s, although France's greatest witch panics occurred in Languedoc between 1643 and 1645 and in Burgundy between 1644 and 1646. In England, prosecutions tapered off significantly after 1607, although the largest single witch hunt in English history occurred in 1645–1647, thus interrupting this period of decline. Scotland also experienced its last and largest witch hunt in 1661–1662, following a significant reduction in the number of prosecutions during the 1650s. These late witch panics in England and Scotland, as well as similar episodes in Sweden and Finland in the 1660s and early 1670s, make it more difficult to establish universal patterns of decline. Moreover, a few areas—Hungary (including Slovakia), Slovenia, Transylvania, Poland, Croatia, and New England—did not bear the full brunt of witchcraft prosecutions until the late seventeenth or early eighteenth century.

Nevertheless, in most of Europe, especially the core witchcraft area that included the Germanic territories, the Swiss cantons, and the predominantly French-speaking lands on the eastern borders of the French kingdom, the period from 1675 to 1750 was a time of contraction in the prosecution of witches. Those trials that did take place, moreover, usually involved only one or two defendants. It took some time, however, before *all* witchcraft prosecutions came to an end. Many courts discouraged prosecutions in the late seventeenth and early eighteenth centuries, but only seven European countries (France in 1682, Prussia in 1714, Great Britain in 1736, the Habsburg Empire in 1766, Russia in 1770, Poland in 1776, and Sweden in 1779) took legislative action either declaring that witchcraft was no longer a crime or seriously restricting the scope of earlier witchcraft laws. The limited number and late dates of those legislative acts, coupled with the determination of individuals to accuse their neighbors of witchcraft, explains why witchcraft trials, and even some executions, continued to take place well into the eighteenth century. In England, for example, the ability of grand juries to indict criminals and petty juries to convict them explains why the last execution took place in 1685 and the last conviction in 1712. In Scotland, where juries had less influence

on the outcome of the trials but where authorities were more inclined to allow charges to be brought against witches, such trials continued until 1722. In France, the royal edict of Louis XIV ended almost all witchcraft prosecutions, but failure of the edict to end acts of sacrilege and blasphemy allowed isolated trials until 1745. Within the German territories, a number of late executions took place, most notably in Würzburg and in Württemberg in 1749. The last execution in Europe occurred in the Swiss canton of Glarus (which was also the last territory to ban torture) in 1782. An execution in Poland, which occurred during a period of great political upheaval in 1793, was probably illegal.

CIRCE

A Greek mythological figure, Circe is the subject of the earliest extant witch portrayal in Western litera-

ture. She is found first in books ten to twelve of Homer's *Odyssey*, which achieved the form we know in the seventh century B.C.E., but had been shaped by centuries of oral tradition before that. She was given the epithet *polypharmakos*, "of many drugs" or "many spells," and the exceptional nature of her powers was conveyed in the ambivalent description of her as "goddess or woman." Above all, the syndrome of the abilities attributed to her requires that she be considered a witch, whether from an ancient Greek or modern Western perspective. Most striking were her animal transformations. She turned Odysseus's companions into pigs by feeding them a stew into which she has inserted her drugs, striking them with her wand, and issuing an instruction. The tame wolves and lions that surrounded her island palace may also have once been human victims; more poignantly, so may be the magnificent stag that Odysseus killed and ate.

Odysseus himself was preserved from porcine transformation by the herb *moly*, given to him by the god Hermes, which he either ingested as an antidote or carries as a protective amulet. These practices may be considered the first attestation of the notion of countering magic with magic. In due course Circe turned Odysseus's companions back into men by the different technique of smearing them with a lotion, and she also rejuvenated them in the process (cf. Medea's rejuvenation of Aeson in the seventh book of Ovid's *Metamorphoses*). A number of her other powers were indirectly implied. She could mysteriously "unman" men by taking them to bed; this is most easily read as an ability to perform enslaving erotic magic. Such an ability was more clearly seen in Circe's doublet in the *Odyssey*, the nymph Calypso, who contrived to keep Odysseus sleeping with her, although his true love was for his wife Penelope. Circe was also adept at necromancy, furnishing Odysseus with instructions and supplies for his journey to the underworld and his consultation of the shades of the dead. In passing by Odysseus unseen, she demonstrated the ability either to teleport herself or to render herself invisible. Finally, she could control the elements by sending a favorable wind for Odysseus's voyage. Circe was portrayed as a beautiful woman, but her personality is inscrutable, as she switched instantaneously from predatory deceit to open friendship.

In later Greco-Roman literature, Circe was closely associated with Greek mythology's other great witch, Medea, usually said to be her sister, and with the witch-goddess Hecate, usually said to be their mother. In the fourth book of Apollonius of Rhodes's epic *Argonautica* (ca. 270–245 B.C.E.), we are told how Medea visited her sister, together with her lover Jason, for purification after killing her brother Apsyrtus. Here her island was described as populated by misshapen semitransformed

creatures, a description perhaps inspired by attempts to portray the process of transformation in ancient art (*LIMC* Circe nos. 5–26). Of particular note for the later Western tradition was Circe's appearances in Ovid's *Metamorphoses*, published ca. 8 C.E. The fourteenth book of this poem told how she transformed Scylla into a monster with multiple dog heads by poisoning the pool in which she bathed, and an elaborate sequence related her encounter with Picus. Here Circe fell instantly in love with a young man whom she encountered while engaged in the characteristic witches' activity of gathering herbs. She separated him from his hunting companions by manufacturing a phantom boar and by controlling the elements to bring on darkness. But Picus rejected her, so she transformed him into a woodpecker with her wand and a thrice-repeated incantation. She changed Picus's companions by a different technique: Circe used her herbal powers to create the dark woodland suitable for the performance of necromantic rites, and then summoned up ghosts to enact the men's transformations into varied animal forms.

CIRUELO, PEDRO (1470–1548)

A distinguished Aragonese theologian and mathematician of *converso* origin, born in Daroca (Saragossa), Ciruelo wrote the most influential and widely known Castilian-language tract about witchcraft and superstition: the *Reprobación de las supersticiones y hechizarias*

(Rebuke of Superstitions and Sorcery, Salamanca, 1530). It went through eight editions between 1538 and 1628 (Homza 2000, 183).

After completing his early studies in the humanities in Saragossa (Zaragoza), Ciruelo moved to Salamanca a round 1482 to study the liberal arts at its university, attracted by the fame of its professors of astrology and mathematics. In 1492 he journeyed to Paris, where he studied theology and taught mathematics for more than ten years. Returning to Spain, Ciruelo was named lecturer in Thomist philosophy at the university recently created in Alcalá de Henares by Cardinal Cisneros. Besides his work on superstition, Ciruelo also wrote an extremely popular vernacular handbook for parish clergy, the *Arte de bien confesar* (The Art of Confessing Well, 1514), which saw twenty-two editions by 1560, far outstripping its competitors in this genre (Homza 2000, 163). Ciruelo's didactic analysis of witchcraft and superstition thus constituted only one part of an extensive literary corpus, primarily in Latin; his ten works on various theological, philosophical, and scientific problems included the first book on mathematics printed in Spain. Having mastered Hebrew, he also made fresh Latin translations of several biblical texts between 1526 and 1537. In 1527, he participated in the great Valladolid conference about the orthodoxy of Desiderius Erasmus, where (unlike the majority) he endorsed Erasmus's opinions as often as he censured them (Homza 2000, 75).

Because Ciruelo's *Repbación* appeared only a year after the first Castilian-language treatment of the same theme by the Franciscan friar Martín de Castañega, *Tratado muy sutil y bien fundado de las supersticiones y hechizeries y vanos conjuros y abussiones, y otras cosas al caso tocantes, y de la posibilidad y remedio dellas* (A Very Exact and Well Founded Tract on Superstitions, Sorcery, Vain Incantations, Witchcraft, and Other Things Touching upon Such Matters, and on the Possibility and Remedies of the Same, Logroño, 1529), comparison of these two tracts, printed almost simultaneously in the same vernacular, is inevitable. Both authors expressed an identical objective, that of distinguishing in a didactic manner that which was licit and that which was illicit in a matter so confused as magic and superstition. Furthermore, their sources were practically identical, including the Bible, St. Augustine, Isidore of Seville, Thomas Aquinas, and, above all, Jean Gerson, chancellor of the University of Paris and author of another famous work against superstitions, *De erroribus circa artem magicam* (Concerning Misconceptions About Magical Arts). Both works avoided casuistry, and both emphasized that such apparently extraordinary phenomena as the flight or metamorphoses of witches might be attributed to tricks or demonic illusions, nothing but mere delusions of the senses. Both also censured the activities of the many healers or workers of charms and enchantments

(including many priests) who tried to fool people with their sophistry. Nonetheless, Castañega's work was quickly forgotten, while Ciruelo's book became the dominant discourse in the matter of witchcraft and superstition in sixteenth-century Spain, replaced in the seventeenth century by Martín Del Río's *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599–1600).

Ciruelo's *Repbación* was basically divided into two parts. The first is dedicated to the arts of divination, with the objective, according to Ciruelo, was to know what only God could and should know. The second part concerned itself with sorcery, with the objective was to seek in a brief time, and with demonic aid, certain benefits that only God could give. Among the arts of divination, the author especially condemned necromancy (which, although often performed by priests, included witchcraft), predictive astrology, recourse to ordeals or augury, in addition to numerous other forms of fortunetelling known from antiquity, including palmistry and dream interpretation. Among the various forms of sorcery, he condemned using spoken or written curses, charms, superstitious prayers, and the evil eye; above all, he denounced the activities of healers and exorcists lacking episcopal license, who, in Ciruelo's opinion, only sought to ensnare the innocent by pretending to do such things as conjure away storms or excommunicate insects.

CLARK, STUART

Professor of history at the University of Swansea, Clark has written authoritatively on European witch beliefs

during the early modern period. An intellectual and cultural historian, Clark has devoted most of his career to the study of early modern demonologists. In a series of articles and essays, and most notably in his magisterial volume, *Thinking with Demons: The Idea of Witchcraft in Early Modern Europe* (Oxford, 1997), Clark has argued that demonology, rather than being an esoteric theological specialty, was part of the mainstream of early modern thought, intersecting with more general intellectual concerns about the scientific study of nature, the course of history, the maintenance of religious purity, and the nature of political authority.

Clark's most important methodological contribution to the field of witchcraft studies has been his analysis of the language of witchcraft, which he studies on its own terms rather than as perceptions of some external reality. Influenced by the work of linguistic philosophers like Ferdinand de Saussure, who view language as a system of signs, Clark rejects functionalist interpretations of witch beliefs because one need not seek external explanations for people's belief in things that already made sense to them. Clark's decision to study witchcraft theory as a "closed belief system with its own internal meanings" explains why his work remains almost entirely within the realm of early modern thought and is unconcerned with relating the ideas of demonologists to patterns of witch hunting.

Among the many challenges that Clark's work offers to conventional wisdom is his treatment of the relationship between science and witchcraft. In contrast to the traditional interpretation that the Scientific Revolution, and in particular the argument that seventeenth-century mechanical philosophy undermined witch beliefs, Clark has argued that demonology had the status of a science in its own right, and that the belief in a Devil who exercised power in the natural world was consistent with early modern scientific thought. For Clark, demonology was just one of many attempts made during the early modern period to explain the natural world. It involved the same type of empiricism that characterized the work of members of the Royal Society in England, where belief in witchcraft flourished in the late seventeenth century.

Unlike most other historians of demonological thought, Clark is not particularly concerned with either the origins or the decline of witch beliefs; his work lacks a strong diachronic dimension. This deficiency is more than compensated for by his analytical insights regarding a large body of writings covering the entire early modern period. His analysis of the intersection of witchcraft theory and politics illustrates the value of this approach. By emphasizing the sacerdotal, mystical, and charismatic aspects of early modern political authority over a long period of time, he shows how rulers and witches were thought of as being, in a sense, competitors for the same type of power. This approach

to political thought informs his discussion of a range of issues, including the immunity of magistrates to witches' power, the sacred duty of judicial authorities to prosecute the crime, and the relationship between royal healing and the cures performed by witches. In writing about the French judge and political theorist Jean Bodin, Clark argued for the compatibility of the political theory of absolutism expressed in Bodin's *République* (1576) with the witchcraft theory of the same author's *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580) by exposing the religious dimensions to the former work and the political dimensions of the latter. Both works reflect the same view of absolute magistracy based on divine authority.

In addition to his major work on demonology, Clark has edited a collection of essays on the language of witchcraft and coedited with Bengt Ankarloo a comprehensive six-volume history of witchcraft and magic in Europe. He is preparing a book on visual paradox and visual reality that will include, among other things, a discussion of witchcraft, demonology, and apparitions.

CLERGY

A collective term for all ecclesiastics who have acquired the license to act as Catholic priests (both secular and monastic) or Protestant pastors. This entry first discusses the participation of members of the clergy in the theoretical preparation of the trials by promoting the belief in witches and drawing juridical consequences thereupon; then their practical involvement in witchcraft trials, both

as persecutors, helpers, and victims; finally, it addresses the problem of their historical responsibility. Given the absence of any general overview of this topic, the main conclusions are illustrated by only a few examples, each of which represents a vast amount of similar ones.

MIDDLE AGES

Before the twelfth century, deviance from the Catholic faith rarely disturbed learned clergymen in the Latin West, and neither did the crime of magic. Famous penitentials like the *Corrector* of Bishop Burchard of Worms contained ecclesiastical penances for sorcery; but they punished it rather mildly, and neither the ecclesiastical nor the secular authorities were interested in investigating such crimes. When the inquisitorial process began to be applied against the *crimen magiae* (crime of magic) in the central Middle Ages, a theoretical discussion began among theologians and canonists, especially after Pope Alexander IV ordered the inquisitors to occupy themselves actively not only with heresy but also with those kinds of divination and sorcery that—an elastic clause—might include heretical elements (1258–1260). This discussion, however, occupied only chapters within larger theological works, such as Thomas Aquinas's *Summa contra gentiles III* (Summary Against the Gentiles). Until the fourteenth century, nearly all authors still shared the view of the *Canon Episcopi*, explaining the nocturnal rides as mere illusions.

This situation changed in the first half of the fifteenth century, when the full witchcraft stereotype was developed; now many clergymen published on that subject, and Pope Innocent VIII sanctioned persecution. Most of the clerical theoreticians were Dominicans and had often been inquisitors: Nicolas Eymeric, Johannes Nider, Juan Toquemada the Elder and the Younger, Lope Barrientos, Jean Vinet, Nicolas Jacquier, Girolamo Visconti, Jordanes de Bergamo, and Rategno, Bernardo of Como. It seems that, during the Council of Basel, the Dominican convent functioned as a center for spreading the new witchcraft concept (as opposed to simpler conceptions of heresy and magic). A few Franciscan priests, like Bishop Alfonso de Spina, also discussed witchcraft; the secular clergy produced very few authors in this field, although Thomas Ebendorfer, a professor of theology and parish priest near Vienna, may be mentioned. The few clerical defenders of women against witchcraft included the canon Martin Le Franc, secretary of antipope Felix V.

Members of the ecclesiastical hierarchy led the earliest processes that qualify as witchcraft trials, namely those against Dame Alice Kyteler and Joan of Arc, even if based on political machinations. Soon, however, secular authorities took over this task. Occasionally, ecclesiastics actively prevented a persecution. In 1459, the bishop of Amiens refused to follow the inquisitor's wish

to investigate those persons who had been delivered to him under the same accusations as the “heretics” of the *Vauderie* (Waldensianism, but used to label witchcraft) of Arras. In 1486, Bishop George Gosler of Brixen stopped Heinrich Kramer from hunting witches in Tyrol, despite his papal license. And Guillaume Adeline, a prior and professor of the University of Paris, paid for his disbelief in the Sabbat voyages with life-long imprisonment.

EARLY MODERN PERIOD: CLERGYMEN WRITING ON WITCHCRAFT

The general belief in, and fear of, witches in the sixteenth and seventeenth centuries that led to huge numbers of trials was accompanied by a flood of pamphlets, tracts, studies, and other written materials, many of them by clerical authors, both Catholic and Protestant. Suffice it to point to such witchcraft theorists as Martín Del Rio, Joseph Glanvil, Meric Casaubon, and Sylvestro Prierias among so many others. Within the Catholic Church, the majority of clergymen expressing themselves in favor of the witch hunts were still Dominicans, now supplemented by Jesuits. However, a Franciscan provincial, Benedikt Bonelli (d. 1783), became one of the last defenders of Del Rio. The main Reformers, Martin Luther, Ulrich Zwingli, and John Calvin, though publishing no specialized treatises on the subject, clearly approved of the witch hunts. Significantly fewer clergymen, notably the Jesuits Paul Laymann and Friedrich Spee von Langenfeld, the Theatine Ferdinand Sterzinger, the parish priest Cornelius Loos, or the Reformed pastor Balthasar Bekker, raised their voices in defense of suspected witches. However, the Roman and Spanish Inquisitions both showed a rather distanced and skeptical attitude to this question.

How did the clergy succeed in spreading their ideas about diabolical witchcraft among their parishioners? Though learned theological discussions were usually still published in Latin, numerous writings appeared simultaneously in vernacular translations, influencing popular imagery. To take a few examples: the Catholic suffragan Peter Binsfeld had his Latin *Tractatus de confessionibus malefactorum et sagarum* (Treatise on Confessions of Sorcerers and Witches), printed in 1589, translated into German two years later. The Calvinist theologian Lambert Daneau published his disputation on witches in 1573 in both Latin and French, followed by German and English editions. Niels Hemmingsen published his treatise in 1575–1576, in both Latin and Danish, and ten years later in German. The same is true also of publications by clerical authors inclined to disbelief in witchcraft and the necessity of its persecution. The Amsterdam pastor Balthasar Bekker already used his native Dutch to present *De Betoverde Wereld* (The World Bewitched, 1691–1693), soon translated into

German and many other tongues. However, in contrast to the Middle Ages, clerical authors increasingly felt competition from laymen, especially jurists and doctors, who published on the same subjects.

But the clergy had another and perhaps more effective way to spread their opinions, namely by preaching. Generally, many preachers intensified, or even kindled, their audience's interest in punishing heretics and witches. At executions, sermons were often given about the crimes that had been committed. A Catholic example would be the lectures by the Jesuit Georg Gaar before the stake of the burned Maria Renata Singerin (1749) that continued in the local cathedral; David Meder (1605) may be mentioned as a fanatic Protestant who preached against the "Devil's murder-children" and "milk-thieves."

EARLY MODERN PERIOD: CLERGYMEN AND THE TRIALS

An inexhaustible number of sources show the activities of both Catholic priests and Protestant pastors who engaged in the practice of witch hunting. The former, of course, dominated imperial ecclesiastical territories, where bishops and abbots possessed not only spiritual but also secular powers. In the bishopric of Bamberg, one of the centers of the persecutions, the suffragan bishop Friedrich Förner had a special witch prison, the *Hexenhaus*, built for the imprisonment and torture of the accused witches; within 34 years, 600 witches were burned according to official figures sanctioned by the archbishop. In 1657, Bishop Dietrich Adolph of Paderborn ordered a general inquisition in his territory to find persons guilty of sorcery. One could multiply such examples from nearly all ecclesiastical territories, both large and small. Among Protestant ecclesiastical functionaries, the famous preacher and playwright Thomas Naogeorgius offers an example. He kindled the fire in Esslingen by preaching against the witches whom he blamed for raising a devastating hailstorm in 1562, moving the population to such a degree that a reluctant city council was forced to start a wave of trials. In Scandinavia, the Danish bishop Peder Palladius (1503–1560) persecuted witches not only in preaching but also practically. He qualified everybody still using Catholic prayers as a witch not different from those who used magic. The notorious Swedish prosecution of children-witches in 1669 was only possible because it was demanded eagerly by ministers who insisted that children could not invent stories of the Sabbat. In 1692, two Puritan ministers of high reputation, the Mathers, father and son, stood at the center of events in Salem. When conflicts arose between the secular and the ecclesiastical hierarchy about the question of persecuting or not, it was usually the latter who insisted on further trials (for example, Rostock, 1660–1670).

It is more difficult to find instances of clergymen taking practical actions against the persecution of witches. Alonso de Salazar Frías, an inquisitor visiting Navarre in 1611–1612, did much to stop the wave of persecution raging there at that time. The Roman Inquisition issued some instructions prescribing its officials to proceed only in a juridically correct manner against persons accused of witchcraft. Cardinal Federico Borromeo even planned to found a hospice for converted witches, which he never realized. Later, those prince-bishops who integrated parts of the Enlightenment into their worldview had their officials stop further inquisitions, as did the secular princes.

Though secular authorities carried out the majority of the trials, priests participated in them both as exorcists and as confessors, sometimes even as associated judges. It is not clear how often the inquisitional procedure began with exorcists carrying out their rites in order to prevent the Devil from interfering on the delinquent's behalf. Confessors, however, seem to have been employed at nearly all trials. In the processes of the Holy Inquisition, the inquisitors, always being priests, could, and did hear the confessions of the accused. Official prohibitions notwithstanding, it is not true that clergymen left the office of torturer entirely to laymen; in 1256, Pope Alexander IV permitted inquisitors to absolve each other from canonical irregularities to give these priests the possibility to administer torture themselves or via their servants. In any case, priests were present in the torture chamber and directed the measures. Friedrich Spee told of confessors eagerly instructing torturers how to proceed with the best success (*Cautio Giminalis* [A Warning on Criminal Justice, 1631] 19, 26). But there were cases also outside the Inquisition: when accused of witchcraft, the senile subprioress of the nunnery of Unterzell near Würzburg, Maria Renata, was hit cruelly by the fathers to make her confess. A monk kindled the stake of Urbain Grandier, and Cardinal Richelieu, an ordained priest and a bishop, engineered the parish priest's execution. Even if such events seem to have been somewhat exceptional, it must be underlined that inflicting physical pain, especially flogging, was a common means of exorcism procedure, just as it was a common ecclesiastical penance, both being administered by the respective priest.

It is an open question of how many among the confessors performed nothing but their spiritual office. Secular authorities often used them to break prisoners down by asking the confessors to depict the eternal torments the accused faced in hell to make them avow their crimes out of this fear (cf. Spee, *Cautio Criminalis* 51). Nevertheless, some confessors tried to help those of the accused whose innocence seemed obvious. During the notorious Salzburg Zauberei Jackl (Sorcerer-Jack) trials, which ended with the death of 124 "sorcerers" of all ages, a Capuchin father, Gerardus Pasendorf, tried to

save a girl of eleven and a boy of thirteen; but the judge appealed to the archbishop, who prevented further interventions of that kind.

Professors of theology were also members of the clergy. Often the authorities did not consult only specialists in criminal law, but also demanded theological and canonical expert opinion. This happened as early as the investigation in the series of witchcraft trials known as the *Vauderie* (Waldensianism, but used to label witchcraft) of Arras (1459–1460), when theologians from Cambrai had to study the acts. A much later example, among many, is the theological expertise that the University of Würzburg contributed to the condemnation of Maria Renata in 1749.

Did clergymen also become victims of witch hunts? There are indeed examples, but on the whole, they are atypical. Ordinarily, their social and juridical position exempted them from being accused, and especially from being tortured. The exceptions from this rule include cases where personal intrigues by members of the ecclesiastical hierarchy or the secular aristocracy played a part, as in the French trials against Louis Gaufridy of Aix-en-Provence, burned in 1611, or Urbain Grandier of Loudun, burned in 1634. Moreover, when a wave of persecution reached its peak, not even priests remained untouchable. The witch hunts at Cologne in the second half of the sixteenth century included victims from the priesthood, canons, vicars, and monks; on one day, 70 alumni (that is, future priests) were incarcerated by the prince-archbishop. Between 1588 and 1593, at least eight priests were put to death in the dioceses of Trier during the first great German witch hunt. In Münstereifel, two priests were accused by tortured witches, put to the torture themselves, and sentenced to capital punishment (1629–1630). That accused clergymen received incomparably more attention than civil victims is shown by the case of a parish priest of the diocese of Olmütz, Aloys Lauter, whom the prince-bishop would not have had executed until the pope himself had approved of the sentence (1680). Perhaps even more infrequent was the execution of a Reformed pastor; when George Burroughs, the ex-minister of Salem, was hanged, the consequence was a near revolt.

THE QUESTION OF RESPONSIBILITY

Over and over again it has been said that the historian's task was to write *sine ira et studio* (without anger and without bias). This indeed must be practiced when collecting and evaluating facts and figures, taking into consideration all kinds of pro and contra evidence. Nevertheless, where central moral issues are involved, taking a standpoint becomes inescapable. No one can write the history of slavery, torture, or mass destruction *sine ira*, with complete disinterest. Neither can that be

done concerning the question of responsibility for the witch persecutions; and one can hardly find any academic publication whose author does not betray, explicitly or implicitly, a personal judgment on that phenomenon.

It is probably not accidental that there seems to be no overview publication on the topic "clergy and witchcraft." In so-called "serious," that is, tendentiously-neutral historiography, the subject is not treated apart, because the involvement of the clergy with magic and witch hunting is taken as self-evident, basic knowledge. In the older writings by church historians from particular confessions, this theme was treated for a long time in an openly apologetic way. Especially during the time of the strife between church and state in nineteenth-century Germany, confessionally biased historians functionalized the theme for directly political purposes. However, in our more ecumenical and far more secular age, most recent publications tend to minimize or simply to conceal the role of the clergy in witch hunting. At the same time, anticlerical authors as well as some feminists generally depict the male clergy as malicious wrongdoers guided by only the meanest moral principles including voyeurism, sadism, and greed.

Evidence for the historical guilt of both individual clergy and the hierarchies of all confessions generally in both establishing and maintaining a theological system that worked as the theoretical (ideological) basis for the persecutions is absolutely overwhelming and therefore beyond any doubt. The fact that, in the early modern period, it was usually secular courts that dealt with witchcraft does not excuse the Churches, except the Anabaptists and perhaps the Greek Orthodox Church, because both the religious reasons for hunting down these women and men and the method, the inquisitorial process, had been shaped by clergymen and were continually approved by them. Those few priests who bravely fought against the persecution of witches must be contrasted with the much greater number of those who opposed all movements intending to end that tragedy. It is also beyond doubt that there were a few clerics seeking material gain and sadistic lust by participating in witchcraft trials (the first is most evident, for example, for the Cardinal Prince-Bishop Emanuele Madruzzo of Trent [d. 1658], the latter testified by Spee *Cautio Griminalis* 51). But this does not mean that most priests did not honestly believe in the necessity of saving souls by destroying those whom they thought induced innocent people to commit mortal sins that would lead them into eternal damnation. It is also clear that there existed clergymen whose involvement in the trials did cause them earnest inner conflicts; Spee's testimony about that is evidence enough.

Given the wide palette of theoretical attitudes and practical behaviors throughout the Christian confessions, and even among individual monastic orders in

Catholicism, we can only speak of one *collective* responsibility of the clergy, that is, in establishing and maintaining a demonological worldview, which formed the official background, making it possible to solve social conflicts and destroy enemies through the instrument of the witchcraft accusation. There is no doubt that the persecutions perpetrated by secular authorities during the early modern era were a late consequence of their obligation to execute punishments that medieval ecclesiastical law had prescribed against unrepentant heretics. “Who goads the authorities to the witchcraft trials?” asked the Jesuit Spee, and answered: “First and foremost the clerics and prelates . . .” (*Cautio Criminalis* 15). Like him or Bekker, a few individuals within the clergy would rebel against them, but none of the Churches as hieratic organizations played any role in ending the trials.

CLERICAL MAGIC

The phrase “clerical magic” does not denote a distinct branch of magic, but rather any spell, charm, or magical ritual performed by a member of the regular or secular clergy. Most clerics who were accused of dabbling in magic during the medieval and early modern periods were male (clerics probably comprised the largest

single group of men accused of practicing magic), Catholic, and participated in learned forms of magic. Ordained clerics made powerful magicians, many Europeans believed, because they could divert the sacerdotal power that allowed them to perform the miracle of the Mass to magical ends. While the judicial records of the period indicate that clerics were most frequently involved in necromancy or other ceremonies of ritual magic, they were also often found practicing forms of popular magic such as healing, love magic, and fortunetelling.

Ordained Roman Catholic clergy possessed sacerdotal powers that allowed them to function as mediators between the supernatural and the natural worlds. It was this access to the divine that enabled a priest to effect the miracle of transubstantiation, where by he transformed the Communion wafer and wine into the body and blood of Jesus. The logic of popular magical tradition dictated that a priest might also direct this unique power at will; by celebrating Mass over a magical charm, he was believed able to infuse the spell with sacerdotal power and thus activate it as he activated the miracle of the Mass. Sorceresses and magicians therefore commissioned corruptible priests to consecrate and thus strengthen a dizzying variety of charms. One French priest, for example, confessed that he had been hired to say Masses over a charm for winning at dice, over the dice themselves, over the rope with which a man had been hanged, and over a scrap of paper that, when ground to powder and scattered over someone, would cause him to fall passionately in love. A sixteenth-century Venetian priest admitted that he had written *hoc est enim corpus meum* (for this is my body—the Latin phrase that consecrates the Communion host) on leaves of sage, as well as on a Communion wafer, for a courtesan wishing to increase her lover’s passion for her. She planned to add the love charms to his soup. Similarly, clerics’ cooperation in magical rituals supposedly heightened the ceremonies’ efficacy. The very functioning of the business of early modern magic, in effect, had a sacral dimension that required priests’ participation in it.

Lay belief in clerics’ supernatural abilities may have been strengthened during the sixteenth and seventeenth centuries by the tenets of the Catholic Reformation. The Council of Trent, which met sporadically to define Catholic doctrine between 1545 and 1563, not only reaffirmed the claims of the Catholic Church to exclusive control over the sacred, but it also required regular attendance at Mass. This development brought an increasing number of Catholics to witness the weekly miracle performed by the priest. In seventeenth-century France, consequently, priests came to be regarded as capable of activating even personal prayers; if a priest read Mass or part of the liturgy over the head of a supplicant, it was believed that the supplicant’s petition to heaven would be granted.

As ordained priests made powerful magicians, early modern Europeans held, so too did they make the most capable of necromancers. The unique ritual powers that allowed priests to heighten the efficacy of magic charms or personal prayers also helped them to maintain control over the demons they summoned. Only if a necromancer triumphed in a contest of wills with these powerful and malign spirits could he compel them to carry out his desires, whether it be to win the love of a woman, cause bodily harm to an enemy, or reveal the whereabouts of hidden treasure. Some sixteenth- and seventeenth-century manuals of necromancy even specified that a priest's participation was necessary to the success of any demonic conjuration described within.

Priests, monks, and friars shared several experiences that may have made them likely candidates to develop a taste for demonic magic. Like all clerics, they had received some education and thus possessed at least a basic knowledge of Latin and a degree of familiarity with the rites of exorcism. While knowledge of Latin was certainly not limited to the clergy in early modern Europe, priests did possess both a facility of ritual forms and a command of ritual language that may have provided them with a sense of ownership over that vocabulary and therefore an affinity for ritual magic. Their education may also have introduced them to astrological images or other forms of magic. When coupled with access to the books of demonic magic that circulated throughout the period, such an education provided all the tools necessary to experiment with necromancy.

COBHAM, ELEANOR (CA. 1400–1452)

This duchess of Gloucester became a central figure in the most spectacular of the treason-cum-sorcery trials among the English upper classes in the later Middle Ages. The daughter of Lord Cobham of Sterborough, Eleanor became the mistress, and after the dissolution

of his first marriage, the wife of Humphrey, Duke of Gloucester (1391–1447), a man who combined a talent for power politics with a love of books and learning and a taste for debauchery. By 1440, however, Gloucester's fortunes had waned, and his attempts to charge the archbishop of York and Cardinal Beaufort with malfeasance during King Henry VI's minority provoked a counterattack from his enemies, in which allegations of witchcraft against his wife were a central plank. Gloucester was disliked for his power, and, among conservative churchmen, for his patronage of new scholarship, while his wife was disapproved of because of her previous status as his mistress.

Eleanor Cobham was charged with using sorcery to kill Henry VI, and to advance her husband's ambitions for the crown. Those accused with her included Margery Jourdemayne, known as "the Witch of Eye" (a settlement near Westminster), Roger Bolingbroke, whose confession probably first implicated the duchess in the affair, and Thomas Southwell. A canon of St. Stephen's Chapel in Westminster, Southwell was a man of considerable learning, an astrologer and alchemist who had enjoyed Gloucester's patronage. With assistance from Southwell, Bolingbroke allegedly attempted to compass the king's death by necromancy, while, quite apart from the other charges, Cobham was accused of capturing the duke's affections by the use of love potions supplied by Jourdemayne. Bolingbroke seems to have been a genuine sorcerer; his magician's paraphernalia, including wax dolls suitable for employment in image magic, were displayed at his trial. Jourdemayne was burned, either for heresy or treason; Bolingbroke was hanged and drawn-and-quartered for treason; Southwell died in prison; and Cobham was made to do penance and then subjected to permanent imprisonment, later on the Isle of Man, where she was living at the time of her husband's death in 1447.

The Cobham affair was typical of a number of such cases involving political elites that punctuated European political history in the high and late Middle Ages. These cases occurred in royal, princely, or papal courts that were locked into a long-term transition from being households to becoming formal seats of government. State officials, favorites, royal wives and lovers, courtiers, and servants all competed at court for power, wealth, advancement, and security. It is, perhaps, natural that accusations of sorcery should flourish in an environment where competition was fierce and the rules uncertain. That such cases could afflict the very top of the English political elite is further illustrated by the allegations of sorcery made by another duke of Gloucester, in this case the future Richard III, against Elizabeth Woodville, wife of the recently deceased king Edward IV, in 1483. At that time, Richard was trying, with the objective of their future elimination, to ensure the incarceration of Elizabeth's two sons, the rightful

heirs to the throne; to discredit the queen and her family generally; and to break the rapprochement between the Woodvilles and a faction led by Lord William Hastings. As part of his campaign, Richard, according to tradition, accused the queen dowager of withering his arm through sorcery. Another woman, Jane Shore, wife of a London goldsmith, was also involved. Shore had been mistress to Edward IV, and after his death achieved the same status with Thomas Grey, Marquis of Dorset (Elizabeth Woodville's son by her first marriage), and then with Hastings. Politically, she had given offense to Richard by acting as go-between in negotiations between the Woodville and Hastings factions. Richard's accusations against Elizabeth Woodville did not stick, but he had Jane Shore convicted of "harlotry" before the bishop of London's court, and confiscated her considerable fortune. She died in poverty in 1527.

Such cases remind us that witchcraft was not restricted to the peasantry, but that it was also a force in the elite politics of this period. Taking Europe as a whole, such cases served to spread ideas about witchcraft, and in particular to help elaborate learned theories of witchcraft in the later Middle Ages.

COLOGNE

Cologne refers both to a large imperial free city and to its surrounding territory, the so-called electorate of Cologne. While relatively few executions occurred in the city of Cologne, the electorate of Cologne became a center of the European witch hunts.

IMPERIAL CITY OF COLOGNE

With about 40,000 inhabitants, Cologne was one of the largest cities in Germany in the late Middle Ages. We know today that Jakob Sprenger, the prior of Cologne's Dominican monastery, was not one of the authors of the *Malleus Maleficarum* (The Hammer of Witches, 1486), although his name was connected with this handbook of witch hunting for centuries. Nevertheless, the new theory of witches as Devil-worshippers found its way to Cologne only two decades after the *Malleus* first appeared: in 1507, a certain Tringin von Breisig confessed all elements of this new doctrine under interrogation. She was not executed but expelled from the city. Throughout the sixteenth century, there were no death sentences for witchcraft in

Cologne and only a few arrests. The judges of Cologne's municipal high court remained skeptical about accusations of witchcraft. Even the first wave of persecutions in the surrounding territories in the 1590s did not change their cautious attitude.

In the seventeenth century, a new generation of High Court judges affected the treatment of witchcraft accusations. In 1617, the city's first death sentences for witchcraft were carried out against three women. This new mentality became the precondition for the city's major witch prosecution, which began on January 9, 1627, with the imprisonment of a patrician woman, Katharina Henot. In 1626, two nuns from the convent of St. Clara in Cologne had been suspected of being witches and were brought to Lechenich near Cologne. One of them, Anna Sophia of Langenfeld, confessed under torture that Katharina Henot was also a witch. The second nun, Franziska Henot, a relative of Katharina, was arrested in Lechenich on January 22, 1627. The trials against the nuns of St. Clara seem to have begun the rumors against Katharina Henot. She tried in vain to fight against spreading defamations by appealing to the vicar-general and to the archbishop of Cologne, but the Church refused to intervene. Katharina Henot was executed on May 19, 1627. By 1630, thirty-three other men and women had been arrested at Cologne under suspicion of witchcraft; twenty-three women and one man were executed.

The turning point of the persecution was the trial of Christina Plum. She openly accused members of the city council and other respectable notables of Cologne, until she was arrested herself. Under torture she confessed to being a witch and to have invented her accusations against prominent people. After Christina Plum's death, the uncertainty about the reliability of witchcraft accusations brought the outbreak to an end. Between 1647 and 1655, five more people were executed in the city of Cologne, including two children, but after these trials witchcraft prosecution ended in Cologne. The total number of known executions amounted to thirty-three between 1617 and 1655. The Jesuit Friedrich Spee, who had been in Cologne during its great persecution, was deeply upset by the witchcraft trials he witnessed there; however, his courageous book opposing the witch hunts, the *Cautio Giminalis* (A Warning on Criminal Justice) of 1631, had no visible influence on Cologne's city council.

ELECTORATE OF COLOGNE

The electorate was divided into three different parts: the *Erzstift* (secular part of the archbishopric, where the ruler—prince-bishop—was both the spiritual leader and the territorial lord) on the left bank of the river Rhine, the duchy of Westphalia, and the *Vest* of Recklinghausen. Around the year 1600, the electorate contained approximately 220,000 people—about

130,000 in the *Erzstift*, 73,000 in Westphalia, and only 18,000 in the *Vest*.

The first trials using the new witchcraft doctrines occurred in the *Erzstift* at the end of the fifteenth century. During the sixteenth century, many further trials were held in the Rhineland. Most of the witchcraft trials took place in the united duchies of Jülich, Cleves (Kleve), and Berg, which surrounded the *Erzstift* part of the electorate. This situation changed in the final decade of the sixteenth century, when the persecution of witches concentrated on the territory of the elector and archbishop of Cologne. The first persecution began in 1592, probably stimulated by the extensive trials and lynchings in the archiepiscopal electorate of Trier. In 1607, to preserve the territory of Cologne's archbishop from mob justice, the Court Council of the electorate proclaimed an edict regulating criminal procedure in witchcraft trials. Henceforth, the assessor's courts in his small towns and villages were required to use the help of an impartial lawyer whenever a witchcraft case exceeded their juridical knowledge. These lawyers, who normally came from the High Courts of Cologne or from the archbishop's court at Bonn, were called witch commissioners. The concept of decentralization, presumably created in order to guarantee fair trials for accused witches, became instead a terrible instrument of intensified prosecution. In many places, an alliance of witch commissioners, local landlords, and unscrupulous village officials led to an increased number of trials and a more extensive use of torture.

The promulgation of Cologne's new witchcraft criminal procedure did not cause an immediate increase of witchcraft trials. The first mass executions only occurred in 1616, in an isolated part of the territory in the Eifel. The great mass persecution in the prince-bishopric of Cologne started, just like in the city of Cologne, in 1626. The first chains of trials took place in villages bordering the Eifel hills, but within two years people were being executed for witchcraft throughout the *Oberstift*, the southern part of Cologne's Rhineland territories. In 1628, Elector Ferdinand of Wittelsbach renewed the witchcraft criminal procedure of 1607, and added confiscation procedures designed to preserve husbands and children from the loss of their property.

The number of trials decreased after Spee published his famous *Cautio Criminalis*; in some parts of the elector's territory, the witch hunt even stopped entirely. But between 1636 and 1638 a new wave of witch persecution broke out in several places. Elector Max Heinrich, who followed Ferdinand in 1650, decreed a new witchcraft edict, but apart from some distant isolated areas, no new persecutions were initiated. All in all, we can assume that in the *Erzstift*, the Rhineland part of the electorate of Cologne, at least 600 men and women lost their lives during these witch hunts. The persecution was concentrated

on the southern part of the electorate. North of the city of Cologne, in the so-called *Unterstift* (lower archbishopric), very few trials were held. One reason for this surprising phenomenon might lie in the different housing patterns north and south of the Rhineland. North of Cologne, the form of settlement changed from huddled village houses to widely scattered farmhouses. Further research will show whether this had an influence on the attitude toward witchcraft in each region.

The second major part of the electorate was the duchy of Westphalia, also called *Sauerland*. Although Westphalia had some degree of legal autonomy, the development of its witchcraft persecutions seems similar to that in the southern Rhineland parts of the electorate. Available sources reveal 915 witchcraft trials in Westphalia; considering the gaps in documentation, the total number of executions here must have exceeded a thousand. The first Westphalian witchcraft case took place at Werl in 1508, later than in Rhineland areas. However, while the prosecution in the Rhineland stopped by the mid-seventeenth century, witchcraft trials continued in Westphalia until 1732. The peak of the witch hunt here occurred between 1626 and 1632. As in the Rhineland part of the electorate of Cologne, special witch commissioners were deployed. One of them, Kaspar Reinhard, is considered to be responsible for the execution of almost 500 people. His colleague, Heinrich von Schultheiss, even wrote a handbook for witch hunters.

The history of the witch hunt in the third and smallest part of the Electorate, the so-called *Vest* of Recklinghausen, differed from the other two regions. Witchcraft trials began here in 1514 with the burning of eleven weather witches charged with raising storms. Greater persecutions followed beginning in 1580: at least twenty-three women and six men were executed in this year, and another eighteen people in 1581. Between 1588 and 1590, a second wave led to forty-five arrests, of whom twenty-one were executed, two died in jail, and one committed suicide. In the *Vest* and other parts of western Westphalia, the water test (swimming test) played a decisive part in demonstrating guilt or innocence. However, in Recklinghausen intensive prosecution ended in 1590. In the district of Horst, near the river Emscher, a last wave of trials can be found in 1609, but little *Vest* Recklinghausen, apparently avoided the terrible fate of most other parts of this region—the Westphalian *Sauerland*, the southern Rhineland *Erzstift*, or the city of Cologne—during the late 1620s and early 1630s.

COMMUNAL PERSECUTION

Communal persecution examines not simply the fact of witch hunting *in* villages, but *by* villages, that is, relying on communal structures, traditions, and organizations. It clearly indicates an extensive degree of popular participation with far-reaching consequences, raising further questions about its relationship to territorial and administrative politics, or about the significance of communal traditions in the context of witch hunts.

Recent German research has produced much evidence about the important role of popular demand for persecutions in wide regions of the Holy Roman Empire. A chronicle written in Trier around 1620 even labeled the persecutions ravaging the region some 30 years before as insurrections: “Because it was commonly believed that the witches were responsible for the sterility of the time, the whole country rose up in order to exterminate them” (*tota patria insurrexit in extinctionem maleficarum*). An ordinance issued by Trier’s archbishop in 1591 described this popular movement as a virtual social upheaval threatening his governmental prerogatives: “Unfortunately, the vice of witchcraft could not be eradicated by ordinary means. Instead, agitators were inciting whole communities, which then assemble conspiratorially in order to pass resolutions (*Verbündnisse*) close to sedition. As a result, great numbers of communal committees were set up, whose members run impatiently back and forth, thereby not only violating justice but also causing immense financial damage” (Scott 1832, cited in Rummel 1991, 26).

Since the Middle Ages, committees, either permanent or ad hoc deputations, were commonly used by village communities for negotiating with the authorities. In addition, rural deputations or *Landesausschuss* organized paramilitary units, mobilizing the male adults of a territory in urgent need of defense. In 1732, *Zedler’s Universal-Lexikon* offered a variety of meanings for the term but still emphasized its communal forms: “generally and especially, it refers to a certain number of people chosen to act in the name of the community.” In

his study on the communal basis of the Reformation, Peter Blickle (1992) mentioned such communal committees engaged on behalf of the new ideas.

Hence, communal traditions of organized self-help for urgent purposes probably fostered the idea that such deputations could also be created to defend village communities against the danger of witchcraft. Besides general communal tradition in the Rhineland, specific regional heritages may have prepared a more direct ground. Throughout the villages around Trier, the idea of legitimate self-help had long since been established by the institution of *herschaw* (*clamor forensis*), that is, a state of alarm leading to immediate collective action by communities belonging to *Herschaw*-districts. In 1588, these districts set up their own special committees to persecute witches. The earliest evidence from Luxembourg (1520, 1523, 1535, 1546) concerns suits brought forward by alliances between private persons and regular functionaries of village communities; the first trace of a general oath creating a formal committee in 1564 also comes from Luxembourg.

REGIONAL ROOTS AND DISPERSION

The close affinity between witchcraft committees and communalism (as defined by Blickle) suggests that such actions could have taken place in many regions of the Holy Roman Empire (there is scattered evidence from Brandenburg, the duchy of Münster, the county of Wertheim, the *Stift* [monastery] of Odenheim [Kraichgau], and the Austrian Alps). Political conditions, however, were not always favorable to *Ausschüsse*, even when they were favorable to witchcraft persecutions. Territories with strongly centralized and bureaucratic features displayed hostility to such communal activities on principle, especially in judicial matters. In general, the western parts of the Holy Roman Empire with their numerous territories of medium and small size were a stronghold of committees, notably the mountain regions of Eifel, Hunsrück, and Westerwald together with the valleys of the Rhine and its major tributaries (Saar, Mosel, Lahn, Sieg). In territorial terms, they included the electorates of Trier and Cologne, German parts of the duchy of Luxembourg, the counties of Nassau-Saarbrücken, Sponheim, Arenberg, Wied, Nassau-Siegen, Nassau-Dillenburg, and Sayn, not to mention numerous mini- and micro-lordships. Confessional allegiance had no influence on this phenomenon.

In general, committees represented either single villages, several villages together, or even entire districts. In the city of Trier, single committees installed by the individual guilds as well as a sort of super-committee pressured the electoral government into taking further actions against witches (Voltmer 2001). In villages, we find ordinary neighbors, sometimes officials, and even priests as members.

INAUGURATION AND FUNCTIONING

The basic reason to set up a committee to hunt and accuse witches was to avoid the risks connected with private suits. The principle of trial by accusation made plaintiffs personally responsible for their actions by putting themselves (or a guarantor) into prison. If the action failed, plaintiffs or their guarantors would have to pay all costs. Communal action setting up an accusatorial committee implied that the entire community would take over this responsibility; village members had to swear accordingly, after the assembly had voted to set up a committee. Thus, a formal *pactum* (pact) or *Verbündnis* was established. This ceremony drew heavily on archaic symbolism: villagers underlined their loyalty to the *pactum* by touching the court's mace (*Gerichtsstab*) or by promising solidarity to the mayor's hand. The oath might be sworn at a church altar; it could also be confirmed by everybody stepping forth and grasping the handle of a knife stuck into a table.

The whole situation was highly charged emotionally. Tensions were already high because of an agrarian crisis. Ongoing persecutions in the vicinity often intensified the desire for similar action, especially if members of their own village community had been identified as accomplices by confessing witches. Such incidents inflamed these scenes, as happened in the village of Zilshausen (Hunsrück) in 1595, when Jacob Daum, jolted out of bed by a nightmare, ran totally naked into the street yelling that his house was full of witches. The alarmed villagers assembled and proclaimed a committee that very night. Witnesses testified that such assemblies were tumultuous, filled with much agitation for persecution and even naming potential targets. Anyone who dared to dissent ran the risk of being accused of witchcraft. Though externally cooperative in terms of procedure and structure, the inauguration of witch-accusing committees was as tyrannical as what followed.

ATTITUDES OF CENTRAL GOVERNMENTS

Even princes and councils who favored witch persecutions were generally hostile to such acts of communal self-help. Official terminology used *by* as well as in addresses *to* the provincial council of the duchy of Luxemburg called such committees *monopoles* (monopolies) and *conspirations* (conspiracies). In an ordinance of April 1591, the council prohibited any communal action leading to their formation, notably the establishment of financial statutes. Notaries and lawyers were forbidden to accept commissions by these monopolies. Half a year later, the archbishop-elect of Trier issued a similar ordinance banning these irregular committees because of their seditious actions and similar abuses. But except in the duchy of Lorraine, these and similar attempts by various Rhineland governments had hard-

ly any effect. Clearly the aim of the Luxembourg ordinance was to weaken the persecution by limiting suits to individuals at full risk of their action. In turn, village monopolies simply covered their activities behind front-men who appeared at court as formal accusers, swearing not to act on behalf of a committee. The Trier ordinance of December 1591, aiming more at regulation than at suppression, suffered from inherent ambivalence: though declaring irregular committees illegal, it allowed communities to choose deputies as formal suitors in witchcraft accusations. Committees therefore continued to exist openly.

The biggest loophole was the committees' cooperation with notaries and lawyers and with local officials or lords eager to defend their reputations and rights against central governments. The combination of such secondary interests with the communities' desire for effective action integrated persecutions into a local milieu almost totally impervious to external intervention or inspection. Although central governments saw these lawyers and notaries as guaranteeing equity and justice in local procedures, they either let themselves be deceived by written evidence or, as Friedrich Spee correctly observed, ignored hints and even explicit complaints from victims about abuses. All attempts to discipline committees and their local supporters revealed continuous abuses, scandals, and failures. And by formally prohibiting membership in such committees to the jurors of village courts, governmental regulations made the former into potential opponents of the latter, creating scenarios best suited to provide new weapons for the hitherto unprivileged parties in village disputes over power, property, and honor.

COMMUNALISM?

Summarizing recent studies dealing with persecution by committees, Behringer (1989) concluded that such "democratic organization" of persecutions undermined older interpretations focusing on governmental input. These committees indeed offer reasons to revise some notions about how early modern states functioned. But communal persecution was in no way democratic. At best, it was cooperative in a contemporary sense, but even that only insofar as we do not confuse structure with content. Communalism, however, required both cooperative structure in action *and* a corresponding justification that defended the common man's rights against the other estates, especially against lords, bureaucrats, and sovereigns. In contrast to Dillinger (1999), who also sees communalism at the basis of village witchcraft persecutions, I would argue that what we see here is only formal external cooperation. In terms of content or justification, no argument has yet been found that draws directly on the discourse of communalism to defend the committees' activities. Finally, though witchcraft represented an external threat that

helped to legitimate community action, prosecuting witches was not a defense of the community as such against external social powers, but only of its individual members against individual enemies from within. Therefore, communal persecution necessarily took on the character of civil war, and the particular trials followed the tracks of preexisting village feuds.

CONFESSIONS

Several thousand confessions by accused witches in trials have been preserved, primarily in archives but also in numerous printed texts (demonologies, pamphlets, and so on), after the cumulative concept of European witchcraft belief had been assembled by the early fifteenth century. There were so many because confessions were extremely important in Roman law. Considered the "queen of proofs," a confession almost inevitably formed the basis for a judicial conviction in continental Europe, particularly for an "occult" or hidden crime like witchcraft. Interpreting confessions constitutes a major headache for any historian of the subject. They are too numerous to ignore, but obviously impossible to accept at face value for one simple reason: confessions contained manifest physical impossibilities, such as flight to the witches' Sabbath or sexual intercourse with the Devil or demons. Some types of *maleficia* (harmful acts) found in confessions—for example, sticking pins in dolls to cause injury or death, or tying knots in a string to cause impotence—probably represent real deeds (indeed, sometimes we can be quite confident of this), while others—for example, sending demons to possess people's bodies or raising hailstorms—obviously do not.

One cannot raise a hailstorm by beating running water with a stick, but many women confessed to doing this. Nicolas Rémy (a notorious exaggerator) claimed to have seen 200 confessions of this particular crime; instances do appear in several early confessions from various parts of French Switzerland (Monter 1976, 151–155). It is easy to imagine villagers actually performing this gesture—a traditional way of doing laundry in many parts of the world. This detail suggests that many evil deeds reported in witches' confessions reflected real intentions, whether or not one accepts the witches' etiology.

Nevertheless, "stories with manifestly impossible features are not to be trusted in any particular, as evidence of what physically happened" (Cohn 1975, 115). Both the willingness of late medieval and early modern prisoners to make confessions replete with elements that were both empirically unverifiable and contrary to the laws of nature, and the propensity of judges to accept them uncritically derived from their general absence of any strong sense of skepticism about the workings of the cosmos. Such mythopoeic attitudes, which slowly changed (principally among the judges) as a result of the Scientific Revolution and the Enlightenment, accepted the daily intrusion of the supernatural into the

natural; miracles, wonders, demons, and angels made the impossible possible.

Because witchcraft was a secret crime, witches did not adopt outward signs of their beliefs, went about their nefarious activities unobserved, and left little trace of their actions except the results: murdered corpses, injured bodies, damaged crops, or sick livestock. Essential in identifying alleged witches, witnesses could provide information about the circumstances of such inexplicable harm, testify to the malicious words spoken by a reputed witch, and report rumors about specific individuals.

The secret nature of the crime, however, more often required authorities to concentrate on forcing the witch to confess his or her deeds. This was because in early modern jurisprudence, confession was regarded as the most certain proof of a crime, other than being caught perpetrating it, and much more reliable than witness testimony. To produce a confession effectively, European authorities, from the fifteenth century onward, frequently made witchcraft a *crimen exceptum* (the excepted crime), exempting it from normal rules of judicial

procedure. In doing so they also turned the confession into a useful tool of witch persecution, as witch suspects were forced to name alleged accomplices.

Most witch suspects were either accused by their self-confessed victims or named by other witch suspects under duress. In continental Europe, where inquisitorial procedure was dominant, this meant that most of those arrested for witchcraft had to convince an interrogator that they were not witches. In Spain and Italy, where state-run inquisitions prosecuted most witchcraft cases, it was not generally regarded as an exceptional crime. Consequently, state-run inquisitions allowed defense lawyers (although their actions were heavily circumscribed) and rarely used torture to extract confessions. Suspected witches therefore stood a reasonable chance of being released with little or no punishment.

In other parts of Europe, such as Germany, secular courts tended to prosecute witchcraft. They denied access to defense lawyers and freely used torture. In numerous witchcraft cases tried by inquisitorial-style courts, the template for interrogation was an interrogatory list of questions to be put to the defendant about his or her crime. We have known for over a century that uniform confessions will result if a uniform series of questions is asked to all prisoners under torture. This procedure was used during the trial of the French Templars at the outset of the fourteenth century, long before witchcraft trials proliferated.

In some parts of early modern Germany, such as Eichstätt and Kelheim, the witchcraft interrogatory became standardized and was followed in all known sixteenth- and seventeenth-century trials. The lists often began with questions about the suspect's biography, but very quickly turned to questions about the suspect's character. The Eichstätt list included questions about the legitimacy of the defendant's marriage, whether he or she had fornicated with his or her spouse before their marriage, and whether superstitious objects were used at their wedding. All questionnaires also asked why the suspect thought he or she had been brought before the interrogators and how long the suspect had been in the vice of witchcraft. The tone of such questions clearly showed the suspect that the interrogators already believed him or her to be guilty because of testimony from him or supposed victims or accusations of complicity from other witch suspects. A suspect's only defense was to deny the accusation strenuously, but the interrogators had a series of threats and tortures at their disposal with which to break the suspect's resistance. They could threaten torture, bring the torturer and his instruments into the room, prepare the suspect for torture, and finally use it, moving from thumbscrews to the rack. Occasionally, the suspect would also be confronted with the testimony of others or even with his or her accusers in person, especially if they were also witch suspects. Priests, jailers, and others might also visit the

suspect in custody to induce him or her to confess or spy on others.

Torture proved the most effective means to make a suspect admit to being a witch and then construct a confession that would condemn the suspect and implicate others. In its complete form, a confession covered who had seduced the suspect into witchcraft and when; what he or she had to do to become a witch (promise him or herself to the Devil, have sex with him, renounce God and the saints, and promise to abuse the host and harm Christians); the names of the suspect paramours at the witches' Sabbats, of those whom seduced into the witch sect, and of other accomplices; and details of his or her activities as a witch (killing and injuring people, especially infants, harming their property, causing extremely bad weather, causing marital strife, and so on).

There are intimate connections between witches' confessions and the use of torture. In England and other regions that did not base their judicial systems on Roman law, no legal confession could be obtained through torture because torture was forbidden (except in cases of treason). However, these places also removed the need to obtain confessions, because juries could and often did convict prisoners on the basis of evidence of *maleficium* (harmful magic) provided by witness testimony. But most accused witches were tried under some form of Roman law, where, confession was a *de facto* (if not *de jure*) prerequisite for conviction. A careful survey of surviving confessions from the formative, fifteenth-century period of cumulative witchcraft underlines that many suspected witches confessed diabolism only after undergoing torture and insists that "the extent of the confessions appears to have been directly proportional to the length of the torture"; but it also points out that many accused witches confessed without undergoing any form of torture, that prolonged imprisonment often sufficed to elicit confessions, and misleading promises by judges—recommended, for instance, by the *Malleus Maleficarum* (The Hammer of Witches, 1486)—probably elicited even more (Kieckhefer 1976, 88–90).

If it is common knowledge that most witchcraft confessions were made under torture, it is much less well known that, under Roman law, a confession made under torture had no legal validity. Therefore, every confession had to be confirmed before the judges freely, that is, in a separate room and without the presence of torture implements. Few witch suspects took this opportunity to retract their confessions, because the usual consequence would be further torture until their confession was reasserted freely. In the context of early modern jurisprudence, the interrogators were frequently able to produce watertight confessions including the names of other members of the witch sect. A neatly written version (the one preserved in archives) was assembled for the official sentence. But confessions

were rarely made in an orderly or coherent fashion: it could take months of imprisonment and multiple interrogations to extract a legally satisfactory version. As the famous example of the Pappenheimers at Munich in 1600 shows, even a carefully drawn confession text, officially approved by high-ranking and highly trained judicial authorities, could still bristle with self-contradictions in addition to its manifest impossibilities (Kunze 1987).

Perhaps the fullest exploration of the intricate and occasionally unexpected connections between torture and witches' confessions during the sixteenth- and seventeenth-century apogee of western European witchcraft trials was made half a century ago by a Lorraine archivist who had read hundreds of them (Delcambre 1953–1954, partly translated in Monter 1969, 88–109). Avoiding the simple reduction of witches' confessions to products of leading questions put to accused witches under torture—there were no standard interrogation forms here—he stressed such things as the genuine religiosity of many uneducated village judges, who fully shared the widespread assumption among witchcraft suspects that torture was an ordeal that would reveal their innocence—thus, when they were compelled to confess, the defendants' expressions of guilt were more sincere, and more devout, than historians had usually assumed. In addition, Delcambre's argument that confessions frequently contained a considerable degree of sincerity explained many anomalies that cannot be reduced to simple effects of torture: for example, the sizable number of confessions made spontaneously before torture. Another large number confessed only part of their *maleficia* while denying others under torture. Interestingly, and counterintuitively, the most common pattern was to admit the more serious charge of casting spells against humans while stubbornly denying having done so against animals; one woman confessed that she "had no wish to put any animal to death, but only people." Even more surprisingly, other prisoners confessed only *after* withstanding torture successfully; one woman claimed she did so then "by a divine inspiration."

In England, where accusatorial procedure continued to dominate justice, confessions made during the investigations conducted by the magistrates prior to trial seem to have been freely given. The main exception to this would be the persecutions conducted by Matthew Hopkins, and one cannot discount the probability of pressure in other cases. However, it was not necessary to obtain a confession to prosecute a suspected witch successfully in England: the petty jury at the assize courts determined the verdict, based on the presentation of the examinations and investigations made by the magistrates. At any stage, the suspect might also avail him or herself of legal help. The English process led to a different type of confession, which tended to be shorter, omitting

descriptions of Sabbats and the events supposed to happen at them. Moreover, these confessions rarely implicated others in the crime and concentrated on one or two specific acts of harmful witchcraft, to which there were frequently witnesses. Most notably, perhaps, the Devil and his demons became conflated in some small domesticated familiar, such as a cat or a toad, that did the deeds requested of it by its mistress.

Perhaps the most famous investigation into the (un)reliability of witchcraft confessions was undertaken in the Spain of Don Quixote by Alonso de Salazar Frías, a maverick and skeptical judge and inquisitor, who not only considered witchcraft impossible, but who also attempted to disprove confessions made voluntarily. In an episode unique in the history of witchcraft trials, he persuaded his superiors in 1611 to conduct a series of “controlled verification experiments” on such confessions in the Basque country. In an exercise that diametrically reversed the witchcraft questionnaires in places such as Eichstätt, Salazar Frías prepared a fourteen-point questionnaire and put it to 108 confessed witches above the age of majority, attempting to *disprove* the guilt of people who had already admitted it (Henningsen 1980, 295–301).

Like Nicolas Rémy, Salazar Frías had heard and read several hundred confessions. Unlike Rémy, the majority of Salazar’s confessions came from people well below the minimum age for capital punishment and, more important, none of them came from people who had been tortured. Most important of all, Salazar Frías had become heavily prejudiced against the sincerity of every confession he heard before he began this series of experiments. And the results were interesting. He conducted three sets of experiments: one on the witches’ meeting places, one on the material corroborative evidence for witchcraft (which the Spanish Inquisition called *actos positivos*), and the last on outside witnesses to the witches’ exploits.

When it came to *actos positivos*, twenty-two jars of magic ointments containing witches’ salves, Salazar’s skepticism scored a ringing triumph. No confiscated jar contained anything with preternatural properties. Apothecaries and physicians fed the contents to dogs and found them completely harmless; one woman, a reputed witch, swallowed some of the contents in the presence of many witnesses with no ill effects. At least three witches now claimed they had concocted the stuff hastily to satisfy some priests who had threatened to have them burned unless they produced it; two of them gave their recipes—porkfat, water, wild plums, chimney soot, and scraps of kitchen waste.

Salazar’s third investigation checked out twenty-seven episodes involving specific acts of magic attested by people who were not themselves witches, and similarly found no corroborative evidence for any of them. But his second test on the meeting places for the witch-

es’ *aquejarres* (Sabbats) proved more problematic, although Salazar conducted it with exquisite care. Nine groups from different towns in northern Navarre, each including four adult witches (who, Salazar stipulated, “must be chosen from among the most intelligent”) who had confessed attending the same *aquejarre* and named the other three as accomplices, were carefully isolated before being taken one by one, under supervision, on different days at different times, to their supposed meeting place. There a notary asked them eight extremely precise questions about these Sabbats: did they travel separately or together, where the Devil sat, how they got home, and so forth. In seven groups, multiple contradictions emerged from previously homogeneous confessions by comparing notes. Some witches now flatly revoked their confessions, claiming they resulted from intimidation verging on torture. However, the groups from two towns, Ciga and Vera, remained in substantial agreement. But as Salazar’s apologist noted, “none of the original documents pertaining to this investigation are preserved,” and when the answers did fundamentally concur, “Salazar did not attach any great importance to them” (Henningsen 1980, 297).

Salazar’s whitewash could not quite erase these voluntary confessions. Witchcraft confessions cannot be read with the pseudoneutrality of treating them as simple examples of discourse: all too often, as at Eichstätt, they represent answers to standardized questionnaires given under torture. At the same time, they must also be read without undue condescension toward the people who made them, or even toward the scribes who tried to record them conscientiously. The issue of torture is ultimately a red herring. Most confessed witches (including those at Eichstätt, Salazar’s Basques, and Rémy’s Lorraine villagers) were post-Tridentine Catholics who understood the sacramental concept of confession very well. For present-day investigators of Satanic ritual abuse of children, be they trial lawyers, prosecutors, judges, or juries, any attempt to filter out the authentic elements of a confession dictated to someone else becomes extraordinarily difficult in the absence of corroborative evidence. When historians confront confessions by sincere Catholics who were themselves confronting possible eternal damnation centuries ago, identifying the authentic parts becomes even more problematic.

CONFESSORS

In the Catholic Church, confessors are all priests possessing the license to hear confession, to absolve from sins, and to impose a suitable penance.

When the Fourth Lateran Council (1215) obliged all faithful to confess at least once a year, if they did not want to be excommunicated *ipso facto*, the social position of the confessor was markedly heightened. By this decree, Pope Innocent III probably wished not only to intensify pastoral care in general, but also to install a means of exercising deeper control over minds in a period of dangerous religious deviance (Cathars and Waldensians). This forced people to scrutinize their consciences before speaking to their priest, a custom that deeply influenced the general mental attitudes of Europeans. In the political sector, royal confessors often wielded much power in kingdoms like France, Spain, or the Holy Roman Empire.

Of course, some confessors encountered among their penitents both people who told them about their magical practices, and bewitched people who informed them about the Devil's attacks against them. A few priests (for example, Thomas of Cantimpré, *Liber apium* [Book of Bees] 2, 56), wrote about these subjects, using anonymous confessions as source material. In witchcraft trials, other priests, mostly members of a religious order, especially Franciscans and Jesuits, had the task of hearing the final confessions of the accused and condemned. They often collaborated with the court by trying to induce the prisoners to tell their secrets, threatening them with the eternal tortures of hell,

which they had to expect otherwise. Friedrich Spee, a Jesuit whose own experience as a confessor made him write his famous book against the witch hunts in 1631, did not conceal the pains these expectations caused for the accused. Though confessors' participation is not documented for all witchcraft trials in Catholic territories, their presence must have been usual at least during executions, as in other criminal cases. Sometimes, confessors are mentioned as sharing the banquets that the members of the court held at the expense of the accused. A special situation characterized the tribunals of the Holy Inquisition, as their members were simultaneously "inquisitors of heretical depravity," judges, and confessors. Admittedly, the anticlerical stereotype of the confessor abusing his power must not be generalized, but ample evidence exists from within the clergy that sexual and financial malpractices were frequent.

The confessor's opinion was extremely important for the small number of Christians who experienced paranormal phenomena, as confessors were the first persons to decide whether the visions, apparitions, auditions, stigmata, and so forth, of their penitents should be considered authentic mystic manifestations or diabolical frauds. Therefore, Catholic theologians developed a special method of testing these persons, called discernment of (good and bad) spirits. Quite often, opinions concerning these women (and occasionally men) were divided, one party believing in their holiness, and another declaring them to be witches. Some confessors saved their penitents' lives by their positive statements, as did, for example, those of Dorothea of Montau (d. 1394) or Eustochia of Padua (d. 1469), even preparing their veneration as saints. Others convinced women with mystical experiences that these were only demonic temptations; in 1755, after years of saintly life, the nun Gesualda Forni was convinced by her confessor of the contrary and therefore declared herself a hypocrite before the inquisition of Udine. How this discernment of spirits worked in practice, we know from the example of Ursula Benincasa (d. 1618), who, during eight months, had to make daily confessions and submit herself to exquisite humiliations imposed by Saint Filippo Neri. After the Council of Trent, very often a female mystic could avoid being prosecuted for demonolatry only by responding to such tests with the most demonstrative pious humility.

CONFISCATIONS OF WITCHES' PROPERTY

Skeptics have long believed—or rather, assumed—that “by the beginning of the seventeenth century, witchcraft had developed into a vested interest and an industry” (Robbins 1959, 15). In other words, confiscating the property of people condemned for witchcraft made witch hunting profitable for many European governments and thus provided an economic explanation for witch hunting. However, such skeptics never bothered to demonstrate this theory from the abundant financial evidence about witch hunts. The question was first investigated a generation ago for the largest witch hunts of southwestern Germany (Midelfort 1972, 164–178), with unexpected results.

In the laws of the Holy Roman Empire, where the vast majority of witchcraft executions occurred, confiscation was always problematic and almost never implied that the entire estate of someone executed for witchcraft went to the state. Of the twelve districts in southwestern Germany that executed the most witches, three never practiced confiscation. The two largest witch hunts, however, occurred in places that did: Ellwangen and Mergentheim. Large samples show clearly that both governments actually confiscated only a small share of the witch's estate; at Mergentheim, the average was only one-seventh (14 percent), and over half of all confiscations cost the dead person's heirs less than 10 percent of the estate. Similar investigations have been rare, but about a thousand scattered instances of confiscation in the rich fiscal records of the duchy of Lorraine essentially confirm these findings: the government's major goal was to recover the costs of a witch's trial and execution, if possible, without impoverishing the heirs. In a half-dozen instances where exceptionally wealthy people were burned as witches, thus guaranteeing a profit for the government, the duke of Lorraine simply awarded the windfall spoils of their confiscations to minor courtiers.

Outside the Holy Roman Empire, the Spanish Inquisition routinely practiced confiscations of personal property for anyone convicted of heresy. Especially in its early years under Ferdinand and Isabella, there were

numerous complaints that it deliberately targeted the richest converted Jews (often dead people) to confiscate their assets from their heirs. However, the Spanish Inquisition ordinarily exempted convicted witches from this provision. On one significant occasion, at Logroño in the Basque region (1609–1611), a tribunal petitioned successfully for the right to confiscate property from convicted witches. Four years later, Logroño's records revealed that the cost of the operation had been almost three times greater than the receipts; only three of seventy-seven convicted witches had enough personal property for confiscation to exceed trial costs, and over half of them left absolutely nothing that could be confiscated (Henningsen 1980, 381). It seems that confiscations proved unprofitable for witch hunters in systems using inquisitorial rather than accusatory procedures, which provided the vast majority of Europe's witchcraft trials.

CONRAD OF MARBURG (CA. 1180–1233)

A merciless inquisitor operating in the Rhineland in the early thirteenth century, Conrad of Marburg's reports describing widespread Luciferan (that is, devil worshiping) heresy were accepted by Pope Gregory IX (ruled 1227–1241), becoming the basis for the pope's decretal letter *Vox in Rama* (A Voice in Rama), which described a heretical cult worshipping the Devil. This document was an important source for later ecclesiastical authorities seeking to link heresy with diabolism and devil worship, and can be seen as a precursor of later descriptions of witches' Sabbats.

In many respects, Conrad was a shadowy figure. He was certainly a priest, and he may have had some association with a religious order, possibly the Dominicans or Franciscans, although the strongest evidence now suggests a slight association with the Premonstratensians. He, however, was most likely a member of the secular clergy. He had some level of university education. While certain scholars maintain that he was a papal inquisitor, indeed the first papally appointed inquisitor in German lands, the evidence is open to possible qualification. Many scholars argue that he was an episcopally appointed inquisitor who, after 1231,

received papal sanction and approbation for his actions against heretics, but not any formal appointment as a papally designated inquisitor.

Conrad's involvement with heresy may go back to 1224. Certainly by 1227 he seems to have been directing his own investigations into heresy; that year, a letter from Gregory IX encouraged Conrad in such pursuits. In 1231, Gregory became determined to initiate more systematic inquisitions into heresy in Italy, France, and German lands. He issued a letter to Conrad giving him official papal support to proceed as an inquisitor in German lands, mainly in the Rhineland and in parts of Thuringia. As an inquisitor, Conrad's methods were remarkably extreme. He was inclined to accept any testimony, however fanciful, and he appears to have been willing to sentence to death any suspect who did not offer at least some admission of guilt. Never active against witches or sorcerers of any kind, Conrad focused instead on the Cathar and mainly Waldensian heresies that actually existed in German lands at this time. He coerced extravagant confessions of devil worship from suspects and became fully convinced of the reality of numerous Luciferan heretics in the Rhineland. Many authorities recognized Conrad's fanaticism for what it was, and his activities aroused much opposition. The archbishop of Mainz refused to accept Conrad's accounts of Luciferan cults, for example, and urged him to moderate his activity, but to no avail.

Gregory IX, however, was convinced by Conrad's reports of heretical activity. His decretal letter *Vox in Rama* of 1233, addressed to the archbishop of Mainz and bishop of Hildesheim, presented a detailed description of a heretical sect gathering in secret to worship demons who appeared in various forms, first as a giant toad, then as a gaunt, pallid man with an icy touch, and finally as a large black cat. Novices in the sect were required to kiss each of these, either on the lips or hindquarters, to renounce their faith and swear loyalty to the sect and its demonic master. The pope also described the abominable sexual orgies in which these heretics supposedly engaged. Certainly this was not the first time a connection had been drawn between such diabolism and heresy. For example, one source described a group of heretics burned at Orléans in 1022 as participating in similar orgiastic and diabolic rituals, and there were other accounts of Luciferan heresy in German and Italian lands in the thirteenth century. Nevertheless, *Vox in Rama* marked an important step in the progressive demonization of heresy in the high and late Middle Ages that culminated in the notion of diabolical witchcraft.

Meanwhile, Conrad continued to operate without any apparent restraint, and in the face of much opposition. Eventually he went so far as to accuse a nobleman, Count Heinrich of Sayn, of heresy. A synod was held at

Mainz in August of 1233 to judge this case, and the charges were dismissed. A few days later, while returning to Marburg, Conrad was murdered, possibly by supporters of the count of Sayn or others opposed to his inquisitorial activities.

CONTEMPORARY WITCHCRAFT (POST 1800)

Most histories of European witchcraft end with the last public witchcraft trials in the late eighteenth century. By 1800 the spread of new intellectual ideas and legislative developments led to the decriminalization of witchcraft across Europe, one of the odd exceptions being the belated repeal of the laws against witchcraft in Ireland in 1821. Yet despite the easing of educated concern over the continued existence and threat of witchcraft, the mass of the population continued to fear witches and considered them a serious threat to their lives and livelihoods.

The history of witchcraft after its decriminalization is, therefore, very much concerned with popular attempts to employ unofficial and often illegal forms of trial and punishment. Newspaper reports and legal records attest to the fact that across Europe people continued to try witches in a variety of ways, such as the water (swimming) test, which was employed quite widely in the Netherlands, Ukraine, and England during the first half of the nineteenth century. Severe physical abuse was also meted out to accused witches as a means of forcing them to remove the harmful spells they had cast. In Belgium and France the courts dealt with a number of cases of “grilling” or “burning” accused witches in or over a hearth to make them confess and “unwitch” their victims. One such event took place in Flanders in 1815 when a farmer and his wife, believing their daughter and cattle had been bewitched, seized a female neighbor they suspected, bound her, and shoved her into a fire to make her talk. Likewise in nineteenth- and early twentieth-century England, the courts dealt with many cases

involving scratching suspected witches to draw blood. The vigorous employment of such coercive violence sometimes led to the death of the victims. In the Flanders case, the suspected witch died a week later from severe burns, and in England an old woman named Ann Tennant died in 1875 after being badly wounded with a pitchfork by a villager who wanted to draw her blood. In some instances the death of suspected witches was intentional, and was seen by the killers and their sympathizers as a just sentence in the eyes of the community and God, if not the official authorities. In Russia in 1879 some 200 locals gathered to witness a suspected witch being deliberately burned alive in her house. Similar terrible cases can be found from across Europe during the nineteenth century.

Directly confronting suspected witches was by no means the only way of countering witchcraft in the absence of laws against it. The work of nineteenth-century folklorists and prosecution records provide a wealth of relevant information in this respect. Written charms and amulets were commonly worn or placed in houses and outbuildings to ward off witchcraft. A wide and diverse range of private counter-magic, spells, and rituals were employed to torment witches at a distance, or to compel them to appear at the homes of the bewitched to remove their spells. These were commonly based on sympathetic

magic, such as piercing crude dolls or images made to represent the witch; burning or boiling the hearts of bewitched animals, which would consequently cause the witch severe heart pains; cooking toads that were closely associated with witches; boiling black chickens alive, as was practiced in the Netherlands; and creating of witch-bottles. In England, examples of the latter dating from the nineteenth century are not uncommon. In 1848 a bewitched couple from the county of Somerset put some of their urine in an earthenware bottle along with some hobnails, and buried it under their hearthstone. The bottle symbolized the bladder of the suspected witch, who would suffer terrible pains as the bottle heated up and agitated the sharp objects within.

In many instances such practices were employed on the advice of cunning folk. The widespread popularity of these magical practitioners, and others who engaged in witch-doctoring during the nineteenth century, provides further confirmation of the popular fear and concern regarding the power and prevalence of witches in Europe in the years following the decriminalization of witchcraft. In Catholic countries, where the clergy, under certain conditions, still conducted exorcisms and used the healing powers of blessed objects such as holy water, the Church and its representatives continued to play an instrumental

role in the struggle against witchcraft, albeit often unofficially. The sensational French cases of witchcraft and possession in Cideville, Normandy, in 1850, and in the Alpine village of Morzine (Haute-Savoie), a few years later, highlight the various ways in which Catholic clergy were bound up with popular concerns over witches. The drama in Cideville, for example, began after the local priest criticized a parishioner for consulting a cunning man. When the latter was later arrested, it was thought in the village that the priest had reported him to the police. Not long after, two boys in the care of the priest began to exhibit the symptoms of witchcraft.

Yet, there is no doubt that from the early twentieth century onward the fear of witches became less intense and less pervasive. Across Europe, as the nineteenth century progressed, inexorable urbanization, mechanization, developments in transportation, the opening of global markets, and other broad economic factors slowly but surely changed the social and cultural experiences of millions of people. One aspect of this process of change was the reduced need to explain misfortune in terms of witchcraft. Better state welfare provision and the development of personal banking and insurance, particularly in the farming sector, lessened the financial impact of livestock losses and ill health. Improvements in sanitation and medicine reduced the spread and impact of a wide range of once prevalent contagious diseases. The decline of domestic production of cheese, butter, bread, and beer in the face of industrial-scale manufacturing further reduced the scope for suspicions of witchcraft to arise. Because of such changes, and other interlinked developments, fewer and fewer witches were created through the accretion of suspicion and gossip, and so witches became increasingly redundant as communal scapegoats.

But the pattern of witchcraft's declining social relevance across Europe has yet to be fully explored and is little understood. What is certain is that it was highly variable. In England, by the 1930s, witchcraft ceased to be a significant concern, even for a minority of the rural population. In many other regions of Europe, however, the fear of witches continued well beyond that time among a large minority of the population. To underline the seriousness with which some people continued to fear the threat of witchcraft since World War II, one need only consider a series of witch-related shootings in France. In 1948, for example, a farmer of Saint-Maurice-du-Désert, near Domfront, shot his neighbor dead and seriously injured another who he believed had cast a spell on his animals by making the sign of the cross the wrong way whenever he passed his property. Around the same time, across the border in Germany, the work of Johann Kruse, an ardent campaigner against the belief in witchcraft whose schoolteacher mother had been persecuted as a witch,

revealed a continued widespread popular concern regarding witchcraft. Furthermore, in parts of France, Germany, Greece, and Spain, researchers have recorded a vibrant traditional discourse regarding witchcraft during the last few decades of the twentieth century (Blécourt 1999; Favret-Saada 1980; Sebald 1978).

Because the popular witchcraft discourse had become largely redundant in England and America by the early twentieth century, anthropologists and ethnographers turned to African, Pacific, and South American societies to study the dynamics of witchcraft, and so from the 1920s, academic interest in contemporary witchcraft shifted away from Europe for several decades. From the 1970s onward, however, there was a growing recognition by anthropologists that there was still plenty of scope for studying witchcraft in Europe. In particular, the research by Favret-Saada on the witchcraft discourse in the Bocage (hedged farming landscape) of western Normandy, France, provided a timely corrective to all those—historians and anthropologists included—who had consigned European witchcraft to the past. Favret-Saada became immersed in a world of accusations and insinuations involving bewitched pigs and humans, witch doctors, fortunetellers, local politics, and religious devotion.

The history of witchcraft in the modern era is, however, not just about the decline or continuation of traditional belief in witches; it is also concerned with the origins and growth of contemporary Neo-Pagan witchcraft. While the popular belief in witchcraft waned during the second half of the nineteenth century, a significant renewal of interest in ritual magic began among western Europe's middle classes, born of a fusion of mystical freemasonry, early-modern occult philosophy, interest in recently deciphered Greek and Egyptian magical papyri, Eastern mysticism, and Western spiritualism. In France the influential works on ritual magic and tarot reading by Eliphas Levi (Alphonse Louis Constant [1810–1875]), and the publications of the spiritualist Allen Kardec (Hippolyte Rivail [1804–1869]) and Papus (Gérard Encausse [1865–1916]), were at the forefront of what can be described as the occult revival. It was in England, however, that this new melting pot of esoteric magic and interest in the arcane took root most vigorously. It was in England in 1865–1866 that the *Societas Rosicruciana* was formed by a small group of erudite Masons with a keen interest in ceremonial magic. The society was the seed from which grew the more famous Hermetic Order of the Golden Dawn, and later, the English branch of the *Ordo Templi Orientis*, headed by the infamous Aleister Crowley. Membership of these various groups was tiny, but some members published translations of rare magical texts and created rituals and initiations that would have a strong influence on the development of Wicca and modern witchcraft. English and

German enthusiasm for the mystical writings of Madame Blavatsky (1831–1891) and her Theosophical Society also did much to encourage a more interventionist and imaginative engagement with supernatural forces, which fed into the general reawakening of intellectual occultism.

These occult societies of the late nineteenth and early twentieth centuries provided the textual resources and organizational inspiration for the Neo-Pagan witchcraft movements that emerged after World War II. Yet the linking of the Neo-Pagan witches of the present with those labeled witches in the historical record, which underpins the postwar concept of modern witchcraft, was very much influenced by the work of someone who was not a practicing occultist: the Egyptologist and folklorist Margaret Murray. In two books, *The Witch-Cult in Western Europe* (1921) and *The God of the Witches* (1931), Murray (mis)used early-modern trial records to construct the theory that those persecuted as witches in the past were adherents of a secret pagan fertility religion centered on the worship of a horned god. While the basis of Murray's theory was easily undermined by experts on the history of witchcraft who highlighted her crude and misleading use of historical sources, her "findings" were nevertheless taken seriously by some scholars, who gave her work an enduring veneer of respectability that facilitated the establishment of Wicca as a religion.

Wiccans were the first firmly identifiable group of Neo-Pagan worshippers describing themselves as witches. Gerald Brosseau Gardner (1884–1964), a former customs official in Malaya who returned to England in 1936, founded the movement. From his active interest in folklore, spiritualism, Eastern mysticism, and freemasonry, and his enthusiasm for the theories of Margaret Murray and the activities of the *Ordo Templi Orientis*, he molded the history and structure of an ancient organized witchcraft religion. His ideas and claims were revealed in several publications beginning with the influential book, *Witchcraft Today*, published in 1954. Gardner alleged that in 1939 he had discovered and been initiated into a coven of secret pagan worshippers in the New Forest, Hampshire. The coven represented the last survivors of an indigenous fertility religion whose adherents were described as witches. Their secret knowledge had been passed on from one generation to the next orally, though key ceremonies were written down in a manuscript known as the *Book of Shadows*.

In subsequent decades, offshoots, schisms, and new formulations of pagan witchcraft emerged. The most influential group was that formed by Alex Sanders, who practiced "Alexandrian" Wicca. During the 1960s he broke away from Gardnerian Wicca, publicly declaring it to be bogus, and instead claimed for himself a true link with the ancient religion of the past through his

grandmother, who had passed on to him her own *Book of Shadows*. Sanders did not leave any significant body of work like Gardner, but two of his adherents, Stewart and Janet Farrar, went on to write a series of successful books beginning with *What Witches Do* (1971), that laid open the workings of Alexandrian Wicca in an accessible way. Around the same time Doreen Valiente, one of the founding members of Gardnerian Wicca, also produced a number of equally successful guidebooks such as *Witchcraft for Tomorrow* (1978). These publications were key to the impressive spread of Neo-Pagan witchcraft in the United States, Australia, and parts of Europe from the 1970s onward. As Ronald Hutton observed, "Wicca, is in fact the only religion which the English can claim to have given to the world" (Hutton 1999b, 1).

At the beginning of the third millennium, our understanding of what is meant by witchcraft in contemporary society is to a considerable extent determined by where we live, how we live, and personal belief systems. For some people in mainland Europe, witchcraft consists of a similar set of traditional beliefs and fears to those found in the records of the witchcraft trials of the early modern period. This conception of witchcraft is very much intertwined with Christianity. For others, witchcraft is a vibrant and growing alternative to the churches. It is a *religion* in itself, providing a new means of expressing religious devotion and spirituality. Whether it really has any direct connection with the witchcraft tradition of the past has become less important, with many Neo-Pagan witches now recognizing that Gardner's and Sanders's claims of ancient continuity are either bogus or unproven.

CONTRARIES, CONTRARIETY

Expressing the relationship of maximum opposition in Aristotelian logic, dichotomies were most often chosen by authors to establish and describe the difference between witchcraft and the normal world. In ancient philosophy and religion, and in early, medieval, and Renaissance Christianity, the cosmos, nature, and human relations were often said to be "composed of contraries," for example, those between the elements, the virtues and vices, Christ and Antichrist, men and women, and the contrasting social and political conditions of individuals.

Contrariety became especially prominent in Renaissance communication theory and therefore in all forms and levels of education. In both logic and rhetoric it was recommended as an especially effective strategy for persuasion. This gave rise to widespread forms of discourse based on antithesis and on the principle that contraries were best revealed when placed next to each other in a phrase, a sentence, or an entire argument. Moral values benefited most from this form of mental and linguistic patterning, good being best appreciated when set off against evil and vice versa. But there was little to which the principle could not be applied, and early modern authors in all fields took considerable advantage of this in exploring copious numbers of contraries and forms of contrariety in their writings.

An evil like witchcraft was easily assimilated to forms of thinking, speaking, and writing based on contrariety. The Devil and God were obvious contraries; so too were their servants. All the actions of witches and especially those associated with the Sabbat could be interpreted as contrary behavior, in the sense of being *contrary to* normal actions. In addition, since most contraries were related asymmetrically (good was better than its contrary evil), a form of behavior that suggested the opposite was also an *inversion of* normal actions. Contrariety became the governing principle, therefore, of both how witchcraft was conceived and how it was described.

There were three consequences for witchcraft belief. First, it drew considerable strength and credibility from the fact that witchcraft could be absorbed by a principle that was already thought to be of paramount importance in philosophy, religion, and social and political theory. Contrariety enabled writers intelligibly to construct and depict what was thought to be the most evil of all crimes by means of the concepts and the language of maximum difference. As a result, witchcraft continued to be thinkable for as long as the logic and rhetoric of contrariety continued to be rational communication strategies. Second, contrariety enabled witchcraft believers to argue that witchcraft *must* exist in the world, since without such an extreme form of evil, extreme forms of good would go undefined and therefore unacknowledged. The paradox of contraries is that, since they require each other, the negative contrary is as important as the positive. In this sense, witchcraft had a necessary role in human affairs and a purpose that was ultimately beneficial; it was required to complete the moral system. This was God's reason for allowing it to happen. As James VI and I, king of Scotland and England, wrote of knowing witchcraft: "there can be no better way to know God, then by the contrarie" (*Daemonologie*, Edinburgh, 1597, 55).

Third, the same paradox could have damaging implications in the context of skepticism about witchcraft. Those who were inclined to doubt witchcraft's objective reality were able to argue that it was, instead, a made reality—a product of the logic of contrariety, instead of merely its subject. Johann Weyer was to argue, for example, that in Catholic cultures witches were accused simply of doing anti-Catholic things—things *contrary to* Catholicism. For Protestants, such accusations clearly made no sense and could be ridiculed as ideological constructions. Eventually, in 1718, another skeptic, Francis Hutchinson, was able to turn the logic of contrariety completely against acceptance of witchcraft as an objective crime. Such a logic, he wrote, had created the absurd situation in which every society and culture saw witchcraft as simply the inversion of its own values. Witchcraft was no longer a necessary part of the objective world order; it had been

debunked as nothing more than a requirement of thinking in a certain way.

CONTZEN, ADAM, SJ (1571–1635)

A major political thinker of Catholic Germany during the Thirty Years' War, Contzen's long acquaintance with religious and political conflict, plus first-hand knowledge of witch hunts, heavily influenced his consistently "zealot" opinions and actions.

Born in Monschau (a village in the duchy of Jülich near Aachen), he was acquainted at an early age with the religious wars raging across the border in the Netherlands, the struggles between Calvinists and Catholics in Aachen in 1582, and the effects of the Cologne War in 1583. Contzen attended the Jesuit College at Cologne in 1588, and then moved to Trier while a major witch persecution was taking place. He entered the Society of Jesus in 1591 and studied theology at the Jesuit academy in Mainz in 1599, where he witnessed more witch persecutions. In 1603 he was ordained a priest, followed by appointments in Cologne and in 1606 as professor of philosophy at the University of Würzburg. In 1609 he assumed the chair for biblical studies in Mainz formerly held by his teacher Nikolaus Serarius; from 1612, he also lectured on controversial theology, succeeding another mentor, Martin Becanus.

During his ten years at Mainz, Contzen published controversial theological tracts, gaining a reputation as one of the leading controversial theologians of his day. He directed his polemics mainly against Calvinists and the Reformed Church, which he blamed for obstructing religious reconciliation and peace in Germany. His anti-Calvinism formed the centerpiece of his most enduring work, *Politicorum Libri Decem* (Ten Books on Politics, 1620), which became required reading at Catholic universities and for Catholic rulers; it remained one of the most influential statements of Catholic statecraft in central Europe until the early eighteenth century.

Contzen set out a moral program to combat Germany's political crisis and to develop a Catholic state. He sought to integrate politics with Christianity, denying Machiavelli's claim that a ruler could not be a good Christian. Contzen's anti-Machiavellian attack on the "pseudo-politicians," also condemned Calvin's "pseudo-theology," which he claimed had caused chaos in Germany. The only solution was through strong government, with an all-powerful ruler, who should firmly preserve Catholicism and reintroduce it into newly converted territories through a balanced worldly and

ecclesiastical administration and an educational system to create a pious and disciplined populace. Moreover, Contzen was a pioneer in mercantilist theory, stressing the necessity of economic development as the way to state power. Like most theorists of the well-ordered police state, he emphasized the urgent need of taxation to fill the state treasury, essential for the creation of an offensive army consisting ideally of career soldiers, echoing the doctrines of Justus Lipsius. As a maxim of politics, he argued that the prince should always think in terms of the augmentation and consolidation of state power and do everything to increase it.

Contzen's program was very agreeable to Duke Maximilian I of Bavaria and the publication of the *Politics* probably led to Contzen becoming confessor to the Bavarian duke in 1623. In this position, Contzen gained intimate influence as Maximilian's chief political advisor and formed a zealous court faction of militant Catholics at Munich. He viewed the Thirty Years' War as a holy crusade, conducted for the honor of God, and played a major role in convincing Maximilian I to support the policy of Catholic restitution.

Like other Bavarian "zealots," Contzen took a hard line on witchcraft, thus provoking resentment from the moderate party at court. Thanks to Contzen's political rivals, who converted the Jesuit Adam Tanner to their view, no extensive witch persecution occurred in Bavaria even during the general peak between 1626 and 1630. Contzen lamented the lack of zeal for persecuting witches among Bavarian moderates, whom he derided as *politici*, which would ultimately lead to divine retribution. Contzen was in close contact with Friedrich Förner, the chief architect of Bamberg's witchcraft trials, and he congratulated Bamberg's bishop, Gottfried Johann Georg II Fuchs von Dornheim, for burning 600 people for sorcery: God will surely have mercy, Contzen wrote, for a prince working so ardently for his honor.

For Contzen, however, persecutions were not the only means to extirpate witchcraft. When he published a political novel in 1628, employing a legendary Ethiopian king to demonstrate his principles of government, he made it clear that the origins of sorcery lay in ignorance and a lack of proper education. Besides executions and public prayers, Contzen's idealized Ethiopian king also founded public elementary schools. Through literacy and public prayer, Ethiopian youth achieved true inner piety and thus helped root out sorcery.

When Contzen died in 1635, Maximilian's policies immediately shifted to moderation; Bavarian witch persecutions ended abruptly and the elector's imperial policy now sought conciliation with the Protestants. Maximilian's new confessor, Johann Vervaux, was also a Jesuit, but his policies were far more moderate and he mediated actively in peace negotiations.

CONVENT CASES

In early modern Europe, some famous witchcraft cases originated in nunneries. They seem to follow a fixed sequence: First, one or more nuns began to experience a kind of "psychosomatic" malaise (sometimes it became a true "epidemic" spreading throughout the convent); second, the disease was perceived as a demonic possession, which immediately involved an exorcist; third, during their exorcisms, the possessed nuns accused of witchcraft the persons whom they believed responsible for their possession; and, fourth using this evidence, both lay and ecclesiastical courts sometimes arrested and tried the presumed criminals. Convictions for witchcraft and *maleficium* (harmful magic) frequently resulted, until at the end of the seventeenth century an increasingly skeptical view of convent possessions persuaded the judges to view them as matters of mendacity or illness.

We do not know exactly how many cases of this kind occurred; the impression that they were numerous might be due to the echo and to the public debates which such episodes caused, especially in seventeenth-century France. Nor is it clear exactly when these episodes started to multiply. Among others, Gregory the Great (ca. 600), Hincmar of Reims (early ninth century), and Caesarius of Heisterbach (thirteenth century) mentioned possessed friars and nuns. However, these involved single individuals, in whom the possession re-

resented temptation by the Devil and the consequent punishment for surrendering to him; no human cause was thought to be responsible for the possession, with the partial exception of the possessed himself.

The first epidemics of demonic possession in nunneries, followed by accusations and trials for witchcraft, go back to the mid-sixteenth century and occurred in post-Reformation Catholic Europe. Johann Weyer, a German physician writing in 1563, reported at least four episodes of this kind; they occurred in the Cloister of St. Bridget, near Xanten (1550–1556); in the convent of Uvertet in the County of Hoorn (1551); at Kentorp, near Strasbourg (1552); and at the Nazareth convent of Cologne (1560–1564), respectively. Weyer used these cases (at least two of which ended with the death of the suspected witch) to show that all such malefices were the Devil's deceptions, designed to confuse faithful Christians and to cause the death of the innocent presumed witches. Believing that disease might explain such cases, the Protestant Weyer protested strongly against Catholic remedies for possession (that is, exorcism), which he considered superstitious. This offers a first clue to the cases of witchcraft in convents: along with other highly publicized early episodes of demonic possession (for example, France's famous "Miracle of Laon," 1566), they were used as propaganda by Catholics to emphasize the efficaciousness of their sacraments and rites. This interpretation obviously applies to European areas, such as sixteenth-century Germany, the Netherlands, or France, where the conflict among different Christian confessions was very harsh.

However, the same cannot be said of some cases in Italy (Bologna, 1562–1563; Reggio Emilia, 1625; Piacenza, 1625; Carpi, 1636–1639) or Spain (monastery of St. Placido, Madrid, 1628). Our explanations here begin with the application of rules approved by the Council of Trent, which imposed on the nunneries a much stricter reclusion than before. When we also take into consideration the fact that in both Italy and Spain (as elsewhere in Catholic Europe), girls of good family who had no chance of getting married were obliged to take shelter in the nunneries, we can easily understand why there were so many strains and conflicts inside them. In Italy, however, at least since the first decades of the seventeenth century, the Roman Congregation of the Holy Office assumed a mild, cautious approach to the cases of demonic possession and witchcraft in the nunneries. Though never denying the existence of genuine possession in theory, Roman and Spanish authorities recognized the strong pathological and imitative components that such cases emphasized. Both Inquisitions, therefore, interrupted any legal proceedings based on exorcism and strictly forbade the exorcists to continue their work. Instead, they ordered that convents where such cases had occurred be provided with better confessors and

spiritual directors, and occasionally dispersed the possessed nuns among unaffected convents.

In seventeenth-century France, to the contrary, the nuns who accused their sisters or other ecclesiastics of witchcraft found influential persons willing to listen to them. Three famous cases are recorded: the Ursulines of Aix-en-Provence (1609–1611), the notorious case of the Ursulines of Loudun (1632–1638), and the hospital nuns of Louviers (1642–1647). At Aix, one sister who was possessed by the Devil accused Louis Gaufridy, her confessor, of sorcery; the *Parlement* (sovereign judicial court) of Provence sentenced him to death. At Loudun the same fate befell Urbain Grandier, a handsome and highly esteemed priest, but also much criticized in his town. Finally, the *Parlement* of Normandy sentenced to death the spiritual director of the nunnery at Louviers (since he was already dead, his corpse was burned); the same doom befell his vicar, while another nun hardly escaped the stake. Many overlapping explanations have been offered for these disconcerting events. First, constraint and sexual deprivation (as mentioned above): according to a psychoanalytical interpretation, the accusations of witchcraft represented the denial and projection of one's own sexual desires. Additionally, we should consider that the lengthy discourses by the possessed nuns during public exorcisms represented the closest approximations to female preaching permitted by the Catholic Church; generally speaking, the peculiar condition of a possessed person justified behavior that in a different situation would have been severely suppressed. Moreover, the accusations against confessors and spiritual directors emphasized the importance that these clerics had assumed in the post-Tridentine Catholic world and the dangers of nearness between nuns and confessors.

Nevertheless, high-ranking French courts condemned to death some prominent clergymen on the grounds of accusations drawn from exorcisms and other related evidence. A change of mentality among judges finally stopped such trials in France during the seventeenth century. After the Loudun and Louviers cases, the enormous publicity given to such events started a lively intellectual debate that eventually led to the disappearance of the crime of witchcraft by royal edict in 1682. A thorough judicial evaluation of the problem, therefore, was provoked through the outcry stemming from events in French nunneries.

Since comparative research in this field remains rudimentary, we do not know what happened in other parts of Catholic Europe. During the eighteenth and nineteenth centuries, lay culture was increasingly inclined to consider possession as a real illness, until Freud's famous research labeled the demonically possessed of the previous centuries as hysterics. By that time, however, any connection between demonic possession and

witchcraft had disappeared and only the problem of possession remained.

COOPER, THOMAS

Cooper was a demonologist, one of a number of seventeenth-century English clerics who identified the pact with the Devil as the essence of witchcraft. Like most demonologists, Cooper regarded witchcraft as one aspect of a much broader range of religious issues. We know relatively little about him, not even the dates of his birth and death. Cooper was born in London, educated at Westminster School and Christ Church College in Oxford, where he took his BA in 1590, subsequently adding an MA and an MD. He held a couple of clerical livings in Lancashire and Cheshire, and another subsequently in Coventry. Cooper moved to London in 1610, apparently supporting himself as an author.

Cooper's importance in the history of witchcraft lies in his book on *The Mystery of Witch-Craft: Discovering the Truth, Nature, Occasions, Growth and Power thereof: Together with the Detection and Punishment of the Same*. Published in 1617, it was dedicated to the mayor and corporation of the city of Chester and the justices of the peace of Cheshire. A major work of demonology, some 368 pages in length, it made an important contribution to a corpus of distinctively English demonological works, a series that had begun in 1590 with Henry Hollands *A Treatise against Witchcraft* and ended with Richard Bernard's *A Guide to Grand Jury Men with respect to Witches* of 1627.

Cooper's *The Mystery of Witch-Craft*, while demonstrating some peculiarities, lay firmly within this evolving English Protestant tradition of demonological works. He claimed to have been prompted to write it both by the general issue of witchcraft and by his knowledge of some recent cases. Indeed, he claimed to have been involved in a case of demonic possession by witchcraft at Northwich in Cheshire (almost certainly the possession of Thomas Harrison of 1601–1602), and also to have comforted the widower of a “Lady Hales” after she had been killed by witchcraft. Cooper was well aware of the Lancashire trials of 1612, and also mentioned suspicions of witchcraft at Coventry (where, according to one confessing witch, there was a “confederacie” of some sixty witches).

He couched his ideas about witchcraft in a conventional theological context. He saw witchcraft as being, among other things, a product of the superstition of the period; noting that the Lancashire witches had arisen in a backward part of the country, where right religion had not yet been sufficiently planted. Cooper saw the creation of an effective preaching ministry as the most effective way to prevent people from falling into the Devil's snares. Toward the end of his book, Cooper devoted sections to excoriating “the atheisme of these times,” the widespread contempt of God's word, the “idolatorie and false worship of this present age,” and other problems caused by the imperfect state of religious observance in England.

Cooper's treatment of witchcraft was essentially similar to that advanced by other English writers of the period. He defined witchcraft as “a wicked art serving for the working of wonders by the assistance of the devill, so farre forth as God in justice shall permit” (Cooper 1617, 47). Cooper saw the satanic pact as central to witchcraft; like other writers, he interpreted the pact as an inversion of God's covenant with his people. Again, like other British Protestant authors, he expressed hostility to cunning folk and countermagic and disapproved of divination, including fortunetelling and astrological predictions. He based his interpretation of witchcraft entirely on Scripture, making little or no reference to other demonological writers or to any recent

examples of witchcraft, apart from those few instances already mentioned. (However, Cooper made extensive and unacknowledged borrowings from William Perkins's *A Discourse of the damned Art of Witchcraft*.) The book struck a responsive chord: a second printing appeared in 1622, under the title of *Sathan transformed into an Angell of Light . . . Emplified [sic] specially in the Doctrine of Witchcraft*.

Cooper's views on witchcraft need to be placed in the context of his other writings. He wrote about a dozen tracts on religious and related matters. His weightiest work appears to have been his devotional treatise, *The Christians Daily Sacrifice*, which had reached 532 pages by its third edition in 1615. Other titles by Cooper included a piece of patriotic propaganda, *The Churches Deliverance . . . in remembrance of the wonderful Deliverance from Gunpoulder-Treason* (1609). Cooper's final tract, published in 1620, discussed murder, focusing on a recent homicide in Suffolk.

CORPOREALITY, ANGELIC AND DEMONIC

The concept of witchcraft that evolved in western European Christianity between about 1400 and 1700 differed in two ways from definitions in other cultural contexts. First, the power to perform magical harm (*maleficium*) did not always originate with the witch. In learned witchcraft, but not necessarily in the popular tradition, it came from a demon that assaulted the victim according to a formal agreement or pact with the witch. Second, the notion of pact presumed face-to-face encounters between the demon and the witch, usually at the beginning of their relation (the moment of temptation), and at intervals thereafter. Thus, the question of how angels and demons appeared to humans, and whether they needed bodies to do so, was a major concern of writers on witchcraft in this period.

Demons habitually perpetrated *maleficia* (evil acts) invisibly, and in theory needed no bodily presence to do so. But because they appeared to witches, and interacted with them corporeally, witches were imagined as having privileged sensory information (especially visual and tactile, but also auditory and olfactory) about demons. Moreover, by 1500, witches and demons were usually accused of congregating at mass meetings, where they engaged in various activities that presupposed the bodily presence of demons: feasting, dancing, and various rituals, including the presentation of initiates to the Devil “in person.” Because such interactions

were described according to norms of purely human social interaction, Western Christian witchcraft displayed an obsessive attention to the corporeality of demons.

KINDS OF EVIDENCE

Human–demon interaction was analyzed in juridical terms, as a question of human guilt, provable by the witches’ “confessions,” and conserved in writing. Trial procedures and penalties for witchcraft began from the assumption that interpersonal contact with demons was real and possible: evidence of corporeal interaction was therefore evidence of guilt. (Some defendants were executed merely for attending Sabbats, not for harming their neighbors.) However, even the earliest writers on witchcraft sought to corroborate trial evidence with more philosophical proofs. Provability of human–demon interaction had implications that were epistemological (how do we know what we think we know?); ontological (are angels and demons “real” in the same way that humans are?); cosmological (what is the world really like?); and theological (if angels and demons are not demonstrably real, can we assume the reality of the immortal human soul? If demons are not real, what is the origin of evil?).

PREHISTORY OF DEMONIC CORPOREALITY

The problem of demonic corporeality reflected apparent contradictions in the Bible. Certain passages implied an opposition between spirit and flesh, causing many theologians to define demons as beings with no bodily dimension. The influential writings of pseudo-Dionysius the Areopagite (sixth century C.E.) supplied extra-biblical, philosophical support to the incorporeal definition. Other Bible passages portrayed interactions that required the corporeality of angels and demons, their existence in a physical dimension, external to the human mind.

Pagan philosophers from Plato through Apuleius and Porphyry had defined *daimonia* ontologically, as a species of beings midway between humans and gods. Plato’s *Symposium* averred that humans and gods never interacted directly, but only through the mediation of daemonic *aggeloi* or “messengers.” In the *City of God* (8.14–10.32), St. Augustine redefined daemons morally as irredeemably evil “demons,” and identified them with the fallen angels mentioned in Jewish and Christian Scripture. Despite radically redefining the character of daemonic beings, Augustine did not contest the Neoplatonic notion that they had by nature an immortal body. Augustine declared that humans should not envy the demons’ “better” bodies; rather, we should understand that true excellence was moral and recognize our potential superiority through redemption.

Demonic corporeality did not seriously preoccupy Western Christian thinkers until Peter Lombard (d. 1160), whose *Four Books of Sentences* explored “Whether angels have bodies, as has seemed to some writers, with whom Augustine seems to agree” (book 2, distinction 8). Lombard and his commentators gradually revealed demonic corporeality as a thorny ontological problem.

Thomas Aquinas supplied the definitive solution to the problem in his *Summa theologiae* and elsewhere. Angels and demons, said Aquinas, are spiritual creatures, pure form without matter, and thus have no God-given bodily dimension or presence. However, they can create virtual bodies by compressing air and vapors. When “animated,” these aerial statues can simulate any human corporeal activity so realistically that the artifice is undetectable. Good angels make such apparitions altruistically, to edify humans. Evil angels appear for spiteful ends, to tempt and ruin us with sin. Demons can copulate with human beings, and can probably create human children by artificial insemination. Bonaventure disagreed with Aquinas’s theory, asserting that angels and devils had bodies naturally composed of a superfine “spiritual matter.” However, like Aquinas’s angels and devils, Bonaventure’s were by nature imperceptible to humans, and would still have to assume a fictive body to signal their presence. Thus, Aquinas’s explanation prevailed among witchcraft writers (Keck 1998, 28–33; Stephens 2002, 58–86).

WITCHCRAFT TREATISES

Corporeal interaction between humans and demons had implications that fascinated and tantalized certain clerics into imagining a new heresy: witchcraft. By the 1450s, their treatises argued that heretics’ sworn confessions had removed any doubt concerning the reality of demons. From Nicolas Jacquier (1458) to the seventeenth century, witchcraft theorists exhaustively discussed human–demon corporeal interactions, especially sexual relations, as proof of demonic reality. Even the *Malleus Maleficarum* (The Hammer of Witches, 1486), infamous to modern scholars for its cruel misogyny, declared that its primary goal was to demonstrate that demons were not imaginary.

Writing in the vernacular languages, authors from about 1580 to 1700 invoked witchcraft and ghosts to rebut “Sadduceeism” (the disbelief in angels, demons, the immortal human soul, and the resurrection), and its heinous consequence, atheism. Yet the earliest Latin witchcraft theorists had long before declared that corporeal interaction with humans proved that demons were real, and thus that Sadduceeism was untenable (Stephens 2002, 1–57).

Anxiety about the reality of spirits is traceable even earlier, in Thomas Aquinas. In several works Aquinas noted that some Aristotelians had no use for angels and

demons, and once he even admitted that Aristotle himself shared this prejudice. Aquinas retorted that Aristotelian principles could not account for phenomena such as demonic possession and necromancy: hence, demonic reality was vindicated. Witchcraft theorists would endlessly repeat this claim (Stephens 2002, 323–331).

Nonetheless, in isolated remarks outside his systematic angelological and demonological treatises, Aquinas conceded that some thinkers (presumably those same Aristotelians) claimed that demons existed only in the imagination of vulgar, unphilosophical people. And, Aquinas added, *since* these thinkers disbelieved in demons, they declared that *maleficium* was an imaginary category, born from ignorance of natural causation and the power of human imagination. To these objections Aquinas could only reply that demons were an article of faith (Stephens 2002, 318–321).

Owing to the enormous prestige of Aristotelian philosophy after Aquinas's time, Aquinas's few mentions of Aristotelian skepticism about demons had a vast social influence, greater in proportion to their bulk than his confident, systematic essays on angelic and demonic being. By the 1450s, precursors of the *Malleus Maleficarum* were repeating, expanding, and striving to improve Aquinas's refutations of Aristotelian skepticism by discovering the human accomplices of demons. Between 1516 and 1520, the overworked refutations provoked Pietro Pomponazzi to publish demonstrations that Scholastic theories of demonic reality, witchcraft, and the immortality of the human soul were contrary to the plain sense of Aristotle's arguments. Two extremely hard-line theorists of witchcraft, Silvestro Prierias and Bartolomeo della Spina, savaged Pomponazzi's work (Stephens 2002, 77–79, 358–363).

Physical interactions between demons and humans fascinated many thinkers who were not witchcraft theorists. Michael Psellus, an eleventh-century Byzantine, included a few pages about demonic corporeality in his *On the Operations of Daemons*. Thanks to Marsilio Ficino's Latin translation (Psellus 1497), the passage spread throughout humanist culture. Ficino's milder Neoplatonic daemonology did not prevent his Psellus translation from becoming an authoritative proof-text of witchcraft theory in the following two centuries for authors like Torquato Tasso or Ludovico Maria Sinistrari.

COTON, PIERRE (1564–1626)

A Jesuit polemicist and mystic, court preacher, and confessor to kings Henry IV and Louis XIII, Coton was involved in several major French episodes of exorcism and possession. He belonged to a core group of influential early modern French Catholics—including André Duval, Benet of Canfield, Pierre de Bérulle, and Sébastien Michaelis—who promoted a cult of possession and exorcism. For Coton, demonic possession was a sign of holiness that existed on a continuum with other ecstatic religious phenomena. He was involved in the spiritual direction of numerous female mystics and demoniacs, and in the establishment of new female religious houses.

In his twenties, while studying jurisprudence in Milan, Coton was taken to visit a famous female mystic, Isabella Bellinzaga. This encounter appears to have led to his lifelong fascination with female devotees. Such women were a common preoccupation among post-Tridentine churchmen. The example of Saint Teresa, who had received support from many Spanish clerics, was a powerful force in France's so-called "century of saints." At Paris, Coton belonged to a group of religious enthusiasts including Duval, Bérulle, and Madame Barbe Acarie, a founder of St. Teresa's Discalced Carmelites in France. Coton was reputed to be a formidable orator: as preacher-ordinary to King Henry IV, he impressed visitors to court by giving impromptu sermons on royal command.

At the time of the controversial Marthe Brossier episode in 1599, Coton had been absent from Paris, because the *Parlement* of Paris (sovereign judicial court) had excluded Jesuits from the area of its jurisdiction from 1594–1603. Later, he helped restore exorcism in the capital, both as part of the Catholic revival and for courtly entertainment. In 1604, the queen, Marie de Medici, sought a replacement exorcist to treat a young possessed woman from Amiens, Adrienne Du Fresne; she had been exorcised at court by an Italian Ambrosian, who had returned to Italy. When the queen reportedly noticed that the woman's "demon" showed

signs of resistance in Coton's presence, she chose Coton to carry on this work. Skeptics in Paris and at court tried to embarrass Coton publicly in 1605 by publishing more than forty interrogations he reputedly held with DuFresne's percipient "Devil," about matters of theology and prognostication, including queries about whether or not King James I of England would convert to Catholicism. A minor diplomatic incident ensued, leading Henry IV to defend Coton to James, claiming that the published texts had been falsified by the enemies of Catholicism, and of the Jesuits in particular. DuFresne later returned to Amiens, however Coton's biographer claimed that her exorcisms had converted more than 500 Huguenots and induced over 10,000 general confessions.

Coton was a friend of the Dominican reformer, Sébastien Michaelis, the senior exorcist in the possession scandal at the Ursuline convent in Aix-en-Provence in 1609–1611. Michaelis's exorcisms there led to the execution for witchcraft of Father Louis Gaufridy in 1611. Coton, who had spent some time in Provence in the 1590s, was said—possibly retrospectively—to have known and disliked Gaufridy, seeing him as falsely pious.

Later, Coton actively supported the demonically possessed widow Elisabeth de Ranfaing in her attempt to set up a religious order in Nancy, while simultaneously cautioning her not to become too attached to her possessing demons. His major devotional book, the *Occupation Intérieure* (Inner Pursuit) of 1608, exercised considerable influence on the Norman mystic-demoniac, Marie des Vallées. The book describes something like the controversial "exchange of will" with God that Vallées undertook in order to bring herself closer to the divinity and prevent herself from sinning. When Vallées asked Coton about the validity of her contact with demons, which spurred her devotions, he replied that if she were fooled, it was nonetheless "good foolery." The history of Coton's activities and networks lends weight to the argument that historical trends can be shaped by the passions of a few individuals, as much as by a *zeitgeist*.

COTTA, JOHN (CA. 1575–1650)

A Cambridge-educated physician who practiced medicine in the English town of Northampton, Cotta is best remembered for his treatise *The Triall of Witch-craft*, published in 1616. A second edition, amended and enlarged but containing no new important arguments, appeared in 1625 under the title *The Infallible True and Assured Witch*.

Little is known of Cotta's family background or early life. He was born in Warwickshire, entered Trinity College, Cambridge, in 1590, and obtained his medical degree in 1603. Soon after, he established a thriving practice in Northampton under the patronage and influence of Sir William Tate. He first aired his views on witchcraft in a chapter of his *Short Discoverie of the unobserved dangers of severall sorts of ignorant and unconsiderate Practisers of Physicke*, published in 1612, four years before *The Triall of Witch-craft*. He published nothing after 1625.

Cotta's major treatise appeared at a time when witchcraft prosecutions were declining, but when the clergy still made vigorous calls for a systematic campaign to root out witchcraft in all its forms. A succession of books written by such clergymen as William Perkins, Alexander Roberts, Thomas Cooper, and Richard Bernard, all warned of a serious threat to Christianity. Cotta broadly shared their viewpoint, calling witchcraft "this high treason against God" (quoted by Sharpe 1996, 83), and referred to Perkins's posthumous publication *A Discourse of the Damned Art of Witchcraft* (Cambridge, 1608). Yet his complete acceptance of the reality of witchcraft was mitigated by his cautious council regarding the identification of witches and evidence required to prove guilt. Cotta found it "a hard and difficult matter to detect Witch-craft," and likewise difficult for wrongly accused persons to prove their "innocency" (Cotta 1616, 20). The trial of witchcraft had to be subject to the same standards of evidence "common unto all other detections of truth," with judgments "drawne and derived either from Sense or Reason, or likely probabilitie raised from both" (Cotta 1616, 23).

He was consequently dismissive of many popular beliefs and practices concerning witchcraft, even expressing skepticism about some methods of proof that his monarch, James I, had endorsed. Trial by water, for instance, although never formally recognized, was accepted by some judges as a valid proof of guilt. The result of witch swimming, Cotta argued, was "not alwayes the same; if not alwayes the same, then is it sometimes fayling; if sometimes fayling, then is it not infallible; if not infallible, then in no true judgement or justice to bee trusted or credited" (Cotta 1616, 107). Cotta subscribed to the view current in educated Protestant circles that nothing done by the Devil, either alone or through witches, was supernatural. Only God the creator had the power to work beyond natural laws.

Therefore, any means of detecting and curing witchcraft that did not operate according to natural principles were at best ineffective and at worst, satanic deceptions.

Like many of his medical contemporaries, Cotta considered cunning folk to be as pernicious a threat as witches. After all, they represented serious competition in the medical marketplace of early seventeenth-century England, as well as a social and moral danger. Such people were “swarming in this kingdom,” he complained. No one could fail “to observe the uncontroled liberty & license of open & ordinary resort in all places unto wise-men, & wise-women, so vulgarly termed for their reputed knowledge concerning such diseased persons as are supposed to be bewitched” (Cotta 1616, 60). He urged that those truly bewitched should seek the spiritual comfort of God and the medical advice of trained physicians.

COUNTERMAGIC

Most Europeans before the twentieth century, like most other people, lived in a world they assumed was permeated by magical forces that connected peoples' psyches to other peoples' psyches, to material reality, and connected both psyches and material reality to a variety of disembodied occult forces and entities ranging from local spirits through angels and the planets to God Almighty. This state of affairs could represent an opportunity, a chance to accomplish some purpose by manipulating these magical forces, and many people made such attempts occasionally, while some did so routinely. However, the same processes could work in reverse, making people vulnerable to malign influences from independent occult entities and other peoples' magic, in particular the *maleficium* (harmful magic) associated with witchcraft.

Consequently, a huge body of magical lore offered ways to counter these dangers. One basic approach was protective magic: spells, rituals, and objects thought capable of warding off malign influences before they could take effect. The other basic approach involved various means of countering baleful magical influences after they had started to work. The first approach included both passive defenses, like using magically potent objects as charms or amulets, and active precautions like spells, rituals, observance of taboos, and prayers. The second almost always involved active measures. A great deal of countermagic was conducted by ordinary people, either as precautionary measures within their daily routine or when they thought themselves under attack, but there were also in virtually every community specialist practitioners whom people consulted when they thought themselves victims of malevolent magic beyond their own power to counteract. A great deal of religious ritual, from Catholic processions to Protestant prayers and fasting, worked as a form of countermagic, defending against malign influences and supplicating God to effect cures. Clergy therefore constituted one type of countermagical specialist. This was particularly true in Catholicism, but even the stoicism Protestantism advocated was expected to help people ward off rather than simply endure evil. In addition, there were innumerable popular practitioners, “cunning folk,” who offered services like healing and finding lost objects, and “unwitching” was one of the most important. Preventive and curative magic played a central role in daily life; they were an integral part of popular culture, and offered an effective response to at least some of the problems against which they were employed.

HARMFUL MAGIC AND COUNTERMAGIC

Countermagic existed to counteract magical threats. These might include malign natural sources, like unfavorable conjunctions of the planets and unlucky days on the calendar, against which charms could be employed to alleviate their negative influence. More frequently, the danger to be countered came from purposive spiritual forces in the environment, like fairies thought to attack babies or women in childbirth, and against which elaborate precautions were generally taken. By far the most common magical danger, however, came from other human beings. Some people were known to employ magical rituals to advance their own interests and harm others, and many more were suspected of doing so. Other people were thought to exercise a baleful influence spontaneously, through harsh words, the evil eye, or just the negative force of their personality. The most common type of misfortune attributed to these sources was human illness and death; but impotence, untoward sexual attraction, accidents, harm to animals, the failure of domestic processes like churning butter, bad

weather, crop failures, and bad luck might also be blamed on evil magic.

Against these varied threats, people deployed a whole range of countermeasures. Some were not even magical, like appeasing a reputed witch with gifts or threatening one with physical violence to get her to remove a spell. Most ways of dealing with magic, though, involved other kinds of magic, and the first line of defense was protective magic, which included both passive and active measures. Passive measures included painting protective symbols on homes, barns, and other buildings, and hiding magically potent objects like “witch bottles” in or around them. Passive measures also included wearing amulets or charms containing magically potent objects or inscribed with magically potent words. Active measures offered a wide array of rites, including processions, rituals, observance of taboos, prayers, incantations, and spells. Catholics used religious objects and religious rites as protective measures within an explicitly religious context. Innumerable local traditions and popular practices among both Protestants and Catholics integrated rituals and beliefs based on Christian rites, symbols, and doctrines with customs rooted in their pagan past.

These various forms of protective magic were a ubiquitous feature of early modern life. A full catalog would involve thousands or even tens of thousands of items, but a few examples convey the range and variety of protective items and rituals. In Scotland, iron was thought to give protection from fairies, while in modern Greece it is supposed to ward off the bad luck seeing a priest brings. In the Basque Country, priests blessed cattle bells to protect the animals from the evil eye. In the Friuli region of Italy, people born with the caul dreamed on specific nights that they went out and battled witches to determine the fate of the harvest. In other parts of Italy, herbs of St. John carried at Corpus Christi were burned to ward off the demons held responsible for storms. Such examples could be multiplied endlessly because, as Hessian church visitors noted, “No man or woman begins, undertakes, does, or refrains from doing, desires, or hopes for anything without using some special charm, spell, [or] incantation.” (Clark 2002, 107).

Despite the widespread use of protective magic, malevolent influences were widely perceived in the pervasive incidence of disease, accidents, droughts, and other misfortunes that plagued early modern life. To be sure, not every unfortunate incident was ascribed to malign magic. Like most peoples who believed in magic, early modern Europeans were aware that most physical effects have physical causes, and suspected magic only when certain specific criteria were met, and when some circumstances or features of a misfortune indicated that a supernatural force was at work. For example, for illness to be ascribed to witchcraft, it generally fol-

lowed a hostile or unusual encounter and either came on suddenly, lingered, or presented symbolically significant symptoms, like paralysis in a limb that had been touched.

Very often, the first type of magical countermeasure was some form of divination to determine if magic was to blame for the misfortune, and, if so, who or what was responsible. While local traditions included different sources of malevolent magic like fairies in Wales and “house women” in Sicily, in early modern Europe the most common source was witchcraft. Once the nature of the misfortune and, where indicated, the identity of the agent responsible was established, there were several steps that could be taken. One was appeal or appeasement to get the agent responsible to remove the spell voluntarily. Another was to perform some ritual to suppress or break it. A third possibility was to shift it to someone or something else, which, in the case of witchcraft, could include turning it back on the witch herself. The possibility of turning the spell back on the witch was employed as a threat to get the witch to remove the spell, and this was accomplished on occasion through the threat or infliction of physical violence. A final alternative in the case of witchcraft, particularly after the mid-sixteenth century, was to take the accusation to the authorities. While this was not a particularly magical approach, it is worth noting that trials often contained an element of counter magic in the form of ordeals. Some popular tests like “swimming” were explicitly magical; the witch’s buoyancy was supposedly determined by her guilt or innocence. Even torture, which was used routinely in continental witchcraft trials, contained an element of magic, for while jurists justified it in rational terms, it was also related to medieval ideas about ordeals, in which it was assumed that God would give the innocent the fortitude to endure torment and not be falsely convicted.

CLERGYMEN AND CUNNING FOLK

While there were innumerable ways that people who believed they were the targets of a magical attack could counter it on their own, virtually every community in early modern Europe had specialist practitioners to whom the populace turned when self-help seemed insufficient. Clergymen were one such resource. One of Christianity’s original appeals had been the ability of its agents to defeat the magic of its pagan rivals, and the Catholic Church had traditionally provided a variety of counter magical services like blessing the fields before planting, or exorcizing demons from possessed people. However, Protestantism rejected these practices as superstitious, offering prayer and faith in God in their place.

Because of Christian ethics, even Catholicism could only offer a limited range of services compared to popular practitioners. These were variously referred to in English as wizards, cunning men, wise women, healers,

and unwitchers, but the term most commonly used by historians is “cunning folk.” As a group, cunning folk could be of either gender and offered services such as locating lost or stolen goods and missing persons and healing people and animals as well as countering malefic magic. Some undoubtedly performed *maleficium* (harmful magic) as well, for clients or on their own account. Any particular cunning person might specialize in one or several of these arts, or might offer a full range of services. Most practiced on a casual or part-time basis, but for some it was their main occupation. Some charged nothing for their services, some charged only if they were successful, and others took payment on a regular basis. The majority probably kept a low profile and operated on a very local level, but more than a few had widespread reputations that brought clients from many miles away. Most of their clients were ordinary villagers and townspeople, but it was no secret that members of the elite would patronize them at times. Most European states had laws against their practices, which were seen as impious and disobedient, with penalties ranging from fines to incarceration and even banishment, but support for the penalties was weak and enforcement was sporadic.

Cunning folk might offer charms and other protective mechanisms to ward off evil, but their main role in the area of countermagic was intervention once a magical attack was suspected. Typically the supposed victim or his or her family called in cunning folk to determine if magic was at work, who or what was behind it if it was, and implement the appropriate countermeasures. The means they employed generally came from local or regional magical lore, but they might have books as well, and they also had a certain latitude to innovate. “Cunning” today generally carries the negative connotations of an intuitive intelligence put to questionable ends, but as used for these practitioners it had the positive connotations of an intuitive intelligence supported by practical knowledge and seasoned by experience.

To satisfy their clients, they needed to know the signs that distinguished a malady that was amenable to cure by countermagic, be able to help the client identify a likely suspect, and conduct a persuasive ritual or prescribe an effective remedy. Furthermore, since they generally lived and worked at a fixed location, it was not enough to succeed with a single case; they continued to practice because they were able to gain and maintain a reputation for success over time within an established community. While some undoubtedly employed cynical shams, in general, the countermagic of a successful practitioner mixed mundane resources like knowledge of local social relations and medicinal herbs with the manipulation of cultural forms and expectations to tap psychological processes that brought peoples’ unconscious knowledge about their situation into awareness and mobilized psychophysical processes to promote health.

FUNCTIONS AND EFFICACY

Preventive countermagic enabled people to act more confidently in the face of the myriad dimly perceived threats life presented than they would otherwise. This confidence enhanced their probability of success both because action is more likely to lead to success than inaction, and because one person’s confidence influenced other peoples’ expectations, perceptions, and reactions. Furthermore, to the considerable extent that magic worked through psychological manipulation, preventive magic directly enhanced peoples’ resistance to negative influences. Similarly, curative countermagic had the ability to mobilize peoples’ psychological resources to counteract the effects of psychologically rooted problems. Like other magical cures, countermagic enhanced peoples’ ability to recover from illness, which is the misfortune most commonly attributed to malevolent magic. Recent medical studies have shown that the psychological posture most highly correlated with recovery is “a fighting spirit,” as opposed to “denial” or “stoic acceptance” (Hafen et al. 1996, 527). Thus, while some of the assumptions behind countermagic may be invalid, and the specific forms of belief may be explicable in terms of their sociocultural context, countermagic could act as a useful palliative, help avoid or overcome psychogenic problems, and foster the most effective psychological response to illnesses of all sorts—a power of particular importance in societies in which psychology is the most effective, if not the only, form of intervention available.

COURTS, ECCLESIASTICAL

Church courts—either inquisitorial or ecclesiastical—played a relatively small role in trying and executing presumed witches during the early modern period.

Church courts exercised jurisdiction over various organizational and disciplinary matters. Although ecclesiastical courts cannot decide doctrinal or liturgical issues, they seek to uphold the teachings and rites of the Church through the application of canon law—a system of regulatory norms requiring obedience in matters of religious hierarchy, discipline, and morality. The term “ecclesiastical courts” is usually reserved for tribunals associated with the Roman Catholic Church or the Eastern Orthodox Church and, since the sixteenth century, the Church of England, but other Protestant Churches developed roughly equivalent institutions. Within the Catholic tradition, ecclesiastical courts formed a hierarchy from episcopal (subject to the authority of a bishop), to metropolitan (subject to the authority of an archbishop), to papal (subject to the authority of the Roman pontiff). Notably absent from this list are tribunals associated with various inquisitions. Although such courts may be understood as ecclesiastical in a generic sense and all employed canon law, in fact they functioned quite differently: the Spanish and Portuguese Inquisitions had their own Supreme Councils appointed by their respective monarchs, while medieval and Roman Inquisitions were directly answerable to the Holy See.

Before the fifteenth century, episcopal courts tried the majority of the relatively few witchcraft cases. After the development of the witches’ Sabbath and a significant increase in the number of trials, inquisitorial courts took a much larger role. By the fifteenth century, secular courts already began to hear most witchcraft cases. This trend accelerated during the period of the major witch hunts between 1580 and 1640, by which time the courts associated with the institutional inquisitions had largely lost interest in prosecuting witchcraft as a demonic crime. However, most of the largest witch panics during this period occurred in the lands of several German prince-bishops, who were not only religious authorities but also secular princes. Almost no ecclesiastical courts (in the strict sense) were involved in these panics; representatives of these prince-bishops

conducted these witchcraft trials through their secular jurisdictions. Although these bishops’ Catholic zeal certainly encouraged their prosecution of witches, the absence of trials in many Catholic territories and the presence of trials in many Protestant lands usually led scholars to question the general significance of confessional identity to witch hunting.

MEDIEVAL AND EARLY MODERN DEVELOPMENTS

Although canon law is rarely followed in modern secular societies, throughout the Middle Ages and well into the early modern period ecclesiastical courts claimed jurisdiction not only over the clergy and church property, but also over the laity in many criminal and civil matters related to sinful behavior. They also claimed jurisdiction over many things connected to the sacrament of marriage, including contractual obligations, legal procedure, and inheritance. A variety of ecclesiastical courts emerged to judge such cases. In earlier times, provincial councils acted as courts, especially when deciding important issues. Normally, however, the court of the archdeacon (an assistant to a bishop) and other inferior judges (deriving their jurisdiction from custom or specified privilege) supplemented the courts headed by the bishop’s Official (chief judge). Their decisions could always be appealed up as far as Rome (for example, Henry VIII’s divorce from Catherine of Aragon). Beginning in the twelfth and thirteenth centuries, the courts of vicars-general began to replace these earlier courts and brought their jurisdictions under episcopal, metropolitan, or ultimately papal control. In 1561, the papacy established the *Rota Romana*, a papal appellate court functioning as a collegiate body that replaced less formal means of hearing cases brought before the pope.

Developing along a separate trajectory, inquisitorial courts emerged out of the eleventh- and twelfth-century interest in the imperial law of ancient Rome as a particularly effective means to combat heresy. Adapting canon law, itself largely derived from the revived Roman law, popes and bishops used inquisitorial procedure—the placement of significant investigative, prosecutorial, and judicial powers in the hands of one judge or tribunal. Pope Gregory IX (1227–1241) first appointed such inquisitors, and numerous bishops did as well. The Middle Ages created both papal and episcopal inquisitors, operating outside the traditional system of ecclesiastical courts, and unlike them, capable of ordering secular authorities to carry out a death sentence. Subsequent popes expanded inquisitors’ prerogatives of and slowly extended their jurisdiction to include sorcery or witchcraft as either implicit or explicit forms of heresy. Royally appointed national inquisitions emerged in Spain and Portugal before the Holy See created a Roman Inquisition in

1542 and made it an official Congregation of the Church in 1588, creating an administrative department of the Holy See outside the system of ecclesiastical courts and claiming jurisdiction over the entire Church. Despite the fifteenth-century Inquisition's role in prosecuting witchcraft harshly, by the mid-sixteenth century the Spanish, Portuguese, and Roman Inquisitions showed little inclination to pursue accused witches and put them to death.

MEDIEVAL WITCHCRAFT TRIALS

Both ecclesiastical and inquisitorial courts pursued accused witches and magicians sporadically during the fourteenth and fifteenth centuries, particularly in France, northern Italy, and Switzerland. For example, an inquisitor tried a woman for magic at Le Mas Saintes-Puelles in 1245, but she convinced him she was guilty of no heresy. Later, an ecclesiastical court at Château-Landon tried a group of clerics and laymen for necromancy in 1323; an inquisitor in Florence condemned a man to death for magic in 1384; and two others were burned at Milan soon afterward. By the fifteenth century, the number of cases heard by inquisitors far outstripped the number tried by episcopal jurisdictions, but both lagged behind secular courts, which initiated mass round ups with suspects being brought in for questioning, sometimes by the hundreds—even though the diabolical aspects of witchcraft, the pact with the Devil, or attendance at a witches' Sabbat, became more prominent.

Significantly, continental secular courts increasingly imitated inquisitorial and ecclesiastical courts by adopting inquisitorial methods to deal with such "secret" crimes as sorcery or witchcraft. But they did so without incorporating some of the safeguards of canon law, thus permitting dramatic increases in numbers of trials and executions. Although the adoption of inquisitorial procedure represented a rationalization of medieval legal practices in many respects by providing stricter rules of evidence and standards of proof, it added a number of dangers as well: judges were empowered to arrest suspects without a formal accusation and to interrogate both suspects and witnesses secretly, using torture without supervision to force suspects to confess and name accomplices. In a sense, this process was a "necessary precondition" of the early modern hunts (Levack 1995, 69).

The transformation of witchcraft from an ecclesiastical into a secular crime was facilitated because sorcery had traditionally been understood as a "mixed" crime, both spiritual and temporal in nature. Any crime that represented a threat to the religious order also represented a threat to social order. Despite the important roles played by ecclesiastical and inquisitorial courts in early witch hunts, their significance within the larger phenomenon collapsed during the early modern period. Both Protestant and Catholic ecclesiastical courts con-

tinued to try individuals for "white magic" well into the eighteenth and nineteenth centuries, but they treated it essentially as superstition and meted out light sentences.

COURTS, INQUISITORIAL

Construed broadly, the inquisitorial courts included any legal forum employing *inquisitorial* procedure, in which investigative, prosecutorial, and judicial powers are vested in a single judge or tribunal. Ordinarily, such courts are distinguished from those following *accusatory* procedure, in which an aggrieved party brings formal charges against a suspect and takes legal responsibility for proving guilt, facing punishment for failure to do so. They are also contrasted to systems of justice employing jury trials, in which a defendant's peers play at least some role in determining guilt or innocence. More narrowly, inquisitorial courts have been associated with several Roman Catholic practices or institutions known to posterity as the medieval (or papal), Spanish, Roman, and Portuguese Inquisitions. All of them followed canon law and inquisitorial procedure in the prosecution of violators of the canon law and especially heretics, and they should not be confused with either secular or episcopal courts, which also used inquisitorial methods. Scholars have long recognized that, although church courts frequently pioneered the use of inquisitorial procedures during the Middle Ages when prosecuting heresy and sorcery, the institutional inquisitions convicted relatively few accused witches and executed a very small percentage of them. Nonetheless, inquisitorial procedure became extremely significant within trials for witchcraft, because numer-

ous European secular courts employed it in their criminal prosecutions of accused witches throughout the age of witch hunting. Thus, the vast majority of persons accused of witchcraft between the early 1400s and 1750 were convicted not by inquisitorial courts but by secular courts that followed inquisitorial procedure derived from Roman law and taught in every continental university since the eleventh century, together with the newer discipline of canon law, also derived from Roman procedures.

INQUISITORIAL PROCEDURE

One characteristic of early modern courts using inquisitorial procedure was that sweeping authority was often vested in one individual or one tribunal. Courts following inquisitorial procedure exercised what we understand as distinct police, prosecutorial, and judicial powers that since Montesquieu have usually been divided among separate and independent public officials. Judges or magistrates employing inquisitorial procedure were responsible for initiating prosecutions (either on their own or in response to a complaint), investigating suspicious activities or circumstances, interrogating both suspects and witnesses (often through the use of torture), rendering verdicts on those whom they investigated, and sentencing offenders. In modern British and American eyes, this system has appeared especially vulnerable to abuse and excessive zeal. Many modern legal systems outside the common-law tradition of accusatory procedure still employ aspects of inquisitorial procedure to this day, while trying to establish safeguards against its potential for misuse.

In practice, inquisitorial procedure replaced forms of medieval justice that were not only accusatory but also often nonrational. Borrowing the prestige of Roman law, the inquisitorial system provided a more rational form of justice, independent of the status or abilities of the litigants or the judgment of God, revealed through ordeals, both unrelated to the evidence in the case. In theory, inquisitorial procedure introduced more reasoned approaches to evidence and established strict standards of proof, which could nonetheless be ignored or misapplied by judges. One of the procedure's key features was that plaintiffs no longer risked harsh penalties if they could not prove their case, a practice that had tended to keep frivolous complaints to a minimum.

While this feature revolutionized the way criminal cases were initiated, more significant was the officialization of the judicial process resulting from secular or ecclesiastical courts assuming all responsibilities, particularly the investigation of pertinent facts and the application of clear rules of evidence and proof when rendering verdicts. Most investigations entailed the interrogation under oath of all parties involved, both

suspects and witnesses, confronting them when they contradicted each other and torturing suspects (and occasionally witnesses) who seemed to be lying. Thus, the court established the facts of a case to its satisfaction before passing sentence. Most early modern Europeans regarded inquisitorial procedure as the best way to prosecute crimes, including concealed or hidden crimes for which no direct physical evidence or eyewitness testimony was available. Witchcraft was precisely the kind of secretive and spiritual crime for which legal authorities had designed such "exceptional" inquisitorial methods. Rumors of guilt and interrogation under torture replaced ordinary methods of gathering evidence; suspects confessed their own crimes and often named accomplices.

INSTITUTIONAL INQUISITIONS

As secular courts throughout Europe began reviving the basic tenets of Roman law in the eleventh and twelfth centuries (with the notable exception of England and, to some degree, Scotland and the Scandinavian kingdoms, where juries continued to play important roles in determining guilt), ecclesiastical courts were among the earliest to adapt its methods. By the early thirteenth century, Pope Gregory IX began appointing inquisitors to identify and eradicate heresy, thus establishing a new kind of inquisitorial court. These roving judges supplemented episcopal courts, which also adopted inquisitorial procedures. By 1252, Innocent IV authorized papal inquisitors to use torture during their investigations, a practice consistent with Roman law and recently reintroduced by some secular Italian jurisdictions to help convict notorious criminals suspected of perpetrating concealed crimes. Papal inquisitors used torture while investigating heretics, and, after some initial reluctance, began to use it against suspected witches as well. From a religious perspective, heresy and witchcraft constituted concealed crimes without peer.

Throughout the Middle Ages, papal appointment of inquisitors lacked any official institutional structure: there were inquisitors appointed directly by the pope, but no Inquisition. Moreover, the papal system had begun to unravel well before Europe experienced a significant rise in the number of witchcraft trials, and it collapsed with the breakdown of a unitary Western Christianity during the sixteenth-century Reformation.

Soon, better-organized successors took its place in southern Europe and Spanish America. The new Spanish Inquisition emerged under the authority of Spain's most famous monarchs in the late fifteenth century. It soon extended its operations throughout the Iberian kingdoms, including parts of Italy under Spanish rule, and in its overseas American colonies. A Portuguese Inquisition likewise emerged and maintained several autonomous tribunals. Finally, a new Roman Inquisition, under papal control and with a

well-organized infrastructure, was created in 1542 to combat the consolidating Protestant threat in Italy. In point of fact, however, its influence remained confined only to central and northern Italy, because slightly different versions operated in the lands of the Republic of Venice and in the Kingdom of Naples.

All three institutional inquisitions tried and executed exceptionally few accused witches. Although it would be a mistake to consider them benign (at times they acted harshly toward those they caught), it is important to note that by the mid-sixteenth century, their centralized authority, standardized judicial practices, and strict rules of evidence and proof were coupled with a generally skeptical attitude toward magic. They came to view witchcraft as sinful superstition to be corrected, rather than a real demonic threat to be eradicated. With a few exceptions, they tried to reconcile practitioners of magic with the Church, rather than order the secular authorities to execute them.

Although papal inquisitors ordered hundreds of suspected witches executed in the fifteenth century, in a sense there by paving the way for the far more numerous trials to follow, most recent scholarship on the early modern inquisitions suggests something else entirely. Before 1610, the Spanish Inquisition ordered about fifty persons executed for witchcraft. Thereafter it battled secular courts for jurisdiction (while expressing its skepticism) as Spain's secular courts executed perhaps 200 more between 1610 and 1625. Portugal's Inquisition executed only seven accused witches. And although executions occurred sporadically in alpine regions of northern Italy, apparently the Roman Inquisition ordered none after 1580 (Monter 2002, 13–14).

INQUISITORIAL PROCEDURE AND TRIALS FOR WITCHCRAFT

While these centralized inquisitions may have been well regulated and skeptical, plenty of secular and ecclesiastical courts using inquisitorial procedure were not. In fact, many historians now believe, on the basis of more corroborating data, that well-organized, relatively centralized secular states (like these state inquisitions) conducted far fewer trials for witchcraft than loosely governed states, in which the absence of administrative oversight allowed some judicial officials to engage in zealous prosecution and execution of suspected witches. There can be no doubt that the prosecution of witchcraft in some areas was made far more severe by treating witchcraft as *crimen exceptum* (the excepted crime, where ordinary rules of evidence and proof were suspended), by granting extensive authority to judges, by limiting the liability of accusers, by failing to apply carefully the rules of evidence and proof, and by using torture in interrogations—in short, by adopting inquisitorial methods. But for this very reason, it is necessary to balance any account of the inherent dangers of

inquisitorial justice against its potential to rationalize, and to render more fair, legal proceedings against criminal suspects. Inquisitorial procedure most certainly contributed to the trial and execution of many, but as historians are discovering, it just as easily led to the release of still others. And the faults of the accusatory system emerge clearly from a comparative map of per capita witchcraft executions across Europe, with Scandinavian averages exceeding those from Mediterranean Europe, and common-law southern England relatively less humane than Roman-law north-central France.

COURTS, SECULAR

The secular courts are any judicial forums convened by political authorities to adjudicate civil or criminal cases. In the Middle Ages and early modern period, secular courts were constituted by principalities (including kingdoms, duchies, counties, and so on) or municipalities (from villages and market towns to cities). Some exercised jurisdiction on behalf of higher political authorities; others claimed it in their own right. In addition, legal systems could operate under very different procedures from one principality or municipality to

the next. In other words, secular courts exhibited enormous variety, which reflected not only dissimilar types of secular states, but also numerous idiosyncrasies among polities of an essentially similar nature. Their wide variety makes generalization about secular courts difficult.

As sites for witchcraft trials, secular courts already rivaled religious courts in the fifteenth century. During the Middle Ages, most of them adopted inquisitorial procedure (placing police, prosecutorial, and judicial powers in the hands of a single judge) also employed by Church courts, deriving from a renewed admiration for the judicial methods and techniques of the ancient Romans. Well into the early modern period and beyond, most secular courts on the European continent followed the precepts of Roman law. (Scandinavian, Scottish, and especially English courts followed a somewhat different trajectory, one influenced by Roman law but still dominated by customary legal practices.) After 1550, secular courts became even more prominent in prosecuting witches, when they increasingly claimed jurisdiction over such matters in most states. (Spain, Portugal, and Italy remained exceptions to some extent.) These trends constitute part of an even larger political phenomenon that some historians call a judicial revolution.

In all of Europe, recent estimates suggest, roughly 75,000 trials led to the execution of some 35,000 to 50,000 accused witches. The vast majority of these trials took place in secular courts exercising inquisitorial procedures. Some recent scholarship suggests that the worst trials took place only in territories where judges operated with little or no institutional oversight, where judicial centralization remained incomplete. Other recent scholarship argues that judicial reforms were less important than local animosities and desires among the general populace in fomenting trials for witchcraft. In some places (for example, the electoral Palatinate), secular authorities actively discouraged the prosecution of witchcraft even while their legal codes listed it as a crime. Regardless, early modern *trials* for witchcraft, as distinct from contemporary *beliefs* in witchcraft, were inherently political events, usually conducted by officials representing a secular state.

MEDIEVAL CUSTUMALS

At first glance, medieval trials for sorcery and witchcraft conducted by secular courts share few common features, but they do reveal widespread belief in the reality of supernatural power among the populace. Although these cases involved a variety of magical practices (divination, charms, poisoning, image magic), causing different levels of damage (storms, injury, murder), with different levels of punishment (fines, exile, death), they demonstrated that magic was associated primarily with *maleficia* (evil acts), which threatened social order or

personal well-being. Medieval trials also illustrated relatively mild attitudes toward punishment and restitution. Usually they lacked any mention of the witches' Sabbat, although some contained elements suggesting diabolical intervention in *maleficium* (harmful magic).

Some of our best evidence for a broad understanding of magic, sorcery, and witchcraft as threats to societal or personal well-being comes from late medieval or early modern customals. The products of manor, municipal, or even provincial assemblies meeting for judicial and political purposes, they catalogued traditional local legal "customs" of people under the administrative and judicial authority of a particular lordship. Although customals were collected and formulated by men with legal and administrative training, peasants and burghers attested to the authenticity of the customs they contained. They were probably the negotiated results of both seigneurial and peasant understandings of law. Customals clearly delineated threats to order, and they made identifying and eradicating them the responsibility of everyone, from individual peasants to appointed judicial authorities.

Most customals treated magic as one threat amonged many, and, more important, rarely defined what it entailed. Brief references seem to suggest that beliefs in sorcery were widespread, encompassing a whole gamut of loosely related activities identifiable as harmful magic, although sorcery was usually separated from diabolical crimes. Communities openly acknowledged their fears of *maleficia* and could take steps to punish perpetrators. Customals usually associated magic only slightly with diabolical intervention, and never with the witches' Sabbat.

THE JUDICIAL REVOLUTION AND WITCHCRAFT

By the late fifteenth century, judicial organization and practice witnessed the gradual replacement of relatively decentralized, communal legal orders with more bureaucratic and better-supervised arrangements derived from the precepts of Roman law. Professional judges and lawyers sought to implement more abstract forms of justice in well-defined court systems, following clearly formulated territorial law codes. These changes directly affected the prosecution of witchcraft.

In the late Middle Ages, ecclesiastical courts were concerned mostly with the diabolical or heretical aspects of magic, rather than *maleficia*, while the opposite was often true in secular courts. But from the late Middle Ages on, the threats to Christianity posed by heresy, apostasy, and witchcraft were also interpreted as direct threats to the political order. Various magical practices with both religious and secular elements fell under mixed jurisdiction; the prosecution of witchcraft (including its most diabolical forms) increasingly became a matter for state officials rather than Church

courts. Likewise, secular authorities supported elaborate police and administrative efforts devoted to its eradication. Although recent scholarship has challenged the priority of legal and administrative changes in understanding the course of witchcraft trials, emphasizing instead the local or popular roots of prosecution for witchcraft-related crimes, the notion of a judicial revolution cannot be entirely abandoned.

Changes in legal theory and practice during the early modern period created the necessary conditions for widespread witchcraft trials, if not outright witch hunts. During the early modern period, judicial systems throughout Europe depended predominantly on the centralizing state's de jure claims to, and de facto exercise of, abstract justice, rather than community-based, interpersonal notions of justice. As this transformation took place, the state established itself as the final arbiter of disputes between its subjects. Rulers and officials sanctioned and staffed courts that adjudicated disputes between parties. Now centralized, and rationalized, these courts simultaneously prevented local forms of retribution and encouraged making accusations to officials empowered to dispense justice according to new standards. These changes can be seen best through the numerous law codes promulgated by European territories in the sixteenth and seventeenth centuries. Each replaced relatively vague medieval references to sorcery with clearer statements about the nature of the crime; they likewise established clear guidelines for its prosecution.

After this transformation from interpersonal to more abstract conceptions of justice, fears of harmful magic began to generate more accusations to officials and more responses from the increasingly elaborate official legal machinery. Magistrates adjudicated witchcraft accusations through their power to investigate, interrogate, intimidate, and torture suspects brought before them, while aggrieved parties no longer needed to pursue other responses to fears of the supernatural. Countermagic to undo the effects of spells, retaliatory magic against perceived enemies, and physical violence to achieve vengeance certainly persisted, but such activities could also draw unsympathetic attention from state officials. In fact, state officials dealt very harshly with perpetrators of unofficial punishments of presumed witches.

Criminal procedures during the late medieval and early modern periods began to reflect changing attitudes toward justice. The most striking feature of the move toward rationalization and abstraction was the increasing abandonment of accusatorial procedures in criminal cases by both ecclesiastical and secular authorities after the twelfth century. The inherently nonrational mechanisms of accusatorial procedures held both the accuser and the accused to the same standard of proof, understood essentially as the immanence—or better still, the divine intervention—of God, revealed

through an ordeal, oath, or compurgation in the absence of certain proof or a confession. Judges presided impartially (at least in theory) between two equal parties, the accusation being prosecuted by one and defended by the other. Judges could not investigate the legitimacy of accusations or seek to prosecute named suspects. The threat of punishment weighed equally on both parties, according to the Roman legal concept of *lex talionis* (law of the claw), which held that false accusers should be punished with the same penalty facing the accused if convicted.

In contrast, inquisitorial procedure granted a far greater role to investigative procedures and, ultimately, to human judgment, rather than divine intervention. This procedure did not preclude individual accusations, and in fact most trials conducted relied on them in an informal way. Presiding magistrates could also begin an investigation on the basis of reputation or public rumor, and thereby accusers could report on others, rather than accuse them in a strictly legal sense. No longer did the accuser act as prosecutor, for the inquisitor acted simultaneously as investigator, prosecutor, and judge. This dramatic change did not technically remove the threat of *lex talionis* for false accusations, but it had the effect of placing trained legal specialists on the accusers' side.

The most important innovation of the new criminal procedures was the means adopted to arrive at verdicts. Each phase of the case became an official act of the court: active investigation of the circumstances, formal interrogations of witnesses and suspects, the application of torture in the course of interrogations, the gathering of material evidence, the determination of the facts, the recording of all proceedings, and finally careful evaluation of all pertinent factors before reaching a decision and rendering a verdict. Inquisitorial methods could be abused, but the delegation of so much authority and discretion in the hands of a single judge was tempered by demanding standards for evidence and testimony, as well as clearly defined procedures for all phases of the investigation, including especially torture. But whereas the nonrational nature of accusatorial procedures (and especially the *lex talionis*) may have reduced frivolous accusations, inquisitorial procedures were very well adapted for prosecution of such an ill-understood, anxiety-producing, supernatural, and above all, secretive crime as witchcraft. Public ill repute or rumor sufficed for beginning an official investigation, and the use of officially sanctioned judicial torture to obtain confessions frequently led not only to guilty verdicts, but to additional accusations against others as well.

Throughout most of the Middle Ages, the existence of real fears of supernatural harm and the existence of real desires to eradicate those deemed responsible did not translate into witch hunting. Especially with the *lex talionis*, a judicial system based on interpersonal, retributive notions of justice and accusatorial procedures

prevented widespread accusations for witchcraft in most areas of Europe. Although Europe experienced a significant number of trials for both *maleficia* and diabolical witchcraft before 1500, and therefore before many substantial changes in legal procedures or much political centralization occurred, it is extremely important to note that during the European high point for witchcraft trials between 1580 and 1640, most of those changes were well underway. The judicial revolution enabled witch hunting of various kinds, shapes, and sizes in disparate regions of Europe. It did not cause any of them.

JUDICIAL CENTRALIZATION AND LOCAL DYNAMICS

Although developments associated with the judicial revolution clearly facilitated trying large numbers of accused witches, scholars have recently suggested that strong administrative oversight usually led to fewer witchcraft trials than those in loosely governed territories. Evidence for this claim can be found in the widespread differences among territories in which witchcraft was criminalized. Some experienced a great number of trials, while others had very few. In many jurisdictions, no trials for witchcraft occurred. Surviving records also show significant chronological fluctuation in the numbers of those tried and executed within particular jurisdictions. Decentralization and its resulting extension of individual prerogative to presiding magistrates seem to account best for these differences and fluctuations.

In the extremely fragmented lands of the Holy Roman Empire of the German nation, which (in its broadest definition) accounted for well over half of the total number of trials and executions in all of Europe, decentralization seems to account for the worst of the prosecutions. Within the German-speaking lands, for example, some trials took place in relatively well-governed states such as Bavaria or Austria, but the numbers of those tried and executed are slim compared to some of the worst witch hunts that took place in loosely governed territories elsewhere in the empire. The same observations may be made about relatively centralized monarchies such as England and France, where the worst trials usually took place in the absence of oversight, or about Italy or Spain, where well-organized inquisitions kept the prosecution of presumed witches to a minimum.

Most of the initiative behind trying accused witches came from various localities—in the form of popular pressure or from especially zealous magistrates—rather than from central governments, which were usually keenly aware of the destabilizing effects that accompanied witchcraft trials. The so-called “village witch-committees” (*dörfliche Hexenausschüsse*) of the German Saarland (similar institutions can be found elsewhere) seem to provide the best evidence of this kind of local

initiative in the absence of centralized oversight. Operating in the name of the village commune, these committees solicited accusations, conducted investigations, and generally contributed to an atmosphere of rumor and manipulation. They also placed significant pressure on judicial authorities empowered to render verdicts.

For these reasons, although it is tempting to propose a clear link between the judicial revolution, as well as the state-building of which it was part, and trials for witchcraft, the documentary record seems to suggest that the connection was partial at best. Where judicial reforms were most successful, careful oversight apparently mitigated the worst excesses of witch hunting, without eliminating them entirely. In contrast, where officials could pursue uncontrolled agendas, trials could become exceptionally numerous and large. Changes in legal practice and theory undoubtedly had a direct impact on the prosecution of reputed witches. After all, in the absence of secular prohibitions against magic and without a magistracy willing to prosecute practitioners, trials could not take place. Secular authorities viewed witchcraft as a threat to the political and social order, and even promulgated law codes and established judicial forums to eradicate it, but in the last analysis, their attitudes and actions offer only some of the reasons witchcraft trials took place.

CRANACH, LUCAS (1472–1553)

A painter, engraver, and designer of woodcuts, Cranach's contribution to the visual representation of witchcraft rests on four *Melancholia* paintings done between 1528 and 1533 (in Colmar, Copenhagen, and in two private collections).

Cranach (named after the small town of his birth) spent the early years of his career in Vienna, then lived from 1505 until his death in Wittenberg, the capital of electoral Saxony. In 1507 he set up a large workshop, which achieved a prolific artistic output in panel painting, mural designs, and woodcuts. His work covered many subjects, including devotional and religious themes, individual portraits, scenes from the life of the nobility, mythological and moralizing subjects, and images promoting the Protestant Reformation. Appointed court artist by Elector Frederick the Wise, Cranach ranked among Wittenberg's wealthiest citizens, owning several houses and an apothecary, becoming a member of the city council from 1519 until 1545, and acting three times as mayor of the city.

The *Melancholia* paintings were completed in 1528 (private collection), 1532 (Musée d'Unterlinden, Colmar), 1532 (Statens Museum for Kunst, Copenhagen), and 1533 (private collection). There is also a later sixteenth-century copy of the 1528 painting in the Museum of Fine Arts of Toledo, Ohio. All feature Melancholy as a winged female figure, sharpening or peeling a stick, and surrounded by items traditionally associated with melancholia. Cranach's paintings allude to the famous 1514 engraving of *Melencolia I* by his fellow German artist, Albrecht Dürer. Unlike Dürer's very positive, Neoplatonic emphasis on the role of melancholy in human creativity, Cranach expressed an older medieval tradition identifying melancholy with the vice of sloth. Cranach was heavily influenced by Martin Luther, who had described melancholy as "a bath prepared by the devil" (Koepplin and Falk 1974, 292). In Cranach's *Melancholia* paintings, diabolical spirits invade the melancholic imagination through a wild cavalcade of witches, located in a bubble cloud above the figure of Melancholy.

Witches are portrayed in similar ways through the series. Drawing on the iconography developed by Dürer, Albrecht Altdorfer, Urs Graf, and especially Hans Baldung [Grien], Cranach depicted almost all of

them as naked females, both young and old, riding a range of different animals: goats, stags, boars, horses, cows, a ram, a large cat, a dragon, a hound, and an owl. Other animals, including a cock, serpents, and toads, are also prominent. Cranach's witches drew on traditional folklore associated with nocturnal cavalcades or processions, sometimes referred to as the "Furious Horde." They are easily identifiable as witches because of their naked bodies and flying hair, their forked cooking sticks, distaff, and spindle (only in his third painting), and by the animal skulls hoisted on long sticks. Already in 1515, in an illustration created as part of his contribution to a lavish *Book of Hours* designed for the Holy Roman Emperor Maximilian, Cranach had portrayed a flamboyantly garbed witch riding a wild, snorting ram with the same animal skull hoisted on a stick. An older woman with exposed, sagging breasts, holding a similar stick or banner accompanied this extravagantly dressed witch, probably meant to suggest a prostitute.

Cranach created quite different scenarios for his wild cavalcades, however, based on contemporary notions and traditions of disorder and alluding to the evil spirits that melancholy was believed to release within the imagination. The 1528 painting emphasized the violence and destruction associated with the folklore of the wild hunt. The 1532 paintings provided coded images of the sexual disorder and emasculation of witchcraft based on popular stories of the *Venusberg*, that sinful mountain paradise given over to carnal lust and the black arts, the site of female seduction and male delusion, also identified in some sources as the site of witches' assemblies. The 1528 and 1532 paintings also included visual references to the military destruction associated with folkloric traditions of the Furious Horde, but now likely to be understood in moral terms. The 1533 painting, with its inclusion of a sexually dissolute clergy, linked the disorder of witchcraft to Reformation critique of a disordered and sinful Roman Church. In all these ways, Cranach expanded the visual language of witchcraft and endeavored to make it topical and relevant.

CRESPET, PIERRE (1543—1594)

Preacher and writer, Crespet addressed many religious themes and published *Deux Livres de la Hayne de Sathan et Malins Esprits Contre L’Homme* (Two Books on the Hatred of Satan and Evil Spirits Against Mankind) in 1590. His text provides an excellent example of the way that Holy League zealots used demonology to support their political position in the French Wars of Religion.

Born in Sens, Crespet spent his career in the Celestine order. He became the prior of the Celestine abbey in Paris and in that position was well known as an active preacher and devoted supporter of the Holy League during the religious wars. Like almost all his colleagues, Crespet used the pulpit as a platform for the condemnation of the spread of Protestantism, which he considered a Satanic heresy.

Starting from the cliché of this age that heresy was the work of the Devil, Crespet’s approach in his book was essentially historical. “Lucifer,” he stated, was “the first chief of the Heretics and Apostates . . . Never has the Devil left the Church of God in peace.” For Crespet, the heretics of his day—Huguenots—were the direct heirs of the heretics of the early and medieval Church, such as Arians, *Vaudois*, and Waldensians. He stated, for example, “The Albigensians committed the same insolences and cruelties as the Huguenots have perpetrated in France; blasphemed the Virgin Mary, massacred priests, pissed on the holy vessels, left their excitement on the sacred altars, renounced the Roman Church, condemned all the sacraments and broken images; in short we have seen all these cruelties revived in France, so that we know that this is the same demon who has agitated these (heretics) today as well as those in the past.” The rise of heresy was the work of the Devil. German soldiers in Coligny’s Protestant army, “to show that they are of Satan’s religion, use diabolical characters . . . around their necks as if these could preserve them from danger” (Crespet 1590, 47v, 66r, 179v).

Crespet was obviously agitated that the high courts of France did not take witchcraft very seriously as a criminal heresy. It was essential, he wrote, that the criminal courts deal severely with this horrible crime. “Judges are so blind that they deny that there have ever been witches . . . These judges fascinated and

bewitched by Satan cannot or do not want to discover such a corrupt and impious doctrine and mock those who show them the truth . . . either they are blind or they are themselves of the league and confederation of Satan, helping to strengthen his power.” The results of this official laxity were grave. Crespet argued, “Heresies tolerated with impunity have opened the door to the Devil to bring disorder to Christendom” (Crespet 1590, 115r, 233r). The sense of betrayal by French royalist judges and officials was common among zealot preachers and writers.

Through such themes as the identification of heresy with the Devil, the equation of Protestantism with ancient heresies and witchcraft, and the accusations of judicial complicity in aiding the Devil’s work, Crespet provides an excellent example of the way influential French Catholic writers sought to mobilize their readers to fight the spread of the new religion. Crespet died in 1594, as the Catholic League was crumbling, and its former stalwarts rushed to recognize Henry IV as king of France.

CRIMEN EXCEPTUM

Crimen exceptum (the excepted crime) is a term of Roman law, later adapted to medieval and early modern European learned law, that designated a category of criminal offenses that were so serious and often so difficult to prove that they justify both irregular legal procedure—often summary—and also deserve neither Christian charity nor imperial *clementia* (clemency) in the matter of sentencing. Roman law is also emphatic that they are among the offenses that should never be pardoned.

The earliest and most serious of these crimes was treason, against the Roman people during the Republic and against the emperor during the Empire. In various late-imperial laws the number of these crimes varied from five to twelve, usually including homicide, adultery, treason, rape, and counterfeiting, but sometimes extending to the violation of tombs, incest, and poisoning. These offenses were perceived especially to threaten the very fabric of society. Later Christian legal thought, derived as well from Hebrew Scripture, also considered those offenses that threatened to call down God’s wrath on those peoples who did not prosecute the offenses vigorously.

Christian influence was also evident in imperial legislation regarding the testimony of otherwise inadmissible witnesses—women, those declared infamous, soldiers, and slaves—in cases of excepted crimes, when the testimony of convicted heretics was allowed against other heretics (the basis in later learned law of the admissibility of the testimony of witches about other witches). Christian influence also began the process of aligning new offenses with older ones, as occurred when the offense of simony (the purchase of ecclesiastical office) was aligned with treason. Although early Christian discipline generally did not extend further than exclusion from the community, the spread of Christianity and the problems of organizing large ecclesiastical communities led to reconsideration of criminal offenses within the community. As harsh as some of these were, St. Augustine argued that they were intended to be therapeutic, not vengeful nor retributive.

From the fifth to the tenth century, the laws of European peoples generally considered injury or offenses against personal honor in terms of dispute settlement rather than crime. But in the late eleventh and twelfth centuries, partly through the influence of the revived Roman law, both ecclesiastical and secular criminal law theory began to be articulated, although both contained strict procedural rules. Some thinkers identified sin with crime, and great sins with great crimes, while at the same time developing the doctrines of seriousness and notoriety, initially in clerical crimes, and later in all crimes. Heresy and idolatry in particular were aligned to theft, then to treason in the handbooks of criminal procedure that began to appear in the late thirteenth century. The category of the enormous crime permitted the execution of summary justice. Early modern continental thinkers also included blasphemy, prevarication, apostasy, and simony as excepted crimes.

A series of political trials in France around 1300 raised the question of crimes so great that they threatened the stability of the kingdom itself—including the crime of sorcery. When canon lawyers and inquisitors of heretical depravity questioned whether sorcery could be prosecuted as heresy, they decided that it could if it involved apostasy from the Christian faith and idolatry, the worship of a false god—in this instance, the demon. When the crime of witchcraft was formally defined in the first half of the fifteenth century, then, it clearly belonged to the category of excepted crimes, because it was considered part of a vast conspiracy against humanity directed by the Devil and therefore an enormous crime that threatened to bring down the wrath of God on those who refused to prosecute it, and because it was difficult to detect, requiring exceptional legal procedural rules. This was the standard argument in the handbooks of witchcraft prosecution, from the *Malleus Maleficarum* (The Hammer of Witches) in 1486, through the treatise *De la démonomanie des sor-*

ciers (On the Demon-Mania of Witches) by the jurist Jean Bodin in 1580. Against the excepted crime, Bodin argued, the judge may use secret accusations, the testimony of close relatives and accomplices, pretended kindness toward suspects, torture, and even lies about evidence. Bodin's definition of witchcraft as a *crimen exceptum* was challenged first by Johann Georg Goedelmann in 1592, by the earl of Dunfermline in Scotland in 1614, and by Ernst Cothmann and other German jurists in the 1620s. The refusal to consider witchcraft a *crimen exceptum* contributed to the decline of witchcraft prosecutions in the seventeenth century.

CROATIA

Modern Croatia, which borders central Europe, the Mediterranean, and the Balkans, was divided politically after 1500 among the Republic of Venice, the Habsburg Empire, and the Ottoman Empire. It experienced very different histories of witchcraft trials in each part. Northwest Croatia (also referred to as Habsburg or continental Croatia) experienced an outburst of witch hunting from the early 1600s until the 1750s, much like Hungary (to which it had been joined since 1102) or most Habsburg possessions in east-central Europe. Meanwhile, the coastal parts and islands under Venetian rule remained almost untouched by this phenomenon. We know nothing about court trials from Croatian regions under Ottoman rule, although some witch lynchings apparently occurred here even after 1850.

The first indications of witchcraft occurred in several coastal Dalmatian statutes dating between 1214 and 1640. Most statutes were slightly older than their preserved versions and represented codifications of older traditions and customs. Although written in different time periods, they all shared similar perceptions of witchcraft, essentially treating it as a crime without diabolical implications. The Latin terms used—primarily *maleficium* (harmful magic), but also *herbaria* (herbal lore) or *ars magicalis*—were obviously borrowed from older Italian statutes, and clearly stated that the crime of witchcraft was mainly attributed to women, although there were also trials against male sorcerers. The most common punishment was burning

Witchcraft trials in Croatia, 1400–1758. (Courtesy Tripimir Vedriš)

at the stake, inflicted on second offenders; other recommended punishments included flogging, fines, and confiscation of property. Before 1500, only one witchcraft trial is known, at Sibenik in 1443.

On the other hand, the continental part of Croatia lacked any law codes, but held trials, beginning at Zagreb in the 1360s. These cases, and some later ones, showed elements of old Slavic accusatory court procedures being used in Croatia until the early seventeenth century. This means that the accused had an opportunity to clear herself by bringing to court a number of witnesses ready to swear to her innocence. The last recorded acquittal following justification of the accused occurred near Zagreb in 1622.

During the sixteenth century, new ideas from western Europe changed attitudes toward the crime of witchcraft in northwest Croatia, gradually replacing the older “irrational” system of providing evidence and justification by compurgation. These new attitudes eventually resulted in an increased number of trials, more severe punishments, more executions, and the use of torture in such trials. However, traditional methods of providing justification and the slow inflow of new theological and juridical opinions made the persecutions from this period less frequent, less systematic, and seemingly less severe.

THE PERIOD OF PERSECUTIONS (CA. 1600–1758)

Data about witchcraft trials along the Dalmatian littoral are extremely rare between the sixteenth and eighteenth centuries. When a young woman was accused of witchcraft at Ragusa (Dubrovnik) in 1556, the famous Jewish physician Amatus Lusitanus was

called in for assistance. Two other trials held in seventeenth-century Dubrovnik also showed that local judges did not know how to act in such cases, which suggests that they were indeed extremely rare. The witch craze never spread in these parts, perhaps because of local perceptions of some pre-Christian beliefs and practices. Women soothsayers and healers, called *vilenice* (plural, derived from *vila* = fairy) enjoyed great confidence among common people, and contemporary popular beliefs made a great impact on high culture of the period. In the works of Croatian poets of the Renaissance, we can trace a kind of syncretism between classical motifs and elements of popular culture: ordinary people were often idealized, and contacts between shepherds and fairy-like creatures were frequent and usually benevolent.

On the contrary, clusters of trials involving the complete panoply of diabolical witchcraft (pacts with the Devil, witches’ Sabbats, sexual intercourse with demons, and so forth) occurred in northwest Croatia in the early seventeenth century and reached a higher level of intensity there between 1698–1699 and the mid-eighteenth century. However, many of these elements had no background in traditional Croatian beliefs; and although some elements of “popular superstition” could mesh with imported theological and juridical terms, recent ethnological research suggested that more archaic perceptions of witchcraft, completely alien to diabolical witchcraft, were preserved in regions weakly influenced by western ideas.

Sources from regions under Ottoman rule (including Bosnia and Herzegovina) also mentioned some witchcraft trials, which, however, seem quite different from those in northwest Croatia. Some Bosnian trials dated from the second half of the nineteenth century and showed elements typical of traditional perceptions of witches. Trials conducted by nineteenth-century Bosnian Muslims, however, did not differ greatly from those of their Christian neighbors, whether Catholic or Orthodox. Everywhere “witches” were tried according to the “old custom,” that is, by the cold-water ordeal (swimming test); the usual punishments were flogging, stoning, drowning, or burning. Written records also suggested that accused witches could still clear themselves by swearing to their innocence.

STRUCTURE OF TRIALS IN NORTHWEST CROATIA

The accusation against the witch followed the inquisitorial procedures of Roman law. It would be brought by a *fiškal* (Lat. *fiscalis*), or public prosecutor. An investigation (*inquisitio*) followed, conducted by local officials or the responsible nobleman, who listened to testimony from witnesses under oath about the crime. Following this investigation, the *fiškal* made a formal accusation

and the authorities summoned the accused to appear at court. This was usually followed by arresting the accused witch and searching her house for magical or dangerous objects. In court, the prisoner was first interrogated alone and then confronted with the witnesses. If the prosecutor concluded that the evidence proved the probable guilt of the accused witch, she would be tortured, despite her denials of the accusation.

Torture was known in fourteenth-century Croatia, but rarely used in witchcraft trials before the seventeenth century and used regularly only after 1700. The interrogation procedures and instruments of torture, divided into categories from mildest to most severe, resembled those used in other parts of the Habsburg Empire. The most common included the thumbscrews (*compressio pollicum*), the strappado, the “Spanish boot” (*ocra hispanica*), the “horse” (*equulus*), and others. If a “witch” withdrew a confession given under torture, she was tortured again. Acquittals were very rare in this period (in 245 cases, only eleven of the accused were acquitted), and many accused women died during torture or soon afterward. Capital punishment was the most frequent sentence for witchcraft; “witches” were usually decapitated or strangled and then burned at the stake.

There are several reasons witchcraft trials multiplied from the end of the seventeenth century. By then, Croatian authorities believed that witches were a real threat to society and part of an international conspiracy against humankind. The second very important reason was that confessions obtained under torture raised new accusations, starting a chain reaction. In northwest Croatia, trial records give precise information about 245 accused witches. However, there was, in addition, mention (but not sufficient information) of a further 517 witches arrested owing to denunciations made under torture; from 1600 to 1650 there were seven such arrests; from 1650 to 1700, 198 arrests; and, finally, from 1700 to 1750, 311 witches were arrested on the basis of denunciations given under torture. It seems paradoxical that increasing witchcraft trials in northwest Croatia accompanied a vigorous expansion of cultural life and an improved school system: a Jesuit school was established in Zagreb in 1607 and in 1669 Zagreb University was founded. Such institutions educated an increasing number of noblemen and commoners, providing them with a better understanding of the theological and juridical notions of witchcraft. Seventeenth-century Croatian prosecutors were familiar with foreign demonological literature; the National University Library in Zagreb preserves many such works, including the *Malleus Maleficarum* (The Hammer of Witches, printed in 1497), Nicolas Rémy’s *Demonologia* (Demonology, 1596), an Italian translation of Jean Bodin’s *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1592), and a

reprint of Martín Del Río’s *Disquisitionum* (Six Books on Investigations into Magic, 1746). The Hungarian Jesuit Marton Szentivanyi exercised a significant influence on Croatian persecutions and court trials through his translation, *Praxis Criminalis* (Criminal Practice, 1687), of the Holy Roman emperor Ferdinand III’s law code.

Numerous legal regulations, for example, the decisions of the synod in Trnava in 1611 or the provisions passed by the Croatian Parliament between 1609 and 1635, requiring all inhabitants of Croatia to participate in hunting witches, sorcerers, and poisoners (*strigas, sagas, et veneficas*), provided strong incentives for the diffusion of persecutions. In 1656, Emperor Ferdinand III decreed a code of criminal procedure for Lower Austria, used also in Hungary and Croatia because of the lack of a general criminal code.

The Catholic Church did not participate in witchcraft trials, except for some of its officials, who did so as feudal landlords. However, the Venetian Inquisition was involved in trials in 1443 in Šibenik that ended with the escape of the two accused women and in a dozen trials held in Venetia against Croats from Dalmatia and Istria. Most of these cases ended with acquittals.

As in Hungary, most witch hunting in northwest Croatia coincided with years of peace and with lulls in times of war. As in Germany, there was also a relationship between mass accusations and periods of crop failure and famine; this was even more the case with lynchings at the local level.

It is difficult to speculate about the total number of accused and executed witches for many reasons: many of the trial records are lost, not all of the towns kept precise documentation, and scholars have not researched all the records that do exist. Nevertheless, the existing data allow us to make some observations. We know of approximately 245 accusations for witchcraft in northwest Croatia from 1360 to 1758; 230 of the accused were women (94 percent). Of the 245 arrested, 145 were executed (59 percent). Of the 145 executed, 138 (95 percent) were women. Three women died in prison, 2 escaped, and 11 of the accused (7 women and 4 men) were acquitted. We do not know the fate of 84 of the accused, although it is very probable that most of them were executed. The age of the witches ranged from a 5-year-old girl to an 85-year-old woman, but most of the accused were middle-aged or older women. Most were peasant women, the unemployed, and the small town artisans, but there are also some noblewomen and one monastery prioress.

If the records from northwest Croatia are quite scarce, they are more so for other parts of Croatia. The Venetian Inquisition conducted some witchcraft trials in Istria. The last legal persecution took place in St. Vincent in 1632. In the community of Kastav, we know

two witches were burned, one in 1625 and the other in 1626. In 1716, a mass trial resulted in fourteen executions. Further to the south there are almost no records of witchcraft trials except for the one in Šibenik in 1443 (where two accused women escaped), a trial in Dubrovnik in 1556 (which ended in acquittal), and two other trials in Dubrovnik in 1660 and 1689 that resulted in the executions of two women. Presumably, there were more trials and executions, but sources are not extant.

It would be useful to measure the intensity of witch hunting in Croatia, but both the number of accusations and executions as well as the population of Croatia are quite uncertain. Long periods of exhaustion and destruction (since the fifteenth century), followed by great refugee crises, along with epidemics and constant warfare, slowed population growth until the 1880s. The first serious censuses were taken in the late seventeenth century for Dalmatia, and not before the middle of the eighteenth century for Croatia. By 1780, Croatia had approximately 1.5 million inhabitants. Witch hunting and massive witchcraft trials occurred only in northwest (Habsburg) Croatia, in the only area more or less untouched by the seventeenth- and eighteenth-century wars, whether the Thirty Years' War, the warfare between Venice and the Ottoman Empire, and Ottoman raids (which decreased significantly after the Ottoman defeat at Sisak in 1593 and the subsequent movement of the border eastward).

END OF TRIALS

Empress Maria Theresa, who enforced some precautionary measures in 1756 and 1758, is erroneously considered to have abolished witchcraft persecutions in Croatia. In fact, the empress personally intervened in only one trial, which ended by acquitting the accused woman, but Maria never formally abolished persecutions. However, afterward no Croatian court could conduct a witchcraft trial without the empress's permission—which she never gave. Her *Common Criminal Code* of 1768 confirmed belief in the existence of sorcerers and witches; it even allowed torture. However, her code strongly emphasized the need to take great precautions during trials to avoid sentencing innocent people. Together with the change of the intellectual climate in the second half of the eighteenth century, such measures produced the paradox that witchcraft trials ceased in Croatia without ever being formally abolished.

CROSSROADS

The intersection of roads has a long history as a location imbued with magical, spiritual, and religious powers. In antiquity, crossroads were the dwelling place of the goddess Hecate, whose alternate names *Enodia* (The One at the Crossroads) and *Trioditis* (The One Worshipped at the Crossroads) indicate the connection. Similarly, in Rome, Hecate was called *Trivia* (Lady of the Crossroads). It is recorded that people placed "suppers" at the crossroads to supplicate Hecate, whose three-formed image was often found there. In antiquity, crossroads also became an area associated with ghosts, often the companions of Hecate. This development was likely the partial result of the custom of burying criminals "at a particular place where three roads merge outside the community" (Plato, *Laws* 9.873). In ancient Greece, unwanted babies were sometimes placed at crossroads, although this custom has a closer association with the consistent presence of passers-by rather than the connotations of death linked to such sites.

In Greek and Roman magic, crossroads became the site for certain practices. Pliny the Elder, for example, recorded that boiling frogs at a crossroads could cure fever (*Natural History* 32.113) while another spell

specified an ingredient obtained from the crossroads (Ibid., 36.256–36.264). Similarly, one spell from a Greek magical papyrus stipulated the burial of particular objects at a crossroads (Ibid., 1: 167–168). Such beliefs were also mirrored in other ancient cultures; the preeminent text of the *grimoires*, the Key of Solomon, written in Greek in around the third century C.E. but based on a Jewish tradition, stated that crossroads, particularly when visited late at night, were the preferred location for the performance of magic (*The Key of Solomon the King* 1989, 2.7).

In the early modern era, the continuation of antique modes of thought concerning crossroads was revealed in their general correlation with danger. This danger was manifested in the figures of ghosts, witches, sorcerers, demons, and the Devil, all of which were believed to frequent such junctions. The haunting of the crossroads by ghosts is explained by the practice of burying suicides at such locations, for they were denied a Christian interment, a practice common throughout Latin Christendom. The fact that executions were also performed at the meeting of roads further strengthened the connections between ghosts and crossroads. Such burials were apparently based on the assumption that the souls of suicides and criminals are restless, probably because they were denied burial in consecrated ground. So, by placing them at a crossroad, their spirits would become confused in their search for a proper resting place.

Traditions concerning the Devil's presence at the crossroads have a long history as illustrated by the story of Theophilus, a precursor to Faust. In the version of the story recorded by Gonzalo de Berceo (1195–1264) in *Miráculos de Nuestra Señora* (Miracles of Our Lady), Theophilus, through the agency of a Jewish sorcerer, made a pact with the Devil at the crossroads at midnight. Historical cases of accusations concerning such pacts also have early origins in terms of the witch persecutions; in 1324, the Irish witch, Dame Alice Kyteler, was accused of visiting the crossroads to meet her familiar and to offer sacrifices to him in the form of cockerels. Fairies, sprites, and other such beings were also believed to dwell at crossroads; the Welsh fairy Gwrach Y Rhibyn, a harbinger of death, was thought to begin screaming her prediction to the traveler she was following as he or she approached a crossroad or stream.

Contemporary scholarship has interpreted these traditional beliefs about the power of crossroads in part on the basis of the concept of liminality. In this view, the crossroad and such related places as entranceways or shorelines symbolize a liminal point or no-man's land; a place that is literally "nowhere," and which serves simultaneously as a transitional zone that presents one with options but no certainties. Doubts concerning such locations of limbo and decision-making were there by originally the objects of ritual procedures, such as the

propitiation of Hecate, who, in addition to her more frightening manifestations associated with her role as the goddess of magic and sorcery, was the goddess of transition—either of movement from one physical sphere to another, as evidenced by the movement through the crossroads, or in a more nonphysical or symbolic situation of transition such as that from life to death.

CUNNING FOLK

Cunning men ("wise men") and cunning women ("wise women") worked beneficent magic, notably healing and fortunetelling. They practiced herbal, humoral, and magical medicine, helped people select future spouses, locate buried treasure, identify thieves, and, through countermagic, protect against or undo the evil magic of witches.

Lodging a formal complaint against a supposed witch was only one way to get rid of maleficent sorcery. Simpler and cheaper preventive measures and home remedies and, if these were ineffectual, recourse to cunning folk, were probably used at least as frequently. Until now only little systematic research has been carried out regarding the numbers and practices of expert countermagicians. According to Reginald Scot, there were English parishes that counted among their inhabitants as many as seventeen or eighteen specialists who "could worke miracles supernaturallie" (Scot 1584, 4). Although in other parts of early modern Europe cunning folk may have been less numerous, it seems certain that their help was easily available, not only in the British Isles but also on the Continent.

Cunning folk differed considerably in social background and status, techniques, reputation, and the quality and origin of their talents. A main difference separated sedentary from traveling soothsayers. Cunning folk from the first category expected their clients to come to them; some only drew visitors from nearby, while others met with little trust among their immediate neighbors but were frequently consulted by people living farther away. Most sedentary cunning folk carefully avoided public exposure, as this could inspire the authorities to start an investigation into their activities, whereas traveling wizards often put on a

public show to draw potential customers. These mobile cunning folk had no interest in building up a stable group of clients.

Some cunning folk were quite poor, while others appear to have enjoyed a comfortable income. Jacob Jodoci de Rosa of Courtrai, for instance, whose conviction in 1548 in Arnhem by the Court of Gelderland Johann Weyer recorded in his *De Praestigiis Daemonum* (On the Tricks of Devils) (Weyer 1991, 484), was clearly well off. According to his file in the court's archives, de Rosa was dressed in velvet and satin and adorned with gilded chains and a golden purse. He was well-educated and spoke several languages, including Latin.

According to legal theory and theology, the activities of cunning folk were tantamount to witchcraft. But because practitioners of beneficial magic were usually prosecuted less ardently than suspects of malicious sorcery, details about their practices generally cannot be found easily. It is therefore often difficult to assess their role and analyze their activities. Another complication is the fact that it was not really possible in the early modern period to agree on a definition of illegal magic. Around 1500, it was not uncommon for local courts to ask a specialist on magic to assist them in a witchcraft trial. After the Protestant Reformation, it became even more difficult to define the perimeter and content of cunning practices. Exorcism had always been part of the duties of Catholic priests, but in the eyes of Protestants this sacramental ritual provided yet another proof of the superstitious character of Catholicism. According to Protestant Reformers, praying and fasting were the only scriptural means to help victims of witchcraft or demonic possession, from which they concluded that there was no fundamental difference between Catholic exorcism and practices of cunning folk. But despite this drastic restriction on their pastoral duties, several Protestant clerics actually practiced as magical healers. The Buckinghamshire minister Richard Napier, whose healing activities have been analyzed in detail (MacDonald 1981), offers a good example of this type of clergyman, but he was certainly not unique, not in England and certainly not abroad. In Germany, for instance, numerous Lutheran ministers also practiced as exorcists. Definitions of cunning folk's practices therefore depended largely on the sociopolitical context. These activities were illicit and forbidden, but the question of whether a certain healer was or was not a cunning man ultimately rested on local political circumstances.

Because of their illicit character, these activities were far more flexible than canonical beliefs and rituals. The magical world view could be incoherent, but its adherents only rarely perceived this as a problem. As a result, the activities of cunning folk and the way in which they presented themselves to potential clients could be adapted without much difficulty to changes in the sociocultural context. In the eighteenth century, for

example, at a time when physics and natural science were held in high esteem, a cunning man could present himself as an extraordinarily gifted expert on the hidden laws of nature without the risk of being questioned about the empirical basis of his claim. Its chameleon-like character was actually one of the strongest elements of this unofficial set of beliefs and rites. This adaptive quality helps to explain the enormous regional variety in the practices of cunning folk.

One assumption, however, was common to all cunning practices: the conviction that there existed apart from the material, natural world another immaterial world, and that some humans were able to consult or even deploy the powers that dwelled in that nonnatural domain. For most people it was very difficult to establish contact with these extraordinary forces; but thanks to special qualities, cunning folk were able to cross the line between the two domains. These qualities were either innate or acquired after birth. It was often assumed that people who had been born under strange circumstances possessed extraordinary powers. In Friuli in northern Italy, for instance, the *benandanti* (dogooders; persons who had been born with a caul) were expected to fight witches in nocturnal battles at certain seasons of the year. The outcome of these combats was thought to be decisive for the quality of the harvest. Similar beliefs were found elsewhere in Europe. In the northern Netherlands (Dutch Republic), several cunning folk claimed to have been born with a caul and they were for that reason able to discern things that remained hidden from ordinary people.

People born by Caesarian were believed to have similar powers. For instance, a cunning woman from Hamburg, Tryn Jans, who was repeatedly convicted for fraud in the Dutch Republic during the 1620s, claimed that she had been cut out of her dead mother's body. As a result she could detect hidden treasures and was able to drive away—in exchange for a handsome fee—the ghosts that stood guard over these valuables. She also conversed with the dead and cured people of witchcraft. It is in that light no coincidence that in Shakespeare's tragedy *Macbeth* the tyrant could only be killed by Macduff who “was from his mother's womb untimely ripped” (V: 8, 81–82). Another example of the belief that a person born under strange circumstances had extraordinary qualities was the widespread idea in France around 1800 that the seventh son of a seventh son had special gifts enabling him to heal sick people.

Some cunning folk acquired their professional skills later in life. Because of their exorcistic abilities, Catholic priests were often asked to undo witchcraft, and even Protestants sometimes consulted them. But other professions were also associated with extraordinary powers. Throughout Europe, executioners were believed to be expert magical healers; in the Holy Roman Empire, skimmers, gravediggers, and soldiers

had a similar reputation. In normal life, that is, in the domain of nature, these people were professionally connected with death, but when they were active in the domain of magic, where the rules of nature are turned upside down, they were associated with the preservation of life. Just as parts of the bodies of dead people could be used for all sorts of magical purposes, so persons who were experts in killing people or in caring for the dying were seen as qualified magical healers. Herdsmen and gypsies were also widely believed to have access to the preternatural world. The south-German magical healer and occasional witch finder Chonrad Stoeckhlin, for instance, who was himself executed as a witch in 1587, was a professional cowherd. Gypsies were not only thought to be able fortunetellers, but it was also believed that they could drive away ghosts and heal witchcraft. In these cases it seems that this attribution of extraordinary powers resulted from their social marginalization in ordinary life.

In many respects the things cunning folk did copied the techniques of legal professions. Many of their rituals were clearly based on the rite of Catholic exorcism. With muffled voices, they read out long conjurations in a language that sounded somewhat like Latin. While doing so, they would repeatedly make the sign of the cross and call on God and his saints to attack a witch. Catholics and Protestants alike disapproved of such rituals, but they undoubtedly were Christian insofar as their starting points were the same as those at the base of the Christian faith.

Other cunning folk employed techniques that seem to rest on the same foundations as the axioms of humoral pathology, the classic medical theory of Galen and Hippocrates that was generally accepted in early modern times. In that system, bodily fluids like urine or blood were assumed to provide detailed information about a patient's condition and character. Cunning folk often closely inspected a sick person's urine, or a cow's milk, to find out if the illness was caused by witchcraft. To that end the fluid could be cooked. If it boiled over, the sickness had natural causes; but if it stayed in the pot, witchcraft was diagnosed. It was furthermore believed that the person of the witch could be attacked through bodily fluids. By adding specific ingredients like sharp pins or a living black cock to the boiling substance, the witch would feel forced to come, after which she could be compelled to undo the spell. Some cunning folk inspected the blood of a client, which they acquired by making small incisions in his skin. The blood provided information not only about the client himself, but also about his social network and its quality. In England witches were sometimes battered in order to cause a nosebleed or scratched on their faces to draw blood. Their blood was then used to heal their supposed victims. In the early seventeenth century, this belief was also present in the Netherlands. From such

evidence it can be concluded that the concepts structuring the practices of cunning folk were inextricably bound up with their cultural context.

CUNNING FOLK'S MANUALS

Popular healers and fortunetellers claimed several sources of inspiration, such as fairies or angels; but after the rise of print culture in the sixteenth century, literature became an increasingly influential source. In a predominantly illiterate society, those who owned books

and manuscripts were popularly held to possess occult knowledge, and cunning folk made great show of their manuals to impress their clients. Surviving examples that were definitely possessed by “cunning folk” mostly date from the late seventeenth century onward, though we have good evidence for their use since the mid-sixteenth century. There were numerous cases of ecclesiastical and secular authorities confiscating and destroying such manuals, believing them to contain demonic rituals and pacts with Satan. In fact, some manuals were merely compilations of simple herbal remedies, astrological calculations, prayers, and charms, drawn from oral tradition and popular literature such as almanacs, chapbooks, German *hausvater* (housefather) books, the Bible, and other religious texts. Others, however, consisted of extracts from, or entire copies of, notorious works of ritual magic that contained instructions on how to conjure angels, demons, and spirits to find treasure or stolen property, procure love, and perform many other useful services.

Trial records reveal that throughout western and southern Europe the most influential sources of such magic were the *Fourth Book of Occult Philosophy* and the *Clavicule (Key) of Solomon*. The former, which was spuriously attributed to Cornelius Agrippa, first appeared in a Latin edition during the 1560s; over the next few decades, numerous manuscript versions circulated around Europe in Latin and vernacular translations. The even older *Clavicule* was one of several pseudo-Solomonic works circulating in manuscript in medieval Europe, and was particularly desirable for its instructions on treasure conjuration. In Germany, from the mid-eighteenth century onward, the apocryphal *Sixth and Seventh Books of Moses* became the most desirable possession for cunning folk, while in Scandinavia the *Cyprianus* was the basis for most of the *Suardeböcker* (“black books”) used by cunning folk. It is a great irony that in England Reginald Scot’s influential skeptical work *The Discoverie of Witchcraft*, with its disquisition on charms and conjurations, ranked alongside the *Fourth Book* as the most important basis for manuals.

With the massive growth in literacy and popular literature during the eighteenth century, many texts that had once been available only in manuscript form or at great expense became available to cunning folk cheaply. But as surviving manuals show, cunning folk copied the contents of these unprepossessing chapbook *grimoires* into manuscript books. The *Book of Secrets* compiled by an Alpine peasant around 1810, for example, contained dozens of extracts copied from the popular French chapbook *Admirables Secrets d’Albert le Grand* (Admirable Secrets of Albertus Magnus) (Monter 1976, 187–188). The process of transcription rendered the charms and conjurations more potent,

and the consultation of a manuscript presumably generated a greater sense of awe among customers.

The ways in which cunning folk used their manuals is not easy to assess. They obviously served as repositories of useful remedies and simple charms for practical application, but their importance was also symbolic. From the point of view of popular perception and reputation, which ultimately determined the success or failure of cunning folk, the possession of a manual was as important as its actual use. Regarding the arcane conjurations drawn from works of Neoplatonic magic, it seems likely that only a small minority of cunning folk employed these according to the long-winded preparations, consecrations, and fastings instructed in works like the *Clavicule*. Nevertheless, the hasty drawing of circles and pentacles on the ground, and the invocation of angels and demons, became a common part of the ritual theater of cunning folk’s trade. The words of adjuration, holy names, seals, and symbols copied into the manuals were also used to construct written protective charms, the sale of which provided a good income. Cunning folk’s manuals, then, played an important role in the popularization of high magic.

CURSES

One of the most common charges against witches was that they cursed people. A curse is a linguistic expression of the desire that misfortune befall someone, and it can take the form of a simple articulation of a malign wish or an invocation of the wrath of some god or spirit. Cursing appears to be a ubiquitous feature of human life, although the forms and presumed effects vary significantly. Early modern Europeans, like most premodern peoples, believed that curses could really cause misfortune, and their witchcraft accusations frequently included the charge that a suspect had uttered a curse

against an antagonist who then suffered some harm. Educated modern people, in contrast, use curses as a way of expressing their feelings without believing that words by themselves have the power to actually cause harm. Since the Enlightenment, educated opinion has held that any effects curses might have simply reflect people's belief in them, and that their primary importance to the person making them is in allowing the expression and venting of hostility. However, consideration of the role of psychosocial influences on health and in accidents suggests that beliefs about cursing build on, rather than originate, the power of hostile displays, and that cursing therefore has inherent potency rather than a merely derivative or palliative effect.

TYPES OF CURSES

Curses can be spoken, written, or simply thought. A curse can be as simple as a spontaneous shout or can entail elaborate, formalized wording embedded in a complex ceremony involving a special location, time, props, and non verbal ritual actions. Spoken curses can be made publicly or in secret. They can range from inaudible mumbles to sophisticated rhyming verses to incomprehensible mystical phrases, and can be combined with gestures, hostile facial expressions, and ritual activities. Written curses can be inscribed on metal, pottery, or other surfaces as well as paper; hidden to prevent counteraction or delivered to unnerve their target; supplemented by drawings or symbols; and intensified through mutilation or other ritual acts. Subvocalized curses are most likely to be fleeting thoughts, because rituals generally call for words to be spoken out loud, but they can be accompanied by gestures and expressions making manifest the anger articulated only inwardly.

Curses can be thought to come directly from a deity, but usually involve an unceremonious expression or formal invocation by a person. An invocation can be a public act by a priest or other religious leader, or a means of private vengeance by an ordinary person or hired specialist. Spontaneous expressions of hostility can be made with the intent to cause harm, to threaten harm unless certain conditions are met, to demonstrate the level of anger a person feels, or simply to vent.

THE HISTORY OF CURSES

Virtually all cultures appear to include some form of cursing, and evidence of curses can be found back to the beginnings of Western history. Ancient Mesopotamians and Egyptians employed a wide variety of techniques for cursing and countering curses, and the Hebrew Bible mentioned curses in a number of places. The ancient Greeks left numerous cursing tablets, metal plates on which curses were inscribed, and Greek myths and writings mentioned other, less

durable forms of cursing. The Romans made even more elaborate cursing tablets, and also employed a wide range of techniques. The tablets were used not only to get revenge, but also to gain advantage in love, business, lawsuits, petitions, and even sports. They were typically inscribed in secret and then hidden, but their existence was often suspected by rivals and enemies, and might be hinted at or proclaimed by the curser in order to heighten their psychological effect. Specialized practitioners offered many forms of cursing for pay, and were probably frequently involved in preparing tablets.

The use of cursing tablets apparently ended by the eighth century, presumably because of opposition from the Christian authorities, but other forms of curses continued. The Church used curses extensively to call down God's wrath on people who opposed Christianity's spread, ignored dictates, or stole its property. Both clerics and the laity used curses to strengthen and sanction contracts; laypeople and Church's many individual clerics used curses for private vengeance or gain despite theological objections. Throughout the Middle Ages, professional and semi-professional practitioners of magic included cursing among their services, and as the written body of learned magic increased during and after the twelfth-century Renaissance, a genre of elaborate ritual curses involving explicit and extensive invocation of evil spirits developed. While these necromantic rituals came from a cultural stream somewhat removed from popular magic, the two influenced each other, and the necromancers' practices reinforced the Christian authorities' fear that curses and other forms of malefic magic not only caused harm, but also involved an explicit alliance with evil supernatural beings.

CURSES IN EARLY MODERN WITCHCRAFT

The anthropologically oriented English historians Alan Macfarlane and Keith Thomas put cursing at the center of their influential interpretation of early modern witchcraft as a dynamic of charity refused, curse uttered, and misfortune suffered. Although accusations arose from many other situations, it is clear that cursing played an important role not only in accusers' fears, but also in some suspects' actions. Cursing was one of the most commonly reported forms of *maleficium* (harmful magic), and there is no doubt that it was actually practiced in some cases.

Early modern Europeans hurled curses routinely, even chronically, in interpersonal disputes, calling for the ruination or damnation of their antagonists with a viciousness that shocks modern sensibilities. In most cases, though, it seems clear that they did not expect their words to take effect and that they employed curses much as modern people do, to signal displeasure and

vent anger. Some women had reputations as habitually quarrelsome scolds, leading to the theory that witch suspects were simply such people who had the bad luck that their invectives were followed by some associated misfortune, making it seem that their curses had worked.

While some chronic scolds undoubtedly did develop reputations for witchcraft through this process, the German historian Rainer Walz found that witch suspects in the villages he studied were not prominent among the scolds and slanderers in judicial records. Instead it seems that some people were known as yellors, or verbal abusers, while others were suspected of more dangerous things. To some extent, these suspicions stemmed from the accusers' paranoia or guilt, but eyewitness reports, books of spells found by the authorities, and surviving curse tablets and parchments confirm that some early modern people employed curses both openly and in secret to harm others. Such curses included both simple threats and calls for retribution and elaborate rhyming spells. Some open curses were spontaneous, while others were delivered in premeditated confrontations, by themselves or in conjunction with gestures like kneeling and stretching the arms toward heaven. Curses performed in secret ranged from simple expressions of a desire for vengeance to complex spells spoken or written as part of elaborate ceremonies. While not every curse hurled in the heat of an argument was malefic, or the suspicion that a neighbor was secretly working malevolent curses was valid, fears that some curses were meant seriously and that some people cursed their neighbors privately were not unfounded.

Early modern commoners worried about the harm that could follow from curses, but popular culture was somewhat ambivalent about curses because it generally held that they were most often used by the weak against the strong and would only work if they were justified. The early modern elite, in contrast, was less concerned about the harm curses might cause, but was wholly opposed to them for moral reasons. Clergy and magistrates punished ordinary cursing as blasphemy and prosecuted malefic cursing more seriously because they understood its power to come from the Devil. According to Christian doctrine, demonic agency was required for a malefic curse to take effect, so the power to curse successfully was taken to be a sign of allegiance to the Devil.

THE POWER OF CURSES

While traditional cultures have generally believed that curses can cause harm, they have not necessarily held that every angry utterance has power, and they have had differing ideas about what makes curses work. Some cultures have ascribed a curse's effects to its or the curs-

er's intrinsic power, while others have assumed that it depends on some sort of spiritual intermediary, that is, that cursing is a form of supplication or invocation rather than direct causation. Early modern commoners appear to have believed that most curses would not take effect, but that some might. Popular explanations for this dichotomy focused on the inherent power of the curser and the curse, while elite theory explained it by reference to the curser's relationship to the Devil and the Devil's decision about how his interests might best be served.

Early modern theologians held that the Devil was needed for a curse to work, but they did not accept that he could actually cause supernatural effects because only God could transcend natural law and work true miracles. Enlightened opposition to witchcraft beliefs grew out of and elaborated this naturalistic orientation, beginning a skeptical tradition that explains most allegations of malefic cursing as forms of paranoid or guilt-ridden scapegoating, most alleged effects of curses as fallacious explanations for inexplicable misfortune, actual effects of curses as the products of belief in them, and actual attempts to curse magically as narcissistic confusion of desire with agency. Modern social scientists embraced this tradition in the nineteenth and twentieth centuries, although some historians and anthropologists emphasized how belief in the power of curses could play a positive social role by inducing people to practice neighborly behavior. The anthropologist Stanley Tambiah focused attention on the expressive value of curses. None of these attempts to see value in belief in the power of curses challenges the basic assumption that they cannot do what they claim, however. Current understanding of the role of psychosocial factors in disease and accident proneness—that they are not mediated primarily by symbolic psychodynamics but by persistent activation of the fight/flight mechanism leading to chronic stress—suggests that the power of curses is rooted in their object's psychophysical reaction to the hostility they manifest, with their linguistic meaning and belief in their power acting as intensifiers rather than originators of this visceral effect.

D

D'ANANIA, GIOVANNI LORENZO (CA. 1545–CA. 1608)

A Southern Italian polymath (philologist, natural scientist, geographer, and theologian), D'Anania's works include a dissertation on the nature of demons and their occult operations. D'Anania lived in Naples for several years as a private teacher of the archbishop, Mario Carafa, but returned to his native Catanzaro in Calabria after the latter's death in 1576. His best-known work is probably *La universale fabbrica del Mondo, ovvero Cosmografia* (The Universal Structure of the World, or Cosmography, Naples, 1573, and Venice, 1576).

D'Anania's book about demons, entitled *De natura daemonum . . . libri quatuor* (Four Books on the Nature of Demons) was first printed in Venice in 1581 by Aldo Manuzio the younger. There followed repeated editions—Naples, 1582, and Venice, 1589. Long after his death, it was reprinted in Rome in 1654 and in Lyons in 1669, together with another of his works, *De natura Angelorum* (On the Nature of Angels) in an edition entitled *De substantiis separatis* (On Separated Substances), dedicated to Innocent X by the author's nephew Marcello D'Anania, bishop of Nepi and Sutri. The structure of its four books is very clear: The first contained a description of the origins of demons and their different types; the next explored their power over human beings; the third book described the things demons could do to people; and the final book told what demons could do with human help.

De natura daemonum reflects well the mental condition of the period, which ascribed many afflictions to supernatural causes and held that infinite numbers of demons were ever surrounding men, ready to work spiritual or material evils. D'Anania believed in the existence of celestial and terrestrial demons that were always at work to seduce men into sin and lead them to apostasy from God, tempting all through their prevailing weaknesses or passions and taking advantage of every favorable moment. Demons, according to him, could assume any shape, but their shapes had no substance. Their preferred activities were inflicting diseases that could not be cured by traditional medicine but only by saints' relics, and they could also raise tremendous tempests. Although most evils were attributable to demons, D'Anania stated there were four sources of human

misery: *natura* (nature), *ministerium* (ministry, occupation), *noxæ* (punishment), and *maleficium* (harmful magic). The first, *natura*, is attributable to the influence of the stars; *ministerium* occurs when God sends his angels to execute justice; *noxæ* occurs when God exacts punishment by giving power to evil spirits; and *maleficium* is sorcery exercised by wicked men with potions, herbs, ashes, animal blood, the venom of serpents, human nail parings, and the tongues, eyes, hair, and ropes of those who have been hanged; the sacrilegious use of sacred words and sacraments; and the like.

In his dissertation, D'Anania gave a full account of the Sabbat and its obscene rites. According to him, the Sabbat had been practiced in all ages, but it had so increased during his lifetime that, if the laws did not extirpate it with fire, it would spread everywhere. These nocturnal Sabbats he unhesitatingly pronounced as real, as he also did sexual intercourse between human beings and incubi and succubi. He stated that children had sprung from such unions, such as the ancient demigods and heroes or heresiarchs like Luther and Mohammed. D'Anania concluded his tract with a long catalog of demonic crimes done through sorcerers: tempests, floods, fires, sickness, and the like, all of which required human agency. In turn, astrologers and necromancers could only undertake their deplorable activities with the help of demons.

D'Anania's book was filled with examples from daily life; for example, he described showers of stones in the region of Vesuvius, and how fifty girls in an orphan asylum at Rome became demoniacs in a single night. His sources came from various epochs (Hebrew, Greek, Roman, and Christian) and many continents (Asia, Africa, Europe, and the New World).

DANEAU, LAMBERT (CA. 1530–1595)

Lambert Daneau was a French Calvinist minister who published a short work on witchcraft at Geneva in 1574. Originally entitled *Les sorciers, dialogue tres-utile et necessaire pour ce temps* (Witches, a Very Useful Dialogue and One Necessary for the Present Time), it was followed immediately by a Latin translation with a title that explained Daneau's principal preoccupation rather more clearly: *Workers of Poisonous Magic, Once Called "Fortunetellers" but Now Popularly Known as "Witches."* In Daneau's eyes, witches distributed poison among their communities. They infected the air, the water, the grass, and thus rendered not only animals and humans sick, but even crops as well. Sometimes their poisons killed. Daneau thus saw witches mainly as subtle poisoners. Witches harmed people without regard for sex, age, or rank. The cause of their magical effects was concealed, so those effects were especially dangerous because they did not appear to be different from extraordinary effects produced by nature. Thus, Daneau accepted that witches could fly to the Sabbath because, he said, there was no natural reason such a flight could not be effected naturally. Regarding witches' "miracles," Daneau pointed out that Satan could not actually do anything except by natural means and causes. Therefore, if one wanted to know whether a witch's confession was reliable or not, one should ask whether she claimed to have done anything beyond the power of nature to accomplish. Similarly, Daneau did not claim that judges and advocates had any inherent, God-granted power to protect them against a witch's malevolent magic, and suggested that a witch became powerless once she was put in prison.

On the other hand, he asserted the reality of the Devil's mark, which he interpreted as a sign that the witch belonged to Satan as though she (or he) were a piece of his property. He maintained that a witch's presence at a Sabbath was no illusion (as many earlier and contemporary writers on witchcraft argued), but a real experience. Nor did Daneau lay any emphasis on the gender of witches. He did think they should be extirpated, and said that every judge should be given sufficient authority within his local jurisdiction to put such people to death. For witches' victims, Daneau had cold comfort. They could resort to legitimate medicines, he said, but otherwise they had to bend to the will of God, seeking only His help, and depending entirely on His providence.

BIOGRAPHY

Daneau was born into the provincial French nobility, and from 1553 to 1559 studied law at Orléans and

Bourges, where he obtained his doctorate. Falling under Calvin's influence, he went to Geneva in 1560, abandoning law for theology. Not long after, he was appointed a minister and sent into France to bolster the Reformed Church there. He quickly began to write voluminously, producing twenty-seven important works of varying length between 1573 and 1581 alone. His treatise on witchcraft belonged to the beginning of this fertile period. The range of his subject matter was extensive. Apart from witchcraft, he published works about games of chance, methods of interpreting Scripture, commentaries on St. Augustine and Peter Lombard, and various polemical works. In 1576 came his *Physice Christiana* (Christian Natural Philosophy), with its contemporary English translation, *The wonderful woorkemanship of the world*, indicating its principal import; it consists of a series of lengthily developed analogies between the processes of nature, the structure of the human body and its relationship with the soul, and the constitutions of households and commonwealths. In 1581 Daneau left Geneva, where he had been granted citizenship, in order to become a professor of theology at Leiden. Almost at once, he became embroiled in a conflict with the city's magistrates and left, thereafter filling a succession of appointments in Ghent, Orthez, and Castres. From 1583, when he published his most influential treatise, *Isagoge de Deo* (A Preliminary Essay on God), Daneau continued to produce theological works until his death, including a posthumously published book on Christian politics (1596).

DANZIG (GDAŃSK)

Culturally German but part of the Polish kingdom since 1454, the city long known as Danzig, and since 1945 as Gdańsk, was an important center of international trade, Poland's major port, and probably its wealthiest city during the sixteenth and seventeenth centuries. Opulence, however, did not save Danzig from witchcraft trials. Between 1570 and 1660, about two dozen people were tried as witches and at least sixteen of them were executed.

Although the law code (*Ius Culmense*; in German, *Der Alte Culmische Recht*, "Old law for Kulm [Chelmino] City") used in Danzig since 1346 stipulated

burning alive as the penalty for witchcraft, surviving sources mention no such trials in the fourteenth century. After 1454, when the city obtained the right to issue its own statutes (*wilkierze*), no municipal edicts mentioned witchcraft. Meanwhile, ecclesiastical courts heard a few local cases. In 1477, an unnamed townswoman charged with practicing magic cleared herself and filed a countersuit for slander. In 1483, a woman was accused of bewitching cattle, but was found innocent; in 1497, a Danzig clergyman, charged with letting treasure hunters manipulate the Host, was acquitted.

A *wilkierz* introduced around 1500 punished those who caused injury to property by magical means. Although the bishop's representative protested, Danzig juries began to hear witchcraft trials after 1501. After the city became Protestant in 1526, all ecclesiastical protests were disregarded, despite a Polish law of 1543 giving ecclesiastical courts precedence in trying witches. By 1570, all cases of this type were tried by municipal courts. Later, after Danzig held its final witchcraft trial (1659), Poland repeatedly (1672, 1713, 1745) reserved witchcraft cases to Church courts.

The first trials held before the municipal court took place in 1501. Two women were arrested and tortured but refused to confess; the verdict is unknown. No further prosecutions were recorded until 1570, when two women were sentenced to the stake and burned; one had already committed suicide in prison. Thereafter, trials increased gradually. In 1571, Anna Brands was flogged and banished perpetually from the city for numerous offenses, including a charge of practicing witchcraft. Another woman was burned in 1573. This time, before the execution, her body was torn by red-hot pincers at four different public places in the city. In 1575, the first man, Hanss Schrecken, went to the stake together with his tools of magic; in an act of clemency, he was first beheaded. In 1577 accusations were raised against two wayfaring barber-surgeons. The burgrave (king's representative) in Danzig ordered them tortured, but the outcome is unknown. In 1579 doctors from Danzig accused a foreign healer of witchcraft, but he was acquitted. In 1582, a woman from a village under the jurisdiction of Danzig courts was attacked for witchcraft by the head of her local community. The evidence she managed to present to the court was so overwhelming that, although the files of the case lack their final pages, she probably succeeded in obtaining compensation.

In 1586, two more witches were burned. Jacob Jordan avoided burning in 1594 only because his other offenses, such as theft and escape from prison, were considered more serious. Anna Eggert was flogged and banished from the city in 1604 for deceiving people with magic. On one day in 1615 a double stake was erected for two women convicted of having entered

into a pact with the Devil. In 1639, two more women were executed by burning; one of them, who pleaded guilty and expressed remorse, was beheaded prior to burning. The same mercy was shown to Gręta Schriewen in 1640 before she was burned. In 1647, three were burned and one beheaded before being executed at the stake.

Gdańsk's final witchcraft trial took place in 1659. The accused was an eighty-eight-year-old widow, Anna Krüger. In her confession, she said she had learned witchcraft from her husband. She said that she had also bequeathed her soul to a devil named Klaus in return for the promise that she would receive a place in hell free of torment to indulge in pleasure. She was sentenced to be burned alive, but the executioner mercifully wrapped several sacks of gunpowder around her body to reduce her agony. A significant contribution to the ending of witchcraft trials in Danzig came from Mayor Gabriel Krummhausen, who appended to his correspondence with a French opponent of witchcraft prosecution the 1657 instruction from the Roman Curia ordering judges to exercise caution in evaluating witchcraft accusations and to refrain from torture in such cases.

In the general criminal statistics from Danzig between the fifteenth and eighteenth centuries, witchcraft accounted for less than 1 percent of all offenses. Even at its peak, in the second half of the seventeenth century, it represented only 1.3 percent of all crimes. About 90 percent of all cases involved women.

DARRELL, JOHN (1562–?)

An obscure preacher, John Darrell achieved a brief notoriety when his involvement in cases of demonic possession attracted the attention of English ecclesiastical authorities at the end of the sixteenth century. Born in Mansfield around 1562, Darrell matriculated in 1575 at Queen's College, Cambridge, as a sizar, that is, a student who was effectively working his way through college as a servant to the fellows and the better-off

undergraduates. He took his B.A. in 1579, and then apparently studied law for a time before abandoning that calling to become a preacher. (It is doubtful that he was ever ordained.)

In 1586 he began a long career as what was, in effect, an exorcist when, back in Mansfield, he helped treat a seventeen-year-old demonically possessed girl, Katherine Wright. As so often, possession led to accusations of bewitchment, but a skeptical justice of the peace quashed the case against the woman who was named as Wright's tormentor, and Darrell disappeared from history for a decade. Then, in 1596, he was involved in another possession-cum-witchcraft case, involving a teenage boy named Thomas Darling. In this instance, a woman named Alice Gooderidge was convicted for causing young Darling's troubles through her witchcraft. Having by now obviously gained a reputation in such matters, in March 1597 Darrell was called to Leigh in Lancashire, where seven members of the household of a gentleman named Nicholas Starkey, most of them children or adolescents, were thought to be bewitched. This case too led to the conviction and execution of a witch, in this case a man called Edmund Hartley.

The next, and final, case involving Darrell began in November 1597, when he was called to Nottingham to help a supposedly bewitched teenage boy named William Sommers. Once again his arrival was followed by suspicions of witchcraft being leveled against a number of local women, creating a real danger of the outbreak of a witch panic in the town. Darrell's skill as an exorcist attracted considerable favorable attention from Nottingham's population, and he was appointed preacher at one of the town's churches. But the mayor of the town was worried by his activities and the prospect of a local witch craze, and the archbishop of York appointed a commission of inquiry to investigate the affair.

At this time, the Church of England was trying to steer a middle way between Roman Catholicism and extreme Protestantism, and possession and exorcism had become something of a political issue. The Church of England, like most Protestant churches, denied the efficacy of exorcism, but it had been shaken by several well-publicized exorcisms carried out in England by Catholic priests in the 1580s. Now, faced by over-enthusiastic treatment of the possessed by a Protestant preacher, the Church acted quickly. John Whitgift, the anti-Puritan archbishop of Canterbury, took an interest, and handed the case over to the like-minded bishop of London, Richard Bancroft. Darrell and his associate George More were imprisoned; Darrell was exposed as a fraud and imprisoned for a year. The affair, however, prompted a bitter pamphlet war, with Darrell and More defending their actions, while Samuel Harsnett, Bancroft's chaplain, handled the propaganda against Darrell.

Darrell's arrest and discrediting, although frequently ignored by mainstream church historians, serves to remind us that exorcism, possession, and witchcraft were occasionally important issues in the religious politics of the period. The Church of England's attitude to Darrell's involvement in the Sommers affair, and to a number of other similar cases around the same time, demonstrates how a decidedly skeptical attitude to such matters seems to have been common among senior churchmen, who were very concerned about controlling the treatment of those supposedly possessed. Conversely, the evident spread of Darrell's reputation, and the way in which his help was so avidly sought, shows the concern of those who felt that they or their families were possessed or bewitched in this period. They enthusiastically greeted exorcists like Darrell, who they thought could help them, not least by identifying the human agents who had presumably directed the demons into the bodies of the possessed.

DAUPHINÉ, WITCHCRAFT TRIALS IN

This Alpine province of eastern France, traditionally ruled by the dauphin, the heir of the French king (hence its name), witnessed one of Europe's earliest major witch hunts and produced the first brief treatise on witchcraft composed by a layman, Claude Tholosan, who conducted many of these trials.

Numerous archival traces enable us to follow the outlines of Dauphiné's witch hunt as it unfolded, primarily between 1424 and 1445, in the highest mountain valleys along the eastern border of this province adjoining the duchy of Savoy-Piedmont. The core of information comes from a thick fiscal register of over 500 folios, the *Quintus liber Fachurierorum* (Fifth Book of Sorcerers). It includes a lengthy list of property confiscated from Dauphiné's convicted witches up to 1445, which enables us to reconstruct 126 of their names, as well as, usually, their home village and the date of their trial, from the missing previous four volumes. It adds 29 sentences against other suspects, whose confessions add another 51 names. Perhaps more surprisingly, this fiscal register also includes a brief treatise about witchcraft written by Tholosan, a local judge who claimed to have tried more than a hundred criminal cases, some of which can be corroborated from other sources.

Although the *Quintus liber* is largely confined to high Alpine valleys in the diocese of Embrun and part of the

diocese of Turin belonging to Dauphiné, the preceding unpaginated fiscal register adds much miscellaneous information about witchcraft trials in other parts of fifteenth-century Dauphiné; it includes the region's only complete witchcraft trial containing denunciations by witnesses, which led to 6 deaths in 1458–1459 in the diocese of Grenoble. Dauphiné's local treasury records provide the names of 62 additional witches condemned between 1424 and 1446. All together, we have information about more than 350 witches in Dauphiné in the ninety years before 1511, including 52 trials or final sentences. This fund constitutes the richest regional archival stockpile ever found in fifteenth-century Europe.

The meticulous investigation of Pierrette Paravy (1993, 2:771–905) enables us to reach several conclusions on the basis of this evidence. First, Dauphiné's witches were, as later stereotypes insist, basically female and usually old: Women comprised two-thirds of the 287 suspects during the great witch hunts between 1425 and 1460 and nearly 90 percent by the early sixteenth century; only 3 of the 34 whose ages are known were under the age of 40. Second, their sentences were quite severe: In the diocese of Grenoble, 24 of 29 were condemned to death, and 13 of 16 in the diocese of Gap, though only 3 of 7 in the diocese of Vienne. Third, Dauphiné's witches included a minority of well-off people: In this depopulated and impoverished region, one-fourth of a sample of 140 convicted witches left estates of over 100 florins (the average trial lasted a month or two and cost around 20 florins). Fourth, despite Tholosan's xenophobic insistence that this plague had somehow come from abroad, only three of Dauphiné's witches (a German furrier, an Italian charlatan, and a Spanish beggar woman) were clearly foreigners. Apart from such quantitative information, it has also been noted (Russell 1972, 217) that at these Dauphiné trials, the devils resemble the "little people" of pre-Christian Celtic legends, and their various names (*Corp-diable*, *Griffart*, *Guli*) suggest mischief rather than terror.

Dauphiné's Alpine valleys also sheltered groups of Waldensian heretics, making them a target for inquisitors since the final third of the fourteenth century. The links between medieval heresy and early witchcraft seem unusually strong here, although for tactical reasons Tholosan did not emphasize it explicitly in his treatise, which was partly intended to establish the right of lay judges to try witches. It seems equally significant that Dauphiné's centers of witchcraft in the 1420s bordered the lands of Amadeus VIII of Savoy, a state that emerged as the epicenter of early European witchcraft during the Council of Basel (1431–1449), the time when Tholosan composed his treatise. It is also interesting that Dauphiné, like Savoy, experienced large numbers of witchcraft trials before the Protestant

Reformation, but extremely few in the later sixteenth and seventeenth centuries, during the peak period of persecutions in most parts of western Europe.

Perhaps most sinister is the observation, drawn from fiscal records, that Dauphiné's witches were often prosecuted enthusiastically by their neighbors, even in the 1420s. Two women arrested in one remote valley were taken to prison on mules, escorted by four men on horseback and five on foot; when they were returned to be executed, only five men were paid to escort them, because the villagers themselves furnished ten additional volunteers. In 1530 one official hired a posse of fifty-eight armed men to capture a witch in a remote spot near the Italian border (Paravy 1993, 2:805). In order to spare family honor, kinfolk occasionally asked for—and got—the special grace of secret executions for their relatives, but they never protested these judgments.

DECEPTION AND MAGIC

Most magic works through deception. Shamans use tricks to make their clients believe they will get better. Sorcerers frighten their enemies into thinking they are sick. Stage magicians entertain their audiences and charlatans scam their marks by tricking them into seeing things that do not happen, or not seeing things that do. Fortunetellers pretend to learn things through magic that they have discovered through other means, and oracles like Nostradamus speak in riddles that seem prophetic whatever happens. Amulets and talismans delude people into believing that they are protected from harm or that they will be lucky. Believers distort their own perceptions to see things that are not there, and their memories to forget things that were.

Medieval theologians recognized the relationship between magic and deception by styling the Devil both as the magician's master and as the ultimate deceiver. God could work true miracles, *miracula*, transforming reality outside natural processes, but the Devil could only accomplish *mira*, the appearance of such transformations, using natural processes and the power of illusion. By extension, saints and priests could perform miracles because God was working through them, but magicians could not because they derived their power from the Devil. St. Augustine, for example, denied that lycanthropes could actually transform themselves into wolves, while the tenth-century *Canon Episcopi*

pronounced that women who said they flew at night with the goddess Diana were victims of illusions. The pact, implicit if not explicit, into which magical practitioners entered with the Devil to gain their powers was itself a deception, because the Devil generally either did not deliver on his part of the bargain or arranged for the magician to come to a bad end. Even beneficent magic was a diabolical deception; the Devil only made it effective to lure people from the path of faith. Churchmen emphasized the deceptiveness of magic as a way of undermining heterodox beliefs.

On a more mundane level, popular practitioners ranged from cynical to credulous. Most probably fell in between, aware that some magicians were charlatans and that many magical practices involved deception, but convinced nonetheless that real magic was possible. The anthropologist Claude Lévi-Strauss discussed an example of this mentality, a Native American shaman named Quesalid who started out convinced that shamanism was fraudulent and ascribed his first success to his patient's belief in him, but became less sure of his skepticism as he gained experience and knowledge of competing practices. He found that his method worked when others had failed, and while he exposed many of his rivals as impostors, he took pride in his own successes, and regarded one other practitioner as a genuine shaman.

The basis for such ambivalence is that, as the first sentence of this essay states, most magic works through deception, meaning not simply that deception makes magic appear to work, but that deception can actually *make* magic work. Healers deceive their patients into imagining that they are getting better, and that imagining can actually help them to get better. Witches make their victims imagine they are getting sick, which cannot only make them feel sick, but can also make them more susceptible to somatic ailments. Diviners trick their clients into revealing things they know unconsciously but are not aware of, just as prophets "hear" voices telling them what they cannot apprehend through their ordinary cognitive processes. Oracles pronounce self-fulfilling prophecies; amulets give frightened people the confidence to act bravely. Deception has the power not only to make people misperceive reality, but also to change reality, for when people create an image of the world and then act on it, they warp reality toward the image. This process is not automatic nor is its power unlimited, but it can exert significant influence on human affairs.

The limits of the power and reliability of magical processes in the face of the extravagant claims made for them and their inherent reliance on deception, combined with the frequency with which these were used as a cover for cynical frauds, provoked much skeptical criticism by natural philosophers during the Enlightenment of the eighteenth century. Furthermore,

as natural explanations were advanced to explain magical processes, the boundaries between the magical and the mundane shifted steadily until magic became a residual category containing only impossible phenomena, fairy tales, and delusions. Finally, skepticism about magic was one area of common ground materialists shared with the religious establishment, with which they were otherwise generally at odds. Consequently, early modern governments punished magical practitioners for both fraud and impiety, and educated opinion shifted from regarding magic as a source of occult power to considering it as simply a delusion.

DECLINE OF THE WITCH HUNTS

During the seventeenth and eighteenth centuries, prosecutions and executions for the crime of witchcraft declined in number and eventually came to an end. The decline was marked by an increasing reluctance to prosecute witches, the acquittal of many who were tried, the reversal of convictions on appeal, and eventually the repeal of the laws that had authorized the prosecutions. By 1782, the last officially sanctioned witchcraft execution had taken place, and in many jurisdictions, witchcraft, at least as it had been defined in the sixteenth and seventeenth centuries, had ceased to be a crime. Individuals continued to name their neighbors as witches, and in some cases even took violent action against them, but they did so illegally and at the risk of being prosecuted themselves (as some were).

The reduction and eventual end of witch hunting occurred at different times in the various kingdoms and regions of Europe. In some countries, such as the Dutch Republic, the decline in prosecutions became evident by the end of the sixteenth century, while in others, like Poland, it did not begin until the middle of the eighteenth century. The length of time that the entire process took also varied greatly from place to place. In Scotland, for example, the initial reduction in the number of prosecutions was followed by more than fifty

years of trials, whereas in Franche-Comté and colonial Massachusetts, witch hunts came to an abrupt end only a few years after the courts started to discourage prosecutions. Even the legislation declaring that witchcraft was no longer a crime was passed at different stages of the process. In some kingdoms, such as Hungary and Prussia, the formal decriminalization of witchcraft preceded and was largely responsible for the end of witch hunting, whereas in Great Britain and Denmark it did not occur until long after the trials had stopped.

In most jurisdictions, the decline of witch hunting did not begin until those persons who controlled the judicial machinery became persuaded that many witches were being convicted and executed for crimes they had not committed. This realization usually arose in response to excesses in witch hunting in certain localities, such as Spain in 1611, Würzburg in 1627, England in 1647, Scotland in 1662, or Sweden in 1676. These excesses led judges and other persons involved in the hunts to criticize the ways in which the trials were being conducted. These critiques led in turn to the formulation and implementation of stricter procedural rules for the conduct of witchcraft trials, including greater restraint in the administration of torture and the application of more demanding standards of evidence. As a result of these judicial changes, trials of witches resulted in a larger number of acquittals, panics in which scores of witches perished no longer recurred, and courts became increasingly reluctant to initiate prosecutions.

The most clear-cut and decisive change in the judicial process was the tighter regulation of local justice by either central or superior judicial authorities. Local officials who operated with considerable—sometimes complete—independence from central state control conducted the most severe witch hunts in early modern Europe. The areas in which witch hunting was most intense over a long period of time were those jurisdictions in which central state power was relatively weak. This is one of the main reasons why most major witch panics took place in relatively small principalities and prince-bishoprics within the Holy Roman Empire. In those states with relatively strong central judicial establishments, the most serious witch hunts occurred in communities that found ways to ignore or circumvent state supervision of witchcraft trials.

The differences in judicial outlook between central and local authorities often resulted in deliberate efforts by judges from the central legal establishment to enforce stricter rules of criminal procedure, to demand that all prosecutions be warranted by central authority, to insist that all death sentences in witchcraft cases be reviewed on appeal, and to punish local officials who violated established procedural norms. These efforts were often sustained over a long period of time, and they did not always meet with success. Occasionally the

central authorities tolerated violations of their own high procedural standards. Ultimately, however, the state authorities that made such efforts succeeded in bringing about a permanent reduction in the number of prosecutions and executions.

The second reason for the decline of prosecutions was a rising tide of criticism of the use of torture, leading to a reduction in its frequency and ultimately to its abolition. In the sixteenth century, a few writers, including Anton Prätorius and Johann Weyer, objected to the administration of torture, but in the seventeenth century the critiques became more numerous and more passionate. Three of the most influential were written by Jesuits in German-speaking lands, Friedrich Spee, Adam Tanner, and Paul Laymann, all of whom claimed first-hand experience with the trials. From the Protestant side came works by Johann Meyfart, a Lutheran professor from Erfurt whose work betrayed a heavy reliance on Spee, and Johann Greve, a Dutch Arminian theologian who condemned the use of torture by Christians for any purpose whatsoever.

This body of work criticizing the use of torture continued to grow in the late seventeenth century, and three later works achieved fairly widespread circulation. In 1682 a Burgundian judge, Augustin Nicolas, wrote a closely reasoned assault on the practice. The second work, a dissertation by Meint Johan Sassen of the University of Halle, was published in 1697 and went into several printings, and the third, which also came from the law faculty at Halle, was a dissertation by Christian Thomasius. It drew heavily on the earlier works of Spee, Tanner, and Meyfart, but Thomasius also gave his treatise a distinctly Protestant flavor. A Pietist known for his anticlericalism, Thomasius argued in the manner of Greve that torture was an un-Christian means of extorting the truth, that it was never mentioned in Scripture, and that the papacy had used it to strike down its enemies under the pretext of heresy and witchcraft.

The third judicial change that led to a decline in the number of trials was the adherence to new and more demanding standards of evidence. During the seventeenth century, judges and legal writers throughout Europe showed themselves to be increasingly reluctant to accept the sort of evidence that was presented to them to justify the conviction and execution of witches. This caution led to the realization that the crime of witchcraft was extremely difficult, if not impossible, to prove. This conclusion was of incalculable importance in bringing witchcraft trials to an end. It led directly to the increasing number of acquittals that occurred in virtually all jurisdictions, and it also contributed to the ultimate realization that witchcraft as a crime could no longer be effectively prosecuted.

The skeptical attitude toward evidence in witchcraft cases, just like skepticism regarding the possibility of

the crime, was not completely absent in earlier periods of witch hunting. There had always been judges who demanded that proof of witchcraft be absolutely conclusive before proceeding to sentence. But whereas those early recommendations of caution were eventually ignored or contradicted, on the grounds that society needed to be protected, by the late seventeenth century they found more widespread and lasting acceptance. In this way an erratic pattern of witchcraft prosecution, in which courts oscillated between periods of intense prosecution and relative leniency, gave way to an enduring pattern of judicial caution and restraint.

Skepticism regarding the sufficiency of evidence in witchcraft cases took a number of different forms. It can be seen, first and foremost, in a growing reluctance among judges and legal writers to accept confessions, traditionally regarded as the queen of proofs, as sufficient proof of guilt. This skepticism was not restricted to those confessions that were made under torture; judges and lawyers seemed just as unwilling to accept at face value those confessions that witches had allegedly made freely. This skepticism arose mainly when the confessions had a high diabolical content, that is, when the witches had confessed to either a pact with the Devil or attendance at the Sabbat. By the late seventeenth century, judges were willing to accept confessions to witchcraft (or any other crime) only if such confessions were in no way extorted, if they contained nothing that was impossible or improbable, and if the person confessing was neither melancholic nor suicidal. The Danish jurist Laurits Nørregård, in urging the greatest possible caution in witchcraft cases, warned that the last thing an authority should do was to believe the accused person's own confession.

A second and even more frequent expression of judicial caution in the interpretation of evidence was based on the possibility that events attributed to supernatural agency might have had natural causes. This was particularly relevant to charges of *maleficium* (harmful magic), in which it was claimed that witches had inflicted harm by supernatural, that is, diabolical means. The skeptical response to such allegations, frequently adopted when lawyers defended witches against such charges, was that the act had natural causes, and that in order to convict a person of the crime, the possibility of natural causation had to be ruled out. Thus, in Spain, in the wake of the witch hunt of 1609–1611, inquisitors were instructed to inquire whether the maleficent deeds that witches confessed to, such as having killed children or destroyed crops, might have had natural causes. Inquiries of this sort became more and more common in later seventeenth-century trials. In Italy, inquisitors from the Congregation of the Holy Office insisted that in cases of infanticide by witchcraft, the physicians who had treated the children should examine the children to discover whether they could determine if the illness was

or *could have been* natural. The burden of proof was on the prosecution; all that was necessary to secure acquittal was evidence that natural causation was *possible*. In a number of trials in Scotland in the late 1620s, advocates for the witches went to great lengths to prove that *maleficium* might not have been the product of supernatural intervention. In securing the acquittal of a witch accused of murder by sorcery in 1662, Paul von Fuchs was content to show that the alleged supernatural cause of the disease that killed his victim could not be proved.

The question of whether afflictions had diabolical or natural causes arose in a particularly telling fashion in those cases of witchcraft that involved demonic possession. During the seventeenth century, witchcraft cases of this sort became increasingly frequent, especially in England and France. Demoniacs, very often women and children, identified witches as the cause of their possession, claiming that the witches had commanded demons to occupy their bodies and to afflict them with fits, contortions, and other forms of abnormal behavior. The question naturally arose how such symptoms should be interpreted. Those who did not readily accept a demonological explanation of the possession or claimed that it was fraudulent argued that the demoniacs suffered from a disease brought about by natural causes, such as hysteria. Once this possibility was introduced, courts found it difficult to convict witches for causing the possession. In 1697 the Scotsman James Johnstone observed that in France the courts had stopped trying witches in such cases because they could not distinguish possession from a natural disease.

Formal declarations by various countries in Europe that witchcraft was no longer a crime occurred after the prosecutions for witchcraft had slowed to a trickle or already come to an end. Before the beginning of the nineteenth century, witchcraft laws were repealed or significantly modified in only seven kingdoms: France in 1682, Prussia in 1714, Great Britain in 1736, the Habsburg monarchy in 1766, Russia in 1770, Poland in 1776, and Sweden in 1779. Only the last two kingdoms legislated a complete ban on witchcraft trials. The Polish statute, passed by the diet a year after a witch hunt in the village of Doruchowo had claimed the lives of fourteen women, forbade the prosecution of witches by all tribunals, including the court of the small town of Grabowo, which had conducted the trials at Doruchowo. The Swedish National Code of 1779 simply omitted the clause regarding witchcraft in the old Code of 1734, thus rendering prosecutions impossible.

The British statute of 1736 also bears most of the signs of a blanket prohibition of witchcraft prosecutions, since it repealed the English statute of 1604 and its Scottish counterpart of 1563. But by making it an offense to “pretend to exercise or use any kind of witchcraft, sorcery, enchantment or conjuration or undertake

to tell fortunes” on the pain of imprisonment for one year, Parliament failed to decriminalize all those activities that once marched under the broad banner of witchcraft (Levack 1999, 75). Prosecutions for conjuration under the statute of 1736 were rare, but they did occur, and the judges who charged grand juries continued to remind them that it was a crime to pretend to be a witch. This provision of the new witchcraft law was not repealed until 1951.

The French royal edict of 1682 achieved even less than the British law of 1736. It is true that the edict, just like the later British statute, referred to magic as “pretended,” possibly to offer protection against imposters. But as far as witchcraft prosecutions were concerned, it was far more qualified than the British statute. Designed in part to prevent a recurrence of the Affair of the Poisons, it left intact the death penalty for forms of magic that were overtly sacrilegious, and it permitted some prosecutions for *maleficium* that continued in France during the following decade. The same was true of the Habsburg law of 1766. While eliminating prosecutions in cases arising from fraud and mental illness, it nonetheless ordered the banishment of those who made pacts with the Devil and even allowed the possibility of the death penalty in cases of *maleficium* performed with the assistance of the Devil.

The least comprehensive of these laws was the Prussian edict of 1714, issued by King Frederick William I less than two years after his accession to the throne. This mandate was designed entirely to reform the criminal procedures used in witchcraft trials, so that innocent persons would no longer be tortured, forced to confess, and executed. Its concern with legal procedure reflects the influence of Christian Thomasius, the chancellor of the University of Halle, and indirectly that of Spee, upon whom Thomasius relied heavily in his work. The edict, which was to be proclaimed in local courts, demanded that all judicial decisions either to torture or execute witches be submitted to the king for confirmation before being implemented. This provision, which echoes French policy and anticipates that of the Habsburg monarchy, provides further evidence of the role played by central authorities in restricting witchcraft prosecutions. The law did not, however, ban witchcraft trials or even executions, although it did require the removal of all the stakes from the public places where witches had been burned. In 1721 Prussia abolished the death penalty in all witchcraft trials.

The formal decriminalization of witchcraft had little bearing on the decline in prosecutions, which was already well underway. The blanket repeals that took place in Great Britain and Sweden had no effect whatsoever on witchcraft prosecutions in those countries, because the last trial had long preceded the legislation effecting the change. The same could be said of the large number of states that repealed their laws only in

the nineteenth century. Even in those countries that passed witchcraft statutes before the end of the trials, the new laws had only a limited effect on the volume of prosecutions. The first of these laws, the French edict of 1682, probably prevented prosecutions in only a few outlying regions of the kingdom where trials were still taking place. The same could be said of Frederick William I’s edict of 1714, because prosecutions in Prussia had slackened considerably since the 1690s. The Polish law of 1776 affected only those isolated villages like Doruchowo where there was still pressure to prosecute. Only Maria Theresa’s law of 1766 seems to have led to a demonstrable curtailment in the number of trials and executions. Even then, however, witch hunting was taking place in only certain parts of the Habsburg monarchy, mainly in Hungary. In Austria, trials had long since ended, with the last execution occurring in 1750.

The more common pattern of decriminalization was the de facto cessation of trials, without any accompanying edict. This was achieved at different times in different places, but in most cases the very last trials occurred long after the decline in prosecutions had begun. In Germany, for example, the decline in prosecutions had begun in the 1630s, but many German territories held prosecutions well into the eighteenth century. Würzburg had its last trial in 1749, Bavaria in 1792, and Württemberg in 1805. In Spain, where the decline in prosecutions began in the early years of the seventeenth century, occasional trials took place until 1820.

DEE, JOHN (1527–1608/1609)

England's most famous magician, Dee was a scholar with an international reputation, and is now best known for his detailed record of the conversations he had with angelic or spirit beings via a number of mediums between December 1581 and 1588. These sessions produced a number of books that transmitted an angelic alphabet (later called Enochian), the language supposedly spoken by angels. They also provided instructions for making various pieces of magical apparatus, including the elaborate table that supported Dee's crystal ball, the medium wherein his mediums both saw and heard the spirits. The procedure for scrying was that Dee and his medium would retire to a private room where the crystal was set up. After praying for divine protection, Dee would sit in a corner with pen and paper, ready to record the medium's answers to his questions. Kneeling before the crystal, the medium proceeded to report whatever he saw and heard therein, with Dee asking supplementary questions as necessary. These sessions could be very long, and might be renewed day after day for a protracted period. Those spirits who appeared in the crystal included the archangels Uriel, Michael, and Raphael ("Medicine of God"), and an extraordinary spirit in the guise of a playful little girl called Madimi, whose moods were subject to terrifying change.

The contents of Dee's spirit record reveal a deep commitment to his own personal religious development, unflagging intellectual curiosity about the hidden secrets of creation, and an obsessive desire to understand them in order to use them for the betterment of humanity. Because he was generally unable to hear or see the spirits, Dee was obliged to depend on a series of mediums, of whom the most gifted and unscrupulous was Edward Kelley, also known as

"Talbot." It was from Kelley's intense but debilitating efforts at mediumship that Dee derived the contents of most of his angelic conversations.

After Dee's death, these came to light in a number of manuscripts. Some, which had been buried in a field, were published by Meric Casaubon in 1659 under the title, *A True and Faithful Relation of What Passed for Many Years between Dr. John Dee (A Mathematician of Great Fame in Q. Eliz. and King James their Reigns) and Some Spirits*. Then more papers came to light in a private house. A maid used these to line pie dishes and start fires until, in 1672, the papers came to the notice of Elias Ashmole, who transcribed but did not publish what remained.

In 1547, Dee became a founding Fellow of Trinity College, Cambridge, where he studied mathematics, a subject often associated with magic. On one occasion, he astonished the audience of a Greek play with a remarkable automaton that seemed to leap from the stage and fly in the air. Later he traveled considerably in Europe, where Gerard Mercator taught him much about cartography and navigation. Bringing this innovative knowledge back to England, he materially assisted the search for the Northwest Passage. From a decade of extensive traveling, he assembled one of the finest personal libraries in Europe, only to have some of his pupils and their associates loot it during his later absence. He and Kelley shared an interest in alchemy. Emperor Rudolf II, whose court attracted a great number of practitioners of every occult science, invited them to Prague in 1584. There Dee and Kelley continued their work with the crystal, which now showed a series of alchemical visions. The spirits also transmitted a number of doom-laden messages that left Dee both frightened and despondent. A personal meeting with the emperor went badly. Dee was suspected of being a spy, and so had to resume his travels. For a while, Kelley conducted alchemical operations alone, until he too fell from favor, was imprisoned, and finally disappeared. After the death of Queen Elizabeth I, Dee failed to attract her successor's patronage, and died in relative poverty and obscurity.

DEFIXIONES

Defixiones is the Latin name for ancient “binding curses” or the “curse tablets” that contained them, the parallel Greek term being *katadesmoi*. These curses were typically scratched on small, thin sheets of lead (*lamellae*) that were then folded or rolled up tightly, pierced with nails in a “sympathetic” gesture of binding or confusion, and entrusted to the dead for enactment. The earliest known examples, ca. 500 B.C.E. come from Selinus in Sicily, but they eventually flourished throughout the Greco-Roman world until the end of antiquity and indeed beyond.

Up to 2,000 examples have now been discovered, mostly written in Greek. The earlier ones, and the majority of them, consist of little more than lists of names, with or without adding such phrases as “I bind” or “I register.” By late antiquity, some tablets contained elaborate, extensive, and repetitive texts. These invoked, ghosts aside, a syncretistic range of gods and demons with names of Greek, Egyptian, Jewish, Near Eastern, or indeterminate origin. Some also appealed to *voces magicae* (words of power), not always easily distinguishable from demon names. The inherent magical power of writing and letters was freely exploited: Written lines or individual words or names could be reversed or confused in various ways, for sympathetic effect upon the victim; tablets were decorated with squares or triangles composed of vowels, with palindromes, or with “what are called” the “Characters,” letter-like symbols. Tablets could be illustrated with appropriate images, such as bound corpses.

Once manufactured, the tablets were activated through deposition, usually in a grave, and sometimes they were actually placed in the corpse’s right hand. Otherwise they could be deposited in sanctuaries of underworld gods, Demeter in particular, or in springs that could carry the tablet down to the underworld. Sometimes ghosts were asked to carry out the act of restraint themselves, appropriately, since any contact with them could be “deadening”; sometimes they were asked to act as messengers and to convey the curse request to the underworld powers; at other times the dead were used in a sympathetic fashion, exemplifying the condition that the curser wished to inflict upon the victim. The removal of a tablet from its place of deposition deactivated the spell. Victims could resist spells by wearing protective amulets or even place a binding spell of their own on the troubling curse.

Most of the extant curses that we can decipher may be classified into five broad types. Four of them are “agonistic,” deriving from situations of social competition.

The agonistic curses include litigation curses, which typically sought to bind the tongues of legal opponents in trials; sports and choral curses, designed to restrain rival competitors, notably, in the Roman era, chario-

teers; trade curses, the Athenian curses restraining rival shopkeepers and prostitutes being notable here; and erotic curses, which either restrained the powers of attraction of rivals in love (“separation curses”), or constrained the object of the curse-maker’s desire to surrender to his or (less frequently) her desire (“attraction curses”). The language used in these curses could be sexually crude. A fifth and more distinctive variety consists of “prayers for justice,” which often, but not always, used the explicit language of binding. These tablets, usually addressed to deities, sought revenge or restitution for some wrong, usually stolen property. A large cache of such tablets has been retrieved from the sacred spring of Sulis Minerva at Bath.

Figurative equivalents of the tablets are found in *kolossoi*, the ancient name for voodoo dolls, already being made in the Archaic period. Some thirty-eight groups of these have been discovered over a geographical spread roughly similar to that of the curse tablets. The dolls express the act of binding or confusion in their configuration: They may be bound hand and foot; they may be shut in tiny coffins; their limbs may be twisted; they may be mutilated, for example by decapitation, or transfixed by nails.

DEFOE, DANIEL (1660–1731)

Defoe’s three book-length studies of the supernatural—*The Political History of the Devil*, *A System of Magick*, and *An Essay on the History and Reality of Apparitions*,

all printed in 1726 and 1727—all contained some discussion of witchcraft. His works reveal a mixture of skepticism and belief of the kind typical among people living in England during the Enlightenment who continued to believe in biblical teachings. During the same years he published these books on the occult, Defoe was also writing books on social and economic problems in England; but he was disturbed by the attacks upon traditional Christian doctrine by such deists as John Toland and Anthony Collins. The main concern of Defoe's works, then, was a defense of the spiritual and of the existence of a spirit world. The title of Defoe's book on apparitions was changed to *The Secrets of the Invisible World Disclos'd* when it was reissued in 1728. Defoe was primarily interested in witches and witchcraft as part of a larger system involving good and bad spirits, which he defended in opposition to the completely materialistic notions of some deists.

When writing in his Enlightenment mode, Defoe maintained that elderly women were often attacked as witches by those trying to rid the community of them or by those seeking personal advantage. He found such behavior despicable, remarking that merely being a widow over fifty-five was to invite charges of being a witch. He also exposed the hoaxes of those pretending to be practicing magic and ridiculed the gullibility of their customers. Defoe argued that the Devil, with whom witches supposedly dealt, was actually an invisible evil spirit, a powerful force operating in the world. He mocked the iconography surrounding witchcraft, from broomsticks to spells, as mere nonsense, and derided the notion that witches have any real power to foresee the future. Instead, according to Defoe, they were men and women obeying corrupt and evil impulses within themselves to call upon the Devil. Always willing to encourage wickedness, the Devil deluded them into believing they possessed powers that they did not have. Thus Defoe believed that there was a core of truth in the confessions of the Salem witches. At the same time, he saw that the method of obtaining evidence against the supposed witches was faulty and doubted the motivations of those making such accusations. Examining the various methods of detecting a witch in *The Political History of the Devil*, such as throwing the person in a pond to see if she would sink or swim or seeing if she was able to enter or depart from a house with a horseshoe over the door, Defoe called such processes "mock Pageantry" and "too simple to be believ'd" (Defoe 2003, 240).

Nevertheless, he found irrefutable evidence of witchcraft's existence in the ancient world in biblical passages warning against witchcraft, such as Leviticus 19:31 and 2 Chronicles 33:6; in the story of the witch of Endor (1 Sam. 28:7–25), he believed there was sufficient proof of how witchcraft was practiced, even if he thought that the spirit was not really conjured up for Saul by the

witch's powers and was unlikely to have been Samuel himself. As he remarked in his *System of Magick*, the sin of witches lay in "the Sin against Reason, against common Sense, the Ingratitude to their Maker, the open Insult of Heaven, the Venture of provoking that *Being* whose Power it insults" (240). He defined a witch in his journal, the *Review of the Affairs of France*, No. 90 (20 October 1711), as "One in Covenant with the Devil, and uses his help to deceive or hurt others." Yet even in this serious reply to a question about contemporary books on witchcraft, he could not avoid treating the subject with some mockery, applying the term "witch" to his political enemies.

Defoe's three books on the supernatural were very popular, each going into a number of editions during the eighteenth century. Two major nineteenth-century English novelists, Charles Dickens and George Eliot, each drew upon *The Political History of the Devil* in a variety of ways.

DEL RIO, MARTÍN (1551–1608)

Del Rio was a Jesuit scholar who wrote one of the most influential treatises on magic and witchcraft, the *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic). It was divided into six books, which were first published in three parts between 1599 and 1600 and frequently reprinted thereafter. Book 1 discussed what was meant by "superstition," the various branches of magic (including divination), and alchemy, which Del Rio treated with caution but did not dismiss out of hand. Book 2 investigated the type of magic involving evil spirits, and answered such questions as how far magicians were bound by the laws of nature; whether sexual intercourse with spirits was possible, and if so, whether it could produce offspring or not; and whether evil spirits could actually cause the dead to appear to the

living. Book 3 had two parts. The first dealt with harmful magic—this was where Del Rio started to discuss witches in particular, along with people under the control of evil spirits—and the second described an enormous variety of superstitious practices. Book 4 reviewed prophecy and divination, along with the various ways of discovering a person's guilt or innocence in relation to a particular accusation. Here Del Rio criticized the practice of swimming suspected witches (the swimming test, or water ordeal) to determine whether they sink (innocent) or float (guilty).

Book 5 provided detailed advice for judges presiding over trials for maleficent magic. Del Rio reviewed the types of proof required to reach a verdict, and the strict rules governing the application of torture. Here he stressed the link between heresy and magic and noted that the crimes imputed to witches must not be regarded as fantasies. Book 6 gave similarly detailed advice to confessors, and described the ways in which suspect witches tried to elude confessing their practices, and the different remedies that may be used to counter maleficent magic. The book thus provided a complete review of the subject matter, and on its publication Del Rio quickly became an acknowledged expert on witches and their treatment, called on, for example, to give his opinion during learned controversies in Bavaria in 1601–1602 about the appropriate legal treatment of witches. After the book's publication, Del Rio took great pains to revise it and bring it up to date. Consequently, it had increased considerably in length by the time he died.

BIOGRAPHY

Del Rio was born in Antwerp in what was then the Spanish Netherlands on May 17, 1551, to a Castilian father and an Aragonese mother. His family was rich, privileged, and influential. Martín received an excellent education at Paris, Louvain, and Salamanca under some of the best teachers of the day, during the course of which he mastered several languages, including Greek, Latin, and Hebrew. His contemporary, the Belgian scholar Justus Lipsius, hailed him as one of the ornaments of their time. His first published books, commentaries on such classical authors as Seneca, Solinus, and Claudian, demonstrated his immense erudition. In 1574, he obtained his doctorate from the University of Salamanca; he tells us that he came into contact with popular magic during these years in Spain, and his *Investigations* contained several examples from this personal experience. His personal curiosity may have been stimulated even earlier by the Jesuit Juan Maldonado's influential lectures, which Del Rio heard while he was a student in Paris, and reinforced in Salamanca. He then returned to the Spanish Netherlands, but after a few years spent as councilor, then as governor-general and vice-chancellor of Brabant under Don Juan of

Austria, he decided to enter the Society of Jesus.

Returning to Spain, he became a novice in the Jesuit house in Valladolid on May 9, 1580. Thereafter, for the rest of his life, the society sent him to teach in various universities: Douai, Liège, Louvain (where he took his final vows in 1600), Graz, and Mainz. During this time, he published extensively, mainly works of theology or commentaries, although he also produced two histories, one of them a review of recent events in the Spanish Netherlands. He died in Louvain on October 18, 1608, after a long and exhausting journey back from Spain.

REASONS FOR WRITING THE INVESTIGATIONS

His huge work on magic and witchcraft and other occult sciences was not typical of his oeuvre, so it is not easy to say why he investigated the subject and expended so much effort and learning upon it. One reason probably had to do with the fact that western Europe was riven by theological disputes that both fueled and stimulated territorial wars. Both Catholic and Protestant witchcraft treatises played a notable role in the attendant intellectual bellicosity, and, throughout his *Investigations*, Del Rio emphasized that magic was closely allied to heresy. So through this work, Del Rio was making a major polemical contribution to the religious controversies of the late sixteenth century. During the 1590s, we find him discussing the Kabbalah with Jean van Helmont, and his interest in magic probably received a major fillip from the notorious case of Jean del Vault, a Benedictine monk from the Abbey of Stavelot, who in 1597 confessed to a relationship with the Devil and a career in maleficent magic stretching back almost the whole of his lifetime. Del Rio had access to the voluminous material produced by this trial and was able to discuss both this and other cases with one of the judges, Pierre Dheure, to whom he referred more than once in the *Investigations*.

DEL RIO'S VIEWS OF WITCHES AND POSSESSED PERSONS

Del Rio has often been regarded as a credulous bigot, but his attitude to all the occult sciences was actually quite sophisticated, although his opinions on witches were somewhat more traditional. All magic, he said, depended on a pact made between a human being and an evil spirit. The notion, propagated by many Catholic and Protestant writers, that the witches' flight to the Sabbath was an illusion was false; they really did anoint themselves beforehand and fly there. On the other hand, they did not really change their shapes. Any such transformations were the results of Satan's deceptive tricks, and in consequence, phenomena such as lycanthropy had to be regarded as pure illusions. Once the witches arrived at their Sabbath, they found Satan

presiding in animal form. They worshiped him in perverse and blasphemous fashion, often parodying the Mass, after which they banqueted (sometimes wearing masks), then danced before copulating with evil spirits. Each witch gave an account to Satan of the evil he or she had done since the last convention. If the Devil was not satisfied, he beat them fearsomely. Then he distributed powders and poisonous substances to enable them to carry out further harm in their communities. These substances, however, were not the only means whereby a witch might perform maleficent magic. Some also used herbs and ointments; and a witch's poisonous breath or even her words alone might be sufficient for her malevolent purposes.

Del Rio asserted that witches could be arrested even in church because their crime was so serious. But Satan could help them in prison, so precautions had to be taken and the accused brought to a speedy trial, although authorities had to be careful to avoid wrongful arrest and imprisonment. Those found innocent of the charges had to be acquitted. A plea of delusion, however, was no real defense; judges must bear in mind that witches were not often deceived about the reality of their experiences. Confessors were forbidden to reveal any admission of witchcraft they had heard during confession, unless they had the penitent's permission to do so or had also come by the information via another route. Physical signs of witchcraft, such as jars, ligatures, keys, feathers, and so forth, ought to be destroyed in order to undo the maleficence of the magic. Because people possessed by evil spirits exhibited physical signs, confessors were to learn from physicians how to recognize them. Exorcism would be successful in expelling evil spirits from the possessed, but it might take time to work. Confessors were to advise their penitents to steer clear of all forms of magic, because these were potentially very dangerous.

DELLA PORTA, GIAMBATTISTA (CA. 1535–1615)

A Neapolitan and skeptical physician, Della Porta, in 1558, dedicated his book on natural magic, *Magiae naturalis, sive de miraculis rerum naturalium libri IIII* (On Natural Magic, or Four Books on the Miracles of Natural Things), in which he reported a famous experiment performed with a woman considered to be a witch, to the Spanish King Philip II. It was the start of a brilliant career: Della Porta became one of Europe's most influential and frequently cited natural magicians. He was a nonconformist who clearly found traditional Aristotelian theory unsatisfactory and substituted a dualism for its four elements. Della Porta's notion, central to the whole natural magical tradition, was that all natural effects proceeded from either attraction ("sympathy") or repulsion ("antipathy") (Clark 1997, 47).

In his *Magiae naturalis*, Della Porta tried to restore the significance of magic. It had no demonic origin, but instead offered an opportunity to explain the hidden causes of natural effects, knowledge underlying all scientific research. Natural magic thus became *naturalis philosophiae consummatio* (the consummation of natural philosophy), the highest level of human knowledge of natural effects. A magician connected such knowledge with the ability to reproduce observed phenomena.

Chapter 26 of Book 2 of Della Porta's first edition reported his notorious experiment testing the belief that witches induced flight by smearing themselves with an unguent. He hired a well-known witch who promised him information about her Sabbats. She turned everyone out of the room, but he watched through the crack of the door. He saw her strip herself naked and anoint herself thoroughly, first rubbing her skin until it was red, to open the pores, and then vigorously rubbing in the ointment. The somniferous drugs threw her into a deep sleep, from which she could not be aroused even by whipping. After regaining consciousness, she recited a long tale about crossing mountains and seas. According to Della Porta, her insistence on having traveled to a Sabbat proved that only dream experiences had actually occurred—dreams produced entirely by the natural ingredients in her ointment, abetted by the fact that such women ate only vegetable food such as beets, chestnuts, or greens. Della Porta provided the formulas for her ointment: Its active ingredients, mixed with infants' fat, included aconite, *eleoselnium*, *frondes populneae*, soot, *pentaphyllon*, bat's blood, and belladonna.

Reactions to this passage, spread all over Europe by sixteen editions in Latin, twenty in French, and two in Dutch, were severe. The skeptical German physician Johann Weyer cited it in its entirety in his *De praestigiis daemonum* (On the Tricks of Devils, 1563) and in his *De lamiis* (On Witches, 1577). A more typical response came from the French demonologist Jean Bodin, who

called Della Porta a venomous magician and an instigator of popular witchcraft in Chapter II of Book 2 in *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580). Della Porta soon removed the famous passage from his Italian editions. Nevertheless, he experienced difficulties with the Inquisition; the Neapolitan tribunal questioned him in 1586 about his astronomical judgements.

Della Porta worked for more than thirty years on a revised and extended version, which finally appeared in 1589. His new *Magiae naturalis* (On Natural Magic), in twenty books, concentrated on the origin of natural effects. Its goal was to bring the magic tradition to the same level as science. Optics (Book 17) and magnetism (Book 7) received elaborate attention; the work constituted an encyclopedia of knowledge, including botany, zoology, physics, chemistry, and alchemy. Its introduction refuted Bodin without naming him (referring to *Gallus quidam*, a certain Frenchman).

Della Porta subsequently prepared a third edition of his book. Hoping to avoid censorship, he dedicated it to Cardinal Federico Borromeo; but after the Congregation of the Index reviewed it, only three of its eleven projected books ever appeared: Book 4, *Liber medicus* (Medical Book), containing a list of remedies, mostly based on organic medicines, against all kinds of diseases; Book 5, *Criptologia* (Cryptography), describing ceremonial magic empowered by demonic intervention; and Book 6, *De mirabili numerorum potestate* (On the Wondrous Power of Numbers), about the quality and magical virtues of numbers in architecture, agriculture, music, optics, and astronomy.

For the rest of his life Della Porta struggled with the Inquisition to gain approval for the publication of his books. In 1592, when he tried to publish an Italian edition of his work on human physiognomy, the Inquisition stepped in. On orders from the Holy Office in Rome, the Venetian Inquisition halted the work's publication and forbade Della Porta, under pain of excommunication and a fine of 500 ducats, to publish anything without the express permission of the Roman High Tribunal. Della Porta maintained that, because demonic forces are natural, it is legitimate to investigate and even employ them, as long as one avoids the rituals adjoined to them. He believed that his research program would lead to a smashing of superstitions, not by persecution but by exploding the false beliefs surrounding the real, natural phenomena. The most convincing way to expose the fraud of demons, thought Della Porta, was to discover the natural truth behind the superstitions of popular magic and to demonstrate these by producing marvels naturally. Obviously, such a radical position on diabolism could never gain the Church's approval.

But Della Porta's advancing age, great fame, and obvious willingness to obey the Inquisition after the ban was

lifted in 1598 almost guaranteed him peace in his remaining years. As a lay brother of the Jesuits and a member of the Roman Accademia dei Lincei, he focused in his last years on comedies, military engineering, and agriculture, and he also perfected the camera obscura.

DEMONOLOGY

Demonology is the name given today to the field of knowledge dealing with the demonic aspects of witchcraft and other practices forbidden by early modern Christianity. More broadly, demonology concerns itself with all forms and expressions of demonism and is thus as old as the concept of Satan. More broadly still, it evokes any attempt to denigrate opposition or stigmatize deviance by presenting these as the worst forms of evil. Demonology had an important role in early Christian and medieval theological and ecclesiastical thought, for example in the writings of St. Augustine and St. Thomas Aquinas. But it flourished in particular from the fifteenth to the eighteenth centuries, alongside the witchcraft trials.

Classically, this field of study gave rise to "demonologies," works that explored and debated the complexities of witchcraft and allied subjects in a systematic and theoretical manner, providing guidance concerning what and what not to believe about them. Did witches have powers over the weather? Could they cause diseases and sexual impotence? Could they transform others or be transformed into animals? Were they physically transported to their Sabbats, and were these real events? How did demons assume human shape and act as

incubi or succubi? Could procreation take place between demons and witches? Could demons and witches predict the future? These were the sorts of specific questions that were standard concerns in early modern demonology, alongside more general questions about why witchcraft was so prevalent and what the churches and secular rulers of the period—as well as private individuals—ought to do about it.

The authors of this literature are now often called “demonologists,” but it is much more useful to think of them as theologians and churchmen, philosophers and moralists, lawyers and physicians—in other words, as intellectuals representing various disciplines and professions. When they wrote about witchcraft, they drew on the usual intellectual resources of the world of learning, especially its methods of discussion, and reflected its contemporary preoccupations. *Demonographer* was a term known in the seventeenth century (it was used in a hostile sense by Gabriel Naudé), but it is too restrictive to limit demonology to specialists. Witchcraft was discussed in far too many diverse contexts for demonology to be limited to one kind of writer or one kind of writing.

EARLY WRITINGS

The history of early modern demonology is partly one of how texts and their contents evolved over time. Textual accounts of witchcraft as a devil-worshipping cult began to appear from the 1430s. In them, witches were definitively associated with ritual dedication to Satan, the practice of infanticide and anthropophagy, the destruction of Christian society, and attendance at Sabbats. Single works on demonology multiplied from this point onwards, with titles like *Lamiarum sive Striarum Opusculum* (A Brief Work on Lamia or Witches), *Flagellum Maleficorum* (The Lash Against Those Who Commit Maleficia), *Quaestio de Strigis* (An Investigation of Witches), and *Malleus Maleficarum* (The Hammer of Witches)—titles that indicate the development of a genre. From the outset, witchcraft was regarded as a controversial and difficult topic, about which many reservations and doubts might be expressed. Intellectuals invariably struggled to come to terms with it, and even those who came to accept its reality always knew that there were serious objections that had to be overcome.

Commonest of all were discussions of the tenth-century capitulary, the *Canon Episcopi*, which appeared to suggest that witchcraft was based on a demonic dream. If the canon applied to the new fifteenth-century witches as much as to earlier ones, it made their crimes illusory; but if the latest sect was unlike the previous ones, then the text could be disregarded. Questions like these were frequently asked in the period between Johannes Nider's *Formicarius* (The Anthill), dating from around 1437, and Bernardo of Como's *Tractatus de Strigibus*

(Treatise on Witches), written around 1510. The Franciscan Samuel de Cassini and the Dominican Vincente Dodo clashed over the canon's implications in the first decade of the sixteenth century, and another cycle to the debate occurred in the 1520s involving Paolo Grillando, who argued that Sabbats and Sabbat attendance were real and not the product of dreams and illusions, and Giovanni Francesco (Gianfrancesco) Ponzinibio, who took the opposite view.

THE PEAK PERIOD

From the 1560s onward, the literature of witchcraft entered a fresh phase. In the first place, skepticism regarding the reality of the crime became even more systematic. To the reservations based on the *Canon Episcopi*, the sixteenth century added various forms of more general doubt regarding witchcraft drawn from the writings of the philosopher Pietro Pomponazzi (notably his *De naturalium effectuum causis, sive de incantationibus* [On the Causes of Natural Effects, or of Incantations], 1556), the Italian lawyer Andrea Alciati, the Dutch humanist Desiderius Erasmus, and the French skeptic Michel de Montaigne. With the publication of the first version of Johann Weyer's *De praestigis daemonum* (On the Tricks of Devils) in 1563, early modern skepticism about witchcraft found its first major voice. And twenty years later, a member of the Kentish farming gentry in England, Reginald Scot, took witchcraft skepticism even further by picking up Pomponazzi's arguments and giving demons no agency whatsoever in the physical world.

Second, there was the publication and republication of a far greater number of texts asserting the general reality of the crime and the need to eradicate it from European society. Such claims were still not always made uncritically; on the contrary, most authors opted for a middle ground between accepting too much and accepting too little. For example, they rejected aspects of witchcraft that contravened theological or natural philosophical rules, aspects such as metamorphosis, miscegenation, and the physical efficacy of curses. Even so, this still left plenty of scope for witch hating.

The best-known group of writings of this period comprised the books published by magistrates or judges in witchcraft trials, who wished to pass on their experiences and reflections to their legal colleagues and the reading public. From the French-speaking lands—based on trials in the duchy of Lorraine, in Burgundy, and in Labourd (the French Basque country), respectively—came monographs by Nicolas Rémy, Henri Boguet, and Pierre de Lancre. These texts offered the by now standard arguments concerning the full range of witchcraft issues—the act of apostasy, the powers of demons and spirits, *maleficium* (harmful magic), travel to the Sabbat and its ceremonies, banquets, and dances, sexual dealings between witches and devils, the

possibility of metamorphosis, and so on—while constantly citing individual cases purporting to come from the judicial archives. Even the legally trained Jean Bodin, who had little experience with any actual trials and whose demonology was vastly more abstract and philosophical, opened his *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580) with the case of Jeanne Harvillier, executed at Ribemont in 1578. The largely unoriginal demonology published by James VI of Scotland in 1597 falls into the same category, originating in trials in Edinburgh in 1590–1591.

Protestant and Catholic clerical reformers who saw witchcraft through an evangelical and spiritualizing lens provided a further group of texts. In attempting to turn *maleficium* into a case of conscience, they played down the physical damage done by witches and saw their crime much more as an act of apostasy, a crime of which those who practiced counter-witchcraft might be equally guilty. Protestant writers in particular, men like William Perkins and George Gifford in England, thought that secular laws that stressed the doing of harm by witchcraft were, therefore, wide of the mark. This attitude meant that, while they often lamented the vengefulness of witchcraft victims and pointed to legal abuses and the convicting of innocent people, they would undoubtedly have strengthened the witchcraft legislation had they been able to.

In this sense, religious reform contributed to the belief in the reality of witchcraft and the pressures to prosecute it that developed from the 1560s onwards. The many Catholic intellectuals who wrote on witchcraft included prominent bishops, like the two suffragans Peter Binsfeld of Trier, whose demonology appeared in 1589, and Friedrich Förner of Bamberg, who published thirty-five sermons on superstition, magic, and witchcraft in 1625, and several prominent theologians, including Martín de Azpilcueta, Gregory Sayer, and Francisco de Toledo. Among the orders, the Dominicans had been prominent among witchcraft theorists from the beginning, but it was the Jesuits who contributed most in this later period, Juan Maldonado, for example, and, above all, Martín Del Rio. Such men were absolutely central to the intellectual strategy and direction of the Counter-Reformation, and they saw the spread of witchcraft throughout Europe as an inevitable accompaniment of Protestant heresy.

GROWING SKEPTICISM

The combined impact of all these publications must have been to encourage witchcraft prosecutions, or at least to justify and explain them. It is striking, for example, how the intensification of discussions of witchcraft in print from the 1560s onwards coincided with the opening of the key century of witchcraft trials. But if intellectual disbelief in witchcraft seems more muted in this period, it was certainly still an important option.

Many of Weyer's arguments were endorsed in Germany in the 1580s and 1590s, especially by Johann Georg Goedelmann, a law professor at Rostock, whose lectures on witchcraft appeared in 1591 as *Tractatus de magis, veneficis et lamiis deque his recte cognoscendis et puniendis* (A Treatise on Magicians, Poisoners, and Witches and How Properly to Identify and Punish Them). In Trier in 1593, Cornelius Loos, a Catholic priest and theologian who sympathized with Weyer, was also forced to recant what seems to have been a more extreme denial of the physical existence of devils.

Skepticism and opposition to witchcraft trials had come to take a variety of forms by this stage, including doubts about whether witchcraft was a crime for which any human agent could be held responsible. Criticism was directed at the evidence cited in support of the reality of witchcraft, including biblical texts in translation. Above all, the whole conduct of witchcraft investigations and trials came under attack, notably the use of torture. German opponents of witchcraft trials such as Adam Tanner, Paul Laymann, Friedrich Spee von Langenfeld, and Johann Meyfart reflected these various issues in their demonological writings. Each paid at least lip service to the possibility of witchcraft and thus of true convictions, while virtually ruling out guilty verdicts as unjust in the present legal circumstances. Spee's *Cautio Criminalis seu de Processibus Contra Sagas* (A Warning on Criminal Justice, or a Book on Witch Trials), published anonymously in Rinteln in 1631, and Meyfart's *Christliche Erinnerung* (A Christian Reminder), which appeared in Schleusingen in 1636, rank among the most passionate and eloquent denunciations of excessive religious zeal and barbaric legal procedures from this period. These authors thought that witchcraft trials, not witches, were demonic.

Outright demonological skepticism was much less clear-cut. It was much more difficult for critics to distance themselves intellectually from orthodox demonology than to attack trial procedures and investigative techniques such as torture. If restricted to the relative powers and responsibilities of witches and devils and the role played by trickery and delusion, the arguments could seldom be decisive, since no believer in witchcraft ever thought witches themselves had occult powers or denied that they could be deceived. In this way, negative arguments were already anticipated among the positive ones. The same was true of the naturalistic alternatives proffered for witchcraft phenomena. Because devils were acknowledged by all to be inside nature and natural causation, to give a natural explanation for witchcraft effects was not as damaging as it might now seem. To get rid of devils altogether, or at least remove their physical powers from the physical world, would certainly have delivered a knock out blow to the acceptance of witchcraft; but such a step was far too radical for most to take, because it was perceived as

opening the door to atheism. Across the European intellectual community, the aphorism voiced by the Englishman Henry More in 1653 held good throughout the seventeenth century: “assuredly that Saying was nothing so true in Politicks, No Bishop, no King; as this is in Metaphysics, No Spirit, no God” (More 1653, 164).

Yet even if legal criticisms were easiest to mount and most effective overall, notable individual attempts to sweep witchcraft beliefs away by restricting or reconceptualizing the powers of demons multiplied in this final period too. In England, where Scot’s arguments fell into abeyance for about three quarters of a century, they were eventually taken up again by the physician Thomas Ady in the 1650s, by the one-time religious radical John Webster in the 1670s, and by Francis Hutchinson in 1718. By 1691, when Balthasar Bekker began publishing his complete repudiation of witchcraft, *De Betoverde Weereld* (The World Bewitched), it was possible for this Dutch Calvinist pastor to combine all the misgivings previously felt about miscarriages of justice and misreadings of texts with a radical demonology that left no place for a devil who made a mockery of Providence. The same was true of the total skepticism of the Prussian jurist Christian Thomasius, whose *De Crimine Magiae* (On the Crime of Magic) appeared in 1701. In a later work of 1712, his *Historische Untersuchung vom Ursprung und Fortgang des Inquisitions Prozesses* (Historical Investigation into the Origins and Continuation of the Inquisitorial Trial), Thomasius even went so far as to demolish the very genre that was demonology by treating every one of its canonical texts as critically unsound.

TRIALS AND TEXTS

The relationship between texts about witchcraft and witchcraft trials remains elusive. It is easy to assume that the texts were preoccupied by the need to justify the prosecutions, and in the past demonology has been read almost entirely from this direction, as if this was the only interesting thing about it. Naturally, many witchcraft texts did originate either in specific episodes or in waves of prosecutions, provoked by reflection on or the desire to defend what had occurred in the courtroom. The demonologies by magistrates who acted in trials are obvious examples, as are the writings of Binsfeld and Förner, intimately related to the “super hunts” in Trier and Franconia that they helped to coordinate. Many adverse reactions to witch prosecutions, like those of Scot, Goedelmann, Spee, and Filmer, arose likewise in response to individual cases or longer episodes of witch hunting that struck these critics as grossly unjust.

There are also numerous examples of individual witchcraft texts being brought into play during the course of prosecutions, most often when lawyers sought

help with legal technicalities directly from professional manuals or indirectly from the legal faculties of neighboring universities in the form of what in Germany was called a *gutachten*. Many other general forms of guidance and advice could be found in demonologies, should judges and magistrates choose to consult them, as, for example, they were invited to do by the English preacher Thomas Cooper or by Pierre Nodé in France. For such reasons, modern historians have sometimes made demonology into one of the principal causes of witchcraft prosecutions, believing that its profile as a scholarly genre rose and fell exactly as they did in seriousness and frequency.

Yet discussions of witchcraft in print also had a life that was independent of the trials. They flourished in some contexts—in the Dutch Republic in the 1690s or in England on the eve of the repeal of the witchcraft legislation in 1736, for example—after prosecutions had long since ceased. They appeared in texts such as catechisms, guides to casuistry and the Ten Commandments, biblical commentaries, university dissertations, medical textbooks, and works of political theory, whose primary purpose had little or nothing to do with either encouraging or criticizing the legal process. And they were written by authors, such as Joseph Glanvill and Henry More in English philosophical circles after the Restoration, who showed little interest in apprehending and punishing witches. Throughout European natural philosophy, indeed, witchcraft excited a theoretical interest completely unrelated to the practice of witch hunting. Acknowledging these discussions—not overlooking, for example, that Thomas Hobbes entitled the last book of *Leviathan* “Daemonologie”—means locating demonology within its various intellectual contexts in a more open-ended manner.

INTELLECTUAL CONTEXTS OF DEMONOLOGY

Demonology was in fact embedded in the broadest intellectual and cultural developments of early modern Europe. A work like Del Rio’s ranged over a truly vast intellectual terrain that far transcended anything as focused as a witchcraft trial. Educated beliefs about witchcraft were not held in isolation but were dependent on other intellectual commitments, as well as on a whole series of social and institutional practices. This dependence was not just a matter of intellectual processes and styles of argument and scholarship—rather, it was a matter of substance. Demonology was linked conceptually to views about the workings of the natural world and the human body, the course of divine and human history, and the nature of religious, political, and legal authority. To accept witchcraft’s reality was, broadly speaking, congruent with particular ways of looking at such questions, and incongruent with oth-

ers. On many occasions, too, it seems that witchcraft was used as a kind of intellectual resource—a means of thinking through problems that originated in these other areas of life and thought and had little or nothing to do with the legal prosecution of witches. What witchcraft scholars are currently looking for in demonology has much to do with these various features, making it an unusually revealing guide to early modern intellectual and cultural values in general.

DEMONS

In Christianity, demons are malignant beings, usually invisible, who try to induce the faithful to sin and afterwards punish them eternally in hell. Though in the Latin sources *diabolus* and *daemon* were regularly used as synonyms, this essay will deal only with minor devils, and not their overlord, Beelzebub, Lucifer, or Satan.

A HISTORY OF DEMONS

Several traditions united to make these evil creatures a significant component of traditional Christianity. From the Hebrew Bible derive demons like Behemoth, Asmodeus, and Leviathan, which remained only names, except to the most learned demonologists. More important were some episodes in the New Testament, such as Jesus’s exorcism of the “legion” of evil spirits who entered into swine (Matt. 8:28–34; Mark 5:1–15;

Luke 8:26–33). This episode provided a scriptural basis for both the belief in demonic possession and the possibility of ritual exorcism. The medieval and postmedieval idea that hundreds or thousands of fiends molested many demoniacs obviously is backed by this example.

The *Interpretatio christiana* (Christian interpretation) changed the pantheon of classical antiquity into a coven of demons. What that meant in the Middle Ages can be learned by the poignant example of an antique sculpture of the goddess Venus, chained in the church of St. Matthew at Trier, which was stoned ritually as a heathen idol. Roman religion contributed only a few details to the picture of the demons, including some attributes of Faunus and a belief in incubi. Neither did the Church hesitate to transform all Celtic and Germanic deities into devils by the same mechanism. Although the survival of the main heathen gods in demonological disguise seems to have been rare, a charm was used against the demons of the night in fourteenth-century Silesia, naming Odin (Wodan, Wotan) and his army. Usually, the “little” goddesses, imps, goblins, trolls, and similar creatures continued to play roles as helpers in popular belief. Only the instrument of the *Interpretatio christiana* equated them with the lesser pagan deities of the Latin tradition and changed them into demons. The clergy characterized them as such, whereas for the people they remained friendly beings, if treated correctly. A good instance thereof was the creature called *dyabolus* by Brother Rudolph in his *De officio cherubim* (Concerning the Duties of Cherubim, 1235/1250). This “devil,” who inhabited a privy, possessed a horse and a goshawk and foretold their future suitors to local women in exchange for gifts and bathing.

In the Early Middle Ages, fear of such beings seems to have formed a component primarily of monastic spirituality. This changed during the twelfth and thirteenth centuries, when the example-stories of the preachers, pious vernacular literature, and sculptures and paintings of ecclesiastical art made the laity much more aware of the fiends’ actions and appearance. The demoniacs were considered the best proof of their existence, as we know from the Cistercian Caesarius of Heisterbach, author of an influential collection of exempla (ca. 1220). In the Catholic Church, many forms of mental illness were explained as possession by evil spirits.

Already in the High Middle Ages, but more frequently in the early modern period, theologians constructed systems of specialized demons, each of whom fulfilled a certain office. A Cistercian monk, Richalm of Schöntal (early thirteenth century), described the hierarchy of fiends dedicated to tempting monks as an exact but invisible copy of the monastic functionaries. There were a demonic abbot, prior, cantor, and so on, who

encircled their targets like a thick cloud, continually causing cough, toothache, insomnia, inebriety, and so on. A later monk, Martin Luther, shared Richalm's imagination.

Despite some earlier discussion, the concepts of natural spirits and natural magic only began to complicate theoretical views about demons in a more serious manner in the age of Agrippa of Nettesheim and Paracelsus. In the sixteenth-century German literary genre of *Teufelsbücher* (devil books), semi-allegorical demons appeared to personify different vices: a *Hbsenteufel* (pants devil), inventor of new luxurious trousers; a *Saufteufel* (drinking devil), instigator of drunkards; a *Spielteufel* (gambling devil), who tempted people to play risky games for money, and so on. During the early modern epoch, scholars developed truly baroque systems of the society of demons, constructing complex hierarchies and integrating classical mythology (Pluto as demon of greediness, and the like). The Jesuits' religious theater and their sermons also brought common people into contact with these kinds of demons, before the Enlightenment ended their credibility.

The question of whether the phenomenon of demonolatry actually existed during the Middle Ages and the confessional period (sixteenth and seventeenth centuries) has found no generally accepted answer.

Cases like that of Gilles de Rais, the fifteenth-century French nobleman executed for invoking demons, practicing sodomy, and murdering children, or the preservation of conjuring books with prayers to demons prove that some people did try to make a pact with demons, though the vast majority of extorted confessions on that subject probably only mirrored the inquisitors' fantasies. Conversely, a few Christians, getting no response from God, indeed turned to his enemy for help.

Today, it is the common opinion of scholars that the demons described by witches in their confessions show, on the one hand, traces of popular belief, and, on the other hand, incorporate elements of learned theology acquired from sermons and the suggestive questions of the prosecutors. Whereas the latter components were more or less identical throughout Catholic Europe, being based on the standard Latin works of Scholastics, inquisitors, and demonologists, the former show certain regional differences. For instance, the Devil helping the witch to churn is a typical Scandinavian motif, whereas the animal-familiar imp seems to have been most frequent in England. That fiends could show themselves in the guise of animals, usually chthonic ones such as vipers or toads, but also dogs or cats, seems to have been a pan-European conception. Often the evil spirit changes appearance: The nun Magdalena Crucia (d. 1560), a once famous case, used to be visited by her devil Balbán in the form of an angel, as Jesus, as various animals, and as a handsome young man. This ability of the bad angels to show themselves in the form of good ones required the development of a theological analysis, called discernment of spirits. It was one of the reproaches used against Joan of Arc that she had not asked the ministry to apply this technique to the apparitions whose orders she obeyed.

Many demons, however, appear to have been confined to certain natural locations where they met with their human accomplices, often a wood, or an elevation in the ground. Neither was the place for staging of the Sabbath chosen randomly; it often corresponded to a "sacred" place of popular religion, like the famous Brocken, or Blocksberg, in Germany, or the walnut tree of Benevento in Italy. According to the minutes of the trials in Prussia, the witches apparently gathered at places that had had a cultic function for the Prussian population before its Christianization.

THE DEMONS' OFFICES

Demons were widely believed to be able to bring all sorts of ill luck on humans. In the ninth century, Agobard of Lyons condemned the belief that fiends cause thunderstorms and hail, but the official benedictions against tempests, used in all churches, show that his long remained a lonely voice, seconded successfully only much later by reformers and enlightened thinkers.

In the later Middle Ages, theologians became increasingly convinced that religious deviance and witchcraft must have been caused through collaboration between men and demons. Magic, it seems, had traditionally been practiced through the natural virtues inherent in special plants, stones, gestures, and the like, as well as through the mental powers of specially disposed individuals. The clergy construed magic, according to a formula deriving mostly from St. Augustine, as actions intended to bring those who performed them into contact with demons and to do harm with their help. The “classical” witch, the witch as she appeared in the imagery of the learned, could do nothing through her own energy, but had to rely on her demon’s power. Apart from helping to perpetrate magic and other crimes, the devils had an additional function, namely that of nonhuman sexual partners, in the form of incubi and succubi. It is clear that this function was mostly the projection of the inquisitors’ sexual fantasies, as the majority of accused women had to confess intercourse with their own *Buhlteufel* (demon lover), whereas male witches were seldom required to avow this aberration. Descriptions of demonic intercourse varied from occasional enthusiastic praise of the extrahuman lover’s erotic talents (very outspoken, for example, in the confessions of Gostanza, the witch of San Miniato, tried in 1594), to more frequent lamentations about their brutality and coldness (especially in the Basque records). Many theologians thought changelings were the fruits of such intercourse; Luther recommended their immediate and unquestioned killing.

Eventually, the most terrible task of the demons was the punishment of sinners in hell and (as many believed in spite of the official teaching) in purgatory. The Middle Ages produced a vast literature of otherworldly visions where one could study in detail the torments they prepared for the condemned. This genre influenced the abundant depictions of demonic actions in the underworld produced by ecclesiastical art from the twelfth century onward. What the demons did to their prisoners—flogging, boiling, smashing, and castrating them—was a combination of sadistic fantasies with equally sadistic corporeal punishments factually executed in accordance with criminal law. In this respect, the human-like figures of the demons offered an ideal screen for a socially accepted projection of aggressive individual and collective fantasies.

DENMARK

The first European kingdom to require legal appeals for all witchcraft convictions (1576), Denmark played a significant role in the history of European witchcraft. In 1080, writing to the Danish king, Harald, Pope Gregory VII warned against accusing women of causing changes in temperature, raising storms, or inflicting diseases on humans. During the next 400 years, sorcery was only occasionally mentioned in Danish sources, predominantly in legal texts. It was not until the early sixteenth century that cases of sorcery, defined as the ability of certain individuals to harm without the agency of the Devil, or witchcraft, involving a pact with the Devil or his assistants, reached Danish courts.

From the mid-fifteenth century, wall paintings with witches in many Danish churches all over the country testify to the fact that Denmark had become part of the European witchcraft tradition. It must be termed a witchcraft tradition, because the paintings reveal a clear and close connection between the witches and the Devil. The insignificant part played by the Devil during the subsequent trials thus provokes some surprise. It can be explained, however, as a consequence of the legislation enacted in Denmark beginning in the 1540s.

Almost all Danish legislation before the royal decree of 1617, beginning with twelfth-century provincial laws that mentioned sorcery only in connection with homicide, dealt exclusively with procedural questions. The only exception was Christian II’s so-called *landlov*, “law of the country,” from 1521; this law defined the

crime as *maleficium* (harmful magic), but we find hints of a notion of the Sabbath together with permission to use torture in order to elicit a confession. The typical accusatorial procedure used in Denmark was almost replaced by an inquisitorial procedure. This law code, however, was quickly repealed in 1522, when Christian II was expelled from the country.

Two paragraphs in a nationwide law of 1547, which was repealed in 1558, had procedural consequences for the next 150 years and was of utmost importance for the content of Danish witchcraft trials. One paragraph stated that the testimony of convicted thieves, traitors, and witches ought not to be used in court as evidence against other people. This meant, of course, that the high numbers of convictions based on chains of denunciations, known in countries using an inquisitorial procedure, were unknown in Denmark. The other paragraph stated that torture was not allowed before a death sentence had been pronounced; an accused witch could thus not be convicted through a forced confession. In 1576, yet another law was promulgated preventing mass trials. The Danish Council of the Realm had passed sentence on appeal in several witchcraft cases, finding the accused not guilty; however, at the time of the sentencing, the women had already been executed. To prevent similar occurrences, it was decreed that all guilty verdicts by the juries of local courts should be brought before a High Court for confirmation.

Not until October 1617 was legislation passed defining the material content of the crime of witchcraft. This decree distinguished between those who cured human beings and their property through supernatural means and those who made a pact with the Devil. The former were to be banished, but the latter were to be executed by fire. The decree lasted until the *Danske Lov*, the Danish Law Code of 1683, when minor changes in the law were carried through, at a time when witchcraft trials were on the brink of disappearing from Danish law courts.

The 1617 decree created a situation in which a comprehensive witch hunt seemed the next step, but ideology and legal practice did not mesh. The ideology hinged on the pact, but very few would voluntarily admit to having made a pact with the Devil; and the legislation of 1547 would not allow the use of torture before the accused had been convicted. Moreover, the High Court judges demanded two independent witnesses before they would pass a death sentence. As the Danish authorities never changed their legal system, Denmark never experienced mass witch hunts.

The actual number of trials in Denmark is unknown. Even the High Court records after 1576 are missing from most of the provinces. It was not until 1609 that these records were preserved, and then only for the province of Jutland. It ought to be stressed, however, that the records from Jutland are quite intact for most

of the remaining century. It can be calculated that 494 trials took place between 1609 and 1687, which was the year of the last known trial (Johansen 1990, 347). An extrapolation for all of Denmark does not seem feasible, because the distribution of trials in Jutland, although highly significant, was very uneven. Four areas in Jutland stand out: three with a very high number of trials and one with very few. In part of eastern Jutland, hardly any cases can be found during these almost eighty years. The kingdom's agrarian structure helps explain the geographical distribution of its witchcraft trials. Most Danish farms were centered in a village; but exactly in those areas most heavily plagued by trials, isolated farms were scattered across the countryside, creating a higher degree of fear. Additionally, the soil in these areas was often of poor quality, thus threatening the balance between agricultural surplus and deficit. The loss of a cow could be disastrous.

The chronological distribution also seems significant; almost 60 percent of the 494 trials took place between the promulgation of the 1617 decree and 1625. From 1625 until the early 1650s there was a slow but steady trickle of trials. After that date, the trials almost stopped until a final flare-up in the late 1680s. The rise in the number of trials during the mid-1680s was primarily due to a minor nobleman, Jorgen Arenfeldt, who at his manor court initiated more than half of the trials. The motives for his desire to prosecute witches are, however, unknown.

Denmark's legal system influenced this course of events, first in the low rate of witches sentenced to be burned by the High Court judges: Just under 50 percent suffered that fate. This rate is not surprising when compared with other European countries where verdicts were appealed to appellate courts. But the discrepancy between the percentage found guilty in the courts of first instance and the High Courts is amazing; nine out of ten accused were found guilty by the local courts; moreover, the High Court judges did not need a confession to sentence the accused to be burned. The fear of witches was thus manifest in local communities, but the High Court judges did not share the same fear. This did not mean that those whose lives were spared were acquitted. Almost all received an *absolutio ab instantia*, meaning that they were found not guilty until proved otherwise. The social consequences of this sentence must have been immense, as very few suffered a new trial. The disciplinary effects probably led them to act in such a way that their neighbors had no reason to waste time and money on new trials.

One feature of the Danish trials changed in the years immediately after the 1617 decree. As the High Court judges had to confirm all guilty verdicts from the juries of the local courts, several trials involving cunning folk were also appealed. The judges were in no position to confirm verdicts where the accused had confessed only

to “cunningness,” beneficent magic, and therefore returned such cases to the local courts with orders for new trials. But, apparently, no new trials took place, as the local population needed the cunning folk—and the High Court judges must have become aware of this fact. As early as 1619, they began a new practice of banishing cunning folk without requiring a new trial. In terms of sentence, banishment meant that a convicted healer had to leave the High Court district where she or he lived and go to another one. This attitude of the High Court judges was in accordance with the fierce attacks of prominent members of the Danish clergy against cunning folk. The royal historiographer and canon Anders Sørensen Vedel described in the 1590s how people were prepared to be cured by cunning folk, though they knew full well that the Devil had sent the cunning folk.

Most of the time, an accused person would have a long reputation for witchcraft, usually traceable back ten or fifteen years (in a few cases, forty to fifty years). During those years more and more suspicious occurrences accumulated, building up to a trial. One representative woman, over the course of eleven years, was accused of bewitching piglets (after her victim had refused to sell her one of his piglets); of maiming a hand (of a man who had shot at her dog); of the loss of a horse (belonging to the man who shot her dog, when it had chased his cattle); of the illness of a man (who had given the husband of the accused poor grain as wages); and of the death of sheep (whose owner complained that she had allowed her dog to chase his grazing sheep).

It is very interesting to note that, in many cases, it is possible to pinpoint the occurrence that led to a reputation of being a witch. A witness testified in court that her brother had told her six years previously how a woman had threatened him, because he had taken her heifer from his oat field. Shortly thereafter he died, and the minister testified at the trial that the woman had had a reputation of being a witch ever since.

Danish witchcraft accusations centered on two subjects: the death or illness of other people, and the death and sickness of farm animals, because almost 90 percent of the Danish population lived in the countryside.

In the situations leading to a bewitchment, Danish trials resembled those cases of “denied begging” that Alan Macfarlane studied in Essex, in which beggars were turned away and supposedly retaliated by laying a curse on those who had rejected their requests. One of the few vagrants (called the “Wild Sheep”) accused of witchcraft visited a farm asking for some mead at the time of the party being held celebrating a childbirth. The whole village was present, and she was denied the drink. Unwisely (but understandably) she said that their bees should produce no more mead, which turned out to be true. It is clear that the “Wild Sheep” would have expected at least a minimum of decent behavior at

this party, and it is equally clear that the hosts treated her the way they did because she already possessed a reputation for being a witch.

The typical Danish witch was a woman, married but past childbearing age. The preponderance of women among Danish witches can largely be ascribed to the fact that in quarrels, women were apt to curse rather than fight, and cursing was dangerous in a time of general fear of witchcraft. Their age must be attributed to the fact that it usually took a long time to build a reputation as a witch; because most women were married, so were most witches.

A development toward mass trials was thus on its way during the years after the 1617 decree; although denunciations by convicted witches alone could not be used as a reason for conviction, they could always be used to start a trial. In areas with many trials, we can find chains of trials slowly creeping across Jutland on the basis of denunciations; for instance, one starting in May 1619 in southwestern Jutland and ending fifteen months later 60 kilometers to the east.

One reason why Danish trials never reached mass proportions must be found in the lack of a widespread and shared notion of the Sabbath and the all-important role of the Devil. An idea existed of an organization among the witches, who met at specific places at specific times. The sexual themes of European mythology were sometimes suggested but never became the decisive element in these trials. The number of members in a coven varied, for instance, between eight and twelve.

Our most detailed description of a Sabbath was almost chaste in its content. Three other women had taught Anne Friiskone what to do when the coven met at the churchyard. She walked backwards around the church three times, denying her Christianity. Then she blew three times through the keyhole in the Devil’s name, and the Devil appeared before her like a black dog, putting his sign on her forehead. Jørgen Simensen was the leader of the coven, Lars Krag the drummer, and Chresten Pedersen the piper. When they gathered for a dance at the churchyard, the witches brought beer and mead. At first they met in the church, where their “imps” were counted, they confessed what they had done, and Jørgen Simensen gave a sermon; sometimes he threw the chasuble over his head. However, Anne Friiskone never told the judges what she saw when he did it. A few times he had intercourse with one of the women in the church, but always with the same woman; we find no confession involving promiscuity.

The notion of the Devil’s mark was vivid among the population, but an elaborate history only evolved slowly. It began in the court cases with the story of Anne “Sand,” who told how she was bitten in the thigh when she refused to participate in a bewitchment. Kirsten Ibsdatter later said that the coven met in Troms Church (in Norway), where its leader gave a sermon in Latin

and German, which she could not understand. Her imp, called Plett, put a mark on her stomach—which apparently was a bit too indecent, because she told the High Court that it was on her nose. Anne Giertsdatter crafted an elaborate story, telling how twelve persons had walked to the church in Hørby, where a beautiful “lad” greeted her. They asked her to blow through the keyhole and denounce her Christianity; when she turned around, the beautiful lad had turned into a black, bald dog. The Devil then put his mark on her forehead, where it was still visible. This slow process testifies to the fact that the notion of the Devil’s mark evolved during the trials and only took shape after the publication of the 1617 decree, when the trials grew in numbers.

Both theoretically and practically, Danish clerics did little to pursue witches. Indeed, the cessation of witchcraft trials originated in the frequent adherence of Danish ministers to early sixteenth-century providentialist explanations, such as those of the Catholic Martin Plantsch and the Lutheran Johannes Brenz, which emphasized that suffering came from God and not through the evil deeds of witches. Although Brenz was widely read in Denmark, it is likely that most Danish ministers were inspired by other theologians who drew on Brenz, such as Anders Sørensen Vedel and the bishop of Stavanger, Jørgen Ericksson. In his sermon on the Book of Jonah, Ericksson pointed out that adversity should never be attributed to the Devil or sorcerers, because it was God’s punishment for sins. In his third sermon on the ninetieth Psalm, Vedel wrote that sorcerers should not be given the honor of being thought able to cause death or disease, because man only suffered such afflictions through God’s providence. Vedel did not deny the existence of sorcerers, but he spiritualized the question of guilt, sin, and fate. It is hardly coincidental that Ericksson chose the Book of Jonah and Vedel the ninetieth Psalm as their points of departure. Luther had emphasized in his sermon on the ninetieth Psalm that under no circumstances should man link his misfortune or death to a demonic power. Similarly, in his commentary on the Book of Jonah, Luther had underlined that God visited man with all sorts of plagues and finally even with death.

In practice, even though the decree of 1617 had described witchcraft as primarily a religious crime, Denmark’s clergy displayed an extraordinary passivity in denouncing suspected witches. In 1623, a minister testified that a suspected witch had been notorious for witchcraft for more than twenty-one years, but he had never denounced her. Only one minister found it necessary to apologize for his inaction; he was well aware that a certain woman was notorious for witchcraft, but, as he pointed out, he was an old man. Evidently, the behavior of such ministers indicated that they had little desire to initiate trials; in many cases, they were in no

position to take action. The minister in Præstkær pointed out before the beginning of a trial that he had never heard of the woman being accused of witchcraft.

After Vedel, sorcery did not reemerge as a topic in subsequent Danish theological writings, whereas the spiritualization of the relationship between sin and adversity was extensively covered. During the first two decades of the seventeenth century, the spiritual nature of the relationship between sin and adversity was given only moderate attention by theologians, but from the start of the 1620s it became more and more dominant, coinciding with the growth of a pre-Pietist movement. During the Thirty Years’ War, when German Lutherans increasingly abandoned this tradition, seeing adversity as sent by Providence, several Danish ministers retained it. The minister on the island of Fur had been of the opinion that a woman had bewitched him, but a colleague praised him for following the example of Job and accepting his pain as a test from God.

The cessation of the Danish trials must be explained in this theological context, but the severe rebuke and the high fine the High Court imposed on Jørgen Arenfeldt for bringing innocent people to trial clearly taught prospective witch hunters that the Danish authorities had no intention of tolerating similar behavior in the future. The last official execution in Denmark took place in 1693, although the belief in witches did not disappear. There was a lynching in Northern Jutland in 1722. Not until 1866 was all witchcraft legislation repealed.

DESCARTES, RENÉ (1596–1650)

The influence of Descartes on the story of early modern European witchcraft was indirect but crucially important, because the highly influential worldview he developed left no room for witchcraft. Commonly called the "father of modern philosophy," René Descartes was one of the most significant intellectual figures of the seventeenth century, a reformer and innovator in natural science, mathematics, metaphysics, and methodology. Born in La Haye, France, in 1596 and educated at the famous Jesuit college of La Flèche, Descartes soon became dissatisfied with traditional Scholastic learning based on the teachings of Aristotle, and resolved henceforth "to seek no knowledge other than that which could be found either in myself or in the great book of the world" (Descartes 1972, I, 186). In his *Discourse on the Method* (1637), he recognized only mathematics among contemporary sciences as capable of producing reasons that are evident and certain; all others provided nothing but doubtful opinion. Descartes' consequent advice to knowledge-seekers was to take mathematics as their model, eschewing the traditional reliance on the teachings of authority in favor of an analytical method in which conclusions were logically drawn from carefully collected and properly verified premises. His own writings on science demonstrated this method in action: Descartes' physics and cosmology abandoned the metaphysical baggage of Aristotelian science and attempted instead a comprehensive explanation of terrestrial and celestial phenomena in purely mechanical terms. For Descartes, the physical universe was a structure governed by a set of universal natural laws that could be characterized in the language of mathematics.

Descartes wrote nothing about witchcraft, magic, or demonology, apparently deeming these subjects unworthy of notice. Unlike some other major figures of the seventeenth-century Scientific Revolution, Descartes had no belief whatever in the occult sciences (here he contrasts, for instance, with Sir Isaac Newton, who

retained a lifelong faith in astrology). Yet his indirect influence was great: Soon after 1700, Christian Thomasius praised Descartes for disturbing "the nest of scholastic fantasies" in which the evil of witch prosecution had been hatched. Descartes' silence was more effective in diminishing belief in witchcraft than the laborious refutations of many other writers. The Cartesian universe leaves room for God as its designer, but it admits no occult forces or properties of any other kind.

Although many of the details of Descartes' physical theories were later found to be erroneous, the mechanistic outlook of his thought had a far-reaching and irreversible influence on the subsequent course of scientific culture. Mechanism, which stresses natural laws as the ordering principles of reality, excluded earlier notions of a universe permeated by personal and spiritual forces. Once the world had become a machine, the phenomena of experience had to be explained in the quantitative language of physics rather than in terms of symbolic relationships, the *spiritus mundi*, or the struggles between good and bad angels. It was hard for the Devil to keep a foothold in such a world; such Cartesian thinkers as Nicolas Malebranche (1638–1715) turned to naturalistic psychology for explanations of such phenomena as "bewitchment" and "demonic possession," which had formerly seemed to demand demonological interpretation.

Nevertheless, in the first of his *Meditations on First Philosophy* (1641), Descartes' philosophical masterpiece, he introduced an evil spirit "not less powerful than deceitful" to serve in a strictly methodological role (Descartes 1972, I, 148). If we are to reconstruct our knowledge on firmer foundations, we first need to strip away our old assumptions and prejudices. Therefore, Descartes asked us to imagine that a *malin génie* (evil spirit) devoted his energies to making us believe falsehoods. It was possible, he speculated, that "the heavens, the earth, colours, figures, sound and all other external things are nought but the illusions and dreams of which this genius has availed himself in order to lay traps for my credulity" (Descartes 1972, I, 148). It has been suggested that the inspiration for this famous thought experiment was the Grandier case at Loudun in the 1630s, but there is little need to look to any specific cause célèbre for its source. More than a thousand years of energetic speculation about the powers of the Devil stand behind the speculation of the *First Meditation*. However, as Descartes was careful to explain to a correspondent, the doubt raised by the demon fantasy was "hyperbolic" and not meant to apply in real life; the demon hypothesis was merely a device for loosening the grip of received ideas that needed to be reassessed (Descartes 1972, II, 266). Although Descartes would probably have conceded the impossibility of firmly disproving the existence of a

malin génie, there is no place in the Cartesian worldview for the operations of deceitful demons that created such fear in ordinary people and perplexity in the judges in witchcraft trials.

DEVIL

The Devil, traditionally defined as the personification of evil, is one of the most important elements distinguishing European and American Christian ideas of witchcraft from ideas of witchcraft in other cultures. The real terror and dread that many Christian Europeans and Americans, educated and uneducated alike, felt toward witches from the fifteenth to eighteenth centuries was magnified by their conviction that witches were the willing servants of God's greatest enemy. The Devil, also often called Satan, had enormous cosmic power; he was seeking always and everywhere to ruin the divine plan for the world and specifically to wreck and undo God's plan for the happiness of humanity. The Devil's power, might, and hatred of Christ and Christians were demonstrated by divine revelation: Because God had revealed it in the Bible, it could not be dismissed without dismissing the authenticity of the Bible.

The belief that the reality of the Devil was an established fact is the master key to the whole question of alleged diabolical witchcraft. Under the Devil's leadership, witches strove to kill the body and destroy the soul of every Christian. Just as the Devil was able to change his shape in order to entice, intimidate, or allay doubts, so witches could make themselves appear to be normal and innocuous neighbors. Just as the Devil was the greatest of all liars, deceiving people into doing harm, so his followers, the witches, could deceive people and so ruin them. For European and American Christians from the fifteenth to the eighteenth centuries, a witch was a Satanist; witchcraft was equivalent to Satanism, a blasphemous war against Christ and against humanity. The devastating terror of witches and of their master, Satan, was deep, widespread, and genuine.

PRINCIPLE OF EVIL

Most societies have not had an idea of one single principle or personage of evil. Some religions, such as Buddhism (which does, however, have a tempter spirit named Mara) regarded evil as an illusion to be overcome with enlightenment. Many societies, such as those of ancient Egypt, Greece, and Rome, attributed both good and evil to their morally ambivalent gods and goddesses. For example, the Greek Artemis (Roman Diana), was at once virgin, fertility goddess, huntress, and lady of the underworld. In India, Shiva both creates and destroys. Some societies, such as early India and Iran, posited warring powers of good and evil. A few societies believed that two supreme principles were constantly at war. Ancient Greek Orphism (a pre-Socratic blend of religion and philosophy) and some followers of Plato—especially the Neoplatonists of the third century C.E.—held that the two principles were spiritual (good) and material (evil).

The Zoroastrians, whose founder, Zarathushtra, lived about 600 B.C.E. in Iran, introduced the idea of two opposite and totally independent spirits or principles, Mazda and Ahriman.

Only in monotheistic religions has the idea of a single prince of evil been dominant. Evil is an inevitable logical problem in monotheism. If there is one god, then evil seems to limit either his power or his goodness. Monotheist religions have devised many ways out of this dilemma, one of which is to believe in the existence of a great power opposing good. The Devil has had many names, the most common being Satan and Lucifer. The word *Devil* comes from Latin *diabolus*, derived from Greek *diabolos*, a slanderer or accuser or adversary. *Diabolos* is a translation of the Hebrew *satan*, meaning someone or something obstructing the way. The names Belial, Mastema, and Semyaza also appear in the Jewish Apocryphal literature (200 B.C.E.–100 C.E.), but in the New Testament, which was written in Greek, the usual terms are *Satan* and *diabolos*.

THE BIBLE

The ancient Israelites distinguished between good and evil but without a clear idea of evil's origins. The Hebrew Bible, or Old Testament (composed over the period roughly 1000–200 B.C.E.), contains only vague and disparate ideas of the Devil: (1) *satan* appears as a common noun; (2) a vague concept of a heavenly court includes the *bene ha elohim*, “sons of God,” who were rather like minor gods more or less under the Lord's command yet able to sin against him (as in Genesis 6:5–6); (3) the *malakim*, messengers of the Lord, could be either creative or destructive; and (4) a spiritual personage named Satan, whose chief role is as the tempter and punisher, appears in the Book of Job.

The idea of the Devil as a powerful leader of evil spirits became greatly more prominent in the Jewish Apocalyptic literature, written at a time when the Jews were suffering oppression by the Syrians and then the Romans. Although this literature was not accepted by either Jews or Christians as biblical (that is, it was not considered revealed Scripture), it exerted wide influence on the New Testament and other early Christian writings. For the apocalyptic writers, the Devil controlled the rulers of this world, both the demons and the human evil-doers, but the good God would soon arrive, heralded by his Messiah, to destroy evil-doers and establish an eternal kingdom of justice and right. The use of the word *diabolos* to mean “the Devil,” the chief of evil powers, first appeared in the translation of the Hebrew Bible from Hebrew into Greek (the so-called Septuagint translation, ca. 200–50 B.C.E.). The term was then used, along with the name “Satan,” in the Greek of the New Testament.

The power of the Devil in the New Testament, as in Apocryphal literature, was immense, though he was ultimately doomed by the power of the Messiah, Christ. The New Testament writers had a sharp sense of the immediacy of evil. The conflict between good and evil was absolutely central to the New Testament. God became human in Jesus Christ in order to save us. What he saved us from was the power of the Devil. The Devil was God's adversary in the struggle for human souls and bodies waged between Christ and Satan. The Devil tempted Adam and Eve to original sin, and he continued to be effective in assaulting people by obsession (attacks from outside), by possession (attacking their souls from within), and, worst of all, by tempting them to pervert their free will by choosing evil over good. At the end of time, Christ would return to break the Devil's power and to establish the Kingdom of God.

CLASSICAL CHRISTIAN CONCEPT

Subsequent Christian writers emphasized the theme of the Devil's power to varying degrees, but in the first three centuries of the Christian era, when persecutions of Christians and Jews by pagans were frequent, the theme was prominently expressed in spiritual dualism. Spiritual dualism was the belief that two mighty spiritual powers struggle against one another for control of the cosmos. A spectrum of dualistic ideas pervaded Christianity at that time. On the extreme dualist end of the spectrum were sectaries known as Gnostics (from *gnosis*, “secret knowledge”). The Gnostics believed that only they knew the true meaning of Christ: namely, that he was a pure spirit sent from the invisible, spiritual, hidden God to save humans from their bodies. Some Gnostics (like the Zoroastrians) thought that the Devil was independent of the true God and almost as powerful. Since the true God hated matter and especially the human body, which kept the spirit imprisoned, the “God” of the Hebrew Bible was really the Devil.

Most Christians at the time held the milder view that Satan was the leader of rebel angels, whom Christ had already vanquished but who still exercised the remnants of their powers by trying to pull as many humans as they could down with them in their ruin. The milder view generally prevailed, but the Devil was nevertheless a figure of terrifying immediacy for the hermits and monks of the third to the sixth centuries, whose writings dominated much Christian thought in that period. The hermits and monks went out into deserted places to fight against the temptations of worldly affairs and the Devil. Satan tempted early monks such as St. Anthony (Egyptian ascetic and hermit) and St. Pachomius (Egyptian hermit) with visions of sex, wealth, banquets, and power—and when temptations failed, assaulted them with whippings, shakings, stench, and clashing noises.

Christian concepts of the Devil were distilled in the thought of St. Augustine, whose ideas on the subject became the basic, classical view for later Christians. In this view, the Devil is a great angel who was created by God both good and also with free will. Using his free will, he chose to serve himself rather than God, and he persuaded many other defiant angels to follow him; these fallen angels shared his evil will and became known as demons. The Devil is the commander of these demons and of all humans who choose to flout God's will. The Devil's greatest success was tempting the human race (represented by Adam and Eve) to choose their own will over that of God. Their "original sin" was atoned for only by the incarnation and passion of Christ. The Devil continues to assault us body and soul, yet he also is allowed by God to torment sinners in hell, so that Satan is at one and the same time a warden and a prisoner of the underworld. Though Christ is ultimately victorious, Satan will be allowed one last chance to destroy the world: his servant, a human ruler known as Antichrist, will lead his forces at the end of the world in a doomed effort to upset the divine plan and to ruin human happiness.

Such views prevailed in both Eastern and Western Christianity. For most Christians, this story was taken as explicit, real, immediate, and terrible. Fear of the Devil and of hell, rooted in Scripture and theology, was commonplace and magnified by popular legend, literature, and art. The Devil was seen as continually tempting humans. His trickery was all the more deceitful because he changed his shape at will: he often showed himself in attractive, appealing, or sympathetic form, although he could also intimidate human beings in the form of a dragon, serpent, goat, or giant; he could even make himself as small as the tiniest particle. He could appear as either a man or a woman, and though he generally presented himself as male, he could appear in the darkness to seduce either sex. Associated with night, darkness, cold, and the North, he was usually portrayed as black, but he might also be portrayed as red because of his connection with flame, fire, and heat. He belched flames from his mouth and nostrils. He was the ape of God, blasphemously mocking him (as in Dante, where Satan's three faces parody the Trinity). He emitted foul odors. His horns represented the power of the bull and the unrestrained lust of the goat; they were connected with the crescent moon and therefore with night and death as well as with power. He had a long tail, again symbolizing both animal strength and the penis. His wings symbolized his power over the air and his ability to move instantly from place to place. No one, anywhere at anytime, was safe from him. Nonetheless, this terrible being was frequently depicted as being tricked or fooled by clever humans, at times becoming a figure of comedy in folklore and on

the stage; making Satan a foolish object of humor was an effort to control or reduce his psychological terror.

THE LATER MIDDLE AGES AND REFORMATION

In the twelfth century, a current of strong dualism reappeared in western Europe, particularly among the heretics known as Cathars, who reprised the Gnostic idea that the devil was lord of all matter, including human bodies, and almost as powerful as his spiritual enemy, Christ. Orthodox Christians at the time, while rejecting such extreme views, nevertheless moved a bit in the direction of dualism, especially because the twelfth through fourteenth centuries were also a period when zealous popes and bishops were attempting to reform morals and education by imposing strict controls on society and labeling their opponents as demonic. As such views were not only drawn up and aired by theologians and ecclesiastics but also preached from street corners and in marketplaces, fear of the Devil had become stronger and more widespread by the fourteenth century than it had been for a millennium.

Renewed terror of Satan was one of the many causes of the accusations of witchcraft that spread from the late Middle Ages through the Renaissance and Reformation. The leaders of the sixteenth-century Protestant Reformation, Martin Luther and John Calvin, changed nothing important about belief in the Devil; their theology on that subject was continuous with, and virtually identical to, that of the Middle Ages. By insisting upon a literal interpretation of the Bible, they underscored the reality of Satan. Luther believed that he had grappled with him personally. Protestants thus promoted the terror of Satan and were as quick to identify the Devil in the Catholic Church as Catholics were to see the Devil's work in the Protestants. Thus, the conflicts caused by the Reformation promoted heightened belief in Satan's might on all sides and encouraged accusations of diabolical witchcraft.

DIABOLICAL WITCHCRAFT

Fear of the Devil defined and delineated the character of European witchcraft in a unique way. For Christian Europe, unlike many other societies, such as those in Africa, witches did not have inherent magical powers, nor were the means that they used to attack people inherently imbued with such powers. Every supernatural power to harm and every means with which to do harm were granted to witches by Satan. Thus Western Christian society linked witches to heretics, Muslims, and (from the eleventh century) Jews as the enemies of Christ. These enemies of Christ, allied with the demons, were marching in a huge, dark, shadowy army against Christianity and every Christian soul. Indeed, the witches were deemed the worst of all the human enemies of Christianity.

For Western Christians, all witchcraft was diabolical—and diabolically deliberate. Other sinners might be unconsciously following the Devil, but witches were guilty of the staggeringly evil crime of consciously agreeing to help in his plan for the destruction of the world. When theologians defined witchcraft, they argued that nothing could be worse than the intentional choice to worship Satan in place of God. Nothing remotely resembling the widespread devil worship imagined by the enemies of witchcraft ever existed. In other words, diabolical witchcraft as defined by theologians and lawyers simply did not exist outside of their own minds.

At the center of the alleged diabolical witchcraft was the idea of a “pact,” a contract between the witch and the Devil in which the witch gave herself or himself to Satan in return for supernatural powers. The idea of a pact derived from ancient legends popularized from the ninth century about persons who signed a written contract with the Devil, often in order to procure ecclesiastical preferment. The ultimate, classical version of the pact was the widespread Faust legend, first published in 1587 and immortalized by two playwrights, Christopher Marlowe and Johann Wolfgang von Goethe. Pacts could be of two kinds: written, explicit contracts and implicit contracts. The accusation that an implicit pact had been made was a much more common and more effective tool of prosecutors, because no written or even oral evidence was needed to accuse a suspected witch of this crime. In an implicit pact, the accused witch did not have to have made a formal contract with the Devil: Malevolent supernatural acts (*maleficia*) were enough to demonstrate that the accused had enlisted in the Devil’s ranks and was therefore a witch.

Witches, it was believed, worshiped the Devil either singly or in groups, at meetings called Sabbats. The meetings of the alleged Satanists were considered a monstrous mockery or perversion of Christian liturgy and a defiance of civil law. The witches allegedly believed that Satan was the Lord, instead of Christ. The witches supposedly sacrificed children in parody of Christ’s sacrifice and ate human flesh in parody of the consecrated bread and wine of the Mass, or Eucharist. The Devil appeared at such meetings in the form of a man or an animal, usually a goat, which the witches worshipped. Another indication of the witches’ involvement with the Devil was the “Devil’s mark.” It was believed that when a witch made the pact with Satan, he left a mark on his new follower. Sometimes these marks were visible (as in the shape of a mole); more often, they were invisible and discovered only by pricking the victim: Any insensitive point on the skin was considered a Devil’s mark. The Devil aided his accomplices by helping them deceive investigators into believing them innocent. It was for this reason that the accused were frequently tortured into self-incrimination.

Belief in diabolical witchcraft has never diffused from Western Christianity into other cultures except insofar as those cultures have become Christianized. The idea of the Devil made little sense in religious traditions other than the monotheistic ones. The Devil cannot be abolished from Christianity so long as Christianity is based on the New Testament. Still, as belief in diabolical witchcraft declined in the later seventeenth century and virtually disappeared by the second half of the eighteenth, belief in the Devil diminished rapidly at the same time. The decline of belief in Satan was probably hastened by the discredit brought on it by the absurdity and wide civil upset caused by the witchcraft trials. But it was above all the scientific and philosophical revolutions of the seventeenth and eighteenth centuries that diminished belief in both. Isaac Newton, René Descartes, David Hume, and Voltaire lived in a different world from that inhabited by St. Augustine, Luther, and Calvin. As belief in Scripture and in Christian tradition made way for belief in mathematics and empiricism, the Devil was increasingly marginalized.

DEVIL BOOKS

Short, didactic, and often amusing tracts attractively printed and presented, devil books appeared as a popular new print product in Germany during the second half of the sixteenth century, as Protestant reforming movements encouraged a heightened awareness of human weakness in the face of the overwhelming power of sin and its instigator, the Devil. This growing consciousness of human turpitude and sinfulness made the Devil a metaphor for all evil as well as a means of chastising specific personal behaviors deemed unacceptable in the early modern community, with witchcraft, of course, as a prime target.

In these books, the Devil appeared as the demon responsible for appealing to and tempting human vanities, passions, and anxieties. These were portrayed as individual devils assigned to specific sinful behaviors, such as drinking, hunting, clothes craziness, money grabbing, gambling, witchcraft, conjuring, and destructive mental states like melancholy. In all, thirty-eight books have been identified as belonging to this special genre of early modern didactic writings. Devil books can be divided into three thematic groups: Some were tracts on moral sins and evil habits (“devils” of drinking, fashion, cursing, gambling, hunting, stinginess, sloth, arrogance, dancing, flattery, lying, swearing, and melancholy); others concerned matrimony and family (“devils” of marriage, women, domesticity, worry, servants); still others addressed demonology and church life (about heaven and hell, conjuring, necromantic devils, clever or learned devils, sacramental, plague, and perjury devils). Individual devil books were short tracts attractively printed in easily readable letters. The German word for “devil,” *Teufel*, usually appeared in their title, printed in black or sometimes in black and red. Some title pages of early modern devil books also boasted attractively produced woodcuts, most often presenting an appropriately fiendish-looking devil in the company of the people he is leading astray.

The Protestant theologian Andreas Musculus, who worked in Frankfurt an der Oder after 1541, wrote the first devil books. The prolific Musculus wrote several of

the most popular devil books, such as *Vom Hosen Teuffel* (The Pants Devil), satirizing male passion for dressing in increasingly elaborate trousers; *Wider den Fluchteuffel* (Against the Devil of Cursing), reflecting Protestant emphasis on controlling and disciplining social interactions; and *Wider den Ehetueffel* (Against the Marriage Devil), a tract about how men and women should conduct themselves to achieve a happy marriage. This last tract was especially successful because of its mocking description of a marriage where the woman “wears the pants” and the man, satirized as *Dr. Siemann* (She-man), becomes a woman. Johan Einhorn, who was also responsible for several accomplished and attractive title-page woodcuts, originally published Musculus’s tracts in Frankfurt an der Oder.

Between 1551 and 1604, the success of the genre led to the printing of at least 38 first editions by 31 authors, followed by 105 further editions. Individual print runs are estimated at 600 for first editions and 1,000 for second editions; individual devil books may have been printed in as many as 2,000 exemplars, thus reaching a significant number (one-fourth of all German-speaking families) of early modern readers and listeners. Because of the small format of the individual devil tracts, a high loss rate over the centuries must be assumed.

These individual devil books became a lucrative business for print shops in many German-speaking towns, particularly Frankfurt an der Oder, Leipzig, Eisleben, and Frankfurt am Main (which took the lead in devil book production during the last quarter of the sixteenth century). Most authors and printers of devil books lived in overwhelmingly Protestant areas. Encouraged by the rapid sales of individual devil books, in 1569 the Frankfurt am Main printer Sigmund Feyerabend collected twenty of them into a folio volume, the *Theatrum Diabolorum* (Theater of Devils). Following his first folio edition, Feyerabend produced a second and third edition of his *Theatrum* in 1575 and 1587/1588, respectively. The latter had sold out by the 1590s. Feyerabend’s decision to gather devil books in one big luxuriously produced volume was based on his own positive sales experience. He had sold 1,220 single devil tracts, among them 232 on marriage, 203 on gambling, 180 on cursing, and 151 on hunting. In spite of their rather steep price of three Taler, the folio editions of the *Theatrum Diabolorum* soon drove individual devil books out of the market. Feyerabend targeted such educated readers as scholars, pastors, and church officials. The title *Theatrum* was, at the time, quite modern and appealed to an increasing trend toward gathering large amounts of information into one encyclopedic volume.

The first edition of the *Theatrum* began with Jodocus Hocker’s *Der Teuffel selbs* (About the Devil Himself). Hocker was pastor in Lemgo; after his death from the plague, his colleague Hermann Hamelmann

completed this work. *Der Teuffel selbs* offered a systematic review of all the “horrible habits and sins caused by the devil in these bad times, when the world is about to come to its end.” The tract reviewed what was known about the Devil and all his minions’ nature from Holy Scriptures, past and present authors, and from human experience. Even though the title directed the reader’s attention to one devil, Satan, the text very quickly talked about many, “Von den Teuffeln . . . Ob Teuffel seyn” (Of Devils . . . whether there are devils). Hocker went on to discuss the devils’ names, their nature, their purpose, how they got their evil inclinations, and how they fell from grace. His readers learned where devils lived, how hell was organized, what it looked like, where it was located, and what kind of wonders devils could perform. Readers also found out about his minions, the witches, and what they were able to do; about the efficacy of their pact with the Devil; about witchcraft trials, including a discussion of the effectiveness and legal and moral ramifications of torture; about the perennial question of how and why the Devil tempted Christians so cruelly and relentlessly, and why God gave him permission to do so. Hocker’s devil tract continued to be popular into the seventeenth century, when many demonologies quoted it.

The devil tracts following Hocker’s introductory essay were directed against personal sins and bad habits. Quite popular among them was Ludovicus Milichius’s *Der Zauber Teuffel* (The Devil of Magic, 1563). A small section from it appeared in the anonymous *History of Dr. Faustus* in 1587. The title woodcut of a 1566 edition shows a Faust-like figure standing in a magic circle holding alchemical paraphernalia, while a demon presents a mirror to the necromancer showing the devil’s backside.

Heinrich Grimm (1960) did the most important and still unsurpassed research on the devil books genre, significantly broadening previous studies by Karl Goedeke (1886) and Max Osborn (1893). Between 1973 and 1983, five volumes of selected devil books were republished, with a general introductory volume yet to be done.

DEVIL’S MARK

Although fifteenth-century witchcraft theorists did not consider it a significant indicator of an accused witch’s guilt, the custom of searching suspects for an anesthetic scar or mark, reputedly made when the Devil sealed his pact with the witch, became a major feature of seventeenth-century witchcraft trials in many parts of the Continent and in Scotland. Much confusion attaches to the term in England, where “Devil’s marks” were unknown (except for Matthew Hopkins in 1645); instead, the British preferred “witch’s mark,” referring to an extra teat, or nipple, on a woman’s body that was reputedly used to suckle her diabolical familiars.

Few of the fifteenth-century writers about witchcraft, including Heinrich Kramer in his *Malleus Maleficarum* (The Hammer of Witches, 1486), had anything to say about a Devil’s mark. Although theorists who did mention the mark mostly refuted it, local judges in various parts of western Europe from Belgium to Italy had already begun shaving all body hair from suspected witches in order to discover hidden diabolical charms long before 1500. It was a relatively short step to have professional surgeons shave and search suspected witches in order to discover the place where the Devil had marked them at the time they had made their pact. This step seems to have been taken first in the original home of witchcraft theory, the lands formerly belonging to the duchy of Savoy.

We find successful searches for the mark by inquisitors in the vicinity of Geneva in 1534, and by Geneva’s newly Protestant authorities in 1537 and 1539 (Monter 1976, 157–158). In both Geneva and the neighboring Swiss canton of Vaud, a place that had mixed witchcraft with heresy for a century, suspected witches were being systematically searched for the mark by 1550, although the practice did not spread to other nearby regions, whether Protestant Neuchâtel or Catholic Fribourg, until a generation later. The Catholic demonologist Henri Boguet even chided the Genevans in 1602 for their excessive confidence in locating the Devil’s mark before convicting a witch; Devil’s marks, he said, were very difficult to find, being very inconspicuous, and the Devil usually erased them as soon as the witch was arrested (oddly enough, the great Protestant skeptic Johann Weyer expressed similar opinions about the transitory and even reversible nature of the witch’s

mark in the 1560s; it is equally noteworthy in this deeply confessional age, where the divide between Roman Catholicism and Protestantism was so deep, to find Boguet's Protestant neighbors in Neuchâtel saying similar things about the mark in their 1602 procedural code for judging witches).

Despite such hesitations, the practice of shaving and searching suspected witches for the Devil's mark was spreading rapidly across both Protestant and Catholic parts of western Europe, including Boguet's own province of Franche-Comté, by the late sixteenth century. In France, local judges were frequently shaving suspected witches or checking their marks in Berry and Normandy by the early 1580s; Boguet's regional Catholic predecessor, Nicolas Rémy, had no qualms about asserting that the Devil ordinarily marked witches in Lorraine and cited several local instances from the 1580s when discussing the matter in his *Daemonolatria* (Demonolatriy) of 1595 (Book 1, chap. 5). In Scotland, Agnes Sampson was searched for the Devil's mark during King James VI's first witch hunt in 1590–1591. In the great regional witch hunt afflicting southeastern Germany at the same moment, hangmen routinely probed suspected witches for the mark with needles, looking for places where the needles would cause no pain.

Although the great Mediterranean Inquisitions paid no attention whatsoever to the Devil's mark, Catholic laymen north of the Alps sought and found it. In Franche-Comté, they searched fewer than 20 percent of witchcraft prisoners for the mark, but they found it 144 times in 146 searches (Rochelandet 1997, 31). The greatest secular court in Europe, however, seems to have paid relatively little attention to verifying the Devil's mark. It had been found on fewer than one-fourth of the hundred witches the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France) sentenced to death, and only three of them, including two brothers in 1583, had their marks confirmed by the *parlement's* own surgeons (Soman 1993, 95–96). In fact, this court asked its surgeons to test suspected witches for the mark in fewer than 3 percent of all witchcraft cases appealed to it and apparently paid little attention to the results.

Matters were entirely different in Calvinist Geneva. If the great Parisian judges did their best to ignore the Devil's mark, the Calvinist Rome became obsessed with it; Genevan judges relied on professional surgeons to verify the Devil's mark in every major witchcraft trial after 1600 and made this a precondition for pronouncing death sentences (Monter 1976, 54–55). At first, the surgeons found the mark seven times in nine cases; then they encountered an extremely difficult case in 1622, in which they admitted a mark was "suspicious" but refused to make a positive identification. Afterwards, they found a Devil's mark only once in eleven searches,

and then only after making a second test and in such an ambiguous manner that Geneva's magistrates called in a surgeon from Vaud, who quickly verified it.

In the seventeenth century, Calvinist Scotland relied almost as much as Calvinist Geneva on finding the Devil's mark. As late as 1699, the Glasgow synod debated the value of having experts with "skill to try the insensible Mark" in Scotland's court of justiciary (Larner 1981, 112). Although several suspected Scottish witches voluntarily resorted to this ordeal in order to prove their innocence, the "pricking" was generally done locally, by persons far less humane and less medically astute than Geneva's surgeons; few escaped unscathed. Throughout French Switzerland, except Geneva, Devil's marks continued to be found in the 1660s and 1670s on the last witches sentenced to death.

Numerous scandals dogged seventeenth-century experts who searched for Devil's marks. The hangman of Rocroi, in the Ardennes, had positively identified no fewer than 274 marked suspects, all but 8 of them in the Spanish Netherlands, when French authorities arrested him in 1603, convicted him of fraud (he collected a fee for each positive finding), and sent him to the galleys. Although three villages in Franche-Comté paid heavy fines in 1618 for hiring a surgeon who claimed he had a commission from the provincial *parlement* to prick and summarily banish suspected witches, the practice continued here until inquisitor Symard's witch hunt in the late 1650s; the local physician who translated Friedrich Spee claimed in 1660 that the proof of "the so-called supernatural Marks" would soon be abolished "if one takes care to recognize the truth," and his prediction soon came true (Monter 1976, 164). The Spanish Inquisition, like its Roman counterpart, paid no attention to the Devil's mark; the tribunal of Barcelona arrested a professional witch finder and sent him to the galleys in 1621. In France, the *parlement* of Languedoc similarly arrested a few surgeons for abusively pricking suspected witches for the mark during the great panic of 1643–1644. Something similar occurred after Scotland's final major witch hunt, in 1662, when the kingdom's most famous witch pricker, John Kincaid, was exposed as a fraud, along with two minor prickers, "Mr. Paterson" and "John Dickson," both of whom turned out to be women in disguise (Larner 1981, 111).

Whereas the ordinary European Devil's mark could be found on men as well as women, this was impossible in England, where it took the form of an extra nipple to suckle familiars. Despite this peculiarity, the history of searching for the mark followed much the same chronology in England as on the Continent, becoming more frequent during the later sixteenth century and apparently reaching a statistical peak during the Matthew Hopkins witch hunt of 1645, in which 78 of the 110 surviving testimonies mentioned familiars and

thereby included many details about the resulting witch's marks (Sharpe 1996, 137). Like so many other aspects of English witch lore, this form of the witch's mark crossed the Atlantic to New England, where teams of matrons conducted searches for it (Demos 1982, 179–181). But once again, the chronology fit European patterns, since both types of searches for the mark had virtually disappeared by 1700.

DIABOLISM

Diabolism, the belief that some humans worship and serve the Devil, became the central reason behind mass witch hunting in the sixteenth century. The development of diabolism from the twelfth to the sixteenth century, although convoluted, can be loosely sketched as a process in which learned inquisitors and theologians transferred notions about diabolical conspiracies from Jews to heretics to witches.

JUDAISM, THE DEVIL, AND HERESY

Early Christians condemned the Jews, who refused to recognize Jesus as their messiah, as children of the Devil, leading to suspicions that Jews worshipped the Devil and were perhaps even demons in human guise. Medieval artists frequently depicted Jews with horns. In the twelfth and thirteenth centuries, Christian preachers told stories about the ritual murder of Christian boys and the desecration of consecrated Hosts by Jews, suggesting that Jews required Christian blood to fulfill their diabolical rituals and prepare their magical ingredients. Denying that Jewish worship was directed to the same god they worshipped, many Christians postulated a mirror-image worship service directed to Satan instead, usually in the shape of a toad or cat.

As thirteenth-century Church leaders fought against the rising tide of dissident religious groups, especially Waldensians and Cathars, they readily transposed this

belief in Devil worship from Jews onto heretics. Their goal was to counteract the potential appeal and anticlericalism of heretical groups by demonizing them. Catharism proved to be a particularly useful target, since its proponents believed in a powerful god of evil, and inquisitors needed merely to twist that belief into a frightening portrayal of Cathars as worshippers of Satan.

A thirteenth-century German inquisitor, Conrad of Marburg, fixed the image of heretics as demon-worshippers in many inquisitors' minds. Conrad saw heresy as a great diabolical conspiracy in which heretics, appearances of piety notwithstanding, had made a pact with and secretly venerated Satan, symbolized by the noxious obscene kiss (the kiss of shame). After Conrad's assassination in 1233, Pope Gregory IX issued his bull *Vox in Rama* (A Voice in Rama) asserting the reality of the Luciferans. In short time, Waldensians were similarly accused of worshipping the Devil, and the idea that all heretics were secret devil worshippers became an established tenet of inquisitorial literature.

States as well as churchmen adopted such notions: In 1307, a fiscally desperate Philip IV of France had the Knights Templar accused of venerating the bust of the demon Beelzebub, renouncing the Christian faith, desecrating Christian objects, and performing the obscene kiss on the anus of the order's grand master at their secret meetings. More often, Jews became scapegoats for such conspiratorial fears. In the early 1320s, Philip V of France accused the Jews of hiring lepers to poison Christian wells, part of a conspiracy ultimately masterminded by Satan.

DIABOLISM AND THE SUPPRESSION OF MAGIC

Despite such charges of demonic service and worship, most educated people refused to believe that Satan could actually empower simple women to fly or perform magic. Instead, they supposed that the Devil had deluded simple-minded people into believing they had done these things—a position set out in a forged tenth-century decretal called the *Canon Episcopi*. However, those who believed they exercised such magical powers were still regarded as dangerous blasphemers who in some fashion worshipped the Devil rather than God. The thirteenth-century Scholastic St. Thomas Aquinas, for example, argued that all popular magic was effectual only through diabolical agency, and so inquisitors and judges began suspecting practitioners of illicit magic of diabolism.

Nevertheless, in 1258 Pope Alexander IV sought to restrict inquisitors from investigating magical offenses that did not involve consultation or worship of demons. Papal policy finally succumbed to the pressure to attack magicians as secret demon worshippers in 1320, after Pope John XXII became convinced that there had been a magical attempt to poison him. In 1326, the papal court listed many heretical magical

acts, which now included invoking or sacrificing to demons, making a pact with the Devil, and abusing the sacraments. Inquisitorial courts focused their efforts primarily on clerical transgressors, especially necromancers, and political enemies.

The first known trial for sectarian diabolical witchcraft occurred in 1324–1325 against Dame Alice Kyteler and several confederates in Kilkenny, Ireland. Concentrating on charges of *maleficia* (harmful magic), apostasy, and demon worship, their trial, like that of the Templars, was politically motivated and did not begin a general hunt for other demon-worshippers. Other trials of alleged Luciferans rarely included charges of sorcery, which remained restricted to political enemies or clergy. In no surviving trials before 1500 do we find the complete stereotype of a fully diabolized, night-flying, Sabbat-attending, cannibalistic witch.

THE VAUDERIE

These two types of accusations, sectarian diabolism and illicit magics, became fused around the turn of the fifteenth century. Several infamous cases of necromancy at noble courts, along with the continuing papal schism, wars, famines, and plagues that clearly indicated divine displeasure, led the University of Paris in 1398 to declare demon-assisted sorcery heretical, since it required a pact with the Devil. Mendicant preachers widely blamed demon-worshipping Jews, heretics, and other deviants for incurring divine displeasure, and trials of heretics increasingly incorporated sorcery and demon worship among the charges.

The Dominican Johannes Nider's treatise on sin, *Formicarius* (The Anthill), composed in 1437 and 1438 at the Council of Basel, mentioned some Swiss trials from the first decade of the fifteenth century of a sect of devil-worshipping sorcerers who devoured infants and performed *maleficia*. Simultaneously, deep in the French and Swiss Alps, both inquisitors and secular courts began systematically overlaying popular notions of magical, nocturnal assemblies onto their conception of the heretical witch synagogue.

Nider's efforts helped convince many judges and bishops of the existence of a massive diabolical conspiracy combining *maleficia* and Devil worship. Trials against alleged demonic witch sects gradually escalated after 1420, spreading through Swiss, French, and German territories. In 1486 a German Dominican inquisitor, Heinrich Kramer (Institoris), composed the most infamous witch-hunter's manual, the *Malleus Maleficarum* (The Hammer of Witches). It irrevocably linked *maleficia* to a diabolical sect and explained why women so often served the Devil. Even the moderately skeptical Ulrich Molitor, author of *De laniis et phitoniciis mulieribus* (Concerning Witches and Fortunetellers) of 1489, who argued that the *maleficia* of witches was

merely a diabolical illusion, affirmed that witches should still be treated harshly because of their devil-worship and apostasy.

THE REFORMATION AND DIABOLISM

With the start of the sixteenth-century Reformation conflicts, witch hunting declined considerably as courts concentrated on controlling more dangerous lay movements. Even though Martin Luther considered the spiritual bewitchment of heretics more dangerous than witchcraft, he believed that witches deserved harsh punishment for their apostasy. Reformers of all stripes pushed for the suppression of religious deviants, and the frightening image of demon-worshipping apostates proved long-lived. Such fears were reinforced by reports that many of the New World's native converts were secretly worshipping demons. The polemical conflicts of the Reformation era, moreover, escalated fears of diabolical conspiracies and divine punishment, as well as expectations of the apostasy and devil-worship expected to precede the Second Coming. Protestant and Catholic polemicists blamed each other for the sudden, apocalyptic rise in diabolical activities. Protestants associated belief in magic with Roman Catholicism, while Roman Catholics depicted Protestants as agents of the Devil, spreading doubt, heresy, and atheism, preparing the ground for diabolical witchcraft.

Mainstream propagandists saw Anabaptists and spiritualists as inspired, wittingly or not, by the Devil. Anabaptist refusal to baptize infants was frequently equated with sacrificing children to the Devil, and many Lutherans and Catholics feared that refusal to exorcise infants prior to baptism (Calvinists) or to baptize them at all (Anabaptists) would lead unerringly to an increase in diabolical activity.

THE GREAT WITCH HUNTS AND DIABOLISM

For both those who believed the diabolism of witches' confessions to be real and those who argued they were mere diabolical illusions, diabolical witchcraft remained a most serious crime. The presence in Europe of even a small number of blasphemous devil-worshippers was widely believed to provoke the wrath of God, evident especially after 1560 in an apparently increasing number of catastrophes, plagues, famines, and destructive storms. It became more necessary than ever to discover and remove the horrible blasphemers who were responsible. By now, most Anabaptists had been wiped out or driven underground. Other scapegoats had to be found, so there was a huge revival of the fifteenth-century stereotype of witchcraft as a demonic sect.

Ordinary people took responsibility for ridding their communities of troublesome and dangerous witches. Fear of *maleficia* was old and widespread, and natural disasters fueled fears of witchcraft, leading to increased

popular pressure for judges and rulers to act against alleged witches. Once in the courtroom or torture chamber, however, interrogators quickly turned the subject of questioning from harmful magic to diabolism. By the thousands, prisoners were compelled to confess to having made pacts with the Devil and joining a diabolical sect in which they flew to the witches' Sabbath, had sexual intercourse with demons, worshipped Satan (often symbolized by the kiss of shame), and plotted evil. Everywhere in Europe that witchcraft trials escalated into large-scale hunts, these diabolical elements became central in trials and in learned justifications. Every major witchcraft trial was a judicial effort to eradicate diabolism. Once belief in these diabolical elements declined among the learned, government leaders, and judiciary, the rationale behind mass trials disappeared, although concern about *maleficia* lingered for centuries.

DIANA (ARTEMIS)

The Roman goddess Diana has a long history of associations with the nocturnal practices of witches. As early

as the sixth century B.C.E., Diana was identified with the Greek goddess Artemis, the daughter of Zeus and Leto and the twin sister of Apollo. Known as a virgin who could be cruel and vindictive, she was associated with hunting and the moon. The second-century B.C.E. Roman scholar Varro said that in ancient times country folk would seek out solitary beasts and remote forests “under the leadership of Diana, so to speak,” (Varro 1619, 163) and the seventh-century encyclopedist, Isidore of Seville, in his *Etymologiae* (Etymologies, 8.11.56), proposed deriving her name from *duana* (from *duo*, “two”), because the moon appears during the day as well as the night. Diana's two earliest shrines were at Capua and Aricia, near Rome. At Ephesus, where St. Paul encountered her cult, she was worshipped as a goddess of fertility.

Diana was also associated and sometimes identified with the Greek and Roman goddess Hecate or the German goddess Holde, both of whom people identified with night and moonlight, the dead, and necromancy. A number of ecclesiastical texts also associated Diana with a shadowy figure, Herodias, whose identity is disputed, and with others, such as Bensozia or Perchta, whose provenance is equally obscure.

From at least the tenth century C.E., churchmen exercised themselves over a widespread belief that there were certain women who were seduced by Satan and his demons into believing that on particular specified nights they would ride upon beasts, covering great distances, in the train of Diana or Herodias, and that they did so because they had been specifically called to act as her servants. There was also another belief, equally widespread, that a ghostly throng of the dead, especially those who had died before their appointed time, could sometimes be seen or heard rampaging through the air—an association more appropriate, strictly speaking, for Hecate than for Diana.

This spectral hunt and Diana's band were not always kept apart in popular (or indeed learned) imagination. We find that the tradition of some such group headed by Diana, denounced in the text known as the *Canon Episcopi* (ca. 906), appeared over and over again in discussions and glosses between the eleventh and fourteenth centuries. A Veronese priest, for example, recorded in 1313 that many among the laity believed in the existence of a nocturnal society whose leader was Diana or Herodias. The tradition lived on in later sixteenth- and seventeenth-century texts, as early modern demonologists quoted it in support of their arguments about whether witches really flew through the air on their way to a Sabbath.

Skepticism, however, was not confined to the later period. The twelfth-century English bishop, John of

The goddess Diana linked to night, moonlight, and the dead; thought to lead a furious horde of witches on a nocturnal ride. (Tooke's Pantheon of the Heathan Gods, 1659)

Salisbury, noted in his *Policraticus* (The Statesman) that people were deceived by evil spirits into imagining that “Noctiluca” or “Herodias” summoned them at night to orgiastic feasts where rewards and punishments were meted out, and infants were sacrificed and eaten before being vomited up and returned unharmed to their cradles. “Indeed, it is obvious from this,” said John, “that it is only poor old women and the simpleminded kinds of men who enter into these beliefs” (John of Salisbury 2001, 78).

The penalties imposed by the Latin Church upon those who persisted in believing that these things were real rather than illusory were not particularly severe at first. Burchard of Worms prescribed one year’s penance on bread and water for those who flew with Holde, and two years for those who flew with Diana. But should anyone believe he or she could resuscitate the dead (as

John of Salisbury mentioned), the penance was increased to seven years.

Later on, however, as these legends about a divine queen and her hunting band started to blend with the fantasy of witches’ transvection to a Sabbat, the problem for the Church increased considerably. If the flights were diabolical delusions, the sufferers must be warned (which was, by and large, what the Inquisition tended to do). If, however, the flights were real, mere penance would not be enough. Diana’s “game,” as it was sometimes called, therefore became a factor in the development of the later witch prosecutions in Europe.

During the nineteenth century, Diana was incorporated into a new myth directly related to the emergence of *Wicca*, or modern witchcraft. In *Aradia* (1899), Charles Leland, an American journalist, suggested that Diana had sent her daughter Aradia to earth to teach witchcraft to outlaws from feudal oppression, thus making her the goddess of what Wiccans call “the old religion,” a fantasy the Egyptologist Margaret Murray strongly reinforced in the 1920s and 1930s.

DIONYSUS (BACCHUS)

Dionysus was the god of wine and intoxication in Greek mythology, honored by the Romans as Bacchus. His cult, which spread from the East and continued for half a millennium, originally showed him as the god of fertility and vegetation. Some scholars have mistakenly believed that a religion of witchcraft existed in late medieval and early modern Europe and that it was a successor to the Dionysian cult. After reaching adulthood, he was said to have roamed the world, accompanied by his tutor Silenus, satyrs, and bacchantes (female followers), spreading his invention, wine. A dying and reviving god with some sun-god attributes, he possessed the gift of prophecy; in Thrace, places of divination were associated with his name.

Euripides described the main features of his cult in his *Bacchae* (fifth century B.C.E.): bacchanalia, rituals

accompanied by mad dancing, Dionysian, or Bacchic, mysteries in which one can detect Orphic and Pythagorean influences promising a happy world after death. At the ecstatic nightly orgies of early Dionysian bacchantes in Thrace, groups of women led by men usually participated as escorts to Dionysus (his *thiasos*, “band of revelers”), assimilating themselves to a deity that assumed an animal shape (tiger, leopard, snake, donkey, goat) and possessed them. In other cases, they impersonated the maenads and satyrs escorting Dionysus. These orgies were characterized by wild dances and promiscuity. Certain interpretations claim that the bacchantes also performed a ritual killing of the child Dionysus, tearing to pieces their human sacrifices embodying the deity and eating them raw (*omophagia*). This practice is related to the myth that, as a baby, Dionysus was torn to pieces, boiled, and subsequently revived by Rhea.

From the second century B.C.E. onwards, the most widely known sequence of festivities within the Greek Dionysia came from Attica and had three crucial points, in December, December–January, and February–March. The essence of these festive rites (which played an important part in the emergence of the dithyramb and Greek drama) was a march carrying phallic symbols and chanting ecstatic choral songs, with a sacrifice performed as part of magical-religious metamorphosis-plays commemorating Dionysus’s death and resurrection.

In the Hellenistic age, this cult became public. Its followers organized themselves in groups called *speira*, or *spira*, which included military officials, kitchen heads, and wine masters. They organized banquets in caves—the cultic places of nymphs. Traces of these festive drinking binges survived as late as the ninth century C.E.; memories of these tamed orgies of Hellenistic Dionysia may have survived in Balkan narratives of feasts by “winter demons” or the movable feasts of witches marching from house to house and wine cellar to wine cellar. Several surviving sources from Thrace and Dacia describe organized marches and banquets of the *speiras*, which share many features with Bulgarian and Romanian groups of fairies: the “horse,” the “mute” who impersonates a policeman, and other typical characters return in dramatic plays for New Year and Carnival.

Some scholars (Nilsson 1911; Lawson 1910) saw modern Balkan survivals of ancient Dionysia in the masked rites of Greek, Bulgarian, and Serbian areas between New Year and Carnival, which include death-and-revival plays performed in the course of *kukeri*, *turca*, *koledari*, the battles of the dark and light (Turkish and Christian) groups, the fights between winter and spring, and the battles between two villages over fertility. Their rites enact the death and revival of vegetation; they employ the horse, goat, bull, and deer

masks of masked plays, and use sticks as phallic symbols. These rites, in midwinter and at Carnival time, approximately correspond to the dates of the minor village and the major urban Roman Dionysia and Saturnalia. Probably through conscious use of ancient literary sources, impersonations of Dionysus or Bacchus reappeared in Central European Carnival and grape harvest festivals, where clerical authorities banned invocations of Bacchus.

In the Balkans, Thracian Dionysia also survived in the Rosalia Feast, the most popular death feast of imperial Rome. Rosalia coincided with Anthesteria, a Dionysian festival of the dead. This was the time when the dead came to be among the living. In Thrace, connections between the cult of Dionysus and the cult of the dead remained strong. A period of the Rosalia week is still devoted to visiting the family dead and offering them treats in the Pravoslavnic part of the modern Balkans. Russian, Romanian, and Southern Slavic fairies bearing this name (*rusali*, *rusalki*) have a strong death-related character.

Certain features of Dionysus’s Thracian death-related cult may survive in the fairy mythology of the Balkans and in the possession rites practiced in Orthodox areas (*caľusarii*, *rusalia*), where ecstasy through music and dance played an important role through the *mainesthai* state, a possessed state of mind identifying with the deity. The same might be said of the possessed, ecstatic healing practice of fairy magicians who were snatched to the otherworldly sphere of fairies and who communicate with the fairy world. By the Hellenistic age, an essential component of Dionysian mysticism was being “joyously lost” in a heaven flavored with the pleasures of Aphrodite (Nilsson 1957). This heaven shares many features with the heaven of modern Balkan fairies.

DISCERNMENT OF SPIRITS

The term *discernment of spirits* refers to the various ways true manifestations can be distinguished from false, and has been especially important in assessing whether someone was believed to be possessed by the Devil or filled with God. *Discretio spirituum* was, in Catholicism, a personal gift, an institutional imperative, and a manner of assessing the authenticity of worldly manifestations of divine favor in individuals.

Catholicism is a sacramental religion, that is, it allows for direct and unexpected manifestations of divine power in the material world. Because such signs as the gift of prophecy, visions, or ecstasies, offer renown—for example, in the cult of saints living or dead—the Church requires those in authority to distinguish truly God-given signs from the work of devils, or human frauds.

Paul identified the capacity to discern one manifestation from another as a divinely bestowed grace (1 Cor. 12:10), and John wrote, “test the spirits to see whether they are of God” (1 John 4:1); but the Devil’s capacity to disguise himself as an “angel of light” (2 Cor. 11:14) has historically rendered this task of discernment difficult for Catholics. In the late Middle Ages, a time of strong mystical tendencies, the discernment of spirits became an especially pressing issue when inspirational figures—frequently women, such as Bridget of Sweden, Catherine of Genoa, or Joan of Arc, but also men, as, for example, Meister Eckhart and Savonarola—came to be venerated and emulated. In the case of women, the emergence of such figures aroused fears of female susceptibility to devils, linked with a deepening anxiety about the power of the Devil in the world. The central question was whose will was at work in any given case: God’s, the Devil’s, or a human being’s.

The most influential late medieval commentator, himself a notable mystic, was the French theologian Jean Gerson, the chancellor of the University of Paris. Gerson wrote two guides to this problem, *De Distinctione Verarum Visionum a Falsis* (On Distinguishing True Visions from False) in 1401, and *De Probatione Spirituum* (On Testing Spirits) in 1415, instructing Church officials in how to authenticate or invalidate claims to divine inspiration. *De Probatione* was written at the Council of Constance to address and implicitly to condemn the revelations of St. Bridget of Sweden. Gerson (who at the end of his life supported Joan of Arc) here drew attention to the supposed moral and mental weakness of women, said to make them more vulnerable to delusion and to the sin of pride. Clearly, though, the behavior of female aspirants reflected their marginal position in relation to the Church hierarchy, and the direct receipt of divine favors was often their only way of actively participating in spiritual life.

Many other theologians set down guidelines for spiritual discernment, from St. Augustine through such

medieval luminaries as Thomas Aquinas, Bernard of Clairvaux, and Richard of St. Victor, to Pierre d’Ailly, Ignatius Loyola, Domenico Gravina (d. 1643), and Giovanni Bona (d. 1674). Broadly, they concurred that discernment should be undertaken both for the purposes of self-examination and the examination of others, especially by spiritual directors and inquisitors. The principal guides were believed to be the inquirer’s own gift of discernment (acquired through inner knowledge or through holding a Church office), aligned with “art and science,” gained through experience and the study of theology. Judgment required knowledge of the circumstances in which the phenomenon arose (including ill health); of the credibility of the visionary, including his or her attitude to the phenomena being experienced; and of the nature of the manifestations, including whether such prophecies or revelations concurred with Church teaching. Because discernment worked to expose and eliminate personal pride, willingness to submit oneself to scrutiny became an indispensable mark of possible holiness.

St. Ignatius (d. 1556) focused on discernment within oneself. He described, for example, how experiencing an emotion, from its source in thought to its expression in feeling, helped one “little by little [. . .] to know the difference in the spirits that we are at work, one of the devil and the other of God” (Christian 1982, 103). The demonically possessed nun Jeanne Féry claimed that Mary Magdalene had visited her and explained how to discern the actions of good and evil spirits: “Good spirits when they arrive bring fear to the person, but when they leave, leave them full of joy and consolation. In contrast, evil spirits cause some apparent recreation when they arrive, and when they leave, the person is confused, perplexed, bewildered and ill at ease” (Buisseret 1586, fol. 19r). This example, of course, begs the question of the authenticity of the vision. Jeanne des Anges, the superior of the Loudun Ursulines, had a guardian angel that resolved the problem by telling her not to obey what it said unless it accorded with what her human spiritual director told her.

In this system, those most liable to be scrutinized were also potentially ideal people to discern: Thus, Madame Barbe Acarie, a French Carmelite mystic, discerned fraud in an ecstatic named Nicole Tavernier, but, following the example of St. Teresa, she had her own ecstasies scrutinized by churchmen. The problem of who could judge such gifted judges was particularly acute for women, especially those like Jeanne des Anges who were also exorcised for demonic possession. In 1599, Martín Del Rio interpreted false claims of divine favors as the product of witchcraft.

The discernment of spirits provides a basis for judging ecstasies, visions, and revelations and implies a hierarchy of holiness. Without it, validation of divine

inspiration by the institutional Church becomes impossible. Thus, discernment arguably remains crucial to the survival of Catholicism.

DISEASE

Disease was by far the most common harm ascribed to witchcraft. In theory, witches can inflict many types of damage, but most suspicions in early modern Europe involved bodily dysfunction or death. The kinds of maladies blamed on witchcraft varied greatly, but in general they were maladies that seemed unusual and somehow linked to interpersonal conflict.

Explanations of how witches inflict bodily ailments vary from culture to culture. They include the idea that witches' spirits fly out at night and devour the spirits of their victims, that their words or gestures or touch or breath have an innate power to harm, and that they conjure spirits or use poisons against their enemies. In late medieval Europe, demonologists concluded that

the power of witches to inflict harm inherently involved the mediation of demons, so they must have concluded a pact with the Devil. During the early modern period, Europeans frequently suspected that their maladies resulted from others' malice. Changes in medical theory, more rigorous legal standards concerning proof of causation, and growing skepticism about confessions obtained through torture ultimately led doctors, jurists, and magistrates to prefer natural explanations for diseases over spiritual ones. The decline in witchcraft persecutions was thus intimately connected with the rise of modern medical materialism, which caused psychological influences on health and disease to be de-emphasized, not only in medical theory but in historical and anthropological understanding of witchcraft as well. Only recently have medical theory and social science begun to appreciate the full extent to which emotions and social relationships can influence health and disease.

WITCH-RELATED DISEASES AND CURES

Over 70 percent of the accusations against witches in Essex county, England, involved illness and death of people, and almost all the rest concerned injury to animals (Thomas 1971, 539). The proportion was not this high everywhere, for witches could also be blamed for bad weather and a variety of other problems; but disease—bodily maladies and death—nevertheless accounted for most suspicions and accusations elsewhere.

In early modern Europe, as in many premodern societies, many, although not all, diseases might be ascribed to witchcraft. Witches were only occasionally blamed for epidemic diseases, and diseases with clear and well-known symptoms were less likely to be blamed on witchcraft than diseases with etiologies that were unclear. Witchcraft could be blamed, however, for any disease that seemed somehow unusual, if it came on unusually swiftly, lingered unusually long, or presented other unusual symptoms, for it was the sense of strangeness that most strongly characterized accounts of disease attributed to witchcraft.

This sense of abnormality was strongly reinforced if, in addition to presenting unusual symptoms, the onset of the disease came at a time of some interpersonal difficulties, and especially if its symptoms seemed symbolically linked to the conflict. Witchcraft was not associated with any specific diseases, because it was concerned with another dimension of health and illness, social relations. Although practically any disease could be attributed to witchcraft in theory, in practice only a small fraction of all illnesses were blamed on it. The explanation is that a disease was seen as caused by witchcraft only if its symptoms meshed with the patient's social relationships in certain ways. Two conditions were necessary: Witchcraft was blamed if a disease

could not be fully accounted for by natural agents and if the patient had had an altercation or encounter that suggested a malign interpersonal influence.

Because of the primacy of social relations in diseases caused by witchcraft, cures similarly focused on social relationships. One approach was to try to get the suspected witch to remove the disease, either by reconciling with her (or him) or by threatening retribution. A second approach was to shift the disease to another person, or even transpose the illness back onto the person causing it. A third was to punish the witch, either through informal violence or by denouncing her to the authorities. Sometimes the afflicted person attempted these remedies, but more typically, popular healers, "witch doctors," or even specialized "unwitchers" performed this service. Most societies have such specialists, and they were common in early modern Europe.

HOW WITCHES CAUSE DISEASE

Explanations of how witches are supposed to cause disease vary from culture to culture, but basic to them all is the assumption that witches exert some sort of occult or magical power over the victim. The Dobu Islanders in the Western Pacific say that a witch's spirit leaves her body while she sleeps and steals the spirit of her victim. Similarly, the Nupi and Gwari in Africa say that a witch's soul roams about at night and eats the soul of her victim, causing the person to die of a wasting disease. The Pueblo of North America hold that witches send an insect, sharp object, or piece of flesh or shroud from a corpse into a person to cause disease; staring, the evil eye, is commonly thought to cause disease in South Asia. Early modern European popular culture believed witches possessed a variety of occult means for causing disease: dispatch of familiar spirits; pressure by the witch's own spirit on a sleeping victim; the evil eye; touch; uttered threats or curses; performance of ritual magic; and poisons.

Popular ideas about how witches caused illness were seldom very specific about the underlying mechanisms that made them work, but natural magicians, philosophers, and theologians constructed elaborate theories that connected magical actions to theories about health and disease. Galenic medicine, dominant since antiquity, emphasized physical bodily processes; but its notion that health depended on a balance of humors combining physical and emotional aspects, subject to environmental as well as internal processes, left some possibilities for spiritual and astrological influences. Renaissance Neoplatonic philosophy posited a living universe suffused with spirits that could affect the physical world, and its principle of sympathetic action supported popular notions of sympathetic cures. Simultaneously, late medieval theologians classified all agents of magic as demons, and concluded that anyone exerting an occult influence on health or disease must be in league with the Devil.

Although neither the populace nor most governments evinced much alarm about beneficent healers, demonology apparently heightened popular concern about the baleful influence of witches. This new ideology not only made people more likely to look for witchcraft as the cause of illness, but also increased their vulnerability to psychosomatic disorders provoked by fear of witchcraft. Apparently, it even affected the nature of people's symptoms, as they adjusted their reactions to disease to fit their cultural preconceptions.

THE ENLIGHTENED UNDERSTANDING OF WITCHCRAFT AND DISEASE

Symptomatology may have changed during the early modern period, not only when people in previously isolated regions began shaping their ailments to fit new, standardized models disseminated by witch hunters, but also when, later, they felt compelled to manifest increasingly extreme symptoms of bewitchment to justify accusations as the elite gradually disengaged from prosecuting witches. A growing skepticism in the elite about tortured confessions of *maleficium* (harmful magic) as well as about diabolism, together with new currents in medical thinking, combined to downplay the potential for magical influences. One crucial step, taken in Louis XIV's France in 1682, was the legal redefinition of poisoning as a purely material process, stripped of its traditional magical associations; another was the increasing propensity to regard psychogenic ailments as something other than genuine disorders imposed by external assaults. These currents of thought reinforced each other and blended with larger cultural trends in the eighteenth century to shape both medical theory and the retrospective understanding of witchcraft trials and witch beliefs. Although medicine never completely lost sight of the role of nonmaterial factors in disease, it dropped the idea that illness could be imposed by someone else's ill will, and the role of the patient's emotions in disease was long supported by little more than the pragmatic observations of country doctors.

Subsequently, the rise of psychosomatic theory made physicians and social scientists more aware of the extent and power of psychogenic diseases, and so hysteria and the power of suggestion became acknowledged as secondary aspects of witch beliefs, whose power depended on general cultural expectations and individual psychological vulnerability. In recent decades, however, psychosomatic theory has undergone a fundamental revision, replacing the old Freud-based psychodynamic model with an interpretation centered on the physiological effects of stress. Although it is still believed that intrapsychic tensions are sometimes somaticized, as postulated in classical psychosomatic theory, the new consensus is that physiological changes

that are adaptive in the short term but damaging when they become chronic are responsible for far more health problems. Such changes may cause discrete ailments, and they may also be contributing factors in maladies with additional causes. Internal psychological factors play a significant role in these processes, but environmental forces, including interpersonal conflicts, can have a far greater and more direct influence than earlier medical theories appreciated. Psychological factors, like witchcraft, affect a wide range of health problems, and include powerful environmental influences. These parallels do not reduce witchcraft beliefs to psychophysical theory, but they do suggest that witchcraft fears have a firmer basis than traditional enlightened understanding held.

DIVINATION

Many cultures that believe in witches employ divination to determine whether or not some particular misfortune was caused by a witch, and, if so, to reveal his or her identity. Divination is a broad category of magic that functions to learn otherwise inaccessible knowledge about the past, present, or future. It is practiced in most, if not all, human cultures, from simple hunting-and-gathering societies through all levels of agricultural society, including medieval and early modern Europe, to modern

industrial civilization. The kinds of knowledge sought can pertain to almost any human problem, from the identity of a petty thief or future spouse to the prospects of an empire embarking on war.

There are hundreds, probably thousands, of divinatory techniques, ranging from general-purpose oracles to specialized methods focused on a single type of concern. Divinatory techniques include the deliberate seeking of omens, observation of spontaneously occurring natural phenomena considered as portents of future events, and consciously induced prophecies, internally generated prognostications; but divination generally entails overt rituals with results that are interpreted to provide the desired information. Although anyone can undertake divination, many cultures have specialists who provide this service. Though modern social scientists reject the supernatural transmission of information assumed by people who believe in divination, they recognize that it serves numerous socially and personally useful purposes, facilitating choices and validating judgments, particularly when available information is insufficient for a rational decision. They tend, however, to emphasize the ways in which divination can be used to manipulate the credulous or blithely validate people's preconceptions, and by so doing they miss the more important point that when conducted properly, divination serves an important function by bringing into awareness knowledge normally kept unconscious by sociocultural or personal-psychological inhibitions.

PURPOSES

Divination can be used to gain information about or insight into almost any human situation. In modern usage it is most commonly associated with prediction of an individual's generalized future, "telling someone's fortune," which indeed has been a common use for it, through time and across cultures. Specific predictions about certain common topics, such as a person's prospects for love and marriage, career success, and longevity are usually included within such generalized fortunes, and often are the objects of more focused divinatory inquiries. Furthermore, divination can be used to answer more detailed questions, such as which of two or more courses of action to take, whether or not a specific endeavor will succeed, or when the auspicious time to start a project might be.

Though modern Westerners associate divination with personal fortunes, it has also played a more public, social role in other times and places. In tribal cultures and ancient civilizations, divination was often used in making communal decisions. In early agricultural societies, predictions about the weather and the harvest were a major focus of divinatory activity. Public use of divination continued in the West into Roman times, but the conversion to Christianity ended official employment of divination, since wanting to know the

future was contrary to Christian faith in God's providence, claiming to know the future implied a constraint on God's omnipotence, and some practices used in divination were suspected of involving demons. Nevertheless, kings and other public personages, along with ordinary people, commonly prayed to God for certainty about the best course of action, and they understood omens and prophecies to be legitimate indications of God's intentions.

On a more local level, divination continued to be employed informally for public purposes throughout medieval and early modern Europe. In particular, divination was frequently used to determine the guilt or innocence of suspected criminals, although by the early modern period it was seldom part of official trial procedures. In the Middle Ages, judicial ordeals were commonly used, in which a suspect's ability to prevail in combat or endure some torment was taken to signify innocence, and which may be considered a form of divination, since the outcome had no intrinsic connection to the question. In both the Middle Ages and the early modern period, more traditional forms of divination were often employed informally to identify thieves. Another form of judicial divination widely used in the early modern period involved "swimming" (that is, throwing a suspected witch in the water to see whether she [or he] would sink or float) to identify witches, although it was nearly always used outside official proceedings.

Other uses for divination were not focused on discerning guilt. Closely related to identifying thieves was locating stolen or lost property, and equally popular was divination to locate buried treasure or missing persons. Still other uses of divination included learning about the well-being of a distant loved one or the disposition of a competitor or potential ally, and obtaining information about some past event with current relevance. In short, though divination was most commonly used to address a fairly limited number of concerns about the future, it could be used to guide almost any vital decision a person had to make.

TECHNIQUES

The techniques by which divination is conducted are legion. Over 100 of them have been formally classified, including scapulomancy (inspecting animals' shoulders), dactyliomancy (using a finger ring), oneiroscopy (interpretation of dreams), chiromancy (palm reading), and necromancy (contacting the spirits of the dead). Supplementing these are a host of local and even personal techniques, some early modern examples of which include forecasting the weather by interpreting ravens' cries, foretelling the future by the croaking of frogs, and predicting the price of corn by watching what happened to grains placed on a hot hearth.

However, these innumerable techniques generally fall into a few broad categories. One is the interpreta-

tion of omens, spontaneously occurring natural phenomena ranging from weather events to animal behaviors to the features of a person's palm print to the day on which something occurs. Strictly speaking, paying attention to these phenomena is not a form of divination if they are observed and reacted to spontaneously, but it is if they are deliberately studied and systematically interpreted. Astrology, the prediction of the future from the positions of the planets and stars, is the best-known form of divination of this sort. Another type of divination involves certain forms of prophecy. In contrast to externally produced omens, prophecy depends solely on internal meditation. Like omens, prophecy can be considered a form of divination when it is nurtured deliberately through ritual preparation and conscious cultivation.

Most characteristic forms of divination involve the employment of rituals intended to generate results that will reveal the desired hidden information. These rituals fall generally into two major categories. The first includes rituals that create physical patterns or outcomes that the diviner then interprets; the second involves rituals in which the diviner gazes into a reflective surface and "sees" an image relevant to the issue at hand. In the early modern period there were innumerable rituals of the first type; examples include ordeals, the casting of dice or other lots, opening a book like the Bible and reading the first passage noticed, putting a drop of liquid from a pregnant woman's breast into water to learn by whether it sank or floated the sex of her unborn child, and interpreting the pattern of ashes, smoke, and, in the eighteenth century, coffee grounds to answer a specific question or discern a general fate. Other examples of physical rituals, employed particularly, although not exclusively, to identify thieves, included the "sieve and sheers" and "book and key," in which objects held by people who had been robbed moved when the name of the thief was spoken, and the practice of putting slips of paper with names on them in balls of clay and dropping them in water to see which unraveled first.

A method used to identify witches involved holding ceremonies designed to draw the guilty party, and then noting the first person to enter the house. The more limited range of "gazing" rituals usually utilized crystals, mirrors, sword blades, water, or polished thumbnails. Some rituals straddled the two categories, for instance, geomancy, in which the diviner gazed at a random pattern of dots to generate not an image but an answer. A few worked in other ways entirely, like necromancy, in which a spirit summoned by the conjurer simply divulged the desired information.

PERSONNEL

Divination does not inherently require any specialized qualifications, although forms involving books obviously

require literacy, and complex methods like necromancy might require training. A wide variety of techniques are available to anyone and are often used by ordinary people. Nevertheless, many societies, including Europe, since prehistoric times, have had specialized practitioners. In medieval, early modern, and modern Europe, these have included both local “cunning folk” and itinerant fortunetellers. The former might or might not charge for their services; the latter certainly did. Either might specialize in a certain form of divination or offer a variety of types, and might combine divinatory with other magical services as well. Many claimed to be able to detect witchcraft and identify witches; some specialized in this, and most who did either also offered ways to remove their spells or retaliate against them through similar magic.

BASES

In some forms of divination, the meaning of the outcome is self-evident, as when someone opens a Bible at random, or the “sieve and sheers” move when a particular suspect’s name is mentioned. In others, the meaning is prescribed by a written source, as when dice are cast and a book listing possible fates is consulted, or by tradition, as in the ritual to determine the sex of an unborn baby. The methods involving gazing clearly utilize the mind’s ability to construct a meaningful image by combining incoherent perceptions with subconscious expectations. Similarly, rituals involving the spontaneous interpretation of patterns appear to be techniques to bring unconscious knowledge into consciousness, and the use of devices like the “sieve and sheers” serve to trigger unconscious reactions. The austerities and ritual preparations that often precede divinatory activity would appear to serve a similar purpose, helping to induce an altered state of consciousness in which otherwise inaccessible knowledge can be brought into awareness. For those who do divination on their own account, the manifestation of knowledge in consciousness occurs directly; when specialists do it for someone else, the process involves a more complex process, in which diviners combine manifestation of their own knowledge and a subtle reading of the unconscious reactions of the client.

Of course, rituals relying on unconscious processes are subject to conscious manipulation, while rituals relating objective results to standard interpretations assume an occult connection between objectively independent events or processes. Furthermore, interpretations are often couched in ambiguous terms, so that whatever happens, they appear to have been correct (or any mistake was in how they were understood), and memories of successes tend to overshadow those of failures. All of these considerations have led social scientists to explain divination’s pervasiveness and persuasiveness in terms other than its validity. They emphasize that divination allows the questioner to ven-

tilate deep concerns, that it is often manipulated to validate preexisting knowledge or decisions, that it serves to bolster confidence in necessarily arbitrary decisions, that it justifies deviations from traditions or social norms, that it creates apparently disinterested resolutions of otherwise irresolvable disagreements, and that it provides authoritative support for otherwise mundane advice.

Granting the vulnerability of divination to manipulation and the truth of the points made by social scientists, it is nonetheless important to recognize that recent advances in neurological science tend to confirm that the human nervous system contains a great deal of knowledge not directly accessible by consciousness, and which cannot be rationally justified even when brought to consciousness; therefore, techniques that bring this knowledge into awareness in a legitimizing context have real value for people operating in a world of imperfect information and beset by both conscious and unconscious distortions of rational thought and discourse.

DODO, VINCENTE (LATE 15TH–EARLY 16TH CENTURY)

An ardent believer in the reality of diabolical witchcraft and in the flight of witches (Lea 1957, I, 367), Dodo achieved significance from his debate with Samuel de Cassini (Cassinis), a skeptic of the ability of witches to fly, who attempted to stop witch hunting. Little is known about the life of this Dominican theologian, who lived in the late fifteenth and early sixteenth centuries and became abbot of the monastery of Saint Thomas in Pavia. The dispute between Dodo and Cassini represents a fundamental clash of beliefs about

this topic in the first decade of the sixteenth century. Because Heinrich Kramer's *Malleus Maleficarum* (The Hammer of Witches, 1486) was not yet important, especially in Italy, Dodo's statements certainly reflect his personal views rather than external influences. Dodo wrote his *Apologia contra li defensori delle strie, et principaliter contra Quaestiones lamiarum fratris Samuelis de Cassinis* (Apology Against the Defenders of the Witches, and Most of All Against the Treatise on Witchcraft Written by Samuel de Cassinis), in order to refute some arguments about witchcraft that he claimed that Cassini had abused. Dodo followed the traditional scholastic method of explaining his opponent's arguments before refuting them, but he clearly exaggerated in asserting that Cassini supported the sect of witches. According to Dodo, Cassini held that no miraculous event can produce or induce sins, and so Dodo overthrew this theory. Also he felt fully justified in claiming, in rebuttal of Cassini's explanation, that the authority of the *Canon Episcopi* (the tenth-century ruling that maintained that supposed witches only imagined they could fly) applied only to a bygone situation, not the one in which they were living: The truth about witchcraft and its reality rested on factual evidence.

Neither Cassini and his allies nor Dodo and his allies wanted to encourage credulity and a lack of critical analysis of experience. They shared the view that no claim should be blindly accepted, since blind acceptance only encouraged religious charlatans. Instead, both authors tried to encourage a reformed and pure religion. Dodo, however, worried far more than Cassini about the increase in demonic actions, which he viewed as a threat to the whole natural and divine order of the world; he also castigated various forms of witchcraft as heresies.

When dealing with demonology, Dodo accepted the major versions, Platonic and Aristotelian, both of which accepted the reality of demons, concluding that demons can do anything. Beginning with brief accounts of the origins and the development of each belief, Dodo explored such topics as the demonic power to transport and to deceive men. He remarked that, in such circumstances, it was impossible to determine the correct reason for such supernatural deeds, and asserted that God allowed demonic powers in order to test humanity's faith and powers of endurance. Dodo situated the need to understand witchcraft within a far broader context, in which God's will was seen as remaining mysterious and obscure to men. Such statements constituted a textual application of Thomistic theory to demonology.

Throughout his controversy with Cassini, Dodo strongly defended the authority of the Dominican order; in fact, their quarrel exemplified the fierce polemic between Franciscans and Dominicans, and his treatise served to emphasize the superiority of the latter.

Dodo even asserted that Cassini lacked common sense. Moreover, he supported the inquisitors (who were nearly always Dominicans) against Cassini's attacks: The emergence and increase of witchcraft justified their power.

Their polemics continued. Cassini answered Dodo's confutation, to which the Dominican abbot replied with an *Apologia*. Dodo also composed another treatise, *Contra inectivam dicti Samuelis in doctrinam Sancti Thomae Aquinatis* (A Refutation of Cassini's Critical Statements on Saint Thomas's Doctrine), defending Saint Thomas against Cassini's attacks, using both logical arguments and the authority of respectable theologians; he concluded by accusing his enemy of heresy.

DOGS

The dog has a long and diverse tradition as a symbol of witchcraft, the demonic, and the dead. The dog or jackal appears in ancient Egyptian art as the deity Anubis, a god of the underworld. Cerberus, the three-headed hound, guarded the gates of the realms of Hades. Dogs were traditional companions of Hecate, the Greek goddess of witchcraft. It is not surprising that medieval Christian demonologists used dogs, especially black dogs, as symbols for the Devil and witches. Witches' familiars could assume the form of dogs. Witches were also associated with wolves, and at times these two canines became confused in the popular imagination. For instance, there is a trial account from 1450 of a Swiss witch, Else von Miersburg, who was accused of riding on an enchanted wolf. But she was also known for riding on an enchanted dog. Ulrich Molitor's 1489 *De lamiis et phitonicis mulieribus* (Concerning Witches and Fortunetellers), the first illustrated printed book on

witchcraft, contained stories of a witch who rode on a wolf's back and a discussion of whether witches could transmute themselves into animals such as wolves or dogs. It contains an illustration of a canine-witch riding on a pitchfork as well as of a witch riding a wolf.

The Devil could appear in the form of a black dog. Johann Weyer, the famous German sixteenth-century physician, wrote of this belief in his 1563 *De praestigis daemonum* (On the Tricks of Devils). This book dealt with beliefs in witchcraft, magic, divination, and the like. It was also an early text on mental illnesses. Weyer is famous for his sympathetic comments concerning witches, who, he felt, were more likely just deranged elderly people and should be treated accordingly. Weyer studied with Heinrich Cornelius Agrippa von Nettesheim, a man himself accused of sorcery. Agrippa kept a black dog, called Monsieur, which some believed was actually the Devil. The dog was supposedly Agrippa's assistant and also his succubus. Weyer noted that this was merely a dog, and not the Devil, and that such ideas as those concerning its diabolic nature "never cease to amaze me." He stated that the dog "would always lie between us on the table that Agrippa and I shared in our studies." He wrote, "He was truly a normal male dog" (Mora 113). Agrippa so loved his pet that it slept in his bed. Weyer wrote further about other dogs, not so benign as Agrippa's, that were thought to be incubi who tormented nuns. So, even if Weyer did not really believe in such tales, he was not above recording them. His text makes clear the sorts of beliefs that were popular in the sixteenth century.

If a witch's dog were not a demon, it still might serve as an assistant in harvesting mandrake roots. Special dogs, one could say the drug-sniffing dogs of their time, were believed to be able to locate and dig the root without coming to harm. The dogs were thought to be impervious to the poison of the plant and to its lethal screaming as it came from the ground. In another tradition, the one who drew up the mandragora root was actually killed. Dogs were therefore used as substitutes and were killed during the operation.

The dog also appears in renaissance and seventeenth-century art depicting witchcraft and the demonic. Pieter Brueghel the Elder's engraving of *The Sin of Lechery* shows copulating dog-devils. This print is one of a set of seven prints made under Brueghel's direction and from his original drawings of the theme of the Seven Deadly Sins. The print was engraved by Jerome Cock of Antwerp, but is considered Brueghel's work, as Cock was merely a technician working for Brueghel. Other demonic dogs appear in many works by Hieronymus Bosch. In the seventeenth century, the dog as a demonic creature was commonly seen in paintings by such followers of Pieter Brueghel the Elder as David Teniers the Younger and Cornelis Saftleven.

Although the notion of the dog as demon is not quite the same concept as that of the werewolf, it is clear that there was a blending of wolves with dogs in demonological literature and beliefs when it came to the supernatural nature of these animals. Witches could transmute into dogs or wolves. Witches might have familiars who were dogs or wolves. And werewolves might at times also be witches.

DOMINICAN ORDER

The contribution of members of the Dominican order to the history of witchcraft is huge and lies mainly in two fields: their activity as inquisitors and their role in defining the nature of witchcraft.

The very beginning of the Dominicans as a religious order is linked to the growth of heresy in western Europe. Its founder, Dominic Guzman (1170–1221), was a Castilian priest who took part in the missions to convert the Cathars of Languedoc around 1206–1207. During this experience, he had found the Catholic clergy insufficiently prepared to confront the Cathar *perfecti* (the "perfect" ones, who served as leaders and priests). Soon after the crusade that battered the Albigensians (as the Cathars of southern France were called) in 1208–1209, Dominic gathered numerous disciples around him; they became the first nucleus of a new order, known as the Order of Preachers. Pope Honorius III officially approved it on December 22, 1217; in 1216 the former pope, Innocent III, had authorized Dominic and his companions to choose a rule. They adopted the rule of St. Augustine, adding a few articles in 1228 that mandated renunciation of private ownership of property and regulated their activity as preachers. Between 1239 and 1241 the canonist Raymond of Peafort, master general of the order, rearranged the text, giving it a shape that has remained almost untouched until the present.

From their earliest days, the Dominicans had women followers; the Dominican Sisters received their Constitutions in 1259 from Master-General Humbert of Romans. Similarly, the many laymen who had gathered around Dominic and his disciples were confirmed as a fraternity of Tertiaries (Third Order) in 1286. The first Dominican apostolic mission had been the convent of Prouille, in the diocese of Toulouse, where Dominic sent the women he had converted from Catharism. Soon after winning papal approval, the Dominicans spread their sermons beyond southern France; after Toulouse, Paris, Madrid, Rome, and Bologna became their principal centers. When Dominic died, his order was present almost everywhere in western Europe. Dominicans were divided into provinces guided by a master general, who deferred only to the pope. This direct relationship with the pope explains why, when Gregory IX decided in 1231 to institute an Inquisition in every diocese not subject to the local bishop, Dominicans seemed an obvious choice for these positions.

Although the Dominican Inquisition did not eliminate episcopal inquisitions, its role in the persecution of heresy was enormously important and was meant as an addition to the Dominicans' activities as preachers, instructing laymen in order to preserve them from heresy. Through the bull *Ille humani generis* of February 8, 1232, the pope assigned the *negotium fidei* (matter of religious orthodoxy) to the Dominicans, stating that all bishops must aid them unreservedly. On August 21, 1235, Gregory IX appointed a Dominican, Robert "the Bulgar" (so-called because he had once been a Cathar himself, and the Cathars were also called Bulgars), as general inquisitor for the entire kingdom of France.

The Dominicans received careful training in theology; many of them held positions in universities; their knowledge was useful both for preaching and for leading inquisitorial activities. Also, after 1220, each convent of the order was required to include a doctor (later often called *rector*), in order to guarantee a suitable cultural level. Convent schools could be attended both by internal friars and by clerics who lived inside the convent. Larger convent schools, able to give more complete education, were called *studia solemnna* (serious studies). Above the convent schools were the *studia generalia* (houses of studies). The first *studium generale*—and the main one, for a long time—was that of St. Jacques in Paris, which housed both Albertus Magnus and Thomas Aquinas.

Their activity as preachers and inquisitors led many Dominicans to confront magical beliefs and practices. This is made clear in one of the first manuals for inquisitors, written by the Dominican friar Bernard Gui in the early fourteenth century, in which a chapter is devoted to those who worship the Devil. Similar interests were shared by several other Dominicans,

among whom the most prominent were the Catalan Nicolas Eymeric and two Germans, Johannes Nider and Heinrich Kramer, whose writings played major roles in shaping the concept of diabolical witchcraft in the fourteenth and fifteenth centuries.

DOUGLAS, MARY (1921–)

Douglas is an important member of the functionalist school of British social anthropology, in which Edward E. Evans-Pritchard has played a leading role, and which has contributed so much to the academic study of witchcraft. After studying with Evans-Pritchard, Douglas did her fieldwork in the 1950s among the matrilineal Lele in Congo. Later she taught at the University of London. Her work on social anthropology is based on Emile Durkheim's sociology, as Anglo-Saxon ethnology generally is, and the functionalist approach is central to her work, including her studies of witchcraft. This approach means that she sees a correlation between the structure of a society and its central ideas. In contrast to Max Weber, functionalists explain the individual from the society, not vice versa, since they believe that the mind of the individual mirrors the society. Her most detailed statement on functional analysis is in *How Institutions Think*.

Douglas applied functionalist explanations to witchcraft. According to her theory, outlined in *Natural Symbols*, cosmology and social structure are closely connected. Belief in witchcraft as an explanation of evil depends on specific factors. In order to show this, Douglas framed a grid of classifications, in which the vertical axis distinguishes between a shared and a private system of classifications, and the horizontal axis separates groups in which ego is controlled by other people's pressure from groups in which ego controls other people. Societies in which the shared classifications are highly developed, positions clearly defined,

and interpersonal rivalry less pronounced, generate no accusations of witchcraft. Evil (illness, accidents) is attributed to the sufferer: transgressions of taboos and sins explain the sufferer's fate. On the other hand, belief in witchcraft and accusations of witchcraft thrive in societies in which the shared classifications are weak and the pressure on the individual is high. Such societies have strong competition for status; villages are densely populated, and one cannot evade the pressures of society. The witch represents the opposite of usual life, negating the conditions and rules of the society in which s/he lives. Witchcraft accusations reflect that people depend on their fellow humans more than their individual nature. Douglas found support for this theory by comparing the African cosmologies and witchcraft beliefs of the Nuer and Dinka with the Anuak. Accusations of witchcraft, she pointed out, serve as weapons of attack against certain individuals. On the whole, witchcraft belief and accusations crystallize around the critical points of a social structure.

In *The Lele of the Kasai* (1963), based on her fieldwork, Douglas applied the functionalist approach. She showed that sorcery in this polygynist society is above all ascribed to old men and especially to diviners. Because the privileged status of old men enables them to marry young girls and force young men to remain bachelors, witchcraft beliefs here express the hostility between generations.

In Douglas's most famous book, *Purity and Danger* (1966), she connected the theory of witchcraft with a theory of the scapegoat. The impure, perceived as dirt, represents disorder. This state is ascribed to beings that do not fit into normal categories, the impure animals in Exodus, for example, or young people during their rites of passage, twins, and menstruating women. The archaic code of the taboo (distinguishing pure from impure) is connected with witchcraft. Witches and Jews are, like twins, people who are not temporarily but always in a state of impurity. They are "interstitial persons," and their threat to society does not depend on their personal characteristics, but on this status. So the scapegoat is explained by the code pure-impure. The horrible nature of the witch can be explained by the fact that a combination of blood, sex, and food is mostly used for the discrimination of persons and groups. This archaic code of the taboo (pure-impure) again allows for the comparison between leprosy and witchcraft (Douglas 1991) and is connected with the way various peoples understand witchcraft.

Douglas's most recent major work (1999) applied her theory of purity to the interpretation of Leviticus.

DRAMA, DUTCH

The role played by devils and witches in early modern Dutch drama reflects the relatively skeptical perspective of the audience for which it was written. Until the development of professional theaters in the seventeenth century, the major performers of drama in the Low Countries (Belgium and the Netherlands) were the Chambers of Rhetoric, literary societies of artisans, merchants, and professionals whose productions appealed primarily to the urban middle and upper citizenry.

Compared to drama elsewhere, rhetorician plays became increasingly allegorical in nature, depending upon the vices and virtues for many leading roles. For example, in fifteenth-century scripts, the Devil was a frequent character, and he embodied all the vices. In the sixteenth century, the Devil faded from view as particular vices replaced him on stage. Many rhetoricians thus promoted an internalized, or spiritualized, conception of the diabolical.

THE DEVIL IN PRE-REFORMATION DRAMA

Early rhetorician plays reinforced lay devotion to Christianity while criticizing clerical abuses. Such mystery, miracle, and saint plays as *The Five Wise and Five Foolish Maidens* (*De V vroede ende van de V dwaeze Maegden*) or *The First Joy of Mary* (*Die Eerste Bliscap van Maria*) depicted Lucifer as the instigator of efforts to hinder the godly work of the protagonists. The dialogue between Lucifer and his minions provided both satirical humor and moralistic warnings. Rhetoricians also performed comedies, such as *The Entertainment of the Apple Tree* (*Het Esbatement van den Appelboom*), which tells of a farmer who possesses an Eden-like magical apple tree that captures all who climb into its branches in search of fruit. Among those caught are Death and the Devil, who are forced by the farmer and his wife to promise them another forty years of life devoid of evil temptations.

One of the most famous miracle plays is *Mary of Nijmegen* (*Mariken van Nieuweghen*), a saint's tale first dramatized around 1500. The protagonist, Mary, a young woman from Gelderland, is sent by her uncle, a priest and a sorcerer, to Nijmegen to buy supplies. Finding herself without lodgings at night, the frightened girl begs for help from either God or the Devil; the latter appears first as an attractive but horned man. He persuades Mary to sign a pact with him in exchange for knowledge of the seven liberal arts, although rejecting her request to learn necromancy as well (her uncle practitioner had likewise refused). The demon then demands that she change her name to Emma and promise never to make the sign of the cross. She and her demon lover tour the Netherlands, astonishing people with her knowledge. After seven years, the pair returns to Nijmegen, where they see the *Play of Masscheroen*, which portrays the eschatological defeat of Lucifer. When Emma seeks to break the demonic pact, the spurned demon raises her and then drops her from a considerable height. She soon recovers, and with her uncle embarks on a penitential pilgrimage to the pope, who grants a life penance of wearing massive iron rings. She becomes an extremely ascetic nun, and an angel ultimately releases her from her bonds.

In this popular play, Mary is a female Faustus, but not a witch. She makes a diabolical pact, renounces Christianity, takes on a demon lover, and amazes people with her knowledge; but there is no harmful witchcraft or Sabbats, and she is ultimately forgiven. This, the only Dutch pre-Reformation play to deal explicitly with diabolism, deviates considerably from the contemporary stereotype of witchcraft expressed in the *Malleus Maleficarum* (*The Hammer of Witches*, 1486).

DRAMA AND THE DEVIL DURING THE EARLY REFORMATION (TO 1566)

The distinguishing specialty of Dutch rhetorician drama was the *spele van zinnen*, “play of the senses,” in which allegorical virtues and vices (*sinnekens*) played leading roles. These became vehicles for sixteenth-century rhetoricians to condemn social ills or satirize clerical hypocrisy. While many rhetoricians promoted reform, Christiaan Fastraets, a Dominican of Louvain, sought to counteract reform propaganda by dramatizing the life of Saint Trudo. A stylistic throwback to fifteenth-century saint plays, this work shows the efforts of Lucifer and his demons, Baalberith, and Leviathan, to tempt the saint constantly foiled through the power of the priest and sacraments, thus proving Catholic clerical claims to supernatural power.

The much more popular approach to the Devil and magic in sixteenth-century Dutch drama was to allegorize them. Of the nineteen plays performed at the rhetorician competition at Ghent in 1539, only one—that of Brussels—contains anything like a devil in the

character of the “old serpent,” while all the others make do with vices. In fact, among eighty surviving religious scripts from the era of Charles V (1515–1556), only one play, the antiwar *Play to Perform in Times of War* (*Een spele te speelen in tijden van oorloghe*), contains a traditional dancing devil. Toward the end of this piece, a large globe is brought onstage, from which a gleeful devil speaks and dances. Even then, he remains invisible in the everyday world—which he rules during times of tumult.

More typical is Clodius Presbiter's *Human Spirit Deceived by the Flesh* (*sMenschen Gheest van tVleesch Verleyt*), a spiritualist play promoting inward-looking piety. This play too concludes with an image of the earth, this time showing the Devil and Flesh peering out from within as the risen Jesus rescues a soul, an allegory of the spiritual rescue of the human soul from flesh and evil. In many plays, the Erasmian-minded playwright Cornelis Everaert of Bruges criticized popular belief that demons caused humans to sin and instead blamed the individual's inner evil inclinations. Even in two pre-1568 Haarlem plays in which the dialogue between Lucifer and his diabolical minions looms large—*The Play of the Brewer's Guild* (*Het Spel vant Brouwersgilde*) and *The Play of the Great Hell* (*Het Spel vande Grote hel*)—the demons have become little more than rhetorical devices to satirize the peccadilloes of contemporary clergy and laypeople. In fact, unlike their colleagues in *The Play of Saint Trudo*, these demons prove useful for the Church by pointing out that humans are entirely responsible for their own choices.

No known plays from this period had sorcerers or witches as characters, and only two refer in any way to illicit magic. In an anonymous dinner play called *The Multiformity of the Deceit of the World* (*Die Menichfuldicheit des Bedrochs*), the vice Origin of Sins claims to have wares that he has found on “Lady Venus' mountain,” a mythical place thought to imbue visitors with magical powers. However, when Origin of Sins describes these wares, they become figures for various sins, stripped of magical attributes, acting instead as rhetorical tools to condemn a worldly clergy. Such sentiments critical of the clergy and popular magical beliefs were commonplace in upper artisan and merchant Netherlandish culture. The other reference to magic appeared in the Catholic Reynier vanden Putte's *The Incarnation of Christ* (*De Menschueringe Christi*) of 1534, in which he had an Anabaptist peddler say that he intends to inflict greater harm on the world than witches and sorcerers, an extremely inflammatory comment in this century of persecution.

DRAMA AND THE DEVIL DURING THE REVOLT (1568–1648)

After the revolt against Spain began in 1568, cultural and economic preeminence moved from the southern

to the northern provinces. In the south, the Spanish rulers closely censored literature and drama, approving only whatever accorded with Catholic doctrine and discouraging the use of Dutch, which they identified with rebellion. For their part, northern magistrates continued to sponsor vernacular drama, and many plays memorialized Dutch victories and promoted Calvinist Protestantism. Dutch playwrights readily identified the devil with their Catholic opponents. The Spanish authorities did, however, tolerate traditional saint stories, such as *Mary of Nijmegen*, which continued to be printed into the seventeenth century. It remained popular in the north also, although references to the Virgin Mary and the Catholic Mass were expunged. Most interesting for the purposes of this entry are the northern plays that featured the Devil or witches.

Not surprisingly, given the rising notoriety of the witch hunts, witches or sorcerers began to appear in a handful of plays from the end of the sixteenth and the early seventeenth centuries, including *King Balthasar* (*Coninck Balthasar*), written for a Hasselt chamber in 1591; Pieter C. Hooft's *Geeraerd van Velsen* (1613); Guillaum van Nieuwelandt's *Saul* (1617); Jacob Struys's *Syrus and Ariame* (1629); Jan van Swol's *Constantinus* (1630); and Johan Beets's *Daphne or Boschvryagie* (1630). All are based on biblical stories or ancient histories, and, as with Shakespeare's *Macbeth*, their witch scenes revolve around the desire of a ruler to discover his future by magical means. We will use the first two as examples.

King Balthasar recounts the story found in the fifth chapter of the Book of Daniel of the Babylonian king Belshazzar, who saw an apparition of a ghostly finger writing on a wall and who, after his sorcerers failed to interpret the writing, turned to the Hebrew prophet Daniel. In this dramatic version, two of the king's sorcerers resort to necromancy, conjuring up first Belial, who springs onto the stage amid thunder and lightning, but who is so terrified by the words on the wall that he prefers to die rather than read them. The second demon, Belsebub, also flees the stage, claiming that he has sat too long in hell and has lost his ability to read.

Hooft's *Geeraerd van Velsen* dramatizes the murder of Count Floris V in 1296 in the castle of Gerard van Velzen, who is its rather dark hero. In the play's third act, van Velzen sends his squire to consult Timon the Sorcerer to see if his plan to murder the count—whom he has imprisoned for having seduced his wife—will succeed. On the way, the squire tells what he has heard about spirits and sorcery and resolves that, despite his fear of dabbling in evil spirits, he will obey his lord's command. Timon introduces himself as one who "rules over spirits, ghosts and demons," who can raise the dead, find hidden treasure, and discern the future (1976, 95–96). When the squire puts Gerard's question to him, Timon uses various necromantic props to

conjure an evil spirit, which responds to the query with the words "He has thought well / what he has undertaken" (1976, 99). This the squire considers happy news, until he realizes that the term for "thought," *versint*, could also be interpreted as "to be mistaken." In other words, the spirit's statement, produced with such magical fanfare, is ambiguous.

The most famous Dutch drama involving the Devil is undoubtedly Joost van den Vondel's *Lucifer* (1654), a widely known work that seems to have influenced Milton's *Paradise Lost*. Vondel, a liberal Mennonite who converted to Catholicism in the late 1630s to promote his ideal of a universal Christianity, composed this work as a political allegory instructing Christian rulers to stop playing ambitious Lucifers and unite against the Turks. For Vondel, Lucifer is no longer the epitome of evil, but a tragic figure who rebelled against his lord only because he listened to the advice of an evil aide, Beelzebub.

Dutch dramatists, then, expressed a great deal of skepticism about the reality of magical endeavors and diabolical activity. From *Mary of Nijmegen* to *Timon the Sorcerer*, the magicians in Dutch plays are neither terrifying necromancers nor members of a diabolical female sect of witches. Instead, playwrights used demons as metaphors for human vices or as rhetorical devices for satirical purposes, and they stressed human responsibility for evil. This parallels, to a remarkable degree, the skepticism of many among the Netherlands' intelligentsia and magistracy toward both popular belief in magic and learned belief in a diabolical conspiracy that gripped their peers elsewhere in Europe.

DRAMA, ITALIAN

Magic, especially in the form of witchcraft, through its enchantments, wonders, and spells, provided a source of inspiration for numerous Italian comic playwrights during the Renaissance and baroque periods. Outside the inquisitorial tribunals, the *veterum sapientia* (ancient science), often reduced to trickery, served as the background for the complex intrigues of romantic comedies.

Beginning with Niccolò Machiavelli's *Mandragola* (The Mandrake, 1518), in which a reference to the mandrake root (act 2, scene 6) is used by the protagonist Callimaco to signal his desire to lie with the beautiful Lucrezia, magic became a central element in numerous works. In *Il Negromante* (The Necromancer, 1520), by the well-known playwright Ludovico Ariosto, the protagonist Massimo brings a necromancer, Lachelino, really a master rogue, to cure his adopted son Cintio of impotence. An illness presumed to be the work of the Devil sets into motion the events narrated in Girolamo Bargagli's *La Pellegrina* (The [Female] Pilgrim, 1564), in which the protagonist Lepida pretends to be possessed by demons to avoid marriage. The protagonist of Giordano Bruno's *Il Candelaio* (The Candle-Bearer, 1582) is Master Bonifacio, a married man who is in love with Signora Vittoria. The gullible Manfurio, an amateur alchemist named Bartolomeo, and Master Bonifacio are swindled by a group of tricksters of various calibers. Bonifacio entrusts the magician Scaramurè with casting a spell on Vittoria that will make her fall in love with him. Interestingly, Bruno's play contains a reference to witches' ability to fly, a belief that the playwright attributes to Bonifacio, who thinks "co l'arte magica, facesse uscire Satanasso da catene, venir le donne per l'aria volando là dove piacesse a lui" ("by magical art made Satan escape from his chains, and made women come to him wherever he wished by flying through the air") (*Candelaio*, act 5, scene 20). There were also comedies dedicated to astrological influences, such as Giambattista Della Porta's *L'Astrologo* (The Astrologer, 1606).

The theme of witchcraft also became a feature of early modern Italian musical theater, particularly during the seventeenth century, where there are characters with magical powers, such as the magician Falsirena in *Catena d'Adone* (The Chain of Adonis, 1626), by

Domenico Mazzocchi, libretto by Ottavio Tronsarelli (but taken from Giambattista Marino's *L'Adone*), Armida in *Erminia sul Giordano* (Erminia at the Jordan, 1632) by Giulio Rospigliosi from Torquato Tasso's *Gerusalemme liberata* (Jerusalem Liberated, 1581; books 6–7), and Alcina in *L'Isola d'Alcina* (The Island of Alcina, 1728) anonymous libretto, by Riccardo Broschi, based on Ludovico Ariosto's *Orlando Furioso* (Orlando Gone Mad, 1532). Demons and magical practices are also present in *The Andromeda* by Benedetto Ferrari and Francesco Manelli (alias Fasolo, 1637), in Ferrari's *La Maga Fulminata* (The Witch Struck by Lightning, 1638) and *Pastor Regio* (1640), in librettist Giovanni Faustini's and the composer Francesco Cavalli's *Virtù de' Strali d'Amore* (The Power of Love's Arrows, 1642) and *Ormindo* (1644), in *Ulisse Errante* (Ulysses Wandering, 1644) by Giacomo Torelli, and in Nicolò Fontei's (Fonte, Fonteio) *Sidonio e Dorisbe* (Sidonio and Dorisbe, 1642).

Darker descriptions of magical rites are found in such late-seventeenth-century works as *Carlo Re d'Italia* (Carlo, King of Italy, 1682), by Matteo Noris, which opens with a scene where "magical operations are performed on a corpse" (Fabbri 1996, 212), and the third act of *Rodoaldo Re d'Italia* (Rodoaldo King of Italy, 1685), by Tommaso Stanzani, which contains a scene that portrays necromancy in greater detail (Fabbri 1996, 212).

A recurrent character in several Renaissance works is the *vetula*, a term that could refer to a prostitute, a panderer, or a sorceress whose services were sought by a protagonist who knew that such women had the ability to arouse human vices. The prototypical character in this category is found in the *Tragicomedia de Gallisto y Melibea*, or *La Celestina* (1499), attributed to Spanish author Fernando de Rojas. In this comedy, analyzed by Spanish ethnologist and historian Julio Caro Baroja, the protagonist Celestina is described as an old townswoman witch, astute and experienced in every type of evil. Her practices derive from the realm of erotic magic and are based on the use of medicinal and poisonous herbs, but also diabolical ingredients such as the bones of the dead. In particular, she is depicted as a figure who represents the dangerous aspects of instinctual forces, challenging social norms and disturbing traditional male domination of the social and religious order. In this sense, the *vetula* shares with the witch the same license for diabolical activity, through both her unrestrained sexual activity and her knowledge of magic.

Celestina reflects a specific sixteenth-century social type that was not only Spanish but also Italian, as shown by the witchcraft trials conducted in Venice, in which the majority of the accused were prostitutes or ex-prostitutes (Milani 1996, 307), and the trials in Naples in 1588, at which one of the principal defen-

dants accused of witchcraft engaged in prostitution and pandering on the Sabbath (Romeo 1990, 6). This social type inspired Ludovico Ariosto's *La Lena* (1528), one of his most successful comedies. Its action centers on the character of Lena, a middle-aged procuress whose intrigues are tolerated by her husband Pacifico. Lena seems to view events with veiled rancor and resentment out of bitterness about the crudely materialistic character of relationships based only on convenience and personal interest, and she maliciously hopes that every business initiative of various characters will fail.

In *La Cortigiana* (The Obsequious One, 1525), Pietro Aretino also includes a *vetula* in his character Aloisia, whom we find mourning the death of her mistress, Monna Maggiorina. Aloisia exclaims dejectedly that people are burned in Rome for "not having done anything" (Act 2, Scene 6). Of particular interest is the list of items in Maggiorina's will, which included detailed descriptions of many of the *vetula's* professional tools, such as "equipment for distilling, waters for removing freckles and spots, and a clamp for pendulous breasts" (Act 2, Scene 6). Borrowing from Lucan, Aretino also describes Aloisia wandering in cemeteries "to remove fingernails from corpses," of her transformations into animals such as "cats, mice, and dogs," adding her nocturnal flights "over water and through the winds to the *noce di Benevento* (walnut tree of Benevento)."

Echoes of the Sabbath under the *noce di Benevento*, a legendary meeting place for Italian witches, also occur in the intermission of *La Gelosia* (Jealousy, 1550) by Anton Francesco Grazzini (alias il Lasca), in which the witches sing, "Running swiftly like the wind we go to the *noce di Benevento*." Much later, this legendary tree even became the focus of an opera, *La Noce Maga di Benevento Estirpata da San Barbato* (The Walnut Witch of Benevento Taken from St. Barbato, 1665), first performed in Rome in 1666. Its author, Nicolò Jperno, was the son of a medical examiner and historian who wrote *De Nuce Maga Beneventana* (On the Magical Walnut Tree of Benevento, 1634). This myth continued to inspire theater through the nineteenth century, particularly the successful ballet by Salvatore Vigandò, *Il Noce di Benevento*, with music by Franz Xaver Sussmayr, first performed at La Scala in Milan in 1812.

DRAMA, SPANISH

In Spain, two major dramatic traditions evolved during the sixteenth century: the *auto sacramental*, a one-act allegorical religious drama, performed especially at Corpus Christi; and the *comedia*, a three-act theater play conceived for the secular stage. In both kinds of drama, magic could be involved in the action, and characters associated with magic, such as the Devil, witches, and sorcerers, appeared on stage. A significant difference between the Spanish *auto sacramental* and the *comedia* consists in the characters. As representations of abstract ideas, the *auto's* characters were personifications of concepts like human nature, sin, or innocence. On the other hand, the *comedia* dramatized actions of individual people, and generally employed magic in love intrigues. At the end of the seventeenth century, Enlightenment secular drama ridiculed belief in the power of sorcerers and witches as superstitions of backward people. Subsequently, magic on stage was understood as a kind of science, requiring special knowledge, but no pacts with devils. This new *comedia de magia* was at its height during the eighteenth and part of the nineteenth centuries.

Spanish Golden Age drama of the sixteenth and seventeenth centuries did not question the reality of witchcraft and sorcery, but magic played an ambivalent part on stage. In the same drama, witches and sorcerers could seem to possess great magical powers, but then might suddenly be presented as impostors with little or no capacity for magic. Sorcery, magical flights, and the Devil's pact could have different meanings according to the general theme of the drama. Religious drama of the *comedia* genre, such as Pedro Calderón de la Barca's seventeenth-century theological plays, classified magic as evil, representing diabolical temptation of the human soul. In the more popular tradition, for example in Lope de Vega's *comedias*, magicians were often famous figures from ancient mythology, and sometimes magic was related to the life of saints.

Dramas that presented sorcery and witchcraft in mythological times—great magicians from antiquity or saints who had been magicians before becoming saints—thus presented a different context than that of the author's or audience's, which was that of witchcraft

cases in early modern Spain. Nevertheless, some authors also took their inspiration from current beliefs and notorious contemporary cases of witchcraft or sorcery. In numerous comedias, magic had a burlesque character, especially in dramas that continued the tradition of Fernando de Rojas's tragicomedy *La Celestina* (1499). Like their famous ancestress (and like numerous defendants in inquisitorial trials), the protagonists—supposed relatives of the great sorceress created by Rojas—engaged especially in love magic. In a similar vein, the devil of the *comedia* was usually conjured in order to procure the love of a certain person or to unveil hidden treasures. A further *comedia* tradition, sometimes intertwined with these other types, discussed quite seriously the relationship between diabolical and natural magic.

In Enlightenment drama of the later seventeenth century, magic became a ridiculous delusion, featuring a supposed “sorceress” with no real magical powers who skillfully exploits the superstitious belief in witchcraft for her own benefit. This kind of drama created a new type, named *comedia de magia* (drama of magic), which flourished from the beginning of the eighteenth century through most of the nineteenth century. Its protagonists were magicians—male or female—mainly interested in pursuing their material or social benefit. Magic was now considered a sort of science; religious or theological problems were no longer a concern. The *autos sacramentales* coexisted with the secular drama through the whole period until 1765, when they were ordered banned because of their fantastic elements and the improbability of their stories. Although these dramas remained extremely popular, more educated Spaniards found much of their plots, with the prominent role of the Devil, completely anachronistic. In fact, *autos sacramentales* (unlike *comedias*) were still performed in the Age of Enlightenment just as they had been in previous centuries, even though the world in which the Devil and witchcraft had seemed such a frightening reality was long gone, at least among the educated.

DRUGS AND HALLUCINOGENS

Hallucinogenic drugs appear to have contributed to European witchcraft beliefs when the ecstatic experiences of a small but significant minority of people who used them were understood by late medieval demonologists and early modern magistrates to be evidence that witches flew to diabolic Sabbats, where they participated in a variety of fantastic and perverted activities.

Hallucinogenic drugs include several types of psychoactive chemicals that induce altered states of consciousness, generally involving distortions of normal cognitive processes, visual and auditory hallucinations, and vivid and frenzied dreams. Almost all natural hallucinogens are found in plants, and people in a wide variety of cultures have long used them as one method of inducing ecstatic trances in which they experience interactions with the spirit world. Europe contains a number of natural hallucinogens that some people in late medieval and early modern Europe apparently utilized to induce such altered states of consciousness. The biochemical effects of the active ingredients in one class of these drugs were probably a principal source for the idea that witches flew to Sabbats. Hallucinogenic drugs may also have contributed to the witchcraft persecutions in two more limited ways: accidental ergot poisoning may have, in a few cases, caused delusions and hallucinations attributed to demonic possession or bewitchment, and there is evidence that hallucinogens may have been used occasionally during interrogations to induce stubborn suspects to confess.

HALLUCINOGENS AND SHAMANISM

Ethnographic studies show that a wide variety of people around the world have consumed locally available hallucinogenic plants in order to experience their psychoactive properties. Furthermore, the purposes of their use are generally similar, and the experiences, while reflecting the diverse cultures of the people using them, share some fundamental commonalities. They are used to induce a trance state in which the user experiences direct participation in a dreamlike alternate “spirit” world where hidden or occult knowledge of the ordinary world is revealed, and human and natural processes can be influenced. The features experienced in this world are described in various ways, but they generally include a variety of nonhuman, nonmaterial, but conscious entities, which often appear in human, partially human, or animal form. They also commonly include a sensation of flight, and often convey insights into the nature and source of communal problems such as disease, conflicts, or natural disasters.

In some societies, use of hallucinogens is widespread, but in many societies, shamans specialize in entering the trance state and communicating with the spirit world. Not all shamans use hallucinogens, but many

do, and use of the hallucinogenic mushroom *amanita muscaria* was central to the Siberian shamanism that served as the archetype for ethnographers. These shamans' initiatory rite involves ingestion of the hallucinogenic mushrooms, the experience of death and decay, ascent to the spirit world, and interaction with spirits to acquire occult knowledge and power. There are interesting if merely suggestive structural parallels with the experience witches were believed to have: They applied hallucinogenic ointments, flew to a witches' dance, worshipped the Devil, and thereby acquired malefic powers.

EUROPEAN HALLUCINOGENS AND WITCHCRAFT BELIEFS

Priests in some ancient Near Eastern and classical Mediterranean religions appear to have used hallucinogens, and some early medieval Germanic peoples are known to have used *amanita muscaria*. However, while these mushrooms are found throughout Europe, they were not featured in hallucinogenic recipes contained in witchcraft literature, and there is little trace of them in trial records. Instead, various plants belonging to the *Solanaceae* family—nightshade or belladonna (*Atropa belladonna*); henbane (*Hyoscyamus niger*); datura, or thorn apple (*Datura stramonium*), and mandrake (*Mandragora officinarum*)—figured prominently in these recipes, and ointments presumably derived from them frequently figured in trial documents. These plants contain the anticholinergic alkaloids atropine, hyoscyamine, and scopolamine, which interfere with the normal functioning of the nervous system by blocking the neurotransmitter acetylcholine. The chemical *bufotenin*, which is found in the skin secretions of the common European toad, is related, and toads are also mentioned in some recipes. These chemicals are extremely toxic, which is presumably why recipes called for them to be made into ointments to spread on the skin or mucus membranes. Even when such ointments are used, users experience powerful hallucinations and generally fall into a deep trance with vivid dreams.

These hallucinations and dreams are generally experienced as real in a way more profound than those produced by drugs like LSD; upon waking, users remain convinced of their reality. These effects were noted in several early modern accounts of experiments in which confessed witches were observed to anoint themselves, fall into a deep sleep, and awake convinced that they had flown to distant lands and experienced all sorts of adventures. Modern researchers who have created recipes contained in early modern texts and anointed themselves have sometimes experienced similar effects.

Some historians downplay or even deny these drugs any role in the history of witchcraft, pointing to the frequency with which unguents brought forward in trials were found to be inert, and suggesting that the learned

descriptions of experiments were merely literary exercises modeled on classical accounts. It is true that in some cases the suspects listed only benign ingredients in their testimony, but in most cases, reports that the unguents were inert mean little because they do not specify the means by which the potency of the salves was ascertained. Modern LSD research indicates that one type of test that is known to have been used for poisons, experiments on animals, would have been useless for hallucinogenic salves because of differences in body weight and metabolism and the fact that the drugs affect higher-order mental functions. Furthermore, some archival sources contain reports of drug-induced experiences that diverge significantly from the Sabbat stereotype, and some suspects were observed in trance states they later ascribed to drugs (Bever 1983, 261–262, 294–295).

Similarly, the objections to the human experiments described in the witch literature are also weak, since three different situations were described, one by the demonologist Johannes Nider and two by skeptical physicians, Andrés de Laguna and Giambattista Della Porta. Each differs substantially from the others and from classical accounts. For example, Nider and Della Porta said their witches agreed to anoint themselves, while de Laguna said he got the unguent from a pair of suspects and used it on a volunteer. Della Porta's witch and Laguna's volunteer fell into such deep sleeps that they could not be woken up even when beaten; Nider's witch woke up when she fell off the bench she was seated on. Differences in ingredients and proportions would account for these differences; literary imitation would not. De Laguna described how his volunteer's eyes dilated dramatically before she fell asleep, a detail consistent with the drugs' known effects (the name Belladonna, in Italian "beautiful lady," comes from the fact that women used small amounts to dilate their pupils to make themselves more attractive) that was not mentioned in the other reports. Della Porta mentions looking through a chink in the door as his "witch" disrobed and anointed herself, which is reminiscent of Apuleius of Madaura's account of watching through a chink in the door as a woman used an ointment to transform herself into an owl, but the classical author claimed he saw the woman physically transform and fly away, whereas Della Porta's point was that no physical event occurred. On balance, it seems that the accounts in the witch literature reported real events, and that some, although far from all, allegations and confessions involving hallucinogenic drugs in the trial records similarly reflected reality.

Use of hallucinogenic ointments does not mean that drug experiences explain the widespread belief that large numbers of people flew to a diabolic Sabbat, but it does suggest that some of its elements stemmed at least partly from reports of what people actually experienced

in these dreams. Specifically, the fact that the active alkaloids block the neurotransmitter acetylcholine in the peripheral as well as central nervous system would account for the feelings of dissociation and flight they induce, making the experience of flight more likely a product of biochemistry than of cultural suggestion. Similarly, the specific form of paraesthesia produced by scopolamine may be responsible for the sensation of growing hair or feathers, suggesting the commonly reported experience of turning into an animal. Other aspects of the hallucinations and dreams probably reflected the users' cultural milieu as well as their individual psychological dispositions. It seems likely, however, that such elements as copulation with strangers, feasting and revelry, and encounters with spirit figures predated and therefore contributed to late medieval demonology, although the diffusion of the demonology would have caused these particular dreams to be experienced more widely and in forms that conformed ever more closely to the stereotype.

Since scopolamine and hyoscyamine are often experienced as unpleasant, and they also make the user susceptible to suggestion, they were probably the basis for drugs that were occasionally administered to recalcitrant suspects (Sidkey 1997, 208). Such practices, though documented, were rare, and account for only a small fraction of recorded confessions.

Another drug effect that has been suggested as accounting for at least some witchcraft beliefs is ergot poisoning. But it is at most an explanation for particular instances to which general ideas about witchcraft arising elsewhere were applied. Ergot (*Claviceps purpurea*) is a fungus that grows on grains, particularly in cold, wet weather. It contains the alkaloids *ergine*, ergonovine, lysergic acid hydroxyethylamide, and, sometimes, *dlysergic acid diethylamide* (LSD). When consumed in bread, it can cause either gangrenous ergotism, known as St. Anthony's Fire, or convulsive ergotism, both of which cause delirium and hallucinations. The former causes a sensation of burning inside, dry gangrene, and the loss of fingers, toes, and even limbs, while the latter culminates in convulsions. Some symptoms of ergotism, particularly analgesia, *fornication* (the sensation of something creeping over or under one's skin), and spasms, correspond closely with characteristics of bewitchment or demonic possession, and there is occasional geographical and temporal correlation between some outbreaks of ergotism and reports of mass bewitchment in Europe. The witch panic at Salem has also been blamed on ergotism; but numerous objections have been raised to this theory, and even in the case of the much better founded European instances, the essential point is that ergotism may explain why some people in certain specific cases experienced symptoms they attributed to witchcraft or diabolic possession, but it does not explain why they attributed the symptoms to

them, or why people in the far greater number of cases unrelated to ergotism thought the Devil had possessed them or witches had caused them harm.

DUHR, BERNHARD (1852–1930)

This German Jesuit is one of several Catholic Church historians who sought to reevaluate the persecution of witches and its origins, arguing against Germany's dominant liberal Protestant historiography during the nineteenth-century Kulturkampf (culture war). Duhr joined the Society of Jesus in 1872, living in various European countries before settling in Munich in 1903.

In 1900, Duhr entered the long-standing debate on which denomination bore the greatest guilt in the issue of witchcraft trials. This was the same year his major work, *Die Stellung der Jesuiten in den deutschen Hexenprozessen* (The Jesuit Position in German Witchcraft Trials) was published by the Görres Society, then at the center of German Catholic cultural life.

Duhr's views had been preceded by those of two other Germans, Johannes Janssen and Johann Diefenbach, both of whom had attempted to lay the main blame for the excesses of the witch persecutions on the Protestant Reformation and its theological and social impact. Duhr justified his investigation by asserting that previous Jesuit studies had been overly biased in one or another direction. Duhr presented a huge amount of

information and sources extremely concisely, thus providing a solid foundation for any further examination of the attitude of the Jesuits and of the Catholic Church as a whole to the issue of witchcraft.

Obviously, the two opposed major representatives of the Jesuit order, Martín Del Rio and Friedrich Spee, who had taken opposed stands on witchcraft trials, assumed primary importance in Duhr's discussion. In his evaluation of these two, Duhr revealed both his greatness and his limitations: Without attempting to acquit the Jesuit order of all responsibility for promoting witchcraft trials, he imitated other late-nineteenth-century apologists in matters of guilt and responsibility. He also argued from an apologetic point of view in marginalizing Del Rio and Gregory of Valencia, both famous Jesuits, while attempting to categorize Spee, along with his predecessors Adam Tanner and Paul Laymann, as true, traditional Jesuits in their uncompromising opposition to witchcraft trials. On the other hand, he correctly accused his opponents of hastily labeling Spee a humanist outsider, while portraying Del Rio and other advocates of the trials as "typical" Jesuits. Duhr's main achievement was to bring relative impartiality to the historiography of the witchcraft trials at a moment of extreme polemics. Rather than painting a black-and-white denominational picture, he suggested a contextual understanding of the theory of witchcraft. Even Duhr, however, could not finally resolve the tension between Spee and his order.

Duhr's achievement can only be fully appreciated within the context of the situation of the Jesuits in the German Empire at the time he was writing, when they were in fact prohibited. Duhr's entire work can be seen as an apologetics for the Jesuit order, beginning with his *Jesuit Fables*, which saw its fourth edition in 1904. All his publications reflected his endeavors to convince the German public that the Jesuits deserved a place in the cultural and academic life of Wilhelmine Germany. Most of his liberal and anti-ultramontane critics argued that Duhr placed the Jesuit order and the attitude of the Roman Catholic Church toward controversial issues in an overly favorable light.

DÜRER, ALBRECHT (1471–1528)

Dürer was a painter, printmaker, draftsman, and writer, whose engraving *Witch Riding Backwards on a Goat* (ca. 1500) exercised a strong influence on sixteenth-century witchcraft iconography through the work of Hans Baldung [Grien]. Dürer is generally considered the greatest of all German artists and an extraordinary innovator in the fields of printmaking (especially engraving), portraiture, and self-portraiture. Apart from his journeyman years in the upper Rhine region, two trips to Italy in 1495 and 1505–1507 (which shaped his approach to color, human proportions, and perspective), and travel to the Netherlands in 1520–1521, Dürer spent most of his life in his native city of Nuremberg. His high standing as an artist is demonstrated by the large number of commissions he received from the Holy Roman emperor Maximilian I after 1512; and by a life pension to oversee imperial artistic commissions, granted by Maximilian in 1515 and renewed by Charles V in 1520.

Throughout his entire career, Dürer completed only two images of witches, both of them engravings: *Four Naked Women* or *The Four Witches* (1497), and *Witch Riding Backwards on a Goat*. The central subject of the latter, a woman riding a goat and holding a spindle, soon became one of the stock representations for witchcraft in the sixteenth century. Wild flying hair and the hailstorm (in the left top corner) quickly developed into two common visual cues for witchcraft. Another critical iconographical contribution of Dürer was the association of witchcraft with inversion: His witch is shown riding backwards, her hair flies out in a direction contrary to all expectations, and even Dürer's monogram is reversed. The backward ride alludes to a medieval trope and cultural practice used as a form of punishment or mockery in cases of cuckolding or husband beating, cases in which the traditional sexual honor and order of the community was considered to have been overturned. Moreover, the goat was strongly associated with lust in the late Middle Ages, particularly in depictions of the seven vices. This association helps underline the sexual associations of Dürer's figure, as does her grasp of the goat's horn, once again a reference to cuckoldry and the overturning of sexual order. The nakedness of the witch may well reflect the influence of classical models.

The four putti below the riding figure are more mysterious and have eluded clear explanation. One carries a toy tree and stick; another balances a round vessel,

Albrecht Dürer's engraving *Witch Riding Backwards on a Goat*, ca. 1500, had an enormous influence on witch iconography, including such elements as the goat, the spindle the witch holds, the flying hair, the hailstorm, flying backwards, and the association of witchcraft with lust and sexuality. (Bildarchiv Preussischer Kulturbesitz/Art Resource)

possibly a wine jar; a third performs a somersault; a fourth endeavors to take a stick from his fellow. These figures have been understood as personifications of the four elements or four seasons; or as attendants of a goddess of lust, similar to the winged putti associated with fifteenth-century Italian representations of the Priapus and Dionysus cults. The latter explanation would fit with Charmian Mesenzeva's understanding of the witch as modeled on the ancient figure of Aphrodite Pandemos, the earthly Venus and goddess of lust and night, of which a number of examples were extant in the late fifteenth century. Whatever the precise explanations, the putti underline the associations of witchcraft with sexual disorder and inversion. Likewise, the curious depiction of a goat with the tail of a fish or serpent may be an allusion to Capricorn, a figure closely

associated in the late Middle Ages with the planet-god, Saturn, who included magicians and witches among his "children." Interest in this engraving is demonstrated by six surviving copies, three prints and three paintings (one by Adam Elsheimer).

The presence of evil is clearly the subject of *Four Naked Women*. A monstrous devil, surrounded by flames and smoke, stands in a doorway, looking in at four naked women. Two are shown from the back and two face the viewer, while the skull and bone at the women's feet clearly suggest the presence of evil. The identity and activity of the group remains a mystery, accentuated by the sphere hanging overhead displaying the letters *O. G. H.*, which, like the figures themselves, have been deciphered in numerous ways. Although reminiscent of the Graces, the female figures have also been identified as the seasons, the temperaments, the elements, and as four witches. This engraving also aroused considerable contemporary interest: four copies were made over the next few years, and such later artists as Sebald and Barthel Beham reworked the scene.

DUVAL, ANDRÉ (1564–1638)

Leading theologian of the Paris Faculty of Theology (Sorbonne), friend of such luminaries as Pierre Coton, Pierre de Bérulle, and St. Vincent de Paul, spiritual companion and biographer of Barbe Acarie (Marie de l'Incarnation), who founded the French Discalced Carmelites, Duval was also involved in assessments of demonic possession, witchcraft, and charismatic spirituality. Appointed to a chair in theology at the University of Paris in 1597, Duval was a formative figure in the French "century of saints." Church and state officials regularly called on him to evaluate such phenomena as demonic possession or ecstasies, or to judge the orthodoxy of new books on these subjects.

Duval rarely avoided controversy. In the Wars of Religion, he had been a supporter of the militant Holy Catholic League, and he remained an ultramontane, who tended to side with pope over king in jurisdictional matters. Soon after joining the Sorbonne, Duval was among those who used Marthe Brossier's "demonic" anti-Huguenot exorcisms as evidence that God did not approve of the 1598 Edict of Nantes, Henri IV's new peace accord with the Huguenots. Those who supported the edict feared that Brossier and other exorcists might encourage fresh religious violence. Royal doctors engineered an unfavorable medical judgment that Brossier was a fraud, and the *Parlement* of Paris (the sovereign judicial court, with jurisdiction over approximately one-half of France) imprisoned her.

For Duval and his colleagues, such actions represented an unacceptable degree of royal power over the Church. To prevent exorcisms, they preached, was to deny miracles, and they claimed that Huguenot influence lay behind the *Parlement's* decision to suppress the exorcisms. Duval's criticism was sufficiently shrill for Duval and another priest to be charged by the *Parlement* with offending both court and king. Duval ("an otherwise learned man," the *parlementaire* Jacques Auguste de Thou noted; Congnard 1652, 10) got off with a reprimand.

Duval's next public statements on exorcism, in 1615 and 1618, concerned the controversial practice of interrogating the demons of the possessed in order to extract witchcraft accusations. Here he was more cautious. Consulted by officials in Valognes (Normandy) about the legitimacy of demonic testimony as legal evidence, Duval and two Sorbonne colleagues summarily rejected the practice: although the Devil can tell the truth, they held, he can never be trusted to do so. This response was published in a 1618 work by an Augustinian, Sanson Birette, *Refutation of the Vulgar Error Regarding Exorcised Devils*, with a letter of support from Duval. In his defense against witchcraft accusations made by the possessed nuns at Loudun, the priest Urbain Grandier later cited Birette's book. Ironically, in 1633, Duval signed a report giving qualified, but crucial, support for the authenticity of the possessions at Loudun. One of the principal exorcists there later invoked the Sorbonne's validation of the authenticity of the possessions in print. Duval's equivocation on the Loudun possessions was probably related to Cardinal Richelieu's influence over both the exorcisms and the Sorbonne theologians (Mandrou 1968, 318–322).

Duval's other statements about possession and witchcraft emphasize both diligence and the need for authority and discernment. In the 1620 case of Elisabeth de Ranfaing in the independent duchy of Lorraine, Duval and two colleagues rejected the use of diabolic testimony in the absence of other evidence, judging Ranfaing's

performances suspect because they lasted too long, "without syncope or interruption" (*Avis de Messieurs Du Val*, fol. 172r), arousing suspicion that the possessed woman was controlling the proceedings; their report also criticized some of the more flamboyant practices of the Lorraine exorcists as superstitious. In 1623, Duval appears to have been behind Sorbonne moves to condemn a book by the layman Jean le Normant about the possessed nuns of Lille, although two of his colleagues approved its publication. In 1625 Duval signed a joint response to a request from a court in Orléans for guidance about the realities of witchcraft and limits on the Devil's power. The authors of the response accepted several controversial forms of witchcraft, but urged judiciousness regarding claims made in this case by self-confessed witches. Duval's responses allow for many supernatural activities and signs, but also reflect a desire to qualify or limit his approval, sometimes for political reasons or to reassert the authority of the Faculty of Theology.

In his commitment to spiritual and mystical aspects of Catholicism, combined with a rigorous authoritarianism, Duval's attitudes resemble those of Jean Gerson, chancellor of the same faculty two centuries before, who addressed similarly vexing themes. Duval drew directly on Gerson's work, and like Gerson, he sought theologically rigorous arguments. But Duval's views, like Gerson's, were inevitably constrained by the political and polemical exigencies of his day. His career shows that good theological practice, like good case law, sometimes focuses as much on mustering authoritatively coherent views from within a canon as on arriving at a single constant version of the truth.

E

ECCLESIASTICAL TERRITORIES (HOLY ROMAN EMPIRE)

During the early modern period, some of the numerous Holy Roman Empire's ecclesiastical territories experienced particularly severe witch hunts. At the beginning of the seventeenth century, witch burnings became so frequent in central Europe that we cannot localize the exact starting points of individual waves of persecution. Surprisingly, the most prominent ecclesiastical princes of the Holy Roman Empire, the three archbishop-electors, ranked among the most active witch hunters. However, their witch hunts were never related to their quality as spiritual lords of their dioceses or archdioceses, but were carried out in their capacity as secular rulers.

As a result of political developments of the late Middle Ages, these archbishops ruled over sizable secular territories, usually located within their dioceses but covering only a small share of each. For example, the archdiocese of Mainz stretched almost from the North Sea to Italy, but the prince-electorate of Mainz (*Kurfürstentum Mainz*, or *Kurmainz*), consisted of patches of land scattered across the middle of the Holy Roman Empire: a large portion in the Rhineland; another portion stretching east of Frankfurt into upper Franconia; a third patch in Thuringia around the town of Erfurt, where Luther received his university education; and further tiny particles of land elsewhere. Altogether *Kurmainz* was about 8,300 square kilometers with nearly 400,000 inhabitants, and generated around one million gulden of income annually. Prince-bishops usually came from the lower regional nobility and were elected by cathedral chapters.

The witch craze in Mainz started with about 650 burnings during the short reign (1601–1604) of Johann Adam von Bicken, a man of fragile health. Under his successor Johann Schweikhard von Cronberg (ruled 1604–1626), a powerful imperial politician, the persecution slowed, but another 361 people were executed as witches. Witch hunting reached its climax under Archbishop Georg Friedrich von Greiffenklau (ruled 1626–1629), when 768 witches were killed in just four years. All in all, about 1,800 people were legally killed as witches under the rule of these three archbishops.

The electoral archbishopric of Mainz may serve as an example for ecclesiastical territories more generally, because many severe witch hunts were conducted by ecclesiastical prince-electors, prince-bishops, and prince-abbots (and even one prince-abbess, at Quedlinburg). Perhaps the primary reason so many witches were executed in central Europe was the fact that these ecclesiastical territories lay at the core of the Holy Roman Empire. To put it another way, there were few ecclesiastical territories outside central Europe (one apparent exception, the state of the Teutonic Knights in Prussia, was secularized by the Hohenzollern dynasty in 1525 during the Reformation, long before serious witch hunting started). The prince-bishopric of Breslau in Silesia (now in Poland) saw a considerable number of witch hunts as well. In Italy, the Papal States largely escaped such persecutions, although a witch panic apparently occurred in the papal territory of Avignon in southern France.

Some infamous prince-bishops, the so-called *witch-bishops*, conducted the most terrible witch hunts within the Holy Roman Empire. In the 1580s, the archbishop and elector of Trier began the series of massive witch hunts in the Holy Roman Empire with a paradigmatic persecution. For the first time, witches did not come only from the lower levels of society, and the execution of wealthy citizens, noblemen, and clerics as witches became a hallmark of persecutions in ecclesiastical territories. The prince-electorates of Mainz, Cologne, and Trier; the prince-bishoprics of Bamberg, Würzburg, Eichstätt, Minden, Osnabrück, Augsburg, Strasbourg, and Breslau; the prince-abbey of Fulda, Stavelot, and Ellwangen; the imperial abbey of St. Maximin (close to Trier); the lands of the Teutonic Order at Mergentheim all were ecclesiastical principalities that proved particularly susceptible to major witchcraft persecutions.

Nineteenth-century Protestant scholars attributed these persecutions to Counter-Reformation zeal, and Catholicism generally. Recent research, however, has demonstrated that attributing responsibility for these witch hunts is more complicated. The electorate of Mainz, to return to our example, was one of many fragmented Imperial territories where state-formation failed. There are obvious reasons for such structural

weakness: First, there was no continuity in office since ecclesiastical lands were not hereditary. Second, the bishops had considerable difficulties introducing reforms, one of their prime tasks as proponents of the Counter-Reformation. Moreover, the cathedral chapters that had elected them were irremovable and frequently pursued their own politics—they were dominated by interests of the regional nobility rather than the universal Church. Third, in Mainz, as in the electorates of Cologne and Trier, the regional nobility, the towns, and even the peasants retained considerable rights to self-government, and none lacked self-confidence. Taxation was difficult, and legal administration was decentralized and fragmented among competing jurisdictions.

These territories also experienced a most embarrassing conflict between the desire for religious reform and political reality. Because prince-bishops were temporal as well as spiritual lords, in theory, the process of confessionalization (the efforts of the different churches in sixteenth- and seventeenth-century Europe to align with the state to control all aspects of daily life) should have been particularly easy. In fact, some prince-bishoprics were Catholic only in name, while most of the nobility, and a number of towns, like Erfurt, or portions of the citizenry, remained Protestant. One of the most famous laws of the empire, *cuius regio eius religio* (subjects must follow the creed of their ruler), introduced by the Peace of Augsburg in 1555, could never

be put into practice. Until the end of the sixteenth century, even members of the cathedral chapters remained Protestant. Some bishops had to accept Protestant councillors, because they found no able Catholics among their subjects and would not risk employing foreigners. As late as 1582, one of the empire's most prominent ecclesiastical princes, Gebhard II Truchsess von Waldburg, archbishop of Cologne, converted to Protestantism, a traumatic experience for the Catholic party. The nobility was split into a lower branch, subject to the princes, and a higher branch, subject only to the emperor, virtually independent, and organized in cantons. Both branches were closely interlinked by marriage and represented a powerful social stratum, particularly in Franconia, Swabia, and the Rhineland. Many Imperial Knights and many of the lower nobility were Protestants, so when the bishops tried to embark on the business of Counter-Reformation, they faced considerable resistance.

It was symbolic of the bishops' weakness that Balthasar von Dernbach (ruled 1570–1576 and 1602–1606), the prince-abbot of Fulda, an ecclesiastical territory almost as large as the neighboring prince-bishoprics of Bamberg and Würzburg, failed to reform his territory. To the great displeasure of his subjects, including members of the nobility who constituted his chapter, von Dernbach was among the first generation of ecclesiastical princes who tried to introduce the rules of the Council of Trent. Like other reforming princes, he tried to use the reforms to discipline his subjects, and to strengthen his state. According to the Peace of Augsburg, dissenting burghers, clerics, and nobles could be driven into exile, and local society could be reshaped by discipline and education, with the Jesuits serving as intellectual cadres supporting absolutist rule. The struggle against concubinage usually served as a means of disciplining the clergy, and particularly the cathedral chapter. The public whipping of concubines, one of the zealous abbot's reforms, was considered an insult by his noble canons, as well as by the citizens of Fulda, who had accepted these unofficial "marriages" of their daughters, which conveniently united the strata of local society. The opposition to Abbot von Dernbach was considerable, and came not merely from Protestants, but also from some leading Catholic families, who were slow to accept his new religious program. Supported by the prince-bishops of Würzburg, this opposition forced the abbot to resign. However, von Dernbach managed to regain his territory through a decision of the *Reichshofrat* (imperial aulic court). Back in office, he launched one of the fiercest witch hunts in the Holy Roman Empire. There were 276 victims in three years in a territory with fewer than 90,000 inhabitants. Only after the abbot's death did the persecution stop. Under the new abbot, the infamous judge Balthasar Nuss was imprisoned and, after years of a

behind-the-scenes power struggle, executed for his atrocities.

It is rewarding to explore the microstructures of these ecclesiastical territories. For example, the persecution at Fulda had links to three other large-scale persecutions: that in the lands of the Teutonic Knights at Mergentheim (1602–1606), and those in the prince-bishopric of Bamberg (1616–1619 and 1626–1630). Among those who triumphed with the resignation of Prince-Abbot Dernbach in 1576 was an influential citizen, Hans Haan. After the zealous abbot's return, Haan's wife Anna was among the first to be accused of witchcraft. The family's losing appeal to the *Reichskammergericht* (imperial chamber court) was one reason judge Nuss was put on trial and eventually executed for his severe abuses. Not even during the confessional age were witchcraft prosecutions meant to serve as instruments of political or religious power struggles, or of revenge. A contemporary report labeled the Fulda persecution as "unlawful, cruel and tyrannical" (Oestmann 1997, 438–446). But this does not end the story. Recent research suggests that the Chancellor of Bamberg, Dr. Georg Haan (1568–1628), was Anna Haan's son. Originally a councillor in the interim administration of Fulda before 1602, Haan later rose to become vice-chancellor of Bamberg under Johann Philipp von Gebsattel (ruled 1599–1609), a bishop who indulged in the Renaissance joys of loving music and women (he had at least six children). But in 1610 the Catholic League installed an ardent reform-minded bishop, Johann Gottfried von Aschhausen, who was already bishop of Würzburg. His new suffragan bishop, Friedrich Förner (1568–1630), who resembled the Trier demonologist Peter Binsfeld, began to form new alliances and immediately attacked witches. A witch hunt started in 1612, making Haan uneasy for more than one reason: he was probably the son of a suspected witch who was arrested about the same time that his wife's mother had been burned as a witch in the territory of the Teutonic Knights at Mergentheim.

Factionalism entered politics as proponents of the Counter-Reformation established their power. Förner found support from the former chancellor's son, councillor Dr. Ernst Vasoldt, now eager to serve as a Witch Commissioner. Their conflict climaxed in 1618. Haan had already indicated his distaste for such persecutions. When the Thirty Years' War began to cause financial problems, he sharply reduced the budget of the persecutors, thus ending the persecutions. The hard-liners had lost a battle. The situation changed again after the election of Bishop Johann Georg II Fuchs von Dornheim (ruled 1622–1633), another Catholic League candidate, whose election had been engineered by Förner. Haan remained in office, but his enemies began to undermine him. In 1625 Förner delivered a series of thirty-five sermons on magic and witchcraft

that he dedicated to the prince-bishop of Eichstätt, Johann Christoph von Westerstetten. The prince-bishop was a man who represented the fundamentalist type of Counter-Reforming ecclesiastical prince and was well known for his persistent witch hunting. He initiated a permanent state of persecution in his prince-abbey of Ellwangen from 1603 to 1612, leading to no fewer than 75 days of executions during which groups of 4–12 were burned. He then added another 60 group burnings in his prince-bishopric of Eichstätt between 1612 and 1636. Even if Westerstetten's reign resulted in only 240 executions at Eichstätt (Durrant 2002), he was still responsible for at least 550 burnings, including the Ellwangen persecutions—and in both cases, the witch hunts lasted exactly as long as Westerstetten was in power. Guided by Förner, the most prominent victim of Bamberg's final witch hunt was the leading local politician, the veteran chancellor Dr. Haan, who had served the bishops of Bamberg and the Catholic League for many years. Eventually the whole Haan family was burned at the stake.

In comparison to earlier large-scale witch hunts, a new rationale guided these persecutions. Grassroots witch hunts in places like Lorraine might last for decades, and therefore accumulated large numbers of victims. This new type of witch hunt, however, was started deliberately, gained momentum within weeks, and led to the burning of hundreds of witches within a few months. Even when these persecutions were not initiated from above, the authorities used them to gain popular support for centralizing their legal administrations. These persecutions were coordinated by a new type of judge, a direct representative of the prince, later called a *Hexenkommissar* (Witch Commissioner), whose prototype was the Fulda judge Balthasar Nuss. As at Trier in the 1580s, the Mainz persecutions of 1602 were driven by village committees, whereas the prince-abbot's friend in Fulda was responsible for the whole territory and could bypass the *Zentgerichte* (district courts) or even the central government, like a Spanish inquisitor. Prince-Abbot Westerstetten, who appointed two lawyers as commissioners for Ellwangen when he saw the chance to launch a witchcraft persecution in May 1611, adopted this effective model. Such commissioners developed a standard procedure to minimize outside interference and combine torture with denunciations. Superseding slow and traditional circumstantial evidence, they created the proverbial *witch hunt*, using minimal evidence to steer the trials and guarantee a maximum number of convictions. From Ellwangen, Westerstetten brought this type of witch hunt to Eichstätt in 1613, from which other Franconian bishoprics (Bamberg, Würzburg) adopted it in 1616. Many territories experienced political struggles in the 1620s over whether or not to appoint Witch Commissioners. Both sides, "zealots" and moderate

“politicians,” clearly understood the implications. If Bavarian politicians managed to avoid large-scale persecutions, a Bavarian prince, the archbishop-elect of Cologne, deployed Witch Commissioners to produce the largest number of victims anywhere in German-speaking lands.

Ecclesiastical principalities proved particularly susceptible to witch persecutions, but many ecclesiastical territories were only slightly afflicted, and some not at all. It seems worth emphasizing that most of the imperial abbeys avoided persecutions. None of the extensive monastic lands most closely associated with baroque culture, including some large prince-abbeys (Berchtesgaden, Buchau, Corvey, Ettal, Irsee, Kempten, Kornelimünster, Malmédy, Marchtal, Oshenhausen, Ottebeuren, Prüm, Salem, Schussenried, St. Blasien, Ursberg, Weingarten, Weissenburg, or Zwiefalten), can be connected with any witch hunt, and some of them never had any witchcraft trials at all. Our perception has been distorted by a few sensational cases, like Fulda and Ellwangen, St. Maximin, or Stavelot. Many prince-bishoprics engaged in witch hunting, although we can also find a good number of examples to the contrary. Only a few trials occurred in the small prince-bishoprics of Speyer, Worms, Passau-Regensburg, Brixen and Trent, and a few took place in Münster, the largest ecclesiastical territory in the Holy Roman Empire, which moreover bordered on the archbishopric of Cologne and was even ruled by the same prince-bishops, Ernst and Ferdinand of Bavaria. Even where severe witch hunts took place, they were usually confined to only a few of the years between 1580 and 1640. We have already mentioned some factors that contributed to the potential susceptibility of ecclesiastical territories: structural weakness, the failure of state formation, the demand for persecutions from below, as well as the hardships caused by extreme climatic deterioration. We can add as causes the lack of medical care, social insecurity, and spiritual uncertainty from the competing confessions and tensions between official and popular religion. Of course, deficient infrastructures contributed to economic misery and underdeveloped institutions. Most of these factors operated in all monastic territories as well, and even in many secular lordships. So what made the difference?

One reason may have been that the political aspirations of prince-abbots were usually smaller than those of prince-bishops. Only a few, like Fulda or Ellwangen, embarked on state formation or confessionalization, thereby risking a power struggle with their estates or their subjects by forcing them violently into uniform belief. Some smaller prince-bishoprics, like Speyer or Constance, resembled monasteries in their leniency, and never aspired to state formation or forced their subjects into confessionalized Catholicism. Nor did these smaller prince-bishoprics systematically persecute

witches or heretics (Forster 1992). They experienced spiritual uncertainty, but only minor ideological stress. Furthermore, several prince-abbots, sometimes as a strategy for survival in areas where threats of rebellion, Protestantism, and secularization were imminent since the 1520s, developed particular kinds of social pacts, helping them alleviate social crises and providing their subjects, when necessary, with capital for investments. Monastic welfare systems became proverbial among the peasantry in southern Germany during the early modern period: *unter dem Kummstab ist gut leben* (life is good under an abbot's staff). Third (although for various reasons not yet well explored), at least some prince-abbots apparently had their own interpretations of the regulations of the Council of Trent. All prince-abbots of Kempten, for example, had concubines and children, as chroniclers in the neighboring Protestant Imperial City of Kempten meticulously and maliciously recorded. The abbots of wealthier territories were usually not zealots, and their attitude toward sin, like their attitude toward women, seems decidedly more relaxed than those of some Counter-Reformation bishops.

EICHSTÄTT, PRINCE-BISHOPRIC OF

The *Hochstift*, or prince-bishopric, of Eichstätt in southern Germany comprised the part of the diocese ruled by the bishops of Eichstätt. Between 1590 and 1631, three successive prince-bishops—Caspar von Seckendorf (1590–1595), Johann Conrad von Gemmingen (1595–1612), and Johann Christoph von Westerstetten (1612–1637)—presided over three episodes of witch persecution: in 1590–1592 in the outlying districts of Abenberg and Spalt; and in 1603 and 1617–1631 in the capital, also called Eichstätt.

In these years, between 240 and 279 alleged witches were arrested, most (between 181 and 210) during the final episode of persecution. Almost all were executed or died in custody. About 88 percent of the victims were women. The Eichstätt persecutions were part of a wider regional program of Catholic reform and re-Catholicization. They took place in a time of agrarian crisis and increasing confessional and political tension that culminated in the Thirty Years' War (1618–1648). Episodes of group persecution in the *Hochstift* were interspersed with isolated trials that continued an older local pattern of sporadic prosecutions for witchcraft, begun in the late fifteenth century. Before the first major episode broke out, there had been six executions for witchcraft between 1494 and 1562. An alleged witch was exorcised in 1582.

The origins of the persecution of 1590–1592 are unknown, but it coincided with conflict in the cathedral chapter over the election of a successor to Bishop Martin von Schaumberg, whose thirty years of rule (1560–1590) had been characterized by confessional tolerance and political stability. Two factions, one resistant to the changes decreed by the Council of Trent (1545–1563) and a younger reformist group led by Westerstetten, finally compromised over the election of Seckendorf, who was too ill to undertake his episcopal duties. The appointment of Gemmingen, a humanist unconcerned with reform, as Seckendorf's coadjutor in 1593 may have prevented further persecution. The accused witches of 1590–1592 were all female and came mainly from the local secular elite of Abenberg and Spalt, both of which were enclaves separated from

the capital by the territories of other rulers. The initial trials of this episode of persecution were cited as examples along with the case of Dillingen in the bishopric of Augsburg, in a 1590 opinion about the suppression of witches from the University of Ingolstadt sought by Wilhelm V of Bavaria. Afterward, between 1593 and 1602, cases against nine individuals accused of witchcraft or consulting with a wise woman were all resolved peacefully or dismissed entirely. Three dubious cases of witchcraft may have resulted in executions.

In another outbreak in 1603, twenty women, all of whom were residents of the town of Eichstätt and related to its secular political elite, were executed for witchcraft. (Their cases were not connected with those from 1590–1592.) Although members of the *Hofrat* (court council) conducted this episode of persecution, the outbreak may have been connected to a dispute within the cathedral chapter about introducing the Society of Jesus into the *Hochstift*. After his plans to invite the Jesuits to take over the local seminary were rejected, Westerstetten left the *Hochstift* in 1603 to become prince-provost of Ellwangen. There he began persecuting witches on a great scale a few years later. Of the ten or fewer cases of accused witchcraft between 1604 and 1616, including two slander suits brought before the *Reichskammergericht* (imperial chamber court) in Speyer, only three ended in execution.

Using fresh denunciations (no use was made of those from 1603), Eichstätt's witch persecution resumed in 1617 and lasted until 1631. It was conducted by an ecclesiastical witch commission, established by Westerstetten after his election as prince-bishop in 1612. The eradication of the heresy of witchcraft was part of Westerstetten's agenda to introduce Tridentine reform and re-Catholicize local Protestant territories. The persecution quickly moved from the countryside to the town of Eichstätt. The persecution focused not on accusations made by alleged victims of harmful magic, but on denunciations of accomplices made by suspected witches who were under interrogation. Because these suspects named friends and close neighbors as fellow witch-heretics, the accusations escalated among members of patrician households. In this process, more men were denounced than were arrested. That such a high proportion of women were among those arrested (about 85 percent) reflected the stereotyping by the Witch Commissioners. Opposition to the prosecutions proved ineffective, and the end of the persecution coincided with Westerstetten's prolonged stay in the Bavarian university town of Ingolstadt from 1630 to 1637.

Witchcraft trials also occurred at Eichstätt in 1723 and took place even as late as 1891–1892.

ELLWANGEN, PRINCE-ABBEY OF

The witchcraft trials in the princely prebend (*Fürstpropstei*) of Ellwangen, a small Catholic ecclesiastical territory in eastern Swabia, rank among the most significant in southern Germany during the early modern period. Both the number of victims (ca. 450) and the intensity of the juridical proceedings were exceptional. Only a few other ecclesiastical territories—the *Hochstifte* (prince-bishoprics) Würzburg, Bamberg, and Eichstätt, and the electorate of Mainz—experienced similar patterns of witch hunting. Ellwangen's witchcraft trials took place almost exclusively in the years 1588 and 1611–1618. In the first instance, between 17 and 20 people were executed, while over the second period, around 430 people were put to death. Almost 300 of them died in 1611 and 1612.

The main factor contributing to the advent of the 1588 trials in Ellwangen was the influence of witch persecutions in other territories and imperial cities in southern Germany, especially those occurring in the *Hochstift* Augsburg. As in many witch hunts in the sixteenth and seventeenth centuries, people already imprisoned for witchcraft accused someone else of sharing in their crime and that person would then be arrested. An experienced executioner, Hans Vollmair from Biberach, who was also active in other witch hunts in southern Germany, conducted Ellwangen's juridical proceedings. Forms of torture were very severe in Ellwangen, severe enough to ensure that everyone who was tortured either confessed or died. The victims of the 1588 Ellwangen trials were almost all poor, older women who lived in the town. Later in the same year when younger people and members of the social elite began to be accused of witchcraft, the provost stopped the trials.

In the early seventeenth century, witch hunts became increasingly common in Catholic territories and cities in southern Germany, while in the same period Protestant authorities frequently rejected them. Ellwangen's major witch hunt of 1611–1618 was strongly supported by two provosts, Johann Christoph

I von Westerstetten (governed 1603–1613) and his successor Johann Christoph II von Freyberg und Eisenberg (1613–1620), both zealous representatives of the Catholic Counter-Reformation. Shortly after the witch persecutions began in April 1611, Provost von Westerstetten changed the juridical procedures of the trials. A special deputation dominated by two court councillors now supervised witch hunting, and people were tortured on the basis of a single denunciation by another prisoner. The prisoners—who now included men and women of almost every age and social status—were usually forced to confess that they had made a pact with the Devil, flown through the air, had sexual intercourse with the Devil, participated in witches' Sabbats, and perpetrated several *maleficia* (evil acts). Ellwangen's juridical procedures became a model for the witch hunts in Bamberg, Würzburg, and Eichstätt in the 1620s.

In 1618 the trials stopped for three reasons. First, witch persecutions had caused tremendous social and economic damage; merchants avoided doing business in the region for fear of the "witches" in Ellwangen. Second, the trials did not achieve their intended goal of eliminating natural catastrophes or disease, among other things, in this fight against the Devil's assistants. Third, the legitimacy of the whole process was called into question by the fact that many more people were denounced than could ever be brought to trial—the "supply" of witches far outran the capacity for their condemnation.

After the great Ellwangen witch hunt ended in 1618, only a few witchcraft trials took place in this princely prebend. Between 1618 and 1694, some fifteen people were brought to trial on charges of witchcraft, but only two of them were executed.

ENDOR, WITCH OF

The biblical story of the so-called witch of Endor is found in 1 Samuel 28:3–20, with two brief references in 1 Chronicles 10:13, and Ecclesiasticus 46:20. By the

fifteenth century the story began to acquire an overtly diabolical interpretation, with the “witch” representing the one scriptural example that could be used to sanction campaigns against witchcraft. Yet uncertainty remained about how to interpret this story of necromancy.

The Bible describes King Saul, facing a large Philistine army without assurances from God about the outcome of the imminent battle, visiting a female necromancer at the settlement at Endor. Because Saul himself had earlier been responsible for expelling all necromancers and wizards, he decided to visit the woman at night in disguise. When he asked the woman to reveal his future by conjuration, she demurred, fearing a trap to catch her for transgressing the king’s prohibition. But when Saul swore she would suffer no harm, she finally agreed.

The woman realized her visitor had to be Saul when she saw that she had conjured the ghost of Samuel. The king immediately bowed down in homage before the vision, described by the woman as an old man, rising from the earth wrapped in a cloak. But Samuel’s words were far from comforting. After rebuking Saul for disturbing his rest, he announced that because of his disobedience, God had abandoned Saul and given his sovereignty to David. Moreover, on the next day the Israelites would be defeated, and Saul and his sons would die. Saul was terrified by the prophecy, and, as he had eaten nothing the whole day, fell to the ground in shock. The woman finally comforted him by feeding him; she slaughtered her fattened calf and prepared some cakes. As the spirit prophesied, on the next day the Israelites were defeated at the battle of Gilboa, Saul’s sons were killed, and Saul committed suicide by falling on his sword.

From the time of St. Augustine, biblical commentators and theologians have provided very different explanations of the figure that appeared to Saul. Augustine himself oscillated between several views: it was the Devil, an apparition created by the Devil, a conjured human soul, a ghostly body, or Samuel himself. Peter Comestor discussed the question at length in the twelfth century. By the fifteenth century, works such as the *Malleus Maleficarum* (The Hammer of Witches, 1486) cited Augustine and Thomas Aquinas to support their view that the figure represented a phantasm produced by diabolical illusion.

The process was reflected in visual representation from the twelfth century. Late medieval images focused on the interaction between Saul and Samuel rather than on the witch and her act of conjuration. A marked shift occurred with a miniature illustration in an early fifteenth-century Parisian *Bible historiale*. The witch is now positioned in the center, on her knees before Saul, while the apparition of Samuel stands behind her. The compact between the two is given great

prominence, while a flying devil assures viewers that this is diabolical.

A 1526 painting by Jacob Cornelisz van Oostanen expresses this new biblical exegesis and provides a spectacular example of the integration of the biblical story with the new visual language of witchcraft. This work of turbulent movement and energy combines the image of a powerful female necromancer, seated in a magic circle, with a group of four witches modeled on compositions by Hans Baldung [Grien]. The latter are depicted seated around a grill, two of them on goats, cooking sausages, drinking, and possibly also making an offering. Wild naked females riding brooms and belching goats through the sky with a range of strange beasts complete the scene. The witch of Endor remains a necromancer, but has now come to be identified with the new group image of sixteenth-century witchcraft.

This identification is also reflected in a woodcut by Johann Teufel, first found in the 1572 Wittenberg edition of the so-called *Luther Bible* and reproduced in at least six subsequent editions. Teufel also includes paraphernalia of necromantic magic (burning candles, an altar, a magical circle, and crosses) not found in his

biblical source. The witch holds a long staff like a magician's ritual wand and prayer beads hang from her left arm, thus linking her necromantic practices to what pious Lutherans considered the abominable magic of Catholic devotion. In agreement with Luther's commentary, which identified the ghost as the Devil in Samuel's form, both the witch and Samuel were placed inside the magic circle to emphasize their close liaison.

Controversy concerning the nature of the witch and her conjuration continued. In 1563, Johann Weyer included a long discussion of the episode in *De Praestigiis daemonum et Incantationibus ac Veneficiis* (On the Tricks of Devils, Incantations, and Poisoners) (Weyer 1991, 127–133). According to Weyer, the figure that appeared was an apparition or specter in Samuel's image, an illusion created by the Devil, who simply made the specter obey this pythoness, as the Hebrew text called her, "an evil-doer or woman filled with the prophetic spirit." Refuting Weyer in 1580, Jean Bodin's *De la démonomanie des sorciers* (On the Demon-Mania of Witches) (Bodin 1995, 105) considered the woman a necromancer and therefore a witch; and on the basis of Ecclesiasticus 46:20, the figure she conjured was Samuel rather than the Devil. In 1583, Reginald Scot rejected both positions in his *Discoverie of Witchcraft* (book 6, chaps. 8–14), seeing the whole episode as an act of "cousenage" and "counterfeit," a series of tricks, disguises, and ventriloquy devised by the woman of Endor.

By the seventeenth century, the Devil's active and effective involvement in the events at Endor was widely believed. The King James and Geneva Bibles both described the woman as one "that hath a familiar spirit." This was understood to refer to animal familiars, the personal demons accompanying and serving contemporary witches. A graphic example occurs in a woodcut by the Swiss artist, Christoph Murer, in a Luther Bible published at Basel in 1625. The central focus of the image is a flask with a familiar spirit, held up by a witch in front of the figure of Saul, while the figure of Samuel remains in the background. The witch's necromantic techniques and paraphernalia (books, candles, vials, skulls, and bones) are emphasized in many seventeenth-century illustrations of the biblical text. Examples include a woodcut by Johann Jacob von Sandrart, originally published in a Nuremberg Luther Bible of 1641 and often reproduced; a woodcut of the Monogrammist VW from a Luther Bible of 1670; and a title-page etching by Andreas Frölich for Bernhard Waldschmidt's collection of twenty-eight sermons on the subject, published at Frankfurt in 1660. By the late seventeenth century, Endor scenes even included cauldrons, as in a Melchior Küsel 1679 adaptation of an earlier etching by Jan van der Velde, or a splendid cartouche by Joseph and Johannes Klauer, published at

Augsburg in 1748. Even without her paraphernalia, the witch frequently remains the dominant figure, as in the wonderfully eerie scene set among the graves of the dead in a Gabriel Ehinger etching of about 1670.

In parts of Europe where the witch hunt was limited or in decline, alternative interpretations focusing on the figure of Samuel remained strong. An important example is Joseph Glanvill's *Saducismus Triumphatus* (Sadducism Conquered), published posthumously in 1681 by his Cambridge Platonist supporter, Henry More. Glanvill's attack on what he called Sadducism, a denial of the spirit world, involved detailed consideration of this biblical story (Glanvill 1996, 296–317). Against Reginald Scot and John Webster, Glanvill denied that the events at Endor involved trickery or the appearance of the Devil. Rather, it was the blessed soul of Samuel himself that appeared, clothed in his "more pure Aerial or Aetherial Body." The focus of the accompanying engraving by William Faithorne is on Samuel, who is surrounded by a brilliant aureole, while the witch of Endor remains an observer on the perimeter. An Italian tradition, principally represented by a famous painting of 1668 by Salvator Rosa, similarly emphasizes the radiant presence of Samuel, as does the work of some Dutch followers of Rembrandt, such as Ferdinand Bol.

ENGLAND

Although insufficient records survive for certainty, there is every indication that over most of the period of the

European witch persecutions, England enjoyed a low intensity of witchcraft trials, along with a low conviction rate among those who were brought to trial. Current estimates indicate that no more than 500 people were executed as witches in England, and the number may have actually been much lower. English witchcraft trials are very interesting, however, in that they demonstrate how witchcraft was treated by a unique criminal justice system. The numerous contemporary pamphlets describing witchcraft trials frequently provide the modern student with rich insights into what happened when accused witches and legal authorities met in the courtroom.

Although witchcraft was not a felony under common law until 1542, England in the late Middle Ages experienced its share of “treason-cum-sorcery” trials involving members of its political elite. Perhaps the most famous case of this type came in 1441, with the trial of Eleanor Cobham, second wife and former mistress of Duke Humphrey of Gloucester, the brother of King Henry V. Cobham escaped the death penalty, but one of her female associates was burned as a witch, while a reputed astrologer was hanged, and then drawn and quartered for treason. English monarchs thought themselves vulnerable to treasonous sorcery up to the reign of James I (ruled 1603–1625).

More prosaically, local court records contain scattered references to trials for witchcraft and sorcery. These references are too dispersed and insufficiently detailed to permit any detailed analysis of early witchcraft trials in the fifteenth and early sixteenth centuries. Most of the references survive in the records of ecclesiastical courts, which could only inflict light penalties. Our current state of knowledge suggests that many of the accused were “good” witches, local sorcerers, and cunning folk, rather than persons suspected of malefic witchcraft. Nevertheless, many aspects of witchcraft recorded in trial records from the late sixteenth and seventeenth centuries were familiar by 1500.

The legal position of witchcraft changed in 1542 with an act defining witchcraft as a felony (33 Hen. VIII, cap. 8). This was the most draconian of English witchcraft statutes, probably prompted by several witch scares in the preceding years, and also part of a general tendency to remove offenses from ecclesiastical jurisdictions. The act was repealed, along with other Henrician legislation, after Edward VI came to the throne in 1547. England had no secular laws against witchcraft until a further statute was passed in 1563 early in Elizabeth I’s reign (5 Eliz. I, cap. 16). This law, among other provisions, imposed the death penalty for killing humans by witchcraft, but allowed those who were convicted of harming humans or killing animals the lesser punishment of a year’s imprisonment and four sessions on the pillory for a first offense; a second offense of this type punishable by death. A further act

came in 1604 (1 Jas. I, cap. 12). The exact circumstances behind its passage remain obscure, although it is now accepted that the tradition attributing it to the direct influence of the newly arrived demonologist monarch is unfounded. The Jacobean statute eroded the possibility of lesser punishments on first offenses, included a clause intended to make keeping familiar spirits a capital offense, and, curiously, also made exhuming corpses for purposes of witchcraft a capital offense. This statute remained in force until 1736, when the Parliament of Great Britain repealed all English and Scottish witchcraft statutes (9 Geo. II, cap. 5).

As in many other European states, accusations of witchcraft in England could lead to trials in a number of courts. Ecclesiastical courts continued to exercise jurisdiction over sorcery and the activities of cunning folk, while a steady trickle of cases in which alleged witches sued their accusers for defamation also reached the church courts. Many church courts records have not yet been researched, but it is obvious that the level of prosecutions varied enormously from area to area. Hence, numerous presentments reached the Essex church courts between the early years of both Elizabeth I’s and James I’s reigns, but there were practically none in Wiltshire, and only a moderate number in Yorkshire. Church courts still inflicted only light penalties, and those whom they convicted of sorcery or witchcraft were, at worst, sentenced to perform a public penance.

Under secular law, witchcraft could be tried at county quarter sessions. Although a number of cases (including many that involved cunning folk) were tried before these courts, the growing reluctance of the presiding justices of the peace to try offenses that might result in the death penalty meant that few cases of malefic witchcraft were tried there. Witchcraft could also be tried as a criminal offense in borough courts that had rights of jail delivery. Several witches are known to have been tried and convicted before them, an extreme case being the thirty witches tried and fifteen executed in a local panic at Newcastle-upon-Tyne in 1650.

The most important tribunals trying witches in England were the assizes. English counties were grouped into a number of circuits; twice each year, in January and around Midsummer, two judges were sent out by the government at Westminster to ride each circuit. Along with other business, they would try criminals held in the county jails, most of whom had been committed to prison by local justices. Two things should be noted about these judges. First, they were usually very senior men with extensive legal training and considerable experience, and thus very unlike the sometimes untrained judges who presided over witchcraft trials in many English boroughs. Second, there was a convention, usually observed, that an assize judge could not ride a circuit where he had his main residence

to keep judges away from local power struggles. Thus the judges who tried most English witchcraft trials were highly qualified, metropolitan-based outsiders.

Unlike most other European criminal justice systems, which generally followed Roman-law precedents, the English system involved trial by jury and did not use torture as a means of proving guilt in criminal trials. It should be noted, however, that jurors were frequently drawn from that same rural middling sort who were so often involved in prosecuting alleged witches, a situation that, on many occasions, worked to the accused's disadvantage. Despite the eulogies heaped on the jury system in the period, trial judges regularly gave juries a strong lead on what verdict to find. Certainly, by the mid-seventeenth century, assize judges were willing to aid witches convicted by juries toward reprieves or pardons.

Unfortunately, few assize records between the passing of the 1563 act and the mid-seventeenth century survive. Those that do are effectively limited to the Home or southeastern circuit of the assizes, encompassing the counties of Essex, Hertfordshire, Kent, Surrey, and Sussex. Using the surviving documentation, analysis of witchcraft indictments tried on this circuit reveal that between the first indictments (which in fact slightly predated the 1563 statute) and the last, which came in 1701 and resulted in the acquittal of a woman named Sarah Moredike, some 785 indictments involving 474 alleged witches were tried on the Home Circuit.

These indictments followed a marked chronological and geographical pattern: they rose in the 1570s, peaked in the 1580s, remained high in the 1590s, and then fell rapidly, with fewer than twenty indictments surviving from the 1630s. This evidence suggests that witchcraft trials were declining rapidly in England by this point, although after the Civil Wars began in 1642 there was a tremendous upsurge. Geographically, for reasons that remain unexplained, over half of these indictments, 464 (or 59 percent) involved inhabitants of the county of Essex. At the other extreme, the rural and somewhat isolated county of Sussex experienced only thirty-six indictments against sixteen alleged witches, of whom only one was hanged. Certainly, the chronological pattern of indictments owes much to the situation in Essex. In Kent, for example, the peak of trials appears to have come in the 1640s and 1650s.

The 474 accused witches tried on the Home Circuit enjoyed a very low conviction rate. Two hundred and nine of them were convicted; but of these, only half, 104 (or 22 percent of those indicted) were hanged. A further forty-seven (10 percent of those indicted) were sentenced to the lesser punishment of a year's imprisonment and four sessions on the pillory. The documentation does not give the fate of a few of those remaining, but we know that the judge either reprieved, pardoned,

or remanded a further forty after conviction. Additionally, seven women escaped execution because they were pregnant. The legal requirement that they should be executed after giving birth was rarely enforced at this time. Nearly two-thirds of the executions occurred in the period 1570–1609, and trials in Essex and Kent in the 1640s and 1650s were responsible for most of the remainder. It should be noted that English law executed witches, like other felons, by hanging rather than burning. Exceptions occurred when women killed their husbands by witchcraft, because murder of a husband was classed as "petty treason." A "mother Lakeland" for example, was burned at Ipswich in 1645 after being convicted for using witchcraft to kill her spouse.

The overwhelming majority of those indicted for witchcraft on the Home Circuit were tried for acts of *maleficium* (harmful magic). The 785 indictments detailed 794 specific instances of witchcraft, of which 36 involved trying to raise or deal with spirits (including familiars), while 10 others involved cozening through sorcery or related offenses. Conversely, there were 415 cases in which adults were killed or injured through witchcraft, plus another 161 where the victims were children, 164 where livestock or poultry had allegedly been harmed by witchcraft, and a further 8 where other types of goods or property had allegedly been damaged. Of the 474 alleged witches, 425, or nearly 90 percent, were women. The 10 percent of male witches were accused of a wider variety of types of witchcraft than were women; for example, many cases of cozening through sorcery involved accused males. On the evidence of the Home Circuit indictments, by far the most significant body of archival evidence relating to English witchcraft trials, malefic witchcraft was seen as an overwhelmingly female activity.

Other relevant bodies of court records, notably those for Middlesex and Cheshire, which enjoyed an independent jurisdiction over serious crime, show a very different pattern. Cheshire, whose Court of Great Sessions enjoys an excellent record survival rate, recorded only sixty-nine indictments for witchcraft, the last coming in 1675, with a small peak in the 1650s. Forty-seven individuals were accused of witchcraft; seven, all women, were sentenced to death. Sixty-three cases were tried at the Middlesex Sessions, all of them between 1574 and 1659, with minor peaks in the 1610s and 1650s. These cases involved forty alleged witches, thirty-five of them women, of whom seven women were hanged, the last in 1653. By that date, it is possible to reconstruct patterns of prosecution in other assize circuits, and these generally confirm the pattern found on the southeastern circuit. There was a general falling away of cases after a mid-century peak, with progressively fewer indictments each decade as the seventeenth century progressed, and very few convictions. As

far as we know, the last executions came in the southwest. Three women were hanged at Exeter in 1682, and another, Alice Molland, was sentenced to death there in 1685. If her sentence was carried out, she has the distinction of being the last person known to have been executed for witchcraft in England.

By the later seventeenth century, it was becoming obvious that assize judges were becoming increasingly reluctant to render convictions. It is doubtful that many judges entirely discounted the reality of witchcraft, but they had long since been aware of the problems of proof in individual cases. At some point before 1700, this awareness had become so deep as to inhibit guilty verdicts. Moreover, the broadening gap between polite and plebeian cultures in the later seventeenth century reinforced what was probably a preexisting attitude by judges. While they were unable to discount witchcraft as an abstract possibility, they regarded the folklore of witchcraft, which so often formed the basis of the accusations they tried and the evidence they heard in court, as the nonsensical superstition of the lower orders. Famously, that great hero of the English Common Law tradition, Sir Matthew Hale, convicted two witches at Bury St. Edmunds in Suffolk in 1662. Yet within a generation, another leading lawyer, Sir John Holt, was routinely directing juries to acquit at witchcraft trials. Indeed, in 1701 Holt presided over an important trial in which a young man called Richard Hathaway was tried and convicted for falsely accusing Sarah Moordike. A full record of this trial survives and shows Holt working very hard in his conduct of the trial, in particular, in his cross-examination of witnesses, to secure Hathaway's conviction.

English judges, like their continental equivalents, had always been aware of the difficulty of proving witchcraft, and many trials demonstrate how normal standards of proof were dropped in witchcraft trials. There was heavy dependence on hearsay evidence and the accused's reputation, and children were allowed to testify (perhaps most famously in the Lancaster [Lancashire] trials of 1612). Persons who were allegedly bewitched frequently went into witchcraft-induced fits when the accused came into court. The courts also admitted spectral evidence. The presence of the witch's mark, which according to English beliefs typically took the form of a teat from which the witch's familiar sucked the witch's blood, was also seen as conclusive proof. Courts regularly received evidence from groups of women searchers appointed by parish constables, justices of the peace responsible for the initial interrogation of suspects, or assize judges. Generally, judicial authorities were very nervous about popular "proofs" of witchcraft. They were especially hostile to the swimming of witches. As the seventeenth century progressed, some of the fuller accounts of trials given in pamphlets demonstrate an increasing circumspection

by judges running witchcraft trials, which were evidently regarded as an unusually problematic type of judicial proceeding.

The last trial known to have resulted in a conviction came in 1712, and provoked a pamphlet debate that, once again, included a full description of the trial. The case involved a woman called Jane Wenham from Walkerne in Hertfordshire, who had long been suspected as a witch. She was finally brought to court after she was accused of bewitching a servant girl named Anne Thorne. The case unleashed considerable local odium against Wenham, and the charges against her involved a number of locally influential people. The trial judge, Sir John Powell, was apparently extremely skeptical. He expressed dismay when Thorne went into allegedly witchcraft-induced fits in court, and he also bullied prosecution witnesses. One, a woman who claimed that she had been too poor to initiate court proceedings against Wenham for bewitching her child nine years previously, was asked sarcastically "if she had grown rich since." There is also a tradition, probably invented after the incident, that Powell, after hearing a witness depose that Wenham was able to fly, had cheerfully informed the court that there was no law in England against flying. The jury, possibly swayed by the weight of evidence provided in court by eminently respectable men, found Wenham guilty. Judge Powell gained a reprieve, however, and Wenham ended her days living on a local magnate's estate. The case, which among other things showed how witchcraft was now a matter of contention between Whigs and Tories (Wenham's eventual benefactor was a Whig), also demonstrated how deeply held the belief in witchcraft in England still was. Moreover, in light of Powell's performance, the case illustrates how completely judicial attitudes had hardened against accusations of witchcraft.

English witchcraft trials thus signify a number of characteristics: the low conviction rate, the high proportion of accusations against females, the prominence of incidents of *maleficium* in indictments, and the decisive input of increasingly skeptical judges. The absence of torture helped create this situation, although English juries were capable of convicting witches on evidence that would not have gotten the accused into the torture chambers of the better-regulated continental states. Perhaps more decisive was the fact that assize judges were experienced and well-trained men who were also, as the seventeenth century advanced, increasingly culturally distant from the context of village tensions and neighborly disputes that so often underlay witchcraft prosecutions. All this helped create an impression that in England, witch persecution was relatively low key and weak. It should be noted that the great exception to this conclusion, the mass East Anglian trials of 1645–1647 associated with Matthew Hopkins, flourished in large measure because of a temporary and partial weakening

of England's normal legal and local administrative structures.

ENLIGHTENMENT

Historiography is generally very clear and certain on attitudes toward witchcraft in the Enlightenment—a term designating a period (ca. 1650–1800) of great intellectual activity in the cause of general education and culture, including emancipation from mere prejudices, conventions, and traditions. Whereas Satan had triumphed during the late sixteenth and first half of the seventeenth centuries in western Europe, and until the mid-eighteenth century in eastern Europe, conventional wisdom holds that his reign ended in the Age of Enlightenment. In the slipstream of a triumphant mechanical philosophy, intellectuals used their typical critical methods of reasoning to question the earthly power or even the existence of the Devil, and thus the powers of his preferred companions, the witches. Witchcraft was merely a vulgar notion, bred of ignorance and credulity. What had previously been attributed to devils and witches was now explained in terms of medical and psychological pathology, legal injustices, and superstition (Clark 1994, 788). The entry on *sorcellerie (magie)* in Diderot and d'Alembert's *Encyclopédie*, published in the 1760s and generally considered the bible of the Enlightenment, indeed sounds very skeptical: "a magical operation, shameful or ridiculous, stupidly attributed by superstition, to the invocation and power of demons." It defined "superstition" as "any religious excess," a product of fear, that is, the

antithesis of reason. David Hume's essay *Of Superstition and Enthusiasm* (1741) repeated the assertion that weakness, fear, melancholy, together with ignorance, were the true sources of superstition.

Recent studies, however, have shown that theories of witchcraft were far more robust—and not as mere signs of popular superstitious credulity—than this historiography acknowledges. Parallel to different degrees of Enlightenment, moderate (and surely not irreligious) and radical, there existed different degrees of Devil and witchcraft beliefs. For example, Ian Bostridge divided his analysis of the strength of witchcraft beliefs, a pattern he found all over Europe, into three groups: a small number of the credulous, prepared to believe almost any tale of witchcraft; a few skeptics who believed nothing; and a vast majority who repudiated some vulgar beliefs, but believed in the possibility of witchcraft and the veracity of some accounts of it.

The ideological importance of witchcraft was far too great among the elites of the Old Régime to be played down; in France, England, Spain, and the New World it was politically contested ground. If Father Benito Geronymo Feijoo became the critical mind in Spain (*Teatro Critical* [Critical Theatre, 1720–1759]), he still dared not deny the existence of witches. Hence Goya, as an enlightened artist, produced his *Caprichos* and *Pinturas negras* to satirize and condemn the dangerous inheritance of Spain's old regime (Bostridge 1997, 203–243).

DECLINE OF WITCHCRAFT PROSECUTIONS

By the mid-eighteenth century, the great European witch hunt was a thing of the past. Louis XIV promulgated official prohibitions of witch hunting in France in 1682, King Frederick William I in Prussia in 1714 and 1721, Maria Theresa in Austria-Hungary in 1768, and Stanislaw II Poniatovski in Poland in 1776. England and Sweden repealed their witchcraft legislation in 1736 and 1779, respectively. Nevertheless, the restriction on witch hunting did not necessarily imply the extinction of witchcraft as a legitimate belief, or even as a criminal offense. In France, for example, "it is certainly not the case that the 1682 ordinance represented a precocious triumph of French rationality, a first blast on the enlightenment trumpet" (Bostridge 1997, 231). The crime of witchcraft was redefined, but not abolished in statutory law until 1791. Even the *Encyclopédie*, in its entry on "sorcières" and "sorcières," took witchcraft theory relatively seriously; "to give credence too lightly to all accounts of this sort, or to reject them absolutely," it said, "are two equally dangerous extremes" (Bostridge 1997, 224).

Moreover, the decline of the prosecutions was gradual. In most states, after a period of severe prosecution came a period of sporadic trials and small hunts, and

then the end of executions and trials (Levack 1995, 250). In eastern Europe, large-scale witchcraft prosecutions began much later than in western Europe and lasted until the middle of the eighteenth century. In Poland, for example, diabolic theories, local (clerical) autonomy, and the unrestricted use of torture, were the ingredients of a large-scale witch hunt between 1675 and 1725. Even afterward, isolated prosecutions occurred in several places, for example, Sweden (1763), Kempten in southern Germany (1775), and, finally, the last legal one in Europe, at Glarus in Switzerland (1782).

The countries where witchcraft trials endured long after 1650 were those where belief in diabolism, inquisitorial procedure, and the use of torture persisted. The complete abolition of torture, for example, usually occurred only when authorities no longer believed that witchcraft merited the death penalty. As early as 1712 the German academic Christian Thomasius wrote powerful condemnations of inquisitorial methods, especially the use of torture, in witchcraft trials. Already several European jurisdictions had adopted stricter rules for both the application of torture and the admissibility of evidence obtained by it. Such was the case in Spain in 1614, in Italy in the 1620s, in some German principalities after 1630, and in Scotland in the 1660s. Torture was not abolished in Prussia until 1740 and only much later in such places as Saxony (1770), Austria (1776), the Habsburg Netherlands (1787), Switzerland (1803), or Bavaria (1806) (Levack 1995, 237–238).

LEARNED DISCUSSIONS

Skepticism regarding witchcraft and diabolism did not begin in the seventeenth and eighteenth centuries. Many of the arguments offered were the same as those made by Johann Weyer, Reginald Scot, or Michel de Montaigne in the sixteenth century. What was new was that the skeptics' views were now widely accepted. The assertion that skeptics no longer posed a threat to religion, philosophy, or the social order (Levack 1995, 240) is very doubtful. All over Europe, a key argument in learned discussions on witchcraft during the Enlightenment claimed that denying the power and the existence of the Devil could easily lead to denying the operations of Divine Providence and even the existence of God. The English Methodist preacher John Wesley stated that "giving up witchcraft is, in effect, giving up the Bible," while the English jurist William Blackstone affirmed that "to deny the possibility, nay the actual existence of witchcraft and sorcery is at once to contradict the revealed word of God" (cited in Ankarloo and Clark 1999, 44). Hence, *De betoverde Weereld* (The World Bewitched, 1691–1693) by the Dutch pastor Balthasar Bekker provoked severe reactions. His relatively moderate Cartesian skepticism about the power of the Devil and his active engagement with

humankind generated an extremely violent polemic in France, England, and Germany, spawning dozens of pamphlets and books. Bekker was considered an extravagant freethinker or even an atheist.

A half-century later, a lively discussion about witchcraft and magic divided Italy after the publication of Girolamo Tartarotti's *Del congresso notturno delle Lammie* (On Nocturnal Gatherings of Witches) in 1749. Tartarotti's search for the genuineness of witchcraft from a historical viewpoint disputed a remark by Ludovico Antonio Muratori in his *Della forza della fantasia umana* (On the Strength of Human Fantasy, 1745) that witches had never existed. Contrary to Muratori's optimism about the absence of any witch beliefs at present, Tartarotti pointed to the ongoing beliefs and prosecutions in Germany. Moreover, Tartarotti believed in the historical authenticity of magicians who had all belonged to the intellectual world, men who intended to violate God's law by using demonic powers. No Catholic, Tartarotti claimed, could assert that the existence of the Devil was impossible. The reaction of Gianrinaldo Carli (1720–1795) on that scrupulous point of view of Tartarotti's was clear: he did not believe in the historical reality of magicians either: there was no difference between them and witches—they were both swindlers and had to be punished. When Scipione Maffei stated in 1749 that there was no consensus about the historical reality of magic, and that the magic of his days was "*un bel nulla*" (absolutely nothing), events in Germany contradicted him. On June 21, 1749, a nun, Maria Renata, accused of witchcraft, was decapitated and burned in the city of Würzburg. During her public execution, the Jesuit Georg Gaar preached against all intellectuals who protected witches and magicians by denying their existence and power. Such ideas, Gaar said, would ultimately lead to the denial of the Devil, the angels, and God.

Between 1750 and 1754, discussions of witchcraft involved many representatives of the Italian Republic of Letters: no fewer than fourteen intellectuals participated, including a theologian, Daniele Concina; a Church historian, Tommaso Maria Mamachi; a Franciscan, Benedetto Bonelli; a philosopher, Clemente Baroni; a Cartesian, Costantino Grimaldi; and an enlightened scientist, Paolo Frisi. Maffei finally ended it by demonstrating, in *Arte Magica annichilata* (The Magical Art Annihilated, 1754), that Tartarotti's theory of a difference between magic and witchcraft had no theological, philosophical, or moral grounds.

This Italian debate had repercussions in other Catholic lands, especially France. In 1751 Maffei's first book appeared in a French translation in Paris, alongside a re-issue of the critical dissertation of the Benedictine Father Augustin Calmet on the phenomenon of ghosts, revenants, and vampires in Hungary and Moravia. The libertine Lenglet du Fresnoy (1674–1755) published two

books on these subjects in 1751–1752. Voltaire reacted with typical sarcasm to such discussions in his *Prix de la justice et de l'humanité* (The Prize of Justice and Humanity, 1777), wondering if he was really living in the century of Montesquieu and Beccaria, since witchcraft was still defended; he condemned what had happened in Würzburg and in Provence (with the Jesuit Jean-Baptiste Girard and Catherine Cadière affair) as idiotic pieces of barbarism. In his popular novel, *L'histoire des imaginations extravagantes de Monsieur Oufle* (The Story of the Extravagant Imaginations of Monsieur Oufle, 1710), the theologian Laurent Bordelon poked fun at witchcraft beliefs and demonology.

Catholic Austria, especially Vienna, also held learned discussions, but they were mostly about “posthumous magicians and witches,” that is, vampires. In the 1750s, Moravia, Bohemia, and Hungary each experienced several cases of postmortem prosecutions: corpses of presumed vampires were exhumed, their hearts pierced, their heads shattered and burned, and the ashes dispersed to prevent their eventual return. The reaction of the enlightened Holy Roman Empress Maria Theresa was prompt: relying on the expertise of her personal physician, Gerard van Swieten, she decided to combat such superstitious acts and issued several decrees concerning witchcraft, magic, and vampirism between 1753 and 1756. Not long before, van Swieten's predecessor, Anton de Haen, had stated in his *De Magia* (On Magic, 1744) that witchcraft and magic with the help of the Devil existed and that witches really could fly, although innocent people were accused and executed during the witchcraft prosecutions because of the deceptive methods of justice. “The time has come to change jurisprudence,” as Konstantin Franz de Cauz concluded his elaborate dissertation, *De cultibus magicis* (On the Cult of Magicians, 1767).

In 1761, the year Tartarotti died, Italian enlightened ideas and tracts on the existence of witchcraft and magic were adopted by the Augustinian monk Jordan Simon. Using the works of Tartarotti and especially Maffei, he demonstrated the absurdity and impossibility of both witchcraft and magic (*Das Weltbetrügende Nichts* [The World-Deceiving Nothing]). Five years later, the Theatine Ferdinand Sterzinger declared in Munich's Bavarian Academy of Sciences that in these enlightened times one could not believe any more in witchcraft and that the so-called pact with the Devil was a mere fantasy. Like Italian Catholic intellectuals, he wanted reason to triumph over the Devil's partisans. It was the start of a real witch war in Bavaria; Sterzinger had to cope with attacks from an Augustinian, Agnellus März, and a Benedictine, Scheyern Angelus März, both convinced of the existence of witches and magicians. The Age of Enlightenment was far from witchcraft-free.

“ENORMOUS” CRIMES

Strongly influenced by Roman law, the criminal law of late medieval and early modern Europe distinguished crimes by degrees of seriousness and accordingly assigned different legal procedures and levels of punishment. In ancient Rome, the major distinction was between private offenses and public crimes. Many centuries later the categories multiplied. It became possible to differentiate between slight and serious crimes, or between atrocious and extremely atrocious crimes, according to the various punishments established by law. The ultimate category was punishable by death by cruel means, subsequent confiscation of the culprit's goods, and legal disabilities charged against his descendants. At the same time, exceptions to normal legal procedures created a distinction between ordinary crimes and crimes of difficult proof, classified as *crimina excepta* (excepted crimes).

In cases of *crimina excepta*, torture was allowed even in the absence of strong evidence. Furthermore, witnesses could include convicted criminals, women, children, relatives, and accomplices—all persons whose statements were not normally acceptable as valid evidence. (It is worth recalling that inquisitorial

procedures recognized two forms of “perfect” proof: the confession of the culprit, which could be obtained through torture, and full agreement between two eye-witnesses publicly deemed “respectable people” who were not related to each other.)

During the medieval and early modern periods, witchcraft was considered an extremely atrocious crime and therefore a *crimen exceptum*, like *laesa majestas* or rebellion against human authority (conspiracy and treason) or against divine supremacy (e.g., heresy). These three legal categories, applied to many scandalous crimes that could cause harm to the wider public, soon produced the concept of the “enormous” crime, which required both extremely severe forms of punishment and extraordinary procedures.

“Enormous” crimes, as cataloged by jurists, generally included heresy, treason, counterfeiting, poisoning, incest, sodomy, bestiality, sacrilege, rape, infanticide, and, last but not least, witchcraft. In 1486, the *Malleus Maleficarum* (The Hammer of Witches), a manual written by the German inquisitor Heinrich Kramer, advocated the inclusion of witchcraft among these so-called “enormous” crimes (Part I, questions XIV and XVII). According to Kramer, witches, by making a pact with the Devil, became guilty of several major crimes (worship of absolute evil, contempt of God, apostasy, blasphemy, evil spells, sacrilege, infanticide, orgiastic intercourse), each of which deserved the cruelest punishment. Witchcraft was not only an enormous crime; it was the most horrible crime that any human being could commit. Witches deserved more extreme punishment than even heretics or infidels, because their willing submission to the Devil represented the most complete form of apostasy possible, prone to culminate in evil deeds against God and God’s creatures.

The witch’s alliance with demons thus stood out as a crime worse than any other that could be committed in the public sphere. If counterfeiters were immediately punished for forging false money, Kramer insisted, this should be all the more necessary for those who attempted to forge a perverted faith. Therefore, the rules of canon law, which allowed ecclesiastical courts to forgive or lightly punish a repentant heretic at his or her first trial, were not applicable to witches, who on the contrary deserved immediate capital punishment.

Although the great Mediterranean state inquisitions always refused to consider witchcraft an “exceptional” or “enormous” crime, and despite similar refusals from great appellate courts like the *Parlement* of Paris, many secular courts followed Kramer’s suggestions and relied on torture to obtain confessions and inflicted extremely cruel forms of capital punishment, both of which were justified by the “enormity” of this “exceptional” crime. In 1580, in the final pages of his *De la démonomanie des sorciers* (On the Demon-Mania of Witches), Jean Bodin stressed that a witch’s allegiance to the Devil constituted

an extremely serious crime, not only because it denied divine authority, but also because it rejected political authorities, who derived their legitimacy from God. Witchcraft thus implied rebellion and conspiracy against the divinely established order: it was *lèse-majesté divine et humaine*, said Bodin, treason against both God and the state. In his *Daemonologie* (1597), a Protestant king, James VI of Scotland, agreed with the great French jurist that witchcraft also constituted a crime against public order.

EPISCOPAL JUSTICE

One of the characteristic features of Western Christianity—the dualism of secular and ecclesiastical law—originated during the final centuries of the Roman Empire. In several sections of his Epistles, Saint Paul recommended that Christians solve their conflicts within their communities without asking the secular authorities for assistance. This recommendation encouraged bishops, from the first centuries of Christianity, to administer justice on a voluntary basis and without relying on secular laws. As an arbitrator to the disputes, accusations, and trials among parishioners, the bishop, whose legal functions were recognized by the Roman Empire only in 318 under the rule of Constantine, could assign punishments and settle controversies. With the passage of time, the episcopal courts’ responsibilities widened and came to include the ratification of pacts and the right to relieve people from sacraments. The use of excommunication became increasingly sophisticated as the Church enforced its policies and doctrines. Following the collapse of the Roman Empire, many areas remained exclusively under the jurisdiction of episcopal courts, which became the main point of reference for people seeking protection, hoping to settle a conflict, or wishing to collect the money owed to them. Clerical crimes fell exclusively under the jurisdiction of the episcopal courts. Together with his assistants, the bishop was also concerned with parishioners’ spiritual health. It was his duty to watch over the community and to remove and punish sinners

who provoked public scandal. According to the laws of the late imperial period, ecclesiastical courts were also partly responsible for dealing with religious offenses, while the punishments clerics imposed were carried out by secular courts. At the height of their greatest influence (from the seventh to the thirteenth centuries), episcopal courts watched over the clergy, dealt with beneficial matters, registered testaments, and ruled over property and matrimonial arrangements. They also punished usury, immoral crimes, scandals, and disobedience against religious ceremonial regulations, as well as sacrileges, offenses against the Church's jurisdiction, heresy, and superstition. When a bishop was informed that a person was publicly deemed a criminal (this could be indicated to him during his visits to parishes or reported as an accusation or complaint) and when this allegation was confirmed by sworn witnesses, he had the right to excommunicate this person and to impose public penitence. Until the end of the first millennium, public penitence was specified by special "rate books." The bishop's duty to fight superstition was vigorously endorsed by Church councils, leading to the composition of the famous *Canon Episcopi* in the tenth century, which cast doubt on the belief that witches could fly.

TWO COMPETITORS: SECULAR COURTS AND THE INQUISITION

Episcopal jurisdiction, exercised by judges called *officials*, was formally recognized in civil statutes and, more important, in canon law, codified in the twelfth century, which defined the purview of episcopal courts and the people falling under their jurisdiction (clergy, Church employees, pilgrims, orphans, and widows). Subsequently, European universities increasingly taught Roman law, which led to profound changes in the administration of justice, specifically in the treatment of "enormous" crimes against divine or human authority. Such crimes were investigated through the newly created inquisitorial procedure, which authorized investigations even in the absence of accusations and the use of torture to obtain confessions. The crimes were punishable by burning convicted individuals at the stake and confiscating their property. Inquisitors also had a duty to punish crimes whose repression had previously been a task for episcopal courts: simony, heresy, apostasy, superstition, and sorcery.

Two competing systems—secular courts (city, feudal, and princely) and the papal Inquisition—increasingly contested episcopal control over these crimes (and other crimes against public morality, such as blasphemy, usury, polygamy, sodomy, and sacrilege). The papal Inquisition began its activity (not everywhere, and without a centralized organization) during the third decade of the thirteenth century. Initially the Inquisition was not concerned with superstition and

witchcraft and did not provoke conflicts with episcopal courts, which it assisted (where its assistance was requested) in the struggle against heretics. Soon, however, conflicts between them—which were also conflicts between the regular and secular clergy—became overt, especially in southern France. Innocent IV (1252), Gregory X (1273), and Clement V (during the Council of Vienne, 1311–1313) insisted that inquisitors and bishops had the duty to assist each other, especially in the administration of torture, severe punishments, and burnings at the stake.

Subsequently, the competition between episcopal and inquisitorial courts grew as they quarreled about their respective competence over crimes of witchcraft and evil spells. Meanwhile, secular courts also sought to affirm their influence as a consequence of the growth of modern states. During the fifteenth century, as witch hunts became more and more widespread, juridical doctrine came to define witchcraft (as well as other crimes against public order, religion, and morality) as a matter of "mixed legislation." This meant that the secular authorities could prosecute witches for the physical harm and public scandal they provoked, whereas ecclesiastical tribunals prosecuted them on the basis of suspicions of apostasy and heresy. Neither system could claim exclusive competence over the matter. According to some jurists, trials were to be concluded by whichever court had initiated them. Others suggested that the accused should be moved from court to court and receive a double punishment: for maleficence (from the secular court), and for apostasy and abuse of sacred objects (from the bishops or the inquisitors).

During the fifteenth century, the papal Inquisition had firmly established its authority over matters of witchcraft, understood as heresy, and had limited the power of episcopal courts. Yet it chose to remain largely inactive, leaving the field to the competition between episcopal and secular courts. In some cases, the latter acted undisturbed. This tendency is particularly evident in France, where—thanks to an order of the *Parlement* (sovereign court) of Paris (1391), the Pragmatic Sanction (1438), and some decrees by Francis I—ecclesiastical courts had been stripped of many of their juridical powers by the first half of the sixteenth century. This included the right to investigate witchcraft, considered a crime of *lèse-majesté* in France and therefore falling within the competence of secular courts. However, the situation in southern France (Provence, Languedoc) was different. Here episcopal jurisdiction long maintained its strength, while the competition between episcopal and inquisitorial courts emerged strongly during a case of magical spells in 1523. By this date, witches were being burned at the stake all over Europe. Although responsibility for these crimes lay also with the papal Inquisition, which was once again active, especially in the territory of the Holy Roman

Empire and in northern Italy, secular courts mainly burned witches.

THE EARLY MODERN PERIOD: THE STRUGGLE AGAINST WITCHES AND SUPERSTITION

In Protestant regions, secular courts exclusively handled prosecutions for harmful magic. Ecclesiastical courts limped on in England, where Protestants retained an episcopal system, but their importance was greatly reduced. On the Continent, Calvinist consistories dealt with minor cases of magical superstition and continued to excommunicate sorcerers. Meanwhile, episcopal jurisdictions survived in Catholic areas but took very different forms. In Germany, bishops were also rulers of territorial states. Several were driven by extreme disciplinary zeal, and persecuted witchcraft in particularly bloodthirsty ways, albeit exclusively in secular courts that they controlled in their capacity as rulers rather than as bishops.

The situation was different in Mediterranean areas, where jurisdiction over witchcraft lay primarily with the Portuguese, Spanish, and Roman Inquisitions, especially after Pope Sixtus V's bull in 1586. Italy, too, had bishops obsessed with fear of the Devil (such as Carlo Borromeo, who approved two witch hunts in his archdiocese of Milan in 1569 and 1583); but, overall, the Roman Holy Office succeeded in claiming all formerly episcopal responsibilities for repressing illicit magic, and enforced a moderate line in witchcraft trials (the sole exception perhaps being Lucca). In the Papal States and in the Kingdom of Naples, the bishops acted as inquisitors, concerned exclusively with uprooting superstitions and combating healers, necromancers, and phony exorcists, who competed directly with the Church's sacral system. Even where the Inquisition's officials were distinct from the bishop's, they collaborated closely.

Episcopal trials continued to deal with cases of sorcery and superstition without implications of heresy (such as in the important battle against folk medicine). After the Council of Trent, synodal legislation also came to play a prominent role. In Portugal, bishops relied mostly on the system of visitations to discipline the faithful, sometimes applying procedures that differed from the Inquisition's and sometimes absolving repentant sinners privately (a practice used throughout Europe for over two centuries). The latter procedure was known as a pardon by "forum of conscience" and was accompanied by forms of salutary penance: prayers, charitable donations, and enforced catechism instruction. Somewhat distinct from common judicial procedures, this practice was based on a doctrine, according to which there existed specific categories of sins (reserved cases), that only bishops, priests, or judges specially instructed by the pope could absolve without

public attention. Generally speaking, the early modern age—and the areas where there was a strong papal hegemony—witnessed the transformation of episcopal jurisdiction into a part of a disciplinary system that integrated the Inquisition, confession, and pastoral care.

ERASMUS, DESIDERIUS (CA. 1467–1536)

Erasmus, the greatest of Christian humanists, a reformer, moralist, and satirist, believed that the practice of witchcraft was a danger. At the beginning of 1501, Erasmus desperately needed a new patron. The plague forced him to flee from both Paris and Orléans. He sought refuge in the Low Countries with his friend Jacob Batt, who suggested that Erasmus might win the favor of Antoon van Bergen, abbot of St. Bertin, by recounting a witchcraft trial he had heard about while staying in Orléans the previous year. Erasmus complied with Batt's idea, telling the following tale (Erasmus 1975, II, 5).

Having inherited a set of magical books and instruments from an elderly rural "sorcerer," an unnamed citizen of Orléans (who has never been identified) managed to purchase a consecrated wafer from "a starveling irreligious priest" and proceeded to involve his whole family in an act of Host desecration, of a type ordinarily leveled against Jewish rather than Christian communities.

While his young daughter pretended to stab at the wafer with a sword, her father performed a ritual mocking the Trinity, invoking the names of angels and demons in an attempt to summon the Devil. After three years of trying, he finally succeeded in his task; but despite promises of vast riches, he soon began to feel that he was being cheated. At last, the Devil supposedly told him that it was his own lack of education and failure to perform the correct rites that were preventing him from producing the mountains of gold that he desired. If he could persuade the prior of a nearby (also unnamed) monastery to help him, and embroil him in the Devil's scheme, then all would at last go as promised.

Accordingly, the man sounded out the prior and gradually took him into his confidence. Unfortunately for him, the priest was determined to win fame for himself by exposing this case of witchcraft. After the would-be magus had confessed everything he knew, produced the consecrated Host, and handed over all of his books to view, the prior alerted the royal constables and officials of the ecclesiastical court. Though the man was sentenced to life imprisonment eating only bread and water, his wife jailed for three months, and the young girl sent away to a convent, Erasmus felt uneasy over some details of the case. The girl appeared to be perfectly calm and unafraid of the risks that she had run, but her mother appeared to have been tormented each night by visions of a demon, and arose every morning bloody and bruised. To both Erasmus and his judges, the testimony of the father seemed confused and inconsistent.

Monks seldom emerge as heroes in tales by the author of the *Enchiridion*, even when writing to an abbot. And despite the attempts of later writers to portray Erasmus as a thoroughly modern figure, free from superstition or prejudice, Erasmus could still conclude, in his only lengthy reflection on subjects related to witchcraft, that "deep-eyed wickedness" such as that exhibited in this case made him "shudder cold" and merited the harshest punishments warranted by both Judaic and Roman law. Set against the contemporary career of Abbot Trithemius, Erasmus seemed to oppose necromancy every bit as resolutely as the Spanish Inquisition.

Given that he devoted all of his energies to trying to reform the worst abuses of the Church from within, upheld a traditional view of the efficacy of witchcraft that made him "shudder cold," and renounced the extremes of the Reformation, it seems ironic that Erasmus suffered the indignity of a posthumous excommunication and had all his works placed on the Index of Prohibited Books. It seems equally ironic that Johann Weyer, his great admirer and fellow enemy of necromancers, never mentioned this episode, although he used another example from Erasmus' correspondence to mock exorcisms (Weyer 1991, 444–445).

ERASTUS, THOMAS (1524–1583)

Erastus is significant for the history of witchcraft because of his very early challenge to the medical theories expounded in Johann Weyer's *De praestigiis daemonorum* (On the Tricks of Devils). Best known as the putative father of Erastianism, the political theory of state control over the church, Erastus was primarily a physician who never advocated the "ism" attached to his name.

Given this man's unwavering lifelong devotion to Zwinglian theology and ecclesiology and the professional punishments he suffered precisely because of these opinions, it seems extremely ironic that some mid-seventeenth century English advocates of unconditional clerical subjection to state authority pasted the label Erastian on their doctrines; few historical figures have undergone such a thorough posthumous travesty. The historical Erastus, born Thomas Lüber in Aargau (Switzerland), who grecoized his name as a student at Basel, studied medicine in Italy for nine years before being named professor of medicine at the University of Heidelberg and personal physician to the elector-Palatine in 1558. His numerous and controversial writings involved theology as often as medicine. Erastus made his professional reputation as a vehement opponent of Paracelsian medicine, but also involved himself in ecclesiastical politics soon after arriving in the Palatinate; by 1560 he had a seat on the recently created Reformed Consistory and began publishing theological treatises by 1562. He opposed the Calvinistic version of church discipline promulgated by the elector. Because of his correspondence with medical colleagues known for their religious radicalism, he was apparently excommunicated, but reinstated by 1576. In 1580, the new, Lutheran elector-Palatine dismissed him from his Heidelberg posts for refusing to sign the Lutheran Formula of Concord. Erastus spent his final three years

on the faculty of the University of Basel. His reputation as an Erastian began with a posthumous refutation of his views on church discipline by Calvin's successor, Theodore Beza.

Like Johann Weyer, Erastus was a Protestant and a court physician for a major German prince—and neither man's employer approved of witch hunting. Although Erastus realized that Weyer disliked many things about Paracelsus, his major medical enemy, Erastus was unhappy with what he saw as Weyer's unjustifiably lenient stance toward female witches. Erastus doubted the medical validity of his colleague's use of melancholia to explain their phantasms and exculpate them from criminal guilt. Consequently, Erastus's *Dialogue* of 1571 constituted the earliest indirect attack on Weyer by a fellow physician and Protestant. It was nonetheless a relatively moderate criticism. Erastus claimed that Weyer was "moved by good intentions, although incorrectly" and that his real enemy here was (as usual) Paracelsus, who had praised witches for their skills. Erastus ended his *Dialogue* with the admission that "much wrong has been done to many women" in witchcraft trials by overly credulous use of their confessions. A thorough preternaturalist in his approach to magic, Erastus nevertheless accepted the existence of the diabolical pact and wanted witches punished for their apostasy, not for their purported *maleficia* harmful magic.

Erastus accepted many of Weyer's opinions and summarized Weyer's six principal arguments in a professional opinion for the magistrates of Basel (Erastus 1885, II:434–453). However, Erastus argued in his second *Dialogue* that Weyer had refuted none of his objections in his enlarged and revised version published at Basel in 1577, adding that law students "judged it the same way; much less do the theologians doubt [my position]" (Erastus 1885, II: 457). Erastus defended the mainstream medical position that melancholy was normally a male disease—an argument picked up shortly afterward with far more vehemence by the jurist Jean Bodin. Both Weyer's and Erastus's works were published together in 1579 in a combined French translation by Jacques Chouet in Calvinist Geneva (where several of Erastus's theological treatises had previously been published, including a defense of Girolamo Savonarola's diatribe against astrology).

ERGOTISM

Ergotism is a disease caused by eating grain contaminated with the ergot fungus; the symptoms of ergotism include convulsions, paralysis, and delirium. These symptoms could have been regarded in early modern times as due to demonic possession, which in turn sometimes led the possessed person to accuse someone else of causing the "bewitchment." Ergotism, therefore, could conceivably have prompted some accusations of witchcraft. However, this theory must be treated with extreme caution. In most, and perhaps all, cases there are more convincing psychological and cultural explanations for outbreaks of demonic possession.

The fungus *Claviceps purpurea* infests mainly rye and flourishes in cool, wet summers. It can cause two forms of ergotism: convulsive and gangrenous. The symptoms of convulsive ergotism (the relevant form here) include contortions of the body, vomiting and diarrhea, ravenous hunger, crawling sensations in the skin, partial paralysis, and delirium. A psychologist (Caporael 1976) first claimed that the Salem prosecutions of 1692 were the result of ergotism among the "afflicted girls" who accused the witches, and suggested that ergotism could also explain many witchcraft accusations in Europe. Most historians have dismissed this theory, and few if any have endorsed it—though it has proved attractive among members of the public.

At best, the evidence for ergotism is weak. We have no medical case records to give a rounded view of the afflicted persons' symptoms; usually only a few relevant symptoms are recorded, or even only one. Nor is there direct information on their diet. Proponents of the ergotism theory extrapolate from fragmentary data and make unsupported leaps of logic. Ergotism would normally be expected in late summer, but at Salem the outbreak began in December; so we are told that the people first ate the better grain and only got around to the infected rye in December. This seems plausible only until we consider that an outbreak in late summer would immediately have been used as proof of the theory.

Because most witchcraft cases did not involve demonic possession, arguments to prove ergotism by correlating rye consumption with the incidence of witch hunting are irrelevant; one would have to establish a correlation between demonic possession and

consumption of rye. Such a correlation can in fact be readily disproved: Russia, the heartland of rye cultivation, saw very little witch hunting, and hardly any demonic possession.

The theory cannot account for all outbreaks of apparent demonic possession, so psychological alternatives have to be examined. (Fraud too must be kept in mind, since there are some well-documented cases of possession and others probably went undetected.) For example, there was a mass outbreak of possession-associated behavior among adolescents in the Dutch orphanage of Horn in 1666. One after another they writhed, bellowed, and gnashed their teeth. Medical treatment failed, and so did prayer. Then the authorities removed the afflicted persons from the orphanage and distributed them among separate foster homes. Deprived of the stimulus of their group, all instantly recovered. The well-known possessed nuns of Loudun in 1634 were manifestly not cases of ergotism. Proponents of the ergotism theory have failed to show that there was anything distinctive about the cases where they allege ergotism. If some form of psychological explanation can and must account for many cases of demonic possession, can it not account for *all* of them?

The behavior of the possessed followed cultural norms in ways that do not necessarily lead us to regard the affected individuals as mentally ill. Possessed people were expected to contort their bodies, so they did. They were also expected to vomit pins—so several of them did, in much the same way. Contortions conform to (though they do not prove) a diagnosis of ergotism, but vomiting pins does not. At Salem and elsewhere, a correlation of seizures in the courtroom with the presence of the accused was reported; ergotism largely fails to explain this, though there is some suggestion of suggestibility in connection with ergot-induced hallucinations. The afflicted girls at Salem were sometimes reported to be perfectly healthy outside the courtroom—something hard to reconcile with ergotism. Psychological theories can also account for the afflicted girls' claims to have seen the specters of the alleged witches; ergotism usually causes distorted vision rather than the sight of distinct, but imaginary, objects.

Documented outbreaks of ergotism (especially convulsive ergotism, its more severe form) have usually affected entire communities. Demonic possession, by contrast, arose in individuals or among specific social groups: it particularly affected girls and young women between the ages of sixteen to twenty-five. Adolescents and young adults were not especially susceptible to ergotism; in fact, documented ergotism is heaviest among children younger than age fifteen. In Salem, a high proportion of the possessed were orphans—an occurrence susceptible to psychological, but not ergot-based, explanations. Proponents of the ergotism theory have offered no credible explanation for the overwhelming

preponderance of females, and this must be among its most serious weaknesses.

For the well-documented case of Salem, a diagnosis of ergotism must now be considered to have been disproved. Convulsive ergotism probably did affect some young women in early modern Europe, though firm diagnoses are impossible (other diseases could also cause convulsions or fits). Some diseased women may have been perceived as being possessed; but it is impossible to say which, if any, possession cases involved which disease. Usually, psychological and cultural explanations carry more weight. In the last analysis, the strength of the ergotism theory is also its weakness: it is difficult to disprove but impossible to prove.

ERRORES GAZARIORUM

Errors of the Gazars was an anonymous treatise written around 1437 in the region of Val d'Aosta in northwestern Italy, probably by Ponce Feugeyron. Although its title was consistent with traditional descriptions of sectarian heretical beliefs, in this case those of the Cathars or Gazarii (by then a generic term for heretics, in Latin and Italian), the subtitle indicated the specific subject of the treatise: "those who have been convinced that they ride a broomstick or a rod"—that is, those who believed that they flew on these objects and attended the witches' Sabbat in the service of the Devil. Although its author only used the term *heretics* (who may have been equally male or female) and employed no contemporary Latin or vernacular cognates for sorcerer or witch, its date and contents make this treatise an important piece of documentary evidence for the early, formative stages of some of the components of the classical image of the witch. It was one of the two earliest texts that provided an extended description of what became the witches' transvection and Sabbat.

The treatise, with arguments that were based on earlier conventional descriptions of heretical rituals, confessions in recent trials for heresy and witchcraft, and indirect testimony, exists in two versions (recent editors suggested a third manuscript has been lost). One manuscript is at the Vatican (V, probably written in 1437) and the other at Basel (B, probably written in 1438 or shortly thereafter); the latter is a slightly expanded revision of the material in the former. Both manuscripts also contained materials from the Council of Basel, an important diplomatic and cultural event that brought together many of the personnel, ideas, and themes that shaped later concepts of witchcraft. The treatise also suggested an inquisitorial origin and some association with the Franciscan Order.

This short text—the combined Latin versions of both B and V filled only six printed pages in the most recent edition (Ostorero et al. 1999)—circulated widely, because of its brevity and its concise, systematic organization. The first nine of its eighteen sections followed the temptation, initiation, and ritual experiences of a single individual in the process of becoming a servant of Satan. The treatise addressed the flight to the Sabbat (which the author called the *synagoga* of Satan), the nature of the oath and demonstration of homage to the demon, the ritual banquet and attendant cannibalism, the sexual orgy, and the formal profanation of the Eucharist by the initiate. Its next three sections described the motivations of those who, once tempted, decided to enter the sect: vengeance against enemies, avarice, and lust. The remainder of the treatise discussed the motives for such a decision, made additional illustrative points, and concluded with a list of evils committed, including murder and cannibalism, supported by brief quotations from recent confessions by convicted witches.

Aside from condemning these activities as diabolical and heretical, the author of the treatise emphasized his opinion that such heretics must form a sect—that witchcraft cannot be regarded as a series of individual cases, but must be regarded as a conspiracy, an anti-church, whose danger lay precisely in its nature and its collective character. The figure of the demon in the treatise was virtually autonomous, if not quite an equally powered opponent of God. Other earlier and contemporary texts emphasized the importance of God's permission for the demon to act in this way, but the *Erroris Gazariorum* said little about divine permission.

Fully one-fourth of the text meticulously described the contents and manufacture of the unguents and poisonous powders used by the heretics. One line of progression of the text was the moral descent from mere indulgence in vices toward more and more abominable, inhuman transgressions, culminating in infanticide and cannibalism. Skillfully and concisely made, the treatise appears to have influenced the expanded detail of night flight and the ceremonies of the Sabbat found in

confessions before tribunals around the middle of the fifteenth century in western Switzerland and southeastern France.

ESSEX

The English county of Essex, immediately northeast of London, enjoys a central importance in the history of English witchcraft. There are three reasons for this. First, for reasons that remain unclear, Essex, on the strength of surviving documentation, experienced more witchcraft trials than any other English county. Second, witchcraft in Tudor and Stuart Essex was the subject of an important study completed by Alan Macfarlane. Originating as an Oxford University D Phil thesis, it was published in 1970, providing a generally accepted model for English witchcraft until the mid-1990s. Third, possibly because of the county's proximity to London, Essex witchcraft trials became the subject of a number of pamphlets. Covering a chronological span from 1566 to 1645, they provide numerous insights into how witchcraft trials were conducted, the developing nature of witchcraft beliefs, and the ways in which witchcraft was portrayed in this genre.

The importance of Essex in the history of English witchcraft trials was first noticed in 1929, in C. L. Ewen's pioneering survey of witchcraft trials in the records of the Home Circuit assizes. (The assizes were the courts before which cases of felonious witchcraft, as defined in the English witchcraft statutes of 1542, 1563, and 1604, were usually tried.) Between 1558 and 1650, these indictments survive from only one of England's six assize circuits, the Home or South-Eastern Circuit, covering the counties of Essex, Hertfordshire, Kent, Surrey, and Sussex (and even for

this archive, about a third of the relevant records have been lost). Ewen counted some 790 indictments for witchcraft surviving in the Home Circuit records, involving 513 persons accused of witchcraft, of whom 112 were hanged. Among these, 473 of the indictments, 299 of those accused, and 82 of those hanged as witches came from Essex. In other words, nearly 60 percent of all known indictments for witchcraft on the Home Circuit, and an even higher share of those persons subsequently hanged by that circuit's sessions, came from Essex.

Macfarlane's research deepened our understanding of witchcraft trials in the county. Following Ewen, he emphasized that the heaviest period of prosecutions in Essex was the 1580s, followed by the 1590s. Typically, Essex witches were not accused in mass prosecutions but were isolated individuals, occasionally drawn in twos or threes from individual villages. Indictments at the assizes dropped steeply in the 1620s and 1630s, although the great Matthew Hopkins witch hunts that began in Essex in 1645 created a new peak of indictments in the 1640s. Thereafter, indictment levels declined again, with the last Essex trial coming, a little precociously compared with the rest of the southeast, in 1675. The last known Essex executions for witchcraft had occurred thirty years previously in the Hopkins era. Overwhelmingly, the Essex witchcraft assize trials revolved around *maleficium*, doing harm by witchcraft, usually to humans or animals. As Macfarlane's figures emphasized, malefic witchcraft was overwhelmingly a female activity: over 90 percent of those accused as witches at the Essex assizes were women.

Despite the undoubted originality of his approach, Macfarlane built on Ewen's earlier researches in his analysis of assize trials. But he took a totally new approach by surveying records from other courts in the county. In particular, Macfarlane carried out a systematic analysis of ecclesiastical courts in Essex, notably those of the archdeaconries of Essex and Colchester. In Tudor and Stuart England, the ecclesiastical courts still had jurisdiction over various minor forms of witchcraft and sorcery; many cunning folk were presented before them, and several defamation suits involving allegations of witchcraft survive in ecclesiastical court records. Again, Macfarlane's analysis of these records demonstrates the peculiarities of Essex. He found over 200 relevant cases in the archives of its ecclesiastical courts, over half of them called simply "witchcraft and sorcery." Although there were minor peaks in these ecclesiastical cases in 1566 and 1608, the period of their busiest activity, as with the assize courts, lay in the 1580s and 1590s. Macfarlane further extended his research to a systematic analysis of Essex's quarter sessions and of court records from Essex boroughs with criminal jurisdiction. Although he found relatively few witchcraft cases, they helped him present a more complete picture of what

legal activity concerned with "witchcraft" looked like in the court records of one county.

Macfarlane's unusually rich Essex sources have also helped extend our knowledge of early modern witch beliefs. They contain much evidence about counter-magic, about informal methods of dealing with witches and witchcraft, and above all about cunning folk, those "good" witches whose presence was so important in early modern England. An indication of the importance of such matters had, in fact, already been provided in the late sixteenth century in a work by George Gifford (d. 1620), who was from 1582 minister at Maldon, a small port town in southern Essex.

Macfarlane's distinctive interpretation of the background to English witchcraft accusations drew on his analysis of Essex records. Briefly, he argued that such accusations were usually initiated by people living within the witch's community, the actual victims of the supposed witchcraft, rather than by a persecuting authority. He demonstrated that, characteristically, accusations were launched by richer villagers against poorer ones, and accordingly linked them to the socioeconomic changes affecting rural England in the period. He claimed the changes had altered relations between rich and poor and, more generally, perceptions of the notion of community. He argued that quarrels following refusals of charity by a future accuser to the supposed witch provided the essential context for witchcraft accusations whenever some misfortune fell on the refuser after these quarrels. Perhaps uneasy in his or her conscience about refusing charity, the victim of misfortune could now transfer his guilt: it was now the requester of charity who was breaking community norms by inflicting witchcraft, rather than the person who had refused to help his neighbor.

For over two decades, the "Essex model" as constructed by Macfarlane, dominated perceptions of early modern English witchcraft. More recently, albeit usually on the strength of inferior documentation, the universal applicability of this model to English witchcraft has been questioned. At the same time, Essex's remarkable predominance in witchcraft accusations in the southeast has never been adequately explained. The counties of Kent, Surrey, and Middlesex (the last of these outside of the assize system, but enjoying its own sessions that tried felonies) had populations comparable to that of Essex, underwent the same sorts of socioeconomic change as those that Macfarlane saw as central to Essex witchcraft accusations, and their court records survive in levels similar to those for Essex. Yet their levels of witchcraft prosecutions were vastly lower. Obviously, the history of witch prosecutions in Elizabethan Essex needs to be reopened, preferably by focusing initially on whether or not there was any propensity to prosecute among the county's elite.

ESTONIA

This small country, containing about a hundred parishes in the early modern era, participated in a regional pattern, an “eastern-Baltic paradigm,” of witchcraft and its persecution.

This meant that witchcraft in Estonia included many remarkably tenacious surviving pagan practices. It also means that witchcraft trials included very little diabolism (most of it was induced by leading questions under torture, which was legal here either before or after interrogation until the end of the seventeenth century); that its sorcerers were more often men than women; and that its local authorities relied unblushingly on ordeals by ducking (the swimming test) to detect witches.

Apart from the fact that Estonian sorcerers were much more likely to bewitch beer than milk (Madar 1990, 268–269), the major difference separating Estonia’s history of witchcraft trials from those in its southern neighbor Latvia was the fact that Lutheran Sweden ruled Estonia: its northern half since 1561, and its southern half after 1621. Most of modern Latvia fell within the sphere of Catholic Poland-Lithuania. Estonia became the only Baltic area not inhabited by

Germans to be seriously Protestantized. The Swedes founded the first (and for a long time, the only) university in the eastern Baltic at Tartu in 1632, primarily in order to train Estonia’s clergy in their struggle against “repellent idolatry.”

The Swedes were not very successful. The elaborate visitation carried out by Swedish authorities in 1667–1668 provides by far our clearest image anywhere in the Baltic of the extent that pagan practices persisted among the local peasantry: in parish after parish, they still made regular sacrifices at sacred groves and hills. Even during a visit in the late 1690s, which coincided with the last wave of witchcraft trials in Estonia, overt pagan “idolatry” was still identifiable in over a third of Estonia’s parishes, with elaborate ceremonies on Midsummer Eve (Kahk 1990, 280–282). If the sermons of their Swedish-trained clergy gave Estonian peasants a few notions about diabolism—it appears in about two dozen of Estonia’s two hundred witchcraft trials—local witches could not fly and never attended Sabbats. Defendants sometimes began with the Devil and then switched to pre-Christian fairies and wizards, whom they described much more vividly. It is also interesting to note that the Devil sometimes wore blue, a “German” (or Swedish?) color (Kahk 1990, 282).

STATISTICS

Laws against witchcraft appeared in various codes used in Estonia as well as other eastern Baltic regions. Here, as in neighboring lands, a few rather innocuous sorcery trials have been recorded from 1493 and 1526, with indirect evidence about sorcerers being burned around 1530. Evidence about witchcraft trials in Estonia remains sketchy in the sixteenth century, and nonexistent during the lengthy Livonian War (1558–1583). Trials resumed in 1588 when Estonia’s first recorded witch ducking occurred at Tartu (the defendant was a man). Trials increased considerably in the early seventeenth century. In Estland (northern Estonia), forty-one trials were recorded between 1615 and 1652; twenty-seven witches had been executed by 1636, although only five more followed before 1700. In North Livland (southern Estonia), divided into two court districts by Sweden after 1621, only four witches were executed at Tartu by 1699, but fourteen at Pärnu (Madar 1990, 260–263).

Estonian trials required accusatorial procedures and rarely involved more than one defendant: overall, we know of 140 trials held between 1520 and 1725 involving 205 defendants. Over 60 percent of them were men, and fewer than one-third of them were executed. Until 1630, only six men and twenty-three women were executed; afterward, only six women and twenty men (Madar 1990, 261, 267). Two cases still reached Estonian courts in the early nineteenth century.

MALEFICIUM

With their sturdy pagan background, Estonian peasant sorcerers cast many kinds of spells, using everything from fish (1669), strawberries (1633), crayfish (1651), or salt (1542 and 1642), although their preferred method was to cast spells on beer to infest their victim's body with worms or frogs. Estonia's sorcerers could become wolves or occasionally bears; interestingly, eighteen of its thirty-one werewolves, and even two of its three bears were women (Madar 1990, 270–271), although Estonia's sorcerers apparently had no "good werewolf" like the Livonian case of 1692 (Ginzburg 1983, 28–31).

ETHNOLOGY

Ethnology has usually studied "primitive" societies that are rather different from the society of the European witch hunt. They are segmentary societies with little or no social stratification, often based on kinship as their main structural principle. In such societies, magical rites play a much greater part than in complex stratified societies, which also use comparable rites, but at the same time begin to criticize them. Primitive societies explain evil (including evils caused by nature) as the action of ancestors who punish deviant behavior with illness and so on, through gods or sorcerers and witches. Such societies offer rich fields of witch beliefs.

The functionalist Anglo-Saxon school of ethnology, to which we owe most of the epoch-making works on witchcraft in primitive societies, is based on the work of Emile Durkheim. He saw religion as an expression of society as a whole, so that belief systems can be correlated with social structure. The cosmology/religion therefore expresses the fundamental structures of a society through various communication codes (Leach 1976).

Magic has an instrumental function, based on the belief that the surrounding natural and social world can be controlled by ritual practices, for example, by producing needed rain. Magic also has an expressive function, because its rites produce and symbolize the

cohesion of society. In such societies, nothing happens by chance (in theory); whatever happens is caused by certain powers. Good or bad luck are not due to chance, but to ancestors, spirits, or witches.

The main function of witchcraft beliefs is therefore to reduce contingency. This may lead to the notion that every death, even of old people, is caused by evil powers. Mary Douglas's theory of how evil is interpreted is a good example of the methods of the functionalist school. In societies where people live in close contact and are heavily interdependent, evil is attributed to envious neighbors as sorcerers or witches; societies with loose settlement structures and fluid groups tend to explain evil by natural spirits. Belief in witchcraft makes it possible to identify the cause of evil with a concrete person and to fight it. If a person shows envy, anger, or hatred in a transaction, an evil is attributed to her or him.

A further important function of witchcraft is to control deviant behavior, because people must refrain from deviant behavior to avoid being identified as a witch. Among the Nyakyusa, witchcraft beliefs function as "the main sanction for moral behaviour within the village" (Wilson 1951, 108). A further function is connected with this. Segmentary societies develop numerous mechanisms to prevent the development of social and economic inequality. Because the number of goods is regarded as constant and economic growth is considered impossible, the advantage of one individual is necessarily the disadvantage of someone else. That is why wealth is often concealed and leveling mechanisms work in many ways, for instance, by partitions of the kill after hunt or by gambling. Witch belief provides another such leveling mechanism by sanctioning good luck, that is, economic advantages.

A further function of witchcraft is to resolve conflicts between related persons or neighbors. Quarrelling about inheritance between brothers or about boundaries between neighbors may result in accusations of witchcraft, which lead to the end of the conflict. Here witchcraft accusations can win community support for one's case by making one's particular enemy into an enemy of the whole society. This leads to a further important function: the symbolization of evil. Some societies imagine the witch as a terrible monster practicing anthropophagy, "eating up" the person who the witch wants to harm by stealing inner organs. Here witchcraft often symbolizes the special dangers of a society, for example of seafaring among the Trobriands (Malinowski 1922). Other societies, like the Azande, see witches as rather normal people, with whom one may subsequently be reconciled after some evil deed (Evans-Pritchard 1937). This difference is important for the investigation of European witchcraft, because diabolical witchcraft with its doctrine of the Sabbath corresponds to the first type, and simple *maleficium* or

harmful magic to the second kind. This could also be compared to Evans-Pritchard's distinction between sorcerers and witches: The witch works by innate demonic power, while sorcerers use certain techniques.

Ethnographic contributions to the analysis of the role of women might also be helpful for understanding the European witch belief system. Even in such very primitive societies as the Baktaman, who have no elaborate kinship system (Barth 1975), the witch belief has a gendered structure—a man practices sorcery with the help of hair or textiles, a woman appears as a bird, attacking her victim with a stone axe and eating his or her flesh—the difference inverts actual gender roles in this society. In other societies, women sometimes attract attention to their underprivileged status by being obsessed or confessing to their witchcraft: this has been called “peripheral obsession” (Lewis 1989). But we also find societies like the Nupe in Africa, in which women are thought to be witches because they have a better economic status than men (Nadel 1954). The ethnological results remain unclear, and we cannot yet state that attributing witchcraft to women is universally dominant, or that they are more demonic figures than men. Witch beliefs may also be useful in achieving or securing political power. If rivals attack a chief's power, his positive magic power may be interpreted as witchcraft.

In the last decade, ethnologists have concentrated on the processes of decolonization and modernization. They argue more historically, interpreting increases and changes in witch beliefs as expressions of social crisis. The use of such belief systems for purposes of political power can be observed after World War II. In Cameroon, they could be used both ways (Rowlands and Warnier 1988). Political elites were suspected of witchcraft because they persecuted popular witch finders, while the elites feared that envious kin in their home villages were using witchcraft against them. This shows that the archaic leveling mechanism of witchcraft is still working. The strong belief in witches has changed the law. Whereas in the colonial system only accusers of witches were punished, now it is sometimes possible to accuse witches in the regular courts. In South Africa, this constitutes an attempt to end lynchings, which has cost the lives of many people recently (Harnischfeger 2000).

Though the Anglo-Saxon school analyzes the functions of witch beliefs, it does not neglect the possibility that these beliefs can become dysfunctional. This can happen if they cause more conflicts than they resolve, i.e., if they poison the social atmosphere through attributions followed by aggression. This warning against methodological blindness had already been given long ago (Winter 1963): Every function must be ascertained empirically.

EUGENIUS IV (1383–1447; POPE, 1431–1447)

Eugenius IV took a leading role in classifying magic and witchcraft as heresy. Born to a prosperous Venetian family, Gabriele Condulmaro became a canon of the church of St. George in Alga in Venice. His uncle, Pope Gregory XII, appointed him bishop of Siena in 1407 and cardinal in 1408. He attended the Council of Constance (1414–1418), became papal governor in the March of Ancona and in Bologna, and was elected pope in 1431. His pontificate was marked by his struggles with the Council of Basel (1431–1440) and with the antipope Felix V, the outbreak of the Hussite wars in Bohemia, his attempts to reunite the Greek and other separated Christian churches with the Latin Church, and his diplomatic sponsorship of the failed crusade of Varna in 1444. Eugenius IV, who once said that he regretted ever having left the cloister, was also a cleric of intense piety

with a demanding ideal of clerical and lay reform. This ideal underlay his concern with contemporary forms of dissent and heterodoxy, and conspicuously with various forms and practices of magic, divination, conjuring, and other forbidden arts. These concerns regarding magical practices appeared in his letters to inquisitors. They also appeared in his denunciation of Felix V, formerly Duke Amadeus VIII of Savoy, for having protected diabolical sorcerers in his duchy and used their wicked and diabolical arts to further his own aims.

Earlier popes had also expressed concern with, and sometimes fear of, diabolical sorcery from the late thirteenth to the mid-fifteenth century. John XXII (1316–1334) issued several letters on the subject; in 1409, Alexander V (1409–1410) had written to the widely traveled Franciscan inquisitor Ponce Feugeyron, concerning “new sects” formed by both Christians and Jews, some of which practiced sorcery, divination, invocation of demons, and other forbidden arts, urging the inquisitor to cooperate with local diocesan officials and the secular authorities to root out such repugnant superstitions. In 1434, Eugenius IV also wrote to Feugeyron, repeating Alexander V’s charges against Christian and Jewish magicians, diviners, and other practitioners of superstitious and forbidden arts.

In 1437, Eugenius wrote at greater length to all inquisitors of heretical depravity, noting that Satan had used such arts to deceive many Christians into joining his sect. Such people sacrifice to demons, adore them, and make a written or other kind of contract with them, gaining by this the power to commit evil deeds and be transported wherever they wish. They also cure diseases, perform weather magic, and sacrilegiously misuse sacred materials such as baptismal water, the Eucharist, and other sacramentals. They also shamefully desecrate the cross.

In March 1440, locked in dispute with his rival, the antipope Felix V, Eugenius denounced Felix to the Council of Basel for having tolerated and used the diabolical services of many men and women who are commonly called *stregule*, or *stregonos*, or *Waudenses*. The first two terms are cognates with the Italian term *strega*, or witch, and the third was an early instance of using the old name for Waldensian heretics to designate the heretical character of diabolical sorcery, whether magic or witchcraft. There is no evidence that Felix, when he had been Duke Amadeus VIII of Savoy, had done any such thing, although his secretary, Martin Le Franc, wrote a long poem, also in 1440, *Le Champion des dames* (The Defender of Ladies), in which the most recent arguments for and against contemporary beliefs about heretical sorcery and witchcraft were debated by a character who insulted women and one who defended them. The poem was an important example of literary misogyny and philogyny, a popular genre in the fourteenth and fifteenth centuries.

Eugenius IV’s concerns about heretical witchcraft between 1434 and 1440 were thus virtually identical to those of such other exactly contemporary texts as the *Errores Gazariorum* (Errors of the Gazars or Gazarii [Cathars—a common term for heretics and later witches]), the *Formicarius* (The Anthill) of Johannes Nider, the treatise of Claude Tholosan, and *The Defender of Ladies*, all of which dealt with the crucial early stage of the formation of the concept of a sect of diabolical sorcerers and witches.

**EVANS-PRITCHARD,
EDWARD E. (1902–1973)**

Few scholars have exerted such deep and enduring influence on the study of witchcraft as Edward Evans-Pritchard. He began his work on the Azande tribe of the Sudan in 1926 as a postgraduate student, dedicating himself to producing a comprehensive anthropological study of that people’s system of social organization and its relation to their beliefs and practices about magic, witchcraft, divination, and sorcery. Between 1926 and 1930, he made three field trips to the tribe, sponsored and supported by the British colonial government, spending a total of twenty months recording, photographing, and interviewing the Azande about their views on witchcraft. The initial result was his doctoral thesis, “The Social Organization of the Azande of the Bahr-el-Ghazel Province of the Anglo-Egyptian Sudan” (London School of Economics, 1927). Subsequently revised and expanded, it was published in 1937 as *Witchcraft, Oracles and Magic Among the Azande*. His book advanced an extremely compelling theory of the sociology of knowledge and belief and drew an important distinction between the practices of witchcraft and sorcery.

According to Evans-Pritchard, witchcraft was an innate, internal power that some people inherited, in

exactly the same manner as genetic features were passed down from parents to children. However, witchcraft was only considered to be hereditary among ordinary Azande: princes and nobles had no such taint and could never be accused of the crime. Because of witchcraft's hereditary nature, a son could not accuse his father without admitting his own guilt. Witches were perceived as mean, rude, and grasping; they could cause harm, consciously or unconsciously, by a mere glance or malicious thought. Azande witches could harm other human beings, their animals, or their crops, without performing special rituals; their witchcraft required no interventions from supernatural beings to flourish.

By way of contrast, sorcerers had no innate ability to cause occult harm. They employed magical rites, such as chanting spells, or damaged something belonging to their intended victim, such as clothing, hair, or nail clippings, to transfer misfortune to the victim. Therefore, any Azande could become a sorcerer through learning, but it was impossible to become a witch except by birth. Consequently, the Azande evolved a complex system of beliefs in oracles, divination, magic, and leechcraft to detect and counteract the effects of witchcraft.

However, Evans-Pritchard noted that witchcraft accusations clustered together in areas of ambiguous social relationships. He found the Azande a clever and skeptical people who manipulated their oracles to sustain their existing social system and prevalent morality in a society that had experienced severe strain from Christian missionaries and the imposition of colonial military rule between 1905 and 1914. (Their population dropped from two million in 1870 to 750,000 by 1953.) Under intense pressures, accusations of witchcraft multiplied; the Azande might ascribe almost any misfortune to the occult malice of a neighbor or a former friend.

Since the late 1940s, the guiding motifs of his work—namely the differences between witchcraft and sorcery, and the function of misfortune in provoking accusations of the crime—have dominated most discussions of British witchcraft. Keith Thomas and Alan Macfarlane accepted Evans-Pritchard's findings and adapted his idea of social breakdown as a stimulus for fresh cycles of persecution by substituting the Protestant Reformation and England's Poor Laws for the impact of colonial rule and the introduction of Christianity. However, Evans-Pritchard's influence on the study of continental European witchcraft has been minimal. Although his stature as a canonical anthropologist and authority on African tribal societies remains high in a postcolonial world, Evans-Pritchard's ideas on the marked similarities between Azande and European witchcraft beliefs have largely faded from favor.

EVE

In some demonological treatises and other learned writings, Eve is described as the “first witch,” and women's tendency toward witchcraft is linked to their being “daughters of Eve.” This idea was built on misogynist notions that were very common in Christianity. The second-century Church Father Tertullian, for example, described Eve, and through her all women, as the “Devil's gateway.” Medieval and early modern writers set this connection within the context of demonology, and by the later sixteenth century the combination Eve/women/witch became a standard rhetorical device in sermons and treatises, requiring little explanation.

In the *Lectiois super ecclesiastes* (1380) of Johannes Dominicus and the *Preceptorium divinae legis* (Preceptor of Divine Law, 1475) of Johannes Nider, Eve's mental and physical weakness, lack of reason, talkativeness, and credulity were all seen as reasons she gave in to the serpent's wiles. These qualities are still to be found in women, argued these authors, which is why they are more likely than men to be influenced by demons. In his occasional remarks on witchcraft, Martin Luther agreed, noting, in a sermon on 1 Peter, “It is commonly the nature of women to be afraid of everything. That is why they busy themselves so much with witchcraft and superstitions.” In a sermon on the Ten Commandments, Luther commented, “Who can count all the foolish, ridiculous, wrong, senseless, and superstitious things that women deal in? From their mother Eve it has been natural for them to be deceived and made fools of.” And in a sermon on Exodus, he commented, “On witches, why does the law stress

women more than men? . . . Because of Eve” (Karant-Nunn and Wiesner-Hanks 2003, 231–233).

In the *Malleus Maleficarum* (The Hammer of Witches, 1486), Heinrich Kramer similarly saw Eve as the first in a long line of female witches, though he emphasized her lust, seductive nature, and desire for power along with her weakness and foolishness. Eve bears full responsibility for the Fall, in his eyes, because she seduced Adam, causing him to forsake God. In the same way, women who give in to the power of the Devil are not to be pitied as mentally deficient, but feared as enticing and malicious. They hint that Eve’s relationship with Satan was sexual in nature, just like the relationship between witches and demons in their own day; this emphasis on female sexuality pervaded the *Malleus*, so it is not surprising to see it emerging in subsequent discussions of Eve and witchcraft.

In the later sixteenth and early seventeenth centuries, linking Eve, women’s propensity to sin, and witchcraft became a common topos in sermons and witch literature in continental Europe, England, and Puritan New England. In the trial of Anne Hutchinson, for example, Cotton Mather accused Hutchinson of acting like both Eve and the serpent, seducing women and their husbands with her ideas “like a serpent sliding in the dark” (*Ornaments for the Daughters of Zion* [1692]).

Eve has remained a powerful figure in the contemporary witch movement as well. Though modern Wicca witches frequently emphasize the distinction between their beliefs and practices and those of Satanic witchcraft, they stand the *Malleus Maleficarum* on its head by claiming Eve as a positive role model, an independent woman who did not see herself as subservient or inferior to her husband.

EVIDENCE

Central to all judicial proceedings against witches was the presentation and evaluation of evidence. The determination of what evidence was admissible in court and whether it was sufficient for conviction were subjects of controversy throughout the period of witch hunting. Rules regarding evidence varied from one jurisdiction

to another, and local communities often placed credence in evidentiary tests that were not acceptable to legal writers and authorities. In the late seventeenth century, skepticism regarding the admissibility and validity of certain types of evidence contributed to the decline of witch hunting.

Judicial rules governing the admission of evidence (the law of evidence) and those governing the determination of guilt or innocence (the law of proof) were more clearly defined in states that were influenced strongly by Roman law (*jus commune*) and followed inquisitorial procedure than in those states that used accusatorial procedure. In France, the German territories within the Holy Roman Empire, the Iberian kingdoms, and the Italian states, all of which adhered to inquisitorial procedure, rules prescribed how much evidence was required to begin a judicial investigation of a particular suspect (*inquisitio specialis*), to administer torture, and to convict the accused.

Roman law required that judicial decisions agree about what circumstances could legally provoke suspicion of witchcraft and arrests. The evidentiary requirements in this regard were relatively low, consisting of an accusation by an individual, denunciation by an official, or mere rumor. To administer torture, either the testimony of one eyewitness or certain amounts of circumstantial evidence (*indicia*), to which jurists assigned various weights, was necessary. Applying torture required an interlocutory sentence, which sometimes was granted by the law faculties of the universities or councils of sovereign princes. The evidence required for conviction, known as the Roman-canonical law of proof, consisted of either the testimony of two eyewitnesses or a confession. The necessity of obtaining the latter in cases of concealed crimes served as the main justification for torturing suspected witches.

During the most intense period of witch hunting, these rules regarding evidence were often relaxed on the grounds that witchcraft was a *crimen exceptum* (an excepted crime), to which the normal procedural rules did not apply. In many witch hunts in the Holy Roman Empire, courts accepted testimony from confessing witches—convicted felons, barred from testifying under ordinary rules—who had named the accused as accomplices. Without such evidence from confessing witches, the mass prosecution of witches in Germany would not have taken place. In some of the largest witch hunts, including those in Germany, in the Basque Country around 1610, and in Sweden after 1668, testimony from children, which was normally not admissible in criminal cases, was permitted. On a few occasions, such as at Loudun in 1634, courts even recognized “testimony” from demons speaking through possessed persons who were undergoing exorcism. The discovery of the Devil’s mark on the witch’s body—a spot that was

insensitive to pain and did not bleed—was usually sufficient to permit the judicial interrogation of the witch, although not in the Mediterranean inquisitions.

Rules that normally governed the application of torture were ignored in many witchcraft trials, also on the grounds that witchcraft was an excepted crime. Conviction on the basis of circumstantial evidence, including the inability of witches to shed tears and the occurrence of misfortune following the witch's pronouncement of a threat, was commonplace throughout Europe, especially in local courts. Central or appellate tribunals, such as the *Parlement* of Paris or the supreme tribunal of the Spanish Inquisition, where established standards of acceptable evidence were more rigorously enforced, often reversed these sentences.

In England, where courts followed accusatorial procedure, judges exercised far less control over the admission of evidence and the determination of its sufficiency for conviction. English judges could instruct juries, who determined the facts of the case and thus the guilt or innocence of the accused, regarding the evidence that had been presented in court, but juries could and did convict on the basis of circumstantial evidence. In 1608 the demonologist William Perkins, trying to establish continental standards of proof in the prosecution of English witches, enumerated various "presumptions" that would justify the examination of a witch and proofs that were sufficient for conviction. In 1652, the reliability of these evidentiary standards came under direct attack by Sir Robert Filmer in the wake of a witch hunt that took place in the county of Kent in that year. However, English juries continued to convict witches on the basis of circumstantial evidence until the late seventeenth century.

Local communities often relied on extra-judicial tests to acquire evidence of witchcraft and the identification of the malefactors. The most common of these popular tests was "swimming" the witch, a practice that derived from the medieval water ordeal that had been prohibited in 1215. Swimming tests took place in many regions of northern Europe, from the British Isles and France to Russia. In a few places, like Westphalia, before a suspect was permitted to undergo this test, she had to promise to confess if she failed. Authorities usually manipulated the test so that suspects would float, thus proving their guilt. The women who were tested in this manner argued that they floated because of their other sins, like adultery. The swimming test was unknown in Mediterranean regions but persisted in some parts of northern and eastern Europe until relatively recent times. It had no standing at law, and few demonologists (with the notable exception of James VI of Scotland) considered it a valid form of evidence.

Other popular techniques of securing evidence of witchcraft were, from a judicial viewpoint, likewise

considered superstitious and therefore prohibited by law. Many examples mentioned in Heinrich Kramer's *Malleus Maleficarum* (Hammer of Witches, 1486) were of this kind. Despite their illegality, they can nevertheless be found in later records of witchcraft trials. One popular test for witchcraft was to grill the hide of cattle that had died of a strange illness in the belief that the person who had bewitched the cattle would suffer from burns and come to the house where the test was performed.

In the late seventeenth century, the imposition of more demanding standards of evidence in witchcraft cases contributed to the decline in the number of convictions and executions. Little by little the realization occurred that the foundation of witchcraft trials consisted in prejudices, double-bind strategies, and self-fulfilling prophecies. The increasingly frequent employment of lawyers as advocates for accused witches encouraged adherence to these new standards. Skepticism regarding the sufficiency of evidence in witchcraft cases can be seen, first and foremost, in a growing reluctance among judges and legal writers to accept confessions, traditionally regarded as the highest standard of proof, as sufficient proof of guilt. This skepticism arose mainly when the confessions had a high diabolical content, that is, when the witches had confessed to either a pact with the Devil or attendance at the Sabbath. By the late seventeenth century, judges were willing to accept confessions to witchcraft (or any other crime) only if such confessions were in no way extorted, if they contained nothing that was impossible or improbable, and if the person confessing was neither melancholic nor suicidal.

A second and even more frequent expression of judicial caution in the interpretation of evidence was based on the possibility that events attributed to supernatural agency may have had natural causes. This was particularly relevant to charges of *maleficium* (harmful magic), in which it was claimed that witches had inflicted harm by diabolical (and thus supernatural) means. The skeptical response to such allegations, frequently adopted when lawyers defended witches against such charges, was that the act had natural causes, and that to convict a person of the crime, the possibility of natural causation had to be ruled out. In securing the acquittal of a witch accused of murder by sorcery in 1662, Paul von Fuchs only needed to show that the alleged supernatural cause of the disease that killed the witch's victim could not be proved. French courts stopped trying witches in cases of demonic possession in the seventeenth century on the grounds that they could not distinguish possession from a natural disease.

Skepticism regarding the validity of evidence against witches arose frequently in instances where a causal connection was alleged between the pronouncement of threats or the casting of spells and the occurrence of

misfortunes. The validity of the Devil's mark as a form of evidence also came under attack frequently after 1650 in many continental and Scottish jurisdictions (occasionally, as at Geneva, surgeons systematically failed to find it). In England and New England, the convictions of witches on the basis of spectral evidence (the testimony of victims that they could see the apparitions or specters of the witches who were causing them harm) also led to discrediting this form of evidence, especially in the wake of the Salem witchcraft trials of 1692.

EVIL EYE

The belief that harm, misfortune, or bad luck can be inflicted simply by looking at people or their property (especially if the look is envious), also known as "overlooking," has been found in many parts of the world. The belief spans from ancient Mediterranean and Near Eastern cultures onward, and particularly in Europe, the Middle East, North Africa, India, and parts of Latin America and Asia, where the belief is still common. It is well attested in Latin literature, both classical and early Christian. In Reginald Scot's *Discoverie of Witchcraft* (1584, 37) the belief is imputed in particular to the Irish, Muscovites, and West Indians, but these may be simply the most barbarous people he knew. Some scholars accept a diffusionist explanation for the similarity of the belief in different cultures, with a possible source in ancient Mesopotamia.

The belief takes very many forms in different cultures, including the personification of the evil eye as a

kind of demon (as evidenced by some antique amulets), but among its more common characteristics are that such power may be exerted either inadvertently (by persons otherwise of good repute), or with malevolent intent. Its reputed possessors are anyone whose eyes are black, deep-set, protruding, squinting, or distinctive in some way (such as "double pupils") or who are otherwise of peculiar appearance. Its possessors include any witch, male or female; foreigners; and even priests (Pope Pius IX was thought to possess the *malocchia*, like a number of famous rabbis). In Orthodox countries, they even included a saint, the "unbenevolent" St. John Cassian, whose gaze blighted everything it fell upon. Signs identifying a person as having the evil eye are often the same as the reputed signs of a witch.

The evil eye can be blamed for almost any misfortune. Alleged objects of attack often include crops, livestock, weddings (with subsequent impotence or infertility), and babies and young children (in several areas, newborn infants are kept from the eyes of all but family, typically for forty days). Sickness or derangement may also be attributed to the evil eye. The alleged results of an evil eye attack closely resemble the alleged results of bewitchment involving an agent (spells, magic potions, etc.) or demonic attacks. Although evil eye and witchcraft beliefs often overlap, they are usually perceived as distinct.

Protection from, or countermeasures against the evil eye also take a variety of forms. Often these are the same as the protective measures adopted against other kinds of magical or demonic attacks: specific prayers, spells, herbs and roots (these vary widely depending on the region, but garlic is common), crosses, sign of the cross, relics, amulets (a vast range, depending on the region: blue beads, the "hand of Fatima," cowry shells, horseshoes, horns, red wool, salt, garlic, depictions of an eye), spitting (usually three times—a procedure known since classical antiquity), gestures such as the fig or horns, or employment of a witch or priest.

In its principal sense, the evil eye is closely associated with the belief that misfortune will result from tempting fate by expressing a hope or intention, or by injudicious praise (McCartney 1943). The safeguards and remedies, such as spitting, crossing fingers, and touching wood, are almost the same as for the evil eye. The evil eye may also be associated with beliefs about ill-omened meetings (e.g., with priests), for obvious reasons.

The most exhaustive examination of evil eye beliefs was made in several German studies (Seligmann 1910 and 1927). Some of the most important subsequent literature on the topic has been published in two collections of essays, one by anthropologists (Maloney 1976) and the other with a folkloric orientation.

EXECUTIONERS

The executioners who were employed in early modern witchcraft trials were usually local professionals, salaried public employees. Throughout their careers, many of them never encountered magic or superstition at all; only a few burned large numbers of witches. From the executioner's point of view, the method of capital punishment employed in cases of witchcraft did not differ greatly from that used in punishing any other serious crime.

Although witchcraft was often regarded as a *crimen exceptum* (the excepted crime), it was not necessarily treated exceptionally. Harsher forms of torture could be used against witches, but this was not inevitable. Occasionally, unusual forms of the death penalty like impaling were employed. Most of those sentenced were not actually burned alive (as the Carolina—the 1532 law code of the Holy Roman Empire—and other law codes demanded), but were beheaded or strangled before their corpses were burned. The execution of witches can thus be considered one form of capital punishment among others.

The professional situation of European executioners differed greatly from one state and judicial system to another. So far, the problem has attracted little attention among modern historians. In England, late medieval tradition prevailed, inasmuch as ordinary hangmen belonged to the lower classes and chose their profession rather than inheriting it. In contrast, German and French executioners had established the heredity of their profession by the middle of the sixteenth century. Most executioners succeeded their fathers or stepfathers, or married the widow or daughter of the former executioner. Their families formed geographically extensive marriage networks. Killing the condemned on the public scaffold had become a highly skilled profession. After serving a proper apprenticeship under his father's or a foreign master's supervision, a

young executioner would perform his first beheading witnessed and judged by the local legal authorities. A written confirmation of the so-called “masterpiece” testified that the candidate was qualified for the job. Apart from his practical skills, the perfect executioner should be loyal and discreet, leading an irreproachable life and behaving correctly toward everybody. He was expected to obey the authorities and function as a mere tool of justice, never acting according to his own estimation.

An executioner's professional activities consisted largely of piecemeal work. Every job carried out was paid separately according to a list of rates. Payments varied and were not always sufficient to support the officeholder and his family. For that reason, executioners often supplemented regular fees with additional funds from criminal investigations and the application of corporal punishment. Some imperial cities and other governments paid a basic salary in addition to such benefits as a rent-free house, land for gardening, and firewood in winter. Often executioners earned money from supervising local skinners, or employed their servants to collect and make use of dead animals or aged horses.

Until the mid-eighteenth century, when university-educated physicians secured a supervisory function over all other groups of healers and gradually drove them from the market, an executioner's best and most secure income resulted from combining a medical practice with his regular duties. Medical skills were so common among executioners that they became a professional requirement. Executioners usually looked after those who had been tortured, setting their dislocated joints and broken bones and bandaging their wounds; they also had to judge the physical condition of prisoners to decide the degree of torture possible. Their expertise made them detested competitors of other authorized medical practitioners. The medical skills of executioners, who practiced publicly and treated patients from various social classes, equaled those of barber-surgeons and bath-masters, who also treated external injuries. There was nothing “superstitious” about their medical knowledge, which was passed on in the family, rather than certified through an official examination.

Only the witch hunts of the last twenty years of the sixteenth century produced real specialists who were itinerants brought in to carry out investigations. Of these, the executioner of Biberach became especially notorious for his widespread activities between 1586 and 1597. Several studies have provided evidence for the trail of blood that Johann Volmar and his son-in-law Christoph Hiert left throughout an area extending over the small territories of the German southwest and into parts of Bavaria. As experts in magic, they were called in even when local executioners were available. They were usually called to the torture chamber if the employee responsible refused to apply sufficiently

strong methods of torture, or if he could not determine that the accused was a witch. In the witchcraft proceedings carried out by the masters from Biberach, several female suspects died as a result of torture or committed suicide.

The fact that the two often exerted decisive influence on the investigations is highlighted by one detail that occurred in every confession they enforced. Of those convicted, all those who had been tortured by Volmar said afterward that they had danced on the “Heuberg” at the Sabbath, although the concept of a central dancing place was not familiar to people in all their hometowns. Worse, Volmar trained many other executioners and their sons in how to carry out examinations for witchcraft, among them the later Bavarian expert in witchcraft, Johann Georg Abriel. The executioner from Biberach prepared special drinks based on holy water and herbs to test whether a suspect was a witch or not. Johann Volmar was also a recognized authority in finding and examining the Devil's marks. In many cases, Volmar's wife examined the women to respect their sense of shame. This consideration is a remarkable contrast to the exaggerated brutality of the torture.

Reconstructing the psychological profile of witch executioners nevertheless meets with some difficulties. It is impossible to decide whether Volmar, Hiert, and Abriel were fanatic believers in witchcraft, greedy professionals, or a dangerous mixture of both. The only hypothesis that should probably be excluded is individual sadism and a complete lack of scruples. On the contrary, in some cases, Johann Volmar entertained doubts about what he was doing. In August 1596, it was reported that he refused to torture Walburga Hoppenhans in Esslingen, because “er hab ouch ein seel, es sei nit kelblins sondern Christen bluott etc. er halt sie für khain ohnholden” (he, too, had a soul, it was not the blood of a calf but of a Christian, he could not consider her a witch) (Schmid 1994, 413).

Executioners had two main sources of profit from witch hunts. The larger part came from what they claimed for their travel expenses, rather than from what they received for torture or public executions. This gave an incentive to all executioners to work outside their home districts. In addition, legal authorities were generous enough at the beginning of a witch hunt to pay for expensive accommodations; unsurprisingly, we encounter whole parties of executioners in this context. Overall, however, there were limits to an executioner's income.

In the sixteenth century, executioners played a certain role in popular magic culture, linked to their involvement in punishment. Executioners were believed to be experts in identifying thieves or recovering lost and stolen goods; they could predict the identity of the culprit after effecting a magic ritual like the so-called *Siebdrehen* [spinning of the sieve]. Here the executioner

inserted a pair of scissors on the rim of a large sieve. He then drew a circle on the ground and placed pieces of paper with the names of the suspects on the outer edge. The sieve was placed in the center of the circle; the executioner and the victim of the crime then each gripped one handle of the scissors and set the sieve spinning. Whichever piece of paper the weight of the scissors finally pulled the sieve down on revealed the name of the guilty party. Executioners also sold charms and relics from poor sinners to individuals, although the authorities tried to stop such practices. An executioner's contract of employment frequently specified that he would never use spells or other magical or religious items. After the beginning of the seventeenth century, most executioners refrained from magical practices.

EXECUTIONS

Only about half of those tried for witchcraft in early modern Europe were sentenced to death. Most of these

condemned witches were executed by burning or by hanging. Other capital punishments were also used occasionally. In Russia, convicted male witches might be beheaded and female witches buried alive. How a convicted witch was executed depended on the laws of the territory in which she was arrested and the court by which she was tried. However a witch was executed, killing her might involve considerable costs. In Mergentheim in the early seventeenth century, the wood, chains, straw, and other costs incurred in the executions of witches amounted to about 1,615 gulden or almost 17 percent of the total court costs for witchcraft cases (Midelfort 1972, 177).

BURNING

The majority of witches executed on the Continent, especially in Catholic territories, were burned at the stake. They were punished primarily for their heresy, and obdurate heretics were condemned to death by fire. The purpose of burning was to eradicate any physical remnant of the heretic and to purify the community. Canon law permitted penitent heretics to be received back into the Catholic Church, and different interpretations of how to deal with penitent witch-heretics led to different patterns of experience in northern and southern Europe.

In northern Europe, where local courts tended to try witch suspects, secular authorities followed the advice in the *Malleus Maleficarum* (The Hammer of Witches, 1486) that penitent witches were still to be punished for their temporal crimes against their neighbors. The use of torture, leading questions, and unreliable testimony from witches and other accusers during the trials meant that most convicted witches were forced to confess to capital offenses, including murder, serious injury to people, and damage to property. In some territories, such as Eichstätt, penitent witches were beheaded before they were burned.

In southern Europe, where state inquisitions tried suspected witches, their alleged harmful magic was usually considered irrelevant or illusory. The lack of torture during the trial and the limitations placed on witness testimony meant that suspects rarely confessed to such activities. The focus was firmly on trying to correct wrong beliefs and suspects usually had to endure such lesser punishments as public penance, whippings, or banishment, rather than execution.

HANGING

In England, legal emphasis was far less on heresy than on the felonies committed by the suspected witch. Under the Witchcraft Act of 1563, a first-time offender could only be executed by hanging if she had committed murder. A suspect charged with injuring a person or damaging property a second time could be hanged. Unsuccessful witchcraft led to lesser punishments.

However, the Witchcraft Act of 1604 extended death in the first instance to those who injured persons or damaged crops by witchcraft and in the second instance to those who merely attempted to use witchcraft. Except during the witch hunt conducted by Matthew Hopkins in the 1640s, the lack of torture meant that witch suspects rarely confessed to felonies under investigation; instead, as in Scandinavia, juries convicted them. A witch suspect might come before the courts several times before being executed: Elizabeth Francis, for example, was tried in 1566, 1572, and 1573 before being hanged in 1579 for killing Alice Poole by witchcraft.

THE PROCESS OF EXECUTION

The process of execution varied from place to place. Most commonly, however, on the final day in court, after being tortured into confessing, the witch suspect, like all other felons, was required to confirm it freely without torture. Only through confession—the “queen of proofs”—could convictions be made. The convict was then legally sentenced to death.

Throughout much of Europe, early modern law codes like the Carolina of 1532 in the Holy Roman Empire prescribed three days between pronouncing a death sentence and the actual execution. The purpose of this interval was to allow the condemned person to reflect on her sin and make a spiritual confession if she were Catholic or, if Protestant, make her peace with God. At the end of this period, the convict was brought before a judge who then formally handed down the judgment. A public announcement of the judgment was also read to the spectators gathering to view the execution. The witch would then have a last meal, either with the judges or the executioner. After the meal, she would have been taken to the place of execution in a public procession consisting of her judges, the executioner and his assistants, local dignitaries, and priests.

At the place of execution, often outside the city walls, the executioner tied the witch to the stake or gallows. In the case of witches condemned to death by fire, the executioner and his assistants would set the fire. The witch was then killed. Where beheading had been authorized, the executioner performed this before tying the corpse to the stake. Finally the body or its remains had to be disposed of. Ashes were either scattered into a river or buried at some appropriate site (under the gallows or a crossroads). Hanged corpses could likewise be buried or left to rot on the gallows for a period of time.

EXETER WITCHES

In 1682, three women—two widows, Temperance Lloyd (sometimes Floyd) and Susanna Edwards, and the unmarried Mary Trembles, all from Bideford (Devon)—were tried and executed at the Devonshire assizes in Exeter. By that date, executions for witchcraft were rare in England, so the incident aroused considerable interest, inspiring three pamphlets and a ballad.

Evidence about the alleged witchcraft demonstrated the standard English pattern of accusations launched after supposed acts of *maleficium* (harmful magic), while searching the witches revealed witches’ marks in the form of teats in their “secret parts.” All three women confessed, and their confessions demonstrated how far diabolic elements had entered popular thinking about witchcraft at this late time. Thus, Temperance Lloyd confessed on March 14, 1682 to meeting the Devil in the shape of a black man, “about the length of her arm: and that his eyes were very big” (*A True and Impartial Relation*, p. 5). On the first occasion she met him, he tempted her to harm a woman named Grace Thomas, and on the second occasion he sucked from her teats, causing her considerable pain. In a subsequent confession, taken before a clergyman named Michael Ogilvy in the following July, she told how the Devil had tempted her by promising that she would live well, how she could change herself into the shape of a cat, and how she sometimes performed witchcraft through damaging a model of a child.

The case also showed a number of interesting features. Temperance Lloyd clearly had a long, well-established reputation as a witch. She had been tried and acquitted for witchcraft in 1671, and had been interrogated for another supposed act of witchcraft before the mayor of Bideford in 1679. But her trial also demonstrated that witchcraft had by this time become something of a political issue in England. The previous few years had witnessed a sharpening political crisis between England’s nascent Whig and Tory factions, heightened by fears of a “popish plot” aimed at subverting the English constitution and the Church of England, and there were fears that renewed civil warfare might break out.

By 1682, Charles II's government began to implement a reaction that involved attempts to clamp down on opponents of the regime, especially religious dissenters. The early investigations of these witches were carried out, apparently with some enthusiasm, by local authorities in Bideford, and religio-political strife within the town might have helped form a context for the accusations and for the decision to push ahead with prosecuting these women. Certainly a letter from Lord Chief Justice Sir Francis North, who was present at the trials, suggests that their executions were politically expedient: given the tremendous popular outcry against these three women, it was felt that executing them would both demonstrate the effectiveness of the official judicial system and help preempt a larger witch hunt fueled by popular Protestantism, which the crown was anxious to contain. Another member of the North family, remembering the trial at a later date, wrote that the executions were at least partially attributable to the nervousness of the presiding judge in the face of considerable popular pressure to convict.

It should be noted that the last witch known to have been executed in England, Alice Molland, was also sentenced to death at Exeter at the March 1685 assizes. However, we know little about the circumstances of her case, except that she was accused of bewitching three people.

EXODUS 22:18 (22:17)

Contentious translations of this biblical verse (Exodus 22:18 in the Vulgate and in most Christian Bibles and Exodus 22:17 in the Hebrew Bible and in the Septuagint) have provided the justification in natural and divine law for the execution of witches. Translated in the long-standard King James English version of the

Bible as "Thou shalt not suffer a witch to live," it has frequently been quoted as offering Scriptural proof to justify death sentences in witchcraft trials. The translation has ignited many debates. The original Hebrew word is *mekascheph*, which has been generally taken to mean "poisoner." There is a degree of confluence and fluidity in the meanings of these terms, since poisoning was regarded as a separate crime but was often contingent on witchcraft or vice versa. However, there is an alternative interpretation of the word, in which it means a female who can effect change in material objects through the utterance of words. This definition corresponded more closely to the concept of a witch. In turn, this was translated as *Maleficos non patieris vivere* ("do not permit wrongdoers to live") in the Latin Vulgate. As Russell points out (1997, 32), *maleficus* (witch or wrongdoer) could also be understood as any criminal, although it came to denote a witch. *Maleficus* became the standard term for a witch, rather than other kinds of criminals, and the crime of witchcraft became known as *maleficia* (evil acts or evildoings). However, the term criminal or wrongdoer is still in evidence as a translation among sixteenth century codifiers of the law.

Divine and natural law decreed only one punishment for the *mekascheph* (poisoner/witch)—death. In gender-specific languages, the term came to be commonly translated as feminine. In German, it was considered to be gender-neutral until the so-called Luther's Bible of 1534 rendered the Exodus verse as *Die Zauberinnen soltu nicht leben lassen*, "Thou shalt not suffer a sorceress to live." In French, *La Sainte Bible* (Holy Bible) published in Lyons in 1566 similarly translated the term in a feminine gender, but added a note that it applied equally to men. Leopolita's Polish Roman Catholic Bible of 1561 renders the term in the masculine form (as in the Bible of 1577 and Wujek's Roman Catholic Bible of 1599), although Wujek's Bible also noted feminine forms in the margin. However, a 1563 Polish Protestant version, the Radziwill Bible, used the feminine form. Many experts attribute the choice of the King James Bible of 1611 to translate the word as "witch" rather than "poisoner" to the king's amply documented personal interest in witchcraft, although the choice might also have been influenced by the wording of England's relatively recent (1604) witchcraft statute.

As early as the sixteenth century, linguistic errors were pointed out. Because it was inherently dangerous to criticize the Bible's authority, criticism could only be made of the translation. The first and perhaps most famous exegesis came in 1563 when Johann Weyer disputed the translation of (pharmakeia—poisoner/sorcerer) as either "sorcerer" or the Luther Bible's German equivalent, *Zauberei*. He contended that the word *mekascheph* could also pertain to the magical

Page from George Gifford's *A Discourse of the Subtill Practises of Devilles by Witches and Sorcerers* (1587) discussing Exodus 22:18 (22:17), the primary biblical passage that justified the execution of witches in the age of witch hunting. (TopFoto.co.uk)

arts, as evinced by other Biblical passages. As the dispute continued, the scriptural foundations were analyzed more closely, especially as regards the translation of the terms *maleficia* and *veneficia* (poisoning/witchcraft). In Book 6 of Reginald Scot's *Discoverie of Witchcraft* (1584), the author points out that the Hebrew term is translated into Greek as **φάρμακὸν δὲκ ξηπίζώσεται** ("Do not permit a poisoner/witch to survive") and rendered in this work as *Veneficos (sive) veneficas non retinebitis in vita* ("Do not let male poisoners/sorcerers [or] female poisoners/sorcerers to remain alive"), which differs from the Vulgate. Other Biblical passages that pertain to magic or supposed witchcraft, such as Deuteronomy 18:10, 2 Chronicles 33:6, Jeremiah 27:9, Daniel 2:2, Malachi 3:5, or Acts 8 and 13, also employ different terminology in the Hebrew, Greek, and the Vulgate, thus creating further variations in commentaries. But, only the

passage in *Exodus* carried life-or-death implications for accused witches.

EXORCISM

In Christianity, exorcism is defined as a rite employed to expel demons from objects, places, and the human body, usually consisting of prayers and blessings. Jesus performed numerous exorcisms and endowed his disciples and other believers with the capacity to exorcise in his name (Matt. 10:1, 8). As exorcism is held to be a miracle—a divine, not human, action—Jesus is the only person in Christian tradition held to have exorcised on his own authority. Early Christian proselytizers displayed their charismatic power by using exorcism in the conversion of pagans. Saints' relics have been used on or in the presence of the possessed, to confront demons. Exorcism became highly contentious in early modern Europe, amid hostility between Catholicism and the new Christian churches. It was used for successful propaganda, but fear of diabolical conjuring and the possibility of fraud also made the rite an object of suspicion and ridicule. For believers, exorcism can display visibly an individual's power over evil, and the rite still features significantly in the militant revivalist churches of the modern world.

THE AIMS AND MEANS OF EXORCISM

While common use of the word *exorcism* suggests merely expulsion of demons from the body, the word itself derives from the Greek word for adjuration, or placing on oath. In this sense, exorcism functions as a calling to account, most often expressed in the requirement that the Devil reveal his name, and identify the things that vex him most to make exorcism (as expulsion) easier for the exorcist. In practice, this ambiguity has at times become a *carte blanche* to override the aim of expulsion, leading to intense dialogues between exorcists and demons, or worse (from the point of view of skeptical observers) demonic monologues. Given this tension between exorcism as adjuration and exorcism as expulsion, the signs of successful exorcism have historically been bewilderingly imperfect. For while exorcisms are intended to represent the imposition of order on inherently disorderly demons, the conduct of exorcisms has often featured a marked degree of spontaneity and inventiveness, due to the mischief of the alleged demons, but also in order to serve the purposes of

proselytism. The risk in such behavior is that exorcists may be accused of mere conjuration, or witchcraft. Indeed, Jesus was accused of conjuring demons by the power of Beelzebub, prince of demons (Matt. 12:24, 27).

Devils are held to be spiritual entities; but in Christian belief, God can give devils permission to affect the material world, spreading their malice in a variety of ways. In Catholic tradition a wide array of protective rituals against lesser or potential diabolical incursions have long served as cornerstones of devotional and daily life, and are sometimes called minor exorcisms. Exorcism of the possessed, with which we are primarily concerned here, is called major exorcism. The most common exorcism of human beings, however, is that effected in the rite of Christian baptism. In this case, the catechumen is not held literally to be possessed, except to the extent that s/he is tainted by original sin. In the Reformation, Lutherans tended to adhere to some kind of baptismal exorcism, while Calvinists rejected it.

Catholic exorcism, like other so-called sacramentals, differs profoundly from the sacraments, which are held to be efficacious, regardless of the moral state of the person performing them. By contrast, the likelihood of success in exorcism has historically been understood as enhanced by the purity of the person performing the rite. And while members of the clergy tend to be the ones to perform exorcism, lay persons—even women and children—can in theory exorcise, should God reward their devotion by expelling a possessing demon. Even the collective prayers of the faithful may move God to perform this miracle. Since at least the third century, Catholic exorcists have been obliged to seek dispensation from a bishop to exorcise, the aim being to prevent cults developing around individual exorcists. The Catholic order of exorcist was until 1972 a minor order, second in the seven stages of ordination.

Many official forms of Christian exorcism of the possessed—such as prayer and fasting, and the laying on of hands—derive from biblical healing methods. In the Catholic case, cumulative accounts from canonical texts have historically encouraged a proliferation of licit exorcist techniques. Catholic ritual formulae for exorcism might entail the recitation of psalms and other holy writings, notably the Gospel of St. John, repeated signing with the crucifix and exhortation of the Devil to leave the body of the possessed. Breathing on the possessed, also found in the baptism ritual, is also sometimes used, and is intended to represent the Holy Spirit entering the possessed. The direct touching of the body of the possessed with church vestments, the Host or other relics has also featured historically, though not without controversy. Early modern exorcism manuals also considered the question of using violence against possessing demons, some authors being more attentive

than others to the human body through whom the devils were to be attacked.

The signs of apparently successful exorcism can vary greatly, and there is an undercurrent of uncertainty in exorcism that is theologically impossible to circumvent. Some examples of signs taken to indicate successful exorcism (as expulsion) include writhing followed by a calm or even comatose state and emetic exorcisms, with success seen in the spewing up of objects, or the emission of a foul odor, followed by a change in the state of the possessed. An oblique form of exorcism, attained through the exposure of magic charms, and which loosened the hold of a witch's spell, was common in the early modern period.

EXORCISM IN THE EARLY MODERN ERA

Because exorcism can be seen as a form of conjuration, it became controversial in the era of the Reformation. Late fifteenth- and early sixteenth-century Catholic authors, such as Martin de Castañega, Pedro Ciruelo, Desiderius Erasmus, and Heinrich Kramer (author of the *Malleus Maleficarum* [The Hammer of Witches, 1486]), saw exorcism as a mixed blessing for Catholicism, if not a downright embarrassment. Exorcism was linked to illicit magic, and exorcists were criticized for their reliance on externals, such as incantations and ritual objects. Critics also objected to exorcists cultivating personal reputations as healers, when theologically their power was null without divine action. The Protestant and Reformed churches took these critiques further, disparaging exorcism as papist magic. Biblical precedent nonetheless gave the rite an incontestable pedigree, and rather than advocating its abolition, reformers insisted on greater adherence to biblical forms. Biblical eschatology also played a major role in the interpretation of possession and exorcism by clerics of all confessions, who saw exorcism as both a literal and metaphorical enactment of humanity's battle with the Antichrist.

For Catholicism, conflict with the new Christian churches both intensified anxieties about exorcism, and gave rise to a boom in its use. While some priests pursued the pre-Reformation critique of exorcism as a form of magic, others performed public exorcisms to display to heretics the miracle-working power of the Catholic Church's priesthood and devotional paraphernalia. The possessed, many of them young women, performed as demons, responding to the force of exorcism by proclaiming the power of the Church. Indeed, a veritable epidemic of exorcism took place across Catholic Europe, as the rite was used to make conversions in times of confessional tension. A reliance on the material and magical aspects of Catholicism left exorcists and the possessed open to derision, however, and many accounts show skeptical onlookers testing the possessed

by using fake holy objects and waiting to fool the demon into a violent reaction. Such tests could be a public relations disaster for militant Catholics. Critics of church magic were able to undermine almost entirely the notion of divine power acting through ritual objects, when, for example, it was shown that holy water and ordinary water were readily interchangeable.

A new literature of Catholic exorcism manuals thus appeared across western Europe, designed to counterbalance skepticism by providing strict guidelines for the use of exorcism, rather than abandonment of the rite. Works by authors such as Girolamo Menghi, Valerio Polidoro, Pietro Thyraeus, and the new papal *Rituale Romanum* (Roman Ritual) of 1614, instructed clerics in how to identify the presence of devils, and showed how to fight them with legitimate spiritual weapons. While seeking to curb the perceived excesses of solo cult exorcists, the successful dissemination of new works seems to have contributed, paradoxically, to an increased use of the rite. This enhanced capacity among clerics was reinforced by an apparent rise in consumer demand from parishioners responding to official critiques of their homegrown superstitious remedies.

Most tragically, the early modern era saw a conjunction between the use of Christian exorcism to interrogate demons and an active belief in the evils of witchcraft. The resulting prosecution of alleged witches, effectively on the basis of demonic evidence, was highly controversial. Several cases in France, such as the execution of the priests Louis Gaufridy (d. 1611) and Urbain Grandier (d. 1634), saw theological battles arise over the limits of exorcism. Even those who believed strongly in the virtues of exorcism, such as the French theologian André Duval, objected to its use for the purposes of prosecuting witches.

EXORCISM IN PERSPECTIVE

The spirituality and altruism of the Christian message have often been at odds with militant, physical forms of proselytism—a tension underpinned by belief in the possibility of spirit acting in matter. Exorcism focuses these issues for Christians, as it has often been associated with an uncompromising religiosity, capable of underscoring the difference between God and his malicious adversary Satan through a visible battle in a human body. Accompanying this zeal has been a frequent perception among exorcists that the body of the possessed (often a woman) is no longer human, but totally in the sway of devils. Historically, this has sometimes led to the use of violence in exorcism, a situation exacerbated since the late twentieth century, as exorcism has become a favored medium among evangelical Christian groups (and among some non-Christians), who see the power to exorcise as the mark of a particular holiness. In several cases, death and injury have

resulted from extreme exorcist practices among these groups. More moderate, intellectualist versions of Christianity tend to be reflected in the often skeptical attitudes articulated by modern mainstream churches. Nonetheless, tensions as to the legitimacy of the rite still exist at the very top echelons of Catholicism, and this is unsurprising, given its history. In 2000, the Church's senior exorcist, Father Gabriel Amorth, asserted that John-Paul II had performed an exorcism on a young woman in St Peter's Square, but the Vatican instantly denied the claim.

EXPERIMENTS AND TESTS

Testing and experimentation were essential to discussions of witchcraft in early modern Europe and America. Because witchcraft was defined as a crime,

rules of evidence and judicial procedure were necessary to evaluate the truthfulness of accusations. Confessions and testimony by witnesses were vital for obtaining convictions, at least in Roman law. Both, however, could be unreliable: confession could be contaminated by dementia or fear of torture, testimony by envy or revenge. So the need for more trustworthy evidence was often felt.

Two tests for witchcraft had a long history: the swimming test and the Devil's mark. Swimming was related to a long tradition of judicial ordeals, ceremonies in which the defendant's (and often the accuser's) ability or inability to perform a task was interpreted as God's signal, revealing guilt or innocence. Before witchcraft mythology was consolidated, swimming had been used to test heretics, on the theory that water, the physical element of baptism, would "accept" innocent defendants and "reject" guilty ones. (Paradoxically, this notion placed the innocent at risk of drowning, because defendants' hands and feet were bound.)

Conversely, the Devil's mark was interpreted as a sign from Satan, a cryptic signature on the body of his human intimates, confirming his pact with them. Judicial authorities and witch finders intent on proof devised tests for discovering Satan's signatures on witches' bodies. Historically, these marks were related to the idea of the pact as a text; Caesarius of Heisterbach told (ca. 1225) of heretics who could not be burned until the Devil revealed that each heretic had sewn a copy of the pact under the skin of his armpit; the story was repeated in *Malleus Maleficarum* (The Hammer of Witches, 1486) (Stephens 2002, 406n.). Conceptually, marks were the contrary both of stigmata, like those that saints received from Christ, and the *character*, an invisible but literal sign left on the human soul by baptism, confirmation, and ordination into the priesthood. Applied only in England and dating from 1566, the test for the witch's mark, a teat or some sort of protuberance on bodies of witches that their familiars or imps (guardian demons) fed on, also proved to be evidence of the pact with the Devil.

EXPERIMENTS

Tests like swimming or pricking were practiced to decide juridical questions of guilt or innocence, although they depended on theoretical and theological presuppositions. Occasionally, actual experiments were undertaken to determine the objective reality of hypothetical interactions between humans and demons. While they might be invoked as judicial proof, their intent was primarily philosophical or scientific. Experimenters commonly tested the reality of witches' crimes by attempting to witness the moment when a demon would arrive in some physical form to interact with a defendant.

These experiments have a paradoxical history. They were not originally intended as proof of human-demon

interaction; the earliest recorded anecdotes (early 1400s) seem intended to disprove the possibility. They concern women who claimed to experience flying and orgiastic banqueting after anointing themselves with herbal unguents. Alonso Tostado (d. 1455) told of a woman who challenged her neighbors to a test because they refused to believe her stories of flying and feasting. By severely beating and burning her while she was unconscious, the neighbors convinced her that the experience was a dream. Johannes Nider (d. 1438) told a similar story in which a Dominican inquisitor witnessed a woman's failure and rebuked her for foolishness.

In these early stories, the experimental initiative came from the woman, not from her opponents; she was accused of delusion, not *maleficium* (harmful magic). Tostado never mentioned demons, while Nider implied that the woman was ignorant of interacting with a demon. Both authors agreed with the *Canon Episcopi* that such women were delusional, but modified it by attributing women's nocturnal illusions to hallucinogenic unguents. Tostado identified and analyzed anesthesia, calling it a natural force derived from certain plants. Paradoxically, both authors were early theorists of witchcraft. Tostado supported the concept of witches' physical transvection or flying; Nider asserted corporeal, face-to-face relations between witches and demons (Stephens 2002, 146–159).

Later theorists of witchcraft told similar stories but clearly regretted that experiments never confirmed demonic presence and the reality of witchcraft. In 1523, Bartolomeo della Spina told how a minor prince persuaded an inquisitor to perform an experiment witnessed by courtiers. A convicted witch was forced to anoint herself while everyone watched. They observed only the witch's nap. The prince and courtiers left convinced that witchcraft was a delusion, that inquisitors persecuted old women for imaginary crimes. Spina rebutted that the experiment demonstrated the presence of two devils, rather than none: one carried the woman away invisibly, the other counterfeited her sleeping form. God allowed this deceit to punish the nobles' presumptuous curiosity and the inquisitor's sinful acquiescence (Stephens 2002, 159–162).

To assert that witchcraft experiments sometimes worked, writers sought second hand empirical evidence. Witches were forced to confess anointing their naked bodies and being carried by demons on brooms, pitchforks, and so forth. Witnesses allegedly observed witches anoint themselves and fly away, then repeated the feat themselves, while remaining innocent of witchcraft or demonic pacts; the venerable tale of Lucius and Pamphile in Apuleius's *Metamorphoses* or *Golden Ass* (second century C.E.) was sometimes cited as historical evidence of this possibility. Silvestro Prierias (d. ca. 1527) claimed inquisitors commanded

children of eight to twelve years to dance “as they do at the Sabbat,” interpreting their “unnatural” movements as evidence of supernatural—that is, demonic—instruction (Stephens 2002, 166).

Subsequent experiments with ointments continued to support nondemonic pharmacological explanations. Johann Weyer repeated stories recorded by Giambattista Della Porta and Girolamo Cardano to oppose the idea of physical interaction between witches and devils. Della Porta tells one story closely resembling those of Tostado and Nider, assuming as obvious that it describes psychopharmaceutical hallucinations, not demonic encounters. Similar stories were repeated far into the eighteenth century. Ludovico Antonio Muratori told of an experiment from the early 1700s performed on confessed witches who had not used the ointment and were proved melancholic (Muratori 1995, 101–102). Girolamo Tartarotti repeated the standard anecdotes and referred his readers to “very many others.” Quoting Tostado’s experiment verbatim, he paired it with a late seventeenth-century case proving the same point through more elaborate procedures. A judge experimented on a woman accused of *maleficium* who believed that she flew to Sabbats at the great walnut tree of Benevento. The injuries she suffered refuted her claims while providing a milder punishment than execution for her “evil intentions.” But Tartarotti exposed the moralistic pretense, saying the judge also satisfied his own curiosity. Although witches’ Sabbat experiences were illusory, Tartarotti affirmed that Satan ordered witches to use hallucinogens, and defended the Devil’s reality (Tartarotti 1745, 108–109, 141–148).

The most extensive and renowned experiments on witchcraft phenomena were arranged by the skeptical Spanish inquisitor Alonso de Salazar, who helped end an epidemic of witch burnings in 1610. Yet repeated failure of witchcraft experiments probably convinced only observers whose will to believe in witchcraft was already weakened. Witchcraft proponents argued that absence of confirmation was not confirmation of absence.

Treatises were not the only source of speculation about experimentation. Sometimes trial transcripts show prosecutors performing tests on accused witches and demanding feats of them that sound suspiciously like experiments to determine the presence of devils (Stephens 2002, 104–105).

Attempts to verify demonic intervention empirically predated the early experiments mentioned by Nider and Tostado. Caesarius of Heisterbach recorded necromantic experiments with stated purposes to verify demonic reality. Thomas Aquinas (d. 1274) had already proposed possession and necromancy as proof that demons were not imaginary (Stephens 2002, 323–324). Benvenuto Cellini left a vivid account of his

own experiments in necromancy at Rome in 1523. Christopher Marlowe’s *Dr. Faustus* (1604, 1616) experimented with necromancy to determine the reality of demonic interventions (including succubi), hell, and human immortality.

Numerous discussions of demonic possession and exorcism from 1400–1700 suggest that tests of possessed persons often served experimental motivations more than therapeutic ends. In *Malleus Maleficarum*, Heinrich Kramer recorded his systematic experiment on a possessed priest to verify the presence of a demon, bequeathing a causal connection between *maleficium* and possession to later witchcraft theorists (Stephens 2002, 322–356). Treatises such as Girolamo Menghi’s *Compendio dell’arte essorcista* (Compendium of the Exorcist’s Art, 1576) reveal endemic doubt and systematic experimentation. But once again, as with *maleficium*, experimental demonstrations of fraud in particular cases of possession could not invalidate the concept.

EYMERIC, NICOLAS (CA. 1320–1399)

Eymeric was known for his massive handbook for inquisitors of 1376, the *Directorium Inquisitorum* (Directory of Inquisitors). Born at Gerona in Catalonia, Eymeric entered the Dominican order in 1334, studying theology, philosophy, and canon law. He taught and preached at Barcelona by 1351. He became vicar of the Dominican province of Aragon in 1361 and inquisitor general of Aragon from 1357 to 1360 and again from 1365 to 1375. His zeal as an inquisitor often stirred up considerable resistance. In 1375, he was imprisoned and then exiled from Aragon

by King Pedro IV. Eymeric became Inquisitor General of Aragon once more, from 1387 to 1392, but was again exiled by King Juan I. Eymeric retired to Gerona in 1397, where he died two years later.

Eymeric wrote theological tracts, commentaries on Scripture, and many polemical attacks against both individuals (including Raymond Lull, Arnald of Villanova, and even St. Vincent Ferrer) and devotional movements. However, his most important work was the *Directorium*. It became the most widely used work of its kind, printed with extensive commentary by Francisco Peña in 1578, several times augmented and reprinted, and extremely influential until well into the seventeenth century. Eymeric's discussion of sorcery in the work is the most extensive of any of the early inquisitorial handbooks, far more detailed, for example, than in the better-known handbook by Bernard Gui, written in 1323/1324.

Eymeric's *Directorium Inquisitorum* was the fruit of many years of extensive theological study and practical experience as an inquisitor. He composed it toward the end of the fourteenth century, after a number of popes, kings, theologians, canon lawyers, and inquisitors had written extensively about the nature of diabolical sorcery and the jurisdiction over it of various tribunals, including those of the inquisitors of heretical depravity. Early in the century, a number of trials involving diabolical sorcery in one form or another, often in political contexts, had taken place. In the best known of these, that of the Order of the Knights Templar in the first and second decades of the century, many similar charges were made. During the long papal residence at Avignon from 1305 to 1378, a number of popes had also expressed increasing concerns about diabolical sorcery, particularly John XXII. Eymeric had written a short treatise on the subject of sorcery around 1359, which he may have reworked for the relevant part of the *Directorium*.

Eymeric's discussion of diabolical sorcery occurs in part II of the *Directorium*, questions 42 and 43. Question 42 deals with the jurisdiction over diviners and magicians by the inquisitors of heretical depravity, a question that had been hotly debated since the late thirteenth century. Eymeric distinguishes a kind of natural and nonheretical kind of divination—his example is palmistry—from the kinds of divination and magic that he thought required formal abjuration of Christian baptism (apostasy) and ritualized submission to demons (idolatry). Therefore, such activities fell well

within the jurisdiction of inquisitors of heretical depravity. In the forty-third question, Eymeric argues that the second kind of diviners and magicians paid *latría* to demons, the kind of honor that was appropriate only for God, as well as a lesser kind of veneration, *dulia*, that was appropriate only for the angels, saints, popes, and kings.

Eymeric goes on to describe the horrific rituals and practices that the demons require their servants to perform, the reasons these qualify as heresy, and allows for the possibility of abjuration, but also envisages the death penalty for those who either refuse to abjure or relapse into diabolical sorcery after they have abjured. He then cites a long list of authorities, including Scripture, St. Augustine, Thomas Aquinas, Pope Innocent V, the *Canon Episcopi*, and several more recent papal decretals.

The significance of Eymeric's discussion of diabolical sorcery lies in his insistent linking of it with traditional and recently articulated ideas concerning the nature of heresy and its prosecution, as well as his categorization of both heresy and diabolical sorcery as forms of apostasy and idolatry, and therefore violations of the First Commandment and the greatest of sins. The extraordinarily wide circulation of the *Directorium* testifies to its wide appeal. As it circulated, Eymeric's ideas about diabolical sorcery circulated with it.

F

FAIRFAX, EDWARD (D. 1635)

Known for his account of his daughter's bewitchment, Edward Fairfax was a member of one of the most powerful gentry families in Yorkshire. He married the sister of a leading government administrator in the north, lived at Fewston in West Yorkshire, and fathered four daughters (one of whom died shortly after birth) and four sons. He was a learned man, best known for his translation of Torquato Tasso's *Gerusalemme Liberata* (Jerusalem Liberated), published in 1600.

Fairfax's connection with the history of witchcraft began on October 28, 1621, when his eldest daughter, Helen, then aged sixteen, fell into a trance in the family parlor for several hours. When she awoke, she claimed that she had been in the church of the nearby town of Leeds, hearing a sermon by the vicar, Alexander Cooke (the family had previously lived in Leeds: Cooke was a very forceful preacher, who also published a number of tracts against popish recusants). She continued to fall into trances and described visions when she emerged from them, behavior that gradually led her parents to believe that she was bewitched.

Her younger sister, Elizabeth, began to demonstrate similar symptoms, and eventually suspicions focused on six local women who were thought to be afflicting the Fairfax girls and another girl from Fewston, Maud Jeffray. Fairfax's account of his daughters' afflictions contributed to a body of narratives about the bewitchment of children and adolescents in English gentry households, which began with the Warboys affair. The visions that Helen Fairfax reported provide fascinating insights into the ways in which a devout young woman of the period envisaged God, the Devil, and witches. Helen frequently suffered afflictions imposed on her by specters of the women who were tormenting her, and her discourse shows obvious familiarity with contemporary witchcraft lore, especially that associated with familiars. The six women were eventually tried for witchcraft at York assizes in 1623, but were acquitted.

Fairfax recorded his daughters' sufferings in a lengthy narrative that has never received a full-scale modern study, although several manuscript copies of it circulated in the seventeenth and eighteenth centuries. His account of his daughters' afflictions provides remarkable insights into an educated, and sincerely Protestant,

gentleman's reactions when his child was thought to be bewitched, and records the kind of sufferings and visions that a supposedly bewitched young woman from a godly background might experience. Fairfax also makes a number of comments about witches and witchcraft in his home region, which is relatively badly documented for witchcraft history. When his daughters were bewitched, he considered going to cunning men or using countermagic, such as scratching, but rejected these means as ungodly, and decided to resort to prayers and fasting, the theologically correct remedy. His narrative also shows that he was aware of classical references to witchcraft, and a number of recent cases.

The women suspected of bewitching Helen and Elizabeth were acquitted after trial, perhaps a surprise given Fairfax's family connections. Fairfax's account of their trial provides useful insights into the way English witchcraft trials were operating by the 1620s, and the degree of caution, verging on skepticism, with which the authorities were treating witchcraft by that time. Fairfax stressed how opinion in Fewston, including that of the vicar, was opposed to his attempt to prosecute his daughters' tormentors for witchcraft, while he was also surprised and offended by the attitude of the local justices of the peace and the assize judges when the six women suspects came to trial.

FAIRIES

During the period of witchcraft prosecutions, many suspected witches throughout Europe claimed under interrogation to possess supernatural powers after their encounters with fairies. No modern scholar has undertaken a full study of this question throughout Europe. Partial studies ranging from classical Greece and Rome

to the British Isles, Sicily, the Alps, and eastern Europe, especially Hungary, suggest a Europe-wide series of conceptually related beliefs—though with considerable regional and local variations. Broadly, what is shared is a belief in fairies as a particular class of dead persons, or more accurately as a possible destination for the bodies and spirits of some of the dead. In particular, those who had died before their allotted span—murder victims, soldiers who died in battle, and women and babies who died in or shortly after childbirth—were likely to return as fairies. Feelings about these beings were ambivalent. Sometimes they were thought to protect their communities against darker supernatural powers, and sometimes to behave like fearsome vampires or revenants, preying on their neighbors and kin. Mortals could gain power over, or from, fairies most commonly either by giving them a baby or by having sex with them, but sometimes by temporarily becoming one of them, a process which often involved joining an airborne fairy ride. Those thus favored by the fairies received some or all of the characteristic supernatural powers of cunning folk: healing powers, the ability to find lost objects and buried treasure, and the ability to prognosticate. Others

regarded these powers, and their fairy donors, as simultaneously useful and dangerous in the community.

The fairies were—alarmingly, in the patriarchal cultures of early modern Europe—a matriarchy, and praise of Elizabeth I of England as “the fairy queen” acknowledges the exceptionality of this form of government. Moreover, the queen of the fairies was overtly sexual, often abducting young men for her sexual delight. More pertinent to women storytellers was her appetite for babies; rationalized later by folklorists as due to her own inability to bear children. The primal hunger for an infant spoke deeply to maternal feelings and ambivalence in women. This was especially true of the belief in changelings, the idea that the fairies stole a mortal child and left a fairy child in its place. Stories add that it was possible to get one’s own child back by making the changeling suffer, for example by burning it over a fire or by abandoning it in woodland for hours at a time. Such things may never have been practiced, but such stories, perhaps offering a popular explanation for Down’s syndrome children, express otherwise unspeakable rages and loathings of some mothers toward some children.

A fairy procession. Europeans believed that fairies comprised the dead who had returned to life, could be either benevolent or malevolent, and often gave powers to witches. (Images.com/Corbis)

When told by women, stories about fairies seem less a matter of wish-fulfillment than of fear of breaking the bounds set for them by society. It seems clear that under interrogation and during trials, cunning women often told the same story about their encounters with fairies that they had been using to explain their powers to clients. Like all magical healers, suspected fairy witches were often among the first to be accused during an outbreak of local prosecution. It may be that the English familiar, so puzzlingly alien to continental demonology, is a form of household fairy, or hob; several accused witches speak of their familiar as if it were a brownie, and a few speak of feeding them on milk, as brownies were fed. If so, it may be that fairy beliefs—or, given the fact of frequent prosecution, the failure of fairy beliefs—lie behind many more witchcraft trials than have so far been studied. More extensive studies of relations between folklore and witch beliefs are needed.

Fairy beliefs of the kind described above were gradually but patchily displaced by the creation of literary fairies—tiny, morally good or neutral, and comely, with minimal supernatural powers—in which few people ever truly believe. These figures were introduced by Shakespeare and promulgated by his contemporary Michael Drayton, and they later became key aspects of social satire. Yet even a late version of fairy beliefs like James Barrie's *Peter Pan* retains some of the folkloric sense of fairies' ambiguity, power, and connection with death. Even the faked fairies of Cottingley retain a connection with death through the spiritualist rhetoric used to describe them. (The Cottingley fairies, made out of shapes traced from a children's book, cut out of cardboard, and stuck on hatpins, then photographed by two teenage girls, were hailed as genuine by Arthur Conan Doyle and the Theosophical Society in 1922; they were welcomed by those who had recently lost family members in the Great War and were in search of reassurance; many other fairy sightings followed, and many people have written to me to say that they have really seen one.) Despite this, the modern fairy is anodyne and one-dimensional in comparison with her more complex ancestors.

FAMILIARS

The familiar spirit was a private, and in many instances domesticated, demon usually taking an animal form, that a witch would keep to aid her in acts of *maleficium* (harmful magic). Future research may modify this assertion; but it now seems that the familiar, in its fully developed form, was very much particular to English witchcraft. Familiars seem to have been an integral part of Basque witchcraft beliefs, where toads played a part, but they seem less important than the familiar in England—and toads, unlike most British familiars, secreted real poison. Similarly, anthropologists occasionally report something like familiars among the witchcraft beliefs of the peoples they study, but these too generally seem less elaborate than the ideas about familiars current in early modern England.

However, the concept of the familiar in early modern English witchcraft has not been given thorough analysis, although both trial records and pamphlets about trials contain a wealth of detail, sometimes contradictory, about them. The concept already appears in the first English witchcraft-trial pamphlet, describing the trial of three Essex women in 1566. According to the pamphlet, one of them, Elizabeth Francis, confessed that she had learned witchcraft at age twelve from her grandmother, who made her renounce God and gave her a familiar, named "Sathan," in the shape of a cat. Here we have an indication of one possible function of familiars in English witch beliefs: although the demonic pact took a long time to enter English popular thinking about witchcraft, a familiar named "Satan" was clearly diabolical and functioned as a substitute for the Devil. This cat was reportedly fed bread and milk and kept in a basket. The cat could speak and was sent by Francis to perform acts of *maleficium*.

Another important element was present in this early pamphlet. Whenever the cat did anything for Elizabeth Francis, it required a drop of blood, which the witch provided by pricking herself. This notion developed fairly quickly into the idea that the familiar sucked blood from a witch's extra teat, the English version of the witch's mark. By the early seventeenth century, it was generally accepted that the mark would be on the witch's genitals or on her anus, thus adding a sexual dimension to the relationship between the female witch

and her familiar. This functioned as a pornographic transference for the direct sexual intercourse with the Devil that characterized continental witchcraft.

Throughout the period of witchcraft trials in England (and long afterwards), familiars remained central to English witchcraft beliefs. The forms they took varied: they might be any simple animal. By the time of the Matthew Hopkins trials of 1645, familiars assumed a variety of shapes, sometimes taking on grotesque hybrid forms. Their names ranged from the very familiar to the totally fanciful. The way in which familiars were acquired also varied. Sometimes familiars were passed on by a relative, as with Elizabeth Francis in 1566, or were gifts from another witch.

There is also some possibility of regional variations in the strength of belief in the familiar. In this period, familiar spirits are mentioned most frequently in East Anglia and Essex, but apparently less often in such northern counties as Lancashire or Yorkshire. The witch's teat became central to "proving" that a woman was a witch, and hence, the role of the familiar became more important. These developments were almost certainly strengthened by the English 1604 witchcraft statute. Like its Elizabethan predecessor, it made invocation or conjuration of an evil spirit punishable by death, but added the death penalty for those who dared to "employ, feed or reward any evil and wicked spirit to

or for any intent or purpose." This addition was clearly directed at the keeping and using of familiars. Subsequently, women were occasionally indicted simply for keeping familiars, even without performing acts of *maleficium*.

Conversely, the familiar played a role similar to that of the Devil in tempting a woman to repudiate her god and serve the Devil; indeed, some confessing witches scarcely differentiated between the Devil and their animal familiar. A good example of this, also from a trial pamphlet, is provided by Elizabeth Sawyer, "The Witch of Edmonton," executed in 1621. In this case, the Devil first came to Elizabeth in the shape of a dog when she was cursing, swearing, and blaspheming. The dog assured her that he would help her revenge herself upon her enemies whenever she asked, in return for which he took her soul and her body. Sawyer sealed the bargain by allowing him to suck her blood a little above her "fundament," a continuation of this process resulting in the forming of a teat. She called the dog-devil "Tom," and would stroke its back, which made him wag his tail.

The familiar was thus a central element in English witch beliefs. At present, however, it is very uncertain where this concept, apparently well developed by 1566 but rarely mentioned in earlier English witchcraft cases, originated, and why it assumed such importance in

England but nowhere else. Some possible clues are provided by another 1566 pamphlet, describing the examination of a man named John Walsh before the episcopal court of Exeter. Walsh described how he had learned magical arts and acquired magical books from his previous master, a priest named Robert Drayton. He said that he also inherited a familiar from his master, which visited him in various animal forms, and sometimes as a man with cloven feet. When first given it by Drayton, Walsh gave the familiar a drop of his blood; but he usually rewarded it for services rendered (normally finding stolen goods) by feeding it a chicken or other live animal. He also told how to use toad familiars to help work magic. Walsh also claimed to be in touch with the fairies, and it seems obvious from some other early descriptions of familiars that there was an overlap in the popular consciousness between such creatures and familiars. Walsh, moreover, told how he would raise his master's familiar spirits by using spells that his master had taught him. Here we may have another clue to the origins of the concept. Were the familiars, so firmly lodged in popular beliefs, the folklorized equivalents of the spirits that necromancers like Drayton had been trying to raise for several centuries? More generally, writers from classical antiquity onward had imagined beings that were half animal and half demon, and it is possible that this tradition, emphasizing the reality of such beings, had entered folklore.

Belief in familiars remained a central aspect of witchcraft beliefs in England long after the end of the witchcraft trials. When folklorists began their investigations in the nineteenth century, they found that familiars, most frequently in the form of white mice, figured prominently in ideas about witchcraft. Now usually described as *imps* (or *niggets* in Essex), familiars were still thought to be passed on from one generation to another, as in 1566. Connected beliefs held that a witch lost her power if her imps were killed, and that a witch could not die until she found a relative who would take her imps. These beliefs, interestingly, were strongest in the eastern counties. There was an associated belief that witches kept toads, who performed many of the functions of the familiar, in the west country. In the north, folklorists found very little evidence of familiars, although in that region the beliefs in shape-changing among witches were stronger, establishing another facet of the witch's interface with the animal world. Thus the familiar, a concept with origins that remain so elusive, retained a central place in English witchcraft until the early twentieth century. The modern worldwide popular notion that the witch habitually keeps a pet cat is a remnant of this notion.

FAMILY

Family units, primarily in the nuclear household, then secondarily among extended kin, formed the basic structure of European society, so the family naturally played a vital if ambiguous role in witchcraft beliefs and practices. The classic misfortunes attributed to witches struck against families, most notably their children and their animals. It was therefore natural for suspicions to form at this level, before gossip spread into the wider community, and for family members to join together in action against the witch.

At the same time, there was a marked tendency for whole families to become suspect, which probably increased once persecution became endemic in specific localities. A significant number of accusations against men, in particular, can be seen as extensions of the reputation that first attached to their wives. Once a close relative, and especially a parent, had been executed, all family members could expect to have this remembered against them, and cited as if it amounted to a presumption of guilt.

In most of Europe it was normal to confiscate the property of a condemned witch, so children might also be reduced to extreme poverty. Unsurprisingly, many of the condemned seem to have left their native communities, although their dangerous reputations accompanied them to their new addresses. There appears to have been a notion of witchcraft as a craft that was learned, with parents corrupting their children, often under heavy pressure from the Devil. Children were allegedly taken to the Sabbath for initiation, a notion that helped to set up the pattern of denunciation by child witches found in some notable panics. There are numerous less spectacular instances where children told fanciful stories or claimed magical powers in such a fashion that they brought their parents under suspicion.

Families normally provided a considerable degree of protection for their members. Husbands are often recorded as threatening or conciliating those they feared might accuse their wives, or seeking damages from them for slander. Mothers often intervened to defend their children against other children or adults in

ways that led to lasting animosities or became the basis for witchcraft charges if illness or death followed a confrontation. Groups of village children also became the mouthpieces of local gossip, publically voicing suspicions their elders only expressed privately, and taunting others with the reputations of their parents. At a more mundane level, the elderly were expected to receive support from their children and kin rather than go begging. The vulnerability of older women to witchcraft charges clearly related to the fact that many became widows, and a significant proportion of these had no surviving children. Potential accusers would have been well aware of the ill will relatives of the convicted might feel toward them; they may also have been conscious that countercharges could be made against members of their own families. Reputations stretching back many years might therefore become far more dangerous once individuals had become both isolated and dependent on aid from the community. Such people occasionally seem to have played on the fears they aroused to extract more support from their neighbors, following a very high-risk strategy.

Tensions both within and between families are often perceptible from the legal records. A striking example can be found in the famous Salem Village episode, where family rivalries helped structure a complex pattern of accusations. There are German cases where envious younger men attacked leading male members of village communities by charging their wives with witchcraft. Discord between spouses could be blamed on witchcraft by third parties, although in extreme cases it might lead to direct accusations. Both the popular and the ecclesiastical rituals of marriage were thought to offer protection against various dangers, including the infliction of impotence by tying ligatures, although this widespread belief does not appear in many witchcraft cases. Marital troubles are another matter, because one of the most common reasons a woman gave for supposedly yielding to the Devil's blandishments was that she was in despair after quarrelling with her husband or being beaten by him. On other occasions women alleged that they were in terrible poverty because their husbands drank away their money and left the children hungry. These negative pictures imply a more positive ideal, and should not be taken as reliable evidence for the normal state of early modern family life. The witchcraft trials also contain much evidence for supportive attitudes, showing heavy expenditures of time and money caring for sick spouses or children. Many of the attitudes repeatedly expressed are quite incompatible with the dismal view of dysfunctional families that have been adopted by some incautious historians.

High mortality rates necessarily led to many broken families and remarriages; inevitably, problems with stepparents and stepchildren manifest themselves in the evidence, sometimes as motives for the hostility that led

to bewitchment. The same role might be attributed to disputes over inheritance, which often led to splits in the extended family network, or between parents and children. While it was very rare for suspicions within families to turn directly into formal legal proceedings, they quite often became known to neighbors and helped to create reputations. The frequency of infant mortality may have had more subtle effects, because it would have reinforced the tendency for siblings to believe that ill will toward the new rival for maternal attention was truly deadly, the kind of link between inner feelings and external effects that was a central constituent of witchcraft beliefs. Another set of tensions involved servants, whose relationships among themselves and with their employers were often uneasy. They might be accused of bewitching one another, or arguments about payment and treatment could be treated as the motive for a vengeful parent's magical assault on the family. At other times it was a servant who became the victim after turning away a beggar or running some errand for her or his employer, because the servant was the person in direct contact with the supposed witch.

Official doctrines attached great importance to the family as the framework for a well-regulated society, in which women, children, and servants submitted to patriarchal authority. Breaches of the rules were readily identified as signs of more fundamental disorder, yet wives in particular were often obliged to act with a degree of assertiveness that contradicted the theories. Whether marketing household produce, dealing with importunate neighbors, herding animals, or participating in group activities, they needed to be pertinacious in defending their household's interests. Their social role as prime creators and propagators of local gossip also threatened the passive stereotype. Housewives emerge from the record as rather assertive figures. In witchcraft cases, there are reasons to believe that housewives did not merely testify against suspects, but that they often spurred their menfolk into action against suspected witches whose labeling was largely the work of the female community. For some educated male commentators this was indeed an additional reason for skepticism when dealing with accusations they saw as irremediably tainted by feminine credulity and superstition. A women's household role might also help to shape the nature of charges, with suspected witches identified as threatening the housewife's basic duties of childcare and nourishment. Witchcraft often appeared as the polluting element that disrupted such everyday activities as making butter or spinning; the sufferers who found that practical efforts to put matters right were ineffective might well resort to countermagic, such as placing a red-hot piece of iron in the milk.

In their general assault on fertility of every kind, witches might well be seen as aiming to destroy the family as the center of reproduction. Their supposed

ability to penetrate into domestic space, whether as assertive unwelcome visitors or through shape-changing, gave dramatic expression to this threat. Confessions about the Sabbat sometimes explained how groups of witches sallied forth to snatch babies from their cradles by night, or to kill them. In more elaborate theories, it was supposed that the Devil wanted his agents to behave in this way to prevent the completion of the divinely appointed number of the just, thus delaying his own predestined fate at the Last Judgment.

At the popular level, the dominant fears were rather that households enjoying some modest level of viability might lose both property and status, or be unable to bring any children to maturity. Occasionally this pattern was inverted, in the sense that unusual economic success was attributed to witchcraft. The most common expression of such beliefs attached to dairying, with the idea that neighbors could somehow steal milk from other people's cows, surfaced at various points across Europe. In other cases the allegations simply involved the ability to produce exceptional quantities of butter or cheese. The most typical situation, however, was when some envious neighbor sought to disrupt a successful family, so it was natural that some of the most common forms of countermagic were designed to protect thresholds and prevent any incursions into the private world of the household.

FAMILY OF LOVE

A sixteenth-century religious group of Dutch origin, Family of Love included some who were skeptical of diabolical witchcraft, the reality of the pact with the Devil, and the existence of demons. The central ideas of

those associated with the Family of Love, also known as Familists, *Familia Charitatis* (Family of Charity), and *Fedeli d'Amore* (the Faithful of Love), the last name being used by a thirteenth-century literary current associated with Dante Alighieri, would have had obvious appeal to nondogmatic Christians. There are similarities between the Fedeli d'Amore and the *familia amoris* (Family of Love) persecuted in Milan in 1300–1302. The Familists held their meetings in secret and concealed their true beliefs while appearing to be orthodox Christians, both being types of behavior that many in early modern Europe attributed to witches.

They were followers of Hendrik Niclaes (1509–1580), a Dutch spiritualist and a wealthy merchant. In 1540, Niclaes had a revelation that induced him to found this sect. Niclaes was arrested in Münster for holding Lutheran views, and then went to Amsterdam, where he was suspected of being an Anabaptist, and then to Emden. His works were strongly influenced by the Radical Reformation, as well as the medieval Brethren of the Free Spirit and Erasmianism. Niclaes signed with his initials, H.N., also meaning *homo novus*, or *Helie Nazarenius*, a prophet of God.

As a group, the Familists practiced Nicodemism, dissembling their true beliefs while conforming to orthodox norms. Stressing righteousness, Niclaes thought that faith was meaningless without an imitation of Jesus's passion. Niclaes asserted and defended an internal liberty that allowed men to live peacefully and avoided confrontations through an emphasis on Christian ethical values. Prayer was also rejected, and Familists attached little importance to external sacraments or forms of worship. When accused of being Familists, they could claim their legal rights as God-fearing and churchgoing Christians. Familism on the continent appealed to humanists who found it a way of living freely. Some famous sixteenth-century people, including the printer Christophe Plantin, the mapmaker Abraham Ortelius (Ortelius), the neostoicist philosopher Justus Lipsius, and the Spanish humanist Arias Montano, joined this second Family of Love, adopting their leader's theories toward political troubles, practicing an external conformity and inward withdrawal that preserved both themselves and their individualistic religion.

England experienced a peculiar type of Familism. The standard view sees English Familism as the adaptation of a set of imported beliefs to existing patterns of English nonconformity (Marsh 1994) or as a kind of adulterated Niclaesism with Anabaptist roots (Hamilton 1981). Despite any "national" differences that the "Brotherhood of Love" took in England and in the Low Countries, its main aim everywhere was mutual assistance and protection. The Familists held their meetings in secret and hoped to convert new enlightened members. Here as on the Continent, the writings

of Niclaes appealed to humanists who found in Familism a way of finding a freer spiritual life, but the Familists never spread their message beyond a tiny portion of society. Familists were never a major force, but they provided a source for other continental themes that influenced other later groups.

At the end of the sixteenth century, Familism disappeared in the Netherlands with the deaths of Niclaes in 1580, Plantin in 1589, and Hendrik Jansen van Barrefelt after 1594. Most of its confraternities tended to Protestantism. In the Netherlands, a new movement, Arminianism, a moderate form of Calvinism, attracted similar individuals, while in England the birth of the Fraternity of the Rose Cross gathered in some ex-Familists (Hamilton 1981). While it is difficult to define the heritage of Familistic experience, it seems clear that the Enlightenment became the ultimate heir of that kind of thought. The underground culture of the Family of Love prepared the way for the Rosicrucian brotherhood, and in some ways for the eighteenth-century Enlightenment, the philosophical fraternity. Its heritage is found in its desire to cut through existing creeds, and in its claim of freedom to explore a personal mystical faith.

FAUST, JOHANN GEORG (CA. 1480–1540)

An almost mythical figure (*faustus* means the lucky one), Faust's dates of birth and death and even his Christian name remain in dispute (Johann or Georg?). However, the historical Faust was probably born at Knittlingen (southwestern Germany) and studied theology at the university of Heidelberg after 1507. He has left traces in local records at Erfurt

1513 and Bamberg in 1520, where Bishop Georg III acknowledged the importance of "Doctor Faustus" with a gift of 20 florins. The towns of Ingolstadt and Nuremberg expelled a "Doctor Faustus" in 1528 and in 1532, respectively, as a necromancer and sodomite. Faust's historical existence is beyond doubt. During his lifetime he was mentioned by Abbot Johannes Trithemius in 1507, by Conrad Mutianus in 1513, Abbot Kilian Leib in 1528, Joachim Camerarius in 1536, Philip Begardi in 1539, and by Philip von Hutten, writing to his brother Moritz from Venezuela in 1540.

Faust apparently sought the reputation of a Renaissance philosopher who was familiar with natural magic, but his negative image was already shaped by the ferocious attack of Trithemius in May 1506. The abbot, involved in a dispute with Faust near the imperial city of Gelnhausen, suggested that Faust had claimed to perform wonders superior to those of Jesus. In his demonology *Antipalus Maleficorum* (Testimony of Witches, 1507), Trithemius constructs Faust after the image of Simon Magus, the sorcerer in the *Acts of the Apostles* (8: 9–24) who aspired to supernatural power.

Because Trithemius was extremely well connected in both humanist and political circles, his enmity toward Faust was readily transmitted to prominent intellectuals of his day (Trithemius 1536, 312). The example of Dr. Faust was presumably used in sermons, since the proliferation of Faust narratives can hardly be explained otherwise. Already during Faust's lifetime, the constructed figure of "Faust" acquired characteristics from earlier magicians or figures like Theophilus who had made pacts with the Devil. Such authors as Martin Luther and Philipp Melanchthon and various chronicles (for example, the *Zimmerische Chronik* or *Waldeckische Chronik*) referred to Faust as an almost mythical or legendary figure.

Folk tales of Faust remained popular in the mid-sixteenth century and were amplified with details borrowed from such better-known historical magician/scientists as Paracelsus or Cornelius Agrippa von Nettesheim, Johann Weyer's teacher at Bonn. Quoting Luther (and indirectly defending Agrippa), Weyer mentioned Faust as a magician who had a close relationship with the Devil. Johann Fischart, the translator of Jean Bodin's demonology, subsequently turned the tables by modeling Agrippa on the figure of Dr. Faustus, implying that Weyer was numbered among the Devil's minions. Like Fischart, most later sixteenth-century demonologists, including some opponents of witch beliefs, like Hermann Witekind in 1585, refer to Faust as a quintessential diabolical sorcerer.

By then Faust had become a literary figure. He already appeared, for instance, on the front cover of Ludovicus Milichius's *Der Zauber Teuffel* (The Devil of

Faust and the Devil make their pact. (Bettmann/Corbis)

Magic) in 1563, subsequently incorporated into the first edition of the *Theatrum Diabolorum* (Theater of Devils, Frankfurt am Main, 1569) and all later editions. The *Historia von D. Johann Fausten*, the first book purporting to describe Faust and his deeds, was printed in Frankfurt in 1587. The anonymous author assembles contemporary narratives on Faust, arranging them in chronological order, and placing the magician's compact with the Devil at the center of his story. By constructing Faust as a male witch, his moral was a warning about human curiosity, a deadly sin leading Christians to hell. The publisher Johann Spies threw this pamphlet, presumably compiled by a Lutheran author, on the market when the witch hunts in southern Germany first climaxed in the late 1580s.

The subject proved to be unusually successful even beyond Germany. The English writer Christopher Marlowe composed the first of many subsequent plays on the subject, *Dr. Faustus*, in 1588. There were numerous adaptations of the Faust legend during the early modern period. Long afterward it continued to inspire such famous authors as Johann Wolfgang von Goethe, Paul Valéry, Thomas Mann, and Michael Bulgakov, all of whom produced major adaptations that reached

international audiences. Inspired primarily by Goethe's masterpiece, the theme of Faust was subsequently spread through nineteenth-century operatic adaptations by such major composers as Giacomo Meyerbeer, Franz Liszt, and Hector Berlioz.
