On September 29, 1645, three women, Joan Williford, Joan Cariden, and Jane Hott were executed for witchcraft at Faversham in Kent (a fourth woman, Elizabeth Harris, was also investigated, but apparently not hanged). Although there is no direct link, the timing and content of these trials suggest that they were very strongly influenced by the mass witch hunts, presided over by Matthew Hopkins, which had broken out that summer in eastern England. Faversham was one of the English Cinque Ports, a borough with its own rights of jail delivery, and some of the irregularities that occurred during these trials probably resulted from their being presided over by the mayor and jurats of the town rather than trained judges. In particular, this is one of the few English witchcraft trials in which the swimming test was used with official approval. The trials should also be placed in their local economic, religious, and political context. In particular, there had long been ill feeling between Joan Cariden and Faversham's mayor, Robert Greenstreet—in 1635, when he had held the office previously, Cariden had cursed him in the course of a dispute. Joan Williford testified that Greenstreet had never prospered after that curse, and it is significant that his wife had died in the summer of 1645, shortly before these trials.

The Devil, sometimes in animal form, figured prominently in the confessions of the Faversham witches. Joan Williford told how the Devil appeared to her in the shape of a little dog and promised to help her revenge herself on her enemies. She then gave him some of her blood,

which he used to write the covenant between them. Elizabeth Harris repeated the story of the covenant written in blood, and confessed that she scratched her breast to get the blood she used. Joan Cariden told of a great meeting of witches at the house of a woman called Pantrey, at which the Devil sat at the head of the table. As ever, the Devil proved to be an unreliable friend. In a graphic image, Jane Hott told how when she underwent the swimming test, the Devil assured her that she would sink, that is, that she would be proved innocent. But she floated, and when she was in the water the Devil sat on a crossbeam and laughed at her.

The Faversham witches' confessions also included the standard matters of revenge and *maleficium* (harmful magic), but the intrusion of the Devil, the covenants written in blood, and the suggestion of a Sabbat are unusual, and demonstrate how English witchcraft beliefs were becoming diabolized in the mid-seventeenth century. In a well-documented case of 1586, Faversham had held another trial that led to the execution of a woman named Joan Cason. Here, too, the lack of legal training on the part of borough authorities affected her conviction, this time because they proceeded under the mistaken impression that they were convicting her on a noncapital charge.

Concentrating on the neighboring county of Essex has led to a relative neglect of scholarly study of witchcraft in early modern Kent (but see Gaskill 2000). Because Kent was home to the skeptical writers Reginald Scot and Sir Robert Filmer, witchcraft trials in this county may well show some peculiarities. Certainly, despite the numerous cases coming through the county's ecclesiastical courts in the early years of Elizabeth's reign, Kent never experienced such relatively high levels of endemic prosecutions as Essex in the late sixteenth century. However, they continued even longer in Kent: after the 1645 Faversham trials, Kent put eighteen suspected witches on trial in 1652, and six of them were hanged.

FEAR

From the modern perspective, the world before 1800 seems to have been dominated by fear and anxiety; the very term "witch panic" suggests this. Scholars such as H. R. Trevor-Roper (1967), Denis Crouzet (1990), and especially Jean Delumeau (1978) have made much of the turmoil accompanying witch hunts and confessional conflict. It is often asserted that apocalypticism and millennial expectations were high in these societies and cultures, with people's lives deeply troubled by uncertainty. On one level this might well be true, but seeing fear as the paramount feature of the age would be as misleading as using tabloids and conspiracy theorists to characterize the modern age.

What role then did fear play in the Europe of 1400–1800? Clearly, there were numerous sources of concern for any community (especially urban environments). The response to witches and witchcraft was, in some ways, very different from fears of pestilence or warfare that periodically gripped such communities—but, in the long term, they were relatively similar. For example, fire in confined cities containing many timber buildings was a serious threat. However, people did not run howling into the night. Rather, they instituted regulations about the use of fire meant greatly to decrease its danger. In this they were largely successful and devastating fires (in an age without any real means to stop a fire once it had started) were remarkably rare. The danger of plague was very real and very present: most urban environments were swept by pestilence every fifteen years and nearly a quarter of the population carried away each time. Indeed, in western Europe's last outbreak (Marseilles in 1722), half the city's populace perished. Despite the horrific danger posed by plague, most people did not abandon their homes. Rather they developed extensive systems of monitoring, prevention, containment, and purification designed to lessen the frequency and virulence of plague outbreaks. While these were largely ineffective against the disease, they provided psychological immunization against the fear and panic accompanying a pestilential attack. Invasion and siege were also major threats, but these were, likewise, dealt with by practical and levelheaded means. Fortifications were built at tremendous expense. Citizens were drilled in defending the town. Preparation, as with fire and plague, was the watchword. And, in this context, preparation meant bureaucratic development and increasing governmental control over wide areas of private activity. Societies responded to those things that threatened and frightened them by preparing themselves against a future onslaught and ensuring that every defense possible was ready to bring into play.

The response to the fear of witches was, in one key way, very different from responses to fears of fire, pestilence, or warfare. Everyone agreed at every level of

society, that spirits, demons, and angels existed. There was no doubt that there were powers in the created world that lay beyond the material and natural, but which could be accessed and used by mortals. These powers and beings existed in the preternatural realm. While this belief no longer prevails throughout modern Western society, it is important to realize that our reactions to accusations of “Satanic” sexual abuse and programs or books that “promote” witchcraft and sorcery imply that these views are not so archaic as one might suppose. The important point, though, is the unanimity of belief about the ubiquity of the spiritual and preternatural in the early modern period. Such powers were everywhere and could be used. But, who could use them? By what means did an individual gain access to them? For what purposes were they being used? How might one guard against people using these powers? Clearly, bureaucratic and governmental responses were largely impotent. Powers beyond the natural were not subject to edicts and civil servants. They were invisible and dangerous.

WHO COULD USE THIS POWER?

There was universal agreement that the powers of the world inhabited by demons and angels were accessible to mere mortals. However, there was more than one way to make use of this power. The wise could, through study and piety, gain control over powers from this realm. These magicians and alchemists made use of these powers for good or ill. Dabbling in such things, even for the wisest and most pious, was extremely dangerous. There was always the potential to misuse these powers or to be seduced by Satan and his minions into delving too deeply and, thereby, coming under his control. The key point in the approach of the learned to these powers and this realm was the possibility of a mortal to use and maintain control over these dangerous, frightening powers. Such men (and they were almost only men) were feared and often fell under suspicion. Nevertheless, they offered the possibility of taming this region and its powerful forces by examination, experimentation, and the application of education and piety. Others, less learned and usually female, would also use these powers. However, their access to these powers differed dramatically. They did not gain entry into this realm by means of knowledge and piety but by seduction, delusion, and the renunciation of true religion for demonic worship. They were not in control of the situation; rather they were in the thrall of Satan because they had entered into a pact with him to serve him in return for magical power.

BY WHAT MEANS DID AN INDIVIDUAL GAIN ACCESS TO THIS POWER?

Thus, one might access these dangerous and frightening powers by means of careful training and piety, or by

blasphemy. In both cases, the use of magical powers or witchcraft was ideally suited to terrify people. One could not immediately tell if an individual had been dabbling in such things. One could not tell if they were in control or being controlled. Of all the things besetting pre-modern Europe and its colonies, these unseen forces were the most terrifying. Even regarding the use of magical powers by a learned man, there was always the very real possibility that the magician had been duped or seduced into becoming a tool of Satan. The greater the seeming success of the magician, the greater the malevolence of the witch, the more likely it was that Satan was the true master. For the less learned practitioners, access to this power focused on some of the key fears of this world: the demonic pact, the Sabbat, and Satan. In ritualized gatherings (stereotypically mocking or inverting normative Christian religious rites) the witches worshipped Satan, renounced Jesus, engaged in frenzied and immoral acts (such as sex with demons and cannibalism), pledged themselves to the Devil and evil deeds, and, in the end, submitted to (often sodomitical) sex with Satan and kissed his anus. This horrific gathering combined every fear and broke every taboo. It both disgusted and terrified—and, it has to be said, fascinated. The true evilness and fearfulness of a witch was evident not so much in the malevolent acts perpetrated by the witch but by the witch’s participation in these vile congregations. The fear of the Sabbat and concourse with Satan was both the fear of true unbridled evil and the horror of seeing evil run rampant.

HOW WAS THE POWER BEING USED?

A constant source of fear and anxiety was the inability to know with certainty where, when, or how magical powers were being employed. Every chance disaster or calamity might be a symptom of the use of magic or signal the presence of a witch. A passing glance, a muttered oath, or a sour relationship might involve the use of magic and witchcraft. The more annoying or disturbing an individual, the greater the possibility that his or (more often) her neighbors might suspect witchcraft. Most frightening of all, there was no real way to know that magic and witchcraft were being employed until it was too late, or without recourse to another practitioner of the same terrifying arts.

HOW MIGHT ONE GUARD AGAINST THOSE USING THESE POWERS?

Inevitably, the best defense was to denounce a suspected witch and to allow the courts to deal with the person. This was relatively infrequent and often ineffective. Many people were acquitted, or refused to leave if ordered banished. However, there is every reason to assume that the intervention of the state put the accused (and his or her behavior) on notice and greatly reduced fear in the specific community by showing that something was being

done. Over time, public authorities came to the conclusion that no conviction was legally justifiable. Once the state stopped being involved, prosecutions ceased though the belief in witches and magicians, and the fear of them, did not (nor has it). In effect, the unseen, underground danger that caused so much fear and panic had been joined in the realm of the largely unseen and underground by the fear of it.

What then did these societies and cultures really fear? The great dangers were not the obvious ones like war, famine, or disease. These were chronic, but could be dealt with (albeit with little actual success) by positive action. Real danger came from the unseen and the secret. Groups that met apart (Jews, Anabaptists, English Recusants) could be suspected of anything (cannibalism, sedition, sexual deviance). Individuals on the margin of society, individuals who seemed at odds with all their neighbors, the malevolent and mean-spirited, and the disturbed, were viewed as inherently suspicious and their every action and word open to multiple misinterpretations. Fear came from the unseen, the secret, and the magical.

FEMALE WITCHES

The significance of witchcraft in the history of European and American women lies in the fact that

between 1570 and 1680 the overwhelming majority of those executed were women, some 71–92 percent (Monter 1977, 132). Witchcraft was the most important capital crime for women in early modern Europe. More women were executed for this alleged offense than for all other crimes put together. Estimates of the number of people accused and executed for witchcraft have been vastly reduced from earlier estimates, such as the ludicrous figure of nine million. Even Brian Levack's much smaller estimate of 110,000 witchcraft trials and some 60,000 executions (Levack 1995, 24–25) has been further cut by a third. Because many judicial records have been destroyed or are missing for much of western, southern, and eastern Europe, it is impossible to arrive at exact figures. Monter (2002, 13) estimates that approximately 35,000 witches were executed, 29,000 of whom were women, while other historians assert the number of witches killed to be higher, but surely not above 50,000. The epicenter of European witch hunting lay in the Germanic core of the Holy Roman Empire, where it is estimated that between 20,000–25,000 executions occurred.

During the early modern period, the stereotype of the witch was significantly altered. Where previously witches had possessed their own magical powers, now they were entirely dependent on the Devil, and they congregated at obscene Sabbats, where they worshipped the Devil and engaged in perverse antisocial activities: promiscuous sexuality; obscene dancing; and cannibalism, especially of children. The witches' Sabbat did not exist in the Middle Ages; it was an invention of early modern demonologists. In the view of some historians, it represented an increased fear of disorder and a prurient fascination with female sexuality. Historians question how deeply this new, learned stereotype of the witch as the Devil's disciple penetrated into popular culture, where a witch was still primarily thought of as performing harmful magic (*maleficium*); but it is generally agreed that witchcraft trials and the publicity accompanying them spread the new stereotype.

Most historians agree that poor, middle-aged, widowed, or single women were most likely to be accused of witchcraft, although younger women charged with sexual crimes (fornication, adultery, abortion, infanticide) were also targeted. In New England, female heiresses without male kin were prominent among the accused. However, it is important to note that in some parts of Europe, such as in Estonia, Iceland, and Russia, the majority of indicted and executed witches were men.

The question why women were disproportionately targeted as witches only became an issue in the 1970s with the rise of feminism and the legitimization of women's studies in academia. Earlier historians from

Wallace Notestein to H. R. Trevor-Roper failed to see anything unusual in the fact that witches were primarily women, concluding that witches were either “failed” women beyond the age of reproduction or hysterical and sexually deprived. Even after the 1970s, major historians of witchcraft continued to ignore the issue of gender, attributing the increase in witchcraft prosecutions variously to religious conflict, the growth of the nation-state, demographic changes leading to an increased number of single women, community tensions, emerging capitalism, and changes in the judicial system. Alan Macfarlane rejected sexism as a factor in Essex witchcraft trials, although 92 percent of the accused were women. Keith Thomas also excluded gender as a factor on the grounds that women were as likely to accuse other women as men. Macfarlane and Thomas did, however, discuss the economic and social changes that led poor, old women to be marginalized and resented in an emerging capitalist economy.

Although H. C. Erik Midelfort did not think the sixteenth century was unusually misogynistic, he acknowledged misogyny as a factor in witch hunts, but wondered why “women seemed . . . to provoke” it (1972, 183).

By 1977 there had been a sea change in witchcraft studies. Most historians recognized gender and gender conflict as important factors in witch hunts. William Monter concluded that witch accusations were sex linked and part of a campaign to control women’s bodies and sexuality. In 1981 Midelfort reversed his position and acknowledged that early modern witch hunts were accompanied by “a burst of misogyny without parallel in Western history.” During the 1980s and 1990s more direct correlations were made between witch and woman hunting. A number of historians argued that because of their close connection with folk medicine, folk magic, and popular religion, women were particularly vulnerable to witchcraft accusations.

A Sicilian fairy cult, the *donas de fuera* (women from outside), offers an example of the popular religious and magical beliefs associated primarily with women and interpreted by the Inquisition as heretical and demonic. The *Malleus Maleficarum* (The Hammer of Witches, 1486) considered midwives particularly likely to be witches, although this connection is not borne out in actual trial records (Harley 1990). More recent evidence suggests, however, that women who cared for newborn children were vulnerable to witchcraft accusations because of high mortality rates combined with an unprecedented emphasis on motherhood (Roper 1994, chap. 9; Demos 1982).

A characteristic of newly emerging political regimes and religious authorities was their demand for a high level of control and conformity. Fear of disorder was a prevalent theme in early modern thought, and historians have recognized the special place that “disorderly” women (prostitutes; women without male supervision; scolds) played in witch hunts. For male authorities, chaste, obedient, and, most important, married women were synonymous with a strong well-ordered state, while disobedient, rebellious women were suspect witches. Legal systems were increasingly used to punish wayward behavior (especially sexual) as well as wayward thought, and in this regard it is significant that witchcraft first became a criminal offense in the early modern period.

This fear of disorder reflected the very real disorders in the early modern European world, where religious wars, plagues, famines, peasant rebellions, banditry, and vagabondage were endemic, and new ways of thinking threatened established systems of thought. The climate of fear engendered by political, social, and intellectual turmoil led many people to embrace a pessimistic form of apocalyptic millenarianism, in which the Devil assumed a position of unparalleled importance. “Devil books” became a new genre of literature in Germany during the second half of the sixteenth century, and witches gained new prominence as the Devil’s most faithful and obedient servants. Millenarian and apocalyptic thought encouraged a black and white view of the world and the demonization of one’s enemies. Stuart Clark (1997) provides numerous examples of the way in which notions of “contrariety” come to pervade early modern thought in all its branches—physics, natural magic, medicine, psychology, ethics, politics, and theology. In his view, the polarity between the genders was so firmly established in the early modern period that demonologists and witch theorists had no choice but to view witches as women. Consequently, witch theorists and demonologists were no more misogynist or prurient than their male contemporaries. This view is seconded by Stephens (2002): witch theorists were not women haters, but tormented skeptics trying to resolve the conflicts in Christian doctrine about the

benevolence of God, the existence of spirits and souls, and the efficacy of the sacraments.

Clark and Stephens represent a new phase of witchcraft scholarship that has come full circle, minimizing the importance of gender conflict. The fact that women accused other women has been taken as evidence that witchcraft accusations were strategies used by women for their own purposes. While these offer welcome correctives to the view of witches as passive victims, it is also important to recognize the ways that women internalized patriarchal values. It is equally important to consider evidence of increasing misogyny and sexual violence against women during the early modern period and the way witch hunts reflected both.

The sixteenth century has been seen as one of the most bitterly misogynistic periods in Western history. Literary and fictional discussions of obstreperous, disobedient wives and illustrations of women attacking and killing men proliferated. While historians have argued that Protestantism enhanced the position of women, others see this as a factor promoting witch hunts. By granting women responsibility for their own salvation, by emphasizing their importance as spiritual leaders in the home, and by making marriage the norm for everyone, Protestantism increased male anxieties and exacerbated gender conflict. The idea that Protestant attitudes toward women contributed to witch hunts is significant in light of research documenting the lenient treatment of witches by the inquisitions. This leniency has been attributed to the fact that Catholic authorities, all male, devalued women to such an extent that even witches posed no threat.

While gender conflict is generally acknowledged as one of many factors in generating witch hunts, its role in the decline of witchcraft prosecutions remains problematic. Carolyn Merchant offers the most sustained effort of gender analysis in this regard. She attributes the end of witch hunts to the emergence of a new patriarchal, hierarchical, and scientific social order, which reduced disorderly female nature to inanimate matter and robbed middle- and upper-class women of their independent economic roles. With both nature and women tamed, the climate of fear and uncertainty in which the witch hunts flourished declined. The problem with this analysis is that the mechanical philosophy was not accepted until after the decline of witch hunts had already begun. Moreover, it was possible to subscribe to the mechanical philosophy and still believe in witchcraft. Furthermore, a number of historians reject the idea that women’s economic roles changed radically in the late sixteenth and seventeenth centuries, suggesting that the decline was more gradual and began earlier.

A more persuasive argument for the decline of witch hunting is that it was the result of judicial skepticism. The acrimonious controversies of the Reformation and

Counter-Reformation period contributed to an increasingly critical attitude toward evidence and to the search for new methods of establishing truth. Judges and lawyers exhibited a growing concern with the credibility of witnesses and the probability of events. Judges did not stop hunting witches out of disbelief but because they no longer knew where to find them (Midelfort 1972, 6). At a certain point—a point usually reached whenever men became a significant portion of accused witches—the excessive nature of the witch hunts made magistrates and judges have second thoughts.

Although an analysis of the witch hunts in terms of gender cannot by itself answer the question of why witch hunts proliferated in the early modern period or why they ended, it has contributed significantly to a vastly more nuanced and comprehensive understanding of women's history in the early modern period.

FEMINISM

Feminism has done much to put the study of witchcraft in all ages on the historical agenda, and some of the finest work on witchcraft comes from feminist scholars. And yet some feminist scholars have fulfilled the worst apprehensions of their opponents by insisting on elevating political polemic over historical scholarship.

Feminism is not a single monolithic entity, but encompasses a diverse set of positions and ideas. A certain strand of feminism has unfortunately been responsible for systematically misleading and confusing the public on the subject of witchcraft. In English, this misguided narrative began with the American suffragette Matilda Joslyn Gage, who made the absurdly overinflated claim that 13 million women had died in the era of witchcraft persecution (a more plausible figure—including thousands of men—is somewhere between 35,000 and 50,000). Later feminists, particularly from the strand called radical feminism, identified strongly with the figure of the witch.

They were not the first people to use the witch politically. The witch/enchantress/sorceress had at first been glamorized by the combined efforts of Romantic and Pre-Raphaelite artists, who equated witchcraft and magic with sexual knowledge. They were the first to suggest that witches were in search of sexual gratification, and the witch/sorceress herself became eroticized. Later, poets and writers of the 1940s and 1950s, particularly Arthur Miller, used the Salem witchcraft trials as a metaphor for McCarthyism and hence for illiberal repression. Because everyone could agree that only silly superstitious persons could possibly believe in magic, the witchcraft prosecutions became a handy and very obvious metaphor for moral panic, false accusation, and injustice. Stigmatizing the persecutors of witchcraft as unnatural and even lunatic gave a comforting boost to modern self-esteem; it told a story of "our enlightenment" versus "their backwardness" that deformed attempts to understand exactly why the prosecutions had taken place at all. Instead, mainstream historians and amateurs sought bizarre explanations (such as the use of hallucinogenic drugs, ergotism, collective madness) to explain beliefs that had simply become symbols for all that was bad about the past. This could be generalized and often became an attack on organized religion, and particularly on the Roman Catholic Church, which was often said to be behind the prosecutions on the strength largely of the *Malleus Maleficarum* (The

Hammer of Witches, 1486), which also stood for what was seen as an unacceptably superstitious past.

Women writers eagerly and uncritically accepted this almost entirely male creation of the witch as victim, and embraced it as a political and personal symbol. Anne Sexton began her personal appearances with an impassioned reading of a poem about herself as a witch flying sensually through the night. For Sexton, and for her contemporaries Sylvia Plath and Adrienne Rich, the witch represented untamed female sexuality, and hence, they assumed that the witchcraft prosecutions were aimed at controlling that sexual expression. This involved some complicity with less obviously protofeminist representations of witches' sexuality. Liberal representations of witches as sexual beings constrained by patriarchy were prone to collapse into the pornotrooping, the reduction to flesh, of witches as young, beautiful, and objects of desire by their interrogators in fiction and films such as *Witchfinder General* (1968) and *The Devils* (1970). Yet fundamentally the same narrative was adopted by Barbara Ehrenreich and Deirdre English, who in 1974, at the height of radical feminism, argued that witches had been single, free-living midwives and herbalists disliked by the male medical profession for their knowledge of women's bodies. Their ideas were taken up by the Dianic or feminist pagan movement, which borrowed from Margaret Murray the notion that witches were pagans persecuted for their beliefs, and coupled that with the feminist narrative to create a composite figure of the witch as a sexual and empowered single or lesbian woman disliked by puritanical Christians and persecuted by the Church. A key figure among many in inscribing and promulgating this narrative was the witch Starhawk, whose literary ability made it very seductive to many women in and outside feminism. Marion Bradley absorbed her work in her rewriting of Arthurian legend as a story of Dianic witchcraft, *The Mists of Avalon*. There was never very much evidence to support any part of this narrative, and there is much evidence against it, but it continues to inspire reams of genre fiction for children and adults.

Because witchcraft was tarnished by contact with such popular and inaccurate histories, and because early academic feminist history tended to focus on nineteenth- and twentieth-century women, academic feminist historians neglected the witchcraft trials for some time. This meant that many accepted the explanation proposed by Keith Thomas and Alan Macfarlane for the witchcraft prosecutions, an explanation that did not address gender at all, but explained the witch figure in terms of class. This theory fitted well with early academic feminist historians' Marxist leanings, and spared them the embarrassment of engagement with what could be seen as a lunatic fringe of victims and madmen. However, as the place of feminist history within the discipline became more secure, feminist historians

felt able to risk tackling witchcraft, and the result has been a new burst of creative and important interpretations that take gender fully into account without embracing witches as naively as earlier popular feminist histories. More mature and sophisticated feminist work has sought to address the question of the gender of the witch in a nuanced and carefully conceptualized fashion, focusing especially on the question of why most witches in most areas were women, particularly in England. Some seek answers primarily in anxieties generated by the perceptions of the female body while others see the primary cause in women's relative powerlessness both socially and in the legal system. Still others stress psychoanalytic factors, especially the strains of motherhood and the relations between mistresses and servants, mothers and children. Recent feminist work has placed considerable emphasis on the fact that most *accusers* as well as the accused, were female. And, feminist scholars have been among those pointing out the relative neglect of the male witch-figure in historical accounts of the causes of witchcraft beliefs. There has been a fruitful dialogue between historians and literary critics in this area, with literary critics contributing the possibility that witchcraft was women's business because it ultimately came, and was perceived to come, from folklore and storytelling, which were primarily women's realms. Some of the best work of this kind has drawn, –judiciously, –on psychoanalysis as a theory of how the irrational desires of human beings come to permeate their acts and beliefs.

Feminists were drawn to the material because it appeared to contain so many women's stories. Now they have been among the first to discuss pamphlets and trial records as historical texts, and emphasize how difficult it is to reconstruct real people from such texts. They also began to call into question assumptions about the gender of witches by researching male witches. This indicates how very far feminist histories of witchcraft have come since the rather simpleminded tales of "gynocide" once in circulation. Male historians too are now much more interested in, and aware of, gender dynamics in witchcraft trials.

FERDINAND II, HOLY ROMAN EMPEROR (1578–1637, RULED 1619–1637)

During Ferdinand's reign, more witches were burned in the Holy Roman Empire than anywhere else in Europe at any time. Although the Thirty Years' War (1618–1648) had started during the reign of his predecessor Emperor Mathias (1557–1619, ruled 1612–1618), Ferdinand II set the stage for this first pan-European War, which eventually involved all major continental powers from Spain to Sweden, turning central Europe into an international battleground. The main reason for this escalation was Ferdinand's distinctive Catholic agenda and his readiness to overturn the privileges of the Estates of Austria and Bohemia. In particular, the scene was set with his later bold attempt of 1629 to re-Catholicize every ecclesiastical territory alienated by Protestant princes since 1555 in the Holy Roman Empire by decreeing the Edict of Restitution. Whereas foreign powers like England, the northern Netherlands, or France had been involved only indirectly in the first decade of the war, this deadly threat to Protestantism provoked the Swedish invasion, and subsequently French and Spanish intervention in Germany. At about the same time, the witchcraft persecutions climaxed.

Ferdinand, the son of Archduke Charles of Inner Austria (1540–1590) and his wife Maria of Bavaria (1551–1608), was born in 1578 at Graz in Styria. At the time of his birth—during the rule of his cousin, Emperor Rudolf II—he seemed unlikely to ever inherit anything other than a small part of Habsburg, Austria; his father's lands comprised roughly modern Slovenia plus the Austrian lands of Styria and Carinthia. From 1590 to 1595, Ferdinand was educated together with his Bavarian cousins, the future dukes Maximilian and Ferdinand, at the University of Ingolstadt, then dominated by two Jesuits, Gregory of Valencia and Jacob Gretser. The Jesuits at Ingolstadt introduced Ferdinand to witchcraft trials in 1590–1591, as they did his cousin Maximilian. After becoming archduke of Inner Austria in 1596, Ferdinand was the first Austrian ruler to introduce a rigid Counter-Reformation regime. In violation of his state's constitutions, all Protestants (including such celebrities as the astronomer Johannes Kepler) were exiled, while the internationally renowned demonologist Martín Del Rio became the most famous member of the Jesuit College at Ferdinand's capital in

Graz, which ran the recently founded university. Only because three of his cousins—emperors Rudolf, Mathias, and Archduke Maximilian—lacked legitimate sons (whether by coincidence or as a consequence of their rigid Counter-Reformation morals), Ferdinand was first elected king of Bohemia in June 1617, then king of Hungary in May 1618, and finally Holy Roman emperor in August 1619. After Ferdinand flagrantly violated the liberties of the Bohemian Estates in 1618, the estates decided to review their decision and elected instead the Calvinist prince-elect of the Palatinate, Frederick V, the son-in-law of King James I of England. Aided by the Catholic League headed by Duke Maximilian I of Bavaria, whose sister Maria Anna (1574–1622) had married Ferdinand, the new emperor crushed the Protestant armies in 1619 at the Battle at the White Mountain near Prague and soon introduced a rigid Counter-Reformation in Bohemia as well.

Despite Ferdinand's obvious zeal and inclination toward radical solutions, there is no evidence that he ever promoted witch hunts, either in Austria, Bohemia, or in the Holy Roman Empire. As they had under his Habsburg predecessors in Austria, Bohemia, or Hungary, the number of recorded witchcraft trials remained low throughout Ferdinand's territories, and the number of burnings even lower. Almost inevitably, there were a number of such trials; but since his vast estates, kingdoms, archduchies, duchies, earldoms, and lordships were only loosely connected and by no means comparable to a modern state with a central administration, it is impossible to argue that this suzerain stimulated any such persecutions.

Meanwhile, however, witchcraft persecutions climaxed in the Holy Roman Empire in the late 1620s outside the emperor's own territories. Many suspects and relatives of imprisoned "witches" fled to Prague and Vienna, the emperor's capitals, particularly from the Franconian prince-bishoprics, to rally support for their cause. There are no signs either that Emperor Ferdinand was interested in their cries for help, or that he discouraged imperial institutions from acting on their behalf. He may have learned through his second wife, Eleonora Gonzaga, princess of Mantua, that the Roman Inquisition was not interested in burning witches. The emperor's Jesuit confessor, William Lamormaini, was apparently disgusted by the persecutions, and several other imperial advisers and lawyers were embarrassed by the involvement of Catholic prince-bishops in such activities. The *Reichskammergericht* (imperial chamber court) intervened in a number of prominent cases (e.g., Burckhardt, Cramer, Haan, Henot, Mahler) and threatened the worst persecutors, the prince-bishops of Bamberg, Cologne, and Würzburg, with sanctions if they failed to stop their witch hunts. The emperor neither supported nor prevented these interventions, and

may have appeared to his subjects as an *Imperator absconditus* (a “hidden emperor,” comparable to the seventeenth-century French philosopher Blaise Pascal’s hidden God, whose silence was frightening).

FERDINAND OF COLOGNE (WITTELSBACH, 1577–1650)

Under Ferdinand’s rule as archbishop and elector of Cologne, more than 2,000 people were executed for witchcraft, but, while there is no doubt about his stern and rigid attitude toward witchcraft, Ferdinand’s degree of personal responsibility for the persecution of witches in his various lands is still debated. Ferdinand governed a group of ecclesiastical principalities in the northwestern Holy Roman Empire, some for more than fifty years. Besides the electorate of Cologne, his territories included the prince-bishoprics of Liège, Münster, Paderborn, and Hildesheim.

Ferdinand of Wittelsbach was born on October 7, 1577, the second son of Wilhelm V, Duke of Bavaria, and his wife, Elisabeth Renate. It was common practice that the younger sons of the duke pursued an ecclesiastical career. So Ferdinand received benefices in several cathedrals from the age of seven. From his childhood onward, he was very pious, and it seems that he never resisted his fate to become a churchman.

Ferdinand’s first encounter with the doctrine of witchcraft came in his school days. In 1589, at age twelve, he was sent to the Jesuit university in Ingolstadt, together with his elder brother Maximilian, the future duke of Bavaria, and his younger brother Philipp. His professor and tutor, the Jesuit theologian Gregory of Valencia, was a relentless proponent of witch persecutions who once brought Maximilian with him to watch the torture of an accused witch. Maximilian was so

impressed that, in 1591, when still a student, he participated in organizing witchcraft trials at Ingolstadt. Doubtlessly, Gregory of Valencia had a considerable influence on young Ferdinand.

At age eighteen, Ferdinand was elected coadjutor for his uncle Ernst of Wittelsbach, the archbishop of Cologne. Because of many other commitments, his uncle could not fulfill the requirements of his office as archbishop and secular ruler. After the war of Cologne (1583–1589), a religious conflict won for the Catholic side by Bavarian troops, the house of Wittelsbach had established de facto hegemony in the electorate of Cologne. Officially, Ernst remained archbishop until his death in 1612, but in reality his young nephew Ferdinand governed the electorate of Cologne. Operating at first under the strict control of his father, the duke of Bavaria, and of the papal nuncio in Cologne, Ferdinand tried to establish Tridentine reforms in his archdiocese, as well as in all the other prince-bishoprics that he soon acquired. Most of his actions in his fifty-five years of rule can only be understood in light of his deep Catholic faith and equally deep concern for its renewal and reformation. He maintained a strict anti-Protestant policy in all his territories and a firm control over all religious institutions.

The first years of Ferdinand’s government in the electorate of Cologne saw few witchcraft trials. The Court Council of Cologne, the highest governmental office of the electorate, was skeptical of the crime of witchcraft and tended to refuse petitions to prosecute witches, while Ferdinand’s attention was concentrated on Catholic reform and on restoring the finances that had been shattered by the war of Cologne.

In 1604, Ferdinand received a request from Bavaria to report about legislation and jurisdiction in cases of witchcraft accusations in the electorate. This request apparently provided the impetus for the coadjutor to require the Court Council of Cologne to formulate rules of procedure for witchcraft trials in the electorate of Cologne. But, for reasons that are not yet clear, the council took three years to promulgate a witchcraft criminal procedure. The 1607 Cologne witchcraft trial regulations, based on Emperor Charles V’s criminal code (the *Constitutio Criminalis Carolina*, or Carolina Code) of 1532, denied the *crimen exceptum* (the excepted crime) theory and allowed torture only in the case of clear evidence of *maleficium* (harmful magic). Because such evidence was hard to find, two clauses were added: one was the identification of a person by a convicted witch (*Besagung*); the other was a Devil’s mark, found by pricking the suspect’s skin with a needle. A peculiarity of this procedure was that all local courts of justice were required to employ an impartial lawyer, called “witch commissioner,” whenever a witchcraft case exceeded its legal knowledge. The edict of 1607 was never printed, which helps explain why no great wave

of witchcraft trials followed the edict's promulgation. Ferdinand's influence on its formulation is uncertain. But it is certain that his attitude toward witchcraft had not changed from his early days as a student or as coadjutor after he succeeded his uncle Ernst as archbishop and elector in 1612, and in all the other prince-bishoprics that Ernst had held. But witchcraft trials in Ferdinand's territories remained unsystematic and rare.

In 1626, a great persecution wave started, which would cost hundreds of lives within six years. According to Gerhard Schormann (1991), Elector Ferdinand initiated the whole extirpation program by sending witch commissioners to the small towns and villages of his electorate for a systematic eradication of anyone suspected of witchcraft. Although there is no doubt that Ferdinand truly believed in the danger emanating from the witches, there is no demonstrable proof for any such program. It is more likely that Ferdinand did not initiate the great persecution wave of 1626–1632, but merely reacted to already ongoing persecutions. In 1628, complaints from the family members of condemned witches led to an order (copying the example of the electorate of Mainz), by which, after deducting the children's inheritance, only half of the remaining property of a condemned witch was to be confiscated to cover expenses for trial and execution. The witchcraft criminal procedure of 1607 was renewed and promulgated together with this confiscation order. Neither suggests an extirpation program by Ferdinand.

Unsurprisingly, given his background, Ferdinand took great interest in the process of juridical prosecution between 1629 and 1631. But afterward, we find a more cautious judgment in his deeds and thoughts. This might owe something to the appearance of Friedrich Spee's *Cautio Criminalis* (A Warning on Criminal Justice) in 1631, but it might also owe something to the fact that in the imperial city of Cologne, a certain Christina Plum accused Ferdinand of being a sorcerer. When the city council of Cologne tried to end its persecution wave with her execution in 1630, Ferdinand demanded to see the denunciations of other witches burned with her.

In the years following, smaller persecution waves or isolated witchcraft trials occurred in parts of the electorate of Cologne, but the huge numbers of victims (approximately 2,000) between 1626 and 1632 was never reached again. Wherever a witchcraft trial was initiated, Ferdinand did not try to stop it. But when, as in the prince-bishopric of Liège or the *Vest* Recklinghausen, the local interest of a territory or the mentality of the local judges and courts did not lead to a prosecution, Ferdinand accepted the attitude of the local authorities.

Ferdinand's attitude toward witchcraft never changed, but the apparent ambivalence of his deeds

shows that he did not initiate the witch persecutions in his territories but rather reacted to them. Claims about his attitude toward witchcraft diverge. But this is typical of Ferdinand, because similar contradictions can be found in his most important concerns, the repression of Protestantism and the reformation of the Catholic Church.

FERRER, DOMINGA ("LA COJA")

An inhabitant of Pozán de Vero (Huesca), a village in the Aragonese Pyrenees, Ferrer was tried for witchcraft by both secular and inquisitorial courts in 1534 and 1535, respectively. Her fate exemplifies what happened to many other women from rural environments who were condemned to death throughout the sixteenth and seventeenth centuries by secular judges under the remarkably informal criminal procedures of the kingdom of Aragón. However, the inquisitorial documentation we possess (which includes both her previous secular trial and the extralegal statutes that provoked it) represents an extremely important source for Aragonese witchcraft. First, hers was the last known death sentence for witchcraft ever carried out by the Inquisition in Aragón. Second, the documentation describes her different interrogations under torture with unique precision and fidelity. This document provides our only clear evidence from Aragón where a witch confessed to having killed both people and animals as an accomplice of the Devil.

Once the prosecutor's petition was read, accusing Dominga of being an "evildoer, witch, and sorceress," she was stripped and submitted to a visual inspection (*ocularis inspectio*) to discover any marks made by the

Devil after concluding a pact with her. After inspecting the defendant, the local representatives of justice concluded that Dominga had three marks “like the track of a cat’s paw” in different parts of her body (right arm and knee, and left leg). The fact that she had no hair under her arms and that her skin there was “of a color like dark violet” was also considered suspicious. Finally, the judge ordered to test “whether or not tears come from [her] eyes . . . when she pretends to cry”; subsequently, it was cautiously noted that “no tear seems to come forth from her eyes” (Tausiet 2000, 224–225).

In view of Dominga’s refusal to confess to any of the crimes of which she was accused (principally the deaths of people and livestock), the judge decided to submit her to torture. Customary Aragonese law explicitly prohibited torture, and judges could not instigate trials without a formal accusation from a particular person. Nevertheless, Aragón permitted *desaforamientos* (i.e., juridical suspensions of ordinary procedure) for crimes considered exceptional, including witchcraft. In such instances, judges could order torture even without clear proof of any crime. A startled Dominga stood up and exclaimed, “How can it be that matters have gone this far, without anything having been proved!”

Before the torture began, Dominga was shown the *garrucha* (the strappado, whereby the victim would be suspended by a pulley, with a rope tying her wrists with her arms behind her back) to see whether she could be frightened into confessing some of the deaths attributed to her. This she did; but because she refused to admit that she was a witch and had made a pact with the Devil, she was then suspended from the *garrucha* with a stone tied to her feet. When she refused to confess everything the judges wanted, she was taken down. Then, as in an exorcism, her scalp was shaved, she was given holy water to drink, more holy water was sprinkled on her head, and she was given a clean shirt before being put once again on the *garrucha*. This time Dominga confessed everything the judges wanted: she belonged to a company of witches who, after smearing their armpits with certain ointments and riding on vine shoots, flew regularly to celebrate their Sabbat “in the vicinity of Tolosa” (i.e., Toulouse, in southern France) (Tausiet 2000, 226).

Certain of Dominga’s willingness to confess anything that the tribunal wanted to hear, the judge ordered her untied, dressed, and led to another room, where she could sit and warm herself by the fire. There her interrogation and confessions continued. Although everything Dominga subsequently said was conditioned by fear of renewed torture, her affirmations were now legally “outside torture” (*confessio ex tortura*).

Guided by the judge’s questions, Dominga’s descriptions fit closely with the demonological stereotypes common in northern Spain. The Devil resembled a man with horns; whenever somebody new attended the

witches’ gatherings, the person was presented before Satan as a vassal and the newcomer paid homage by kissing Satan’s anus. In her case, this act was completed by fornicating with the Devil, who took her and mounted her. The judge insisted upon asking her about the Devil’s virile member; she responded that it was “made of iron and very sharp” and that around the middle there was a palm with four fingers (Tausiet 2000, 227).

Despite such detailed confessions, however, and repeated pressure from the judge, Dominga still refused to admit that she had apostatized from God and taken the Devil as her lord, as the judges charged. At one point, she apparently lost her voice, so she was sprinkled with holy water and given holy water to drink. After this ceremony, Dominga began confessing that she had apostatized from God, and had trampled “a cross on the ground, in contempt for the Catholic faith.” After she named various accomplices, her judges continued her purgative ordeals; Dominga now began to acknowledge every accusation that had been formulated against her. By her own confessions, she had killed four or five goats, a woman, four infants and a two-year-old girl. Although her case was transferred to the Inquisition (which spared the lives of many other women convicted of witchcraft by Aragonese secular justice), next year the Holy Office ordered Dominga *la Coja* (“the Lame”) to be “relegated to the secular arm,” that is, given capital punishment (Tausiet 2000, 230).

FERTILITY CULTS

In the narrow sense, *fertility cults* is a term used by recent historical anthropological research to describe the rites (supposedly legacies of European shamanism) performed by fertility magicians to attain a state of trance. In a wider sense, it applies to any magical or religious rituals of traditional agricultural societies intended to ensure vegetative fertility.

CHANGE-OF-SEASON RITES

Since James Frazer, several anthropologists, folklorists, and historians of religion have associated various European agricultural rites with cults of dying and

reviving deities (e.g., the cults of Osiris, Adonis, and Demeter) presumably imported from the eastern Mediterranean region during the Hellenistic age.

These cults and myths associated the (re)birth of deities at the start of the agricultural year with the emergence of new vegetation from the underworld. Such change-of-season rites preserve traces of the cults of Hellenistic deities within a Christianized medium; for example, the widespread tradition in central and southern Europe of “Lucy’s wheat” (made to sprout in a dish during the period between Christmas and St. Lucia’s day and placed on the Christmas table) supposedly relates to Adonis’s garden. The growth of the sprouts forecasts the fertility and harvest of the coming year. Some scholars emphasize customs depicting the struggle of winter and spring, especially the carrying out of winter and bringing in the spring, which symbolically destroy winter, death, illnesses, or the old year: for example, the German *Todaustragen*, Polish, Czech, Moravian, and Slovakian *morena* and related forms; in the Hungarian *télkihordás*, usually held on the third Sunday before Easter, or on Palm Sunday, a decorated stick or straw man is removed from the village in a chanting procession before being thrown into the water or burned. Other rites symbolizing the struggle between the old and the new year through a ritual battle between two masked teams, or dramas of death and resurrection performed at the beginning of the agricultural year or during carnival (Serbian, Greek, Bulgarian *kukeri*, *kalandai*, *koledari*, Hungarian *borica*) also come under this heading.

WELCOMING RITES OF FERTILITY MAGIC OR PROCURING BLISS

Almost everywhere in Europe, at some time between the winter solstice and Carnival, groups of masked marchers disguised as demons, dead people, or animals engaged in fertility magic or expressed wishes for a good harvest and fertility. In most territories of the Latin Church, Carnival was the usual date for such rituals, while in Orthodox eastern Europe such rituals were ordinarily held around the winter solstice. Besides the dead or demons who supposedly bring fertility, masks depicting such animals as goats, bears, horses, or deer figure frequently. Groups of players, going from house to house, often performed magical rites specifically promoting the fertility of cereal crops (among the Rutens, Bulgarians, Romanians, or Hungarians) scattering grains in a farmer’s courtyard or ritually pulling the plough.

Spring or early summer rites of carrying a green branch, widespread throughout Europe, celebrate the birth of the new vegetation and symbolize the fertility of the coming harvest. The custom of erecting a decorated tree on May Day or at midsummer is well known, as is lighting a fire during the summer solstice, thereby

connecting the course of the sun with vegetable and animal fertility. The fertility aspect of lighting fires at the time of the winter solstice seems particularly clear in the rites of the Christmas log in the Balkans and in central Europe, which sometimes involves primitive methods of striking a fire and is often performed by the first male visitor of the new year.

RAIN MAGIC

Fertility rites connected with dew or water also occur throughout Europe, particularly around a spring or summer festival. Some rites of rain magic involve collecting dew or immersing in water on Whitsun or May Day, on St. John’s day, or on the day of the Russian Ivan “the Bathing” (*Ivan Kupala*). These rites are to ensure that rain brings fertility by collecting dew from other people’s land (the pasture of the neighboring village) or by bathing naked in lakes or rivers (which occasionally provoked orgiastic parties in some places in the Balkans).

DEATH SACRIFICES

Archaic images of the dead who support or protect living people abound in European mythologies: the dead return at the beginning of the year during special festivities and secure the well-being of the community in return for sacrificial offerings. Traces of such cults include offerings made at festivals surrounding the winter solstice (according to the Julian and Gregorian calendars: at St. Lucia’s day or in the period between Christmas and Twelfth Night) to the dead who visit at this time, to the unbaptized demons, or to non-Christian supernatural beings leading the host of the dead that survive in the mythology of several peoples (*Lucia/Luca* in central Europe, south-German and Austrian *Perchta*, Slovenian *Pehtra Baba*) and were often impersonated in masked rites. The dead presumably secured health, fertility, and prosperity for the coming year in return for sacrificial offerings of food (in the Balkans, bread-cakes put on the roof; in central Europe, the *lucapogácsa* or St. Lucy’s scone; in South Germany and Austria, *Perchtmilch* was offered; in northern and central Europe, food was put on the table for the dead during the night before Christmas). On these same festive days, all European peoples consumed foods suitable for fertility magic (grain meal, cabbage, pork, lentils, etc.) and baked symbolic sweet breads that could also be used for fertility magic or carrying out divination about the coming harvest, love, or death (e.g., St. Lucy’s scone, *Perchtmilch*, or poppy seed Christmas pasta). Certain features of the “good dead” survive in the fairy mythology of a death-related character in areas from the Balkans to Ireland or Scandinavia even in very recent times (e.g., Bulgarian and Serbian beliefs about fairies who appear in the spring and bring fertility.)

EUROPEAN SHAMANISM

The rites of so-called shamanistic magicians represent a special branch of European fertility cults. These rites may be connected to the cult of the “good dead,” the good fairies who guarantee agricultural fertility, Christian mythological beings, or the deities and demons of pre-Christian mythologies. Basic to these rituals are techniques of going into a trance and the related notion of the soul separating from the body. In other words, magicians use their ability for trance to fight soul battles in the other world in the interest of their own community. Shamanistic magicians were active in various parts of early modern Europe, and in some areas of central and southeastern Europe to the twentieth century. To ensure good weather and sufficient rain, and to avert hailstorms, shamans fought otherworldly battles against hostile demons. Similar to the Slavic types of magicians (South Slavic *kresnik*, *stuha*, *zduhaè*, *zmej*, western Slavic *chmurnik*, *p³anetnyk*) were the Italian *benandanti* in seventeenth-century Friuli and the Hungarian *táltos*.

A European agricultural shamanism was tied to agricultural cycles, while some features show a similarity to the myths and rites of deities that die and are resurrected. One type of agricultural shaman (usually male) was a weather magician who fought battles of the soul in the otherworld for good harvests and weather. This battling type was the classic perpetrator of the fertility cult. Magicians who were more predominantly female were initiated by groups of the dead or by goddesses of death and were usually involved in healing, clairvoyance, or treasure seeking. Each type of weather magician had a different guardian or calling spirit (good dead, storm demons, storm dragons, heavenly fiery eagle, such as the Hungarian *táltos*, Bulgarian *zmei*, Serbian and Croatian *stuh/zduhaè*, western Slavic *chmurnik*, *p³anetnyk*), the fairy queen, werewolf demons, well-intentioned dead, or werewolves who support their clan (Slovenian and Croatian *kresnik*, Hungarian *táltos*, another type of the *stuh/zduhaè*). Saint Elijah, angels, the Christian creator god, and Jesus appeared as “Christianized” guardian spirits. Another group of calling or initiating spirits was the demonic werewolf (who also took the shape of a dog, wild boar, snake, or dragon). This notion hints at the clear werewolf character of certain types of magicians, confirmed by magicians’ birth traits and marks. These magicians were often born from an animal ancestor (e.g., the Bulgarian *zmei* or certain types of the Hungarian *táltos* descend from an eagle, snake, or dragon father), and with animal traits (tail, wing, tooth, in snakeskin, as a snake, or with bristles, etc.). These werewolf magicians were believed to fight in the otherworld in an animal form corresponding to that of their calling animal spirit and to their birth traits (e.g., wild boar, eagle, dragon, snake, bull). In the otherworld, in the case of some Bulgarian and

Serbian types, the magicians’ guardian spirits were thought to fight alongside them.

It was also a common belief that magicians born in a caul possessed werewolf qualities (*benandanti*, Livonian magicians, *kresnik/krsnik*, one type of *zduhaè*). The caul seemed to play the same role as the “second skin” did in the werewolf’s ability to enter a trance. The enemies to be overcome in the soul battles included the dead who had snatched the grain or the rain, storm demons who brought hailstorms, and the storm dragon or the magic soul of the neighboring “foreign” tribe. The aim of the battles was to bring back the grain that had been carried to hell or to a cave in the underworld or to vanquish the storm souls or storm dragon and thus send away the hailstorm. The battles took place in the archaic otherworld of the storm clouds, accompanied by lightening, thunder, and other meteorological phenomena. *Stuhas* were thought to tear out huge trees during these battles in cooperation with the wind souls, and used these trees as weapons. *Zmei* took the form of fiery eagles or dragons and fired arrows of lightening at the demons bringing hailstorms. These usually tumultuous battles to retrieve the grain (e.g., featuring certain types of *zduhaè*, *táltos*, as well as the *benandanti* and Livonian magicians) took place during festivities at the start of the year or at the change of seasons (St. Lucia, Christmas, Whitsun, St. George’s Day, Midsummer) when other rites aiming to assure the harvest or the rain were as common as sacrificial death rites for fertility. Farming and household tools (baking shovel, coal drag, field broom, scythe, etc.) were used in these battles.

Certain types of shamanistic magicians were recorded as still active in the early twentieth century (particularly in Serbia and Bulgaria). These retained their important communal function in securing agricultural fertility: those Serbian villages that still had a *zduhaè* considered themselves lucky. At a storm’s approach, they would retreat to a quiet nook, fall into a spontaneous trance, and at the end of the storm awake, exhausted by the battle of souls.

FÉRY, JEANNE (1584)

Jeanne Féry was a demonically possessed nun, at Monsen-Hainaut in the Catholic Low Countries.

Jeanne Féry was a *Soeurs Noires* (*Black Sisters*) nun of twenty-five, whose demons, we are told, promised her great gifts, but tormented her when she tried to withdraw from them. Her story was recounted in the *Histoire admirable et véritable des choses advenues a l'endroit d'une Religieuse* (*Admirable and True History of the Things Which Happened to a Nun*), a book proclaiming the efficacy of Catholic ritual healing. This case later attracted medical commentary in the nineteenth century from a colleague of Jean-Martin Charcot (Bourneville 1886), confidently describing the pathology he saw Féry as having experienced.

The *Histoire admirable* traced Féry's afflictions between April 1584 and May 1585, starting with her first visit to the archbishop of Cambrai, Loys de Berlaymont, who oversaw her spiritual and medical treatment. While under his care, Féry was subjected by demons to violent wailing and writhing, and to actual and attempted self-harm. At one point, she (through her demon) lashed out at the archbishop and she showed a tendency (diagnosed as diabolical) to dispute points of Church doctrine. Together with several other senior ecclesiastics, including the book's author, archdeacon François Buisseret, the archbishop supervised a period of intense engagement with Féry, including medical examination and treatments, physical

removal to the archbishop's residence, and searches for spiritual remedies including St. Gregory's water (into which Féry's head was plunged until she emerged spluttering), and the Eucharist. Féry was also put in solitary confinement. Buisseret's book emphasizes the great malice of demons, the many divine remedies for their attacks, and God's great mercy and providence. Its publication in Paris in 1586 coincided with the height of the French Wars of Religion, when Catholic zealots used rituals to maintain morale and win converts.

In this era, possessed women fascinated many senior churchmen, but Féry seems to have been an unusually compelling figure. Her story is underpinned by an acute sense of pathos: she reportedly gave herself to devils at age four in order not to feel the beatings she underwent at home. Much of the narrative depicts ecclesiastics substituting for her family: one exorcist became her "father," and the archbishop agreed to be her "grandfather." Féry appears to have received careful attention partly because a relative was Mother Superior of her convent.

For modern readers, Féry elicits more sympathy than many other possessed people. Her story features no scandalous accusations of witchcraft pursuing an execution; responsibility for her condition falls primarily on her father's neglect and abuse. The portrait of her family, while it reads compellingly, given modern awareness of child abuse, cannot necessarily be taken at face value: Church narratives at this time frequently emphasized the failure of the family unit in order to make convent life seem preferable. Yet the validity of such a claim by the Church was moot: religious vows could call for an especially austere lifestyle. The actions of exorcists, or indeed of doctors, in many possession cases make it hard to imagine that anywhere existed where true care for a troubled individual was given. And even beyond this, we are faced with the issue of sources: how can we assume, from a propaganda-oriented account that ends with a cure, that Féry's story took place as described? Moreover, the account considers Féry's reconciliation with the Church as the final sign of her cure, outside any improvement in her emotional life.

Féry seems an articulate but relatively powerless post-Tridentine Catholic woman. Not only were her views on doctrine trivialized by being demonized, but Féry's intellectual ability was also presented as coming from the Devil. The success of exorcism was claimed at one point when she was reduced to a childlike state in which she had to learn to read and write again. Féry internalized the apparent shifts in her intellectual capacities, and perhaps revealed her ambitions, when she wrote that "wicked devils" used their knowledge to make her like a god, then took her knowledge away from her. Against the vicissitudes of her misplaced trust in devils, the story sets the pacifying influence of Mary

Magdalene, who, Féry said, comforted her, and who at one point also spoke through her, when she was in ecstasy.

FEUGEYRON, PONCE

An early fifteenth-century Franciscan Master of Theology, Ponce Feugeyron (also known as *Fougeyron*, *Frugeronis*, *Fergusonis*, *Fongerons*, or *Sengeronis*) was an inquisitor whose investigations successively involved Jews, heretics (especially Waldensians), and witches. He worked an area covering nearly all of southeastern France, from Avignon through the Dauphiné to the duchy of Savoy. Around 1437, he may have written one of the very first texts to mention the witches' Sabbat, the *Errores Gazariorum* (Errors of the "Gazarii," or Cathars, an omnibus name ascribed to heretics).

In a rescript dated August 1409, Pope Alexander V commissioned Feugeyron to proceed against Jews who taught the Talmud, against Judaizing converts, and against anyone who asserted that usury was not sinful. His mandate also concerned Christians and Jews who were reportedly inventing new sects with forbidden rites. The pope authorized him, with the support of local ordinaries, to persecute Christians and Jews who practiced witchcraft, divination, conjuration, and other magical activities. This was one of the most comprehensive

assignments ever entrusted to an inquisitor (Simonsohn 1991, 362). For such a large task, Feugeyron received an annual income of 300 florins to cover his expenses and those of his staff. His activities as inquisitor spanned almost thirty years; Popes Martin V in 1418 and Eugenius IV in 1435 renewed his mandate. Drawing attention to the existence of new sects of Jews and Christians practicing magic and witchcraft constituted a novelty. Although what is exactly meant remains unclear, it seems likely that the pope and the inquisitor feared some dangers, real or imagined, from such practices, even though they did not clearly imply the presence of demons. Twenty years before the elaboration of the witches' Sabbat, the idea of clandestine groups perpetrating nefarious deeds was gaining ground.

Feugeyron's activities against Jews led him into some excesses, and Martin V attempted to curtail him twice, in 1418 and 1421. Supported by Avignon's Christians, its Jewish community complained that Feugeyron targeted Jews and exceeded his powers. The pope ordered an adjunct to work with him in order to control Feugeyron (Simonsohn 1991, 362–363). With the support of Duke Amadeus VIII of Savoy, Feugeyron led a vast campaign in 1426 throughout Savoyard lands against Jewish books, especially the Talmud. After a long inquiry, the Jewish community was again permitted to use its books—after it paid 300 florins and struck out passages considered "heretical."

In 1433, Feugeyron was incorporated into the Council of Basel as procurator of the Franciscan province of Provence. Among others attending the council, he could have met the bishop of the Savoyard Val d'Aosta, George de Saluces (1433–1440). This prelate, who was transferred to the diocese of Lausanne in 1440, initiated the first witch hunts in Aosta and in the Pays de Vaud, both belonging to Savoy. In 1434, probably as a consequence of their encounter, George de Saluces established an inquisitorial tribunal and appointed Feugeyron to begin proceedings against a witch. This is approximately the time when the anonymous *Errores Gazariorum* was written in the Val d'Aosta. The treatise, one of the first to describe the witches' Sabbat, emphasizes the danger of new sects of devil worshippers who practiced nefarious rites and even cannibalism. Several arguments suggest that Ponce Feugeyron is its author. First, the same fears and anxieties run through the *Errores Gazariorum* and Alexander V's rescript of 1409; second, the treatise was composed in a region where Feugeyron exercised his activities. Moreover, both surviving manuscripts of the *Errores Gazariorum* have direct links with the Council of Basel, where Feugeyron was involved. Within thirty years, the dangerous new sects of Jewish and Christian magicians had been transformed into the phantasm of the witches' Sabbat (Ostorero 2002).

FILM (CINEMA)

Witchcraft has been treated extensively on film, although rarely from a perspective that privileges

historical accuracy. This discussion concentrates mainly on films made in the English-speaking world. This, of course, should not diminish the awareness that some excellent films with witchcraft themes have been made by filmmakers elsewhere. It is noteworthy, for example, that a French version of Arthur Miller's *The Crucible*, entitled *Les Sorcières de Salem*, directed by Raymond Rouleau with a script by Jean-Paul Sartre, was released in 1957, nearly forty years before the American movie adaptation of Miller's famous dramatic work.

Indeed, the nondocumentary movie probably nearest to historical accuracy was *Vredens Dag* (Day of Wrath), the product of the great Danish director Carl Theodor Dreyer. Dreyer made only fourteen films in a career that stretched between 1918 and 1964, but his movies are among the most intensely made ever, and *Vredens Dag* was no exception. Set in a Danish village in 1623, the film was cast as a tale of fear, superstition, religious bigotry, and interpersonal betrayal. The heroine is Anne, the wife of an elderly clergyman who has been involved in a witchcraft trial. She fell in love

Scene from Carl Dreyer's *Day of Wrath*, a Danish film that recounts the story of the Norwegian witch Anna Pedersdotter. (Palladium/Kobal)

with her husband's son and wished her husband dead. The old man died a little later, and Anne was accused as a witch by her mother-in-law and was subsequently burned. The story is based on that of Anne Pedersdotter Absolan, the wife of a Lutheran minister who was in fact executed in 1590. Obviously, Dreyer's reconstruction of the story, while attempting to catch the mood of the period, was not totally accurate, but it remains a moving and evocative piece of cinema. The film was released in 1943, when Denmark was under German occupation, and hence it is difficult not to read it as an allegory of Nazi rule. The standard British reference work on the movies, *Halliwel's Film Guide*, described Dreyer's great witchcraft film as a "harrowing, spellbinding melodrama with a message, moving in a series of Rembrandtesque compositions from one horrifying sequence to another. Depressing, but marvellous" (1990, 253).

Another film that dealt with an actual event and made at least some pretense at historical accuracy was Ken Russell's *The Devils* (1970). Based on Aldous Huxley's reconstruction of the Loudun affair, *The Devils of Loudun* it began by being history at one remove. The theme, as a number of reviews commented, allowed the director to indulge his taste for the outrageous and the camp, while it is also possible to trace a strain of misogyny in the film. Yet Russell's peculiar genius allowed him to capture in a wonderfully spectacular fashion the atmosphere of what a nunnery full of demonically possessed inmates must have been like, while the trial, torture, and eventual execution of Urbain Grandier (Oliver Reed in one of his best roles) was well handled. *The Devils* remains one of the most powerful cinematic representations of early modern witchcraft and demonic possession. In particular, the scenes depicting the possessed nuns conveyed the sheer chaos and terror group possessions like that experienced at Loudun must have engendered in reality, while if Oliver Reed's performance as Grandier was striking, no less was that of Vanessa Redgrave as Soeur Jeanne des Anges. It should not be forgotten, however, that Russell's version of the events at Loudun was preceded by nearly a decade by *Matka Joanna od Aniolow* (Mother Joan of the Angels), a retelling of the Loudun story in which Grandier and Jeanne des Anges were presented as characters whose repressed love led to supposed demonic possession and witchcraft accusations. The film, released in 1961, was directed by the Polish filmmaker Jerzy Kawalerowicz, and despite initially attracting the opprobrium of Poland's Catholic Church went on to win a Special Jury Prize at the Cannes Film Festival.

Curiously, given the play's popularity, no English-language cinematic version of Arthur Miller's *The Crucible* appeared until 1996 (director Nicholas Hynter). Again, of course, it was Miller's version of

what happened at Salem that is laid before us, although, as with Russell's version of the Loudun affair, the movie of *The Crucible* presented some powerful images. The courtroom scenes were generally well handled, while Paul Scofield turned in an especially impressive performance as the judge presiding over the trials. Despite the film's attempt to meet the demands of historical accuracy, we are left wondering how far a movie dealing with a theme like witchcraft can ever provide a really satisfactory account of even a witchcraft episode as familiar as this one. The events at Salem provided the basis for an underrated TV movie, *Three Sovereigns for Sarah*, directed by Philip Leacock and again starring Vanessa Redgrave (1985), and they also formed the background for the older *Maid of Salem* (1937), in which a young woman accused of witchcraft was saved by her lover. The critical consensus is that its leads, Claudette Colbert and Fred MacMurray, saved this particular film.

Other films based on real historical incidents are comparatively rare. One, which has acquired cult status, is an older film, *Witchfinder General* (1968), directed by Michael Reeves, that retold the story of Matthew Hopkins. This is a powerful film, shot partly in locations where Hopkins actually operated, but its connection with historical accuracy was sometimes shaky, based as it was on a novel by Ronald Bassett. However, this is somewhat offset by a splendidly villainous Matthew Hopkins, played by Vincent Price, for whom a suitably robust demise was invented. The film was noteworthy for its air of brooding evil, which in particular created a wonderful sense of how this bout of witch hunting operated against a background of more general disruption. Although the English Civil War received little direct treatment in the film, we are constantly reminded that it formed a necessary backdrop to Hopkins's witch-finding activities. Another film using English witchcraft in a historical context, *The Blood on Satan's Claw* (director Piers Haggard, 1970) basically interpreted historical witchcraft as a fertility religion in the Margaret Murray mode. Other films on historical themes did have witchcraft references, among them *The Last Valley* (1970), an action-packed and intelligent movie set in the Thirty Years' War, and Ingmar Bergman's *The Seventh Seal* (*Det Sjunde Inseplet*, 1957), where the burning of a witch illustrated one of Bergman's central themes, the absurdities of medieval Christianity. And, although not strictly an historical movie, mention should be made here of the striking and detailed witchcraft scenes in Roman Polanski's 1971 version of *Macbeth*.

Whether in movies set in the remote past or those set in the present, witchcraft is a theme that lends itself to the horror film genre. Perhaps the most recent, and most hyped, film in this tradition has been *The Blair Witch Project*, directed by Eduardo Sanchez and Daniel

Myrick and released in 1999. This low-budget film followed three students who went into the Black Hills Forest of Burkittsville, Maryland, to film a documentary about the infamous Blair Witch, an old woman who lived in the woods and was accused of luring children to her home and killing them dreadfully. The students were caught up in the legend of the Blair Witch, and fell foul of her power, although the audience never catches a glimpse of her. *The Blair Witch Project* was, of course, preceded by a string of films that used witchcraft as a means of horrifying their audiences.

Starting with British productions, we note *Witchcraft*, directed by Don Sharp (1964), in which a family of witches revenged themselves on their enemies, and *The Witches*, a Hammer Film directed by Cyril Frankel (1966), in which a newly arrived village schoolmistress found herself surrounded by witchcraft. British horror movies using witchcraft themes also included adaptations of works by the once extremely popular thriller writer, Dennis Wheatley. Perhaps the best known of these, *The Devil Rides Out*, another Hammer Film (1967), failed to frighten, although *To the Devil a Daughter*, a joint British/German production (1975), at least had a pleasantly campy quality. Another British horror movie that is more likely to amuse than terrify the modern viewer is *The Curse of the Crimson Altar* (1968: director Dennis Lewis). Here the theme was one that cropped up in a number of films with witchcraft connections, the notion of the descendants of an executed witch wreaking vengeance on the descendants of her accusers. This was set in the fictional English village of Greymarsh, where the villagers annually celebrated the anniversary of the burning of Lavinia, the seventeenth-century Black Witch of Greymarsh. This film is memorable for the maladroitness of its attempts to weave in scenes depicting late 1960s permissiveness, and, more positively, for performances by Christopher Lee and Boris Karloff.

The U. S. film industry has provided some more solid horror, especially if we include two films on themes that, while not quite on witchcraft, were closely related to it. These are Roman Polanski's *Rosemary's Baby* (1968), in which a woman was impregnated by the Devil, and *The Exorcist*, directed by William Friedkin (1975), which portrayed demonic possession as vividly as any early modern possession narrative. More mundane witchcraft horror movies originating from the United States included *Halloween Three: Season of the Witch*, directed by Tommy Lee Wallace (1983), in which a malicious toy maker sought to use a forthcoming Halloween as an occasion for a takeover of the world by witches through the sale of magic masks made at his Santa Mira factory. Perhaps the most significant comment on this movie was that an Englishman, Nigel Kneale, wrote the original script, but subsequently requested that his name be removed from the credits.

Witchcraft as a theme for horror movies has not been, of course, restricted to Anglo-American productions. Indeed, one of the most successful films of this type was *Suspiria*, directed by the great Italian horror movie director Dario Argento and released in 1977. The film, set in a fictionalized Black Forest region in Germany, opened with the arrival of the central character, the young American woman Susy Banyon (Jessica Harper), at a storm-lashed airport. She was set to enter a famous dance academy in the area, but rapidly discovered that what she had in fact enrolled in was a witches' coven, presided over by Helene Marcos, a woman of Greek origins who was the academy's elusive head. The film, in the best horror traditions, flitted between the real world and an imagined Gothic one, the latter being adequately symbolized by the building in which the dance academy was based. This Gothic element (again as is so often the case with horror movies) lent an almost fairy tale quality to *Suspiria*, and one of the most sustained commentaries on the film, by Linda Schultes-Sasse, made much of how Argento's movie operated in a world that was like an inversion of a Disney story. The same author also argued that some passages of *Suspiria* could be construed as an allegory of fascism (*Kinoeye*, 2002). Whatever the value of these insights, it remains undeniable that this was a very powerful horror film, with a violent double-murder sequence at the film's commencement to set the mood.

If witchcraft has served as a central theme for horror movies, it has also, perhaps a little implausibly, done the same for comedies. René Clair directed the delightful *I Married a Witch* (1942), in which a Salem witch, played by Veronica Lake, and her father returned to haunt the descendants of the Puritans who had them executed, only to have the witch fall in love with one of them. The theme of love between a witch and a normal member of society also figured in *Bell, Book and Candle* (1958, director Richard Quine), in which a New York publisher (James Stewart) gradually realized that his new girlfriend (Kim Novak) was a witch. *Bell, Book and Candle* provided an essentially benign portrayal of a modern coven, interestingly enough in the same sort of way as many modern Wiccans would present themselves. One quasi-erudite reference to witchcraft history in this film was that the witch's pet cat was called Pyewackett, the name of one of the familiars featured in the Matthew Hopkins witchcraft trials of mid-seventeenth-century England. A better-known film among modern readers was a rather darker comedy, *The Witches of Eastwick*, directed by George Miller (1987). In this movie, the Devil (played with panache by Jack Nicholson) seduced, but was ultimately thwarted by, three divo cées (played by Cher, Susan Sarandon, and Michelle Pfeiffer). For the historian of witchcraft, one of the more enjoyable aspects of this film was that the Devil, just as early modern demonologists told us he

would, won all three women by tempting them with things they wanted desperately. The theme of a non-witch falling in love with a witch in the modern world was also explored in a likable French film of 1997, *Un Amour de Sorcière* (director Rene Manzor).

There have been some films based around witchcraft that almost defy categorization. One such film was *Baba Yaga*, a Franco-Italian production released in 1973 and directed by Carrado Farina. The central character, based on the heroine of a popular adult comic strip by Milan artist Guido Crepax, was Valentina (played by Isabelle De Funes), a fashion photographer. One night she met Baba Yaga (Carroll Baker), a mysterious older woman who gave her a ride home. A lesbian relationship developed between the two women, while a devil doll dressed in S&M clothing created mayhem. The film was an odd production, weaving together themes of witchcraft and lesbianism, with undertones of sadism, 1960s pop art and kinkiness, eroticism in general, and references to the earlier French avant-garde movies. Baba Yaga was, of course, the name of an evil witch of Russian folklore, among whose attributes was a set of steel teeth. Mention should also be made of Damiano Damiani's *La Strega in Amore* (The Witch in Love) of 1966, an erotic horror movie that placed witchcraft in a modern setting.

If witches figured in comedy, so did they in children's movies, including, of course, animated movies. Children can still be frightened by the very potent images of witches given in those two classic Walt Disney cartoon films, *Snow White and the Seven Dwarfs* (1937) and *Sleeping Beauty* (1959). Children's films featuring witches and witchcraft have been too numerous to list, but mention must be made of *The Witches* (1990, director Nicolas Roeg), a superb adaptation of Roald Dahl's novel, and, of course, of the more recent adaptations of J. K. Rowling's "Harry Potter" books, although a purist might comment that what Rowling's novels and the film adaptations of them have been concerned with was the world of natural magic rather than that of witchcraft proper. But at the very least, these film versions of the Harry Potter books provided yet another reminder of the infinite adaptability of the witchcraft theme, which in this case was transported with remarkable success to the world of the English boarding school.

But no treatment of the theme of witchcraft in the children's light entertainment fields would be complete without a mention of that most successful of films, *The Wizard of Oz*. Directed by Victor Fleming, adapted from the book by L. Frank Baum, and released in 1939, *The Wizard of Oz* was most memorable for Judy Garland's performance as Dorothy Gale. But there was also a bravura performance by a relatively obscure actress, Margaret Hamilton, as the Wicked Witch of the West.

Besides the English-speaking cinematic tradition, others have produced a number of significant films on the representation of the witch. Indeed, perhaps the most remarkable film dealing with witchcraft as a historical phenomenon was a silent Danish movie, *Häxan*, directed by Benjamin Christensen, a key figure in the early Danish cinema, and released in Sweden in 1922. This film began with something like a lecture on the history of witchcraft, but then passed rapidly into a series of sometimes still very effective reconstructions, including what was (allowing for the quality of the special effects of the period) a compelling depiction of the witches' Sabbat.

Witchcraft has figured in a wide variety of cinematic productions in a wide variety of ways. It is a theme that continues alternatively to scare us, amuse us, and provide an occasional shiver of horror for our children. So far, however, there have been few films that have provided an accurate reconstruction of an historical witchcraft episode.

FILMER, SIR ROBERT (CA. 1588–1653)

Filmer presents historians of witchcraft with an apparent contradiction: conservative in his defense of monarchy, he seems provocatively modern in his attitudes toward the crime of witchcraft. After attending Trinity College, Cambridge, and studying law at Lincoln's Inn, he was knighted and served as Justice of the Peace in his native Kent. A virulent royalist during the English Civil War, he was imprisoned in Leeds Castle, near Maidstone, between 1643–1647. After his release, he published, anonymously, many polemical pamphlets; the last one, *An Advertisement to the Jury-Men of England Touching Witches*, was written shortly before his death in May 1653.

This pamphlet had been prompted by the harsh treatment of several people tried for witchcraft at the

Maidstone Assizes in July 1652. Although several were acquitted, others were pilloried and six women were sentenced to be hanged for causing the deaths of adults, children, horses, and cattle through diabolical magic. However, the fury of the mob, which demanded that those convicted should be burned rather than hanged, probably compelled Filmer to compose it.

He chose to attack the definition of witchcraft in the 1604 English statute, arguing that it put judges and juries in an unenviable if not impossible position, in trying to decide what differentiated a witch from a conjurer, an enchanter, or a sorcerer. Filmer chose two opposed authors—a Jesuit, Martín Del Rio, and a Puritan, William Perkins—for particular censure; they exemplified opinions “which ignorance in the times of darknesse brought forth, and credulity in these days of light hath continued” (Filmer 1653, iv). Clearly separating Hebrew witchcraft in biblical times from supposed manifestations of the crime in Stuart England, Filmer attacked the theological proofs for the existence of witchcraft. Although both Jesuit and Puritan agreed that the contract with the Devil was the defining act of the witch, neither could find any examples in the New Testament; Perkins could only find one unconvincing example in the Hebrew Bible (Psalm 58:5). Quoting Perkins’s own words, Filmer undermined the notion of the witches’ covenant with the Devil. Furthermore, he obliquely opposed applying the death penalty for the crime and denounced the notion that torture could possibly secure reliable confessions. According to Filmer, the Devil and not the witch should be the target for scorn, hatred, and vigilance of every good Christian, for “the Devill” was unable to work miracles; he was only “the worker of wonder, and the Witch but the Counsellor, Perswader, or Commander of it.” Thus, the witch was deluded “and onely accessory before the Fact, and the Devill onely principall” (Filmer 1653, 7). In English law at that time, an accessory to a criminal offense could be convicted only if the principal felon had already been charged and brought to justice. Because the Devil could not be brought, bound and gagged, into court, Filmer was not only mocking the notion of the reality and efficacy of witchcraft, but also attempting to establish that it was legally impossible to secure convictions for this crime within the conventions of existing common law.

Thus, although John Locke might have concluded that, in his political writings, so much “glib nonsense was never put together in well-sounding English” (DNB, 1908, VI: 1304–1305), Filmer deserves much credit for introducing both humor and withering cynicism into the scholarly debate on the nature of witchcraft. While his legal training served to pinpoint anomalies in the prosecution of this crime, his enthusiasm for scientific advance led him to declare that “it would pose Aristotle himselfe, to tell us every thing that can be

done by the power of Nature, and what things cannot, for there be dayly many things found out, and dayly more may be which our Fore-fathers never knew to be possible in Nature” (Filmer 1653, 8). Though Filmer’s voice was largely ignored and prosecutions for witchcraft continued in the short term, his profoundly skeptical views gradually dominated elite culture by the late seventeenth century, rendering the chances of a successful prosecution for witchcraft almost impossible throughout England.

FINLAND

It was long believed that very few witchcraft trials took place in Finland, but this was not the case. Unlike many other countries where the number of accused witches has diminished greatly after recent detailed studies, in Finland the number of persons indicted for witchcraft and magic has increased considerably with every new study. Now we believe that probably over 2,000 persons were charged with such crimes between 1520 and 1750 (Nenonen 1992, 433; 1993, 83). Because the population of seventeenth-century Finland, which was then part of the Swedish kingdom, never exceeded much more than half a million inhabitants—at the end of the seventeenth century, before the Great Famine—scattered across a territory larger than the British Isles, where provincial centers were hundreds of kilometers apart, the number of those accused can be considered remarkable.

MYTHOLOGICAL TRAITS OF FINNISH MAGIC

Even when it was believed that few witchcraft trials occurred on Finnish territory, many tales circulated as early as the Middle Ages about the great power of witches and shamans in Lapland and Finland. Later, in 1555, a Catholic priest (nominally the last Catholic archbishop in Sweden) named Olaus Magnus Gothus spread these stories among Europe’s learned elite by publishing a book on the history and culture of Scandinavia and Finland, *Historia de Gentibus*

Septentrionalibus (History of the Northern Peoples). Since then the great fame of northern witches and shamans has been well established in literature.

The Finnish word *noita* (witch) originally referred to one who employed the technique of falling into a *lovi* (trance), or an ecstasy ending in fainting. The term *lovi*, which literally means a hole or a cut, referred to the gap between Heaven and the underworld. According to some Finnish mythology, this gap was the gateway to Hades (*Tuonela*, *Manala*). Falling into a trance meant that the soul of the person traveled to the underworld to meet the souls of the dead, who offered wisdom unattainable otherwise.

The underworld was governed by a female goddess called *Louhi* or *Pohjolan Emäntä* (Mistress of the North, which was often a synonym for the underworld). According to some folk poems, when the world began, the Mistress of the North, while fighting with other gods, created all of humanity's adversities—illnesses, crop failures, and so on. Shamans and witch doctors, it was believed, could fend off the evil spirits of *Louhi*. By conjuring or singing incantations, the seer sent the misfortunes back to the gloomy northern underworld where they belonged.

Shamanism was part of the Finns' and Lapps' ancient religion, although among the Finns the tradition seems to have almost entirely vanished before the time of the witch hunts. Very few shamans appeared in courts in Finnish Lapland, although shamanism was still a living tradition and the area was famous for shamans and witches. Shamanism was by no means the last Finnish tradition of great witch doctors and seers. Fervent seers, who did not fall in trances or use a shaman drum (*noitarumpu*) in their rituals, were known as *intomies* or *myrrysmities* (enthusiasts or witch doctors). This type of seer dominated soothsaying and magical healing long before the time of the witch hunts. The shamanistic witch culture probably survived alongside them until well into the Middle Ages (Siikala 1986, 285–297).

Many fragments of traditional incantations can be found in court records, but we lack any contemporary explanations of how and in what context to interpret these spells. It seems likely that the old mythological traits of magic were rarely prominent in the witchcraft trials of sixteenth- and seventeenth-century Finland, although fervent seers are occasionally met in court records and some features of shamanism can be found even later. Professional healers were seldom accused of witchcraft during the sixteenth and seventeenth centuries—so far there are no detailed studies from the eighteenth century—and this may explain why a minimum amount of material related to older mythological beliefs has been published from court records.

Conversely, the magical deeds described in these records generally resemble the kind of acts known almost everywhere in Europe during the witch hunts.

Some cases of love magic can also be found from the court records. Various *maleficia* (harmful magic) were performed to bring about damage or harm people, although witches were very seldom accused of collective mischief, like crop failures. In Finland, simple threatening speech or “bad words” sufficed to cause malignant effects. Singing incantations were typically used in magical healing, but they could be used to cause harm as well. In Finnish folk poems, “to sing” (*laulaa*) often refers to singing incantations (*laulaa loitsuja*). Casting salt often accompanied reciting spells.

Usually such magic was aimed at harming people or livestock, but it also could be employed to heal sick people and cattle. As in Estonia, interference with, and destruction of, beer being brewed also appeared often in court records. However, tar burning was very seldom damaged by magical means, although tar soon became Finland's most important export and figured among the most important subsidiary trades of peasants. In general, magic was directed almost exclusively against traditional means of livelihood.

Modern theories of witches worshipping Satan at the witches' Sabbath had little influence in Finland. Such theories dominated only some trials in places under particularly strong Swedish influence, like Ahvenanmaa (Åland), a group of islands located between Sweden and Finland, or Ostrobotnia on the western coast. In the interior of the country, or in eastern Finland, ideas of diabolism were hardly known.

CHRONOLOGY OF THE PERSECUTIONS

Countermagic was an everyday habit, and unofficial violence against witches took place in the Middle Ages and long afterwards; courts were not the only place to attack witches. However, Finland's first recorded witchcraft trials appeared in court documents from the 1520s. The number of trials increased from the 1550s but decreased at the end of the century. In all, 93 persons were accused before 1600, two-thirds of them (64) between 1560 and 1590. Two-thirds of the accused were men, and thirteen death sentences were passed (Nenonen and Kervinen 1994, 232–234, 277, note 5).

Political turmoil in Finland, a long war against Russia, and, soon after, a civil war between members of the Swedish royal family help explain the decline in witchcraft accusations between 1590 and 1620. Trials increased after the 1620s, and the number of convictions increased rapidly. Fewer than forty persons are known to have been charged in the 1630s, but at least 150 persons were accused of witchcraft and magic in the 1650s. Most of the supposed witches were men, though women now constituted almost half of them. One group stands out sharply: some twenty notorious witches—male and female—were tried in western Finland from the 1640s until the late 1660s. Despite

the fact that their numbers were few, they were greatly feared and widely blamed for misfortunes, sometimes by an entire parish. These witches were itinerant beggars who lived by terrorizing ordinary people; we can call them beggar witches.

During the 1660s, the number of trials rose. It increased even further in the next decade, when 217 persons were reportedly accused; the actual total probably exceeded 300. Finland's witch persecutions culminated in the 1670s and early 1680s. After 1690 witchcraft trials declined. War and social turmoil at the beginning of the eighteenth century may explain the decrease, as Russian troops occupied Finland for years during the Great Northern War (1700–1721). Minor revivals of witchcraft trials took place later in the eighteenth century.

Finland's witchcraft trials differed from time to time and from place to place. One may ask whether Finland followed any consistent patterns. Currently, three different phases of witchcraft trials can be clearly differentiated (Nenonen 1992, 41–72, 223ff.; 1993, 88–90).

First, until the 1670s, mostly men were accused of maleficent magic, and at least two-thirds of the accused were acquitted. Most often, the accuser was a private person who had some quarrels with the supposed witch. The accuser believed that his or her enemy had used malevolent magic to revenge some insult or harm.

Benevolent magic was not considered an indictable offense until the 1660s, even though some statutes against white magic dated from the mid-sixteenth century. The courts did not enforce these edicts, but based their judgments instead on Swedish laws from the late Middle Ages. Sometimes the Church punished performers of benevolent magic. But during the 1660s, a turn took place in witchcraft cases. It was so sharp and swift that many courts had difficulties following the new policy, according to which benevolent magic, including healing with suspicious procedures, became an offense in secular courts. In the 1660s, men still dominated among the accused. However, during the next two decades, women formed the majority, most often charged with benevolent magic.

Two-thirds of those accused of benevolent magic were convicted, and mostly given fines, because they had indeed performed acts that were now seen as illegal (healing by herbs and other natural means was however still permissible). Moreover, benevolent magic was easy to verify as it usually had many witnesses, for example, the sick person who had asked for help. Often, people could not distinguish between their ordinary daily work habits and the illegal magical means they were said to have committed. "Our Father who art in Heaven" was fully appropriate for prayers, but when repeated nine times in suspicious circumstances, its meaning could appear doubtful. Most often, the accuser in trials of

benevolent magic was a member of the clergy, often the parish minister, or a state official, usually a bailiff (*kruununvouti* or *nimismies*).

A third kind of witchcraft trial emerged in the mid-1660s, when some of the leading figures of the Finnish elite, among them the bishop of Turku, Juhana Gezelius the Elder, adopted continental theories about witches who worshipped Satan at the Sabbath. The first trials based on theories about flying witches and diabolism emerged in Ahvenanmaa (Åland) in Turku diocese during 1666 (Heikkinen 1969, 204ff.). This occurred two years before the great Swedish mass hunts of northern Dalarna. The impact came from Germany through the Baltic; a judge who had attended the Swedish University of Tartu in Estonia was appointed to the Ahvenanmaa district.

Perhaps no more than eighty persons were accused of diabolical witchcraft in Finland. Most such trials took place in the 1670s and early 1680s in Ostrobothnia, located on Finland's western coast some 300 kilometers north of Turku, then the capital of Finland. In these trials, women dominated among the accused. Ostrobothnian mass panics paralleled those in Sweden on the opposite shore of the Gulf of Bothnia; in both places, women dominated among those accused of diabolical witchcraft. The role of the government was prominent in these cases, even though private accusers had an important place as well. However, most of the supposed Sabbath-goers were acquitted, and in the late 1680s the courts took a more critical attitude toward Sabbath beliefs.

In addition to these different types of trials, some mid-seventeenth century cases against men using demonic magic took place at the new University of Turku (established in 1640). Bishop Eskil Terserus, who came from Sweden, even blamed Finnish schools and the university for teaching magic (Heikkinen 1969, 380).

MALE AND FEMALE WITCHES

Most of the accused were peasants or their wives, and in towns burghers or their wives; in both instances, most of those accused were married. More strikingly, the persons accused of witchcraft and magic were often of considerable wealth, though many itinerant beggars appeared in the courts as well (Nenonen 1992, 201–220). Almost without exception, the supposed witch was an acquaintance who lived in the neighborhood and had been known for years by his or her accusers. Despite tales about great and famous witches dwelling somewhere in the far north, it was invariably someone from the neighborhood, rather than such terrifying but distant enemies, who happened to be caught and tried for witchcraft.

Very few (5 percent) of Finland's accused witches are known to have been charged more than once with

witchcraft or magic, and there is little evidence of accused witches coming from different generations within the same family (Nenonen 1992, 200, 218–219). All of this contradicts much of what has been believed about witches. However, as professional healers were not often charged with illegal magic, nothing can be said about their families.

According to the court records, men seemed more inclined to use harmful magic, whereas women were more often accused of healing through illegal magical means. However, statistics based on court records give a one-dimensional picture (Nenonen 1992, 353–363). Because accusing women of any witchcraft and magic was uncommon in many areas before the 1670s, they were rarely charged with maleficent magic either. Conversely, because benevolent magic was not regularly considered a crime before the 1660s, the men who predominated among Finland's earlier accused witches were not often charged with benevolent magic.

Contrary to the statistics derived from the court records, it is evident that in everyday life, both men and women used malevolent magic, and both acted as healers. Nevertheless, women probably dominated the various forms of benevolent magic employed in such everyday tasks as animal husbandry and healing. To a great extent, animal husbandry was women's work in traditional agriculture, and informal healing may also have been more appropriate for them. The division of ordinary tasks along gender lines may have dictated who used which kinds of magic in everyday life. Perhaps men were less vulnerable. With the occurrence of a serious quarrel or disagreement between men, followed by some sort of misfortune falling upon one or the other, suspicions of malevolent magic could be aroused. But when men were hunting or fishing, no one could observe their use of magic.

Only during the 1670s and 1680s did women comprise most of Finland's accused witches, reaching a peak of 72 percent in some western areas. It is noteworthy that the change in jurisdictional practice criminalizing benevolent magic did not cause an immediate shift from male to female witches; in the 1660s, men were still charged more often than women. However, the new theories about witches who flew to the Sabbath in order to worship Satan could have been the final cause that broke the male stereotype of the Finnish witch in the 1670s.

Theories about the witches' Sabbath had no impact on either inland or eastern Finland. With some exceptions, Finnish clergy and secular authorities mostly remained critical towards such new theories and never gave unqualified approval to such beliefs. Regarding the practice of benevolent magic, which was not harmful but highly offensive to the orthodox Lutheran clergy, the authorities were quite severe and would not tolerate such customs. The high number of Finnish witchcraft trials can

be explained by this extremely strict policy of both state and church opposing traditional magic in everyday life. People were usually punished with a heavy fine; poor people who could not pay were sentenced to the lash. However, the most sacrilegious practices—for instance, using a consecrated wafer for magical purposes, or uttering curses against God—received a death sentence. Most such condemnations were made in the relatively short period of time between 1649 and 1684.

Jurisdictional practice in eastern Finland followed the same lines as in western Finland, and benevolent magic became a target for secular courts. However, women were seldom charged with magic and witchcraft in eastern Finland, and—unlike elsewhere—even less so in southern Karelia around Vyborg at the end of the seventeenth century, when only one-fifth of the accused were women. In general, the further from the west coast a trial was held, the more often men were accused. This was inversely proportional to the frequency of trials: far fewer judicial proceedings took place in the inland areas and eastern Finland than in western Finland, except for southern Karelia, where trials were more frequent than in other eastern areas. Most trials in northern Finland took place on the shores of Ostrobothnia, but not in the interior.

With few exceptions, Finland's judicial system did not yield to mass hysteria but retained traditional procedures and investigated witchcraft according to its best understanding. Torture was illegal, though it was permitted by the Court of Appeal, as happened a few times during trials for diabolism in Ahvenanmaa. Very rare traces of unofficial violence and injustice can be found in court cases. In all, 150 death sentences may have passed in lower courts; but the Turku Court of Appeal, established in 1623, confirmed fewer than half of them.

FISCHART, JOHANN (1546–1590)

Fischart was a late-Renaissance German humanist from Strasbourg significant in the history of European witchcraft in two capacities: first, as the German translator of Bodin's *Démonomanie des sorciers* (Demon-Mania of Witches, 1580), and later as a witch-hunting official in the Germanophone part of the duchy of Lorraine. In the latter capacity, Fischart became an informant of Lorraine's homegrown demonologist, Nicolas Rémy. Fischart is best known for his German translation and adaptation of François Rabelais's *Gargantua and Pantagruel*.

Educated at Paris and Basel, where he earned a doctorate in law in 1574, Fischart published a remarkable variety of writings. In addition to his great Rabelais translations, or *Geschichtsklitterung*, which he reworked twice after its first version in 1575, Fischart produced numerous anti-Catholic (especially anti-Jesuit) polemics, many poems (including a verse version of *Till Eulenspiegel*), a misogynistic satire told from the viewpoint of a flea, a treatise on laughter as a cure for gout, and much else. His brother-in-law, Bernard Jobin, one of Strasbourg's greatest printers, in whose house Fischart lived during the 1570s, published most of them. In 1580 Fischart moved to Speyer, where he practiced law at the imperial chamber court or *Reichskammergericht* in Speyer. After marrying in 1583, he found a post in a Lorraine fief belonging to his Protestant patron Egenolf von Rapperstein. During the last seven years of his life, the Protestant Fischart administered the solidly Catholic district of Forbach as *Antmann* (bailiff) in the service of its suzerain, Duke Charles III of Lorraine.

When translating Rabelais, Fischart added some anti-Jewish asides to the original material and adopted a realistic rather than jocular approach to diabolical magic (Weinberg 1986, 114–120). But it was only after starting to work at the *Reichskammergericht*, which showed the same caution and skepticism about witchcraft as other

appellate courts, that Fischart became involved in translating and editing demonological texts. In 1581 he employed his mastery of French to produce the first German translation of Bodin's demonology in 1581. A telltale phrase about the "parliament of witches" shows that Fischart's translation of Bodin was employed later that decade for interrogating witches in the bishopric of Augsburg (Behringer 1997, 125). In 1582 Fischart prepared an index for a reprinting of the infamous *Malleus Maleficarum* (The Hammer of Witches, 1486) by the Frankfurt printer Bassaeus. In 1586, Fischart offered a second edition of his German translation of Bodin, dedicated to the son and successor of his patron von Rapperstein (Hauffen 1921, I, 84); it was apparently the last published book signed by this prolific author.

Unfortunately, Fischart's involvement with witch hunting did not stop with modernizing the *Malleus* or translating its demonological successor. Although no legal records have survived from Forbach, the Lorraine district he administered, we know that at least four or five witchcraft trials were held there in August and September 1587, probably resulting in death sentences. The evidence comes from the demonology published in 1595 by Lorraine's chief prosecutor, Nicolas Rémy, who included (with apparent precision) the names and residences of many imprisoned witches and the dates of their sentencing. In Book I, chap. 12, Rémy says that "as I was writing these lines, I received reports from the interrogations of some witches at Forbach, a small town located in the German part of the duchy of Lorraine. I learned something of which I had been unaware, about the witches methods for assuring that their husbands noticed nothing when their wives left them in bed while preparing to fly off to their reunions" (Rémy 1998, 108–109). Each of Fischart's three witches employed a different technique: one put a child's mattress in her place; a second used a straw broom (both after pronouncing their demon's name); the third and most original rubbed her sleeping husband's ears with the same magic grease that she used to anoint herself. Rémy presents other details from confessions by Fischart's Forbach witches, telling us that two other suspects were arrested for helping an arch-witch poison her own son; one of them, a man, also dug up a newly buried child and boiled him in order to make a diabolical unguent to spread on trees (Rémy 1998, 184–185, 197).

FLADE, DIETRICH (1534–1589)

Dr. Dietrich Flade, *Stadtschultheiss* (town bailiff) of Trier and the richest man in the city, was burned at the stake as a convicted witch on September 18, 1589. His trial aroused interest throughout the Holy Roman Empire; Peter Binsfeld, Cornelius Loos, and Martín Del Rio mentioned it. Moreover, the complete trial record has survived, along with other documents related to Flade's case.

The son of Trier's town clerk, Dietrich Flade was born in 1534. After studying law, he found service with the elector-archbishops of Trier. In the ensuing years, he made a good marriage, accumulated various offices, and made many loans, gaining significant political influence while becoming the wealthiest man in Trier. By 1559 he was already a *kurfürstlicher Rat* (electoral councillor); by 1569, he combined the offices of *Schultheiss* (bailiff) at the criminal court in Trier, *Beisitzer* (assessor) at the *Hofgericht* (electoral court) of Koblenz (Coblenz), *Schultheiss* of the cathedral-deanery in Trier, and *Schöffe* (court assessor) of the criminal court of the imperial abbey of St. Maximin. As a faithful servant of the electors of Trier, opposing attempts by the city of Trier to gain greater autonomy, Flade approved the suppression of its Protestant faction led by Caspar Olevian in 1559. Flade also supported Elector Jakob III von Eltz (died 1580) in the expensive legal suit brought by the municipal councillors before the *Reichshofrat* (imperial aulic court), attempting to obtain confirmation of Trier's status as an imperial city and thus its independence from its territorial lord, the elector. The case ended in 1580 with a crushing defeat for the municipality, throwing the city of Trier into financial chaos, economic depression, and a crisis of political legitimacy.

Flade was rewarded for his service by being appointed *Stadtschultheiss* and thus chairman of the city's administration and criminal court when the elector reformed the city government. Until 1583, Flade also acted as the electoral *Statthalter* (vice-governor). He was considered avaricious and ambitious, and was believed to accept bribes in his role as judge. Flade had not only made various loans totalling 40,000 florins to citizens, peasants, and vintners of Trier and its rural hinterland, but also loaned money to both the elector and the city, which owed him 9,000 and 4,000 florins, respectively. He also acted as judge in eight witchcraft trials and sentenced eight female citizens of Trier to death, so Flade cannot be considered an opponent of witchcraft trials.

A large-scale regional witch hunt occurred when the whole archbishopric and electorate of Trier suffered a prolonged and severe subsistence crisis after 1580. By 1586, as witchcraft trials took place with increasing frequency in the territories bordering Trier, accused witches (under torture) began describing inhabitants of Trier as leaders of the witches' sect, who allegedly destroyed crops with weather magic to profit from famine by selling their private stocks of grain. Suspicion rapidly focused on Flade as a leader of these wealthy Trier witches, alleging that he presided over the witches' Sabbats. Accused witches even alleged that Flade was involved in a plot devised by the witches to murder the archbishop of Trier. In the summer of 1587, denunciations against Flade increased, sometimes made by accused witches who were themselves his debtors. The archbishop of Trier (who took the threat of witchcraft seriously) requested the Jesuit-led theology faculty of Trier University to evaluate the allegations against Flade, and they incriminated him. Flade tried twice to escape trial by fleeing the city; he offered to spend the rest of his life in a monastery after giving all his money to the elector. Nothing worked. Dr. Flade was arrested on April 22, 1589. Rendered tractable through torture, Flade soon confessed to all the acts of harmful magic of which he had been accused. The pardon that he hoped for until the end of his trial never materialized, and on September 18, 1589, he was strangled and then burned at the stake.

The trial of Dr. Dietrich Flade must be seen in the context of the history of the city of Trier. The city's failure to gain autonomy within the Holy Roman Empire and the ensuing humiliating capitulation to the power of the elector in 1580 meant that the standing and legitimacy of its governors were seriously compromised. They, and particularly people connected in any way with its political and economic depression, were regarded by most citizens as corrupt traitors, opportunists, or easily became proofs of witchcraft, because individuals first fell into sins such as ambition and greed through their seduction by the Devil. After 1585, municipal authorities in Trier could no longer resist popular pressure for witchcraft trials, now accompanied by riots and disturbances. The authorities' hesitant, indecisive action in the matter only succeeded in raising the suspicion that they too belonged to the witches' sect. The execution of Flade, pandering in part to popular anger against witchcraft, dramatically shattered any assumption that high social and political rank protected individuals from being tried as witches. It acted as a catalyst for subsequent trials against high-ranking men and women, during which almost all those who had been involved in the humiliating political defeat of the city in 1580 were executed.

FLIGHT OF WITCHES

The belief that demons transport magicians and witches through the air simply inverts the belief that angels carry saints and holy men. Both, known as transvection, have been around since antiquity. In Grecian and Roman lore, sorceresses could transform themselves into birds, especially owls and ravens, as Apuleius of Madaura vividly describes in the *Golden Ass*. The European folk belief in the ecstatic flight of women as the entourage of a fairy queen was ascribed ca. 900 to the Roman goddess Diana. Medieval romances are full of beautiful fairies like Morgan le Fay, who had not only the ability to fly and change her appearance but also the power to heal.

Witches, who did harm rather than good, flew only under cover of darkness and usually with the aid of broomsticks, forks, or shovels. Or they might ride demons who had transformed themselves into such animals as goats, horses, cows, or wolves; clerics claimed the devils even had the power to pick people up and whisk them through the air without any visible means of support or transport. Witches were further accused of using ointments consisting of fat boiled from unbaptized infants to help them fly. Other magic ointments supposedly contained herbs and drugs that put witches into hallucinatory states, causing them to believe that they had actually flown, usually toward certain mountains or remote places where Sabbats were performed.

HISTORY

Two famous biblical stories involve magical flight. In the Hebrew Bible, angels carried Habakkuk from Judea to Chaldea almost instantaneously. The New Testament describes how Simon Magus, a Samaritan magician, challenged St. Peter to a magical competition in Rome. When Simon was able to fly with the aid of demons, Peter, observing the evil spirits carrying him, started to pray, thus forcing the demons to let Simon fall.

Pagan Europe offers rich examples of magical flight, particularly in Nordic tradition. The fourteenth-century Icelandic sagas (whose manuscripts date from the fifteenth century) describe the idea of the *gandreið*, usually implying a witch going out, often in a noncorporeal sense. The later manuscripts use the term for physical transvection to the site of an assembly or feast. But the most suggestive testimony of all with respect to assembly and transvection is the famous passage from Hávamál in the *Edda* (ca. 1200).

Because such notions smacked of paganism and idolatry, Christian theologians condemned women who believed that they left their homes secretly at night to attend the court of a goddess or spirit (with different local names, but often identified as Diana), and rode with her on processions, traveling great distances. First condemned in the *Canon Episcoporum* in the early tenth-century penitential by Regino, abbot of Prüm, the condemnation was repeated in the following century by the well-known canonist, Burchard of Worms, who warned against such women in book nineteen of his *Decretorum libri XX* (The Twenty Books of Decisions), known as the *Corrector et Medicus* (Corrector, or the Physician). Early medieval theologians were convinced that such beliefs were merely delusions of the Devil. Although the nocturnal processions were illusory, they were nevertheless linked to diabolical activities. The leader of the nocturnal host had many names: Herodias, Abundia, Satia, Helda, and Perchta were most common. In the thirteenth century, William of Paris added *Domina Abundia* (Lady of Abundance) and her ladies, who were believed to enter houses at night and bring riches when they found offerings. The poem *Romance of the Rose* (ca. 1270) mentioned that sorcerers believed they wandered with "Lady Abundance." Their souls left their bodies and went with good ladies into strange places. Some scholars have connected these nocturnal groups of women to rural fairy beliefs.

Soon, scholars failed to discriminate between different types of nocturnal ladies and their entourage. As early as the thirteenth century, Stephen of Bourbon wrote that the *bonae res* (good women) rode on sticks but that the *malae res* (evil women) or *lamiae* rode on wolves. The term *lamia* has a complex meaning; according to William of Auvergne (1180–1249), it is an evil spirit like the *striga* (screech owl—ancient Roman belief in a bird-like creature sucking children's blood, but coming to mean an evil woman who practiced magic). Often identified with the Bible's Lilith, the *lamia* also has cannibalistic attributes; she is a complex conflation of nightmare, fairy, and *unholde*. By the fifteenth century, this conflation became general: theologians intermingled the *lamiae* with the *bonae res*, subordinating the latter to the former, and nocturnal flight became diabolized.

Witch flies out from a house while others prepare to ascend the chimney. Flight (*transvection*) was essential if witches were to travel great distances to attend their meetings, Sabbats. (TopFoto.co.uk)

The *Errores Gazariorum* (Errors of the Gazars or Gazarii [Cathars—a common term for heretics and later witches]) ca. 1437 asserted that demons presented a stick with flying ointment to all new witches after they had offered the “kiss of shame.” Paulo Grillando, writing in 1525 of the danger church bells posed to witches, concluded that the speed of a witch’s flight “was generally sufficient to obviate this peril.” But he also mentioned the confession of a woman named Lucrezia, who claimed that when returning from a Sabbat in Benevento the ringing of the bells brought her down, causing her to be captured and later burned (Robbins 1959, 512).

Subsequent demonologists also pondered problems connected with flying witches. Jean Bodin, in his *De la démonomanie des sorciers* (On the Demon-Mania of Witches, 1580), affirmed that witches rode a broom or

a black ram; he added that if a boy were born with a caul, he could traverse great distances in a single night. King James VI of Scotland (later James I of England) was generally skeptical about the flight of the witch in his *Demonologie* (1597), and thought it more likely that witches flew in spirit than in their actual physical bodies. (It is worth noting that English witches almost never flew; none of the various witchcraft acts in effect after 1542 ever prohibited flying.)

But could these women really fly? At the end of the Middle Ages, such clerics as Alphonso de Spina, Nicholas of Cusa, or the bishop of Avila, Alonso de Madrigal, accepted the experiences of women who followed the *bonae res* as basically imaginary. Upon investigation, it was determined that while these women thought they were traveling, they were actually lying motionless in a trance, completely insensible to their

surroundings and could not be awakened by shouts, heavy blows, or even by being burned. However, some years later Alonso de Madrigal had completely changed his mind, and he surely was not the only one. He now maintained that such women did not travel in their imagination, nor were they in a trance, but they really did fly through the air at night, with demons carrying them from place to place.

North of the Alps, Johannes Nider's *Formicarius* (The Anthill, 1437/1438), which became a major source for fifteenth-century witchcraft doctrine, reported the case of a woman who claimed to fly by night. A Dominican monk persuaded her to let him and others observe her. They saw her rub some salve on her body while saying a charm. At once she fell into a deep sleep, in which she thrashed around so forcefully that she fell from the table and hit her head. When she woke up, she told the witnesses that she had flown with Venus, but they eventually convinced her that she had been dreaming.

Heinrich Kramer, in the *Malleus Maleficarum* (The Hammer of Witches, 1486) offered two possible explanations of how witches could fly: either a devil could transport them, or, if that was inconvenient, they could invoke the Devil and go to sleep. Both methods incorporated characteristics of the *bonae res*, as well as the evil *lamiae*, into the new concept. Night flight provided a clear example of how Kramer could incorporate the trance-like dream state of women who rode with the benevolent *bonae res* into his image of the witch by adapting the popular concept of the soul leaving the body. While the witches dreamed, a bluish vapor came from their mouths, which made them aware of everything that happened on their travels.

In the second method of flying, the witches of the *Malleus Maleficarum* made an ointment from murdered children. Although they usually rubbed this salve on themselves, they might instead smear it over a chair or some other piece of wood, thus signaling an invisible demon to come, sometimes in animal form, and whisk them away. With this salve, the *Malleus* also managed to integrate infanticide, an old characteristic of *lamiae*, with the night-flying women. If angels or demons transported saints and magicians, and even Jesus had been carried by demons, the *Malleus* concluded, it was much more likely for demons to carry women who worshiped the Devil.

FEAR OF FLIGHT

Henri Boguet, in *Discours exécration des sorciers* (Execrable Speech of the Witches, 1602) quoted many conventional accounts of the physical flight of witches, using examples taken from certain witches whom he had questioned himself. They confessed that while remaining in their houses as dead for two or three hours, they were actually at the Sabbat in spirit. Carlo

Ginzburg (1983) was particularly interested in this type of flight, not the physical forms of flight clearly implausible to the modern reader. It was precisely at this time that Ginzburg found records in northeastern Italy describing *benandanti* (good-doers) fighting witches at night, but "in spirit," to protect the fertility of the fields. While in trance it was quite dangerous, because, if by chance, while they were out, someone came with a light and looked for a long time at the body, the spirit would never reenter it until there was no one left around to see it that night. If the body, seeming to be dead, should be buried, the spirit would have to wander around the world until the fixed hour for the body to die.

The spirit flight of the *benandanti* obviously was the same phenomenon many demonologists described. The difference was that the *benandanti's* flight was entirely part of a coherent belief system, so they could explain it to their inquisitors in the 1570s. In other parts of Europe, references to this "traveling while asleep" are often encountered, but widely scattered, with the Sabbat aspect imposed, usually by the judiciary. In Friuli, it took roughly 100 years to impose the Sabbat aspect onto the people who practiced the flight, so strong was their folklore and knowledge of it. It could be, as Ginzburg suggested, the case that this phenomenon or belief was once widespread and that in most of Europe it vastly diminished, but that in Friuli it remained relatively intact until the mid-seventeenth century.

Another notable example can be traced in the records of the Spanish Inquisition in Sicily from 1579 to 1651 (almost exactly the same time-span as the *benandanti*) associated with a sect known as *donna di fuora* (the women from outside) (Henningsen 1990). Its members confessed to flying in spirit form to Benevento (a famous mainland gathering site for Italian witches) to take part in a Sabbat. In 1560, another Italian witch said she rubbed herself with an ointment and entered a trance; when coming out of it she found herself flying over mountains and seas.

It should also be noted that, precisely during this time, Christian hagiographical records offer numerous instances of ecstatic saints levitating corporeally (e.g., St. Teresa of Avila).

THEORIES

Norman Cohn (1975) asserted that the picture of the Sabbat taking shape in the early fifteenth century was a recent elaboration by lay and ecclesiastical judges and demonologists of hostile stereotypes first applied by Romans to the early Christians. Then the stereotype was applied by early medieval Christians to both Jews and heretical sects, and Cohn denied that this stereotype corresponded in any way to reality. Carlo Ginzburg (1983) amended this argument by emphasizing that the

stereotype underwent radical changes from the medieval period to the sixteenth and seventeenth centuries, under the influence of not only theologians, but also of folk rituals and beliefs: the myth of the Sabbat, as Cohn described it, was not created solely by the elite, because folklore also played a part. Cohn and Ginzburg agreed that when the Sabbat appeared in early modern documents, the flight of the witch was an important part of this myth. Ginzburg (1990) and his followers (e.g., Pócs 1992) emphasized the previously neglected accounts of flight that occurred in folklore and shamanic culture throughout the world, rather than that it was an elaboration by elite mentalities during the witchcraft trials of the early modern period. In other words, they stressed that the flight of witches was not simply invented, or stolen from Roman antiquity, but also, in a sense, discovered (or rediscovered). Ginzburg was particularly concerned to show how and why the flight of witches originated in folklore, believing that the *benandanti* provided vital clues to this. Ginzburg's study about the *benandanti* clearly demonstrated that the notion of the witch's Sabbat took shape around the middle of the fourteenth century, much earlier than was previously thought and clearly not in agreement with Cohn's argument.

Although Cohn's rationalist argument remains valid insofar as witches did not actually fly, considerable evidence about trance-like shamanistic states favors Ginzburg's explanation of the flight. When such accounts are combined with the testimony of the *benandanti*, *Táltos*, and *Calusari*—or indeed, compared with modern accounts of spirit flight—it appears that there is something genuine occurring.

Spirit flight is common today. Anywhere between 8 and 34 percent of respondents in surveys claim to have had an out-of-body experience at some point in their lives. Such testimony describes a completely separate phenomenon that appears to be an elaboration of folk belief in nighttime spirit flight of the type described by Ginzburg. It is possible that spirit flight was indeed once common throughout Europe. Its origins lay in early European pagan practices, possibly shamanistic.

FOLKLORE

Witchcraft, as a normative communal and behavior regulating institution, was endemic in most agricultural communities in medieval and early modern Europe. The system required an ideology in which certain persons could cause damage to fellow creatures through occult means. This witchcraft ideology was mainly passed down through oral transmission in these communities, gradually incorporating some elements from elite demonology, until both strata merged into the witchcraft folklore of present-day Europe. Because of local traditions, witchcraft folklore remains extremely varied; nevertheless, there are many convergences and identities all over Europe because witchcraft tradition is

very ancient and because demonology has exercised a unifying influence.

REPORTS OF EXPERIENCES (MEMORATES)

Memorates most directly reflect the beliefs and rites of witchcraft. They suffice for projecting local beliefs onto a member of a given community who is momentarily accused of witchcraft, and they provide an ideological background to the process of incrimination both in the village community and at the court recording the witchcraft trial through eyewitness accounts. They offer pictures of stereotypical village witches and provide a folkloric map of such figures almost everywhere in Europe. The folklore motifs contained in them define the character, capabilities, activities, methods of making spells, and targets of the witch. The overall character and main features of the witch figure vary from region to region in accordance with their various demonic and magical ancestors (e.g., the witch's relations with Mahr, mara, mora, Alp, Elb, fairy, and werewolf figures).

The most important motifs include the formal variants of witches (various animals according to local tradition such as cats, dogs, snakes, etc.). All over Europe, several attributes manifest their superhuman powers: witches are invisible; they can fly; their soul flies out in a state of trance and so on. Their diabolical helpers, allies or familiars, and their animal helpers present great regional diversions: cats in western and central Europe; rabbits in northern and western Europe; frogs in central and eastern Europe; and snakes and dogs in eastern Europe. Their harmful activities seem broadly similar almost everywhere: witches damaged crops and domestic animals, especially milk and dairy products. The most important personal memories of nonwitches usually concern spells against themselves or their households, which mainly exist in the system of neighborhood witchcraft as narratives based on noticing symptoms of illness. Counteraction is usually fitted into the same narrative. There are several local versions for identifying a witch and avenging the damage, mostly involving divinatory methods for selecting the culprit and symbolic forms of punishment. Thus it was common all over Europe that pricking, firing, or smoking milk provided methods for making the witch sick. An important group of memorates refer to the death of the witch and transmitting its legacy (a witch cannot die before passing her knowledge on to somebody, sometimes by shaking hands).

BELIEF LEGENDS

These are narratives of a higher aesthetic standard that do not connect the stereotypes of witchcraft to a particular person or a personal experience. Although they may include local folklore motifs, these migrant legends seem highly unified all over Europe, mirroring few of

the local variations in witchcraft belief. They are known even in places where witchcraft never existed as an institution or had died out. They are strongly influenced by stereotypes of Christian demonology found in anti-witchcraft manuals. Demonological notions of the witches' Sabbath were thereby transported to a few areas of eastern Europe that were free of antiwitchcraft purges. The similarity of these motifs, overarching several countries and languages, is clearly demonstrated by international and national catalogs of legends, in which types of witchcraft legends form extremely rich chapters throughout central, western, and northern Europe. The situation is somewhat similar in south and southeastern Europe, where similar legends are also associated with demonic figures and magicians.

The most important topics of international witch legends include the unique circumstances of the witch's birth (born of a demon, of a person without status, born with a sign or a bodily mark); the way witches acquired their knowledge, learning from spirits or the Devil through denying God, with an oath sworn to or a pact made with the Devil. The Devil's pact is not necessarily a consequence of elite demonology: it was a well-known folklore motif across much of Orthodox eastern Europe, regardless of witchcraft belief. Stereotypes of *maleficium* (harmful magic) associated with groups of witches are connected not to local and specific cases of bewitching, but to a more general notion of witchcraft, partly inspired by clerical demonology. Elements of this nature include the special dates of communal malefaction (Matthias, Walpurgis night, Friday of the new moon, Luca, Good Friday, St. John's Day, St. George's Day, Christmas, and so forth, depending on the area) and the recognition, detection, and surveillance of witches on these days (such legends, highly popular in central and eastern Europe, usually concern initiation into demonic knowledge such as St. Lucy's stool in central Europe or identification by a priest in Orthodox areas). Group or communal methods of bewitching include taking the yield of the grain by picking dew (a predominantly central European legend), Germanic or Slavic "wind witches" in central Europe, groups of witches raising hailstorms in western and central Europe (witches who "steal" rain were also known in the drier parts of central and eastern Europe), or groups of witches on the Balkan peninsula who remove or eat people's hearts.

Legends about witches' societies and parties range from folklore narratives of demon and fairy groups to the stereotypical demonological narrative of the witches' Sabbats. They contain motifs from legends of groups of witches flying on tours of *maleficium* or marching to orgies on the backs of animals. Sometimes these orgies took place in mills and cellars, but usually they were held atop hills (the German Blocksberg, Hungarian Tokay Hill and Gellért Hill, Ukrainian and Polish Bold Hill, Scandinavian Blåkulla, Croatian Klek, Medvenica,

etc.); their contents (music and dance, feasting, perverse sexuality, Devil's mass) are stereotypical and widespread. They are saturated with the conspiratorial notions of witches' gatherings and Devil's masses propagated by ecclesiastical demonology, particularly in central and western Europe where witchcraft manuals were more commonly known. Legends about the witches' Sabbat were popular in the territories of several peoples. Their motifs include spying on the witches spreading ointment on their bodies (persons spying and copying the witches experience harm); at the mention of God's name the flying witch falls down; food or musical instruments become worthless or obscene objects; the victim dragged to the witches' Sabbat is initiated, or swears membership, or makes a pact with the Devil; initiation by such methods as removing bones or boiling the person; turning people into horses or other animals, then saddling or humiliating these animals. Devices used to fly to these orgies vary according to area: Romanian and Ukrainian witches use instruments of hemp work, while German witches use broomsticks, baking shovels, or milk churns.

In central and eastern Europe, narratives of witches' Sabbats incorporate a great number of beliefs and rites about such pre-Christian supernatural beings as demons, fairies, or werewolves, and offer a large place to "soul journeys" by shamanistic magicians, which were integrated into the medieval system of village witchcraft. For example, we can find both motifs of fairy feasts and battles by witches in storm clouds for good weather and good harvests in Hungarian, Croatian, and Slovenian sources, and we can find battles of Romanian witches to deter disease. Group gatherings of demons, magicians, and witches and their battles appear as the oldest and most persistent topos of witches' Sabbat narratives before being revived as part of European witchcraft beliefs in the Middle Ages.

FAIRY TALES

The witches of fairy tales have little in common with witchcraft belief and the functioning social institution of witchcraft. The witch in these tales is a universal European figure, a vicious, demonic opponent who the hero must defeat to attain his aim—usually, a happy marriage. In other cases, the witch is an ambivalent harming–helping being who sometimes helps the hero in return for certain services or assistance. Witches in fairy tales can be influenced by the demonic beings of local folklore or its stereotypical witch figure, as with the *Holle* and the man-eating witch of German tales, the Russian Baba Yaga, or the Eastern European "Iron-nosed witch" (see types AaTh 450, AaTh 327A, AaTh 709 in the international catalog of folktales).

FOURIER, ST. PIERRE (1564–1641)

Among several post-Tridentine saints who were involved in repressing witchcraft, including the famous St. Carlo Borromeo (who encouraged some prosecutions in his archdiocese of Milan), none had a more bitter experience with this problem than Lorraine's Pierre Fourier. This homegrown saint, canonized only in the twentieth century, who both reformed his own monastic order and founded a new religious order for women (both were approved at Rome in 1628), served from 1597 to 1632 as parish priest in the large village of Mattaincourt, near his birthplace; he also became a respected adviser to Lorraine's rulers, especially Duke Charles IV (1624–1675).

In this baroque age, Fourier seems unpretentious and levelheaded. During his first thirty years at Mattaincourt,

ten people from his parish were tried for witchcraft, although only one of them was burned, in 1598. There is no mention of any of them in Fourier's abundant correspondence; his first recorded opinions on the subject came when he witnessed some spectacular exorcisms of a noblewoman in Lorraine's capital in 1621 and expressed thinly veiled skepticism about the authenticity of her possession and her accusations that two prominent men had bewitched her. Four years later, Fourier attended the celebratory banquet preceding the burning of Lorraine's most politically prominent witchcraft victim, the former ducal councilor André des Bordes: not much skepticism seems apparent here.

It was deeply embarrassing to Fourier when Charles IV learned that a massive outbreak of demonic possession had struck Mattaincourt in 1627. Understandably preoccupied by the fate of his reforms at Rome, Fourier was absent from his parish for over a year, sending a few ineffective exorcists there while local secular officials, confident that local witches were behind this scandal, began arresting suspects. When he finally reached Mattaincourt in 1628, Fourier was aghast at the size of the problem. "There are at least eighty-five people," he reported, "either possessed by the Devil (*l'ennemi*) or tormented by various other kinds of bewitchments. Some of them grunt like pigs, others bark like dogs, and all of them are unable to function normally. Nearly all of them are young girls and a few women; I know of only one man and one or two boys. When they are all together in the church for Mass, they make such strange noises that it is impossible to hear any music, any sermon, any other voices than theirs, which terrify those in attendance. And when they are commanded by the vicar of the Franciscans from Toul (who has been working with them for five or six weeks), those who can speak do nothing but shout, slander, curse, blaspheme, screaming that such-and-such a one (whom they name by their full names) has sent them there, and that she must be burned before they will leave the poor creature. It's all extremely pitiful," concluded Fourier (Derréal and Cord'homme 1988, III, 127–128).

The future saint had been victorious at Rome, but the Devil was handing him a humiliating defeat in his own parish, in a context that looks surprisingly like an early Catholic anticipation of events in Salem Village, Massachusetts, sixty years later. Fourier was not the kind of man to attempt exorcisms himself, and none of his imported experts could control the situation. The secular arm took over: Duke Charles IV named special commissioners to conduct the investigations. Before the fires died out in 1631, almost thirty of Fourier's parishioners had been burned as witches and eight child-witches had to be quarantined indefinitely in a special home, which had been confiscated from the richest victim of this witch hunt. The panic spread to nearby regions; before it ended, fifty people had died,

making it the single worst episode in the history of witch hunting in a strongly affected province. It certainly contributed to Fourier's resigning his position in 1632, but of course, it was never mentioned in the subsequent hagiographic literature leading to his beatification and eventual canonization.

FRANCE

The kingdom of France is a key area for the study of witchcraft trials, despite quite serious archival deficiencies. France had an unusual, highly sophisticated judicial system, which exercised a high level of control over local courts. There were serious disagreements among the elites about witchcraft, which gave rise to highly illuminating disputes and discussions. While there were probably several thousand trials in the country, and numerous lynchings, the number of legal executions was strikingly low, perhaps not more than a few hundred over the century of general activity between 1570 and 1670. One exceptional feature is the high proportion of men among the accused, around half of the known cases, and up to 75 percent in some regions. Ultimately, in the face of some outbreaks of local witch hunting led by self-proclaimed witch finders, the royal government intervened to halt persecution after 1670, and there were only a few sorcerers executed after this time.

The departmental archives of the modern French state contain some extensive records of witchcraft trials, yet with rare exceptions these are from regions still outside the frontiers of the kingdom at the relevant time. Parts of the then Spanish Netherlands, Lorraine, Alsace, Franche-Comté, Savoy, and Navarre all fall into this category. A number of scholars have fallen into the trap of treating these border regions, many of them French speaking, as mere extensions of the areas actually ruled by the Valois and Bourbon kings. The admittedly defective evidence suggests that in most respects this is unjustifiable, since the French kingdom proper followed its own very distinctive pattern.

The most basic problem arises from the dismally poor level of preservation of local judicial archives across France, which are virtually nonexistent for any first instance court before the later decades of the

seventeenth century. It is not clear whether some historians are correct in asserting that trial records were commonly burned with the witch, a practice that would naturally have worsened the situation. This crucial archival gap severely limits the possibilities for close analysis of the French case; it explains the otherwise baffling paucity of local monographs and published source materials. The haphazard survival of documents on a few cases suggests that rural witchcraft accusations in France closely resembled those across most of Europe, a very unsurprising conclusion. The most striking discrepancy is the unusually high proportion of men among French suspects; but there also appears to have been a significant difference in the way the legal system handled the cases, albeit with significant local variations, some of which we can only intuit.

France possessed a complex hierarchical assemblage of law courts (which was evidence for the slow process of state formation), within which royal justice and lawyers played a key role. In the sixteenth century, a series of reforming ordinances, notably that of Villers-Cotterets (1539), reaffirmed and developed the procedures to be followed in these courts. The standard inquisitorial procedure was coupled with the provision that appeals could be made through higher courts until they reached the top level of the *parlements*, sovereign courts whose *ressorts* (jurisdictional areas) between them covered the whole kingdom. These prestigious institutions had wide regulatory powers; while their central concern was with property law, they also maintained a special chamber (the *Tournelle*) to hear appeals in criminal cases (and occasionally to act as a first instance tribunal). The vast *ressort* of the Paris *parlement* covered around half the country; it was surrounded by a range of smaller districts supervised by regional *parlements* at Rouen, Rennes, Bordeaux, Pau, Toulouse, Aix-en-Provence, Grenoble, and Dijon. Once the jurisdiction of these skilled professionals had been established, the crown was apparently content to allow them to define the law through practice, with a wide range of discretion. Witchcraft was just one of many capital offenses that remained undefined by any formal legislation until the late seventeenth century. The underlying assumption appeared to be that the law came close to being a mystical entity, a reflection of divine will as formulated and refined by the best legal minds since the days of the Israelite kingdom and the Roman Republic. Such ideas would have reinforced the other motives of self-interest and prestige that drew the *parlementaires* to assert themselves at the expense of lower courts, usually in the name of ensuring higher judicial standards.

The standard procedure in a late sixteenth-century French trial would be for a local court to collect witness testimony, interrogate the accused, if necessary under torture, and then pronounce its sentence. Anyone convicted of a crime could then appeal to the relevant

parlement, which would review the documentation, question the defendant afresh, and perhaps order another session of torture. This often meant an expensive process of transferring the prisoner long distances under guard, so that the superior court could confirm or modify the original verdict. After the first decades of the seventeenth century, the Paris *parlement*, followed by some others, required automatic appeals in witchcraft cases. That clearly implied grave concerns about the operation of the previous system, which depended both on the accused being aware of their legal rights and on the lower courts respecting them. Because there is a presumption that accused witches would often have been isolated figures, there was an obvious temptation for local judges to evade the costly appeal process. Worse still, evidence was accumulating for episodes of virtual lynch law, with the community seizing suspects in order to subject them to wholly illegal treatment such as the swimming test, or just doing away with them on the flimsiest grounds. In his famous demand for harsher measures against witches, the *Démonomanie des Sorciers* (On the Demon-Mania of Witches, 1580), Jean Bodin blamed excessive lenience by the judges for such abuses. His ingenious argument seems to have fallen flat with the magistrates, who were far more inclined to punish the perpetrators, as part of a general assertion of their own higher rationality when this was set against popular violence and credulity.

Another effect of the central position held by the *parlements* was to restrict the judicial role of the Church. France had never possessed a national inquisition, and the local inquisitorial tribunals around its southern fringes had disappeared by the middle of the sixteenth century. We now know that the hundreds of trials supposedly carried out by the fourteenth-century inquisitors at Carcassonne and Toulouse were complete fictions, invented by the prolific novelist Lamothe-Langon in the 1820s (Cohn 1975, 126–138).

There was a very severe early persecution in the alpine regions of Dauphiné in the fifteenth century, although this territory was still virtually autonomous at the time, after coming under the distant authority of the crown in 1349. Here the ecclesiastical authorities and the secular courts appear to have combined all too efficiently, probably inspired by preachers from the mendicant orders. There were at least 300 trials in the period from the 1420s to the 1460s, most of which probably ended with death sentences. Like the fifteenth-century trials in neighboring Switzerland and Savoy, these cases appear to have been remarkably similar in essentials to those from the major European persecutions that took place more than a century later, with a combination of *maleficium* (harmful magic) and diabolism alleged against most of the accused. As with its Swiss counterparts, it is easier to see how this epidemic began than to understand why it receded by the

late fifteenth century to a relative handful of scattered local trials (Paravy 1993, 775–905).

Across the kingdom as a whole, there is little sign that witchcraft trials were anything but very rare events before the mid-sixteenth century. They begin to appear in growing numbers at just that period, around the time when laws were being codified, new courts created, and something of a repressive drive launched against many other forms of crime, with a particular concern about highway robbery and the misdeeds of discharged soldiers. As elsewhere in Europe, the sixteenth century in France saw a very sharp rise in capital sentences for a variety of crimes, with service in the royal galleys as a thoroughly disagreeable second-rank form of deterrence. These trends appear to correlate better with the social and economic problems associated with a growing population, most notably an increase in begging and vagrancy, than with the highly disturbed era of the Wars of Religion. The ruling classes might well have become conscious of a general threat of disorder, calling for draconian preventive measures. At the level of fantasy, at least witchcraft represented a summation of virtually all the greatest fears of the age, with the witches as the ultimate deviants, traitors both to God and to the rest of humanity.

While a whole range of plausible links of this type can be suggested, the surviving evidence is so scanty that none can be properly tested. We have no reliable figures for the numbers of trials in the *ressorts* of most provincial *parlements*, although the present consensus of opinion favors a very modest figure. The Rouen *parlement*, which was unusually prone to convict witches, is known to have heard a minimum of 380 cases between 1564 and 1660. Samples from Aix-en-Provence show 103 cases, and from Dijon 159, over shorter periods (Monter 1997, 564–567, 584). Elsewhere, records have either been destroyed (as at Bordeaux by fire), are currently unavailable for consultation (one series at Toulouse), or have so far proved uncommunicative.

In relation to the population concerned, the Rouen figure would not differ sharply from the other case where a fairly convincing count is possible. This results from the protracted labors of Alfred Soman in the archives of the Paris *parlement*, a triumph of paleography when dealing with some of the worst handwriting even this notorious period ever produced. A virtually continuous record survives for those prisoners held in Paris while their appeals were decided over the period 1565–1639, with obvious imperfections during the years of the Catholic League (1589–1594); with some other material, this produces a total of 1,288 known appeals from convicted witches between 1540 and 1670. Traces also exist of some 554 other cases known to have been heard in the inferior courts over the same period, while the Paris records include rather summary interrogations of numerous individuals. The same

sources allow a comparison between figures for witchcraft and other crimes. Some of the conclusions from this data apply mainly to the jurisprudence of the *parlement*, and appear under that separate heading. The overall curve is a wholly typical one for neighboring regions: a slow increase in annual numbers until 1580, a plateau at around 20 appeals a year, dropping to 15 across the 1620s, and declining to negligible levels thereafter. It seems probable that any cases not appealed would occur mainly in the earlier period, so the decades before 1600 may contain the highest aggregate figures, as they certainly did for death sentences. At no time did the lower courts condemn significantly more than half the accused to death, a figure that again dropped sharply after 1620, while the *parlement* confirmed only a fraction of these sentences at any time. In consequence, only just over 100 of those who appealed were executed, and after 1625 it was effectively impossible to be legally put to death as a witch within Parisian jurisdiction (Soman 1992, *passim*).

The evidence from appeals to the higher courts, coupled with the scattered local material, does allow some general conclusions about the pattern of events in France. Formal accusations and trials took off abruptly from a previously low level around 1575; within a decade they had probably reached a plateau maintained until about 1620. Over this period there was an underlying pattern of scattered trials over wide areas of the kingdom, boosted by some local panics that promoted brief bursts of more intense activity. The northeastern province of Champagne, and more specifically the Ardennes region, stands out as a center of such witch hunts. They produced various abuses, including murdering suspects and using the swimming test, which attracted strong disapproval from senior clerics, royal agents, and judges alike. There was also the famous hunt at the southwestern extremity of the kingdom, in the Basque *pays de Labourd*, led by the Bordeaux judge Pierre de Lancre in 1609–1610, which seems to have embarrassed his colleagues. His claim to have executed 600 witches is now considered a gross exaggeration, with 80 as a more plausible figure, and only twelve (including three priests) known as certain.

Our very limited information about this and other provincial *parlements* suggests that their attitude evolved in a broadly similar fashion to that of the Parisian judges; the most notable exception is the *parlement* of Rouen. By the 1640s it was becoming evident that there was a real divergence between the judges in Paris and Rouen, to the point that a tactless joke caused trouble at a meeting between leading members of the two courts during the Fronde. It is tempting to think that the Norman judges were trying to uphold traditional Christian values as a way of asserting themselves against their haughty neighbors up the Seine. This might also have reflected the special character of the

cases they heard, for no less than three-quarters of those accused in Normandy were men. A high proportion of these were shepherds, whose widespread practice of sympathetic magic to protect their animals was easily construed as witchcraft. Accusations against a significant number of priests may have been connected to the sacrilegious use of communion wafers for such purposes (Monter 1997, 580–594).

Because the *parlements* of Paris and Dijon also saw a slight majority of male witches, the French situation was plainly an exceptional one, compared to that in any other major European country. Although significant numbers of shepherds, herdsmen, and priests are also found in these other regions, on their own they do not seem a sufficient explanation for an anomaly historians have yet to explain; the lack of fully documented trials is a major handicap here. Within the huge *ressort* of Paris there is a distinct gradient, from around 70 percent men among the accused in the west to 70 percent women in the northeast. Aix-en-Provence had a 70/30 predominance of women, which was probably typical for the Midi as a whole.

The frequent cases where priests were discovered acting as magicians and *devins* (cunning folk) also appear to have been something of a French speciality. They shaded off into the spectacular cases of demonic possession affecting convents in which priests allegedly acted as the diabolical agents who brought about the affliction. In the cases of Louis Gaufridi at Aix in 1611 and Urban Grandier at Loudun in 1634, their supposed victims were Ursuline nuns, while the less impressive episode at Louviers in 1643 involved a local order of Hospitalières and two priests (Mandrou 1969, 195–341; Certeau 2000). There were also some instances of self-confessed werewolves, notably Jacques Roulet of Anjou (1598) and Jean Grenier from near Coutras (1603), both of whom the courts treated with remarkable restraint (Mandrou 1969, 157, 185–188; Mandrou 1979, 33–109). From the start there were evidently many men in authority who took a skeptical attitude toward witchcraft accusations set against other Frenchmen who displayed high levels of credulity or persecuting zeal. The Devil's actions in the world plainly aroused wildly varying opinions and reactions among the French elite, in a period when the Wars of Religion and the subsequent age of Catholic reform created a very special context. Around the middle of the seventeenth century there was a perceptible change in atmosphere as an austere and disciplined religious style gained ascendancy over the more enthusiastic, supernatural elements in French Catholicism. This crucial cultural shift helped make belief in witchcraft increasingly unfashionable among the educated classes, a clear majority of whom came to classify most manifestations as signs of popular superstition and unreason, even if they still accepted the theoretical possibility.

The skepticism of many French lawyers, doctors, and clergy was deepened by the scandalous possession trials at Loudun and Louviers, then by a widespread popular witch hunt in 1644–1645 that began in Languedoc and affected Champagne, the Bourbonnais, Burgundy, and parts of Gascony. In some areas the catalyst was devastating summer frosts, but there were numerous instances where traveling witch finders appeared to organize the hunt for suspects, including a shepherd boy in Burgundy known as the *le petit prophète* and a whole team in Languedoc whom the *parlement* of Toulouse hunted down and hanged. The *parlements* of Toulouse and Dijon were swamped by large numbers of cases sent up on appeal, to which they responded by a handful of executions followed by hundreds of acquittals and reductions of sentences. Not surprisingly, we also hear of many summary executions and killings in 1644 and 1645. For several years afterward, the *parlements* also took action against the witch finders and those who aided them, and numerous death sentences were handed down, mostly in absentia because the ring-leaders fled (Mandrou 1969, 370–394).

After a lengthy period of relative quiescence, a new panic broke out in 1670, this time affecting both the southwest and Normandy. The *parlements* of Bordeaux and Pau had to deal with a renewal of the witch-finding phenomenon; while the former reacted strongly, the commissioners sent out from Pau appear to have been both credulous and corrupt. Meanwhile, the Rouen *parlement* was facing a wave of accusations in the Cotentin area, and First President Claude Pellot found himself at odds with a powerful group of senior magistrates who favored a traditional stance. As a relative and client of the powerful royal minister Jean-Baptiste Colbert, Pellot was able to call royal authority to his aid with an order to suspend the proceedings. He also consulted the chancellor of the University of Paris, Pierre Lalemant, who responded with a beautifully crafted statement of the case for mitigated skepticism and judicial caution. Royal intervention also brought an end to the troubles in Gascony. In 1672 a royal order forced the Rouen magistrates into unwilling compliance, while promising a decisive ordinance on the whole matter (Mandrou 1969, 425–466; Mandrou 1979, 219–230).

No new ordinance was promulgated until 1682; the long delay can be partly imputed to the scandalous *affaire des poisons*, in which numerous courtiers were found to have been dabbling in black magic and divination. The royal decision only dealt with witchcraft in a curiously oblique fashion. It was merely listed among a range of activities that involved imposture and abuse, defined as “so-called magic,” *la prétendue magie*, while at the same time emphasizing the heinous nature of sacrilege and poisoning. Its provisions even allowed the *parlements* of Paris and Rouen to approve the execution

of some shepherds for *prétendue magie* in succeeding years (Mandrou 1969, 466–486, 499–512).

Nevertheless, it is evident that the monarchy and most of its senior officials now saw witchcraft accusations as the kind of disorder they wished to eliminate, an attitude that ensured there would be no more serious persecutions in France. There were to be a few further cases of demonic possession, mostly hushed up quite effectively, while magicians continued to find gullible clients for love magic and for locating buried treasure. Witchcraft beliefs would never be eradicated. Down into the late twentieth century they continued to motivate a scattering of murders and acts of violence in rural communities, and modern anthropologists have been able to study them as a living entity; in that sense, the history of witchcraft in France remains unfinished business.

FRANCHE-COMTÉ

Bordered on the north and east by the two worst witch-hunting regions of Francophone Europe—Catholic Lorraine and the Swiss Protestant Pays de Vaud—Franche-Comté was understandably afflicted with many trials and executions for witchcraft. Today a part of eastern France, this French-speaking province belonged to the Spanish Habsburgs during the age of European witchcraft trials. Although its earliest trial, already featuring flying broomsticks and roasted babies, dates from 1434, the province saw only five known cases before 1500. Perhaps inspired by the imperial law code of 1532 (the Carolina Code), the provincial appellate court wrested jurisdiction over witchcraft from the Inquisition in 1534. However, Franche-Comté's witchcraft trials remained rare after 1500. There were only eighteen known cases before 1549, and only forty-seven more cases (one per year) until 1597 (Rochelandet 1997, 45–46). The vast majority of Franche-Comté's nearly 800 known trials were held between 1600 and 1660, a generation later than in neighboring regions.

Witchcraft legislation was minimal here. After the province laicized this crime in the 1530s, nothing further occurred until 1604, when an ordinance from the Spanish Netherlands permitting all local judges to impose the death penalty for *maleficium* (harmful magic) or for attending Sabbats was extended to Franche-Comté. Because the best predictor of whether or not such a region would experience exceptionally severe persecutions is the extent of its regulation by appellate justice, it is important to realize that Franche-Comté (except for its largest town, the imperial free city of Besançon) had a sovereign provincial *parlement*, which acted much like its French counterparts when judging appeals in witchcraft cases. Surviving sources, carefully explored (Rochelandet 1997), enable us to learn the outcomes of exactly 700 witchcraft trials in Franche-Comté from the fifteenth century until the French conquest of 1668. Nearly 60 percent of them ended with death sentences, but this figure masks the difference between cases decided by local judges and never appealed, with 84 percent resulting in death sentences, over half of which were carried out immediately, and cases judged on appeal by the provincial *parlement*, with 53 percent resulting in death sentences (Rochelandet 1997, 66–67).

Franche-Comté's first major witch hunts, orchestrated by the demonologist Henri Boguet at St. Claude around 1600 and a generation later by his disciple Jean Clerc, the *bailli* (bailiff, the king's representative in a bailiwick) of Luxeuil, both relied on testimony by children and both occurred in lands belonging to great Benedictine abbeys. Neither episode, however, led to a great chain of trials and deaths. Boguet was responsible for fewer than thirty executions in a decade; at Luxeuil,

while Clerc pronounced about forty death sentences. Boguet's career as both witch hunter and demonologist ended after the *parlement* overturned some of his death sentences early in 1612. Clerc's situation seems similar because the *parlement*, after confirming a few appeals of his early death sentences, upheld only four deaths in nineteen witchcraft cases appealed from Luxeuil after summer 1631, and we have no reports of further witchcraft trials there (Monter 1976, 77, 219). Franche-Comté's *parlement* judged cases of witchcraft every year from 1591 until the Thirty Years' War devastated the province after 1636 and destroyed a large part of its population. The *parlement* rarely upheld more than five executions for witchcraft per year, and, even with Boguet or Clerc, no individual village generated more than five trials a year.

Franche-Comté avoided both the excesses and the achievements of its neighbors. The province had no major panics with dozens of executions at a time; there were no bewitched convents, no sorcerer-priests, and no famous cases apart from a peculiar fascination with werewolves. If 136 suspects were searched for the Devil's mark in Franche-Comté and only two did not have one, it is also true that relatively few suspected witches were tortured (Rochelandet 1997, 31, 34). However, its *parlement* never saw fit to imitate the example of its western neighbors and institutional cousins in the duchy of Burgundy (at this time, people spoke of the "two Burgundies") by ordering automatic appeals of all death sentences for witchcraft.

Lycanthropy was a local specialty in Franche-Comté and seems particularly prominent among the province's sixteenth-century witchcraft trials (Oates 1989). "The people of this country ought to know as much as anyone about werewolves," Boguet remarks, "because they have always been known here" (Boguet 1929, 140)—and they were particularly feared for attacking and killing children. Johann Weyer knew about the burning of three local werewolves in 1521; their portraits decorated an important town church. A hermit burned as a werewolf in 1574 was celebrated by a pamphlet. Boguet noted four werewolves (three of them women) among his first group of suspected witches in 1598 and complained that two other confessed werewolves had been executed before they could satisfy his curiosity. Nevertheless, despite this tradition, Franche-Comté's seventeenth-century witches included few werewolves.

After the province had lost much of its population during the Thirty Years' War, Franche-Comté experienced a final flurry of witch hunting between 1658 and 1661. This late panic began when an inquisitor, Pierre Symard, encouraged witchcraft accusations through *monitoires* (monitories—admonitions) in church pulpits in 1657. Symard's antiwitch crusade caused hundreds of arrests, and records show over twenty

witchcraft trials per year after 1657, totals surpassed only by the 1627–1632 surge. However, only 25 of the 116 recorded witchcraft trials in Franche-Comté from 1658–1661 had any connection to this inquisitor (Rochelandet 1997, 58). At first, in 1658–1659, the *parlement* upheld the vast majority of death sentences from those appealing to it. However, the appellate court then reversed itself and the counterattack was rapid and effective. A Besançon physician published the first French translation of Friedrich Spee's diatribe against torture, with the approval of local ecclesiastical dignitaries, in 1660. Complaints to Rome about Symard's methods persuaded the papacy to revoke his appointment as inquisitor by 1661. No more death sentences for witchcraft were carried out in Franche-Comté after 1661 and Louis XIV had no need to decriminalize this offense when he annexed this province in 1674.

FRANCKEN II, FRANS (1585–1624)

Frans Francken II was a Flemish artist whose Antwerp studio is primarily known for its altarpieces and small cabinet paintings depicting religious and mythological themes and innovative subject matter, such as an assembly of witches. Francken's witch scenes are unique for their encyclopedic display of witchcraft motifs, presumably based on a well-digested knowledge of various demonological tracts. They depict old and young women engaged in various demonic activities: worshipping the Devil, anointing their bodies before flying up the chimney and traversing the night skies, stirring a cauldron, reading *grimoires*, divining by twisting a sieve, and conjuring with a magic circle. They also show a dazzling array of attributes of sorcery—a mandragora, a hand of glory, a waxen image, a priest's stole—and monstrous creatures.

Four surviving witchcraft paintings from his studio are by his hand, including three versions of a witches' kitchen (an indoor assembly of witches around a fireplace) (London, Victoria and Albert Museum, signed and dated 1606; Vienna, Kunsthistorisches Museum:

ca. 1610; Munich, Alte Pinakothek: ca. 1610) and a large outdoor night scene (Vienna, Kunsthistorisches Museum, signed and dated 1607). Two additional paintings are mentioned in auction catalogs. One authentic drawing presents a witches' scene (Vienna, Albertina). (Härting 1989, # 405, 410, 409, 408, 406*, 407*, and ill. 67).

THE PRODUCTION OF FRANS FRANCKEN II'S WITCHCRAFT PAINTINGS, INSIDE AND OUTSIDE HIS WORKSHOP

As the head of a painters' dynasty, Frans Francken II excelled in not only painterly but also entrepreneurial skills (Peeters 1999). The organization of his workshop showed early features of an evolution toward mass production of paintings: collaboration between employees and members of the Francken family and diversification into genres. The production of witches' scenes exemplifies this new marketing policy. Francken's drawing shows color indications and must therefore have circulated in his workshop to facilitate the rapid completion of paintings by employees (Peeters 1999, 70–73). Most painted copies and variations date from around 1615. A *Toverij* (sorcery scene) by his brother Hieronymus II, for example, is mentioned in the probate inventory of their father Frans Francken I (Peeters forthcoming). Ursula Härting mentions seven actual paintings, one by Hieronymus II (Prague, National Gallery) (Härting 1983). At least nine more painted and drawn copies and variations of the witches' kitchen can be traced, all from outside his workshop. An etching interpreting a Francken witches' scene by the Parisian printmaker Jaspar Isac (ca. 1654) is accompanied by a French poem titled *l'Abomination de sorciers* (The Abomination of Male Witches), although Francken depicted only females. Francken's inventions directly inspired the witches' kitchens of David Teniers the Younger.

ICONOGRAPHY

Frans Francken II was probably familiar with some of Jacques de Gheyn II's witches' scenes, for he apparently adopted several of his iconographic inventions. Most important was the device of a picture within the witchcraft picture, showing a revelry of naked witches or, as in the much-copied Francken scenes, a church building threatened by witches and demons, symbolizing and advocating loyal constancy to the "True Faith," rather than yielding to "Temptation," that is, allowing the senses to be deluded or deceived by the Devil. This moralizing message is also emphasized by some of the sorcery equipment and monstrous beings in Francken's witches' scenes, which bear a secondary, allegorical reference to devilish temptations or, more specifically, to one of the various sins that people may

Frans Francken II, Witches Sabbath, or The Assembly of Witches (1607), with thirty witches, young and old, erotic and ugly, rich and poor. Demons serve as witches' assistants or are worshipped. Witches perform amatory magic with charms and spells. (Stapleton Collection/Corbis)

commit if they yield to such temptations. A (pierced) toad, for instance, reminds the beholder of the sin of avarice, the result of a Devil-imparted delusion about the attraction of worldly possessions (Löwensteyn, forthcoming).

Like his colleagues, Francken used witchcraft paintings to present some beautiful young, female nudes whose erotic qualities are enhanced by their contrast to ugly old hags acting as procuresses for the Devil. While offering these nubile nudes to the Devil for his delectation, the old hag also offers them to the beholders—and the young women gaze straight into (his) their eyes while performing a striptease—certainly an audacious contribution to the iconographic tradition. Even more striking, however, is the fact that before they undress, these seductive nudes are clothed as contemporary bourgeois ladies of Antwerp, subtly suggesting that these young witches could be the viewers' daughters, sisters, spouses, or even perhaps, themselves (Löwensteyn forthcoming).

FREDEGUNDE (CA. 545–597)

Fredegunde was a Frankish queen associated with two cases of witchcraft. Of low origin, Fredegunde became one of the mistresses of the Merovingian king Chilperic I of Neustria. She later married him after inducing him to strangle his wife Galswintha (ca. 567), a member of the royal Gothic dynasty. This became a reason for the renewed war between the Frankish kingdoms of Neustria and Austrasia. Following the murder in 584 of Chilperic (over whom she had exerted remarkable power) and her order that several sons whom her husband had with other wives be killed, Fredegunde acted as regent for her son Clotaire II. Frankish historiography portrays her as an extremely cruel and power-mad ruler, torturing and murdering many men and women, even those of high standing, at her discretion; no source allows us to contradict that verdict.

When her sons had died during a disease epidemic, Fredegunde became convinced that one of her female servants had bewitched them and intended to do the same thing to her. This woman allegedly wanted to kill the queen and her children because her daughter had become the mistress of Chilperic’s son Clovis and might become the future king’s spouse, if both Fredegunde and her sons could be eliminated. The queen, therefore, had both the woman and her daughter captured and tortured. The servant confessed her use of magic arts or poison (*maleficiis*) and blamed it on Clovis, whom Fredegunde soon had murdered. The suspected sorceress “was condemned to be burned alive. As she was dragged off to the stake, the poor creature started to admit that she had lied, but her confession availed her nothing” (Gregory of Tours 1974, V: 39).

Some what later, Fredegunde’s young son Theuderic also died, probably of dysentery. Again, she searched for

the culprit and found him in the person of the prefect Mummolus, whom she hated. He had boasted of a certain herb in his possession that could cure Theuderic’s illness. As the queen could not attack this royal official directly, she first had a number of Parisian women rounded up and tortured. They were forced to confess “that they were witches . . . and responsible for many deaths . . . ‘We sacrificed your son, O Queen, to save the life of Mummolus.’ Fredegunde then had these poor wretches tortured even more inhumanely, cutting off the heads of some, burning others alive, and breaking the bones of the rest on the wheel.” This was their punishment for having used *maleficiis et incantationibus*, magic (or poison) and incantations, to murder Theuderic. Upon Fredegunde’s instigation, Chilperic I also had the prefect questioned similarly; but he denied all sorceries, admitting, however, to having used unguents and potions in order to bring him into the good favor of the king and his wife. Even after his torments, he boasted not to have felt the pain. Chilperic therefore concluded “it must be true, then, that he is a sorcerer, if the punishment which we are giving him does not hurt him.” So he racked him again, and he did not survive this for long (Gregory of Tours 1974, VI: 35).

For a number of reasons, these incidents are informative for the history of witchcraft during the Early Middle Ages: Through them we learn that the application of magic, both to arouse love and to destroy life, must have been quite common in sixth-century Gaul. Though a man might be the instigator, women were suspected first and foremost of bewitching. Torture created (or, at least, convicted) witches. Burning was a common punishment for crimes of magic, in accordance with the *Lex Salica* (Salic Law) 19, 1. In many respects, this situation was comparable to the later Middle Ages and the early modern era. However, no special ecclesiastical or civil institutions existed for witch hunting, and there is no hint of any suspicion of involvement by demonic forces. Therefore, cases of persecution for sorcery remained relatively scarce before the fourteenth century.

FREUD, SIGMUND (1856–1939)

Freud was the pioneer of modern psychoanalysis, with an abiding interest in demonic possession and witch

persecutions. Born in Freiberg, Moravia (now Příbor, Czech Republic), Freud first became professionally interested in demonic possession while studying at the Salpêtrière hospital in Paris from 1885 to 1886 with the noted French neuropathologist, Jean Martin Charcot. In his autobiographical *Report on My Studies in Paris and Berlin* (1886), Freud praised Charcot for his astute comparisons of modern hysteria with the medieval phenomenon of demonic possession, a method that became known among contemporaries as “retrospective medicine.” Its followers eulogized the sixteenth-century physician Johann Weyer as the harbinger of modern psychiatry. Thereafter, Freud continued to identify himself closely with this highly romanticized notion of an enlightened and compassionate Weyer fighting against popular ignorance.

Apart from his personal association with Charcot, there is evidence that early modern demonological ideas influenced both Freud’s psychoanalytic theory and his practice. In his *Studies on Hysteria* (1893–1895), Freud characterized the psychoanalyst as “a father confessor, who gives absolution, as it were, by a continuance of his sympathy and respect after the confession has been made” (*S.E.* 2: 282). He also described procedures employed to overcome the resistance of patients to depth therapy, such as the laying-on of hands and the pricking of insensitive parts of the body with needles—methods curiously resembling those used by exorcists and witch hunters. In his correspondence with Wilhelm Fliess in 1897, Freud went so far as to suggest that the medieval theory of possession was *identical* with his own theory on the splitting of consciousness, that his own work on hysteria had already been published “a hundred times over, though several centuries ago,” and that he would study the *Malleus Maleficarum* (The Hammer of Witches, 1486) “diligently” (Masson 1985, 224–227). In the same correspondence, he admitted his awareness that “inquisitors prick with needles to discover the devil’s stigmata” and posited a close relationship between confessions about sexual abuse by the Devil made by accused witches under torture and the communications of his own patients made during sessions of psychoanalysis concerning their childhood sexual experiences.

In 1920, a Viennese archivist brought a well-documented case of demonic possession to Freud’s attention, leading him to try his hand at retrospective medicine. His *Demonological Neurosis* (1923) examined the possession experience of a seventeenth-century Bavarian artist, Johann Christoph Haizmann. Freud diagnosed Haizmann as a long-time sufferer from ambivalent sexual identity and a castration complex whose full-blown possession followed the death of his father. He based this interpretation on archival documentation, including a monastic attestation, two pacts with the Devil, and the artist’s own androgynous caricatures of Satan. By

confidently asserting the applicability of psychoanalytic method to historical study, Freud had literally written one of the first works of psychohistory. Ultimately, however, given the overwhelming domination of Georg Wilhelm Soldan’s paradigm of possession and witchcraft at the time, his works were decidedly historicist.

There was another side to Freud’s fascination with demonology. The Devil appears over 120 times in his writing, and he displayed a marked penchant for diabolical literature. His favorite opera was Mozart’s *Don Giovanni*. His favorite books included Flaubert’s *Temptation of St. Anthony*, Milton’s *Paradise Lost*, Hugo’s *Notre Dame of Paris*, and Dante’s *Inferno*, but there is no evidence that he ever read the more famous *Madame Bovary*, or *Paradise Regained*, or Dante’s *Paradise*. Freud, an avid cocaine user from 1884 to 1895, first experimented with the drug on Walpurgis Night. This is especially striking, when one considers the lengths Freud went to in order to purchase the drug from the chemist Emanuel Merck. As Freud knew, Merck headed the German pharmaceutical company founded by Johann Heinrich Merck—a close friend of Goethe and the model for Mephistopheles in *Faust*. One psychiatrist has gone so far as to speculate that Freud (who was fascinated by the works of Nietzsche at the time) was involved in a neurotic fantasy pact with the Devil, and may have even contracted a written pact on the evening of his first experiment with cocaine, before he met Charcot or heard of Haizmann (Vitz 1988, 149–157, 170f.).

FREUDE, MICHAEL (CA. 1620–1692)

A Lutheran pastor in Mecklenburg, Freude implemented confessionalism in the duchy of Mecklenburg-Güstrow with a campaign of puritanical discipline and

rejection of superstitious beliefs. His experiences led him to examine the topics of witchcraft and possession closely in his writings. It is due to his work, and the work of others like him, that the persecution of witches finally ended in Mecklenburg-Güstrow.

Freude was the son of a craftsman's family in the small Mecklenburg town of Plau. He studied theology and served as pastor of Kuppentin parish between 1645 and 1678. He decided to leave his position in 1678 after long and intense disagreements with both the village overlord and with many of his parishioners. He died in Lübeck in 1692. Freude was among the few Mecklenburg pastors who actively supported the discipline and denominational policies of Duke Gustav Adolf of Güstrow, who sought to wipe out folk magic and superstition. In 1667, Freude published the first version of his *Gewissens-Fragen von Processen wieder die Hexen. Insonderheit denen Richtern hochnötig zuwissen* (Questions of Conscience Concerning Trials of Witches. In Particular, Highly Necessary for the Judges to Know). Its expanded 1671 version focused on the three aspects: the social constructs of witchcraft; the repertoire of remedies for bewitchment; and the legal basis for trials against witches. In an appendix, he discussed the topic of possession in both its religious and legal contexts.

The author reflected the theory and practice of witchcraft trials in Mecklenburg, but he also extended the discussion of determining witchcraft and the practice of trials. He determinedly followed the cautious opinion of witchcraft typical of a large group of mostly Protestant scholars, whose total opposition to superstition finally led them to vanquish belief in witchcraft. This balance between the freedom of the human will, divine permission, and the power of the Devil appears to be the complete opposite of the *Malleus Maleficarum* (The Hammer of Witches, 1486). As the Devil has hardly any magical competence to perform destructive magic, the witches fall into his trap, in which Satan need only suggest the actual damage to be done. Freude did, however, consistently refer to the reality of pacts made with the Devil, and to the Devil's persuasive methods.

The educational intentions of Freude's book stemmed from his everyday experience, and he consistently emphasized the equality of the nondevout, the possessed, and witches. There were gradients of difference between these three forms of sin, but doing active or passive damage was one mark of a life without God or morals. The author constantly emphasized that salvation can only be ensured through penance and conversion, and he included witches in this. People who participated in persecuting witches because of damage done to them were stigmatized just as radically as those using any form of folk magic. A denunciation of witchcraft and folk magic would come at some predestined time, but may not be made by the victim himself.

Better to die pious, Freude claimed, than to use magic or other illegal means of healing. The only individual remedy against witchcraft he prescribed was the spiritual sword: true faith.

In addition to his strict rejection of superstition, Freude also criticized witchcraft trials, referring to legal deficiencies and charges brought against innocents in proceedings he knew of. Unlike his early work of 1667, he now quoted extensively from Friedrich Spee's *Cautio criminalis* (A Warning on Criminal Justice, 1631), although Freude seemed less radical. His personal reservations about the use of torture were portrayed vividly to the reader, but did not lead to a radical criticism of the current system of proof. (Torture, however, was not necessarily conclusive proof.) His experience with the noble patron of his parish and the attempts of the Güstrow government to place witchcraft trials under central control informed his call for strict control over local court officials by sovereign princes.

Freude was committed to arguing for a cautious and temperate approach to naming witches, accusations, and circumstantial evidence. As in 1667, his assessment of the legal basis for a trial remained vague, although this section was more extensive in 1671. He referred to witch crimes as *crimen exceptum* (the excepted crime), but also thought that it should be standard procedure to give defendants legal counsel and to examine circumstantial evidence carefully. Prompted by Güstrow, Freude condemned every form of testing for witchcraft and turned his attention toward naming witches and confrontations. Although his views became obscured in citations of pieces of documentary evidence, he dismissed the idea of arresting on a single accusation and argued for cautious dealings with easily spread rumors.

After clarifying different special cases, pointing out that members of the upper classes should also be investigated if under suspicion, and questioning the characteristics of old age or youth in sentencing, Freude returned to his original goal. Witchcraft, according to him, could only be eradicated by fighting against the unbelief and ignorance of the general population. It was precisely this combination of criticism of trials and of superstition that characterized the Güstrow clergy. Only a decade after the publication of *Questions of Conscience*, the persecution of witches had ended there, because the belief in witches had in itself become a form of superstition.

FREY, BERNHARD, SJ (1609/1610–1685)

As father confessor and advisor to the Bavarian Elector, Frey urged moderation in matters of witchcraft, demonic possession, and the insanity defense. He passed his early childhood in Oberstdorf in the aftermath of a severe witch hunt and a peasant revolt. In 1621, Frey enrolled in the Jesuit lyceum in Dillingen, became a novice in Landsberg in 1626, and studied philosophy at Ingolstadt, where he took orders formally in 1628. After teaching in Freiburg, he returned to Ingolstadt in 1633 to complete his studies in theology. After being ordained in 1637, he taught at various Jesuit educational institutions in Augsburg, Ingolstadt, Innsbruck, Landshut, Munich, and Lucerne. During this period, he intensified his interest in casuistry and moral theology (precursors of modern psychology and psychiatry) and published numerous theses on his primary scholarly interests: the soul/mind/body relationship, personal guilt, and mental culpability. In 1652–1653, he led a mission to reintroduce Catholicism to the Sulzbach region of Pfalz-Neuburg.

After 1654, Frey spent his remaining years in Munich, first as head of the elite Marian congregation and then, from 1673 to 1679, as the last in an unbroken, century-long chain of Jesuit father confessors at the court of the Wittelsbach dukes/electors. By this time, a marked shift away from demonological to pathological explanations of madness, suicide, and the insanity defense was underway at court. As father confessor and trusted spiritual advisor to Elector Ferdinand Maria, Frey helped pave the way for this paradigm shift, producing a number of seminal briefs in cases of insanity, demonic possession, and witchcraft. An incident in 1679 clearly illustrated his stance. During a private meeting with the Bavarian chancellor, his personal friend Johann Rottgner stormed into the room, produced a pistol, shot and wounded Frey, and assaulted the chancellor with a knife. Although both escaped with their lives, Rottgner was sentenced to the galleys. However, Frey interceded on his behalf with the elector, pleading for leniency on the basis of an insanity defense.

In his role as ecclesiastical advisor to the elector, he was called on to deliver expert testimony in several extraordinary cases of demonic possession. Between 1666 and 1668, Frey participated in a lengthy investigation into the activities of the demoniac, Anna Puchmayer, who drew large crowds in Freising and

Munich. After an examination of witnesses, the possessed was tested. She screamed when an empty reliquary was applied, but failed to notice the secret application of actual relics. Because she could not detect things hidden or speak in foreign languages, Frey and the other theologians decided it was a case of either melancholy or fraud. Despite subsequent claims that she could now speak Latin, Italian, and Hebrew, Puchmayer was declared a victim of fevers and a madwoman and remanded to the custody of the Holy Spirit Hospital in Munich. Simultaneously, the demoniac Anna Mayer underwent literally hundreds of exorcisms in Altötting and Benediktbeuern. Frey was convinced that all evidence of possession was lacking and that her denunciations threatened a witch hunt. He recommended she be remanded to a respectable family for Christian discipline, heavy work, and fasting. At Frey's urging, the elector officially dismissed her exorcist, the Franciscan Lucas Gasberger, from the case while Mayer, who physically assaulted the skeptical Jesuit rector in Altötting, was ultimately ordered to return home and earn her livelihood through honest toil. In 1668, Frey again discredited the relationship between the demoniac Katharina Rieder, who had signed a pact with the Devil, and her exorcist, Willibald Starck, SJ. His superiors had already had Starck transferred from Straubing to Munich after he disobeyed performed embarrassing exorcisms there on the demoniac Elisabeth Susanna de la Haye. Frey discredited Starck's continued exorcisms in Munich as blatant repetitions of the previous incident in Straubing and again warned that he ran the danger of inciting witchcraft accusations. Frey was already known as an outspoken advocate of moderation in accusations of witchcraft, basing his opinions largely on the earlier ideas of fellow Jesuits, above all Friedrich Spee and Adam Tanner. In 1670, he became the first Bavarian official to refer publicly to the more radical *Cautio Criminalis* (A Warning on Criminal Justice, 1631) on the excesses of torture and the dangers of chain reaction persecutions alongside Tanner's moderate admonitions in an attempt to contain an isolated accusation of witchcraft and to end a series of witch hunts he duly condemned as "dangerous and dreadful trials against witches" (Behringer 1997, 323, 356).

FREYA (FREYJA)

The goddess of fertility Freya is connected with the witch figure in many aspects: her shape-shifting abilities, her connections with magical healing, her lasciviousness, and her ability to fly at night. She became so famous that all women of distinction were given the title “*fru*” (“lady”) in her honor.

In Norse mythology, Freya is the daughter of Njord and Nerthus, or Skadi. She is Freyr’s sister and wife. She is also the wife of Od, a sun god, and Ottar’s mistress. The poet Snurri Sturluson claimed that with Od (Odur) she had two daughters, Gersemi and Hnoss (both names are synonymous with “treasure”). Freya is important to the Aesir, as well as the frost giants, who always seem to find a way to claim her. During the construction of Asgardr, the Aesir commanded one of the frost giants to build the wall around their home. On condition that he finish the wall within a certain time, he asked for and was promised Freya as his wife, in addition to sun and moon as his payment. Another time, the frost giant Thrymir stole Thor’s hammer and held it ransom, demanding the hand of Freya as payment.

Freya was worshiped as a mother goddess, a bringer of fertility and love. Women were thought to go to her abode after their death. She was pictured in falcon garb and moved over the earth in her feather dress. Together with her maids, she sat beneath the fruitful boughs of Yggdrasil, from where Aurboda and Beli abducted her and brought her to Jotunheim. It is obviously a Norse fertility myth with similarities to Persephone.

THE WITCH FIGURE

Freya is also known as a sorceress who introduced magic among the Aesir. In this role, she was identified as Heid. Some scholars saw her as a moon goddess, or the goddess of the night who was drawn across the skies by two cats or boars. She is a spring goddess whose attributes include flowers, music, and the color green. Early Christians considered her a witch, banishing her to the mountains, where she danced with demons on Walpurgis Night (Guiley 1989, 130).

Freya is a lascivious woman, who gives her favors quite freely to gods or mortals. This is clearly illustrated by the story of her necklace *Brisingamen*, a marvelous

jewel made by four dwarves known as the Brisings. When Freya saw the necklace, she agreed to spend a night with each of the four dwarves in return for ownership.

Together with the Vanir hostages Njord and Freyr, she was brought to the Aesir, teaching them her magic, as the *Ynlingasaga* (chap. 4) outlined. Freya’s association with cats may have stemmed from her links to the Volva, who practiced a sort of shaman-like trance divination, known as “*seidr*,” that Freya reputedly invented and then taught; the Volva dressed as animals, often cats. Freya had other connections with the arts of the shaman: she was a shape-shifter, often assuming the shape of a falcon in order to fly from Asgardr to all corners of the nine worlds.

Pre-Christian Scandinavia already had the notion of enchantresses riding or driving out at evening and night, as the *Edda* states. The notion of the Furious Host is at some state intertwined with the notion of the night flight. The female figures known as “ladies of the night” and those participating in the Furious Host are supernatural beings, goddesses. Theologians might have identified them with the Roman Diana or with Herodias, but the populace never entirely forgot their traditional native names. If Dame Holda, also known as Freya or *Abundia*, had once led the round dance of elves, Christian theologians subsequently considered her an *unholde* that is, an evil woman.

FRISIUS, PAULUS (CA. 1555–?)

Author of the 1583 book *Defss Teuffels Nebelkappen. Das ist: Kurzer Begriff den gantzen handel von der Zauberey belangend zusammen gelesen* (The Devil’s Hoodwink: A Short Summary of What Has Been Compiled Concerning the Whole Business of Witchcraft). Frisius [Paul Friese] has left few certain details about his life to posterity. Probably the son of Johannes Frisius, a pastor in Nagold, he matriculated at

the University of Heidelberg in 1575 and seems to have signed the Lutheran Formula of Concord of 1580. Because Frisius dedicated his work to Landgrave Georg I of Hesse-Darmstadt, and a number of his stories originate in Hesse, he was probably a pastor in one of the Hessian territories in the 1580s.

The Devil's Hoodwink, published in Frankfurt by Wendel Hum, belonged to the new literary genre of Devil books (*Teufelbücher*) that appeared with increasing frequency in German cities from the 1550s, and especially in Frankfurt am Main, which became the principal center for their dissemination. Frisius's work was republished in Frankfurt in 1586 in a collection of nine books dealing with devils and witchcraft, the *Theatrum de Veneficis* (Theater of Poisoners), published by Nicholas Bassé and edited by the Marburg lawyer, Abraham Saur.

Frisius structured his work around the popular folklore of the *Nebelkappe*, the large magical hood or cloak (*Kappe*) that supposedly made its wearers invisible and allowed them to carry out their deeds veiled in fog (*Nebel*). The motif had been used in this way by the Nuremberg author and playwright, Hans Sachs, in a play of 1559 about a country bumpkin with such a magic hood (*Der Paurenknecht mit der nebelkappen*). Frisius appropriated the notion to express the complex webs of diabolical deception and illusion within which the acts and perceptions of witchcraft needed to be understood. In Frisius's work, then, witchcraft became a spectacular hoodwink perpetrated on humanity by the Devil, the master conjurer, arch-trickster, and father of all lies.

Frisius's work seldom referred to theological or philosophical arguments, but was built on stories of mysterious and marvellous deeds drawn from the Hebrew Bible, ecclesiastical authorities such as St. Augustine, John Cassian, and Vincent of Beauvais, and from sixteenth-century collections of *exempla*. Its approach was that of the preacher, welding together accounts of common cultural experiences to display the compact between the witch and Devil. Frisius's critical argument was that the marvellous deeds of witches ("poor whores of the Devil," as he repeatedly called them) did not depend on their own power or instruments, but only on the Devil's power. The illusions created by the Devil, the Devil's "blinding" or hoodwink, allowed witches and observers to be duped into thinking that witches had such power, and to hide the Devil's true role. Witches were no more than shadow puppets of the Devil, who manipulated the forces of nature, the human senses, and the human imagination. The witch's responsibility lay in her evil intention to participate in a pact with the Devil, an intention stimulated most commonly in Frisius's work by the vice of lust.

The title-page woodcut for Frisius's work was modeled on an illustration that first appeared in *Die Emeis*

(The Ants), Geiler von Kaysersberg's 1516 and 1517 sermon collection. The woodcut published in 1583 had been used twelve years previously in a pamphlet by a Catholic priest from Schlettstadt, Reinhard Lutz; a slightly different version appeared in several editions of Johann Weyer's *De Praestigiis Daemonum* (On the Tricks of Devils) and in a work by Abraham Saur, which argued for the reality of witchcraft and was published in Frankfurt in the previous year, 1582.

The *Devil's Hoodwink* had some themes in common with Weyer's seminal tract, insofar as it focused on diabolical illusion and trickery as fundamental to witchcraft. Unlike Weyer, however, who partly attributed claims of witchcraft to the melancholic nature of old women, Frisius focused on their evil intentions and on the diabolical pact that they willingly entered. Indeed, Frisius's dedication to Landgrave Georg I of Hesse-Darmstadt constituted a plea to eradicate the evil of witchcraft; and because Frisius's work appeared just one year after the landgrave had established a new criminal code that first stipulated specific punishments for witchcraft, its purpose may have been to support this princely initiative.

FRÜND, HANS (CA. 1400–1469)

Fründ was a Swiss chronicler famous for his report in old German about the witch hunt of 1428–1430 in the bilingual Swiss canton of Valais. Like Dauphiné and Savoy, Valais belongs to the Alpine regions where the earliest witch hunts have been found. For this reason, Fründ's report of witches gathered around an "evil spirit" is a major source of the history of witchcraft.

Born in Lucerne at the beginning of the fifteenth century, Hans Fründ became chancellor (*Landschreiber*) of Schwyz (Schwiz) and wrote a "Chronicle of the Ancient War of Zurich" covering the years 1436–1447 (Marchal 1980, 992). His "witch-report," written soon after the events of 1428–1430, could have been his very first essay. In it, Fründ related how the "wickedness, crimes and heresy" of men and women called *sortilegi* in Latin were uncovered in 1428. These *sortilegi* were first found in the Val d'Anniviers and in the Val d'Hérens, two French-speaking valleys of Valais, and then in

nearby German-speaking regions. Insisting on the novelty of the phenomenon, Fründ reported at length about the sorcerers' practices and beliefs, using information gathered from trials and confessions, mostly made after torture. According to him, those persons gathered in heretical "schools" directed by an evil spirit (*böse Geist*: the words "devil" or "demon" were never mentioned), who appeared to them in the form of a black animal, either a bear or a ram, or in some other horrible form. If they were weak or envious or doubtful, this evil spirit convinced them to reject Christianity by denying "God and all his Saints, Baptism, and Holy Church." The evil spirit perverted the Mass: he preached sermons against the Christian faith, forbidding his audience to attend church or confess. They had to pay an annual fee, either a black sheep or a measure of oats, and promise to give him one of their limbs after their death. Only then did the evil spirit teach them how to make magical potions and ointments that could make women sterile and men impotent, or make people sick, or kill them (Fründ 1999, 53–62).

Fründ believed in the reality of the night flight. According to him, the "evil spirit" taught the sorcerers how to anoint some chairs on which they flew from one mountain peak to another and visited whenever they wanted the castles with the best wine. There, they banqueted and feasted in the cellars, but the wine was magically restored. The evil spirit also taught them how to become wolves, eating raw meat, or how to become invisible by absorbing some herbs. During their gathering or "society" (*Gesellschaft*), they killed and ate their own children or those of their neighbors.

In the aftermath of the War of Rarogne (1414–1420), which had deeply disturbed the political climate in Valais, fears of an anti-Christian conspiracy acquired some plausibility. Even before 1428, some people had been judged there for sorcery or magic spells (*sortilegium*), without mentioning the Sabbat. According to Fründ, in one and a half years since 1428, more than 100 persons had been arrested, judged, and burned in Valais, with trials continuing as he was writing. The new sect counted 700 members and was preparing to overcome the Christians, elect a king, and set up new courts. Though Fründ's numbers—100 or 200 victims burned, 700 members—may be overestimated, the chronicler reported true events in Valais. Between approximately 1428 and 1436, numerous trials were conducted in Valais, principally by secular courts; between 1428 and 1434, secular authorities and assemblies, such as the one in Leuk (Loèche) in 1428, decreed new laws against witchcraft and sorcery. Valais witchcraft trials showed the Sabbat appearing around 1429, which was very early in comparison to the rest of Europe (Fründ 1999, 63–93).

FUGGER FAMILY

In the first quarter of the sixteenth century, the Fugger family succeeded the Medici as the most important bankers in Europe. A half-century later, some members of this family became outstanding supporters of the Counter-Reformation, promoted by public exorcisms and witch hunting.

Of humble rural origins, the Fuggers migrated to the imperial city of Augsburg after the Black Death. Already in the fifteenth century the family rose to importance and divided into two branches, labeled after their coat of arms as "Fugger vom Reh" (deer) and "Fugger von der Lilie" (lily), founded by Jacob I Fugger. His son Jakob II Fugger "the Rich" (1459–1525) managed the Fugger company in Innsbruck after 1485, soon becoming chief banker to the Habsburg dynasty under the Holy Roman emperor Maximilian I. Jakob accumulated an enormous amount of wealth. The Tyrolean Habsburgs had to pawn their silver mines to him. He also acquired copper mines in Spain, Austria, and Hungary, and took over the financial transactions of the papacy concerning the sale of indulgences. As the leading European banker of his age, he provided crucial aid for the election of King Charles I of Spain, who became Emperor Charles V in 1519. In return, the Habsburgs showered the Fugger family with titles and land, on the basis of which the Fuggers became feudal lords, counts, and eventually princes of the Holy Roman Empire. Raimund Fugger (1490–1535) and Anton Fugger (1493–1560), who succeeded their childless uncle Jakob II as "rulers" (*Regierer*) of the Fugger company, maintained the policy of accumulating feudal property and thus managed to survive the major losses contracted through loans to Charles V and his son King Philip II of Spain. During Anton's "reign," the company had branches throughout Europe from Poland to Spain, and in Spanish America. Raimund's grandsons, Philipp Eduard and Octavian Secundus

Fugger (1549–1600), commissioned the most extensive news collection of the sixteenth century, the “Fugger Newsletters” (*Fugger-Zeitungen*), by employing correspondents, postmasters, and news agents in cities all over Europe, from 1568 to 1605, when the printing of periodical newspapers started in the Holy Roman Empire.

The Fuggers remained a bulwark of Catholicity within the largely Protestant imperial free city of Augsburg, guided by their alliance with the Habsburg dynasty and their business relations with the popes. When Martin Luther and his supporters were already raging against so-called “works-righteousness,” in 1519 Jakob II commissioned the construction of large blocks of buildings (the *Fuggerei*) within one of the poorer suburbs of Augsburg, the *Jakober Vorstadt*, devoted to his patron saint St. Jakob. There the needy were (and after almost 500 years still are) invited to live for a symbolic fee and the vow of regular prayers for the salvation of Jakob Fugger. Although trying to maintain friendly relations with the Protestant fellow citizens, Anton Fugger established close links with the bishops of Augsburg, the Catholic dukes of Bavaria, and the new Jesuit order. In particular, he supported Peter Canisius as a Counter-Reformation missionary during his period as cathedral preacher in Augsburg. Anton’s son Markus “Marx” Fugger (1529–1597) continued this support, and during this “rule” the female members of the Fugger family were particularly closely related to Canisius. Marx’s wife Sibylla von Eberstein (1527–1589) converted to Catholicism, as did Ursula von Lichtenstein (1542–1573), Georg Fugger’s wife. In return, both promoted the founding of the Jesuit College in Augsburg in 1582, like other Fuggers by donating large sums of money, estates in the city, and landed property in the countryside.

Members of the Fugger family, such as Anton’s son Hans Fugger (1531–1598), were outstanding art collectors and bibliophiles. They spent enormous amounts of time networking and sponsoring artists, were educated or even learned, and succeeded as humanists. By demonstrating taste or cultural hegemony, they gained the attention and friendship of princes of the Holy Roman Empire. Duke Albrecht V of Bavaria bought the famous library of Johann Jakob Fugger (1516–1575) as a basis of his own library (which eventually became the *Bayrische Staatsbibliothek*). Early on the Fuggers celebrated their success as a dynasty by commissioning works like the “*Fuggerorum et Fuggerarum imagines*,” and the Fuggers have employed historians to the present day in order to celebrate their dynasty.

The darker sides are usually excluded from Fugger-sponsored historiography. Marx Fugger not only allowed Canisius to use his female relatives and their female servants for terrifying public exorcisms to

demonstrate the superiority of Catholicism over Protestantism, but he also started witch hunting. During the first wave of persecution in this region around 1590, witches were burned throughout his large estates that stretched from the Danube in the north to Augsburg, around his small capitals Oberndorf and Nordendorf. As an unknown reporter put it, “Marx Fugger, the noble man, is also rooting out and punishing the evil throughout his estates, everywhere” (*Österreichische Nationalbibliothek, Vienna, Fugger-Zeitungen, Cod. 8963, fol. 751ff.*). These persecutions have not yet been adequately explored. The Fugger newsletters provide detailed reports about witchcraft trials in the prince-bishopric of Augsburg, particularly at the district court of Schwabmünchen, because of the nearby Fugger residence at Kirchheim.

However, in the long run, the Fuggers did not show outstanding zeal in persecuting witches or prosecuting witchcraft, neither as lords nor as politicians in Augsburg or in the Holy Roman Empire. It was even claimed that one Alexius Fugger resigned as a ruling lord in 1590 because he felt unable to cope with pressure from both his peasants and neighboring lords demanding witch hunting in his lordship Randeck on the Danube, because he could not reconcile the bloodshed with his conscience. It was only from the 1640s to the 1660s that further witchcraft trials are reported from the tiny Fugger lordship Wasserburg am Bodensee (Lake Constance), with up to twenty executions between 1656 and 1664. Prince Anton Ignaz Joseph von Fugger von Kirchberg und Weissenhorn (1711–1787), prince-bishop of Regensburg, invited the exorcist Johann Joseph Gassner to cure his beginning blindness and other diseases in 1774. Gassner infamously explained all diseases by witchcraft, and the very fact that this bishop offered a stage to a man who had already been outlawed by Emperor Joseph II, Prince-Elector Max III Joseph of Bavaria, Archbishop Clemens Wenzeslaus von Sachsen, and other enlightened celebrities, seemed outrageous. The bishop survived both witchcraft/exorcism and public opinion, commissioned a marvelous high altar still to be seen in Regensburg cathedral, and donated his property to the poor.

FULDA, PRINCE-ABBEY OF

Germany's largest imperial prince-abbey, located in the former district of the Upper Rhine, Fulda experienced major witch hunts during the interrupted reigns of Prince-Abbot Balthasar of Dernbach (ruled 1570–1576, restored 1602–1606). An enthusiastic supporter of the Counter-Reformation, Dernbach had quarrelled with the Protestant estates and been expelled from Fulda in 1576. When he returned to Fulda after twenty-six years, following a decision by the imperial privy councillor, he carried out a program of drastic re-Catholicization. Additionally, he appointed Balthasar Nuss, an old confidant, as criminal judge for capital offenses. Nuss immediately began a large-scale witch hunt. In contrast to what earlier findings have suggested, this was not a calculated Counter-Reformation measure, as both Catholics and Protestants were among the victims. Nevertheless, many Protestant families left Fulda, starting in 1603. Among those persecuted at the very beginning of this wave of trials was the mother of a Fulda alderman, Dr. Georg Haan. He soon moved to Bamberg, where he later became chancellor, before he too was executed as a sorcerer in 1628.

Between early 1603 and 1606, at least 239 people were executed for alleged witchcraft. Before the wave of persecution started, the prince-abbey had asked the law faculty in Würzburg to certify its methods of conducting witchcraft trials. However, Nuss ignored their rather persecution-friendly guidelines while directing his trials. His procedures thus complied with the concept of *crimen exceptum* (the excepted crime), but did not follow the *processus ordinarius* (ordinary procedure) as provided for in the *Carolina* (the imperial law code, 1532). This apparently caused friction with the abbot, who advocated adhering to standard procedure and forbade Nuss from pocketing part of the legal costs in addition to his official pay. In the end, however, Balthasar of Dernbach tolerated these witchcraft trials, supposedly because they implicated relatives of his political opponents. A special order put the city of Fulda's secular subcourt (the so-called *Müntz*) in charge of carrying out the trials. Members of the *Müntz* allowed to pass sentence included several lay assessors, as well as Balthasar Nuss. This court convicted not only inhabitants of Fulda, but also accused witches from other places under the jurisdiction of the prince-abbot.

The trial of Merga Bien in the summer of 1603 became especially well-known. She was arrested solely on the basis of denunciations by other suspects, and

then, bound by her hands and feet, was locked in a dog-stall, where she could only crawl on all fours. The charges against her concerned elaborate witchcraft, particularly taking part in witch dances and harming cows. Her husband lodged a protest against Nuss and his fellow-judges before the imperial appellate court in Speyer, which ordered that her trial be conducted in strict accordance with the measures prescribed by the *Carolina*, and specifically forbade torture without adequate circumstantial evidence. Nuss, however, forced Bien's husband to withdraw his charges by threatening legal action. That very same day, the court in Fulda started torturing Merga Bien, who confessed and was executed. In the end, Blasius Bien had to pay for the burning of his wife.

A second spectacular incident during Fulda's witchcraft trials was Nuss's attempt to try six women from Fulda's upper class for witchcraft. All six had already left with their families and thus never appeared before the *Müntz* in Fulda. Instead, they filed suit against Prince Abbot Balthasar and his judges before the court of appeals (the imperial chamber court, *Reichskammergericht*) in Speyer for their unlawful conduct of witchcraft trials.

The witchcraft trials ended with Balthasar of Dernbach's death on March 15, 1606. His successor, Johann Friedrich of Schwalbach, dismissed and then arrested Balthasar Nuss, after hearing complaints that Nuss had administered his office improperly. Nuss was imprisoned for twelve years on charges of unjustified profits, corruption, and embezzlement, and was finally executed in 1618. After 1606, no witchcraft trials ever took place in Fulda. In 1612, Friedrich Spee pronounced his vow as a novice of the Jesuit order in Fulda. On this occasion, he probably learned about Fulda's witch hunts and Nuss's arrest, which likely strengthened his loathing for witchcraft trials.

G

GAPPIT, PERRISSONA

The case of Perrissona Gappit, tried in 1465 in the seignury of Châtel-Saint-Denis (today in the Swiss canton of Fribourg), offers exceptionally complete documentation. Unlike almost all fifteenth-century witchcraft cases, the records of her trial include not only the transcripts of the interrogations of the accused and the verdict, but also extensive pretrial material. This allows a nearly complete reconstruction of the case; a critical edition of the whole corpus has been published (Modestin 1999, 276–317). First studied in 1909, the case has been used subsequently by key scholars: one emphasized the shift of the charges from sorcery to diabolical witchcraft during the trial (Kieckhefer 1976, 32–33); another highlighted the intrinsic interest of the case for studying the backgrounds of individuals accused of witchcraft (Blauert 1989, 71–73). The latest discussion (Modestin 2000, 120–128) stressed its political context—the unstable situation of Châtel in the 1460s.

THE PRETRIAL EXAMINATION

The trial began on January 11, 1465, when Claude Burritaz, a notary commissioned by the episcopal and inquisitorial authorities of Lausanne, questioned three witnesses, followed by Perrissona. (Burritaz had previously served as clerk in a 1448 witch hunt near Vevey.) The first witness was the son-in-law of the accused; the second was his father, that is, Perrissona's second husband. Both believed her to be a "heretic" rather than a "good Christian." The reason they offered was Perrissona's character: she was alleged to be extremely irascible—a feature that later became a stock piece preceding an accusation of witchcraft. In addition, they alleged, Perrissona had an intrinsic power to cause illness: her son-in-law claimed to be paralyzed because of her, and her husband had allegedly become mute—which apparently did not prevent him from charging his wife. The third witness, finally, suggested myths about the witches' Sabbat: a neighbor accused Perrissona of attempting to abduct her newborn baby.

The first two accusations illustrated the daily difficulties between the two men and Perrissona within a common household. Details in their depositions offer insights into a microcosm into which Perrissona had failed to integrate even after eighteen years of marriage.

Mutual distrust poisoned their relationships. Yet, what aroused the suspicions of the third witness is unclear.

The accused at first denied the charges brought against her. But when the commissioner confronted her with what were probably minor contradictions in her testimony, she broke down. In the end, she confessed attending the "sect of the heretics" presided by a "big man in black." Thus, at the final stage of her pretrial examination, the accusation had shifted from "domestic" sorcery to diabolical witchcraft. Her subsequent trial focused exclusively on the latter, completely overshadowing the charges that had originally triggered Perrissona's examination.

THE TRIAL

The actual trial, after which Perrissona was sentenced to death and burned in public, was conducted by a vice-inquisitor from the Dominican convent of Lausanne and required seven sessions between January 23 and February 4. The accused confessed denying God, though with considerable reluctance. After undergoing torture, she also admitted having had sexual intercourse with the Devil.

THE POLITICAL CONTEXT

The social positions of the assessors of her trial suggest that the local elite took considerable interest in Perrissona Gappit's conviction. Her trial was preceded by several other cases at Châtel-Saint-Denis sometime in the 1440s or 1450s, but we cannot link her case directly with them. However, in the 1460s, political sovereignty over the seignury of Châtel was claimed both by its local lords and by the city of Fribourg, to which it had been mortgaged. In March 1461, Fribourg appointed a castellan to control Châtel; he remained until mid-1464, when the question of the debts was settled. Châtel-Saint-Denis changed hands several times in the following months, before a Savoyard nobleman, Bernard of Menthon, purchased it on January 16, 1465. Thus Perrissona Gappit's trial was under way exactly when Châtel was changing hands. The chronology of the events suggests that the local elite profited from the brief absence of overlordship to get rid of a particular person by initiating a witchcraft trial.

GASSENDI, PIERRE (1592–1655)

French theologian, philosopher, scientist, Catholic priest, and provost at the cathedral of Digne, Gassendi was a pioneer of corpuscularianism (the theory that matter is made up of corpuscles—minute particles) and empiricism, famous for helping design a revolution in natural philosophy. He advocated abandoning Aristotelianism for a "truer and better" skeptical and empirical philosophy. Without attacking witchcraft directly, Gassendi was one of the major seventeenth-century thinkers who undermined magic. His conviction was that an eclectic, Christianized epicureanism enabled philosophers to contribute to the progress of the new experimental sciences while providing better support for the Christian faith. He distinguished "clear" from "obscure" philosophies, with the latter including those that used fables or symbols to express mystical or occult concepts.

At the request of Father Marin Mersenne (1588–1648), in 1628 Gassendi became involved in a controversy with Robert Fludd (1574–1637), the English hermeticist, cabbalist, chemist, and Rosicrucian, and a spokesman for magical animism. Although he did not agree with Mersenne that Fludd was an evil magician and an atheist, Gassendi judged Fludd's version of the doctrine of the "Soul of the World" to be pantheistic and heretical because Gassendi believed it led inevitably to the deification of creatures including demons, to idolatry, to the conclusion that animal souls were immortal, and that everything done on earth, both good and bad, was done by God (*A Consideration of the Philosophy of Robert Fludd*, 1630). In his later works, especially the *Syntagma philosophicum* (Philosophical Treatise), prepared between 1649 and 1655, Gassendi worked out a clear alternative to such Neoplatonic magical-occult philosophies. A proper understanding of mechanical physics would eliminate forever the world of mysterious metaphysical causalities, sympathies, and antipathies. He saw astrology as a "puerile" superstition that could

only be ascribed to human imbecility and stupidity. Gassendi dealt at length with the vanity of astrologers, denying vigorously that stars can influence humans. If astrological predictions seemed to come true, reasons other than astrology explained it: fortune or chance, the charlatan's cunning, and the ignorance and stupidity of their clients. In the same way, he attacked alchemy. Like René Descartes, Gassendi attempted to reduce every physical phenomenon to local motion, using no concepts except atoms and their reciprocal collisions. Thus, his *Syntagma* completed Gassendi's earlier polemics against magic and astrology, started in his *Epistolica exercitatio* against Fludd, with his atomistic and mechanical explanations. Gassendi expressed skepticism about diabolical and malevolent magic. Tales of long fasts, like those of possession by demons and bewitchment, were often based on imposture. Although he denied the power of imagination over other bodies, nevertheless, this outspoken skeptic was inclined to accept something like the evil eye and tried to offer a mechanistic explanation: a woman "fascinator," her eyes and imagination focused on the tender body of an infant, might throw off maleficent rays and injurious effluvia and so affect the state of the baby's health.

Gassendi's polemics against astrology and magic were very influential in creating a mechanistic alternative to Platonic naturalism and Renaissance Aristotelianism. In 1634 Mersenne used Gassendi's antiastrology polemic in his *Préludes de l'harmonie universelle* (Preludes of Universal Harmony). Only one year after its publication, the part of Gassendi's *Syntagma* attacking astrology was translated into English: *The Vanity of Judiciary Astrology Or Divination By The Stars: Lately Written In Latin By That Great Scholar And Mathematician, The Illustrious Petrus Gassendus, Mathematical Professor In the King of France. Translated into English by a Person of Quality* (London: H. Moseley, 1659). Five years earlier, Walter Charleton (1619–1707) had published his *Physiologia Epicurum–Gassendo–Charltoniana or, a Fabrick of science natural, upon the hypothesis of atoms, founded by Epicurus, repaired by Petrus Gassendus, augmented by Walter Charleton* (London, 1654), which also used Gassendi's arguments opposing astrology and magic.

GASSNER, JOHANN JOSEPH (1727–1779)

Gassner became famous as an exorcist and miracle healer who postulated that all illness was the work of demons and witches. After studies at Prague and Innsbruck, he was ordained as a priest at Chur in 1750 and took over the pastoral care of two parishes, Dalaas and Klösterle. While still at Klösterle, he successfully tested his miracle cures, first on himself and later on his parishioners.

His therapies always followed the same pattern. This is evident from the numerous publications, some by Gassner, that amply document his methods. A patient would appear, and the miracle healer would in most cases inquire about the patient's complaints. Then he would begin an invocation, after exhorting the sufferer to trust in Jesus and his help. The diagnosis of "possession" was, as a rule, a foregone conclusion; the patient's medical history was mostly disregarded. Even if he conceded the existence of natural illnesses in theory, for Gassner, diseases were almost without exception of an unnatural and thus demonic origin. Still, the demons or devils had to manifest some sign of their presence first. This he tried to accomplish through a test exorcism, which official Church law did not permit. He would order the Devil to manifest some of the symptoms that the diseased person had shown before, and only after that would he begin the exorcism proper. However, the priest broke Church statutes again by teaching his patients a prayer with which they would be able to ban the Devil on their own, even without his immediate involvement, which undermined the priestly monopoly on spiritual affairs. The effects of his cures, quite successful in some cases, were never lasting, and can today be partially explained by posthypnotic suggestion.

After some spectacular cures, this parish priest from Vorarlberg gained a wide following that extended beyond southern Germany geographically, and into the highest circles socially. In particular, the upper nobility and the bishops of Regensburg and Chur favored him. Even though he was unable to heal Anton Ignaz Fugger, the blind Prince-Bishop of Regensburg, Fugger gave Gassner official permission to perform exorcisms in his diocese. Even Protestants could be found among his followers, first and foremost the duke of Württemberg and Johann Caspar Lavater. After his initial success at Klösterle, the miracle healer practiced with episcopal permission at Kempten, Regensburg, and then especially at Ellwangen. During his stay at Ellwangen alone, between November 1775 and June 1776, Gassner reportedly treated 20,000 patients. The high degree of

attention the public gave Gassner at the height of his fame can be seen not only by the numerous poems and countless personal testimonies, but also by the reports of the various commissions that investigated him and his methods. More than 100 publications for or against the exorcist (*Gassneriana*) were published within a short time from 1775 onward and reviewed in the leading periodicals of the time; the controversy about Gassner's therapies electrified the entire German-speaking public. In fact, this became one of the most important controversies of the Enlightenment in southern Germany, and one of the prominent debates in the German Enlightenment as a whole.

Enlightened Protestants regarded these cases of exorcism as yet more proof of darkest Catholic superstition, part of the belief in witchcraft and the Devil. Soon, however, critical voices could be discerned from within the Catholic camp. In addition to Elector Max III Joseph of Bavaria and Emperor Joseph II of Austria, even Pope Pius VI eventually turned against Gassner, especially as they feared disturbances of "peace and order" from Gassner's large following. The Bavarian Academy of Sciences played a leading role in the fight to contain the influence of this exorcist, although it was undermined immediately after the end of the Bavarian "witchcraft war." When the Viennese doctor Anton Mesmer seemed to be able to produce much the same effects as Gassner by relying on his "animal magnetism," the academy favored Mesmer as the "lesser evil," although many contemporaries regarded him as hardly less doubtful than Gassner. After Pius VI condemned Gassner's teaching as heretical in a *breve* of April 20, 1776, even his noble patrons were no longer able to support his methods. The miracle healer spent his last years quietly as a parish priest under the patronage of his long-time supporter, Anton Ignaz Fugger, at Pondorf, a village on the banks of the Danube.

GASTALDO, GIOVANNI TOMMASO (D. 1655)

An Italian Dominican angelologist and demonologist, Gastaldo's major work, *De potestate angelica, sive de potentia motrice ac mirandis operibus angelorum atque daemonum* (On Angelic Might, or, On the Locomotive Power and Wondrous Works of Angels and Demons), published from 1650–1652 in three volumes, totals 2,110 large double-column pages. It summarized a half-millennium of systematic angelology and demonology since Peter Lombard's *Sententiarum libri quattuor* (Four Books of Sentences, ca. 1150). Gastaldo's major debt was to his fellow Dominican, St. Thomas Aquinas, but he also exploited two centuries of witchcraft treatises.

Though "scientific," Gastaldo's treatise was polemical. His preface declared his intention to refute skepticism about the existence of angels and demons: "We occasionally find persons so enslaved by their senses that they consider nothing worthy of belief unless they can perceive it with their senses, as St. Augustine asserts in book 21, chapter 3 of his *City of God*" (Gastaldo 1650–1652, 1: vii). Gastaldo investigated whether angels and demons could interact corporeally with human beings and give sensory proof of their reality. Verifiable interaction would provide empirical evidence for the validity of Christianity.

The nine divisions of Gastaldo's treatise rehearsed and expanded the favorite contentions of fifteenth- and sixteenth-century witchcraft treatises: (1) on the might (*potentia*) or locomotive power (*potestas*) of angels and demons; (2) on supernatural angelic power; (3) on angels' power to move themselves; (4) on angels' natural power to accomplish marvels, especially demons' power to produce the wonders of magicians; (5) on angels' power to "assume" virtual bodies; (6) on demons' power to effect sorcery (*sortilegia*) and witchcraft (*maleficia*); (7) on demons' power over the possessed; (8) on demons' power to attack humans; and (9) on angels' power to foreknow and reveal future events (*De potestate angelica*, 1: iv.).

Distinctions four through six polemically vindicated the reality of angels and demons. Distinction five, the center of the work, examined "whether angels, both good and evil . . . can truly take on bodies, so as to

appear to us" (*De potestate angelica*, 2: 414). That angels have appeared to humans in bodily form (*in corporibus*) was an article of faith, because Scripture recorded many such events. "Thus there is no difficulty" concerning the *fact* of such apparitions. "But are angels shown to the external senses by means of true bodies, which can be seen and touched, or . . . instead only through deceiving our senses?" (*De potestate angelica*, 2: 416). Gastaldo required another 172 columns to answer these and related questions.

Distinction six showed the most influence of witchcraft treatises. Like them, it revisited a problem that worried Aquinas: did witchcraft (*maleficium*) actually exist? If it did not, then proof was scarce that demons existed (*De potestate angelica*, 2: 502–503). Like the beginning of the *Malleus Maleficarum* (The Hammer of Witches, 1486), Gastaldo quoted Aquinas's rebuttal: angels and demons were an article of faith, but the reality of *maleficium* demonstrated their reality empirically (*De potestate angelica*, 2: 501–612). Demonic *maleficium* indirectly guaranteed the immortality of the human soul (*De potestate angelica*, 2: 130–164). Moreover, demons were necessary to theodicy: without their *maleficia* (harmful acts), no satisfactory explanation existed for the death of baptized infants: either God seemed unjust or his sacrament appeared inefficacious (*De potestate angelica*, 2: 513–515). *Maleficium* must be defended against the objections of medical writers like Avicenna and Galen, who tried to assign natural causes to every disease, and against more recent skeptics like Pietro Pomponazzi (*De potestate angelica*, 2: 537).

Gastaldo's obsessive-compulsive defense of spiritual reality eloquently demonstrated the fragility of that concept by 1650, the time of Galileo and René Descartes. Despite its immensity, Gastaldo's treatise brought little novelty to arguments current from Aquinas to Torquato Tasso: fictive ("assumed") corporeality, locomotion, *maleficium*, possession, and prophecy. Gastaldo depended heavily on the *Malleus Maleficarum* to develop these ideas; he surpassed such single-minded witchcraft treatises only through bibliographical thoroughness and argumentative stamina.

GAULE, JOHN (CA. 1604–1687)

An obscure clergyman, John Gaule's claim to fame in witchcraft history rests on the publication, in 1646, of his *Select Cases of Conscience Touching Witches and Witchcrafts*, a skeptical work prompted by the author's hostility to the witch-finding activities of Matthew Hopkins. This book appeared shortly after John Davenport's *The Witches of Huntingdon, Their Examinations and Confessions; Exactly Taken by his Majesties Justices of the Peace for the County* (London, 1646), which described the trials of a number of witches, of whom about six were executed. *Select Cases of Conscience* apparently originated in a number of sermons against witch hunting that Gaule had preached to his parishioners at Great Staughton in Huntingdonshire, and was dedicated to the local lord of the manor, colonel Valentine Walton, presumably the man to whom Gaule owed his incumbency and who was also Oliver Cromwell's brother-in-law.

Little is known of Gaule's life. He apparently attended both Oxford and Cambridge universities without taking a degree at either, and in the 1620s moved in aristocratic circles, possibly serving as chaplain to Robert Bertie, first earl of Lindsey, and definitely as chaplain to Baptist Hicks, Viscount Camden, upon whose death Gaule published a "Funebrious Commemoration" in 1630. Gaule published a number of other works that undermine the British *Dictionary of National Biography's* description of him as "an unlearned and wearisome ranter." In 1628, he preached one of the prestigious Paul's Cross sermons in London, an important honor for a young minister; in 1649, after several years as vicar of Great Staughton, he preached an assize sermon at Huntingdon, proof of local recognition of his competence.

Gaule's *Select Cases of Conscience*, like most "skeptical" works of the period, did not reject the possibility of witchcraft, and contained much that was familiar in English demonological works. Its underlying purpose was to stress the need to bring people to a proper understanding of witchcraft. In particular, this implied persuading would-be accusers of witches both to accept that most of the misfortunes they attributed to *maleficium* (harmful magic) were in fact the result of God's providence, and also to contemplate their own sinful and uncharitable hearts. Gaule clearly did not deny the existence of witches. He asserted "that as there have been; so ther are & wil be witches unto the world's end" (Gaule 1646, 9), and he insisted that witchcraft was a great sin. In the best English Protestant tradition, he also stressed the central importance of the demonic pact, accepted the reality of familiars, and spent some time discussing the Sabbat.

Moreover, and again in common with all mainstream English Protestant demonologists, he attacked the "vulgar conceit" that "distinction is usually made betwixt

the white and the blacke witch: the good and the bad witch," arguing that "good" witches were worse than malefic ones, and were equally deserving of censure (Gaule 1646, 30–31). Again like most English writers, he clearly regarded some of the more extreme educated witch beliefs as nonsensical, dismissing the belief that sexual congress between human beings and incubi or succubi could result in the birth of offspring as "the height of all phantasticall delusions" (Gaule 1646, 49).

Gaule's main aim, therefore, was not to attack the belief in witchcraft, but rather to attack the excesses that were causing mass witch hunts in eastern England at the time he wrote. Thus he criticized those who "conclude peremptorily (not from reason, but indiscretion) that witches not only are, but are in every place" (Gaule 1646, 4), and reserved special odium for "witch-searchers or witch-seekers," whom he described as practitioners of "a trade never taken up in England till now" (Gaule 1646, 6). Despite his acceptance of the existence of witchcraft, and the conventional ways in which he viewed it, Gaule's work could clearly provide ammunition for those opposed to the type of witch hunting indulged in by Matthew Hopkins. Written as it was in the wake of Hopkins's activities, it was a brave book, although perhaps one that indicates clearly that attitudes toward witchcraft were not so monolithic at this time as has sometimes been supposed.

Later, in 1652, Gaule also published a major attack on astrology, *The magistro-astrological Diviner posed, and puzzled*, a work dedicated to Oliver Cromwell.

GEILER VON KAYSERSBERG, JOHANN (1455–1510)

A leading pre-Reformation theologian and preacher, Geiler's significance for European witchcraft rests on the twenty-five sermons he preached on witchcraft in 1509, from which the Franciscan author Johann Pauli took notes that he published in Strasbourg as *Die Emeis* (The Ants) in 1516 and 1517. Born at Schaffhausen but named for the town where his grandfather raised him, Geiler received his MA in Freiburg (1463) and his doctorate of theology in Basel (1475), before returning to Freiburg in 1476 to become professor of theology and then rector. In 1478 Geiler became a preacher in Strasbourg, from 1486 in the cathedral, achieving widespread renown and delivering numerous sermon series over the next three decades, most of which were published posthumously.

Anonymous drawing of a Sabbat from Johann Geiler von Kaysersberg's sermons on witchcraft published as the *Die Emeis* (*The Ants*), 1516. The illustration contains many elements common to such representations: weather magic, nudity, demons, bones, cauldron, serpent, and flowing hair. An enchanted table moving with its front legs in the air is an unusual touch. (Cornell University Library)

The title *Die Emeis* was taken from the *Formicarius* (Anthill), the influential work of the south German Dominican theologian, Johannes Nider, from which Geiler frequently quoted and drew his material. Geiler covered topics such as the witches' night rides, their powers of metamorphosis, the relationship between the female gender and witchcraft, the power of the evil eye, and the capacity of witches to inflict harm. He also discussed the extent and limits of the Devil's power, the licit and illicit means used to protect oneself against witchcraft, as well as the relationship of witchcraft to such aspects of folklore as wild people, werewolves, and the processions of the Furious Horde.

Geiler placed much emphasis on the Devil's power to tamper with the human imagination to create fantasies and illusion. This happened with the witches' night rides, he argued, or with claims of shape shifting. And when harm was caused by witchcraft, it was the Devil who intervened to ensure its success. Geiler supported the death penalty for those who carried out serious sorcery, or alternatively for those who believed in their own power to either divine the future, harm by sorcery, or invoke the dead through necromancy.

The Ants also provided a rich source for illustrations of witchcraft. Three are especially significant. The first

was a woodcut accompanying the first of the sermons, modeled on Hans Baldung [Grien]'s work of 1510, that appeared later in Hieronymus Braunschweig's *Book of Distillation* (1519) and in at least five editions of Johann Pauli's collection of moral tales, *Schimpf und Ernst* (Humour and Seriousness, 1522), thereby becoming a most influential example of the new witchcraft iconography. The scene represented Geiler's emphasis that many claims made by witches were merely products of diabolical illusion. The woodcut illustrated a story from Nider, in which a village woman claimed to ride out at night with other witches. The artist supported the text's conclusion that this was simply a diabolical fantasy by including the classical planetary god Saturn, a figure linked to contemporary notions of melancholic delusion.

The second important figure was a woodcut illustrating Geiler's sermon on "How witches milk axe handles to procure milk" that exemplified the common technique used by artists to identify traditional sorcery practices as witchcraft. It depicted a well-known method for stealing milk: an old woman kneels on the ground with an axe firmly wedged into a house post, while milk pours into a pail from the end of the axe handle. The artist has also inserted two visual cues, a

cauldron on a smoking fire and a hailstorm in the sky, which had no connection with the subject but ensured an easy identification with witchcraft.

The woodcuts accompanying Geiler's sermon on the Furious Horde (*Wütisches Heer*) were especially instructive for understanding contemporary readings of traditional folklore. This third significant illustration, a 1516 woodcut, depicted a procession of Bacchus, the god of wine, a drunken Silenus, the father of satyrs, and a satyr playing a bagpipe. The scene represented the world of unbridled senses, a common target of moralist preachers like Geiler. In 1517 this image was replaced with a woodcut previously published in two 1497 editions of Sebastian Brant's popular *Ship of Fools* (1494) and in a Geiler sermon series of 1512. It depicted a soldier standing on his head in a cart, which was being pulled by horses traveling backwards and led by a fool using the wrong end of his whip. This was an image of carnival inversion, in which all was upside-down and ruled by folly. As with interpretations of witchcraft, the folklore of the Furious Horde has been linked to fears of societal disintegration and disorder.

GENDER

Like many other crimes in early modern society—or today—witchcraft was gender related, though not gender specific. Between 75 and 85 percent of those questioned, tried, and executed for witchcraft after 1500 were women, though this percentage varied significantly. In Finland and Estonia, half or more of those prosecuted for witchcraft cases were male; in seventeenth-century Iceland or Muscovite Russia, the vast majority of those

executed for evil magic were men. On the other hand, in the Holy Roman Empire, including pre-1648 Switzerland and modern eastern France, which saw by far the worst persecutions and the greatest number of mass trials, women predominated overwhelmingly; men occasionally comprised up to one-third of accused witches, but some witchcraft trials involved only women. There were reports of German villages where every adult female inhabitant was accused and nearly all of them executed.

Links between gender and witchcraft were not limited to the witches themselves. Except for a few female rulers, all of the authorities involved in witch persecutions—officials, rulers, judges, inquisitors, notaries, executioners—were male. Rulers and officials intent on finding and destroying witches consciously used patriarchy as a model, describing themselves as firm but just fathers, carrying out their investigations for the protection of those under their authority just as responsible fathers protected their children from harm. This harm included physical injury at the hands of witches, or the spiritual danger that could come from any woman, even their own mothers, teaching them magical sayings or other superstitious practices. While investigating suspected witches in many parts of Europe, judges and inquisitors routinely sought the exact details of a female (but never a male) witch's demonic sexual contacts, ordering suspects to be stripped, shaved, and pricked with a needle for the "Devil's mark" (a wart or mole insensitive to pain) left as a result of this contact. In England, searchers (sometimes women) looked for the witch's mark, a protuberance or supernumerary nipple that a witch's familiars (domesticated demons) sucked. Because these investigations were generally carried out by male officials—judges, notaries who recorded the witch's answers, the executioner who did the actual pricking or other types of torture—with the witch at least partially naked, it is difficult not to view them as at least partly motivated by sexual sadism.

Scholars of witchcraft have dealt with its gendered nature in various ways. Some of the earliest historical studies of witchcraft ignored it, discussing demonology or the development of witch persecutions in different areas without analyzing how ideas about witchcraft shaped, and were shaped by, contemporary notions of what it meant to be male or female. During the 1970s and 1980s, several authors asserted that the witch hunts were primarily an attempt by male authorities to suppress independent women, especially those who had spiritual knowledge or were midwives, herbalists, or healers. This conclusion has been refuted by more recent studies, but it has gained acceptance among some contemporary practitioners of witchcraft, who view "true" witchcraft as linked with nature and healing rather than with demonic forces.

Today most historians acknowledge the role of misogyny, asserting that hatred and suspicion of women were important factors in the witch beliefs and witchcraft trials of many parts of Europe and America. They note, however, that negative ideas about women had been part of Western culture long before the age of the witch hunts, and that they were just as prevalent in areas that saw few trials, such as southern Europe, as in areas that saw many. It is therefore important to investigate why accusations of witchcraft developed out of misogyny only at certain times and places and not at others, thus integrating gender with other explanatory factors. It is also important to make distinctions between learned demonological theory, popular ideas, and the actual course of witchcraft trials; though these were often interwoven, gender figured quite differently in each of them.

DEMONOLOGICAL THEORY

The link between women and witchcraft became very strong in the learned demonological theory of central

and western Europe, beginning in the fifteenth century, particularly in the *Malleus Maleficarum* (The Hammer of Witches, 1486), the most influential and also most misogynous treatise on demonology and witch hunting. The authors of these works asserted that women were more likely to be witches than men because they were impressionable, mentally weak, resentful of authority, easily deceived by the Devil and likely to deceive others, ambitious, vain, talkative, and vindictive. This list of women's negative qualities was based on the writings of Aristotle, Church Fathers such as Jerome, Augustine, and Tertullian, and a host of medieval Christian authors, all of whom provided underlying intellectual concepts that supported the link between women and witchcraft. These included the dichotomies of order and disorder, culture and nature, reason and emotion, mind and body—dichotomies in which men were linked to the more positive first term and both women and the Devil to the more negative second one. In both the classical and Christian traditions, women were thought to be more disorderly than men, and witches to be both disorderly and actively bent on destroying order; witchcraft was often portrayed as an inversion of the normal order, as were situations in which women had authority over men.

Demonological theorists added two ideas to this intellectual tradition, making the links between women and witchcraft even stronger. One was the notion that the essence of witchcraft was the pact with the Devil, a pact that required the witch to do the Devil's bidding. Thus witches were no longer people who used magical power to get what they wanted, but people used by the Devil to get what he wanted, a dependent position particularly fitting for women. The second emphasized a sexual connection between witches and the Devil that sealed their pact, combined with an emphasis on women's greater sexuality and the fact that the Devil was always portrayed as male. This is a particular obsession in the *Malleus*, whose author stated plainly: "All witchcraft comes from carnal lust, which is in women insatiable. . . . Wherefore for the sake of fulfilling their lusts they [women] consort even with devils" (Kramer 1486, 127). However, the concept of the pact began in places where men were heavily represented among accused witches and therefore was not always gendered. Demonologists—and most other scholars—saw female sexual drive as increasing throughout a woman's life, making the postmenopausal woman most vulnerable to the blandishments of a demonic suitor. Witches were rarely accused of same-sex relations: if the author of the *Malleus* thought that sexual intercourse with the Devil was limited to women, later French demonologists (who encountered many male witches) thought the Devil took a female form when he had sexual relations with male witches.

The spread of demonological theory, and particularly the use of the *Malleus* as a guide to witch hunters,

stimulated a greater feminization of witchcraft, for witches were now the dependent agents of a male devil, rather than independently directing demons themselves. In some areas of Europe in which the demonic concept of witchcraft never took hold, such as Finland, Iceland, Estonia, and Russia, witchcraft did not become female-identified and there were no large-scale hunts. (England was an exception to this situation.) In these areas and in parts of Europe where the *Malleus* and similar books were not influential, including Scandinavia, sexual relations with the Devil were not part of witch accusations.

POPULAR IDEAS

While witchcraft theorists drew on classical and Christian writers in linking women and witchcraft, common people drew on their observations of the world around them and oral traditions. Women were recognized as having less physical, economic, and political power than men, making them more likely to use magical assistance to gain what they wanted. A man could fight or take someone to court, but a woman could only scold, curse, or cast spells. Thus in popular notions of witchcraft, women's physical and legal weakness was a contributing factor, with unmarried women and widows recognized as especially vulnerable because they did not have husbands to protect them. Because women often married at a younger age than men and female life expectancy may have been increasing, women frequently became widows. If they remarried, it was often to a widower with children, so that they became stepmothers; resentments about preferential treatment were very common in families with stepsiblings, and the evil stepmother became a stock figure in folk tales. If a woman's second husband died, she might have to spend her last years in the house of a stepchild who resented her demands but was legally bound to provide for her, and so old age became a standard feature of the popular stereotype of the witch. Family structure and living arrangements were different in eastern Europe, where extended families often lived together, so the resentment of older women may not have been as strong; this combined with the fact that Eastern Orthodoxy never developed an elaborate demonology may explain why witchcraft was not associated with women there, but remained the province of male sorcerers.

Women also had close connections with many areas of life in which magic or malevolence might have seemed the only explanation for events—they watched over animals that could die mysteriously, prepared food that could become spoiled unexplainably, nursed the ill of all ages who could die without warning, and cared for children who were even more subject to disease and death than adults in this era of poor hygiene and unknown and uncontrollable childhood diseases.

Women who cared for women who had recently given birth and their infants, known as lying-in maids, were especially vulnerable, for this was a particularly dangerous time for both the new mother and infant.

The person initially accused in a witch hunt in most of Latin Christendom fit a stereotype that has been remarkably resilient: she was an older woman, widowed or single, poor, and in some way peculiar—someone who looked or behaved oddly or was known for cursing or scolding or aberrant sexual behavior. She was often on the margins of village society and dependent on the goodwill of others for her support, and was also suspect because she was not under the direct control of a man. She might have had a reputation as a healer, a scold, or a worker of both good and bad magic, and was the inversion of what people expected a “good woman” to be: argumentative, willful, independent, aggressive, and sexual, rather than chaste, pious, silent, obedient, and married. In some parts of Europe and North America, she might also have been suspected of other types of crimes or have been troublesome to authorities.

One might assume that women would have done everything they could to avoid such a reputation, but in actuality the stereotype could have protected a woman for many years. Some women consciously cultivated popular notions of their connection with the supernatural, performing rituals of love magic with herbs, wax figures, or written names designed to win a lover or hold a spouse. Neighbors would be less likely to refuse assistance, and the wood, grain, or milk that she needed to survive would be given to her or paid as fees for her magical services such as finding lost objects, attracting desirable suitors, or harming enemies. This can help explain why some women apparently confessed to being witches without the application or even threat of torture; after decades of providing magical services, they were as convinced as their neighbors of their own powers.

ACTUAL WITCHCRAFT TRIALS

Gender figured not only in learned and popular ideas about witchcraft, but also in the ways in which accusations and trials developed. The entire realm of sexual relationships, for example, created the possibility of conflict that could easily have led to accusations of witchcraft. Choosing a spouse was an important and sometimes difficult business, and those whose courtships failed might search for someone to blame. Once a marriage occurred, sexual or reproductive dysfunction on the part of either partner required an explanation, and natural causes were often not evident or sufficient. Extramarital relationships brought even greater possibilities of danger, uncertainty, and powerful feelings, with witchcraft used as an explanation for both their beginning and their end.

Relations within the family and kin group were similarly fraught with tension and the possibility of

conflict. Family members were expected to be loyal to one another and to defend one another in times of crisis, but tensions over property, stepchildren, or the public behavior of a relative or in-law were very common in early modern families. Women were in a more vulnerable position once such strains came out into the open, for marriage had often separated them from their birth families and they were dependent on their husbands' family to protect them. Women generally married men who were older than they were, and, given high child mortality rates and the prevalence of disease, might have had no children who lived; thus between one-quarter and one-third of the older women in a community might have had no direct descendants to defend them against accusations. Studies in many parts of Europe indicate that when men were accused, they were more likely to have family and friends who testified in their favor—and more likely to flee to avoid being executed.

Neighborhood antagonisms also led to accusations, and because most adults spent the majority of their time with people of the same sex, women generally accused other women and men other men. Women accused other women of harming children or curdling milk, while men accused other men of spoiling crops or killing horses. The witnesses initially brought in were also of the same sex, and often those who knew the lives of the alleged witch and the victim intimately, such as servants or close neighbors. Some scholars have particularly addressed the question of why women would accuse other women in a process they knew might have deadly results, and have concluded that women gained economic and social security by conforming to the standard of the good wife and mother, and by confronting women who deviated from it.

Family and neighborhood tensions played a role in many witch accusations, but aspects of gender relations that were important in one witch hunt might be invisible in others. For example, Carol Karlsen found in her study of the New England witchcraft persecutions that many of the women accused of witchcraft were widows or unmarried women who had inherited property or might do so, and that older women received harsher sentences than younger. In many other groups of trials, however, the women accused of witchcraft owned nothing at all, and sentences were not affected by the age of the accused. All aspects of witchcraft reveal great geographic differences in terms of gender, both over large areas and within one geographic area—from canton to canton in Switzerland or town to town in Austria and Germany.

Geographic differences were even greater once a suspect was brought in for questioning by legal authorities, both in terms of the likely outcome and the way gender shaped this outcome. In southern Europe, witchcraft was handled by the Spanish, Portuguese, or Roman

Inquisitions, which generally simply dismissed the case or at most ordered punishments of public humiliation. Judges in the Inquisition regarded the women and men charged with witchcraft as pawns of the Devil, as misled by the “Father of lies” into thinking they had magical powers. They disagreed with the author of the *Malleus*, which they never used as a guidebook for questioning, as secular and ecclesiastical judges did in central Europe, and asserted that most witches were simply stupid or deluded old women suffering from depression who needed spiritual retraining and (earthly) male guidance. The testimony of such people was certainly not valid grounds to arrest anyone else, which meant there were almost no mass panics in southern Europe. Inquisitors' attitudes toward women were thus more condescending and patronizing than those of northern judges, but the effects of this attitude on women's lives were certainly more positive.

In Europe north of the Alps and Pyrenees, the initial accusation might also be dismissed if the judges regarded the evidence as questionable, or it might have led to a wider round of questioning, which often included the relatives or neighbors of the first suspect, as well as people whose lifestyle made them suspect or who had the reputation of being a witch. Most of those accused in such a hunt fit the stereotype—female, older, poor; male suspects were frequently relatives of the accused women. At this point, especially in central Europe, the hunt might turn into a large-scale panic, in which the circle of suspects brought in for questioning continued to grow unchecked until it numbered in the hundreds. Women continued to be the majority of those accused in such mass panics, but when such large numbers of people began to be accused, the stereotype also often broke down. Wives of honorable citizens were taken in, and the number of male suspects increased significantly, though these were still often related to female suspects and were only rarely accused, of actions such as night flying or pacts with the Devil; male witnesses became more common as well.

This breaking down of the stereotype helps explain why any mass panic finally ended; it eventually became clear to legal authorities, or to the community, that the people being questioned or executed were not what they understood witches to be or that the scope of accusations defied credulity. In many ways it was similar skepticism that led to the gradual end of the witch hunts in Europe. Gradually, the same religious and legal authorities who had so vigorously persecuted witches began to doubt whether witches actually existed, or at least whether the people brought before them actually were witches. Older women who thought themselves witches were more likely to be regarded as deluded or mentally defective, meriting pity rather than persecution, even by people who still firmly believed in the Devil.

It is clear that gender shaped witchcraft in both theory and practice, but less clear exactly how the witch hunts shaped gender, though historians have offered some hypotheses. The stereotypical older woman from the period before and during the hunts was bawdy, aggressive, and domineering, while by the nineteenth century older women were seen as asexual, passive, and submissive. Stereotypes are usually based on something, and some scholars have suggested that the witchcraft trials might have convinced older women to act less “witch-like.” Other scholars have pointed out that along with witchcraft, accusations of women for other types of crimes also increased during the sixteenth and seventeenth centuries, particularly gender-related ones such as prostitution or infanticide. They suggest that this general criminalization of female behavior served as a means of controlling women who did not fit with the more domestic and delicate ideals for women developing during this period. The effects of the witchcraft trials on notions of masculinity or men’s behavior as men has yet to be explored systematically, but future research in this new area of historical inquiry will no doubt suggest some links.

GENEVA

The history of witchcraft trials in this independent city-state, John Calvin’s adopted home, offers a few unexpected features. Because of Geneva’s location in the western Alpine region, home of the earliest witches’ Sabbats, we can find traces of diabolical pacts and spell casting (*sortilegium*) in or near it shortly after 1400. Between 1463 and 1500, more than fifty witches were burned at Geneva (Binz 1997, 577–578). Witchcraft trials here, as in the neighboring Pays de Vaud, continued until and after the Reformation in a practically unbroken series; except for a few interruptions (1540–1543, 1550–1556, or the war years 1588–1593), the Republic of Geneva held witchcraft trials virtually every year from its creation in 1536 until 1662. The most complete tabulation (Broye 1990, 161–173) counted 336 witchcraft trials conducted by the Republic from 1536 until 1681, resulting in sixty-nine deaths.

After Calvin settled in Geneva, he encouraged the republic’s magistrates to “extirpate the race of witches” from a nearby rural parish which they governed; in all, five people were arrested and two killed in 1545. Trials and executions multiplied rapidly after Calvin’s death; one-fourth of all Genevan executions for witchcraft occurred during two plague years in 1567 and 1568. However, after Lambert Daneau published the first Calvinist discussion of witchcraft at Geneva in 1574, there were only two local executions for this crime in the next twenty-four years. Witchcraft trials revived afterwards; between 1595 and 1624, with a population around 15,000, Geneva averaged about five witchcraft trials and almost one execution per year.

A regional peculiarity associated diabolical pacts involving *maleficium* (harmful magic) with persons believed to spread the plague deliberately. Geneva’s particular obsession with such plague-spreading “anointers” began in 1530, well before Calvin arrived. Two subsequent local persecutions of anointers, in 1545 and 1613, were triggered by confessions in smaller towns on Lake Geneva, which coincided with attacks of the plague. In the worst such episode (1571–1572), perhaps the only true panic related to witchcraft in Genevan history, almost a hundred people, mostly immigrants, were either killed or banished within twelve months (Monter 1976, 44–45, 115–118).

Geneva’s overall average of executions for witchcraft (21 percent) was dramatically lower than in any surrounding region (Monter 1976). It fell steadily from over 40 percent before 1550 to about 20 percent during the general peak of witch hunting in western Europe between 1580 and 1630; only one witch died at

Geneva after 1626. However, an unusually high share of Genevan defendants charged with witchcraft, including a large majority of those who withstood torture without confessing, were not simply released, but banished. A survey of the legal opinions of Geneva's most distinguished jurist during Geneva's busiest period of such trials (1562–1570) revealed that he paid no attention to a prisoner's kin and was cautious about proof of a suspect's *maleficia* (evil acts); instead, he was preoccupied with their attitudes toward the reality of devils and witchcraft (Monter 1976, 51–54). In a state that subscribed to the Calvinist doctrine of original sin, such criteria usually created as much uncertainty about a suspect's innocence as about her or his guilt. Doubting the value of torture to elicit truth, Genevan judges preferred to export the problem by banishing such people.

The decline of witch hunting in seventeenth-century Geneva—once again, far sooner than anywhere else in this region—was apparently related to problems with two issues: finding the Devil's mark on suspected witches, and assessing testimony from diabolically possessed persons. After a particularly troublesome case in 1622, professional surgeons located the Devil's mark only once among eight accused witches, and that woman became the last witch ever executed at Geneva, in 1652. Meanwhile, testimony from possessed women and children first became a serious issue in 1607 and 1610; it thoroughly dominated the history of Geneva's witchcraft trials after 1625. However, because their accusations could not be corroborated by surgical searches for the mark, only one woman was executed for this reason after 1626. A decade after her death, virtually no one was arrested for witchcraft. By the 1680s, some “enlightened” Genevans were already wondering why their native city had ever tolerated such “barbarous superstitions.”

GEOGRAPHY OF THE WITCH HUNTS

With the help of many major advances in knowledge during the past generation, it has become possible to

sketch the geographical contours of European witch hunting more precisely than before. Significant lacunae still persist, however, and it remains extremely difficult to agree on the most satisfactory method of measuring the geographical distribution of trials and executions for witchcraft. The fullest account of current wisdom on this topic, found in the most widely used general introduction (Levack 1995, chap. 7), emphasized two general factors affecting the very uneven geographical distribution of witch hunting: first, the extent to which the cumulative concept of witchcraft was accepted in a particular European region; and second, geographical variations in judicial procedures and in degree of central control over local legal systems. At the same time, that account underplays such cultural factors as dominant religions, which greatly influenced the incidence of witchcraft trials in eastern, southeastern, and Mediterranean Europe.

It seems necessary to recall that at the time of the witch hunts and witchcraft trials, European political boundaries were extremely different from what they are today. In general, there were fewer states, several of them multinational. To take some of the most obvious examples, during the age of witchcraft trials, Norway (and Iceland) belonged to the crown of Denmark; Finland and Estonia, and the northern half of Latvia were parts of the crown of Sweden; Lithuania, Belarus, and the Ukraine all belonged to the crown of Poland. Although half of Hungary (including Budapest) was occupied by the Ottoman Empire during much of the witchhunting age, the Hungarian crown also claimed to rule most of modern Croatia, Slovakia, and Romania; in fact, the capital of the kingdom of Hungary from 1550 to 1700 was a Danubian city that is today (under a different name) Slovakia's capital. So the first question is whether to use European geography of the twenty-first century or that of the early modern era when trying to map the incidence of its witchcraft trials. Each strategy presents particular advantages and drawbacks.

Moreover, physical size should be correlated with relative population; some of Europe's largest states, like Sweden, contain relatively few people, while some smaller ones like the Low Countries (three separate national governments today, but not then) have always been relatively densely populated. During the age of the witch hunts, Europe's population was not only far smaller in absolute numbers than it is today (for example, Germany alone held 80 percent as many people as all of Latin Christendom combined around 1600), but it was also distributed differently: for example, France was then more populous than Germany, while Renaissance Italy was almost three times as populous as Tudor England, although they are now roughly equal.

Given these problems, it is understandable that leading contemporary historians, including several on the Editorial Board of this *Encyclopedia of Witchcraft: The Western Tradition*, have found different ways to attack the geographical distribution of witchcraft trials. One approach (Behringer 1998, 65–66, slightly revised by Henningsen 2003, 585) started with current political boundaries and attempted to calculate the approximate number of executions per country, adjusting it by early modern population estimates. Using entries from this *Encyclopedia* to further refine their results creates the following picture of Latin Christian Europe:

TABLE G-1

| <i>Current Nation</i> | <i>Population 1600 (thousands)</i> | <i>Witches Executed (per thousand)</i> |
|-----------------------|------------------------------------|--|
| Luxemburg | 250 | 4.0 |
| Switzerland | 1,000 | 3.5 |
| Germany | 16,000 | 1.6 |
| Denmark | 570 | 1.3 |
| Norway | 400 | 0.75 |
| Estonia | 100 | 0.65 |
| Austria | 2,000 | 0.5 |
| Sweden | 800 | 0.45 |
| Iceland | 50 | 0.44 |
| Poland | 3,400 | 0.4 |
| Czech Republic | 1,000 | 0.4 |
| Belgium | 1,200 | 0.35 |
| Finland | 350 | 0.31 |
| Slovakia | 700 | 0.3 |
| Hungary | 3,000 | 0.28 |
| France | 20,000 | 0.25 |
| United Kingdom | 6,500 | 0.2 |
| Netherlands | 1,500 | 0.12 |
| Spain | 8,100 | 0.03 |
| Italy | 13,100 | 0.02 |
| Portugal | 1,000 | 0.01 |

These calculations obviously contain some margin of error, because early modern demography uses records not much richer or more reliable than legal records. Although some places are literally “off the map”—for instance, the Republic of Ireland (with only two known trials), some Baltic republics, or all of southeastern Europe (which was then mostly under Ottoman control)—a few conclusions emerge clearly from this list. Perhaps the most remarkable one is that the 2004 official boundary of the European Community (EC) closely coincides with the frontier between countries that executed witches in significant numbers and those that did not; except for Ireland, Greece, little Cyprus, and tiny Malta, only witch-hunting countries have been admitted to the EC. Another even more unsettling

observation is that twenty-first-century prosperity correlates positively with intensive witch hunting in the early modern era: the two European nations with by far the highest per capita execution rates for witches, Luxemburg and Switzerland, are also by far the two wealthiest continental European nations today (conversely, Europe’s poorest nations per capita usually rank among the lowest in per capita witchcraft executions). One notes with relief that Ireland now ranks among Europe’s wealthiest nations.

If the Behringer model manipulated some comparable statistical measurements, it used twenty-first-century European political boundaries and has not yet generated any usable maps. On the other hand, a Briggs model not only used early modern political boundaries but even featured actual maps, including one covering all of Europe and another on the “Heartlands of Persecution” (Briggs 2002, x, xi). But it employed extremely vague standards of comparison, distinguishing on a European scale between “areas of sustained moderate persecution or significant local crises” from “areas of relatively light but not insignificant persecution,” and distinguished in the heartlands among “areas of intense witch-hunts,” “areas of intensive but dispersed persecution,” “areas of significant persecution,” and “areas of lower-level and patchy persecution.” Many spaces, including places that we know experienced witchcraft prosecutions, remained blank: *hic sunt leones* (lions roam here), as Renaissance cartographers used to say. In other words, each geographical model had different, but perhaps equally serious, flaws. With the help of the entries in this *Encyclopedia*, it is possible to present useful (though certainly not comprehensive) statistical data on witchcraft trials and executions throughout early modern Europe cartographically, perhaps adopting the Briggs model of Europe’s political boundaries ca. 1600.

It is probably most helpful to begin with a revised version of the Behringer model, and start at the bottom rather than at the top of his witchcraft-persecution scale, taking a close look first at places that experienced no legalized witch hunts in the early modern era. Geographically, the largest zone free of institutional witchcraft trials in early modern Europe coincided with the boundaries of the Ottoman Empire, which governed the Balkans from Europe’s largest city, Istanbul. Nevertheless, there were many witch lynchings, perhaps even popular witch hunts, in the Ottoman Balkans.

The next geographical layer of Europe—the entire far east—actually emerges more clearly against twenty-first-century boundaries than against seventeenth-century boundaries. The key region, now as then, was the Muscovite Empire, which saw over a hundred known witchcraft executions, but a ridiculously small per capita

ratio given its immense size and vast population. The large zone between modern Russia and Poland also experienced tiny totals of known executions (for example, eleven in the Ukraine or thirteen in Lithuania).

One geographical conclusion emerges with dazzling clarity: the “witchcraft frontier” separating eastern Europe from east-central Europe coincided closely with the religious frontier separating Latin from Orthodox Christendom and from the Islamic southeast. While the Orthodox Church was extremely familiar with demonic forces and *maleficium* (harmful magic), for several reasons (including the absence of liturgical references and of medieval heretical movements), it never accepted the cumulative concept of witchcraft developed in fifteenth-century Latin Christendom. Consequently, there were extremely few executions for *maleficium* in Orthodox Europe, as there had been in early medieval Latin Europe, and nothing remotely approaching a witch hunt. Therefore, our first geographical exploration of the absence of institutional witch hunts in far southeastern Europe reveals the importance of sixteenth-century political and religious boundaries (the Ottoman Empire and Islam), while our next observation about its absurdly low incidence throughout far eastern Europe emerges more clearly through twenty-first-century political boundaries. Both explorations demonstrate vividly the dramatic importance of religious boundaries—not those *within* Latin Christendom, which we normally explore carefully during the confessionalized early modern era, but instead those *between* Latin and Orthodox Christendom and especially the political frontier between Christendom and Islam—in determining the geography of early modern European witchcraft, above all its “negative geography.”

The next remarkably low incidence of witchcraft executions concerns Europe’s southernmost regions, the Mediterranean zones of Italy, Spain and Portugal. Political boundaries in the Iberian peninsula are identical in the sixteenth and twenty-first centuries, while “Italy” remained a geographical notion until the nineteenth century. Except for Portugal (where many more accused witches died in prison than were executed), this region showed slightly higher per capita totals than eastern Europe, although Mediterranean ratios never exceeded one execution per 4,000 people. Moreover, these executions were concentrated along the northern rim of “Mediterranean” Europe, namely the southern slopes of the Alps and Pyrenees. If modern Spain had hundreds of witchcraft executions, virtually all of them occurred in its northern provinces (Navarre, Aragon, Catalonia). Henningsen has traced a “witchcraft frontier” cutting east–west across the middle of the Iberian peninsula (see Knutsen 2004, 219); although no comparable frontier has yet been drawn for Italy, it would certainly run east–west across subalpine Italy, with the

heaviest concentrations in the far north and some prolongations in the Apennines. Moreover, chronology seemed more important than geography, because most Italian witchcraft executions occurred quite early, before 1540.

Once again, although less clearly than in Orthodox Europe, geographical mapping points to religious factors. This was the most solidly Catholic region of early modern Europe. But it also points to Levack’s second general geographical explanation through judicial and legal factors. It is now generally recognized that the fundamental reason for the extremely low incidence of witchcraft executions in Mediterranean Europe was the policy of the Spanish, Roman, and Portuguese Inquisitions, all of which claimed (but did not always exercise) jurisdiction over this crime. After its reforms of 1526, the Spanish Inquisition permitted the execution of fourteen witches; the Roman Inquisition, founded in 1542, executed 36 witches; and the Portuguese Inquisition executed only four (Henningsen 2003, 582–583). It is one of the more important paradoxes in European cultural history that, although a fifteenth-century papal inquisitor in northern Europe produced the most widely read guide to witchcraft trials, the *Malleus Maleficarum* (The Hammer of Witches, 1486), a half-century later the governors of Mediterranean Europe’s highly centralized inquisitions had clearly rejected the *Malleus* in favor of an older model inherited from canon law.

The next lowest incidence of witchcraft executions occurred in a region that had emerged by 1600 as the progressive core of Atlantic Europe: England, France, and the Netherlands. England and France, two neighboring kingdoms with very different procedural systems but a comparable degree of centralized judicial controls, both had remarkably low levels of per capita witchcraft executions. Their core districts, the British Home Circuit and the *ressort* or appellate district of the *Parlement* (sovereign judicial court, with jurisdiction over approximately one-half of France) of Paris, boasted ratios well below national Spanish levels. However, in both England and France (or, for that matter, in Spain), twenty-first-century national averages must also incorporate vastly higher ratios—often at least ten times greater—from largely autonomous peripheral regions like Scotland (which was in personal although not institutional union with England when it held 90 percent of its witchcraft trials) or Alsace and Lorraine (which held over 90 percent of their regional witchcraft trials before France acquired them). The northern Netherlands, a new state of early modern Europe created near the end of the sixteenth century, had a rudimentary regional appellate court system, but here too the *Hooge Raad* (High Court) of Holland played a role in ending witchcraft executions sooner than any other corner of Latin Europe. The obvious comparison here is with modern

Belgium (the southern Netherlands), which also had a rudimentary appellate court and enjoyed a relatively low execution rate—which was nevertheless three times higher than its northern neighbor.

Continuing up the per capita execution ladder, we encounter a relatively bunched situation among the solidly Protestant Scandinavian countries. Virtually all of them, from Iceland to Estonia, have been studied carefully. A twenty-first-century political map underlines the essential homogeneity of this region, because it includes six countries instead of two early modern kingdoms (Denmark-Norway-Iceland and Sweden-Finland-Estonia). On the Behringer scale, five of these six clustered between 0.3 and 0.7 executions per thousand, that is, one for every 1,500–3,000 inhabitants. Denmark, the only Scandinavian country attached to the European mainland and the first to experience the cumulative concept of witchcraft, was an exception, exceeding the threshold of one execution per thousand.

The eastern outposts of Latin Christendom added to the EC in 2004 (that is, Latvia, Poland, the Czech Republic, Slovakia, Hungary, Slovenia) appeared to have execution ratios broadly comparable to those from Scandinavia. Although their rates seemed slightly lower, their executions came slightly later, and only one of them (Hungary) has been studied carefully. Throughout these eastern edges of Latin Christendom, it was the numerous and widely scattered pockets of German speakers, descendants of the medieval German *Ostsiedlung* (the colonization of the east) scattered from the Baltic to the southern Carpathians, that provided the first and often the most intensive examples of witch hunting in a region populated overwhelmingly by Slavic speakers but governed mainly by Magyars or Austrians.

At the upper end of our per capita execution scale were countries with more than one witchcraft execution per thousand population in 1600. Two small regions bordering modern Germany—Switzerland and Luxemburg—had Europe's highest per capita ratios. Nevertheless, on a national European scale, the Behringer model never reached five witchcraft executions per thousand people—unless one counted the tiny principality of Lichtenstein, where this ratio easily surpassed fifty executions per thousand. However, Lichtenstein was also the only modern European state to be created because of excesses in witchcraft trials by its previous rulers; after acquiring the County of Vaduz in the early eighteenth century, the Lichtenstein princes carefully avoided witchcraft trials. At the most superficial level, therefore, it is apparent that Europe's witch-burning nations formed a contiguous block centered on modern Germany, which by itself accounted for at least half of the entire European total. And it is in explaining Europe's highest per capita executions that the Briggs model finally becomes necessary; here one must think exclusively in terms of sixteenth- and seventeenth-century political geography.

The key concept is the Holy Roman Empire of the German Nation, which included not only all of present-day Germany but a great deal more besides. Until 1648, it technically included modern Austria, Switzerland, Luxemburg, and the Low Countries, plus Alsace-Lorraine. Experts disagree about the exact number of truly autonomous governments within the Old Reich before Napoleon destroyed it, but agree that there were at least several hundred. Experts also disagree about the exact number of trials and executions for witchcraft within its ample borders, but they agree that a large majority of the entire European total occurred here. Moreover, they agree that witchcraft executions were distributed extremely unevenly throughout the empire. Therefore it becomes indispensable to map the old Holy Roman Empire, the true heartland of this phenomenon, in such a way as to reveal the hot spots among these hundreds of governments.

The scale of the Behringer model must be refined at the upper end to adjust the Briggs model and highlight the centers of persecution within the Holy Roman Empire. One obvious threshold for regions with over 100,000 people ca. 1600, like Luxemburg, would be five executions per thousand. Few places this large reached this level. Extremely few territories approaching 100,000 people ca. 1600 reached the level of ten witchcraft executions per thousand; the Pays de Vaud in modern Switzerland ranked among the rare exceptions attaining this dubious distinction. However, a few of the Empire's hundreds of microstates (*zwergerstaaten*) like Vaduz-Lichtenstein saw fifty or more witchcraft executions per thousand population, and a handful of tiny ecclesiastical territories (for example, St. Maximin, Mergentheim, Ellwangen) may have exceeded Vaduz in relative severity. But none of these autonomous states ruled as many as five thousand subjects, and any map of west-central Europe's "black holes" of witch burnings needs to emphasize this fact.

Another cartographical desideratum would be a map displaying the geographical spread of Europe's witchcraft executions from 1420 to 1500, noting every place affected by the new cumulative concept and highlighting the handful of places with one or more executions per thousand (Dauphiné in France, Valais in Switzerland, the city of Arras, etc.). The excellent maps showing the early spread of printing could be modified to do this.

GERMANY

"Germany, mother of so many witches!" cried Friedrich Spee in his famous *Cautio Criminalis* (A Warning on Criminal Justice, 1631), at the climax of central European persecutions, and his despairing diagnosis is confirmed by retrospective statistics. But we must keep in mind that Germany as a national state did not exist before 1871; instead, Spee used the Latin term *Germania*, referring to Germanophone areas. Most of them belonged to the Holy Roman Empire of the German Nation, to the nobility of which Luther addressed his famous diatribe in 1520, but many did not: the German-speaking parts of present-day Switzerland, Denmark (duchy of Schleswig), the Netherlands (Limburg), Luxemburg, Poland (Prussia and Silesia), and a number of towns in Estonia, Latvia, Hungary, and Romania (Transylvania). The elected Holy Roman Emperors were moreover not German, but rather—a legacy of the Middle Ages—were considered successors of the ancient Roman Emperors, and protectors of the Holy (Roman) Church; in 1519, the principal candidates for Holy Roman Emperor were the kings of France, England, and Spain. Most emperors in the early modern period were Habsburgs, a dynasty of Swiss origin with their main dynastic lands in Austria, Hungary, Bohemia, Alsace, and northern Italy.

Nevertheless, recent research has established the concept that more witches were killed within the confines of present-day Germany than in the rest of Europe—something between 25,000 and 30,000 victims, far more than half of all estimated victims throughout Europe. This observation is particularly helpful for the linguistic geography of witch hunting, especially when one considers that even outside the boundaries of Germany (*Deutschland*) in its present form, most of the recorded witches in places like Austria, Switzerland, Alsace, Luxemburg, or even Hungary or Silesia also spoke some dialect of German. Even the few parts of western Europe where numerous witches did not speak

Germanic dialects, like Lorraine or the Pays de Vaud, were contiguous with regions that did. Linguistically, Spee was completely correct: a very large majority of Europe's witches were Germanophone, but they were not necessarily politically German.

In the early modern period when witch hunting occurred, most contemporaries spoke of "the Germanies" in the plural, rather than Germany. In fact, using Lucien Febvre's regressive method, we find that a German Empire (*Deutsches Reich*) existed as a unified state only from 1871. Between 1815 and 1871, an alliance of German territories (*Deutscher Bund*) had existed, with an inclination toward state construction guided by nineteenth-century nationalism. After an attempted unification from below failed in 1848, the German states were forced into two unifying wars by the Kingdom of Prussia, whose territory stretched across parts of western and northern Germany and Poland from France to Russia. Afterward, the imperial Habsburg monarchy—still ruling parts of northern Italy, Slovenia, Croatia, Bosnia, Hungary, Slovakia, and Bohemia—was excluded from the new German Empire, which also soon annexed Alsace (largely Germanophone) from France. After World War I, Alsace returned to France and the Austrian monarchy disintegrated; but a German Republic, founded at Weimar after the revolution of 1918, still extended far into eastern Europe. Only after World War II were the eastern parts of former Prussia lost, with Königsberg, the home of Immanuel Kant, becoming Kaliningrad in the Soviet Union. In 1945, large parts of the former Nazi state were also annexed by Poland, which lost most of its former eastern territory to the Soviet Union.

It has also been claimed that witch hunting was concentrated in Germanophone areas within the Holy Roman Empire, as well as elsewhere in eastern and southeastern Europe. It is true that, since the tenth century, the term "*deutsch*" (German) described the language of uneducated people, those who were incapable of speaking Latin. In the nineteenth century, the German language served as a pretext to forge a German nation-state; linguists like Jakob Grimm tried to promote ideas of its continuity, and even called their language studies "*Germanistik*." However, the concept seems anachronistic for the late medieval and early modern periods. Around 1500, people from Hamburg understood Swedish or Danish more easily than Bavarian or Austrian. "*Dutch*" was not yet considered different from "*Deutsch*" (German), since the dialects spoken in Amsterdam, Antwerp, or Atrecht (today Arras in France) were not yet greatly different from those in Cologne or Münster in Westphalia. The Anabaptists of Amsterdam therefore had no problem in choosing Münster as their new Jerusalem in 1533, and Jan van Leiden easily became the "king" of this Anabaptist

commonwealth. Johann Weyer, born in Grave on the Meuse, later part of the Netherlands, had no problem serving as an apprentice in the household of Cornelius Agrippa in Bonn, or working as court physician for the dukes of Cleves at Düsseldorf, or with publishing his *De praestigiis daemonum* (On the Tricks of Devils) at Basel in 1563, of course in German. The concept of “Low Countries” or “Netherlands” relates to the geography of the Rhine valley, with “Upper Germany” on the other end. Begun by Luther’s poetic Bible translations, which first deliberately attempted to bridge the gulf between High and Low German (*Hochdeutsch* and *Plattdeutsch*), the modern German language took firmer shape after the mid-seventeenth century, when the Holy Roman Empire was disintegrating after the Thirty Years’ War and literary societies (*Sprachgesellschaften*) were created to construct a new national language based on Luther’s vernacular Bible. By then, however, witch hunting was already in sharp decline.

When witch hunting was being attacked at the beginning of the sixteenth century, the Italian jurist Andrea Alciati labeled the persecutions in the Italian Alps as *nova holocausta*, a “new holocaust,” referring to ancient human sacrifices to pagan gods. More recently, some scholars have tried to correlate the modern Holocaust with the period of witch hunting, and (avoiding comparisons with parts of contemporary Africa or Asia) attempted to interpret a politics of extinction as something essentially “German.” However, since politics and language are unlikely to provide sufficient evidence, scholars maintaining this idea may be asked whether they imply that persecuting minorities is genetic. However, Germanophobia does not make more sense than a stereotyping hatred of any other linguistic or ethnic group. Humanists invented the concept of Germania after the discovery of Tacitus’s ancient text a round 1450, and a number of Germanophone humanists embarked on attempted constructions of ancient pedigrees. Meanwhile, following the cultural phenomenon of lumping all foreigners together, the “German nation” at Italian universities included Hungarian and Czech students—in fact, any European from outside the Romance countries and Britain. In conclusion, the cultural concept of “Germany” makes little sense during the period of witch hunting.

For the convenience of the present-day reader, and with a bow toward the ancient notion of “the Germanies,” this *Encyclopedia of Witchcraft* includes four separate entries on Germany—northeast, west and northwest, southwest, and southeast. The numerous independent territories comprising the central European Holy Roman Empire of the German Nation are rarely part of common knowledge today, and useful directions are most easily provided through articles based on twenty-first-century geography. Because Germany did not exist in the early modern period, it is

appropriate to cut its current version into more digestible slices.

GERMANY, NORTHEASTERN

To date, studies of witch persecution in northeastern Germany—the present-day states (*Länder*) of Mecklenburg, Western Pomerania, Saxony-Anhalt, Brandenburg, Thuringia, and Saxony, all formerly in the German Democratic Republic (GDR)—are few and often quite out of date. After reunification in 1990, there was a push to conduct more research, from which new publications should emerge; their results are partially reflected in this survey. Only a rough sketch of the persecutions can therefore be offered. We can see, for instance, that like the rest of the Holy Roman Empire, northern Germany also saw some west-to-east, as well as a smaller south-to-north differentiation in witchcraft persecutions. The rate of death penalties ranged from a round 50 percent in Mecklenburg and Electoral Saxony to about 70 percent in Western Pomerania and Thuringia. In most areas the persecutions reached their peak between 1580 and 1630, with significant regional differences. From 1650 to 1670, a second large wave affected some northeastern areas but apparently spared the regions of Saxony-Anhalt and Brandenburg. All regions possess enough records to document an apparent social spread of the accusations over time. At first they were aimed primarily at the lower classes, but there was a decided upward shift later. Although northeastern Germany was mostly rural in nature, the highest concentration of witchcraft persecutions occurred in its smaller cities.

Persecutions of witches began later in the eastern regions of Germany than in the western regions. The trials were driven by the fully elaborated concept of witchcraft, which became more embedded in the middle of the sixteenth century, after the crime of witchcraft had been included among other legal transgressions. Once witchcraft had been redefined and criminalized,

the number of trials increased dramatically throughout this overwhelmingly Lutheran area, creating a series of trials that already showed signs of the persecutions to come, such as the use of torture, the serialization of trials, and the death penalty for witchcraft that resulted in serious harm or involved Satanic activities. Throughout the witch persecutions, these northern leaders generally adhered to the procedures of the Carolina Code (*Constitutio Criminalis Carolina of 1532*), which called for a *processus ordinarius* (ordinary procedure) and defined witchcraft in the sense of damaging *maleficium* (harmful magic), as in the Middle Ages. The southern states tended to lean toward stricter definitions, reflecting a complete reception of a cumulative concept of witchcraft, as set down, for example, in the 1572 criminal code of Electoral Saxony.

MECKLENBURG

The persecutions of witches in Mecklenburg, which divided into two duchies after 1621, rank among the most intensive in the Holy Roman Empire, or anywhere in Europe. Nearly 4,000 trials were conducted in these sparsely populated lands between 1570 and 1700 (Moeller 2002b, 38). They came in two waves of roughly equal size and intensity, peaking from 1599–1614 and again from 1661–1675.

Following the Carolina Code, Mecklenburg's church ordinances of 1552 and its police regulations of 1562–1572 defined magic and witchcraft as criminal activities. At first there was a marked reluctance to prosecute witchcraft as a spiritual crime, evident in adherence to the *processus ordinarius* and warnings against using rumors as accusations. Two strong Lutheran voices, Johann Georg Goedelmann and Ernst Cothemann, criticized the new definition of witchcraft. The rapidly increasing number of trials held in Mecklenburg resulted from government efforts to implement the new legal codes in criminal cases, not only by applying procedures from Roman law, but also through increased professionalism and discipline in local courts. The confessionalizing and modernizing campaigns of the Reformation dukes helped increase witchcraft trials considerably, especially prosecutions of professional magicians. At the same time, pressures for prosecution came from beneath, from peasants clinging to the idea that harmful—and now criminal—witchcraft was used in neighborhood conflicts. Moreover, Mecklenburg's first wave of prosecution between 1599 and 1614 followed epidemics and crop failures. Strikingly, many of the witchcraft trials conducted during this phase were individual prosecutions taking place in courts under the complicated jurisdictions of the changing manor lords. After these jurisdictions had been consolidated, most manor lords lost interest in conducting witchcraft trials.

After a temporary standstill of witchcraft persecutions during the Thirty Years' War, a new cycle of severe

and massive persecution began in 1650, peaking between 1661 and 1675. The social range of suspects was now much broader than before, and serial trials also began at this time. Both regions, Mecklenburg-Schwerin and Mecklenburg-Güstrow, showed the same tendencies but developed very differently because of the way the trials were conducted.

Mecklenburg-Schwerin's ruler, Christian Louis I, spent most of his time abroad. He was a repeated and vocal proponent of stopping the trials. His officials, however, encouraged by the creation of a separate inquisitorial committee and supported by legal advisers, tended to employ practices that came very close to redefining witchcraft as a *crimen exceptum* (the excepted crime). Confiscation of property or additional taxation helped expand witch hunts into large serial trials, which were held primarily in this region. Even in cases with no clear verdict, the decision was usually to banish rather than release the accused. Not until the last rabid proponent of the death penalty had passed away in May 1700 was this practice of sentencing in witchcraft trials stopped. The crime of witchcraft, however, remained on the books.

Witchcraft persecutions developed quite differently in Mecklenburg-Güstrow under the leadership of Duke Gustav Adolf. Here the view of witchcraft and magicians formed the core of an intensive policy of Lutheran confessionalism, with widespread inquisition measures to investigate occurrences of suspected magic. Pastors, local leaders, members of the judicial system, and church courts were all parts of this control system, which considerably intensified investigations of witchcraft. At the same time, however, legal safeguards were increased. Therefore, sentences were much less severe in Güstrow after the first phase. The means of conducting trials, including meticulous appraisals and the requirement that impartial officials observe and obtain approval from state leaders, resulted in prolonging them over many years. The Güstrow church, also involved in the whole process, maintained a rather critical view toward these trials, which eventually led to a fundamental criticism of the terms defining witchcraft. Prosecutions ended here between 1681 and 1683, as witchcraft was demoted from a crime to a superstitious belief.

WESTERN POMERANIA

No recent research has been done on witch persecutions in Pomerania-Wolgast (including the Bogislav XIII region of 1569) or the regions that in 1648 became Swedish and Prussian Western Pomerania.

Prosecutions for performing magic appeared early in the Pomeranian legal practice. The "Wendisch-Ruganiarian regional practices," written by the District Officer Matthäus Norman from 1525–1541, stated that the normal punishment for

harmful magic was the death penalty; although it added that cases of witchcraft crimes were rather rare. In 1566/1569 the relevant stipulations of the Carolina Code were integrated into regional criminal codes (the *Hfgerichtsdordnung*). Subsequent versions of these police orders in 1663 and 1672/1681 retained these rulings. Swedish Queen Christina's orders to the city of Verden in 1649 to stop persecutions of witches apparently had no influence on Swedish Pomerania.

A survey of the sentencing recorded at the law faculties of Rostock and Greifswald universities showed a total of 567 people accused of witchcraft crimes in these regions. The lay judges in Stettin, Brandenburg, and Stargard were also of great importance in exchanging and dispatching documents. Altogether there must have been at least 1,000 cases brought to trial (Moeller 2002a), making the western Pomeranian regions about average in their percentage of witchcraft cases per thousand population. The first "real" witchcraft trials can be situated around 1570; the last trials where torture was used took place in 1709 and 1710. Roughly 60 percent of the accused were sentenced to death. Throughout the eighteenth century, there were further accusations, all of which were dismissed in light of the intensified stipulations regarding investigation procedures. According to source material now available, the persecutions reached their highest points around 1610 or 1620, and especially between 1650 and 1670. There was a slow and general transformation from late medieval trials dealing exclusively with harmful magic, into real witch persecutions. Only the mass persecutions in the second half of the seventeenth century established the cumulative definition of witchcraft. In Western Pomerania, an unusually high number of witchcraft trials occurred in the very smallest towns. On the other hand, the share of witchcraft trials judged by seigneurial courts was rather small.

The practice of exchanging and dispatching documents became part of set committee practice at Greifswald University that, in accordance with the state laws, adhered to the *processus ordinarius*. Claims to justify the use of torture through merely circumstantial evidence were dismissed. While investigations of accusations of witchcraft and other crimes were given a rather free hand, the use of defense counsel was granted upon request. Greifswald's law faculty was more accommodating than Rostock's in granting consultation requests, there by maintaining good client relations. In the second half of the seventeenth century, legal officials gave considerable leeway to their consultants by moving away from the older mild questioning methods and developing searches for the Devil's mark which, when proved, could shift directly to torture. If the accused did not shed tears or showed no emotions under torture, or made a revocation or retraction, such behavior invariably served to justify repeating the torture.

The tendency at this time was also toward the expulsion of the accused rather than release. Property confiscation, however, could not be conducted on a regular basis by the consultants.

The last death penalty handed down by the legal authorities in Greifswald was sent to the consuls of Prussian or Western Pomerania in September 1714. Reacting to this decision, King Friedrich Wilhelm I issued a decree that December requiring that all parts of the legal proceedings—namely the use of torture—and sentencing in witchcraft trials must be approved by a central instructional and certifying agency. As early as 1706, the Estates of Prussian or Western Pomerania issued a mandate criticizing abuses in witchcraft trials and calling for stricter control mechanisms. Reacting in an opposite vein, in 1723 Swedish Western Pomerania issued a new version of the antique police order that called for the death penalty in cases of witchcraft, except in cases of harmless forms of popular magical practices.

BRANDENBURG

Our knowledge of witchcraft trials in Brandenburg and the surrounding regions is incomplete and even older research shows large gaps.

At the beginning of the sixteenth century, Elector Joachim I of Brandenburg asked the Benedictine abbot Trithemius to tell him about the new definition of witchcraft. Magical acts were condemned in early sixteenth-century legal codes, but only with moderate restraints, and after 1534 the Carolina Code served as the basis for criminal law. The decisions of lay judges in Brandenburg show them always adhering to the practice of the *processus ordinarius*. The results suggest a relatively early focus on investigating magicians, but no early widespread concept of witchcraft. The majority of trials dealt with harmful magic and simpler magical practices, sometimes with the Devil helping in destructive magic. Even though torture was probably used in the earliest witchcraft trials, we find no confessions of pacts with the Devil or participation in a witches' Sabbath. Not until the end of the 1550s do confessions appear that resemble those in other north German territories, showing an elaborated view of witchcraft.

The high point of the persecutions in Brandenburg can be pinpointed between 1560 and 1590, when the newer view of witchcraft became more widely accepted. Nearly 90 percent of the 266 cases of witchcraft and magic known in Prignitz took place before the start of the Thirty Years' War (Enders 1998, 23); a similar tendency is evident from the surviving legal consultations for this region. Although there was an increase in witch persecutions after the Thirty Years' War, the numbers in Brandenburg seem quite small in comparison to its northern and southern neighboring regions. It is striking that efforts were made to reach amicable settlements in accusations of witchcraft, as with other kinds

of injury. In general, Protestant skepticism of witchcraft trials was evident in the maintenance of trial standards, such as the right to defense counsel or discounting rumors as grounds for accusations. Only a few exceptional cases from the second half of the seventeenth century constitute genuine witchcraft trials, and even these never turned into serial trials. The establishment of a central supervisory office of trials in 1714 served as an effective measure to restrict witchcraft trials, although by this time the persecution of witches played a very small role in the region. Other witchcraft trials in 1721 and 1728 do, however, serve as reminders that witchcraft remained a criminal offense.

SAXONY-ANHALT

Even though the present-day state of Saxony-Anhalt is famous for the mountain Brocken and the witches' dancing square in Thale, very few studies of witchcraft have been done on the area. This may be because the loss of source material is thought to have been relatively high. Today we can find documentation for roughly 200 trials in the region, nearly all of them between 1550 and 1650 (Lücke 2001, 12). Just as in Brandenburg, the trials peaked before the start of the Thirty Years' War, with most trials taking place between 1575 and 1600 and another peak between 1615 and 1620. A final cluster of trials in the mid-1660s did not match these earlier incidents in either numbers or severity. The fully articulated concept of witchcraft was embraced early on in some regional courts. A trial in Luther's hometown of Wittenberg in 1540 showed elements of the crime of making a pact with the Devil or influencing the weather. This practice, however, did not continue for long; the fifteen cases in 1540 and the six cases in 1544 remain exceptions.

Two cities, Quedlinburg and Wernigerode, each sentenced roughly forty accused witches. However, no sources confirm the supposed mass executions mentioned in older literature, claiming that no fewer than 133 witches were put to death in a single day at Quedlinburg. There is, however, proof of occasional confiscations. The idea of the *Elbenzauber* is typical for the region of the Harz Mountains. The accused is said to have bewitched other people with *Elben* or "bad things," creatures thought to be the children of the Devil, and a witch that invaded a person's body like worms and caused damage.

THURINGIA

In the early modern era, the region of Thuringia (like Electoral Saxony) extended well north and south of the borders of the present-day *Land*. Over 1,500 cases of witchcraft persecution can be documented in this region between 1526 and 1731 (Füssel 2001, 89ff.). After a slow start earlier in the century, the number of cases increased rapidly after 1590. Between 1598 and

1631, there was a larger wave with several breaks. Late 1629 seems to have marked the absolute apex of witch persecutions in Thuringia, while 1631 saw a sudden end to the number of cases because of the Thirty Years' War. After 1648, there were a few quiet years, but the persecutions resumed in 1656 and built up to a second massive wave by 1700. After that, one finds only a few sporadic cases.

Over 60 percent of these cases took place in the south and southwestern regions of Henneberg (750 cases) and Coburg (roughly 230 cases). But Gothian Georgenthal also saw a fair amount (50 cases), as did the two imperial free cities of Mühlhausen (roughly 65 cases) and Nordhausen (roughly 30 cases). Seen from a geographical perspective, the persecutions were centered in the mountains of the Thuringian forest and the Rhone region; whereas there were only a few persecutions in the Thuringia basin region.

The points of dispute and accusations clustered around homes and farms, usually involving illness and death of people and livestock; there are records of only a few cases dealing with influencing the weather. Despite the large number of different rulers in Thuringia, the witchcraft inquisition was conducted in nearly identical ways throughout the region, with most cases following the *processus ordinarius* as outlined in the Carolina Code. Spokesmen and government representatives alike paid attention to this, and witchcraft was not treated as *crimen exceptum*.

Local courts did not decide Thuringian witchcraft cases on their own, but they relied on the rulings of *Schöppentühlen* (learned jurists) and law faculties, which were then confirmed through the state government. The *Schöppentuhl* of Jena was consulted in over half of these cases, the Coburg jurists were consulted in about 20 percent, and Leipzig's *Schöppentuhl* in roughly 15 percent. After electoral Saxony promulgated its criminal code in 1572, most Thuringian rulers, although not all, adopted it. The records show that roughly 75 percent of the cases in Thuringia ended in executions. Half of all those sentenced were executed by burning, with only 11 percent being "mercifully" decapitated beforehand. Other types of execution were rare. Eight percent of those accused of witchcraft died during the proceedings before a verdict was spoken, suggesting a rather severe and intensive use of torture.

SAXONY

The modern-day *Land* of Saxony is much smaller than electoral Saxony in the early modern era; parts of it now belong to Thuringia and Saxony-Anhalt. Electoral Saxony contained a number of ruling courts within a relatively small area, which were often consulted in difficult criminal cases by lesser courts elsewhere. Not only the renowned legal faculties of Leipzig and Wittenberg (now in Saxony-Anhalt), but also the central district

capital's courts and lay judges were just as involved in judging witchcraft and related matters as the actual top legal authorities in Dresden. Moreover, Saxon jurisprudence was unusually rich. The early *Sachsenspiegel* viewed crimes of illicit magic or *Zauberei* as heretical and proposed the punishment of death by fire. When electoral Saxony found it necessary to create not only a modern but also a unified law for itself after the Reformation, it promulgated new criminal and procedural codes in 1572.

These new codes were epoch making in dealing with witchcraft, because they did not share the view of the Carolina Code, which did not include witchcraft among its articles concerning heresy. Electoral Saxony's new criminal codes set an important precedent by proposing to punish merely consorting with the Devil with death by fire, whether or not any intent to do damage could be proved. In contrast, even harmful witchcraft, if performed without the involvement of the Devil, deserved the milder punishment of decapitation. In comparison with the terms of the Carolina Code, this spiritualization of witchcraft offenses meant that sentencing for crimes of illicit magic became much stricter. This legislation became known far beyond the borders of electoral Saxony through the writings of renowned Saxon jurists, above all the famous Benedict Carpov.

The effects of this "strict" legislation in electoral Saxony seem to have been much less serious than one might have expected. Some very old studies, supplemented by the records of the Nazi "SS Special Commission on Witches," show only a total of 200 cases raised against witches and magicians, mainly in the years around 1540, 1580, and 1615. Between 1660 and 1690 there were a few further cases, but nothing indicates any large wave of persecutions. Most trials were carried out in Dresden, Leipzig, and Wittenberg (now part of Saxony-Anhalt), since the central courts and ruling courts were located in these cities. We hear of a trial for *Zauberei*, or magic, at Zwickau in 1424, but it cannot be seen as a precedent for the witchcraft trials.

A general regional study of witch persecutions in electoral Saxony between the early fifteenth and the mid-nineteenth centuries shed light on witchcraft persecutions in one of Germany's largest territorial states and one of only four lay electorates in the empire (Wilde 2003). For the approximately 750 witchcraft trials, most originating in the Thuringian part of Electoral Saxony, there were peaks of persecutions from 1570 to 1630 and again from 1656 to 1670. Thus far, no evidence has been found of any mass persecutions resulting from unsupervised accusations based on rumors. Most cases were based on claims of *maleficia*, acts of harmful witchcraft, and stemmed from neighborhood squabbles. Of the roughly 300 cases that ended with the death penalty, approximately 200 came from the Thuringian area of electoral Saxony (Wilde

2003, 166). In a state with a population of roughly half a million, this means that we cannot speak of mass persecutions. Even at their peak, the total number of witchcraft trials made up only about 5 to 7 percent of all criminal trials, and therefore never played a major role.

GERMANY, SOUTHEASTERN

Southeastern Germany refers to present-day political boundaries, which were meaningless during the period of witch hunting. During the late medieval and early modern periods, southeastern Germany was a part of the Holy Roman Empire, a patchwork of territories including dozens of prince-bishoprics, prince-abbeyes, imperial free cities, and scores of imperial lordships and earldoms. The region generally supported the imperial cause, being geographically close to the residential capitals of the Habsburg emperors at Vienna and Prague, and most of the territories needed protection against expansive modernizing states. Nevertheless, during the sixteenth century, the duchy of Bavaria became increasingly dominant. In 1609, it annexed the imperial free city of Donauwörth, and in 1623 the Upper Palatinate (*Oberpfalz*). By 1803 or soon after, Bavaria had sacked the prince-bishoprics of Augsburg, Bamberg, Eichstätt, Freising, Passau, Regensburg, and Würzburg, as well as large parts of electoral Mainz and Salzburg, together with the imperial abbeyes of Benediktbeuren, Berchtesgaden, Ebrach, Edelstetten, Elchingen, Irsee, Kaisheim, Kempten, Ottobeuren, Roggenburg, Söflingen, St. Ulrich and Afra, Ursberg, Waldsassen, Wengen, and Wettenhausen; and the imperial free cities of Augsburg, Bopfingen, Buchhorn, Dinkelsbühl, Kaufbeuren, Kempten, Lindau, Memmingen, Nördlingen, Nuremberg (Nürnberg), Regensburg, Rothenburg, Schweinfurt, Wangen, Weissenburg, Windsheim, and Ulm, plus the imperial villages of Gochsheim and Sennfeld. Eventually Bavaria also annexed the territorial states of the Margraves of Burgau, Ansbach, and Bayreuth, of the Teutonic Order, and of the Habsburgs in Swabia, not to mention dozens of earldoms and hundreds of lordships of imperial knights with their mostly tiny territories, mainly in Swabia and Franconia. At the dissolution of the Holy Roman Empire in 1806, almost all of the formerly independent territories in southeastern Germany had become part of the Kingdom of Bavaria. Now stretching from the Alps north to Thuringia, the Bavarian monarchy voluntarily joined the second German Empire in 1871. During the 1918 revolution, Bavaria became a republic (*Freistaat*) and joined the Weimar Republic in 1919. Bavaria remained intact until 1934, when the Nazi dictatorship wiped out all federal structures. After liberation by American troops, the republic (*Freistaat Bayern*) was restored, comprising six provinces: Upper and Lower Bavaria (*Ober- und Niederbayern*); the Upper Palatinate (*Oberpfalz*); Swabia (*Schwaben*); Upper-, Middle-, and Lower-Franconia (*Ober-, Mittel-, und Unterfranken*). In 1949, Bavaria became a member state of the Federal Republic of Germany. Unlike France or Britain, Bavaria has maintained its conquests in Swabia and Franconia to the present day. Southeastern Germany in this sense

refers to the territory of the modern state of Bavaria, not to be confused with the historical duchy of Bavaria.

Southeastern Germany may serve as a test case for theories about witchcraft and the persecution of witches, since until its unification under Bavarian rule this region was extremely heterogeneous, containing large and small territories, rich urbanized capitals, and poor backward regions, absolute rulers, and territories governed by parliaments. Subsistence farming zones bordered protoindustrialized regions, agrarian face-to-face societies lay close to large towns where strangers could live anonymously. The imperial free city of Augsburg was a major center of communications, where the European postal routes between the Netherlands and Italy, France, and Bohemia met. It was a center of early capitalism: contemporaries were struck by the gap between the extraordinary wealth of the Fuggers, a banking dynasty, and the extreme poverty in their immediate neighborhood, where scores of people died of hunger during the subsistence crisis of 1570; one old man froze to death on the Fuggers' dung heap. In addition to such economic and social discrepancies, the region had extreme political and religious tensions: Nuremberg was the first imperial city to embrace Protestantism, while Bavaria founded the Catholic League and assumed leadership over the prince-bishoprics. The Upper Palatinate belonged politically to the electoral Palatinate and was therefore part of the major Calvinist territory in central Europe. The region had Counter-Reformation post-Tridentine Catholic states; moderate traditional Catholic ecclesiastical territories; ecclesiastical states split by confessional infighting; Calvinist and Lutheran territories; Lutheran and Zwinglian city republics; Catholic, Lutheran, and Calvinist lordships; towns like Augsburg with mixed confessions; and territories with Jewish, Anabaptist, Schwenckfelder, or Spiritualist minorities. Gypsies and travelers roamed through the region, together with discharged soldiers ready for violent attacks, adding to rural insecurities. How did any of this affect the belief in witchcraft or the inclination to persecute witches?

Throughout southeastern Germany there was widespread belief in the efficacy of magical cures, divination, sorcery, and witchcraft. Wise women, herbalists, diviners, and witch doctors were sought after, as sources from the imperial cities of Augsburg, Memmingen, and Nuremberg demonstrate. However, we cannot assume that the intensity of witchcraft beliefs was uniform, and in several cases we encounter eminent contemporaries who did not believe in witches—particularly in Nuremberg, where humanists, artists, poets, and even lawyers ridiculed belief in witchcraft. It is impossible to imagine Jacob Fugger the Rich fearing witches; throughout the fifteenth and sixteenth centuries, the self-confident patricians of urbane centers like Augsburg, Ulm, or Memmingen seem to have maintained a relaxed

attitude toward suspected witches. In such places, attitudes toward witchcraft had consequences for the persecution of witches. Urban courts prosecuted witchcraft, because the populace expected such action, but they hardly ever forced anyone suspected of witchcraft into confessing by means of torture, thus ensuring few death sentences. Many smaller imperial cities were satellites of the largest ones; all Franconian cities looked to Nuremberg. For example, Weissenburg asked for advice in 1590, and stopped its first witchcraft trials immediately after Nuremberg's lawyers and theologians had given their opinion.

Within centralized territories, legal treatment depended on decisions by the central authorities. The Calvinist government in Heidelberg rejected belief in witches and simply forbade their provincial government at Amberg from conducting witchcraft trials in any district court of the Upper Palatinate. After the Upper Palatinate was occupied by Bavarian troops in 1623 and subsequently annexed, Protestantism was suppressed. Nevertheless, even under Catholic Bavarian rule, the Upper Palatinate had few witchcraft trials and only a handful of executions. The duchy/electorate of Bavaria also saw relatively few executions, except one witch hunt around 1590, when witches were persecuted in several district courts. However, these trials were soon seen as a severe mistake and promptly stopped. As a relatively large territorial state, Bavaria's complex system of institutions generated considerable resistance against witch hunting: Although most Jesuits and the University of Ingolstadt, as well as the duke and his court council, had supported the witch hunt, many larger towns, the nobility, the Bavarian estates (*Landschaft*), and the Privy Council opposed the idea that witchcraft could be considered an extraordinary crime that required extraordinary measures (a basically illegal court procedure).

This opposition won the struggle. Bavaria's roughly 100 district courts were tightly controlled by the central government in Munich and the provincial governments in Burghausen, Straubing, and Landshut (and, after 1623, in Amberg). District judges had to report immediately after suspects were imprisoned and ask permission for any further steps. Within the duchy of Bavaria, only governments could impose torture, which they decided after reviewing a complete written record of all interrogations of suspected witches and independent witnesses. Because only the government could impose torture and death sentences, Bavarian death sentences for witchcraft were rare events, even if most councilors and certainly the princes believed in witchcraft. Avoiding witch panics in a large territory was a matter of state policy, not religion. Because Bavaria and the Upper Palatinate were by far the largest states in the present-day southeastern German provinces of Upper and Lower Bavaria and the Upper Palatinate, the

number of regional executions was comparatively low, just like in the neighboring southern states of Tyrol and Austria, or the kingdom of Bohemia to the east.

In contrast to such well-ordered police states, the picture in Swabia and Franconia is unbalanced. Small lordships, earldoms, or abbeys lacked the complex system of checks and balances that existed in large territorial states. Because the more important towns had become independent before 1500, urban opposition was generally absent; certainly there were no universities or a complex system of government. In many cases, decisions depended simply on the ideas of the ruling lord or abbot. There are cases where a bishop's illness caused witchcraft trials (e.g., presumably in the prince-bishopric of Augsburg) or where demands by the peasants drove the local ruler into witch hunting. For example, the Catholic Hans von Rechberg permitted burning witches in his tiny lordship of Illereichen (Swabia) in 1562 to calm his peasantry, while the Calvinist lords von Kaltenthal conducted trials in their fief of Osterzell in 1590 for similar reasons. Large-scale witch hunts with more than twenty burnings are reported from the County of Oettingen-Wallerstein around 1590 and again around 1629, alongside witch panics with several victims in Illereichen and in some Swabian lordships of the Fuggers. The tiny principality of Pfalz-Neuburg saw two witch hunts: one around 1590, when it was Protestant, and another around 1629, when it had become Catholic.

On the other hand, considering the scores of small territories in this region, most petty rulers seem to have remained cool and obviously managed to deflect demands for persecution. The same seems to apply to most abbots and abbesses in southeastern Germany as well. Although not all sources have been scrutinized, we have no evidence that any of the many imperial abbeys mentioned earlier ever conducted a witch hunt. It seems more than unlikely that any major witch hunts have escaped our attention, because they would be mentioned in supralocal sources like legal opinions, broadsheets, correspondence, travel reports, diaries, chronicles, or early modern publications on witchcraft. The reasons ecclesiastical territories in this region (unlike those further west and north) avoided witch hunting were multifold. Some had a relaxed attitude toward confessionism, and therefore to the female sex; abbesses may even have felt some solidarity with persecuted women. Reason of state also played a role: for example, the Benedictine abbot of Benediktbeuern avoided dispensing death sentences because his right to enforce them was disputed by the dukes of Bavaria. In his criminal records, all cases of homicide were mitigated into financial compensation to the victims' families. This was done to avoid a decision of the *Reichskammergericht* (imperial chamber court) about the constitutional status of his territory and maintain

the fiction that Benediktbeuren was a free imperial abbey, not a Bavarian vassal.

Although it seems self-evident that most “witches” were executed during witch hunts, it is also possible to substantiate this claim statistically. Of about 950 known “witches” executed within the boundaries of the modern provinces of Upper and Lower Bavaria, Swabia and the Upper Palatinate, 51 percent died during 14 large-scale witch hunts (those with more than 20 executions), mostly conducted around 1590 or 1629; another 31 percent fell victim during 38 lesser panics (with between 4 and 19 executions), mostly between 1580 and 1630. And, between 1300 and 1800, only about one “witch” in six (18 percent) received a death sentence in episodes involving three or fewer executions. The fact that 82 percent of these victims were executed in clusters, after trials using “extraordinary” procedures, verifies the proverbial use of the term *witch hunt*. In southeastern Germany, convictions for witchcraft were unlikely outside such panics or witch hunts; in the long run, contextualized within the broader history of crime and punishment, the number of executions for witchcraft was marginal. Witch hunts molded the perception of contemporaries, and large-scale witch hunts decisively distinguished this region from Franconia, where several hundred witches were burned in each of the prince-bishoprics of Bamberg, Eichstätt, Mainz, and Würzburg, and hundreds more in the territories of the Teutonic Order, and the prince-abbey of Ellwangen. Here even Protestant principalities like Saxe-Coburg hunted witches excessively. Overall, more than 4,000 “witches” were probably burned between 1590 and 1630 within the provinces of Upper, Middle, and Lower Franconia, presumably more than 90 percent of them in large-scale witch hunts. Very few witches were burned in this region either before or after these dates.

What caused such excessive witch hunts in Franconia? Like everywhere in early modern Europe, Franconia had a magical subculture and experienced neighborhood conflicts, plus the characteristic subsistence crises of the Little Ice Age. Clearly, its massive witch hunts around 1600, between 1616–1618, and between 1626–1630 were linked to extreme climatic events. In contrast to the Upper Palatinate, Bavaria, or Swabia, its dominant cash crop, viticulture, was even more vulnerable than cereals in these northern areas. Many areas with severe witch hunting, in Germany as in France, Switzerland, or Austria, practiced viticulture under marginal conditions. The loss of wine harvests through hailstorms or late frosts apparently triggered scapegoating. However, not all wine-producing territories succumbed to these demands from below; for instance, the government of the Palatinate, aided by the university of Heidelberg, discouraged accusations and punished accusers; Lutheran Württemberg with its university at Tübingen also kept accusations under

tight control, very much like Catholic Bavaria. Strong secular governments, whether Calvinist, Lutheran, or Catholic, remained unaffected by popular demands. But Germany’s prince-bishoprics were weak both politically and structurally. In many ecclesiastical territories in Franconia and the Rhineland, self-confident peasants and burghers took action autonomously, forming village committees and hunting witches, leaving the authorities with a choice between facing open rebellion or accepting the illegal actions of their subjects. These committees often handed suspects to officials only after they had confessed. After 1600, the authorities tried to gain control by introducing witch commissioners, who spearheaded or even replaced the committees by taking fierce action against anyone suspected. Here is where denunciation and torture entered the picture: witch commissioners could act faster than village committees, and their prince-bishops officially authorized them.

The rulers of these Franconian prince-bishoprics actively supported a militant Counter-Reformation and were prepared to suppress any form of heresy. All of them considered witchcraft primarily a form of heresy rather than a secular crime, as suggested by the *Malleus Maleficarum* (The Hammer of Witches, 1486). Whenever the populace and the authorities worked together, witchcraft trials grew into massive hunts. Obsessed by a desire to eradicate heresy, these prince-bishops, like the prince-provost of Ellwangen, the prince-abbot of Fulda, or the master of the Teutonic Order at Mergentheim, overlooked the dangers of shedding innocent blood. Such “political” considerations were considered Machiavellian by intransigent ecclesiastical members of the Catholic League around 1600, and therefore implicitly atheist or heretical. When defending pure belief, no compromise was possible. These prince-bishops were not only ready to wage war on the battlefield (which they were indeed about to do in the Thirty Years’ War), but they were also ready to wage war against all kinds of internal enemies, and as a Catholic historian (von Pölnitz 1934) remarked, eventually against themselves. Jesuits frequently advocated this kind of radicalism, and an American Jesuit (Bireley 1975) did not hesitate to label them extremists. The remarkable ferocity of witch hunting in Franconia can be best explained by a combination of extreme zealotry, spiritual uncertainty, and physical insecurity, which drove the populace into scapegoating.

We can sometimes see how moral entrepreneurs were directly involved in triggering a witch hunt. The only large-scale witch hunt in any imperial free city of southeastern Germany occurred after an ideologically motivated lawyer gained power in Nördlingen. He exploited the case of a mentally disturbed maidservant working in a household where three little children had died mysteriously in 1589. In this witch hunt, thirty-five people were burned within five years, despite considerable

resistance from the Protestant superintendent. In many witch hunts we find that individual agency played a decisive role in either starting, maintaining, or stopping hunts. Although rural supporters usually appear as unstructured crowds, one can sometimes identify leading individuals if the sources are sufficiently detailed. Some moral entrepreneurs were driven by material interests, some by anxieties, others by ideology, and many by varying mixtures of these ingredients.

In this region, witch hunts started comparatively late and peaked relatively early, with the persecutions of the late 1580s. Afterward, persecution declined sharply in the southeast, but gained momentum in Franconia until reaching unprecedented levels of cruelty in the late 1620s. After a whole generation of Catholic prince-bishops had been replaced, their successors obviously repudiated their predecessors' conduct. Between 1630 and 1700, death sentences for witchcraft in these ecclesiastical territories approached zero, while many Protestant imperial cities now held witchcraft trials, and most saw a few executions. This picture reversed after 1700, with no further executions recorded from the free cities, while Catholic territories resumed witch hunting. Southern Germany saw chains of trials, particularly linked to agrarian crises of 1709 and the 1720s. It was clearly a sign of Catholic backwardness that only a late execution at Würzburg in 1749 triggered a public debate, eventually leading to the Bavarian War of the Witches, the final debate on the subject in the Holy Roman Empire, where supporters of witch hunting (mostly conservative theologians) were labeled superstitious and inhumane in the late 1760s.

GERMANY, SOUTHWESTERN

Conceptions of the witch, originating in the early 1400s in Dauphiné, Savoy, and western Switzerland, spread extremely early into the southwestern German-language area, which long remained a central witch-hunting zone. Recently, Oliver Landolt not only found the insult *Hex* in the municipal *Frevelbuch* (register of offenses) of Schaffhausen between 1367–1387, but also located evidence of the burning of one or more *hegsen* from Beringen in its financial records from 1402–1403, thereby obtaining the earliest known uses of the German term for witch, *Hexe*.

After the Council of Basel (1431–1449), the cumulative witch concept expanded northward and eastward, with trials around Basel, in Alsace, and in the Palatinate. Rudolf von Baden, regional commander (*Komtur*) of the houses of the Order of St. John of Jerusalem in Breisgau between 1456 and 1470, staged witch hunts in Freiburg, Neuenburg, and Heitersheim, all three in Breisgau. In a letter dated November 1484, Heinrich Kramer (Institoris), papal inquisitor for all of upper Germany since 1478 and author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), recommended Count Rudolf, now commander at Überlingen on Lake Constance, to Count Johann von Sonnenberg (d. 1510) as an expert in witch hunting. Kramer, an Alsatian Dominican, conducted large persecutions in the diocese of Constance during the early 1480s, where he boasted of bringing forty-eight women to the stake, although no corroborative records survive.

However, after the appearance of Kramer's *Malleus*, regional witchcraft proceedings were rare and mainly limited to the old concept of harmful sorcery practiced by individuals. In 1562, this picture changed abruptly when the great witch hunts began in southwestern Germany. The chronology of these persecutions was marked by surges and lulls, with high points from 1590–1600 and 1626–1630. In some regions, another upsurge followed between 1650 and 1670, preceding a short phase of single trials that trickled off around 1700. In their regional and confessional distribution, larger territories were less affected than smaller, and Catholic regions more frequently and to a greater degree than Protestant regions, especially after 1600.

Monographically, southwestern Germany, has been treated only once, but in a fundamental and striking way that created a paradigm shift in German witch research (Midelfort 1972). The region Midelfort investigated, largely within the current *Land* (state) of Baden-Württemberg, was then splintered into more than 350 often minuscule and fully autonomous states, including imperial free cities, cloisters, and abbeys as well as a nearly unmanageable series of noble territories. In southwestern Germany, without using serial sources, Midelfort counted 3,229 witch burnings between 1561 and 1670 through simple addition of substantiated cases. His methodological approach was based on bundling various observational techniques to create a regional-historical approach, obtaining a maximum of vividness and differentiation through a combined consideration of the political, legal, economic, social, cultural, religious, demographic, and settlement developments within a clearly bounded geographical space. Its principal results have held up extremely well.

Given the many questions that still face witchcraft researchers in southwestern Germany, witch hunts have been the object of historical seminars since 1992 at the University of Tübingen's *Institut für Geschichtliche Landeskunde und Historische Hilfswissenschaften*. On the basis of Midelfort's study, congenially complemented to the east by Behringer's 1987 work on Bavaria (Behringer 1997), several monographs have been published that have deepened our earlier picture and clarified its outlines. In cooperation with the *Badischen Landesmuseum* in Karlsruhe, a sizable exhibition about "Witches and Witchcraft Prosecutions in Southwestern Germany" opened in 1994, generating an extensive volume of essays (Lorenz 1994). A revised and greatly expanded edition was offered as a *Festschrift* to Erik Midelfort ten years later (Lorenz and Schmidt 2004).

Meanwhile, a series of projects on the history of witchcraft trials in various southwest German territories have appeared. Investigating the witchcraft trials in the duchy of Württemberg, Anita Raith's results differentiated Midelfort's picture by clarifying the role of Württemberg's judicial system and exposing the decisive role of the Stuttgart chancellery, under whose competent and usually uncompromising supervision its local courts lay. This ducal council, two-thirds legal experts, held strictly to the requirements for legal proof in Charles V's *Carolina Code* (*Constitutio Criminalis Carolina*) of 1532, ensuring that even in witchcraft trials, proceedings were orderly, that is, without legal abuses. While Württemberg's legislation of 1567 made it the first territory in the Holy Roman Empire to mention and punish pacts with the Devil, it provoked no mass trials because of legal constraints on the behavior of its judiciary. Of about 350 witchcraft trials in Württemberg, only around 100 executions are demonstrable. Considering its size and population, Württemberg ranked among the least-persecuting

territories in the empire. The desire to persecute witches came mainly from ordinary people, not officials. The trial against Katharina Kepler was, therefore, not an exceptional event: like her, over 60 percent of Württemberg's other accused witches survived their trials.

The very divergent developments in the margravate Baden, divided after 1535 between the houses of Baden-Durlach and Baden-Baden have also been investigated (Schneider 1994). A Reformed territory, Baden-Durlach ranked among the persecution-poor territories of the Holy Roman Empire: between 1550 and 1670, only nineteen people were implicated in criminal proceedings for sorcery or witchcraft. In Baden-Durlach, no witch hunt took place. Matters were quite different in Baden-Baden, which underwent a strong re-Catholicization after 1569. Here two waves of persecution occurred. The first, between 1569 and 1580, cost 43 women their lives; the second, between 1625 and 1631, included at least 244 arrests and 231 executions. Both waves of persecution coincided with phases of re-Catholicization; but, unlike during the first wave, the attitude of the authorities became the force driving the later trials.

An excellent dissertation on the imperial free city of Esslingen (Je rouschek 1992) combined legal expertise with psychoanalytical observation. A great storm of 1562, which laid waste to large stretches of inner Swabia and apparently provided the impetus for a marked witch hunt in the region, also struck Esslingen harshly. Its chief pastor, Thomas Naogeorgus, explained the storm from the pulpit as witchcraft and demanded punishment of the culprits. His insistence found popular approval and ultimately forced the city council to begin proceedings against three women. This resulted in one execution, but also cost Esslingen's head minister his office; henceforth, Esslingen's clergy opposed such persecutions. Only in 1653, when Tobias Wagner became chancellor of the University of Tübingen, did the situation change when the council lawyer Daniel Hauff developed into a fanatical witch hunter. While over fifty people in Esslingen and in the villages of Möhringen and Vaihingen fell victim to his zeal between 1662 and 1665, Hauff made this broadly planned and executed witch persecution a springboard for accelerating his career within the hierarchy of municipal offices. The persecution fell apart after Hauff's abrupt and ominous death at the end of 1665; no further deadly witchcraft trials took place in the territory of this imperial city.

Three regional studies informed another volume. Johannes Dillinger's study of witchcraft prosecutions in the Habsburg county of Hohenberg revealed how Austrian authorities in Innsbruck found witchcraft trials objectionable and sought to forestall them. Often, intermediary authorities and officials successfully outmaneuvered the Tyrolean government through

unauthorized decisions. In addition, a resolution of internal conflicts through witchcraft trials took place in Rottenberg, Hohenburg's capital. Tensions were exacerbated by difficulties in suppressing the Reformation amid a feeling of being surrounded by Lutheran territories, and by economic difficulties resulting from storms and exclusion from Protestant markets. The high point of the prosecution fell between 1595 and 1602, when the ineffectiveness of Habsburg authorities exacerbated weak leadership by local authorities, as magistrates yielded easily to popular demands to persecute witches. Rottenburg's witchcraft trials provoked fresh internal conflicts because of the city's unequal treatment of suspected witches. Its council was criticized for protecting rich and prominent citizens. The persecutions abated after three investigative committees were sent from Innsbruck to Rottenburg to examine abuses in the local judiciary, administration, businesses, and in its local church.

Between 1565 and 1667, witchcraft trials cost at least fifty-three people their lives in the imperial city of Reutlingen. Whereas an oligarchic city council controlled Esslingen, a democratically elected council dominated Reutlingen. Here, the persecution waves correlated more or less to council elections (Thomas Fritz, in Lorenz 1998). New men striving to enter the council frequently echoed the persecution desires from below to earn votes from Reutlingen's citizens. After a violent but short period of witchcraft trials, the council quickly returned to a moderate stance; as a rule, it only yielded to these popular desires during a change of generations in the city council. Like Daniel Hauff in Esslingen, Reutlingen's Johann Philipp Laubenberger used witch hunting as a springboard for his political career. His popular prestige as a tough and sweeping witch commissioner catapulted Laubenberger into the mayoral office in the council elections of summer 1665. Once securely in power, however, Laubenberger rapidly developed doubts about the circumstances of witchcraft trials (which he naturally knew better than anyone) and underwent a conversion "from Saul to Paul" on the witchcraft question.

The persecutions in the prince-abbey (*Fürstpropstei*) of Ellwangen were unique within southwestern Germany (Wolfgang Mährle, in Lorenz 1998). Both the total of around 450 trial victims and the intensity of the proceedings were significantly higher than in other southwestern territories, resembling the patterns of persecution in the trial series in the Franconian prince-bishoprics of Würzburg, Bamberg, and Eichstätt, and in the Teutonic Order's district of Mergentheim. Aside from a few single cases, Ellwangen's witchcraft trials were conducted exclusively in 1588 and from 1611 to 1618. The second persecution wave was particularly meaningful, because it revealed the effects of an increasing confessionalization in contemporary witch discourse. Molded

by Tridentine doctrine, Ellwangen's prince-abbot Johann Christoph von Westerstetten represented this connection between confessionalization and witch hunting. He carried out massive series of trials not only in Ellwangen but also in Eichstätt after becoming bishop there in 1613. His persecutions claimed nearly 300 victims in Ellwangen in 1611 and 1612 alone. This intensity, exceeding anything known previously, apparently resulted from a new form of witch judiciary that removed competence from the ordinary agencies of criminal justice; instead, a witch commission established by the prince-abbot controlled the proceedings.

This commission, consisting of two councillors, efficiently applied the prince-abbot's desire to persecute. Procedural law changed to the disadvantage of the accused, and no accused person escaped with his life thereafter. This omnicompetent management of the trials by deputized councillors employed the idea of close familial or social ties among the victims, structuring these persecution waves by trials of entire witch families or households. Once the criterion of family relationship or close social connection between the victims became authoritative, the demonological stereotype of the old woman witch broke down completely, as persons of nearly every age, gender, and social position were executed. When the persecutions ended abruptly in 1618, they had caused a powerful demographic cleft throughout broad sections of the population, especially in the capital city of Ellwangen, and had destroyed the mutual trust that upholds society. In addition, the economic dislocation resulting from the prince-abbot's confiscation practices further destabilized the entire local social system.

It should be emphasized that only a few Catholic territories were affected by such excessive witch hunts. The moderate and persecution-hindering attitude of the government in Bavaria (Behringer 1997) reappeared in the Habsburg territories. Likewise, many ecclesiastical territories, for example, the diocese of Constance (Zimmermann 1988), did not follow the pattern of Ellwangen. Between 1570 and 1590, the diocese of Constance resembled neighboring territories, with executions at Meersburg and the *Obervogtei* (lordship) of Reichenau accompanying persecutions in the rest of the Lake Constance region. But in the first half of the seventeenth century, hardly any further convictions can be found in episcopal territory, although court records from the *Obervogtei* of Reichenau show that witchcraft accusations remained part of everyday village life. The episcopal government, strengthened by the formation of a secular council at the end of the sixteenth century, hesitated to confirm petitions for executions presented by communities; its reluctance to persecute witches forestalled trials and convictions.

With twenty-seven villages spread across 220 square kilometers, the Catholic imperial free city of Rottweil

controlled one of the largest geographical territories (next to Ulm and Schwäbisch Hall) in southwestern Germany. Here at least 266 people fell victim during various waves of persecution (Zeck 2000). Evidence suggests that Rottweil's witchcraft trials were not promoted by local authorities, but rather originated in its urban and rural middle classes; neighborhood conflicts often provoked trials. Rottweil's witchcraft trials developed their dynamic through a blend of social, economic, and legal struggles, strongly influenced by traditional superstitions.

A methodologically superb study (Schmidt 2000) illuminated the unique place of the Palatinate in the history of witchcraft trials, both among the electorates and among other major territories of the Holy Roman Empire. This large territory substantially avoided the great western witch hunt. The most important explanation was the reluctance of its elector and his high council to accept the new cumulative witchcraft concept. Thus sorcery never turned into witchcraft in the Palatinate, nor could such elements as night flight and the witches' Sabbath lead to witch hunts. The Palatinate's complete abstinence from witchcraft trials was an active stance that its administration defended against both external and internal threats. Its authorities steadfastly repelled accusations from witchcraft trials outside its borders and ignored local demands to instigate them.

Schmidt (2000) provided an intricate analysis of the influence of Calvinism, which dominated in the Palatinate, in provoking this result. Although the Heidelberg theologians initially counseled witchcraft persecution, they began to follow the approach of the electors and their high council by the end of the sixteenth century. However, the Reformed confession with its emphasis on the omnipotence of God appears to hold a key to the position of the jurists of the high council. If supernatural intervention by the Devil was impossible, there could be no criminal proceedings involving supernatural acts, which could never have occurred. This critical stance toward the crime of witchcraft was reinforced by the electors' and the high councils' engaged advocacy of the *processus ordinarius* (ordinary procedure), the criminal proceedings developed by jurists on the basis of the Carolina Code. Helped by an efficient defense (entirely unlike a heresy trial), the accused was thus able to pick apart the grotesque and absurd insinuations, which elsewhere in the empire generally led to an order for torture and thus usually to death.

Another new method of approach, likewise using a regional-historical framework, compared the witch hunts in Swabian Austria and Electoral Trier, seeking commonalities, differences, and interactions for an integrated comparison (Dillinger 1999). This impressive work offered a wealth of findings, especially noteworthy for its convincing integration of popular magic

and "church magic" into elements constituting an explanatory model. The dispersed territories of Swabian Austria, organized into four districts, were sometimes inefficiently administered from relatively remote Innsbruck. At least 528 people fell victim to the persecutions in Swabian Austria.

However, despite social and economic difficulties, no part of Swabian Austria was affected by the wave of witchcraft trials in southwestern Germany at the end of the 1620s. The impetus of the archducal administration at Innsbruck to persecute witches was never strong, and after 1600 it was further weakened by the impact of the Jesuit Adam Tanner's opinion regarding the relationship of the Devil and the witch. Tanner argued that one should deprive demons of their human tools not through execution but through conversion. The Habsburg officials at Innsbruck increasingly rejected witchcraft trials carried out by autonomous committees of subjects. As soon as the territorial overlordship, as a superlocal power, was able to subjugate the organization of courts under their control and thereby delocalize it, the persecution system fell apart. Witchcraft trials not approved by higher authorities provoked the coalescing territorial state to harsh countermeasures, justified through the numerous victims of unsupervised proceedings.

Other research has focused on smaller places in this region. Using new sources, Robert Meier studied the trials carried out in the county of Wertheim around 1630. An investigation of sixteenth-century witchcraft trials in the Franconian margravates included the margravate of Ansbach, which occupied the northeastern corner of the current state of Baden-Württemberg (Kleinöder-Strobel 2002). Another work used surviving archival records of witchcraft trials in the imperial abbey of Marchtal on the Danube, which cost at least sixty-one persons their lives between 1586 and 1757 (Störk 2003). Here, under the rule of the Premonstratensians, trials were concentrated in a few waves of persecution; the last, between 1745 and 1757, fell almost entirely outside the usual chronological framework. Other research investigated the territory Bussen on the Danube, possessed by the *Reichserbtruchsessen* of Waldburg but threatened by Habsburg attempts to take it over. Using the records of the *Reichskammergericht* (imperial chamber court) in cases of *crimen magiae* (crime of magic) from the imperial free city of Offenburg illuminated the possibilities and limitations of its influence on witchcraft trials (Oestmann 1995).

Thus the impulse that southwestern German witchcraft research received from Erik Mdelfort's work in 1972 has borne much fruit. Nonetheless, researchers still have much to accomplish in order to blanket the area of southwestern German with regional studies, to say nothing of microstudies. Still missing are major studies of

such southwestern German territories as the prince-bishoprics of Strasbourg and Speyer, the counties of Fürstenberg or Limpurg, the dominions of the *Reichserbttruchessen* of Waldburg, and the imperial free cities of Weil der Stadt and Heilbronn, without overlooking the numerous upper Swabian imperial abbeys and noble domains with the right to judge capital cases. Whereas most cloisters and abbeys have a rich archival inheritance, written sources suitable for drawing a picture of witchcraft trials can rarely be found for the smaller territories of the nobility, which were mostly reorganized at the end of the Old Regime. Here often only large-scale archival research accompanied by an intimate knowledge of regional conditions and administrative structures allows a representation of events. Unfortunately, this is especially true for the highly significant territory of Wiesensteig, where after the great storm of 1562 the Lutheran count of Helfenstein had very large numbers of women burned following short trials. These events, sketched only hazily in archival records of neighboring territories, urgently need a reappraisal, because they apparently marked the beginning of the great witch hunt in southwestern Germany, as contemporary observers also noted. Even in the distant Pomeranian university of Greifswald, the rector noted with shock in his matriculation register of 1562 the news of the widespread execution of witches in southwestern Germany.

GERMANY, WEST AND NORTHWEST

Western and northwestern Germany, extending roughly from the Saar, Nahe, Mosel, and Middle Rhine regions in the south to the North Sea, encompassed a variety of territories of widely varying size, cohesiveness, and importance. Divided confessionally as well as administratively, the western and northwestern portion of the Holy Roman Empire did not comprise a unified area of persecution where witch hunts were consistently and uniformly conducted in the early modern period. Nevertheless, certain common structures can be discerned.

Basically, there were five different zones of persecution. The first was the Saar, Nahe, Mosel, and Middle Rhine region with the electorate of Trier and the Nassau counties. The second was the central Rhineland with the counties of the Eifel region along with the electorate of Cologne (including the duchy of Westphalia). In

these two zones, the mass witch hunts in whose course thousands of people were executed were concentrated. Intensive witch hunts also occurred in the third region, the more northern prince-bishopric of Münster, the county of Lippe, and the ecclesiastical territories of Osnabrück, Verden, Bremen, and Minden. Here execution levels did not reach those of the first two zones, but still took hundreds of lives. Moreover, in this zone, the witch hunts were often concentrated in larger cities instead of in villages and small towns. In the far northwest, the fourth zone encompassed the united duchies of Jülich-Berg and Cleves and the counties of Oldenburg and Friesland, while the fifth, in the eastern-northwestern parts, included the Hessian counties, the Brunswick principalities, the duchy of Schleswig, and the duchy of Holstein. These last two zones experienced more moderate persecutions that seldom led to mass trials (the prince-abbey Fulda constituted an exception).

THE CENTERS OF PERSECUTION

THE SAAR, NAHE, MOSEL, AND MIDDLE RHINE REGIONS, THE ELECTORATE OF TRIER, AND THE NASSAU COUNTIES Under the influence of the *Malleus Maleficarum* (The Hammer of Witches, 1486) and its author, Heinrich Kramer, who was active around 1488 in the Mosel region, the Mosel and Middle Rhine regions experienced their first witchcraft trials before 1500. Knowledge of the new teaching about the evil-doing witch sect spread rapidly along the river systems of the Rhine, Mosel, Maas, Nahe, and Saar. However, the mass persecutions in the countryside around Trier and the territory of the imperial abbey of St. Maximin, which gained empire-wide notoriety, came only after 1586. Economic crises caused the witch hysteria. Witches were held responsible for persistent periods of bad weather and harvest failures, and the rising prices, hunger, disease, and deaths of people and animals that followed. The shifting movement of witch fears and accusations is also apparent, for parts of the electorate of Trier were infected by persecutions underway in the neighboring duchy of Luxembourg. Even at the beginning of these witch hunts, village communities formed committees that stoked popular persecutory zeal. Originally extra-legal, these committees conducted a good part of the preliminary investigations, consolidated witch accusations, and drove the persecutions, eventually working closely with officials. Local persecutory zeal was so strong that the weak territorial lord, Archbishop Johann VII (1581–1599), who strongly feared witches himself, was hardly able to enforce his 1591 criminal ordinance regulating the witchcraft prosecutions.

The imperial law code, the Carolina Code (*Constitutio Criminalis Carolina*), promulgated by Emperor Charles

V in 1532, laid the formal foundation for the witchcraft trials. It prescribed inquisitorial procedures, but restricted the use of testimony by a confessed “witch” against accomplices “seen” at a witches’ Sabbat. In the first wave of persecutions between 1587 and 1596 in the electorate of Trier, hundreds of women and men met a fiery death. The spectacular trials in the city, to which even highly placed citizens and members of the upper clergy fell victim, were widely noted at the time. They came to a rapid end in 1596 because the many scandalous injustices finally brought the territorial governmental to exert control. A second wave of persecutions in the electorate began in 1629, caused by witch hunts in the neighboring Eifel territories. Once again villages created local committees that played a substantial role. Invasions by French and Swedish troops brought this wave of persecutions to a quick end. Isolated trials still occurred until 1640–1641, and a third wave of persecutions took place around 1650. However, the new elector and archbishop, Carl Caspar von der Leyen (1652–1676), resisted the trials after his ascension, and after 1654 only small trials took place in outlying areas and condominiums, lasting into the 1680s.

Particularly severe persecutions occurred in the nearby imperial abbey of St. Maximin. Between 1586 and 1596, in 1637, and from 1641 to 1642, approximately 500 people were burned, a fifth of all inhabitants.

The intense witch hunts in St. Maximin and Trier influenced the trials in the Saar and Nahe regions. Between 1500 and 1700, at least 591 witchcraft trials took place in the jurisdictionally fragmented Saar region. The equally fragmented Nahe region experienced approximately 140 witch prosecutions between 1534 and 1684. However, while in the Mosel and Middle Rhine regions members of village as well as city elites, members of the upper clergy as well as parish priests, government officials, and judges were among the victims even at the beginning of the trials. In the Saar and Nahe regions, generally only members of the lower classes were executed, with rare exceptions. In the Catholic territories (Trier and St. Maximin), at least one-third of the victims were men, while in the Protestant areas 80 percent of the executed were women. (This was exactly the reverse in Protestant and Catholic parts of French Switzerland.)

In the Middle Rhine, Mosel, Saar, and Nahe regions, popular pressure for persecutions was especially strong, manifested in the creation of communal witch-hunting committees. Moreover, these witch hunts were concentrated primarily in minor lordships that conducted witchcraft trials on their own to defend themselves against the growing control of higher-level authorities. These petty religious and secular lords cooperated with the local commoners’ committees to create intensive persecutory environments in which hundreds of executions might occur. Only with difficulty did major

territorial governments assert control over the trials as part of the state-building process.

Similar persecutory structures were also found in the Nassau counties (Nassau-Idstein, Nassau-Weilstein, Nassau-Saarbrücken, Nassau-Dillenburg, Nassau-Siegen, Nassau-Beilstein, Nassau-Hadamar, and Nassau-Diez), a majority of which were Calvinist. A total of 411 witchcraft trials are known between 1573 to 1713, although there were undoubtedly many undocumented cases. At least 264 people were executed and 17 died in prison or from torture; 88 percent of the victims were women.

The Carolina Code provided the legal foundation for the trials in the Nassau counties, so the required legal consultations were made either with the count's chancellery or with the law faculties at the universities of Marburg, Giessen, or Mainz. During the first wave of persecutions under Count Johann VI of Nassau-Dillenburg (1559–1606), who united many of the divided counties under his lordship, the convicted were mostly burned alive in straw huts. During the high points of persecution, around 1618 and 1629–1632, when two of the territories (Nassau-Hamar and Nassau-Siegen) reverted to Catholicism (1629), the convicted were beheaded first, and their corpses burned.

In the Nassau counties, the impetus for witch persecutions also came from the populace. Numerous appeals to the count's chancellery demanded witch prosecutions under the threat of withholding taxes. Johann VI interpreted such demands from his subjects as an assault on his sovereignty, so he only allowed witchcraft trials after careful examination by his chancellery, imposed strict oversight on the local judges, and accepted no communal action against suspected witches. Twenty people were executed in all.

A substantial increase in witchcraft trials occurred in Nassau-Dillenburg and the other Nassau counties in 1629–1632, when the creation of communal witch-hunting committees was permitted if the villagers agreed to bear the horrendous trial costs. Overwhelmed by the volume of requests for legal advice in witchcraft trials, the count's chancellery named several witch commissioners to provide on-site consultations. The result was to decentralize the control of local persecutions, and the close collaboration between the witch commissioners and the local witch-hunting committees produced an intense persecutory environment reinforced by savage torture. While the witch-hunting committees selected the suspects and assembled the evidence against them, the witch commissioners heard accusations, which were mainly convicted suspects' reports of who they had "seen" at Sabbats, interrogated witnesses, imprisoned suspects, conducted the hearings of the accused, and reported to the count about the process of the trial. In order to

make suspects confess, pricking for the Devil's mark and the swimming test (the water ordeal) were employed. Between 1629 and 1632, 154 executions and 9 deaths under torture occurred in Nassau-Dillenburg alone. In 1632, the Thirty Years' War interrupted the trials.

In Nassau-Diez, fifteen witchcraft trials were conducted in 1644–1645, while in 1651–1652 seventeen people fell victim to trials in Wehrheim, which was administered collectively by Trier, Nassau-Diez, and Nassau-Dillenburg.

There was another outbreak of witch hunting with perhaps forty-five trials and thirty-two executions in 1676 in Nassau-Idstein. Promoted by Count John, the wave of persecutions only ended with his death in 1677. Thereafter no more executions took place.

In 1644 in Nassau-Diez and Nassau-Beilstein, the tolerant Count Wilhelm Frederick, also the governor of Friesland in the Netherlands, spoke out against the trials. Nevertheless, local judges still carried out trials until 1645. However, the moderate position to convert rather than to burn those suspected of magic won out, promoted particularly by Calvinist theologians. In general, to assert their judicial power, the counts conducted and even promoted witchcraft trials in the Nassau counties.

CENTRAL RHINELAND: THE EIFEL
COUNTIES MANDERSCHIED-KAIL,
MANDERSCHIED-BLANKENHEIM,
MANDERSCHIED-GEROLSTEIN, THE
COUNTY ARENBERG, AND THE ELECTORATE
OF COLOGNE

The Catholic counties Manderscheid-Kail, Manderscheid-Blankenheim, and Manderscheid-Gerolstein lay in the Eifel region, contained fewer than 5,000 inhabitants, and at the turn of the seventeenth century conducted a massive witch hunt. Between 1580 and 1638, at least 260 trials ended in death. The consequences reached as far as Cologne and Trier. Excepting isolated trials around 1580 and 1590, the trials in these counties were almost always initiated and promoted by the counts themselves.

In Manderscheid-Kail, Count Diedrich II (1577–1613) had at least thirty witch suspects executed between 1590 and 1597. Popular initiative played almost no role. Diedrich II appears to have begun the prosecutions to discipline recalcitrant officials, threaten annoying creditors, increase the financial exactions from his subjects, and expand his powers. The Carolina Code did not constitute the legal foundation of the prosecutions, but rather the criminal ordinances of Luxembourg, to which Kail was subordinate.

Arnold II became count of neighboring Manderscheid-Blankenheim in 1604. This former cathedral prior of Trier had once been suspected of

witchcraft. Charges of various harms attributed to witchcraft led him to have the local parish priests question his subjects about witches. By the time of his death in 1614, there had been at least eighteen executions for witchcraft, and he planned a campaign to eradicate witchcraft that his son Johann Arnold implemented after reaching majority. The new count invited the famous witch hunter Johann Möden to Blankenheim to conduct prosecutions as an official witch commissioner. Möden tyrannized the local judiciaries and ran the prosecutions himself. Accusations concerning harmful magic played only a secondary role; testimony of convicted witches against people “seen” at the Sabbat sufficed to make an arrest. Möden obtained confessions through unmerciful torture. He worked as witch commissioner not only in Blankenheim, but also in Manderscheid-Gerolstein. Here he faced opposition from a county official, Heinrich von Mühlheim, but Möden gained Count Karl’s (1611–1649) support for massive persecutions after casting suspicion on von Mühlheim. Between 1627 and 1633, Möden had ninety-five people executed in Blankenheim and sixty-four in Gerolstein, including, in 1629, von Mühlheim.

The massive witch persecutions in the electorate of Trier and in the Eifel influenced the county of Arenberg, which lay to the north. Here the populace complained about the great harm to people, animals, and harvests, as well as epidemics and famines, caused by witches. Hence, the populace created communal witch-hunting committees in 1593, when there was a chain-reaction trial against thirteen accused witches. Renewed witch prosecutions were conducted in 1615 and 1629–1630. While Arenberg’s trials were based on the Carolina Code, testimony of convicted suspects about others they had “seen” at Sabbats was accepted as sufficient evidence for prosecution. The total executed in 1615 is not known, but in 1629–1630 forty-one people were charged and thirty-three burned (85 percent women).

In the neighboring electorate of Cologne, the prosecutions began around 1592, inspired by the intense witch hunts in Trier. However, severe prosecutions only started in 1626, probably influenced by hunts raging in the Eifel. Further high points occurred in 1636 and 1638. In Cologne, the local judges and juries were supervised by legally trained witch commissioners to guarantee that trials were conducted properly. However, the judicial counselors of the electorate’s central government thereby gave control of the prosecutions to the commissioners, who took over the trials from the locals and often led cruel, excessive persecutions comparable to Manderscheid-Blankenheim, Manderscheid-Gerolstein, and the Nassau counties.

The practice of sending commissioners replaced the usual practice, followed in other territories, of procuring legal advice from higher levels of government or

universities. In Cologne, the witch commissioners were not sent as a result of a governmentally initiated witch persecution, but rather on the basis of petitions from subjects who wanted witchcraft trials. Communal witch-hunting committees were established to work with the witch commissioners. The trials in Cologne thus did not stem from a governmental program to eradicate witches, but rather they concentrated in minor lordships as well as in small judicial and administrative units where committees, local officials, witch commissioners, and noble landlords jointly ran the persecutions. Approximately 600 people in the southern portion of the electorate were executed. In the northern portion, hardly any trials took place. In the duchy of Westphalia, which had a similar structure of persecutions as electoral Cologne, around 1,000 people were executed between 1508 and 1732, peaking between 1626 and 1632.

THE PRINCE-BISHOPRICS OF MÜNSTER, OSNABRÜCK, VERDEN, BREMEN, AND MINDEN, AND THE COUNTY OF LIPPE

This area presents a contrast between scattered witchcraft trials in rural areas and more extensive persecutions in capital cities. Witchcraft prosecutions began in Münster after 1555. Between 1580 and 1650, 177 ended with an execution. The city of Münster conducted around thirty trials. The hunts were concentrated not in districts controlled directly by the prince-bishop (only about twenty death sentences are known), but rather in the independent lordships created by a reorganization of the prince-bishopric that Bishop John von Hoya implemented in 1571. This reorganization required that all criminal prosecutions follow the Carolina Code, which mandated written consultations, to better control the many minor noble jurisdictions by placing them under the territorial government’s supervision. The small, autonomous lordships resisted von Hoya’s reforms by conducting witchcraft trials on their own. In contrast to the territorial government’s judges, the nobles’ judges often used an abbreviated trial procedure, not uncommonly arresting suspects after a single denunciation. None conducted the required consultations, and one even used the swimming test (which the territorial government had specifically forbidden), justifying it as a traditional legal practice.

The small county of Lippe, Calvinist after 1600, became a center of the witch hunt in the northwest although the number of executions remained low compared to Trier, St. Maximin, Cologne, and Westphalia. Of the 40,000 rural Calvinist inhabitants, just 221 were involved in witchcraft trials between 1550 and 1686, but the Lutheran city of Lemgo affirmed its autonomy from the count by pronouncing verdicts in criminal trials, and conducted mass witchcraft trials in 1565, 1583–1605, 1628–1637, and

1653–1681. The testimony of convicted suspects sufficed to justify an indictment, and over 250 people were executed in this city with a population of 4,000.

Similarly, in Osnabrück (perhaps the most confessionally mixed state in all of Germany) the witch hunts in the city differed from those in the surrounding prince-bishoprics. The seven rural districts had ninety trials between 1538 and 1638, with one last trial in 1691. Fifty-three ended with an execution. Fifty of these trials took place during the sixteenth century. All concerned harmful magic and focused on individual suspects. The water test was only occasionally employed. Consultations with a law faculty were rare, for usually the princely council decided the outcome of the trials. One reason for the early end of the trials was probably their high cost, which this relatively poor territory could not bear.

The trials went differently in the city of Osnabrück, which strove for the greatest possible autonomy, and in the seventeenth century was able to achieve virtual independence. Of the approximately 4,000 inhabitants, at least 276 were executed for witchcraft between 1561 and 1638. By 1583 there had already been 121 executions. Under Mayor Hammacher the total rose to 204 by 1592. Such massive witch hunts were possible because of the excessive use of the water test and torture. Testimony by confessed “witches” against people they accused (generally under torture) of being at Sabbats fueled the persecutions. The second wave of intense persecutions began in 1636 under Mayor Wilhelm Peltzer, who used witchcraft trials to carry out a local political power struggle as well as to defend the city’s autonomy against the prince-bishop’s chancellery and the Swedes (who had occupied Osnabrück in 1633). Peltzer undertook these witchcraft prosecutions despite the open opposition of Lutheran clerics. In 1639, the hunts, which had killed sixty-four people, ended, the last witch prosecutions to take place in the city. Peltzer’s trials, which even targeted members of the elite, earned him influential enemies. In 1640 he was removed from office; in 1650 he was extrajudicially imprisoned; and in 1669 he died in custody, insane.

The bishopric of Verden fell under the administration of the duke of Brunswick-Wolfenbütel after it turned Lutheran in 1566. The only two known witchcraft prosecutions in the rural territory of Verden occurred in 1585. But in the city itself, forty-six witchcraft trials are known to have taken place between 1564 and 1647. They played an important role in the city’s jurisdictional struggles for independence from the territorial government, evidenced in a 1617 hearing in the *Reichskammergericht* (imperial chamber court). During the Thirty Years’ War, first the Danes and then the Swedes occupied Verden. The last witchcraft trial took place in 1647, when a nine-year-old girl claimed she had seen members of the city’s elite engaged in

witchcraft. The accused’s relatives appealed to the Swedish administrators, who insisted that they be freed and all documents be turned over for examination. When Verden complained to Stockholm about this infringement of its rights, Queen Christina of Sweden responded with the famous edict that curbed further trials in Swedish-occupied territory. Sweden continued to rule Verden after 1648 under the terms of the Peace of Westphalia.

Like Verden, Bremen turned Protestant in the 1530s, occupied first by the Danes and then by the Swedes during the Thirty Years’ War, and granted to Sweden in 1648. Only two known witchcraft trials occurred in the rural territory, in 1550–1551 and 1559, involving individual suspects. The city of Bremen experienced forty trials for harmful magic between 1503 and 1603, when an edict of the Protestant bishop Johann Friedrich von Waldeck (1596–1634) brought them to an end.

The Protestant prince-bishopric of Minden experienced an intensive witch hunt with at least eighty-two executions between 1651 and 1657. While no trial documents have survived, the duke of Brandenburg and governor of Minden, Georg Friedrich, issued an edict against excessive accusations, and consultations were conducted with the legal faculty in Helmstedt and the court of jurors (*Schöffentuhl*) in Herford. In the city of Minden there is evidence of witch prosecutions in the sixteenth century, and 126 people are known to have been prosecuted for witchcraft between 1603 and 1684.

AREAS WITH MODERATE PERSECUTIONS

The Lower Rhine Region with the Duchies Jülich, Cleves, and Berg, the County Oldenburg, and Imperial County East Friesland were areas with moderate numbers of persecutions.

Although the duchies Jülich, Cleves, and Berg (which were united until 1609 and had a population of almost 500,000, making it the largest state in northwestern Germany) appear to have seen relatively little persecution in part because of the influence of Johann Weyer, physician of Duke Wilhelm III (V) (1539–1592). Fears of a secret witch conspiracy as described in the *Malleus Maleficarum* had spread in the Lower Rhine region along trade and communications routes around the turn of the sixteenth century. Consequently, the first trials in the united duchies, which were clearly related to prosecutions in neighboring districts of Cologne, took place before the Carolina Code took effect in 1532. By 1540, fifty-three people had been executed in Jülich and Berg for harming animals and bewitching milk. In Duisburg, part of Cleves, trials are known from 1513 and 1514. However, after 1533, witchcraft trials gave way to trials of Anabaptists, and a series of wars in the region after 1543 further hindered witchcraft trials. Trials for magic therefore died

down even before the appearance of the famous antipersecution writings of Johann Weyer. A broadsheet published in Augsburg claiming that over eighty-five women in the neighborhood of the city of Jülich were executed as we revolves in 1591 appears to have been pure invention, and while fifty to sixty trials of single suspects are known to have taken place in Jülich and Berg between 1580 and 1650, witch hunting virtually ceased in Cleves. The final trial in the duchies took place in 1737–1738 in Gerresheim, Berg.

While there were only a few witchcraft trials in districts ruled directly by the duke, more intense persecutions occurred in minor lordships like Wildenburg, where eleven people were executed in 1627–1628. The territorial prince, Duke Wolfgang Wilhelm (1614–1653), attempted to curb these with a decree in 1631 requiring lesser jurisdictional units to receive written consultations from the ducal chancellery before conducting witchcraft trials.

Overall, witchcraft prosecutions in the Lower Rhine region were concentrated in the southern parts of Jülich, Cleves, and Berg, near the areas of intense persecutions in Eifel and Cologne. However, even though the populace exerted pressure for prosecutions, they did not form communal witch-hunting committees.

No witch hunts appear to have taken place in the county of Oldenburg, although mass trials did occur in two small autonomous lordships, Kniphausen and Jever. In Kniphausen, twenty women were executed for witchcraft in 1590, while in Jever 21 women were prosecuted for magic in 1592, and three more were tried in 1615. In the large imperial county of East Friesland, forty-one people were prosecuted for magic between 1543 and 1592, while in the city of Aurich fifteen suspects were burned by 1543.

THE COUNTIES OF HESSE, THE PRINCE-ABBAY FULDA, THE PRINCIPALITIES OF BRUNSWICK, AND THE DUCHIES OF SCHLESWIG AND HOLSTEIN

Hesse was definitely among the areas of moderate persecution. The first Lutheran count, Philipp I (1518–1567; conve rted 1524) opposed witch prosecutions during his reign. In 1544 he intervened in a trial in favor of a person suspected of magic. Only during his imperial imprisonment in 1550, when his court councilors, who favored persecutions, were in charge, were three executions carried out. After Philipp's death, his territory was divided among his sons Ludwig IV (1567–1604), Georg I (1567–1596), Wilhelm IV (1567–1592), and Philipp the Younger (1567–1583) into the counties Hesse-Marburg, Hesse-Darmstadt, Hesse-Cassel, and Hesse-Rheinfels. Ludwig and Wilhelm retained their father's skeptical attitude. In Hesse-Marburg, a woman was executed for witchcraft in 1582, but other investigations do not appear to have resulted in trials. In

Hesse-Cassel, Wilhelm IV regarded witch fears as papist superstition, and only one woman was executed for magic and murder by poison. The main phase of the witch persecutions in Hesse-Cassel occurred during the reigns of Wilhelm V (1627–1637), his widow Amalie Elisabeth (1637–1650), and his son Wilhelm VI (1650–1663). Between 1511 and 1710, 214 prosecutions for harmful magic and witchcraft were conducted in Hesse-Cassel, but torture was administered in only in 20 percent of the cases, and only 60 people (less than 30 percent, of whom approximately 80 percent were women) received death sentences. The trials never broadened into mass panics, and were geographically limited to the jurisdictionally and confessionally fragmented region of north western Hesse.

An important reason for the moderation in Hesse was the tightly organized, centralized judicial procedures, based on the Carolina Code, which insured the supervision of local judges by higher judicial organs. In fact, the law faculty of Marburg University and the count had to authorize any death sentence. Torture was employed only moderately, and neither testimony by confessed "witches" nor denunciations from the populace carried much weight. Many accused of magic were not prosecuted because of insufficient evidence, and reconciliation between accuser and accused was sought. Furthermore, it appears that the subjects did not press actively for witch prosecutions, for there is no record of communal witch hunting committees in Hesse.

Only one great witch hunt affected Hesse-Darmstadt during the reign of Georg I (1567–1596). Between 1582 and 1590, thirty-seven people, almost exclusively women, were executed there for witchcraft. A plague epidemic and fear of poisoning may have been the causes, and Count Georg I led the persecution himself and ordered his district officials to seek out suspected people. His court preacher Johann Angelus took part in the hearings and also brought new cases to the chancellery's attention. In contrast to his skeptical brothers, Georg I believed in magic. He exhibited all the characteristics of a fanatical witch hunter: uncompromising severity, relentless self-discipline, ascetic austerity, and rigid morality. He sought to use the witchcraft trials politically. This was particularly apparent when he stood up forcefully for a Hessian subject in 1571 who had been incarcerated and tortured on suspicion of magic by Count Wolfgang von Isenburg-Büdingen. Georg did this not from sympathy, but rather because he wanted to defend his rights from an outsider. His decisive role in the witch hunts from 1582 to 1590 is shown by the fact that after his death no more executions of witches occurred in Hesse-Darmstadt. Even a plague epidemic in 1597 did not cause a new wave of persecutions.

In the neighboring Catholic abbey of Fulda, at least 239 people were executed for witchcraft between 1603 and 1606 during the reign of Prince-Abbot Balthasar

von Dernbach. He recruited the witch hunter Balthasar Nuss, who led the witch hunt with unrelenting hardness and cruelty. Nuss patently sought financial profit, illicitly pocketing part of the fines for judicial costs on top of his official salary. His scandalous activities, which disregarded the Carolina Code, led to numerous charges before the imperial court. Catholics as well as Protestants fell victim to his persecution, as did political opponents of the prince-abbot. After Dernbach's death, Nuss was dismissed, imprisoned, and finally sentenced to death by the new prince-abbot, and the witch persecutions in Fulda ended.

Older accounts often cite the reformed principalities of Brunswick as an area of terrible persecutions. In particular, Duke Heinrich Julius of Brunswick-Wolfenbüttel (1589–1613) is supposed to have been a relentless witch hunter. However, trial records document only 114 trials for magic and 53 executions between 1590 and 1620. Little is known about the social historical background of these prosecutions, but many shepardesses were apparently prosecuted as witches. Records of only 21 more trials from 1620 to the end of the seventeenth century are known, and between 1557 and 1670 a total of 225 witchcraft trials, which ended in death for 88 people, mainly women, can be confirmed. In the principality of Brunswick-Calenberg, there was a sensational trial in 1572–1573 against Duke Erich II's wife Sidonie and four female associates. Similarly, the elite appear to have initiated some large persecutions. In particular, a mass trial in the Hitzacker district of Brunswick-Lüneburg took place in the context of a conflict between the sons of Heinrich of Brunswick-Lüneburg, Julius Ernst, and his younger brother August, over their father's estate. August claimed the district Hitzacker, and in 1610 initiated witchcraft trials that lasted until 1615 and that resulted in seventy executions. August had subjects of his brother incarcerated and tortured, and only released them when threatened militarily. These witchcraft trials clearly served to demonstrate and expand lordship and legal rights. Except for this interlude, however, the Brunswick principalities experienced only moderate persecution.

Denmark ruled the linked Lutheran duchies of Schleswig and Holstein (in all around 495,000 inhabitants) after 1581. Holstein was part of the Holy Roman Empire, so trials there were subject to the Carolina Code, while trials in Schleswig were judged according to Danish law. From 1530 to 1735, 852 witchcraft trials can be identified, of which almost 90 percent were against women. Approximately 600 people were executed. Protestant clerics in Schleswig and Holstein believed in the power of witches and supported the persecutions in sermons and tracts, but they questioned the reality of the Sabbath. Consequently, accusations of people purportedly seen at Sabbats carried little weight, hindering the development of mass trials. Instead, accu-

sations of harmful magic generated individual trials, so the witch hunts remained endemic. Furthermore, witchcraft trials did not occur evenly over the entire region; instead they were concentrated in the splintered judicial entities where ultimate judicial power lay in the hands of petty lords. The persecutions came to an end as King Christian V of Denmark curbed the legal jurisdiction of the minor nobles as part of a broader centralization of the state. As a proportion of the total population, executions in Schleswig and Holstein were around 0.12 percent of the inhabitants, in contrast to 20 percent in St. Maximin, 6 percent in Lemgo, and 6 percent in the Manderscheid counties. This northern extension of the Holy Roman Empire certainly belongs to the areas of moderate persecution.

CONCLUSION

1. In western and northwestern Germany, witch hunts were often concentrated in minor ecclesiastical and noble lordships, which wanted to defend their autonomous judicial rights against the encroachments of centralizing regimes. Securing seigneurial autonomy from outside interference bolstered the legitimacy of governmental authority over subjects. Cities similarly used witchcraft trials against their territorial lords to demonstrate autonomy and to solve local political conflicts. This phenomenon of using witch persecutions to assert political and administrative control was not confined to northwestern Germany, but occurred in other parts of Germany and Europe wherever central authority was sufficiently weak.
2. In minor lordships characterized by dense settlement and close communications, witch fears, suspicions, and denunciations were easily disseminated. Consequently, no severe witch hunts occurred in the more thinly settled regions of the north German ecclesiastical territories, while their capital cities presented a decidedly favorable environment for persecutions.
3. Epidemics, agricultural crises caused by bad weather, or witch hunts in neighboring territories often precipitated persecutions. However, no simple causal relationship between local crises and witch persecutions existed.
4. Popular pressure for witchcraft trials existed in all regions, although in different degrees. Weak central governments allowed communal witch-hunting committees enormous leeway in selecting suspects and lodging accusations. When communal witch-hunting committees worked together with cooperative minor lords, district officials, judges, or witch commissioners, the interplay created an intensely persecutory environment.
5. Occasionally the elite initiated and conducted witch hunts that whipped up the persecutory zeal of the

populace. An ambitious, careerist, greedy, or fanatical witch hunter often led these hunts.

6. Individual prosecutions could only become mass persecutions if the institutions conducting the trials accepted the reality of Sabbats. When combined with the classification of the witch offense as a *crimen exceptum* (the excepted crime), justifying the unreserved use of torture, a long list of denunciations of people “observed” at the gatherings of witches could be compiled. Without these components, intense witch hunts did not develop regardless of popular pressure. Prosecutions involving only harmful magic therefore tended not to broaden into mass witchcraft trials.
7. A persecutory environment could only develop in the absence of centralized state control. Where a centrally organized judicial process had established or could establish firm standards of evidence and require the submission of documents, and where local judicial lords could no longer, or only with state supervision, exercise capital jurisdiction, either severe persecutions did not occur or they were quickly suppressed. In contrast, decentralized or weakly asserted government facilitated severe witch hunts.
8. In western and northwestern Germany, massive witchcraft trials were not confined to rural areas, but were instead related to small-scale jurisdictions, dense settlement, and close communications, combined with political conflicts. Consequently, there were few structural differences between the intensive witch hunts in smaller cities and those in small but thickly populated noble or ecclesiastical lordships.
9. The witchcraft persecutions in western and northwestern Germany came to an end generally because an intensification of state control over the local trial procedures made the conduct of witchcraft prosecutions significantly more difficult and limited scandalous judicial misconduct. In effect, tighter state control meant a prohibition of trials, even if this was seldom stated explicitly. Such procedural corrections did not mean that territorial lords had suddenly become enlightened, but rather that they sought to unite all state functions, in particular, legal jurisdiction, in their own hands. In addition, the financial pressure of the often-astronomical trial costs helped bring the prosecutions to an end. The broadening of prosecutions to members of the social elite played only a limited role, for in some cases members of the elite were executed at the beginning of mass trials without causing them to cease.

GERSON, JEAN (1363–1429)

Gerson's teaching about sorcery provided an intellectual source of legitimacy and justification for later witchcraft trials. Until the early sixteenth century, Gerson—his real

name was Charlier—remained an influential authority for German and French theologians alike; even Protestants referred to him.

Named after his hometown Gerson-lès-Barby, situated in the diocese of Reims, Gerson began his studies in Paris in 1377, receiving a professorship from its theological faculty in 1392. Three years later he was elected chancellor of the University of Paris. In spite of long absences, he held this office until he died on July 12, 1429, at an abbey near Lyons. This eminent critic and reformer was referred to as the "most Christian theologian" (*doctor christianissimus*, a flattering parallel to the "most Christian king" of France) and is now considered a moderate nominalist, whose teachings favored mysticism more than scholasticism. He played a leading part in the early fifteenth-century conciliar movement that attempted to heal the schism in the Western Church; Gerson saw councils as a higher authority than the pope. His pastoral ethics gave a major impetus to promoting the Ten Commandments as Christian values above the seven deadly sins, reversing common practice during the Middle Ages.

Gerson considered the belief in magically charged items such as amulets, or calling on sorcerers or sorceresses, as serious offenses against the First Commandment. In Gerson's book on sins, *Le miroir de l'âme* (Mirror of the Soul), both actions were described as a most serious offense, falling within the definition of apostasy. In September 1398, under his chairmanship, the faculty of theology of the University of Paris issued twenty-eight propositions of superstition which he probably also drafted. In 1402 he repeated the condemnation of magic practices in his essay *De erroribus circa artem magicam* (Concerning Misconceptions about Magical Arts), giving further reasons. Misconceptions and blasphemy included not only the belief in other gods and entities, but also summoning demons by invocations or incantations, even if veiled by Christian formulas. Even magical arts with some good purpose, such as the search for protection against ghosts, constituted idolatry. Gerson strived especially to oppose the process of blending Christian with so-called heathen beliefs by stressing that Christian prophets were not magicians, whose acts, he thought, relied fundamentally on a tacit or expressed pact with demons.

Gerson related learned and popular magical practices, naming both as errors of belief. The Hebrew Bible punished these violations by death. In *De erroribus*, Gerson both summarized and advanced the dominant view of magic by contemporary theology. On one hand, the Inquisition could now prosecute magic and conduct sorcery trials, because of the attested heresy. On the other hand, Gerson continued a theological development begun by Thomas Aquinas, arguing that sorcery was not powerful in itself but only in connection with the Devil—a foundation of later demonology. Separating

protective from aggressive spells had now become more difficult, although other elements that would later belong to the witch paradigm were still missing.

Secluded in his abbey, the aged Gerson supported Joan of Arc in 1429 by declaring her God's agent and thus opposing numerous rumors that she was a heretic. However, he died before her trial started.

GESUALDO, CARLO (1566–1613)

Gesualdo was the most illustrious victim of witchcraft in Baroque Italy, suffering lengthy and severe illness in 1603 through the spells of his concubine, Aurelia d'Arrico, and her accomplices.

Gesualdo was a many-faceted personality. Best-known today as a composer of sacred music and madrigals (Stravinsky ranks among his posthumous admirers), he was also prince of Venosa, ruling almost two dozen fiefs in the Kingdom of Naples, and a reputedly violent man who had his first wife murdered before remarrying a Modenese princess, Leonora d'Este. Moreover, he enjoyed intimate connections with the hierarchy of post-Tridentine Catholicism: himself the grand-nephew of Pope Pius IV, Gesualdo's maternal uncles included St. Carlo Borromeo, and a paternal uncle had been Cardinal-Archbishop of Naples.

In the best traditions of Neapolitan love magic described a generation earlier by Giambattista Della Porta, the spells applied to Gesualdo involved various incantations and conjurations, including some sacred ingredients (the Eucharist, holy water) supplied by a local priest, Antonio Paulella. The most bizarre spell, which may explain Gesualdo's illness, involved serving the prince a slice of bread containing his own sperm and his mistress's menstrual blood. It was supplemented

by other spells: two small statues, representing Gesualdo and Leonora, transfixed by nails and pins; a key and lock buried under the prince's favorite passageway, together with a crucifix and a large loaf of bread; some hair and toenails from corpses placed in a lock. Last but not least, Paulella sold Aurelia a magic spirit, trapped in a carafe, which told her—in Greek and in falsetto—what Gesualdo was doing.

In 1590, Gesualdo's bodyguards had murdered both his first wife and her noble lover, a Carafa. This time, Gesualdo was once again in a position to revenge himself through subordinates by ordering his mistress imprisoned in his castle at Gesualdo, together with the local *fattucchiera* (witch) who had recruited Paulella, Polisandra Pezzella (a priest's daughter, previously punished for blasphemy by an episcopal court), and her apprentice. However, the priest's legal status put him beyond Gesualdo's reach (we do not know if he was even arrested), and the prince's other actions provoked a jurisdictional quarrel between his baronial judge, Cesare Stabiano, and the local bishop of Avellino. Despite a threat of excommunication, Stabiano had his prisoners tortured and refused to surrender them to a notoriously lenient ecclesiastical court. We know nothing of the fate of Polisandra's apprentice, who was probably released or allowed to escape, but both Gesualdo's mistress and the local witch probably died in their lord's dungeons.

Thus the scandal was snuffed out as quietly as possible. Although their only child, a boy, had died at age five in 1600, Carlo Gesualdo's wife had two brothers, a cardinal and a duke, and he could not afford a second marital scandal or a formal separation. Leonora suffered from chronic ill health, fashionably labeled as melancholia. She returned to Modena, complaining that the women imprisoned in the castle of Gesualdo had continued to cast spells even after their deaths. Her husband's death in 1613 probably gave her some relief; remaining a widow for twenty years, she died at age seventy-six. Only Carlo Gesualdo's music remains, thus reversing Shakespeare's famous remark that "the evil that men do lives after them; the good is oft interred with their bones."

GHEYN II, JACQUES DE (1565–1629)

Netherlandish draughtsman, engraver, and painter, de Gheyn addressed the themes of monsters, witchcraft, and

Jacques de Gheyn's *Witches' Sabbat*, also called *La Cuisine des Sorcières* (The Witches' Kitchen). Surrounded by demons, familiars, and a snake, witches concoct, while their sister witches depart for the Sabbat. (TopFoto.co.uk)

related topics in several drawings from the first decade of the seventeenth century. Born in Antwerp, de Gheyn trained with Hendrick Goltzius in Haarlem (1585–1590) and opened workshops in Amsterdam (1590–1595), Leiden (1596–1600), and The Hague (1600–1629), where he received commissions from the Stadholder's court.

The nucleus of his witchcraft oeuvre is formed by scenes of an assembly of old women engaged in different acts of witchcraft, often situated near or in ruins, and studies of monstrous rats and toads, skulls, and sorcery books (Van Regteren Altena = VRA 1983, cat. nos. 50, 131, 493, 510–530, 538 recto, 539 recto, 743, 867, 892, 1050; Meij 1986, cat. no. 70; Nürnberger 1999, cat. no. 35; Löwensteyn forthcoming: a gathering of young and old witches, signed and dated 1605). An elaborate design of witches in an overcast landscape was presumably engraved by Andreas Stock and published by Nicolaes de Clerck in Delft (Filedt Kok 1990, 279–280). The Polish artist Jan Ziarnko included elements of this engraving in his print illustrating the Sabbat for Pierre de Lancre's *Tableau de l'inconstance des mauvais anges et demons*

(Description of the Inconstancy of Evil Angels and Demons, 1612, 1613, and 1623).

INTELLECTUAL ENVIRONMENT

Like most artists engaged in the representation of witchcraft, de Gheyn was a member of the educated elite and moved in circles where witchcraft was discussed. In Leiden he established connections with the newly founded university and the publishing business, and was certainly acquainted with its professors of medicine and philosophy who, in 1594, had negatively advised the court of Holland about the validity of the water ordeal (swimming test). In 1602, after de Gheyn had already moved to The Hague, the publisher Thomas Basson, originally from England, received the request to translate Reginald Scot's *Discoverie of Witchcraft* into Dutch. The curators of Leiden University and others in the academic community, who favored toleration toward individuals accused of witchcraft, especially old women, supported the project. Scot's *Ontdecking van tovery* (Discoverie of Witchcraft) appeared in 1609 with a Dutch version of Leiden's professorial advice. De Gheyn drew his witches while his

friend Basson was translating Scot. De Gheyn had certainly remained in contact with Basson, whose son Govert married de Gheyn's sister Anna in 1608. De Gheyn's 1603 drawing of *The Devil sowing tares* (Matthew 13: 24–30), a parable traditionally cited in pleas for religious tolerance, with flying witches in the background, may indicate that he shared the enlightened attitude of Basson and his companions. Also, de Gheyn's witchcraft iconography with its focus on old women and occasional hints at their melancholic hallucinations makes this plausible (Löwensteyn forthcoming).

ICONOGRAPHIC TRADITION AND INTERPRETATION

In Antwerp, de Gheyn would have seen demonological scenes in the tradition of Hieronymus Bosch or Pieter Brueghel the Elder. In the course of de Gheyn's career, he could not fail to have been exposed to depictions of demons and witches by other artists as well, including Hans Baldung [Grien], Cornelis van Oostanen, Bartholomeus Spranger, Jacob Isaacz van Swanenburg, and Frans Francken II, either in the original, or as a copy or variation. Clear influences were Baldung's woodcut of a witches' Sabbath and the pendant prints depicting *Saint James and Hemogenes* designed by Brueghel (VRA cat. nos. 519, 522). In addition, De Gheyn's direct or indirect knowledge of demonological literature other than Scot's tract is proved by his use of the motif of Diana and Herodias, the lady captains of the witches' flight (VRA, cat. no. 522), a stock item since the *Canon Episcopi*.

Various attempts have been made to interpret de Gheyn's enigmatic representations. Recently it was demonstrated that the left-handedness of the witches in the large print (VRA, cat. # 519) was intentional, introducing the motif of inversion inherent to the phenomenon of witchcraft (Swan 1999, 335–339). The print as a whole should be interpreted within the conceptual framework of inversion. De Gheyn confronted the sun-bathed city teeming with church towers in the distance with the clouded world of the witches and demons in the foreground, respectively symbolizing faith in God and temptation by the Devil. Additional emblematic motifs warn against the sin of avarice, the possession of earthly goods constituting the most evil of all devilish temptations. Specific motifs symbolizing the opposition of faith to temptation, a recurring theme in contemporary moral theology, often determines the reading of Netherlandish witchcraft images. Susceptibility to temptation frequently figured as a typically female weakness (Löwensteyn forthcoming).

GHOSTS

Ghosts are innately difficult to define; as the dead returned to or existing in the physical world, ghosts may still have many and varied forms, qualities, and purposes. In medieval and early modern Europe (ca. 1200–1750), these variations stem from the diverse sources for the widespread beliefs in ghosts: biblical, classical, Germanic, and folkloric. Of particular importance to medieval ghost beliefs was the doctrine of purgatory, developed and disseminated in the thirteenth and fourteenth centuries. As a "home" for souls between the fires of hell and the bliss of heaven, purgatory provided an explanation for ghosts' origins and intentions. The Protestant challenge to the doctrine of purgatory also threatened the logic of ghost beliefs, although it did not prevent Protestants from continuing to believe that the dead could return to or remain on earth and make demands of the living. Throughout the Enlightenment and into the twenty-first century, belief in ghosts persisted, fostered by thousands of printed works advertising "true ghost stories" and the application of such new technologies as photography to studying apparitions.

ANCIENT AND MEDIEVAL GHOSTS

Biblical, classical, and Germanic texts provided strong support for medieval beliefs in ghosts who had ambiguous and frequently dangerous relationships with the

living. Biblical examples such as the ghost of Samuel (I Samuel 28:13) and condemnations of “ghosts and familiar spirits” (Deuteronomy 18 and Isaiah 8) distinguish between ghosts and spirits such as demons, but leave many questions unanswered. Both classical and Germanic sources described haunted houses and forests, wild nighttime hunts including both ghosts and other supernatural beings, and ghosts who were so “alive” that they could conduct business, hold hands, and even have sex. The belief in ghosts was so strong in late Roman society that early Christian authors, such as St. Augustine, were afraid any concessions in this area would reinforce widespread pagan belief in spirits. Instead, Augustine and his later followers argued that apparitions were actually “spiritual visions,” immaterial images produced by the imagination. Many early ghost stories depended on these ideas and made no distinction between a ghost seen while awake and a vision during a dream of a person about to die.

Building on these concepts, a “theology of ghosts” emerged in the late Middle Ages. Ghosts were frequently described as physical, corporeal entities who were known to the percipient and who returned to this world to deliver a doctrinal or moral message. The dead appeared when funeral rites were improperly observed, when mourning or penitence was incomplete. As such, they affirmed the bonds linking the communities of the living and the dead in Christian society. Moreover, they emphasized the role of God in establishing these bonds and rules by which heaven and earth functioned; as “marvels,” ghosts testified to the astonishing diversity of God’s creation while supporting beliefs about its underlying order.

Ghosts were also sources about humanity’s fate after death, and from the thirteenth century they appeared in an increasingly diverse array of sources. Ghosts revealed the landscape of the dead—not only what would happen, but how everything would look, feel, smell, sound, and even taste. As such, medieval ghosts reinforced the ideas about good works, intercession, and salvation that were spreading throughout medieval Europe. Medieval ghosts also generally had personal connections to those who saw them: kin, neighbors, confessors, bondsmen, or clerics from the same community. Such social ties were perceived as also having a spiritual component, forming essentially a transcendental kinship.

THE REFORMATION AND GHOSTS

When in the 1520s Protestant reformers attacked the doctrine of purgatory, theologians became homeless. The Zurich theologian Ludwig Lavater wrote one of the earliest and most influential attempts to explain ghostly phenomena within a Protestant framework. Rather than challenge ghosts’ existence, he reclassified them; what people called ghosts were either angels or demons. According to Lavater, whatever their

qualities, ghosts had a mission to make people understand and experience God’s presence in the world. Lavater’s angelology and stress on angelic assistance spread through many Protestant regions in the sixteenth century, taking on characteristics similar to those of the Catholic cult of guardian angels. Lavater’s stress on the possibility of ghosts’ demonic nature also reflected an increased focus on the demonic in many aspects of sixteenth-century thought; it was rare in medieval accounts of ghosts.

Despite these challenges, many patterns of medieval ghost beliefs and practices continued into the sixteenth and seventeenth centuries among Protestants and Catholics alike. Ghosts continued to visit their relatives, ask for aid, and strive to conclude unresolved business. They followed people on voyages and physically pushed and pulled the living, if necessary, to obtain their mysterious ends. Moreover, sources for reports about ghosts were also growing. Diaries, broadsheets, sermons, theological treatises, and other writings that noted ghostly phenomena circulated more freely because of changes associated with the printing press. As prophets, ghosts were active during the English Civil War and Restoration and during the French Wars of Religion. Records of hauntings also made their way into judicial records; in the duchy of Bavaria accounts of specters (*Gesperster*) earned special hearings from the ducal court and the archiepiscopal court of Augsburg.

ENLIGHTENMENT AND SCIENTIFIC GHOSTS

With the eighteenth and nineteenth centuries came challenges to traditional belief in ghosts. Some scholars and lawyers now saw ghosts as delusions of the uneducated, the rustic, the downtrodden, and women. Despite Enlightenment skepticism, interest in ghost stories, “true life” accounts, and even trials involving spectral evidence continued unabated. Writers such as Daniel Defoe, scientists such as John Beaumont, and theologians such as Auguste Calmet all wrote influential works attesting to the reality of ghosts. Yet the qualities and interests of ghosts, and the means by which people learned about them, were changing. By the nineteenth century, challengers of Enlightenment rationality, such as Romantics, saw the ghost and the spectral as aspects of an essential nature that the “modern” had wrongly abandoned. Their ghosts were ethereal and enigmatic. They haunted places, unlike the medieval and early modern ghosts who primarily haunted people.

By the later nineteenth century, belief in ghosts had also taken a new manifestation inspired by the foundation of scientific societies devoted to the study of paranormal phenomena and whose membership included leading scientists of the day. The most famous was England’s Society for Psychical Research (SPR),

founded in 1882, and its goal was to employ the latest scientific methods to the study of psychic phenomena, including ghosts. Such societies used modern census techniques to survey percipients, tape measures to check the thickness of walls and to search for hidden chambers; still cameras for indoor and outdoor photography; a fingerprinting kit; and even portable telephones for contact between investigators. Sigmund Freud incorporated ghosts and the “uncanny” into his theories about the mind and human nature, as did a score of lesser philosophers, psychologists, and scientists in the late nineteenth and early twentieth centuries. Movements such as spiritualism, mesmerism, and theosophy had a broad social appeal, and circulation of scientific texts such as the SPR’s *Report on the Census of Hallucinations* (1894) further legitimized belief in ghosts. In populations traumatized by World War I, belief in ghosts and deathbed sendings flourished, and the 1920s and early 1930s saw the last resurgence in Europe of widespread, open belief in haunted people and places. Despite growing skepticism in the later twentieth and early twenty-first centuries about a rational foundation for ghost beliefs, however, ghosts retained an active place in popular culture and media, and hundreds of societies with diverse credentials continued to study “ghostly” and psychic phenomena.

GIFFORD, GEORGE (D. 1620)

Gifford was a Puritan clergyman whose two tracts on witchcraft are noteworthy for the evidence they provide on popular beliefs about witchcraft and witches. Gifford matriculated at Hart Hall, Oxford, but earned

his degrees (BA and MA) at Christ’s College, Cambridge, which in the later sixteenth century was a hotbed of advanced Protestant thinking. In 1582 he obtained the living of All Saints, Maldon, a small borough and seaport in southern Essex. After his Puritanism provoked problems with the ecclesiastical authorities, the townsfolk retained him as a lecturer (that is, preacher). Gifford was admirably positioned to study witch beliefs in a county experiencing steady witchcraft prosecutions, and he published *A Discourse of the Subtill Practises of Devilles by Witches and Sorcerers* in 1587 and *A Dialogue Concerning Witches and Witchcraftes* in 1593 (it would be republished in 1603).

Gifford’s reputation for drawing heavily on local beliefs about witchcraft rests mainly on the second work *A Dialogue Concerning Witches and Witchcraftes* opens with one of its characters, Samuel, declaring his fear of witches. He constantly heard stories of how they exercised their malice to maim and kill cattle, children, and adult humans, he believed that there were one or two witches in every town and village in the county, and he described his fears of the strange animals he had seen around his house, which, he was convinced, were witches’ familiars. Samuel also had a great deal to say about cunning folk. But, despite providing these details of local beliefs and concerns, Gifford’s work had an agenda that placed it firmly in the mainstream of English Protestant demonology. He described popular beliefs as a first step toward correcting popular errors about witchcraft. Gifford’s concern was to provide his readers with an informed and theologically correct view of witchcraft (expressed by another character in the *Dialogue*, Daniel), which would facilitate more effective witch hunting devoid of what he regarded as widespread misconceptions on the subject. Gifford was not denying the reality of witchcraft or *maleficium* (harmful magic), but rather attacking, via Daniel, the popular conception of how it was performed and what it represented. For example, Gifford stated firmly that witches should be hanged not for the harm that they did to humans and livestock, but rather for entering into a pact with the Devil. He also, like other English Protestant writers of his period, took a very hard line against cunning folk, those “good” witches to whom the population resorted in large numbers, not least for advice when they thought themselves bewitched. Moreover Gifford, along with other English demonologists, stressed the absolute sovereignty of God, encouraging his readers to take a providentialist view of their misfortunes and endure them with Job-like patience, rather than attributing them to the malice of witches.

Gifford’s writings on witchcraft thus demonstrated a broader Protestant concern with evangelizing and christianizing the population. It should be remembered that for Gifford like many other writers whom witchcraft historians have identified as demonologists, witchcraft

was just one of many areas in which it was necessary to confront and correct popular misconceptions about religious matters. Apart from his two works on witchcraft, Gifford wrote a number of theological tracts, their thrust being indicated by the title of one of the first, *A briefe Discourse of certaine Points of the Religion, which is among the common Sort of Christians, which may be termed the Countrie Divinitie*, published in 1581. For Gifford and many other Protestant writers, in both England and elsewhere, replacing this “countrie divinity” with a more theologically and scripturally informed view of witchcraft became the main objective when considering the problem of witchcraft. Thus Gifford’s writings on witchcraft, while undoubtedly providing modern scholars with rich evidence on popular notions on the subject, demonstrate advanced English Protestant thinking on the issue of witchcraft and remind us that works of demonology need to be considered in the broader context of their author’s entire corpus.

GINZBURG, CARLO (1939–)

Former professor of history at Bologna University and now at the University of California at Los Angeles, Ginzburg’s provocative books have helped renew interest in the study of witchcraft among early modern historians. At the *Scuola Normale* of Pisa, he built up a strong interest in sixteenth-century Italian religious history under the direction of Delio Cantimori, and in Marc Bloch and Lucien Febvre’s historiographical “revolution” of the 1930s. Bloch’s voracious reading, amazing skill to “invent” historical problems, and constant eagerness to renew the historian’s craft must have left some sort of genetic imprint on Ginzburg.

Ginzburg’s career had a precocious beginning. In 1966, *I benandanti* (*Night Battles*) appeared, a book on a then rather weird topic. The protagonists were

described as members of a “sect,” probably diffused earlier over a vast area, who practiced rites of an ecstatic agrarian cult to ensure the fertility of fields. Inquisitors tried them and interpreted their nocturnal gatherings as diabolical Sabbats. In 1976, he turned to the study of popular mentalities by publishing *Il formaggio e I vermi* (*The Cheese and the Worms*). There he scrutinized the moods and mind of Domenico Scandella, called Menocchio, the unforgettable sixteenth-century miller burned by the Inquisition. Afterward, he began toiling on his most ambitious work that signaled a return to the history of witchcraft, and in 1988 *Storia Notturna* (*Ecstasies: Deciphering the Witches’-Sabbath*) appeared. In a book of wide erudition and theoretical purpose, Ginzburg attempted a characteristically bold interpretation of the medieval origins of the witches Sabbat stereotype, seen as part of a body of shamanistic myths and rituals.

Ginzburg certainly must be considered the most imaginative early modern Italian historian of the 1970s and 1980s and his works, translated into many languages, have been hailed as major contributions to the study of the mentality of popular classes and to the method known as microhistory. This being granted, some forty years after *Night Battles* and fifteen since the publication of *Ecstasies*, we can now assess Ginzburg’s specific contribution to the study of beliefs about magic and witchcraft.

The *Benandanti* was not an anticipation of the new interpretative paradigm inaugurated by Keith Thomas’s *Religion and the Decline of Magic* (1971). Julia Caro Baroja’s influential *Las brujas y su mundo* (1961), translated in English in 1964 as *The World of the Witches* (and, curiously, never mentioned in Ginzburg’s works), makes a more suitable forerunner for that future trend. After appearing in English, *Night Battles* soon flowed into the continuing renewal of witchcraft studies begun by Thomas’s work. Today, it has not escaped the fate of many path-breaking books: a closer reading and new archival research have shaken some of its main assumptions. In fact, there is no evidence in the trials for the existence of a “sect,” nor of an agrarian fertility cult. Ginzburg’s far-fetched reading of sources and his neglect of late seventeenth-century trials made him downplay the *benandanti*’s main role in Friulan society, namely, their function as healers and cunning men to counter malefic witches.

Although *Night Battles* was immediately acclaimed as stimulating research, *Ecstasies*, on the contrary, received an immediate negative reaction. The reason for this generally harsh criticism goes far beyond the book’s minor factual mistakes and inconsistencies, and must be connected with Ginzburg’s ultimately fatal urge to reshape the rules of his discipline. In retrospect, Ginzburg’s reaction to some reviewers of *The Cheese and the Worms* seems significant; he postulated a need

for changes in the standard of evidence and for new criteria of proof, specifically suited to an investigation based on heterogeneous and unbalanced documentation. Briefly, in *Ecstasies* this tendency to jettison the conventional burden of proof was rife. Ginzburg's deciphering of the Sabbat was soon submerged by his search for the fundamental structure of human nature. His narration wandered off seeking a shamanistic interpretation for the origins of this myth, and in prose that became excessively allusive but hardly ever analytical, Ginzburg gathered a multiplicity of heterogeneous cultural data, blithely indifferent to their social contexts. Paradoxically, women—the protagonists of the Sabbat and main victims in the witch hunt—were again sacrificed in the book.

Nevertheless, despite his questionable interpretations, it seems fair to say that breadth of outlook featured constantly in Ginzburg's writings. Moreover, each of his major works was preceded or followed by original essays, meant to give a fuller picture of his methodological concerns.

GIRARD, JEAN-BAPTISTE (1680–1733)

Girard was a Jesuit priest, tried in 1731 in Aix-en-Provence for seducing and bewitching his nubile former penitent, Marie-Catherine Cadière, in the last major witchcraft trial involving demonic possession to take place in France.

Arriving in Toulon in 1728, Girard became the spiritual director of the teenage Cadière, who aspired to become a saint. Girard wished to become known as a maker of saints, and the bishop of Toulon and others who desired fame for the city and diocese supported his endeavor. Cadière quickly gained a reputation as a living saint for her asceticism, visions, powers of divination, and for having received the stigmata. By November 1729, Cadière began to experience sexual desires, trances, hallucinations, and assaults by demons.

By the end of the following summer, Cadière broke from Girard because he had declined to permit her to leave her convent and because he had begun to doubt her claims to holiness. She confided to her subsequent confessor, Nicolaus Giroux, that Girard had seduced her and helped her instigate an abortion; the anti-Jesuit Giroux then concluded that Girard had bewitched his penitent with demons. Cadière was exorcised to expel the malign spirits and to prove that the Jesuit priest had caused her demonic possession.

This case of demonic possession and supposed sexual intercourse (Cadière's lawyers found—or cajoled—ten other women who claimed Girard had seduced them) produced a pamphlet war in Provence that gained national, even international notoriety, and became embroiled in the century-old struggle of Jansenists (Catholics who advocated strict asceticism and who followed St. Augustine's doctrine of predestination) and Jesuits, strongly committed to the role of free will in achieving salvation. Girard's enemies depicted him in songs, lampoons, engravings, and broadsides (some pornographic) as the successor to other lecherous sorcerer-priests: Louis Gaufridy at Aix-en-Provence in 1611, Urbain Grandier at Loudun in the 1630s, and Thomas Boullé at Louviers in the 1640s.

Cadière's family managed to have the trial evoked from the ecclesiastical court at Toulon, which had favored Girard, to the *parlement* (sovereign judicial court) of Aix. In September 1731, its *procureur-général* (public prosecutor) recommended a guilty verdict, torture, and execution for Cadière for false accusation, pretending saintliness, and debasement of religion. This further inflamed a populace (already excited by the midnight public exorcisms of Cadière organized by her brother, a Dominican priest), prone to believe the tales of Girard's sexual and clerical abuse, and to accept Cadière's claims to holiness. However, there is no conclusive evidence that the confessor had sexual relations with his penitent, and it seems likely that Cadière had applied her own menstrual fluid to help mimic the stigmata. The Jansenists, who had used the affair as an opportunity to attack all Jesuits, had waged their propaganda war well.

Next month, the *parlement*, by one vote, acquitted both Cadière and Girard, remanding the priest, because of his clerical irregularities, to a Church court (which later exonerated him) and holding Cadière and her family liable for court costs. The *parlement's* failure to convict Girard sparked vandalism and disturbances in Provence, including violence against Jesuits; the army had to restore order. Cadière soon left Provence for good; Girard moved to Dôle in 1732, dying there the following year.

What had happened? For some, primarily but not entirely from lower social groups, demons as well as depraved sorcerer-priests were part of this world. For

Jansenists and their allies, the public dissemination of Girard's alleged misbehavior and indiscretions provided a great victory over the Jesuits by presenting them as licentious and evil. Cadière's accusations, the trial, and the enormous publicity weakened the Jesuit order and presaged their expulsion from France in 1764. For many in France, the trial, charges, and testimony smacked of superstition and credulity; the accusations of witchcraft and demonic possession were nothing but fabricated and fraudulent nonsense; the era of miracles had long passed. In this sense, the trial and its outcome clearly belonged to the early Enlightenment and reaffirmed the French royal edict of 1682 that had redefined the crimes of witchcraft and magic as superstition.

GLANVILL, JOSEPH (1636–1680)

Together with Henry More, Glanvill published the most influential defense of the reality of spirits and witches in post-Restoration England. Intended to counter the fashionable skepticism of materialists and atheists, their *Saducismus Triumphatus* (Sadducism Conquered, 1681) joined the approaches of modern empirical science to ancient erudition to offer both a philosophical and a natural historical account of how spirits acted in the world.

Born in Plymouth, Glanvill was educated at Oxford after 1652. He held a series of livings in Somerset after 1660; in 1666, he acquired his most prestigious post, the Abbey Church of Bath, which he kept until his death. Powerful connections also got him a prebend in Worcester Cathedral and a royal chaplainship in 1672. In addition to his works on witchcraft, Glanvill published on philosophical and scientific subjects, attacking Aristotelianism and defending the new science of the Royal Society, whose moderate skepticism and experimentalism, he believed, best supported the truths

of revealed religion. Although latitudinarian toward the essentials of Christianity, Glanvill strongly defended the rights of the Church of England against dissenters, both in his writings and as an active parochial clergyman; his publications guided Anglican clergy and laity on such issues as plain preaching, the sacraments, and morality. He followed Henry More's "Cambridge Platonism," which used the world of spirits (and preexistence of the soul) as support for the established church against enthusiastic dissenters, Roman Catholics, and materialistic atheists.

In 1666, Glanvill published *Some Philosophical Considerations Touching the Being of Witches and*

Title page of Joseph Glanvill's *Saducismus Triumphatus* (*Sadducism Conquered*), a late seventeenth-century defense of the reality of witchcraft. (The British Library/Topham-HIP/The Image Works)

Witchcraft, responding to Thomas Hobbes and perhaps to the 1665 edition of Reginald Scot. A second edition appeared in 1667; a third, retitled *A Blow at Modern Sadducism*, is dated 1668, although Samuel Pepys was reading it on Christmas Day 1667. The third edition contained the famous story of the Drummer of Tedworth, a poltergeist case that Glanvill had witnessed himself in January 1663 at Mr. Mompesson's house in Wiltshire. Glanvill also had access to notes about the witchcraft cases prosecuted by Robert Hunt in Somerset between 1657 and 1665; but, although his 1666 book was addressed to Hunt, he never incorporated most of this material into his work until the revised edition, responding to John Webster's 1677 *Displaying of Supposed Witchcraft*, which he was preparing at his death, was published in 1681 by Henry More as *Saducismus Triumphatus*. Because Glanvill's work followed the pattern set by More's *Antidote Against Atheism* (1652) and More added greatly to the various editions of the *Saducismus*, they should really be seen as joint authors. Their work proved the most influential defense of witchcraft for many years: revised editions appeared in 1682, 1689, 1700, and 1726, and it set the pattern for similar collections of cases, including *The Certainty of the World of Spirits* (1692) by Glanvill's long-time correspondent Richard Baxter.

More and Glanvill were interested in witchcraft primarily for the experimental evidence it offered for the existence and nature of spirits, thus offering an antidote to materialist atheism. They provided a philosophical account within which the action of devils, directly or through witches, could be reconciled with the new empirical science; but they also appealed to the weight of authentic testimony of witchcraft and related phenomena as proof that such things were matters of fact and could not be declared impossible a priori by those skeptical of witchcraft. Hence their collection of such cases, in which many members of the Royal Society, including Robert Boyle and John Aubrey, joined enthusiastically, was as central to the Baconian enterprise of natural history as Glanvill's other investigation into such local phenomena as the Mendip lead mines or Bath's spa waters. In turn, such contemporary evidence reinforced scriptural testimony for witchcraft. Despite Glanvill's use of Hunt's trial material, however, we lack evidence that he and More were interested in witches either as threats to the established church or as harmful agents within local communities. Instead, their work contributed to a lively intellectual and scientific debate lasting well into the eighteenth century, when it formed the chief target of such writers as Francis Hutchinson.

GOAT

The goat has a limited role in literary descriptions of witchcraft, but is quite prominent in pictorial representations. It is either the animal on which witches are most frequently shown to ride through the air, or the physical shape that the Devil adopts at the witches' Sabbat. In Teutonic, Celtic, and Classical mythologies, goats represented the life force and fertility. Christians subsequently associated the goat with lust. In the New Testament, goats were identified with the wicked, and contrasted to the good sheep, while in the Hebrew Bible the scapegoat carried the sins of the community. By the late Middle Ages, the most popular animal forms used to represent the Devil were the serpent, the dragon, the dog, and the goat.

In descriptions of the witches' Sabbat, the Devil sometimes appeared as a goat, but equally often as a cat, dog, horse, fly, or man. As late as 1608, Francesco Maria Guazzo's account of a diabolical Sabbat in his *Compendium Maleficarum* (A Summary of Witches) described the Devil seated on his throne "in some terrible shape, as of a goat or a dog" (Book I, chap. xii). However the anonymous artist who illustrated the work depicted the Devil with the head, horns, and tail of a goat. In Jean Bodin's *De la démonomanie des sorciers* (On the Demon-Mania of Witches) of 1580, the Sabbat concludes by the Devil consuming himself in fire and witches collecting the ash to harm their victims (Book II, chap. 4). Nicolas Rémy's *Demonolatrie* of 1595 acknowledged these different animal forms, but claimed that the Devil chose the shape of a goat whenever he was involved in some ceremony, because the goat's "rank smell" and his "obscene lasciviousness" accorded best with his diabolical nature (Book I, chap. xxiii).

The identification of the Sabbat Devil with a goat in the fifteenth and early sixteenth centuries was possibly influenced by widespread accounts of the 1459–1460

Witch riding a goat to the Sabbat, sixteenth-century woodcut. (Bettmann/Corbis)

prosecutions of the French Waldensians or Vaudois in the northern French town of Arras. Though the documents described the Devil appearing in different forms, the “kiss of shame” (the *osculum infame*) applied to the Devil’s rear involved a goat. In three French manuscript versions of the *Speculatio in secta Valdensium* (Speculation on the Sect of the Waldensians, ca. 1460) by the Cologne theologian Johann Tinctor, written in the wake of the Arras trials, groups of Waldensians were depicted kneeling around a goat with lighted candles.

A century later, the Devil was again shown as a goat in a Sabbat scene of ca. 1570, which survives as a colored drawing in the Zurich collection of Johann Jakob Wick. In this case, as in most others from later decades, the Devil appears as half man and half goat, depicted either with the head of a goat or simply with horns and possibly hooves or a tail. Only with the famous etching of Jan Ziarnko in 1613 did the Devil take on the full appearance of a goat. This was followed by numerous illustrations, the most important of which is that in Johannes Prätorius’s description of Walpurgis Night festivities on the Blocksberg in 1668.

Goats also featured in witchcraft accounts and illustration as animals on which witches rode through the air. While literary descriptions included the goat among many possibilities for transportation, in pictorial images the goat represented the most common animal depicted. In the first two decades of the sixteenth century, the images of Albrecht Dürer, Albrecht Altdorfer, Hans Schäuffelein, and especially Hans Baldung [Grien] established the visual stereotype of a witch riding a goat. The strongest grounds for this identification seem to be the association of goats with the vice of lust, and the interest that these artists had in the theme of sexual disorder. For instance, Dürer emphasized this by the witch’s grasp of the goat’s horn, an allusion to her powers of castration, while Baldung depicted a witch lighting her torch from a goat’s genitals. In such ways the goats included in pictorial representations of witchcraft helped foreground sexual themes that were more fully elaborated in the demonological treatises.

GOEDELMAUN, JOHANN GEORG (1559–1611)

A Lutheran jurist, Goedelmann was one of the most prominent late-sixteenth century opponents of witch hunting in Germany. His three-volume work on this theme, entitled *Tractatus de magis, veneficis et lamiis deque his recte cognoscendis et puniendis* (A Treatise on Magicians, Sorcerers and Witches and How Properly to Identify and Punish Them), was published in Frankfurt am Main in 1591; a German translation followed in 1592. In the work, Goedelmann distinguished between different categories of witches and argued that only those proved to have worked *maleficium* (harmful magic) should be executed. He also dismissed as physical impossibilities certain aspects of witchcraft belief. Of greatest importance was Goedelmann's insistence that witchcraft should be treated according to normal rules of legal procedure, and not as a *crimen exceptum* (the excepted crime), in the prosecution of which all the safeguards that usually worked to protect the accused from over-hasty arrest and excessive torture were ignored.

Goedelmann was born in Tuttlingen in Swabia. He studied law at the universities of Tübingen, Wittenberg, Rostock, and Basel, where he graduated in 1580. In 1583 he became a professor of law at the University of Rostock, but stopped teaching in 1592 to become a court-counsellor (*Hofrat*) to the elector of Saxony in Dresden, a position he held until his death. His *Tractatus* originated from lectures he gave in Rostock in 1584 and from legal opinions he had written on the subject of witchcraft as a member of the Rostock law faculty. In book one, Goedelmann chiefly discussed and criticized learned magicians and sorcerers (*Magi, Schwarzkünstler, Zauberer*), who deliberately made pacts with the Devil that empowered them to work harmful magic. Book two consisted of a far more sympathetic discussion of witches (*Hexen, lamiae*). Following Johann Weyer, whose 1563 criticism of witchcraft trials Goedelmann cited frequently, Goedelmann defined witches as melancholy old women, deceived by the Devil into believing that they had had sex and entered into pacts with him, and that

they had flown to witches' Sabbats and caused bad weather by magical means. Goedelmann dismissed sex with the Devil, night flying, Sabbats, and the metamorphosis of witches into animals as physical impossibilities. Confessions to these deeds were thus the result of the diabolic delusion of weak minds, as was the admission by a witch that she had raised hailstorms: only God had the power to cause bad weather.

In book three, Goedelmann discussed the legal treatment of witches. In opposition to French jurist Jean Bodin, who advocated treating witchcraft as a *crimen exceptum*, Goedelmann insisted that all types of witch should be handled by German courts according to normal legal procedure as laid down by the Carolina Code (*Constitutio Criminalis Carolina*), the criminal law code issued for the Holy Roman Empire in 1532. In adopting this position, Goedelmann was influenced by the work of witchcraft trial critic Hermann Witekind, and by the legal opinions of Frankfurt jurist Johannes Fichard and Lorenz Kirchhof, one of Goedelmann's Rostock colleagues. In a detailed discussion of many specific points of law, Goedelmann argued that the evidence on the basis of which a suspected witch could be arrested and tortured was to be subjected to rigorous scrutiny and that suspects must be given adequate opportunity to defend themselves against the charges brought against them. Goedelmann was generally critical of witchcraft trials conducted in haste and on the basis of flimsy evidence. He pointed out that torture was an unreliable method for obtaining the truth and that judges would have to answer for any innocent blood that they shed.

Regarding the punishment of witches, Goedelmann adhered rigidly to Article 109 of the Carolina Code, which decreed that only those who worked harmful magic should be executed. Those who made a pact with the Devil or who worked magic without causing harm were, according to Goedelmann, to be given various discretionary punishments, such as fines, flogging, or banishment. The *lamiae* whose confessed crimes were impossible and the result of delusions needed medical treatment and better instruction in God's word. Again following Weyer, Goedelmann thus suggested that the spiritual crime of apostasy was not worthy of the death penalty.

There were inconsistencies in Goedelmann's work. For example, although the first two books of his *Tractatus* suggested a division between learned, powerful, maleficent, male magicians who willingly made pacts with the Devil, and weak-minded, powerless, female witches who were deceived by the Devil, in book three Goedelmann referred to female sorcerers (*Zauberinnen*) who were capable of working *maleficium*. Despite such ambiguities, Goedelmann's work made an important contribution to the developing criticism of witch hunting. He made Weyer's ideas

available to a wider audience and, in his insistence that witchcraft be treated as an ordinary crime, foreshadowed such seventeenth-century witchcraft theorists as Friedrich von Spee or Johann Matthäus Meyfart, who criticized legal abuses in witchcraft trials. Goedelmann's impact on contemporaries can be seen in the fact that his critics vilified him as a defender of witches, while skeptics as far away as Catholic Bavaria also cited his work favorably. Second and third editions of his *Tractatus* were published in 1601 and 1676, respectively.

GOLDAST, MELCHIOR (1578–1635)

A well-known lawyer and constitutional historian who studied at universities of all three confessions (Catholic, Lutheran, and Calvinist), Goldast confirmed the necessity of the witch hunt and confiscation in a work published in 1629.

The son of an impoverished Reformed nobleman near Bschofszell in the Swiss canton of Thurgau, Goldast showed an early far-reaching confessional orientation by studying philosophy and law first at the Jesuit university of Ingolstadt (1595–1596) and then at the Lutheran university of Altdorf near Nuremberg (1597–1598). He worked in 1599 at the library of the St. Gallen monastery, registering charters and documents, before moving to Geneva in 1600 and 1601, where he worked at publishing manuscripts for his rich protector Bartholomäus Schobinger. Goldast then became secretary to Duke Henry of Bouillon, going with him to Heidelberg, where he presumably received

his doctor's degree. (Baade 1992, 34). But neither his new title nor his move to Frankfurt am Main in 1606 improved his financial situation. Goldast worked as an author, editor, and lawyer, joining the court of Saxe-Weimar in 1611 and becoming a councillor in 1613. But in 1615 he moved to the court of Count Ernst II of Schaumburg-Bückeburg, where he remained until 1624. Because of the Thirty Years' War and Ernst II's death in 1622, Goldast left Bückeburg and moved his library to the relatively safe city of Bremen. By 1625, Goldast was back in Frankfurt am Main, where he had married Sophie Ottilie Jeckel in 1612 and had two daughters with her.

Already during his service with the count of Schaumburg, the Holy Roman Emperor Ferdinand II commissioned Goldast, a Swiss Reformed Protestant, to justify the imperial succession to the Bohemian crown against the Reformed rebels. In gratitude for these works, Ferdinand appointed Goldast imperial councillor in 1627 and simultaneously councillor to the Catholic elector-archbishop of Trier. His last position was his appointment in 1632 at Landgrave George II of Hesse-Darmstadt's University of Giessen, where he was presumably named university chancellor. After Goldast's death in 1635, his library of 4,151 titles, including every important ancient author as well as many medieval and early modern works, was bought by the city of Bremen, where it still can be consulted (except for the manuscripts given to Queen Christina of Sweden).

Some of the 65 works Goldast published or wrote extended to several volumes. Because many of them were purely collections of documents, he has been accused of an "uncritical, often compilatory treatment" (Müller 1995, col. 820), especially because some documents were questionable (Hoke 1971, col. 1736). Goldast's special interests included imperial and Bohemian law, medieval lyrics (first edition of Walther von der Vogelweide), Swabian writers, and theology. His abundant editions helped German constitutional law to base itself not only on ancient but also on medieval and early modern sources.

GOLDAST AND WITCHCRAFT

While serving the dukes of Saxe-Weimar, Schaumburg-Bückeburg, the archbishop of Trier, and the landgrave of Hesse-Darmstadt between 1611 and 1635, Goldast encountered witchcraft trials. Goldast took a relentless position about witchcraft. His point of view was explained in a 180-page book, finished in 1629 but not published until 1661: *Rechtliches Bedencken. Von Confiscation der Zauberer und Hexen-Güther* (Juridical Considerations. On Confiscating the Property of Magicians and Witches). Presumably Goldast wrote this work in Frankfurt am Main in his capacity as a councillor of Trier, influenced by the witchcraft trials in

this territory. But his praise for the confiscation laws in Schaumburg showed that he was previously acquainted with the subject. Goldast was undoubtedly exhorting the authorities to conduct witch hunts; otherwise they would become guilty before both God and the emperor. Goldast's position constituted an indirect affront to his latest employer, Landgrave George II of Hesse-Darmstadt, who was very cautious in witchcraft trials. Goldast knew what he was talking about with respect to "hard punishment," because in 1603 his brother had been executed on the wheel for murder at Strasbourg.

Goldast had a very wide-ranging definition of witchcraft. In the category of sorcerers, he included not only people who committed harmful magic (*Schadenszauber*), those convicted of copulation with the Devil, or treason against God, but also many others. For him, witchcraft began with petty superstition and the help of the Devil. Goldast included not only fortunetellers, and casters of love magic (referring to the *Malleus Maleficarum* [The Hammer of Witches, 1486]), but also astronomers, rat-catchers, jugglers, tightrope-walkers, and even such physicians as Paracelsus or Johann Weyer as sorcerers who have either concluded a pact with the Devil or at least used his help. For every magician convicted of a pact with the Devil, Goldast demanded the death penalty by burning, regardless of any possible physical harm through magic that might have occurred. He rejected the possibility of a conversion, proposed by such authors as Weyer, Anton Prätorius, or Johann Georg Goedelmann. Goldast resolved the contradiction with the Carolina Code, where confiscation in cases of lese-majesty was prohibited, by two methods. First, he changed the sense of the paragraph by replacing "not" by "with" ("*ni t*" by "*mit*"); second, he referred to a few territorial laws that ordered confiscations. In this manner, Goldast evaded the central axiom "*ubi leges non distinguunt, neque nos distinguere debemus*" (where laws do not differ, we must not differ either) in order to legalize confiscation policies actually in practice. Because witchcraft was growing enormously in 1629, he considered a strict and relentless persecution necessary, without respecting social rank or origin.

GÖLDI, ANNA (1734–1782)

The last known person to be executed in Europe for the crime of witchcraft, Anna Göldi was beheaded in the Swiss canton of Glarus in 1782. A servant, Göldi was accused of poisoning the second-eldest daughter of her employer, Johann Jakob Tschudi, with a *Läckerli* (literally a "tasty treat"; in this case, a piece of cake), so badly that *Gufen* (pins) and wires grew in the girl's stomach, causing her to vomit almost daily for two months. The girl additionally suffered from "gout-like convulsions" and spasms in her left leg. Children often exhibited such symptoms, which under closer examination always turned out to be fraudulent; however, the fact that Göldi was able to heal the girl ultimately persuaded judges of her guilt. The trial of this "poisoness" was the only witchcraft trial that led to a death sentence in Glarus.

Born in Sennwald, in the present-day Swiss canton of St. Gallen, Anna Göldi was the fourth of eight children and earned her living as a servant. At age twenty-four, she gave birth to a son. No marriage took place, however, and she secretly gave birth to a second child in 1765, while working in a clergyman's house. This child, whose father left for Dutch military duty, died in its first night. The death was labeled infanticide. Göldi was sent to the pillory and banished to her sister's house for six years. However, after only three years, she began working in Glarus for one of the area's wealthiest families. Becoming pregnant by her employer's son, she gave birth to her third child (a son) in Strasbourg, France, in 1774, giving the child to a foundling home.

After working satisfactorily for various families in Glarus, in 1780 she entered the service of Johann Jakob Tschuldi, a doctor and *Fünfferrichter* (local judge), and his family of five children. When *Gufen* were found in the breakfast milk of the family's second-eldest daughter, Anne-Miggeli, following an argument with Göldi

in October 1781, Tschudi immediately suspected the maid. She was quickly dismissed and fled to another canton under an assumed name.

An odd spectacle affected the house of Tschudi in mid-November 1781. Anne-Miggeli was bedridden with cramped limbs and, between screams, spit up pins, pieces of wire, and nails during November and December of 1781. Either the girl took the objects out of her mouth, or they were removed for her by relatives, her father, or her mother.

Guests never witnessed these events. A warrant was issued for Anna Göldi's arrest. She was found and jailed at Glarus in March 1782. Anne-Miggeli suffered from "gout-like convulsions." Anna Göldi was urged to heal the girl, and her third attempt was successful.

Instead of dropping his complaint, Göldi's employer pressed opening trial proceedings. Anne-Miggeli told the court's board of inquiry that Anna Göldi and her friend, Rudolf Steinmüller (a man with no criminal record), were the cause of her suffering: they had given her an overly sweetened *Läckerli* with "nail seeds." The pins, pieces of wire, and nails had then grown from these seeds, which the girl had consequently vomited up. Interestingly enough, no injury to her esophagus could ever be determined.

The malfeasance trial against Anna Göldi began mid-March 1782. During her third cross-examination, she confirmed Anne-Miggeli's testimony and accused Steinmüller of having given her the *Läckerli*. During her *Schreckexamen* (an interrogation while showing the torture instruments), Anna said that the Devil had given her the *Läckerli*. Three additional interrogations (all torture sessions) followed. At this point, Steinmüller was ordered questioned; but the night before his interrogation began, he hanged himself. On May 19, 1782, Anna Göldi's final interrogation took place. Tschudi pulled every string to get her sentenced to death by beheading. On June 6, 1782 (in accordance with the Julian calendar), she was found guilty of poisoning Anne-Miggeli. By a margin of only two votes she was sentenced to death by beheading rather than perpetual imprisonment. Her execution followed one week later.

This decision caused outrage in central Europe, although censorship prevented public debate in Switzerland. The resulting discourse about the "Göldi Affair" in Germany about superstition and trial conduct created the term *Justizmord*, meaning "judicial murder."

GOLSER, GEORG (CA. 1420–1489)

Golser was the bishop of Brixen responsible for stopping the overzealous inquisition and witch hunt being carried out by the Dominican inquisitor Heinrich Kramer (Institoris) in Innsbruck. In 1485, Kramer had returned from Rome authorized by the papal decree *Summis desiderantes affectibus* (Desiring with Supreme Ardor), to conduct a formal inquisition against witches in all German Church provinces. Invested with such a carte blanche, Kramer tried to start a paradigmatic witch hunt at Innsbruck. The capital of the duchy of Tyrol was a significant place, since Archduke Sigmund was then the most powerful Habsburg prince, ruling over a patchwork of territories stretching from northern Italy, over Tyrol and southwestern Germany into Alsace, the inquisitor's homeland. Innsbruck would serve as Kramer's gateway into the Holy Roman Empire. His inquisition there, starting in July 1485, was characterized by a climate of intimidation, brutal force, unlimited use of torture, the denial of legal defense, and distorted reports—all in all, scandalous conduct even according to late fifteenth-century legal standards. Therefore, not only the relatives of the accused, but the citizens of the capital, the clergy, and the Tyrolean nobility protested against such illegal procedures.

Bishop Georg II Golser, successor of the famous philosopher Nicholas of Cusa in the see of Brixen, appointed a commission to scrutinize Kramer's inquisition. The formal interrogations of seven imprisoned women started on October 4. And despite desperate resistance from the inquisitor's side, the bishop stopped the persecution on October 29, nullified its results, and—after having secured the archduke's support—liberated all suspected women on November 2. Kramer was discredited as a fanatic, and Bishop Golser went as far as to ask the papal inquisitor formally to leave his diocese on November 11. Later, on February 14, 1486, Golser even threatened to use force if Kramer failed to leave Tyrol immediately.

On this occasion, Golser formulated the famous words: "I am really upset about the presence of this monk in the diocese. . . . It seemed to me that he has become completely senile and childish, when I had the

opportunity to listen to him here in Brixen, together with the cathedral chapter. I advised him to return to his monastery and stay there forever. Really, I got the impression that he is crazy, and that he wants to carry on witch hunting. But I will not agree, since he committed so many errors in his previous trial” (Behringer 2000, 63). An Augustine canon of Brixen, Hartmann Ammann (1856–1930), excavated a written defense of Kramer from the local archive, which clearly indicates that he started working on the *Malleus Maleficarum* (The Hammer of Witches, 1486) as a consequence of this defeat. The prince-bishops of Brixen never again allowed a witch persecution, and—even more important—the Tyrolean government suppressed attempts by lower courts to launch witch hunts even in future generations. The Innsbruck inquisition was an unmitigated defeat for the papal inquisitor, primarily at the hands of a courageous bishop named Georg Golser.

GOODWIN CHILDREN (1688)

The case of the Goodwin children of Boston in 1688 provides a classical example of diabolical possession in America. It resembled numerous earlier instances, such as the case of the Warboys witches in England, where an unpopular old woman became a scapegoat and was executed following accusations from children, and it anticipated the happenings during the Salem witch hunt of 1692–1693, where children’s accusations led to the conviction and execution of nineteen witches. Puritan New England played a special role in regard to witchcraft in seventeenth-century British North America; while in the middle and southern colonies, witch hunting was either restrained or nonexistent. In New England, some 234 people were indicted for witchcraft, and 36 of them were executed—including Mary Glover, an old Irish Catholic widow, who was hanged in Boston

for bewitching the Goodwin children.

In the summer of 1688, four of the six children (Martha, age thirteen; John, eleven; Mercy, seven; and Benjamin, five) of John Goodwin, a mason living in Boston, began to display symptoms that contemporaries judged to be diabolical possession. One eyewitness found them “grievously tormented, crying out of head, eyes, tongue, teeth breaking their neck, back, thighs, knees, legs, feet, toes, etc.” (Hall 1991, 266–267). Furthermore, they were sometimes deaf, dumb, and blind; however, because their problems seldom occurred after ten o’clock in the evening, they managed to sleep well at night.

Martha, the oldest of the children, accused Goody Glover, who did the family’s laundry, of stealing some linen, allegedly in order to perform some type of witchcraft. Confronted with these allegations, the mother of the laundress, Mary Glover, also a washerwoman, became very angry and used foul language against Martha. Martha immediately retaliated by developing strange fits; within a few weeks, one of her sisters and two brothers exhibited the same behavior. The best local physicians were called in to check on the afflicted children and diagnose the cause of their sufferings. One of them, Dr. Thomas Oaks, concluded that the origin of the children’s strange behavior was “a hellish witchcraft” (Hall 1991, 268). Accordingly, ministers from Boston and the surrounding area joined in a day of prayer in the Goodwin home; following this, the youngest child of the four gained relief from his troubles.

Reports of the case soon reached Boston’s secular authorities. Witchcraft in New England was a secular crime and hence tried in a civil court; it was also a capital crime in old and in New England, and clergy as well as magistrates condemned it primarily because it implied a demonic compact. When civil authorities received a complaint from John Goodwin that his neighbor, Mary Glover, and her daughter Goody Glover had bewitched his four children, both mother and daughter were arrested, but only the mother was put on trial for witchcraft. During the proceedings, Mary Glover’s interrogation was conducted through interpreters, because she spoke Irish (Gaelic). Among the charges levied against her was that six years before she had bewitched a woman to death. Meanwhile, her house was searched and some images, puppets and babies, all made of rags and stuffed with goat’s hair—materials believed to be essential to witchcraft—were found. Before reaching its final verdict, however, the court appointed six physicians who checked Mary’s mental condition to confirm her sanity. They declared her *compos mentis*, fully sane, and hence capable to stand trial. After she had confessed to being in league with the Devil, enchanting the four children, and practicing image magic, Mary was condemned to death and hanged at Boston on November 16, 1688.

Despite Mary Glover's death, the strange behavior of the three Goodwin children continued. Cotton Mather, minister of Boston's Old North church, who had followed the case closely from its beginning, now took Martha into his house in order both to observe her behavior more closely and to apply some spiritual healing. Almost a year after their first appearance, the children's fits and strange behavior finally disappeared. Memories of the case of the Goodwin children continued to haunt public imagination, especially when other "afflicted" children emerged in Salem Village within four years.

**GOYA Y LUCIENTES,
FRANCISCO JOSÉ DE (1746–1828)**

A world-famous Spanish painter, Goya's ample works contain some notable engravings and paintings dedicated to the themes of witchcraft and superstition. Goya's life coincided with the end of the Enlightenment and the beginning of Romanticism, as well as profound political and social changes in Spain after the War of Independence against Napoleon (1808–1813). These revolutionary years ended Spain's Old Régime, recognizing the principle of national sovereignty for the first time in Spanish history. Nevertheless, once the war ended, the monarchy was restored in the person of Fernando VII and absolutism returned to Spain. Despite his privileged position as the official court portraitist, Goya was moved by these events to go into voluntary exile in France in 1824, dying at Bordeaux four years later.

Goya's work on witchcraft and superstition followed a grave illness in 1792, which left him completely deaf. In opposition to the amiable and popular technique that had characterized his first epoch as a painter, he now turned his vision to the realm of the phantasms of imagination. In a famous series of 80 engravings called the *Caprices* (*Caprichos*, works of pure imagination), which were put up for sale in 1799, the theme of witchcraft appears clearly in 19 of them (numbers 44–48, 51, and 59–71). But many

others in addition to these also partake indirectly in this theme. For example, the 49th *Caprice*, entitled *Duendecitos* (*Goblins*), oscillates between representations of an underworld of witchcraft (that of the goblins) and anticlericalism, where monks are represented as gluttonous, lewd, dirty, and obese goblins. Similarly, the theme of prostitution and pimping links with the practices of love magic, each of these being present everywhere in contemporary Spanish society. In reality, as some critics have made clear, the world represented by Goya in the *Caprices* is not a simple accumulation of singular scenes, but presents a unity around the concept of the night, of gloom, and, in general, of everything which in the light of day and reason lies hidden behind appearances and conventions.

One idea appearing throughout the *Caprichos* is that of the "world of the other side," which corresponds to the world represented in the scenes of witchcraft, and, more concretely, with anything that parodies or reverses the Catholic religion, which Goya criticizes harshly in

Se Repulen (*They Spruce Themselves Up*), by Francisco de Goya, the celebrated Spanish painter of the Enlightenment, who depicted witchcraft satirically as superstition in many paintings. Here one witch clips the toenails of another, who has been partly transformed into an animal, while a third witch has become a bat. (Bettmann/Corbis)

various scenes dedicated to the activities of the Inquisition. Indeed, one of Goya's principal inspirations for his arrangement of witchcraft scenes must have been the printed account of the *auto-da-fé* (act of faith) that took place in Logroño in 1610, where 33 witches and sorcerers were tried, which included detailed accounts of the crimes of which they were accused. Not coincidentally, in 1811 the Enlightenment writer Leandro Fernández de Moratín, a friend of Goya, published under a pseudonym an annotated edition of this account, with the aim of demonstrating the injurious effects the Inquisition had on Spain, and of contributing, for this reason, to its scorn and abolition. Nicolás Fernández de Moratín, his father, had published a long poem entitled *Arte de las putas* (The Art of the Whores), that the Inquisition prohibited in 1777; it was also considered a source of inspiration for several *Caprices* dedicated to this theme.

For many critics, the satirical and political aims of Goya's witchcraft scenes are patent. It was a question of making clear how the destructive monsters, engendered in the deep obscurity of the night, continue to be active even in the clear light of day—in other words, how ancient or obscure elements continue undiminished in power, even though modern institutions had been born from the hands of the liberal revolutions, using ideas of the Enlightenment. It is certain that commentaries on the *Caprices* that use such verbs as *untar* (to smear), *soplar* (to blow), and *chupar* (to suck), apparently referring to representations of witches and the activities of which judges accused them, have a double meaning in a picaresque idiom. As Diego Torres Villarruel wrote in one of his *Witches' Couplets*, "Judges and witches/we all give suck/some to children and others to joints of meat."

Nevertheless, unlike Moratín, who throughout his life defended rationality, the Enlightenment, and progress, which had finally dissipated the darkness and monsters of injustice, Goya evolved from a superficial and optimistic rationalism, characteristic of the first epoch of the Enlightenment, to a more profound and creative immersion in the world of shadows. The *Witches' Coven*, one of the *Black Paintings* with which Goya's residence called *Quinta del Sordo* (acquired in 1819) was decorated, is a good example. In opposition to the ordered universe offered by Enlightenment intellectuals, Goya uncovers an insoluble and fatal abyss between the intellect and human experience, leading him to acknowledge and explore facets of existence that remain outside of reason's domain. This associates him with Romanticism and its attraction to the mysterious, although Goya's absolute originality and authenticity, oscillating between satire, the grotesque, and monstrosity, prevents his being confined under any single label.

MARÍA TAUSIET;

GRAETER, JACOB (1547–1611)

Jacob Graeter delivered two sermons on witches and sorcerers during the summer of 1589, dedicated to the nobleman Hans Werner von Wolmershausen and his wife, and published that same year at Tübingen as *Hexen oder Unholden Predigten . . .* (Sermons on Witches or Monsters . . .). The first sermon was an interpretation of Luke 6, the second of Luke 1. Although Graeter believed that witches really existed and found them deserving of death according to Exodus 22:18, he also emphasized the delusions caused by the Devil and warned about false denunciations. Whoever lives virtuously, he argued, should not be afraid of witches, because God limits their power. With confessional polemical zeal, he underlined that no righteous Protestant woman could become a witch. Graeter wanted to remove the fear of the witches and give his audience a guide for a moral way of life. Thus he cannot be seen as an advocate of mass prosecutions of witches. His opinions accorded well with both the Württemberg providential tradition promoted by Johann Brenz and others and with the lenient position of the Schwäbisch Hall magistrates: only one witch execution is known at Schwäbisch Hall, in 1574.

Born in the imperial city of Schwäbisch Hall, where his father Jacob the Elder, a Lutheran pastor, had translated the influential sermon by Johann Brenz on hailstorms and witchcraft, Jacob the Younger studied at the university of Tübingen. In 1582, after occupying some other parishes, he also became a pastor at St. Michael in his native town. In 1588 Graeter was made preacher and dean, but had to leave Schwäbisch Hall in 1594. He died as pastor of Gernsbach, near Baden-Baden. Between 1582 and 1600, some of Graeter's other sermons were printed at Tübingen, Frankfurt am Main, and Strasbourg.

GRATIAN (FL. 1130–1150)

Gratian was designer and compiler of the *Concord of Discordant Canons*, which became the basic textbook for the study of canon law from the mid-twelfth century onward. Said to have been a monk, Gratian appears to have taught canon law at a school in Bologna. The aim of Gratian's work and his teaching was to reconcile different traditions and scattered and locally applicable earlier collections of canon law; to resolve apparent conflicts in earlier sources; and to create a coherent and consistent system of ecclesiastical law. His work, popularly known as the *Decretum*, was produced in two versions, one around 1130 and a revision in the 1140s, with later additions by other scholars. The *Decretum* discusses sorcery in several places, and from these discussions emerged the legal basis of understanding sorcery in canon law.

Part II of the *Decretum* contains Gratian's material on heresy and sorcery. Part II is divided into *Causae*, or *cases*, which may be actual or hypothetical. Each case raised several points of law, which Gratian posed as questions. Within each question and addressing one of the points of law, Gratian cited individual canons, authoritative texts that he culled from many earlier collections (in the entire *Decretum* he cites 3,945 individual canons, usually cited individually by their opening word or words), and he added his own comments before or after each canon. *Causae* 23–26 deals with issues of heresy and sorcery, the latter discussed in *Causa* 26. Gratian also discussed sorcery in *Causa* 33, part of his treatment of marriage law.

Causa 26 presents the case of a priest who was a magician and diviner, investigated by his bishop, refused to stop his activities, and was excommunicated by his bishop. Later, at the point of death, he was given last rites by another priest without his bishop having been consulted. Gratian raised seven questions about the case, five of which pertained to magic and divination. He drew on texts from St. Augustine, Isidore of Seville, and Regino of Prüm, sometimes from later citations of these, including the collection of Burchard of Worms. *Causa* 26, question 5, canon 12 is the *Canon Episcopi*, which condemns sorcery and divination, and also expresses profound skepticism that some women actually rode great distances at night with the goddess Diana. Later canonists who wished to prove the reality of the transvection of witches thus had to find ways around Gratian's explicit citation, and some of them eventually did so.

Gratian's *Causa* 26, question 1, canon 4 (*Nec Mirum* ["It is not to be wondered at . . ."]) was also a frequently cited text attributed to St. Augustine, but taken by Gratian from the ninth-century treatise against the magic arts by Hrabanus Maurus, which addressed condemnations of both classical and biblical instances of magic. This text, too, was later regularly cited by canon lawyers and theologians (including Martin Luther) writing against sorcery, divination, and witchcraft.

Gratian's third most important text, *Causa* 33, question 1, canon 4 (*Si per sortiarias* ["If, by means of magic . . ."]), deals with magically caused impotence and whether or not such impotence was an impediment to marriage. Gratian stated that, in such cases, the couple should confess their sins, be contrite, fast, and even undergo exorcisms, while giving alms to the poor. If these methods did not work, the couple may be separated, but they could not marry others. Such afflictions occurred with God's permission, through demons, and must be borne with patience. Because marriage law was developing in its technicality during this period, this text probably drew more attention in schools of canon law than the texts from *Causa* 26 discussed above. Not until the early fifteenth century, when the classical image of the witch was being formulated by theologians, inquisitors, and canon lawyers, did Gratian's citation of the *Canon Episcopi* find opposition, and arguments were devised, most notably by Nicolas Jacquier, to prove that it did not address the contemporary new heresy of witchcraft as it was perceived in the fifteenth century.

GRAUBÜNDEN (GRISONS), CANTON OF

Graubünden was a confessionally and linguistically mixed region (today Switzerland's southeasternmost canton) that experienced numerous witchcraft trials.

There were perhaps 500 casualties in both Catholic and Reformed regions, and throughout its German-, Rhaeto-Romanic-, and Italian-speaking parts of what was then the autonomous Gray Leagues, or Grisons.

In the early modern Grisons, jurisdiction remained in the hands of local communities. They mostly followed the Carolina (*Constitutio Criminalis Carolina*), the 1532 code of criminal procedure for the Holy Roman Empire. In 1657, they supplemented it with a special *Kriminalverordnung*, or criminal ordinance, on witchcraft matters. In 1716, regional authorities issued another criminal ordinance, naming witchcraft and sorcery as major crimes. In the Grisons, most executions were carried out by beheading, followed by burning the corpse, while numerous trials ended with expulsions. Many people evaded arrest by fleeing.

Some witchcraft trials with fatal outcomes were already documented here in the fifteenth century (1434, at Thusis and at Lostallo; 1448, at Safien). In the Valtelline (Veltlin) valley, a subjugated area, some severe witch hunts took place at the end of the fifteenth and the beginning of the sixteenth century. Afterward, only single trials are known in the Grisons until the end of the sixteenth century. In the wake of the reforming activities of Milan's archbishop and cardinal, St. Carlo Borromeo, a systematic pursuit of witches finally started here, first in the Italian-speaking valleys of Misox and Calanca. The importance of Borromeo's activities remains controversial. Presumably, his persecutions of Protestants paved the way for the witch hunts that were carried out by local courts at the request of large parts of the population.

Graubünden's witch hunts seem to have spread across the Alps from the south toward the end of the sixteenth century. In 1590, a large witchcraft trial in Disentis cost 14 women their lives. In the Rheinwald, four executions are mentioned in 1598; three years later, two women were tried for witchcraft; and in 1604 a man from the Austrian valley of Montafon was burned as a sorcerer in Maienfeld. Witchcraft trials are also known to have taken place at Chur (the regional capital and seat of the local bishop) shortly before the end of the century. Witchcraft trials reached a new peak in 1613, when about 30 people were burned in Misox and Calanca. During the Thirty Years' War, which greatly affected the Grisons, only Poschiavo seemed to have experienced extensive witch hunts; 53 people stood trial for witchcraft there between 1630 and 1633.

Shortly after 1650, in almost every part of the Grisons, severe witch hunts occurred. The northeast was particularly affected at that time. Within a decade, the persecutions had claimed more than 100 deaths; in 1655 alone, 58 persons were supposedly burned in the valley of Prättigau, a phenomenon made locally famous as *die gross Häxatöodi* or "the great witch killing." In Vals, 23 people were executed in 1652. Two years later,

15 children from this valley, also accused of sorcery, were handed over to the Milanese inquisition, which lodged them in the homes of "honest people" to give them proper religious educations—and save them from possible execution.

Poschiavo was struck by another exceptionally severe persecution from 1672 to 1676, when no fewer than 124 people stood trial. Also in Disentis, a large number of people were prosecuted for malevolent sorcery, leading to the execution of at least 31 of them. Around 1700, still another accumulation of witchcraft trials took place in several parts of the Grisons. The last extensive series probably occurred at Klosters (Prättigau); it claimed at least ten lives. Until 1779, several other sorcery and witchcraft trials were held, but now only one or a few people were arrested, and these trials had milder outcomes.

The sex distribution of victims in the Grisons was close to the general European average: about 80 percent of those executed as witches were women. Because most victims of the witchcraft trials were also poor as well as female, the legal prosecutions usually caused serious financial losses for local communities. While most confessions in court corresponded to the fully elaborated witch doctrine, the accusations continued traditional patterns, with magic that harmed people or cattle predominating.

GREEK MAGICAL PAPYRI

The generic name given to a substantial body of magical recipe books, cursing, and amuletic texts produced in Greco-Roman Egypt. Most were made between the second and fifth centuries C.E., although the oldest text, the "curse of Artemisia" (*PGM* XL), dates from the fourth century B.C.E. and is among the oldest extant Greek papyri. The series of lengthy and often repetitive recipe books or "grimoires" or "formularies" that constitutes their basic and greater part offers a matchless resource for the study of magic in antiquity.

The bulk of these formularies derived from a single ancient collection, the so-called "Theban Magical Library" (that is, *PGM* IV, V, Va, XII–XIV, and probably I–III, VII, LXI; alchemical texts were also present). Discovered in a third- or fourth-century tomb in western Thebes, they were bought in 1828 by the colorful antiquities dealer Giovanni Anastasi, who broke them up and sold them to the great museums of Europe,

where they still reside. These books were among the few to survive the attempts of early Christians to burn them into oblivion (cf., for example, Acts 19:19). The curse-papyri bear strong affinities with the lead *defixiones* (curse tablets), and the amulet-papyri resemble the metal and gemstone amulets that flourished across the Greco-Roman world.

The religious background of the papyri was syncretistic, but their dominant inputs were Greek, Egyptian, and Jewish, these elements being unified in a remarkably homogenous and distinctive blend. The papyri therefore expressed the cultural mix peculiar to the city of Alexandria in the Hellenistic period (Egypt belonged to Rome after 30 B.C.E.; the dearth of Latin material in the papyri is striking). Some of their Greek formularies contained portions written in Demotic or Coptic, and some purely Demotic and Coptic papyri had similar contents.

The oldest substantial surviving formularies date from the first century B.C.E. (*PGM* CXVII and CXXII). They were more literary than later documents, but relatively brief. They showed no trace of the elaborate magical rituals and lengthy series of obscure “abracadabra”-style *voces magicae* (magic words), vowel-series, word-triangles and -squares, palindromes and “characters” that were to become the hallmarks of the genre. But these features flourished by the time of the largest extant formulary, the *Great Magical Papyrus in Paris* (*PGM* IV), which is thought to be a fourth-century C.E. copy of a second-century original.

This document can be used to illustrate the structure, texture, and sorts of content typical of mature formularies. Its 3,274 lines comprised a wide variety of recipes in a largely random order. They offered protection against death and demons and the expulsion of the latter; the attraction of lovers; the inspiration of friendship and favor, and the restraint of anger; divination by trance alone, by bowl, by lamp, or from a corpse or skull, and the inducing of dreams; and they described how to manufacture multipurpose charms based on Homeric verses and the Bear constellation. The formulary also contained a number of ancillary or meta-magical recipes for such things as prayers, hymns, consecrations, initiations, and techniques for picking plants. A brief astrological text was also included.

We can be sure that practical use was made of such formularies. This book’s elaborate erotic-attraction recipe at 296–434 corresponded closely (but not perfectly) with a remarkable third- or fourth-century trove of magical materials, perhaps from Antinopolis, now in the Louvre. This consists of a voodoo doll representing the woman Ptolemais, pierced with thirteen pins, and a curse-text inscribed on a thin lead sheet invoking the ghost of one Antinous, possibly the local hero.

GREGORY IX, POPE (1170–1241; POPE, 1227–1241)

This pope did much to diabolize heretics if not witches, and laid much of the groundwork for what later became an institutionalized papal Inquisition. Hugh, count of Segni, was born about 1170 in Anagni, and probably studied canon law in Paris. His relative, Pope Innocent III, made him a chaplain at the Roman curia in 1198 and, eight years later, cardinal-bishop of Ostia. As a papal legate and preacher, he carried out missions in many regions of Italy and Germany. After the death of Honorius III, whose most important counsellor he had been, the cardinals elected him pope in 1227.

The main problem of his pontificate was his hostile relationship with Emperor Frederick II, revolving around the question of which of them should dominate the Christian world, and especially Italy. Their struggle remained unresolved when the pope died in August 1241. Within the Church, Gregory favored especially the new mendicant orders of the Dominicans and Franciscans, canonizing their founders and encouraging their missionary work. He also supported crusades to Palestine and in the Baltic—and with more success against the Stedinger, a community of free peasants who had been declared heretics by the bishop of Bremen, who wanted to force them under his obedience. In the bull *Vox in Rama* (*A Voice in Rama*), published on this matter in 1233, the pope described the abominable practices of these rustic devil worshippers, including kissing the anus of a black tomcat, initiation orgies involving sexual promiscuity and incest, and desecration of the Eucharist—stereotypes that would be quoted again and again as typical behavior for both heretics and witches.

In 1231, Gregory began a search for heretics in his own dioceses, in Rome; several persons were burned at the stake. By sending copies of the relevant instructions to all archbishops and princes in Europe, he invited them to undertake a similar task. Ordering the

Dominican friars to enter into the office of papal inquisitors, he of course came into conflict with the bishops whose rights of jurisdiction were thereby infringed. After inviting the Dominican prior of Paris to create inquisitors for all parts of France in 1233, he soon had to revoke his instructions because of strong opposition from French bishops. In Languedoc, however, he succeeded in establishing a permanent tribunal of Dominican inquisitors whose task it was to eradicate whatever remnants of Catharism still existed after the Albigensian crusades. As a legislator, Gregory commissioned the Spanish Dominican Raymond of Peñafort to collect a volume of decretals in 1230 to strengthen his authority: it was entitled *Liber Extra* (The Book That Goes Beyond), and the pope sent it to the University of Bologna for use in teaching. Its chapter X 5, 7, entitled *De Hereticis* (Concerning Heretics), contained the juridical basis for the persecution of heretics, a text that would remain part of canon law until 1917. With such measures, Gregory established precedents for what later became an institutionalized inquisition, although he himself only commissioned temporary investigators for locally acute problems.

The most famous of Gregory's appointed inquisitors were Conrad of Marburg and Robert le Bougre. The first, a secular priest and confessor of Saint Elizabeth of Thuringia, had hundreds of alleged heretics burned in Germany, until he made the mistake of taking action against members of the high nobility, who had him killed in 1233. Gregory was deeply upset when he learned about Conrad's "martyrdom," though he did not approve of his irregular and arbitrary way of proceeding. Meanwhile, Robert, himself a former Cathar, proceeded in a no less fanatical manner against deviant Christians in northern France. He enjoyed the special protection of a future saint, King Louis IX, but people thought he possessed a magic charm that forced everyone to confess whatever he wanted. About 1241, he was finally deposed, though we do not know the details.

GREGORY OF VALENCIA (1549–1603)

A prominent Catholic theologian, Gregory of Valencia supported the persecution of witchcraft. Born at Medina del Campo (Spain), he joined the Jesuit order in 1565 and received an excellent education at the University of Salamanca. Early in the 1570s, Gregory was sent to Germany, where the Jesuit generals concentrated their troops in order to maintain bridgeheads of Catholicism and to roll back the Protestant advance. Gregory is considered to have been the most eminent post-Tridentine theologian in Germany. He served at the Jesuit University of Dillingen in the prince-bishopric of Augsburg from 1573 to 1575, and subsequently at the University of Ingolstadt in Bavaria from 1575 to 1597, where he dominated the theological faculty and educated a new generation of theologians. There he rose to become a figure of European importance and was called to Rome, where he defended the Jesuit Luis de Molina before Pope Clement VIII. Gregory also played an important role in Catholic debates about grace and capital interest rates. His prime importance lay in his attempt to reshape Thomistic theology with his four volumes of dogmatic *Commentarii theologici* (Theological Commentaries, Ingolstadt, 1591–1597).

In this standard work, Gregory of Valencia recommended the zealous persecution of witches, based on the theory of witchcraft as an extraordinary crime (*crimen exceptum*) requiring extraordinary measures. His main authorities (instead of St. Augustine or St. Thomas Aquinas) were the *Malleus Maleficarum* (The Hammer of Witches) of Heinrich Kramer, and Peter Binsfeld's recent treatise on witchcraft, *Tractus de confessionibus maleficorum et sagarum* (Treatise on Confessions by Evildoers and Witches, Munich, 1589). In contrast to these authors—the first a maverick inquisitor, and the other an obscure suffragan bishop—Gregory of Valencia was an authority of European reputation, the first post-Tridentine Catholic theologian to write powerfully on witch hunting.

Historians have agreed that the years around 1590 marked a watershed in Catholic attitudes toward witchcraft. Gregory may well have served as a beacon in this redirection. And the Spanish Jesuit knew exactly what he was talking about, because in the years 1589–1591 he regularly attended the torture chambers of Ingolstadt during the first wave of persecutions in Bavaria, in order to instruct young prince Maximilian, the future ruler of Bavaria, whose tutor he then was.

The correspondence between Maximilian and his father, Duke Wilhelm V of Bavaria, revealed the nature of these lessons, where Christian mercy and compassion played no role at all, and local women served as examples for demonstrating demonological theory.

Because of his great number of successful students, Gregory earned the nickname *doctor doctorum* (teacher of teachers). Unsurprisingly, he produced a good number of future hard-liners, like Jacob Gretser SJ, but also a few dissidents like Adam Tanner SJ. Gregory died at Naples, the capital of Spanish southern Italy.

GRETSER, JACOB, SJ (1562–1625)

Born at Markdorf in Baden, Gretser became a leading protagonist of the second generation of Jesuits in Germany and a leader of the witch-hunting faction in Bavaria. Influenced by Peter Canisius at Fribourg (Freiburg) in Switzerland in 1585, Gretser settled at the University of Ingolstadt for the rest of his life. The Bavarian dukes surrendered its theology faculty to the Jesuits, and, after the departure of the Spaniard Gregory of Valencia, who became his second teacher, Gretser rose to central importance in the late 1590s as a prolific teacher in moral theology and an experienced and successful author, with a total of 234 publications.

Like Gregory, Gretser strongly supported witch hunts, at first on the basis of the *Malleus Maleficarum* (The Hammer of Witches, 1486) and Peter Binsfeld, later on the basis of Nicolas Rémy and especially his fellow Jesuit Martín Del Rio, who had made demonology resemble a modern science by 1600. When opponents of witch hunting in the Bavarian government stopped an outrageous witchcraft trial in 1601, the pro-persecution faction used Gretser as its authority. For a time, there seemed to be a “Jesuit party” in Bavarian court politics, and, because the Jesuits dominated the university, Gretser’s faction seemed invincible. When the moderate “politicians”—as they were labeled by Gretser—of the Bavarian Privy Council managed to obtain a skeptical legal opinion from the law faculty, Gretser served as a secret agent, denouncing the culprits and their alleged motives, asserting that they had simultaneously served as lawyers for accused witches (in the same case, where their employer, the prince, had com-

missioned an opinion) and were therefore guilty of treason. Gretser, sometimes labeled as an “irenical” author by Catholic Church historians, was indeed willing to send his academic colleague, the leading legal expert, Dr. Caspar Hell, to the stake.

When Bavaria’s “politicians” managed to stop the treason trial against Dr. Hell, Gretser urged Duke Maximilian I to commission opinions from Lorraine’s Prosecutor-General Rémy (Maximilian was married to a Lorraine princess) and Del Rio, from the law faculties at Freiburg/Breisgau, Padua, and Bologna, and from the governments of electoral Trier and electoral Mainz, where large-scale witch hunts had taken place in recent years. Unsurprisingly, Del Rio supported Gretser’s opinion. However, the Bavarian privy councilors and their secretary managed to split the “Jesuit party” by commissioning a theological opinion in 1602, from Adam Tanner, whose interpretation was diametrically opposed to those of his fellow Jesuits Del Rio and Gretser. Although Gretser continued to back the hard-liners, his influence was thus curbed and the disgruntled zealots lost this struggle.

Repeatedly, Gretser indicated that his mind remained unaltered. For example, in the foreword to his book on Christian holidays (*De festis Christianorum*, Ingolstadt, 1612), he congratulated the prince-bishop of Eichstätt on his excellent witch hunts. But Gretser never regained his central position of the years around 1600, when it seemed possible to purge Bavarian society by burning everyone who aroused suspicion. Believing that God would not permit the burning of innocent persons, Gretser was an extremely dangerous “arsonist,” because he asserted that everybody who was burned was indeed guilty. Like Binsfeld and Del Rio, he epitomized the kind of zealot against which his fellow Jesuits Tanner and Friedrich Spee fought.

GRILLANDO (GRILLANDUS), PAOLO (PAULUS) (1ST HALF 16TH CENTURY)

Born in the Tuscan village Castelfio rentino, Paolo Grillando became a famous demonologist with his *Tractatus de hereticis et sortilegiis eorumque poenis* (Treatise on Heretics and Sorcerers and Their Punishments) in five books, written around 1524. Grillando’s detailed and

suggestive description of the witches' Sabbat unquestionably contributed to establishing the credibility of witchcraft in Renaissance Italy. His work enjoyed considerable authority. After several re-editions (Lyons, 1536, 1545, and 1547; Rome 1581), his tract was coedited with Giovanni Francesco (Gianfrancesco) Ponzinibio's *De lamis* (Concerning Witches, Frankfurt/Main, 1592). Later it was integrated into miscellanies on criminal justice, and after 1615 alongside the *Malleus Maleficarum* (The Hammer of Witches) in miscellanies on demonology. Grillando was cited in subsequent demonological works by Martín Del Rio and Francesco-Maria Guazzo, and by the exorcism expert Girolamo Menghi; he was even plagiarized in 1554 by the Flemish jurist Joost de Damhouder in his *Praxis rerum Criminalium* (Practice on Criminal Cases, 1554).

Grillando was a doctor of both canon and civil law who served as judge in witchcraft cases in the vicinity of Rome; later, he heard criminal cases in Arezzo for the papal vicar Andrea di Giacomo. The first edition of his treatise was dedicated to Felice Troffini, archbishop of Chieti (1524–1527), and Bishop Gregorio Gori of Fano (1518–1524). This dedication not only enables us to date Grillando's tract, but, more importantly, it contained the author's motivation for writing it: the constant growth of this pernicious sect and the fact that many clerics were its leaders or members. Grillando referred to few other works on witchcraft: he never mentioned the *Malleus*, but relied on what he had himself seen or heard as a judge. In his treatise, Grillando gave a detailed enumeration of the different sorts of sorcery. He explained the difference between tacit and express professions (or pacts) and described astrology, chiromancy, divination, and especially amatory sorcery. He discussed the materials used in sorcery (teeth, hair, nails, fragments of the clothes of a person to be bewitched; bits of corpses—especially from hanged criminals). He dwelled on the Devil's power and knowledge, and on why God permits many evils that he could easily prevent. Grillando also explained why no witch could escape from prison. A cardinal point, on which proper punishments depended, is whether sorcery is or is not a savor of heresy.

The treatise's most interesting part treated the question of transvection, whether witches were transported corporeally to the Sabbat or whether it was merely a diabolical illusion. Grillando formerly adhered to the first opinion, found in the *Canon Episcopi*. But after long experience, after various examples of witches' operations, some of which he had seen and others he received from trustworthy persons, Grillando became convinced that witches were transported bodily. Grillando gave several reasons and examples for his view, including evidence from several witchcraft cases in the vicinity of Rome. Some of them—like a September 1524 case in Castro Nazareno—he heard

himself as a judge. They all contained detailed information about the Sabbat. Recurrent topics included the reverence paid to Satan, that all dances were done backward; that after the feast the lamps were extinguished and the demons, as incubi or succubi, fornicated with the women and men present (with extreme voluptuousness). The demons had to carry the witches back before the church bells sounded the *Ave Maria*; if they heard it on the way, they dropped their burdens instantly, no matter where they were. One of the "witches" stated that, after attending a Sabbat, she was so exhausted that she suffered for three or four days. All these confessions, Grillando insisted, were made by women who were not tortured. The author saw and handled the unguents with which they harmed men and beasts, and ordered all of them burned with the witches.

GRIMM, JACOB (1785–1863)

After the execution of witches had already ceased, a completely new, post-Enlightenment interpretation developed, inspired by Romanticism. In 1835, Jacob Grimm, the founder of international language studies and academic romanticism, whose influence can still be felt in collections of fairy tales all over Europe, redefined witches as "wise women," who conserved the traditional age-old wisdom of their peoples, the "Germanic tradition" in particular. Grimm thereby turned people whom enlightened criticism perceived as innocent victims into mysterious bearers of ancient wisdom, unjustly persecuted by a Christian Church seeking to destroy European national cultures. The wise woman emerged from Grimm's head like Athena from Zeus, and Grimm created the "Romantic paradigm" in the interpretation of historical witchcraft. Furthermore, he could almost be seen as founding a new religion, because Grimm's reinterpretation of witchcraft became the starting point for the more recent religion of the neopagan "New Witches," as well as feminist fairy worlds like those constructed by such authors as Marion Zimmer Bradley.

Grimm's interpretation reveals signs of its nineteenth-century political agenda. Between the beginning of the French Revolution (1789) and the Congress of Vienna (1815), most old states had crumbled under the

impact of the Napoleonic Wars, particularly the Holy Roman Empire in 1806. New nation-states were constructed, and the past was reinterpreted, preferably by nativists exalting the supposed values of the local populations, now redefined as ethnic groups (*Volk*) with a glorious past. Grimm studied at Marburg in 1802 under the famous legal historian Karl Friedrich von Savigny, and participated in Romantic literary circles at Heidelberg. Ironically, Grimm started his career as librarian for Napoleon's brother Jerome, king of Westphalia after 1808.

By then, he and his brother Wilhelm Grimm had already collected their famous fairy tales. Their ideas about the origins of fairy tales and other folk narratives began serious European folklore studies. Meanwhile, Jacob Grimm also conducted language studies, leading

to the publication of a "German Grammar" (1819) and a monumental German dictionary, but eventually produced more general studies about the development of languages. Jacob became a founding father of modern language studies generally and of Germanic studies (*Germanistik*) in particular. His research in libraries and archives unearthed important early examples of Old German, Anglo-Saxon English, and Old Nordic languages.

When Jacob Grimm published his *Deutsche Mythologie* (Teutonic Mythology) in 1835, he had become university librarian and professor at the university of Göttingen. As a liberal-minded scholar, he publicly opposed an attempt by the king of Hanover to abolish the liberal constitution. Together with five other scholars, Jacob and Wilhelm Grimm were therefore fired in 1837, Jacob also being exiled. The *Göttinger Sieben* (Göttingen seven) became celebrated as martyrs of the liberal cause, and their subsequent publications contributed decisively to the development of German liberalism. Soon afterward, the Grimm brothers were named to the Prussian Academy of Sciences at Berlin, and Jacob (like three others of the Göttingen seven) was elected to the German parliament at Frankfurt during the 1848 Revolution.

Grimm designed his *Deutsche Mythologie* in a period well before politicians succeeded in assembling the tiny principalities of central Europe into a German nation. His "nationalist" publications received overwhelming applause from the educated. But after his death, hundreds of well-paid folklorists collected shaky ancient evidence of Germanic glory. Another liberal language scholar, Moriz Haupt (1808–1874), ridiculed the activities of the *Altertumsvereine* (Antiquarian Society), suggesting that every stinking billy goat or red rooster risked being interpreted as a Germanic god.

Meanwhile, other nations developed their own obsessions. Jules Michelet, an equally fervent nationalist, not only constructed an interpretation of the French nation based on the French Revolution, but also transformed Grimm's notion of wise women into female "doctors of the people," fighters against feudal oppression who were ruthlessly crushed by a conspiracy of feudal princes, lawyers, theologians, and academic physicians. Witches, therefore, became suppressed forerunners of the French Revolution, or the French nation. In Michelet's eyes, witches should also be remembered as a source of power in an eternal fight for freedom.

The examples of Grimm and Michelet illustrate the liberal political agenda of the nineteenth century. Their "poetic visions" were ridiculed or simply ignored by academic historians in the Rankean tradition, who wished to replace imagination with evidence. A "Soldan Paradigm" or "Rationalist Paradigm" replaced the

Romantic approach (Monter 1972). But clearly, Grimm remains one of the most influential authors in the history of witchcraft.

GRIMOIRES

The term *grimoire*, derived from the French word *grammaire*, refers to a magician's written or printed manual, his "black book" for invoking demons. It was later extended to include all books dealing with any subdiscipline of magic and divination. Grimoires have usually been fictitiously ascribed to famous personalities of outstanding knowledge—for example, Moses, Solomon, even popes—whose "secret" wisdom they purportedly contain. Rumors and legends about magicians especially emphasized their books of magic. Grimoires provide practical information—how to draw a magic circle, what robes to wear, spells to utter, prayers to offer, tools to use, and so forth.

EARLY SOURCES

Hermes, a god associated with magic since late antiquity, was worshipped as *Trismegistus* or "three times greatest." Medieval Arabic secret literature viewed him as an alchemist and as the ultimate source of wisdom. Roger Bacon called him the father of philosophy. His name became synonymous with secrecy and several "hermetic" writings are ascribed to him. The *Lunar*, quoted by Albert the Great and William of Auvergne, dealt with the magical power of names. Another, *Thot*, provided love and death spells, listed magical herbs, and

Page from a sixteenth-century grimoire, a magician's manual containing practical knowledge of how to invoke demons or perform other types of magic or divination. (Fortean Picture Library)

explained the appropriate rituals and requirements of a magician.

Famous (still in print) is the *6 and 7 Book of Moses*, bogus additions to the five Mosaic books of the Hebrew Bible. This *grimoire*, of uncertain origin but relatively modern, is particularly well-known in Germany, but is also widely read by North Americans of African descent.

The legendary King Solomon was not simply a synonym for wisdom, but he was also rumored to be a master of magic: the power of his ring commanded all spirits and demons. A famous Persian poet, Firdausi, wrote Solomon's history in verse (the *Book of Kings*); afterward, Arab, Turkish, Persian, and Talmudic writers enhanced the story. Solomon became a legendary figure, not only the richest and wisest king on earth, but also a man who commanded celestial, terrestrial, and infernal spirits.

A book of incantation for summoning demons was already in circulation under the name of Solomon in the early Roman Empire. The historian Havius Josephus stated that this book was used by a Jew named Eleazar, who, in front of Emperor Vespasian, delivered those possessed of devils by applying a ring (containing the figure of a root designed by Solomon) to their noses. Formulas were added to the book, later called *Clavicula Solomonis* (The Key of Solomon). Various authors mentioned this book of sorcery. The

eleventh-century Byzantine writer Michael Psellus referred to a treatise on stones and demons. By the thirteenth century, it had reached the Latin world. A new version, called *The Sworn Book of Honorius*, or *Juratus*, published in 1629, was ascribed to the twelfth-century Pope Honorius III, who was suspected of practicing sorcery, as were Leo II, John XXII, and especially Sylvester II, the legendary Gerbert of Aurillac (999–1003). Printed versions reputedly had less value than a manuscript written by a sorcerer's own hands and the Bibliothèque de l' Arsenal in Paris contains a considerable number of these manuscripts. Later, the *Small (or Lesser) Key of Solomon* or *Lemegeton* became a tutorial for inflicting illness or death and conjuring the dead.

Aristotle was one of the most important and influential personalities in medieval philosophy, but his name also appeared as the author of magical books. At the end of the twelfth century, Alexander Neckham mentioned that Aristotle had carefully buried his magical books with him and shielded them by a curse. The most famous *grimoire* ascribed to him was the *Secretum secretorum* (The Secret of Secrets), well known for centuries. Two hundred surviving manuscripts could still be counted in 1900. Translated into almost every major world language, the book was a compilation from many sources, whose present form dates from the seventh or eighth century. One of the translators (supposedly Patriarch Guido of Antioch) explained in the preface how Alexander the Great demanded that Aristotle reveal to him the secret courses and influences of the planets, alchemy, geomancy, and the art of conjuration, all in one manuscript. The work explained the magical effects of precious stones, herbs, and amulets, and offered remedies.

A *Book of Secrets* ascribed to Albert the Great circulated since the later Middle Ages, supplemented by writings from a pseudonymous "Albert the Small." Many clerics and inquisitors mentioned black books; a few even made lists of them, like Johannes Hartlieb's *Book of All Forbidden Arts* (*puoch aller verpoten kunst*).

Little is known about the historical Doctor Faust described by Christopher Marlowe and Johann Wolfgang von Goethe, but legends quickly appeared in the sixteenth century. A certain Christoph Kaylinger allegedly taught him the art of crystal gazing. Eventually, he made a pact with the Devil and gained the help of a spirit, Mephistopheles. In his latter years, he reportedly practiced alchemy; according to Philip Melancthon, the Devil destroyed Faust about 1540 at a rural inn in Württemberg.

Although later times or enlightened contemporaries considered Faustus's magical feats to be petty and fraudulent, Martin Luther and Philip Melancthon obviously took him seriously. His notoriety made him

a symbol of the "wrong" religious, scientific, and philosophical thought of his day, as he appeared in the first so-called "Faust-book," the anonymous *Historia von D. Johann Fausten* (History of Dr. Johann Faust, 1587). However, this obscure personality, Faust, became the archetypal German magician of the age. His posthumous reputation as a magician swelled in German and English literature shortly after his death; a number of *grimoires* were soon attributed to him, featuring his alleged familiar Mephistopheles. The treatise *Doctor Johannis Fausti magia naturalis et innaturalis*, later famous as *Doctor Faustus's Coercion of Hell*, told the apprentice and reader how to summon and bind all spirits and force them to bring everything demanded.

THE WITCH'S GRIMOIRE

Up to this point, only men have been associated with *grimoires*. When the Jesuit Martín Del Rio published his *Disquisitionum Magicarum Libri sex* (Six Books on Investigations into Magic, 1599/1600), he saw the wise women of his own time, whom he called sibyllae (purposely connecting prophetesses with witchcraft), in relation to the manteses, who allegedly wrote a little book that they intended to present to the "Wise Women," to make them guardians of necromantic magic. These women were to consecrate these books so that the demon invoked would appear in the shape of a handsome young man and obey them; they were to sign the books with a powerful magical formula to protect readers from arrest and judgment. As reward, the magicians promised they would take these wise women as their ladies and rulers forever. Obviously, for Del Rio, presenting books of magic to apprentice witches was part of the ritual of the pact with the Devil. In section 17, Del Rio emphasized that books of magic must not be left to an heir to read, but must be burned. Access is reserved to the pope, who may permit certain others to read them, namely inquisitors and censors. Anyone else who kept such books was to be excluded from absolution, a major punishment.

Most sources tell us that one became a witch either hereditarily or voluntarily; only a few mention books to instruct the sorcerer's apprentice. Moreover, it required a certain talent. Learning and studying books was not emphasized, though the notion of a witch conjuring with the help of black books found its way into illustrations.

GUAZZO, FRANCESCO MARIA

Guazzo was famous for his witchcraft treatise, *Compendium Maleficarum* (A Summary of Witches, 1608), which he wrote in 1605 at the request of Cardinal-Archbishop Charles Borromeo of Milan. It was published in 1608 and ran to an amplified second edition in 1626. Guazzo (who flourished in the early seventeenth century) was a Barnabite friar. His small order specialized in exorcisms. He had served as a consultant on witchcraft trials at the capital of his order, Milan, where witches were burned in 1599 and 1603. The Barnabites were keen to reform the corrupt morals of their time by personal example and missions to the people—hence one stimulus for Guazzo’s writing the *Compendium*. Another was his visit to the German state of Cleves-Jülich at the request of its chronically bewitched Duke Johann Wilhelm (Midelfort 1994, 98–124), who suffered personally from magical attacks and whose territory suffered from werewolves.

The *Compendium* is divided into three books. Book 1 begins with a chapter on imagination, which, as many other writers on magic and witchcraft agree, can have a powerful effect on both mind and body. Thereafter we are given a survey of what witches allege they can do, their pact with Satan, the reality or unreality of such phenomena as transvection to the Sabbat, incubi and succubi, and shape changing. All these Guazzo regarded as both possible and probable. He ended book 1 with a discussion on the reality of ghosts, a contentious subject that provided both Catholic and Protestant writers with a theme for theological dispute. Guazzo took the line that ghosts may indeed appear, but only on irregular occasions and by God’s special dispensation. This raised a point about whether evil spirits could be summoned by human beings and constrained to obey their orders, and Guazzo came to the standard conclusion that evil spirits only appear to cooperate in order to entrap their victims.

Book 2 details different kinds of harmful magic witches practice. These included administering poisonous or soporific drinks, or overpowering the objects of their malice with smoke induced by setting fire to dead people’s hands or feet. Witches also used parts of corpses for a variety of magical purposes and as food in their cannibal feasts. They induced impotence in men, set houses and towns on fire, and caused diseases

of various kinds. This they did to gratify their own spiteful natures, and were permitted to do so by God as a tribute to his glory when people maintained their faith regardless, as a demonstration of his power over both evil spirits and humans, and as a punishment for people’s sins. But when people fell into Satan’s clutches, deceived by his powers of illusion, or foolish enough to practice superstitious rites, they tended to stay there.

Book 3 points out that one may not lawfully use magic to undo the effects of maleficent magic, and discusses how one may distinguish between someone who was possessed by an evil spirit and someone who had merely been bewitched. Guazzo gave many physical symptoms by which one may judge both. This appeal to medicine rather than theology was very common among writers on magic during this period, as was Guazzo’s opinion that the werewolves that so troubled the duchy of Cleves were simply illusions of the Devil. However, few authorities agreed with Guazzo’s assertion that Martin Luther was the offspring of a nun and the Devil. His treatise ended with edifying stories to illustrate the efficacy of Catholic sacraments in combating Satan.

The *Compendium* was learned, but not in the least original. It leaned heavily on two of Guazzo’s predecessors and contemporaries, Martín Del Rio and Nicolas Rémy, and it repeated many of their anecdotes. Indeed, the construction of the treatise cut discussion to the bone while anecdotal illustrations formed the major part of the text. The *Compendium* thus provided more entertainment than scholarly disquisition. This impression is increased by the inclusion of an unusually large number of woodcuts frequently reproduced in modern books about witchcraft. In book 1, these concentrated heavily on the figure of Satan—depicted as a winged male with horns and cloven toes—superintending the idolatrous actions of witches, who were rather oddly depicted as fashionably dressed men and women. In book 2, the pictures illustrated witches’ acts of malevolence. Several were repeated, either within book 2, or from book 1. Those in book 3, however, were quite different. They clearly came from a different source, and showed episodes from the life of Jesus, who appeared as the major figure.

Guazzo thus cannot be considered a major writer on the subject of witchcraft. He is sometimes cited because his work has been translated into English by the notorious Montague Summers (Guazzo 1929), and his illustrations have often been reproduced, but shorn from the context that gave them meaning.

GUI, BERNARD (CA. 1261–1331)

Perhaps the most famous of all medieval inquisitors, and certainly one of the most important and influential, Bernard Gui is best known for his monumental inquisitor's handbook, *Practica inquisitionis heretice pravitatis* (The Practice of the Inquisition of Heretical Depravity), written around 1324. Although he never described anything like the full stereotype of witchcraft as it would appear in later centuries, he did include in this work several sections dealing with learned demonic magic, or necromancy, as well as more evidently popular forms of sorcery. The *Practica inquisitionis* became one of the most widely read of all medieval inquisitorial manuals, second only to the later *Directorium inquisitorum* (Directory of Inquisitors) of the Catalan inquisitor Nicolas Eymeric. Gui's descriptions of sorcery thus seem very important, particularly in terms of shaping later clerical, and especially inquisitorial, thought on this subject.

Born in southern France around 1261, Gui entered the Dominican order and studied theology both at Montpellier and Paris. In 1307, he was appointed inquisitor of Toulouse, and served in this office until 1323 or 1324. From 1324 until his death in 1331, he was bishop of Lodève. Throughout his life, Gui was active in the administration of the Dominican order as a theologian, and also as a historian. Yet it was as an inquisitor that he achieved his greatest influence, mainly through his *Practica inquisitionis*. Intended as a practical handbook to guide inquisitors in the conduct of their office, this work covered all major forms of heresy existent, or thought to be existent, in Gui's time, outlining heretical beliefs and practices, offering guidelines to be used in questioning, and proposing formulas for the conviction and sentencing of heretics. Within this large work, only a few brief sections were actually devoted to sorcery, divination, and demonic invocation.

During his tenure as inquisitor of Toulouse, Gui seems never to have tried a case of heretical sorcery personally. Nevertheless, during this period sorcery was increasingly becoming a matter of inquisitorial concern. In 1320, Pope John XXII had specifically ordered the inquisitors of Toulouse and Carcassonne to take action against any sorcerers who offered sacrifices to demons or otherwise worshiped or adored them. In all likelihood, the type of magic that worried Pope John XXII was learned demonic magic, or necromancy. This sort of magic involved complex and often quasireligious invocations of demons. It was above all a clerical form

of magic with which many people at the papal court at Avignon would have been familiar. Judging from the material in the *Practica inquisitionis*, this was also the form of magic that most concerned Bernard Gui. His most extensive sections on sorcery and demonic invocation contained formulas for the abjuration and degradation of clerics found guilty of performing superstitious or sorcerous acts, often involving misuse of the Eucharist or of baptized images and figures. He also described in detail a complex necromantic ceremony as it was supposedly performed by a clerical sorcerer, involving wax images, blood rituals, and explicit sacrifice to demons.

In other sections of the *Practica inquisitionis*, however, Gui described a different form of sorcery, involving less complex rites and more commonplace material and devices. Here sorcerers worked through simple incantations, herbs, and bodily items such as hair and nails. According to Gui, these people sought to cure disease, detect thieves, recover lost items, arouse love, and restore fertility between couples. In short, his accounts here seem clearly to reflect common or popular magical practices that might actually have been in fairly widespread use in the region of Toulouse in the early fourteenth century. His descriptions of the practices contained virtually no hints of the demonic invocation and diabolism that had been so evident in his sections on clerical sorcerers. Nevertheless, he was explicit in his conviction that these simpler practices were also necessarily demonic in nature. Indeed, it was the element of demonic invocation that allowed inquisitors to bring charges of heresy against these people. Thus Gui serves as a particularly good example of how the clerical conviction in the demonic nature of almost all magic, suited mainly to ecclesiastical authorities' understanding of learned necromancy, was transferred to the simpler practices of popular or common sorcery. Although Gui never described witchcraft in the full sense, this conviction on the part of clerical authorities, and learned secular authorities as well, came to play an important part in sustaining the witch hunts of future centuries.

GUNTER, ANNE (1584–16??)

Anne Gunter was an English woman famous for her fraudulent bewitchment. Born at Hungerford in Berkshire, Anne was the youngest child of Brian Gunter and his wife, also named Anne, a locally important gentry family of Welsh origins. By 1587 Brian Gunter and his family were living in the village of North Moreton (then in Berkshire, but now in Oxfordshire), a small agricultural settlement dominated by a few long-established farming families. Brian Gunter was a forceful, and indeed violent, personality, whose presence in North Moreton seems to have disrupted the equilibrium of the village, especially after he inflicted fatal wounds on two members of the Gregory family in the course of brawl at a village football match in 1598. Thereafter, ill will existed between Brian Gunter and the Gregory family.

In the summer of 1604 Anne Gunter fell ill with a mysterious malady. Early diagnoses of hysteria or epilepsy proved unsustainable, and eventually local physicians suggested bewitchment as a possibility. By this point Anne was demonstrating many of the classic symptoms of what might be described as a typical English witchcraft-cum-possession case of the period. In her torments, Anne accused three women of bewitching her. The chief one was Elizabeth Gregory, abetted by two “likely suspects”: Agnes Pepwell, who had a well-established local reputation as a witch, and her illegitimate daughter, Mary. Agnes Pepwell fled, but Mary Pepwell and Elizabeth Gregory were arrested and tried for witchcraft at the Abingdon assizes in March 1605. After a lengthy trial that was obviously treated with considerable circumspection by the two assize judges, both women were acquitted.

Matters should have ended there. However, in August 1605, the University of Oxford was visited by King James I, who, as James VI of Scotland, had acquired the English throne two years before. James was regarded as an expert on witchcraft, and that was probably why Brian Gunter took his allegedly bewitched daughter to meet the monarch. Gunter had good connections with Oxford University (Oxford is about twelve miles north of North Moreton), especially because Thomas Holland, Regius Professor of Divinity,

had married another of Gunter’s daughters, Susan. However, Gunter miscalculated badly. He fell foul of a temporary and unusual phase of contemporary ecclesiastical politics, in which issues of possession and witchcraft were near the top of the agenda.

James delegated the investigation of Anne to Richard Bancroft, formerly bishop of London and from early 1605 archbishop of Canterbury, who was a confirmed skeptic on these issues. Anne was put in the custody of Bancroft’s chaplain, Samuel Harsnett, who had been a propagandist for skepticism in the John Darrell affair, and her medical state was examined by the physician Edward Jorden, who had demonstrated his skepticism about possession and witchcraft a few years earlier in the Mary Glover case. Anne was soon alleging that her father had put her up to accusing Elizabeth Gregory and the Pepwells of witchcraft, and that her sufferings had been simulated, in part at least after reading a tract dealing with the witches of Warboys. Probably at Bancroft’s instigation, Anne and her father were tried before the Star Chamber for falsely accusing Elizabeth Gregory, Agnes Pepwell, and Mary Pepwell of witchcraft. The resulting dossier, which runs to several hundred pages of testimony delivered by over fifty witnesses, makes this quite simply England’s best-documented witchcraft case.

Unfortunately, gaps in the documentation make it impossible to know how the Star Chamber prosecution ended, or, indeed, what happened to Anne Gunter afterward. But the Gunter affair remains a remarkable episode that allows one to study reactions to a witchcraft case on a variety of social levels, from the villagers of North Moreton at one end of the spectrum to the royal demonologist, James VI and I, at the other, with local gentry, the medical profession, and a body of Oxford dons in between. It also demonstrates how skeptical the upper levels of the Church of England were about witchcraft and related matters by the early seventeenth century.

H

HAIR

In many traditional societies, hair was closely connected to the identity, virtues, or strength of the person to which it belonged. A lock of hair often became a keepsake, and saint's hair was venerated as a relic. Through similar sympathetic association, hair became a common ingredient in charms used in popular magic and sorcery throughout Europe. And in visual images, disheveled hair became a visual cue for moral disorder. But in witchcraft treatises, hair was most frequently referred to as an instrument used by witches to resist accusation and interrogation.

Many witchcraft treatises from the late fifteenth century warned judicial officials that witches used their hair and clothes to hide magical charms or drugs that made them taciturn, or insensible to torture. In order to avoid this "spell of silence," as the *Malleus Maleficarum* (The Hammer of Witches, 1486) called it, the witch should be shaved. The shaving often involved not only the hairs of the head and face, but also those of the whole body including the genital area. The *Malleus* even referred to the practice of inquisitors using this shaved hair in countermagic: it was mixed with holy water and blessed wax and given to the witch to drink to break her silence. The Jesuit demonologist Martín Del Rio claimed in Book V, sect. 1 of his *Disquisitiones Magicae libri sex* (Six books on Investigations into Magic, 1599) that this countermagic had to be repeated thirty times for it to be effective, but he remained concerned about the superstition it could breed. In 1580, Jean Bodin, in his *De la démonomanie des sorciers* (On the Demon-Mania of Witches, Book IV, chap. 1), also recommended that witches who refused to confess have their clothes changed and all their hair shaved off to remove any charms they were hiding. Other experts, such as Nicolas Rémy (*Daemonolatriae* [Demonolatriy], Book III, chap. 9) or Francesco Maria Guazzo (*Compendium Maleficarum* [A Summary of Witches], Book II, chap. 14), described the Devil himself hiding in a witch's hair or hair net, from where it whispered instructions and advice into the witch's ear.

In England, Scotland, and France, an important reason for shaving the witch's whole body was to discover the Devil's mark, that anesthetic scar on a witch's body that was considered firm evidence of a pact with the

Devil. The mark could be located anywhere; in order to help find it, the hair of the head, the armpits, and the genital area was shaved off. Searches for the Devil's mark by judicial officials began in the regions of Geneva and the Pays de Vaud from the 1530s, and by the seventeenth century the practice of subjecting accused witches to the invasive and shameful practice of shaving, examining, and pricking the mark was widespread.

In visual representations, witches were sometimes depicted with shaven heads as they were burned at the stake. Several such examples can be found in the so-called Wonder Book of the Zurich pastor Johann Jakob Wick, a mass of documentary material concerning the state of Christendom compiled between 1560 and 1588. But in the first half of the sixteenth century, hair also achieved quite a different role in representations of witchcraft. In the new iconography developed by such German and Swiss artists as Albrecht Dürer, Albrecht Altdorfer, Urs Graf, Niklaus Manuel Deutsch, Lucas Cranach, and especially Hans Baldung [Grien], witches were frequently depicted with long and disheveled hair, flying out wildly in a multitude of directions. Throughout the Middle Ages, long, uncut hair was associated with women; indeed, according to Paul (II Corinthians, 11:14), long hair was shameful for men but an adornment for women. It was customary in the sixteenth century to associate long and flowing hair with unmarried and sexually available women. Thus, contemporary iconography frequently depicted prostitutes or lustful women with wild and frizzy hair, as they did the mythical wild folk of the forest or the savage natives of the Americas. Baldung, in particular, developed this physical feature of the witch. He matched the wild and billowing hair of witches with the fiery vapors shown escaping from both their bodies and their cauldrons, emphasizing the sexual energy and disorder that Baldung's images consistently identified with the powers of witchcraft.

HALE, SIR MATTHEW (1609–1676)

Hale was a fervid believer in witchcraft, known for being the presiding judge at the notorious witchcraft case that began on March 17, 1662, in the English market town of Bury St. Edmunds, an assize site in East Anglia. The accused, Amy Denny and Rose Cullender, were elderly women from the coastal town of Lowestoft. Hale convicted and then sentenced them to be hanged. Previously, at the Kent summer assizes in 1658, he had presided over the trial of three persons accused as witches, one of whom, Judith Sawkins, was hanged.

Born in Alderly (Gloucestershire), Hale was educated at Oxford, with his law training in London at Lincoln's Inn. He was a prodigious writer, and his jurisprudence dominated not only his own time but also centuries thereafter. Among his better-known works, published posthumously, are the *History of the Pleas of the Crown* (1736–1739) and a *History of the Common Law of England* (1713).

Numerous flagrant flaws riddled the state's case at Bury St. Edmunds. Those unpersuaded by the young girls who declared that they had been bewitched by Denny and Cullender called for a courtroom experiment. In it, one of the girls, blindfolded, mistook the touch of an innocent person as that of one of the accused. Nonetheless, Hale accepted the explanation of the girl's father that the misfiring of the experiment merely indicated the cleverness of the Devil. In retrospect, much of the evidence presented at the trial seems downright silly. Witnesses described mysterious overturned carts and infestations of "lice of extraordinary bigness" visited by the accused women on decent folk. One farmer testified that, because of enchantment, as soon as his sows pigged, the piglets would "leap and caper" and then fall down dead.

Ironically, Sir Thomas Browne, a doctor-essayist who testified at the trial to a belief in witchcraft, was the author of *Pseudoxica Epidemica* (sometimes referred to as *Vulgar Errors*), a book on how to think properly and to reject "fabulosities." Browne had warned against relying on authority and illogical reasoning because these produce "a resignation of our judgments." He also cautioned against "erecting conclusions in no way inferable from

their premises." Nonetheless, in his testimony at Bury St. Edmunds, Browne relied heavily on a similar witchcraft case in Denmark, in which the accusers also had vomited pins, to "prove" that demonic forces truly were at work.

The trial at Bury St. Edmunds played a prominent part in legitimating the Salem accusations in New England thirty years later. For one thing, the accusers behaved at Salem much as they had in Lowestoft; for another, many of those involved in the Salem trials had migrated to the New World from East Anglia and were familiar with the witchcraft cases tried there. John Hale, a New England minister, noted shortly after the Salem trials that the judges there "consulted the presidents [precedents] of former times & precepts laid down by learned writers about witchcraft, [including] Sir Matthew Hale." (Hale 1702, 27–28)

Yet Hale was not an unkind man. Seven months before he sentenced Amy Denny and Rose Cullender to death he had sympathetically paused and listened to the pitiful pleas of John Bunyan's wife to release her husband, the to-be famed author of *The Pilgrim's Progress*, from the Bedford jail. Following the Bury St. Edmunds trial, Hale tried two other women in Lancaster as witches, one of whom was hanged. From 1667 until 1669, Hale lived near Richard Baxter, a preeminent Puritan divine, and they shared views on the manner in which biblical authority demonstrated the reality of witchcraft and the need to be forever vigilant in rooting out diabolic practices. In 1691, the final year of his life, Baxter published *The Certainty of the Word of Spirits*, an extraordinarily credulous treatise, ridiculed by a critic of the time as an instance of "aged imbecility."

The strong theological element underlying Hale's position on witchcraft can be seen in his charge to the jury in the Bury St. Edmunds trial:

That there were such creatures as witches he made no doubt at all; for first, the scriptures had affirmed so much. Secondly, the wisdom of all nations had provided laws against such persons, which is an argument of their confidence of such a crime. And such hath been the judgment of this kingdom, as appears by that act of parliament which hath provided punishments proportionable to the quality of the offense. And desired them [the jury], strictly to observe their evidence: and desired the great God of heaven to direct their hearts in this weighty thing they had in hand. For to condemn the innocent, and to let the guilty go free, were both an abomination to the Lord. (Geis and Bunn 1997, 227)

In 1671, Hale was appointed lord chief justice of the King's Bench, a post that he held until February 1676 when he retired due to ill health.

HALLOWEEN

As celebrated today, this secular (and primarily American) holiday bears only token resemblances to similarly named observances in past centuries. It takes its name from the Christian Vigil of the Feast of All Saints on October 31 (All Saints Day is November 1). Known earlier in England as “All Hallows’ Eve,” the phrase was contracted to “Hallowe’en.” Because this Christian feast is celebrated at a time when Celtic peoples marked the beginning of winter, it may also be related to the ancient pagan festival of Samhain (pronounced SOW-an). Although scholarly opinions differ,

the festival may have marked a special time of the year when the boundary between the living and the dead became especially permeable. While some practices (e.g., role of ghosts) associated with the holiday today indirectly reflect such a tradition, most people pay little attention to it. Instead, it offers an opportunity for children to dress up in costumes, attend parties, and in particular to go trick-or-treating for candy, and for adults to engage in carnivalesque behavior. A growing number of modern Neopagans also celebrate Halloween as one of two central holidays, along with Beltane (May 1), in their religious calendar. Today, Halloween is becoming more global as a consumer-oriented holiday generating huge profits through the sale of both foods and other merchandise.

Although Halloween may have pagan roots, very little is known about precisely how Samhain was observed. Historical sources are either second hand Roman accounts of Celtic religious practices that do not mention it at all, or Irish and English sources written centuries after the people in the British Isles had become Christian. Nevertheless, some themes emerge from folkloric scholarship. Samhain was probably a fire festival, featuring huge bonfires burning on hilltops, done at a time when it was believed that the boundaries between the material and the supernatural worlds broke

Halloween postcard of witch flying on a broomstick, ca. 1907–1915. (Poodles Rock/Corbis)

down. It was thus a time for placating the gods before entering the bleak months of winter, when food was scarce, and for communicating with the dead, whose spirits could return to haunt people in the material world. Most scholars deny that the holiday also featured human sacrifice.

The Feast of All Saints may have incorporated some pagan traditions, even as it sought to supplant them, becoming a holiday for Christians to say special prayers for the dead. It was mentioned in a seventh-century martyrology (a list of saints' feast days) attributed to the famous English monk and historian, the Venerable Bede. Further, we know that in Italy, Pope Gregory III dedicated an oratory to the saints (a prayer service) in the eighth century, and that in France, Alcuin, the famed tutor of Charlemagne, sought before 799 to have this feast day celebrated throughout Europe. When the feast spread throughout Christendom in later centuries, it bore little resemblance to its pre-Christian forms.

Although Halloween was not celebrated in the rest of Europe during the early modern period, in at least some areas of Britain and Ireland (if modern folkloric sources may be believed), many pagan practices continued alongside more orthodox ones, especially such activities as trying to foretell the future, burning fires, and suspending the rules of everyday life in favor of revelry and celebration. In later centuries, Halloween celebrations were never uniform in the British Isles, but reflected different local customs. In places where it persisted, it was mostly a pious holiday for families and a more carnivalesque occasion for rowdy young men seeking to upend community norms, at least momentarily. From roughly 1540 to 1690, Protestants suppressed Halloween in the British Isles; instead, many of them, like Protestants throughout Europe, commemorated October 31 as "Reformation Day," the anniversary of Luther's posting of his famous ninety-five theses. Afterward, religious authorities in the British Isles tended not to treat All Saints Day as a significant threat. Although Halloween was not celebrated in the rest of Europe during the early modern period, religious or secular authorities often suppressed other festivals similar to it, such as Walpurgis Night on April 30. Today, some Christians (especially American fundamentalist Protestants who have forgotten about Reformation Day) treat Halloween, like anything with even remote pagan roots, as inspired by the Devil (which it most certainly is not).

Halloween came to America around the mid-nineteenth century with Scottish and Irish settlers, but it was not until the early twentieth century that it became a genuinely national celebration. This change accompanied the growth of national magazines and radio, which spread information about Halloween and how to celebrate it. By the late nineteenth century, outside of immigrant communities it was a rather genteel

affair, an opportunity for adult socializing. It acquired an essentially secular aspect, although preserving such elements of earlier traditions as telling ghost stories, divining the future as a game, and dressing in costumes. It was also slowly becoming a day for children's revelry. But only during the 1930s, and especially after World War II, did trick-or-treating really become a national American custom.

More recently, adults have begun to celebrate Halloween as much as children (if not more so), making it an opportunity for transgression and carnivalesque reversals, an occasion for pranks, parties, and parades. Although accounts of Halloween sadism (poisoning candy, abducting children, placing razor blades in apples) have been largely the result of urban folklore, "Devil's Night" in Detroit, Michigan, was something else entirely during the 1980s and 1990s: the night before Halloween (October 30) became an occasion for literally setting the city on fire, causing millions of dollars worth of damage. Although many other less dire pranks also take place throughout the United States, millions of adults merely dress in costume, act out their fantasies, make political statements, and party the night away. In many areas of North America, especially among urban gay communities, Halloween includes informal parades as a kind of street theater. Most striking, however, as the holiday shifts toward adult revelry, consumerism mushrooms: in the United States, only Christmas now generates more sales than Halloween.

Despite this trend toward commercialization, Halloween has also acquired (or recovered) some religious dimensions—not among Christians, but as a major holiday for modern NeoPagans (contemporary witches), who have made Samhain their spiritual new year, perhaps the most important of the eight Sabbats in the pagan calendar. Although NeoPagan celebrations of the holiday take various forms among its highly individualistic, nonsectarian, and nonhierarchical believers, some general themes can be identified. Samhain marks the end of the harvest, and its rituals and meditations both honor the dead and explore such spiritual themes as loss and remembrance, natural cycles, transitions, and renewals.

HALLOWEEN TRADITIONS

For All Hallows' Eve in Europe, people carved turnips and placed candles in them to represent the souls of people in purgatory (where sinners waited before joining God in heaven). Instead, immigrants to America used indigenous winter squash, especially pumpkins, which were much easier to carve. Modern Jack-o'-lanterns derive their name from an old Irish folktale about a night watchman named Jack, who was too stingy to get into heaven but too much of a trickster to be tolerated in hell, so the Devil set him to wander the earth with his lantern.

Trick-or-treating may have its roots in the related Irish and English activities known as “mumming” and “souling.” Because normal rules were suspended at Halloween, groups of revelers threatened the better-off citizens with mischief. These “mummers” dressed in outlandish costumes and demanded bribes to restrain themselves. Meanwhile, almost everybody baked “sweet soul-cakes” to distribute to family members and poor neighbors in exchange for prayers for the dead. Over time in America, these two activities merged into the practice of trick-or-treating.

Because Halloween presumably emerged from a festival marking a season when the boundaries between the material and the supernatural worlds broke down, people could give expression to their fears of witches, who were thought to have special powers, and expect to encounter ghosts, who were the returning dead seeking to settle scores with the living, and “little people” such as fairies or other trickster demons. It is important to remember that witches, ghosts, and fairies could seek vengeance on the living at any time, but Halloween reminded everyone of the claims that the dead could make on the living and more generally of supernatural forces. Wearing costumes at Halloween probably has its roots in these beliefs as well as in “mumming,” dressing up and engaging in mischief. More recently, even though fewer people believe in witches, they often recall other monstrous figures from folklore and myth by dressing up. Of course, in any given year, many people prefer dressing up as superheroes, fairy-tale characters, or other political, pop-culture, or historical figures. Nonetheless, scary costumes (and often extremely gory ones at that) remain popular, and the macabre remains a central attraction within Halloween activities. Nowadays, fewer people believe in the reality of supernatural powers, but can still pretend to be frightened by them, as the astonishing growth of Halloween-related “haunted houses” and horror movies seems to suggest. Some scholars consider Halloween’s celebration of the frightening as a form of social catharsis, but clearly the holiday remains far more than that; in the contemporary United States, a country where relatively few celebrate Mardi Gras or Carnival (as many Europeans and Latin Americans do in February), Halloween has become an opportunity for both children and adults to bend the rules of normal, everyday life, a time for fun through reversals and transgressions of everyday norms.

GROWING POPULARITY

Halloween evolved into an essentially American holiday, which is now often celebrated in Canada, Mexico, and in parts of Europe. While each culture celebrating the holiday draws on its own traditions, in some, the American ways of doing things are gaining popularity. As culture becomes more “global” and more consumer oriented, it is possible to see this American influence at

work. Many Canadians now celebrate Halloween just like their neighbors to the south, as some have been doing for decades. In Mexico, Halloween is slowly merging with *El Día de los Muertos* (the Day of the Dead), which is primarily a religious holiday blending Christian with indigenous pagan practices (a Tex-Mex hybrid is emerging in parts of the southern United States). In Europe, Halloween festivities are a relatively new fashion, except for parts of Great Britain and Ireland where many traditional practices endure. Despite the continued existence of significant local variations, as Halloween becomes increasingly part of consumer culture, its practices are becoming more homogenous. Nonetheless, Halloween was and remains a holiday subject to constant reinvention by those celebrating it, so a variety of practices and beliefs will continue to shape it.

HAMBURG AND BREMEN

Hamburg and Bremen conducted comparatively few witchcraft trials during the early modern period, even though the penal legislation concerning witchcraft in Hamburg was stricter than the 1532 Carolina Code, the general criminal code (*Constitutio Criminalis Carolina*) for the Holy Roman Empire.

HAMBURG

The largest city of northern Germany, Hamburg had some 40,000 inhabitants around 1600, rising to 75,000 by 1700. The city at the mouth of the river Elbe took precedence over the other cities in the north because of its great population and its position as a commercial center. The merchant elite of Hamburg had controlled the city’s politics since the thirteenth century with virtually complete autonomy. The council (*Rat*) was the highest court in the city. Hamburg’s penal legislation punished sorcery as early as 1270, 1301, and again in

1497, always in the sense of classical *maleficium* (harmful magic). In 1603/1605, the Lutheran-dominated council redefined witchcraft in such a way as to bring it more into line with the fully developed, “demonized” early modern witch doctrine. Henceforth, proven *maleficium*, in combination with a pact with the Devil, was a crime punishable by death. These regulations were stricter than the Carolina Code, but Hamburg’s laws were different from most other German criminal procedures because here the defendant had to be granted a defense counsel.

Witchcraft trials in Hamburg began quite soon, indeed uniquely so for northern Germany. As early as 1444, a woman was burned for sorcery. The heyday of the trials began after 1540 and continued through the second half of the sixteenth century, before receding noticeably in the early seventeenth century—in other words, witchcraft trials decreased in Hamburg precisely when the new, diabolized definition of witchcraft was promulgated there. After 1583, there is no evidence of witchcraft trials involving multiple defendants. The last classical witchcraft trial occurred in 1642. Another trial for a different crime, with witchcraft as a subordinate crime, took place in 1701/1702. Between forty-five and fifty-five people, about 80–90 percent of them women, were arrested. Only a few were acquitted; the vast majority were executed. We do not know the exact numbers because Hamburg’s great fire of 1842 destroyed many sources. Nevertheless, it is certain that there were no mass executions in Hamburg and the trials stopped comparatively early, despite the stricter regulations after 1605.

BREMEN

Just as in Hamburg, Bremen’s governing town council, which also functioned as the highest court, consisted for the most part of members of the wealthy merchant class. By the end of the sixteenth and beginning of the seventeenth centuries, the Hanse city of Bremen, which had formed a close alliance with Hamburg, reached a population of nearly 20,000 inhabitants. During the Thirty Years’ War, the city’s authorities were able to prevent troops from destroying the town’s infrastructure, thereby sustaining its economic position during the first half of the seventeenth century. Yet Bremen’s citizens and preachers tended toward the Reformed religion. According to municipal laws of 1303, 1428, 1433, and 1497, the punishment for witchcraft and heresy was burning at the stake. A new law passed in 1606 bore distinctive resemblance to the municipal law of Hamburg. This *Statuta Reformata* (Reformed Statute) went beyond the Carolina Code and demanded the death penalty not only in cases of proven *maleficium*, but also for apostasy and for making a pact with the Devil. However, this new law was not reinforced.

Bremen’s first trial for witchcraft dates to 1503. However, up to the mid-sixteenth century, the persecution

of witches was restricted to offenses such as simple harming, healing, and protection spells. It was not until 1559 that elements of the new witch laws turned up in a trial of two witches that included accusations of entering into the pact with the Devil, sexual intercourse with the Devil, and attending the witches’ Sabbat. The last burning of a witch took place in 1603. Even though witches were still being persecuted and accused of being the Devil’s servants in the seventeenth century, they faced milder sentences or were simply expelled from the city. The official witch hunt gradually changed into trials based only on individual accusations. The last trial, in 1714, did not have typical witchcraft trial characteristics. Between the years 1503 and 1714, at least sixty-one people were tried for witchcraft in Bremen. The tribunals of the town council held a large majority of those trials. Unlike witchcraft trials in other German cities, torture was used moderately. One-third of the accused were sentenced to death, one-half acquitted, and the rest expelled from the city. Trials of one or two witches predominated, and none of the trials exceeded three accused. Two-thirds of the accused were women, who belonged almost exclusively to the lower classes, whereas in some cases the males who were put on trial had citizen status. The comparatively high percentage of males among the prosecuted witches in Bremen can be explained. In the sixteenth century, the town council also prosecuted persons who dealt with protective magic, healing spells, or fortunetelling on a commercial base; many of these witches were men.

Bremen’s moderate persecution of witches corresponded to the attitude of the city’s cultural elites after 1600. The town’s physician and scholar, Johann Ewich, warned against overestimating crimes of witchcraft in 1583 in his book, *De sagarum* (Concerning Witches; republished in 1586 as *Theatrum de veneficis* [Theater of Poisoners]) Ewich was a friend of Johann Weyer, the great German skeptic of witch hunting. In 1603, the highest church dignitary of Bremen, Archbishop Johann Friedrich, rejected the swimming test (water ordeal) as legal proof and doubted the existence of the witches’ Sabbat. In 1647, a Bremen printer published the first partial German translation of the influential *Cautio Giminalis* (A Warning on Criminal Justice, 1631) by Friedrich von Spee, the famous opponent of witch hunts.

Hamburg’s and Bremen’s moderate persecution of witches was typical of many large cities in the Holy Roman Empire, which rarely conducted severe witch hunts. Hamburg’s and Bremen’s records of witchcraft were similar; both places were comparatively unaffected by the great witchcraft trials of seventeenth-century Germany.

HAND OF GLORY

The severed and mummified hand of a corpse, the Hand of Glory, was believed to have magical properties, in particular that of making its possessor invisible.

Variant forms of the Hand of Glory are widely known, in both literature and recorded folklore, in many parts of Europe from Ireland to Russia (see Aarne-Thomson 1961, Type 958E; for examples in Britain from 1440 onward see Opie and Tatem 1989, also Elworthy 1900, pp. 178–193). The hand (of a felon, murderer, or witch) had to be cut from the corpse on the day of execution, or during an eclipse, by the intending user. It was then mummified or dried in the sun, or in smoke (details of the process were given in some versions of *Le Petit Albert*, reproduced in English in Waite 1911, chap. 8, §4, and Walter Scott's *The Antiquary*). A summary of the process as given by Waite was: "Take the hand of a dead hanged man, wrap it in a shroud and press it to squeeze the remaining blood out, and put it in an earthen vessel with powdered *zimon* [cinnamon], saltpetre, salt, and pepper-corns; it should remain in this vessel for fifteen days and then be exposed to the Sun during the Dog Days until it dries completely; if it has to be dried more, put it in an oven with vervain and bracken; make a candle from the fat from the hand, virgin wax, and sesame of Lapland."

The hand, either with each finger set on fire, or holding a "dead candle" made of human fat with a wick made from the hair of a corpse, had the property

The Hand of Glory, the severed and mummified hand of an executed murderer, thought to have magical properties, such as making its possessor invisible. (Fortean Picture Library)

of sending everyone in a house into deep sleep, and opening locks; it was used by thieves to rob houses and to find treasure because only they could see its light. In some German accounts, the hand had to be cut from an unborn child torn from its mother's womb. The recommended defense against burglars employing the Hand was to smear the threshold with an unguent made during the Dog Days from the gall of a black cat, grease from a white fowl, and the blood of a screech owl.

In English and French literature, especially fantasy literature, and more recently in fantasy and horror films, the theme of the severed hand with magical or demonic properties, or more particularly the Hand of Glory, has been popular. It can be found in a variety of forms from Scott's *The Antiquary* (1816) to R. H. Barham's *Ingoldsby Legends* (1840) ("The Nurse's Story"), several later novels and short stories, and J. K. Rowling's best seller, *Harry Potter and the Chamber of Secrets* (1998). It probably owes its long literary life to the description of its preparation in later versions of the popular and regularly reprinted *grimoire*, *Les Secrets du Petit Albert* (also found under other similar titles), falsely ascribed to Albertus Magnus but in fact was published much later (see Husson 1970). An early illustration of the hand appeared in one of the plates appended to *Superstitions anciennes et modernes, préjugés vulgaires* (I, Amsterdam, 1733: *Main de gloire ou main de pendu dont les voleurs se servent pour voler la nuit* [Hand of glory, or hand of the hanged that thieves use to steal during the night]). The hand was the subject of

a story by Gérard de Nerval (*Main de gloire* [Hand of Glory], 1832) which was turned into an opera by Jean Françaix in 1945. The Hand of Glory and the *Petit Albert* are also the subject of the first Canadian novel in French: Philippe Aubert de Gaspé, *Le Chercheur de trésors, ou l'influence d'un livre* (the Treasure Hunter, or the Influence of a Book, Quebec, 1837).

The *Hand of Glory* is more than just a folktale or literary motif. Several specimens have survived in museums, notably in the Whitby Museum in Yorkshire. One recorded case, in St. Lucia, of the murder of a boy performed to obtain a hand, included the detail that the murderer had a copy of the *Petit Albert* in his pocket when he was arrested.

The name *Hand of Glory* is translated from French *main de gloire*, which some see as a folk etymology of mandragora, the mandrake. This is unconvincing and ignores the ring of light meaning of glory; it true that one of the many beliefs about mandrake is that it grew beneath the gallows and was used as a narcotic, but in all other respects, the extensive magical reputations of the mandrake and the Hand of Glory are distinct.

The Hand of Glory is a specific variant of an ancient belief in the magical properties of severed hands. The first literary reference to its alleged curative powers appears to be Pliny, *Naturalis historia*, XXVIII.vi.11. This therapeutic use of the hand persisted until modern times in Britain and Ireland: a reputed “witch’s hand” capable of curing all ills was sold at auction in London in 1925. A Cairo Genizah Jewish formula for finding treasure also required the use of the hand of a corpse (Thompson, 1955–1958, motif D 1314.5).

HANSEN, JOSEPH (1862–1943)

One of the most important historians of witchcraft, Hansen’s edition of sources, *Quellen und Untersuchungen zur Geschichte des Hexenwahns und der Hexenverfolgung*

im Mittelalter (Bonn, 1901) remains fundamental for European intellectual history, although (because fewer students now read Latin) more and more of the sources he discovered and first edited have been re-edited and translated in recent years. Hansen epitomized the rationalist approach toward witchcraft, and nineteenth-century scholarship on the topic culminated in his *Zauberwahn, Inquisition und Hexenprozess im Mittelalter und die Entstehung der grossen Hexenverfolgung* (Munich, 1901).

Born into a Catholic milieu in Aachen, Hansen became a spirited liberal, and a sought-after scholar. Educated at Bonn by Moriz Ritter (1840–1923), and in close contact with the reforming social historian Karl Lamprecht (1856–1915), Hansen became director of the important City Archive of Cologne (*Stadtarchiv Köln*). From this position he created networks of scholars in different areas. In witchcraft research, he was closely linked to the Bavarian Liberal Sigmund Riezler, as well as with the American historian George Lincoln Burr, whose studies in German archives Hansen supported. To his own edition of sources, Hansen appended a lengthy article on the terminology of witchcraft, authored by his friend Johannes Franck (1854–1914), a linguist and professor of German and Dutch languages at Bonn. Hansen received three calls to universities—Leipzig (1912), Kiel (1914), and Breslau (1916)—all of which he declined.

One may take it as an irony of history that Hansen, who had withdrawn from the public in 1933, because he despised the Nazi regime, was killed in his house ten years later, together with his wife, in a British air raid on Cologne. At the same time, British social anthropology also demonstrated the limitations of Hansen’s approach. His refusal to accept witchcraft and magic as part of social life, as a social fact, had confined his research to a methodological position, characterized as “Whiggish” by Anglophone historiography. However, Hansen represented traditional historiography at its finest. His editions of the reports of papal nuncios in the late sixteenth century, his writings about the history of the Jesuit order in the Rhineland, and his edition of medieval sources for the history of witchcraft are still unsurpassed. His papers in the City Archive of Cologne demonstrate how scrupulously Hansen organized his international archive trips, and how carefully he kept contact with a host of international scholars. Being in command of at least Latin, Greek, French, English, and Italian, he referred quite naturally to the Oxford anthropologist Edward B. Tylor (1832–1917), and opened his book on witchcraft with a quote from William Hartpole Lecky (1838–1903).

HARTLIEB, JOHANN (CA. 1410–1468)

Hartlieb was a renowned many-sided author and translator of the fifteenth century, whose works included magical, didactical, rhetorical, medical, religious, and narrative texts. For a long time, scholars believed that necessity made him translate anything his noble patrons demanded. Recent research has provided a different perspective.

Hartlieb's life clearly fell into two periods. In the first period, he served several princes while continuing his studies. He began at the court of Duke Ludwig the Bearded of Bavaria, who sent him to study in Vienna in the late 1430s. In early 1440, while in Vienna, he translated a *Treatise on Love* for Duke Albrecht (Albert) VI. Finally, Hartlieb became a doctor of medicine at Padua and physician and counselor to Duke Albrecht III of Bavaria-Munich. This began Hartlieb's second phase, where he spent the rest of his life in a permanent position at the Munich court as a medical attendant. Hartlieb even married Albrecht III's daughter by a first marriage to Agnes Bernauer, who was executed as a sorceress. After Albrecht's death, Hartlieb remained physician to Albrecht's son Sigmund. For him he translated the *Secreta mulierum* (Secrets of Women) and wrote *Buch von warmen Bädern* (The Book of Hot Baths).

HARTLIEB'S TREATISES ON MAGIC

Hartlieb's treatise on lunar divination attempted to reveal a person's fate, deriving from the twenty-eight moon stations, that is, the planets the moon passes in twenty-eight days. Hartlieb combined two methods, the hour of birth and the numbers combined with the name. In his *Mantic of the name* (ca. 1440), he first described a method of foretelling the outcome of an ordeal by using the names of the opponents. Furthermore, he listed the favorable days and times of day, and the most likely outcomes of the duel. He used numerology, the ancient practice of converting letters into numbers, to uncover the hidden associations between words. Unlike modern numerology, which revolves around interpretations of individual numbers, this older form focused on lists of words, names, and dates with numerical values that match one's own numerical value in some way.

When Hartlieb stayed with Margrave Johann (the Alchemist) of Brandenburg-Kulmbach in January

1456, he was invited to write a general treatise on secret arts for him, as Hartlieb stated in the prologue to his *puoch [Buch] aller verbotenen kunst* (Book of All Forbidden Arts). This study of magic and divination provided clues to reveal the author's personality. His first translator, Dora Ulm, wished to prove that Hartlieb intended to write a book against superstition; later researchers have followed suit, although with less naiveté. But it remains puzzling that if Hartlieb had rejected superstition, as he asserted in his *Book of All Forbidden Arts* (and can therefore be celebrated as one of the first German representatives of Renaissance enlightenment), why did he later write detailed treatises on chiromancy without expressing any distaste or rejection? Some scholars responded by simply denying his authorship of those treatises.

To protect his orthodoxy, Hartlieb did condemn magic in all its forms and provided a list of sources that should be avoided at all costs. He denied the possibility of demonic prediction. Therefore, when he described the art of scrying, it was always an angel who helped the medium, a boy, to see the future. The first part of his *Book* warned the reader against these forbidden arts and demonic influences. Its second part showed how to perform such secret arts in full detail. Although the two parts of his book seem to contradict each other, its details could well serve as a practical manual of superstitious practices under the mask of enabling his reader to avoid them. Hartlieb, of course, claimed that he had learned this information from hearsay, rather than through his own research.

HAT

The modern Halloween witch is almost always shown wearing a pointed black hat. This image is so commonplace that it defines "witch" to the modern observer. But witches' hats are actually a very recent item of iconography and have almost nothing to do with the visual images of witches as they appear in earlier periods. The earliest images we have of witches, such as those who appeared in Ulrich Molitor's 1489 *De Lamiis et phitonicis mulieribus* (Concerning Witches and

Fortunetellers), were shown as ordinary persons in everyday dress. Some wore head coverings, but they did not wear tall pointed hats. In almost all of the illustrated publications from the period of witch persecutions in Europe, that is, from about 1500 to 1680, one generally does not see witches wearing headgear of any kind. The same observation holds true for paintings and prints of witches.

It has been suggested that the witches' pointed hat derives from the hats that some Jews were constrained to wear during the Middle Ages and the early modern period, but this is clearly not the case. The hats were not the same shapes. And, Jews were not heretics as witches were considered to be. Jews were seen as a different type of religious deviant than witches. Furthermore, witches, as Christian apostates, did not have to wear special garb meant to single them out in society. It has also been suggested that the witches' pointed hat might possibly have derived from the *sanbenito*, the penitential dress given to convicted heretics in Spain that included a tall kind of "fool's hat." Such hats appeared on various inquisitorial victims shown in Goya's *Caprichos*, and can be seen on figures in *Capricho 23* "Those Specks of Dust," and *Capricho 24*, "Nothing Could Be Done About It." But Goya was not the source for our modern witch's hat. The *sanbenito* hat was shaped differently and was not black. Furthermore, in the Goya etchings the hats were decorated with images. This hat was an item of ridicule, part of a clown suit.

How did the modern witch image come to include a person wearing a tall black hat? The witch's black hat probably derived from headgear worn by both men and women in seventeenth-century England. One sees a pointed hat worn by Anne Baker, an English witch, in a pamphlet from 1619 recounting the activities of another witch named Joan Flower. Interestingly enough, the infamous Matthew Hopkins (died 1646), known as the "witch-finder general," was commonly shown wearing a very similar tall crowned black hat. As early as the eighteenth century, however, the witch's black hat appeared as an item of stereotyped ridicule. William Hogarth's print entitled "Credulity, Superstition and Fanaticism" depicted a Protestant minister inveighing against witches and the Devil while his congregation was far less than properly attentive. The minister held a witch puppet in his hand. This he dangled in front of his congregation so that they might see for themselves what a witch looked like. This witch rode a broomstick and wore a "witch's hat." Toward the end of the nineteenth century, the witch's hat was well established in the iconography of the witch. Witches wearing hats became quite popular images in the United States. The image was so commonplace as to appear on the "Salem Witch" in Daniel Low's Salem, Massachusetts, commemorative spoons and other souvenir items. These spoons and other items

began appearing in the early 1890s. The Salem jeweler and silversmith produced an entire line of witch items ranging from pencil cases to stickpins to small portable containers for drinking glasses. All were emblazoned with his Salem witch image and every one of these witch images included a pointed hat. This Salem souvenir explosion may have had something to do with the popularity of the hat in twentieth-century Halloween decorations. Witches wearing pointed hats were also commonly shown on turn of the twentieth-century Halloween postcards. Some of these witches wore black garb and hats, but others wore red apparel. Red or black, the peaked hats were firmly in place on the witches' heads.

**HAUBER, EBERHARD
 DAVID (1695–1765)**

When he edited his *Bibliotheca sive acta et scripta magica* (Library of Magical Practices and Writings) between 1738 and 1745, Hauber was church superintendent of the Calvinist county of Schaumburg-Lippe. Hauber had studied mathematics, sciences, and theology at the universities of Tübingen and Altdorf (Nürnberg); he was one of the founders of scientific cartography and wrote the first history of cartography, *Versuch einer umständlichen Historie der Land-Charten* (Attempt at a Detailed History of State Charters, Ulm, 1724). As pastor in Stadthagen, Hauber supported a kind of rationalist pietism. His interest in witchcraft was intensely local, springing from his discovery of extensive witchcraft trial records from the Calvinist territory of Schaumburg-Lippe, and especially of its capital Lemgo, where hundreds of people had been burned for witchcraft only two generations earlier.

Surviving copies of his publication were usually presented as books, in three volumes (Lemgo 1739–1745). These, however, did not represent the original form of Hauber's *Bibliotheca sive acta et scripta magica*; it was a unique mixture of source edition, comment, and historiography in a period when witchcraft trials were still a potential reality. Hauber clearly aimed at influencing public opinion, and did so by publishing his material as a magazine with about four issues per year in 1738, later speeding up to an average of six per year. In the first issue of 1738 (52 pages) he actually asked for support, news, and reviews; later, he apparently commissioned articles

from well-known contemporaries to add their reputations to his project. Furthermore, he dedicated each issue to a famous public figure, for example the Hamburg senator and poet Barthold Hinrich Brockes (1680–1747), editor of the enlightened moral weekly magazine *Der Patriot*. Many issues were dedicated to academics at the University of Halle, surviving supporters of Christian Thomasius, like the jurist Jacob Brunnemann, the professor of medicine Friedrich Hoffmann (1660–1742), or the Protestant Church jurist Justus Henning Böhmer, and celebrities of the period. Hauber's first piece (I, 1–52) began with an engraving of Pope Innocent VIII, the Latin edition and the first German translation of his bull of 1484 that entitled the future author (Heinrich Kramer) of the *Malleus Maleficarum* (The Hammer of Witches, 1486) to inquire against the witches' conspiracy, and included fragments from the *Malleus* itself. Hauber's second issue (I, 53–139) was less coherent, and combined bulls from other popes, for example, John XXII's *Super illius specula* (Upon His Watchtower), with a copper engraving of Johann Weyer and texts from opponents of witch hunting. The third part (I, 141–212) started with an engraving of the swimming test, reported actual witchcraft trials in Hungary, and finished with further editions of papal decrees. Hauber's fourth issue (I, 213–276) dealt mainly with appearances of ghosts and cases of sorcery in ancient Greek and Roman texts, displaying his classical erudition. His first twelve pieces were followed at the end of 1739 with an index, suggesting they be shelved as a book.

The next issue—#13 (1740) if treated as a newspaper, or vol. 2, pp. 1ff. if seen as a book—caused a sensation: An edition and translation of the British witchcraft act of 1736, the first official repeal of witchcraft legislation anywhere in Europe, was decorated with a comment on “the improvement of our present age.” In this style, Hauber's publication continued as a kind of quarterly magazine for enlightened intellectuals who wished to have their knowledge of superstition and witchcraft updated. The mixture became ever more colorful, with reports on early witchcraft trials in Savoy, Eskimo shamanism, Chinese sorcery, the recantation of Cornelius Loos (translated from Martín Del Rio's *Disquisitiones Magicae libri sex* [Six Books on Investigations into Magic], 1599/1600), an account of the burning of Dr. Dietrich Flade at Trier, a discussion of why Thomasius's intervention of 1701 had been so successful, and a review of Francis Gayot de Pitaval's *Causes célèbres* (#25, 1741). In the foreword to this number, Hauber boasted that his magazine sold well. In the end, however, Hauber offered stories rather than history, although his only permanent collaborator, Johann David Köhler—who shared Hauber's interest in cartography (*Bequemer Schul- und Reise-Atlas*, Nürnberg, 1719)—was appointed professor of history in Göttingen. Like Henry Charles Lea at the beginning of

the twentieth century, Hauber offered his “Materials Towards a History of Witchcraft.” His “materials” finally stopped in 1745 with issue # 36, concluding volume 3.

It may well be that Hauber terminated his witchcraft quarterly because he gave up his job in Stadthagen for unknown reasons, and moved to Copenhagen. In 1746, he became parish priest of the German community (*Petri-Gemeinde*) in the Danish capital. But the lack of successor may imply that witchcraft had ceased to be of great importance to German Protestants, whereas the Germanophone Catholic south had not yet begun public debate about the subject. When these debates began, Hauber's achievement had vanished from memory, and Italian, Austrian, and Bavarian intellectuals cited Thomasius or earlier English debates.

HAUSMÄNNIN, WALPURGA (CA. 1510/1527–1587)

The trial of Walpurga Hausmännin became prominent in the Anglophone world, because her case was included first by Victor Klarwill in his edition of the Fugger Newsletters (1923), then in English translation in George T. Mathew's *News and Rumor in Renaissance Europe* (1954), and eventually by William Monter in his frequently reprinted collection *European Witchcraft* (1969). All these editors may have included it in their collections because it seemed to exemplify a full-fledged confession of witchcraft as well as the persecution of midwives, as suggested by the *Malleus Maleficarum* (The Hammer of Witches, 1486). And this met exactly the function it was meant to serve in 1587 as well. However, none of these editors made any attempt to contextualize their source and analyze its significance, despite abundant source material, including court council records and correspondence.

In reality, Hausmännin's confession was not at all stereotypical at the time of its first publication on the occasion of her execution. She received her death sentence on August 26, 1587, and was presumably executed on September 2, as the Fugger news collection reported (not August 20, as misread by Matthews and Monter, who copied Klarwill's misreadings). As the first stereotypical confession to appear in print in the German south, where witchcraft trials were still unusual, it provided valuable news concerning witchcraft.

Walpurga Hausmännin was the first of four midwives accused among seventy-nine known suspects in

M. D. LXXXVII.

Walpurga Hausmännin was a midwife executed as a witch in Dillingen in the prince-bishopric of Augsburg in 1587. She achieved notoriety for the heinous crimes that she confessed, including having sex with the Devil, entering into a pact with the Devil, desecrating the Host at a Sabbath, and murdering forty-four children. The illustration is from a 1587 pamphlet. (Cornell University Library)

the Danube town of Dillingen, the capital of the prince-bishopric of Augsburg, and the first to be sent to the stake. Another midwife, Anna Beringin, was released the same year, as was Maria Jauffmännin in 1611. However, a former midwife, Afra Butzin, was executed in 1612. The approximately 300 known suspects of witchcraft in the prince-bishopric included two more midwives, executed at Schwabmünchen in 1590 and 1591. This raised the ratio of midwives among those executed to roughly 2 percent, which was indeed unusually high, but less than expected. The trial of Walpurga Hausmännin demonstrated why prosecution of midwives was not a viable option: She was the pledged town midwife of the city of Dillingen for almost twenty years. Like most urban midwives, she was no medical freelancer, but a licensed official, sworn in by the magistrate.

However, Hausmännin's case aroused considerable notoriety, because she confessed to almost incredible crimes. She admitted intercourse with the Devil, the pact, apostasy, demonolatry, desecration of the host at the witches' Sabbath, and harmful magic: the killing of forty-four children, weather making, and the devasta-

tion of crops and livestock. Her confession suggested that she indeed should have been considered the most dangerous person in the principality. Not even members of the government were safe from her attacks: she accepted responsibility for having magically killed chancellor Dr. Peuter's wife eleven years earlier, and two of their children, and for having killed no fewer than three children of the princely governor (*Satthalter*) Wilhelm Schenk von Stauffenberg, who died on October 23, 1587, and may have been ill during the trial. Not only did Hausmännin receive poison from her devilish lover, but she also sucked out the children's blood to prepare her harmful unguent. Her crimes seemed so extraordinary that she received an extraordinarily cruel punishment. Before being burned alive, Hausmännin was pinched with red-hot pliers on her way to the stake, and her right hand was cut off at the place of execution because of her perjury. Her ashes were dispersed into flowing water, the Danube.

The Dillingen town secretary, presumably on demand, communicated the confessions privately. Handwritten copies can be found in the archives of the imperial city of Weissenburg, the earls of Waldburg-Wolfegg, and in the Bavarian capital at Munich. On September 14, 1587, the government of the prince-bishopric urged the two lord mayors of Dillingen to reprimand the secretary for his unauthorized action. The lord mayors had to assure that in the future, the secretary would be controlled more tightly. A local printer, however, had already printed Hausmännin's confession. This pamphlet of early September caused concern among contemporaries, as can be seen from the correspondence of neighboring Lutheran princes early in September (now at Hauptstaatsarchiv München), and from its inclusion into the Fugger news collection in Augsburg (now at the Österreichische Nationalbibliothek, Vienna). Presumably the authorities feared either that someone might imitate Hausmännin's crimes, or that emotions about witchcraft could be fueled unduly. The pamphlet was reprinted the following year, though very poorly and with a different title. This second printer dated her execution on October 24, which was definitely wrong, and even misspelled the victim's name as "Hausmaennen" (see the copy in the Cornell University Library).

HECATE

An Anatolian goddess, originally associated with the protection of entranceways and with childbirth, Hecate subsequently became associated with chthonic deities, the crossroad, demons, and the patronage of witchcraft. The earliest literary mentions of Hecate occurred in Hesiod's *Theogony* and in the *Homeric Hymn to Demeter* (both seventh century B.C.E.). In these sources, she was seen as a favorite of Zeus, closely connected with nurturing children, and as a tireless friend to Demeter when Hades abducted that goddess's daughter. Both literary and archaeological sources attested to her association with gates, thresholds, and other liminal places where demons or ghosts were believed to have lingered, hoping for the opportunity to enter. According to Aristophanes in *Wasps*, protective statues known as *hekataia* were placed at these entrances to guard them from demons and malevolent spirits. It is quite possible that their presence also served as a boundary marker dividing the polis and the household from outsiders. Like Diana (Artemis), Hecate was invoked by young women who were about to pass from maidenhood to marriage or who were in childbirth. Thus, Cassandra in Euripides's *Troades* called on Hecate to "give light" to the maiden's marriage bed. The goddess was often described or portrayed in art carrying a torch, and this may have related both to her chthonic associations (living in a cave or at the entrance to the underworld) and to nocturnal celebrations that brought brides to their husbands' households.

The originally benevolent character of Hecate at her cult places in southwestern Anatolia (principally Lagina in Caria) seemed to be transformed in the Greek context to one more associated with magic, witchcraft, and the world of demons and ghosts. This change may have been the result of the Greeks already having both a god of entrances (Hermes) and a goddess (Artemis) whose primary role included protecting maidens and women in childbirth. Thus, given the dual nature of many of the ancient deities, the Greeks emphasized the darker side of Hecate's character: instead of averting evil, she allowed it to pass freely over the threshold. The dual-sided character of the goddess may have been an indication of her connection to the Mesopotamian underworld goddesses Lamashtu and Lamassu. These deities were cardinal opposites, with Lamashtu serving as the frightening demon who ripped unborn children from their mothers' wombs with her bloody claws and was associated with the she-wolf, dog, and serpent.

Physically, Hecate took on the character of a demoness, whose frightening aspect, like the Gorgons,

included a head of writhing serpents instead of hair (*Orphic Argonautica*—a fourth- to sixth-century C.E. poem that recounts the participation of Orpheus in Jason's expedition for the golden Fleece). Theocritus described her devouring the flesh and blood of those who died before their time. Apotropaic sacrifices, including circular cakes, were made to her at crossroads, a practice similar to Mesopotamian excretion rituals in which the practitioners of magic buried images made of dough at a crossroad to invoke a curse against an enemy. Like Artemis and Selene, Hecate was associated with the moon, but only to its dark phase, when the dead had their greatest power, and she received the chilling epithet, "black Hecate."

In this more malevolent manifestation, Hecate's association with dogs, sometimes seen as a healing attribute, was transformed into a sinister, unclean familiar given to demons as a sacrifice. Significantly, Eusebius described Hecate's instruction that serpents were to entwine her waist and be coiled around her entire body. Instead of turning back the spirits of the dead, Euripides's *Helen* noted Hecate's willingness to torment the living with these phantoms. Because control of the soul was essential to the efforts of ancient magicians, it is not surprising that Hecate's power over the dead made her an object of worship and invocation. So powerful did this tradition become that Shakespeare used Hecate in the scene in which the three witches appeared to the ill-fated Macbeth.

While later Greco-Roman traditions tied Hecate to the sorceresses Medea and Circe, this may have been a conflation of attributes rather than any physical tie. The close association of Hecate with witches or female magicians was the result of her role as leader of the souls of the dead. However, Hecate's earlier, more benevolent character, assisting women in childbirth, would have also served as a reason for her to be worshipped or invoked by women engaged in folk medicine and the use of magical herbs.

HELL

MAIN LINES OF CHRISTIAN TEACHING

Hell is the eternal abode of damned souls, in contrast to the temporally limited purgatory. The Bible con-

firms its existence in many passages and hell stands as a dogmatic truth in the teachings of all Christian confessions. Originally, God created it as an everlasting prison for the rebellious angels following Lucifer. Hardly anybody doubted its location in the middle of the earth; volcanoes were interpreted as roads to hell. Apocryphal texts, visions of the otherworld, sermons, didactic works, and so forth, tried to surpass each other in inventing the most sadistic punishments for each category of sinners. Images of hell as a part of the Last Judgment were present in all churches from the twelfth to the eighteenth centuries, and concrete representations of this subterranean dungeon could be seen in many religious plays. Fire formed the main torture in hell, but devils, who functioned as jailers in these concentration camps of the ecclesiastical imagination, administered a great variety of other torments. That pain which theologians qualified as the most severe, the complete loss of God, did not play an important role in popular mentalities. Both of our most complete descriptions of hell, Dante's *Inferno* and Regnaud le Queux's *Barâtre infernal* (Infernal Churn, 1480), integrated features from classical mythology into the Catholic tradition. Hell's most detailed pictorial representations were painted by Taddeo di Bartolo (cathedral of San Gimignano, 1393) and Hieronymus Bosch (several retables, late fifteenth–early sixteenth centuries).

People of the Middle Ages and the early modern period were convinced that God had predestined most human beings to hell, a doctrine extending from St. Augustine to Gottfried Wilhelm Leibniz. It was irrelevant whether a dying person had committed many mortal sins, or was only burdened with Adam's and Eve's original sin. Either way, the person would end up in hell, although tormented by different punishments. A special compartment of the netherworld, called Limbo (*limbus puenorum*), was reserved for children of Christian parents deceased without baptism. Another special compartment, the *limbus patrum*, had served as a residence for the patriarchs and other people of the Hebrew Bible. They, however, were delivered from the underworld when Jesus "conquered" hell between his death and resurrection. Apart from some individuals or sects, only the Enlightenment reduced the intensity of the Churches' use of this threatening device for establishing moral and practical discipline. Whereas nineteenth-century catechisms still gave very sensual pictures of hellish pains, more recent theologians usually have adopted a position of complete agnosticism about the physical reality of its punishments.

HELL AND WITCHCRAFT

There was, of course, no doubt that witches would end up in hell, sorcery being an especially dangerous kind of

The torturing of witches in hell. (Fortean Picture Library)

heresy. Nonetheless, they were rarely recorded in the medieval visions of the otherworld. Hell was mentioned occasionally in postmedieval magical formulae; but it was its employees, not the place itself, which the sorcerer wanted to contact.

The English Benedictine Edmund of Eynsham had a vision of the infernal underworld in 1189, where he saw the punishments inflicted on women who caused abortions through *maleficiis* (evil acts): they had to drink boiling liquefied metals and were tortured by snail-like demons. This description was clearly a reworking of the early Christian apocryphal *Vision of St. Paul*, which also combined the "typical female" sins of infanticide and divination. According to St. Hildegard of Bingen (d. 1179), sorcerers were tormented in a fetid and burning swamp full of vipers (*Liber vitae meritorum* [Book of Life of Merits] 5, 64). St. Francesca Romana (d. 1440) insisted that those practicing sorcery suffered alongside their customers. In Norway, the famous late medieval visionary folk-ballad *Draumkvaede* [The Dream Song], tells about the "trol-lkjeringan" (witch) whose hell consisted of eternal exhausting churning while standing in blood. Several late medieval wall paintings of the Last Judgment in Northern Germany and Scandinavia also showed a witch with a butter-churn among the damned. The most famous magician to enter hell alive was Faustus, whose impressions of that place were first rendered in a 1587 pamphlet. Later, Goethe replaced Faust's descent into hell with his participation in Walpurgis Night, the major witch Sabbath in the Harz

Mountains. Certain books of necromancy entitled “*Höllenzwang*” (Constraint of Hell) circulated in German-speaking countries of the seventeenth and eighteenth centuries, most of them allegedly related to the famous Dr. Faust or to the Jesuits. They proposed to force the demons out of hell through special conjurations, often in order to make them help find buried treasure.

HEMLOCK

Hemlock (*Conium maculatum*) is among the poisonous and medicinal herbs traditionally believed used by witches in compounding ointments and potions for use in black magic. This use of the herb was mentioned in various sixteenth- and seventeenth-century demonological texts. There may have been some confusion on the part of herbalists and demonologists as to which form of hemlock the witches used. *Conium maculatum* looks similar to another poisonous plant called water hemlock (*Cicuta virosa*). Linnaeus eventually gave the two plants different scientific names in 1737 to remove the confusion. Generally the most noticeable difference between the two plants lies in the shape of the leaves. Water hemlock is deadly to humans as well as to cattle that consume it. Because witches were notorious for poisoning cattle, this property of toxicity to animals is especially interesting. Johann Weyer, the sixteenth-century German physician and witch expert commented on

witches’ use of hemlock in his *De Praestigiis daemonorum et Incantationibus ac Veneficiis* (On Witchcraft, Incantations, and Poisoners) of 1568. Hemlock was one of a collection of deadly poisonous herbs supposedly employed by witches in particularly supernatural ways. Thus even though this herb was extremely toxic, the witch might use the herb to make up a brew or flying ointment to help her get to a Sabbath without killing herself, or she might go a more practical route and just poison someone with the herb. Witches using hemlock can also be seen in seventeenth-century art. *Witches Scene*, a painting by David Teniers the Younger, dated about 1650, hanging in the city museum (*Staatliche Kunsthalle*) of Karlsruhe, Germany, shows two female witches working at the foot of a gallows, busily digging up mandrake roots, plants that were thought to grow at such places. Fittingly, the events take place at night and the witches work by lantern and torchlight in the company of a whole host of zoomorphic devils. One of the witches also has filled her apron with hemlock. Without question these witches are harvesting components for some very deadly brews.

HEMMINGSSEN, NIELS (1513–1600)

Denmark’s foremost witchcraft theorist and undoubtedly the most influential Danish theologian of the sixteenth and seventeenth centuries, Hemmingsen matriculated at the University of Wittenberg in 1537, where he became strongly attached to Philipp Melancthon, whose theology Hemmingsen championed all his life. Returning to Denmark in 1542, he was appointed professor of Greek and in 1553 professor of theology at the University of Lund. During the controversy concerning the Lord’s Supper in the 1560s, Hemmingsen openly favored Melancthon’s ideas, and in 1574 he declared himself in favor of the Calvinist doctrine of the Lord’s Supper. Complaints came from other princely Lutheran courts, and although his prestige remained high in Denmark, the Danish king felt compelled for the “sake of concord” to dismiss Hemmingsen from his post as professor of theology in 1579. However, visitors came from abroad to discuss religious questions with him, including the Scottish King James VI, who met him in 1590 while visiting Denmark on the occasion of his marriage.

In 1575, Niels Hemmingsen published his *Admonitio de superstitionibus magicis vitandis* (Warning About the Tricks of Superstitious Magicians), the only treatise

published in Denmark during the period of witchcraft persecutions dealing exclusively with the subject. Recent research has shown his shorter vernacular treatise, *En vnderuisning aff den hellige scrifft / huad mand dome skal om den store oc gruelige Guds bespottelse* (Instruction of the Holy Scripture on How to Judge the Great and Awful Blasphemy), once considered an abbreviated translation of his 1575 book, to be a translation of a chapter of Hemmingsen's 1562 commentary on the Gospel of John, *History of the Lord Jesus Christ*. In both treatises, Hemmingsen discussed the things sorcerers and witches could do through their magic, and suggested how secular and religious authorities should deal with this crime.

In both texts, Hemmingsen answered three questions of central importance to the subject: its origin, its effects, and God's permission. The *Admonitio* added discussions about the use of counterwitchcraft and protective measures (white witchcraft). Hemmingsen argued that all witchcraft originated with the Devil; evil people could not act alone. Although he never doubted the efficacy of witchcraft, he believed it could be done only with God's permission through the Devil. God permitted the Devil and the witches to harm people's lives and property either to test their faith or to punish them for their sins. A Christian congregation should exclude any member who had abused God's name, whether for harmful or for benevolent purposes. Hemmingsen's *Admonitio* stressed that it was inexcusable to use white magic to counter witchcraft, because the sin was the same, whether the purpose was harmful or benevolent; thus he disapproved of using magic for protection against illness or death.

The main difference between the *Historia* and the *Admonitio* is that the latter offered a dictionary of witchcraft in eighty pages, in which Hemmingsen, among other things, rejected the notion of women gathering at night at certain places for a Sabbath. When people claimed to have seen the women, it was only an illusion, as were tales of metamorphoses.

Hemmingsen's conclusion insisted that adversity and hardship originated with God, and emphasized the need to imitate the example of Job. It told a vicar to treat a person who used white witchcraft against illness by provoking a sense of guilt, then counseling repentance, and ending with a prayer for divine assistance. However, secular authorities should punish harmful magic without mercy, if it could be proved. But while advocating this, Hemmingsen criticized the Danish judges as insufficiently devout and pious. He recommended that all complicated cases be brought immediately before the High Court to avoid ignorant judges acquitting those accused of witchcraft, because, according to Hemmingsen, many judges knew only the secular laws and not God's laws.

Hemmingsen's opinions in his *Admonitio* together with similar ones by the canon of Ripe, Anders Sørensen

Vedel, and the bishop of Stavanger, Jørgen Frickssøn, played a significant part in the rather mild witchcraft persecution in Denmark. It can hardly be doubted that the Danish ordinance of 1576, the first in Europe to require all witchcraft cases to be reviewed by a High Court, owed much to Hemmingsen's influence.

HENNINGSEN, GUSTAV (1934–)

Two interrelated themes, European witchcraft and the Spanish Inquisition, have dominated the long and fruitful career of the Danish ethnographer and historian Gustav Henningsen, best known for his magisterial study of a seventeenth-century Navarrese inquisitor, Alonso de Salazar y Frías, whom he has immortalized as *The Witches' Advocate*.

Originally trained in ethnography, Henningsen began his scholarly career with a thesis about witchcraft beliefs in a remote Danish island, which has remained unpublished because the local population was too small to disguise the identities of some suspected witches. Winning a lengthy research grant for work on contemporary witchcraft beliefs in northwestern Spain, Henningsen, inspired by the great Spanish anthropologist and historian Julio Caro Baroja, began deepening the historical dimensions of his research. He soon discovered a largely untapped collection of witchcraft cases in the central archive of the Spanish Inquisition, especially the *relaciones de causas*, the annual summaries of cases judged by each tribunal, which had to be submitted to its central board in order to collect a hefty supplement to their regular salaries. By autumn 1971, Henningsen realized the remarkable richness of this material and recruited a gifted young Spanish historian, Jaime Contreras, to help him index the entire collection of *relaciones*, not simply its witchcraft cases. After two years, they had inventoried about 25,000 cases. In 1975, a young French historian, preparing a doctoral thesis on the tribunal of Toledo, adopted their method and contributed over 4,000 *relaciones* to their project.

By 1977, when Henningsen published a path-breaking article in Spanish outlining the results, this embryonic multinational collaboration had created about 42,000 handwritten cards, which they sorted out to produce our first reliable statistical profile of the global activities of the Spanish Inquisition spanning the century and a half after 1550.

Snubbed at a Spanish conference commemorating the 500th anniversary of the Spanish Inquisition in 1978, Henningsen organized a competing and more broadly international conference at Copenhagen; its results, coedited with an American expert on the Roman Inquisition, became a landmark in comparative Inquisition studies (Henningsen and Tedeschi 1986). The long-standing delicate balance between Spaniards and foreigners in Inquisition research revealed by this episode has had frustrating consequences. In 1980, Henningsen attempted to create an international program on the Inquisitions of Spain, Italy, and Portugal under the aegis of the multinationally funded European Science Foundation, but the Spanish representative vetoed the proposal (Henningsen 1993). One by-product of this decision is that international funding has never been found to produce a usable electronic version of the now venerable *relaciones de causas* project.

Henningsen's career followed an unusual trajectory. Like another well-known European interdisciplinary scholar, Philippe Ariès, he never held a university chair, but was instead employed by Denmark's national folklore archives. While there, Henningsen completed and published his most ambitious project, subsequently translated into several languages, about the Spanish Inquisition's fateful encounter with Basque witchcraft in 1609–1614 (Henningsen 1980). His numerous articles, all marked by a distinctive ethnographic curiosity, often drew on his unparalleled fund of information about witchcraft-related "superstitions" provided by inquisitorial tribunals throughout the Spanish empire. He has investigated topics ranging from Basque influences on the practice of black magic by African slaves in seventeenth-century Colombia to the activities of fairy-like Sicilian night witches, whom the Spanish Holy Office called "ladies from outside" (*doñas de fuera*).

Throughout his scholarly career, international collaboration has remained a leitmotif of Henningsen's activities. Together with a Swedish colleague, he organized another landmark international conference about his other specialty, European witchcraft, in 1984; they coedited the published results (Henningsen and Ankarloo 1990). Henningsen remains a major figure at international conferences about witchcraft or the inquisitions.

HEPSTEIN, JOHANN

In 1525, when a majority of the five lawyers (*Ratskonsulenti*) in the service of the imperial free city of Nuremberg wavered in their judgment of a witchcraft case, with one of them supporting execution, Dr. Hepstein openly challenged their position. In 1533 he recommended that the small imperial city of Weissenburg, a satellite of Nuremberg, not torture a woman suspected of witchcraft. In a trial of three women at Nuremberg in March 1536, when plenty of evidence suggested sorcery, and a number of witnesses accused them of witchcraft, Hepstein argued that sorcery and witchcraft were generally taken for "fantasy and self-deception." In his eyes, belief in witchcraft, and hence related accusations, were a consequence of "disbelief, stupidity, and excited imagination of the people" (Kunstmann 1970, 62). He considered the supposed deeds of the witches to be impossible. Hepstein concluded that the suspects were to be released without delay, except for one of them, who seemed to be guilty of fraud. The woman Hepstein wanted to see convicted and punished with a fine was a diviner, who had served as a witch doctor, and had accused the other two. Although Hepstein's was a minority position, the government followed his advice soon after. In June 1536, the government decreed a law against witchcraft, sorcery, divination, and incantation, stating explicitly that it was a serious error to believe in the existence of witchcraft, and imposing serious punishments on those who exploited the credulity of the people through divination or sorcery. Hepstein was clearly not a Catholic, and he displayed humanist inclinations, but his life and thoughts have yet to be studied.

HERBAL MEDICINE

For the overwhelming majority of people living in early modern Europe, “medicine” meant primarily herbal medicine: plants and vegetable products were the principal pharmacopoeia for both doctors and folk healers. Sometimes, their remedies seemed close to suggesting food, such as a good tonic soup. Many herbal healers were accused of being witches because of their arcane knowledge; herbal medicine had real power for those who mastered it, whether witches or not.

During the fifteenth century, herbal medicine was so well developed that this century has been called the “century of plants.” The ancient founders of medicine, Hippocrates (460–377), Dioscorides (first century C.E.) and Galen (ca. 131–ca. 201) were widely published and quoted. *Nicholau’s Antidotarium* (The Antidote Book of Nicholas) was a standard handbook of medicinal recipes that circulated widely in Europe since the twelfth century. Most important early illustrated herbals were produced in Germany: in 1485, Johann Wonnecke von Cube published his *Hortus Sanitatis* (The Garden of Health) at Mainz; Hieronymus Bock, called Tragus, edited his *Kreutterbuch* (Book of Herbs) at Strasbourg in 1539 with beautiful woodcuts by David Kandel; Otto Brunfels, using the engraver Hans Weiditz, published his *Herbarum Vivae Eicones* (Living Portraits of Plants) in three volumes between 1530 and 1536 at Mainz; and Leonhart Fuchs published his masterpiece, the herbal *De historia stirpium* (Concerning the History of Plants), at Basel in 1542. Valerius Cordus’s *Dispensatorium* (Dispensary) became, after 1542, the official guide for the apothecary guild at Nuremberg and influenced all of Europe. The commentaries on Dioscorides by Matthioli (1500–1577) also constituted one of the greatest books of medical botany. After the crusades, Arab medicine had introduced new plants into Europe. In polypharmacy, the use of many plants in one mixture, including plants imported from a great distance, involved a great change: the remedies could not be homemade any more, and had to be purchased in apothecaries. The result was a progressive loss of the ability to prepare one’s own remedies, and control of the healers, usually women, by representatives of medical authorities, always men.

At the beginning of the sixteenth century, Paracelsus marked a turning point by criticizing Galen’s and Avicenna’s theories. In his work, plants had a special place: he offered a specific remedy for every sickness, according to his famous doctrine of signatures. He attempted to match the properties of plants with their morphological characteristics, shape, or color. Thus, the

lungwort, with leaves that have white stains like lung tissue, could be used in the treatment of pulmonary diseases.

Current research confirms that these plants were usually judiciously used. The active principles contained in the plants in their natural state are sufficient to cure or to poison the patient. Plants were used fresh or dried, entirely or only in part, root, rhizome, stem, leaf, flower, or bark from trees. Remedies usually combined several plant-based ingredients with other constituents from animal or mineral sources. Some remedies, called *theriac*, included about a hundred ingredients. These different elements can act as catalysts to make the remedy significantly more active to cure the patient. Plants served as remedies in different ways: internally through infusion or decoction, or externally through applications of poultices, plasters, or enemas.

Some plants were (and are) associated with witchcraft, such as the mandrake, belladonna, datura, or juniper. The mandrake is the most famous. If such plants are really toxic or lethal, they have been linked to the Devil for a long time. Numerous superstitions and legends accompany the magical properties of these plants. But even so, the recipes listed in old sources are known for their narcotic and analgesic properties. Solanaceae plants are listed among the ingredients of physicians’ recipes and also of the witches’ ointment—along with unbaptized baby’s fat.

Plants were used not only for their medical properties, but also for their symbolic and alleged supernatural powers. That is why the moment and the ritual of the gathering was very important. St. John’s Day (June 24), corresponding to the summer solstice, has given its name to many herbs called St. John’s herbs, for instance, “St. John’s wort,” vervain, or mugwort (*artemisia*), the “mother herb.” The gestures and the words during the picking, the preparation, or the administration of remedies made from these plants, were as important as the plants themselves in the eyes of both the patient and the healer.

HERESY

Witchcraft's heretical roots are often largely underestimated, because the large European witch hunts date from the early modern era and most historians of witchcraft are therefore experts in this period, with little or no knowledge of late medieval heresy. Even students of the witch hunt's medieval beginnings (e.g., Ginzburg 1991) have all too often underestimated witchcraft's heretical heritage. Ginzburg, for example, drew a straight line from the persecution of the lepers (around 1320) and the Jews (around 1350), to that of witches (fifteenth century), thereby almost completely neglecting the heretics.

Important exceptions to this rule include Jeffrey Russell (1972), Norman Cohn (1993), Brian Levack (1993), and Andreas Blauert (1989). Russell argued that witchcraft should be viewed as a form of heresy, and that heresy was far more important for understanding it than magic. Russell (1972: 19, 39f., 133, 267–269) also contended that early witch hunts occurred mainly in places where heretics had allegedly previously been found, including southern France, the Netherlands, the Rhineland, northern Italy, and the Alps (a region to which heretics had withdrawn, but not an especially backwards area). On the other hand, Russell incorrectly believed (63ff.) that both witchcraft and heresy existed already in the Early Middle Ages. Cohn (1993, chaps. 1, 3, 4) saw late medieval heresy only in its distorted, demonized form, and used his observations to construct a stereotype that he believed was originally used to defame the early Christians. Levack (1993, 43f.) agreed with Cohn and claimed that the idea of the witches' countersociety, as expressed in their confessions, originated in the rhetoric of the invidious clerics of the thirteenth and fourteenth centuries used against heretics, and developed a life of its own. Blauert directed attention to the territory of modern-day Switzerland and especially western Switzerland, where (with the important exception of Dauphiné) the last Waldensian-hunts and the first witch hunts took place simultaneously in the first half of the fifteenth century.

Starting with the cumulative idea of witchcraft as presented in the *Errores Gazariorum* (Errors of the Gazars or Gazarii) written in the Aosta valley before 1436/1438 and one of the earliest descriptions of a witches' sect, one can indeed differentiate between heretical and magical elements. Heretical elements included initiation into the sect; the pact; the nighttime gatherings; the sect's organization and the accusation of hypocrisy; the magical flight of witches and warlocks to

the witches' Sabbat; some of the *maleficia* (harmful magic), especially infanticide; and motives for joining the sect (vindictiveness and hedonism, as well as sexual desire). Even the tract's title went back to the Cathars; *gazarii* is a form of "Cathar" found mostly in northern Italy (Ostorero et al. 1999, 301–303). Although it had been effectively wiped out by the early fourteenth century, the heresy of the Cathars contributed a great deal to the cumulative concept of witchcraft.

The Cathars' name was derived from "cat" in Alain de Lille's twelfth-century polemic "because it is said that they [the Cathars] kiss a cat's posterior, in which form, it is said, the Devil appears to them" (*Dicuntur [Cathari] a catto, quia, ut dicitur, osculantur posteriora catti, in cuius specie, ut dicunt, apparet eis Lucifer*) (Lambert 1998, 43). One main feature of the Cathar movement, in its widespread form in thirteenth-century southern France, was dualism (or Manicheism): the role ascribed to the Devil as the creator of the visible world (Lambert 1998). This was an obvious parallel to later sects of witches, who also reputedly worshiped the Devil. The Cathars' most important sacrament was the *consolamentum*, which was first administered in the form of adult baptism upon acceptance into the sect, and later as the last rites, which were said to guarantee direct acceptance into heaven. Subsequently, after the Cathars had fled to the Pyrenees (Montaillou) to escape the Inquisition, this sacrament was possible only at night. Cathars thus held nighttime gatherings around the beds of the dying, to which the few remaining *perfecti* (the perfect ones, the master adepts) had to be brought, frequently from far away. If a *perfect* did not successfully administer the *consolamentum* to the dying person, his or her soul would have had to set out on a transmigration and could be reborn up to seven times. The chaste and vegetarian *perfect* asked those gathered at the death bed to administer the *melioramentum* (a sort of prayer or devotion) and required those present to accommodate him and offer him gifts. Those present often entered into a pact (or *convention*) with him, stating that they, too, wished to receive the *consolamentum* from him in their hour of death. According to the inquisitors, such accomplices were therefore guilty and were punished accordingly, although only recidivists were burned at the stake.

One must not ignore the fact that it was during the fight against the Cathar movement in southern France that the papal Inquisition was created in 1233, which employed a new inquisitorial method (Lambert 1998, 125, 127; also Levack 1993, 68–99). Both the Inquisition and inquisitorial procedure were responsible for the analogies and parallels between heresy and witchcraft. In the end, it was inquisitors such as Geoffrey d'Ablis (inquisitor in Carcassone, 1308–1309), Bernard Gui (inquisitor in Toulouse, 1307), and Jaques Fournier (bishop of Pamiers, 1318–1325) who wiped out the Cathar movement in its refuge in the Pyrenees.

Nevertheless, remnants of the Cathar movement survived in the Alps, in Piedmont, between southern France and Lombardy, and next to Spain, the preferred refuge of the southern French Cathars. The Alpine valleys of Piedmont and Dauphiné were simultaneously a place of refuge for Waldensians. Especially in Piedmont toward the end of the fourteenth century (Merlo 1977), a mix (or syncretism) of the Cathar and Waldensian movements thus came into being, which bore a great deal of similarity to the doctrines of the later witches' sects. An interrogation led by inquisitor Antonio di Settimo on March 23, 1387, described the "synagogue of the Walsensians" taking place "in the hour of the first sleep" (*primum somnium*); the *consolamentum* (consisting of consecrated bread); the rejection of purgatory (a Waldensian characteristic); and a sexual orgy. The designation of Cathars as *gazarii*, which reappeared in the *Errores gazariorum*, also appeared here (Lambert 1998, 295). The Waldensians, who stood much closer to the orthodox Church and did not recognize dualism, served oddly enough as a mediator between the Cathar movement and witchcraft.

Around 1170, the Waldensian movement was started by a merchant from Lyons named Waldo, who not only devoted himself to poverty and preaching, but also drew inspiration from the Bible (Audisio 1998). Because it was then forbidden for laymen to preach or have knowledge of the Bible, the archbishop of Lyons condemned Waldo and his followers and expelled them in the early 1180s. Nevertheless, Waldo's teachings spread widely throughout Europe in the thirteenth and fourteenth centuries, reaching from southern France, Lombardy, Piedmont, and Dauphiné as far as Austria, Bohemia, Moravia, Silesia, Brandenburg, and Pomerania. By the fourteenth century, Waldensianism had two distinct wings, German and Roman. Through drastic inquisitorial persecution, the German wing was almost completely exterminated by the end of the fourteenth century; practically only the Swiss Waldensians of Fribourg survived.

Persecution changed Waldensian behavior: while originally the Waldensians mainly denied the oath, which the Bible forbade, they later began to deny purgatory, which had already become prominent in the Latin Church. Waldensians believed that atonement must take place here and now, and could not be postponed until purgatory; therefore, the only sacrament that a Waldensian master (or apostle) could administer to his followers was confession. This took place during nighttime gatherings, as it was not otherwise possible, at which they also preached. Believers received their other sacraments from the orthodox Church, thus earning them accusations of hypocrisy. The Roman wing of the Waldensian movement (active in Piedmont and Dauphiné) was decidedly more anticlerical than the German wing: the Roman wing attached no impor-

tance whatsoever to any sacrament administered by sinful Catholic priests. Their own masters were called *Barben* ("barbels," "beards") by the mid-fifteenth century, at the latest. Throughout the entire fourteenth century, the Waldensians of Dauphiné and Piedmont faced severe persecution from constantly present inquisitors. Persecutions against Waldensians in Dauphiné continued far into the fifteenth century, until a Crusade in 1488, and caused them to flee to southern France (to Provence, especially Luberon). They thus became the only medieval heretical sect to survive and join the Protestant Reformation in 1532, at the Synod of Chanforan.

We have already seen that a syncretism of Waldensian and Cathar movements with similarities to witchcraft emerged in late fourteenth-century Piedmont. Shortly afterward, in 1392–1394, 400 Waldensians were interrogated in Brandenburg and Pomerania, some of whom had recently been suspected of being devil worshipers, or Luciferians. Inquisitor Peter Zwicker did not believe this accusation, unlike his colleague in Piedmont, Antonio di Settimo; Zwicker found that these suspects were merely Waldensians. Such "Luciferians" had already been persecuted in Angermünde in 1336, and they too had been Waldensians; the roots of Luciferianism indeed came from the Cathar movement, albeit in a rather mutated form (Kurze 1968, 56f.; Patschovsky 1981, 660f.; Lambert 1998, 120). Furthermore, the German Cathars persecuted in the thirteenth century by Conrad of Marburg had been accused of being Luciferians, as were the Waldensians persecuted under this name in Schweidnitz in 1315, after the Cathars had been destroyed (Patschovsky 1991). These Luciferians suggest the stereotype of the demonized heretic portrayed by Cohn. The demonization of heresy ran parallel to the hereticization of magic; Pope John XXII put the Inquisition in charge of the latter through his 1326 bull *Super illius specula* (Upon His Watchtower) (Cohn 1993, 114f.).

The accusation of Luciferianism was transferred from the Waldensians to sects of witches and warlocks in the fifteenth century; they could be assimilated all the more easily, because neither sect had ever actually existed. Until the end of the fifteenth century (and well beyond), witches in French-speaking Switzerland were invariably called "heretics," or "*vaudois*." The necessary prerequisite for the seamless transfer of this label from one sect to another was a constant inquisition, with a continuous existence in western Switzerland that can be proven from 1399 (Andenmatten and Utz Tresp 1992). Its first sphere of activity was the city of Fribourg, where it conducted Waldensian trials in 1399 and 1430, finally destroying the German Waldensian movement (Utz Tresp 2000). In the second trial, one sees a change from heresy to witchcraft (also a form of

heresy). Practically all the heretics persecuted were clearly Waldensians. Trial records already termed their gatherings “sects” and “synagogues,” exactly like later gatherings of witches in western Switzerland.

Surrounding the 1430 trial, however, a few instances arose of non-Waldensians who were not yet entirely witches. Such was the case of Itha Stucki, who came from the surrounding countryside, denounced because she allegedly knew “how to make a wagon move on its own, without outside aid” (*quod uxor Willini Stucky sciebat taliter parare currum et artificiare, quod per se sine alio adiutorio ibat*). Her judges, including the inquisitor Ulric de Torrenté, pursued the matter further and found that Itha Stucki reputedly committed many harmful acts (*vehementer diffamata est et erat de multis maleficiis et nephandis*). Because it could not be proved that she had summoned help from the Devil, she only had to take an oath of cleansing. A similar case was that of Oetzschina, also denounced toward the end of the second trial. She believed neither in purgatory nor in revenants. She defended Waldensian preachers from accusations that they “kissed the cat beneath its tail” (*osculantur catum sub cauda*), and that they were preachers of the Devil (*predicatores diaboli*). In both cases, the accused had to be released. However, in 1442, Itha Stucki was caught up in the first witch hunt conducted by the city of Freiburg itself, without first consulting the inquisitor, and she was sentenced to burning at the stake, along with her son Peter. The heresy trials in Freiburg and surrounding areas thus turned seamlessly into witchcraft trials in the 1430s.

In Dauphiné, where witch hunts began slightly earlier (1424–1428) than in western Switzerland, persecution was aimed at both witches and Waldensians throughout the fifteenth century. In this region, secular judges tried the witches, while the Inquisition tried the Waldensians (Paravy 1993). Meanwhile, in western Switzerland, Waldensian hunts were almost completely replaced by witch hunts. In the later 1430s, the Inquisition in western Switzerland (still led by Ulric de Torrenté) also conducted witchcraft trials at Dömmartin in 1438 and at Neuchâtel in 1439 (Andenmatten and Utz Tremp 1992, 93f., 95–97, 110–118).

Practice followed theory almost immediately; the first five theoretical texts describing the witches’ sect were created in the western Alps between 1428 and 1442 (Osterero et al. 1999). In western Switzerland, the Inquisition conducted its first small-scale witch hunt at Vevey in 1448 (CLHM 15), repeated in the same place on a larger scale thirty years later (CLHM 17). Significantly, the witches of Vevey in 1448 were described as “modern Waldensian heretics” (*heretici moderni Valdensium*); apparently, there and only there was any need felt to distinguish witches from Waldensians. Around 1460, the bishop of Lausanne,

Georges de Saluces (Saluzzo), had witches arrested and executed in his own territory (CLHM 25). In 1498, the chapter followed suit in its village of Dömmartin, where a male witch had previously been executed in 1438 (CLHM 17). In this case and in a further witch hunt conducted in the same area from 1524 to 1528 (CLHM 1), the heretical elements (inauguration into the sect, nighttime gatherings, and the sect’s organization) took a backseat to magical elements, particularly *maleficia*. The heretical tradition receded in favor of the magical tradition, which would have been both more apparent and more important in village society.

The heretical substrate nonetheless decidedly influenced the first witch hunts. If we examine present-day French Switzerland at the end of the Middle Ages, we can conclude that, wherever heretics had been persecuted by an established inquisition, heretical elements surfaced quite frequently in early witchcraft accusations and confessions, and men were frequently prosecuted as witches, while *maleficium* (harmful magic) dominated in rural regions with no previous experience of inquisitorial persecution aimed at heretics. This knowledge makes the contrast between western and eastern Switzerland (especially Lucerne and its environs) especially significant, as does the contrast between early witchcraft trials in northwestern Switzerland and those in Val Leventina (Canton Ticino, Switzerland), shaped by northern Italian inquisitors (Modestin and Utz Tremp 2002).

HERMETICISM

An intellectual fascination with or pursuit of the mysticism contained in the writings attributed to Hermes Trismegistus ("Thrice-Great Hermes"). Hermetic literature incorporates an amalgam of philosophical and magical doctrines, not characterized by any explicit doctrinal unity, coming from a variety of sources (including Greek, Roman, Egyptian, Gnostic, and Neoplatonic) ascribed to Hermes and delivered to his chosen scribes. From the Hellenistic age (ca. third century B.C.E.) through to late antiquity, and then during its revival in the Middle Ages and Renaissance, this body of material acquired significance and influence because of its supposed great antiquity.

The Hermetic tradition was created within the historical and literary perspective of Greco-Roman Egypt. Between the first and third centuries B.C.E., a series of works from Alexandria, a syncretism of Egyptian and Greek belief systems resulting from the extensive cultural exchanges in Greco-Roman Egypt

was attributed to Hermes Trismegistus—the honorific title for the "Egyptian Hermes," otherwise known as Thoth, god of wisdom, the scribe of the gods, and the inventor of writing. While both of the latter attributes explain his association with Hermetic literature, Thoth's connection with the Egyptian doctrine of fate and its association with the regulation of the cosmic ordering of religious and cultic activity is also an important explanatory signifier in the historical origins of Hermes Trismegistus as the founder of the Hermetic treatises. As the divine scribe who presided over the sacred calendar and the related rituals and invocations, Thoth was also regarded as the author of certain texts, as illustrated by the attribution to him of parts of the *Book of the Dead*. Works of a magical, theological, and also secretive nature (specialized techniques employed in temple workshops, for example) were also ascribed to Thoth or Hermes Trismegistus.

The extant works on philosophical matters include the *Fragmenta Hermetica*, consisting of fragments from authors ranging from Tertullian in the second–third

Hermes Trismegistus, Thrice-Great Hermes, mythological founder of Hermeticism, a philosophical and magical corpus of writing that appealed to medieval and early modern intellectuals. (Stapleton Collection/Corbis)

centuries B.C.E. to Bar Hebraeus from the thirteenth century); the *Corpus Hermeticum*, compiled sometime between 500–1100 C.E.; the *Asclepius*, a Latin work based on *Logos Teleios* or “Perfect Discourse,” ca. 500 C.E.; the *Nag Hammadi Codices* (expressly, 6.6, 6.7, and 6.8, which were not discovered until 1945); and the *Fragments* of Joannes Stobaios, compiled ca. 500 C.E. in his *Florilegium* (Collection of Flowers).

A. J. Festugière distinguished three categories of occult science or technical works within the Hermetic corpus: material on astrology, dating from the third to second centuries B.C.E.; alchemical texts dating from the second to first centuries B.C.E.; and magical papyri from the fourth to fifth centuries C.E. (but deriving from a much earlier tradition). The preeminent text in astrology is the *Liber Hermetis* (Book of Hermes) written in Latin but with discernable Greek influences from the Hellenistic age. It included a description of the decans, an Egyptian method of dividing the zodiacal circle or year into thirty-six components (thirty-six ten-day periods), each with its own astrological or divine attributes. There were also treatises on astrological medicine (Book of Asclepius, called *Myriogenesis*) and works that related botany and minerals to astrology (for example, the *Holy Book of Hermes to Asclepius* detailed the association between plants and decans to achieve certain botanical prescriptions).

Among alchemical texts of related interest, the most significant is the *Cyranides* or *Kuranides* (ca. first-century C.E.), which identifies Hermes Trismegistus as its supernatural source: “the god Hermes Trismegistus received this book from the angels as God’s greatest gift and passed it on to all men fit to receive secrets” (Prologue, Book 1). Here we detect an echo of other ascriptions, such as Manlius’s recognition of Hermes as the one who bestowed astrology to mankind: “God of Cyllene [Hermes], you are the author and the inspiration of this great sacred tradition. Thanks to you, we know the distant reaches of the sky, the constellations, the names and movement of the stars, their significance and their influence.” Book 1 of the *Cyranides* had twenty-four chapters, each based on a letter of the Greek alphabet with corresponding names of the plant, bird, fish, or stone under examination. This first book was distinctly magical: recipes for specific remedies were characterized by detailed actions of a ritualistic nature intended to be performed in conjunction with the use of various and, at times, hard to obtain, ingredients. Other books dealt with the construction of magical instruments, such as amulets and talismans, which resembled certain passages from the *Greek Magical Papyri*. This collection (Festugière’s third category) contained several spells that required the aid of Hermes for a successful completion. Like the other many and varied spells in the *Papyri*, they represented practical magic at its least ambiguous, using Hermes as the instructor

who illuminates the means through which a person can manipulate the natural world for his benefit.

By the Middle Ages, several texts showed Hermetic influences: *Hermes on the Reproof of the Soul* (ca. eleventh to thirteenth centuries), an Arabic text in the philosophical tradition, and the *Picatrix* (eleventh century), also Arabic, but distinctly magical. At the beginning of the Renaissance, more complete texts and manuscripts emerged, producing further fascination and imitation. In the fifteenth century, for example, Marsilio Ficino (1433–1499) translated the *Corpus Hermeticum* (1–XIV) into Latin. This constituted a collection of dialogues, opening with the *Poimandres*, which deals with the creation of the world and the infinite mysteries of life: “Once, when thought came to me of the things that are and my thinking soared to the heights and my bodily senses were restrained, like someone heavy with slumber from overeating or toil of the body, an enormous being totally unbounded in size seemed to appear before me and call my name and say: ‘What do you want to hear and see; what do you want to learn and know from your learning?’” (Cited in Copenhaver 1992, 1).

Scholars such as Giovanni Pico della Mirandola and Heinrich Cornelius Agrippa von Nettesheim, inspired by Hermeticism but to an even greater extent by Neoplatonism, developed fresh theories of natural magic. Pico interpreted *magia naturalis* (natural magic) as the sum of natural wisdom, an integral and practical component of natural science based on a comprehension of the natural world; Agrippa regarded it as a study of what exists in the world, aligning it with “medicine and the natural philosophy (in effect, with physics)” (Clark 1997, 218).

Pico studied and developed a magical system that included an elaborate combination of Hermetic knowledge and the Kabbalah. His *Conclusions* (defended in Rome in 1486) and *Oration on the Dignity of Man* (1487) rank among the most influential texts of the Renaissance. The latter began with a direct reference to the Hermetic tradition: “Most esteemed Fathers, I have read in the ancient writings of the Arabians that Abdala the Saracen, on being asked what, on this stage, so to say, of the world, seemed to him most evocative of wonder, replied that there was nothing to be seen more marvelous than man. And that celebrated exclamation of Hermes Trismegistus (what a great miracle is man, Asclepius) confirms this opinion.” Inspired by the *Asclepius*, among other Hermetic and Neoplatonic texts (such as those by Plotinus, Porphyry and Iamblichus), the *Oration on the Dignity of Man*, as the previous quotation illustrates, places man as a being in possession of a divine spark with the capability, through the study and practice of *magia naturalis*, to affect change.

Hermes, as the ascribed instigator of such a variety of texts—both philosophical and magical and, at times, a

combination of both—may best be described as a mystagogue. To the Renaissance mind he may best be defined as the *magus* par excellence, the personification of wisdom, philosophy, and esoteric knowledge. In addition to other materials, such as the aforementioned Neoplatonic texts, medical texts such as those by Galen, as well as earlier scientific research and methodologies, Hermetic literature belongs within a series of influential texts from antiquity expounded on in medieval and Renaissance magic.

HERMOGENES

Hermogenes was an ancient magician who featured in accounts of the travels and miracles of the apostle St. James the Greater as early as the apocryphal

Historiae apostolicae (Apostolic History) of the pseudo-Abdias, compiled in the fifth century. These stories were popularized by the *Golden Legend* (ca. 1260) of Jacobus de Voragine, and from that source were taken up by many different artists in the later Middle Ages. By the sixteenth century, the struggle between James and the magician Hermogenes had become representative of the Church's assault on the magical arts, which now also included witchcraft.

The *Golden Legend* tells how Hermogenes, a magician allied with the Pharisees, attacked the apostle James when he was preaching in Judea. Hermogenes sent one of his disciples, Philetus, to demonstrate the falsity of James's teaching. But Philetus was converted to Christianity by James's miracles and was sent back to his master to convert him in turn. Hermogenes became furious and had Philetus bound by invisible magical bonds, from which he was later released through the power of James's handkerchief (*sudarium*). In a rage, Hermogenes then commanded his demons to have James delivered to him in chains. But confronted by James, the demons changed their allegiance and pleaded to be released from Hermogenes's service. In exchange, they promised to deliver Hermogenes to James. Finally, the convert Philetus released Hermogenes from his shackles, Hermogenes's books were thrown into the sea (rather than burned, in order to avoid harm from their noxious smoke), and Hermogenes converted to Christianity.

Our earliest visual images, such as the thirteenth-century stained-glass cycles at Chartres, Bourges, and Tours, or the many Italian images from the later fourteenth century, follow the *Golden Legend* very closely. The story is also found in several early frescoes such as Arrigo di Niccolò's in the cathedral in Prato and Altichiero's from the late 1370s in the Basilico del Santo in Padua. Mantegna completed a fresco for the Eremitani church in Padua about 1450, which includes a scene of James ordering two demons to deliver the bound Hermogenes to him. In 1387/1388, Lorenzo Monaco painted a panel for the predella of an altarpiece for the monastery of Santa Maria degli Angeli in Florence (now in the Louvre) that depicts the bound Hermogenes being brought by three devils to St. James and Philetus. And about 1430, Fra Angelico completed an exquisite panel (now in the Kimbell Art Museum, Fort Worth), depicting Philetus freeing Hermogenes on James's command, while James stands by holding a group of terrible demons at bay with the power of his staff.

Visual versions of the struggle between James and Hermogenes were not limited to Italy, but also appear in northern Europe. A panel by Ludwig Kornreuter (ca. 1490) from the altar of the church of St. James in

Hermogenes shackled by the devils he had sent to chain Saint James. (Erich Lessing/Art Resource)

Nösslach in Austria shows two devils presenting the bound figure of the magician to the saint; a relief from the high altar of the Teutonic Knights Castle church in Winnenden (ca. 1520) depicts St. James and Hermogenes burning the magician's books (based on pseudo-Abdias rather than the *Golden Legend*); and a panel dated ca. 1510–1520, possibly by Hieronymus Bosch, depicts James in the vicinity of the magician, shown seated on an ornate chair, supposedly relaying spells and orders to the strange demonic creatures gathered around him.

Hermogenes occasionally appears in later demonological literature, for example, Johann Weyer's *De praestigiiis daemonum* (On the Tricks of Devils, Book VI, chap. 2), as one of a line of ancient magicians. But his most dramatic appearance occurs in two engravings by Peter Van der Heyden after drawings by Pieter Bruegel the Elder, published by Hieronymus Cock in 1565. One depicts James in the magician's chambers and represents the range of demonic forces over which Hermogenes was believed to exercise power. Prominent among these are the forces of witchcraft, represented by three different belching cauldrons and witches riding dragons, goats, and brooms. The second, *The Fall of the Magician Hermogenes*, which depicts Hermogenes's demons attacking their former master and hurling him headlong to the ground, includes a witch riding a broom among the massed phalanx of metamorphic monsters and hybrids. The ancient story of the Church's struggle against magical arts has been extended to include witchcraft.

HESSE

Witch persecution happened practically everywhere in Hesse, in both Protestant and Catholic areas. The present *Land* (state) of Hesse, founded in 1945, included more than a dozen territories during the Holy Roman Empire (especially after the death of Landgraf [Landgrave] Philipp 1567); they were often very small and were governed by both noble and ecclesiastical lords. In addition, Hesse contained three imperial free cities: Friedberg, Gelnhausen, and the largest one, Frankfurt am Main (which never executed any

witches). All three cities were Protestant, as were the sovereigns and subjects of the secular territories. The Catholic territories belonged to the archbishop of Mainz (along the river Main, in the Taunus mountains and around the city of Dieburg) and the fully autonomous prince-abbot of Fulda, who ruled the largest *Fürstabtei* (prince abbacy) in the empire. When from time to time the local population demanded persecution by their government, it could be motivated by the example of a neighboring territory, even one that belonged to another confession.

Persecutions were generally more intense in the smaller territories, despite the great number of trials in the large ecclesiastical dominions of Mainz and Fulda. The number of executed witches in Hesse approached 2,000, with most (as elsewhere) being female. The largest territory, the *Landgrafschaft* (Landgraviate) of Hesse-Kassel, saw only fifty-one executions of witches, forty of them taking place between 1650 and 1680. The smaller *Landgrafschaft* of Hesse-Darmstadt saw thirty-seven executions between 1582 and 1590. Hesse-Darmstadt also owned the *Amt* (district) of Homburg when up to twenty executions were ordered there between 1603 and 1605. After the *Amt* Homburg became an independent *Landgrafschaft* (Landgraviate) of less than 10,000 persons in 1622, about seventy more witches were executed here, with persecutions peaking in 1634/1635 and particularly from 1652 to 1656. Landgrave Wilhelm-Christoph, who reigned over Hesse-Homburg from 1650 to 1681, preferred to live in his even smaller *Landgrafschaft* of Hesse-Bingenheim (joined with Hesse-Homburg after 1648). From 1648 until his death, Wilhelm-Christoph and his *Amtmann* (bailiff) ordered a total of fifty-three executions in Hesse-Bingenheim, including twelve men and five children under age fifteen. Here the persecutions seemed to depend on the rulers; a similar case happened with the *Grafschaft* (county) of Isenburg-Büdingen, where a single *Amtmann* (Johann Hartlieb) was responsible for legal proceedings in 1633–1635 and 1651–1654 that led to at least 283 executions. However, it would be a mistake to assign sole responsibility to the administration: in Isenburg-Büdingen, dozens of inhabitants wrote petitions urging the administration to continue with the persecutions. The same happened in the *Grafschaft* of Nassau-Dillenburg, where witch committees (*Hexenausschüsse*)—copying the neighboring electorate of Trier—professionally searched for witches from 1618 to 1648 and found 158 of them.

Many petitions (*supplicationes*) survive from other parts of Hesse, especially during the Thirty Years' War. In extremely troubled times, it seems that part of the population sought people whom they blamed for their situations and hoped for an end to their problems by killing witches. Hessian persecutions stopped when Swedish troops arrived in 1631 (Dieburg, Büdingen),

but resumed after they left. On the other hand, there were many executions both before and after the war, for example, up to 100 in the *Grafschaft* of Hanau-Münzenberg from 1580 to 1618, or 51 executions after 1650 in the *Grafschaft* of Nassau-Usingen, and 49 executions in the small principality (*Fürstentum*) of Waldeck. Persecutions were very rarely based only on the bad (or ill) will of one person: if the crazy *Bürgermeister* (mayor), Johann Koch of Gelnhausen, was responsible for twenty-two executions from 1596 to 1599, he was outdone by a very corrupt but apparently sane *Schultheiss* (mayor) named Geiss, who was responsible for twenty-five executions between 1662 and 1664 (including seven men) in the tiny town of Lindheim.

Hessian persecutions decreased sharply in the 1680s, due largely to the influence of enlightened leaders. The last execution in Hesse took place at Gambach, in the *Grafschaft* of Solms-Braunfels, in 1718. The last trial (whose results remain unknown) was held at Nieder-Mörlen in the electorate of Mainz in 1739.

HISTORIOGRAPHY

Witchcraft and witch persecutions became a distinct sub-discipline of history only around 1970, when previous

research was first internationally reviewed (Midelfort 1968) and subsequently classified, just about the time when a paradigm shift also occurred. In a still useful classification, Monter (1972) divided witchcraft research into three major paradigms (in the Kuhnian sense): rationalist, Romantic, and social science. Obviously, some approaches, like Carlo Ginzburg's (1983) did not fit into Monter's classification trinity; and even if we stretch its meaning, it would be hard to accept a late demonologist like "Reverend" Montague Summers (1926) as "Romantic."

The third paradigm was the most recent, and most scholars then subscribed to this apparently more sophisticated approach, by employing theories derived from sociology, anthropology, or psychology. The most attractive models included Keith Thomas's *Religion and the Decline of Magic* (1971), which borrowed extensively from Edward Evans-Pritchard's classical (1937) study of British social anthropology. These two Oxford scholars even staged a polite scholarly exchange over the relationship of history and anthropology. One of Thomas's students, Alan Macfarlane, seemed to demonstrate how fruitful this exchange was in his dissertation, published in 1970. However, it soon turned out that social-scientific theories made little sense for a good number of phenomena in continental European history, which required more traditional historical methods and explanations (Midelfort 1972). Some of these theories, like Evans-Pritchard's, were already outdated when historians discovered and employed them, and structural-functionalist social anthropology was less widely accepted than British historians believed; they overlooked previous Russian research on shamanism (Shirokogoroff 1935) or American cultural anthropology (Kluckhohn 1944).

Therefore, a generation beyond 1970, it seems appropriate to take a broader, long-term view of the historiography of witchcraft. In Europe, a number of clear-cut definitions have drastically challenged traditional notions of witchcraft and molded perceptions of its history. First, Christian demonology equated black and white magic. Founded on the thought of St. Augustine, bishop of Hippo in northern Africa, any kind of magic, and even superstitious customs like wearing amulets or watching stars for astrological purposes, implied some contract between a human and a demon (the Devil), because magicians expected effects from ceremonies or things that could not work without one (*De doctrina christiana*, II, 30–40). In this scenario, witchcraft became a chapter in the everlasting struggle between good and evil, although its specific forms reportedly came from ancient Babylon. In the wake of Roman sorcery scares, and inspired by monotheism, any kind of magic seemed equal to witchcraft. Magicians and witches were allies of the Devil and belonged to the *civitas diaboli* (city of the Devil). As

offenders of the law, biblical (Exodus 22:18) as well as Roman, they were to be killed.

Second, for theologians of the early and high Middle Ages like Bishop Burchard of Worms, author of an influential penitential whose formulations would become part of canon law, witches were individuals who believed they possessed powers that in reality did not exist. In this period of missions, devils were equated with pagan gods, which were defeated and therefore less powerful than Jesus. Witches were merely deceived by devilish illusions. They should not be killed, but corrected and educated (*Corrector Burchardi*, in *Patrologia Latina* 140, col. 491–1090).

Third, the rise of heretical movements in the later Middle Ages changed this perspective. Some theologians, like the Dominican inquisitor Heinrich Kramer, author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), imagined witches to be members of a vast conspiracy directed against Christian society, which God allowed to cause immense physical and spiritual hardship. The witches' power, although supported by the Devil with God's permission, was real. Witches therefore must be physically eradicated, according to divine and secular law, and by virtually any means, because exceptional crimes required exceptional measures. However, because canon law disputed the existence of night-flying witches, historical inquiry was necessary. Kramer claimed that these witches were novel, and traditional Church law did not apply to them. The appearance of the witches was one sign of the imminent end of the world.

Fourth, opponents of witch hunting generally disapproved of the atrocities. But it took Johann Weyer, a court physician to the duke of Cleves, to find a nonreligious reason. The author of the most influential early modern book against witchcraft persecutions considered so-called "witches" to be melancholic females who needed leniency and medical care to cure their mental illness. They were not evil but sick, and they needed not punishment, but sympathy. Killing them could not be justified under any circumstances, but was a "massacre of the innocents" (*De praestigiis daemonum*, Basel, 1563, preface). Opponents equated witch hunting with the persecution of Christians in ancient Rome. The European denial of witchcraft had firm roots in this pre-Cartesian opposition to atrocity, subsequently adopted by representatives of European spiritualism, rationalism, and Enlightenment. Because they did not believe in the existence of witchcraft, they considered witch killings a cruel injustice committed by authorities, as Andrea Alciati suggested, or "judicial murder" (*Justizmord*) as the enlightened historian August Ludwig Schlözer called it on the occasion of the last legal execution of a witch in Europe (Schlözer, *Stats-Anzeigen*, 1783, 2: 273–277).

Fifth, whereas Renaissance scholars like Alciati had already attributed the creation of the crime of witchcraft

to the papal Inquisition, the enlightened scholar Christian Thomasius scrutinized the history of witchcraft and witchcraft persecution more thoroughly. In 1712, this law professor at Halle wrote the first dissertation on the history of witchcraft, based on printed sources. By demonstrating that witches had been legally persecuted only for a short period from the fifteenth to the seventeenth centuries, and that their "crime" had indeed been an invention of the inquisitors, as Alciati suggested, Thomasius managed to instrumentalize history as a weapon of Enlightenment. When he first challenged beliefs in witchcraft in a 1701 legal dissertation, he was fiercely attacked and moved to the center of public debate in Germany. Thomasius received considerable support from theologians, as well as from lawyers, philosophers, and physicians. The debate, which lasted for more than two decades, had much in common with earlier English debates. Like Thomas Hobbes or John Wagstaffe, Thomasius was labeled an atheist, but like the Whig politicians he managed to turn the subject into a weapon against the clergy. However, Thomasius's main argument was historical. Soon afterward, Francis Hutchinson published his *Historical Essay Concerning Witchcraft* (London, 1718), and subsequently, historical considerations became commonplace in Enlightened discourse.

Rationalism remained the dominant ideology among academics during the period of industrialization. Most professional historians were proponents of a rationalist approach, labeled the "Soldan paradigm" by Monter (1972), referring to Wilhelm Gottlieb Soldan, a Lutheran professor of history, and member of Parliament in Hesse, who in 1843 published the first modern *Geschichte der Hexenprozesse* (History of the Witch Trials), firmly based on sources in a Rankean style. Joseph Hansen, the most influential protagonist of the Rationalist interpretation, considered witchcraft to be a nonexistent crime, and his interpretation has molded Western historical research to the present day, including anthropologists like Bronislaw Malinowski or Evans-Pritchard. Nevertheless, it must have been evident to everyone reading the trial records that some of those accused had indeed experimented with magic, worked as healers, experienced visions and ecstasies, or even dared to invoke demons, very much like their educated male contemporaries, or witches outside Europe.

Meanwhile, at the beginning of the nineteenth century, when the execution of witches had already ended, a completely new, postrationalist interpretation turned up, inspired by Romanticism. Emphasizing the importance of women, witches were reinterpreted as incarnations of popular culture, or even of popular resistance. Jacob Grimm, the godfather of language and folklore studies, redefined witches as "wise women," bearers of ancient wisdom, unjustly persecuted by the Christian

Church's attempts to destroy European national cultures. A Romantic paradigm was created, culminating in the fantasies of the French historian Jules Michelet, who reinterpreted the witches as heroines of folk medicine, victims of feudal suppression, and predecessors of the French Revolution. Although marginalized in the nineteenth century, the seeds sown by Grimm and Michelet flourished among occultists, and later in feminist movements (Howe 1972); they eventually helped create a new religion, the New Witches, which gained momentum after the 1960s (Purkiss 1996).

These Romantic or even fantastic approaches have received support more recently from postmodernist philosophies, which blur the boundaries between reality and fantasy. However, as Diane Purkiss pointed out, witchcraft persecutions, like the twentieth-century Holocaust, may not be the best subject for such intellectual exercises (Purkiss 1996). Even without reducing reality to text, we must admit that the European approach to witchcraft over the last two millennia has been characterized by what Eric Hobsbawm and Terence Ranger (1983) termed the "invention of tradition." Augustine, Burchard, Kramer, Weyer, Grimm, and Michelet, but also Thomasius and Soldan, were founders of distinctive traditions. Witchcraft historiography was deeply involved with constructed realities centuries before the advent of deconstructivism or postmodern theory, but most historians remained convinced that, at least to some extent, past realities can be reconstructed.

Due to the rise of social theory, the interpretation of witchcraft underwent a leap of abstraction around 1900, best illustrated by some contemporaries of Hansen, whose concepts have proved influential to the present day. Psychology since Sigmund Freud viewed hidden desires of omnipotence and aggression, suppressed into the subconscious, as a driving force of witchcraft fantasies, and saw witches as objects of projection for anxieties and aggression. The functionalist sociology of Émile Durkheim (1858–1917), particularly his idea that societies define norms through deviance, has molded social anthropology's doctrine that witchcraft should be considered a means of securing norms, and therefore identity. Max Weber's (1864–1920) historical sociology linked the process of rationalization in Europe to complex changes in mental as well as economic structures, leading to a disenchantment of the world. Anthropologists since Malinowski have interpreted witch fears and antiwitchcraft movements as symptoms of crisis in society. Like earlier European rationalists, these anthropologists considered magic a product of the imagination, a consequence of deficient technology, and a lack of insight into the laws of nature in primitive societies.

But the widespread assumption that belief in witchcraft was characteristic of primitive, uneducated people,

like medieval peasants or tribal societies, has proved untenable. Even in Western Europe and North America, traditional anxieties about witchcraft persisted, and individuals may still be suspected of being witches under certain circumstances. The assumption of primitivism also failed to fit the experience of early modern Europe, where innumerable educated people firmly believed in the existence of witches and urged their prosecution. There was also an obvious paradox, because for those believing in witchcraft, its dangers were indeed real, because severe anxieties can provoke psychosomatic reactions, and thus real harm. Such a conclusion makes it more difficult to explain away witchcraft as imaginary or irrelevant. One of the most recent observations of anthropological research was the “modernity of witchcraft.” No longer considered a marker of “primitive cultures” or of a distant past, modern witchcraft was instead characteristic of complex societies at the beginning of the twenty-first century. These anthropologists have ceased to treat witchcraft as being located in tribal societies, and deliberately inserted historical analysis of developments in African societies into their narratives (Geschiere 1997).

Most historical paradigms have served some specific political purpose. The examples of Grimm and Michelet demonstrated the nationalist political agendas of the nineteenth century. Witchcraft gained new importance in the increasing conflicts between the European nation-states and the still-powerful Catholic Church. Tensions increased when Pope Pius IX (ruled 1846–1878) condemned Rationalism and Liberalism in his *Syllabus of Errors* (1864), and Catholic political parties tried to implement papal policies within some nation-states. These conflicts gained momentum after the pope declared himself infallible during the First Vatican Council in 1870. The subject of witchcraft gained importance as circumstantial evidence against the dogma of infallibility. In central Europe, large parts of the literature on witchcraft, and on witchcraft persecutions in particular, were written by a generation molded by the conflict between Church and state, the *Kulturkampf*. Even Hansen, who exemplified the Rationalist paradigm in the historiography of witchcraft, felt obliged to make this comment: “The elements of the craze, leading to witch persecution, are almost without exception still part of Christian teachings in all denominations. This is why our historical research is of particular actuality” (Hansen 1901, vii). American scholars like Henry Charles Lea and George Lincoln Burr had their own political agendas, emphasizing the guilt of Church and state in these persecutions. Burr’s employer, Andrew Dickson White (1832–1918), president of Cornell University, was deeply annoyed by the attempts of religious fundamentalists to restrict the freedom of science and control the curriculum at Cornell. Therefore he included a long

chapter on the European “witch craze” in his utterly polemical *History of Warfare of Science with Theology and Christendom* (1913).

A quite different use for witchcraft developed in the context of a rising occultist movement, which flourished in *fin de siècle* European cities like London, Paris, or Vienna. Prosperity and boredom created strange combinations: life reform, theosophy, spiritualism, early communism, early feminism, vegetarianism, and antivivisectionism, but also anti-Semitism, clearly a sign of unrest in these centers of industrial capitalism. The son of a beer brewer, Edward Alexander (1875–1947), founded a satanic order under the pseudonym of “Aleister Crowley.” His *Thelema* club (alluding to a group of free-thinkers in Rabelais’s *Gargantua*) became a magnet for all kinds of sinister figures, including L. Ron Hubbard, a member of the American branch of Alexander’s movement before founding his own group, later called the “Church of Scientology” (Howe 1972). Another of Alexander’s students was Gerald B. Gardner (1884–1964), who founded a new religion of witchcraft. Gardner built it from a most irritating publication, Margaret Murray’s *The Witch-Cult in Western Europe* (1921), which imagined the persistence of an age-old pagan fertility cult where wise men and women ritually adored a horned god, the “god of the witches,” who was of course misinterpreted by the Christian Churches as the Devil. Murray must have been amazed by the success of her story, which made her a celebrity, gaining applause even from eminent British scholars like Christopher Hill and Sir Stephen Runciman, and wide audience through the *Encyclopedia Britannica*, whose entry on witchcraft from 1929 until 1968 was based on Murray’s fantasies. Murray remained entirely innocent of the existing secondary literature as well as all but a handful of sources, which she quoted uncritically. Shortly before publishing her autobiography, *My First Hundred Years*, she came into contact with the new witches’ movement, even contributing a foreword to Gardner’s *Witchcraft Today*, the first description of his new religion of witchcraft, constructed from Murray’s fantasies.

Except for a few examples of international cooperation (for instance, between Hansen and Burr) and cases of national political propaganda in the context of the *Kulturkampf*, witchcraft research remained largely confined to local historians, exploring their town, their valley, their region, or their nation. Between about 1880 and 1930, when cultural history flourished in most European countries, numerous source-based studies could be mentioned, exploring local evidence without much theoretical ambition, quite unlike recent “micro-histories.” Many of these studies are still worth reading to get information about particular areas.

The “rational assumption” that atrocities like the witch hunts would never again happen in Europe, as

Sigmund Riezler had claimed in 1896, crumbled after the World War I, World War II, the war crimes, and the Holocaust. It was during this crisis of European rationalism that the new academic discipline of anthropology produced studies on witchcraft. The social-scientific approach dominated the academic perception of witchcraft throughout the twentieth century, with Malinowski and Evans-Pritchard as outstanding figures, surrounded by a corona of researchers who even reached a wider public, like Lucy Mair (1901–1986) or Mary Douglas. Some recent anthropologists (Niehaus 2001; Geschiere 1997) have developed a stronger sense of the historicity of not only customs and mentalities, but also of institutions. With the rising importance of post colonial African states and the integration of local economies into the world market, anthropologists increasingly look at the publications of historians and start to compare African and European developments (Geschiere 1997, 187ff.).

In historiography, a major increase in witchcraft studies started in the 1960s. Some scholars, like Kurt Baschwitz (1963) and Hugh Redwald Trevor-Roper (1967), tried to summarize older witchcraft research within the Rationalist paradigm, relying on published sources (Hansen 1901) and available literature. However, at about the same time, younger scholars started correcting mistakes of older witchcraft historiography by critically reviewing the sources (Cohn 1975). They took trial records seriously and studied them systematically, informed by a variety of ideas from neighboring disciplines, as well as new developments such as history “from below,” the history of crime, inquisition studies, and gender history. Although the French *Annales* school usually receives credit for all kinds of innovations, the decisive new studies on witchcraft, indicating a paradigm shift, came from Italy, the United Kingdom, and the United States. In Italy, a student of Delio Cantimori, an expert on heresy, revolutionized witchcraft studies by taking the witches’ confessions seriously. In 1966, Carlo Ginzburg published his dissertation on the *Benandanti*, a folk belief about ritual specialists who mystically fought witches to secure fertility; several scholars understood this as an attempt to revive Murray’s ideas on prehistorical survivals. However, although obviously stimulated by Grimm’s ideas about popular traditions, Ginzburg clearly interpreted existing sources from a particular region, the Friuli, eventually developing them into a vision of hidden traces of Eurasian shamanism throughout historical Europe (Ginzburg 1990).

Whereas Ginzburg focused on folk mythology, in England Keith Thomas used folk practices. Although employing the glasses of structural-functionalism, his study on magic (1971) carried so many details from trial records and contemporary pamphlets that it was also possible to grasp early modern mentalities and folk

beliefs. Its wealth of insights, exceeding the author’s intended interpretation, was mirrored in the variety of approaches chosen by his students. Whereas Macfarlane (1970) tried to prove that witchcraft in early modern Essex resembled British colonial Africa; Robin Briggs (1996) focused on neighborhood quarrels in Lorraine; Ian Bostridge (1997) scrutinized the final debates on witchcraft in Britain, a compelling exercise in social and intellectual history; and James Sharpe became the leading social historian of English witchcraft (1997).

In the United States, H. C. Erik Mdfelt (1972) and William Monter (1976) tried early on to deliver balanced regional studies, taking into account social theory as well as regional peculiarities, and social as well as intellectual history. For many central European scholars, Mdfelt provided a convincing pattern of research as well as of interpretation, because his comparative regional study on the German Southwest avoided the impression of premodern intellectual underdevelopment and painted an entirely novel landscape of early modern debates that were closely related to specific witch hunts. Within such a scenario, traditional historiographical methods like prosopography made as much sense as quantification, and the combination of approaches and the discussion of results on a theoretical level created a new type of study on witchcraft. The importance of scholars like Thomas, Mdfelt, and Ginzburg for the historiography of witchcraft has been widely acknowledged; each has been honored with conferences (Exeter, 1990; Weingarten, 1997; Budapest, 1999) and related publications or *Festschriften*.

In the 1980s, new witchcraft studies proliferated. Flourishing schools of research were established in Scandinavia (Bengt Ankarloo, Gustav Henningsen, Hans Eyvind Naess), where the impact of British social history was particularly strong, whereas in France the tradition of the *Annales* school prevailed (Robert Muchembled, Alfred Soman). Important schools of research also started in Austria (Heide Dienst, Helfried Valentinitzsch); Germany (Sönke Lorenz, Gerhard Schormann, Wolfgang Behringer, Eva Labouvie, Walter Rummel, Karen Lambrecht, Johannes Dillinger, Britta Gehm); Hungary (Gábor Klaniczay, Eva Pócs); the Netherlands (Willem Frijhoff, Marijke Gijswijt-Hofstra, Hans de Waardt, Willem de Bécourt); Switzerland (Agostino Paravicini-Bagliani, Martine Ostero, Kathrin Utz-Tremp); and Scotland (Christina Lerner, Julian Goodare).

Reviewing historical research of witchcraft on an international level has therefore turned into a major challenge. More research has been done within the past years than in any previous decade, often within the context of multinational conferences. Contributions of younger (and, to an increasing degree, female) scholars have changed our perspectives. More studies are now

characterized by interdisciplinary, comparative, and experimental approaches. It is therefore impossible to summarize the abundant studies published in the last two decades of the twentieth century without using hundreds of pages (Behringer 2004a).

However, it is possible to sketch some major trends. Beyond comparative regional studies, new models of research have been employed to study several specific problems, including the witches' Sabbath, a major exercise in folk beliefs (Ginzburg 1990); the system of demonology, a major contribution to intellectual history (Clark 1996); microstudies of particularly interesting cases (Behringer 1998); and sometimes exploring such specific methods of interpretation as psychoanalysis (Roper 1994). Historians of witchcraft have also explored related subjects, including the history of modern European inquisitions (Henningsen and Tedeschi 1986), of fairy beliefs (Pócs 1989), of divination (Pócs 1999), or the history of madness (Midelfort 1999).

These new models of research confirmed that social theory has ceased to be the main model for research. We observe a much greater awareness of cultural issues (institutions, folk beliefs, customs and rituals, mentalities, mental diseases) and intellectual systems (legal, medical, theological, philosophical). Whether these already constitute another paradigm shift, an entirely new approach in historical studies, is still difficult to determine. Anthropology, too, has experienced an upsurge of recent publications. Some scholars claimed that new interpretations have already been reached by interpreting witchcraft as a "language" of the suppressed (Bond and Ciekawy 2001, 1–38). It is hard to see where the "cultural turn" will take us; it seems to mean different things in different disciplines. But the kind of cultural history, or historical anthropology, presently preferred by scholars exploring witchcraft seems to surpass the boundaries of a mere "social-science paradigm."

The fascination of the subject remains unbroken; more scholars than ever before are exploring the meaning of witchcraft. But why are we so fascinated by the subject of witchcraft? There are many different reasons for different people, and more than one even for the same person. Beyond sheer entertainment, the best guess is that the subject of witchcraft is a matter of identity. It offers the endless attractions of sex and crime, the stereotypes of forbidden knowledge, hidden conspiracies, occult powers, secret circles, underground rituals, feminine power, misogynistic clerics, blood-thirsty persecutors, and heroic fighters against suppression and persecution. For obvious reasons, the term "witch hunt" serves as a metaphor for certain types of oppression by forces now conceived as evil. The historiography of witchcraft seems to be informed by coded subjects: the suppression of human rights by specific institutions in specific political circumstances; the issue

of religious fundamentalism, emphasized by late nineteenth-century scholars in Europe and America alike; injustice generally; or the gender issue, so prominent in recent years (Wunder 1998; Wiesner 2000). Students are usually more attracted by witchcraft than by drier parts of their academic disciplines. And they are right to choose this exotic and entertaining subject, which offers at least as many insights as traditional but boring topics. For academics, there is the fascination of witchcraft's cross-cultural prevalence, frequent cultural prominence, and paradoxical attributes, with the potential for testing theories about structures, belief, and social action (Levack 1993; Behringer 2004b).

Furthermore, the subject generates lively and controversial discussions in seminars or in public, because there is room for interpretation. It is, however, indispensable to be aware of existing debates on the subject. Some recent multivolume tools have made this easier: a comprehensive *History of Witchcraft and Magic in Europe* (Ankarloo and Clark 1999–2002) as well as this *Encyclopedia of Witchcraft: The Western Tradition* (Golden 2005). Both can be taken as harvests of late twentieth-century witchcraft research, and as guides to further reading.

HOBBS, THOMAS (1588–1679)

Rationalist, empiricist, materialist, and mechanist philosopher and political theorist, Hobbes, in Book IV of his great work *Leviathan* (1651), argued that the concept of spiritual causation generally, and witchcraft in particular, were philosophically inconceivable and insignificant.

Hobbes was a powerful thinker and an eloquent writer, qualities that gave his works great vividness, but also generated heated opposition to both his scientific and political ideas. In *Leviathan*, he insisted that the

supremacy of the state was essential in order to rescue humanity from the savagery and chaos of the state of nature.

Hobbes dismissed all the biblical citations usually brought forth in support of witchcraft beliefs as merely metaphorical. Following John Calvin, Hobbes condemned the Roman Catholic doctrine of transubstantiation as inferior to the illusions created by the magicians of the Pharaoh in Exodus 7:8, who at least produced visual effects. Although Hobbes attacked chiefly Catholic doctrines and practices, consistent with other Protestant identifications of Catholicism with witchcraft and sorcery, his denial of spiritual causation proved unsettling to most other Christians and provoked strong criticism from Protestant circles.

Hobbes's work on geometry and optics during the 1630s acquainted him with both continental (he met René Descartes, Marin Mersenne, and Pierre Gassendi, and was said to have once met Galileo) and English scientific circles, leading to friendship and brief service with Francis Bacon. Hobbes's exile from England during the Civil War ended in opposition from both the French Catholic clergy and the exiled court of Charles II, and Hobbes returned to England in 1651. Subsequent scientific controversies, including one with Robert Boyle, diminished Hobbes's reputation as a scientist, but the enduring arguments of *Leviathan* have preserved his reputation as a major political philosopher.

Hobbes's reference to the case of Pharaoh's magicians in Exodus 7:8 cited one of the key scriptural texts in the debates on witchcraft in the sixteenth and seventeenth centuries, a text Cotton Mather cited a generation later in North America on the eve of the Salem witchcraft trials. In Hobbes's view, all assertions of spiritual causation in the material world, whether or not they produced visible effects, were erroneous. In this respect, Hobbes stood in a seventeenth-century tradition of material causation that originated with Descartes and was continued by Baruch Spinoza. Hobbes was extremely well read in contemporary science and medicine, and the materialist physics that he represented provided the strongest philosophical attack on witchcraft beliefs in early modern Europe. His attack encountered a vigorous reaction from philosophical opponents like Henry More and Joseph Glanvill, and later Richard Bovet, among others, who attempted to demonstrate the reality of spiritual causation based on empirical data of individual cases that More and Glanvill assiduously collected and presented in works like the *Sadducismus Triumphatus* of 1689. Such work became the most popular, although ultimately failed, philosophical counterthrust to Hobbes's arguments, which they dismissed as "coarse-grained Philosophers as those Hobbesians and Spinozans." The case of witchcraft and demonology became the central ground for this debate.

Hobbes began by redefining Christian ideas of demons and demonic possession, arguing that scriptural descriptions of spiritual powers describe corporeal, although subtle and invisible, rather than incorporeal or spiritual beings. Although the apostles and other early Christians were given power over these by God, thus making their exorcisms successful, their increasingly corrupted successors lost that power; no one who pretended to possess it at the present time was telling the truth. Besides mechanists who opposed spiritual causation, Hobbes's arguments also appealed to thinkers who did not wish to abandon Scripture, but who also were reluctant to admit the interaction of matter and spirit. Independent of his scientific and political works, Hobbes's ideas about witchcraft and exorcism influenced a wide spectrum of seventeenth-century thought about witchcraft and demonology.

HOGARTH, WILLIAM (1697–1764)

Hogarth was an English artist who represented Enlightenment skepticism concerning popular religious beliefs. His genius lay in his ability to transform rationalist literary, philosophical, and sometimes theological arguments into devastating moral pictorial satires. Hogarth's series of paintings and the engravings made from them offer vivid and theatrical depictions of what he called "modern moral subjects." He instructed his viewer in appropriate moral conduct by displaying the terrifying, shameful, and often ridiculous consequences of immoral conduct. His best-known series, called *The Rake's Progress*, displays the progressive degeneration and impoverishment of a profligate young man. Hogarth's moral satires were also informed by a powerful skepticism about explanations of the supernatural manifested in human affairs that made belief in God's power almost contingent on belief in spiritual causation and the alleged activities of demons, sorcerers, and witches.

This resistance to criticism of witchcraft beliefs on many grounds was a response to what many in seventeenth-century England, including the Cambridge Platonists Henry More and Joseph Glanvill, saw as the growing threat of atheism and deism. The best-known English representative of this view in Hogarth's century was the Methodist John Wesley, who claimed, "giving up witchcraft is in effect giving up the Bible" (Wesley 1906, 3:330).

Hogarth's 1763 engraving *Fontis-Piss*, for example, shows a stereotypical witch with a broomstick sitting on top of a crescent moon, urinating in a great cascade on a telescope and on books by Isaac Newton and Francis Hutchinson, whose *Historical Essay* of 1718 was one of the milestones in the criticism of witchcraft beliefs. This illustration, like others by Hogarth on similar subjects, employed pictorial elements from a long tradition of serious and credulous pictorial representations of sorcerers and witches, but turned them into satirical objects of scorn, which later artists like James Gillray employed in the satire of political cartoons. In the eighteenth century, the image of the witch as a withered old hag—destitute and comical, dressed in clothing and headgear a century out of date—became common in literature, art, and even in costumes for masquerade parties, which were often condemned as occasions of demonic worldliness. Hogarth's *Masquerade Ticket* of 1727 shows just such a witch figure in the foreground, while the same picture also depicts a witches' Sabbath in another picture hanging on a rear wall.

Perhaps Hogarth's best-known attack on witchcraft beliefs as mere superstitions is his 1762 print of *A Medley—Credulity, Superstition and Fanaticism*. This crowded and busy engraving represents many forms of chicanery, charlatanism, and what he and others considered to be popular superstition; it also contains pictorial references to many recent and near-contemporary events. At the top of the picture, a preacher in a high pulpit manipulates two puppets—a stereotypical witch riding a broomstick and a winged Satan with a gridiron. The preacher's text is the biblical "I speak as a fool": his wig flies off, revealing him to be a Jesuit dressed as a clown and disguised as a Methodist preacher. A thermometer hanging to the preacher's right indicates the sermon's intensity on a scale ranging from lukewarm to raving, with a great open mouth at the top. Three panels in the pulpit show reliefs depicting apparitions of well-known ghosts. The chandelier contains a map of hell as a monstrous face. The ugly, wildly behaving congregation kisses images and listens to demons; a woman in the left foreground is clearly Mary Tofts of Surrey, an impostor who claimed to have given birth to rabbits and here does the same thing. To her right, the Bilson Boy, another well-known recent case, spits pins and nails, the basket to his right sitting on a

William Hogarth's Enlightenment print *Credulity, Superstition, and Fanaticism*, 1762, which mocked popular superstitions and religious zealotry (Brian P. Levack, ed. *The Witchcraft Sourcebook*, 2004, p. 304)

copy of James I's treatise on demonology. A thermometer-like scale on the far right of the picture, which sits on a copy of John Wesley's sermons, is labeled a Methodist's brain. It is topped by a picture of another contemporary ghost report, this one of "Scratching Fanny," a deceased wife who knocks on the bedroom wall of Elizabeth Parson. At the top of this scale, directly under the preacher's intensity thermometer, is the figure of the Drummer of Tedworth, a famous example of spiritual causation much studied by More and Glanvill.

The picture crowds together many of the diverse elements of popular belief that Hogarth and others had come to see not merely as targets of rational argument, but equally properly as objects of venomous pictorial satire.

HOHENEMS, FERDINAND KARL FRANZ VON, COUNT OF VADUZ (1650–1686)

Controversy over Count Hohenems's persecution of witches from 1678 to 1680 eventually led to his disposition and death and contributed to the establishment of the principality of Liechtenstein. Ferdinand Karl Franz was the first son of Franz William I, count of Hohenems-Vaduz, and Eleonora Katharina von Fürstenberg. At the age of twelve he lost his father, who had left Vaduz in desperate financial straits. From 1662 to 1675, a regency jointly presided over by Ferdinand's mother and his uncle Karl Friedrich von Hohenems governed the county. Their leadership was equally oppressive. In the autumn of 1675, the count, aged twenty-five, finally assumed office during a war against France. The bad economic situation of the count, who had no children and was unhappily married to Jakobaea Eusebia von Wolfegg, was worsened by his inclination to arbitrariness and violence. His penchant for coarse jokes and his extreme tactlessness made him even more unpopular.

Ferdinand Karl Franz did his utmost to squeeze money from his territorial estates. Witch hunting, which had begun shortly after his assumption of government, played an important role in this respect. Because wide sections of the population wished to get rid of their enemies, the estates of Vaduz borrowed a large sum of money from nearby Grisons in the summer of 1676 to continue these witchcraft trials. The count guaranteed repayment of this loan with money from the confiscations of convicted witches. In all probability, witchcraft trials were not reintroduced until the beginning of 1678, when they claimed at least nine casualties. However, the count did not enforce these persecutions as intensely as the public wished him to. Next year (1679), the witchcraft trials under *Landvogt* (governor) Dr. Romaricus Prügler ended with the execution of twenty people. Soon strong resistance arose against the prosecution, although the legal files had been submitted to a jurist. Its neighbors mocked the county of Vaduz as a "land of witches," which put it at an economic disadvantage. The problems with these witchcraft trials, leading finally to the *Landvogt's* hasty escape, were only part of a general dissatisfaction with the rule of Ferdinand Karl Franz. In 1679 the count's siblings as well as the bishop of Chur (his principal creditor) lodged complaints about him with the Holy Roman Emperor in Vienna.

The conflict concerning the witchcraft trials finally was settled with a deal. The count, who was seriously in

debt, granted the estates all his future income as well as the money from confiscations from previous trials. This new situation apparently changed the attitude of the estates toward these persecutions. The new *Landvogt*, Andreas Joseph Walser, who had sharply condemned his predecessor's conduct of these trials, now started similar legal proceedings in 1680, assisted by a specially assigned lawyer. These trials resulted in twenty-five deaths. Because no more official resistance against witch hunting could now be expected, some affected people, supported by the minister of Triesen, decided to turn for help to the emperor. They were heard.

In Vienna, an imperial commission presided over by the prince-abbot of Kempten, Rupert von Bodman, originally created to investigate the count's conduct, was now also instructed in the summer of 1681 to examine these complaints about the witchcraft trials of Vaduz. The commission issued an injunction prohibiting the count from continuing any legal proceedings or recovering any confiscations. Von Bodman sent the legal files for closer examination to the University of Salzburg, where a jurist recommended the revocation of all verdicts from the years 1679 and 1680. Meanwhile, the conflict between the count and his subjects escalated; they accused him of ruthless financial exploitation and of breaking the law. In 1684, the proposals in the legal report from Salzburg were implemented by imperial order. Soon afterward, the count was not only deposed but also arrested. Tossed in a dungeon at Kemnat near Kempten, Ferdinand Karl Franz died after a two-year imprisonment, on February 18, 1686. Subsequently, his brother Jakob Hannibal (1653–1730) sold his rights to Vaduz and Schellenberg to the House of Liechtenstein with the blessing of the emperor, who raised it from a *Grafschaft* (county) to the dignity of a *Fürstentum* or principality in 1719.

The problematic witchcraft trials of the county of Vaduz thus contributed decisively to turning a financial disaster into a governmental crisis and ultimately played an indirect role in creating a new state, the Fürstentum Liechtenstein, which prospers today.

HOLDA

About 906, Regino, Abbot of Prüm, wrote in the *Canon Episcopi* that some women, beguiled by demonic hallucinations, believed that they ride out on beasts on particular nights, led by the goddess Diana and covering great distances. Pagan Germans surely did not

worship Diana; but folk belief isolates a traditional German female figure named Holda who was connected with the “furious host,” the cavalcade of the dead.

Holda can be identified with Nerthus, the German Earth-Mother, who leads a “Furious Host” of those who had died prematurely. Another name for this female leader was Perchta, who had terrifying as well as nurturing aspects. Holda, however, always served beneficent functions. In France and Italy this concept took the form of a belief in mysterious “ladies of the night” who, together with their “queen,” visited people’s homes for benevolent purposes.

THE LEGEND

Regino was the first to give evidence about these nocturnal rides. In 1015, Burchard of Worms repeated the story in his *Decretum*, naming Diana and Herodias as leaders. Already, the *Decretum* connected these nocturnal ladies with the Devil (“Herodias,” scholars presume, was mostly a goddess of witches). The belief in Holda, who was able to ride out by night on wild beasts like those possessed by the Devil, dismayed Burchard. He was twisting an ancient belief mysterious to him, based on the concept of the external soul, which the pagan Germans knew as “*hamr*” and Latin sources called “*animus*” or “*spiritus*.” This external soul left a sleeping or entranced body to wander in either human or animal shape. This ancient concept informed notions that evidently existed in medieval folk-belief, and that clerics “translated” into demonical sorcery, devilish deceit, or delusion.

THE NOCTURNAL CAVALCADE

It seems reasonable to suppose that the influence of the widely used *Canon Episcopi*, an instruction to preachers, helped to spread Regino’s tale about ladies capable of supernatural nocturnal flights among learned and unlearned alike. These female cohorts traveled under many names. East of the Rhine their leader was known as Percht or Perchta. Berthold of Regensburg condemned these Bavarian superstitions, commanding that Christians must never believe in such nocturnal travelers or *nahtvaren*, neither the benevolent type, named *holden*, nor the malevolent, the *unholden*. Even the elves, as well as the “ladies of the night,” were all demons in disguise. The *unholden* (mainly some aspects of Perchta) feasted on human flesh; here the notion evidently intertwined with the older *striga* of Greco-Roman antiquity. According to Claude Lecouteux, the concept of the holdas originated in fairy cults. Mircea Eliade was the first, in 1970, to discuss both imaginary and real Sabbats, but historians ignored his points until Gustav Henningsen and Carlo Ginzburg took up the idea. Both elucidated the concept of the trance state during which the soul wanders. Unlike Norman Cohn’s position that the origin of the Sabbat lay in demono-

logical theories, they locate it in trance, dream, and vision. Indeed, there were instances where witches claimed the ability to extract their soul from the body.

The Austrian and Swiss concept of the “saligen” or the blessed people seemed to prove this theory of the trance state and the wandering soul, which Wolfgang Behringer denoted as some sort of peasant utopia. Another branch of stories connected the hulden or good people with the abduction to the court of Venus where the poet Tannhäuser lived. This popular legend appeared, for example, in the preacher Geiler von Kaysersberg’s sermon on the “unholden and witches” that mentioned those women who traveled at night to the mountain, or court of Venus.

THE MODERN FOLKTALE

A related Germanic version of the “furious host” pictured the god Wuotan (Odin, Wodin, Woutan, Wodan, Wotan) as its leader. Both legends eventually amalgamated, with some legends picturing Holda joining Wuotan in leadership. Jacob Grimm was convinced that Holda, as leader of the wild host, was Wuotan’s “wife” and identified her with the mild goddess Freyja or Fricka. Other folktales also adopted and adapted the goddess Holda, transforming her into a friendly old crone who taught mortal women orderly housekeeping by setting tasks. But she also remained a nature spirit, because when Lady Holle shook her cushions, the loose feathers tumbled to earth as snow. Holda and Berchta (Perchta, Bertha) also oversaw spinners, and on the last day of the year, they destroyed work that they found unfinished.

HOLINESS

Christian notions of holiness (holy words and signs, such as “Jesus” and the “Cross”) were taboos at the Sabbat and

in the world of the witches in general. In Jewish and Christian theology, holiness is primarily a quality reserved for God, distinguishing Him (theoretically exclusively) from all other existence. Although Samuel 2:2 announces that there is no holy one besides God, his previous order “Be ye holy, for I am holy” (Lev. 11:44) warrants the possibility of human holiness. Catholic Christianity applies the term “holy” not only to God, but also to men (e.g., saints, or the “Holy Father,” i.e., the pope), to institutions (“Holy Mother Church,” “Holy Office,” i.e., the Inquisition), to dates (“Holy Thursday”), and even to objects (“Holy Water”). Until very recently, with a few exceptions like cardinal Nicholas of Cusa, Catholic clergy restricted the quality of sacredness to elements of their belief while denying it to all other religions or confessions.

From the standpoint of the phenomenology of religions, there is no basic difference between the attitudes with which a witch venerates the demon, casts spells, or pronounces magical formulas, and that of a priest celebrating the mysteries of his religion. The sorcerer is an awe-inspiring person, working miracles, and is thereby comparable to the living saint, because he and his actions surpass the profane everyday world, possessing rather their own, sacred sphere. This is how a *magus* differs from an illusionist and his conjuring tricks. So the function of the rites of official religion and the charms of forbidden magic is the same for those who, respectively, believe in it. The location where these rites take place, the church, is hallowed, as are the sites of magic ceremonies like crossways or enchanted spots in nature. A place can be haunted either after the manifestation of a divine power there or after that of a demonic force. As Protestants have pointed out for almost 500 years, the phenomenological identity between ecclesiastical and magical formulas can be illustrated clearly by the Catholic doctrine of transubstantiation. Only if the priest uses the absolutely correct wording “*hoc est enim corpus meum*” can the bread of the Host be transformed into the body of Jesus. This miracle occurs regardless of the priest’s personal merit or his intentions, exactly as magical incantations do. In both cases, only the holiness of the precisely correct words accomplishes the task. So the development of the ecclesiastical formula into “hocus pocus” does not seem to be fortuitous.

From the standpoint of the history of religions, however, holiness is a category valid for all religions, in fact their very core, as by definition, a religion requires some distinction between holy/sacred and profane. According to a seminal study of Rudolf Otto, the sacred is characterized by four components: the tremendous (the awe inspiring), the majestic (the overwhelming), the energetic (a gripping dynamism), and the mysterious (the completely alien). The term “sacredness” expresses this ambivalence better than the purely positive “holiness,” because it comes from the Latin

word “*sacer*,” which comprises not only the notions of holy and sanctified, but also accursed. Holiness can be defined as a theoretical concept, but it remains meaningless if not intuitively and emotionally experienced by the faithful. From extra-European religions, some expressions have been integrated into our general terminology about the holy, for example, “mana” or “taboo.” The first designates positive holiness and implicitly, power, while the second articulates negative holiness, implying danger and prohibition.

HOLT, SIR JOHN (1642–1710)

As Lord Chief Justice of the King’s Bench in England for twenty-one years, from 1689 to 1710, Sir John Holt presided over at least eleven trials in which women were accused of witchcraft. Every time, Holt had the jury return a verdict of “not guilty,” thereby establishing his reputation for skepticism about witchcraft and contributing significantly to the end of English witch hunting.

Born in Oxfordshire, Holt reputedly led a dissolute life at Oxford University and left without taking a degree. He studied law at Gray’s Inn in London and embarked on a distinguished legal career that led to his knighting by King James II in 1685, and his appointment four years later, after the Glorious Revolution, to preside over England’s highest court. Holt died at his house in Bedford Row, London, and was buried at Redgrave church in Suffolk, where an elaborate baroque-style monument shows him sitting in his judge’s robes, flanked by allegorical figures of Justice and Mercy.

Typical of witchcraft trials before Holt was the case of Phillippa Munnings of Hartset, heard in Bury St. Edmunds in 1694. Munnings was accused of casting

a spell on her landlord and predicting, correctly, that he would lie “nose upward” in the churchyard before the next Saturday. She also was accused of possessing a polecat and two other black and white familiars. Holt decided that the alleged black and white imps were merely two balls of wool, and he set Munnings free.

In another case tried by Holt, the mother of a supposed bewitched girl said that on four or five occasions her daughter had walked backwards up a wall nine feet high, and then walked across the ceiling with her face and the forepart of her body parallel to the ceiling. The daughter claimed that Betty Horner had carried her up to her ceiling perch by means of witchcraft. Holt was not persuaded and set Horner free. Others Holt acquitted had been charged with having witch marks on their body, causing a young girl to vomit pins, straw, and feathers, and leaping five feet into the air.

Historians discussing Holt and witchcraft invariably repeat an unverifiable story about a trial where a woman was accused of witchcraft because of scraps of indecipherable paper found in her possession. Holt reportedly told the jury that one of the scraps was his own writing; he had given it to her years before, when he was without funds on a visit to Oxford and the woman, who rented rooms, had a daughter who was suffering from a bout of ague. Holt wrote some mumbo-jumbo in Greek (some sources say Latin) and told the woman that this would cure her daughter. When the girl improved, Holt received a room free for a week. When the jury, hearing the story, acquitted the woman, Holt allegedly gave her money to pay for his lodgings and for her time in court. True or otherwise, the story testifies to the reputation for integrity and kindness that Holt brought to his work as a judge.

Apart from his witchcraft verdicts, Holt is highly regarded by legal historians for his general contributions to jurisprudence. He is credited with being influential in establishing a separation between the domains of the king and the Parliament and the courts. An anonymous review of Holt's career, *The Life of the Right Honourable Sir John Holt, Knight, Lord Chief Justice of the King's Bench* (1764), maintained, “There never was an abler, more unbiased and upright judge since England was a nation . . . his Lordship was always remarkable strenuous in . . . supporting the Rights and Liberties of the Subject” (cited in Holt-Wilson 2001, 1). When a Recorder in London, he resigned his judicial position rather than condemn an army deserter to death, despite the king's wishes that he do so. Holt maintained that in times of peace, desertion could only be prosecuted as a breach of contract.

Holt occupied an honored place in the history of English witchcraft. In witchcraft trials, Holt invariably assumed that plaintiffs were imposters, which, one writer notes, “greatly reduced their numbers.” To each

trial, he brought “a mind unclouded by prejudice and a single-hearted desire to give the prisoner every chance” (Hole 1957, 162).

HOLY ROMAN EMPIRE

The Holy Roman Empire, a fragile structure that served in practice as an umbrella for several hundred virtually independent territories, allowed witch hunts for structural reasons, without ever stimulating them. The emperors and their institutions never openly supported witch hunting.

Neither “Holy” nor “Roman,” the empire was based on the prophecy of Daniel (2:37–45, and 7:8–11) that this world would end with the collapse of the four great empires of world history. Therefore, it was important for medieval minds that the fourth and last world empire, the Roman Empire, would endure. According to this “invention of tradition,” the pope had transferred this empire from ancient Rome to Charlemagne by crowning him (Roman) emperor on Christmas day, 800; the legitimate title of Roman emperor was subsequently transferred to Carolingian rulers, then to the Ottonian and Salian dynasties, and eventually to the Staufers. After the glorious reigns of Frederick I Barbarossa (ruled 1152–1190) and Frederick II of Hohenstaufen (ruled 1212/15–1250), this vast empire, then stretching from the North Sea to Rome and claiming suzerainty over all European kingdoms, disintegrated.

Even at this stage, the almost-virtual empire proved an obstacle to nation building. The fiction of empire permitted the construction of middle-size territories like Bavaria, Lorraine, or Saxony, but also allowed for the survival of numerous small independent feudal lordships, abbeys, imperial cities, and even autonomous villages. Its political fragmentation contrasted increasingly with rising national kingdoms like France, England, Spain, or Sweden, which became (after periods of war or civil war) unified states. In contrast, the Holy Roman Empire resembled the United Nations more than a state or an empire. Its imperial diet was no parliament, but an assembly of delegates from territories ruled by autonomous princes or parliaments, or both. According to the “Golden Bull” of 1356, the *Kaiser* or emperor was elected by seven powerful princes, including three archbishops: the prince-electors (*Kurfürsten*) of Mainz,

Cologne, Trier, Bohemia, the Palatinate, electoral Saxony, and Brandenburg. They mostly chose princes from the powerful Habsburg, Luxembourg, and Wittelsbach dynasties. However, there were also candidates from abroad, including some kings of England, France, and Spain. When the Habsburg heir Charles I, a king of Spain born and educated in the Netherlands, was elected emperor in 1519, he defeated both Francis I of France and Henry VIII of England.

After 1555, the Peace of Augsburg guaranteed considerable freedom of conscience in the empire: liberty for princes and cities to remain Lutheran, and permission for individuals to choose a residence according to their faith. In 1648, the Peace of Westphalia, terminating the horrors of the Thirty Years' War, extended these rights to Calvinist states and carefully regulated coexistence among its different Christian confessions. From then until the Holy Roman Empire collapsed in 1806, there were few further constitutional changes.

The Holy Roman Empire was no "German Empire," but instead resembled a United Nations of central Europe. Unlike national monarchies such as France or Spain, which waged aggressive wars to acquire their neighbors' lands, the Holy Roman Empire served as a peacekeeping organization. Because of its complicated political structure—the emperor was dependent on taxes granted by the imperial diets—it was unable to declare war except in extreme situations, for example, when the Ottoman Sultan launched a major military campaign against Habsburg lands, or when France invaded the empire's western parts. In two cases of real danger (1529, 1683) when Turkish armies besieged Vienna, the empire was able to strike back effectively. By improving its political tools, the *Reichstag* (diet) and the *Kreistage* (district assembly), and its judicial tools, the *Reichskammergericht* (imperial chamber court) and the *Reichshofrat* (imperial aulic court), the Holy Roman Empire managed to keep peace within its boundaries, to avoid civil wars, and to maintain the rule of law.

Several languages were spoken within the Holy Roman Empire, certainly one reason Latin served as lingua franca among the educated, maintaining its high esteem until the end of the eighteenth century. All academics in the empire could converse in Latin, the teaching language at its universities. Former territories of the Holy Roman Empire are now parts of France, the Netherlands, Belgium, Luxembourg, Switzerland, Liechtenstein, Italy, Slovenia, Austria, Slovakia, the Czech Republic, Poland, and, of course, Germany. Around 1600, the Holy Roman Empire included 7 prince-electoral, 43 secular principalities, 32 ecclesiastical principalities, 140 lesser secular lordships, about 70 imperial abbacies, 4 cantons of the Teutonic Order,

about 75 imperial free cities, and many independent imperial knights (about 670 in Swabia, 700 in Franconia, and about 360 in the Rhineland). Because of constant fluctuation (even the number of electors grew after 1648), it is impossible to provide a definite total of all territories with independent jurisdictions within the empire's boundaries, but there must have been more than 2,000. This constitutional pluralism permitted the coexistence of a wide variety of lifestyles, aided by the Reformation with its plurality of denominations and the invention of the printing press and later the periodical press. For example, Johann Kepler invited Galileo Galilei to move to Germany in order to escape persecution in Italy, because there was no papal Inquisition north of the Alps, and he could choose a new home wherever he desired. At the same time, however, the virtual independence of even tiny territories enabled imperial lords, knights, or abbots to commit the most incredible crimes. Only a few of them were ever punished, like the witch-hunting count of Hohenems and Vaduz, who was stripped of his feudal rights and imprisoned for the rest of his life; his territory was awarded to the princes of Liechtenstein.

Witch hunting was first introduced in the Holy Roman Empire during the reign of Emperor Frederick III (ruled 1440–1493), a weak monarch incapable of exercising any control over his realm. We do not know whether he ever noticed the activities of the author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), the Dominican inquisitor Heinrich Kramer. Frederick's son Maximilian I (ruled 1486/1493–1519) established a kind of cultural hegemony in part of the empire, but although evidently interested in learning more about the threat of witchcraft, this means little, because he was interested in almost anything. The Benedictine abbot Johannes Trithemius claimed that he had answered eight questions from Maximilian concerning witchcraft, and the author of the *Malleus* claimed that Maximilian granted him a royal privilege in Brussels in 1486. But this cannot have been very favorable, because Kramer avoided publication and no other trace of this alleged privilege remains. There is no indication whatsoever that Maximilian approved the atrocities of witchcraft trials; the stifling of trials in his homeland (Tyrol) suggests the opposite.

Under his grandson and successor Charles V (ruled 1519–1556), witch hunting abated in Germany (as well as in his other possessions in the Netherlands, Italy, and Spain), possibly because of preoccupations with the Reformation, or maybe by a more favorable climate during his reign, when most parts of the Holy Roman Empire were enjoying relative prosperity despite religious tensions. Clearly the imperial legislation of 1532, the Carolina Code (*Constitutio Criminalis Carolina*), tried to calm attempts to

promote the persecution of supposed witches and even avoided using the term. Like Charles V's Spanish Inquisition, his German Estates denied any authority to the *Malleus Maleficarum*, and German lawyers even managed to repeal heresy laws. The upsurge of trials under Charles's Austrian successors, Ferdinand I (ruled 1556–1564) and Maximilian II (ruled 1564–1576) can hardly be explained through any particular persecutory zeal; the latter was an articulate supporter of religious toleration.

However, once economic conditions turned unfavorable after the early 1560s with the onset of the Little Ice Age, triggering grassroots demands for persecution, the political fragmentation within the Holy Roman Empire and its lack of a centralized judicial system allowed a plurality of attitudes toward witchcraft. Whereas territories like the electoral Palatinate could simply deny the existence of witches and suppress any accusations, neighboring territories like the prince-archbishopric of Mainz could conduct waves of severe persecutions, or the duchy of Lorraine could adopt a policy of chronic prosecution for forty years. No emperor could affect anything that these princes or parliaments decided in their territories.

Nevertheless, it seems a striking coincidence that the ruler in whose reign the witchcraft persecutions reached their first climax considered himself bewitched, and was considered by some Jesuits and Capuchins to be a magician or sorcerer possessed by the Devil. Emperor Rudolf II (ruled 1576–1612) was famous for his complacency, his melancholy, or his madness; but more recent research demonstrated that his court at Prague was unusually civilized and culturally rich, attracting diplomats from Russia and Persia, and artists and scientists from all over Europe, including such celebrities as Giordano Bruno or John Dee, the English magician and mathematician. Like his predecessors, Emperor Rudolf did nothing to promote witch hunting, and very few executions occurred in his hereditary lands in Bohemia and Austria. The same holds true for his successors, emperor Matthias (ruled 1612–1619) and Ferdinand II (ruled 1619–1637), although the latter was a zealous supporter of the Counter-Reformation. Religious warfare in the Holy Roman Empire and witch hunts climaxed simultaneously around 1630, but obviously for different reasons. (The coincidence of civil war with witch hunting is well known in France and England as well.) The anarchy of the Thirty Years' War, with Spanish, French, and Swedish armies including soldiers from all over Europe ravaging the Empire, may have aggravated its political anarchy and certainly added to its hardships. However, the devastating famines with consequent mortality crises were clearly caused independently, by climatic extremes of the Little Ice Age like the terrible frosts of early summer 1626 or the "year without a summer" in 1628. Such hardships

may have increased the fierceness of warfare, and both were clearly beyond the control of any political authorities in the Holy Roman Empire.

Whereas witchcraft accusations were mainly grassroots reactions triggered by individual and collective hardships, with the weak administrations of some ecclesiastical territories succumbing easily to popular pressure, imperial institutions tried to stop the atrocities. The *Reichskammergericht* as well as the *Reichshofrat* issued several judgments in favor of those persecuted and even imposed penalties against two prince-bishoprics, Bamberg and Cologne. Relatives of victims of witch hunting managed to form a lobby and convince officials that more direct political pressure was needed to stop the persecutions. The Habsburg capitals at Prague and Vienna, centers of the Counter-Reformation, became refuges for witch suspects from the Catholic prince-bishoprics, very much like Holland or such imperial cities as Frankfurt or Speyer, the seat of the *Reichskammergericht*. From these safe havens, the refugees organized resistance against the hellish persecutions in their homelands. Because no imperial diets were summoned between 1608 and 1640, a meeting of the prince-electors (*Kurfürstentag*) at Regensburg in 1630 became a forum for their complaints. Imperial and Bavarian politicians were prepared to intervene even against their closest political allies, making Franconian prince-bishops aware of rising disapproval of their conduct within the Counter-Reformation camp. Although the Swedish invasion in Germany liberated the remaining prisoners in Franconia, executions had already stopped in 1630.

A close look at the activities of the *Reichskammergericht*, the highest independent court of appeals in the empire, which moved to Wetzlar after the demolition of Speyer by Louis XIV's troops, shows that its judgments influenced public opinion, although not immediately, and affected the conduct of lawyers in various territories. This is rather surprising, because this court had no responsibility for criminal justice. However, defendants could appeal cases that demonstrated faulty legal procedures in territories where rulers had not managed to gain a *privilegium de non appellando* (exemption from the jurisdiction of the imperial courts). Despite all its limitations, this court of appeals was more successful in influencing the politics of persecution than was formerly assumed. Even at the climax of the persecution in the late 1620s, it issued harsh decrees against the Franconian witch hunts. The number of lawsuits about witchcraft trials in no way reflected the volume of witchcraft trials in the empire, but represented their general course surprisingly well: a substantial rise from the 1560s, a climax between 1590 and 1630, a gradual decline until the 1680s, and few cases afterward.

TABLE H-1 LITIGATIONS OVER WITCHCRAFT TRIALS AT THE REICHSKAMMERGERICHT, 1500–1800 (Behringer 2004, 137, using data from Oestmann 1997, 531–602)

| <i>Generation</i> | <i>Victims Appealing</i> | <i>Litigations over Witchcraft Trials</i> |
|-------------------|--------------------------|---|
| 1500–1529 | 1 | 3 |
| 1530–1559 | 10 | 17 |
| 1560–1589 | 19 | 39 |
| 1590–1619 | 50 | 97 |
| 1620–1649 | 29 | 46 |
| 1650–1679 | 17 | 30 |
| 1680–1709 | 3 | 6 |
| 1710–1739 | 2 | 6 |
| 1740–1769 | 0 | 1 |
| 1770–1800 | 0 | 2 |
| Totals | 131 | 247 |

Because of general criticism of the atrocities of witch hunting in the 1630s, articulated most fervently in public by the Jesuit Friedrich Spee and the Protestant Johann Matthäus Meyfart, accompanied by a general exhaustion of religious zeal and a collapse of population in central Europe, the number of witchcraft trials and executions declined sharply. During the regency of Emperor Ferdinand III (ruled 1637–1657), there were relatively few persecutions in the empire, and virtually none in his Austrian homelands. Under his successor Leopold I (ruled 1658–1705), central Europe saw another upsurge of trials. But for the first time, the imperial administration intervened to stop a local witch hunt. After Count Ferdinand Karl Franz von Hohenems had conducted a large-scale persecution of witches between 1677 and 1680, within his tiny county of Vaduz, the *Reichshofrat* commissioned the prince-abbot of Kempten to hold an enquiry, eventually stripping the count of his rights. The count died in prison at Kempten after two years of confinement and his lands were given to the prince of Liechtenstein, an imperial favorite, whose descendants still rule this land as an independent nation.

In the first half of the eighteenth century, there were few changes under the Habsburg emperors Joseph I (ruled 1705–1711) and Charles VI (ruled 1711–1740). Like their predecessors, they did not react to witchcraft trials in the empire, nor did their unfortunate Wittelsbach successor, Charles VII (ruled 1742–1745). Even the Habsburg-Lorraine emperor Francis I Stephen (ruled 1745–1765), although personally enlightened, failed to intervene in sporadic late trials in the empire, much like his wife, Empress Maria Theresa, who ruled the Habsburg Austro-Hungarian possessions. It was

only under their son, emperor Joseph II (ruled 1765–1790), a radical proponent of enlightened ideas, that the endemic witchcraft trials were finally stopped from above in Hungary and Austrian Silesia (currently in Poland), and accusations were discouraged everywhere through public campaigns like the Bavarian War of the Witches. Only Josephine legislation in Austria-Hungary removed magical crimes altogether shortly after the French Revolution, although no witches had been executed for about a generation.

HOMER

Homer is the supposed author of the earliest surviving works of European literature, the Greek epics *Iliad* and *Odyssey*, which contain the earliest surviving literary accounts of magical phenomena. In later antiquity, Homeric verses were considered to have magical qualities, while Homer came to be regarded as a magical adept.

The epics attributed to Homer are now recognized to be the products of an oral tradition that matured over many centuries. They were probably written and fixed

in more or less the form in which we possess them around the seventh century B.C.E. Their most striking and important magical episode was the *Odyssey's* tale of the hero Odysseus's encounter with the witch-like Circe in books 10–12. It also incorporated Odysseus's trip to the underworld to summon up the ghosts of the dead, in accordance with her instructions.

In the *Iliad*, the goddess Hera borrowed the love goddess Aphrodite's *kestos himas* or "embroidered band" so that she could seduce her own husband Zeus, king of the gods (14.197–222). This mysterious band can almost certainly be identified with the "saltire" Aphrodite was sometimes depicted as wearing in ancient statuary. This consisted of a pair of straps worn over the upper torso and crossed over the breasts. They emphasized the shape and prominence of the breasts beneath a loose-fitting dress. The function of such a band as an erotic amulet was therefore self-evident. The *Odyssey* also mentioned a healing amulet. When a boar young Odysseus was hunting gored him above the knee, his friends, the sons of Autolycus, bound the wound and "staunched the black blood with an incantation" (19.449–458). The use of the incantation suggests that the binding had a magical as well as a practical function.

The *Iliad* may also have alluded to magical cursing. King Proteus dispatched Bellerophon to Lycia with a folded tablet, on which he inscribed "many life-destroying baleful signs." When the Lycian king read these, he understood that he was to attempt to kill Bellerophon (6.167–170). But the mysterious signs need only have been coded images; or they may reflect the once-again illiterate Homeric society's memories of a forgotten Mycenaean writing system, Linear B.

Over time, such paradigmatic magical episodes led to the notion that Homer had been a master sorcerer. In the fifth century B.C.E., he was attributed with some remarkable verses, *Kiln*, a curse against potters, in which a variety of appropriately named demons, Basher, Smasher, Over-fire, Shatterer, and Under-fire, were invited to destroy the potters' work, and the kiln itself was asked to grind their pots as if in a horse's mouth ([Homer] *Epigram* 14). In the second or third century C.E., Philostratus claimed that Homer had used the necromancy with which he was so familiar to call up the ghost of Odysseus and learn the details of the *Odyssey* story from him.

Interest was also taken in the magical nature and properties of the Homeric texts. In ca. 230 C.E., the Christian scholar Julius Africanus remodeled the Homeric account of Odysseus's evocation of the ghosts, and inserted into it an exotic prayer saluting the magical culture of his own age (*Kestoi* ["Magical embroideries"] 18 = *PGMXXIII*). The prayer made appeal to a series of powers familiar from the Greek magical papyri: to Greek underworld deities, to the Sun, to Egyptian

deities (Anubis, Ptah, Phre/Ra, Nephtho), to Jewish ones (Yahweh), and to prominent demons (Ablanatho and Abraxas/Abasax). Africanus explained that it had been an original part of the poem, and that it had been suppressed either by Homer or his subsequent editors because its tone was inappropriate to the epic.

The recipes of the Greek magical papyri exploited Homeric texts in a number of ways, doubtless because of the paradigmatic magical episodes they contained. Most remarkable were the instructions for the "Homer oracle" in a third- or fourth-century C.E. papyrus (*PGM VII.1–148*). One posed a question and threw a die three times. A verse of Homer was supplied to be read in prophecy for each of the 216 possible sequential combinations up to 6.6.6. The fourth-century C.E. "Great Magical Papyrus in Paris" prescribed the inscription of an iron tablet with three seemingly random verses from *Iliad* book 10, to make a multipurpose magical assistant (*PGM IV.2145–2240*). The tablet concealed runaway slaves; it enabled dying and dead men to prophesy; it delivered one from binding spells; it conferred victory upon athletes and litigants; it dismissed demons and wild animals; and it brought love and riches to its wearer.

HOMOSEXUALITY

The associations between the two "monstrous" crimes of homosexuality and witchcraft in medieval and early modern Europe were purely theoretical, but not infrequent. Demonologists read the story of Sodom and Gomorrah (*Genesis* 19:1–29) as the archetypal depiction of human wickedness, mixing sexual deviance with violence and pride, although "sodomy" meant primarily an "immoral" and "depraved" form of sex. Sodomy and witchcraft were seen as essentially similar forms of

radically rejecting God's commandments. Early demonologists often made vague allusions to the unspeakable sexual acts performed by witches during their night gatherings. But whereas they offer graphic descriptions of the witches' alleged cannibalism and vampirism, they avoid any direct reference to sodomy.

The distinction between our modern concept of homosexuality and medieval and early modern sodomy is of essential importance. Although in recent times some scholars have tried to desexualize sodomy, claiming that this concept is merely a generic label for sinfulness, all treatises on demonology uphold the explicitly sexual nature of sodomy.

In the *Malleus Maleficarum* (The Hammer of Witches, part I, question 2), Heinrich Kramer held that Zoroaster, inspired by the Devil, first practiced the arts of magic. Referring to St. Augustine's *City of God* (book 21, chap. 14), Kramer wrote that Zoroaster laughed when he was born, which was a clear sign of his demonic nature. Zoroaster was defeated in war by king Ninus, who had a morbid love for his father Belus. When Belus died, Ninus built a statue of his father, which became the first example of idolatry. For the authors of the *Malleus*, sodomy and incest were the foundations of idolatry and magic, and thus of witchcraft. Being an act "against nature," that is, an act of rebellion against the natural laws of God's creation, sodomy subsumed all possible forms of sinful behaviors and beliefs.

It was a commonplace assumption of medieval and early modern demonology that even devils refrained from practicing sodomy with their followers, because of its baseness. We can trace this hypothesis back to Thomas of Cantimpré (d. ca. 1270–1272). In the chapter "Devils blush over the sin against nature" of *Bonum universale de apibus* (The Universal Good Concerning Bees, 2.30.2), Thomas stated that he had never heard of any succubus or incubus being engaged in acts against nature. According to several demonologists, devils will even avoid a man for three days when he has practiced sodomy with another man. Although treatises on demonology hinted at repulsive sex acts between devils and their followers, witchcraft theorists reject sodomy as a possible form of intercourse because the devils (if not their human partners) find it repugnant.

In *An Investigation of Witches* (*Quaestio de strigibus*, 1523), Bartolomeo della Spina stated that by offering themselves to the Devil, witches abandoned their condition as human beings, for they lost their free will forever. According to Spina, witches could not withdraw from their duties after signing a pact with Satan. Spina defined witches as "heretics" who have committed an act against nature. If to be human meant to exert free will, witches were sodomites in that they have turned into beasts.

Perhaps the most thorough analysis of the interrelationships among witchcraft, sodomy, and heresy was

De encantationibus seu ensalmis (*On Incantations or Ensalmi* [evil incantations], 1620) by the Portuguese Manuel Vale de Moura. He believed that "sodomite" indicates all people who have given themselves to Satan. Jews, de Moura was convinced, were devoted to the practice of sodomy. As the sodomites insulted the creation by misusing their sexual organs, so did the Jews reject God by denying that Jesus was God. *De ensalmis* focused on those invocations called *ensalmi* (texts made of quotations from the Bible and Catholic prayers) that *conversos* recited to address the Christian God. For Moura, *ensalmi* were in fact forms of witchcraft; *ensalmistae* or *ensalmadores* (those who performed these rituals) were magicians inspired by the Devil. The word *ensalmista* equaled *sodomita* (section 3, chap. 4).

In his *Breve discurso contra a heretica perfidia do iudaismo* (Short Discourse Against the Heretical Treachery of Judaism, 1623), Vicente da Costa Mattos claimed that the Bible, especially Hebrew Scripture, was written *against* the Jews (chap. 16). In the Bible, God meant to leave a written record of the Jews' perverse nature. Innumerable travelers in Northern Africa, Mattos says, reported that indeed the Jews indulged in this unspeakable sin even with their own children. As with Zoroaster, sodomy was linked to incest.

The concept of sodomy ranks among the most enduring legacies of medieval and early modern demonology.

HONOR

The concept of honor often played a key role in both early modern witchcraft trials and in lawsuits brought by the victims of witchcraft slander, trying to defend their (and their family's) reputations against such suspicions. Moreover, arguments about honor often surfaced in the preliminaries to a witchcraft trial. Mutual slandering as witches can often be interpreted as struggles over personal and clan honor.

In recent years, historians and sociologists have developed several concepts of honor in face-to-face societies: Pierre Bourdieu, for example, decoded honor as symbolic capital that was spread between the members of a society in different portions. But in the case of witchcraft slander, honor can be understood better as a

binary formula (Walz 1993, 422–425), that is, that either honor or dishonor characterized a person in general. Strong tendencies existed to designate one's enemies as completely dishonest while trying to represent oneself as completely honest. In this context, it is therefore necessary to describe honor and dishonor as fundamental concepts of identity. Slandering somebody as a witch often demonstrated that the opponent was a person beyond normal sociability.

For many sixteenth- and seventeenth-century legal experts, honor was a significant criterion to be considered in a witchcraft trial. An assessor of the highest German tribunal, the imperial chamber court (*Reichskammergericht*), delivered an expert opinion in the context of a witchcraft trial from 1588, arguing that a good reputation (*bona fama*) normally should bar any witchcraft suspicion. Therefore, he thought that the testimony of honorable witnesses about a person's reputation should be much valued in the attempt to prove guilt or innocence (Gylmann 1602, 77). On the other hand, in juristic circles, the idea was widespread that witchcraft was a *crimen obscurum* (secret crime). Some jurists therefore thought that, in witchcraft trials, testimonies of neighbors were not reliable and the affirmation of a good or bad reputation (*mala fama*) was not conclusive, especially if other incriminating facts had been revealed.

In European countries with legal systems using Roman or canon law, a trial for witchcraft slander could be initiated by the *actio iniuriarum* (defamation suit). But even in England, which used neither, it was possible to bring an action against a person who had cried out a witchcraft slander (Sharpe 1980; Rushton 1982). In Westphalia and some other German regions, insulted and offended persons had four main ways to affirm their honor: first, by accusing the slanderer before lower criminal courts; second, by the swimming test (water ordeal); by *canonica purgatio* (canonical purification—the oath of compurgation); or finally, by a formal *actio iniuriarum*.

If a charge of slander was upheld in a lower criminal court, the slanderer was condemned to a fine, which the court normally collected. Little is known about these summary and oral proceedings. But we can assume that slanderers rarely had a chance to bring up evidence for their imputation, even if they actually intended to do so. The widespread condemnation of aggressors in lower courts resulted mainly from the desire of local authorities to punish any disturbance of social peace.

Most educated jurists refused the cold-water ordeal. Nevertheless, local judges ordered many water ordeals performed, often because a suspected witch had requested it in order to clear herself of suspicion. Water ordeals were frequently real contests over honor between two people who had slandered each other as witches or werewolves. If the water ordeal failed, this fact was not only taken as a very strong indication of

guilt, but also as dishonorable. Nevertheless, a successful water ordeal offered a good chance to restore a damaged reputation.

Few postmedieval documents have been preserved concerning the *canonica purgatio*, an outmoded and discredited method of proceeding, in which the suspected person took an oath that he had not committed the alleged crime and produced a required number of honorable witnesses (*compurgatores*) who swore by a fixed oath formula that the suspected person had told the truth (Graminaeus 1594, 68). Although it was very difficult to obtain permission to take such an oath and it might be equally difficult to find enough suitable witnesses, a few prestigious people tried to free themselves from suspicion in this way (Fuchs 1995, 2; Fuchs 2002, 117–120). In Croatia, into the early seventeenth century, the accused had the opportunity to seek acquittal through witnesses who would testify to his or her innocence in court.

The most important legal method for upholding one's honor was the formal Romano-canonical *actio iniuriarum*. It could be used in two different ways. In a criminal proceeding, the aim of the plaintiff was to punish the slanderer physically—with prison, banishment, pillory, and so forth. In a civil proceeding, the plaintiff and court estimated the sum of money needed to repair the damage to the plaintiff's honor (Fuchs 1999, 52–54). In either form of proceeding, a slanderer could also be required to declare in public that he regretted the slander and that he considered the plaintiff to be a totally honorable person.

Because the struggle for honor normally increased during such proceedings, a defendant often tried to bring in evidence supporting his witchcraft accusations against the plaintiff. If a defendant produced enough credible witnesses, it increased the plaintiff's risk that the suspicions of witchcraft were considered substantiated, and an ex officio trial might be started against the plaintiff. Nevertheless, as some case studies have shown, plaintiffs also had a real chance to rehabilitate themselves from suspicion of witchcraft.

HOOGSTRATEN, JACOB VAN (1465–1527)

The Dominican friar and papal inquisitor Jacob van Hoogstraten (also Hochstraten or Hoogstraeten) abandoned the demonology of the *Malleus Maleficarum* (The Hammer of Witches, 1486). Born in Hoogstraten, a village now in Belgium, he matriculated in arts at Louvain in 1482 before studying philosophy and theology at Louvain and Cologne. In 1505, he became professor of theology at Cologne; in 1510, he was elected prior of the Dominican convent in Cologne, leading to his nomination as papal inquisitor for the archdioceses of Cologne, Mainz, and Trier. He died in Cologne.

In 1510 he published a *Tractatus magistralis declarans quam graviter peccent querentes auxilium a maleficis* (Magisterial Treatise, Declaring That Those Who Seek Help from Witches Commit a Grave Sin). In 1486, Heinrich Kramer, his predecessor as papal inquisitor in the Rhineland, identified witchcraft in his *Malleus Maleficarum* as a crime that could only be perpetrated by people who had concluded a formal pact with the Devil. Van Hoogstraten, however, returned to the teachings of St. Augustine and Thomas Aquinas, according to which magic indeed implied a pact, but it could very well be only an implicit covenant, of whose implications a witch might not be aware. Van Hoogstraten interpreted magic as a system of signs that informed demons about the wishes of a magician or a witch. Van Hoogstraten did not deny the reality of the explicit pact as a contract concluded by a human being with a demon, but his statement that witchcraft did not need such a covenant to be effective reduced the unmitigated position of the *Malleus*—not so much from any sort of toleration, but because of Hoogstraten's devotion to traditional scholasticism.

He showed similar conservatism in the controversy over whether or not to destroy the Talmud. In 1507, Johannes Pfefferkorn, a convert from Judaism, began campaigning for the confiscation and destruction of the Talmud to promote the conversion of the Jews. In 1510, the Holy Roman Emperor Maximilian I asked

advice from several people and institutions, including van Hoogstraten and Johannes Reuchlin (1455–1522), a humanist lawyer who had learned Hebrew and had published a commentary on the Kabbalah in 1494. Backed by the University of Cologne, van Hoogstraten favored adopting Pfefferkorn's policy. Reuchlin opposed destroying the Talmud for a variety of reasons: Jews should be considered fellow citizens with a legal right to maintain their own religious traditions, and the Talmud and the Kabbalah contained passages that corroborated Christian views; these texts should therefore be studied and not destroyed. Hoogstraten responded by formally accusing Reuchlin of heresy.

In November 1513, the pope ordered the bishops of Speyer and Worms to preside over a trial against Reuchlin, with van Hoogstraten as prosecutor. In March 1514, this episcopal court acquitted Reuchlin, but van Hoogstraten appealed to the pope. The Holy See took six years to reach a verdict; in 1520, Rome finally ruled in favor of van Hoogstraten. By then, the matter had lost much of its significance, with the early Lutheran Reformation occupying the center of German public attention. During this quarrel, known as the *Reuchlinstreit*, some of Reuchlin's supporters ridiculed van Hoogstraten and his allies with satires, portraying him as an ignoramus who understood nothing about the contents of the Talmud, but was convinced that, as an inquisitor, he should prosecute everything he was unable to understand. In a collection of fabricated letters, van Hoogstraten's imaginary allies expressed themselves in barbarous Latin and were completely ignorant of both Greek and Hebrew. The conflict over the Talmud thus became a public dispute between traditional scholasticism and humanist philology. In 1520, van Hoogstraten's fellow Dominicans deposed him as prior of their convent in Cologne and also as papal inquisitor. But the pope promptly restored him in order to concentrate on the struggle against Luther. Meanwhile, soon after his trial had ended, Reuchlin was appointed professor of Greek and Hebrew at the University of Tübingen, where he died in 1522.

HOPKINS, MATTHEW (D. 1647)

Matthew Hopkins, the “Witch-Finder General,” was associated with the only mass witchcraft trials to occur in England, taking place in some eastern counties between 1645 and 1647. We know practically nothing about Hopkins before those years. The best guess is that he was the son of a Suffolk minister named James Hopkins; the tradition that he was a lawyer is probably unfounded.

By his own account, Hopkins, then a minor gentleman living at Manningtree in Essex, first became worried about the presence of witches in and around his home village in the winter of 1644–1645. His fears, and those of other local residents, resulted in a number of women in Manningtree and the neighboring parishes being investigated as suspected witches. On March 25, 1645, the first of these, an aged, one-legged widow named Elizabeth Clarke, confessed to keeping familiars. Others were drawn in and subjected to a process known as “watching,” which entailed lengthy periods of sleep deprivation, combined with general rough handling, leading questions, and psychological pressure. Thirty-six women, of whom perhaps nineteen were subsequently executed, were tried at Chelmsford in July 1645.

The trials did not end there. Manningtree was a locally important port on the River Stour, and witchcraft fears evidently crossed the river into neighboring Suffolk, which experienced the most numerous trials in this episode (for extracts from relevant sources, see Ewen 1933, 281–302). From there the trials spread into Huntingdonshire, Cambridgeshire, Norfolk, the Isle of Ely, and perhaps less intensively, into a number of adjacent counties. Records are insufficient to permit a complete reconstruction. However, surviving documentation suggests that maybe 250 suspected witches were tried, or at least subjected to preliminary examination, of whom at least a hundred (some contemporary sources double this figure) were executed. It was by far the biggest witch hunt ever experienced in England, on par with many large-scale hunts of continental Europe, and occurred at exactly the same time as the largest witch hunt in the Kingdom of France convulsed Languedoc.

A number of factors were at work that made witch hunting on this scale possible. Obviously, Hopkins, along with his associate John Stearne, provided a catalyst. Occasionally aided by a woman called Mary Phillips (who had acquired great skill in finding the witch’s mark), these two men rapidly acquired a reputation as witch-hunting experts, and the presence of such

“professional” witch finders acquired considerable significance. It has been suggested that Hopkins’s enthusiasm for witch hunting was fueled by the fees that he (like his counterparts in Languedoc) received from settlements grateful for having their witches detected and removed. But this interpretation seems overdrawn: Hopkins generally received only a small fee and money for his expenses: his main motivation seems to have been a genuine fear and hatred of witches, and a desire to root them out. What is rather more certain is the importance of the methods Hopkins and Stearne used to obtain confessions in a land where torture was legally prohibited, except in cases of high treason. The use of “watching” meant that suspects were sometimes kept without sleep for two or three days while subjected to general ill treatment and severe psychological pressure. Although a close reading of records from earlier English cases occasionally reveals similar pressures being brought to bear on suspected witches, the degree and intensity of such abuse in the Hopkins trials are remarkable.

These methods, coupled with the apparent preconceptions of Hopkins and Stearne about witchcraft and the religious mood in East Anglia at the time, produced a distinctive flavor to the witches’ confessions that they elicited. For the first time, the Devil appeared regularly

Title page of Matthew Hopkins' *The Discovery of Witches* (1647) depicting accused witches and their familiars.

in the confessions of English witches: many admitted to having made a pact with him, and several to having had sexual intercourse with him. But the English witchcraft stereotype did not break down entirely. Many women may have claimed to have met the Devil; but despite Hopkins's conviction that the witches around Manningtree met regularly, there was no hint of a Sabbath in their confessions. Women were more likely to describe their familiars, which featured very prominently in these trials, than to claim they had met the Devil. Most of those tried were charged with acts of *maleficium* (harmful magic) that had long formed the basis of English witchcraft accusations. Above all, as in Languedoc in 1645, the stereotype of the witch never broke down, almost all of those accused being relatively poor women. The major exception was John Lowes, vicar of Brandeston in Suffolk, who was executed. One of the women convicted, Mother Lakeland, was well connected socially and had previously enjoyed a good reputation; she also had the distinction of being burned at Ipswich in 1645 because she was convicted of killing her husband by witchcraft (which redefined her offense as petty treason and even permitted the use of torture).

It is obvious that Hopkins could only have initiated mass witchcraft trials if there was popular enthusiasm for them, and recent rethinking of these trials tends to emphasize the importance of popular demands for witch hunting rather than ascribe the whole affair to the evil genius or greed of Hopkins. Both Hopkins and Stearne, in their respective justifications of their actions, stressed that they only carried out their witch-hunting activities in towns that had welcomed or even invited them to come and search for witches. There may be an element of special pleading here; but the inhabitants of the eastern counties certainly seemed happy enough to participate in witch hunting, or at least give evidence against supposed witches, and we can trace a number of factors at work in this respect.

The Hopkins witchcraft trials came toward the end of the First Civil War. East Anglia had not been a war zone; but it was, along with London, the heartland of parliamentarianism. By early 1645, that war was becoming increasingly ideological. In particular, south-eastern England had developed a hard-line, popular Puritanism that identified very strongly with the parliamentary cause. One aspect of this was the purging, under the direction of parliamentarian committees, of "scandalous and malignant" clergymen in 1643–1644. Some of them were men who led scandalous lives or were regarded as professionally incompetent, while others (and the two categories were not mutually exclusive) were simply not enthusiastic enough for the parliamentary cause. This meant that many experienced and relatively moderate parish clergy were replaced by young and enthusiastic committed Puritans. Religious zeal boiled over in 1644, when a Suffolk man of respectable

yeoman stock, William Dowsing, had, under parliamentary authority, led a campaign of iconoclasm in which ornaments and decorations in about 150 Suffolk parish churches were mutilated or destroyed. The more moderate religious style that had been largely responsible for the virtual ending of witchcraft trials in England in the 1630s had been replaced in this region by a much more hard-line form of belief. Moreover, the experienced justices of the peace who might have helped dampen down the early stages of the witch hunts had either been replaced as ideologically unsound or were preoccupied with maintaining the war effort; normal judicial structures, although far from absent, had been in some measure eroded by events of the previous three years. Religious enthusiasm, and a situation that allowed Hopkins to operate without much supervision from justices of the peace or assize judges, formed the essential context within which these trials took place.

Hopkins remains a well-known figure among the general public, his fame being enhanced by the British film of 1968, *Witchfinder General*. Curiously, Hopkins's major influence in the medium term was to alienate moderate opinion from witch hunting. After the Restoration of 1660, even those who advocated witch beliefs shied away from large-scale hunts, seeing them as a by-product of the religious enthusiasm of the Civil War period and its aftermath. Hopkins, as a relatively obscure man, could be represented as typical of those whose short-lived prominence in the 1640s and 1650s rocked the social hierarchy. The tradition, still repeated in reference works, that Hopkins was himself investigated as a witch and hanged, is unfounded. John Stearne recorded that Hopkins died of consumption in Manningtree, and his death in 1647 is in fact recorded in the register of the parish of Mistley cum Manningtree.

HORACE (65–8 B.C.E.)

Horace's portrait of the "witch"—old, female, ugly, grotesque, dealing in images, herbs, and poisons, and working largely maleficent magic—played an important part in establishing later clichés about them.

Quintus Horatius Flaccus was a Roman poet whose oeuvre consisted of lyric verses (*Odes and Epodes*), poetic conversation pieces, letters, and advice on how to write poetry (*Ars Poetica*). Horace had a dry sense of humor that seemed to have escaped many later writers on magic and witchcraft who used and quoted him as one of their sources.

His principal "witch" was called Canidia. A late but unreliable source suggested that she was modeled on a real person. A commentator on Horace's *Epode* 3.7, remarked that "the name Canidia refers to a Neapolitan maker or dealer in ointments, called Gratidia, a worker of poisonous magic." She appeared in several poems, always described in highly theatrical terms. Her matted hair was entwined with vipers; one of her fingernails had grown very long; her teeth were badly discolored—hence her foul and deadly breath—and her complexion was pale and sallow. She wore a large black mantle and went barefoot. At least some of her teeth might have been false, because on one occasion, taken suddenly by fright, Canidia ran away and they fell out. Her companion Sagana, who was older than she, was just as unpleasant to look at. She wore a wig that she lost when Canidia lost her teeth (*Epode* 5; *Satires* 1.8 and 2.8).

Epode 5 involved a boy who began the poem by asking Canidia fearfully why she was staring at him like a stepmother or a beast at bay. Canidia made no immediate reply, but instead gathered together pieces of fig-wood uprooted from a cemetery, the eggs and feathers of an owl, smeared with toad's blood, poisonous herbs, and some bones, all of which were to be burned on a magical fire. Meanwhile her accomplice, Sagana, was sprinkling water from Lake Avernus (reputedly the entrance to the underworld), while a third "witch," Veia, dug a shallow grave. The boy was to be buried therein and starved to death, after which his marrow and liver were to be extracted to make a love potion. Canidia, Horace explained, was in love with a man called Varus who was impervious to her passion. At the end, however, the boy threatened to come back and haunt Canidia as a vengeful ghost.

In *Epode* 17, Horace addressed Canidia, asking her to cease her incantations and magical rites, because she succeeded in driving away his youthful bloom and he was wasting away in torment. He was ready to buy her

off, he said. But Canidia replied scornfully that, in view of the way he had been openly mocking her and the rituals she had been performing on the Esquiline hill, she would continue to harass him magically. She boasted of her skills in magic. "I can impart motion to images made from wax; I can snatch down the moon from the sky by my incantations; I can arouse the dead after they have been cremated; and I can blend drinks which excite desire."

Canidia's references to mockery and the Esquiline hill came from *Satire* 1.8 which had been published some six years previously. The satire was put into the mouth of a fig-wood statue of the god Priapus. The Esquiline, he said, would be a pleasant enough place were it not for the women who upset people with their incantations and poisons. He remembered seeing Canidia and Sagana there, digging a trench with their nails, tearing a black lamb to pieces with their teeth, and pouring its blood on the ground in a necromantic ritual intended to invoke the souls of the dead. When the ghosts arrived, their voices were sad and shrill. Canidia and Sagana then buried a wolf's beard and a snake's tooth, and burned a wax image. At this point, Priapus became so frightened that he farted, causing both "witches" to run away in confusion.

HOVAEUS, ANTONIUS (ANTON VAN HOVE) (D. 1568)

A Benedictine abbot who supported Johann Weyer's fight against the belief in witchcraft, Hovaeus, formerly abbot of the Benedictine convent in Egmond (Holland), became abbot of Echternach in the duchy of Luxembourg (Spanish Netherlands) in 1562. Following the publication of Weyer's *De praestigiis daemonum* (On the Tricks of Devils) in 1563, Hovaeus sent the author an enthusiastic letter stating his agreement, which was added to later Latin editions between 1564 and 1588 as well as to the German translation in 1586. Hovaeus's name appeared under the Latin acronym A.H.H.A.E. (*Antonius Hoveaus Haecmundanus Abbas Ehtemacensis*). The abbot argued that the witch hunters, who allegedly fought the Devil, believed more in the power of the Devil than in the power of God and Jesus. Hovaeus was fundamentally opposed to torture. A skeptical humanist, he considered malicious magic impossible and any belief in witchcraft superstition,

which he illustrated with two examples from Echternach. Hovaeus was also a poet and published a dialogue entitled *Zuermondus* in 1564, followed by *De arte amandi Christum* (Concerning the Art of Loving Christ) in 1566, which contained a book of odes and hymns. He lies buried in his abbey church at Echternach, where his portrait survives among its abbots.

HUNGARY

With perhaps 1,110 executions for witchcraft in a population that ranged between 3.5 million and 5.3 million from the fifteenth through the beginning of the eighteenth centuries, Hungary experienced quite moderate witch hunting.

THE MEDIEVAL PRECEDENTS

The legislation of the first Hungarian kings—Saint Stephen (1000–1038), Saint Ladislaus (1077–1095), and Coloman (1095–1116)—provided the first legal measures against the use of magic and witchcraft. These early texts referred to *maleficium* (harmful magic), *sortilegium* (sorcery), and *veneficium* (poisoning), and also used the term *striga* (witch or blood-sucking night creature). All three kings ordered that people practicing magic be brought before ecclesiastical courts. Coloman's law made an important distinction between *strigae* and *malefici* (practitioners of harmful magic). Following the tradition of the *Canon Episcopi* and the Carolingian capitularies, it denied the existence of the former ones, and condemned the latter.

Compilations of individual cities' customs began to include punishment for magical acts during the late Middle Ages, the earliest being Dalmatian city laws in the thirteenth and fourteenth centuries and those of Zagreb. The customs of Buda, written between 1403 and 1439, condemned so-called *ansprecherin* (woman casting spells) and *czaubern* (sorceress), ordering them to wear a pointed ("Jewish") hat painted with angels

before being burned. The synod of Esztergom (1100–1116) ordered those convicted of *maleficium* punished according to canon law; the synod of Buda (1279) threatened to excommunicate sorcerers and those using sacraments for magical purposes.

The first trials against magicians—*fytonissa* (female seer or diviner) and *incantatrix* (woman casting spells)—seem to have appeared during the thirteenth century in both ecclesiastical and secular courts (feudal and municipal), but until the sixteenth century no regular witch persecutions took place in the Kingdom of Hungary (modern Croatia, Slovakia, and much of Romania).

Thirty-nine people, all of them women, were accused of magic and witchcraft between 1213 and 1496. The earliest cases were at the bishopric of Várad (fourteen cases of *maleficium* and *veneficium* between 1208 and 1235) and at Zagreb (six women tried between 1360 and 1379; at least one went to the stake). We know of only a dozen trials from the fourteenth and fifteenth centuries in Hungary.

EARLY MODERN WITCH PERSECUTION

Witch hunting in early modern Hungary coincided with difficult times. The Ottoman Turks defeated the Hungarian army at Mohács in 1526 and occupied Buda, the capital, in 1541. For the next 150 years, Hungary was divided into three parts. The Hungarian kingdom, ruled by Habsburg kings, was limited to the northwestern part (Upper Hungary). The central and southern parts of Hungary (the area of the Great Hungarian Plain), occupied by the Turks, belonged to the Ottoman Empire, while the eastern part, Transylvania (today part of Romania) became a quasi-independent principality ruled by Hungarian noble dynasties. During the 1680s and 1690s, the Habsburg army drove the Turks out of Hungary, bringing the whole country, including Transylvania, under Habsburg rule until 1918.

Witch hunting began in sixteenth-century Hungary, intensifying during the 1580s. Legal persecutions of magic and witchcraft were reinforced; for example, in 1614 the Transylvanian diet issued a decree punishing sorcerers and witches. However, throughout Hungary witchcraft was never considered a *crimen exceptum* (the excepted crime) and was punished together with other crimes at feudal, municipal, and county courts. After 1656, Hungary's most frequently used criminal procedure was based on the teachings of a German jurist, Benedict Carpzov, adapted for Austria and published in Latin at the Hungarian university of Nagyszombat (Trnava) in 1687. Entitled *Forma processus iudicii criminalis seu Praxis Criminalis* and reprinted (always in Latin) in 1697, 1700, 1717, 1732, and 1748, this compilation—with its precise textual relationship to Carpzov's famous *Practica nova imperialis Saxonica*

verum criminaliam (New Rules in Criminal Cases for Imperial Saxony) unknown—introduced such western demonological concepts as the Sabbat and the witches' pact to Hungary. This helps explain why Hungarian witchcraft trials reached their peak only at the end of the seventeenth and the first half of the eighteenth centuries.

Chronology of accused Hungarian witches:

1526–1552: 17

1553–1600: 131

1601–1650: 330

1651–1700: 781

1701–1750: 2,254

1751–1800: 534.

Although Hungary has been a multiethnic country throughout its history—Upper Hungary hosted a considerable number of Germans, Slovaks, and Czechs; Transylvania Germans and Romanians; while Croatian, Serbian, Romanian, and, later, Slovakian groups lived on the Great Plain area, not to speak of Gypsies—the great majority of the accused witches seem to have been ethnically Hungarian.

LEARNED AND POPULAR DEMONOLOGY

Protestant churches, whose demonological ideas are much better known in Hungary than those of the Catholics, played a considerable part in starting witchcraft trials in sixteenth- and seventeenth-century Hungary. The Transylvanian Lutheran synod of 1577 threatened anyone practicing magical acts with the stake. The earliest Hungarian treatises commenting on witchcraft and the Devil's works also came from a Lutheran preacher, Péter Bornemisza, who surveyed various northwest Hungarian peasant witch beliefs and magical practices in his *Ördögi kísértetekről* (About the Temptations of the Devil) published at Sempete (Sintava) in 1578.

Calvinist teachings on witchcraft and demonology, the best known in Hungary, began in 1562 with the *Confessio Ecclesiae Debrecinensis* (Confession of Faith for the Church of Debrecen), compiled under the direction of Péter Méliusz Juhász, the first Calvinist bishop in Hungary. A follower of Johann Brenz, Méliusz expressed a highly skeptical point of view about the reality of diabolical witchcraft. Similar skepticism penetrated the comprehensive treatise on demonology (*Disputatio theologica de lamiis veneficis*, or Theological Dispute About the Ill-Willed Lamiae) compiled by two Reformed theology students, Joannes Mediomontanus and Andreas Csehi, and published in Várad (Oradea) in 1656. They surveyed international demonological literature, quoting more frequently from Johann Weyer than the Puritan William Perkins.

However, seventeenth-century Hungarian Calvinist opinions on witchcraft seem far from homogeneous. A Reformed synod held at Margita (Bihar county) in 1681 seems to have stimulated witch hunting in this region by ordering sorcerers and their clients excommunicated. Its president, Bishop Mátyás Nógrádi of Debrecen, had visited England just when Matthew Hopkins, the notorious witch finder, was active there; he included a short treatise on “*Az ördögi practicáról mint kellyen ítélni embernek*” (How to Judge Devilish Practices) in his *Lelki próbakő* (Spiritual Touchstone) of 1651. Although Nógrádi argued for rather prudent treatment of village witches, he analyzed various types of pacts with the Devil carefully, taking them more seriously than his colleagues. If most Hungarian Calvinists considered the witches' pact and the Sabbat as illusions (or a product of melancholy), they condemned all forms of popular magic. In 1610, the Debrecen Calvinists published *Lex Politica Dei* (God's Public Laws), a collection of biblical texts including a long list of the Hebrew Bible's laws punishing sorcery and divination. Seventeenth-century Calvinists condemned primarily the treatment of illnesses by popular healers, emphasizing that cunning people and midwives using magical practices deserved severe punishment. As late as 1719, Imre Pápai Páriz's *Keskeny út* (The Narrow Road), published at Debrecen, reinforced this rather skeptical trend in Hungarian Calvinist opinions about diabolical witchcraft, while supporting the punishment of any form of “white” magic.

Some seventeenth-century Hungarian students upheld antidiabolical and antidemonological conceptions of magic in disputations at Wittenberg, the Lutheran Rome. In 1665, Georgius Fridericus Magnus, from Pozsony (Bratislava or Pressburg), defended Weyer's propositions denying the possibility of the witches' pact; in 1692, Johannes Surmann, from Beszterce (Bistrita, Transylvania), in his *De daemonologia recentiorum auctorum falsa* (About the False Demonology of Recent Authors), dared to defend Balthasar Bekker.

Unfortunately, we know too little about Hungarian Catholic opinions on the issue of witchcraft during these times. The *Malleus Maleficarum* (The Hammer of Witches, 1486) was known in Hungary—Miklós Zrínyi, one of the greatest seventeenth-century Hungarian poets and writers, had a copy in his library and it was explicitly mentioned during the 1691 trials at Somorja (Samorin)—but it apparently exerted little influence on witch hunting here. The criminal courts of Catholic communities regularly used Carpozov's *Praxis criminalis* or other legal guides that propagated concepts of diabolical witchcraft. Rituals of exorcism were routinely included in Catholic liturgical manuals; Franciscan and Jesuit missionaries (often Italians or Southern Slavs) performed this rite among the nobility

and peasantry alike during the seventeenth century. Much like Hungarian Protestants, Catholics condemned both diabolical witchcraft and “white” magic (conceived as instigated by the Devil himself) throughout the eighteenth century in printed collections of sermons (József Telek, *Tizenkét csillagú korona* [Crown of Twelve Stars], 1769), *exempla* (János Taxonyi, *Az embernek erkölcsének és az Isten igazságának tüköre* [Mirror for the Morals of the People and the Truth of God], 1757), or manuals of *ars vivendi* (the art of living) (Ferenc Nagy, *Az egy igaz és boldogító hitnek elei* [The Foundations of the One and True Faith That Makes One Happy], 1796).

German demonology seems to have played a significant role in Hungarian witch hunting at both learned and popular levels, although its more diabolical trend is still not very well known. It was the predominantly German or Saxon towns of Upper Hungary and Transylvania that launched Hungary’s first campaigns against witches in the late sixteenth century, coinciding with the demonological teachings of the Lutheran Church. Hungary’s first detailed description of a Sabbath came from the area near Pozsony, at the Austrian border, in 1578. The Lutheran preacher Péter Bornemisza claimed that the witches had a queen, transformed themselves into cats, and danced and fornicated at their meetings. A much later—and this time Calvinist—Sabbat was described by Joannes C. Mediomontanus in his 1656 *Disputatio theologica de lamiis veneficis* (Theological Dispute About Witches and Poisoners): the witches ordinarily gathered at the wine cellars on Mount St. Gellért near Buda, an ill-famed hill called *Blocksberg* by local Germans.

The first data suggesting popular adoption of demonological ideas also came from regions mainly inhabited by Germans. A witch’s alliance with the Devil was mentioned in 1581 at the Upper Hungarian mining town of Selmechánya (Schemnitz; Banská Štiavnica). Western Hungarian cities—like Kőszeg, Sopron, and Pozsony—might have been affected by witch hunts spreading eastward from Austria during the 1560s. One of the first popular descriptions of witches flying on broomsticks and copulating with the Devil came from the city of Pozsony in 1602. It was also in this region, around such communities as Sopron, Körmend, Lakompak, or Darázsfalva (Trausdorf), that extended series of popular Sabbath descriptions appeared when mass persecutions started in the 1650s. The other area with a similarly early appearance of popular diabolical beliefs included the seven self-governing Saxon towns (*Siebenbürgen*) of Transylvania. The cities of Segesvár (Sighisoara/Schassburg) or Nagyszében (Sibiu/Hermannstadt) experienced regular and intensive witch hunting from the 1660s into the eighteenth century. Austrian and German soldiers, occupying Hungarian villages during and after the Turkish wars, constituted

another important channel in mediating German conceptions of witchcraft throughout Hungary. In many local cases from the seventeenth and eighteenth centuries, German soldiers accused their hosts of witchcraft, sometimes even acting as witch finders.

However, witch hunting in Hungary seems as much a local and primarily urban phenomenon as an adoption of German demonological concepts. Among the first persecuting cities, both Kolozsvár in Transylvania and Debrecen on the Great Plain were mostly inhabited by Hungarians. Kolozsvár, a town of mixed religions, saw at least twenty-one witchcraft trials between 1565 and 1593, with fifteen resulting in burnings; Debrecen, which was then turning from Lutheran to Calvinist, probably received its first stimulus for witch hunting in the 1570s through wandering preachers from Kolozsvár. Moreover, the towns and villages of the Great Plain, a typical frontier society, occupied by Ottoman Turks until the end of the seventeenth century and almost completely resettled during the eighteenth century, saw no intensive witch persecution before the 1710s and 1720s. Although the Turks did not prevent local jurisdictions from functioning in this region, only in 1728 did one of Hungary’s largest witch panics develop there, in the Catholic city of Szeged (Csongrád county), with thirteen witches burned and a further twenty-eight accused; in the nearby religiously mixed town of Hódmezővásárhely, forty-one people were tried between 1724 and 1763 (only seven died at the stake). Similarly, 20 witches were accused in the village of Ottomány (Bihar county) in 1724; altogether, there were 107 accused witches (but only 15 capital sentences) in that predominantly Calvinist county between 1711 and 1730. These late witch hunts can best be explained by the belated urbanization of this region.

The popular image of the Hungarian Sabbath emerged less from foreign demonological concepts than from such local (and originally nondiabolical) sources as the *táltos* (a sort of shamanistic sorcerer) as well as from *tündér* (fairy) beliefs. The Sabbath encountered in Hungarian confessions resembled a village feast, with excessive eating, drinking, music, and dancing, held in ordinary houses, churchyards, or the local tavern, mostly without the Devil’s presence. In cases where the Devil was present, he was modeled from stereotypes of learned diabolical witchcraft, appearing either as a billy goat or in human shape (a tall black man, a priest, or a handsome peasant lad); such devils wore Hungarian dress in German-inhabited regions and German dress in ethnically Hungarian regions.

STATISTICAL AND CHRONOLOGICAL PATTERNS OF WITCH HUNTING

According to our present knowledge, 4,089 accused witches were brought to trial between 1213 and 1800 in the Kingdom of Hungary (the total number of trials

being 2,205). The vast majority of the accused, including everyone before 1500, were women: overall, women comprised 3,516 or 87 percent for the entire period, as opposed to 518 men. Similar gender percentages recur in local studies: for example, only 11 men (roughly 9 percent) were brought to trial in the city of Debrecen between 1575 and 1759, and 8 (barely 5 percent) in Bihar county between 1591 and 1766. By nationality, about two-thirds of these alleged witches (3,067) were Hungarian, the majority of the rest were Germans (362), Croatians (301), and Romanians (173), with occasional Slovaks (84), Gypsies (47), Ruthenians (23), and Serbs (9).

The exact rate of death sentences in Hungarian witchcraft trials cannot yet be determined. Formerly, it was estimated at 51 percent (Klaniczay 1990a,b,c). According to the most recent statistics (based, however, on only 3,269 accused witches between 1213 and 1800), 498 witches (that is, roughly 34 percent) received capital punishment among the 1,468 people whose final sentence is known. One must, however, consider that for 1,801 persons (over half), the final sentence remains unknown. If we suppose the same percentage of the 1,801 people were executed as were the 498 witches whose sentences are known, we can add 612 executions, giving a total of 1,110 probable executions. The majority of those avoiding death received corporal punishment or were expelled, temporarily or permanently, from their communities. Only a small minority was acquitted. The capital sentence of convicted witches meant burning at the stake, without strangulation beforehand. No other methods of execution, such as hanging, seem to have been used.

Local rates of capital sentences vary. In the Calvinist city of Debrecen, among 147 witches (82 percent with known sentences) only 28 (roughly 27 percent) were executed—the majority burned. In mostly Calvinist Bihar county, out of 177 witches (only 39 percent with known sentences), 26 people (roughly 38 percent) received capital punishment.

Early modern Hungarian witch hunting seems well embedded in the country's long-term local history. It tended to increase during peaceful periods after major wars and uprisings, and also coincided with the aftermath of devastating plague epidemics. It reached its first peak in the 1580s, a peaceful period but in the aftermath of a plague epidemic. The intensity of the persecutions decreased during the Fifteen Years' War with the Turks (1591–1606) and the anti-Habsburg uprising of István Bocskai (1604–1606). The 1620s saw a new increase during a decade when Prince Gábor Bethlen of Transylvania led three campaigns against the Habsburgs. Individual trials usually occurred in peaceful years and regions, and it is highly probable that the plague epidemic of the 1620s helped intensify persecution during these years.

Another rise in Hungarian witchcraft trials followed the end of the Thirty Years' War, from the 1650s, which included another big plague epidemic, until the 1670s; but the most dramatic increase occurred when the Ottomans were definitively driven out of Hungary after 1690. In the first half of the eighteenth century, Hungarian witch hunting reached its peak, especially after the end of the anti-Habsburg revolt led by Prince Ferenc Rákóczi (1703–1711), during and between the two greatest eighteenth-century plague epidemics (1709–1711 and 1738–1745).

Studies of local witch hunting nuance this pattern of long-term fluctuation. The generally small-size witch hunts of Debrecen and Bihar county (1–3 accused per annum) intensified during and after plague epidemics or other natural catastrophes, such as drought, frost, or famine (up to 5–10 accused per annum).

Although witch persecution seems to have started to decline in the 1750s, the Habsburg Empress Maria Theresa stopped it from above after 1756. After having personally examined a Slovenian woman named Heruczina accused of witchcraft, Gerard van Swieten, the enlightened court physician, submitted a memorandum to Maria Theresa in 1758 arguing that witchcraft charges were built on false concepts and suggested that the persecution cease. The Royal Court first changed some municipal sentences of witches to acquittals, and then, in 1768, issued a royal decree permanently prohibiting the execution of witches.

MICROSOCIOLOGY OF WITCHCRAFT ACCUSATIONS

In this respect, early modern Hungarian witchcraft charges illustrate at least three significant patterns.

The first was “accusations from above,” a sociologically stronger, more powerful party accusing a weaker one. This pattern typified the politically motivated witchcraft trials among the Transylvanian high nobility during the sixteenth and seventeenth centuries. The princes accusing the families of their defeated political enemies of witchcraft included Sigismund Báthory (blaming the mother of Boldizsár Báthory, whom he murdered, for his impotence); Gábor Bethlen (who, after having succeeded the murdered Gábor Báthory in 1612, accused the latter's sister and two other noblewomen in his entourage with witchcraft); and Mihály Apafy (initiating a major witchcraft trial, with some twenty accused between 1679 and 1686, against the wife of his exiled rival).

Similar patterns were also manifest in early modern town and village witchcraft. For example, in the Calvinist city of Debrecen, prosperous burgher merchants and artisans accused their lodgers, their house servants, or the city beggars of witchcraft in dozens of cases, in the context of a local sociopolitical campaign against the poor. In the same place at the same time,

“honest” Puritan citizens accused “adulteresses,” “drunkards,” “thieves,” or “blasphemous” women of the same crime (fifty-three people, roughly 36 percent of all Debrecen witches). The “from above” pattern can also be seen in two other typical forms of social conflict in the eighteenth-century frontier world of the Great Plain. Local people had a considerable inclination to accuse strangers and newcomers of witchcraft (in Bihar and Csongrád county as well as in Debrecen or Hódmezővásárhely); such formerly privileged social groups as the *hajdú* (Haiduk) nobles, who lost their administrative, economic, and military privileges after the end of the Turkish occupation, used the weapon of witchcraft to get rid of newcomer peasants settling in their communities.

A second and complementary pattern was “accusations from below,” a sociologically weaker party accusing a more powerful one. This pattern seems to have been typical in some Hungarian witch panics; for example, in the 1728 trials in the Catholic city of Szeged, a poor “wise woman” and a beggar accused a former judge, Dániel Rósa, of witchcraft. Other local magistrates and judges similarly found themselves or their families accused, for example, in the 1724 Ottomány panic, the 1724 Nagykereki panic, or the 1734 Kiskunhalas panic. Another recurrent manifestation of this pattern can be seen when fourteen- to sixteen-year-old maidservants or even nine- to twelve-year-old children accused their landlords, hosts, or even grandparents of witchcraft. Sometimes this occurred during witch panics, sometimes not: child accusers first appeared in Kolozsvár toward the end of local witch panics in 1615 and 1629; however, young kitchen maids and children were constantly present as accusers in scattered Debrecen and Bihar county trials until well into the 1760s.

Accordingly, the “from below” pattern also occurred in periods of rather moderate witch hunting. It can be seen in the eighteenth-century Debrecen trials in a few cases where lodgers accused their hosts of witchcraft; and also in the far more frequent cases where clients accused “wise women,” midwives, or other magical experts of inadequately curing the sick. Such accusations suggest a considerable degradation of the traditional status of these popular healers. The Haiduk nobles of the estate of Derecske were charged with witchcraft by the local peasants during the eighteenth century, who tried to bring the trials before the landlord’s court, trusting that the landlord, a political adversary of the Haiduks, would decide in the peasants’ favor.

The third pattern was “status rivalry,” witchcraft accusations developing among those of similar social rank. The most typical form of this pattern emerged as a personal competition among cunning folk (called in Hungarian *tudós* or *orvos*, “wise (wo)man”); a large number of Hungarian witchcraft accusations arose in

this way. The first victims of the Kolozsvár trials in 1565 were nearly all cunning folk mutually accusing one another. The same holds for the Debrecen trials: forty-five persons, roughly 31 percent of all accused witches, were practitioners of popular magic: “wise women” brought charges against each other, midwives against other midwives, and—a typical urban phenomenon—barber-surgeons and official midwives testified against their colleagues. This type of witchcraft accusation seems to have been quite closely connected to the reorganization of Debrecen’s local health care system during the eighteenth century.

Tudós pásztorkok, “wise” or cunning shepherds, also found themselves charged with witchcraft during the seventeenth and especially the eighteenth centuries, either by their village clients, or by their shepherd colleagues. A peculiar form of these charges seems too have been founded on werewolf beliefs; such cases appeared all over Hungarian territory. It is highly probable that these charges were connected with the crisis of the old cattle-herding lifestyle, lowering the social status of the shepherds, and itself embedded in Hungary’s great economic and social transformations after the Turkish occupation.

HUNGARY AND SOUTHEASTERN EUROPE, MAGIC

Remnants of traditional folk belief and everyday practice of popular magic have lingered in village communities of the area until modern times. Fortunetellers and specialists in communication with the otherworld with quasi-shamanistic abilities were active. Folklore views of popular belief spread through oral transmission, as well as popular magic, are both inseparable from folk religion which included ideas and forms of behavior not included in or even rejected by official dogma and liturgy. (These were labeled as pagan, heretic, or superstitious by the Christian religion.)

Better preserved by the Orthodox populations of southeastern Europe (Serbia, Macedonia, Bulgaria, Romania, Greece, and Albania) than in Latin Catholic areas (Hungary, Croatia, Slovenia), popular magic syncretized various elements of Christian and non-Christian origin. In the Eastern Church, basically unaffected by witchcraft trials or demonology, elite and popular religion have remained close, preserving many medieval European traditions. Their history, marked by prolonged foreign occupation (several centuries of Ottoman rule), migration, and language changes have affected folk belief and magic between different peoples and regions. Historical contacts and cultural interrelations and the influence of Christianity (including the considerable effect of Bogomilism on Balkan peoples) gave popular magic the same basic features across the entire region.

In Latin areas, many magical norms, sanctions, and actions that remain alive in the east have disappeared, or survive only in folklore narratives. In Latin Catholic areas (Hungary, Slovenia, and Croatia), surviving sixteenth- through eighteenth-century witchcraft trial records enable us to reconstruct some traditional magical cosmogony and practices. The following summary describes a few important phenomena that characterized the entire region, ignoring for the most part local characteristics.

COSMOGONY, MYTHOLOGY, AND THE SPIRIT WORLD

In this region, cosmic explanatory systems combined the Hebrew Bible's creation myth with Bogomil notions of a dualistic creation by God and Satan and with pre-Christian traditions retained in folk narratives (e.g., the defeat of a dragon of chaos by the god of heaven). Notions of the universe were similarly manifold. A widely known notion was a universe with seven "layers," and the world tree reaching from the underworld to the heavens. (According to the Macedonian myth, underworld monsters, called *kallinkantsaroi*, whose aim was to destroy the world, gnawed the roots of the tree, but the birth of Jesus prevented this from happening.) Other widely known elements were dragons and werewolves that caused eclipses of the sun and moon or earthquakes, a floating whale or a buffalo that supported a disc-shaped earth on its back, an earthly otherworld in the west or over the river, an underworld filled with frogs and snakes, and a mother goddess with attributes of an underworld snake, traceable in Serbian, Croatian, Slovenian, or Bulgarian folklore.

Pre-Christian mythical beings survived mainly in ambivalent roles of determining people's fates and distributing sanctions or rewards. A largely negative pagan demon world merged with the Christian Satan to create a great variety of "popular" devils among all these peoples; for example, in Albanian *djall*, *dreq*, and *satan*

refer to different devilish-demonic beings. Hardly any non-Christian spiritual beings had positive roles, which were invariably taken by Christian saints and the Virgin Mary, who assumed several features from similar pagan forerunners. Thus, saints who were patrons of animals (St. George, St. Michael, St. Blasius, or St. Sava) carried features of an archaic “lord of animals.” Saints associated with the prescriptions and taboos of the magic of husbandry and the household, or with divinatory and sacrificial rites, played normative roles in regulating human behavior. St. George and St. John the Baptist (and his day in the calendar) were connected with innumerable individual and collective rites of crop magic and milk magic. St. Elias bore the features of the Slavic sky and storm god Perun, also traceable in Romanian and Hungarian folk beliefs. Female healing saints had numerous pagan features, thus Saint Marina, honored throughout the Balkans for protecting people from snakes, was connected with such antique “snake” goddesses as Artemis or Bendis. Saint Lucia (for Latins) and Saint Paraskeva (for the Orthodox) were associated with spinning and other women’s jobs as well as with fertility. Similar features, sanctioning all the taboos of female jobs even in the modern period, appeared in the Hungarian and Romanian “*Woman of Tuesday*,” Romanian and South Slavic *Piatnitsa* (Friday) and Slovenian *Pehtna Baba*, who guaranteed fertility and deserved sacrifices (cakes, floury foods, hemp, flax) on their days.

An exceptional and clearly non-Christian figure in folk mythologies was that of the “fate woman.” Belief in the power of these beings who announced human destiny (Greek *moira*, Serbian and Croatian *urishnitsa*, Romanian *ursitoare*, Bulgarian *urishnitsi*, Albanian *fatia*, Slovenian *rojenice*) remained common in twentieth-century Orthodox countries, where food sacrifices were prepared for these women. Such figures, who carried features both from antiquity and pre-Christian Slavic traditions, usually appeared in groups of three on the night after childbirth to announce the destiny of the newborn.

Traditions about nature spirits, creatures of the forests and the waters, survived in the entire region until the twentieth century (except in Bulgarian and Greek areas, where fairies filled these roles). Forest spirits (e.g., Serbian *lesnik*, Slovenian *lesnik*, *lesni škrat*, *divji moû*, *cateû*, Hungarian *vadöreg*, *erdei csoda*, *vadléány*) were natural beings belonging to a part of the world outside human experience; lords of the forest and often of the animals, they had a wild exterior and plant or occasionally animal attributes (a dress of moss or bark, hairy bodies, long flowing hair). They uprooted trees and supported woodcutters, but tended to frighten anyone lost in the woods. Woodcutters occasionally gave them gifts of meat or wine in the hope of better treatment. Some of their female versions were seduc-

tively beautiful (Romanian *fata padurii*) or appeared as large-breasted, lascivious fertility goddesses (Serbian *shumska maika*, “forest mother”). They aided pregnant women and newborn babies, but also tended to “swap” babies (cf. changeling). Slovenian *zalik ûene* (“blessed women”), who looked like fairies, also had similar features.

The role of water spirits may also have been filled by the water-nymph varieties of the fairies. Other water spirits were mainly known in the western Balkans (Slovenian *povodni moû*, Croatian *vodni moû*, Serbian *vodeniak*, *vodeni duh*, etc.) Often resembling dwarfs, drowned bodies, or mermaids, they turned into water demons after drowning, and lured people into the water, pulled bathers under the surface and drowned them, or tangled fishermen’s nets. Sometimes they aided fishermen and, as “lords of the fish,” received food or drink poured into the water in return.

DRAGONS GOOD AND BAD

Dragons and their variants, the most archaic type of nature spirits, still play significant magical roles for many people. All types of dragons (Bulgarian and Serbian *hala*, Serbian *ale*, *azhdaha*, *lamnia*, Bulgarian *lamnia*, Albanian *lamje*, *kuûsedra*, *bolla*) were weather demons that caused storms, rain, or hail; in myths, they also caused cosmic disasters, for example, stealing the sun or causing earthquakes. Born from beings of the marshes or the underworld, dragons dwelled in water and caves. Certain types of dragons could be guardian spirits; among the Bulgarians, they became patrons of the shamanistic magicians protecting a tribe or village. These “good” dragons (Bulgarian *zmei*, Serbian *zmai*, Macedonian *zmev*, Romanian *zmeu*, Croatian *pozofj*) fought cosmic battles against foreign dragons to aid their own communities in ensuring good weather. Despite their watery origins, they also had fiery features—in the rites of shamanistic magicians, their heavenly patrons fired arrows of lightning.

FAIRIES

The complex and varied figures of fairies have played an important role in the beliefs, magic, and sacrificial rites of southeastern Europe, but by the twentieth century, this role survived only in Orthodox areas. In Roman Catholic central Europe, they survived only in folklore, or their features were projected onto witches. In the Balkans, fairies played an important role in heroic epics, while the majority of Hungarian fairy beliefs were much more secondary. The use of taboo names for fairies was quite characteristic, for example, Romanian words meaning “them,” “the belles,” or “the misses,” or Albanian terms for “the whites,” “the happy ones.” Fairies were water, forest, or mountain nymphs; they had the characters of dead persons (in the Orthodox

Balkans their figure coincided with the periodically returning dead), presented as good-looking women, migrating or flying in groups singing, dancing, and playing music. They could assume animal shapes (snake, donkey, horse, etc.). They could fulfill the role of fertility goddess or communal guardian spirit, guaranteeing the well-being of a family or a village or a good harvest. At the same time, they were taboo figures regulating behavior, sanctioning those who transgressed their places (paths, crossroads, meadows) or times (night, midday, period between Easter and Whitsun) with specific “fairy diseases.” They snatched the living and those they took died or returned sick; innumerable legends described men who were snatched to become musicians in the fairies’ ecstatic groups for music and dance. They also snatched the healers and fairy magicians that they supported and took them to their own otherworldly sphere, where they participated at feasts accompanied by music and dance and learned the art of healing, thus becoming initiated into the trance and dream techniques of conferring with the otherworld. Such magicians (e.g., Croatian *vilenica*, *vilenjak*, Hungarian *tündéres*; Greek, Bulgarian, and Serbian forms also existed) could heal the transgressors of fairy taboos by conjuring up the fairies and presenting them with sacrifices.

GHOSTS

The haunting dead and ghosts were syncretic mythical beings carrying both Christian and pagan attributes. Up to the present, archaic views held that a person’s spirit lived on after death, separating from the body only gradually. Until the gap left behind by the person vanishing from a close community was again filled, until the mutual expectations of the living and the dead were complied with, the dead soul lingered in some transitional place, not far from the living, and returned to haunt them through signs, dreams, or apparitions. It was also possible to communicate with the dead person in this period in order to complete affairs that had been cut off because of the death. This gradual distancing from the world of the living and the occasions for communication both had traditionally appointed times such as after forty days of mourning, the anniversary of the death, the Day of the Dead (November 2) for Roman Catholics, or Orthodox festivals of the dead (Easter, Whitsun, Saturdays of the dead). Even today, numerous Christian and non-Christian rites and acts of magic are performed to provide for the dead, keep them at a distance, or help them in the otherworld.

It was common to provide for the bodily, physical needs of the dead by including objects and personal belongings in the grave, or holding a mourning feast, eating together with the deceased. Christian forms intended to influence the lot of the deceased in the otherworld were known everywhere, while such

customs as feasting on the grave, “feeding” the deceased, and giving a treat to the dead at memorial feasts were confined to Orthodox areas. During this transition period, magicians and seers could contact the dead, interpreting their wishes in response to requests of the survivors; such “seers of the dead” remain active in Hungary, Bulgaria, and Romania.

HOUSE SPIRITS

House spirits or family guardian spirits, known throughout the entire region (e.g., Bulgarian *stopan* or *talasâm*, Serbian *talasoni/talasomi*, Greek *pergalio*) were related to ancestors or came from their souls after they stayed with the family. Their various names in Hungarian, Serbian, Croatian, or Albanian often mean “snake of the house”; the Greek *stoicheion* and related terms in Bulgarian, Macedonian, southern Albanian, or Romanian often mean shadow (“shadow soul”). These spirits, whether goblins or taking the form of an animal, often a snake (but the Bulgarian *stopan* could also be a horse or an ox), lived in the house, in its hearth, doorstep, or wall, and were in a way the double of the master of the house. It is universally known that if one measures the shadow of a stranger in the house, using a reed that is then built into the wall, then the person who was measured will die and become the *genius loci* of the house. The house spirit could be given a sacrifice when the house was built (e.g., a hen killed on the doorstep and its bones then built into the house). In return, the spirit protected the residents of the house; its absence afflicted them with sickness, death, or collapse of the building. Narrative traditions about house spirits from Hungarian and other Latin territories (e.g., legends about a child who fed milk to a snake) seem less vivid than the beliefs and cults of the Orthodox Balkans.

Beside a varied world of folk devils, the “original” forms of malevolent popular demons have also survived in great numbers in the entire region. Some of these are related to the dead who are often ambivalent toward the living. They also have expressly malign types that attack their own community.

Among ghosts coming from persons who died without religious rites (major sinners deprived of burial rituals, suicides, unbaptized babies, the unburied dead who perished in a disaster or war) are those who attacked their own family, causing confusion or bringing disease, such as the Romanian *movi* or Hungarian *szecske*, or those who were referred to as “shadows” (Greek *isklos*, Serbian *osenia*, Romanian *samca*, Bulgarian *senka*, *sianka*, Hungarian *rosszak* [the evil ones], or *keresztletlenek* [unbaptized], Macedonian *nav*, *navi*, Croatian *nekrestenci*, *nevidinci*, or the Greek *telonio*, Macedonian *navi-ia*). These “shadows”—usually bird-shaped beings, often weather demons—appeared in groups in times devoted to the dead (e.g., between Christmas and

Twelfth Night. They also had a communal guardian role, fighting battles for their own community against the spirits of the neighboring community.

MALEVOLENT DEMONS

Sickness-causing demons (against St. Antony's fire, throat diseases, fevers, etc.) are known mainly in Orthodox regions, partly through spells against them. According to Romanian, Serbian, and east Hungarian narratives, demons of plague and cholera break into the village and snatch the living. Some remnants of protection rites survive: having the village ploughed around by virgin maidens or twin calves, or hanging up a shirt sown or woven in one day in the fields surrounding the village.

Demons of the childbearing bed were particularly well known in the Balkans under such names as *mora*, *gello*, *gilo* and were related to the Jewish Lilith (feared by eastern European Jews). These demonic females usually attacked in groups and assaulted both mothers and babies after childbirth. Amulets proclaiming that a saint could defeat these demons were hung on walls as protection. Beliefs regarding changelings, known throughout the region, were also connected with these demons (or elves, werewolves, or demonic witches), who swapped an unbaptized baby for one of their own. "Re-swapping" rites also existed. These beliefs both explained premature, ill-formed, or sickly babies and documented a form of double beings, widespread across Europe, which permeated boundaries between the living and the dead.

DOUBLE BEINGS

Double beings penetrating the boundaries of the worlds of the living and the dead are the Serbian, Bulgarian, Croatian, and Serbian *mora*, *morina* (a related Hungarian figure is the will-o-the-wisp *lidérc*) who were humans or demons (corresponding to German *mahr/marel/mara*). As humans they had a double life; in a state of trance, they were capable of turning into demons that attacked humans. They were usually women whose souls left their bodies to enter homes through a keyhole during the night. The double beings then assaulted the sleepers and "pressed" their bodies. The victims experienced the presence of the double beings as invisible spirits or as animals (turkey, hen, cat, etc.). They could also enter into sexual contact with their victims as incubus or succubus demons. In some places, they were purely demonic figures with no human double. "Dead *mora*" were demons that were the dead version of a person who was a *mora* in his or her life. *Mora* played an important part in the present by diagnosing, explaining, and repelling ill health or sexual disturbance accompanied by feelings of pressure during the night. Witches of the region displayed many *mora* as well as werewolf features.

WEREWOLVES

Werewolves were also double beings existing on the boundary of the living and the dead (Serbian, Croatian *vkodlak/kudlak*, etc., Slovenian *volkodlak*, Bulgarian *vkolak*, Albanian *vrvulak/vurwollak*, Greek *vrikolakas/varkalakas*, Romanian *pricolici*, Slovenian *vedomec*, Hungarian *csordásfarkas*, *szakállas farkas*, *prikulics*). A werewolf could turn into a demon that attacked humans both in its life (in a trance) and (in the case of "dead werewolves" or werewolf demons) after its death. Contrary to *mora* figures, which were mainly female, werewolves were usually men. Their birth was fated: those who were outside of time/space/society were usually werewolves (illegitimate children, seventh children, twin brothers, children conceived on a day of celebration, unbaptized, excommunicated, or swapped by a werewolf, etc.). Werewolves were often persons born with animal signs (teeth, tail, bristles, wings, or in snake skin). They were capable of turning into animals (mainly wolves, as well as snakes, dogs, male wild boars, horses, cats, etc.) by sticking themselves through a belt of silver birch, by putting on a belt of wolf skin, by doing a somersault, or during a trance or dream ("in their soul"). There were typical times for this transformation (the new moon, Fridays, nights, between Christmas and Twelfth Night, at Easter, etc.). After transformation, the werewolf joined the wild group of werewolves and together they assaulted humans and animals. A typical group of werewolf beliefs from the Balkans were about dead, otherworldly beings that attacked humans at the winter solstice (Serbian *karakondzuli*, Greek *kallinkantzawi*, Macedonian *karkandzule*, Albanian *karkandsoli*, *karkanxholl*, Croatian *karangjolož*). Known primarily in Orthodox areas, these demons attacked when human activities (women's housework, spinning, sexual activity) were governed by taboos. The world was ruled by conditions of the underworld: werewolves brought chaos and sickness into houses and indulged in repulsive orgies in kitchens and cellars. Serbian, Bulgarian, Greek, and Hungarian rites enabled babies born as werewolves to evade their destinies or to be re-swapped. These included the symbolic cooking or roasting of the baby, or dressing it in a shirt woven in one night. These rites intended to turn the double beings into humans. More recently, an expansive vampire belief has accreted over these beliefs. Presently, the term *double being* refers to a vampire or a werewolf with strong vampiristic features. There were also werewolves that protected humans. Some werewolves played the role of the "lord of animals," the leader of the werewolf group that protected flocks from attacks by other werewolves. Thus the werewolf triumphed over its own assaulting self in "battles of the soul." These notions provided the mythical background to the so-called werewolf magicians of the region who fought mythical soul battles in animal shape against hostile werewolves.

Related to werewolves were horse demons (Romanian *sântoaderi*, Serbian *todorci*, *todorovci*), which attacked on Saint Theodor's day in Orthodox Balkan areas. They marched at night in the shape of centaurs, horses, or men with hooves accompanied by the clapping of hooves. They brought sickness but also fecundity to the living. Also related to werewolves was the dog-headed demon (Serbian *psoglavac*, *pasoglav*, Croatian *pasoglavec*, *soglav*, Slovenian *pesoglav*, Romanian *capcaun*), which attacked from the "far side of the waters," from "over the wall"—in other words from a symbolic alien otherworld.

MAGICIANS AND MEDIATORS

Throughout this area, various magical specialists played an important part in traditional communities, as did mediators offering contact with the spirit world. Magicians healed, ensured the health of animals, and provided good weather as well as amorous services. It is not possible to separate magicians using divination techniques from mediators establishing contact with the supernatural world through visions and dreams, who went to the otherworld to acquire knowledge and fulfill their tasks in trance visions. They also entered the otherworld to fight soul battles with demons attacking their community, to conjure up the dead, or to get information about their fate in the otherworld. Using trance and dream techniques and various methods of divination, they could provide information about the future or about lost animals or missing persons, identify thieves, or locate buried treasure. One important divinational task was to diagnose the malefactions of witches and identify the malefactors.

Each fortuneteller, seer of the dead, or quasi-shamanistic magician could fulfill one or more of these functions simultaneously. All of them used various techniques of divination: wax casting, spinning a sieve, looking in a mirror or at the stars, trance journeys, or being possessed. All were active throughout central and eastern Europe, but with some specific variants. Both sexes were involved in fortunetelling, divination, and their principal activity, healing. Female magicians were mainly healers or seers of the dead; they were also involved in love magic and, according to seventeenth- and eighteenth-century sources, in finding hidden treasure. Most weather magicians were men. Magical methods are still practiced by many village healing women. Few except healing monks used manuscript recipe books; most repeated long spells that they knew by heart.

Local magicians differed according to which spirit world or otherworldly realm or guardian spirit they contacted. Weather magicians and fertility magicians with quasi-shamanistic abilities (some still active in the early twentieth century) had different local variants. Croats and Serbs had "cloud leaders" (*stuhal/zdubac*), in

contact with the winds, who fought storms. Numerous types of werewolf-magicians, born with cauls or in snakeskins (Serbian, Macedonian, Bulgarian *zmei/zmail/zmija*; Slovenian, Croatian *kresnik*, relevant types of Hungarian *táltos*), kept contact with various animal guardian spirits (eagles, dragons, snakes, cockerels). All these fertility magicians traveled to the otherworld in order to fight magicians from a neighboring village or clan, or fight against underworld dragons or witches attempting to steal the harvest or snatch the grain to the otherworld. Some Slovenian *kresniki* went to the underworld in order to take grain from a snake goddess. Magicians of fertility, particularly some healers, also kept ritual contact with fairies. Holy people, lay Christian spiritual mentors, who often mediated simultaneously with the spirit world and with otherworldly Christianity through visions and other mystical experiences, often fulfilled these tasks.

RELIGIOUS MAGIC AND FOLK CULTS

Popular magic was inseparable from rites of popular religion and had similar functions, such as protection from demons, influencing everyday life, and farming. Certain manifestations of the cult of saints, pilgrimages to sacred spots, holy oaths and vows, magical healing taking place at sacred spots, priestly blessings and healings, spells and divination, exorcism against the Devil, and other chastening exorcism rites concerned the same profane sphere of everyday life as nonreligious magical activity. Priests who healed or looked into the future used or prescribed magical means and objects similar to lay practices (e.g., wearing sanctified objects as amulets, magical fasting, blessing or cursing over the belongings of the sick). Priests and monks have more important roles in healing, exorcism, and blessings in the Orthodox areas today than in the Catholic western Balkans. These Orthodox peripheries of Europe have retained medieval practices of clerical magic and divination in their commissioned blessing and cursing rituals and their positively or negatively motivated votive masses.

EVERYDAY MAGIC

Both religious and magical rites had their everyday forms, including versions of sacrifice and divination related to calendar holidays (e.g., divination of death and love affairs near the winter solstice, fortunetelling from pig's shoulder blades at Orthodox Christmas dinners). Belief in presaging signs (particularly of death) and other forms of divination not related to the calendar were also common. Certain methods of divination on festive days were related to sacrifices offered to the mythical beings visiting at these times—floury foods were offered to the dead on Christmas night and to Luca (St. Lucy) on Luca's day. Forms of activity within magical practice permeated all-important areas of the

everyday life of traditional communities, although the procedures varied. Ensuring the fertility of grain and animals (milk yield) and the protection of flocks and of fields from hailstorms was associated with certain calendar occasions or the start and end dates of work (e.g., rites related to the animals first being led to the pastures, such as making the animal tread on an egg to make it fertile—on St. George's day). Many divinatory rites to protect people also accompanied the transitional rites of human life. It was common to offer magical protection through amulets and sanctified objects to persons in liminal states, such as mothers just after childbirth, babies before baptism, and the dead displayed in coffins. On days known for attacks by demons, the house and the stables needed protection through objects worn on the body or placed in the doorways and by deterrent spells. Magical and religious actions, objects, and spells surrounded all procedures of farming and the household, but particularly those with a more risky outcome, such as butter churning or bread baking. In crisis situations, magical and divinatory practices survive to the present (e.g., rain magic by pouring water, deterring hailstorms by throwing the bread shovel or the axe into the courtyard, love magic, or identifying future husbands). Some areas of folk healing persist as well (especially the healing of maladies attributed to malediction). Harm through magic had intentional and unintentional, graver and less serious forms. The evil eye was considered an inherited and thus unintentional malediction, separate from witchcraft, perceived as intentional. The evil eye is still the most common magical cause of illness today in the southern Balkans, where "casting water" (throwing embers in cold water) curbs its effects. Amulets and spells can ward off the evil eye, as might devices such as the sign of the horn or the fig, and the colors red or blue.

Other types of black magic in the Orthodox Balkans included fasting, laying curses, and burying objects of malefaction in somebody's path. Sometimes people commissioned magicians to practice these types of harmful magic. Even today, priests send curses or give masses of malefaction. Love magic commonly involves taking the person's bodily fluids or belongings or acquiring the person's bodily parts—such as hair—and tying them to one's body or to a house (e.g., picking up a person's footprint from the ground and pasting it to the bread-oven with mud). On other occasions, people sought specialized experts (usually Gypsies) for love potions.

COMMUNAL MAGICAL AND HEALING RITES

Most communal magical rites were intended to ensure the fertility of grain harvests or the health of animals. Most were rites of transition from one season to

another and were connected to a particular date. The rite of dipping in the water on St. John's Day, mainly practiced in Orthodox territories, or the rites of "picking the dew" done throughout the region on St. George's Day, Whitsun, or St. John's Day, both aim to ensure rain, fertility for grain, and the milk yield of cattle and sheep. Masked rites of fertility magic had two main festive cycles: around the winter solstice (in the entire region) and the end of winter carnival (mainly in Latin parts). The varied dramatic plays of the different nations emphasized wishes for the fertility of grain and animals as well as humans; they included numerous death and resurrection plays, ritual pulling of plows and sowing of seeds, masked impersonations of the "returning" dead and of werewolf demons who became active at these times.

Rain magic among the Serbs, Croats, Albanians, and Romanians in times of drought included such rites as *dodola* and *paparuda*, whereby naked girls dressed in green branches roamed over the village singing songs of rain magic while villagers poured water on them.

Collective healing rites entailing a possessed state of consciousness are known from the Orthodox Balkans in the Serbian, Bulgarian, and Romanian forms of *rusalia* and *calusari*. These specially organized ritual societies had serious communal functions each year between Easter and Whitsun and during the twelve days of Christmas, times when people could be possessed by the dead or by fairies. Their main task was to heal illnesses caused by fairies. Through music and dance, the "good fairies" possessed them. Sick people were drawn into the dance, inducing a trance in which they fought, with the help of the spirits that possessed them, against the evil spirits. Traces of Whitsun fertility rites related to fairies have also survived in Roman Catholic Croatia, Slovenian, and Hungarian territories (*ljelje, kraljice, pünkösdi királyné*), but have no known healing function. Bulgarian *nestinari*, who dance on embers, maintain a cult related to a possessed state and include a healing function, but *nestinari* are possessed by Christian saints (chiefly St. Constantine and St. Helena) rather than fairies, and the rite is connected to their festivals. All these rites survived in the nineteenth and twentieth centuries in many places as both fertility magic and healing rituals.

HUNGARY AND SOUTHEASTERN EUROPE, WITCHCRAFT

In Hungary and Southeastern Europe, popular concepts of witchcraft mainly entailed *maleficium* (harmful magic), done by a known local enemy. In this fashion, witchcraft helped to interpret otherwise inexplicable misfortunes of all kinds—particularly sudden diseases in humans or animals, decreases in milk production of cows, or the death of babies. In medieval and early modern times, at the southeastern edges of Latin Christendom (i.e., Hungary, Croatia, and Slovenia), witchcraft became an important community function expressing tensions between members of isolated and close-knit communities. Traces of witchcraft as a village community institution still survive in areas that most strongly retain traditions, but other areas only record narratives about the actions and beliefs of witches.

In Orthodox southeastern Europe (i.e., Greece, Macedonia, Bulgaria, and Romania), other systems of beliefs explained many such misfortunes, including supernatural causes and reasons for diseases (e.g., fairies, transgressions of taboos about the dead, sickness demons, etc.). In this region, black magic and *maleficium* did not exist solely in relation to witchcraft beliefs, but might operate, for example, through religious curses "sent" with the participation of priests. We know much more about the history of witchcraft in Latin

Christian regions of central Europe, where the persecution of witches was institutionalized, than we do in the Orthodox lands of southeastern Europe. Moreover, relevant documents are extremely sparse here before the fifteenth century, unlike Hungary, where eleventh- and twelfth-century law codes discussed magicians and fortunetellers (*maleficia* and *weneficia*) as well as *striga* (night demons known in Hungary through sixth- and seventh-century German legislation).

Throughout Latin Christian areas (Hungary, Croatia, and Slovenia), accusations of sorcery and black magic recurred too sporadically throughout the Middle Ages to enable us to describe the supposed activities of witches, while sermon literature usually mentioned witches together with fortunetellers and magicians. But neither do we know what forms of harmful magic were condemned by scattered clerical prohibitions in Orthodox sources (Serbian, Bulgarian, Greek, and Macedonian). Afterward, documentation from thousands of witchcraft trials in seventeenth- and eighteenth-century Hungary, Croatia, and Slovenia reveal the early modern Latin system of witchcraft; methods for channeling tensions within villages and small communities onto scapegoats through accusations of *maleficium*, against a background of a syncretistic religious/magical cosmogony that aided the functioning of the system.

As elsewhere in Latin Christianity, accusations of *maleficium* usually gave vent to various social tensions (neighborhood conflicts after the rules of coexistence were trespassed). That is, witchcraft accusations often affected persons with whom the accuser had previously had a personal conflict (neighborhood jealousy, material damage to each other, refusal of help, denial of services or loans, territorial conflicts, family, particularly marital conflicts or those between mother-in-law and son-in-law, inheritance conflicts, libel, and so on). Others accused of witchcraft had actually carried out sorcery or acted as magicians or healers or pursued some other suspicious trade, for example, midwives, fortunetellers, or people who practiced conjuring up the dead. Communities often had a "standing witch" who provoked the suspicion of bewitching through his or her magical activity as healer, midwife, or magician. Other persons became the regular victims of witchcraft accusations because they were judged to be aliens within the community, by personality or by socioeconomic status. In Hungary, witches commonly cured their own spells, or the healer was the same person who identified the witch. Throughout the entire region, there were and still are numerous folk methods for identifying a witch, most of which force the malefactor to the victim's house or symbolically injure the witch by beating or burning a piece of his or her clothing, hair, or feces.

If the bewitching was remedied, private accusations against witches were rare. But we find communal

sanctions for recurring cases of *maleficium* through water ordeals or through beating the witch, both before and after the times of witch hunting and also in places and times free of such hunts. Witchcraft purges provided opportunities for drastic legal solutions to such tensions and accusations by expelling the accused persons from the community, while local remedies for solving tensions and accusations survived. In this region, witch persecutions never became sufficiently extensive to effect radical changes. The effect of demonology was too weak to demonize archaic witch beliefs at the village level, and local experts in magic did not change much during three centuries of witchcraft persecutions.

POPULAR WITCHCRAFT IN MODERN TIMES

In more recent times, anthropological and folklore collections provided ample data for the entire central and southeastern European regions, including Orthodox Serbia, Bulgaria, Romania, and Greece, which were free from witch persecution (Albania and Macedonia remain less well known), enabling us to draw a clear outline of modern functioning of witches, magicians, and witchcraft within communal systems, as well as the mythical background behind witchcraft and the typical attributes of regional witches.

Throughout the region, people accused of witchcraft displayed supernatural traits (including the occult capacity for bewitching), making them suitable subjects to whom various misfortunes could be attributed.

On the other hand, ordinary people actually practicing black magic existed mainly in the Balkans. Among Hungarians, the actual practice of harmful magic occurred mainly in Hungarian communities presently living in Romania. Persons involved in such practices and their techniques (curses, black fasting, placing or burying objects in the victim's path) were not necessarily considered sorcerers and sorcery, especially in areas where communal traditions of witchcraft were weak (Greece, Bulgaria, parts of Romania, eastern Hungary). In such regions, one should talk of magicians rather than witches, because Slavic terminology for magic and sorcery is often inextricably intertwined; for example, *ved* (Old Slavic for "know") reappears in Serbian, Croatian, and Slovenian *veščica*, Bulgarian and Macedonian *veštica*, or Serbian *vještac*, *višćun*, *vjedogonja*, *vjedovit*. Another group of terms denotes demonic witches, especially those who live and function as night demons (vampires, werewolves, or *mora*—"pressing" night demons from the underworld), and in the Balkans they refer to witches with two formal variants, one living and one demonic or dead. Hungarian *boszorkány* originated as a "pressing" night demon or incubus that caused, by weighing down on the sleeping person during the night, a sense of suffocation, pressure, heart complaints, and erotic experiences. By the

Middle Ages, it came to include human witches, but in Hungarian folk belief the *boszorkány* still retains the traits of the "pressing demon."

Some terminology refers not to human but to demonic witches. The Greek word *strigla*, *striglos*, *stringlos* (a bird-shaped demon harming animals, children, or women, or a demon of the childbearing bed), as well as the Romanian term *strigoi* (simultaneously meaning human witch, werewolf, vampire), was carried north by Vlachian shepherds from the southern Balkans into Slovakian–Ukrainian–Polish areas, where it refers to vampires or demonic werewolves. However, among Dalmatian and Istrian Croats, Slovenes, Albanians, and Serbs, it also denotes a human witch (probably through the classical Greek *striga*, a bird-shaped demon harming animals, children, or women, which also means human witch). The Bulgarian term *bnodnica* denoted a different type of demon, originally a water fairy but today a witch who steals grain from a neighbor's land. Hungarian *szépasszony* (fine-looking woman) originally and often still means a fairy, but could be a synonym for a human witch.

In medieval or early modern Hungarian, Slovenian, and Croatian folk beliefs, demonic ancestors lost their original functions and apparently merged into the topos of the witch, adding the werewolf and fairy traits attached to such names. Meanwhile, to a much greater extent than in Latin regions of eastern Europe, Orthodox peoples have retained a rich range of demonic beings that have endured until the present. In many respects, Serbian witches resemble *mora* demons rather than humans; Romanian *strigoi* are also more vampire than human. Bulgarian witches are closest to fairies, while Greeks practically never mention human witches. All this is connected both to the relative lack of witchcraft as a communal village institution and simultaneously to the extensive survival of demonic rather than human causes for misfortune.

Among southeastern European peoples, even human witches often had demonic formal variants, which characteristically existed as living and dead pairs. For example, a Romanian *strigoi* could be either living or dead. Like human witches, a living *strigoi* could assume a demonic form in the night, while a dead *strigoi* was usually the ghostly variant of a dead *strigoi*, or possibly its ancestor or guardian spirit. Dead variants occurred also in Serbian and even in Latin (Croatian, Slovenian, or Hungarian) beliefs. Here a witch could possibly become a demonic being—a werewolf or a vampire—after its death. For example, dead Hungarian witches sometimes became demonic *lidérc*, similar to *mora*.

Witches could acquire their supernatural knowledge either through birth, inheritance, or learning; and in the background we may find helping or guardian spirits, demons, or even the Christian Devil. The dichotomy between taught witches and born witches

characterized the entire region. The inherited capacities of the born witch may be indicated by some sign at birth, such as being born with teeth or a double line of teeth, being born with a caul (white cauls indicated a good werewolf who supported humans, black ones foretold an aggressive werewolf or a vampire). These traits were generally known—probably least among Hungarians—and were connected everywhere with werewolf and *mora* characteristics of the witch (teeth, caul) as opposed to vampire characteristics (double line of teeth). Romanians preserved beliefs about *priculici*, witches born with a tail, which was also a werewolf trait. Another Romanian belief (also known in other Balkan contexts) was that at birth, the “fate women” or midwives defined the destiny of the *strigo*-baby, committing them either to positive lives or to evil, anti-human deeds.

There were many beliefs in southeastern Europe regarding learning witchcraft, the most common being the acquisition of some sort of helping spirit, often a chicken or a snake. This spirit was gained either by performing certain rituals (sometimes with chicken’s blood) or frequently through travel in the underworld from a cave, from water or a marsh, or from a snake-like underground goddess-type creature. Through the assistance of this helping spirit, the sorcerer acquired the capacity for trance. During their soul journeys in the night, the chicken or the snake became quasi-shamanistic soul animals, like the helping spirits of the “good” werewolf magicians; but the sorcerer used the trance for negative aims: in the night, the soul left the body and harmed sleepers by getting through their keyholes or taking an animal or spirit shape. A dragon or even the Christian Devil may have played a similar assisting role. Hungarian witches also used *lidérce*s (as chickens or owls) for helping spirits, this latter being related to the South Slavic *mom*. Regardless of demonology, the region was full of helping spirits that went along with innumerable variants of learning from the Devil, initiation by the Devil, or general contact between witches and devils. Given the Byzantine origin of legends about Theophilus’s pact with the Devil, it is not surprising that Romanian, Bulgarian, and Greek folklore contains numerous witches who were possessed by the Devil, surrendered themselves fully to the Devil, became united with the Devil, or maintained sexual contact with the Devil. Certain folkloric notions of the witches united with the Devil or permanently possessed by devils also occurred in Hungarian, Slovenian, and Croatian folk beliefs, where the name of witches was actually *ördög* (= Devil) in a large eastern region.

Witches could assume animal forms in all regions: butterflies or birds in Bulgaria, Romania, Serbia, or Macedonia; a goose, dog, or wolf in Bulgaria; cats or dogs in Croatia, Serbia, Hungary, Romania; a wolf, horse, or cockerel in Romania; a turkey or chicken in

Romania and Serbia. They could become invisible and fly. In other words, they could behave like spirits, but according to many beliefs, only during night hours, when they could appear as pressing night *mora*, *lidérc*, werewolves, fairies, or fate-women.

Other sources reveal that the ability to turn into animals was connected with the capacity for trance: their “free souls” or doubles, leaving the body during the trance, took the shape of an animal (usually a butterfly) or a demon, and set out to attack, harm, and sicken humans, traveling both individually and in groups. In a third widely known type of explanation, witches had more or less permanent corporal and spiritual doubles who could appear as spirits, either in human or animal form, and possess other persons or animals in whose shape they appeared. With such double witch figures, the “dead” variants could be identical to the living ones in every respect, except that soul journeys and transformations into animal shape referred to spiritual beings rather than living people.

Witchcraft entailed the supernatural ability to bewitch or heal everywhere, but methods of *maleficium* varied widely. They could be performed from a distance, when only the result was perceived; or directly, when the witch made a victim swallow substances causing *maleficium* or placed objects under a neighbor’s doorstep, in a courtyard, or by using objects stolen from the victim. Spells against animals or the deprivation of milk required touching, stealing the necessary objects, or symbolic actions mimicking milking. Throughout the region, “picking dew” was a widespread method for taking milk from a neighbor’s cow or grain from his fields on St. John’s Day, St. George’s Day, or on other important agricultural festivals. It was not necessarily connected to witchcraft but often surfaced as a witchcraft accusation in trial documents. Verbal magic, curses, and threats played a great part during the centuries of witchcraft persecution and continue to do so in Orthodox regions. A unique trait of Bulgarian and Macedonian witches connected their milk-spoiling with the moon: they “pulled” the moon down magically and milked it like a cow in order to steal milk from other houses.

Other beliefs connected witches’ maleficent methods to their capacity for trance. A great deal of data depict witches lying unconscious; legends related that after awakening, they described their experiences at the witches’ meeting or during their journey. Beliefs often associated flying with the journey of the soul. Beliefs regarding flights, both individually or in groups, were highly varied: the *mora* witch, known in all regions, sat on the chest of sleeping humans and assaulted them or initiated sexual intercourse with them; a Macedonian or Greek *striga* or *striglos* sucked blood; like Croatian witches, a Serbian witch flew from house to house eating humans, particularly little children, or people’s

hearts. The belief about witches making victims into horses and galloping on their backs was known throughout the region, and was most intensely alive in relation to Hungarian witches.

The souls of Romanian *strigoi*, flying out in a trance, went in groups bewitching herds, milk, and grain, participating in parties and feasts, or fighting with poles against neighboring groups of *strigoi*. These activities happened on certain feasts at the start of the agricultural season (which are also days associated with werewolf beliefs) such as St. George's Day, St. John's Day, and St. Andrew's Day. Similar flights of groups of witches attempting some *maleficium* against the harvest, or battling against neighboring grain-spoiling witches, also appeared in Croatian and Slovenian folk beliefs. Witches who traveled as wolves or other animals on tours of harmful magic were also known in Hungarian, Romanian, and Serbian folk beliefs. Narratives often associated visions of witches with their capacity for trance and for assuming animal shape. In the former phenomenon, the night spirit-ghost appeared in the victim's dream or vision as an apparition that sat on the victim's chest as a "prëssing" demon, tried to strangle the victim, and finally cantered on the victim after turning him or her into a horse. On other occasions, a group of witches arrived in a house as elf-like creatures that held a rough and noisy party, playing music and dancing. These night apparitions abound in the documentation from witchcraft trials everywhere they occurred, providing this region with unusually rich and varied images of spirit and demon figures in the early modern period. The integration of the demon world, and particularly the rich world of fairies characteristic in the Balkans, made witch parties into fairy balls, while its scenes of battle resembled the soul fights of the witch's magician ancestors, fought in a state of trance.

In all the countries of the region, these dream apparitions, group soul journeys, and battles preserved autochthonic parallels from folk belief to demonological doctrines. Antiwitchcraft demonology reached Hungary, Croatia, and Slovenia through witchcraft trials and priests who had studied in the West, and appeared to some extent in trial records but the doctrine of witches renouncing baptism or the witches' Sabbat as a conspiracy of apostate witches never took root as an ideology serving antiwitchcraft purges. None of these ideas ever penetrated Orthodox areas free of witch hunts. Hungarian, Croatian, and Slovenian stories about the journeys and meetings of witches' societies shared some features with clichés about the witches' Sabbat used in official demonology (e.g., a village lad, who was in fact the Devil, initiated or forced a pact on a victim dragged away from the village). Similar stereotypical elements, including the witch's ointment or the motif of flying with the Devil's help, can only be documented from the minutes of trials; these elements

are absent from modern witch beliefs, where witches' parties become dinners and dances taking place either on a local mountain or hill, under a tree, or at a crossroads. These parties, following the stereotypical elements of international legends, suddenly turn rough and wild (e.g., the food turns into dung), or in other cases, they are described as slightly disgusting underworld-type events, noisy and rough feasts held in cellars or mills. Such narratives sometimes contain initiation motives more archaic than the official pact with the Devil, incidents in which the victim is cooked and boned. They include some otherworldly symbolism, such as crossing a river or narrow path, or reaching the goal in a small object such as a sieve or a nutshell drifting downriver. Together with other data referring to the witch's ability for trance and soul flight, such details support the hypothesis (Ginzburg 1991) that these archaic images of journeys to the otherworld serve as the basis of the images of the witches' Sabbat.

HUSSITES

The relationship between the reform movement named after the Czech reformer Jan Hus (1370–1415) and the history of witch persecutions was twofold. On the one hand, like witches, the Hussites became victims of the fifteenth-century papal inquisition after the Council of Constance, where their leader Jan Hus was burned at the stake in 1415; on the other hand, the Hussite church, founded in Bohemia in the fifteenth century, consistently rejected witchcraft.

The term *Hussites* incorporates various groups formed after the conflicts in Bohemia, which survived into modern times in one way or another. Differentiating among "Taborites," Moravian and Bohemian Brethren, and the Assembly of Brethren exceeds the scope of this entry. A direct connection between the inquisitorial persecution of the Hussites and the onset of witch persecution can be found in the writings of Heinrich Kramer (Institoris), the author of the infamous *Malleus Maleficarum* (The Hammer of Witches, 1486). Within the context of demonology, it mentioned the Hussites (II/1,1), but without implying any direct connection between witchcraft and their heresy. Unlike the term Waldensian, Hussite never became a synonym for witches or sorcerers, but after his inquisition of witches in southwestern Germany, Kramer turned to the persecution of Hussites with similar intensity. When appointing him inquisitor for Bohemia and Moravia in 1499, Pope Alexander VI issued a papal decree explicitly condemning the Bohemian Brethren and the Waldensians, and Kramer soon published a book with a title as militant as the *Malleus*, his *Sancte Romane ecclesie fidei defensionis clipeus adversus Waldensium seu Picardorum heresim* (Shield of Defense of the Faith of the Holy Roman Church Against the Heresy of the Waldensians or Picards in the Nations of Germany and Bohemia . . . Olomouc, 1501). It alluded to witchcraft by charging

that one of the heresies of the Bohemian Brethren was their rejection of proceedings taken against witches. Another Catholic demonologist, Jean Maldonado, linked the Hussite heresy to witchcraft: "Bohemia and Germany, [where] the Hussite heresy was accompanied by such a storm of demons that witches were busier than heretics" (cited in Waite 2003, 106).

The Hussites' own views on witchcraft are more difficult to ascertain. The main representative of Hussite theology, Luke of Prague (1460–1528), who probably came under the influence of the German Reformation in his last years, expressed a comparatively moderate attitude. His own catechisms, and those written or influenced by other Hussite theologians, contained almost no references to sorcery and witchcraft. Their exposition of the first commandment, which is helpful here, emphasized the ethics of love, in which love for God finds its true expression in love for one's neighbor. Christians must reject strange cults and false gods on the basis of the Decalogue; according to the Hussites, this primarily involved the rejection of such Catholic forms of devotion as reverence for saints. Not until the late sixteenth century did Hussite catechisms prohibit all consultations with sorcerers and diviners, whether to prevent or to cause harm. The formulas used, however, showed strong influence from Lutheran catechisms of sixteenth-century Germany. Thus the Hussites, and later the Bohemian Brethren and the Assembly of Brethren, ranked among reform movements of the late Middle Ages and early modern period that consistently internalized their conception of the black arts, developed no doctrine of demonology, dissociated themselves from witch hunting, and bridged the transition to the moderate attitude of Reformed Protestantism and early Pietism in the late seventeenth century.

HUTCHINSON, FRANCIS (1660–1739)

Author of *An Historical Essay Concerning Witchcraft* (1718; 2d enlarged edition, 1720), Hutchinson was educated at Cambridge (BA, 1680; MA, 1684; DD, 1698). He was, first, vicar of Hoxne in Suffolk, and by 1692 became curate of St. James's church in Bury St. Edmunds. Hutchinson became bishop of Down and Connor in Ireland in 1720.

His politics were those of the Whig establishment; he preached in 1707 in favor of Anglo–Scottish union, and in 1717 he published a biography of Archbishop John Tillotson, a figure approved of by the Whigs. In 1708, he published a rationalist tract against the contemporary practice of prophecy and faith healing (*A Short View of the Pretended Spirit of Prophecy*), and his *Compassionate Address to . . . Papists* (1716) dismissed Catholic claims to practice exorcism. He planned his book on witchcraft as early as 1706, but was advised against publishing on the subject by the bishop of Norwich and the archbishop of Canterbury. In 1712, the case of Jane Wenham momentarily revived his plans to publish; but he only pressed ahead in response to the publication of Richard Boulton's *A Compleat History of Magick, Sorcery and Witchcraft* (1715). Boulton later defended himself against Hutchinson with a *Vindication* (1722).

Hutchinson's *Historical Essay* demonstrated an extensive knowledge of previous literature for and against belief in witchcraft. He listed twenty-five works published since the Restoration defending belief in witchcraft, and among the skeptics, he was familiar with Johann Weyer, Reginald Scot, Friedrich Spee, Thomas Ady, John Webster, and Balthasar Bekker. Hutchinson sought to place himself in the tradition of Samuel Harsnett (1561–1631), author of attacks on Catholic and Puritan exorcisms (*A Declaration of Popish Impostures* and *A Discovery of the Fraudulent Practices of John Darrell*), and eventually archbishop of York; Harsnett, for his part, was much influenced by Scot. Hutchinson followed both Scot and Harsnett in treating witchcraft and possession stories as ridiculous and contemptible; he referred with approval to François Rabelais and Miguel de Cervantes as exponents of the art of telling stories that in their telling could be seen to be patently untrue (1st ed., p. 172).

It would be wrong to think that Hutchinson had nothing new to contribute to the debate on witchcraft, for he is the first of the skeptics to deploy probability theory (which had been effectively invented in the late seventeenth century) to measure the reliability of historical testimony. Thus, Richard Baxter had given an account of an elderly parson, Lowes, who had sunk a ship by witchcraft. Hutchinson responded: "When wise men believe wonderful things, they take care, that the proof be as extraordinary to support it: But in this case we have no corroborating circumstances of time, or

place, or the name of the ship, or any witnesses, in a case that requires vast numbers, that could depose, that at such a time, that very ship by name, or at least a ship particularly described, did sink miraculously, when it had a calm sea and a fair wind, without either rock or tempest. Instead of these kinds of probabilities . . ." we have only a confession extracted under torture (Hutchinson 2003, 67). Boulton responded in kind. Where Hutchinson had protested that much of the evidence for witchcraft was the result of mental disease, imposture, and torture, Boulton insisted it was easy to lay such evidence to one side, for "who would convict a witch against probability and circumstances of actions? These are the things which moral proof consists of, and which give credit to testimony, and as belief is founded upon moral proof, upon that proof judgement ought to be given" (Boulton 2003, 50)—"moral proof" being a technical term referring to testimony in support of a matter of fact so reliable as to make disbelief irrational. The issues in debate between Hutchinson and Boulton were thus identical with those later raised in Hume's "Of Miracles."

Hutchinson also relied on a new notion of evidence that, Ian Hacking (1975) has argued, was a by-product of probability theory. Hutchinson explained his novel system of reasoning by appealing to the story of the ass that tried to pass as a lion by donning a lion's skin, but one ear stuck out and betrayed him. So a woman confessed in 1618 that she had asked her cat to bewitch someone, "whereupon the cat whined and cried mew," signifying she had no power to do so. "Now this one circumstance looks to me like the ass's ear. For what should a cat say but *mew*? And how could the poor woman have been suffered to have interpreted that to her own destruction, if she had not been in the hands of fools?" Despite testimony that convinced a jury, "I do not believe a word of it." "A true lion, let him be young or old, or lame or blind, yet he hath not an ass's ear; nor hath a natural true action anything about it that is unnatural and false" (Hutchinson 2003, 28–29).

Unsurprisingly, Hutchinson balanced his skeptical historical arguments regarding the evidence for witchcraft (developed through a detailed study of numerous cases) with two sermons, one giving a brief and conventional account of the evidence for the truth of the Christian religion (from prophecy, well-attested miracles, reliable histories, etc.), and the other outlining what we can reliably know about good and evil spirits. There was, however, a tension between these sermons and Hutchinson's earlier claim that "The Scripture facts soberly interpreted, agree with the notions we have of God and Providence, and the Laws of Nature" (Hutchinson 2003, 11) and his insistence that we should always remember "how very steadily nature, and even the imitations of it, keep their course" (Hutchinson 2003, 150).

Hutchinson's historical knowledge was considerable and enabled him to rebut the traditional argument that the evidence for witchcraft is the same in all times and all places by a much more sophisticated account of the history of witch beliefs. He argued that certain beliefs were peculiar to certain times and places—belief in familiars or “imps,” for example, to England—and that the evidence in favor of witchcraft was not objective, but was constructed to validate beliefs people already held. Insofar as that evidence depended on what Hutchinson called “spectral testimony” (evidence of spirits and visions, or evidence produced by charms and magical practices), he was prepared to dismiss it out of hand—not by denying the existence of evil spirits or the possibility of magic, but by insisting that the Devil was a liar, and was likely to give testimony against the innocent. (Boulton's reply had to adopt the uncomfortable position that the Devil often deliberately betrayed his adepts into the hands of justice.)

As a contribution to a wide-ranging debate on the character and reliability of historical testimony, particularly testimony in favor of supernatural events, Hutchinson's *Historical Essay* belongs alongside such works as his own *A Defence of the Antient Historians* (1734). There has been considerable puzzlement as to why belief in witchcraft declined rapidly among educated people after 1718, without a sustained attack on traditional demonology: Hutchinson's book stood alone and could not have been widely read. The answer lies in

a wider shift in standards of evidence that took place as part of the emergence of probability theory, a shift Hutchinson's book illustrated.

I

ICELAND

Iceland is situated far enough outside the European mainstream that witch persecutions lagged behind continental witchcraft trials. While the island was somewhat belatedly undergoing the changes of the Reformation (1550–1600), witchcraft still remained in the background. Nevertheless, once witch persecutions finally reached Iceland, then inhabited by barely 50,000 people (Finnsson 1970, 195), witchcraft doctrines shook its society with great force. Between 1593 and 1720, Iceland recorded 134 trials for sorcery and magic, involving 186 individuals, 166 men, 15 women, and 5 of unknown identity. As many as 103 of those cases, involving 128 individuals, were brought before the *Althing*, Iceland's highest court; 22 of them were burned at the stake as witches (Fiorvar'ardóttir 2000, 175–184, 317–319). In an Icelandic context, the word “witch” seems an inappropriate term for the accused; “cunning people,” “wizards,” or “magicians” better translate the Icelandic word *ffólkyngisfólk* (literally, “wise people”), the most frequently used term in the protocols (Fiorvar'ardóttir 2000, 22–25).

Remarkably enough, and a sharp contrast to what happened in most other parts of Europe, the Icelanders accused and tried for practicing sorcery were nearly always adult males; with rare exceptions, Iceland's women and children were not punished as witches. Of the 128 witchcraft defendants at the *Althing*, only 10 were women; of the 22 burned, only one woman was executed as a witch (Fiorvar'ardóttir 2000, 317–319). The only woman ever executed at the stake for this crime in seventeenth-century Iceland died together with her teenage son in 1678—apart from him, no adolescents were executed as witches in Iceland, unlike in some parts of continental Europe. Before the actual era of Iceland's witch persecutions, two other women were executed at the stake for diabolical crimes. A nun, damned by the church for making a pact with the Devil, was burned to death in 1343 (Storm 1888, 402); in 1580, a woman was executed for breeding a *tilberi* or imp, created by witchcraft, somewhat similar to the Swedish *mjólkhænt/trollkatten* (Resen 1991). Apart from these two, a woman was burned to death in 1608 for murdering a child by throwing it into boiling water (Benediktsson 1881–1932, I, 90). That is the only

known case in Iceland where a murderer suffered that kind of death penalty; normally women were drowned and men were decapitated for capital offenses other than witchcraft. However, although this woman was not legally a witch, the court punished her as one because it was so horrified by her crime.

Most of those burned at the stake for sorcery in seventeenth-century Iceland lived in *Vestfir'ir* (Westfjords). To some extent this severity can be attributed to the fact that two of the most powerful public servants in Iceland, both of them incredibly enthusiastic witch hunters, ruled this district at the time. Closely linked by family ties, these men (*fiorleifur Kortsson*, the lawman of the western and northern regions of Iceland, and *Páll Bjömsson*, a rural dean of *Vestfir'ir*) supported each other in their campaigns against witchcraft (Fiorvar'ardóttir 2000, 99–111).

Most of the accused were individuals of little influence, poor people, even wanderers or vagabonds. Though they were sometimes accused, rich farmers, priests, or chieftains almost never ended up at the stake, with very few exceptions. The accusers, on the other hand, were very often priests and lawyers, the same people who imposed Lutheran ideology with the full support of the Danish kings who ruled Iceland. One can argue that these persecutions originally spread to Iceland from Denmark, where most Icelandic clergymen and other civil servants were educated at the time (Fiorvar'ardóttir 2000, 150, 314–324).

IDENTIFICATION OF WITCHES

A considerable part of antiwitchcraft and countermagic is concerned with the detection of witches. They could be discovered by certain marks on their body or by a characteristic behavior such as an inability to shed tears, or by a divining ritual. Such a ritual is known from a Danish trial for superstition against the housekeeper at an estate in North Jutland. One day in April 1735, when Ane Marie Nielsdatter was going to the dairy, she caught sight of some "witch's butter" (*merulus lacrimans*) on the wall of the building, near the ground. She scraped it off carefully with a potsherd and took it to the captain, telling him: "You had better order the carriage to be driven into the yard, so we can grease it with this butter." The captain complied with the request after receiving an assurance that the horses would come to no harm, and the same butter was spread on the hubs of the wheels in the Devil's name, after which the housekeeper told the coachman to drive off in the Devil's name without looking back. The huntsman had been instructed to ride behind and watch out for anyone running after the carriage. If he saw anyone he was to give him or her a charge of buckshot in the backside. No one followed the carriage, but the affair had consequences for the housekeeper, who was fined for this outrageous performance and sentenced to confess her crime to a minister of the church in private (Henningsen 1988, 132). On the island of Zealand (Denmark), there was a widespread belief that one could see who was a witch in the village by going to church on Maundy Thursday with a pullet's egg in one's pocket. Thus in 1788, during a service that day in Vemmelev Church (on the island of Zealand), a boy started crying out that he could see "four womenfolk sitting there with balls and pots on their heads." Two of the women afterward reported the episode to the authorities, with the result that the boy and two laborers who had put the egg in the boy's pocket were fined and sentenced to eight days on bread and water (Henningsen 1988, 122). Among the peasantry in nineteenth-century Denmark, it was a common saying that witches could not leave the church if the pastor forgot to close the Bible after the service but left it open on the Communion table. In Montenegro and Herzegovina it was believed that witches were best recognized at Easter: if someone turned a tile on the church roof around while people were at Mass, every witch would be unable to move and would have to stay inside the church until the tile was put back the right

way. In some places near Dubrovnik it was said that when a friar saying Mass turned toward the congregation to say *orate fratres* (pray, brethren) he would see a pair of horns on the head of every witch (Vukanovic 1989, 20f.). In all parts of Europe there appears to have been a rich folklore of oracles for the identification of witches. In some cases, however, the "oracles" appear to have been constructions by demonologists. Thus during the great persecution in the Basque country in the early seventeenth century, several of the witches confessed that they were unable to see the Consecrated Host during Mass; all they saw was "that the priest, when elevating, held in his hands something like a black cloud" (Henningsen 2004, doc. 2.4). The special thing about this "divining ritual" was that only witches could perform it, and that makes one suspect it was an invention of the inquisitors.

IDOLATRY

Idolatry, the worship of false gods or images, was strongly linked to Devil worship in the earlier Middle Ages and, in the later Middle Ages, to illicit magic and witchcraft. A practice deeply condemned by all monotheistic faiths, the sin of idolatry directly transgressed the first and second commandments of the Hebrew Decalogue that forbade the worship of other gods and the creation of artistic representations of divinities (Exod. 20:3–5). As the Church of the late Roman Empire accommodated itself to the visual depiction of biblical characters, stories, saints, and even of God, theologians were compelled to make clearer distinctions between the proper use of religious art, as an aid to worship and a didactic tool for illiterates, and its misuses. Missionaries attacked images of pagan divinities as demons while at the same time placing images of Christian saints in their stead. Theologians therefore distinguished two categories of worship: *dulia*, a reverence and respect for saints that stopped short of outright worship, and *latría*, the direct worship of God that could be shared with no creature. Such distinctions were, naturally, lost on illiterates and proved impossible to enforce in common practice.

Some theologians, and occasionally rulers, rejected the validity of such definitions and sought to ban the use of religious icons altogether as the only safe means to avoid idolatry, thus provoking iconoclastic storms in eighth- and ninth-century Byzantium. In the Latin west, such medieval heretics as Cathars, Waldensians, English Lollards, and Bohemian Hussites later sought to purge churches of idolatrous images, for which Roman authorities anathematized the heretical groups. Church leaders counteracted the possible appeal of such heresies by demonizing them, linking them with rebellion and worship of Satan. Thirteenth-century inquisitors such as Conrad of Marburg portrayed heretics as worshipping Satan in the form of a black cat or a toad. The fifteenth-century reinterpretation of popular *maleficia* (evil acts) as witchcraft embellished the new crime with degrading forms of Satanic worship previously attributed to idolatrous heretics.

The general trend after the thirteenth century was to define sin in accordance with the Decalogue rather than the more traditional seven deadly sins, moving the emphasis from harm against humans to that against God, epitomized as idolatry and blasphemy. Scholastics such as Thomas Aquinas defined idolatry as part of the sin of superstition, which encompassed the irrelevant or excessive worship of God as well as according service to the wrong object (idolatry). Aquinas considered divination an act of idolatry, because any effort to divine the future by natural or magical means opposed correct worship, which required humans to turn only to God for instruction. The result was a conception of witchcraft as spiritual apostasy involving demon worship that was readily transposed onto the popular understanding of it as acts of *maleficia*. All magic therefore implied a degree of diabolical idolatry, whether explicitly by making a pact with the Devil, or implicitly, in the naive efforts of necromancers and sorcerers to control the demons they conjured. A lesser variant of idolatry occurred when Catholics treated images not as symbols of divine assistance but as objects of worship themselves, thus shifting from *dulia* to *latria*.

Even popular preachers could find themselves suspected of idolatry. In 1426, Bernardino of Siena was brought before an inquisitor in Rome for his practice of encouraging the veneration of tablets containing the holy name of Jesus. Thanks to high-ranking supporters, he was released, but he turned almost immediately to preaching fervently against the explicit idolatry of witches. By the early sixteenth century, it was widely argued by churchmen that all forms of illicit magic and superstition were demonic in origin and implicated their practitioners in apostasy. Theological differentiations between implicit and explicit pacts were soon blurred in the confessional storm to come and in the need to prosecute blasphemous crimes against God.

The image controversy was revived on a massive level in the sixteenth century through the biblicism of many Protestant reformers, who became convinced that the veneration of saints was a form of idolatry, and destructive acts of iconoclasm accompanied the Reformation in many regions. Late medieval efforts to define and eradicate all forms of idolatry had proved effective in sensitizing ordinary people to the issue. In 1522, Luther's compatriot in Wittenberg, Andreas Bodenstein von Karlstadt, wrote a widely influential tract promoting the removal of religious icons from churches so as to avoid incurring divine judgment for tolerating such idolatry any longer. Although Luther abhorred Karlstadt's initiative, other Reformed leaders and Anabaptists insisted on the removal of Catholic religious art from churches as part of their campaign to cleanse sacred spaces of any taint of "priestly magic." These reformers likened Catholic ritual not only to idolatry, but also to religious magic, associating both with lay magic, divination, and superstition in general. For Protestants, then, it became increasingly essential to oppose all forms of illicit magic, because its survival would keep the doors open for a return to Catholicism.

The Catholic Church responded by defending the proper veneration of saints and more tightly defining the role of images in churches, retorting that, by replacing images with such texts as Bibles or hymnals, Protestants were as guilty of idolatry as ignorant people who improperly worshipped icons. In France, where Huguenots sought to purify churches of idolatrous images, enraged Catholics in some cases committed grisly acts of desecration of Calvinist corpses comparable to what the Calvinists had done to their saints' images. The great iconoclastic fury of 1566 in the Netherlands likewise witnessed thousands of religious images removed, destroyed, or desecrated to prove that these "saints" were not sentient beings after all. In response, such Jesuit theologians as Martín Del Rio and Juan Maldonado argued that while their order was destroying idols elsewhere in the world, the Devil had found a new home in the minds of heretics. Heresy, they believed, would inevitably degenerate into sorcery or atheism, both forms of diabolical idolatry.

After the mid-sixteenth century, both Catholics and Reformed Protestants increasingly returned their attention to the blasphemy and idolatry of superstition. On both sides pastors warned their flocks about the sin of superstition and attempted to track down remnants of heresy or idolatrous practices. Attention also returned to the most egregious form of blasphemy: demonic witchcraft. Catholics found no better way to reinforce the validity of their sacramental system and veneration of saints than by having witches confess to idolatrous worship of Satan in an exactly reversed mirror image of Catholic worship. Similarly, Protestants, who considered Catholic rituals, especially the Mass, as superstitious, also

broadened the charge of idolatry to encompass all manner of religious dissidence, even among their fellow Protestants.

Such polemical use of the language of idolatry for purposes of religious propaganda was reinforced by news from the Americas. In the early 1530s, clerics in New Spain began uncovering evidence that many baptized converts still venerated their ancient idols. The discovery in 1562 of widespread idolatry in Yucatan, Mexico, resulted in massive trials and executions. In the perspective of Spanish-born inquisitors, what they were uncovering were not mere remnants of the old pagan religions, but demonic idolatry and witchcraft. The persecution of New World idolatry paralleled and reinforced the rising fear of diabolical plots in the Old World.

IDOLATRY AND THE WITCH HUNTS

In both America and Europe, authorities were most deeply concerned about the religious apostasy of those whom they believed had made a pact with Satan. The presence of only a few such horrific idolaters, it was believed, would bring down severe punishments from God. The worsening weather and increasing incidents of destructive storms and crop failures after ca. 1560 provided clear signs of God's displeasure. Whether or not theologians or state officials believed that witches could perform weather magic, they were convinced that suspected witches must be arrested for their idolatry that had prompted such evident divine wrath. The forced confessions of witches to their supposed acts of idolatrous worship at their Sabbats became correspondingly more detailed.

Both Catholic and Protestant theologians emphasized the diabolical and idolatrous nature of witchcraft, so that even though the common people feared the *maleficia* of local witches, the crime for which they merited the most horrific death penalty was their service to and worship of the Devil.

Where both rulers and ruled adjusted to some form of religious toleration, fears of divine wrath and diabolical plots behind the religious "other" declined accordingly. For example, in the Dutch Republic, the Reformed Church lacked the powers of a state religion, and membership in it became voluntary. Alternate denominations—Lutherans, Mennonites, and Catholics—were permitted to carry on discreet worship services, and the populace soon had the advantage of religious choice. Fears of diabolical witchcraft declined accordingly, and executions of witches ended shortly after the turn of the seventeenth century, while concerns about idolatry and demon worship receded into the background. But the process was also reversible: other "tolerant" parts of Europe, Poland and Transylvania, took up witch hunting with considerable enthusiasm after overcoming their ecumenical backgrounds. Thus, in some

regions, the religious conflicts and tensions continued to inspire fears of diabolical plots and divine displeasure well into the eighteenth century.

IMAGE MAGIC

The assumed identity of an image, especially a three-dimensional and therefore realistic statue, with the person it supposedly represents, is extremely common in religious history. Countless records describe sculptures of Greek or Roman gods moving, sweating, or speaking, and of wooden statues of Jesus or the Virgin Mary crying, embracing, talking, and so on. According to this notion of "empsychosis" (repudiated by modern theology), the supernatural being actually inhabits the image. In archaic thought (reaching from ancient Egypt to the modern Caribbean islands and even people in major Western cities), this idea also works in a different though related way: Making an image of a living person establishes an existential connection in the form of a magical rapport between both, though the figure is only a life token, and is not inhabited. Upon this conviction, all sorts of black and amorous magic have been based, with the image (mostly a doll) being tortured or destroyed or manipulated in various ways. This is one

reason why some people dislike being photographed, fearing bewitchment by this means.

Apart from direct application of toxic substances, magic done through manipulating images probably was and is *factually* the most effective method of all. Its success requires that the person who is to be vexed or killed or driven into love must know about the ceremonies performed with the alter ego. Through this induced autosuggestion, the person really begins to produce the appropriate psychosomatic manifestations, for example, experiencing pain in the very part of the body whose analogue has been pricked by a needle in the puppet. Therefore, the nail-studded doll usually is placed where the victim must come across it, or else the sorcerer arranges to have the person informed about what has been done to the artificial double.

Various learned theories explain the effectiveness of image magic. On the one hand, it is construed as homeopathic magic, identifying the representation and the represented, and therefore the outcome of an erroneous (“primitive”) mode of thinking; on the other hand, its point has been seen in the process of image making itself, the exactness of the reproduction working as a guarantee of its animation, though this exactness must not be presumed to lie in the naturalistic appearance of the puppets (in fact, usually they are most crude), but in their correct naming (Freedberg 1989).

This magical practice is called *envoûtement* in French (from Latin *invultuatio*, “in the face”), and the doll is called an *Atzmann* or *Rachepuppe* in German (“man to be eaten up”; “doll [puppet] for vengeance”). In medieval and early modern Christianity, it was common to have the doll baptized, giving it the name of the victim, before it could function. Also, some of the victim’s hair or nails might have been added to the wax or clay that often served to make the image. Occasionally a dead animal or even an object, such as a candle, represented the human being in question. Besides wounding the doll with needles or nails, burning it was and is a favorite method of destruction, serving equally well to murder the victim or to enflame a cold beloved’s heart. However, Paracelsus and other early modern authors also knew a similar procedure that was used with the intention to heal the member affected by “burning out” an illness.

Image magic has a long history and worldwide spread. Ancient Egypt has left many pertinent written sources, reaching back to 3830 B.C.E. In classical antiquity, writers as famous as Virgil, Ovid, Horace, and Apuleius of Madaura mention image magic, with Hecate being the goddess to address for this kind of *maleficium* (harmful magic). Some pierced antique statuettes and hundreds of leaden tablets with the name and picture of the intended victim have been excavated in various parts of the Roman Empire, some of them dating from the early Christian era. While there are

only a few cases known from the Early Middle Ages, we have a dense net of evidence from the thirteenth century onward, when this practice, like all other fields of magic, became treated as part of a collaboration with the Devil.

In the fourteenth century, when other uses of images also began to flourish (execution of effigies, pictures of infamy, funeral masks, public statues, etc.) and the *crimen magiae* (crime of magic) attracted the full interest of the canonists, image magic became widespread throughout western Europe. France was the center of its dissemination, especially the papal and royal courts; the Avignon popes especially popularized this practice. Clement V put Bishop Guichard of Troyes on trial for having applied image magic to murder Queen Jeanne of Navarre; it took a decade until he was finally freed in 1314. Other members of the high clergy such as Bishop Géraud of Cahors, and of the secular nobility, even King Louis of Bavaria and two Visconti, were accused of having employed statuettes to kill Pope John XXII; the bishop was convicted and burned in 1318.

The generally intensified persecution of witchcraft during the late Middle Ages also multiplied the written and material sources about image magic. A fifteenth- or sixteenth-century *Atzmann* with a nail in its hip can still be seen in the Bayerisches Nationalmuseum (Bavarian National Museum) in Munich. Image magic remained common in the early modern period, and often this accusation was used in political processes (and in Russia even later). Several kings of France and of England, as well as an elector of Saxony, become targets of such practices, or used them against their enemies. Common people, especially witches, also had recourse to image magic, so that prohibitions against making and wounding such images can be found in some law codes (e.g., Bavaria, 1611). Protestants spread rumors that the Jesuits possessed a waxen image of each reformed prince that they habitually cursed and maltreated in order to kill them. But Catholic clerics reportedly even employed this *maleficium* against the pope; Urban VIII (1623–1644) believed he was the target of such a machination, whose conspirators were executed or made galley slaves. Seabrook and other specialists in contemporary magic claimed that witch’s dolls were still frequently employed in the twentieth century in areas such as the Caribbean and in such cities as London and Paris.

Apart from dolls, there are innumerable other forms of image magic, even if only rarely mentioned or completely fictitious. A few examples will suffice. In several medieval romances about Alexander the Great, the Egyptian king Nectanebos, when endangered by an enemy fleet, put waxen ship models and warriors into a basin with water, bewitched them, and either made them fight the aggressors or simply had them sunk, thereby causing the destruction of the enemy’s armada.

A sophisticated way to tame wild animals was described in a fifteenth-century German necromancer's manual, which, as a learned work, also included astrological features: One must make an image of the beast, carve its name on the head, and on the chest the name of the hour and the lord of the hour, and so forth. After being fumigated, the picture must be buried, thereby turning the animal's will to that of the person performing the ritual (Kieckhefer 1997, 178). This handbook also gave an especially graphic charm by which one could win favor. Two rocks are smoothed down, the figures of the two persons in question are carved into them, their respective names are inscribed, tin is melted, and then cast into the forms. Next, a small iron chain is bound to the neck of the image of the person whose favor one wishes to obtain, the other end of the chain is fixed to the tin sorcerer's hand; the victim's image has to bend its head, and both are finally buried. It goes without saying that all these ceremonies had to be accompanied by many magical formulas and by invocations of devils and God (Kieckhefer 1997, 76–78).

IMAGINATION

Until the late Middle Ages, devils' physical interactions with human beings through demonic possession, temptation, or appearances to groups of heretics apparently provoked little formal analysis until around 1400, when theologians began postulating more widespread and systematic corporeal interactions between heretics and demons. To defend the reality of this witchcraft, theologians had to refute two earlier traditions of skepticism about human–demon interaction.

The oldest was the *Canon Episcopi*, a directive to bishops forged about 900 C.E. and incorporated into canon law. The *Canon Episcopi* described women who claimed to follow the goddess Diana on midnight rides, traversing great distances on the backs of animals. It condemned these beliefs as heretical dreams and visions caused by the Devil, claiming that the women's experiences happened mentally, "in the spirit," not physically or "in the body." Later, Thomas Aquinas (d. 1274) twice parenthetically mentioned skeptics who claimed that demons existed only in the imagination of uneducated people, not in reality. Aquinas's systematic treatises on angels and devils also mentioned Aristotelian philosophers who opposed the reality of demons. In one passage, Aquinas admitted that Aristotle himself never asserted demonic reality.

Moreover, Aristotle's discussions of imagination as a distinct faculty of the human mind implicitly threatened demonic reality. Imagination could combine remembered perceptions from highly disparate experiences and forcefully present the composite pseudo-experience to the conscious mind, indistinguishable from real experience. Addressing the objection that demons existed only in uneducated people's imagination, Aquinas said skeptics assumed that "the terrors that a man creates for himself out of his imagination are attributed to a demon. . . . because certain figures can appear to the senses in exactly the same form as a man has thought of them" (Stephens 2002, 320).

Aquinas's remarks became an important stimulus to treatises (ca. 1450–1520) that transformed earlier stereotypes into the heresy of witchcraft. Jean Vînet avowedly wrote to refute "the presumptuous and heretical-sounding opinion of those who say that demons do not exist, except in the imagination of the common people." Quoting the same passage of Aquinas, the first page of *Malleus Maleficarum* (The Hammer of Witches, 1486) defends the reality of demons by asserting that witches encountered them in reality and interacted with them "in the body" (Stephens 2002, 25, 36, 318–321).

Early demonologists were dismayed because these traditions implied that all experience of demons was in dreams or hallucinations. Tales of experiments from

around 1400 seemed to support such a conclusion. Some women reportedly claimed to travel rapidly to nocturnal feasts and revels by anointing themselves with mysterious unguents, but reliable eyewitnesses soundly refuted them, observing that the women fell asleep and went nowhere until awakening. Thus any writer who affirmed the reality of demonic witchcraft had to disqualify or limit the power of the human imagination. Another theory of Aquinas filled the need ideally. Demons could create a convincing *praestigium* or illusion in two ways. First, they could create aerial bodies and “assume” them so convincingly that experience of them—including sexual intercourse—would seem real. Second, because demons had no intrinsic bodies, they could freely enter the human mind and deceive it from within. Retrieving “images” of previous perceptions from the memory, demons could combine traces of real experiences into a compelling hallucination (Stephens 2002, 277–321).

The second hypothesis became socially significant in juridical debates over hallucinations related to physiological rather than purely emotional conditions. Sufferers from melancholia were known to have aberrant imaginations and powerful delusions. If accused witches were proved melancholic, their encounters with demons were presumably hallucinations: how guilty were they then? The encountered devils could still be real. Some writers defined black bile, the humor that caused melancholia, as *balneum diaboli* (Devil’s bath), asserting that melancholics were especially vulnerable to demonic influence. Opponents of witch hunting argued that demons exploited this physical handicap, and that witches were therefore innocent, because their crimes happened involuntarily in imagination. Defenders of witch hunting occasionally found ways of making the *balneum diaboli* condition culpable. The Devil’s bath argument allowed still other writers, for example, Johann Weyer and Girolamo Tartarotti, to defend the reality of demons and the supernatural while opposing the persecution of “witches.”

Between 1450 and 1750, few discussions of witchcraft neglected its relation to imagination; Francesco Maria Guazzo even began his treatise with a chapter on imagination. Witchcraft inspired more general treatments of imagination by both proponents and opponents of witch hunting, for example, Gianfrancesco Pico della Mirandola and Michel de Montaigne. Ostensibly objective seventeenth- and eighteenth-century treatises on psychology concealed defenses of demonic reality and witchcraft. Thomas Feyens (+1631) concentrated on the power of imagination to affect bodies, particularly the notion that a gestating mother’s imagination left birthmarks on her fetus that symbolized her cravings for particular foods. How did this take place? Could the imagination do things to external reality that seem magical but are natural?

Feyens thought so. But he warned that Avicenna and Algazel, often invoked by writers on imagination, “were far too superstitious in their praise of the soul and the imagination, ascribing things to the imagination that should be attributed to the power of the Devil. Because they as yet lacked the knowledge of witchcraft and magical arts that we now possess, when they saw and heard that some men could do wondrous, supernatural things, they thought the men did these things through the power of their souls and imaginations, whereas they did them through the power of the Devil” (Feyens 1635, 63). Marsilio Ficino, Pietro Pomponazzi, and others repeated the error, “for they attribute so much to [imagination] that many things, which everyone else thinks are done either by diabolical witchcraft [*fascinatione diabolica*] or else by a miracle, they believe are done by the sole force of a powerful imagination” (Feyens 1635, 87).

In 1745, Ludovico Antonio Muratori explored the creative effects of the imagination as well as its pathologies, foreshadowing modern and more aesthetic appreciation of its power. Muratori forcefully criticized Feyens and others, dismissing witchcraft as a delusion of nymphomaniacal women and their gullible male audience. Some women “have not known . . . how to disguise their dissolute lasciviousness, otherwise than by pretending to frequent those spirits [*incubi*], depicted as so libidinous; and they have persuaded whoever is especially inclined to believe everything that wears the livery of the marvelous and supernatural.” Muratori concluded that “a powerful imagination alone is the cause of their supposed nocturnal travels through the air, and of the bestial outbursts of their lust” (Muratori 1995, 101–102). Paradoxically, Muratori’s misogyny nurtured his confidence in the reality of demons: “To attribute so much power to devils over Christians, after our divine Savior harrowed hell, is to wrong our holy religion” (Muratori 1995, 100).

Girolamo Tartarotti (1745) attributed the Sabbat to rampant imagination, stimulated by lust or vengefulness, and amplified by narcotic unguents. However, he defended the possibility of demonic interaction by distinguishing among three phenomena: *veneficio*, often confused with *maleficio* (*maleficium*), is poisoning, an unmiraculous effect produced by natural agents; magic (*magia*) produces real effects through the concurrence “of God who permits, . . . of the Devil who works, and . . . of the magician who desires and invites” the Devil’s agency; and, finally, witchcraft. *Milleus Maleficarum* and similar treatises erroneously refer to *magia* as witchcraft, but witchcraft produces effects only in the mind. Because the witch obeys the Devil rather than commanding him, she herself is bewitched, “receiving the effect of [the devil] or, if we prefer, of her own ruined and filthy imagination” (Tartarotti 1745, 161). Rationalistic critics scoffed that Tartarotti’s

distinctions were pointless; he retorted that denying demonic power was potentially heretical (Tartarotti 1745, 353–362, 426–447). He was perhaps the last systematic defender of demonic reality against the rationalistic valuation of human imagination.

IMPERIAL FREE CITIES

A few of Germany's eighty-odd imperial free cities experienced early executions for witchcraft (Metz or Ravensburg, 1484) or sorcery (Lindau, 1443 and 1493; Regensburg, 1467). As elsewhere in Germany, most large-scale witchcraft trials occurred in imperial free cities between 1560 and 1630, although there were some later seventeenth-century outbreaks (thirty-two executions at Esslingen from 1662–1666; fourteen executions at Reutlingen, 1665) and a few executions occurred later still (one at Ulm, 1680; five at Augsburg, 1685–1686; one at Rothenburg ob der Tauber, 1692). The council of an imperial free city constituted its court of high criminal justice. The city councillors were thus responsible for trying alleged witches from both the city and its rural hinterland; sometimes one or more councillors were deputized as special *Commissaren* (commissioners) to make preliminary investigations in such cases. Legal procedures in witchcraft trials in imperial

free cities were prescribed by the Carolina Code (*Constitutio Criminalis Carolina*), the criminal law code issued for the Holy Roman Empire in 1532. Whether or not (and to what extent) witchcraft trials escalated in an imperial free city largely depended on whether the councillors chose to abide by the Carolina Code or instead treated witchcraft as a *crimen exceptum* (the excepted crime) and tortured accused witches without restraint.

Because there were so many imperial free cities of such different sizes, it is hard to compare or generalize about the witchcraft trials that they experienced. Moreover, the history of witch persecution has been thoroughly researched for only a relatively small proportion of them; usually the largest and most important, or else those which experienced significant episodes of persecution. Sometimes (for example, in Schwäbisch Gmünd), poor source survival means that only a partial history of witchcraft trials can be recovered. Despite these caveats, it is possible to divide the imperial free cities into three categories in relation to witch persecution (illustrated by the case studies that follow):

1. Those that experienced severe, endemic persecution of witches, such as Rottweil. In the context of current research this is the smallest category.
2. Those that experienced at least one wave of relatively severe persecution, such as Esslingen, Reutlingen, Schwäbisch Gmünd, Offenburg, and Nördlingen. These waves occurred in the context of popular pressure for witchcraft trials (sometimes linked to a subsistence crisis), instability or factionalism within the political elite, or the influence of particular individuals in favor of witch hunting. Often, however, one such wave of persecution taught city councillors that severe witch hunting was destabilizing and best avoided.
3. Those that experienced an extremely low level of witch persecution, characterized by an absence of large-scale witch hunts and a low number of executions relative to population size. Several imperial free cities—particularly some of the largest—fall into this category, including Augsburg, Nuremberg, Frankfurt-am-Main, Lübeck, Ulm, Rothenburg, and Schwäbisch Hall. The deliberate refusal by the councillors of these cities to share the contemporary enthusiasm for witch hunting, even during periods of regional witch panics, was due to various political, economic, and religious reasons.

Given the significance of this third category, it is possible to conclude that the pattern of witch hunting in imperial free cities was, overall, relatively restrained.

URBAN POLITICS AND THE ECONOMY

Ruled by councils of varying size, imperial free cities were autonomous political and juridical units within

the Holy Roman Empire. They owed allegiance directly to the Holy Roman Emperor, who had granted them privileges and rights that gave them their independent status. Many of them were situated in what is today southern Germany. The number of imperial free cities in the Empire declined during the early modern period from eighty-three in 1521 to fifty-one by 1800; all but six finally lost their independence in 1803. Most experienced economic decline by the late-seventeenth century, a process accelerated significantly by the Thirty Years' War. Imperial free cities varied greatly in size. The very largest (Augsburg, Cologne, Lübeck, Nuremberg) surpassed 20,000 inhabitants. Most, however, were middle-sized, with 5,000–7,000 inhabitants (Esslingen, Schwäbisch-Gmünd, Rothenburg ob der Tauber, Rottweil, Reutlingen), while others such as Gengenbach (1,100 inhabitants) were small. A few imperial free cities (Nuremberg, Rothenburg, Rottweil, Schwäbisch Hall, Ulm) also governed large rural hinterlands.

From the fourteenth century, most imperial free cities experienced latent or actual conflict between the guilds and the urban patriciate for dominance of membership of the city council. By the early modern period, this conflict had been largely resolved in favor of the patriciate, but political tension still found expression in some cities through the medium of witchcraft trials. Pressure from guildsmen who regarded the councillors as too lenient in their treatment of witchcraft played a part in instigating witchcraft trials in Gelnhausen and Offenbourg. Emperor Maximilian II's restoration of Reutlingen's old guild constitution in 1576 introduced an element of instability into the city's politics that helped shape three of the five waves of witchcraft trials that occurred there in 1603 (seven executions), 1660/1661 (nine executions), and 1665 (fourteen executions). Each persecution was linked to the election of a new generation of councillors, eager to prove their witch-hunting zeal to the general citizenry. In 1660/1661 and 1665 the impetus came particularly from councillor and *Commissar* Johann Philipp Laubenberger, who acquiesced to popular demands for witchcraft trials to increase his political power at the expense of his rivals. Laubenberger even managed to drive his main political opponent, Heinrich Efferen, from Reutlingen, after forcing other alleged witches to name Efferen's wife as their accomplice (Fritz 1998). Laubenberger was not alone in using a demonstration of witch-hunting zeal as a way of advancing a political or legal career in an imperial free city; this was also done by jurists Leonhard Friz (Schwäbisch Gmünd, 1613–1617), Wolfgang Graf (Nördlingen, 1589–1594) and Daniel Hauff (Esslingen, 1662–1665), and by mayor Johann Pferinger (Nördlingen, 1589–1594). Given the potential of witch persecution as a tool for personal aggrandizement in the context of local politics,

however, it is striking that it was not used more often in imperial free cities and that so many free cities avoided large-scale witchcraft trials.

Popular anxiety about witchcraft in an imperial free city could be stirred by a specific local disaster, such as the outbreak of fires in Reutlingen in 1593; by voluntary confessions of witchcraft, particularly by children; by the influence of witch hunts in a neighboring territory; and by bad weather (blamed on witchcraft) that caused a severe subsistence crisis. For example, the witchcraft trials that took place in Schwäbisch Gmünd between 1613 and 1617, causing forty-two executions, were triggered both by severe hailstorms that destroyed the harvest in 1613 and by the influence of the exceptionally severe witch hunts in nearby Ellwangen from 1611. However, there was no automatic connection between agrarian crises and episodes of severe witch persecution in imperial free cities. The late 1580s and early 1590s were years of inflation following harvest failures; many towns in southern Germany were also affected by plague epidemics. The Swabian imperial free cities of Kempten and Memmingen were both badly hit by this double crisis, yet neither experienced executions for witchcraft. Overall, of the thirteen imperial free cities in Swabia and Franconia, only five became caught up in the major wave of witch persecution that swept through this region around 1590 (Behringer 1997). The crucial issue was whether or not a city council was disposed to acquiesce to popular demands for witch hunts during such agrarian crises, should such demands arise in the first place. Witchcraft may have been regarded as less of a threat to communal well-being at both a popular and elite level in imperial free cities that were generally relatively prosperous (at least until the Thirty Years' War) and thus more able to cope with periods of crisis. Nuremberg, Augsburg, Ulm, Rothenburg, and Schwäbisch Hall all fall into this category, and all experienced very low levels of witch persecution. Schwäbisch Hall may have been particularly immune to agrarian crises because its main industry was the salt trade (Schraut 1994). We need further research into the connections between witch persecution and the economies of individual imperial free cities and into the issue of crisis management by city councils, especially after harvest failures.

SEVERE ENDEMIC PERSECUTION:

ROTTWEIL

Rottweil (population 5,100), a Catholic imperial free city on the Neckar in Swabia, was the seat of the imperial *Hofgericht* (a high court for settling disputes between territorial lords). The city ruled a 220-square-kilometer hinterland containing twenty-seven villages that produced a high proportion of the victims of the city's witch hunts. Compared to other imperial free cities, Rottweil experienced remarkably severe witch hunting,

with 287 witchcraft trials between 1525 and 1701; 266 of them ended in executions between 1546 and 1659. The most severe outbreaks occurred in the last two decades of the sixteenth century and the late 1620s, coinciding with cycles of agrarian crisis and plague epidemics. However, a striking feature of the witch persecution in Rottweil was its endemic nature: apart from 1578, every year between 1571 and 1607 saw executions for witchcraft. The majority of Rottweil's executed witches were poor: most of those who came from the city or its villages were from the lowest social order, while many of those who came from other territories were vagrants (Zeck 2000).

Because of the city's many contacts with the Swiss Confederation, Rottweil's inhabitants probably had an early interest in witchcraft and witch persecution. Ideas about witchcraft were spread further in Rottweil by demonologies published by Reinhard Lutz and Johann Spreter. There were two main reasons—one legal, the other social—for the intensity of Rottweil's witch persecution. The first was that, although the city council as a whole pronounced verdicts in witchcraft trials, the interrogation (and torture) of suspects was supervised by a small committee of five councillors, who consistently treated witchcraft as a *crimen exceptum*. Because of their many personal links to the imperial *Hofgericht*, this small committee enjoyed a high level of authority; their severe handling of witchcraft trials seems never to have been challenged. This may also have been because most of those tried as witches were poor, and often came from outside Rottweil. The city's witchcraft trials can thus be interpreted as expressions of social conflict, in which individuals who were both poor and antisocial ran the greatest risk of being accused of witchcraft by their wealthier neighbors, especially during years of inflation and hardship. These social conflicts lost relevance during the Thirty Years' War when the population of Rottweil declined by half; as a result, witch persecution also declined rapidly after 1631 (Zeck 2000).

WAVES OF SEVERE PERSECUTION: ESSLINGEN

More commonly, imperial free cities experienced one (and occasionally more than one) wave of severe persecution, during which ten or more people were executed. Such waves of persecution occurred, for example, in the following cities:

Cologne, which experienced one witch hunt in 1627–1630 during which twenty-five individuals were executed, can also be included in this category. However, given its great size (35,000–40,000) and its low total number of witchcraft executions during the early modern period (thirty-three), Cologne is regarded as having a generally restrained pattern of witch persecution.

TABLE I-1

| City | Date of Witch Hunt | Number Executed |
|------------------|--------------------|-----------------|
| Esslingen | 1662–1666 | 32 |
| Gelnhausen | 1596–1599 | 19 |
| | 1633–1634 | 18 |
| Kaufbeuren | 1591 | 17 |
| Nördlingen | 1589–1594 | 33 |
| Offenbourg | 1627–1629 | 61 |
| Reutlingen | 1665–1667 | 14 |
| Schwäbisch Gmünd | 1613–1617 | 42 |
| Windsheim | 1596–1597 | 24 |

Such waves of severe witch hunting occurred when city councils were unwilling or unable to resist popular pressure in favor of witchcraft trials, or when one or more members of the political-judicial elite attempted to advance their careers by demonstrating zeal as witch hunters. In a general context of increased anxiety about the threat posed by witchcraft, it was treated as a *crimen exceptum*, as a result of which the number and severity of trials escalated. These waves of persecution ended either because the political aims of pro-witch-hunting councillors had been achieved (Reutlingen, 1666–1667), because the councillors lost confidence in the treatment of witchcraft as a *crimen exceptum* (Nördlingen, 1594), because witchcraft accusations began to threaten too many members of the city's social and political elite (Cologne, 1629–1630), or because of the intervention of the *Reichskammergericht*, or imperial chamber court (Gelnhausen, 1599).

The Lutheran imperial free city of Esslingen (population 6,000) formed an enclave in the duchy of Württemberg. It experienced a severe wave of witch hunting between 1662 and 1666, during which around sixty people were tried for witchcraft and thirty-two executed. Before 1662, only five individuals had been executed since witchcraft trials began in 1541, and no further executions occurred after 1666. The 1662–1666 episode began when a seventeen-year-old boy named Hans Elsässer from Vaihingen boasted that he had made a pact with the Devil and flown to Sabbats. The city councillors gave the case to a newly appointed jurist, Daniel Hauff, to investigate, and their decision had significant consequences. Hauff forced confessions and the names of their supposed accomplices from Elsässer and other alleged witches, using severe torture or its threat. Most of those arrested, tried, and executed for witchcraft came from Vaihingen and Möhringen, two villages subject to the authority of the Esslingen Hospital. Hauff also sought advice on the witchcraft trials from the legal faculty of Strasbourg University as well as from Tübingen University. This was a clever ploy, because the Strasbourg jurists were

much more likely than their Tübingen counterparts to confirm and give added authority to Hauff's actions and decisions. Hauff's pursuit of witches was motivated both by a genuine belief that they were evil and worthy of eradication, and by a desire to further his career. Although Hauff was largely responsible for the instigation and escalation of the 1662–1666 witch hunt, it could not have progressed without the support of a powerful subcommittee within Esslingen's city council—the Secret Council (*Geheimer Rat*), made up of three mayors and two other influential councillors. Council support for Hauff declined only after accusations of witchcraft spread from Vaihingen and Möhringen to Esslingen, threatening the city's social elite. Increasingly desperate attempts by the council to put a stop to Hauff's actions were cut short by his death—perhaps by means of poison—at the age of thirty-six in 1665. Thereafter the council brought the witch hunt to an end.

**LOW-LEVEL PERSECUTION:
ROTHENBURG OB DER TAUBER**

A significant number of imperial free cities had a very low level of witch persecution throughout the entire early modern period, characterized by a low total number of executions relative to population size and an absence of large-scale witch hunts, even during widespread witch panics in Germany in the 1590s and 1620s. These included some of the largest and politically most important imperial free cities—Nuremberg, Augsburg, Ulm—which may have set an example of restraint to other, smaller cities in their regions (Behringer 1997). Individuals tried for witchcraft in these cities had a reasonable chance of being released unpunished or of suffering a noncapital punishment, such as banishment.

The complex web of factors underpinning low levels of witch persecution can be seen in the Lutheran imperial free city of Rothenburg ob der Tauber. Situated in Franconia, Rothenburg had an early modern population of 5,000–7,000 and also ruled a 400-square-kilometer hinterland containing 10,000–11,000 inhabitants. Between 1549 and 1709, its city council dealt with twenty-eight trials involving accusations and confessions of witchcraft. None of them escalated into a large-scale witch panic; only three of the sixty-five people involved in these trials were executed (in 1629, 1673, and 1692), and two of them had also committed other capital crimes, namely infanticide (1629) and poisoning (1692). Rothenburg's city councillors and the jurists who advised them consistently refused to treat witchcraft as a *crimen exceptum*. Consequently, torture was used against only twelve alleged witches and with relative restraint; no one tried for witchcraft there was forced through torture to make a false confession. The

TABLE I-2

| <i>Name of City</i> | <i>Population Size (pre-1618)</i> | <i>Witches Executed</i> |
|---------------------|-----------------------------------|-------------------------|
| Augsburg | 50,000 | 17 |
| Nuremberg | 40,000 | 6 |
| Lübeck | 30,000 | 13 |
| Ulm | ca. 19–21,000 | 4 |
| Frankfurt am Main | ca. 15–20,000 | 0 |
| Rothenburg o. d. T. | ca. 5–7,000 | 3 |
| Schwäbisch Hall | ca. 5,000 | 0 |

maintenance of this legal caution was in part an assertion of Rothenburg's judicial autonomy as an imperial free city. Until 1671, its councillors never sought advice from a university law faculty in a witchcraft trial, although the Carolina Code had recommended this procedure in 1532. Treatment of witchcraft as an ordinary rather than an exceptional crime also helped protect Rothenburg's councillors from imperial interference in governing the city by ensuring that alleged witches and their families had no grounds for complaint to the *Reichskammergericht*. The councillors also felt that witchcraft was such a difficult crime to prove at law that its punishment was best left up to God, rather than attempted by mere mortals who might make (literally) fatal mistakes in their judgment of guilt or innocence. Confessions of attendance at witches' Sabbats (by children or mentally unstable individuals) never provided the trigger for a large-scale witch hunt in Rothenburg because the councillors and the jurists who advised them held the characteristically Lutheran belief that Sabbats were merely delusions wrought by the Devil on the minds of impious individuals. Such confessions thus offered an inadequate legal basis on which to pursue other supposed Sabbat attendees. Zealous legal pursuit of alleged witches also made little practical sense to the Rothenburg councillors. The city's prosperity depended on the agrarian productivity of its hinterland as well as the industry of its craftsmen. Large-scale, socially destabilizing witchcraft trials could have affected both the rural and urban economies adversely, and were therefore best avoided. Rothenburg's councillors generally regarded the maintenance of social harmony as a higher priority than the legal pursuit of witches during the early modern period. For this reason, they treated as slander (and punished, with varying degrees of severity) a significant proportion of the allegations of witchcraft with which they were confronted between 1561 and 1652. This policy discouraged popular enthusiasm for making formal accusations of witchcraft. Popular agitation in favor of witch hunts was anyway largely absent in Rothenburg throughout the early modern period, partly because the lower orders were not especially terrified of witches, and partly because they regarded nonlegal

methods as the most effective way of dealing with witchcraft (Rowlands 2003).

Similar factors help explain the low level of witch persecution in other imperial free cities. It was significant that most imperial free cities with low or very restrained levels of witch persecution (apart from Cologne and Regensburg, which were Catholic, and Augsburg, which was biconfessional) were Lutheran. This probably encouraged their rulers to regard the witches' Sabbats as an illusion rather than a reality, an attitude that helped prevent the escalation of witch panics. However, a desire to maintain social stability to protect the economic well-being of the urban community was probably the most important factor explaining an absence of witch-hunting zeal, perhaps especially so in Ulm, Nuremberg, and Schwäbisch Hall that, like Rothenburg, also ruled large rural hinterlands. The councillors of these and other cities that experienced a low level of witch persecution realized from an early date, and without having to suffer the horrors of a large-scale witch panic themselves, that discretion was wiser than zealotry as far as the prosecution of witchcraft was concerned.

IMPOTENCE, SEXUAL

Many cultures hold that sexual impotence can be caused by magic, and concern about this form of bewitchment played a noteworthy, and perhaps somewhat exaggerated, role in the witch persecutions of early modern Europe. Impotence can be ascribed to witchcraft, spontaneous bewitchment—or sorcery, ritual casting of spells—or both, depending on the culture. In late medieval Europe, ritual techniques for causing impotence and the jealousies and disputes that prompted people to use them were rather common, so employing them was not necessarily a sign of malevolent witchcraft for ordinary people. However, late medieval and early modern demonologists emphasized this form of *maleficium* (harmful magic) in their discussions of the Devil's conspiracy, and their alarm appears to have had a particular resonance among prominent laymen and clerics, who seemed more concerned with it than

its actual incidence warranted. Virility, both in the sense of powerful sexuality and in the desire for procreating offspring, was a vital measure of a man's worth in early modern Europe, and male vulnerability to sexual dysfunction therefore became a major concern to elites. Modern social scientists have long recognized that impotence can result from emotional distress, so bewitchment can play a role in its onset and, conversely, magical treatments can cure it. Generalized concern about this form of magical attack clearly manifested deeply rooted and widespread masculine insecurities, but while some accusations undoubtedly transferred attention from a man's internally generated impotence to a convenient scapegoat, it is also clear that this form of "magical" attack was attempted and could be effective.

ELITE ANXIETIES AND POPULAR CONCERNS

One of the earliest theories insists that early modern witch hunts developed from the repressed sexuality of celibate clerics in the late Middle Ages. Although the authorities who actually hunted witches were overwhelmingly married magistrates, the preoccupation of some clerical demonologists, seen especially in the *Malleus Maleficarum* (The Hammer of Witches, 1486), with unbridled female sexuality and the threat to male virility did reflect the sexual neuroses of their authors. In the *Malleus*, witches' ability to interfere with normal sexuality was the first form of harmful magic discussed, moving from a chapter on their ability to manipulate people's affections to one on their ability to obstruct the procreative act—mainly by causing male impotence—to a third that discusses their ability to make men think that their genitals have been removed entirely.

Members of the secular elite and Protestant ministers were not only allowed but also were expected to marry, so that it might appear that they did not have to struggle against temptation as the Catholic clergy did, but because one legacy of the Reformation was a heightened emphasis on fidelity in marriage, these husbands often had to repress their sexual desires in ways not totally unlike the self-restraint expected of their Catholic brethren. Furthermore, they were even more sensitive to threats to virility than the Catholic clergy, because a sexually active male's honor was strongly connected to both his sexual prowess and his procreative accomplishments. A threat to virility became an intimidating prospect in this honor-conscious culture, calling for vigilant precautions or a vigorous response.

Although ordinary peasants and townsmen shared upper-class male concerns with virility and honor, witchcraft trials involving impotence were rather less frequent than theoretical discussions of it would suggest. In England, the charge was very infrequent, and on the Continent, although more common, it was

still never a major cause of trials. However, the plethora of popular cures suggests it was indeed a common problem. The likeliest explanation is that the dishonor of impotence inhibited men from making a public issue of it if they could avoid it. Because this malady often has a strongly psychological dimension, it was particularly amenable to less drastic remedies than a formal accusation, and so cases were more likely to end in a cunning person's cottage or a priest's chambers than in court. Together, these reasons explain why a common malady, frequently discussed theoretically, precipitated so few trials.

RITUAL ATTACKS, MALEVOLENT INTENTIONS, AND MAGICAL CURES

The means for provoking male impotence included both ritual attacks (practices that anthropologists label sorcery) and spontaneous acts and unstated ill will (that anthropologists call witchcraft). Both mechanisms operated in early modern Europe, and both were countered by a wide variety of popular rituals designed to overcome the bewitchment and restore male sexual functioning.

The most common form of ritual spell to cause impotence was *ligature*, the tying of a cord or lace in a knot to cause a sympathetic effect on the man's member. It was sometimes thought to be particularly potent if performed during a marriage ceremony, but could be conducted in other circumstances as well. Other ritual procedures involved the use of images, rooster testicles, and various herbs. Some, like bent snuffed-out candles, were to inhibit erection, others to prevent ejaculation, and some to cause premature ejaculation. Related ceremonies were available that supposedly prevented women from conceiving or caused abortion, but they seem less common (and presumably less reliable) than rituals aimed at men.

While anyone could use these rituals, some people were thought to be able to inflict impotence through spontaneous words or gestures, or simply through the power of their ill will. Spontaneous actions could include a crude sexual gesture, a sharp glance (the "evil eye"), or a simple motion or touch. Words might be hostile (a threat or insult) or insinuating (a sexual reference or innuendo), but apparently even benign or friendly signals could be construed as spells depending on the relationship between the people involved, the circumstances, and the aftermath. Theoretically, some witches needed no mechanism at all to inflict the damage; the sheer power of their ill will sufficed. In practice, because it was understood that magic did not cause all instances of impotence, legal allegations generally required some reference to the suspect's words or actions to support them.

Early modern Europeans had a range of remedies available to counter impotence caused by a spell. Some

could be performed at home by anyone, while others involved consulting a professional healer. A number involved such symbolic actions as urinating through some sort of hole, like a church keyhole or a wife's wedding ring. Other methods were more direct, including at least one example of a sexual surrogate who plied a respectable trade restoring the virility of other women's husbands. Educated physicians, who understood that many instances of impotence stemmed from psychological roots, might resort to placebos to tap their patients' powers of imagination.

BELIEF, FEAR, AND PHYSIOLOGY

Like early modern physicians, modern social scientists agree that psychological problems can cause impotence. Furthermore, they acknowledge that at least some of the ritual techniques in early modern and other cultures intended to inflict or cure impotence could work through this link between mind and body.

Social scientists have traditionally played down the significance of this efficacy, assuming it to be a manifestation of psychological weakness in the afflicted person rather than psychological strength in the sorcerer or healer, and also by assuming that it merely reflects a prior cultural belief in the power of magic. In particular, psychodynamic psychosomatic theory classified psychogenic impotence as a conversion reaction, a symbolic somatization of an intrapsychic tension, while cultural determinism insists that impotence resulting from witchcraft or sorcery always stemmed from fear instilled by cultural belief in its power, and took its form from cultural expectations as well.

However, current medical understanding classifies psychogenic impotence as a psychophysical disorder, a direct manifestation of hormonal changes triggered by the "flight or fight" stress response. Fear can indeed trigger this response, but so can other strong emotions, and the fear that triggers it can come from a wide variety of perceived dangers. Spontaneous words and gestures can instill fear, anger, despondency, or rage leading to impotence without any prior expectations or enculturation, and malicious rituals were developed and used deliberately to trigger this psychophysical process.

INCUBUS AND SUCCUBUS

The word "incubare" (from Latin, "to lie upon something"), which in Christian theology later came to denote a demon lover who seduced women, was originally associated with nightmares: Horace believed that nightly asthma attacks and nightmares were caused by so called *Ephialtes* or "Incubi." Lascivious and lecherous spirits, fauns, and satyrs permeated ancient sources: Strabo mentioned them in his *Geography* (1,19) and Petronius in *Satyricon* (38,8). A "succubus," which became its female counterpart, originally played a major part in hagiography, illustrating the temptations of holy men. The Church Fathers, chiefly St. Augustine, St. Jerome, and Isidore of Seville, introduced both terms and notions into medieval theology: incubi—demons in the shape of human males—preyed on women, whereas succubi—demons in female shape—pursued men.

HUMANS AND DEMONS

Although an incubus was generally believed to be unable to procreate and a succubus was unable to bear children, both concepts appeared in legends of ancestors—one of the most famous was Merlin—to explain their supposed demonical abilities. Most had their sources in pre-Christian traditions, although the Bible insists that the giants sprang from intercourse between fallen angels (or demons) and the daughters of mankind. Many legends of important families detailed such half-human and half-divine ancestors; for example, Merovech, the mythic ancestor of the Merovingians, was allegedly the son of a sea-god. Many others were rumored to have demonical ancestors, including Robert, the father of William the Conqueror; Martin Luther; Alexander the Great; Plato; Julius Caesar; Scipio Africanus; Romulus and Remus; Merlin; or the Huns.

The Latin Church generally did not admit the reality of intercourse with demons before the twelfth century. The most important intermediary, Isidore of Seville, strongly rejected the idea of succubi in his *Etymology*, later, Burchard of Worms in his *Corrector* (Book 19 of his *Decretum*) denied that elves were able to have sex with human beings. In the twelfth century, William of Paris vehemently disapproved of the idea that demons were able to have offspring, although in 1120 Guibert of Nogent said not only that his father

was denied consummation of marriage due to sorcery but also that the Devil visited his mother in the guise of an incubus.

In the thirteenth century, the concept of the incubus became more common, partly through the many variants of the stories about Merlin and Melusine; from then onward, legends about demonical procreation began to spread. After the thirteenth century, the “incubus” condemned in Isidore’s *Etymology* as mere fantasy involved real assaults by lascivious demons, adding a voluntary character as fulfillment of sinful female sexual desire. At the same time, the notion of the voluntary pact with the demon developed as the Inquisition spread; intercourse with demons became an accepted concept in orthodox theology. By the fourteenth century, Pope Benedict XIV employed the testimony of the Bible as proof for the existence of incubi and succubi in his *De servorum Dei Beatificatione et beatorum canonizatione* (On the Beautification of the Servants of God and the Canonization of the Blessed). In particular, heretics, and later witches, were not only accused of copulating frequently with demons (sometimes in animal form), but also of worshipping them, especially during their festivals, the Sabbats.

THE INCUBUS AS LOVER

Demon lovers existed in the stories of the ancient Hebrews, Egyptians, Greeks, Assyrians, and Persians, among others, while contemporary belief in UFOs includes reports not only of abduction by aliens, but also of sexual intercourse with them.

In the *Sefer ha-Zohar* (Book of Splendor), the most important book of Jewish mysticism, any pollution of the semen produced demons. Michael Psellus (1019–1078) retold folk beliefs of demon–human relationships in his *De nugis curialium* (On Courtier’s Trifles) speculating about the offspring of such relationships.

Late medieval and early modern witches invariably described intercourse with demons or with the Devil as disagreeable and painful. Heinrich Kramer, in the *Malleus Maleficarum* (The Hammer of Witches, 1486), noted scornfully that in the past, incubus devils assaulted women against their wills, but now the witches voluntarily offered themselves. Witches’ confessions and some witchcraft theorists described incubi with huge members, sometimes made of horn or covered with scales, obviously emphasizing their animal-like nature; like the Devil, incubi ejaculated icy semen. Silvestro Prierias contributed an extraordinary detail, reporting in his *De strigimagarum, demonumque mirandis* (Concerning the Prodigies of the Witch-Magicians and Demons, 1521), that incubi had a double penis.

Some witchcraft theorists insisted that incubi could impregnate women. Demons, unable to generate semen themselves, stole it from men who had nocturnal

emissions, or as succubi from men during intercourse. The demons saved the semen to use subsequently when copulating with women. Some writers claimed that the children born from such unions were half human and half beast.

Some English incubi served as familiars to witches. In continental trials, after sex with devils became a key aspect of witchcraft, witches were tortured until they confessed to having intercourse with incubi. In 1485, the inquisitor of Come condemned forty-one of these women to death. Incubi were believed to be visible to witches alone, except in unusual circumstances. Stories like *La belle et la bête* (Beauty and the Beast) and its ancient forerunner *Amor and Psyche* described people who had invisible partners, and such folk beliefs became a standard part of theological treatises. These debated whether incubi had physical or spiritual bodies, as well as the gravity of the sin of intercourse with demons and the techniques of intercourse. The insatiable curiosity of the experts led them to examine all possible details of sexual intercourse with demons, and their sadistic industry was rewarded with an abundance of imaginative details.

Intercourse with demons implied a pact with the Devil and therefore served as evidence in trials, starting at an inquisitorial trial in Carcassonne in 1275. The famous Irish witch, Dame Alice Kyteler, was accused in 1324 of having intercourse with an incubus called Robert son of Art. Innocent VIII, in his notorious bull of 1484 against the witches, *Summis desiderantes affectibus* (Desiring with Supreme Ardor), affirmed the reality of intercourse with demons. Witchcraft theorists were keen to find evidence for witches’ sexual intercourse with incubi in order to prove the existence of demons, and thus of the entire spirit world, including angels and God.

SUCCUBI

Less prevalent than incubi, succubi could appear as beautiful women who tempted anchorites, but more often they visited men in their sleep. Because of Christian views about the inherently evil nature of women, they were morally weak and therefore more prone to yield to sexual seduction than men. Although a man visited by a succubus was most likely not at fault, succubi appeared often in the record of witchcraft trials. Intercourse with succubi was often described as penetrating a cavern of ice, similar to the notion of the ice-cold semen of the incubi.

THE DEVIL’S CHILDREN

There was widespread belief that misshapen children descended from the sinful intercourse between a human and an incubus demon. In 1275, a certain Angela de la Barthe bore a child in Toulouse that was half wolf and half human as a result of a long-lasting

relationship with a demon, who had intercourse with her every night. Other women give birth to unspeakable monsters or even objects. Obviously in some legends the concept of the changeling intertwines with the Devil's offspring; folk belief asserts that demons abducted children and left misshapen monsters behind. For its part, the Church interpreted ancient beliefs about fairy abductions as punishment for sins. By the seventeenth century, medical treatises began explaining monstrous children as a result of shock, but still associated them with nightmares.

The Catholic Church offered five methods for driving away incubi and succubi: (1) confession; (2) making the sign of the cross; (3) reciting prayers; (4) moving to another location; or (5) exorcism. Caesarius of Heisterbach stated in his *Dialogus Miraculorum* (The Dialogue on Miracles, 1150) that St. Bernard of Clairvaux reportedly chased away an incubus by exorcism. In some cases, holy water or a Paternoster provided some help.

INDICULUS SUPERSTITIONUM ET PAGANIARUM

This list of thirty religious practices designated as pagan and superstitious followed the canons of the Frankish Council of Estinnes/Leptinnes (ca. 742/743) in the unique surviving manuscript, probably produced at Fulda, later held at Mainz, and now in the Vatican library. Neither the author nor any of the circumstances of its production are known, and it is clearly not an authoritative ecclesiastical document, but rather a list of practices from the northeastern edge of the late Merovingian or early Carolingian Frankish world that the author knew of or had read about. Many of these practices are mentioned in no other source, and some

are extremely difficult to identify. None of them was explicitly condemned, except by using the words “pagan” and “superstitious” in the title of the list. These words had a highly pejorative connotation in the period, although they might also have referred to rivalries among different groups of Christians or different views of ideal Christianity.

Several scholars have linked the text to the reforming, rather than the missionary work of St. Boniface (ca. 675–754/755), although Boniface is not thought to be the author. The list seems to contain practices of pagan origin that the author believed still survived in Christian communities, regardless of whether or not they actually did. Although many earlier and near-contemporary Frankish Church councils, royal capitularies, and individual churchmen had listed and condemned religious practices that they designated pagan and superstitious, there is no necessary connection between the *Indiculus* and the Council of Leptinnes, and the list may well date to the later eighth century or even the early ninth, as analysis of the manuscript evidence indicates.

A number of the practices listed in the *Indiculus* as “pagan” included ceremonies for the gods Mercury and Jupiter (romanized names of Thor and Odin), and the often-criticized observation of the Kalends of January, conducting religious rites in groves dedicated to pagan deities, respect paid to pagan sacred stones, shrines, and idols, and sacrifices of animals to the sun. There is no indication that these observances were in any way diabolical in character. Other practices included “sacrileges”—distortions or misuse of Christian ceremonies of mourning the dead, misconduct in church buildings, excessive sacrifices to saints, or indiscriminate veneration of the dead as saints. Ecclesiastical reformers for the next several centuries sharply criticized such misdirection of devotional enthusiasm as harmful “superstition.”

Later thinkers linked still other practices to both sorcery and witchcraft. Among these were the use of enchanted amulets and knots (ligatures), incantations, divination, weather magic, and the belief that certain women had the power to command the moon and remove men's hearts from their bodies. In addition, at least from the thirteenth century on, diabolical sorcery came to be considered idolatry, so that veneration or worship directed at any being other than God, the angels, or the saints was regarded as the worship of demons. Psalm 95 (96) stated that the gods of the pagans were demons in disguise, and many of the practices on the list that seemed to indicate residual pagan religious practices would then be condemned as something far more sinister than nondiabolical superstitions.

Despite its private and idiosyncratic character, the *Indiculus superstitionum* (A List of Superstitions and Pagan Practices) nevertheless provided important

witness to ecclesiastical interests and concerns about a society, some of whose members defined Christianity by asserting what it was not, at a key moment in Frankish and European history. Other earlier and contemporary sources, particularly church councils and the literature of penitentials were more direct, explicit, condemning, and informative of practices similar to those in the *Indiculus*, but it, too, constitutes a small window on the cultural values of the late eighth century.

INFANTICIDE

When the witches’ Sabbath was first described in the fifteenth century, murdered babies provided vital ingredients for its perverse rituals. Recruits were “given a jar full of ointment with which . . . he must go to the [Sabbat]. . . . That unguent is made . . . out of the fat of small children who have been cooked.” Moreover, some convicted witches confessed to strangling babies and “the next night they open the grave and take the body . . . to the synagogue, where it is cooked and eaten” (Kors and Peters 2001, 161–162). A century later, cannibalism disappeared from witchcraft confessions, but the cliché endured: an illustration of the satanic meal printed in Francesco Maria Guazzo’s treatise of 1608, the *Compendium Maleficarum* (A Summary of Witches), depicts two witches roasting a child over a fire. The ancient myth of ritual murders, brought by Syrians against the Jews, Romans against Christians, Christians against Gnostics, and the medieval Church against Jews and heretics, had been twisted into a new

version: it was the turn of witches, mostly women, to be accused of cannibalism and vampirism. The notion of witches devouring children or sucking their blood, widespread even in such nonprimitive cultures as Renaissance Italy and verified by twentieth-century anthropologists in their field research, cries out for an explanation that can harmonize cultural diffusion with archetypal and structural inheritance.

In the heyday of European witch hunting, witches no longer confessed to eating children at Sabbats, but they continued to be accused of murdering them. Demographic and social factors revived and adapted these ancient beliefs. Crushing high rates of infant mortality struck early modern Europe during its two worst agrarian crises (the 1590s and late 1620s). It is probably not coincidence that at such moments witchcraft accusations offered another way to deal with unbearable illness and death, particularly the death of young babies.

Of course, popular perception of infanticide as *malificium* (harmful magic) varied considerably across Europe. In the French department of Ariège and in southern Netherlands, for instance, witches were blamed for stillbirths and for killing the newborn in their cradles. But in other places, for example, Denmark, such accusations were exceptional.

Although Old Régime Europe was not a child-centered society, much literary evidence suggests that infants were not held cheap. However, centuries-old disguised forms of infanticide, in some ways almost institutionalized, remained widespread. They followed certain conventions and therefore were not considered homicide by practitioners and authorities. These indirect infanticides included the practice of abandoning newborn babies, sending them to wet nurses, and “overlaying,” whereby parents rolled over a baby sleeping with them and smothered the infant. Church authorities repeatedly prohibited parents from sleeping with infants. In several Italian synods, the power to absolve from this sin was reserved to the bishop. For reasons that have yet to be explained, Europe began a draconian criminal prosecution of infanticide in the sixteenth century, when nearly every state passed legislation against child murder. In France, 5,000 seems a conservative estimate for the number of women executed under a statute of 1556; here, the great infanticide craze took vastly more women’s lives than witch hunting (Soman 1992). Ultimately, “change in the conduct of criminal proceedings relating to witchcraft . . . began to take shape in the second half of the seventeenth century. As witchcraft declined and gradually lost its status as a crime, the blurring of the two crimes declined, and mothers who killed their children were tried simply for infanticide” (Levack 1999, 78–80).

INGOLSTADT, UNIVERSITY OF

The sixteenth-century law faculty of Ingolstadt at the Bavarian University first encouraged witch hunting, but by the end of the century, for the most part it adopted a skeptical attitude toward witchcraft. Founded in 1472, the University of Ingolstadt played a characteristic role in the process of early modern state formation. Bavaria's future leaders were to be trained there in loyalty to the ruling house and in regional customs. Ingolstadt was established to prevent money from leaving Bavaria when students attended other universities and to exercise cultural hegemony over neighboring secular and ecclesiastical territories. Ingolstadt proved to be successful, since the dukes managed to employ professors who attracted students. It gained stature when Dr. Johannes Eck, a distinguished theologian, challenged Luther's Reformation theology of justification by faith alone. By emphasizing Catholicism, unity, and tradition, Ingolstadt became a bridgehead of Counter-Reformation Germany, attracting Catholic students from all over central Europe, including future Catholic princes, prince-bishops, and theologians.

When the Jesuits appeared, Duke Albrecht V of Bavaria recognized that his state could benefit greatly from these new cadres' expertise in the Catholic Church by using his land as a strategic base. The Jesuit scholar Peter Canisius was invited to occupy the chair previously held by Eck, and he did so in a much more favorable environment, backed by his fast-growing order in the 1560s. The Jesuits were expected to discipline the clergy and offer important support to the Wittelsbach dynasty's struggle against Lutheran factions within the Bavarian nobility and the citizenry of its larger towns. Eventually the theology faculty was handed over entirely to the Jesuits and all professors

had to swear an oath to support the decrees of the Council of Trent.

This close link between the Bavarian house of Wittelsbach and certain Jesuits at Ingolstadt contributed decisively to Bavaria's position in the history of witchcraft. In the 1560s Canisius became deeply convinced that a war between good and evil was going on, and that the sharp increase in witchcraft was the consequence and climax of all the devilish heresies (Lutheranism, Zwinglianism, Anabaptism, Calvinism, Spiritualism) that had sprung up during the past generation. It is likely, though still unproven, that Canisius was already inspired by the *Malleus Maleficarum* (The Hammer of Witches, 1486). Certainly this was true of the second generation of Jesuits, when Gregory of Valencia SJ dominated the University of Ingolstadt. Gregory wrote the expert opinion on witchcraft commissioned by Duke Wilhelm V "the Pious" in April 1590, which pointed firmly to the *Malleus* and Peter Binsfeld as the only acceptable authorities for Catholics generally, and Bavarian judges in particular. Witchcraft was considered an exceptional crime (*crimen exceptum*) requiring exceptional legal measures (*processus extraordinarius*). This opinion was supported not only by Peter Steuartius SJ (1549–1624), Michael Myrhofer SJ (1548–1641), and of course Jacob Gretser SJ, but also by all members of the law faculty, including the famous Italian jurist Andreas Fachineus. At this point, to the dismay of the Bavarian political elite, the university was dominated not just by the spirit of the Counter-Reformation, but also by persecutory zeal. At the same time, scores of future Catholic rulers and their future councillors were educated here, including the Emperor Ferdinand II, the Bavarian Prince-Elector Maximilian I, the Archbishop Ferdinand of Cologne, Münster, Hildesheim, Liège, and Paderborn, and several prince-bishops, who would become responsible for the most terrible witch hunts in Europe.

The prince-bishops' lawyers and officials as well as the notorious Dr. Johann Sigmund Wagnereckh, councillor in the duchy of Bavaria, were likewise educated at Ingolstadt.

Within ten years after an articulate opponent of witch hunting, Dr. Kaspar Lagus (1533–1606) had been removed from the law faculty in 1585, the scene changed entirely. During the 1590s the law faculty regained independence and a new generation of lawyers, with Dr. Joachim Denich (a son-in-law of Lagus) and Dr. Kaspar Hell as the senior law professors. In 1601, they stopped an irregular witchcraft trial conducted by some zealous court councillors in Munich before it could trigger a general witch hunt. Although the zealot faction tried to intimidate these professors (and Dr. Hell was indeed charged with treason and thrown into prison), the jurists' minds remained unchanged. They insisted on regular criminal proce-

dures according to imperial law (*processus ordinarius*). The university became involved in one of the most ardent power struggles in Bavaria, lasting for roughly a generation, with factions within the university, the Jesuits, the government, and even the ruling dynasty. However, despite the removal of Dr. Hell (whose son, Kaspar Hell SJ, later became one of the most determined opponents of witch hunting in the region, and director of the Jesuit College in Amberg), the law faculty maintained its skeptical attitude and never again conceded the illegal *processus extraordinarius*, as suggested by the zealot faction. In fact, Joachim Denich's son Dr. Kaspar Denich (1591–1660) succeeded his father as the dominant member of the law faculty. Between 1614 and 1629, both served simultaneously on the law faculty when it made some serious decisions. In 1614, the law faculty demanded capital punishment for a judge, Gottfried Sattler, who had conducted an illegal witch hunt at Wemding; similarly in 1618 it sentenced to death judge Balthasar Nuss (or Ross), the terrible witch hunter of Fulda. Both became decisive precedents, cited afterward by opponents of witch hunting like Adam Tanner, Friedrich Spee, and Johann Matthäus Meyfart (Meyfahrt). These cases demonstrated that legal decisions could be erroneous, and witch hunting could become a crime itself. In the late 1620s, the Ingolstadt law faculty tried to curb the terrible persecutions in Eichstätt, and limited witchcraft trials in Bavaria, supported by the Jesuit Adam Tanner, who shared the lawyers' ideas. Kaspar Denich's son Sebastian Denich SJ would continue the family opposition to witch hunting in the third generation.

Between 1670 and 1760, when witch hunts no longer posed an immediate threat, Ingolstadt's reputation declined, and its legal decisions became of less consequence. Under the Jesuit umbrella, the university was cut off from intellectual changes in western and northern Europe, and the legal opinions of luminaries like Christoph von Chlingensberg (1651–1720) or his son Hermann Anton von Chlingensberg (1685–1755) look old-fashioned in comparison to Protestant universities like Halle or Göttingen. Because all Protestant authors were on the *Index Librorum Prohibitorum* (Index of Prohibited Books), Catholic lawyers were not even allowed to use older authors like Johann Weyer, let alone such enlightened opponents of witchcraft trials as Christian Thomasius. In order to break this Jesuit stranglehold, courtiers founded the Bavarian Academy of Sciences in 1759, and officials of the central government avoided consulting the Ingolstadt faculties, considering their expertise as inferior. In 1766, enlightened politicians in Munich, some of them Protestant converts who had studied in the Netherlands, launched the "Bavarian War of the Witches," a fierce public debate that served to intimidate the conservative faction. Only when the Jesuit order was stripped of its power of censorship and

eventually dissolved did Ingolstadt become a center of enlightened ideas. Adam Weishaupt (1746–1830), the founder of the enlightened Illuminate Order, was professor at Ingolstadt. At the beginning of the nineteenth century, the Bavarian university was transferred first to Landshut, and in 1826 to Munich.

INNOCENT VIII, POPE (1432–1492)

Pope Innocent VIII's bull on witchcraft, *Summis Desiderantes Affectibus* (Desiring with Supreme Ardor) on December 5, 1484, supported the efforts of the Dominican inquisitor Heinrich Kramer to prosecute witches in Upper (southern) Germany and contributed to the formation of the belief in diabolical witchcraft and a diabolical conspiracy.

Born Giovanni Battista Cibo in Genoa, the future pope led a profligate and dissolute youth before studying at Padua and Rome and taking holy orders. After entering the service of Cardinal Calandrini, he was consecrated bishop of Savona in 1467, exchanging his see to become bishop of Molfetta five years later. Elected pope on August 29, 1484, he attempted to restore peace to Christendom, meanwhile promoting an abortive alliance against the Ottoman Empire and tackling the papacy's spiraling debt through the expedient of creating and then selling ecclesiastical offices. Though politically inexperienced and frequently ill, Innocent soon proved himself a fearsome enemy to "heresies" of all kinds, strongly condemning both the Hussites in Bohemia and Jewish conversos in Spain. He also sanctioned a ferocious campaign against Waldensian communities in southeastern France and forbade Gianfrancesco Pico della Mirandola to hold a public debate in Rome on his "900 Theses," which ranged from magic to mathematics. He found Pico's ideas "offensive to pious ears" for honoring "the deceits of the Jews" and supporting "the errors of pagan philosophers" (Farmer 1998, 15).

One of Innocent's first actions on becoming pope was to issue his witch bull. Although he apparently lacked

first-hand experience of witchcraft trials, this promulgation was directly prompted by Kramer's appeal against local opposition to his witchcraft trials in Upper Germany. Local elites, clergy, and judicial authorities had all been extremely wary—if not downright skeptical—of the methods Kramer employed to uncover suspected witches and to obtain confessions and convictions. Though Kramer had probably already honed his theories about witchcraft that would surface two years later in the *Malleus Maleficarum* (The Hammer of Witches, 1486), he felt the need to seek support from the new pope. Luckily, he found a receptive audience in Innocent VIII, who incorporated Kramer's views into the main body of his bull, declaring that "It has recently come to our ears . . . that in some parts of Upper Germany . . . many persons . . . give themselves over to demons, incubi and succubi" (Kors and Peters 2001, 178). Significantly, Innocent made no distinction between the respective predisposition of men and women to commit witchcraft; "persons of both sexes" chose to forsake eternal salvation for the joys of practicing demonic arts. Innocent broke little new ground with *Summis Desiderantes Affectibus*, reinforcing numerous earlier papal pronouncements against the use of diabolical magic. Even though Sabbats were not mentioned, the figure of the Devil took center stage as the active instigator of witchcraft.

The bull reinforced the idea that *maleficia* (evil acts or evil doings) rather than ritual magic lay at the heart of witchcraft, railing against the "incantations, charms and conjurings" that cut down "the offspring of women, the young of animals, the fruits of trees . . . and . . . hinder men from begetting and women from conceiving, and prevent all consummation of marriage" (Kors and Peters 2001, 178). Moreover, Innocent intended to strengthen Kramer's authority and compel local authorities to participate in his crusade against witchcraft. Thus, Pope Innocent ordered that inquisitors were not to be hindered in their investigations by anyone, regardless of status or profession; he commanded the bishop of Strasbourg, in particular, to protect and assist them in every way possible. The severest penalties were to be handed down on individuals who opposed, or refused to cooperate, with them; Church officials had the right to compel secular authorities to intervene in the struggle against doctrinal heresy.

Though Innocent VIII was a comparatively weak pope, unable to compel officials to indulge witch-hunting inquisitors or even preserve law and order within his own patrimony, his pronouncements helped create a climate in which the concept of demonic witchcraft described later in his pontificate by the *Malleus Maleficarum* might thrive; the papal bull was often printed in front to early editions, serving as a kind of preface and tacit papal approval for its often dubious assertions.

INNSBRUCK

Capital of the Habsburg county of Tyrol, Innsbruck became the site of a particularly noteworthy trial for witchcraft in 1485. Although part of a larger late medieval trend toward ecclesiastically inspired witch hunts, it is exceptional because both religious and secular authorities intervened to end it. Both Archduke Sigismund and Bishop Georg Golser of Brixen successfully drove the Dominican inquisitor Heinrich Kramer (*Institoris*) from Tyrol and secured the release of the accused witches he had interrogated and tortured. In addition, events in Innsbruck had the unintended consequence of prompting Kramer to compose his notorious handbook for judges, the *Malleus Maleficarum* (The Hammer of Witches, 1486). Significantly, Innsbruck never again experienced a major witchcraft trial, and governmental officials continued to limit the prosecution of witches in Tyrol and most surrounding Habsburg territories.

Shortly after Pope Innocent VIII issued *Summis desiderantes affectibus* (Desiring with Supreme Ardor), his so-called "Witch Bull" of 1484, attempting to remove juridical obstacles to the prosecution of witches, Kramer arrived in the Alpine valleys of Tyrol in summer 1485 to identify and to eradicate the "heretical depravity" of which the bull speaks. His preaching produced numerous denunciations from his audience, and he set about arresting and interrogating those accused by their neighbors. All told, around fifty women found themselves subjected to the inquisitor's investigations, alongside at least two men. Ultimately, seven women were imprisoned and being formally tried when proceedings were halted.

The testimony of both accusers and accused revealed a whole world of everyday magical practices and beliefs.

Most common were chronic or acute maladies stemming from supernatural causes: lameness, rheumatism, gout, arthritis, blindness, headaches, female barrenness, and male impotence. Charges of murder through magical means were also made in the course of the interrogations. Research has uncovered a host of local animosities that led to denunciations (Dienst 1987b). Envy, rivalry, and public quarrels between armorers and bowmen, settled residents and newcomers, as well as younger and older women apparently provoked the formation of suspicions. Largely absent from accounts generated by these cases (and from Kramer's *Malleus*) were details normally associated with diabolical forms of magic, such as the witches' Sabbat.

As Kramer's proceedings were accelerating, Bishop Golser took steps to suppress them. He insisted on the involvement of a secular magistrate and appointed one of his priests to serve as an ecclesiastical commissioner, working to undermine Kramer. The secular magistrate dismissed the charges against all seven women being held, and soon Kramer himself was charged with abuse of office and commanded to leave Tyrol by Archduke Sigismund. Initially, Kramer did not want to acknowledge the order, finding it an affront to his authority; but when the husbands of the women accused of witchcraft threatened to seize him, he thought better and left the territory.

In subsequent years, although many of the surrounding territories of southwestern Germany (including some ruled by the Habsburgs) became major centers of witch hunting, Innsbruck remained immune from further witch panics. Trials involving simple charges of sorcery occurred in 1540, 1602, and 1629, while charges of diabolical alchemy were brought against another suspect in 1650. And although at least seventy-two trials occurred in Tyrol during the sixteenth and seventeenth centuries, they too remained limited in size and intensity (Dienst 1987a, 286–288). In fact, the government in Innsbruck normally tried to limit the prosecution of witches in areas over which it had jurisdiction, as it did in the seventeenth century when it repeatedly suppressed cases originating in Prättigau.

INQUISITION, MEDIEVAL

Inquisition, in a general sense, means a certain form of juridical procedure; in a more specialized sense, it designates the method used by the medieval and early modern Catholic Church for the discovery and prosecution of heretics and others guilty of criminal sins.

ORIGINS

In both ancient Roman and Germanic procedural law, a charge preferred by the injured party was the normal way of instituting an action before a court, a procedure generally termed accusatorial, because magistrates usually did not initiate trials. With the intensified control that the late Roman emperors exerted over their subjects, a new form of initiating a lawsuit in certain kinds of cases came into use: the inquisitorial procedure. In this procedure, without any formal accusation being made, the authorities began to inquire whether a crime had been committed. The search for evidence undertaken by officials both in criminal and in civil cases was called *inquisitio*. In criminal cases, and in the case of testimony from slaves, the magistrates also had recourse to torture to obtain information and confessions.

When Christianity became the official religion of the Roman state around 380, the *inquisitio*-procedure was also used in the criminal prosecution of some non-Christian and Christian heterodox citizens. With the fall of the empire and the foundation of new Germanic successor kingdoms in the fifth and sixth centuries, however, these late imperial practices generally fell into disuse throughout Europe. Within the clergy of the Catholic Church, however, the *inquisitio* procedure survived, although for a long time it was of little importance. Charlemagne (ruled 768–814) tried to introduce official inquisition anew into secular jurisdiction by ordering his emissaries, the *missi dominici*, to inquire diligently into the administration of the counts and other dignitaries, and to use the inquisitorial process known as the *Rügewefahren* (censuring procedure) in certain kinds of serious cases, but these institutions did not survive the ninth century.

In the sphere of religion, the early medieval hierarchy had no need to develop special proceedings against heretics, since there were only rare cases of deviance from the normative faith, which involved only individual persons, usually intellectuals without a popular following.

CENTRAL AND LATE MIDDLE AGES

The first sects that appeared in western Europe during the eleventh century remained restricted to a regional level and therefore failed to evoke significant reactions in ecclesiastical law. The situation changed in the following century, when Cathars and Waldensians alienated a quite considerable part of the population of France, Italy, and the Rhine provinces from the Catholic Church. Local ecclesiastical councils prescribed more severe punishments, including excommunication, mutilation, imprisonment, and the withdrawal of civil rights. The general councils, especially Lateran III and IV (1179, 1215), described and condemned heretical beliefs and practices. Several popes issued detailed bulls about the new heterodoxy, such as Lucius III in 1184 with the decretal *Ad abolendam* (For the Purpose of Doing Away With), ordering the clergy to identify heresies and lay judges to punish them. The papacy, whose religious authority had grown continually since the Investiture Controversy of the late eleventh and early twelfth centuries, soon tended to doubt the vigilance of the local episcopal inquisitions and to substitute its own centralizing power in their place. In the late twelfth century, Pope Innocent III (ruled 1198–1216) explicitly urged the use of the inquisitorial process as a means of disciplining members of the clergy by directly submitting them to his *ex officio* jurisdiction. In the Church's fight against the heretical sects, Innocent was the first pope to combine heresy with the doctrine of *laesa maiestatis* (lese majesty) in Roman law; that is, he argued that the heretics committed high treason against God. Given that this crime was capital in secular law, the same retribution also had to be used against unrepentant heretics. In 1207, Innocent decided that the goods of a convicted heretic should be sold: one part going to the accuser, another to the court, and a third to be invested in building prisons. Gregory IX (ruled 1227–1241) inserted anti-heretical measures firmly into canon law and created the office of inquisitor of heretical depravity. He assigned Dominican friars to act as inquisitors by papal authority as judges subdelegate, a regulation that formed the central structure of "the Inquisition" until its abolition. After Gregory, the inquisitorial method of dealing with heretics became a standard feature of canon law. From the thirteenth through the eighteenth centuries, jurists produced a large body of normative texts on inquisitorial procedure.

The other legal prescription that influenced the future development most deeply was Innocent IV's bull *Ad extirpandam* (to Exterpate, 1252), which permitted inquisitors to use torture without incurring irregularity. Whereas torture had hitherto been excluded from Church law, now it was declared a legal instrument for the detection of heretics. Without the introduction of torture in the inquisitorial process, when

used against both the accused and the witnesses, the witch hunts would probably have remained an insignificant episode in the history of the later Middle Ages and the early modern period, because a tiny number of persons would have confessed to diabolical witchcraft. The fact that practically none of the Knights Templar confessed to any occult beliefs or rites when questioned without force, while nearly all of them confessed to the most absurd blasphemies and misdeeds when subjected to torture, offers sufficient proof of the power of torture.

Although inquisitors were assigned to specific localities and initially did not exchange information with each other, there existed, nonetheless, a certain uniformity to their practices, insofar as the inquisitors acted on the basis of similar papal directions and were nearly all members of the Dominican or (less frequently) Franciscan orders. Nevertheless, besides the papally appointed or delegated inquisitors, bishops continued to exercise this function. The famous trial of the Dominican mystic Meister Eckhart (d. ca. 1328), for example, was initiated by the archbishop of Cologne and then transferred to the papal curia at Avignon.

To understand that the regular use of the inquisitorial process from the second half of the thirteenth century onward constituted an innovation, it is worthwhile to compare it with the synodal court (German *Sendgericht*), an institution established in the time of Charlemagne. The synodal court was held by the bishop or his vicar in each parish on regular terms; sworn parishioners (synodal witnesses), whose obligation it was to spy on the members of the congregation, were expected to denounce all violations of the Church's norms. However, they were concerned with external infringements only; there was no question of their discovering or controlling individual religious beliefs. But the aim of the inquisitorial procedure was precisely to uncover and prosecute such beliefs. For this, the confession of the accused was necessary, and it could now be obtained by torture. The older possibility of purging oneself through the oaths of oath helpers (compurgation) or an ordeal was eliminated. The older punishments had consisted of various forms of conventional ecclesiastical penance, and the secular powers had no part in the procedure. Now, many convicts received a death sentence, to be executed by the secular authorities, or the secular "arm" of ecclesiastical discipline.

PROCEDURE

The common procedure of the Inquisition followed established rules, codified in manuals. When the inquisitor arrived at his destination and began his work, he delivered a sermon and proclaimed a "period of grace" of two to four weeks so that people under suspicion might have an opportunity to confess voluntarily,

and so receive only light penances. The period of grace also allowed private denunciations of suspected heretics. After the period of grace expired, those suspected of heresy were cited, taken prisoner, and questioned; if the inquisitor thought their answers to be insufficient, torture was applied. From 1264 onward, the inquisitors were at least present in the torture chamber, although they usually did not apply torture themselves. Innocent III had greatly restricted the ability of lawyers to defend heretics, so the accused did not dispose of the help of a skilled defender. Those accused of heresy were not told the names of the witnesses for the prosecution because inquisitors learned from experience that relatives of the accused might attack them. Upon conviction by the inquisitorial tribunal, sentences for heretics varied, because there were many possibilities: fines, flagellation, the wearing of badges, penitential pilgrimages, loss of possessions, temporary or lifelong imprisonment, and, at worst, delivery to the secular arm, which meant burning at the stake. The condemned's possessions were divided among the holy office, the pope, and the secular authorities who had lent their help (which, however, was secured by the menace of excommunication).

SOURCES

Given that all trials were held in strict secrecy, and all relevant documents kept under lock and key, what are the historian's sources? Although the inquisitors made and kept far more extensive records than other tribunals, sometimes the relevant documents, especially trial records, have been destroyed. For example, documents were destroyed in 1559 by the Roman mob after the death of Pope Paul IV, and again after Napoleon's reign, when the thousands of trial records he had taken to Paris were sold in fragments. Nevertheless, many inquisitorial documents have been preserved in secular and ecclesiastical archives (like those of the episcopal inquisition in the village of Montaignou, from the first quarter of the fourteenth century) or the vast Collection Doat in Paris. Apart from archival sources, inquisitorial handbooks, written by and for inquisitors, gave a detailed and complete picture of the operating procedures and the self-interpretation of the papal inquisition. The best known are the *Practica Inquisitionis haereticae pravitatis* (The Practice of the Inquisition of Heretical Depravity, ca. 1324) by Bernard Gui, inquisitor at Toulouse from 1306 to 1324, containing three parts on the procedure, one on the power of the Inquisition, and one on the history and types of heresy. In 1376, Nicolau Eymeric, inquisitor general of the Crown of Aragon, wrote a *Directorium Inquisitorum* (Directory of Inquisitors), discussing Catholic belief, the nature and variety of heresies, and inquisitorial procedure. Eymeric's work was the standard manual long into the early modern

period. Specifically for witchcraft, the same is true of Heinrich Kramer's *Malleus Maleficarum* (The Hammer of Witches, 1486). Among the historiographical sources, one chronicle merits special mention, because it was written by a member of that organization, that is, the diary-like notices of the Dominican William Pelhisson (Pelisso) on the actions of the inquisitors in Toulouse from about 1220 to 1240.

INQUISITION, PORTUGUESE

Created much later than the Spanish, the Portuguese Inquisition was preoccupied throughout its long existence with problems of "Judaizing" among the large community of "New Christians" (descendants of Jews converted through a process forced on them in 1497); consequently, it paid relatively little attention to crimes of witchcraft, folk healing, or other illicit forms of magic.

The establishment of a Portuguese Holy Office was a lengthy process, which encountered much resistance from the Holy See from the moment King Manuel I took the first steps in 1515 to resolve Portugal's sizable "New Christian" problem by acquiring the same privileges that his neighboring "Catholic kings" had possessed since 1478. However, the Crown's intentions were obtained only under King João III, exerting all kinds of pressure on the Holy See, in an environment filled with bribery by both royal and "New-Christian" agents in Rome, against a background of weakening papal power due to the Protestant Reformation, the 1527 sack of Rome, and the Turkish conquest of Hungary in 1526.

In 1536, the Inquisition was definitively instituted in Portugal by Paul III's bull *Cum ad nihil magis*. Yet it was not until a further bull of 1547, *Meditatio cordis* (Mediation of the Heart), that the main legal features of the Portuguese Holy Office were finally established. It was a court that was simultaneously ecclesiastical (delegated by the pope, it had jurisdiction over crimes against the Christian faith, and its judges were clerics) and royal (the king appointed the Grand Inquisitor, who was invested by the pope). The Grand Inquisitor controlled the election of the Inquisition's General Council members, oversaw its activities, and physically executed its capital sentences. This institution proved to be extraordinarily durable: for almost three centuries, except from 1774 until its final extinction on April 5, 1821, it used this dual dependence on the pope and the king wisely to consolidate its power and maintain its autonomy. The Holy Office eventually became one of the most powerful bureaucratic and judicial institutions of Portugal. Its second grand inquisitor (1539), Dom Henrique, the king's brother and archbishop of Braga (later cardinal, papal legate, archbishop of both Évora and Lisbon, and even king), played a leading role in the strategy of independence and centralization that characterized Portugal's Holy Office.

It took three decades to draw the template that, with few adjustments, characterized this institution until its extinction. By the 1560s, it had settled into four tribunals: Lisbon, created 1548; Évora, also 1548; Goa, the capital of Portuguese Asia, created 1560; and Coimbra, begun in 1565. It evolved mechanisms to improve its surveillance techniques: regular inquisitorial visits intensified in the last quarter of the sixteenth century (but practically disappeared after 1637); a local network of Holy Office commissioners and *familiares* (lay officials of the Inquisition) was created in the sixteenth century, achieving gigantic proportions in the early eighteenth century. In 1547, its first *Index of Prohibited Books* was published, enlarging the Roman *Index*. Other mechanisms included visits to seaports (initiated in 1550), visits to bookshops on orders from the General Council; and preliminary censorship of all printed texts, which could be distributed only after examination and licensing by Holy Office *qualificadores* (censors). It compiled sets of its internal regulations, or *Regimentos*, in 1541, 1552, 1570, 1613, 1640, and 1774.

In addition, the Inquisition used its own rituals wisely, of which the *autos-da-fé* or acts of faith were the most dramatic. The first was performed at Lisbon in 1540, and the last public act at Coimbra, in 1781. These self-legitimizing rituals affirmed the institution's mission, promoted its power, and disseminated an image of Catholic triumph and terror. The political implications of the Inquisition's actions, more acute in the period after the restoration of Portuguese independence from Spain in 1640, should not go unmentioned, although they require more solidly founded studies.

The rhythms of inquisitorial prosecution were not homogeneous. Following a fairly mild beginning, which lasted until 1605, at an average of 46 cases/year, until 1674, when the pope suspended the Inquisition, the seventeenth century marked a period of maximum repression at 78 cases/year. When it was reinstated in 1681, it showed clear signs of decline, which intensified significantly after 1750, and its annual case average dropped to twenty-six. It is estimated that overall, about 5 percent of its verdicts called for burning at the stake; the usual sentences were imprisonment and banishment, sometimes reinforced by physical punishment (whippings and the galleys) and defamation (e.g., wearing special penitential clothes such as the *hábito penitencial*).

"NEW CHRISTIANS" AND WITCHES

A simple analysis of the Inquisition's 44,000 prosecutions clearly shows that, excepting Goa, its targets were overwhelmingly "New Christians" accused of secretly practicing Judaism. In Portugal, Protestant heresy was insignificant; a few foreigners were prosecuted at Lisbon or Goa. Although Portuguese history lacks detailed statistical analyses, it appears that around 78 percent of those sentenced by the three mainland

tribunals (Lisbon, Coimbra, and Evora) were accused of “Judaizing.” For example, among Coimbra’s 10,374 cases, Judaism accounted for 83.4 percent. Witchcraft and sorcery ranked third at 3.1 percent, behind “actions impeding the Inquisition’s proper functioning” (4.5 percent), but ahead of such offenses as heretical blasphemy (2.7 percent), bigamy (1.9 percent), or sodomy (0.4 percent).

Prosecutions for witchcraft and illicit magic varied throughout the Portuguese Inquisition over time; in the sixteenth century, for example, Coimbra had many fewer such cases than either Évora or Lisbon. Figures for Goa remain unknown and unknowable; but for mainland Portugal between 1600 and 1774, we know of 818 such cases, again just above 3 percent of the overall totals (Coimbra 361, Lisbon 264, Évora 193). Of these, no fewer than 690 of the original trial records remain (284 from Coimbra, 240 from Lisbon, and 166 from Évora). Analysis of these 690 actual trials showed that 36 percent of these defendants were folk healers using superstitious practices, 29 percent were *feiticeiros* (sorcerers) usually charged with some kind of *maleficium* (harmful magic), 18 percent were both folk healers and *feiticeiros*, 8 percent used spells to keep from being wounded, 5 percent were charged with making a pact with the Devil, and 4 percent were healers or *feiticeiros* also charged with some other crime, for example, blasphemy or abuse of Church rituals.

These 818 cases (908, including the small sixteenth-century totals) represent only the tip of the iceberg of denunciations for various kinds of illicit magic made to Portugal’s Holy Office. Again taking Coimbra as an example, its 361 cases resulted from no fewer than 6,190 denunciations recorded in the notebooks of the tribunals prosecutors (*Cadernos do Promotor*) for the period 1611–1757—almost twenty denunciations for every arrest. Denunciations—but not trials—increased sharply after 1690, peaking in the 1740s.

Like other Mediterranean inquisitions, Portugal’s Holy Office did not punish its “witches” very rigorously, although most of them were exhibited at *autos da fê*. The vast majority were banished or exiled. Exactly four were condemned to death, but twenty-seven more died in prison before their trials were concluded. Overall, in comparison with the other major Mediterranean inquisitions, Portugal paid much less attention to witchcraft—proportionately only half as much as Spain after 1600, and vastly less than the Roman Inquisition.

INQUISITION, ROMAN

The Roman Inquisition usually refers to the organization created by Pope Paul III with the bull *Licet ab initio* (It Is Allowed from the Beginning) of July 21, 1542. Governed by a board of cardinals, it eventually included forty-six provincial inquisitorial tribunals, run by Dominican or sometimes Franciscan inquisitors, and located in Italy’s most important cities and, in a few cases (e.g., Malta), in foreign countries.

When Sixtus V reorganized the Roman curia in 1588, the Inquisition board became the *Congregatio Sanctae Inquisitionis Haereticae Pravitatis* or, for short, the *Congregatio Sancti Officii* (Congregation of the Holy Office; hereafter “[Roman] Congregation”). It operated as an independent court and as a surveying board overseeing provincial tribunals through a massive correspondence. Presided over by the pope, it varied from six to fifteen cardinals (inquisitors general—*inquisitori generali*) plus various advisors (experts in theology and canon law), notaries, and warders. After the unification of Italy (1861), the Roman Inquisition no longer held jurisdictional power. In 1908 the Congregation was thoroughly reshaped, and in 1965 changed its name to *Congregation for the Doctrine of Faith*.

Most provincial tribunals were operating before the establishment of the Roman Congregation, which partly was superimposed on a medieval structure. Following is a list of provincial tribunals (those outside Rome), grouped according to states (Del Col 2002,

350–351), with the date of their creation (for those established after 1542) in brackets, and with capital cities in bold:

Duchy of Savoy: Asti, Mondovi, Saluzzo, **Turin**, Vercelli;
State of Milan: Alessandria, Como, Cremona, **Milan**, Novara, Pavia, Tortona;
Republic of Venice: Aquileia, Belluno, Bergamo, Brescia, Capodistria (for Istria), Ceneda, Crema (1614), Padua, Rovigo, Treviso, **Venice**, Verona, Vicenza, Zara (for Dalmatia);
Republic of Genoa: **Genoa**;
Duchy of Mantua: Casale Monferrato, **Mantua**;
Duchy of Modena: **Modena** (1599), Reggio Emilia (1599);
Duchy of Parma: **Parma** (1588), Piacenza;
Grand Duchy of Tuscany: **Florence**, Pisa, Siena;
Papal States: Ancona, Avignon, Bologna, Faenza, Fermo (1631), Ferrara, Gubbio (1632), Perugia, Rimini, Spoleto (1685);
Kingdom of Naples: **Naples**.

A few tribunals operated outside Italy (besides Avignon): Cologne for the Holy Roman Empire; Carcassonne and Toulouse for France; Besançon for Franche Comté; and Malta for the island of Malta (established in 1574) (Del Col 2002).

An inquisitor, nearly always a member of the Dominican order, presided over these courts; only the inquisitors of Tuscany and, partly, of the Venetian Republic, belonged to the Franciscan order. At first, the generals of their orders appointed the inquisitors, but, since the end of the sixteenth century, the Roman Congregation appointed them. In some cases, such as the Republic of Lucca and the Kingdom of Naples, bishops presided over the courts (but in the city of Naples, besides the episcopal court, there was also an inquisitor with jurisdiction over the entire state).

In addition to the main tribunals, there were also some vicariates, that is, tribunals presided over by an inquisitorial vicar under the authority of an inquisitor; for instance, before 1599, Modena was a vicariate under the authority of the inquisitor of Ferrara. Since the beginning of the seventeenth century, moreover, the so-called “vicariati foranei” (lower country courts) spread all over the various Italian States as a branch of city courts.

THE ROMAN INQUISITION AND WITCHCRAFT

Inquisitorial jurisdiction, covering anything defined as “heresy” by canon law or theology, also included witchcraft. Because such offenses aroused suspicions of heresy (usually because they involved the invocation of

devils and the abuse of sacraments and sacramentals), canon law gave inquisitors jurisdiction over *maleficium* (harmful magic) and “superstitions” generally. Worse, when witches admitted adoring the Devil, they became guilty of apostasy—a more serious crime than heresy. In the early sixteenth century, many Italian inquisitorial tribunals started murderous witch hunts, as happened in Valcamonica in 1518 and at Mirandola between 1522 and 1525. Pope Paul III established the Roman Inquisition mainly to check the spread of the Protestant Reformation in Italian cities. Therefore, in its first decades, the Roman Congregation discussed very few cases of witchcraft: exactly five are known from 1542 to 1559. Shaping any clear policy toward witchcraft was delayed by the Roman Congregation’s lack of interest. On May 11, 1559, when Pope Paul IV authorized the execution of four witches tried by the bishop of Bologna, he declared that he was ignoring the law that spared the life of a first-time offender, if the person repented, because of the extreme gravity of these witches’ crimes.

The Roman Inquisition’s attitudes toward the vast field of magic and superstition, together with witchcraft, changed abruptly in the last decades of the sixteenth century, after the final defeat of the Protestant Reformation in Italy; henceforth, these became by far the crimes the Roman Inquisition most often investigated. The Roman Inquisition, born as a special court, now became a more ordinary means of control over religious life throughout the Italian states.

This change necessitated a definite policy toward witchcraft. It remains unclear how far, if at all, the Roman Inquisition copied the guidelines established long before (1526) by the Spanish Inquisition; certainly, they were extremely similar. Specifically, by 1588 the Roman authorities urged their provincial tribunals to ignore denunciations of “accomplices” by witches who had confessed to participating in the witches’ Sabbat. These guidelines prevented witch hunts at a time when massive persecutions occurred in other European regions, but they did not deny the theoretical reality of the Sabbat, as one might expect. Instead, those indicted for witchcraft were treated according to the regulations for heresy trials, which permitted repentant defendants to avoid the death penalty, at least after their first conviction. The witchcraft trials begun or supported by the cardinal-archbishop of Milan, St. Carlo Borromeo, mainly in 1583 in Val Mesolcina (where ten women suffered at the stake), largely bypassed the Roman Congregation because of Borromeo’s exceptional role and prestige. However, inquisitors undertaking similar persecutions were immediately forbidden to proceed by the Roman Congregation, which in some cases even punished overly zealous judges, including the archbishop and

a rchdeacon of Bitonto in 1596. Therefore, as far as the repression of witchcraft was concerned, since the late sixteenth century, the Congregation of the Roman Inquisition clearly preferred persuasion, often through the intervention of confessors, to repression.

Moreover, the Roman Inquisition's moderate policies about witchcraft now received official form in a famous document, the *Instructio pro formandis processibus in causis strigum, sortilegiorum et maleficiorum* (Instruction for Conducting Trial Procedures Against Witches, Sorcerers, and Evildoers). We do not know exactly who drew up this document, or when; either its first draft dates from the very late-sixteenth century and its author was Giulio Monterenzi, the chief prosecutor (*fiscal*) of the Holy Office (Decker 2001), or it might have been assembled by the cardinal inquisitor Desiderio Scaglia, around 1620 (Tedeschi 1991, 205–227). We know that the Roman Congregation began sending its *Instructio* to provincial inquisitors in the first two decades of the seventeenth century.

The Roman Inquisition's *Instructio* emphasized two guidelines: the first gave formal approval to its policy from the late sixteenth century, stating that persons could not be prosecuted for participating in the Sabbat; moreover, inquisitors were forbidden to convict a prisoner by finding evidence of the Devil's mark or by a defendant's not shedding tears under torture. The *Instructio*'s second rule introduced some new principles on the question of *maleficium*, hitherto neglected, probably because lay courts had claimed jurisdiction over it. The Roman Inquisition now claimed jurisdiction over *maleficium* and stipulated (1) no suspect could be arrested unless material evidence of a crime could be found; (2) the judge must consult a physician to identify exactly the cause of an illness, whether natural or diabolic; and (3) inquisitors were forbidden to prosecute suspects on testimony from exorcists, overly inclined to see the works of the Devil and his allies everywhere.

Although the *Instructio* enables us to know the attitude of the Roman Inquisition toward witchcraft, its wider significance, and, especially, its actual impact, remain unresolved, for several reasons. First, the rules of the *Instructio*, like the legal practices from which it originated, did not disturb the theoretical ground on which belief in witchcraft rested. Second, its very existence suggests that provincial inquisitors committed frequent abuses while investigating witchcraft. Last, the Roman Congregation diffused the document only in manuscript form among the bishops or inquisitors under its jurisdiction, until 1657, when a printed edition was published, and it took no official action against those judges who committed abuses outside its jurisdiction. Sometimes Italian courts continued sentencing witches to death by using procedures disapproved by the

Roman Holy Office.

Documentary evidence reveals that the tribunals of the Roman Inquisition by and large spared witches' lives and preferred to punish them by abjuration, flogging, or exile. The Holy Office was more lenient than at least one of the popes who headed it: Gregory XV's bull *Omnipotentis Dei* (Omnipotent God, 1623) imposed the death sentence even on a repentant first offender, if convicted of committing a *maleficium* that resulted in a fatal injury; but his decree was never applied, probably because the inquisitors general opposed it.

In the eighteenth century, the Roman Inquisition seemed to be rapidly decaying. Its judicial business decreased; charges and punishments seemed to involve second-rate crimes such as blasphemy, sexual solicitation in the confessional (the so-called *sollicitatio ad turpia*), and "superstition," which became less and less diabolical and more human. Moreover, many books on exorcism were put on the Index of Prohibited Books, among them the work of Girolamo Menghi, a famous Franciscan friar who had strongly supported witch hunting in the late sixteenth century. Roman authorities began suspecting that much diabolic possession and consequent indictments for witchcraft resulted from mental and physical diseases instead of some diabolical spell.

All this was happening in an Italian and European environment in which Enlightenment culture was spreading with all its radical opposition to witchcraft, magic, and diabolic phenomena. At the end of this process, the Roman Inquisition, with its judicial caution, still upholding the theoretical grounds of the belief in witchcraft (still partly preserved in Catholic culture today), found itself most unfashionable. Unsurprisingly, it attempted to struggle against "Enlightened" philosophy and science rather than against the witches; but even in Italy it lost this battle and could not prevent the diffusion of new ideas. The provincial tribunals of the Roman Inquisition, by now obsolete and useless, were dismantled around mid-century, mainly to satisfy the desire of the Italian states: at Naples (1746), Parma (between 1765 and 1768), Tuscany (1782), or Modena (1785); in the Papal States; most of them were probably suppressed during the Napoleonic conquest. However, some courts, for example, Bologna, continued until the mid-nineteenth century, on the eve of Italian unification.

INQUISITION, SPANISH

The role of the Spanish Inquisition in cases of witchcraft was much more restricted than is commonly

believed. Well after the foundation of the Holy Office in Castile in 1478, jurisdiction over sorcery and witchcraft remained largely in secular hands; a Castilian decree of 1500 ordered an investigation into sorcery but referred the matter to the civil courts. The medieval papal Inquisition had likewise left such questions largely in secular hands, so that no change of policy was involved. In the first thirty years of its activity, the Castilian Inquisition showed little interest in sorcery (*hechicería*); in the early sixteenth century, repression of the offense was still normally in the hands of courts belonging to other jurisdictions (bishops and abbots, nobles and towns). Certain types of popular superstition, and the whole range of astrology, were ill-defined areas in which many learned men and clergy dabbled. Astrology, for example, was on the university syllabus at Salamanca, but not until the late sixteenth century did the Inquisition, encouraged by the papacy, attempt to suppress it as a science. The inquisitorial Index of 1583 followed Rome in banning occult arts and divination. The campaign of the Catholic authorities against popular superstition was a broad one, marginal to the Inquisition's concerns in the sixteenth century but more significant in the seventeenth, when in some tribunals it accounted for a fifth of all prosecutions.

In the crown of Aragon, which received the new Inquisition slightly later than Castile, Inquisition tribunals began to investigate maleficent witchcraft (*brujería*) in mountainous districts by the mid-1490s, claiming that heresy was involved. Medieval secular practice had been that witches should be burned, and the Inquisition at first followed suit: the Saragossa tribunal burned one in 1498, another in 1499, and three in 1500. Afterward, it reported some cases of witches (*brujas*) in Castile also, for example, at Toledo (1513) or Cuenca (1515). By 1520, edicts of faith in both Castile and Aragon added magic, sorcery, and witchcraft to their list of offenses implying heresy. However, even though Spain had already produced several treatises on witchcraft by this time, belief in the Sabbat was still far from being accepted by educated Spanish opinion. At Saragossa in 1521 a theologian declared that the Sabbat "was a delusion and could not have occurred, so no heresy is involved" (Kamen 1997, 270).

The subsequent policy of the Inquisition arose out of an historic meeting held at Granada in 1526. As a result of a persecution of witches by secular authorities in Navarre the year before, Inquisitor General Manrique delegated a committee of ten to decide whether witches really did go to the Sabbat. The discussion paper they offered to the meeting noted that "the majority of jurists in this realm agree that witches do not exist," because of the impossibility of the acts they claimed to do. A vote was taken and six of those present decided "that they really go" to the Sabbat; a minority of four

Pedro Barrugete's painting, Burning of the Heretics (1490), depicting an auto de fe (act of faith), a public ceremony in which the Inquisition transferred convicted heretics to the secular authorities for execution. (Erich Lessing/Art Resource)

voted “that they go in their imagination” (Kamen 1997, 271). The committee also decided that, because the homicides to which witches frequently confessed might well be illusory, they should be tried by the Inquisition and not handed over to the civil authorities. If, however, the authorities had proof of homicide, they could act on their own account.

In general, the committee was more concerned about educating the so-called witches than chastising them. The persecution and execution of witches continued, but the Holy Office played very little part in it. The 1526 decisions were communicated in detail to local tribunals as distant as Sardinia. In Navarre, for example, the inquisitors were given strict instructions not to proceed in such cases without consulting the supreme council (*Suprema*) and the local judges. When cases occurred in Navarre in 1538, the inquisitor, Valdeolivas, was instructed by the *Suprema* not to accept the confessions of witches literally, and to “speak

to the principal people and explain to them that the loss of harvests and other ills are either sent by God for our sins or are a result of bad weather, and that witches should not be suspected” (Kamen 1997, 272). In the next few months, he and his colleague judged and penanced sixty-four witches at Bilbao and Pamplona; some were whipped, but none died.

In other Inquisitions of the peninsula, a similar skepticism was the rule. The tribunal of Saragossa executed a witch in 1535, but after protests by the *Suprema*, it executed no further witches throughout its history. In 1549 the inquisitor of Barcelona, Diego Sarmiento, allowed a number of witches to be executed without referring the cases to his superiors. The *Suprema* sent Francisco Vaca to investigate and report; he sent them one of the most damning denunciations of witchcraft persecution ever recorded, recommending freeing all prisoners, and returning all confiscated property. Inquisitor Sarmiento was pensioned off in 1550 for ignoring regulations (Monter 1990, 265–267). For the rest of its career, the Inquisition executed no witches in Catalonia.

Throughout the sixteenth century, the Inquisition seems to have maintained its hostility to persecution. Juana Izquierda, tried before the Toledo tribunal in 1591, confessed to taking part in the ritual murder of a number of children. Sixteen witnesses testified that the children had in fact died suddenly, and that they considered Izquierda to be a witch. What would in any other European country have earned Izquierda the death sentence, in Spain earned her 200 lashes.

The only significant lapse from this good record occurred a few years later in Navarre, where the tribunal had for many years resisted local pressure to execute witches (see Henningsen 1980). The background to this relapse originated not in Spain but in France. Just across the frontier, in the Pays de Labourd, the Bordeaux judge Pierre de Lancre had conducted a horrendous witch hunt in the autumn of 1609, during which he supposedly executed around eighty witches (but probably only twelve, including three priests). Many suspected Basque witches (*xorquinas*) fled over the border into Navarre and created a witch scare on Spanish territory. The inquisitors of Logroño reacted by arresting dozens of *xorquinas* and even obtained permission from the *Suprema* (which apparently forgot its own guidelines) to confiscate their property. They held a great *auto de fe* on Sunday, November 7, 1610. Fifty-three prisoners took part; twenty-nine of them were accused of witchcraft. Six witches were burned at the stake, together with the corpses of five others who had died in prison. In March 1611, the *Suprema* deputized a Logroño inquisitor, Alonso de Salazar Frías, to visit the afflicted parts of Navarre, carrying an edict of grace inviting the inhabitants to confess their errors. Salazar heard almost 2000 confessions, mainly from children. In the course of his mission, Salazar came to the

conclusion that these offenses were entirely imaginary, and became embroiled with his senior Logroño colleagues, who never doubted the reality of all aspects of witchcraft.

Before Salazar's mission, the Inquisitor General had commissioned an opinion (*consulta*) from Pedro de Valencia. His report, dated April 1611, was careful not to deny the reality of witchcraft. However, he implied that there was a strong element of mental sickness in the Navarre events ("The accused must be examined first to see if they are in their right mind"; their conduct, he said, "is more that of madmen than of heretics"), and urged that exceptional care must be taken to prove offenses through "evidence, according to law" (Kamen 1997, 275).

On August 29, 1614, the *Suprema* finally reaffirmed its policy of 1526, which remained the basic guide to its future policy. Drawn up in thirty-two articles, these instructions advised caution and leniency in all investigations. Although the Spanish Inquisition still regarded witchcraft as a crime and claimed jurisdiction over it, in practice it rejected all testimony about it as delusion. Thus, for the most part, Spain was saved from the ravages of popular witch persecutions prevalent in many areas of Europe. The decision of 1614 benefited those accused but placed the Spanish Inquisition in an ambiguous position both in theory and in practice. In theory, it admitted that diabolism was possible but denied any single instance of it. In practice, it was reluctant to intervene in witchcraft cases and often conceded jurisdiction to the civil authorities. It continued to prosecute all types of superstition with vigor.

INQUISITION, VENETIAN

Although it developed a few individual characteristics, the Inquisition of Venice remained a branch of the Roman Inquisition. From 1500 to 1519, the patriarch

of Venice and the inquisitor, a Conventual Franciscan friar, prosecuted only seven cases against men (one for magic) and twenty against women (nineteen for magic). During a major witch hunt in the Valcamonica, north of Brescia, between 1518 and 1521, the Venetian government's chief executive organ, the Council of Ten, requested that the papal nuncio supervise the work of the Dominican inquisitor and six judges appointed by the bishop of Brescia. After more than 165 trials and 62 to 80 executions by fire, the Council of Ten halted the prosecutions (Del Col 1988). The nuncio remained thereafter the most important inquisitorial judge in the Republic.

From 1541 to 1560, the Venetian Inquisition was run by the nuncio's auditor and the inquisitor, both with competence throughout the Republic. After 1560, the nuncio, the patriarch, and the inquisitor (now a Dominican friar) served as judges; by the end of the sixteenth century, as in other Italian tribunals of the Holy Office, the inquisitor had come to play the leading role. From April 22, 1547, on, the *Tre savi sopra l'eresia*, prestigious members of the Senate elected by the Minor Council and after 1595 by their peers, participated in the tribunal's proceedings—but almost always as mere "assistants." Nonetheless, Venetian secular government, frequently flouting the provisions of canon law, had a significant impact on the Inquisition's operations, because the Council of Ten oversaw the functioning of fifteen Inquisition tribunals throughout the Republic's territories: Belluno, Bergamo, Brescia, Capodistria (covering the Istrian peninsula), Ceneda, Crema (established in 1614), Feltre (only in the sixteenth century), Padua, Rovigo, Treviso, Udine, Venice, Verona, Vicenza, and Zara (covering Dalmatia). It also ruled on issues of territorial competence, impeded the sequestration of convicted heretics' goods, resisted the extradition of Venetian subjects to Rome, allowed foreign suspects to escape from prison, proposed sentences lighter than those formally mandated, and curtailed the ecclesiastical judges' freedom of action in other ways (Del Col 1991).

A rough calculation based on an imprecise inventory of the series *Sant'Ufficio* (Venice, Archivio di Stato) indicates that from 1547 to 1794, 1,041 of 3,592 cases handled by the Inquisition of Venice—by no means all of them complete trials—concerned belief in and practice of illicit magic. At first, cases involving magic constituted a small proportion of the Inquisition's case load; but from the late sixteenth century, they amounted to between one-third and one-half. Studies of about 500 cases tried between 1550 and 1650 (Martin 1989) revealed a wide variety of magical practices: necromancy (learned ritual magic, consulting the spirits of the dead); divination (both learned and popular) and conjuration of spirits and saints through spells and incantations, finding lost or stolen objects, gaining or

impeding love, obtaining money, predicting the future; and a vast range of popular healing practices. Few proceedings culminated in formal condemnations, and culprits received light punishments. Diabolical witchcraft was conspicuously absent (only six cases contain references to the Sabbat), and no one was condemned to death on this charge.

After 1700, however, three men were condemned by the Inquisition and executed by Venetian secular authorities for abuse of consecrated hosts for magical purposes: two were strangled in jail in 1705, the other was burned at the stake in the Piazza San Marco in 1724. This was the first and last such event at Venice, as heretics sentenced to death were usually drowned at night out of the Lagoon (Del Col and Milani 1998).

Although “enlightened” rulers in other Italian states abolished inquisitions in the 1770s and 1780s, those in the Venetian Republic lasted until the arrival of Napoleon’s armies. Only two of its tribunals, Venice and Udine, preserve extensive documentary holdings; two others, Rovigo and Feltre (eventually united with Belluno) are complete for the sixteenth century. Unsurprisingly, few scholars concerned with magic and witchcraft have exploited the surviving trial records.

INQUISITORIAL PROCEDURE

Inquisitorial procedure, the main method used to prosecute crime in Europe during the late medieval and early modern periods, greatly facilitated the conviction of accused witches. The inquisitorial form of criminal procedure was introduced into continental European court rooms between the thirteenth and sixteenth centuries. In most places, it replaced the accusatorial system of criminal procedure, which had been the main method of prosecuting crime in both the ecclesiastical and secular courts since the fall of the Roman Empire.

Inquisitorial procedure changed both the way criminal prosecutions were initiated and the way courts determined guilt. In the accusatorial system, the injured party or his or her kin initiated a criminal action. The accusation was a formal, public, sworn statement laid before the court. The person who entered the complaint technically became the prosecutor of the crime, and the trial was an adversarial proceeding between the accuser and the accused. The outcome of those trials in which the guilt of the accused was in doubt was determined either by an ordeal or by oaths regarding the good reputation of the accused. If the court determined that the accused was innocent, the accuser was liable to a punishment that was the same as the accused would have received if convicted.

In trials following inquisitorial procedure, the courts assumed responsibility for the initiation and prosecution of crime. The first method of initiation was by *accusation*. Most courts still allowed individuals to initiate cases in the traditional manner by accusing another person of a crime, but the state regulated the methods by which this was done. The liability of the accuser was generally reduced to a bond, payable as a surety at the time of accusation, and in many jurisdictions it was eliminated entirely. In certain circumstances, including many witchcraft cases, the courts allowed secret accusations. In cases initiated by accusation, the court superintended the entire process and assumed responsibility for the prosecution if the accuser withdrew the charge or reached a settlement with the accused. A second method of initiation was by *denunciation*, according to which persons holding positions of authority, such as clerics or minor officials, would secretly submit the name of an alleged offender to the court, which then assumed responsibility for trying the person who had been denounced. Ecclesiastical courts had used denunciation as early as the ninth century, but it now became a regular means by which criminal cases could be initiated.

A third method of initiation, frequently used in witchcraft and heresy cases, was by proceeding *ex officio*. In these cases, judges or officials of the court would start the proceedings by themselves on the basis of evidence the court had obtained through its own investigation. Prosecutions *ex officio* often took place when

persons, including alleged witches, were suspected merely on the basis of ill fame or rumor. In some jurisdictions the court arranged for members of the community to testify to the existence of the rumor that the person had committed a crime.

The most distinctive feature of inquisitorial procedure was the collection and evaluation of evidence by the officers of the court in an effort to establish guilt or innocence. The system reflected the growing interest of the state in the prosecution of crime. Regardless of the method used to initiate the prosecution, inquisitorial trials were conducted entirely by officers of the court, who deposed witnesses and interrogated the prisoner as part of an effort to prove guilt. Judges gave weight to different pieces of evidence on the basis of rules established by jurists. "Perfect" proof in capital crimes required either a confession or the testimony of two unrelated eyewitnesses. Circumstantial evidence was insufficient to convict in a capital case but could be used to authorize the use of torture to secure a confession. In contrast to the accusatorial system, in which the determination of guilt was based on the outcome of an ordeal or the reputation of the accused, inquisitorial procedure represented an effort to determine guilt on the basis of human reason. Inquisitorial procedure was the product of the scientific jurisprudence that developed on the European continent in the late Middle Ages. It was introduced only after the Fourth Lateran Council (1215) forbade clerics to participate in the ordeals, a prohibition that effectively abolished them.

While also abandoning ordeals and compurgation, Anglo-American legal practice has retained the accusatorial system, and its adherents condemn inquisitorial procedure for its secrecy, its denial of the rights of the accused, and its authorization of torture. It has also been criticized on the grounds that the same judicial officials who prosecuted the criminal also determined that person's guilt. Although inquisitorial procedure was vulnerable to abuse, especially when torture was applied, it did provide for legal representation of the accused, and it did not presume the guilt of the accused, as is so often alleged. The legal "presumptions" judges made were determinations that there was sufficient evidence to proceed with a trial.

Inquisitorial procedure was not adopted in all European jurisdictions, but it became standard in ecclesiastical courts, especially papal and episcopal tribunals appointed to investigate heresy. In the Middle Ages, papal commissions issued to various ecclesiastics were often referred to collectively as the Inquisition, even though the inquisition possessed no permanent organization (Kieckhefer 1995). In secular courts, inquisitorial procedure was adopted mainly in those areas of Europe most directly influenced by the study of Roman law: Italy, Spain, Portugal, France, the Low Countries, Switzerland, and Germany.

Inquisitorial procedure was never introduced into English secular courts. After the abolition of ordeals, the determination of guilt in courts of common law was assigned to lay juries rather than professionally trained judges. In Scotland, which saw a limited reception of Roman law in the late sixteenth century, certain elements of inquisitorial procedure, for example, the collection of written testimony in dossiers and the introduction of defense attorneys to respond to indictments, became part of secular criminal procedure. In the Scandinavian countries, inquisitorial procedure, and the use of *tortu* with which it was often associated, made little headway. In eastern Europe, especially Hungary, some medieval ordeals survived until the eighteenth century.

The adoption of inquisitorial procedure facilitated the prosecution of all crime, but it proved to be especially useful in witchcraft trials. The elimination of the liable accuser made it possible for villagers to bring charges against their neighbors, sometimes secretly, without fear of being held accountable themselves if the charges were not upheld. Local officials could now proceed against suspected witches *ex officio*, simply on the basis of rumor. Inquisitorial procedure also made it possible to arrest and interrogate witches named by their alleged accomplices, thus making feasible some of the largest witch hunts of the entire period.

Inquisitorial procedure, especially when it involved the use of torture to secure proof through confessions, also made convictions in witchcraft cases more likely than under accusatorial procedure, which could be manipulated to secure acquittals. The most intense witchcraft prosecutions occurred in countries where inquisitorial procedure had come into wide use, especially in the German territories. Conversely, the number of trials and convictions remained relatively low in countries that never adopted inquisitorial procedure. The use of inquisitorial procedure, however, did not necessarily lead to a large number of convictions and executions in witchcraft cases. Witches tried before the Spanish, Portuguese, and Roman Inquisitions, which used inquisitorial procedure but that also insisted on maintaining rigid procedural and evidentiary rules, convicted and executed relatively few witches. The same can be said for those witches who were tried on appeal before the *Parlement* of Paris, the most prestigious secular tribunal in Europe employing inquisitorial procedure.

In certain circumstances, moreover, it was easier to secure a conviction in a court that followed accusatorial procedure than in one using inquisitorial procedure. When courts began to exercise caution in witchcraft trials, especially toward the end of the seventeenth century, it proved easier to secure a conviction of witches by juries, which were not bound by a strict law of proof, than by relying on a trained judge to evaluate the

evidence. The relative “success” of a witchcraft trial using accusatorial procedure under those circumstances explains why the decline of witchcraft prosecutions was sometimes more sudden in countries that employed inquisitorial procedure than in those that did not. In France, for example, where judges controlled the judicial process, witchcraft trials ended abruptly once the courts began to question the validity of the charges brought before them. In England and Scotland, on the other hand, where juries determined the facts of the case, witchcraft trials lingered on well into the eighteenth century.

INVOCATIONS

By the term *invocatio*, the Romans usually meant the proper prayers for the intervention of the gods. Late antique theurgy may be regarded as a form of invocation. In Roman Catholicism, “invocation” is a technical term for both the liturgical prayer for divine intervention, especially in the consecration of the Eucharist, and for a prayer for the helping intervention of the saints.

Though an invocation is phenomenologically kindred with conjurations, spells, incantations, exorcisms, prayers, and cursing—all manifestations of sacred and powerful speech—its distinguishing feature consists in a more or less forceful claim to exercise a degree of coercion over the beings addressed, whose compliance is implied. It is not only begging, but also an order; other elements like narrative ones, quoting a successful

example *in illo tempore* (at that time), may be included. In a narrower sense, the term “invocation” is restricted to those parts of conjurations that contain the names of the powers whose help is being sought (“in the name of thus-and-such divinities or demons”). Even if spoken words form the core of any invocation, it also regularly requires corresponding gestures, very often combined with the use of sacrifices, magic objects, symbols, and so forth. When the powers addressed do not react immediately, which usually happens, the invocation must be repeated or intensified.

Concerning witchcraft in Europe, we must deal here with the invocations used in black magic, be they invocations of God, of events of sacred history (Jesus’s Passion, the Last Judgment), of the saints—or invocations of demons and ghosts. God and his saints were invoked again and again for magical purposes, proving that most people using sorcery by no means thought themselves outside the Christian religion. An example for an invocation spoken for making a dead person rise may be quoted from a fifteenth-century German necromancer’s manual: “by the virtue and power of the divine majesty, and by the thrones and dominations and powers and principalities of Him . . . , and by those [angels] who do not cease to cry out with one voice, saying, ‘Holy, holy, holy . . . , and by these names, which cause you fear and terror: Rator, Lampoy, Despan, Brulo . . . the deceased is conjured to follow the magician’s instructions (Kieckhefer 1997, 128). This broad range of numinous instances who are called to help, from God himself to the most fantastic names of unknown demons, was quite characteristic for those forms of sorcery that intended to effect some advantage for the wizard or his client. Similar forms were applied to find hidden treasures, to compel a dead person to tell the future, and so forth.

Exclusive invocations of the Devil or his hosts seem to have been restricted to heretics and witches, at least according to their persecutors. An early instance of condemning the *invocator daemonum* (invocator of demons) can be found in the *Codex Theodosianus* 9, 16, 5, promulgated in 438. The ban on invocations of demons, which remained a constant item in criminal codes until modern times, can be found in, for example, the early medieval Visigothic code or in Ulrich Tengler’s sixteenth-century *Layenspiegel*. These prohibitions reflect standard Christian mentality. Very rarely, more tolerant positions can be found. In around 1370, a Spanish Dominican (!), Raimundus of Tarrega, a converted Jew, wrote a treatise *De invocatione daemonum* (On the Invocations of Demons), according to which we are permitted to invoke and adore demons, keeping in mind that they can be venerated as God-made beings. Inquisitor Nicolas Eymeric had this book burned and composed one himself against those who called up demons.

*The Devil appears to witches who had invoked him, from Francesco Maria Guazzo's *Compendium Maleficarum* (A Summary of Witches), 1608. (Art Archive/Dagli Orti)*

Notwithstanding the ascription of invocational practices to heretics and witches in the stereotypes of their persecutors, there can be no doubt that demons were indeed frequently invoked; it is sufficient to consider the number of conjuring books preserved from the late Middle Ages onward, both manuscripts and printed books, all clearly intended for practical use. Many of them were written in Latin, which proves their circulation within learned groups of society, that is, during the Middle Ages, the clergy. Biographical, historical, juridical, and other sources present further evidence. A famous early example was the experience of the Roman emperor Julian the Apostate (361–363), who witnessed, much to his terror, the invocations of demons in a pagan temple, reopened by him (Theodoret, *History of the Church* III, 3, 130). The “New Manichaeans,” one of the earliest heretical groups of the Middle Ages, were accused at the synod of Orléans (1022) of ritually declaiming the names of demons, who then appeared

in animal form. For the late Middle Ages, the trial of the perverted marshal of France Gilles de Rais (1404–1440) contains much material on the invocation of evil spirits and shows the technical level that this “art” had reached. All the typical components of a professional invocation—sacrifice, magical circle, conjuring book, and so on—form part of the rituals his collaborators described. Another instance from the age of Louis XIV is connected with the “Affair of the Poisons,” where diabolical invocations formed part of black masses. Gilles de Rais was a medieval Satanist, whose existence as a sect is doubted by most historians. However, there is evidence that such sects indeed existed from the twelfth century onward on a local level, and that they did invoke Satan or demons. Of course, the existence of similar groups in modern times cannot be denied.

The invocation of the dead, that is, necromancy, also formed part of the magical arts. Its most frequent aim was to make the deceased provide information about

the future. Invoking dead men has a long history, starting with the witch of Endor (1 Kings 28) and Ulysses's seer, the blind Theiresias. There is ample evidence for similar practices from late antiquity; it did not cease entirely after the Christianization of the Roman Empire, although real cases become rather rare in the Middle Ages and afterward. In legends and gothic novels, however, like that of the famous scholar Johann Faust, the invocation of the dead remained a *topos*; Faust brought the shadows of Alexander the Great and his spouse before the Holy Roman Emperor Charles V (as the 1587 *Faustbuch*, chap. 33, narrates).

In vocations of the dead have also been recorded as acts of saints, and thus of course qualified as miracles. So St. Spyridion (d. ca. 350) asked his dead daughter to reveal to him the place where she had hidden some precious objects, and she answered him out of her grave. St. Severin of Noricum (d. 482) revived a deceased priest, whom he wanted to continue with his pastoral obligations. St. Fridolin of Säkingen (seventh century) made one of his benefactors, named Ursus, arise from the grave and brought the revived corpse with him to court in order to provide testimony for a disputed donation that he had received from Ursus during his lifetime. This saint's regular iconographic attribute, therefore, is a small skeleton or corpse.

Formally, invocations typically contained an appellative (the addressee), with or without further specific actions, and an order. Most often, they also cited the names of the divinities or demons by whose power the words should work. For example, the formula sung by Matteuccia di Francesco, the witch of Todi, in 1428 to call her animal demon goes: "*O Lucibello, / demonio dello inferno, / poichè sbandito fosti, / el nome cagnasti, / et ay nome Lucifero maiure, / vieni ad me o manda un tuo servitore.*" (O Lucibello, demon of hell, having been banned you changed the name, and into the name Lucifer the greater. Come to me or send me one of your servants!) (Mammoli 1972, 22). The Christian version of an invocation comprises the same elements, as we learn, for example, from St. Severin: "Thus the holy man spoke to the corpse: 'In the name of our Lord Jesus Christ, saint priest Silvinus, speak with your brothers!'" (Eugippius 1965, c. 16).

IRELAND

Perhaps the most remarkable thing about trials for witchcraft in Ireland is how few of them there were. In the case of the medieval period, the irregular structure of the church in Gaelic Ireland means that virtually no archival material has survived. Therefore it is impossible to know whether or not witchcraft prosecutions occurred there. A collection of proverbs made in late sixteenth-century County Clare contained a saying that seems to have originated in a piece of advice literature to a Gaelic lord enjoining him to "Burn them who do witchcraft." However, whether this was in imitation of the biblical injunction in Exodus 22:18 or whether it reflected actual judicial practice within a lordship is not clear. Within that part of medieval Ireland controlled by the Anglo-Normans, evidence survives for only one witchcraft trial, that of Alice Kyteler, who with some codefendants was tried for sorcery and heresy in 1324 by Bishop Ledrede in Kilkenny. Her trial suggests that Ledrede was attempting to introduce the methods of the Inquisition into the judicial practice of Ireland.

The absence of witchcraft trials in early modern Ireland is even more striking, especially given that many of those who migrated to Ireland after 1600 came from Scotland, where witchcraft trials were frequent and numerous. While there are a number of references to the practice of witchcraft in early modern Ireland, only nine trials for witchcraft are known and details survive on only two. The first was that of Florence Newton of Youghal, tried for witchcraft in 1661, and, second, the Island Magee witchcraft trials of 1711. Newton's case followed a classic pattern: first, Mary Longdon's refusal of charity to Florence Newton; second, Newton's curse followed by Longdon's subsequently falling into fits. The Island Magee trial was more complex, with seven women being accused by Mary Dunbar of bewitching her after she fell into fits. On the basis of the surviving deposition evidence, there does not seem to be any concrete cause for dispute, such as the refusal of charity,

between Dunbar and her accusers. In both instances, the normal mechanisms of the assize were used to conduct the trials.

Historians have offered three principal explanations, all of them quite faulty, as to why so few witchcraft trials are known from early modern Ireland. One unlikely theory suggested that Ireland's legal framework differed from England's and discouraged witchcraft prosecutions. This was clearly not the case. The Irish statute against witchcraft of 1586 repeats almost verbatim the English act of 1563. A handbook prepared in 1634 for Irish justices of the peace by Richard Bolton also instructed the justices in the marks of witchcraft, based on English precedents. A second unconvincing explanation blamed the destruction of many Irish records in the 1922 explosion in the Public Record Office of Dublin; hence, records of witchcraft trials simply do not survive. However, St. John D. Seymour's book, *Irish Witchcraft and Demonology*, published nine years before the explosion, failed to identify any further evidence of witchcraft trials. This was unlikely to be the result of careless scholarship, because in other areas, such as his work on the Cromwellian church, Seymour was a meticulous scholar. A third flawed explanation held that the native Irish failed to prosecute witchcraft cases in the common law courts in Ireland as an expression of passive resistance against an alien judicial system. This too seems unlikely. On the basis of surviving Irish court records, it is clear that the native Irish were deeply involved in the workings of the common law system by the 1640s. They eagerly prosecuted theft, assault, and murder through these courts, so it is difficult to see why witchcraft should have been excluded in such a way.

In some ways, seeking answers to the question of why there were so few witchcraft trials in early modern Ireland is to formulate the problem badly. It might be better to ask why the beliefs in witchcraft and maleficent magic, which clearly existed in early modern Ireland and which produced accusations of witchcraft from time to time, failed to translate into formal witchcraft trials. To understand the answer to that question involves both social and economic analysis together with an understanding of the cultural role of law in early modern Ireland. In economic terms, Ireland shared one feature with other areas of the British Empire where witchcraft trials were few or absent before the 1680s, most notably the Isle of Man, the Scottish highlands, and most of colonial America. That feature was a lack of pressure on available resources. Irish population, though growing fast in the seventeenth century, was low in relation to the resources. The result was that, unlike England and many parts of Europe, there was no significant redistribution of wealth through inflation, and hence, those who were increasingly pushed to the edge of society elsewhere, notably the poor and women, were less marginalized in Ireland. Consequently, the

importance of breaches in charity was less significant than in other places. In Ireland, redistribution of resources took place between ethnic groups rather than social ones; hence, while ethnic tensions may have been strong, social tensions remained weak. The kinds of tensions that often underlay witchcraft accusations and trials elsewhere were muted in Ireland, with a corresponding reduction in the general rate of criminal activity—including witchcraft. This trend may have been reinforced by the cohesion that seems to have existed within specific ethnic groups in Ireland: this promoted some extreme violence between those groups, as in the 1640s, but maintained high levels of social solidarity within them.

A second consideration that may have served to mitigate the incidence of witchcraft trials can be traced to attitudes toward the law in early modern Ireland. Ireland in the late sixteenth and early seventeenth centuries was becoming a colonial society, within which there was considerable disruption of native Irish social structures and a simultaneous fracturing of kin networks among colonists through the migration process. In this context, law played an important part in defining and maintaining social relationships. Rather than being seen as an adversarial process, the law served to bind individuals and communities together either by providing sites where relationships could be negotiated, such as the assize or quarter sessions, or by providing a framework for the definition and maintenance of order. In Ireland, law was not, therefore, seen as an appropriate instrument to use when seeking a resolution of the sort of social tensions that appear to have underlain so many witchcraft trials elsewhere. In Ireland, other mechanisms, such as arbitration, proved more important in this area.

ISIDORE OF SEVILLE, ST. (CA. 560–636). St. Isidore of Seville was bishop of Seville (600–636) and the most widely learned churchman of early seventh-century Iberia. He presided over the important Fourth Council of Toledo in 633 and was a prominent adviser to the Visigothic kings of the Iberian Peninsula, particularly in matters of raising the level of clerical culture and systematizing and circulating the knowledge of

antiquity and the early Christian world. Isidore was also a polymath whose interests ranged across a vast number of subjects. Although not an original thinker, he became a successful compiler of much of the learning of the ancient world, including its views on magic and sorcery. He passed that learning on to centuries of later readers in his vast work called the *Etymologies*, a kind of encyclopedia of all knowledge, based on the theory that the meaning of everything could be learned by considering the origins of its name. Although Isidore died before he had completed the work, his friend Braulio of Saragossa edited the work and divided it into twenty books. This work immediately became and long remained the chief source of information on the learning of antiquity. A close reader of the works of St. Augustine, Isidore demonstrated a broader interest in the nonreligious aspects of Greco-Roman thought than Augustine, and his discussion of magic in Book VIII of the *Etymologies* became the standard approach to the term and its history.

In his discussion of magic, Isidore drew heavily on all the Roman literature he knew, whether pagan or Christian. Book VIII, chapter 9 begins with Isidore's version of the history of magic from an imaginary Zoroaster, king of the Bactrians, to his own day, citing as sources Aristotle and the Roman poet Lucan. In VIII.9.3, Isidore stated that the magic arts were the result of the teaching of rebel angels concerning divination, auguries, oracles, and necromancy. Although magicians possessed great powers, they did not perform miracles. He pointed out that Circe, in Homer's *Odyssey*, was a magician in this sense, and he quoted other Latin poets to the same effect. Isidore was one of the most influential transmitters of the image of Circe as a witch to later centuries. He mentioned her again in Book XI.4. For Isidore, all testimonies on the subject were of equal value and referred to the same thing, regardless of whether they are of Hebrew, Greek, Roman, or Christian origin. Just before speaking of Circe, for example, he cited the example of Moses and the magicians of Pharaoh (*Exodus* 7:8).

Isidore offered a long catalog defining twenty different kinds of magic culled from all his sources, concluding with the warning that "In all these the demonic art has risen from a pestilential association of men and bad angels [demons]. Whence all must be avoided by Christians and rejected and condemned with thorough-going malediction" (IX, 31).

Generally, Isidore's ideas about magic were those of Scripture, early Christian literature, the Greek and Latin poets, and Roman law. He does not discuss any practices that can be identified as those of his own day, but he provided a considerable vocabulary of terms to later writers who wished to classify contemporary practices in their own age. On the subject of magic, as on other subjects, Isidore's work became the standard reference book for centuries of later scholars. The

significance of his treatment of magic lies in the wide variety of practices he included in this category and in his lack of discrimination between pre-Christian and Christian sources. In 2001 the Roman Catholic Church named Isidore the patron saint of the Internet.

ISLAMIC WITCHCRAFT AND MAGIC

The Quran (Koran) attests the existence and efficacy of magic and the existence of a class of spirits called *jinn*s in Muslim theology and folklore. In the centuries after the first preaching of Islam, Muslim sorcerers continued to employ pre-Islamic Arab spells and adapted magical materials from the Greeks, Copts, Nabataeans, and others. Moreover, the Quran began to be used for sortilege and other magic. Although practitioners of magic were usually regarded as sinister, they were not systematically persecuted.

The last two *suras* or chapters of the Quran are both very short and apotropaic. *Sura* 113 proclaims:

In the Name of God, the Merciful, the
Compassionate
Say: "I take refuge with the Lord of the Daybreak
From the evil of what he has created,
From the evil of darkness when it gathers,
From the evil of women who blow on knots,
From the evil of the envier when he envies."
(*The Koran Interpreted* 1953, 2: 362)

In pre-Islamic Arabia, spells were commonly cast by tying knots and envy often provoked the casting of the evil eye. According to al-Bukhari's ninth-century collection of sayings concerning the deeds and words of the Prophet, this *sura* was revealed to Muhammad after he

had been placed under a spell that involved the knotting together and burial of a comb with some of the prophet's hair (Al-Bukhari 1893–1896, 5, 250). Muhammad had the sorcerer killed—an act that may have served as a precedent for the order of the Caliph 'Umar (ruled 634–644) that all the sorcerers in one area of Iraq should be killed (Morony 1984, 397–398). The tenth-century bookseller and cataloger Ibn al-Nadim listed a sorcerer who had produced treatises entitled *The Untied*, *The Tied*, *The Knots*, and *The Twistings* (Ibn al-Nadim 1970, 2, 731; Morony 1984, 399).

Sura 114 is as follows:

In the Name of God, the Merciful, the
Compassionate
Say: "I take refuge with the Lord of men,
the King of men,
the God of men,
from the evil of the slinking whisperer
who whispers in the breasts of men
of *jinn* and men."
(*The Koran Interpreted* 1953, 2: 363)

The whisperer in the breasts of man was Iblis or Satan (who in later Islamic lore was usually visualized as a handsome one-eyed old man with a thin beard). The Arabic noun *waswas* means whispering, devilish insinuation, temptation, melancholy, or delusion. *Jinns* are repeatedly referred to in the Quran and consequently form part of orthodox Muslim belief. According to the Quran, the *jinns* were created from smokeless fire. Elsewhere in the Quran, the Biblical King Solomon is credited with power over the *jinn*: a considerable body of Islamic folklore grew up about his dealings with the *jinns*, his use of various magical impedimenta, and his imprisonment of some *jinns* in stoppered flasks (*The Koran Interpreted* 1953, 2: 96–98; 21: 78–82; 34: 12–13). After the conquest of Persia by Muslim armies in the seventh century, Arabic lore about *jinns* was assimilated to the preexisting Persian lore about *divs* (supernatural monsters). The legendary Persian monarch, Jamshid, controlled the *divs* in much the same way that Solomon controlled the *jinns*. *Jinns* were sometimes also referred to as *shaitans* (satans) and in *Sura* 2 of the Quran, the *shaitans* were responsible for teaching people sorcery, making use of two fallen angels, Harut and Marut, who were hung upside down in a well in Babylon (*The Koran Interpreted* 1953, 2: 96–97). This legendary well became a place of pilgrimage for those who wished to learn sorcery.

Like Christian angels, there were good *jinns* as well as rebellious and maleficent *jinns*. Law books proclaimed the lawfulness for Muslim mortals of commercial and sexual intercourse with *jinns*. Jurists set out the property and marriage rights of *jinns*. Nevertheless, though some anecdotes presented individual *jinns* in a benign

light, on the whole, *jinns* had a reputation for cruel and arbitrary behavior. They lurked in such sinister and unclean places as cemeteries, caves, and lavatories. The *ghoul*, shape-shifting jinn, who was usually female and cannibalistic, lurked in wastelands and sometimes used the semblance of beauty to lure men to their doom. Sorcerers usually derived their powers from control of the *jinns*. The mad (*majnun*) were commonly held to be possessed by *jinns* (Westermarck 1899; Macdonald 1909, 130–156; Fahd 1971).

Jinns were held to be the sources of inspiration for the pre-Islamic poetry of the Arabian Peninsula. Every poet was supposed to have his *qarin*, or associate spirit. Poetry was used for cursing, particularly in the final moments before engaging in battle with a rival tribe. To some extent, this association between poetry and demonic inspiration persisted in the Islamic tradition for centuries, and there were numerous anecdotes about famous poets receiving their inspiration from Iblis or one of the other lesser *jinns*. Poetry proper was distinguished from *saj'*, a form of rhymed and rhythmic utterance that was in the first instance the language employed by the *kahins* or soothsayers. The *kahins* of pre-Islamic Arabia not only uttered predictions, but also cast spells, practiced medicine, and acted as tribal mediators. The Prophet fiercely denounced *Kahins*. Nevertheless, their magical use of *saj'* and the forms of divination persisted into Islamic times (Macdonald 1909, 30–34; Fahd 1987, 91–176).

Finally, sorcery also features in *sura* 7 of the Quran relating the encounter of Moses with the sorcerers of Pharaoh. They conjured up serpents, but Moses cast his staff upon the ground and it became a serpent that devoured the hallucinations conjured up by the Egyptian sorcerers (Moses's staff was often discussed in later Islamic occult treatises). The magical powers of Solomon and Moses, as well as Muhammad's resemblance to a *kahin* in some superficial respects, stimulated the production of a body of Islamic literature that sought to discriminate between divinely inspired prophecy and the miracles of saints on the one hand, and witchcraft and various forms of divination and occultism on the other.

One of the most extensive and predominantly skeptical accounts of the various branches of occultism can be found in the fourteenth-century North African philosopher-historian Ibn Khaldun's *Muqaddima* (*Prolegomena*). Ibn Khaldun believed that good intentions underpinned true prophecy, while evil intentions marked out the divinatory powers of the sorcerer. He also stressed the distinction between a miracle-working Sufi, whose powers came from God, and a magician who worked with talismans or magic letters. (Ibn Khaldun 1967, 1, 191). Although Ibn Khaldun wished to reject as much of magic and the related occult sciences as possible, he was fascinated by the occult. He

defined sorcery as the technique by which souls may influence the world without any aid. Because sorcery involved veneration of spheres, stars, or *jinn*, it was a form of infidelity. Not only was the effectiveness of magic attested by the Quran and religious law, but also Ibn Khaldun had personally observed a sorcerer making use of spitting and of knots, as well as a pact with the *jinn*s. Ibn Khaldun also gave an account of the “rippers” of North Africa, who could tear an animal or a garment to pieces by pointing at it and muttering certain magic words. This sort of magic was used to blackmail herdsmen into paying off the sorcerer with an animal from his flock. Ibn Khaldun had actually talked with these sorcerers (Ibn Khaldun 1967, 1, 203–245; 3, 156–227).

Whether effective or not, magic was widely regarded by Muslims as something alien to Islam, as something that had either survived from pagan idolatry or had been imported from neighboring lands. The Copts in particular were regarded as the heirs of an ancient and secret Pharaonic wisdom. Ibn Khaldun regarded Egyptian temples as relics of ancient sorcery and the Copts, together with ancient Syrians and Chaldeans, as the original specialists in sorcery, astrology, and talismans. A great deal of extremely sinister, but most fantastical sorcery was traced back to the mysterious Sabaeans of Harran (today in eastern Turkey). The Sabaeans were star worshippers who reputedly practiced human sacrifice and used severed heads to predict the future; their city was a place of abomination. The tenth-century book-cataloger Ibn al-Nadim mentioned a Sabaean book, *al-Flatifi*, that dealt with planetary worship, human sacrifice, knotting spells, incantations, and talismans. Sabaean paganism, whatever its true nature, apparently survived for several centuries under Islamic rule. Ibn al-Nadim further observed that while some sorcerers claimed to acquire their powers by fasting and living virtuous lives, others boasted that their power came from disobeying divine laws and doing forbidden things. Like Ibn Khaldun, Ibn al-Nadim saw Egypt as the place par excellence for sorcery. He also recorded a dream told to him by a magician of his acquaintance, in which the magician beheld Venus surrounded by black Nabataeans (the ancient inhabitants of Iraq) with cloven hooves (Ibn al-Nadim 1970, 2, 745–773; Hutton 2003, 138–140, 145–150).

Although the *‘ulum al-awā’il*, or sciences of the ancients, including Aristotelian philosophy, Euclidean geometry, and Ptolemaic astronomy, were widely respected by medieval Muslim intellectuals, there was also a sinister side to what was (or at least was supposedly) the legacy of antiquity. The Jabirian corpus is one of the most important examples of this *damnosa haereditas*. Jabir ibn Hayyan was an alchemist who allegedly lived in the late eighth and early ninth centuries, but it seems fairly clear that he did not write the huge number of treatises attributed to him, most of

which apparently date from the late ninth and early tenth centuries. Although alchemical recipes and speculations were at the center of the Jabirian corpus of pseudepigrapha, it contained a great deal of other matter, some of which must be characterized as ritual and talismanic magic (Kraus 1942). Ibn Khaldun (1967, 3, 157) described Jabir as the chief sorcerer of Islam. Among much else, one finds spells to kill snakes, to cure insomnia, to trap *jinn* in statues, and for the artificial generation of serpents and homunculi. The Jabirian corpus placed much emphasis on the “filthy dispensary”—the magical use of corpses, semen, blood, and excrement, as well as relying on the power of the planets and stars to infuse talismans. Jabirians drew on the occult legacy of late antiquity, but also on folk magic.

Similar material was ascribed to the probably no less legendary Ibn Wahshiyya, who was supposed to have written on poisons, magic alphabets, and alchemy. The chief work ascribed to him was the *Kitab al-falaha al-nabatiyya* (Nabataean Agriculture). Purportedly a translation from Syriac made ca. 900, it celebrated the ancient glories of pre-Islamic Iraq, especially its mastery of agronomy. It also contained a vast amount of occult lore. Similarly, the book on poisons, *Kitab al-sumam*, included what we would regard as malefic spells rather than poisons—for example, an unusually disgusting recipe for producing a human-headed calf, the mere sight of which was enough to kill people (Ullmann 1972, 209–210, 384, 440–443; Hutton 2003, 153).

Ibn Wahshiyya’s spells for conjuring spirits, as well as Jabirian speculations about the *khawas* or special properties of plants, stones, and parts of the human body, were drawn on in the manual of magic known as *Ghayat al-hakim fi’l sihr* (The Goal of the Sage with Respect to Magic). Falsely ascribed to a respectable Andalusian Arab mathematician, al-Majriti (d. 1008), it was probably written in the 1050s. It was later abridged and translated into Latin in the mid-thirteenth century as *Picatrix*. The *Ghayat* offered a wide range of recipes for the manufacture of talismans under the appropriate astrological influences. The filthy dispensary was often used; for example, a spell for a magic mirror required the use of tears, blood, earwax, spittle, sperm, urine, and excrement. Despite the protests of Islam in the exordium and elsewhere, the general tone of the *Ghayat* was sinister. Indeed, some of its spells were so sinister and fantastic that a critical reader may conclude that they were included as horror stories to make a reader’s flesh creep, rather than representing the actual practice of magicians in Muslim lands (Pseudo-Majriti 1933; Pseudo-Majriti 1986; Matton 1977, 245–317; Pingree 1980; Ullmann 1972, 385–386; Hutton 2003, 154–158).

Despite ‘Umar’s instructions to his governors in Iraq, there has never been a sustained witch-hunting craze in Islamic lands, nor anything resembling Heinrich

A genie flies with two people (from The Arabian Nights). The Arabian Nights contains much Islamic magic, including jinns, good and evil spirits, and witches. (Bettmann/Corbis)

Kramer's witch-hunting manual, the *Malleus Maleficarum* (The Hammer of Witches, 1486). Pacts with the Devil and contracts to sell one's soul were virtually unknown in Islamic culture. Instead, the sorcerer sought to control the *jinns* by mastery of the right magical words and impedimenta. Moreover, sorcerers were more likely to be male than female. There are very few references to covens of witches in Arabic, Persian, or Turkish literature. However, Leo Africanus, a sixteenth-century North African convert to Christianity, who wrote a *Description of Africa* while residing in Italy, gave an account of something that looks like a coven and that flourished in Fez when he was a boy. Leo recalled that it included female diviners who pretended that they enjoyed the friendship of various types of *jinns*—red, white, and black. When asked to prophesy, the women faked being possessed. Those who had come to consult them left presents for the *jinns*. Leo added that these women were lesbians with predatory designs on any pretty women who came to consult them (Leo 1896, vol. 2, p. 458).

Similarly, in *The Arabian Nights*, witches often featured as lesbians and sometimes as man-eaters. Arab witches were believed to fly on jars rather than broomsticks. But the magical stories of *The Arabian Nights* featured just as many male North African and Zoroastrian Persian sorcerers as they did female witches. Male and female sorcerers were normally presented as working alone, rather than in covens, in both *The Arabian Nights* and in popular epics of folk literature (Irwin 1994, 184, 201–203). 'Aquila, the sorceress in the romance of *Sayf bin Dhi Yazan*, was credited with "knowing magic, having *jinn* helpers, opening up treasures, uncovering the secrets of the heart, changing shape, knowing how to fly in the air, constructing elixirs, countering spells and unlocking talismans" (Lyons 1995, 1: 49). The sorceresses of popular romance were not always malign figures. In "The Tale of the Second Dervish" in *The Arabian Nights*, a king's daughter was able to detect that the prince has been turned into an ape, because as a child she studied with "a wily and treacherous woman who was a witch" who "taught me witchcraft, and I copied and memorized the seventy domains of magic." Despite her sinister apprenticeship, the princess was virtuous and engaged in a shape-shifting battle with *jinn* who had imprisoned the prince in ape's form. (*The Arabian Nights*, 108–112).

In the absence of trial records or of any source comparable to the *Malleus*, one is dependent on tales of the marvellous and what the sorcerers wrote about themselves, together with later accounts by Western travellers and anthropologists. One of the most interesting sorcerer's manuals, the '*Uyun al-haqaiq*' remains in manuscript. It was compiled in the mid- to late-thirteenth century by Abu'l-Qasim al-Iraqi, who worked as street corner conjuror in Mamluk, Cairo. A curious mixture of supernatural spells and conjuring tricks, it contained spells for mind reading, walking on water, and giving a man the appearance of a bird, among many other marvels. Abu'l-Qasim had read widely and had also engaged in the (misguided) study of the images in ancient Egyptian temples (Irwin 1994, 203, 321; Ullmann 1972, 235–236, 391–392).

Abu'l-Qasim was a late representative of the sort of sorcerer who studied what he took to be the '*ulum al-awa'il*' and who invoked authorities like Hermes and Plato. Increasingly, this was replaced by a magic that drew to some extent on Sufi mysticism, used the Quran as a kind of spell-book, and worked magic through invoking the name of God or by manipulating letters and numbers. The great magical compendium, the *Shams al-Ma'arif al-Kubra* (The Great Sun of Gnosis) was the most famous and popular work expounding this kind of magic. Attributed to the North African Shadhili Sufi mystic, Muhyi al-Din al-Buni (d. 1225), it seems to have been assembled some decades after his death by his

disciples. The text (of which there are variant versions) was illustrated with numerous designs for talismans and magic squares. Despite the piety of much of the text and its emphasis on ritual purity and fasting, some of the spells had an evil intent. For examples, the book gave guidance on such matters as soul stealing, magically setting a house on fire, and paralyzing an enemy through fashioning a wax doll (Buni; al-Gawhary 1968).

Literary magic was an urban affair. We know much less about rural and desert sorcery. From the late eighteenth century onward, the puritanical Wahhabi sect set out to extirpate pagan survivals and unacceptable superstitious accretions to strict Islamic practice in the Arabian Peninsula. Nevertheless, plenty of evidence demonstrates the survival of magical practices in the desert up to the present day. In particular, the low-caste Sulluba tribe, who work mostly as hunters and blacksmiths, have a reputation as guardians of magical knowledge. The women of this tribe in particular are reputed to be able to cast spells; they have the power of the evil eye, as well as being experts in poison and witchcraft. They tell fortunes by casting stones and shells upon the ground. (It is worth noting that it is generally held throughout Islamic lands that the bearer of the evil eye is not necessarily aware that he or she possesses it.) The Sulluba serve as scapegoats, for other tribes tend to blame their misfortunes on Sulluba sorcery (Dickson 1949, 521–525).

ISOLANI, ISIDORO (1475–CA. 1528)

Isolani was a Dominican professor of theology, active in Milan and its vicinity in the early sixteenth century, whose numerous writings expressed concern with the growing presence of witches in northern Italy. Isolani discussed the theoretical aspects of the phenomenon of witchcraft, justified the harsh persecution of this diabolical sect, and offered information about contemporary witch hunts. He also discussed female living saints, whom he viewed as antitheses to witches.

Isolani joined the monastery of Santa Maria delle Grazie in Milan, which belonged to the Lombard Congregation, and completed his studies in Bologna,

where he studied under the famous theologian and demonologist Silvestro Prierias. In the first two decades of the sixteenth century, he was reader in philosophy and theology in various Dominican institutions and prior of friaries in Milan, Cremona, and Pavia. At Milan, Isolani was involved in pro-French politics and affiliated with the spiritual circle headed by the mystic Arcangela Panigarola.

He was a prolific author who discussed the major controversies of his time, including prophecy, the immaculate conception, and the Luther affair. Isolani entered the debate on magic and witchcraft in 1506, with his *Libellus adversus magos, divinatores, maleficos* (A Little Book Opposing Magicians, Diviners, and Sorcerers). In the *Libellus*, Isolani rejected any distinction between natural and demonic magic: even magical rites that did not explicitly invoke demons were incompatible with Christianity, and all those who practiced them were heretics with a tacit or explicit pact with the Devil. His arguments resembled other Renaissance refutations of astrology and similar practices, but the *Libellus* was among the first Italian books that discussed witches in a polemical treatise against magic.

Isolani treated witchcraft in the third part of his *Libellus*. He argued that the witches submitted both body and soul to the Devil; they met occasionally in forests, where they sang, danced, copulated with demons, renounced the Christian faith, abused the Eucharist, and worshiped a certain mistress who presided over their meetings. With the Devil's assistance, the witches killed children and caused fatal diseases, impotence, infertility, and natural disasters. Their crimes were real, not imaginary; Isolani repeated standard theological explanations about how God permitted the Devil and his followers to deceive humans. Isolani never served as an inquisitor, but reported testimony heard by contemporary inquisitors to prove his points, and praised their attempts to exterminate the witches' sect.

The *Libellus* deals mainly with types of learned magic popular among Italian men, but its section on witchcraft and *maleficium* (harmful magic) deals with "little women" (*mulierculae*) who practiced the healing arts. Isolani asserted that, being illiterate, these women's healing abilities necessarily derived from pacts with the Evil One. Isolani never cited the *Malleus Maleficarum* (The Hammer of Witches, 1486), but repeated its contention that women's frailty, and especially their lasciviousness, accounted for their greater proclivity toward witchcraft. In the two decades following the publication of his *Libellus*, other Dominicans (Rategno, Prierias) from the Lombard Congregation voiced similar characterizations of the witches' sect.

Isolani's preoccupation with diabolic witchcraft recurred in the first book of his *De Imperio militantis ecclesiae libri quattuor* (Four Books on the "Imperium"

of the Church Militant, 1517), which was concerned with papal authority. Witches provided one indication of an increasing diabolical presence in the world, a sign of the imminent coming of the Antichrist; Isolani praised the execution of more than sixty witches in Como in 1514, while he was serving as a reader in a local friary. In his book about the *Inexplicable Mysterious Deeds of the Blessed Veronica of Binasco* (1518), Isolani attempted to distinguish between diabolically and divinely inspired supernatural phenomena, presenting this Milanese mystic as an antiwitch.

ITALY

"To the fire, to the fire, to the fire!" St. Bernardino of Siena's invocation of stakes in a 1427 sermon against superstitions illustrates that the dangers from sorcery and now witchcraft were already strong in Renaissance Italy. The European fear of witches, endemic among both urban and rural populations, materialized in small and occasionally large and bloody hunts. These patterns lasted over three centuries, but with irregular frequency, intensity, and diffusion. Italy conformed to this general scenario. However, one must also admit that an outline of Italian witchcraft trials is seriously hampered by a lack of reliable modern studies. We know far too little to sketch out anything except the broad temporal and geographical distribution of witchcraft trials in a rudimentary map, with many lacunae.

Moreover, a clear characterization of the crime must precede its general profile. Fantastic tales of witches' gatherings were certainly known by Bernardino's day, but the basis of most witnesses and accusers' depositions

throughout Italy remained the fear of *maleficium* (harmful magic); people were not interested in whether or not the Devil played a part. *Maleficium* was mainly a neighborhood crime, fostered by the malevolence and suspicion endemic in early modern villages. But Italy also swarmed with cities, and we must not overlook the professional urban witches of Renaissance Italy who specialized in love magic; they abound in inquisitorial records as well as in literature.

Italy for the most part escaped large witch hunts. This relatively mild pattern (rivaled on the continent mainly by the northern Netherlands) primarily resulted from three interconnected factors. First, after overcoming the challenge of Protestantism, the post-Tridentine Church wished to indoctrinate its superstitious flock. Second, the Roman Inquisition (created in 1542), a strongly centralized agency, claimed jurisdiction over this crime and successfully removed most witchcraft cases from Italy's less scrupulous secular courts. Third, a judicial rationale raising standards of proof prevailed among the cardinals of the Congregation of Rome's Holy Office, which by 1600 had produced a manuscript *Instructio pro formandis processibus in causis strigum, sortilegiorum et maleficorum* (Instruction for Conducting Trial Procedure Against Witches, Sorcerers, and Evildoers), eventually published in 1657. For example, physicians had to establish whether an infant's death was due to natural or unnatural causes. "In prosecuting suspected witches the inquisitor must not reach the point of incarceration, inquisition or torture until the corpus delicti is judicially established. The presence of sickness in a man or the presence of a corpse in themselves do not constitute adequate evidence, *since* infirmity and death do not need to be connected to acts of witchcraft, but can result from a large number of natural causes" (Tedeschi 1990, 92).

Moreover, after 1588 the Roman Inquisition prohibited prosecuting people denounced by witches as accomplices seen at the Sabbat, thus preventing the domino effect responsible for Europe's worst witch crazes. Other "modern" aspects of the inquisitorial trial, such as an obligatory defense attorney, had little effect, while its reputedly limited use of torture requires careful reappraisal.

TEMPORAL AND GEOGRAPHICAL DISTRIBUTION

Given the physical geography of the Italian peninsula, our model of its witchcraft trials must contain three large zones—the entire Alpine band, a central area, from the Po flatlands southward, and the Kingdom of Naples—and a four-phase temporal subdivision. An early phase, lasting from ca. 1430 to ca. 1530, was followed by fifty years of apparent lull. Around the 1580s came a sudden upsurge of witchcraft trials, mainly conducted by the Roman Inquisition. It endured until the

mid-seventeenth century, followed by a century of rare and scattered witchcraft trials.

FIRST PHASE (1430–1530) A reconstruction of the chronology of early Italian persecutions shows no particular patterns of geographical diffusion. The entire Kingdom of Naples is a blank spot. In the Papal States, there occurred individual witchcraft trials at Rome (1424), Todi (1428), and Perugia (1446), all ending in executions. Despite St. Bernardino's volcanic sermons, there were few prosecutions in fifteenth-century Tuscany: one woman was beheaded in Florence as a *strega* (witch) in June 1427. Further north, and later, we hear of a witch burned in 1471 at Vercelli; elsewhere in Piedmont (Canavese), five women were tried and two of them executed in 1474–1475.

By the end of the century, matters had taken a harsher, dramatic turn. A pattern of escalation emerged; there were clusters of witchcraft trials in the early sixteenth century, culminating between 1520 and 1530—the heyday of Italian stakes. In 1506, three women were burned in the south, at Benevento, and between 1505 and 1524 three more died in Rome. Farther north, in a tiny principality in the Po basin ruled by Gianfrancesco Pico della Mirandola, nephew of the great philosopher, a secular court tried sixty witches and executed ten of them in 1522. Two years later, near Rieti, the notorious Paulo Grillando sentenced three women to death: two of them had attended a *Sabba* under the famous walnut tree of Benevento (already famous at Todi in 1428); the other escaped the stake only by transfixing her throat with a nail. Bellezza Orsini, too, under torture, admitted she had excavated infant corpses in order to prepare the grease to enable her to fly to the Sabbat.

Above all, Italy's Alpine valleys were in flames. In the Val Fiemme (Trent), a secular court tried fifteen women and one man from 1501 to 1505. Under systematic torture, they confessed to killing cattle, infanticide, storm raising, pacts with the Devil, and flights to lascivious nocturnal assemblies, and named their accomplices. Large witch hunts took place in Val Camonica (Brescia): a Dominican inquisitor between 1518–1521 tried at least 165 witches, and 64 of them were burned. In Valtellina, seven women out of thirty were executed. At Venegono superiore (duchy of Milan), a "mixed" court of ecclesiastical and lay judges tried nineteen women and two men, and burned seven women. But, although we have no reliable numbers of witches tried and executed here, the diocese of Como undoubtedly conducted the most ruthless and massive witchcraft trials on Italian territory. Here Antonio of Casale reportedly sentenced 300 witches to the stake in the years following 1416. In 1485, we hear of another forty-one witches burned here. When Bartolomeo della Spina, in his *Quaestio de strigibus* (An Investigation of Witches, 1523) writes that between 1519 and 1522, the number

of witches tried in the diocese of Como exceeded a thousand and those executed exceeded a hundred, we have no way of ascertaining the solidity of his estimates.

THE APPARENT LULL Early in the sixteenth century, “no thoughtful observer would have predicted that witchcraft trials would become relatively rare” in Italy, or that the Roman Inquisition “would be primarily responsible for curbing their spread” (Monter 2002, 44). Though the Roman Inquisition would eventually play a hegemonic role in conducting Italian witchcraft trials, during the central decades of the sixteenth century, its energies were completely absorbed by the fight against Protestantism, and the previous rhythm of persecutions seemed to fall abruptly. During this apparent half-century lull from witch hunting, lack of research makes it impossible to discover variations in witchcraft trials from one region to another. Nevertheless, witchcraft trials did happen at unexpected times and were conducted indifferently by episcopal, inquisitorial, and secular courts. If Italian authorities apparently avoided any large-scale witch hunts, we have evidence of scattered cases in major cities. In 1540, a Florentine vicar sent four women to the stake at San Miniato. In 1569, five women were reportedly burned at Siena, and four women at Rome in 1572. At Bologna, six women were hanged and then burned in 1549, 1559, and 1577; clearly, Johann Weyer’s remark about the “moderation on the part of the magistrate at Bologna” (*De Praestigis Daemonum* [On the Tricks of Devils], 539) needs to be corrected. And a serious confrontation ensued when the overzealous witch-hunting cardinal-archbishop of Milan and future saint, Carlo Borromeo, insisted on sentencing eight women from Lecco to the stake. The Roman Congregation of the Holy Office, unsatisfied by the procedure followed, insisted that in the case of supposed infanticides, the *corpus delicti* had to be verified, thus anticipating its future moderate judicial strategy.

THE MAJOR WITCHCRAFT TRIALS (1580–1660) All of our patchy information points to a resurgence of persecutions during the last two decades of the century, with a clear peak during the 1590s. Trials were conducted in most parts of central Italy, especially those that had already gained the reputation of being infested by witches, but less frequently in the south; meanwhile, in some Alpine valleys, trials again multiplied into extensive persecutions. At Lucca, where a secular court, using severe torture, had already sent two women to the stake in 1571, no fewer than fifteen people (ten women, five men) were tried in 1589, and two women were sentenced to death (both died in prison before their executions). In Perugia, we know of a woman burned for witchcraft in 1590, in Florence of another one in 1612, and in Milan of a few more between 1590 and 1610.

Meanwhile, inquisitorial trials for crimes related to witchcraft multiplied almost everywhere. At Naples, trials for magic virtually doubled, from twenty-five in 1582–1586 to forty-eight in 1597–1601. In Reggio Emilia, they mushroomed from 26 between 1582 and 1591 to 250 in the following decade. In Siena, five-year averages of denunciations and trials for *maleficium* rose steadily from twelve to sixty-five between 1580–1584 and 1600–1604. The trend is confirmed by the indexes of Venetian and Friulan Inquisitions (Monter and Tedeschi 1986); in the latter, denunciations for magical arts increased from 45 between 1557 and 1559 to 256 between 1596 and 1610. In the Ligurian village of Triora, there occurred another significant episode from 1589 paralleling Lucca’s. Struck by famine, it experienced an exceptional toll of infant mortality. An investigation, started by the Inquisition, soon involved 100 suspects among its 2,500 people. When the villagers complained about the mild way it was being conducted, these cases were taken in hand by the Republic of Genoa, which seized eighteen women and one man and sentenced five to death. Rome eventually succeeded in stopping their executions, but only after all five women had already died in Genoa’s prison. As this example suggests, Italy’s fortunate avoidance of the worst excesses of witch hunting was indeed due primarily to the influence of a strong central agency, the Holy Office, which monopolized jurisdiction over this crime in most of the peninsula and enforced such high standards of proof that it eventually aborted a process that caused great human devastation in most other European regions.

In the Alpine valleys, the original Italian hotbed of witch hunting, earlier traditions continued, but on a much smaller scale: deaths declined drastically. Despite some clusters of trials in Val Fassa (1573, 1627–1631, 1643–1644: fourteen victims, including three men), Non valley (1611–1615: ten victims, including three men), or Nogaredo (1646–1647: eight victims, including one man), lay judges ordered barely thirty executions (three others died in prison). If we take into account the Grison Italoophone valley of Poschiavo (part of the diocese of Como), where the secular court conducted some 160 trials between 1631 and 1674 in an area devastated by the Valtelline wars and the 1630 plague, the number of Italian stakes might surpass 100.

AFTER 1650 By the second half of the seventeenth century, *maleficium* trials had become scarce. In a few Alpine valleys, the drag from previous witch hunts was still visible, with trials again reported in Non valley (1679), Nogaredo (1714), and Poschiavo (1705, 1709, and 1753). South of the Alps, the activity of inquisitorial tribunals shrank drastically, but one must not overlook a surprising 1705 capital sentence for illicit magic and sacrilege decreed by the Venetian Inquisition. In the south, we know that the episcopal tribunal of

Capua judged 130 cases of magic between 1600 and 1715. But without further information available to make useful series from this or other scattered cases (which suggest a probable continuation of evil spells intended to cause the death of enemies or unwanted lovers), we have no choice but to admit ignorance about the prosecution of witches in the Kingdom of Naples.

INTERPRETATIONS After an early upsurge of harsh witch hunts, a relatively benign tendency dominated in the Italian peninsula after 1530. Can available studies let us sketch the peculiarities in our three geographical areas? How shall we interpret both the late sixteenth-century rise in persecutions and indictments and the next fifty years, which featured a slow disappearance of *maleficium* cases? Conventional wisdom credits overly skeptical ecclesiastical judges with refusing to convict witches on the basis of formal accusations made by common people. But could not the flow of *maleficium* complaints also have shrunk from below? These are major questions that historians have not yet confronted.

But an even more obvious question leaps off our rudimentary map: why did most places in Italy apparently escape persecution? Of course, lack of research and the dispersal of Roman Inquisitorial archives may hide more than we think; nevertheless, the sparse distribution of witchcraft trials should be seen as a basic condition, closely related to witchcraft beliefs, that were deeply embedded in early modern communities. And before we account for the appearance or disappearance of witch hunts, we must have a better grasp of what this historical phenomenon was. Most Italians managed to coexist with the everyday ill will of some neighbors by relying primarily on the “natural antidotes” to witchcraft: recourse to cunning folk and to a range of strategies (force or persuasion) to tame a suspect neighbor. Settling old scores with such maleficent people through the judiciary was “unnatural,” uncertain, traumatic, and expensive. Still, these “unnatural” solutions recurred. The way in which many Italian trials were carried out, the depositions of victims, and testimonies of bewitchment, reveal divergent typologies between regions.

SUB-ALPINE VALLEYS From the cluster of trials carried out between 1611 and 1615 by an itinerant court in Non valley, it is possible to make some generalizations for the entire Alpine arc (Bertolini 1990). Their past belongs to the history of witch hunting in Tyrol. In 1573, the extension of the 1499 *Neureformierte Landesordnung* to the prince-bishopric of Trent introduced antiwitch measures among its police regulations. Early in the seventeenth century, the prince-bishop Carlo Gaudenzio Madruzzo was encouraged by the

bigoted Tyrolean archduke Maximilian of Austria to extinguish the maleficent sect in the imperial land of Anania. A special tribunal, directed by a lay judge, searched the whole valley and interrogated some 400 people. Angered by *maleficia* committed by their neighbors, 240 villagers testified against 140 suspected witches, including 20 men. The judge interrogated accused witches with the *Malleus Maleficarum* (The Hammer of Witches, 1486) and Peter Binsfeld's *Tractatus de confessionibus maleficorum et sagarum* (Treatise on Confessions of Sorcerers and Witches, 1589) quite literally in his hand, and had them searched for the Devil's mark and tortured.

The main preoccupations of the local population are neatly expressed by the three Italian Ss (*salute, soldi, sesso*/health, money, sex), but in this context, their concern for health and material goods predominated. Infanticides and “wasting” (*guasto*) of cattle or crops were the crimes most often reported, against only one case of impotence induced by bewitchment. Sub-Alpine peculiarities also included the fact that, though accusations and prosecutions were usually directed against women, men were also tortured and burned. There were recurrent charges of weather magic. In the Alps, rain and hail caused by witches already had a long tradition; moreover, these complaints fit with the climatic interpretations of witchcraft trials, whose peak age is congruent with the Little Ice Age, particularly strong between 1570 and 1630. Unfortunately, our information for drawing a sociological profile of witchcraft defendants remains inadequate. Healers seem rare here; in Non valley, only one female witch was surely a healer, although six men were soothsayers (*crivellatori*). In Poschiavò's great drama, no reputed healers could be found among the defendants. We also know that the numbers of married and widowed witches were approximately equal, and we have some data on their ages. But how meaningful are they, if most defendants had already been suspected for many years?

REST OF ITALY The present state of research gives us no option but to propose a pattern using the wide range of evidence available from the post-1560 Siense New State (Di Simplicio 2000), whose differences from Alpine areas were quite considerable. In southern Tuscany, we find no trace of large witch hunts. Trials, mostly of individual witches, were endemic but scattered between 1580 and 1660. The peak of the 1590s, also notable in other parts of Italy, probably overlapped with a more general European crisis. Excessive use of torture was avoided, and peripheral courts like Siena were scrupulously reminded by the Holy Office about its rules of proof. Siense *maleficium* cases concerned human beings, particularly infants, and showed no traces of diabolism. No weather-making witches were ever denounced, and bewitching cattle seems very rare

in this agrarian society. But “binding” to cause impotence was a specific type of spell that was frequently cast by women south of the Alpine valleys.

In bigger cities, like Venice, most spells were directed toward love or gain. Male experts, obsessed with money, specialized in conjurations and divination, useful in gambling and treasure hunting. Female experts, often prostitutes or other women of dubious reputation, practiced “binding” together with charms and incantations for love magic. Here the *maleficium* of infanticide was rarely reported, and of course there were no accusations of “wasting” cattle. A dearth of information prevents us from generalizing the Venetian urban pattern, but a similar profile of illicit magic could probably be found between 1580 and 1660 in every Italian town with more than 15,000 inhabitants.

And who were the witches? In the Sienese state, maleficent witchcraft was a gender-specific crime: *all* witches were women. Unfortunately, we cannot check this intriguing feature against long series of trials from other central and southern regions. Sienese documentation will enable us to sketch some social profiles. Not all these women were old, unmarried, widows, very poor, or marginal, and no specific occupations emerge, certainly not midwifery. Three kinds of witches can be distinguished according to the personal power attributed to them. First came the neighborhood’s “social witch,” who was frequently compelled to heal her victims on the basis of the principle that *qui scit destruere scit sanare* (*who knows how to destroy, knows how to heal*). Second came the expert in therapeutic magic or divination, whose healing expertise was much sought after; it was however a potentially risky activity, as we sometimes find a shift from the status of “good” healer to maleficent witch occurring in popular opinion. Last, indirect evidence reveals a group of highly qualified cunning men, who all managed to slip through the inquisitors’ nets and were never implicated in *maleficium* cases.

WITCHCRAFT AND POWER

At the pinnacle of Italian society and power, we find a few famous cases of *crimen laesae maiestatis* (crime of lese majesty) involving *maleficium*; in both Rome (1635) and Piedmont (1715), little wax figures were made to bewitch and cause the death of Pope Urban VIII and of a Savoyard prince. At the bottom as well, crucial power relations also permeated Italian witchcraft belief and witchcraft trials. Was recourse to inquisitors against rites of witches stronger than the “natural controls” to neutralize bewitchment? Were the cures offered by the Church stronger than unofficial, forbidden healing? Were cunning men stronger than exorcists?

Among many topics that badly need improved scrutiny by historians, exorcisms must be selected first. Their actual diffusion is difficult to reconstruct, because, unlike witchcraft trials, exorcisms rarely left

written traces: trials against them were extremely rare, and they seldom left records like Giulio Cesare Chiesa’s account of his activity in 1690s Piedmont. In early modern Germany, the Devil was equally active in towns and in the countryside. The German experience is relevant for Italy, where admittedly the phenomenon was rife but there seems to be no way to gauge its urban and rural intensity in the course of the seventeenth century and beyond. The impact of widely publicized urban and rural exorcisms on the general population is difficult to assess, and in the short run, one should probably view them as strong antidotes to modernization. A global assessment of their specific role in cases of *maleficium* is difficult. For example, did parents of sick and bewitched infants look first to an exorcist, or to a cunning man who could exert his skill even from afar? In the countryside, which was more easily available, the “official” specialist or the “forbidden” one? Certainly, a competition for power was inherent in the notion of exorcism: would the Devil prevail over the religious ritual? In the fight against illness and death, exorcisms represented a fourth option, alongside healers, physicians, and prayer to God and the saints (including some living saints, mostly in southern Italy). After the sixteenth century, white witches and cunning folk could no longer practice their magical healing with impunity, but the Inquisition’s attitude toward exorcism long remained ambiguous. It is significant that only in the eighteenth century were Girolamo Menghi’s famous treatises on exorcism finally included in the *Inex librorum Prohibitorum* (Index of prohibited books).

The Church’s dogged campaign against superstitions reveals that its hierarchy was playing for high stakes concerning knowledge and power. The close contact between religion and medical care accounted for its relentless concern about any kind of healing practice that affected both body and soul. Such antimagical healing concerns were epitomized in Giovanni Codronchi’s 1593 treatise *De Christiana ac tuta medendi salute* (Of Christian and Safe Remedies for Health), which stated that “for no reason may the sick ask cunning men for help to recover their health; they must suffer all pains and even die instead” (Di Simplicio 2000, 103). This disastrous strategy was strongly rejected by people, judging from the Sienese statistic that therapeutic magic still accounted for 9 percent of all inquisitorial offenses in the eighteenth century. Prayers, holy objects, and amulets remained the paraphernalia of both priests and magical healers. Of course, witchcraft beliefs continued well beyond the seventeenth century, but they disappeared as things actionable at law. Could this change be interpreted, as Sienese sources suggest, as evidence that *maleficium* was increasingly considered simply an unlikely case of misfortune?

Focusing on the problem of power has led our analysis to a core theoretical problem concerning the

meaning of witchcraft trials. What needs more investigation is the Italian dialectic between power and its subjects, between the Church and the faithful. Witchcraft trials cannot be separated from the intense religious climate of the post-Tridentine Church, and its political ideology accounts for their peculiar course. It was not coincidental that the peak phase of repression in the 1590s coincided with the most intense religious climate of the period. Labeling and punishment of deviants became a preoccupation of Church and regional states aiming at achieving conformity in behavior and belief. In Scotland, Italy, and elsewhere, witches were pursued primarily as “enemies of God.” The attempt to equate healers with maleficent witches was a constant concern of the Church, and the mild, drawn-out trials against the *Benandanti* of Friuli seem exemplary of this process of indoctrination.

To be fully victorious, such campaigns would have involved much more than a single agency of repression, even one as powerful as the Roman Inquisition. The uneven penetration of Tridentine teachings across Italy could partly explain why certain places had few witchcraft trials, or none at all. Many areas of southern Italy seem to be cases in point. How far did Counter-Reformation zeal permeate southern peasant villages? Everywhere in Italy, parish priests reading inquisitorial edicts against magical healers and witches acted as potential “triggers” to activate a mechanism of confession/denunciation/trial. But did the South, the land where “Christ Stopped at Eboli,” have a post-Tridentine clergy able or willing to stimulate their flock to report cases of superstition?

J

JACQUIER, NICOLAS (CA. 1400–1472)

Jacquier was a Dominican theologian and inquisitor, known especially for the *Flagellum haereticorum fascinariorum* (Scourge of Heretical Witches, as called by Jacquier and others “Waldensians”) in 1458. Probably born in Dijon, he attended the Council of Basel (1430–1440), where he was instrumental in urging the deposition of Pope Eugenius IV, served as ambassador from Philip the Good of Burgundy to the emperor Frederick III in Vienna in 1451, and was the Dominican proctor in the canonization process of St. Catherine of Siena (1460–1461). He functioned as inquisitor in Artois (1459), Lille (1464), Tournai (1465), and Ghent, as inquisitor against the Hussites in Bohemia 1466–1468, and as inquisitor again in Lille from 1468 until his death in Ghent in 1472. His contemporary Aeneas Sylvius Piccolomini, later Pope Pius II, described Jacquier as a small man with an energetic mind and relentless determination, possessing unusual talents. He authored a number of sermons, a conciliar tract, and a report on his Vienna legation concerning proposals for a crusade against the Ottoman Turks. His most important works were a treatise on demonology, *De calcatione daemonum* (On the Tramping-Down of Demons) in 1452 and, of course, the *Flagellum haereticorum fascinariorum*. Jacquier’s work, based primarily on his experience as inquisitor of heretical depravity in the southern Low Countries, provides important testimony from a key period in the development of the theory of diabolical witchcraft in the early fifteenth century. Jacquier attacked skeptics whose criticisms impeded the work of inquisitors and made a powerful argument that the strictures of the *Canon Episcopi* (the key canon-law text treating witchcraft as a superstitious illusion) did not apply to the new sect of witches, identified by Pope Alexander V in 1409. Here Jacquier followed and developed the slightly earlier arguments of Jean Vinet (1450) and Johann Hartlieb (1456). The *Flagellum* survives in seven manuscripts; it was first printed at Frankfurt in 1581 as a supplement to an edition of the *Malleus Maleficarum* (The Hammer of Witches), the most widely used guide for witch hunters. The *Flagellum* played a role both in the witchcraft trials at Arras in 1459–1461 and in the prolonged debates through the seventeenth century over the *Canon*

Episcopi and the issue of the reality of witches’ flight (transvection) to the Sabbat.

Jacquier’s “scourge” was, he said, both Scripture and the teachings of the saints. The *Flagellum* begins with a discussion of the nature of demonic illusions, particularly those sent in sleep, especially to women. He then cited the *Canon Episcopi* as an example of such illusions. But to Jacquier, as to others, the *Canon Episcopi* addressed only illusions, and ignored the material reality of the new sect of heretical and diabolical sorcerers and witches. It did not apply, therefore, to the witches and sorcerers of Jacquier’s day. Jacquier cited a case of 1453 in which Guillaume Adeline, a convicted sorcerer whom Jacquier knew personally, confessed to the material reality of the accusations made against the new sect of witches. In chapter 7, Jacquier distinguished categorically between the modern sect of witches and the deluded old women described in the *Canon Episcopi*. Jacquier observed that the physical fatigue of modern witches was evidence of the reality of their flight and rituals. He pointed out that modern witches do not mention Diana, the goddess referred to in the *Canon Episcopi*, but rather the Devil himself. Nor did the *Canon Episcopi* mention the apostasy and idolatry to which modern witches have confessed.

Further, Jacquier correctly doubted the authority of the Council of Ancyra, which supposedly produced the *Canon Episcopi*, discussed Scriptural evidence, and relied heavily on St. Augustine’s demonology. He also relied heavily on recent trials and the contents of the confessions of convicted witches, including Gilles de Rais. He directed his arguments against skeptics, especially those who cited the *Canon Episcopi* to argue against more recent theories of witchcraft. Throughout the work, Jacquier used evidence from recent confessions to emphasize the corporeal consequences of the pact with Satan: desecration of the host, infanticide, the ingestion of human semen, enchanted poisons, and the magical infliction of impotence and infertility.

All this, however greatly it displayed the power of demons, was done only with God’s permission, for which Jacquier accounted at great length in chapters 20–26. He then turned to the heretical nature of the witches’ activities, as described by Nicolas Eymeric and others, and to the legal procedures, including punishment, appropriate

for such offenses, which Jacquier insisted could only be death.

JAILERS

The primary role of the early modern jailer was to take care of criminal suspects from the moment of arrest to the day of punishment. As imprisonment was not a common feature of early modern justice, jailers tended not to guard convicted criminals. The jailer ensured that each suspect was fed and clothed as well as his or her resources would allow, and guarded against any escape attempts.

The profile of the early modern jailer depended on the judicial system that employed him and the size of the territory it served. Large bureaucratic institutions, like the duchy of Bavaria or the Spanish Inquisition, had networks of prisons and employed professional, full-time wardens. For example, a jailer known as the “Ironmaster” and his family ran the *Falkenturm* (“Falcon Tower”) in Munich, where Bavarian witch suspects were held from 1600. The Ironmaster was authorized to torture the suspects, but had no other professional obligations associated with his post. In contrast, a caretaker and his wife managed the town hall of the small prince-bishopric of Eichstätt, where local felons were incarcerated. They were inexperienced in caring for prisoners on a regular basis, being occupied mainly with the upkeep of a building normally used for council meetings. In England, a parish constable might sometimes have to guard felons until they could be transferred to jail, where a professional jailer supervised them until they were tried by an assize court.

As witch persecutions escalated in the late sixteenth and early seventeenth centuries, some places found it necessary to employ additional jailers to cope with the increasing number of prisoners, sometimes building new prisons such as the *Hexenhaus* (witch house) in Bamberg (built 1627). These jailers tended to be temporary and part time; the new jailers employed from

about 1617 in Eichstätt included a weaver and a tailor. The wives and children of professional jailers undertook much of the daily care of prisoners. They cooked and cleaned for the suspects, sometimes cared for the wounds inflicted on them during torture, and nursed them through the illnesses prevalent in early modern jails.

Despite the close proximity of jailers to their charges, we know relatively little about their dealings with and opinions about suspected witches. Some jailers, like the Ironmaster of Munich’s *Falkenturm*, reported on the prisoners’ words and actions when they were away from the interrogation chamber. Under investigation for abusing their positions, several jailers in Eichstätt confessed to abusing suspected witches physically and sexually, profiting from the fees paid to cover the provisioning of the prisoners, and smuggling in one suspect’s husband in an attempt to get her pregnant. Johannes Junius, a Bamberg witch suspect, famously persuaded a jailer to pass his farewell letter to his daughter Veronica; and the Ironmaster’s wife may have helped at least one Bavarian prisoner to commit suicide. Later, a Boston jailer and his wife testified to the good behavior of two of the New England witch suspects in their care.

Jailers did these things despite the potential dangers to which they exposed themselves: harm by imprisoned suspects, being accused of witchcraft themselves, and punishment by their superiors. The jailers in Eichstätt lost their jobs; Junius was concerned that his jailer might lose his head. Although such items as “witch-forks,” used by jailers to hold suspected witches at a distance, have survived, it appears that they were ambivalent about the threats to their persons and livelihoods. Sexual gratification, neighborliness, or respect seem to have motivated some jailers to act in favor of the witch suspects in their care. Their main motivation to take greater risks, however, appears to have been money. The Eichstätt jailers who conspired to get a witch suspect pregnant were certainly bribed, and it is likely that Junius’s jailer was also. This is hardly surprising, because the dishonor associated with their contact with criminals meant that jailers endured poor working conditions and received meager wages that were not always paid on time. In 1693, one Salem jailer petitioned for nine years’ back pay at £5 per year.

The abuses committed by jailers against their charges, together with the general conditions in which prisoners were held, figured among other criticisms of witchcraft trials made by Anton Prätorius and Friedrich Spee, among others.

JAMES VI AND I, KING OF SCOTLAND AND ENGLAND (1566–1625)

King James was a monarch widely associated with the intensification of witch hunting in the British Isles in the late sixteenth and early seventeenth centuries whose influence has been exaggerated.

In Scotland, James VI inherited a kingdom where belief in witches was endemic, and trials were occasionally conducted under an existing witchcraft statute. As king, his attitude in such matters was bound to be influential. In the 1590s, James became personally involved in trials and developed an interest in demonology. He read widely on the theory of witchcraft, recording his opinions on the subject. In 1603, he became King James I of England as well, and oversaw the passing of a new statute that made witchcraft a more serious offense. By this time, however, his passion for burning witches had already cooled, and his reign in England was actually marked by declining levels of prosecution in both kingdoms. Like many jurists and clerics, King James became uneasy about standards of evidence used to convict witches, and his personal interventions during the two decades when he ruled England served more often to defend accused witches rather than accelerate their progress to the gallows.

James was born in 1566 to Mary, Queen of Scots. Her kingdom had passed a Witchcraft Act in 1563—the same year that Elizabeth I introduced a parallel measure in England. James became king as an infant when his mother was forced from the throne, but he did not assume power until 1585. He had grown into a bookish and insular young man who, under careful tutorship, rejected his mother's Roman Catholicism while also rejecting the Presbyterian notions of his teachers about a godly contract between monarch and people. Relations with England were uncertain, and, like other nascent Protestant states, feelings of insecurity in religion were strong. Domestically, feuds between Scottish noble clans were endemic, and the Calvinist Church, the Kirk, claimed God's direct mandate.

James thought that monarchs enjoyed a divine right to exercise supreme authority over churches, nobles, and people. He tamed a feuding nobility and curbed the religious autonomy of the Kirk through episcopacy—this obsession with political authority partly explains his interest in witchcraft. In a polity where the “great chain of being” connected God's authority downward through the social order to the meanest household, witches also represented political insubordination, even rebellion and treason. This was why along with every political treatise on which he could lay his hands, after 1590 James came to read the major works concerned with witchcraft, an interest entirely in keeping with the broader concerns of a Renaissance prince.

Witchcraft was just one of many criminal and moral offenses proscribed and punished in the interests of godly state building. It was, however, a peculiarly heinous crime because it symbolized the ultimate offense to God and man, and for this reason the Kirk clamored for more rigorous enforcement of the law in the 1570s and 1580s with a series of protests by its General Assembly to the royal court. We have no evidence that he met their demands; indeed, he may even have blocked them, given his general hostility to the Kirk. But a shift in his thinking occurred. Although it is misleading to characterize James as a dedicated witch hunter in the 1590s, the prosecution of witches in Scotland reached new heights then, especially in the lowlands and across the eastern seaboard, regions where the Kirk controlled the administration of justice. At least where witches were concerned, the interests of church and state did seem to converge.

For a generation after the passage of the 1563 Witchcraft Act, no more than a few cases came to trial each year, and demonic pacts never featured in the charges. In 1590 the pattern was broken when James became involved in a series of prosecutions in North Berwick, where at least seventy suspects confessed to a treasonable plot. In the previous year, with a view to strengthening the Protestant succession, James had agreed to marry Princess Anne of Denmark and he then brought her to Scotland. On the journey, her ship was nearly lost in fierce storms and was forced into harbor in Norway for several weeks until the weather improved. James traveled to collect her, and once more storms blew up. The royal passengers counted themselves lucky to be alive as they docked on the Scottish coast in the spring of 1590. News arrived from North Berwick that the accusation and torture of a healer, Geillie Duncan, had exposed a network of witches who, under orders from the Devil dressed in a black cloak, had conspired to kill the king and his bride by raising storms. Venom was extracted from a toad, it was said, and curses were directed at an image of the king. The accusations spread across East Lothian, Ross-shire, and

Aberdeenshire, and implicated a range of people from the most humble serving girl to James's cousin, the earl of Bothwell. Indeed, fearsome Bothwell, an extreme Protestant dissident, should be seen as the political target of these trials.

James insisted on questioning the North Berwick suspects himself, and yet his attitude seems ambivalent. He called them "extreme liars," but did not deny that their master was the Devil, and so authorized their torture to get at the truth. It was said that he was horrified that the witches appeared to know about private conversations between himself and his bride on their wedding night. Regardless of whether the suspects' actions were treasonable, their words certainly were, and so the old-style political trial involving charges of sorcery was rearranged to fit the style of a European witch craze. From this point, it was clear that the crime of witchcraft became less an exclusively ecclesiastical concern, and that James's academic appetite to understand it had been whetted. Triumphant in the public eye over Satan (and Bothwell, who fled to Norway), he became an avid reader of continental demonologists. In consequence, he devised counterarguments to skeptical Protestant voices, especially the German physician Johann Weyer and the English gentleman Reginald Scot, whose *Discoverie of Witchcraft* had been published in 1584. James's ideas were derivative rather than original; but they were sincerely held and proved deeply influential on the legal, religious, and political contexts in which witches were tried in Scotland in the closing years of the sixteenth century.

The level of prosecutions tailed off after 1591, but this marked a pause rather than a decline. The continuance of the war against the agents of Satan was ensured by the Privy Council's passing a general commission for examining witches in October 1591, which not only devolved specific powers across Scotland but emphasized the importance of torture for extracting confessions. In addition, as an issue of national security, and even as a diplomatic concern, James did not allow the matter of Bothwell and his alleged coven of witches to drop. James encouraged Elizabeth I to extradite witches seeking refuge beyond the border, reminding her that she too was at risk from their malevolent powers. In 1597, James published *Daemonologie* in Edinburgh, a short treatise that advanced many opinions, among them that all but the elect (to whom God's grace had been restored) were tainted by original sin and therefore prone to impiety. The greatest impiety was the worship of the Devil, and the belief in witchcraft followed naturally. James also asserted that, in an inversion of the covenant Protestants formed with God, witches sealed a pact with Satan; female witches outnumbered males twenty to one; and clients of cunning folk were as guilty as the magical practitioners. More broadly, the work united his ideas about kingship with the threat posed

DAEMONOLOGIE, IN FORME

Title page of Daemonologie, 1597, by James VI of Scotland, the only monarch to have ever written a witchcraft treatise. (Fortean Picture Library)

by witchcraft, and therefore should be seen alongside other works that he wrote around the same time, principally his defense of divine right, *Basilikon Doron* (1598).

The symmetry between the idea that kings were orderly images of God and the idea that witches were disorderly images of Satan had a powerful ideological resonance. *Daemonologie* may not have caused the fresh wave of witch hunts that Scotland experienced in 1597, but, alongside the Bible, it served as the textual justification and guide to their orchestration. Earlier in the year, fresh antagonism emerged between crown and Kirk over the treatment of witches, the former concerned that the innocent were being punished, the latter that the guilty were walking free. By summer, however, a craze began that sucked in between 200 and 300 suspects, all spreading from the confession and accusations of a single woman known as "the great witch of Balweary." Although once again James

became personally involved in the examinations (at St. Andrews, for example), overall, it is possible that second thoughts about the bloodletting explain why James decided to revoke the general commission. By year's end, the prosecution of witches had been brought back under central authority. From this time on, James decreed, anyone trying witches without special license from the crown would be punished. As a result, witchcraft cases became scarce in Scotland between 1597 and 1621, when their numbers crept slowly upward until James's death, without reaching the peaks of the 1590s.

James was crowned king of England in 1603. Unlike his Catholic mother, James was a devout and reliable Protestant in whose hands, it was felt, England would be safe. In 1586, an agreement had been made with the English queen, Elizabeth I (who would permit the execution of James's mother soon afterward) acknowledging his right to succeed if Elizabeth died without an heir. In 1603, the English queen died and James lost little time in traveling south to join his two kingdoms, financially and spiritually. Despite meeting stiff opposition from a suspicious Parliament, interest in England's new king was considerable. Anglicized versions of *Basilikon Doron* and *Daemonologie*, published in London in 1603, were widely read. Tradition also has it that James ordered that copies of Scot's *Discoverie of Witchcraft* be publicly burned, although there is no direct evidence that this happened. But the really symbolic change seemed to be with the statutory provisions against witchcraft, dissatisfaction with which was shared by elements in England and Scotland.

In the following year, 1604, the English Parliament passed a new Witchcraft Act, the bill having been examined by a panel of prominent judges, bishops, and other peers. Essentially it was based on the Elizabethan statute, but imposed more draconian terms in keeping with Scots' law and the king's expressed opinions: a first offense of causing harm with witchcraft, which formerly carried a sentence of a year's imprisonment and exposure in the pillory, was now deemed to deserve death; and second offenses of all types of witchcraft were similarly punished. Likewise, invoking evil spirits, with or without maleficent intent, became a capital crime, a change that reflected continental influence and shifted the technical status of witchcraft as an offense away from an antisocial felony and toward heresy. In 1607, perhaps inspired partly by the devilish designs of the gunpowder plotters two years earlier, the Witchcraft Act was extended to allow its use in cases of treason. Contrary to historical myth, however, these statutory changes seem less significant when one examines the old 1563 provisions, nor was James primarily responsible. Legislative impetus came from interested parties active in Parliament around the turn of the century, some of

them gentry affected by the infamous witches of Warboys in Huntingdonshire in 1593.

By the time the new Act was passed, the king's commitment to prosecuting witches had subsided. Shakespeare's *Macbeth*, written and performed for the royal court in around 1605, may well have entertained the king, but perhaps less for its relationship with the reality of witchcraft than the idea it advanced that the Devil's influence over witches was not to empower them but to delude them into thinking they were powerful. This delusion, James argued, was no less of a sin, because it stemmed from moral weakness and deviation from God, and was therefore deserving of punishment. Therefore James could appear to be increasingly skeptical while at the same time still send a reputed witch and healer from Huntingdonshire to be interrogated by the Lord Chief Justice for making prophecies. This he did in 1605. Like many other skeptics, he became persuaded that although witchcraft could theoretically exist as a logical extension of the Devil's existence, it seemed improbable that the poor wretches routinely paraded before the courts could really be his acolytes. James's reputation as a witch hunter may well have been deserved north of the border, especially before he acquired the English crown, but in England his interventions were almost invariably forthright challenges to accusations.

Indeed, in his day James was known not so much as the scourge of witches than as a diligent and shrewd investigator and discoverer of imposture. In the early years of his reign, allegations of bewitchment and diabolic possession in Cambridge and Berkshire attracted his attention, as did a case involving six girls in Caernarvonshire in 1611. He spent the afternoon of January 20, 1605, on the Cambridge case, and instructed doctors from the university to examine women supposed to be bewitched. Regarding the incident in Berkshire, James became personally involved in questioning a girl, Anne Gunter, whose fits and accusations damned several women until she admitted that her father had put her up to it; because the Court of Star Chamber in London heard the case, it remains probably the best documented witchcraft case in English history. The king ordered investigations in other cases. Guilty verdicts admitted at the Leicester assizes in 1616, which once might have received James's support, now brought royal censure upon the judges. Nine people had been hanged, largely on the evidence of a thirteen-year-old boy, whom James ordered be brought to London where he was examined by the archbishop of Canterbury. After his exposure as a fraud, suspects still alive in jail awaiting trial on the boy's evidence were released. James did continue to act against those rebellious subjects suspected of using magic to influence him; in 1620, a schoolmaster called Peacock was tortured in the Tower of London on the king's orders for

just such an offense. Yet his predominant judicial influence from this time was to cause circumspection and restraint. This can be seen in the caution exercised at the trial of six women at York in 1622, when the judges were evidently determined that the mistakes at Leicester six years earlier would not be repeated.

James's succession to the English throne ushered in no new era of witch hunting. Overall, what is striking about his reign is the way that indictments for witchcraft as a whole declined. The influence of *Daemonologie* cannot be doubted; Scottish indictments and petitions continued to cite it throughout the seventeenth century, and it ran to many reprints and new editions, including French, Dutch, and Latin translations. In England, too, its impact can be detected. In the decade after its publication there, more witchcraft accusations acquired a continental flavor of witches communing with diabolical spirits, if not Satan himself. Use of the swimming test, of which James approved, was first recorded in 1612, the same year that the Devil made a personal appearance in the stories of the famous Lancashire witchcraft trials. If accusations sometimes became more wild and cruel, they also became rarer. The busiest period of English witchcraft prosecution had occurred between the 1570s and 1590s, the climax coinciding with the North Berwick craze in which James participated in Scotland. In southeastern England, there was now less than one-fourth of the indictments that had been presented in the 1570s, and during the 1620s a mere twenty cases came to light.

By the time James died in 1625, prosecutions in England were at their lowest level since the passing of the Elizabethan Act in 1563. Although Scotland had another surge between 1628 and 1630, the downward trend persisted during the reign of James's son, Charles I, and it took the peculiar social, political, and legal conditions of the civil war and Interregnum for suspected witches to be arraigned for trial in significant numbers. Close examination of James's reign in relation to witchcraft reveals him to have been, for the most part, a remarkably fair-minded, discriminating, even rather progressive monarch, despite his peevishness, overbearing manners, and conceited posturing regarding the elevated status of kingship. Yet the legacy of the North Berwick interrogations, the endurance of *Daemonologie* as a canonical work, and the increased severity of the 1604 statute, together ensured that he would be remembered as a bigoted and bloodthirsty witch hunter.

JESUITS (SOCIETY OF JESUS)

The most successful early modern Catholic order, the Society of Jesus, was officially recognized by the pope in 1540, and, because the Jesuits' dynamic growth coincided with the peak phase of Europe's witchcraft trials, Jesuits were necessarily involved with them in various ways. However, no systematic modern study of the role of the Society of Jesus in the context of the European witch persecution has yet been undertaken.

The Society of Jesuits grew rapidly; by the time its cofounder, Ignatius Loyola, died in 1556, it had around 1,000 members in Europe (in Portugal, Spain, the Holy Roman Empire, Italy, and France) and overseas (in Brazil, Japan, India, Central America, and soon in China). The Society regarded its main task as missionary work among non-Christians. Its other principal

areas of activity were teaching in schools and universities, training priests, and catechizing the post-Tridentine laity. By 1650, there were about 15,000 Jesuits (at the time of its temporary dissolution in 1773, the Society boasted around 23,000 members).

Jesuits were especially active in serving the Counter-Reformation in the Holy Roman Empire and the Spanish Netherlands; in both places, Jesuits were also extensively associated with the phenomenon of witch persecution. Although the Society never presented a unified opinion on the issue of witchcraft, Jesuits decisively influenced European debates about witchcraft through the publications of such Jesuits as Martín Del Rio and Adam Contzen, who favored persecution, or Adam Tanner, Paul Laymann, and Friedrich Spee, who criticized it. Generally speaking, most Jesuit authors appear to have preached and written in favor of persecution during the sixteenth century. After 1602, however, Jesuits increasingly adopted a skeptical—and sometimes downright critical—stance against witch hunting. In particular, their role as confessors of accused witches brought many Jesuits to oppose witch hunts by forcing them to confront the many horrors of the trials firsthand.

In addition to their role as the confessors of alleged witches, Jesuits also figured prominently after 1600 in exorcising allegedly possessed people, an activity that could trigger witchcraft trials. Already prime targets of hostility and suspicion from their Protestant enemies, Jesuit critics of witchcraft trials were also openly slandered as alleged “sorcerers” by those favoring the persecution of witches. Another form of Jesuit involvement in witchcraft trials derived from their role as teachers; in the late 1620s, several pupils at Jesuit schools in the prince-bishoprics of Franconia fell under suspicion of witchcraft and some were executed.

In addition to texts written by Jesuits for and against the hunting of witches, the *litterae annuae*—annual reports that each Jesuit theological college had to send to its provincial superior—offer our most important source for research on Jesuit involvement in early modern witch persecution. Written for propaganda purposes, these reports intended to glorify the Catholic Church by reporting the successful results of missionary work and of hostilities overcome by the Jesuits. Competing with Protestants, with older Catholic orders, and with other Jesuit colleges, the writers of these reports strove to emphasize the splendid achievements of their own establishments. As triumphs over the Devil’s machinations constituted a major form of Christian achievement, the Devil became an important topic of discussion in the *litterae annuae*. As the Jesuit order’s leadership noted at the end of the sixteenth and the beginning of the seventeenth century, the authors of the reports willingly bent the truth or disregarded the secrecy of the confessional when writing their *litterae*

annuae. The leadership constantly reminded individual authors to refrain from boastfulness, exaggeration, or distorting the truth in their accounts. Collected by the provincial leadership of the Order, these reports were then censored, reworked, and shortened before being published. Although the information contained in the *litterae annuae* must therefore be examined critically, they remained important channels of communication linking the various provinces of the Jesuit Order, through which ideas about possession, exorcism, fear of the Devil, witchcraft and witchcraft trials were spread. Once printed, they were also accessible to readers outside the Jesuit Order.

JESUIT OPPOSITION TO POPULAR MAGIC, BEWITCHMENT, AND DEMONS

Champions of the Counter-Reformation, the Jesuits fought on a broad front against every sort of heresy and deviation from orthodox Catholic belief. In their opinion the Devil was responsible for spreading false religious ideas (that is, for Protestantism), as well as for improper religious practices and so-called “superstition.” The moral code propagated in Jesuit sermons, tracts, catechism commentaries, and missionary activities branded sexual sins, and religious deviation in particular, as mortal sins resulting from seduction by the Devil; their catalog of moral failings could be interpreted as evidence of witchcraft. When catechizing and teaching the lower social groups of Europe, Jesuits vigorously opposed soothsaying, the recitation of quasi-Christian blessings, magical forms of healing, and other types of popular magic for countering disease and coping with the exigencies of everyday life. In place of such practices, Jesuits advocated the efficacy of prayer, confession, and communion, as well as the use of objects (such as the Agnus Dei, or Lamb of God amulet) sanctioned by the Church as protection against demons and witches.

In this context, the *litterae annuae* often reported allegedly successful expulsions of demons from the bodies of possessed individuals. Children or adolescents who had been possessed or seduced by the Devil played a particularly prominent role in such accounts: they were taken into Jesuit-run institutions to be cared for and were sometimes exorcised there. A case from Vienna in 1583, in which Jesuits drove 12,652 demons from a possessed girl after weeks of exorcism, caused a sensation throughout the entire Order. This happened, however, only after the girl’s grandmother—who had allegedly handed her over to the Devil—had been burned at the stake as a witch. Similar cases also occurred in Ingolstadt in 1582 and in the rural environs of Trier between 1586 and 1596. The first German Jesuit, St. Peter Canisius, advocated exorcism in the mid-sixteenth century and later had a significant influence on the witchcraft trials

in the prince-bishopric of Augsburg. Exorcisms by Jesuits also brought suspicions of witchcraft in their wake elsewhere in Europe.

Although by the seventeenth century the Order's leaders generally advised that exorcisms be avoided altogether, six French Jesuits were involved as exorcists in the famous affair of Urban Grandier and the possessed nuns of Loudon in the 1630s. Even after accusations of witchcraft had largely disappeared from courts of law, Jesuits were occasionally active as exorcists, for example, offering their help against alleged bewitchment in Luxembourg ca. 1680.

JESUITS AS ADVOCATES OF WITCH PERSECUTION

Many examples showed that Jesuit priests—acting as confessors of secular and ecclesiastical princes, as professors at universities and theological faculties, or as preachers in urban churches—actively helped encourage the persecution of witches. Particularly in the Holy Roman Empire, some Jesuits pressed adamantly for the pursuit of witchcraft trials. For example, in the 1590s, Jesuit preachers called for persecution in Trier, stopping only after repeated and severe reprimands from the Order's leaders and participating in witchcraft trials afterward only as confessors.

The publication in 1599/1600 of Martín Del Río's *Disquisitionum magicarum libri sex* (Six Books on Investigations into Magic) constituted the high point of Jesuit arguments in favor of witch persecution. It quickly became the standard work of Catholic demonology and was reprinted in twenty subsequent editions. In Munich and Ingolstadt, two Jesuits, Gregory of Valencia and Peter Stewart, significantly influenced important statements of Catholic demonology that defined any criticism of witchcraft beliefs (particularly by Protestants) as heresy. In Bavaria, Jesuits such as Jacob Gretser, Adam Contzen, and Georg Stengel advocated severe witch persecution along the lines suggested by Del Río. During the Bavarian debates about witchcraft in the 1620s, Contzen led the Jesuit faction advocating a hard-line position on the question of witch persecution.

Jesuits were also often involved in witchcraft trials as confessors to accused witches. A Jesuit cathedral preacher, Lukas Ellenz, accompanied more than 200 alleged witches from the rural environs of Trier to the stake, while Father Petrus Kircher acted as confessor to 400 individuals condemned as witches during the mass trials in Bamberg. But the question of how individual Jesuits conducted themselves as confessors must remain open, because Friedrich Spee was probably also involved in this role in witchcraft trials. In some cases, Jesuits collaborated completely with the secular courts trying accused witches, demoralizing suspects with images of eternal damnation, and thus helping

persuade them to make the necessary confessions of witchcraft. On the other hand, the confessional also gave Jesuits an opportunity to lessen the spiritual anguish of suspects forced through torture to make unfounded judicial confessions—that is, to commit perjury—and thus to commit a mortal sin. In his commentary on the catechism for Luxembourg in 1623, the Jesuit Nicolaus Cusanus recommended that confessors not tell the secular authorities when an alleged witch retracted a confession, in order to prevent the renewed torture that usually followed such retractions.

JESUIT OPPOSITION TO WITCH PERSECUTION

Until 1600, the dominant voices within the Society of Jesus (in Germany, if not in Rome) lent unqualified support to the persecution of witches. After 1602, however, outright criticisms of witchcraft trials began to emerge in the Holy Roman Empire in the writings of Adam Tanner and Paul Laymann. After 1602, it was generally recognized that Jesuits were more likely to oppose than to support the persecution of witches. As a result, officials in electoral Cologne demanded that Jesuits no longer be permitted to act as confessors to accused witches there. The Witch Commissioner (*Hexenkommissar*) Heinrich von Schultheiss even wanted to arrest the Jesuit Adam Tanner for witchcraft because of Tanner's criticisms of witch-hunting methods.

After 1620, Nicolaus Cusanus, who had experienced witchcraft trials firsthand in several places (Trier, the Eifel region, Luxembourg, and Lorraine), also expressed serious doubts about the correctness of witchcraft trial procedures. Both Tanner and Cusanus emphasized the false denunciations of accomplices forced from alleged witches in custody, and judged torture unreliable for establishing truth in witchcraft cases. Like other Jesuit opponents of witchcraft trials (or Mediterranean inquisitors), they placed great emphasis on the repentance of alleged witches, and on the general importance of Christian education and discipline for everyone. Meanwhile, Jesuits in such areas as Paderborn and Bamberg also tried to exert a moderating influence on witchcraft trials. Father Kaspar Hell publicly criticized the severe hunts at Eichstätt in 1629, although other local Jesuits eagerly participated in them. At the Jesuit College in Rome, Father Johannes Spies devoted himself to caring for two suspected witches who had fled Bamberg, advocating less severe torture and less reliance on denunciations as evidence in witchcraft trials. Father Spies had previous firsthand experience of witchcraft trials, acting as a confessor to alleged witches tried in Luxembourg and the Spanish Netherlands. However, no Jesuit denied that witches existed; not even the most brilliant Jesuit criticism of witchcraft trials, Friedrich Spee's *Cautio Criminalis* (A Warning on Criminal Justice, 1631), dared go this far.

PUPILS OF JESUIT SCHOOLS ACCUSED OF WITCHCRAFT

At several places (Trier, Würzburg, Eichstätt, and Hildesheim), suspicions of witchcraft were raised against boys attending schools run by Jesuits, often after the Jesuits had taken so-called “witch-boys” (usually self-confessed boy witches) into their schools to question, exorcise, and instruct them. In Würzburg, a few pupils at Jesuit schools were even executed for witchcraft in the late 1620s. Suspicions of witchcraft and examinations of boys as alleged witches at Jesuit schools reached a point where the Order’s leadership issued a special instruction in the midseventeenth century to prevent further escalation of the problem.

JESUS

There are two main components in the life of Jesus as told by the Gospels that link him to the domains of magic and sorcery. One concerns the interpretation of his miracles, the other lies in the field of astrology.

In the New Testament, Jesus accomplishes miracles, most of which consist of healing, for example, in Mark (1:30–34), where we find a brief report about a sick woman, the mother-in-law of Simon Peter, who regains her health after the intervention of Jesus: “30: Now Simon’s mother-in-law lay sick with a fever, and immediately they told him of her. 31: And he came and took her by the hand and lifted her up, and the fever left her; and she served them.” The same episode is told by Matthew (8:14–17) and Luke (4:38–44). But Mark’s account is particularly interesting, for he adds: “32: That evening, at sundown, they brought to him all who were sick or possessed with demons. 33: And the whole city was gathered together about the door. 34: And he healed many who were sick with various diseases, and cast out many demons; and he would not permit the demons to speak, because they knew him.” It is a paragraph where the power of Jesus as an exorcist is clearly stated, although the demons’ knowledge about his true nature and mission establishes some kind of connection between him and them.

Moreover, here Mark shows the link between disease and demonic possession with lucidity. Hebrew culture, though struggling constantly against the idolatry of the populations that interacted with it and sometimes tarnished its monotheism, knew forms of practical magic for both healing and exorcising. The most influential (as well as confrontational) tradition was the Babylonian, as shown in Daniel 1–2, where the young prophet, who has been given special gifts by God, defeats “the magicians, the enchanters, the sorcerers, and the Chaldeans” (2, 2) by interpreting Nebucadrezzar’s dream correctly. Among the Jews, many forms of sickness and insanity were considered as provoked by demonic possession; healing and exorcising were thus very close.

Other episodes in the life of Jesus seem to prove the

The Devil tempts Jesus (late fifteenth-century painting). (The British Library/Topham-HIP/The Image Works)

centrality of his healing miracles as forms of exorcism. The most significant is told, slightly differently, in three of the four Gospels: Matthew (12:22–30), Mark (3:22–27), and Luke (11:14–20). Jesus is casting a demon out of a blind and dumb man: the miracle allows the man to see and hear again. But part of the surrounding crowd is doubtful and accuses him of operating with the help of Beelzebul (Beelzebub), commanding the demons by the power of their lord. Jesus answers this accusation by arguing that it makes no sense for Satan to defeat himself; but it is of the utmost importance to note what Luke adds as a conclusion to Jesus's words: "19: And if I cast out demons by Beelzebul, by whom do your sons cast them out? Therefore they shall be your judges. 20: But if it is by the finger of God that I cast out demons, then the kingdom of God has come upon you." The mention of the *ezbah Elohim* (the finger of God) is a clear reminder of Exodus (6:6), where God speaks to Moses, announcing the coming days of freedom for Israel and the end of their slavery under the Egyptians: a promise that will be accomplished, according to the Hebrew Bible, through many prodigies. Luke's words are even more effective, considering that he is writing for a Hellenistic audience unfamiliar with Jewish tradition, but was probably inclined to pay attention to miracles, which were common in their tradition and caused many Greeks to connect Jesus with the prodigious

healer Apollonius of Tyana.

Though the Christian exegetical tradition has struggled to elevate Jesus's prodigies beyond the domain of "magic," usually by referring to them as *signa* (signs) rather than *miracula* (miracles), it seems a hard task to separate the two completely. It is significant that the very earliest Christian traditions, as shown in *Acts* and in many of the Apocryphal Gospels, hugely expanded the sphere of miracles, which became one of the main components in their narrative texture and influenced heavily the centuries to come. Some of the arguments alleged in order to separate Jesus's prodigies from the field of "magic" involve the fact that his actions—unlike the "pagan" tradition—do not involve rituals and are not associated with sanctuaries or cult places. But the Gospels are complex and seem to allow miracles of many kinds. It is hard not to see "operational" magic in Jesus's healing of the man blind since birth (John 9:6–7), when he mixes saliva with mud and puts it on the man's eyes: "6: As he said this, he spat on the ground and made clay of the spittle and anointed the man's eyes with the clay, 7: saying to him, 'Go, wash in the pool of Siloam.' So he went and washed and came back seeing" (John 9:6–7). The mention of the pool of Siloam is also significant: it was situated outside the present walls of Jerusalem, and was supplied with water by the river Gihon, where Solomon had been declared king by the priest Zadok and the prophet Nathan (1 Kings 1:33–34) and where King Hezekiah had built a canal to bring water to the city (2 Kings 20:20). Back then it was clearly an important place for Jewish religious tradition. Although the probable meaning of the name "Siloam" (the "messenger" or, better, "the one who has been sent," from the verb *salah*, "to send") makes us believe that Jesus chose it as a symbolic reminder of the significance of his presence in the world, it must have been difficult for pagans (or the newly converted) not to perceive it as a sacred, "powerful" place. The same thing would happen at the river Jordan, where Jesus had been baptized, and where for centuries to come innumerable Christian pilgrims would go to bathe, hoping to preserve their bodies from any sickness.

Others among Jesus's prodigies also evoke scenes from the Hebrew Bible. The miracle at the marriage at Cana in Galilee (John 2:1–11), or the one at the Sea of Tiberias that provides the crowd of his followers with bread (Matthew 14:13–21 and 15:29–39; Mark 6:31–44 and 8:1–10; Luke 9:10–17; John 6:1–15), recall other, more ancient episodes when God sent provisions and water to his people in need through the intercession of several prophets, for example, Moses (Exodus 16:14–35), Elijah (1 Kings 17:1–16), or Elisha (2 Kings 4:1–7; 7:42–44). In latter days, this kind of prodigy became commonplace in Christian literature and can be put in the domain of white magic: for

instance, in some novels the Holy Grail had the power to make food miraculously appear at table.

Unlike these prodigies, others lie in more controversial fields. The control that Jesus exercises on nature, shown when walking on the water (Matthew 14:22–36; Mark 6:45–56; John 6:16–21) or calming a storm (Matthew 8:18, 23–27; Luke 8:22–25; Mark 4:35–41), could be easily perceived as weather magic, with its many implications. But the most astonishing accounts are those related to the miracles of the resurrection of dead people: Jairus's daughter (Matthew 9:18–26; Mark 5:21–43; Luke 8:40–56); the young son of a widow at the Gates of Nain (Luke 7:11–17, quoting 1 Kings 17:17–24 and 2 Kings 4:23–37); and Lazarus (John 11:1–46). While the first two episodes are short stories where Jesus operates shortly after the death of children, Lazarus's resurrection scarily transgresses the boundary between the realm of the living and that of the dead: Lazarus has been lying in his sepulchre for four days: "39: Jesus said, 'Take away the stone.' Martha, the sister of the dead man, said to him, 'Lord, by this time there will be an odor, for he has been dead four days.' (. . .) 43: When he had said this, he cried with a loud voice, 'Lazarus, come out.' 44: The dead man came out, his hands and feet bound with bandages, and his face wrapped with a cloth. Jesus said to them, 'Unbind him, and let him go.'" Even if late antiquity and medieval traditions offer many miracles of resurrection operated by saints, the realism of the scene depicted in the Gospel of John, the body coming out of his grave as a walking corpse and brought back to life by Jesus's words, resemble—if only in a barely formal way—an act of necromancy.

From the apocryphal Gospel of Nicodemus comes the account of the Descent of Christ into the Limbo of the Fathers. This legend was already thought to be hinted at by the Acts of the Apostles (2:25–32), but it had a further development in this apocryphal Gospel and then in medieval iconography. The legend says that, while his body was in the tomb, Jesus's spirit went to Limbo where dwelled the souls of the Just of the Ancient Law—from Adam to Dismas, the Good Thief, and including, among many others, Abel, Abraham, Moses, David, Solomon, and John the Baptist—who were waiting to be released. Jesus kicked down the gates of hell and brought them out. Then his soul rejoined his body in the sepulchre, to await the day of resurrection.

Other tales from the apocryphal Infancy Gospels deal with an entirely different pattern of miraculous acts: the Book of James, the Gospel of Thomas the Israelite, and the later, but soon-to-be famous Gospel of the Pseudo-Matthew, fill up the lack of knowledge about Jesus's early years with many miracles and magic tricks, many of which entered the western medieval tradition. The same apocryphal Gospels that had a part in establishing Jesus's fame as a performer of miracles and

magic underlines clearly how the incarnation won over all forms of paganism and idolatry when, during the flight to Egypt, the very presence of the infant Jesus brings down and destroys all pagan idols.

Another controversial side of the life of Jesus concerns the domain of astrology and prophecy. A medieval legend relates that the Tiburtine Sibyl—a priestess of Apollo with the gift of prophecy—had announced to the Roman Emperor Octavius Augustus that a mightier emperor than he was about to be born; this tale was included in the *Golden Legend* (VI, 2.1.3) and in other collections of Christian miracles, and was also made famous by many iconographical representations. Like the Sibyl to Augustus, some *magoi* announced the birth of Jesus to Herod. Matthew (2:1–12) tells how a star announced the birth of Jesus. In this way, prophecies in the Hebrew Bible about the coming of the Messiah (Isaiah 60:6; Psalms 72:10; Numbers 24:17) seemed to have been confirmed first by pagan priests skilled in astrology. Matthew's account gives no further explanations about them: were they meant to be Persian astrologers, perhaps Mazdeans? Or less impressive magicians like Simon Magus or Bar-Jesus, whom we meet in Acts (8:9–11 and 13:6–8)? Regardless, Christians have commonly read their homage to the newborn Jesus as a sign of submission of other religions. But the ambiguity about their status was not easy to forget; between the fifth and sixth centuries, the *magoi* began to be identified with eastern kings. This new condition—together with the development of legends that tended to define their number, their names, their ages—aimed to obliterate gradually that of *magoi*, dangerously linked to forbidden practices of astrology.

The stars remained in Christian symbolic tradition as an announcement of Jesus's coming, while the sun represented Jesus himself. A depiction of Jesus as *Helios* (the Sun), an image linked to the prophecy of Malachi (4:2) about the coming of a messiah defined as *Sol iustitiae* (the sun of justice), became common in Roman and Gothic miniatures during the Middle Ages. This association was reinforced since the third and fourth centuries by celebrating Jesus's alleged birthday on the Latin feast for the *Sol invictus* (invincible sun).

The tie between Jesus and the stars took another turn after the twelfth century, when the diffusion of astrological lore in western Europe brought many astrologers to question the prohibition against determining Jesus's horoscope: if Jesus was not just the son of God, but also a human being, he should also have been subject like other humans to the laws of nature. The Italian poet and astrologer Cecco d'Ascoli was tried and condemned to death in 1327 for his attempt to push his research this far (Pompeo Faracovi 2000).

JEW, WITCHCRAFT, AND MAGIC

Jews have always had a complex relation to magic. The Hebrew Bible condemns both witchcraft and magic. Yet in asserting that precise ritual behavior sustains the world, the Bible and later classical Jewish texts express what might easily be construed as magical worldviews. Moreover, Jewish authorities frequently ruled leniently when called upon to assess the legality of a wide range of quasi-magical practices. Many of the most revered figures in Jewish history were established wonder workers and magical savants. Even those who were not often became so in Jewish hagiography, indicating the esteem given to magical prowess by Jewish society. The frequent association between Jews and magic in non-Jewish literature thus was not pure invention; if there was a “legend of Jewish sorcery” there was also “truth behind the legend” (Trachtenberg 1939). However, the magic imputed to the Jews was often viewed as pernicious, its purpose being to harm Christians (Ginzburg 1991).

The Bible rejects magic and witchcraft unequivocally, as evinced by the terse dictate of Exodus 22:17/18: “You shall not suffer a witch to live.” The prescriptive core of the antimagical legislation of the Hebrew Bible, however, is Deuteronomy 18:9–14. It contains a litany of religious practices condemned as the “abominations of those nations” that live in the soon-to-be-conquered land of Canaan. The Israelites may not practice child sacrifice, nor may they tolerate among them soothsayers, enchanters, witches, charmers, mediums, wizards, or necromancers. Such practices, most of them forms of

divination, represent the biblical view of local pre-Israelite religion, and are forbidden as abhorrent. The ancient rabbinic metonym for forbidden magical practices and beliefs would, in a similar spirit, become “the ways of the Amorites” (*darkei ha-emori*) (Veltri 1998–1999; most of the rabbinic material is in *Tosefta Shabbat* [6–7], a collection of rabbinic teachings redacted in the third century).

Yet not all divination contravened cultic statutes. Licit methods of divination are prescribed in verses 15–22 of Deuteronomy 18, immediately after the prohibitions of verses 9–14. A good example of a biblically approved divinatory device is the “Breastplate of Judgment” or “*Urim* and *Thummim*” worn by the high priest. It was only after the divinatory channels provided by the Jewish cult, including this breastplate, failed, that King Saul made his famous forbidden visit to the necromancer (I Samuel 28). On a routine basis, every Jew received biblical assurance that proper enactment of the Torah would assure the flow of sustenance, expressed primarily as rain (Deut. 11:13). The assumption that by fulfilling the Torah the Jewish people could—among other things—reveal God’s will, gain access to the divine realm, effect the remission of their sins, and secure rainfall, indicates some basic structural characteristics of Jewish religiosity. It is “performative” and predicated on the belief that if one carries out certain actions properly, the desired results will surely follow. It has been suggested (Idel 1997) that the ease with which Judaism assimilated foreign magical traditions throughout its history may be ascribed to this basic structural parallel.

If the normative observance by all Jews had magical efficacy, revered Talmudic sages were also described as engaging in magical activity alongside their legal, exegetical, and homiletical pursuits. R. Hanina and R. Oshaya, Palestinian rabbis of the third century, are portrayed admiringly as having employed the “Laws of Creation” to create mouth-watering calves on Friday afternoon just in time for Sabbath dinner. Rava, a fourth-century Babylonian sage, reportedly created a *golem*-style anthropoid, but his colleague R. Zera returned it to dust upon realizing that it could not speak, and was thus surely “a creature of the magicians” (Babylonian Talmud, *Sanhedrin* 65b, 67b; on *golem*-making in Judaism, see Idel 1990). Honi ha-Me’aggel (“drawer of circles”) was a famous rainmaker, though his powerful magic was attributed to his close relationship with the Almighty. While the rabbinic leader of first-century B.C.E. Jewry in the Land of Israel, Shimon ben Shetah, objected in principle to Honi’s standing in his magic circle demanding rain, his hands were tied. “What can I do,” the Talmud relates Shimon saying in exasperation to Honi, “seeing that you ingratiate yourself with the Omnipresent and He performs your desires! And you are like a son who

ingratiates himself with a father who performs his desires” (Babylonian Talmud, *Berachot* 19a). Elsewhere in the Talmud, however, this same Shimon ben Shetah is reported—perhaps apocryphally—to have ordered eighty witches hanged on a single day (Babylonian Talmud, *Sanhedrin* 45b).

These Talmudic discussions largely defined the parameters of magical activity in subsequent rabbinic discourse. Just as the precise definition of the labors prohibited on the Sabbath clarified those labors permissible on the Sabbath, the rabbinic insistence that biblical terms be precisely defined made it possible to distinguish prohibited from permissible magical activities. Thus rather than a blanket condemnation of any activity that might be considered magical, Deuteronomy 18 came to be seen as a list of specific techniques (and contexts) that were to be avoided amid a wide range of other permissible techniques—including the magical creation of calves and anthropoids. According to rabbinic sources, even forbidden magical techniques could be studied and practiced by rabbis if their goal was to understand the practices academically and acquaint themselves with material they might encounter in a judicial context.

Although the parameters of acceptable magical activity were subject to rabbinic debate over the centuries, “word-magic” was widely considered permissible. Medieval rabbis accepted all forms of name-based incantations to angels; many regarded those to demons as no less acceptable. R. Eliezer of Metz (12th c.) ruled that “invoking the demons to do one’s will is permitted from the outset, for what difference is there between invoking demons or angels?” On the other hand, R. Eliezer ruled that manipulating objects or other ritual performances constituted forbidden magic, for “an action may not be characterized as ‘magic’ unless it consists of taking hold of a thing and manipulating it, that is, if it is the performance of a deed . . . but invoking demons is permitted *ab initio*” (Trachtenberg 1939, 20). The condemnation of ritual magic—the inverted reflection of Jewish religious behavior—may well reflect the classical Jewish construction of forbidden magic as a form of *‘avodah zarah* (lit., alien worship; idolatry).

If Jewish legal sources enable us to frame a description of licit Jewish magic, it would be naive to think that Jewish authorities kept scrupulously within these imposed limits. It was common for Jewish magical treatises to prescribe ritual performances, manipulations of objects, concoctions of foul substances, and whatever else magical tradition suggested might be efficacious. Jews availed themselves of much in the gentile magician’s arsenal of formulas, from blood, saliva, feces, and hair, to herbs, gemstones, and salt; they deployed them much like their non-Jewish neighbors did. Such behavior could be sanctioned by rabbis, who often stressed their secondary relationship to the word-magic, con-

strued as the primary dimension of such ceremonies. The only consistently forbidden forms of magic were silent, voodoo-like rituals.

Language, particularly the use of names, thus formed the quintessential core of Jewish magic. Adjurations, incantations, amulets, and magical bowls from antiquity to the present attest to this. This forte of Jewish magic was recognized in antiquity, with non-Jews like Origen commenting on the special strength of Jewish invocations. “Their names are so powerful when linked with the name of God,” he wrote, “that the formula ‘the God of Abraham, the God of Isaac, and the God of Jacob’ is used not only by members of the Jewish nation in their prayers to God and when they exorcise demons, but also by almost all those who deal in magic and spells” (Origen 1965, 209).

Origen’s comments are especially perceptive in noting that Jews used identical liturgical formulas in “normative” and magical settings. In addition to the liturgical formulas found in synagogue prayers and exorcism ceremonies, such items as sacred scrolls in everyday use, for example, *mezzuzot* (doorpost scrolls, *pl.*) *tefillin* (phylacteries, or head and arm scrolls), and Torah scrolls (the Pentateuch), had prominent magical dimensions (Bar-Ilan 1985). All had to be written by scribes who followed strict standards of purity, taking a ritual bath regularly, often before each inscription of a divine name. Moreover, every aspect of the written text was carefully regulated, from the ingredients in the ink and the animal skin on which the sacred texts were to be written, to the formatting and design of the text, down to the very shape of the letters. If a single calligraphic crown of a letter was missing, the scroll became unfit for use. The magical significance of the visual dimension of the written text in Judaism should thus not be overlooked (Wolfson 2001).

Mezzuzot were scrolls of Deuteronomy 6:4–9, fixed upon critical liminal spaces, the doorposts of Jewish houses. Additional magical formulas were added to the *mezuzah* (*sg.*) in the course of the Middle Ages to augment its apotropaic powers. A standard *mezuzah* still retains two such medieval vestiges on its reverse: the name *SHADDAI* (understood as the acrostic of *Shomer Delatot Israel*, “guardian of the doors of Israel”) and the ostensible gibberish *KOZU BEMOCHSAZ KOZU*. The latter was a transposition of the three core words of Deuteronomy 6:4 (“Hear Israel, *YHVH* (our) *God*, *YHVH* (is) one), with which the obverse side begins. By replacing each letter by the one following it in the Hebrew alphabet (one of many techniques of *temurah* or letter recombination that could be used hermeneutically or to produce new divine names), a formula was created that was both more mysterious and more powerful than the unmodified, familiar text. Medieval Jewish literature preserves cases of Gentile interest in acquiring these potent amulets that adorned every

Jewish home, alongside cases of vandalism that expressed the fear and loathing that accompanied the a we-inspiring image of the Jewish magus. While Jews could not remove the biblically mandated *mezuzah* to protect themselves from Gentile misunderstandings, customary practices could be curtailed if they encouraged suspicions of *maleficia* (evil acts). Thus, sixteenth-century Jewish legal authorities warned Jews not to search their homes by candlelight for leavened products the night before Passover, because of the danger of witchcraft accusations (*Shulhan Arukh, Orekh Hayyim* Passover §433, 7).

Because Jewish magic was grounded in complex textual traditions, it remained a largely masculine affair: learned rabbis were best able to engage in a magic of sacred names learned from arcane manuscripts of *Kabbalah Ma'asit* ("Practical Kabbalah"). Rabbis had the ideal background to decode a magical literature consisting largely of names permuted from classical Jewish sources by means of complex exegetical techniques. Licit Jewish magic, moreover, presumed the saintliness of the practitioner; indeed, magical prowess was an indicator of saintliness: "the righteous man decrees, and the Holy One, blessed be He, obeys." Although in contemporary Christian sources, usage determined whether magic was "white" or "black," Jewish discussions of magic rarely dwell on its intended uses. Assuming the practitioner to be a saintly rabbi who knew that *any* harmful action was forbidden, Jewish authors considered the illegality of *maleficia* as a moot point. Instead, their discussions focused almost exclusively on questions of technique, as we have noted (Trachtenberg 1939, 22).

Jewish magic, however, was not practiced exclusively by learned male elites. Sources from responsa to hagiography and autobiography preserve ample evidence of Jewish women's involvement in magical arts. Women were consulted as healers, diviners, dream interpreters, and mediums. While some were described as enjoying natural gifts of clairvoyance and preternatural senses, many women were clearly expert practitioners of mantic techniques and "folk" medicine. Their expertise was such that even leading rabbis turned to them for assistance in cases of illness, loss, or from sheer curiosity. Female mediums also enabled rabbis to communicate with the dead and delivered messages of the utmost urgency to communities in danger. Numerous examples exist, for example, in an early seventeenth-century autobiography (Chajes 2003, 97–118).

Alongside such benign views, medieval Jewish sources also preserve some threatening images of the female witch. German-Jewish *Hasidim* (pietists) shared the same pronounced fear of vampiristic witches as their contemporary Christian neighbors. The most heinous accusation leveled against these women was that they ate children, and, even in death, continued to

devour the living. *Sefer Hasidim*, the seminal work of the twelfth/thirteenth-century pietists, relates that at the moment of their vigilante-style executions (not by the *Hasidim* themselves!), such cannibalistic witches might be offered an opportunity for atonement in exchange for knowledge of techniques that would render them harmless after death. Driving a stake through their mouths clear through to the ground beneath was recommended by one "witch"; another suggested filling the mouths of her dead cohorts with gravel.

While not active participants in the early modern European witch hunts, contemporary Jewish writers occasionally commented on the events of their day. One leading figure, R. Menasseh ben Israel (1604–1657), who had been Spinoza's childhood teacher, endorsed the entire complex of learned witch beliefs, going so far as to justify the executions of witches. Menasseh was aware of the critique of the witch hunt voiced by such sixteenth-century Christians as Johann Weyer or Reginald Scot. Against their critiques of the witch hunt, however, Menasseh (like most Dutch Calvinist pastors of his day) emphasized the insurmountable significance of the demonic pact, a feature of witchcraft more significant than *maleficia* in nearly all Protestant demonology (Chajes 2003, 119–138).

It is also striking to note that after a millennium during which no Hebrew accounts of spirit possession were written (or at least have survived), such accounts proliferate from the mid-sixteenth century immediately prior to the very period that historians have referred to as "the golden age of the demoniac" (Monter 1976, 60). Jewish accounts have much in common with their Christian counterparts, with one significant difference: early modern Jewish authorities regarded ghosts (called *dybbukim* since the seventeenth century) as the most common unwelcome bodily invaders. As a result of this alternate etiology, Jewish exorcism became a treatment for both parties: exorcists were required to treat the possessor with nearly as much care as the possessed. This augmented responsibility was reflected in the modification of exorcism techniques prescribed by the foremost sixteenth-century Jewish mystic, R. Isaac Luria (1534–1572). Regarding the possessing spirit as a soul in limbo, R. Luria instructed exorcists to conduct the expulsion while incorporating techniques to smooth the soul's transition to Gehenna and, ultimately, to its next incarnation. Luria and his circle actively practiced grave-incubation techniques designed to promote their own possession by benign spirits. Possession by spirits, be they benevolent or malevolent, may thus be regarded as a prominent feature of early modern Jewish religiosity.

Jewish intellectuals in Renaissance Italy created a sizable body of magical literature akin to works by such well-known figures as Marsilio Ficino and Giovanni

Pico della Mirandola. Their rabbinic contemporaries, sharing their view of these Christians that magic was the highest actualization of human potential, construed Judaism as a system of perfected magical words and hermetic vessels. In fact, they had close personal contact with one another. Pico's "tutor" in Kabbalah was Rabbi Johannan Alemanno (1435/1438–ca. 1510), who argued that the study and mastery of magic constituted the final stage of one's intellectual and spiritual education. This contact, initiated as a result of Christian interest in probing the ancient wisdom hidden in Jewish mystical sources, resulted in unprecedented cross-fertilization between Jewish and Christian Renaissance thought (Idel 1983).

Building on these precedents, the eighteenth-century eastern European Jewish pietistic movement known as Hasidism took the figure of the magus and made him the center of religious society. Its founder, Rabbi Israel Ba'al Shem Tov (lit. "master of the good Name"), was an accomplished magical healer as well as a profound mystical thinker. He is portrayed in Hasidic hagiography as a shaman par excellence, regularly ascending to heaven, privy to the secrets of the universe, and conversant in the languages of all creatures. Its subsequent leaders, called *zaddikim* or "righteous ones," were regarded by their communities as conduits for blessing and sustenance (Idel 1995). The blessing of a *zaddik* could heal the sick, fructify the barren, and free the captive. A master of magical devices—though never depicted as slavishly beholden to technique—the *zaddik* could also travel from place to place through the *axis mundi* shortcut, crossing great expanses in a moment (Verman and Adler 1993/1994). Less exposed to the secularizing trends of European society, the magical practices and beliefs of some North African and Middle Eastern Jewish communities remain prominent features of their religiosity to this day, including traditions of venerating their rabbis as wonder-working saints (Bilu 2000).

JOAN OF ARC (CA. 1412–1431)

Mystic, soldier, martyr, and saint, Joan of Arc was also accused of being a witch at her trial for heresy in Rouen, France. In the late stages of the Hundred Years' War with France (1337–1453), the English and their collaborators were keen to destroy Joan, who had succeeded in rallying French troops and leading them to a key victory at Orléans in 1429. Less than a year later,

enemy forces captured her. Eventually tried before a special court headed by Pierre Cauchon, bishop of Beauvais, Joan was condemned to death, handed over to the secular authorities, and burned at the stake on May 30, 1431.

From 1425 on, the young Joan had claimed to hear voices and see lights that she identified as Saints Michael, Catherine, and Margaret. They, she said, revealed her mission to come to the aid of France. Dressed as a male soldier, Joan took up what she considered a mission from heaven. After her victory at Orléans, she also accomplished her goal of having King Charles VII crowned at Reims—an act in defiance of English pretensions to the French throne. Taken prisoner at Compiègne by Burgundian troops in May 1430, Joan was sold to the English and later brought before Cauchon's tribunal. A recent study considered how the subsequent legal proceeding may be considered "the first of the great witchcraft trials," and asserts that in Joan's era the "fear of witches . . . was connected to anxieties about class and particularly gender mobility" (Gordon 2000, 109). Joan's activities and crossdressing stoked those anxieties, and her claims of direct contact with the saints in heaven provided ammunition for accusations of heresy.

Joan's visions were declared false and diabolical. She then seems to have recanted at least some of her claims about those visions, but, on May 29, 1431, after resuming male dress—which she had agreed to abandon—she was condemned as a relapsed heretic. In the final sentence, read publicly before her execution, Joan was said to have fallen into "errors and crimes of schism, idolatry, invocation of demons, and many other misdeeds" (Barrett 1931, 328). Though witchcraft was not mentioned by name, Joan was stated to have invoked demons and to have been "seduced" by the "author of schism and heresy," evidently the Devil (Barrett 1931, 329). News of her heresies and death soon reached the Council of Basel, a crossroads where many strands of European witchcraft doctrine were aired in the 1430s.

In the centuries since her death, Joan has more often been praised than blamed. When the French had finally expelled the English, a court appointed by Pope Callistus III reopened Joan's case, and in 1456 declared her to have been unjustly condemned. While the story of Joan faded from public consciousness after her rehabilitation, nineteenth-century French nationalists revitalized it. Anticlerical, republican voices, such as Jules Michelet, remembered her as a patriotic daughter of the people, and as a victim of an intolerant Church; right-wing monarchists praised her a champion of traditional monarchy and as a exemplary foe of foreign interference in France. Catholics saw her as a saint and martyr for her unshakable fidelity to a divinely appointed mission. Canonized as a saint in 1920, Joan had by then reached international status, the object of devo-

tion even in England.

In the later half of the twentieth century, rapidly growing interest in women's history has served once again to renew interest in Joan. Contemporary studies of Joan have tended to downplay the political context of her trial and execution, and to emphasize how Joan was a casualty of late medieval misogyny and its fear of independent women who not only blurred gender boundaries by taking the role and even dress of men, but who also falsely claimed divine inspiration for their activities, and who, as witches, did the work of the Devil.

JOHN OF SALISBURY (CA. 1115–1180)

Student of Peter Abelard and others at the schools of Paris and Chartres, later a theologian, papal servant, historian, political theorist, and moralist, John of Salisbury, in two places in the *Policraticus* (The Statesman, 1159), a highly original work of political theory, discussed several aspects of contemporary beliefs and practices concerning divination and sorcery.

John traveled widely both in his student life and afterward in service to several popes. He became secretary to two successive archbishops of Canterbury, including Thomas Becket, whose murder he witnessed in 1170. In 1176, King Louis VII of France appointed him bishop of Chartres. John's chief works also included the *Metalogicon* (1159), a defense of the liberal arts; the *Historia Pontificalis* (The Papal History, ca. 1154), a well-informed and opinionated history of the mid-twelfth-century papacy; and a great many letters.

The *Policraticus* was not only a major work of political philosophy, but also a book of vices and virtues for rulers and courtiers. In this respect, the *Policraticus* was similar to, but more systematically organized than the works of Walter Map and Gevase of Tilbury, written around the same time or shortly after. Book I deals with the vices unique to courtiers: fear of fortune, impropriety, hunting, gambling, music, actors, mimes, jugglers, and illusionists. From his discussion of illusionists in

Book I, chapter 9, John turned to magic, omens, dreams, divination, and other forms of vice touching on the preternatural that courtiers must avoid, concluding his discussion at the end of Book II. Thus John's work provided not only a window on the newly emerging life of the court but also an analysis of the insecurities of that world, based on many years of shrewd observation and a profound moral concern.

In his discussion of the magical arts, John drew widely on his extensive reading of classical Latin literature, the Bible, the encyclopedic work of Isidore of Seville, and the Church Fathers, particularly St. Augustine. John considered all of his sources and authorities to be discussing the same phenomenon, and some scholars have dismissed these sections of the *Policraticus* as simply a parade of recondite learning. But John was genuinely alarmed at the prevalence of magic, particularly in the form of fortunetelling, divination, and forbidden forms of astrology. He had firsthand experience of its appeal to many courtiers (including Becket), and he possessed a profound awareness of the dangers it posed to unwitting, ambitious, unlearned courtiers who needed both instruction about its true nature and a body of authoritative evidence to justify John's warnings.

John even included some autobiographical details in Book II, 28, telling of his own youthful experience in which a priest tried to use him as a medium in a procedure of crystal gazing. At the end of Book II, 17, John refers to the general belief in night-riding women and infant cannibalism that was found in the *Canon Episcopi*, as well as in the work of Burchard of Worms. John stated that, with divine permission because of human sin, demons may cause humans to suffer only in the spirit things that they believed happen in the flesh. John brusquely dismissed the idea that such assemblies actually occurred, and insisted that the entire belief was the result of the illusions created by sporting demons, affecting only poor old women and simpleminded men. In this regard, John firmly asserted the power of proper religious and moral instruction as the only legitimate means of combating the powers of demons, which operated only on the spirit and not in the material world. John's work was an important example of twelfth-century humanist moral skepticism.

JOHN XXII, POPE (RULED 1316–1334)

Throughout his pontificate, John XXII exhibited a marked concern over matters of sorcery, divination, and demonic invocation. The pope feared magical assaults and assassination attempts on his own person, and he used charges of heresy, sorcery, and idolatry as political weapons against his enemies. He also promoted the more general persecution of sorcery by ordering papal inquisitors to take action against sorcerers and by issuing a sentence of automatic excommunication against all those who practiced any form of demonic invocation that entailed the supplication or worship of demons. His bull on this matter, *Super illius specula* (Upon His Watchtower), remained an important part of the legal apparatus against practitioners of sorcery for the remainder of the Middle Ages.

John XXII was born Jacques Duèse in Cahors, France, in 1244. He was educated by the Dominican Order, and studied theology and law at Montpellier and Paris. He became a very prominent canon lawyer, a professor of both civil and canon law, and rose through the ranks of the Church to become bishop of Fréjus, then of Avignon, and then cardinal-bishop of Porto. He came to the papal throne as the final choice in a long and hotly contested election (the papacy had been vacant for nearly two years). John's reign was eventful to say the least. He worked diligently to reassert papal power, especially financial power, in the wake of the recent move of the papal curia from Rome to Avignon; he involved himself in the dispute over the proper nature of religious poverty taking place within the Franciscan Order, fiercely opposing the so-called Spiritual Franciscans and their position of absolute poverty; he took issue with leading theologians such as William of Ockham and Marsilius of Padua; and he enmeshed himself in a protracted political contest with the Holy Roman emperor Louis IV.

John's involvement with matters of sorcery began almost as soon as he assumed the papacy. In 1317, he had Hugues Géraud, bishop of Cahors, arrested on charges of attempting to kill him through sorcery. Further charges of sorcery, demonic invocation, poisoning, and attempted assassination soon followed, leveled at various members of the papal court, prelates of the Church, and political enemies of the pope. In 1318, for example, the archbishop of Aix, Robert Mauvoisin, was charged with performing certain illicit magical practices, although he escaped condemnation. In 1319,

the Franciscan Bernard Délicieux was tried at Toulouse for possession of books of sorcery. In 1320, Matteo Visconti, the ruler of Milan, and his son Galeazzo, powerful opponents of John in Italy, were accused of plotting to murder the pope with sorcery, and from 1320 to 1325, numerous charges of heresy and demon worship were brought against John's political enemies in the Mark of Ancona.

In using accusations of heresy, sorcery, and demonic invocation for clear political purposes, Pope John was hardly alone in the early fourteenth century. Many individuals during this period found they could use such charges to eliminate or at least discredit rivals at court, or to augment or secure their own positions. Famously, servants of the French King Philip IV brought numerous charges of heresy and idolatry against the Knights Templar, undermining the order, leading to its dissolution in 1314, and allowing the French crown to seize much of the Templar property and wealth. Philip had also used charges of heresy and sorcery in his political struggle with Pope Boniface VIII. Yet, just because such charges were politically expedient and often clearly employed without real conviction, this does not mean that the belief in sorcery, the fear of possible magical assault, and the conviction that demonic invocation represented a terrible evil in the world were not very real for John XXII. In 1320, through a letter from William, Cardinal of Santa Sabina, he ordered the inquisitors of Toulouse and Carcassonne in southern France to take action against any sorcerer who invoked demons, offered sacrifices to them, or otherwise worshiped them. Later, in 1326, he issued the bull *Super illius specula*, in which he declared a sentence of automatic excommunication on anyone who engaged in demonic invocation, offered sacrifices to demons to procure supernatural services, or worshiped demons in any way. The pope was compelled to act, so he wrote, because such practices were drawing many Christians into grave error, sin, and heresy. Later papal decrees continued to spur inquisitors and other Church officials to act against sorcery and demonic invocation, and John's rulings would form an important legal basis for the prosecution of cases of sorcery, and later of witchcraft, in ecclesiastical courts.

JONCTYS, DANIEL (1611–1654)

A physician, Jonctys offers a good example of the dramatic turnabout some academically trained people made in their views regarding witchcraft. Born in Dordrecht, he began his medical studies in Leiden in 1630, graduating five years later, followed by a Grand Tour during which he visited France, Germany, and Italy. In 1638, he published *Verhandelingh der Tooversieckten* (Treatise on Witchcraft Diseases), a translation of *De morbis a fascino et incantatione ac veneficiis inductis*, a 1633 work by the German physician and Wittenberg professor Daniel Sennert (1572–1637). In opposition to Johann Weyer, this moderate Paracelsian claimed that witches concluded pacts with the Devil with the deliberate aim of harming other people. This alone was sufficient to sentence them to death, even though the pact could not have given them the power to realize their nefarious aims. Jonctys hoped that this translation would contribute to the debate about the reality of witchcraft. He emphasized that he did not believe that witches could change the course of nature, but also that they deserved punishment because of the pact.

In 1641, he published a long poem that, among other things, criticizes the attitude of the Reformed Church toward modern science. In reprisal, the Dordrecht church-council banned him, prompting Jonctys to move to Rotterdam, where the local Reformed Church was known to be less heavy handed. In his new domicile, he was soon allowed to participate again in church services. He also joined the local secular elite, being elected to a one-year term as alderman in 1648. In Rotterdam, his tendency to give a liberal interpretation to Calvinism seems to have increased, judging from his 1651 attack on the use of torture *De pyn-bank uedersproken en bematigd* (The Rack Opposed and Restrained). Its first two parts are a translation of a treatise that the Arminian minister Johann Greve (1584–1624) had published three decades earlier against the brutal treatment he had experienced after his imprisonment by orthodox Calvinists.

Greve had been born around 1584 in the duchy of Cleves in a well-to-do, patrician family. After studying theology, he became a minister of the Reformed Church where he joined the more liberal faction. In 1610, he was called to a small town in Holland. In 1618, the conflict inside the Dutch Reformed Church between Arminian Remonstrants and orthodox Counter-Remonstrants reached its zenith when Maurice of Orange used these troubles to justify his coup d'état. Greve was deposed, and on his refusal to step down was formally banished from the territory of

the United Provinces. However, he repeatedly returned in secrecy to assist the now clandestine Remonstrant congregations. Dutch authorities had him kidnapped from Cleves territory and imprisoned in Amsterdam where he was severely tortured. In 1621, he was released and again forced to leave the country. Three years later he published his *Tribunal Reformatum* in Hamburg, which strongly attacked the use of judicial torture as a completely unreliable and highly un-Christian expedient to extract confessions and information from supposed criminals.

Although the first two parts of Jonctys's treatise about the use of torture were a translation of this *Tribunal Reformatum*, he wrote the third part himself. It was particularly in this section that he repeatedly referred to witchcraft trials as examples of the ignominious effects torture could have. Unlike in his translation of Sennert's book, Jonctys now explicitly accepted Reginald Scot's view that witchcraft was impossible and that the pact was nothing but a chimera. In the thirteen years that had elapsed between these two publications, his views concerning witchcraft and especially concerning the demonic pact had made a full swing. This reflected a development experienced by most academically trained Dutch in this period. Whereas lawyers and physicians had formerly held to the belief that the pact was in principle not impossible, they now saw it as pure fantasy. Jonctys's book had considerable influence, being quoted continuously until the late eighteenth century by Dutch opponents of the belief in witchcraft and the use of legal torture.

JORDANAUEUS, JOHANNES (D. 1650)

Parish priest of the church of St. Remigius in Bonn, Jordanaeus published a book in 1630 entitled *Disputatio brevis et categorica de proba stigmatica* (Brief and Categorical Argument about the Devil's Mark),

which made a veiled attack on the proof of the Devil's mark, or *stigma*, in witchcraft trials. The torturer who searched the naked and blindfolded body of the captured "witch" for conspicuous marks, into which he pricked a needle, executed the proof. If no blood appeared, the mark became an indicator that the suspect was a witch.

Little is known of Jordanaeus's life. In 1610, he obtained his bachelor's degree at the *Gymnasium Tricornatum*, a Jesuit college in Cologne. He later studied theology, receiving a doctorate in theology from the University of Cologne. In 1623, he entered the collegiate church of St. Cassius in Bonn. His canonicate was incorporated in the large parish of St. Remigius. He resigned in 1641, but did not die until 1650, when he made a bequest of 500 books to the Jesuit college at Bonn.

While Jordanaeus was a parish priest in Bonn, the first witchcraft trials began in 1628. In his role as priest and confessor, and because of his close contacts with the Jesuits, Jordanaeus must have been well aware of the witchcraft trials in his city. But was he against them or was he a supporter of the persecution? Joseph Hartzheim, author of the *Bibliotheca Coloniensis* (Cologne, 1747), saw Jordanaeus as the author of the *Processus iuridicus contra sagas et veneficos* (Legal Procedures Against Witches and Poisoners) published at Cologne in 1629 under the name of the famous Jesuit theologian Paul Laymann, who was not the author. If Jordanaeus wrote them instead, he must have been a very committed persecutor of witches at that time. However, we know that in 1630 Jordanaeus published a book in his own name, the *Disputatio brevis*, which criticized witchcraft trials. It was a reply to the *Commentarius iuridicus ad l. stigmata, c. de fabricensibus*, published in 1629 by Peter Ostermann, a professor at the University of Cologne. Ostermann tried to prove that the Devil's mark was the best type of circumstantial evidence (*indiciu[m] indicioru[m]*) to convict someone of witchcraft. Jordanaeus used a threefold argument to counter Ostermann: that the stigma-as-proof was not part of canon law, that the Devil could press his mark on an innocent person, and that an unbleeding mark could be attributed to natural reasons. Therefore, in a charge as serious as witchcraft, the courts could not legally rely on such an insecure method to prove a person's guilt.

Nowhere in his book did Jordanaeus deny the existence of witches and the necessity of prosecuting and condemning them. Jordanaeus's argument against the proof by needle is directed only against a certain method within established procedures in witchcraft trials, not against witchcraft trials as such. But the needle proof was an important element of witchcraft trials, as Elector Ferdinand of Cologne's guidelines asserted in 1607 and again when they were renewed in 1628. It is

therefore possible, as has been argued (Schormann 1991, 38), that opposition to the needle proof substituted for opposition to witch hunts in general. When we consider that Jordanaeus was a priest in a large parish where many trials were pending, and that the commissioner who led these trials was the fanatic and merciless Dr. Franz Buirmann (who used the needle proof whenever he investigated a witch case), it is very likely that Jordanaeus chose this avenue to counter the frenzy surrounding him without endangering himself. Ostermann and others wrote sharp and polemical replies, but neither those writers nor any witch persecutors could inflict any harm on Jordanaeus. On the other hand, he did not succeed in removing the needle proof as an important method for establishing proof in witchcraft, either in the courts of the electorate of Cologne or in neighboring territories.

JORDEN, EDWARD (1569–1632)

A medical doctor who became involved in two well-documented witchcraft trials at the beginning of the seventeenth century, Jorden's importance lay in his being one of the first physicians to be asked to give expert medical evidence in witchcraft trials. His input, and reactions to it, demonstrated how contested such evidence remained at that time.

Born in Kent, he studied at Oxford and Cambridge before traveling on the Continent and earning his MD at the University of Padua, one of Europe's most prestigious medical schools. Returning to England, he became a Fellow of the Royal College of Physicians in 1597, developed some useful contacts, and apparently established a successful practice. He later settled in Bath, where he lived and practiced medicine until his death. Appropriately, his best-known work was *A Discourse of Natural Baths and Mineral Waters*, first published in 1631 and reprinted in 1632, 1633, 1669, and 1673.

Jorden's first known involvement in witchcraft came in 1602, when Mary Glover, a girl of fourteen from a solid and well-connected London merchant family, alleged that a woman named Elizabeth Jackson had bewitched her. The accusation was fiercely contested, with Richard Bancroft, bishop of London and a skeptic in witchcraft matters, playing an active part in Jackson's

defense. More particularly, the case was remarkable because the prosecution and the defense alike drew on medical evidence: both alleging and denying Jackson's guilt had sought opinions from the College of Physicians. The actual trial was marked by an exchange between Jorden and the presiding judge, Sir Edmund Anderson, who was apparently one of the very few assize judges who actively favored witch hunting. Anderson refused to accept Jorden's admittedly rather equivocal opinion that Mary Glover was suffering from hysteria, and harangued the jury on the reality of witchcraft and the need to extirpate it. Jackson was convicted, although for noncapital witchcraft, and it is possible that she was subsequently reprieved. The experience prompted Jorden to publish his *A Briefe Discourse of a Disease Called the Suffocation of the Mother* in 1603. This was a tract of some importance in medical history, arguing that hysteria was caused by disorders of the mind rather than the uterus. It also argued, as its extended title informed us, that "divers strange actions and passions of the body of man" had "true naturall causes," and should not be attributed to "possession of an evill spirit, or some such like supernaturall power."

A few years later, Jorden was involved in another case alleging the bewitchment of a young woman (in this instance aged twenty or so), Anne Gunter. Her father had sought the intercession of King James I in his daughter's case, but James had handed her over to a team headed, once again, by Richard Bancroft, now archbishop of Canterbury. Bancroft put Anne in the custody of his chaplain, Samuel Harsnett, who had a record of skepticism in matters of witchcraft and possession going back to the John Darrell affair. Once again, Jorden gave somewhat equivocal evidence, which is preserved in the relevant Star Chamber dossier, although he recounted that while in his house she had not voided pins, and that her fits and trances had ended. Jorden's wife, Lucy, also gave evidence to Star Chamber, confirming what her husband had said. This documentation suggested a different story from that provided by Thomas Guidott, another doctor who prefaced the 1667 edition of Jorden's *A Discourse of Natural Bathes and Mineral Waters* with a short biography of its author. According to Guidott, Jorden rigged his treatment in such a way as to demonstrate that Anne Gunter was counterfeiting, a conclusion confirmed when he reported to James I that the young woman went into fits when the Lord's Prayer was read to her in English, but not in Latin, a language she did not understand.

JORIS, DAVID (CA. 1501–1556)

Perhaps the most notorious heretic of the sixteenth century, the Anabaptist David Joris denied the essential reality of the Devil and so complemented his unpopular promotion of religious tolerance. A skilled glass painter in Delft, Holland, Joris was exiled for three years in 1528 for his iconoclastic speeches and joined the Anabaptists when they controlled the Westphalian city of Münster (1533–1535). After the fall of their kingdom in 1535, Joris became the major Anabaptist leader of the Low Countries because of his visionary and charismatic authority. Joris became a thorough spiritualist, denouncing all confessions and doctrinal squabbling as inimical to true, internal Christian faith. He emphasized the dichotomy between spirit and flesh, relying heavily on an immediate experience with the “inner Word” for religious authority. When necessary, Joris permitted his followers to practice Nicodemism, outwardly conforming to approved religious ceremonies so as to conceal their true beliefs.

Pursued energetically by the authorities, Joris escaped the flames through the devotion of his followers, many of whom died protecting his whereabouts. A secret network of supporters disseminated his letters and publications throughout Europe. For the last dozen years of his life, he resided in Basel under an assumed name. His death ended neither his influence nor the antagonism of his opponents; when his true identity was revealed three years afterward, a posthumous trial condemned his corpse to the stake in 1559.

One of Joris’s most radical ideas was to repudiate the notion that the Devil existed outside of the human mind. He argued instead that Satan originated only after the fall of Adam and Eve as the evil, fallen nature of humans. Resisting the Devil required neither sacraments nor exorcism, but merely removing the pride that interfered with attaining humility. Joris first expressed this view in a tract published c. 1540 entitled *Behold, the Book of Life Is Opened to Me (Neemt Waer. Dat boeck des leuens/ is mi gheopenbaert)*, reprinted in 1616 as *A Brief and Instructional Tract Wherein Is Handled the Meaning of the Word Devil (Een Cort ende Leerlijck Tractaat: waer in verhandelt wert/ wat dat woort Duyvel sy)*. In the second, 1551 edition of his *magnum opus*, *The Wonder Book (Tiwonder-boeck)*, Joris challenged the Devil to show himself if real; without such a demonstration, Joris pledged to maintain his unorthodox opinion. His continued use of traditional terminology regarding the Devil and antichrist was

merely a rhetorical device for the uninitiated.

No physical Devil implied no witchcraft; Joris also asserted that believers should not fear harm by witchcraft. His position, comparable to Reginald Scot’s, helped shape the opposition to witch hunting among nonconformists within spiritualist and liberal Mennonite circles, and he was in touch with such spiritualistically minded intellectuals as Sebastian Castello and possibly also Johann Weyer, author of the famous *De praestigis daemonum* (*On the Tricks of Devils*), who shared his promotion of religious tolerance and abhorrence of state-mandated persecution.

To counteract such pernicious opinions, Joris’s many adversaries demonized him, calling him an atheist and “the devil of Delft,” and spread rumors that he possessed sinister magical powers. After the public disclosure of his identity in 1559, rumors circulated that Joris had blasphemously predicted his own resurrection and that his followers venerated his preserved remains. One story, told by a Genevan Calvinist, even claimed that a Dutch noblewoman, “persuaded by stories of demonic incubi,” had visited Basel hoping to have sexual relations with the prophet’s corpse and thus receive the Holy Spirit.

Despite such tales, the internalization of the Devil promoted by Joris and fellow spiritualists became remarkably popular in the Dutch Republic, helping to shape its singular position of relative religious toleration and early rejection of witch persecution. In the swirl of polemics surrounding the publication of Balthasar Bekker’s *De Betoverde Weereld* (*The World Bewitched*) in 1691–1693, some opponents sought to discredit its skeptical ideas by comparing them to those of David Joris.

JOSEPH II, HOLY ROMAN EMPEROR (1741–1790; RULED 1765–1790)

An embodiment of the ideals of the Enlightenment, Joseph II decriminalized witchcraft and worked ardently to curtail superstition (including beliefs in witchcraft and the demonic) and the Catholic Church.

Heir to the Habsburg hereditary lands, archduke of Austria, king of Bohemia and Hungary, the oldest son of Emperor Francis I and Empress Maria Theresa, Joseph II initially ruled as coregent with his mother from 1765 until her death in 1780, then ruled alone until his death ten years later. A highly controversial figure, condemned by clerical and aristocratic elites but celebrated by the populace, Joseph II attempted a thorough reorganization of Habsburg politics and society following the Enlightenment values of reason, pragmatism, and natural law, emblematic of late eighteenth-century “enlightened despotism.”

Joseph II vigorously continued reform programs begun as coregent, transforming them after his mother's death into relentless attacks on hereditary and ecclesiastical privilege throughout the Austrian hereditary lands, as well as his Bohemian and Hungarian kingdoms. He wished to establish a well-ordered, centralized state in which loyalty and merit mattered more than birth. Most of his far-reaching and lofty goals proved to be well beyond his reach. Nonetheless, his efforts led to the overhaul of both civil and criminal law, eliminating both torture and the death penalty from the Austrian penal code. In addition, by 1781, Joseph II abolished serfdom and provided a large measure of religious liberty with the Patent of Toleration.

As a direct result of Joseph II's reform of Austrian criminal law, witchcraft ceased to exist as a crime in Habsburg territories. His 1787 penal code (*Allgemeine Gesetzbuch über Verbrechen und deren Bestrafung*—Universal Law Code on Crimes and Their Punishments) and his 1788 court ordinance (*Allgemeine Kriminalgerichtsordnung*—Universal Ordinance for Criminal Courts) simply omitted sorcery, witchcraft, or other magical activities as punishable offenses. Whereas Maria Theresa's 1766 attempt to suppress trials for witchcraft still maintained that diabolical witchcraft remained a possibility (although extremely unlikely), Joseph's reforms simply dispensed with this fantasy all together, along with torture and the death penalty (which had been moderated, but maintained, in his mother's extensive reformulation of the penal code). The number of trials for witchcraft had been declining in the Austrian hereditary lands since at least 1700, and in the Bohemian and Hungarian crown lands since Maria Theresa's numerous interventions in the 1750s. Nevertheless, because magical beliefs remained extremely widespread throughout the Habsburg territories, they continued to influence legal testimony until Joseph's actions prevented judicial action on the basis of such testimony.

As Holy Roman emperor, Joseph II also took steps to suppress the prosecution of accused witches throughout Germany. Following the so-called War of the Witches among Catholic proponents and opponents of witchcraft trials in Bavaria between 1766 and 1770 (in which the enlightened views of reform Catholicism ultimately prevailed), the emperor intervened in a newly emerging controversy involving the Catholic faith healer Johann Joseph Gassner. Exploiting the belief (still widespread in southern Germany) that illness resulted from the actions of demons and witches rather than natural causes, Gassner found followers among both the lower and upper social orders by the mid-1770s. Along with the Bavarian elector and numerous ecclesiastical authorities, including Pope Pius VI, Joseph attempted to halt the influence of Gassner and his adherents. He prohibited the prince-bishop of Regensburg from supporting the preacher's activities, particularly his frequent and public exorcisms of the afflicted.

Joseph's action in the Gassner affair typified his well-known suspicions of superstition and religious zeal. Taught by an early tutor that “bigotry and superstition, astrology, soothsaying and witchcraft are the enemies of God's honor” (Beales 1987, 60), Joseph subsequently sought to curb not only the credulity of ignorant and superstitious people, but also the excesses of orthodox religious practice. Deeply familiar with the works of eighteenth-century rationalist authors, he surrounded himself with like-minded advisors and tried to implement their ideas by reforming Habsburg politics and society.

JUNIUS, JOHANNES (1573–1628)

Mayor of Bamberg, born in Niedermaisch, Wetterau, and burned for witchcraft in 1628 in Bamberg, Junius ranks among the best-known victims of German witchcraft trials, thanks to the unique documentation he left behind. Shortly before his execution, Junius wrote his daughter, Veronica, a moving farewell letter from prison. Because it was intercepted by the prison staff

and added to his *prozessakte* (trial record), we are exceptionally well informed about his trial.

Bamberg's chancellor, Dr. Georg Haan, and his son, both also imprisoned for witchcraft, were among those testifying that Junius had taken part in the witches' Sabbat. When confronted with the witnesses against him, Junius denied everything and demanded that his denouncers be compelled to swear an oath. The judges refused. The witnesses later told him that they had been coerced into providing incriminating testimony. Because he refused to cooperate with the judges, Junius was now tortured, beginning with the thumbscrews. He was then stripped of his clothes and hoisted up eight times on the strappado. Despite enormous pain and bleeding hands, he made no confession. According to ordinary criminal procedure (particularly the 1507 *Constitutio Criminalis Bambergensis* [Penal Code of Bamberg], still valid in the prince-bishopric of Bamberg), Junius had cleansed himself of the accusations against him by surviving his ordeal.

His enemies, however, told the mayor that the prince-bishop, Johann Georg II (ruled 1623–1633), wanted to make an example of him: Junius was to be tortured until he confessed. The prison staff advised Junius to make a false confession to avoid this threat. Junius requested clerical advice and one day to think it over. Junius was granted only the latter, and made a confession on July 1, 1628, containing the usual elements of fully elaborated witchcraft. However, the court was not satisfied and told him to make further denunciations against other inhabitants of Bamberg. When he refused, the names of other witches and sorcerers, listed by streets, were offered to him—another clear violation of contemporary criminal law, which prohibited suggestive questioning.

Surprisingly, Junius was not immediately executed after his forced confession. Instead, he remained incarcerated for several more weeks. By July 24, 1628, his hands had healed enough to allow him to write—with some difficulty—a letter to his daughter informing her of his ordeal. He could hardly have written it without some collusion from the prison staff. Junius feared that the guards would lose their heads if someone learned about his letter. He advised his daughter to leave Bamberg for at least six months, and she probably did flee. Junius had clearly realized that, at the high point of Bamberg's persecution wave, social position offered no protection against accusations of witchcraft.

Junius's case interests researchers in the history of witchcraft for many reasons. First, it contradicts the

notion that the only primary sources available were left by those who prosecuted witches. Victims also spoke, often in complaints filed by persecuted families to appellate courts like the *Reichskammergericht* (imperial chamber court) and the *Reichshofrat* (imperial aulic court). Second, Junius's detailed chronicle of his trial revealed contradictions with prescriptive trial procedures of his time, which exceeded ordinary guidelines of criminal codes through the theory of *crimen exceptum* (the excepted crime). Just two weeks before Junius's trial, the imperial chamber court had strongly recommended to Bamberg that orderly trial guidelines be maintained (Staatsarchiv Bamberg B 68 II no. 1, f. 140v). Finally, Junius's trial (like Bamberg's entire persecution wave between 1623 and 1630) offered important proof of how, at the apex of a witch hunt, even such very prominent people as mayors and chancellors could become victims. Such extreme situations produced a simultaneously dreadful and democratic equality before the law (Behringer 2000, 274). The disappearance of socioeconomic boundaries became one reason to end witch hunts: when denunciations affected the governing class, the trials often ended. The trial of Johann Junius exemplifies the fact that witchcraft trials cannot be reduced to a process directed against lower-class people.

K

KABBALAH

By the late Middle Ages, the occult tradition of Judaism was referred to most frequently by the generic term “Kabbalah,” literally, “that which has been received.” The term reflects the universally accepted attitude among Kabbalists that their teachings form part of the rabbinically sanctioned oral Torah, which complements the written Torah. Kabbalah is not monolithic, but comprises a collage of disparate doctrines and practices cultivated by elite circles within medieval rabbinic society.

Contemporary scholarship ordinarily distinguishes two major typological trends within the history of medieval Jewish mysticism: prophetic and theosophic Kabbalah. Prophetic Kabbalah, as expounded by Abraham Abulafia (thirteenth century) cultivates meditative practices centered on the permutation of letters (*tseruf ha-otiyot*) of the Hebrew alphabet to attain ritual and moral purity. These exercises attempt to unfetter the rational soul from the body and facilitate its conjunction (*devequt*) with the divine intellect, a state also referred to as cleaving to the Name, that is, YHWH, which was thought to be the one true reality that encompassed all the other letters. Moreover, following Maimonides, Abulafia and his disciples viewed this unitive state as the true meaning of prophecy; for them the goal of Kabbalah was to overcome differentiation and be incorporated into the divine Name, which is the spiritual essence of the messianic ideal and the true meaning of the eschatological world-to-come.

Theosophic Kabbalah, by contrast, is concerned primarily with the visual contemplation of ten luminous emanations that collectively represent the configuration of *Ein Sof*, the infinite Godhead beyond all linguistic and iconic representation. The most emblematic term for these emanations was *sefirot*, initially employed in the first section of an older anthology of cosmological speculation, *Sefer Yesirah* (Book of Formation). Over time, Kabbalists developed allegedly new and more intricate images, based at least in part on principles from earlier sources, including, most importantly, the idea that the *sefirot* are comprised within the Tetragrammaton and thus are the name by which the nameless is called. Additionally, the *sefirot* assume the form of an anthropos in the human imagination; because Adam was created male and female, this

divinely human image is androgynous. Therefore, Kabbalists portray the unity of God in the explicitly erotic language of heterosexual coupling. In the *Sefer ha-Zohar* (Book of Splendor, the major repository of Kabbalistic writings attributed to the mystical fraternity headed by Simeon bar Yohai of second-century Palestine, but actually composed in thirteenth- and fourteenth-century Castile), the coupling of male and female is the mystery of faith (*raza di-meheimanuta*).

Complex as Kabbalistic symbolism can be, it views gender very simply: the potency to overflow is masculine and the capacity to withhold feminine. Adopting an earlier rabbinic tradition, Kabbalists further link the male and female potencies, respectively, with the attributes of mercy and judgment, and their designated names *YHWH* and *Elohim*. Kabbalists interpret the traditional religious obligation to unify the God of Israel as the harnessing of male and female, a pairing of the will to bestow and the desire to contain.

One must not oversimplify. Careful textual scrutiny indicates both that Kabbalists identified as “theosophic” had ecstatic experiences of union, and that Kabbalists labeled “ecstatic” presumed that esoteric gnosis imparted theosophic wisdom. Here, we shall concentrate on the convergence of the ecstatic and theurgic aspects of the experience of enlightenment cultivated by the so-called theosophic Kabbalists.

The Kabbalist’s goal—what justifies calling him a Kabbalist—is to receive the secret of the Name; that is, to cleave to *YHWH*, the archaic Deuteronomistic injunction interpreted by Kabbalists (in a manner very close to twelfth-century Andalusian Neoplatonist philosopher-poets) as conjunction of thought (*devequt ha-mahshavah*), the true mystical intent (*kawwanah*) of liturgical worship, and Torah study. In another crucial way, this Kabbalistic ideal betrays crucial affinities to views in Islamic and other Jewish philosophical sources. Twelfth- and thirteenth-century Kabbalists, like later generations, understood this conjunction of intellectual and imaginative components as an expression of prophecy. However, in their case, the contemplative ascent is emphatically a personal experience of *unio mystica*, a more deeply expressed existential sense that the fragmented soul can attain wholeness by being reincorporated into the Godhead. Union with the divine

Name is a psychic transport (after having cleared mundane matters from the mind) that in turn facilitates the theurgical unification of the divine potencies signified by letters of the Name.

Although the mystical conjunction facilitates the theurgical task, it seems preferable to imagine a core experience of ecstasy with two facets, reintegration of the soul in the divine and fusion of the sefirotic potencies. It is tempting to align these two phases in causal sequence, the former occasioning the latter. However, viewed morphologically, as opposed to typologically, that is, under the semblance of form rather than type, ecstasy and theurgy become two manifestations of the same phenomenon.

The consonance of these two elements, too sharply bifurcated in dominant critical studies of Jewish mysticism, is necessitated by the ontological assumption regarding the divine/angelic status of the Jewish soul. This idea assumes that the righteous or holy ones of Israel have been endowed with an angelomorphic nature, a conception that evolved in late-second temple Judaism, probably based on still older ancient near-eastern forms of angelic or divine kingship. Medieval Kabbalists presumed that, because God and Israel are circumscribed within a monopsychic unity that flattens the difference between cause and effect, it follows that mystical union and theurgical unification are concurrent processes that have been artificially separated for extraneous reasons. In the final analysis, the two schools of Kabbalah shared many features: traditions about the secret names of God, particularly the most sacred name, *YHWH*; the unique status of Hebrew, the one language considered “natural” rather than conventional; the understanding of sefirotic potencies as the means to attain mystical communion; and the theurgical interpretation of ritual as the way to maintain the unity of multiple potencies within God.

One of the most significant elements shared by all Kabbalists is their inordinate emphasis on secrecy. Kabbalah is usually studied as a form of mysticism, but a far better term to capture its nature may be esotericism, although the two terms are not easily differentiated, especially with Kabbalistic material. Kabbalah’s mystical dimensions are embedded within a hermeneutical framework of esotericism, and its esoteric dimensions within a phenomenological framework of mysticism.

With respect to secrecy, Kabbalists embrace a fundamental paradox also found in other religious cultures, but expressed in ways that reflect different theological, anthropological, and cosmological assumptions. Although truth is transmitted from generation to generation in a continuous chain—hence the term “Kabbalah”—it is a secret truth that cannot be disclosed in its entirety. These restrictions are not based on any need to hide the truth from those unworthy to receive it, a stance affirmed by Kabbalists, but are due

to the enigmatic nature of the mystery, the doubling of secrecy engendered by the fact that, to remain secret, it can be divulged only if it is concealed in its disclosure. This orientation, probably inherent in the esoteric texture of Kabbalah, was enunciated explicitly by sixteenth-century Kabbalists in Safed, utilizing a maxim taken from the Muslim philosopher Avicenna, “disclosure is the cause of concealment and concealment the cause of disclosure” (Wolfson 2002, 113–114).

Kabbalistic sources often justify secrecy with the biblical verse, “To investigate the matter is the glory of kings, but to conceal the matter is the glory of God” (Ps. 25:2). It is no exaggeration to say that Psalmist’s text served as an oracle posted on the walls of the small elitist circles, where specific secrets concerning both symbols and rites have been transmitted orally and in writing, although the eventual proliferation of the latter usually posed a challenge to the explicit injunction against disclosing secrets publicly. Of course, not every written exposition of occult knowledge defies this injunction; some Kabbalists mastered the art of concealing secrets by revealing them. One might say that the form of esoteric writing—to conceal in the exposition and expose in the concealment—is the hermeneutical method that allowed Kabbalists to explicate their esoteric knowledge. As Abulafia elegantly expressed it, “My intention is to hide and to reveal, to reveal and to hide, for the truth is deep for the enlightened and how much more so for the ignorant!” (Sitrei Torah, MS Paris, Bibliothèque Nationale 774, fol. 149a).

The same principle characterizes Zoharic literature. Mysteries of Torah are disclosed through being hidden, an exegetical pattern perceptible in the Torah. Its exoteric and esoteric layers of meaning are distinguishable, but the latter can only be expressed through the former. The initiated in the mystical teaching sees the secret through the garment of the text, rather than discarding it to behold the naked truth. The greatest of veils would be for one to think that one could see the face of God unveiled; the final veil to remove, therefore, is the veil of thinking it possible to see without any veil. For Kabbalists, the ultimate veil is the Tetragrammaton, the name that is the Torah in its mystical essence.

The minds of Kabbalists, again without distinguishing between theosophic and prophetic camps, reveal an intricate nexus between esotericism and eroticism. Indeed, it would be no exaggeration to say that one enters the heart of Kabbalah by marking the precise spot where the erotic and the esoteric intersect—a spot providing entry into the garden of mystical secrets. From the Kabbalists’ vantage point, the ecstatic experience of enlightenment facilitates knowing the eros of mystery wrapped in the exposé of the mystery of eros.

KEMPTEN, PRINCE-ABBEY OF

The imperial abbey (*Fürstabtei* or *Fürststift*) of Kempten is famous for a very late execution, usually labeled the last legal execution of a witch in the Holy Roman Empire. The case was mentioned already in the mid-nineteenth century (Haas 1865) and widely popularized by Soldan and Heppé's history of witchcraft trials (Soldan and Heppé 1880). In 1892, Von Wachter reliably paraphrased the surviving contemporary copy of a legal opinion—still in place in the Kempten archive in the late 1980s, but which seems to have disappeared recently. According to the document, a death sentence was issued in 1775. This legal opinion referred to the prehistory of the case in much detail and described the entire life story of a mentally disturbed woman of about forty, who had suffered considerable hardships (orphanage, leprosy, lameness), and had converted, hoping to marry a Protestant lover, who abandoned her soon afterward. She gained the impression that he might have been a diabolical seducer, and felt great guilt for renouncing the saints, and the Virgin Mary in particular. Because of her incapacities, she was put in a workhouse at Langenegg, where she incited other female inmates with her fantasies. At some stage she was accused by a possessed five-year-old girl and beaten by other female inmates. The director of the workhouse tried to calm the tumult, but in consequence of their shared fantasies, one of the female inmates eventually delivered her to the authorities. If we can trust the

records, torture was not used in her trial. The criminal court of the prince-abbey dealt with her case from February 20. Because she maintained her stories of devilish possession, a Devil's pact, and apostasy, the high judge came to the conclusion that she had to be convicted according to criminal law, although she denied harmful magic. The prince-abbot, Honorius Roth von Schreckenstein (ruled 1760–1785), signed the death sentence on April 11, adding the words: *fiat iustitia* (let justice be done)! This is exactly what one could expect from a prince-abbot who in 1774 had invited the controversial exorcist Johann Joseph Gassner, notorious for claiming that all diseases were caused by witchcraft. Gassner's booklet on how to fight the Devil effectively, *Nützlicher Unterricht wider den Teufel zu streiten* (Useful Instruction on How to Struggle Against the Devil), was first printed at Kempten in 1774.

Although no newspaper reported her execution, there seemed little doubt that it actually took place. A local lawyer even published a booklet on the case in the early 1890s, amplifying the whole story with more details. However, a local archivist recently started digging deeper in local sources and found that her death sentence was never carried out. Although a conservative faction within the government supported the conviction, another faction fiercely denied the possibility of witchcraft and the legality of the trial, even if witchcraft remained in the law codes. But in the decade after the Bavarian War of the Witches, under the rule of the enlightened emperor Joseph II, even Benedictine monks were able to attack witchcraft publicly. The already convicted witch, Maria Anna Schwägelin (1734–1781), was imprisoned and died six years later. Hers was a witchcraft trial, but can no longer exemplify the final execution in the Holy Roman Empire. In his legal opinion, the high judge, named Treichlinger, referred to an earlier execution of a witch in 1755, in which he had participated, as a precedent within the prince-abbey. Even if this case cannot yet be verified from other sources (and no other local case was referred to in this legal opinion), it implied that the prince-abbey of Kempten shared the experience of late executions with a few other southern German ecclesiastical territories, but also that they must have been extremely rare events.

This surprising turn enables us to tell a completely different story of witchcraft trials in the prince-abbey, setting the events of 1775 in perspective. A thousand years earlier, in 772, the Benedictine abbot of St. Gallen founded a monastery at Kempten, near the ruins of an ancient Roman town, which had succeeded a Celtic settlement. The Carolingians used the monastery as a bridgehead in an Alemannic region. In 1062, the Holy Roman Emperor Henry IV made Kempten an imperial abbey; in 1360, Emperor Charles IV elevated it to the status of a prince-abbey. Its prince-abbots managed a

territory of about 50,000 inhabitants, making Kempten one of the largest monastic lands within the Holy Roman Empire. However, its road to state formation was rocky. By 1289, the town of Kempten became an imperial city and escaped the abbot's rule. After 1525, this imperial city of just about 4,000 inhabitants became Protestant. Likewise, the local nobility managed to become independent, and joined the Imperial Knighthood of Swabia. The abbacy was thus reduced to seven market towns and eighty-five villages. And because other estates were lacking, peasants sat in the parliament (*Landschaft*) of this extraordinary territory. These peasants were particularly self-confident and challenged their feudal overlords in numerous rebellions, including the great peasant war in 1524/1525.

Through the activities of capable local historians and an interested local public, Kempten's history has been particularly well explored. Extensive publications on the history of the imperial city and the imperial abbey revealed few incidents of sorcery or witchcraft, and almost no executions for witchcraft. In an early case of 1484, presumably linked to the activities of Heinrich Kramer, author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), in the region, an accuser—not the witch—was punished in the market town of Unterthingau. In 1549, a village collectively accused a woman of damaging their crops by making hailstorms. The local lord, Veit Werdenstein von Eberspach, tried to convince the witch to retract her spells, but the peasant woman ridiculed him publicly. The nobleman and his villagers appealed to the prince-abbot's government. The Kempten high court scrutinized the case, but concluded that it was impossible to substantiate the accusation and open a formal criminal trial. Under Abbot Wolfgang von Grünenstein (ruled 1535–1557), the prince-abbey's government withstood repeated attempts by villagers to imprison or to punish this alleged witch, because there was no convincing circumstantial evidence; it eventually threatened the villagers with severe punishment if they did not stop harassing her. When witch hunting peaked in the region around 1590, the prince-abbey did not participate in the persecutions. When the prince-bishop of Augsburg tried to extend his persecution into Kempten's territory, Prince-Abbot Johann Erhard Blarer von Wartensee (ruled 1587–1594) was prepared to offer military resistance to invasions by foreign troops.

In 1673, we hear for the first time that a woman was burned for witchcraft within the prince-abbey, at Martinszell. A few years later, in 1687, after witchcraft trials had shaken the imperial city for the second time since 1664–1665, Prince-Abbot Rupert Bodman (ruled 1678–1728) denied the extradition of a peasant woman, because his government considered the circumstantial evidence against her insufficient. By then,

Bodman had already gained deep insights into the treatment of witchcraft. When Count Ferdinand Carl Franz von Hohenems resumed massive persecution between 1677–1680, burning large numbers of subjects within the county of Vaduz, the imperial administration of Leopold I (ruled 1658–1705) intervened and appointed Prince-Abbot Bodman to investigate. He condemned the lack of circumstantial evidence, the “unchristian torture,” and the obvious financial interest the count had taken in his persecutions. Bodman took on not just the responsibility of inquiring the case and suggesting an appropriate sentence, but even took care that this severe sentence was indeed enacted.

After convicting the count in the *Reichshofrat* (imperial aulic court), the emperor commissioned the prince-abbot of Kempten to lead a Habsburg army that eventually captured Count von Hohenems in 1681. The emperor stripped the count of Vaduz of his rights in 1684, and had him imprisoned in the prince-abbot's dungeon, where he died after years of confinement. From 1681 to 1712, the Benedictine abbot of Kempten administered the count's territories, before they were awarded to the princes of Liechtenstein, who still rule it. Rich and noble as the Kempten Benedictines were, at least this abbot did not hesitate to convict another rich and noble ruler for his crimes, and to enforce the most drastic treatment of an aristocratic witch hunter anywhere in the history of the Holy Roman Empire. Possibly Bodman was the most qualified of all Kempten's abbots: he had studied at the universities of Strasbourg, Salzburg, and Padua, and spoke fluent French, Italian, and Spanish in addition to Latin and German.

The prince-abbey of Kempten, formerly stigmatized for its late executions, can now serve as an example for ecclesiastical territories that carefully avoided witch hunts. If we look for explanations, we find a striking absence of religious zeal during the period of the Counter-Reformation and the Thirty Years' War. The Benedictines were certainly Catholic, but they clearly did not share the austerity that characterized Catholic piety elsewhere in this period. For instance, all prince-abbots of Kempten had concubines and children, as the chroniclers in the neighboring Protestant imperial city of Kempten meticulously and maliciously recorded. In 1594, papal visitors lamented that the Benedictines of Kempten all lived in private houses instead of cells, that they wore secular clothes with rich jewelry, and that they spent their time on drinking, hunting, gambling, and women. The abbots of this wealthy sinecure were usually not religious zealots, and their attitude toward sin, like their attitude toward women, seems noticeably more relaxed than those of most Counter-Reformation bishops. Although Abbot Bodman was more serious in his religious attitude, his government seems to have been characterized

by a relaxed attitude, because he granted his subjects the pleasure of smoking and founded new breweries. Furthermore, he improved his territory by commissioning water pipelines and bridges, postal services, and fishing ponds; he replaced feudal services by taxes, regulated social relationships within his territories by means of contracts, and introduced professional health service and firefighters in his prince-abbey.

KEPLER, JOHANNES (1571–1630)

One of the most intriguing episodes of the Scientific Revolution was Galileo Galilei's trial before the Roman Inquisition, but hardly less significant was the fate of Johannes Kepler, who had to flee the Catholic Counter-Reformation at several places, was exiled from his Lutheran homeland Württemberg for refusing to sign the Formula of Concord, and eventually became entangled in an endless witchcraft trial against his mother, Katharina Kepler.

His father Heinrich Kepler (1547–1590) owned the tavern *Zum Engel* in the tiny imperial free city Weil der Stadt; his mother Katharina (1551–1621) was the daughter of an innkeeper and village judge at Eltingen, Melchior Guldenmann. Kepler's parents settled in Leonberg, a Württemberg town, but family life was strained, and Heinrich left in 1589, leaving behind Katharina and four children. In 1608, Margaretha, the lone daughter, married a Protestant theologian, Georg Binder, who became pastor in nearby Heumaden (today a suburb of Stuttgart). One son, Christoph, became an artisan, married a woman from Eltingen, and settled in Leonberg. Another son, Heinrich, became a soldier and died young, after returning to his mother's house.

Their brother Johannes was allowed to study at the University of Tübingen. The astronomer Michael

Mästlin (1550–1631) aroused his enthusiasm for astronomy and mathematics, and, after graduating in 1594, Kepler was hired as a professor of mathematics by the estates of Inner Austria at Graz, a Habsburg territory with Protestant nobility and close links to Tübingen. There Kepler published his *Mysterium Cosmographicum* (Mystery of the Cosmos, 1596), attempting to combine the Copernican system with Neoplatonic ideas. Under the impact of the Counter-Reformation—Martín Del Rio was teaching at the Jesuit College in Graz—Kepler was exiled. Supported by the Bavarian chancellor Johann Georg Herwarth von Hohenburg, a long-standing correspondent, Kepler managed to succeed Tycho Brahe as imperial court astronomer in Prague. In this position, Kepler suggested that God spoke in the language of mathematics and interpreted the movements of the planets in mathematical equations (Kepler's Laws), one of the major achievements of the Scientific Revolution. He published some important books on Copernican cosmology, the *Astronomia Nova* (New Astronomy, 1609), a *Dissertatio cum Nuncio Sidereo* (Discussion of the Starry Messenger, 1610), and *Dioptrice*, a book about optics (1611). During this period, Kepler invited Galileo to settle in Germany, where everybody was free to think and publish whatever he wished. However, Kepler's situation deteriorated sooner than Galileo's. After the death of the Holy Roman Emperor Rudolf II (ruled 1576–1612), his position as imperial astronomer was confirmed by Emperor Mathias I (ruled 1612–1619), and even by Ferdinand II (ruled 1619–1637), who had exiled him from Graz. But Kepler preferred to settle at Linz, where the Protestant estates of Lower Austria employed him as professor of mathematics.

In 1615, his sister Margaretha informed him that their mother was involved in a bitter feud with neighbors at Leonberg, who had accused her of witchcraft. There were no extensive witch hunts in the duchy of Württemberg, but precisely in 1615 a number of women were burned at Leonberg. When a neighbor, Ursula Reinbold, accused his mother of witchcraft, Christoph Kepler sued her for slander. However, the litigation was delayed, since the Reinbold family found an ally in the district judge, Luther Einhorn, who had been rejected by Katharina Kepler as a husband for her daughter. Another ally was a local doctor who had become court physician to Prince Achilles Friedrich of Württemberg. The Reinbold faction began threatening Katharina Kepler physically, and eventually claimed material damages for the harm done to their children through her maleficent witchcraft. In autumn 1616, Johannes Kepler brought his mother to Linz. However, the stubborn lady returned to Heumaden in Württemberg, where the quarrels continued. Kepler tried to protect his mother by intensifying his contacts

with Württemberg's ruling elite. The famous lawyer Dr. Christoph Besold (1577–1638) and the theologian Wilhelm Bidembach served as informants and supporters. However, because Kepler had refused to sign the Formula of Concord, the duchy's orthodox Lutherans, including his former teacher Mathias Hufenreffer, emphasized Kepler's dissidence.

At this point, Johannes Kepler traveled to Württemberg, attempting to influence the decision of its *Hofgericht* (high court). Besold urged Kepler to take his mother back to Linz, and in November 1617, Kepler obtained official assurance that her departure did not constitute "flight," providing circumstantial evidence for her guilt. However, Katharina Kepler decided to stay in Württemberg, even returning to her house at Leonberg in June 1618. Besold kept warning Johannes Kepler about the machinations of Judge Einhorn. Seeking her estate, the Reinbold family commissioned a lawyer, Dr. Philipp Jacob Weyhenmayer, to compile evidence of Katherina Kepler's witchcraft. In August 1619, he presented fifty-two articles, and a formal inquisition into her case was started in winter 1619–1620, hearing numerous witnesses, while Judge Einhorn delayed the Kepler family's countersuit for slander.

On July 24, 1620, the Württemberg aulic council decided to imprison Katharina Kepler, and on August 7, 1620, she was jailed at Leonberg. Christoph Kepler immediately protested and succeeded in having her transferred to a prison in Güglingen. Johannes Kepler tried to intervene through Christoph Besold, before reaching Güglingen himself in September 1620. He commissioned a formal defense, presumably supported or authored by Besold and/or Bidembach, which was submitted to the *Hofgericht* on May 7, 1621. The ducal vice-chancellor, Dr. Sebastian Faber, arranged that this case reached the court's agenda within a few weeks. Councilor Hieronymus Gabelkover gave his opinion by July 14, and the case went to the legal faculty of the University of Tübingen (to which Besold belonged) in August 1621. On September 10, 1621, they ruled that Katharina Kepler was to be tortured at the lowest grade, the *territio*, which in practice meant that the instruments of torture were shown to her before a formal interrogation. Their very precise decision explicitly forbade the hangman to touch her, or even bind her. Under these circumstances, Katharina Kepler would not confess, and on October 3, 1621, Duke Johann Friedrich von Württemberg (ruled 1608–1628) ordered her set free. When the local court finally complied some days later, Katharina Kepler had been imprisoned for 405 days. She died six months later, in April 1622.

Like many contemporaries, Johannes Kepler was acutely aware of freedom of conscience and suppression. He must have been deeply impressed by his mother's

fate, although he admitted openly that, like many old people, she was indeed quarrelsome, difficult, and stubborn. It is striking that his own stubbornness caused him enormous difficulties, since the Lutheran superintendent of Linz, a Württemberger, suspected him of being Calvinist while simultaneously conspiring with the Jesuits. These accusations provoked fierce debate within the parliament of Lower Austria before a precarious favorable decision saved his position at Linz.

About the same time, Kepler published his *Harmonice Mundi Libri Quinque* (Five Books of the Harmony of the World, 1619), dedicated to King James I of England, a Neoplatonic interpretation of the universe as inspired by eternal harmony. His claim that God spoke in the language of mathematics implied that orthodox (but mathematically illiterate) theologians were unable to understand God's word. By Easter 1626, the Counter-Reformation in Lower Austria drove Kepler from Linz. He retired to the imperial city of Ulm, where he published the *Tabulae Rudolphinae* (Rudolphine Tables, 1627), then to Regensburg, both Protestant towns. In 1628, Imperial Generalissimo Albrecht von Wallenstein employed Kepler, and he moved to Sagan in Silesia. In autumn 1630, Kepler decided to return to Austria, but died en route.

Four years later his son Ludwig Kepler (1607–1663) published a manuscript that had played a role in his grandmother's witchcraft trial. After the invention of the telescope, Johannes Kepler had written his *Somnium seu Astronomia lunari* (Dream, or Lunar Astronomy, 1634). Influenced by Plutarch and Lucian, Kepler invented a literary framework for descriptions of the moon, where the possibilities of getting there were discussed ironically. According to Aristotelian physics, dry and thin Spaniards were likely to be attracted by the moon, but Kepler preferred employing an old hag to beam his hero up—and in this story the hero calls his mother a witch. In 1611, Kepler sent copies of this manuscript to Tübingen and other places, where they were recopied and circulated. Kepler suspected that readers identified him with the hero of his story and that his intellectual joke had played a role in the witchcraft trial against his mother.

KISS OF SHAME

The kiss of shame, also known as the *osculum infame* or the obscene kiss, was believed to be an act of worship performed at the witches' Sabbat. The Devil appeared to the witches in the form of a goat or other animal and

his followers kissed him on the anus, genitals, or feet. The kiss had its origins in Roman propaganda against Jews, conspirators, and early Christians. Christian authorities later used the kiss against medieval heretics. It appeared in depictions of the witches' Sabbat used to illustrate early modern demonological texts, and in medieval and early modern literature, notably Geoffrey Chaucer's *Miller's Tale* (late fourteenth century) and Hans (Johann) Jakob Christoph von Grimmelshausen's *Simplicissimus* (The Adventures of Simplicius Simplicissimus, 1669). The kiss of shame had several functions: as a parody of the kiss of peace in the Christian Eucharist; an act of fealty; an act of illicit sexual activity (premarital fornication, adultery, or bestiality); a humiliation; and a means of denoting the dishonor of the performer.

In his *Octavius* (late second century), Minucius Felix, a Christian apologist, recorded the rumor that Christians worshipped the head of a donkey and revered the genitals of their priests. He separated the two essential elements of the kiss of shame, which were later

Witches at a Sabbat offer the kiss of shame to the Devil's anus. (Art Archive/Dagli Orti)

conflated: worship of an animal considered to be abject in the dominant culture; and adoration of an unclean part of the body. The English cleric Walter Map in the late twelfth century and Pope Gregory IX in 1233 both claimed that contemporary heretics worshipped a large black cat by kissing it on the feet, under the tail, or on the genitals. The Waldensians, Gregory stated, had also to kiss a huge toad (or a goose or a duck) on the behind or the mouth, and afterward a mysterious pale, ice-cold being. The notion that Waldensians worshipped the Devil in the form of an animal persisted into the fifteenth century. Illustrations to Johann Tinctor's (Johannes Tinctoris; Jean Taincture) *Contra sectam Valdensium* (Against the Waldensian Sect, ca. 1460) depicted a heretic about to kiss a goat on the anus. King Philip IV of France used this propaganda in his attack on the Knights Templar in 1307. He accused the knights of revering a Satanic cat by removing their hats, bowing to it, and kissing it on the anus.

Although the kiss of shame cannot be found in the *Malleus Maleficarum* (The Hammer of Witches, 1486), at the height of the witch persecutions it was incorporated into later demonological texts, pamphlet accounts of trials, and images depicting the heretical witches' Sabbat. For example, the kiss appeared in a colored woodcut in a news-sheet reporting the witchcraft trials in Geneva in 1570, now in the Zürich collection known as the *Wickiana*, and a century later it was still the central image of an illustration for Johannes Prätorius's *Blockes-Berges Verrichtung* (Performance at the Blocksberg, 1668). In these images, the kiss of shame (clearly a parody of the kiss of peace) illustrated the fealty of the witch heretic to the Devil, and therefore her abandonment of God and the inversion of spiritual norms. It also indicated her sexual promiscuity and lack of chastity: if single, she could not marry the Devil; if married, she was committing adultery with him. The pamphlet *News from Scotland* (1591) introduced English readers to a different version of the kiss of shame. It reported that the North Berwick witches were forced to kiss the Devil's buttocks as a humiliating penance because they had "tarried overlong" in performing their evil duties. Both Chaucer and Grimmshausen also used the kiss as a gesture of humiliation in their works. In *The Miller's Tale*, Alison granted her suitor Absalon a kiss, but he ended up kissing her "naked arse." In *Simplicissimus*, some soldiers were forced to kiss the backsides of the peasants who had captured them before being shot. In a further episode, an impersonator of the eponymous hero refused a duel and was forced instead to kiss the backsides of the sheep he had intended to steal. The duel provided an honorable means of resolving conflict; kissing sheep, or goats in the case of witches, was an act of bestiality that

incurred personal dishonor, social exclusion, and the punishment of exile or death.

**KRAMER (INSTITORIS),
HEINRICH (CA. 1430–1505)**

Kramer (in Latin, Institoris), a Dominican friar and inquisitor, achieved a dubious kind of immortality by publishing the first comprehensive handbook for witch hunters, the *Malleus Maleficarum* (The Hammer of Witches, 1486), which not only described the crime luridly but gave detailed instructions to help lay judges as well as inquisitors conduct witchcraft trials and also did much to associate the crime of witchcraft with women. His career as a witch-hunting inquisitor, however, suggests a pattern of failure and frustration.

Born in Sélestat (Schlettstadt), an imperial city in Alsace, Kramer's father may have been a retailer, as his German name suggests. That Institoris is the Latin form of his original German name is proved by the *Nürnbergger Hexenhammer* (Nuremberg Witches' Hammer), a secular witch hunt instruction from 1491 written in his own hand, where he named himself Heinrich Kramer. He probably entered the Dominican monastery of his native city about the age of fifteen, rising through the order and becoming master of theology by 1474. Being well suited for this profession, he was also appointed inquisitor that same year. By 1475, he was involved in gathering evidence about earlier Jewish ritual murders in south Germany to help with the famous Jew-baiting ritual murder case of the "child-saint" Simon at Trent (the capital of the prince-bishopric of Trent, now Trento in Italy). In 1478, he was promoted to inquisitor of upper (i.e., southern) Germany.

Kramer's first experiences with witchcraft trials date from the 1480s in the Rhineland, mainly in his homeland, Alsace. Encountering some opposition, he went to Rome and obtained the famous bull *Summis desiderantes*

(Desiring with Supreme Ardor) from the new Pope Innocent VIII in December 1484, directed at the bishop of Strasbourg. Afterward, named papal inquisitor in upper Germany, he moved to the diocese of Constance, which covered the greater part of southern Swabia. However, his attempted persecutions of witches in the imperial city of Ravensburg, and especially the Tyrolean capital Innsbruck, miscarried dramatically.

Starting in July 1485, Kramer's inquisition at Innsbruck was conducted through intimidation, limitless torture, denial of legal defense, and distorted reports. Not just the relatives of the accused, but also the citizens of the capital, the clergy, and the Tyrolean nobility protested against Kramer's procedures. The bishop of Brixen, Georg Golser, appointed a commission to investigate his inquisition, which interrogated seven imprisoned women on October 4. Over Kramer's desperate resistance, the bishop stopped the persecution on October 29, nullified its results, and, with the Tyrolean archduke's approval, liberated all the imprisoned women on November 2. Nine days later, the bishop formally requested the inquisitor to leave his diocese; by February 1486, Golser threatened to use force if Kramer did not leave Tyrol immediately.

Kramer sought revenge for such bitter defeats by composing his notorious treatise *Malleus Maleficarum*, published in 1486, with a second edition in 1487 that included the 1484 papal bull. The formerly assumed coauthorship of Jacob Sprenger has been convincingly refuted, and the notarial document giving approval from the theological faculty of the University of Cologne was a forgery.

There was evidence of pathological elements in Kramer's personality; Bishop Golser thought he was mad. Everywhere he picked quarrels and became disliked; soon the wandering inquisitor departed, sometimes exiled. Kramer's misogyny was extreme even for a medieval monk, and his sadism was mixed with prurience; he was accused of illegally investigating sexual affairs of women. In his *Nuremberg Witches' Hammer*, Kramer approved a "reserved" use of torture to avoid releasing women who did not confess after undergoing it. Kramer's boasts of having burned 200 women at the stake in 1491 seem greatly exaggerated. At first, popes protected him, but the jurists at the Roman Curia did not share his opinions and hindered his activities with uncomfortable bulls.

In 1500, Pope Alexander VI, at the instigation of the bishop of Olomouc, Stanislav Thurzo, named Kramer papal inquisitor to Moravia and Bohemia. He moved to Olomouc (Olmütz), which boasted an important Dominican monastery, and devoted himself to literary polemics. In April 1501, he published two tracts at Olomouc against Czech heresies, but never began any inquisitorial trials against them; and so far as we know, he made no further attempt to conduct witchcraft

trials. He died in Olomouc in 1505, but his grave has not yet been found.

KYTELER, ALICE
(CA. 1260/1265–AFTER 1324)

The trial of Alice Kyteler for heresy and sorcery in 1324 is the only such case known from medieval Ireland. It was significant for three reasons. First, it was one of the earliest trials in European history to link sorcery with heresy. Second, it was the first to treat the defendants as members of an organized group. Third, it was the first to accuse a woman of having acquired the power of sorcery by means of sexual intercourse with a demon. Our information about the trial derives from a single manuscript, generally referred to as the *Narrative* because of the title (A Narrative of the Proceedings Against Dame Alice Kyteler) given to it by Thomas Wright in his edition of 1843. Although the *Narrative* is unsigned, it is clear from internal evidence that its author was Alice Kyteler's accuser, Richard Ledrede, bishop of Ossory (1317–ca. 1360).

We know little about Alice. William Outlaw, the son of her first marriage was appointed "sovereign" (equivalent to mayor) of Kilkenny in 1305, suggesting that she was born ca. 1260–1265. Her family was Flemish. In 1277, William le Kyteler of Ieper (Ypres) was granted a safe conduct to trade in Ireland. He settled there and, by 1303, had become sheriff of the liberty of Kilkenny. Joseph de Ketteler (perhaps William's son or brother) died in 1286/1287 and was buried at Kilkenny. Alice was presumably the daughter of one of these men. She married William Outlaw, a wealthy Kilkenny money lender and merchant, ca. 1280. Their son, also called

William Outlaw, inherited the family business after his father's death, which had occurred by 1303. By then Alice had married again, this time to another wealthy man, Adam le Blund. In 1307, Blund's heirs renounced all claims on their inheritance in favor of William Outlaw. By 1309, Blund was dead and Alice had married a third husband, Richard de Valle, the owner of six manors in the neighboring county of Tipperary. William Outlaw was appointed to look after de Valle's business interests, but his heirs refused to surrender their inheritance. On de Valle's death ca. 1316, Alice was forced to take legal proceedings against her stepson, Richard de Valle junior, in order to gain her widow's dower of a third part of the estate. Sometime between 1316 and 1324 she married a fourth husband, Sir John le Poer, a member of a prominent Anglo-Irish aristocratic family. By 1324 Lady (or Dame) Alice, as she had become, was a very wealthy woman. She also had influential connections. Roger Outlaw, a kinsman of her first husband, was the chancellor of Ireland. William Douce, mayor of Dublin, was a close friend, while Walter de Islip, the treasurer of Ireland, and Arnold le Poer, the seneschal (and, therefore, chief legal officer) of the liberties of Kilkenny and Carlow, were her son's trusted friends.

In 1324, Alice and five other women were accused of being heretical sorceresses. There were seven charges. These alleged that (1) they denied the Christian faith for a month or a year, depending on the scale of what they desired to attain through sorcery; during this time they neither heard mass, nor received communion, nor entered any church. (2) They sacrificed to "son of Art," one of the inferior demons of hell, at a crossroads near Kilkenny, using live animals that they dismembered and scattered there. (3) They asked advice and sought responses from demons through sorcery. (4) They usurped the authority and jurisdiction of the Church by excommunicating their husbands at nightly gatherings. Using lighted candles, they named, spat on, and cursed each part of their husband's bodies, extinguishing their candles at the end with the words: "fi, fi, fi [perhaps a manuscript abbreviation of *fiat*, "let it be"], "amen" (Davidson and Ward 1993, 28). (5) They made powders, ointments, potions, and candles, which they used to arouse love and hate, to maim, and to kill. They prepared these from a stew that consisted of a thief's decapitated head, dismembered cockerels, dead men's nails, pubic hair, spiders, disfigured worms, milfoil, and the brains and clothing [perhaps the caul] of boys who had died unbaptized. (6) The sons and daughters of her four husbands had commenced litigation at the bishop's court. They openly accused Alice of using sorcery to kill some of their fathers and infatuate others to such an extent that they gave all their possessions to her and to William Outlaw. Her present husband, Sir John le Poer, had been reduced by sorcery to such a state that he was

totally emaciated, his nails had fallen out, and there was no hair on any part of his body. (7) Alice had a demon incubus, called "son of Art" or "Robin son of Art," who had sexual intercourse with her. He appeared sometimes in the form of a cat, other times as a shaggy black dog, or as a black man with two companions. She had given herself and all her possessions to this incubus, and she acknowledged that she had received all her wealth and everything that she possessed from him. One of Alice's accomplices, Petronilla of Meath, later confessed that, with her own eyes, in full daylight, she had seen Robin materialize in the form of three black men bearing iron rods in their hands and had watched the apparition, thus armed, having sexual intercourse with Alice. Indeed, she added that she had dried the place with a bedcover after their departure.

The local bishop, Richard Ledrede, an English Franciscan schooled at Avignon and a personal appointee of Pope John XXII, formulated the charges. Ledrede requested the chancellor of Ireland to arrest Alice because of the public accusation of heresy and sorcery. But the chancellor was her relation, Roger Outlaw, and he replied by urging the bishop to drop the case. When Ledrede persisted and summoned her to appear before his own ecclesiastical court, his summons was ignored. A second date was set; but Alice, using her influence with the seneschal, Arnold le Poer, had the bishop arrested instead and committed to prison in Kilkenny Castle. If they hoped that a spell in prison would cool the bishop's ardor, it had precisely the opposite effect. He appealed in person at the seneschal's court, reading out the papal bulls that required the secular power to pursue heretics. Ledrede was told bluntly to "go to the church and preach there" (Davidson and Ward 1993, 46)

The case appeared to be lost but, by chance, John Darcy, the justiciar (chief governor) of Ireland, passed through Kilkenny in July 1324 and Ledrede succeeded in having the issue brought before him. Guilty verdicts were returned, but Alice managed to slip away. Her son, William Outlaw, publicly renounced his heresy, accepted penance, and promised to atone by providing monies for the repair of the cathedral. Petronilla of Meath confessed to all the charges after she had been flogged six times and tortured until she was senseless. Refusing to accept penance or abjure her heresies, she was paraded through the streets of Kilkenny and burned alive on November 2, 1324.

Although some commentators detected political motives behind Ledrede's actions, there can be little doubt but that he was endeavoring to introduce the Inquisition's methods into the judicial practice of Ireland and England, where convictions on the basis of confession alone were prohibited. The charges, which have many similarities with those placed against the Templars seventeen years earlier, originated because of a

combination of disaffected stepchildren and a religious zealot. The description of John le Poer's body as emaciated and devoid of body hair fits the symptoms of arsenic poisoning. Together with the allegation that Alice had killed her previous husbands, her stepchildren suspected that she was slowly murdering the current one. The property and wealth of heretics did not pass to their blood heirs but reverted to the family's next of kin. Because both Alice and her son, William Outlaw, would have been dispossessed by her conviction, John le Poer would have inherited her property and wealth.

Instead, Ledrede was forced to flee from his diocese in 1327. He sheltered at Avignon, returning only in 1349 when he again started to pursue heretics. Subsequently he was accused of trumping-up charges against the "decent, simple, faithful people" as a means of extorting money (Colledge 1974, xxxi). Ledrede survived the accusations, however, and died of old age in 1360 or 1361. We have no idea what happened to Alice Kyteler after 1324.

L

LAMBE, DR. JOHN (CA. 1545–1628)

Lambe was a notorious English conjuror, magician, and astrologer who in the 1620s became an adviser to the king's favorite, Sir George Villiers, first duke of Buckingham. The fortunes of the two men became intertwined, their ambition and vanity spread murderous hatred among political elites and common people alike.

Lambe began working as a tutor to the sons of the gentry but turned to medicine and was licensed by the bishop of Durham. Lambe used sorcery, conjurations, and cunning magic. His career ended in 1608 after he was prosecuted at Worcester for bewitching Thomas Lord Windsor. He was also charged with invoking spirits. Although found guilty on both counts, he escaped execution. Initially held in Worcester Castle, he was moved to London after some participants in the trial died. He remained in the King's Bench Prison until June 1623, styling himself "Doctor" and continuing to practice magic for wealthy clients. In 1622, the duke of Buckingham accompanied his mother at a consultation session with Lambe to determine whether sorcery had caused his brother John's insanity. Buckingham became Lambe's patron, quashing his conviction for raping an eleven-year-old girl while in jail. Shortly before he was to be hanged, Lambe told the Lord Chief Justice, in an interview arranged by Buckingham, that he had important information about the gunpowder plot. The attorney general was instructed to issue a pardon.

How close Lambe became to Buckingham is unclear. A letter of 1624 from the duke to the king at least pretended to mock him. In 1625, Lady Purbeck, who had been forced by her father to marry the insane John Villiers, reportedly visited Lambe accompanied by her lover Sir Robert Howard. Upon hearing a rumor of this, Buckingham tried to compel Lambe to divulge what had been said in order to prove that her infant son was a bastard. Nevertheless, Lambe became a symbol of malign influence when the duke's popularity waned. In June 1626, before the king dissolved Parliament for trying to impeach Buckingham, a terrible storm broke over the River Thames. Gossip spread that "Buckingham's Wizard" had caused it. In 1626–1628, tension over parliamentary subsidies accompanied ballads attacking Lambe for both witchcraft and sexual

scandal, suggesting that he used magic to procure women for Buckingham. Meanwhile, rumors abounded that Buckingham's mother had consulted Lambe about her son's fate, and even that Lambe was responsible when Lady Purbeck faced charges not only of adultery but also of witchcraft after the discovery of a wax image of Buckingham. In 1627, Lambe was examined by the Royal College of Physicians and found ignorant of the principles of astrology.

In June 1628, a mob spotted Lambe leaving a London theater. Reviling him as "witch," "devil," and "the duke's conjuror," they chased him and beat him so severely that he died the next day. News of his death caused popular rejoicing and inspired ballads. Martin Parker, in his ballad, *The Tragedy of Doctor Lambe, the great suposed Conjuror*, damned Lambe as "the Devill of our Nation," hated not just for his magic but also for his greed (his last meal had been half a suckling pig). The final verses treat Lambe's death as an act of providential deliverance from treachery, corruption, and immorality. A popular pamphlet ridiculed Lambe in his ribboned knee-points (that hold stockings up), striped silks, and deep lace ruff, pathetically trying to repel his assailants with the sword he carried to affect the appearance of a gentleman. London's authorities made little effort to trace Lambe's killers, earning them a rebuke and a fine from King Charles I.

Mocking verses circulated in the London crowd that Buckingham's authority was bound up with Lambe's magic and that Buckingham would soon share his much-loathed magician's fate. Buckingham was assassinated in August of the same year. The link between Buckingham and Lambe, and their association with witchcraft, was revived in the 1650s during the well-publicized witchcraft trial of Anne Bodenham, who claimed to have been Lambe's servant.

LAMIA

According to late Greek tradition, Lamia was a very beautiful Libyan queen. Zeus, king of the gods, fell in love with her, but his wife, Hera, full of jealousy, robbed her of her children. In despair, Lamia began to steal other people's children and murder them, and this appalling behavior warped her face and made her extremely ugly. Accordingly, she became the bogey-woman of the nursery. Horace, for example, suggests that a poet should not ask his audience to believe impossibilities such as drawing a child still alive from Lamia's stomach (Horace, *Ars Poetica*, 340). Other late Greek and Roman authors, such as Philostratus, conceived *lamiae* as nonhuman females who seduced young men so that they could eat their flesh and drink their blood—hence their development, in modern Greek folklore, to beautiful women with monstrous feet or half-woman, half-fish creatures who drown people who go swimming in the sea.

Lamia quickly became a term used insultingly about female magical operators. Apuleius of Madaura (second century C.E.) has the hero of his *Metamorphoses* describe how two elderly women entered the room as he lay in bed, drenched him with urine, and tore out his traveling companion's heart. And in his famous story of Psyche and Cupid, Psyche's two sisters, creatures endowed, according to the tale, with more than natural envy and malice, are called "wicked" and "treacherous little wolves," as well as *lamiae* (Apuleius, 5.11). These, then, are the associations that the word *lamia* carried forward into later times, deriving in part, perhaps, from men's memories of elderly women in the family who dominated their childhood and played a prominent role in the magical rituals attending almost every act of consequence in family life.

Isidore of Seville made a greater impression on the Middle Ages by deriving the word *lamia* from a Latin verb, *laniare*, meaning "to tear, savage, mutilate"—ingenious but inaccurate: The term is originally Greek. But Isidore's mistaken derivation became popular; Gervase of Tilbury repeated it. A thousand years after Apuleius, Gervase knew *lamiae* as a type of mischievous fairy, describing them as "women who run about all over the place, never still for a moment, looking for a way to get into people's houses. Once in, they empty jars, baskets, and dishes, and peer into pots. They drag babies out of their cradles, light candles or tapers, and often hit people while they are asleep" (Gervase of Tilbury, *De otiiis imperialibus* part 3, chap. 87). A few

centuries later, the title page of Ulrich Molitor's treatise on witches, *De laniis et phitonicis mulieribus* (Concerning Witches and Fortune-tellers, 1489), contained an interesting misprint, since *lamiis* (witches) there appears as *laniis* (butchers), a variation corrected in later editions.

Lamiae was picked up by later writers on magic and witchcraft, who tried, not altogether successfully, to use it as a technical rather than a general term for "witch." Johann Weyer, for example, offered to explain *lamia* to his readers, only to identify it with *striga* and *saga* (two words with very different histories and implications), before saying that he is going to use it to refer to a woman who enters into a pact with an evil spirit and thereafter worked maleficent magic with his help (Weyer, *De praestigiis daemonum* [On the Tricks of Devils], book 3, chap. 1). His contemporary, Johann Georg Goedelmann, went somewhat further, describing *lamiae* as ignorant old women who, unlike magicians (magi) and workers of poisonous magic (*venefici*), did not learn their magical techniques from books but were cozened by the Devil into believing they could work wonders (Goedelmann, *De magis, veneficis, et lamiis* [On Sorcerers, Poisoners, and Witches], book 1, chap. 2). The Jesuit Martín Del Rio, however, mocked Weyer's claim to distinguish among the various names given to workers of harmful magic on the grounds that what was important about such people were their deeds and not their names. By now, he asserted, it had become accepted custom to lump together the various magical practitioners, regardless of what they were called, and to treat them as though there were no differences among them (Del Rio, *Disquisitiones Magicae Libri Sex* [Six Books on Investigations into Magic] book 5, section 16). This is the position adopted by many, perhaps most, early modern authors writing on magic and witchcraft.

LAMOTHE-LANGON, ETIENNE-LÉON DE (1786–1852)

An impoverished nobleman from Toulouse, whose father had been killed in 1794 during the "Terror" of the French Revolution, Etienne-Léon de Lamothe perpetrated the most spectacular hoax in the historiography of witchcraft. Lacking formal schooling, he earned his living as a freelance author and Romantic novelist

with “a marked taste for the sinister, the mysterious, and the melodramatic” (Cohn 1975, 132), becoming one of the most productive French writers of this period. He began writing at three o’clock in the morning and managed to publish no fewer than 400 books (or 1,500 volumes in manuscript) in fifty years.

His work includes a celebrated three-volume *Histoire de l’Inquisition en France* (History of the French Inquisition) of 1829, presumably inspired by Juan Antonio Llorente’s *Histoire critique de l’Inquisition d’Espagne* (Critical History of the Spanish Inquisition, 1817–1818), a best seller throughout Europe. Lamothe allegedly wrote his history from archival sources. However, Lamothe had no time for archival research. In 1829 alone, he published twenty-two volumes, including novels like *La Vampire ou la Vierge de Hongrie* (The Vampire, or The Virgin of Hungary), and he had no training in paleography. Only recently has it become clear that he not only amplified his own name into “Lamothe-Houdancourt” (from 1815–1817) and “Baron de Lamothe-Langon” (after 1817) but also invented his “sources.” They included the earliest reports about the witches’ Sabbat, allegedly from 1275, as well as the earliest reports of a large-scale witch hunt, allegedly conducted between 1300 and 1350. His accounts of mass persecutions seemed plausible, because Pope John XXII in a bull of 1320 had indeed empowered the Inquisitions of Toulouse and Carcassonne to proceed against practitioners of certain kinds of magic.

Lamothe’s forgeries became universally accepted after Wilhelm Gottlieb Soldan quoted them in his authoritative *Geschichte der Hexenprozesse* (History of Witch Trials, 1843), and even more so after Joseph Hansen quoted them fully in both his history of witchcraft in the Middle Ages (1900) and in his source collection (1901). Thereafter, scholars universally took the authenticity of these sources for granted. It was only in the mid-1970s that two historians (Cohn 1975, 126–146; Kieckhefer 1976, 16–20) independently demolished Lamothe’s allegations. Neither Lamothe’s alleged inquisitors of Carcassonne and Toulouse nor their witch hunts could be substantiated from any surviving sources. Lamothe had simply fabricated the victims and their confessions in order to sell his publications and perhaps in order to amplify the importance of France in the history of witchcraft. But even Pope John XXII had withdrawn his authorization in 1330, and thereafter, inquisitors were no longer responsible for sorcery trials in France. With Lamothe’s forgeries eliminated, it became clear that it was only circa 1400–1430 that different aspects of witchcraft and heresy were assembled into a specifically European “cumulative” concept of witchcraft, which allowed witch hunts of unprecedented severity. The case of Lamothe remains a warning to historians not to accept “sources” just because they appear to be plausible. After 1835,

Lamothe specialized in forging sources, and he fabricated (among many others) the memoirs of Louis XVIII and Napoleon Bonaparte. Furthermore, Lamothe’s fraud demonstrated the efficacy of traditional source criticism: In a masterful intellectual exercise, Norman Cohn suggested that Lamothe had simply copied his account of the witches’ Sabbat from a seventeenth-century French demonologist, Pierre de Lancre.

LANCASHIRE WITCHES

The term *Lancashire witches* (sometimes called the *Pendle witches*) usually refers to a group of sixteen alleged witches from the Pendle region of Lancashire who were tried at the Lancaster assizes August 18–19, 1612. This Lancashire outbreak was, at the time, the most serious witch hunt yet experienced in England. Ten of the accused were executed, and another was sentenced to a year’s imprisonment punctuated by four sessions on the pillory. Another woman associated with this group, Jennet Preston, had been tried and executed in the neighboring county of Yorkshire three weeks previously.

Thomas Potts, the clerk of the court that tried the witches, soon recorded the Lancashire outbreak in a lengthy tract, published in 1613. This tract, which reproduced the examinations of the witches and of those giving witness against them, is a major source for the events of 1612. Unusual for an English case, the 1612 Lancashire trials have passed into local legend, and their memory endures in the local tourist

Ten witches from Pendle in Lancashire were hanged in what was England's largest witch hunt up to that time. The witch on the left may be the octogenarian Elizabeth Southernns ("Old Demdike"), while the fear that a Sabbat had taken place was represented by the female witch, male witch, and devil riding on broomsticks to the witches' gathering. and heritage industries. This probably owes much to *The Lancashire Witches*, a novel based on the 1612 trials, published in 1849 by William Harrison Ainsworth, one of the most popular Victorian writers, and still in print. Robert Neill in 1951 published another novel based on the 1612 Lancashire witches, *Mist over Pendle*.

The train of events behind the Lancashire witch scare began on March 21, 1612, when a woman named Alizon Device met a peddler called John Law. Device asked to see some of the goods in his pack and grew angry when he refused her. Law instantly went into what was regarded as a witchcraft-induced illness (to the modern reader, his affliction looks much like a stroke), and he and his relatives decided to report the matter to the authorities. On March 30, the justice of

the peace, Roger Nowell, took depositions from Alizon Device, her mother Elizabeth, and her brother James and from John Law's son, Abraham. Three days later, Nowell examined Elizabeth Device's mother, the octogenarian Elizabeth Southernns (alias "Old Demdike"), Anne Whittle (alias "Chattox"), and three witnesses. On April 4, Nowell committed Alizon Device, Old Demdike, Chattox, and Chattox's daughter, Anne Redferne, to the jail at Lancaster Castle to await trial for witchcraft. Rumors of witchcraft continued to burgeon, especially after a group of suspects met together at the Malkin Tower, apparently to discuss tactics in the face of the developing witch craze and also to plot blowing up Lancaster Castle in order to release their friends. News of this meeting, which looked very like a Sabbat to contemporaries, convinced Nowell and his fellow

justices of the peace that they were confronting a major outbreak of witchcraft, and investigations intensified. Sir Edward Bromley and Sir James Altham, experienced judges who had been responsible for convicting Jennet Preston in Yorkshire, presided over the trials. Both judges had been well briefed by the Lancashire authorities, and the trials, notable particularly for an unusual dependence on child witnesses, were heavily weighted against the accused.

Because the Lancashire trials were the largest yet seen in England, contemporaries regarded them as noteworthy and possibly controversial: Potts's tract was apparently written at the request of the judges and can be read as a justification of their conduct of the trial. Although, as we have noted, the trials have continued to attract considerable attention, they have not become the subject of a full-scale scholarly investigation, despite some useful studies by local historians (for example, Lumby 1995) and an important recent collection of essays (Poole 2002). Many questions about the trials remain unanswered. Most importantly, it is very unclear why such a large-scale outbreak of witchcraft occurred in this place at a time when witchcraft cases in other parts of England were in decline. This problem awaits investigation, but the answer probably lies in the peculiar state of religious affairs in the county.

Lancashire was one of the strongholds of Catholicism in England, but it also had an active Protestant county elite, who were anxious both to check popery and to impose greater godliness on the population at large. The parish of Whalley, within which Pendle lay, was typical of upland England, being large and full of scattered settlements, the kind of area to which it was difficult to bring the message of the Reformation. Much responsibility for the development of this witch craze rests with Nowell, who seems to have played an important part in orchestrating the examination of the suspected witches. Nowell was an experienced local administrator, aged sixty-two at the time, who was not only a justice of the peace but had also served as sheriff of Lancashire. Through his family connections, Nowell also had contacts with advanced Protestantism. He was related to another gentry family, the Starkies of Cleworth, whose household had been in 1595 the center of one of the typical demonic possession-cum-witchcraft cases of the period. He was also close to the Lister family, one of whose members was victim of Jennet Preston, the Yorkshire witch executed in 1612. In Nowell, we have an unusual local justice of the peace who had a strong animus against witches and whose influence was very marked, both in the pretrial investigations of the 1612 witches and on the assize judges.

Although it was the Pendle witches who passed into legend after the 1612 trials, three more women from the nearby village of Salmesbury were also tried at the Lancaster assizes in 1612 (hence the nineteen witches

referred to in Potts's tract). They were prosecuted through evidence given by Grace Sowerbutts, who accused them of offering her various forms of physical abuse, of tempting her to commit suicide, of killing a child whose body they later exhumed and ate, and of transporting her to the River Ribble to participate in what was in effect a Sabbat, where she and the three alleged witches danced with "four black things" and then had sexual intercourse with them after the dancing. The Pendle witches were tried and, in the relevant instances, convicted of standard malefic witchcraft, but Sowerbutts's evidence was very different from that offered by witnesses in the main series of trials. The court, which was in the process of sentencing ten alleged witches to death, totally rejected Sowerbutts's allegations and acquitted the three women she named. The judges would not countenance allegations of this type, especially after they learned that a Jesuit priest had schooled Sowerbutts in her witchcraft beliefs. In 1612 Lancashire, malefic witches were dangerous, but popish delusions about the Sabbat and cannibalistic witches were superstitions.

After the 1612 trials, rumors of witchcraft evidently continued in the Pendle area, and reentered the historical record in a less-well-known witch scare of 1633–1634. At the center of this episode lay an eleven-year-old boy named Edmund Robinson, who claimed that shape-changing witches had taken him to the Sabbat and that he there saw a large number of local people whom he recognized. The 1633–1634 outbreak was badly documented, but one source suggested that sixty people were suspected. Certainly, a large-scale witch panic threatened, with Robinson and his father touring settlements in the area offering their services as witch hunters. But there was to be no replay of 1612. The judge presiding over the trials, clearly worried by what was happening, contacted the central government at Westminster. Apparently no trials were held, and the bishop of Chester, within whose diocese Pendle lay, was sent in to investigate. Robinson and his father were taken to London, along with five of the suspected witches, who were given medical examinations. Robinson withdrew his evidence, claiming that he had made everything up because he was late getting the cattle home and feared being chastised by his mother. The incident demonstrated both the persistence of witch beliefs in rural England in the 1630s and a growing reluctance among British authorities to countenance witch hunting, in stark contrast to the situation in 1612.

LANCRE, PIERRE DE (1533–1630)

In 1609, Pierre de Lancre conducted trials that resulted in dozens of executions for witchcraft—the largest mass witchcraft trial in early modern France, until the Languedoc-Ardenne panic of the 1640s. Frustrated by the persistent skepticism of his colleagues at the *Parlement* (sovereign judicial court) of Bordeaux, Lancre then wrote three lengthy treatises on the subject, defending his actions and arguing that witchcraft was real, that witches constituted a dangerous heretical sect, and that the sect had to be stamped out with severity.

Lancre was born around 1533 to an influential Bordeaux family. He was related by birth and marriage to several well-known Bordeaux authors, including Florimond de Raemond and Michel de Montaigne. On the way to his long legal career, Lancre attended the Jesuit *college* of Clermont in Paris in the early 1570s. He (and Martín Del Rio) probably heard Juan Maldonado's influential lectures on witches in 1571. Throughout his life, Lancre was inspired by the intense Catholic spirituality encouraged by the Jesuits.

In 1579, Lancre received his doctorate of law. He joined the *Parlement* of Bordeaux in 1582. In the early seventeenth century, when he was in his fifties, he began a prolific writing career that lasted almost up to his death in 1630. In 1607, he published a long work of neostoicist philosophy. He devoted about a third of this book to the exalted role of judges in the grave, almost divine, function of dispensing justice. He opposed cruelty and the too-easy recourse to torture he had observed among some of his colleagues. He firmly supported the French legal tradition of trials being conducted by groups of judges to avoid abuses that could occur if one person held the power of life and death. Such judicial caution was an especially powerful tradition among his parliamentary colleagues at Bordeaux, who were apparently the last appellate tribunal in France to approve an execution for witchcraft. Another central theme of this work was the weakness and inconstancy of women. He described women as dishonorable, licentious, and, following the example of Eve, inclined by nature to follow the Devil.

The following year brought the judicial assignment that made Lancre famous. In late 1608 or early 1609, complaints from the Labourd region, a Basque area south of Bordeaux, reached King Henry IV, stating that witchcraft was out of control in the region. The king named two special commissioners, Pierre de Lancre and

Jean d'Espaignet, to conduct a four-month judicial mission to the Labourd to investigate the problem and to conduct trials as they saw fit. They had full powers to convict and execute anyone they found guilty of the heinous crime of witchcraft. Both judges found widespread belief that huge witches' Sabbats were taking place, and they heard hundreds of confessions, apparently without torture, from people who claimed they had attended these diabolical gatherings. Meanwhile, as suspected witches fled for safety across the border, the Spanish Inquisition received similar complaints and began investigating the problem in the Spanish Basque areas.

For four months, Lancre and d'Espaignet traveled throughout the region. As they interrogated people, their goal was to distinguish the witches who had renounced Christianity and to offer clemency to the women and children who had merely attended Sabbats, using their testimony to identify the ringleaders and organizers who were seen to be active members of a demonic sect. The existence of the Devil's heretical sect became Lancre's obsession, inspiring his subsequent writings on witches. The two judges conducted interrogations and trials and carried out executions with speed and efficiency. They seem to have executed between fifty and eighty witches, although we cannot be certain of more than two dozen, including at least three "ring-leader priests." When the judges' commission expired in November 1609, those whom Lancre thought were guilty but whom he had not been able to deal with were sent to Bordeaux for trial by the *parlement*. Lancre's verdicts were based on his perception that the real problem in the Labourd was the sect of Devil worshipers. He based his findings on testimony and confessions about participation in Sabbats. But the *Parlement* of Bordeaux never adopted his views and discounted his evidence. Applying its normal criminal procedures and upholding its traditions about suspected witches (which Michel de Montaigne, a former Bordeaux judge, had eloquently expressed), the judges insisted on evidence of actual crimes (*maleficia*) committed by the accused. On this basis, the court convicted a few of Lancre's witches and released many others.

Lancre's colleagues' professional rebuff, which showed they were unwilling to take seriously testimony on Sabbats and to see it as proof of the existence of a demonic sect threatening godly society, motivated Lancre to write his best-known book, *Tableau de l'Inconstance des mauvais anges et demons* (Description of the Inconstancy of Evil Angels and Demons, 1612). He put great energy into trying to convince his readers that "there was no way to cast doubt on [the reality] of witchcraft and that the Devil actually and bodily transports witches to Sabbats. . . . Sixty or eighty certain witches and five hundred witnesses . . . have stated that Satan had done this" (Lancre 1982, 2). Lancre was

concerned that if judges did not take these matters seriously, their blindness and weakness would help the Devil's power grow.

Central to this book, and to Lancre's concept of witchcraft, was the Sabbat. For Lancre, basing his arguments on Martín Del Rio's recent synthesis, the Devil's transportation of people to Sabbats, in body or in spirit, was real. Belief in this idea was required of Christians. The details of what happened at the Sabbats were shocking. All the attendees practiced unnatural sexual acts and committed horrible blasphemies. Lancre stated, "I can say of the women and girls of the Labourd who have gone to Sabbats, that instead of being quiet about this damnable coupling [with demons], or of blushing or crying about it, they tell the dirtiest and most immodest circumstances with such great freedom and gaiety that they glory in it and take pleasure talking about it" (Lancre 1982, 142). One even called the Sabbat a "Paradise." Of course, this fit in with Lancre's view that women were inclined to witchcraft "because of their imbecilic nature" and basic inclination to evil. For Lancre, aspects of Basque society made the Labourd region especially vulnerable to the Devil's work. He saw these people as foreign, barely civilized, and poorly educated as Christians. The fact that most adult men were sailors meant that normal agricultural life was not present there. Furthermore, it meant that the women were far too independent, so that the proper, male-dominated family life did not exist. "They are Eves," he wrote, "who easily seduce the children of Adam" (Lancre 1982, 43). Although Lancre welcomed testimony from children as part of gathering evidence, he disagreed with Nicolas Rémy's opinion that prepubescent witches should be executed.

Lancre's position on the Devil's power, based on Del Rio, was carefully orthodox. Satan could not do anything really supernatural, such as transforming people into animals (in contrast to what Jean Bodin argued). But he could create illusions of these sorts of changes. For Lancre, witches who joined the Devil "have fallen into heresy and apostasy" (Lancre 1982, 531). In the fight against them, judges had to be vigilant and severe. Although witchcraft and heresy were closely related, Lancre held that witchcraft was more dangerous than ordinary heresy because it was hidden in darkness and because innocent people were victims of witches' evil spells. He went to great length to argue that these evil-doers should be put to death.

Because the parliamentary judges at Bordeaux and Paris continued to ignore his opinions about witches and witchcraft, Lancre published another long work on witchcraft in 1622, *L'incrédulité et mescréance du sortilege* (Incredulity and Misbelief of Enchantment). This book was entirely devoted to the problem of judicial incredulity about witchcraft. He stated that he had written "to dislodge whatever incredulity the

Parlements, all judges and other important people might have . . . who sustain that there is no truth in what is said of witches and witchcraft but that it is only an illusion" (Lancre 1622, 4). This work was very defensive in tone. He reiterated the main arguments of his earlier work, referring often to his experiences as a judge.

In 1627, Lancre wrote his final book on witchcraft: *Du sortilege* (About Witchcraft). But no matter how many books he published, Lancre remained a voice crying in a French judicial wilderness. It is clear that French *parlements* seldom prosecuted witchcraft severely or paid much attention to testimony about Sabbats after 1610. Between 1610 and 1625, although most of the thirteen people executed by the *Parlement* of Paris were charged with having been present at Sabbats, only one was put to death for attending a Sabbat. It is clear that the career and writings of Pierre de Lancre did little to reverse a clearly visible trend in French jurisprudence.

LANGTON, WALTER (D.-1321)

Treasurer (1295–1307) of King Edward I of England and bishop of Coventry and Lichfield (1296–1321), Walter Langton was accused of sorcery, entering into a pact with the Devil (frequently offering the kiss of shame to Satan), murder, adultery, and simony and was tried from 1301 to 1303. Pope Boniface VII suspended Langton from his episcopal duties and ordered him tried by an ecclesiastical court presided over by the archbishop of Canterbury, Winchelsea, Langton's personal enemy. The case was soon transferred to

Rome. Edward I wrote four letters to the pope in Langton's defense and charged that his accuser, Sir John Lovetot, had acted out of personal animosity. Lovetot believed Langton was responsible for his stepfather's murder and that he had maintained an adulterous affair with Lovetot's stepmother, subsequently keeping her as his mistress after her husband's strangulation. The Roman Curia found Langton innocent in June 1303, owing in part to his thirty-seven compurgators.

After his acquittal, Langton returned to England, where he became Edward I's principal adviser. But in 1307, as soon as Edward I was dead, his son King Edward II had Langton arrested, charging him with malfeasance as royal treasurer. Langton was imprisoned, and his lands and wealth were confiscated. However, he was released, became treasurer again, and was subsequently excommunicated by the archbishop of Canterbury. After the archbishop's death in 1315, Langton joined the royal council, until Parliament called for his dismissal two years later, thus ending a tumultuous political career.

Although Langton's trial took place a century before the emergence of the cumulative concept of witchcraft and fully developed witch hunts, it set precedents for a number of political witchcraft trials in the early fourteenth century in which members of the elite were targeted. It slightly preceded the notorious trial of the Templars in France and occurred just two decades before the most notorious of these trials in the British Isles, that of Alice Kyteler in Ireland.

LANGUEDOC

The French province of Languedoc, the heart of southern France, was once believed to be the site of Europe's earliest witches' Sabbats, in the mid-fourteenth century, until the "document" on which this opinion rested was shown to be a forgery (Cohn 1975, 126–138). Actually, witch hunting in Languedoc has a very different history.

Recorded witchcraft trials in this province reach back to the end of the Hundred Years' War. After an apparent pause, they resumed at the outbreak of the French Wars of Religion and peaked when Languedoc experienced the single largest recorded witch craze in France in the 1640s. However, from the mid-fifteenth century until the age of Louis XIV, the *Parlement* of Toulouse, France's second-oldest and second-largest appellate court, consistently played a major role in reducing the severity of punishments of accused witches.

Shortly after its installation in 1443, the *Parlement* of Toulouse investigated various irregularities committed in some witchcraft trials at Millau. It cleared a plaintiff from Millau charged with witchcraft because the written evidence against her was obviously perjured. The *parlement's* investigator discovered other irregularities in this witch hunt as well: An accused witch who had died under atrocious tortures without confessing had been illegally buried in profane ground; the judge ordered a stake put up for another witch before pronouncing sentence against her. All told, at least three witches were burned at Millau in autumn of 1444, two others died before sentence was pronounced, and at least three other women were accused of attending Sabbats and killing babies. The episode reveals how quickly the new crime of witchcraft had spread southwest from Dauphiné, and the *parlement's* attitude anticipated the better-known skepticism of their Parisian colleagues when investigating the *Vauderie* of Arras in 1491.

But the *parlement* could not prevent other burnings of accused witches in Languedoc. Around 1490, a woman was burned for sorcery and diabolism in Vivarais. Shortly afterward, we catch glimpses in notarial records of three women burned as witches by seigneurial courts near Nîmes and of two other women burned in the same region in 1493 (Grard 1995). Then comes a long silence, finally broken in 1555 when the seneschal of Bigorrie in the Pyrenees, asked the Toulouse *parlement* to send commissioners to judge several prisoners charged with witchcraft "in order to extirpate such scandalous and pernicious people from this region" (ADHG, B 3408). The court brusquely dismissed his request, on the grounds that people who "fell into such diabolical errors and illusions" had been improperly educated, and turned the whole business over to their local parish priests.

Only seven years later, the Toulouse *parlement* took witchcraft accusations seriously enough to uphold some death sentences for this crime from Pyrenean Languedoc. In the spring and summer of 1562, amid the turmoil surrounding the first French War of Religion, it approved at least three burnings for witchcraft (Le Nail 1976). However, the *parlement* soon reverted to its previous practice and decreed lesser punishments for the next thirty women from this region also accused of witchcraft.

Afterward more executions certainly occurred in a region as large as Languedoc during the time when most witches were burned elsewhere in France (roughly 1580–1625). However, we cannot trace the Toulouse *parlement's* judgments in witchcraft trials because of the exceptional laconism of its criminal records. A “notable warlock” and five women witches were executed in southern Languedoc in 1586, but the sovereign court for the county of Foix had judged them. However, at some unknown date, the *Parlement* of Toulouse copied the Parisian custom of requiring all local judgments in witchcraft trials to be automatically appealed to it. So when the greatest witch panic in French history struck Languedoc in 1643, it left an enormous paper trail, and an ingenious study (Vidal 1987) examined its actions.

From spring of 1643 until spring of 1645, the *Parlement* of Toulouse judged at least 641 accused witches, only 8 percent of whom were men. It behaved much as it had in 1562. For several months, it upheld many local decisions, and probably some fifty or sixty witches were burned. But by December 1643, the *parlement* became aware of the activities of professional witch finders in several parts of Languedoc. It ordered some of them arrested; by summer of 1644, three men had been hanged for forging commissions from the Privy Council or the *parlement* to hunt witches, and others had been sent to the galleys. At the same time, the *parlement* sharply reduced almost all punishments for accused witches; extremely few were burned, over a hundred were banished for periods of one to five years, and almost two-thirds of these 600 prisoners were released, often because of insufficient evidence. Meanwhile, this witch hunt even inspired a chapbook, the *Historia maravillosa del sabbat de las bruxes y bruxots* (Wondrous History of the Witches Sabbat), supposedly translated from French and printed in 1645 at Barcelona (which was then under French occupation). It described the adventures of “Señor Barbasta,” a mythical super-heroic Languedoc witch finder, who had reputedly identified over 3,000 witches throughout the kingdom of France, including his own wife.

After this panic subsided, as late as 1680 the Toulouse *parlement* was still trying to investigate witchcraft cases in the Pyrenees (at Bigorre, the same region affected in 1555). There was an instance of demonic possession in Toulouse in 1681–1682, but there was no further talk of burning witches in Languedoc (Mandrou 1968, 473–478).

LAPLAND

Lapland's witches were famous throughout early modern Europe. From ancient times, the Lapland sorcerers had a strong reputation for wind magic, shape shifting (metamorphosis), employment of familiars, the ability to move objects (such as small darts) across great distances, and for their wicked drum playing. Portrayals of the evil witches from Lapland became a favorite motif in demonology, travel narratives, and literary fiction between the sixteenth and eighteenth centuries. The expression *Lapland witches* appeared in the work of such renowned English writers as William Shakespeare, John Milton, Daniel Defoe, Henry More, and Jonathan Swift. In 1796, the Swiss painter Johann Heinrich Füssli depicted them in a rather dismal painting, *The Night-Hag Visiting the Lapland Witches*, illustrating some passages from Milton's *Paradise Lost* (1667). By the end of the eighteenth century, the mention of Lapland witches had become a cliché.

The concept “Lapland witches” refers to the indigenous people of northernmost Scandinavia and Russia, the Sami (formerly known as Laplanders or Lapps). Today, the Sami call their land Sapmi, and their whole area is often named the North Calotte. The notion of the far northern regions of Europe as centers of witchcraft and idolatry reduced to the question of Sami sorcery. “For practice of witchcraft and sorcery, they pass all nations in the world” (Anderson 1958, 13), wrote the English ambassador to Russia, Sir Giles Hetcher, in 1591, describing the life and manners of the “wild” Sami in northern Russia. The Lapland witches and the knotted winds had already become somewhat notorious by then, because authors like Olaus Magnus and Jean Bodin had already told Europe that the Sami were immensely dangerous magicians and sorcerers. The conjuring of these Lapland witches was so great that people believed they could use sorcery instead of weapons while in combat with their enemies. Rumors indicating that the Swedes used the techniques of Sami sorcery in warfare dogged Swedish military forces throughout the seventeenth century. When they won several significant battles and advanced deep into German territory during the Thirty Years' War, it was

insinuated that their success was due to sorcery by Sami troops assisting them.

RUNEBOMME—THE MAGIC DRUM; SHAMANISM

Educated Europeans of the early modern age believed that Sami witchcraft entailed three characteristics: First, the Sami were famous for their ability to tell fortunes and predict future events. Ever since the recording of the Nordic sagas, this feature of the indigenous populations of the far North was well known. In general, Old Norse sources give the impression that all Sami were great sorcerers. Ancient Norwegian laws forbade people to travel to Finnmark's Sami to have their fortunes told. Closely associated with their powers of prophecy were their abilities to narrate events. By the use of a magic drum (*runebomme*) and other rituals, a Sami shaman (*noaidi*) would allow himself to fall into some kind of a trance (*ecstasis diabolica*), at which time his spirit would be led far away. Upon awakening, he could describe events that had occurred at the places to which his spirit had traveled. Christians immersed in demonological concepts of shamanism believed that Satan himself gave these drums to the Sami. The drum, an instrument of the Devil, enabled a sorcerer to summon his demons, which were believed to reside in it and were revived by striking it. In this manner, each drumbeat—to quote a Swedish missionary working among the Sami whose discourse helped to “diabolize” them—was intended for Satan in hell. The singing among the Sami, called *Joik*, which accompanied the beating of the drum, was regarded as a diabolical, monotonous cacophony.

While under the spell of his satanic trance, a shaman communicated with his attendant demon that, because of its tremendous acuity and faculty for moving swiftly, could divulge global events to its master. As a result, seventeenth-century Lutheran missionaries to the Sami regions made arrangements to burn these drums and thereby destroy the Sami pagan gods. The demonizing of this pantheistic religion continued throughout the seventeenth century, and Sami who believed they could predict the future were accused of being satanic prophets.

DIABOLICUS GANDUS

The ancient idea of “elf-shot” (in German, *Hexenschuss*) was the third kind of sorcery attributed to the Sami. This kind of spell casting, or *gand* (*diabolicus gandus*, in Sami sorcery trials of the seventeenth century), was what pious Norwegians feared most during the sixteenth century and the beginning of the seventeenth century. The witches of Lapland were known to cast their evil spells across vast distances. Their spells could even be carried upon the

northern winds and could provoke illnesses among people far to the south in Europe. “Shooting,” or the conjuring of spells “on the wind,” was a well-known *maleficium* (harmful magic) across most of northern Scandinavia and was asserted with great conviction by some leading European intellectuals. Among others, the famous French jurist and demonologist Jean Bodin had much to say about the evil magic of Lapland's witches. The *gand* was imagined to be something physical. “Lapp shots” were perceived as small leaden darts, which the Sami could shoot across great distances. In the mid-sixteenth century, Olaus Magnus described them as small leaden arrows. At the end of the seventeenth century, a Norwegian vicar, Petter Dass, later described the Sami spell as vile, dark blue flies, or “Beelzebub's flies.” Court records from northern Norwegian witchcraft trials offer explicit descriptions and actual illustrations of the Sami *gand*. One of the passages even mentions that the *gand* resembles a mouse with heads at both front and rear. What we today call shamanism among the Sami was regarded by the Lutheran confessional church as the worst type of superstition and witchcraft. A few witchcraft trials in Norwegian, Finnish, and Swedish Lapland contained elements of shamanism.

LAPLAND WITCHES AND THE WITCH HUNT

As a collective group living in the borderlands, moving and trading within three countries at the same time, the Sami posed a threat to the territorial expansion of Nordic countries and their endeavors to spread Christian civilization in the North. This was especially the case for the conflicts among Russia, Sweden, and Denmark-Norway at a time of territorial state formation. All of them considered the Sami as subjects in need of proper integration. Fearful of Sami sorcery, the Norwegians, according to reports forwarded to King Christian IV in 1608, dared not inhabit the fjords of Finnmark that were populated by the “wild and wicked” Sami. In response, the king in 1609 commanded the governors of his northern-Norwegian districts to hunt down and eradicate all kinds of Sami sorcery. Those who practiced it would be put to death. In the three counties that comprise Arctic Norway, civil courts held witchcraft trials for thirty-seven individual Sami between 1593 and 1692 (Hagen 1999). Of these, twenty men and eight women were burned at the stake. Suspicion of sorcery was one of the charges that arose every time serious conflicts emerged between the Sami and the Danish-Norwegian authorities during this period. But still, it should be pointed out that there were many more Norwegian women involved in the hunt than people from the indigenous group.

TABLE L-1 WITCHCRAFT TRIALS IN
NORTHERN NORWAY
(ARCTIC NORWAY) 1593-1692

| Gender and ethnicity | Total | Death sentences |
|----------------------|-------|-----------------|
| Female—Sami | 11 | 8 |
| Male—Sami | 26 | 20 |
| Female—Norwegian | 120 | 87 |
| Male—Norwegian | 14 | 5 |
| Unknown | 6 | 6 |
| Total | 177 | 126 |

Meanwhile, in Swedish regions of Lapland, seventy-three Sami males and three Sami females were prosecuted between 1639 and 1749 on charges of using drums and practicing sacrificial rituals (Granqvist 1998). Few of them received death penalties, however.

In both Norway and Sweden, it was primarily Sami men who were accused of witchcraft. The notion of witchcraft, with few exceptions, was primarily a male phenomenon in Sami society. At the same time, in small northern Norwegian coastal villages, witchcraft was basically a crime committed by Norwegian women. Legal sources thus confirm that Sami men were the basic cultural bearers of their traditional ritual magic. And the witchcraft trials of the far north were distinctive in a European context because of the simultaneous prosecutions of wives of seasonal Norwegian fishermen and of Sami shamans.

LARNER, CHRISTINA (1934–1983)

A preminent historian of the Scottish witch hunt. Larner's main book, *Enemies of God* (1981), is a beacon of methodological clarity that ranks among the most influential and widely cited regional studies of European witch hunting.

Larner, a sociologist at the University of Glasgow, taught not only in her own department but also in those of history and politics, and she was appointed to a personal chair shortly before her tragically early death. She wrote her PhD thesis (1962) on Scottish witchcraft, and in 1970 Norman Cohn encouraged her to resume work on this. A new anthropological perspective on village-level witchcraft was opening up, which Larner was well placed to exploit. However, she first studied an elite witch hunter and demonologist, publishing "James VI and I and Witchcraft" in 1973 in a volume edited by Glasgow historian Alan Smith. (It was republished, along with most of the rest of her articles, in the 1984 collection, *Witchcraft and Religion: The Politics of Popular Belief*.) Although her idea that James imported the demonic pact to Scotland from Denmark in 1590 has been questioned, her article remains essential for the development of James's views.

Larner then obtained funding for a project to collect information on all recorded cases of witchcraft in Scotland. The results, published by her research team in 1977, listed 3,069 witchcraft "cases" with their place, date, and trial status. Although an imperfect work (riddled with miscitations, several hundred duplicate cases, and other errors), it exploited hitherto-unused manuscript sources and provided a firmer statistical basis for the Scottish witch hunt than had ever been available before. The best estimates for numbers of executions had hitherto ranged between 3,000 and 4,500; Larner pared away layers of speculation to show that the number must have been much lower. More than half of these "cases" (the exact proportion was unknown) ended in acquittals or other noncapital outcomes, suggesting a figure of probably fewer than

1,500 executions with a maximum of 2,000 (Larner 1984, 28). More recent research has explored further sources and has tended to raise the numbers somewhat but has also endorsed the soundness of Larner's basic approach.

Larner's masterpiece, *Enemies of God*, was also written at this time. It combined statistics with a detailed reading of individual cases. Many seminal works are characterized by a single penetrating idea, but Larner's work stood out in its balanced use of complementary methodologies. She reconstructed peasant networks of accusation with the same verve that she brought to beliefs about the Devil or theories of social control. She confirmed the quarrelsomeness of many accused witches while showing that Scotland did not fully fit the "Thomas-Macfarlane" model, where by English witches were accused after a denial of charity was followed by misfortune. Distinguishing between "English" and "continental" patterns of witch hunting, she placed Scotland between the two. Subsequent research, although refining the "continental" pattern, has not significantly modified Larner's conclusion. She was alive to the hitherto-neglected issue of women as witches, but she resisted the tendency of some feminist contemporaries to turn the witch hunt into a "woman hunt."

As well as peasant quarrelsomeness, Larner emphasized the responsibility of governmental authorities. She came to believe that *witch hunting* was an apt term because witches did have to be sought out and labeled. She had not yet reached that point when she wrote in her 1962 thesis, "There are those who claim that the witchcraft persecution originated at the end of the fifteenth century precisely because this was the era of the creation of the modern state. . . . Yet most historians today would not give that importance to the late fifteenth and early sixteenth centuries in the creation of fully developed administrative systems which writers of an earlier generation did." But she later changed her mind, adding a pencil note in the margin: "But I think I would now (1971) plus literacy" (Larner 1962, 15). She was, in fact, moving toward what she called "the Christianization of the people" (Larner 1981, chap. 12), a process taken up by local elites seeking to inculcate godly discipline; after the godly King James VI succeeded the godly state. A few of its details were problematic—her much-quoted "general commission" or "standing commissions" of the 1590s have proved illusory—but later research has borne out the general soundness of her approach.

What most distinguished Larner's book was its methodological sophistication. She was far more familiar with social theory than most empiricist historians; she could write about the problems of "treating seventeenth-century culture as an alien belief system" (Larner 1981, 134) from within the rich conceptual framework of the social sciences. She took a particular

interest in the belief system of preindustrial Europe, characterizing it as a "middle ground" society, neither primitive nor dominated by belief in science and technology.

After *Enemies of God*, Larner gave the 1982 Gifford Lectures, "Relativism and Ethnocentrism: Popular and Educated Belief in Pre-Industrial Culture." These lectures, by a sociologist intervening in a debate "among philosophers and anthropologists" (Larner 1984, 97), are vital for historians of witchcraft, who need to decide how to respond to beliefs that seem alien. She provided a powerful corrective, both to condescending accounts of past "ignorance" and "superstition" and to extreme relativist interpretations in which all beliefs are equally valid. Larner's clear, jargon-free prose sparkled with erudite wit and humor. Arguing against reductionist explanations for witchcraft beliefs, she asked, "Was the social structure of hell feudal or was it more likely 'hydraulic' (the term given by Karl Wittfogel to despotic regimes organized in relation to permanent water shortage)?" (Larner 1981, 202). She not only knew her subject, she also knew how to communicate it.

LATVIA

Witchcraft trials occurred between 1548 and 1699 in Latvia, which was partitioned and dominated by Poland, Sweden, and Russia in the early modern period.

Latvian folklore preserves extremely rich evidence about witches in its folktales, legends, stories, customs, sayings, riddles, beliefs, incantations, and folk songs. In folktales, the witch's husband is the Devil. She herself eats people and kills her own daughters. Latvian witches live in strange houses with one leg, dance with devils in hell, can change their form, and cast spells that turn people into animals or objects. They have tails, which

not everyone can see. Like sorcerers, they do not die easily. Folklorists have preserved other traditions concerning Latvian witches. Evil people turn into witches, having given up their souls to the Devil. Anyone can become a witch by putting drugs in a mortar and grinding them up while making an incantation; one must also wear appropriate clothes and walk in a circle around the mortar, until one flies away through the air. Or one can become a witch by smearing a special ointment on the body, particularly in the armpits. On the Saturday of Whitsuntide, a woman can wash in the bathhouse, wrap herself in a white cloth, and lie down to sleep in the bushes on her stomach. An evil force will fly down in the form of a bee, crawl into the sleeping woman, and she will become a witch. By a single look, witches can harm newborn babies, often exchanging the children for their own.

According to folklore, milk witches were especially widespread throughout Latvia. They milk cows belonging to others and collect dew from fields to bewitch their neighbors' livestock, transferring the milk to themselves. Witches are particularly active on June 23 (Midsummer Night), but animals also need protection from them on other special nights. Milk witches have their own servants, the milk carriers, whom they feed and maintain.

Although Livonia was famous as a land of witches, sorcerers, and werewolves, its recorded witchcraft trials only began in the mid-sixteenth century and never reached the scale seen in most European countries. Witches and sorceresses were well known in medieval Latvia, under the Livonian Order (a crusading order). Several of Latvia's earliest law codes contained articles dealing with witches, and their punishment was that of heretics—burning—but no trials were recorded. Regulations issued at Valmiera in 1537 charged territorial overlords and church authorities with prohibiting and eradicating sorcery, superstition, and idolatry. The death penalty for malignant sorcery was also envisaged in the Carolina Code (1532) of the Holy Roman Empire, which became law in Livonia soon after being issued in 1532. We know about witchcraft trials from Cēsis in 1548 and from Courland in 1550 (Augstkalns 1938, 169). In 1559, the bailiff of Grobiņa ordered a witch to be burned, the first such instance known in Latvia (Arbusow 1910, 104).

However, after the area came under Polish rule in the second half of the sixteenth century, witchcraft trials attained their typical form in Latvia, with an inquisitorial procedure, examining witches, torture, and irregular institution of proceedings. Much of our evidence comes from sources in Riga and the surrounding area, where twelve sorcerers and witches were burned between 1577 and 1590. Almost as many victims were recorded from the first decades of the seventeenth century (Svelpis 1984, 182).

Latvian legal practice made extensive use of so-called ducking (also known as the swimming test or the water ordeal) to identify witches. It was mentioned in Latvia's first documented witchcraft trial, in 1548, when the master of the Livonian Order, Hermann von Brüggenei, submitted a legal opinion regarding ducking to the Cēsis town council (Augstkalns 1938, 197). The method was as follows: An executioner undressed the accused, tied her arms and legs crosswise, and, holding her by a rope, submerged her three times in cold water, repeating the ducking in case of doubt. According to the records, the accused usually "floated on the water like a duck" or "like a blade of grass," providing sufficient proof of guilt. Some sources also mentioned complaints that executioners, by tugging on the rope or by various other means, had not allowed the accused to sink. If during the ducking the accused died in the icy water, the court recorded that the Devil had killed the witch to prevent him or her from betraying associates. In Riga and the area that later became Courland, ducking was used rarely at first, beginning in the mid-sixteenth century, because neither local custom nor general German law envisaged this form of interrogation. But by the first half of the seventeenth century, witch ducking was practiced throughout Latvia, being abandoned only at the close of the century.

After 1621, Latvia was divided. In the west, the duchy of Courland and Semigallia made up a vassal state of Poland; in the center, the lands on the right bank of the River Daugava along with Riga became the Swedish province of Livland; and the eastern part, Latgale, belonged to Poland. These regions differed in their handling of witchcraft trials.

In Livland, the largest number of witchcraft trials took place in the 1630s. Legends about covens and corporations of sorcerers and witches, who were thought to meet in a bog or on a hill and who could harm livestock, people, and crops with the aid of Satan, were widespread in all sections of society. Pastors and judges also believed in them. Hermann Samson (1579–1643), senior pastor of St. Peter's Church in Riga and superintendent of Livland, demanded in his sermons that all malignant witches be put to death. He also reported that in the course of church inspections, many people had complained to him about witches and sorcerers. Evidence of frequent witchcraft trials can be found in the records of Livland's High Court, which show that forty such proceedings were begun between 1630 and 1640; most of them ended with the burning of the accused. Witchcraft trials also took place at almost every session of the Land Court. Often, the accused named her supposed associates, so the proceedings included groups of defendants. One case tried in 1646 at Riga's Land Court involved fifty accused witches (Arbusow 1910, 118).

In the second half of the seventeenth century, the number of witchcraft trials in Livland fell, and the death penalty was seldom invoked. This resulted partly from Swedish royal decrees from 1665 and 1687 stating that the death penalty could only be applied for malignant sorcery and a pact with Satan; divination, fortunetelling, quackery, and other superstitions were punishable only with fines and corporal punishments, along with public confession and putting in the stocks during the church service.

After torture was forbidden in the courts of Livland in 1686, the number of sorcerers and witches fell sharply. Courts in Livland often complained that they could no longer force accused witches and sorcerers to confess and that the accused had to be acquitted or punished for superstition with quite light, arbitrary penalties, which usually meant beating peasants with ten or twenty blows from rods, followed by confession and being locked in the stocks or pillory. After 1686, Livland's High Court imposed very few death penalties. The last case of witch burning in Livland occurred in 1692 and the last beheading of a witch in 1699 (Svelpis 1984, 183).

By the eighteenth century, when Russia annexed Livland, belief in witches and sorcery had declined significantly. In the court records from before 1731, one still finds a few such cases, but now the guilty were punished only for superstition, and the most severe penalty was a sentence of life imprisonment passed in 1724. In 1731, the Senate, in order to eradicate the superstition of supposed sorcerers, stated that such deceivers were to be burned alive, and those who requested help from witches and sorcerers should be whipped severely or even executed. Afterward, trials connected with sorcery and witches came to an end in Livland.

In the duchy of Courland and Semigallia, persecution of witches, based on Article 209 of the Statute of Courland and on the General German Law, continued unhindered throughout the seventeenth and eighteenth centuries. Court archives show witches being punished by burning, beheading, or banishment. Thus, for example, in the Sēlpils district alone, a total of thirty-one witchcraft trials were held at the Senior Castellan's Court between 1630 and 1720; fifteen executions took place, the last witch being burned in 1718. At Blankenfelde in Semigallia, two witches were burned as late as 1721 (Arbusow 1910, 117–119).

There is very meager information about witchcraft trials in Latgale, the part of Latvia under direct Polish rule. However, witchcraft trials may have been just as frequent there as elsewhere. Poland only repealed the death penalty for witches in 1776, that is, after Latgale had been annexed to Russia.

Belief in sorcery and witches long persisted in the popular mind, as Latvia's rich folklore testifies. Thus, as late as 1808, a noblewoman in Livland ordered her

maidservant to be flogged mercilessly for casting a spell on the manor's livestock and for keeping a "dragon" at home. An 1848 issue of the newspaper *Inland* expressed the opinion that witches existed and suggested that they should be stoned.

LAUSANNE, DIOCESE OF (FIFTEENTH CENTURY)

The diocese of Lausanne, in the center of French Switzerland, covered most of the present cantons of Vaud, Fribourg, Bern, and Neuchâtel. Together with Dauphiné, the Valais, the Val d'Aosta, and the Bernese Oberland (all in the western Alps), it became a center for persecutions of the new heresy of witches and devil worshipers in the fifteenth century. Its first witchcraft trials took place in the 1430s, with many local witch hunts following later in the century. Nearly fifty records of fifteenth-century witchcraft trials are preserved from the diocese of Lausanne. Many recent microanalyses and critical editions have helped clarify both the local and judicial implications of this phenomenon. Dominican inquisitors conducted these trials, using inquisitorial procedure, that is, relying on denunciations and local rumor (*fama*) when arresting suspects, making secret investigations, and employing torture. An element specific to the fifteenth-century witchcraft trials in the diocese of Lausanne is their detailed descriptions of the witches' Sabbath, called the "synagogue," including secret gatherings of the sect around a demon, banquets, cannibalism of children, night flight on brooms or sticks, and evil ointments.

CHRONOLOGICAL SURVEY

The first well-documented witch hunt occurred in 1448 near Vevey. The three trial records preserved establish

that at least seven sorcerers and witches were condemned and that forty other persons were denounced and probably prosecuted (Ostorero 1995). Thirty years later, the same Riviera region of Lake Geneva experienced a second witch craze, often involving the same families, in which at least a dozen victims were condemned to the stake (Maier 1996). Around 1460, a witch hunt affected some territories of the prince-bishop of Lausanne, Georges de Saluces (Saluzzo), located in the eastern part of his diocese (Henniez, La Roche, and Bulle). His persecution of devil worshipers formed part of a larger movement of spiritual reform he initiated in his diocese (Modestin 1999).

The village of Dommartin, north of Lausanne, appeared to be a nest of sorcerers and witches. Relatively important hunts happened here twice, in 1498 and again around 1525—the first carried out by a Dominican inquisitor, the second by the area's local landlords, the cathedral chapter of Lausanne. Microanalyses have shown that the victims of Dommartin's persecution were mostly rich farmers, well integrated into their community but engaged in conflicts either with neighbors, with their own families over inheritances, or with the local authorities. Accusations of witchcraft reveal local tensions and conflicts that led to unusually dramatic resolutions, that is, the inquisitors and the stake (Choffat 1989; Pfister 1997).

In the northern part of the diocese of Lausanne, the region of Neuchâtel experienced two witch hunts: first around 1439, then from 1480 to 1499 (Andenmatten and Utz Tremp 1992). In the east, around Fribourg, the first witchcraft cases appeared between 1438 and 1442; it is the only situation in the diocese of Lausanne when witches were judged not by the Inquisition but by local secular authorities (Utz Tremp 1995, 42–47).

CONTEMPORARY ECHOES OF THE WITCH HUNTS

Apart from the judicial records, both the novelty of the phenomenon and its importance in the diocese of Lausanne were amply attested. In 1438, Aymonet Maugetaz, a young man of the wine-growing village Epresses, went “spontaneously” to the inquisitor Ulric de Torrenté to confess that he belonged to a sect of Devil worshipers who committed *maleficia* (harmful magic). He told how witches stole ice from the mountains in order to make it fall on the crops as hail. This anecdote reappeared almost verbatim in a second version of the anonymous treatise *Erroris gazariorum* (Errors of the Gazars or Gazarii [Cathars—a common term for heretics and later witches]), first written around 1436 in the Val d'Aosta. That clue proved that this text, which contained one of the first descriptions of the witches' Sabbat, was also used by inquisitors in the diocese of Lausanne. In his *Formicarius* (The Anthill, 1437–1438), the Dominican theologian

Johannes Nider, a professor at the University of Vienna, related facts of witchcraft that had taken place *recently* in the diocese of Lausanne, that is to say, around 1435–1438. Nider took most of his examples from trials held in the diocese of Lausanne, mostly in the Bernese territories. Unfortunately, no judicial evidence has been found yet (Chêne 1999, 223–248). Martin Le Franc, the secretary of the Savoyard antipope Felix V, described the new crimes associated with witches in his lengthy poem *Le Champion des dames* (The Defender of Ladies, 1440–1442). Although he referred to a valley in Dauphiné (*Valpute, Vallouise*), Le Franc must also have known about the first witch hunts in the diocese of Lausanne, because he was then provost of the chapter of Lausanne. In a bull of 1440 against duke Amadeus VIII of Savoy, elected by the Council of Basel as the antipope Felix V (1439–1449), Eugenius IV connected his rival's pontificate with all the heresies and sorcery in his lands. Therefore, from Vienna to Rome, the diocese of Lausanne (mostly a Savoyard possession), had the dubious reputation of a land filled with devil worshipers as early as 1440.

INQUISITION AND JUDICIAL FRAMEWORK

In the diocese of Lausanne, Dominican inquisitors conducted all trials in collaboration with the vicar of the bishop of Lausanne. Their intervention began only upon request from local authorities, who were present in court. The local population played an important role by denouncing suspects. Between 1450 and 1480, inquisitors conducted most of these trials in the castle of Ouchy, in Lausanne, where suspects were brought. Their archives were conserved in this castle as the episcopal Inquisition became increasingly effective.

The longtime prince-bishop of Lausanne, Georges de Saluces (Saluzzo), began the first witch hunts in his diocese, after having done the same in the diocese of Aosta before moving to Lausanne. The struggle against heretics was part of his program of spiritual reform. A major regional power in the fifteenth century, he had the favor of his close relative, the Duke of Savoy, Amadeus VIII, overlord of the Pays de Vaud.

MEN OR WOMEN?

One particularity of the witchcraft phenomenon in the diocese of Lausanne was the high rate of men sentenced, amounting to 60 percent of all fifteenth-century cases. The most frequent explanation offered is that in this region, the Inquisition was actively pursuing Waldensians, both men and women, at the beginning of this century. The image of the witch and devil worshiper had been fashioned from the figure of the heretic. For example, the persons persecuted for witchcraft in 1448 at Vevey were defined as “modern Waldensians heretics” (*heretici*

moderni valdenses). Witchcraft implied a pact with the Devil, making it a crime against God; therefore, the sorcerer was above all a heretic. In the first phase of witch persecutions, this crime, like Waldensianism, was often charged to men.

LAWS ON WITCHCRAFT (ANCIENT)

Laws against the practice of magic in the ancient world were more numerous, specific, and punitive in Rome than in Greece.

GREEK LAW

Few traces remain of legislation of any kind against magic by any Greek state. Indeed, it seems the Greeks never outlawed (or defined) magic as a category, although it may have been possible to prosecute harmful acts of magic under more general laws. A common source of ambiguity in ancient law, for the ancients themselves and for modern interpreters alike, has been equivocation of the Greek word *pharmakon* and its Latin equivalent *venenum* between "poison," "drug," and "spell."

Shortly after 479 B.C.E., Teos in Asia Minor erected an inscription known as the *Dirae Teiorum* (Curses of the Teians), which began with the imprecation "If anyone makes harmful spells/poisons [*pharmaka dêlêtêria*] against the Teian state or against individuals of it, he is to die, himself and his family with him" (Meiggs and Lewis 1969, no. 30). The fact that the state was contemplated as an object of possible attack guarantees that *pharmaka* here included spells. The text generally resembled an early law code in style, layout, and phraseology, and it may therefore have prescribed in trials. But the demand that the perpetrator's family should also die suggested rather the deterrent technique of a curse and an ill-defined magical defense against an ill-defined magical attack.

It is sometimes speculated that one could seek redress against harmful magic in fifth- and fourth-century B.C.E. Athens through a "public prosecution for damage" (*dikê blabês*). When, in that city, Philoneos's concubine supposedly poisoned him accidentally in the belief that she was giving him a love potion, she was charged with (and executed for) murder, pure and simple, according to Antiphon. The circumstances of the condemnation and execution of the "witch" (*pharmakis*) Theoris remain obscure, but the charge was one of impiety, as Demosthenes tells us.

In the first century B.C.E., the private rules of a religious cult in Philadelphia in Lydia required its members, among other things, to "swear an oath by all the gods not to use trickery against men or women, not to devise or perform a wicked spell [*pharmakon*] against people, nor wicked incantations [*epôidai*], nor a love charm [*philtron*], nor an abortifacient, nor a contraceptive" (Dittenberger 1915–1924, no. 985).

Beyond this, we can only turn to the imaginary regulations Plato composed for an ideal state in his *Laws* in the fourth-century B.C.E. First he prescribed that those found guilty of the evocation of the dead, of trying to bring compulsion upon the gods through sorcery (*goêteia*), or of trying to destroy families for money were

to be jailed for life and deprived of contact with free men; when they died, their bodies were to be cast out without burial. But then he prescribed execution for those found guilty of producing binding spells, charms, or incantations. It remains unclear whether these laws resembled any on the statute books of any Greek state of Plato's day, but the philosopher does seem to have been particularly hostile to sorcerers inasmuch as they were rival soul-technicians.

It seems, however, that magic was much used in association with the law. Numerous classical Athenian "tongue-binding" curse-tablets, or *defixiones*, manufactured against opponents in lawsuits have been discovered in the city's civic center and its Ceramicus Cemetery. A number of protective amulets for use in lawsuits also survive from the wider ancient world.

ROMAN LAW

Roman law is a more fertile area of study. The original Roman law code of 451 B.C.E., the *Twelve Tables*, included laws against the singing of evil incantations (*malum carmen*) and against the charming of crops from one field into another (*excantatio cultorum*), but we have no indication of the assigned penalties. The specification here of "evil" suggests that harmless varieties of incantation were permitted; certainly Cato the Elder was able to publish a healing incantation in his *De agricultura* of circa 160 B.C.E. In the first-century C.E., Pliny the Elder recounted an apocryphal tale about the unsuccessful prosecution of the honest freedman Cresimus for crop charming in his *Natural History* (77).

The principal law against magic in the Late Republic and after seems to have been Lucius Cornelius Sulla's 81 B.C.E. *Lex Cornelia de sicariis et veneficis* (Law of Cornelius on Assassins and Poisoners/Sorcerers). Once again, the key Latin term is equivocal, but the later jurists leave us in no doubt about the law's scope; they also specify that it outlawed, among other things, the selling, buying, possession, and administering of harmful drugs. It is usually believed that it was in reply to a prosecution under this law that Apuleius of Madaura made his famous ironic *Apology*, or "defense speech," on a capital charge at Sabratha in 158–159 C.E. Apuleius had arrived in the North African town of Oea and persuaded its most desirable rich widow, Pudentilla, to marry him, to the chagrin of her family, who wished to retain control of her money. They accordingly brought him to trial, primarily on the grounds that he had used erotic magic to seduce Pudentilla, but the case was built up with many further allegations of magical practice, such as the use of voodoo dolls and the infliction of trances upon boys for divination. A second-century C.E. rhetorical exercise by Hadrian of Tyre may have indicated that it was usual to burn witches at the stake, in a remarkable anticipation of more-modern ages.

The events of the so-called Bacchanalian conspiracy, resulting in the Senatorial Decree on Bacchanals of 186 B.C.E., and the subsequent execution, supposedly, of some 5,000 people for sorcery (according to Livy) showed the Roman government for the first time linking magic, divination, and foreign cults and considering all alike to be threats to the state. Cassius Dio later imagines Agrippa explaining the relationship to the new emperor Augustus:

You should hate and punish those who introduce foreign elements into our religion . . . because men of this sort, by importing new powers, persuade many people to take up foreign customs, and from this are born conspiracies and gatherings and secret clubs, which are the last thing a monarchy needs. Do not then permit people to be atheists or sorcerers [*goêtes*] . . . it is proper that there should be no mages [*mageutai*] whatsoever. For such men often incite many to revolution, either by telling the truth, or, as more often, by telling lies. (*Roman History* 52.36.1–2)

Executions or expulsions from the city of individuals branded as "Chaldaeans," "astrologers," "sorcerers," or "mages," together with burnings of their books, became frequent. Large groups were again targeted under the Republic in 139 B.C.E. and under the earlier empire in 33 B.C.E. (Augustus), 45 C.E. (Tiberius), 52 C.E. (Nero), and 69 C.E. (Vitellius). The emperors were particularly sensitive to the conspiratorial implications of divinations made to individuals and divinations on the subject of death, their own death in particular. Augustus, Tiberius, Nero, and Valens took special measures to ban this.

Under the Christian empire (for the relevant laws of which see the ninth book of the Theodosian Code), Constantine legislated in 319 C.E. against soothsaying and magic, making special mention of magic to create erotic attraction but excepting measures taken for healing or for agricultural weather control. In 357 C.E., Constantius II legislated against soothsayers, astrologers, diviners, augurs, seers, Chaldaeans, mages, and evildoers (*malefici*) in general. The effects of Constantius's legislation were far-reaching. It resulted, Ammianus Marcellinus tells us, in the execution of individuals merely for wearing amulets or for passing by graves at night. Further legislation followed under Valentinian between 368 and 389 C.E. and under Honorius in 409.

In his *Apology*, Apuleius cleverly argued that there were no circumstances under which a charge of magic should be brought: If a charge was false, it should not be brought for that reason alone, but if it was true, then the accuser would fall victim to the magician's terrible power, which was inevitably greater than that of the court.

LAWS ON WITCHCRAFT (EARLY MODERN)

Although it has recently been claimed that laws on witchcraft constituted a "judicial revolution" in the early modern period (Ankarloo 2002, 63–64), this is clearly not the case. Witchcraft can be considered one of the oldest crimes in the history of mankind, going as far back in history as we can see. From the earliest surviving law code (1792–1750 B.C.E.) of ancient Mesopotamia, literate societies with codified law have severely punished sorcery or witchcraft. The Code of Hammurabi imposed a river ordeal (swimming test) if such charges could not be proved by means of witnesses. This offered an effective remedy against too frequent accusations: According to the principle of talion, the accuser had to face the punishment the accused would have suffered if the ordeal failed to prove the suspect's guilt. In cases of witchcraft, this was the death penalty.

We know similar laws from the Middle Assyrian Empire, and one can assume that the death penalty was imposed on both male and female witches throughout the ancient Middle East (Thomsen 2001, 25–26). The most comprehensive set of texts from the struggle against witchcraft, about 100 incantations and prayers compiled during the rule of King Esarhaddon (680–669 B.C.E.), bore a title significant for the treatment of witches: *Maqlu*, which literally means "Burning." The laws of the Hebrews include the rule that witches (or poisoners) must be killed (Exod. 22:17), that those employing a spirit should be stoned to death (Lev. 20:27), and generally that diviners and prophets were to be killed (Deut. 13:5). Biblical law remained the most important legal source for witchcraft throughout the Christian history in Europe.

How much European perceptions of witchcraft were also molded by long-standing secular law becomes perfectly clear seen against the backdrop of ancient Rome. From the earliest Roman law codes (ca. 450 B.C.E.) to late-imperial legislation, the possibility of magic was generally admitted and its misuse (*maleficium*) penalized (Luck 1990, 147–151). Witchcraft panics generated a rising awareness in Roman law, starting with the *Lex Cornelia de sicariis et veneficiis* (Law of Cornelius on Assassins and Poisoners/Sorcerers), promulgated by Lucius Cornelius Sulla (138–178 B.C.E.), one of the most important sources of European laws on witchcraft in the late medieval and early modern periods (Ferrary 1991, 417–434).

According to a decree of Emperor Diocletian (ruled 284–305 C.E.), harmful sorcerers were to be burned alive, but those who practiced beneficial magic were to remain unpunished. By the later fourth century, the equating of *veneficium* (poisoning), *maleficium* (harmful magic), and divination paved the way for collective actions against evildoers in the Roman Empire. In book 16, chapter 8, Ammianus Marcellinus (330–ca. 395 C.E.) in his *Roman History* reported a sorcery scare from the reign of Emperor Constantius II (ruled 337–361 C.E.) during a period of famines and diseases: "If anyone consulted a soothsayer . . . , or if he used an old wives' charm to relieve pain . . . , he was denounced through some agency which he could not guess, brought to trial, and punished with death" (*The Later Roman Empire*, book 16, chapter 8).

Contrary to the Greco-Roman distinction between bad and good magic or between black and white magic, Christians questioned the efficacy of all magic, but they considered any kind of sorcery as diabolical. During the era of Emperor Constantius II, magicians were labeled "enemies of mankind" (*humani generis inimici*), and the death penalty was imposed for black and white magic alike in a series of laws from 357 (*Lex Nemo; Lex Multi*) and 358 (Fögen 1997, 223–232). This paradigm shift soon had other consequences. When the synod of

Zaragoza (380) condemned the scholar Priscillian as a heretic, he was also subjected to an imperial investigation. Found guilty of magical practices, he and six followers were sentenced to death for *maleficium*. The first convicted Christian heretic was thus actually punished for magic and, against the protest of several bishops, executed in 385. The consequences can also be seen in such late Roman codes as the *Codex Theodosianus* of Theodosius I (ruled 379–395), or the *Codex Justinianus* of Justinian I (ruled 527–565). With the reception of Roman law in medieval Europe, these imperial decrees had a lasting legacy. Their impact was increased by the semiotic theory of magic developed by St. Augustine (Harmening 1979, 303–308).

Early medieval penal codes imposed severe penalties for witchcraft, for example, the Salic law, “if a *stria* shall devour a man and it shall be proved against her . . .” (Hansen 1900, 58–59). Legislation remained contradictory, however; Frankish, Lombard, and Alemannic laws all treated the subject differently. Alemannic law, compiled around 600 C.E., forbade burning *strigae* (witches), which probably indicated that this was the customary procedure. Likewise, the Lombard king Rothari decreed in 643 that Christians must not believe that women devour a human being (“*ut mulier hominem vivum intrinsecus possit comedere*”) and therefore supposed *strigae* must neither be killed nor convicted in court. A capitulary of Charlemagne (ruled 768–814) for the Saxons in 787 imposed the death penalty on and burned those who, like pagans, believed that someone could be a *striga* who devours humans. Around 800, an Irish synod likewise condemned belief in witches, and particularly those who slandered people for being *lamiae* (witches; “*que interpretatur striga*”). Clearly, there was an increase in official skepticism during the Carolingian period, even allowing for an increase in surviving sources.

The most important text on the subject was the *Canon Episcopi*, officially attributed to a fourth-century Church council but in fact formulated and perhaps conceived by Abbot Regino of Prüm in an early tenth-century penitentiary, which admonished bishops (*episcopi*) to proceed against sorcerers in their dioceses. It was later adopted by the most important contemporary authorities, first by Bishop Burchard of Worms and then, around 1140, by Gratian of Bologna. Regino’s canon was important not only for its rejection of the efficacy of sorcery but also for its denial of certain witch beliefs. After an introductory paragraph about the need to fight against sorcerers, male as well as female, suggesting lenient sentences, Regino inserted a long paragraph about women who believed that they experienced nocturnal flights with the pagan goddess Diana. He condemned believers in such fantastical tales for implicitly accepting a supernatural power rivaling God. Bishops should fight against these beliefs through

their clergy and should make clear that these flights were not real, but only dreams and devilish illusions. The canon became part of the *Corpus Juris Canonici*, the Church law of Latin Christendom, and proved influential during the following centuries. The harsh implications of Mosaic law (Exod. 22:17: “Thou shalt not suffer a witch to live”) were reinterpreted by such Carolingian theologians as Archbishop Rabanus Maurus of Mainz, who suggested as punishment mere exclusion from the community instead of physical extinction (Haustein 1990, 69). The idea that “the official church stance regarding magic shifted from a demonic association with paganism to a demonic association with heresy” (Jolly 2002, 21) seems compelling.

Of course, medieval reality was more complex. Harmful magic was considered devilish: According to St. Augustine, it implied a demonic pact, and according to Roman law, it deserved the death penalty. Both traditions influenced the development of European law. For instance, the laws of Alfred the Great of Wessex (ruled 871–899) clearly used the same biblical reference as had Rabanus Maurus to impose the death penalty on women who frequented sorcerers or magicians: Here, witchcraft was considered real. Nor does it sound like “skepticism” when the Carolingian king Charles II decreed in 873 that witches—men and women alike—had caused illness and death in different parts of his realm and should therefore be put to death, together with their accomplices and supporters. Killing witches was obviously practiced among Germanic peoples. The laws of the Franks, Ostrogoths, and Visigoths rejected only the belief in *strigae*, rarely questioning the danger of harmful magic. “Carolingian skepticism” notwithstanding, Charlemagne was quite clear about the punishment of *maleficium*. In his *Admonitio Generalis* (General Warning) of 789, the future emperor, commenting on several papal decrees from Hadrian I (ruled 772–795), decreed that sorcerers and witches (*maleficii, incantatores, and incantatrices*) must not be tolerated, explicitly referring to Mosaic law; in later versions of this list, *tempestarii* (witches who raise storms) were added (Hansen 1900, 63–64).

In Frankish and Anglo-Saxon law, harmful magic was frequently placed together with murder, which makes perfect sense if we consider present-day African ideas about witchcraft. According to the *Lex Salica* (Salic Law), those who could not pay for their magical crimes should be burned (“*certe ignem tradatur*”) (Hansen 1900, 55–56). Numerous decrees from the later Carolingian period implied the death penalty for harmful sorcery. Such sorcerers were liable to suffer capital punishment under Norman rule in England (Ewen 1933, 26), as well as in Sicily. The Venetian Republic issued draconian laws against *maleficium* in 1181, as did many Italian towns in the thirteenth century. Medieval German law codes imposed burning

at the stake as the customary penalty for harmful magic. The *Schwabenspiegel* (Swabian Legal Mirror; ca. 1240), one of the most influential medieval compilations of imperial law, suggested that sorcery implied apostasy and a pact with the Devil (Hansen 1900, 387). The author, probably a jurist close to the Franciscans at Augsburg, merely combined secular law with Christian theology. Demonic witchcraft was no new invention but required only basic knowledge of theology. In a famous legal opinion of 1398, Jean Gerson and the University of Paris came to exactly the same conclusion (Hansen 1900, 283–284).

The decisive step toward mass persecutions of witches in Europe was the construction of a cumulative concept of witchcraft during the late fourteenth and early fifteenth centuries, when the first large-scale witch hunts and major persecutions were launched in some Alpine valleys. Only around 1400 were different aspects of witchcraft and heresy assembled into the specific European concept of witchcraft, which allowed witch hunts of previously unprecedented severity. Harmful magic combined with the pact with the Devil to form the core of the new cumulative crime, the first aspect crucial for secular law, the second for its qualification as a heresy. Around these crystallized a group of what were even by medieval perceptions exotic accusations: apostasy, flying through the air to nocturnal gatherings at remote places, the witches' dance, sexual intercourse with demons, and adoration of the Devil.

In legal practice, accusations of nocturnal flights turned out to be the most destructive, because suspects were asked to name their accomplices, whom they supposedly met at these gatherings. Combined with the use of torture, such questions could generate chain reactions, resulting in massive witch hunts, reminiscent of similar events in Roman antiquity. Inquisitorial procedure was a legacy of Roman law that had survived within the Latin Church; first revived for disciplining the higher clergy, it was later applied in heresy trials. At the Fourth Lateran Council (1215), the Roman Church accepted torture in trials run by inquisitors in order to obtain confessions from suspects, while forbidding archaic rituals like ordeals by hot iron or cold water (the swimming test). Although subsequently illegal, ordeals were nevertheless practiced in lynchings throughout northern and eastern Europe and were occasionally even commissioned by lower courts.

Because legal torture aimed to achieve material truth rationally rather than through mystical intervention, as in ordeals, it was initially considered an improvement to legal procedure. We must keep in mind that the meaning of legal torture differed decisively from modern perceptions. Although torture had been meant to replace ordeals, in practice judges sometimes used unlimited torture as if it were an ordeal, particularly in heresy trials. A blend of physical coercion, systematizing

all kinds of real or false information, and mere fantasy or projection led to the idea that dissidents belonged to a devilish sect and worshipped the Devil.

Harmful magic and heresy were first fused into a new cumulative crime of witchcraft in Savoy under Duke Amadeus VIII (ruled 1416–1451). This new state dominated the eastern Alps. When Duke Amadeus felt bewitched, the persecution of Jews, Waldensians, and witches gained momentum. It was in Savoy that the fusion of heresy, anti-Judaism, and sorcery took place, and the new cumulative crime of witchcraft was born. Amadeus VIII's ambitious law code of 1430, the *Statuta Sabaudie* (Statutes of Savoy), emphasized the crime of sorcery, although still in traditional language. Ten years later, witchcraft surfaced in a much more prominent form when Pope Eugenius IV (ruled 1431–1447) mentioned in a decree that Savoy bristled with "*stregule vel stregonos seu Waudenses*"—female and male witches, or Waldensians (Hansen 1900, 18–19).

In Savoy, trials of sorcery fueled heresy trials and eventually, by the late 1420s, produced large-scale witch hunts. The persecution in neighboring Dauphiné never reached this massive level but was characterized by a steady flow of "small panic" trials. One explanation for this contrast could be the different judicial system. In Dauphiné, subject to France since 1349, only secular courts were responsible for witchcraft trials, with judges referring mainly to secular law, to French jurists, or to Roman law. Therefore, they ignored both witches' flight and synagogues or Sabbats, which were still considered to be devilish illusions. Several late medieval territories accepted the services of papal inquisitors, but, with a few exceptions, they generally observed existing or customary laws on witchcraft. When Tyrol, an independent duchy of the Holy Roman Empire, suffered Heinrich Kramer's attempt to launch a major witch hunt in 1485, both government and parliament were extremely reluctant to accept indictments for witchcraft. "Witchcraft" was in fact never mentioned in its law codes, and when "sorcery" was first mentioned in the *Tiroler Landesordnung* (Tyrol government regulation) of 1544, it was classified as a form of fraud. Likewise, the imperial city of Nuremberg defined witchcraft as fraud as late as 1536.

Spanish and German traditions merged in the legislation of the Holy Roman Emperor Charles V (ruled 1519–1556), the leading ruler of his age. His criminal law of 1532, promulgated as *Constitutio Criminalis Carolina* (the Carolina Code), had been negotiated long before among the imperial estates. This code, which remained virtually unchanged until the Holy Roman Empire collapsed in 1806, completely ignored the cumulative crime of witchcraft as defined by the *Malleus Maleficarum* (The Hammer of Witches, 1486). It contained a paragraph against harmful magic (par. 109), the treatment of which was regulated

scrupulously in three paragraphs on procedural law (pars. 21, 44, 52). Capital punishment was confined to cases where harmful magic could be proven beyond doubt, whereas nonharmful magic of any sort was left to the arbitrary judgment of the courts.

The inquisitorial procedure of the Carolina Code avoided the worst shortcomings of Inquisition courts by granting suspects clearly defined rights and ruling out the arbitrary use of violence. In order to avoid arbitrary acts by local courts, every capital sentence had to be submitted to a high court or a law faculty. Within the boundaries of the *processus ordinarius* (ordinary procedure), as later jurists called it, torture could only be used in cases of evident guilt, when a suspect already stood convicted by two independent witnesses, or in cases of clear evidence. Torture could not be employed in order to extract confessions on the basis of mere denunciation or suspicion.

Later witch hunters complained that under these conditions, hardly anyone could be convicted of witchcraft. Indeed, this may have been one purpose of this legislation. Its main author, the Franconian baron Johann von Schwarzenberg (1463–1528), a humanist translator of Cicero and an early follower of Luther's Reformation in 1521, becoming one of the first lords to forbid Catholic rites in his territory—had belonged to Maximilian I's entourage in the late 1480s and was presumably familiar with discussions about the scandalous inquisitor Heinrich Kramer, the author of the *Malleus*. In contrast to an earlier law code designed by Schwarzenberg before the Reformation, in the Carolina Code he now eliminated any mention of interference by good or evil spirits and any trace of heresy laws. The Carolina Code clearly signaled its disapproval of Inquisition courts, whose activities were no longer tolerated by German estates, thus marking a clear difference from Charles's Spanish and Italian territories. The Carolina Code was accepted even in the most remote corners of the Holy Roman Empire, for instance, Switzerland or the Spanish Netherlands.

Like the Holy Roman Empire, many other states introduced witchcraft into their penal codes during the sixteenth century, either in order to limit the power of ecclesiastical courts or to underline the achievements of the Protestant Reformation. Even in countries where Roman law was never applied, traces of this development can be found. In Tudor England, a new Witchcraft Act was promulgated in 1563. It superseded an earlier attempt of 1542, which had been repealed after five years (Sharpe 2001, 99–100). Like the penal code of Charles V, the Elizabethan witchcraft statute focused on harmful magic, but it also provided extensive details on minor punishments for cases of magic causing harm less than death, or even causing no harm at all. The bill had already been introduced in the House of Commons in 1559, and it received a second

reading in the House of Lords before being revived in 1563, in the context of the Protestant restoration after Elizabeth I's accession. Although historians have not yet discovered related English trials until 1566, we can assume that the act was not enacted without reason. In the Channel Islands, the first recorded death penalties for witchcraft occur exactly at this time, on Jersey in 1562 and on Guernsey in 1563. The English witchcraft bill fits neatly into the general picture of rising awareness about witchcraft in Europe during the 1560s. In Scotland, legislation was also introduced in 1563, accompanied by a Calvinist Reformation and a sudden rise in the number of accusations. Claims that the Scottish Witchcraft Act might indicate skepticism (Larner 1981, 66) are ludicrous. Its wording clearly stated that according to divine law, those who used witchcraft, sorcery, or necromancy must receive the death penalty (Normand and Roberts 2000, 89), as must those who sought help from witches, sorcerers, or necromancers. After 1563, numerous laws dealt with superstition, sorcery, and witchcraft in general; it will be difficult to provide a comprehensive list for all European territories.

Furthermore, after 1563, numerous laws and decrees dealt with certain aspects of the witchcraft trials. In August 1563, the Council of Luxembourg promulgated an ordinance on August 13, 1563, in order to limit ongoing prosecutions in this province of the Spanish Netherlands. Laws on witchcraft became more numerous in subsequent years, usually attempting to curb legal abuses in witchcraft trials or to stop actual witch hunts. Massive witch hunts alerted the government of Luxembourg to promulgate more laws on witchcraft in 1570 and 1573, and frequently from April 1591 onward. Decrees of King Philip II for the Spanish Netherlands in 1592, 1595, and 1606 also affected Franche-Comté and Luxembourg.

Continuing legislation on aspects of witchcraft trials was by no means confined to Catholic governments. King Frederick II of Denmark (ruled 1559–1588) tried to limit executions for witchcraft through a 1576 decree making the ratification of such judgments by the high court compulsory, although there are no indications that this law had any more effect than later Danish decrees. Many German territories tried to curb the persecutions of supposed witches, even states with massive persecutions such as the archbishop-electorate of Trier, which in 1591 and again in 1630 attempted to reduce the power of witch-hunting village committees. Numerous decrees, for example, in electoral Mainz in 1612 or in the prince-bishopric of Würzburg in 1627, limited the extent of confiscations of convicted witches' property. Other laws, as in the imperial free city of Kaufbeuren in 1591 or the prince-bishopric of Bamberg in 1627 and 1628, tried to curb witchcraft persecutions by punishing gossip. But other territories,

like the principality of Saxe-Coburg in 1629, simply tried to regulate court procedures in order to avoid disturbances during witchcraft trials.

A third category of legislation on witchcraft tried to redefine the crime in the spirit of St. Augustine. Not surprisingly, this development began in the duchy of Württemberg, a stronghold of Lutheran orthodoxy, whose reformer Johann Brenz had been attacked by Johann Weyer in 1563 for inconsistencies when discussing witchcraft. Like Weyer, Brenz claimed that witchcraft was ineffective, but Brenz nevertheless wanted to see witches burned because of their apostasy. The legislative process apparently began after Weyer ridiculed Brenz by emphasizing that apostasy was not a crime in secular law. Unsurprisingly, in Württemberg's new law code (*Landrecht*) of 1567, for the first time harmful magic was no longer required when defining the crime of witchcraft. Within a few years, this radical reinterpretation was adopted by other Lutheran states. In 1572, the Lutheran prince-electorate of Saxony's new penal code (*Kursächsische Kriminalordnung*) shifted emphasis entirely to the spiritual aspects of witchcraft: The witch's compact with the Devil now stood at the crime's core. This redefinition of witchcraft explicitly denied the importance of harmful magic and implicitly denied the meaning of both ancient and modern imperial law (Behringer 1988, 79).

The Saxon lawyers drew the consequence of a prolonged Protestant debate over the efficacy of harmful magic, building on both common sense and the theological tradition of the *Canon Episcopi*. Unlike the insulted Württembergers, the Saxons argued directly against Weyer, whose arguments they considered worthless, because he was a doctor of medicine, not of law. The Saxon code was the more consistent piece of Lutheran legislation, because it required no proof of harmful magic for conviction. The then-Lutheran electoral Palatinate followed in 1582 (*Kurpfälzisches Landrecht*), but it soon returned to Calvinism, thus becoming the first Calvinist state with a spiritualized definition of witchcraft in its law code. Other Protestant penal codes showed similar spiritualizing tendencies, enabling us to identify an overall tendency. In Norway, subject to Denmark, the Lutheran clergy got royal approval of a 1584 statute that imposed the death penalty for superstition. This punishment was reduced to exile in Denmark's subsequent comprehensive 1617 witchcraft statute (Ankarloo 2002, 69), while those who made a pact with the Devil were to be burned. This Danish statute was extended to Iceland in the 1630s. Similarly, the famous English Witchcraft Act of 1604 imposed the death penalty not just for the witch's pact but also for harmful magic; it included a broader variety of harm than the 1563 statute. But clearly there was a shift in emphasis from *maleficium* to demonolatry throughout the laws of Protestant Europe.

Similar tendencies can also be observed in Catholic states. In 1588, the Counter-Reformation territory of Baden-Baden (then under Bavarian guardianship because of the minority of its ruler) no longer required proof of *maleficium* for a death penalty, focusing instead on apostasy and the Devil's pact. Interestingly, its government took this wording from the 1582 code of the Calvinist Palatinate (*Kurpfälzisches Landrecht*), although adding several "Catholic" notions (such as the witches' flight) in an appendix that contained an extensive questionnaire. The duchy of Bavaria followed in practice in 1590 and de jure in 1612; electoral Cologne followed in 1607, and the prince-bishopric of Bamberg in 1610.

The Bavarian statute promulgated by Duke Maximilian I in 1612 offered by far the most comprehensive example of legislation on witchcraft, covering no fewer than forty printed pages (Behringer 1988, 165–191). Bavarian lawyers had argued that because the government had failed to explain what witchcraft actually meant, it was unpunishable in principle. So this extensive law first explained why witchcraft must be punished (1–7), then it defined witchcraft as opposed to sorcery and mere superstition (8–29), and, finally, it published sanctions for all forms of witchcraft, sorcery, and superstition (30–40). Although seeming insane from our modern viewpoint, it clearly represented a courageous attempt to impose some order on the chaos of contemporary views about witchcraft. Furthermore, it attempted to protect superstitious peasants from persecutions by Counter-Reformation zealots. Whereas demonologists like Peter Binsfeld and Martín Del Rio suggested that according to Augustinian theology, wearing amulets indicated an implicit compact with the Devil, the Bavarian law clearly considered such customary superstitions completely separate from witchcraft. First published in 1612, this witchcraft statute was reissued in 1665 and again as late as 1746—by then an outstanding example of Bavarian stubbornness and backwardness.

Like the criminalization of witchcraft, the repeal of witchcraft laws has yet to be researched on a comparative level in Europe. With the outstanding exception of the British witchcraft act of 1736 (Bostridge 1997, 180–203), we lack thorough studies. Clearly, the formal British repeal via parliamentary decision was unique. The kings of France and Prussia, the tsar of Russia, and Empress Maria Theresa of Austria-Hungary suppressed witchcraft trials without changes in legislation, just as the Spanish Inquisition and the Dutch Estates General had done earlier. In this context, we should notice that after the massive witch hunts of the 1620s, many German princes and prince-bishops had simply forbidden further witchcraft trials, for example, Carl Caspar von der Leyen, archbishop-elect of Trier in 1659 (Rummel 1991, 246). The first European

government to start crushing witchcraft accusations as early as 1572, the electoral Palatinate, despite its disgruntled clergy and its 1582 penal code, never issued a death sentence for witchcraft. But because such conduct can only be detected by reading archival sources instead of published law codes, there may be further discoveries in the future.

Only shortly before the French Revolution did a landslide start. In 1766, Maria Theresa intervened decisively in Hungary. Witchcraft laws were repealed in Poland in 1776 and in Sweden in 1779. A Swiss “judicial murder” of 1782 provoked action in Germany. In 1787, Emperor Joseph II simply omitted all articles about sorcery or witchcraft from his new criminal code for the Austrian-Hungarian monarchy. French laws against *magie et sortilège* (magic and witchcraft) remained in place, albeit limited by a 1682 royal edict. However, France experienced trials well into the Enlightenment, with the Devil playing an important role (Bostridge 1997, 227–231); only during the French Revolution, in 1791, were these *crimes imaginaires* (imaginary crimes) abandoned.

Some states never formally introduced laws on sorcery or witchcraft and therefore never needed to remove them, but most countries only disposed of those laws during the social and political upheaval around 1800, when new criminal law codes were introduced in the wake of general reforms, often in such newly created states as the Kingdom of Bavaria (1813). A late repeal of witchcraft laws meant nothing. Such legislation remained intact longest in the European country with the fewest known witchcraft executions: Ireland’s 1587 Witchcraft Act remained in force until 1821. The public debates about its abolition remind us that even in the British Isles, a minority continued to believe in witchcraft and were convinced that witches must be punished.

European legislation on witchcraft was exported during the prolonged period of European expansion, not least through such ideologies as Marxism, functionalism, and modernization theory. The Soviet rulers of Russia and China, claiming to dictate their subjects’ belief as had previous rulers of these empires, tried to extirpate beliefs in witchcraft, shamanism, and official religion simultaneously. But more often, disbelief in witchcraft was introduced under foreign colonial rule—in the Americas, Australia, and large parts of Africa and Asia.

However, modern European legislation on witchcraft was not welcomed or universally accepted, and it sometimes even created major problems. Following Christian tradition, such colonial laws not only forbade persecution of evil witches but also criminalized witch doctors. When Dutch legislation was introduced in Indonesia in 1905 or British legislation in eastern Africa in 1922, many natives understood them as laws to protect witches; European law inverted traditional

values. Because the European elites had stopped believing in witchcraft and had exported their laws to the colonies, legal prosecution suddenly became impossible, with the ritual killing of witches classified as murder. Poison ordeals and oracles were prohibited, witch doctors were prosecuted as legal offenders, while witches were protected. The colonized could not believe this inversion of norms: Why would their foreign rulers protect evil witches?

Some postcolonial African countries have begun to legalize witch persecution. In 1965, newly independent Uganda introduced legislation that replaced the colonial witchcraft ordinance with an “Act to Make Provision for the Prevention of Witchcraft and the Punishment of Persons Practising Witchcraft.” This act laid considerable emphasis on “repute” as valid evidence. This repeal may have encouraged the subsequent witch hunts in northern Uganda, launched in the home region of President Milton Obote (ruled 1962–1971, 1980–1985) during a time when he had decided to destroy the traditional Bugandan monarchy and introduce socialist reforms. Obote’s supporters took his Five-Year Economic Plan of 1966/1967 as a model for a “five-year antisorcery plan” and began rounding up suspected witches, many of them educated or wealthy (Abrahams 1985, 32–45).

In Cameroon and Malawi, diviners testified in court against suspected witches. It has become acceptable to decide cases of suspected witchcraft through such occult practices as divination, with the accused risking physical punishment and prison sentences. If witches may be officially accused and tried, it is no longer necessary to kill them clandestinely. During the late 1970s, under President Ahmadou Ahidjo of Cameroon, the official tribunal of the eastern province (home of the Maka people) regularly sentenced accused witches, sometimes even without their admission of guilt. Traditional healers, the *nganga*, testified to the witches’ guilt through their mystical knowledge; on that basis, courts issued sentences of up to ten years in prison, the legal maximum under the 1965 penal code. The interesting aspect is that this law is similar to the English Witchcraft Act of 1736 and to colonial law codes that were meant to punish witch doctors. However, legal practice turned their meaning upside down.

LAWS ON WITCHCRAFT (MEDIEVAL)

During the centuries conventionally defined as the Middle Ages, laws concerning witchcraft cannot be easily separated from those condemning magical practices and beliefs or surviving pagan habits. Unlike the laws of later centuries, medieval laws often aimed to condemn not witches but rather those who believed their powers were real.

Laws constitute one of the better sources for studying magic and witchcraft during the Early Middle Ages. Nearly all of them fall into one of two categories: secular Germanic legal codes and ecclesiastical legislation. To the former belong all the codes produced in different European regions during the reigns formed with the contribution of Germanic and Latin elements. In the latter there are numerous regulations (canons, synods, decrees, penitentials) decreed by the Church during its first centuries as an official state religion. Not all of them have the same purpose: Some were meant to impose or forbid a habit; others just instituted penalties. Only in the twelfth century, with the *Concordantia discordantium canonum* (Concord of Discordant Canons, better known as the *Decretum*) of the monk Gratian, did there appear a revision that harmonized the entire ecclesiastical legislative tradition.

It is not easy to discern exactly what "witchcraft" was in those early sources because most of them express, in Latin, notions emerging from Germanic (and sometimes Celtic or even Asiatic) culture. The long-term result of interchanges among those many traditions ultimately led to the formation of the early modern notion of witchcraft, involving the idea of a diabolical pact or at least some intervention by the Devil. But early legislation dealt with a complex of traditions concerning deadly spells, weather magic, residues of pagan cults, and men and women thought to have certain powers over things or people; many of the laws are not easy to decipher and relate to cultural contexts that we can detect.

The early Christian world inherited two main traditions about witchcraft: one from Scripture, the other from the legislation of the Roman Empire. Both considered practices of witchcraft to be real rather than fraudulent. In the Bible, Deuteronomy (18:10–12) condemns all forms of magic as abominations: 10: "There shall not be found among you any one who burns his son or his daughter as an offering, any one who practices divination, a soothsayer, or an augur, or a sorcerer," 11: "or a charmer, or a medium, or a wizard, or a necromancer." 12: "For whoever does these things is an abomination to the Lord; and because of these abominable practices the Lord your God is driving them out before you" (*The Holy Bible: Revised Standard Version*. London: Nelson, 1966.) Wizards and witches deserve death for their practices, as stated explicitly in Exodus (22:17: "You shall not permit a sorceress to

live”) and reaffirmed in Leviticus (20:27: “A man or a woman who is a medium or a wizard shall be put to death; they shall be stoned with stones, their blood shall be upon them”). The whole episode of Saul’s visit to the witch of Endor (1 Kings 28; now 1 Samuel 28) presupposes the reality of the evocation of Samuel.

Roman imperial legislation toward *maleficia* (harmful magic) was severe as well, showing the same level of belief in the reality of witches’ powers. In the third century C.E., the punishment of burning alive was prescribed for people who had provoked someone’s death through spells. The first Christian councils, held in late antiquity, merged the Roman with the biblical traditions and took witchcraft with the same seriousness. For instance, Canon 6 of the Council of Elvira (306) refused the Viaticum to those who had killed a man *per maleficium* (through harmful magic), adding that such a crime could not be perpetrated “without idolatry”: The worship of pagan idols was already equated with worship of the Devil, as became general in following centuries. Also, Canon 24 of the Council of Ancyra (314) imposed five years’ penance for the lesser crime of seeking advice from magicians. But this ruling seems to refer to the survival of pagan practices and beliefs, especially in rural settings. We have many such indications of this: Throughout the Early Middle Ages, councils held across Europe provided evidence that peasants, even those who were baptized, still worshiped trees, rocks, and springs once linked to some deity. Many “rustics” also required help from figures whom our sources, following the Romans, called *sorilegi* (sorcerers), *auguri* (augurs), *arili* (diviners), and *incantatores* (spellbinders). But the attitude of the Church councils toward these beliefs was generally “disenchanted”: They were considered “superstitions” rather than real menaces.

During the Early Middle Ages, many Germanic kingdoms provided themselves with written codes, usually collected from their common traditions and more or less influenced by Roman legislation. Some of these codes punished practices of magic and witchcraft, but they also contained law that only censured those who believed those practices have real effects or those who accused someone of being a witch or a wizard. For example, in the Salic law, issued by the Franks, those found guilty of *maleficia* had to pay sixty-two and a half golden *solidi* (coins; all Germanic codes refer to this measure, issued from the Roman world, though golden coins were no longer produced and silver coins had replaced them everywhere in Europe); the penalty rose to 200 golden *solidi* for a witch (*malefica*) who had eaten a man. The power of witches was recognized as real, and making an unproved accusation of being a witch drew a fine of eighty-seven gold coins.

The Visigothic Code was harsher because it did not always allow *Wergild* (“man price,” that is, financial damages as the only punishment for crimes): Those

who had done serious *maleficia* could lose their freedom and become slaves; if the *maleficium* had caused someone’s death, the perpetrator could receive the death penalty. Weather magic with bad consequences, invocations, and worshiping of the Devil were punished with severe whippings (up to 200 strokes) and public humiliation. The Lombard laws showed fewer worries about the real effects of magical acts, merely condemning those who call a woman *striga* or *masca* (clearly both names for “witch,” though the second was previously unknown); we must suppose that the Lombard legislators wanted to discourage any beliefs of this kind.

The many codes created in the Carolingian era show little uniformity. The Council of Lipsia (743) prescribed a fine of only fifteen *solidi* for those found guilty of *maleficium*. Another council, held in Paderborn (785), was more detailed, though being partially self-contradictory. Sorcerers were condemned to submit themselves as servants to the Church, but those who, blinded by the Devil and infected with pagan errors, held another person to be a witch who ate human flesh and who therefore burned her, ate her flesh, or gave it to others to eat would themselves be punished with death. We should note that these measures were meant for a particular region, recently conquered by Charlemagne: The Saxons who lived there were still pagans and strongly resisted conversion to Christianity.

Among the laws issued directly by the Frankish kings, called *capitularia* (capitularies), some condemned surviving pagan traditions; they mentioned divine sorcerers, witches who raise storms (*tempestarii*), and, more peculiarly, “women who eat the moon and rip men’s hearts off” (*Monumenta Germaniae Historica* 1883, I, n. 108, p. 223).

In the Church’s prolonged fight against surviving pagan habits, diminishing ancient cults could sometimes be discouraged as useless superstitions, including beliefs and practices about witchcraft. Medieval penitentials shed light upon the various ways Christianity sought to overwhelm paganism. In the Irish world, the penitentials of Finian (written in mid-sixth-century Ireland) and St. Columba (written slightly later in Europe by an Irish author) showed a certain moderation: Forty days of fasting were prescribed for those who joined pagan or diabolical rites; those who repeated the same sin would observe penitence for three Lenten days; three years’ penance was suggested for those who persisted in their crime. As usual in such sources, penalties for Christian clerics were harsher: doubled for deacons, tripled for priests. One year of penitence was the price for fabricating a love potion, and inducing an abortion by magical means could cost up to six Lenten days of fasting or a penance of half a year with just bread and water (plus two years without wine or meat).

In late-seventh-century England, the penitential of Theodore, archbishop of Canterbury, threatened three

years' penance to those who sacrificed to demons (presumably referring to pagan survivals), but in the most serious cases, the penance rose to ten years. If a woman performed diabolical incantations or divinations, she was condemned to a penance of one year. Another English penitential, named for the Venerable Bede but probably belonging to the eighth century, prescribed five years' penance for clerics and three to five for laymen who performed different forms of magic, such as fabricating amulets or consulting diviners. The early-ninth-century French penitential called "of Halitgar" contained interesting details because many of its prescriptions involved surviving pagan traditions: A wizard found guilty of taking away the mind of a man by invoking demons was condemned to a penance of five years; a conjurer of storms received an even harsher penance of seven years, three of them on bread and water, or exactly the same as for those who caused the death of someone performing magic arts. The early-ninth-century Spanish penitential of Silos was more severe: Those who made images of demons or consulted them were condemned to eight years' penance, and a woman who burned grain where a man had died, seeking relief for the health of the living, had to do penance for one year.

Post-Cardingian society produced few written law codes. Sometimes we can discover crimes and punishments indirectly: For example, in tenth-century Anglo-Saxon England, under King Edgar, a woman and her son were condemned to death by drowning for having employed magical figurines, or *defixiones*. Pope Gregory VII wrote to King Harold of Denmark in 1080, forbidding him to put to death those who were believed to have caused storms, damaged harvests, or spread pestilence. In this era, our most important legislative corpus came from three Hungarian kings: Stephen I (997–1038), Ladislas I (1077–1095), and Coloman (1095–1116). Their laws separate magical practices punishable by civil legislation (such as those related to poisoning or *maleficia*) from those that included invoking demons or divination, which were left to ecclesiastical judgment. It is also important to recall that King Coloman, deeply engaged in the fight against the still very widespread pagan practices among his people, refused to issue laws condemning witches (though it is unclear exactly what he meant by the word) because he thought witches did not exist.

After the tenth century, our sources start to show a theme—the "game of Diana"—that would become important in forming the image of the modern witch. It appears in a penitential known as *De ecclesiasticis disciplinis* (About Ecclesiastical Discipline), ascribed to Regino of Prüm and dated to the first decade of the tenth century. Among the usual prescriptions against magical practices, the author inserted a text later known as *Canon Episcopi*, which dismisses the belief that

women, seduced by the illusions of demons, could follow Satan and ride at night upon beasts along with the pagan goddess Diana. Slightly more than a century later, another penitential, the *Decretorum libri XX* (The Twenty Books of Decisions) of Burchard, bishop of Worms (about 1015), returned to this subject in its nineteenth book, often known separately as the *Corrector et medicus* (Corrector, or the Physician). Burchard paid attention to many forms of magic, including magical potions that could produce impotence or abortion, ceremonies for inducing fertility, and love charms. But he also rejected the reality of the nocturnal ride through the air, along with the control of thunder, rain, and sunshine, the transformation of a man into an animal, and the intercourse of *incubi* and *succubi* with human beings (unlike what Scholastics commonly held in later centuries). The beliefs denounced by Regino and Burchard nevertheless soon found acceptance in other legislative sources, such as the English penitential of Bartholomew Iscanus, from the second half of the twelfth century. The author seemed to acknowledge the reality of some magical powers; for instance, those who took away another's supply of milk or honey or of other things by any incantation were condemned to a penance of three years; conjurers of storms or those who, by invoking demons, led someone to insanity had to do five years' penance. But people who believed in the nocturnal rides or in the transformation of men and women into wolves got, respectively, one year and ten days of penance.

Many of the confused norms that had accumulated during the Early Middle Ages were reconsidered and reordered in the twelfth century by the monk Gratian. His *Decretum* included a section devoted to acts of sorcery (*De sortilegiis*), kept separate from the section about heresy, where the belief in nocturnal rides with Diana was included. Meanwhile, about the same time, the rise of the papal Inquisition began a new era for legislation about witchcraft. Though in 1258 Pope Alexander IV stated that the inquisitors should limit their intervention to cases involving a clear supposition of heretical belief, it was often hard to separate heresy from witchcraft. For example, a few years earlier, in 1233, Pope Gregory IX issued the bull *Vox in Rama* (A Voice in Rama), promoting a crusade against the Stedinger, peasants of a northern Germanic region (Steding) who refused to pay taxes to the archbishop of Bremen. The pope excommunicated the Stedinger and accused them of both heresy and magical practices, among them orgies; worshiping the Devil in the shape of beasts (a black cat and a toad) in many ways, including the *osculum infame* (kiss of shame, obscene kiss); and profaning the holy host.

Because inquisitors had to deal increasingly with cases connected with magical beliefs and practices, Pope

Alexander IV stated in both 1258 and 1260 that they had to consider those accusations carefully and that only crimes dealing with divination and sorcery—obviously considered as involving the Devil—should be prosecuted. Consequently, at Toulouse in 1275, where the Cathar heresy had been strong, prosecutions ended with the condemnation of a woman; she was burned to death for having given birth to a creature after intercourse with demons and then nourishing it with babies' flesh, which she procured during her nocturnal rides. The fourteenth century witnessed further enlargement of inquisitors' powers, though not without some opposition: King Philip IV of France forbade inquisitors to prosecute crimes of magic. Under the papacy of John XXII, the Inquisition's authority over magicians and witchcraft became almost boundless. With his *Super illius specula* (Upon His Watchtower) in 1326, Pope John XXII excommunicated anyone who made a pact with the Devil.

In the fourteenth and fifteenth centuries, many jurists, especially in Italy and France, gave opinions about the reality of magical powers. It must be remembered that the most famous among them, the Italian Bartolo of Sassoferrato (1313–1357), a professor at the University of Perugia and an adviser to the Holy Roman Emperor Charles IV, gave a *consilium* (juridical advice) for the bishop and the inquisitor of Novara during their trial of a woman who had confessed to having worshiped the Devil, profaned the holy cross, and bewitched children who consequently died. Bartolo suggested she deserved the death penalty for her heretical crimes (unless she were to repent), as stated by the Roman *Lex Cornelia de sicariis et veneficiis* (Law of Cornelius on Assassins and Poisoners/Sorcerers, 81 B.C.E.), but he doubted that these women could kill with just their looks and touches because of their pact with the Devil.

Increasing inquisitorial activity against magic also pushed many authorities to include laws against magical activities in their codes—though most seemed more worried about frauds than about the real damages these practices could do, and none of them specified punishments against witchcraft. One of the earliest came from the city of Florence, with the *Constitutiones* of its bishop Antonio degli Orsi in 1310–1311. At that time, the Inquisition had many problems in Florence and did not begin to work effectively until the middle of the century. The attention paid by the *Constitutiones* to magical practices probably offered a way to handle the situation without external interference. A chapter about acts of sorcery (*De sortilegiis*) condemned crimes achieved through magic, divination, poisoning intended to hurt or kill (*veneficia*), and amulets (*brevia*). Later collections of laws (*statuta*) issued by different towns contained similar prescriptions.

In the fifteenth century, legislation about witchcraft became tighter. Civil authorities began to judge acts of

witchcraft as distinct from other kinds of magical practices. This situation emerged clearly from the trial of a woman called Matteuccia, held in Todi in 1428 without the intervention of the inquisitor, who lived nearby in Perugia. During her trial, she was accused of many magical activities but also specifically of being a *strega*, or witch, and of flying to the southern town of Benevento with other women, where they met the Devil, had intercourse with him, turned into animals, and went around Todi and nearby villages killing children in their cradles. Matteuccia was found guilty and burned.

In 1451, Pope Nicholas V issued a bull that, reversing precedents from the previous century, explicitly asked inquisitors to involve themselves in cases of witchcraft, even when the link to heresy was not clear. The route leading to the witch hunts was now traced out, and it culminated with the *Summis desiderantes affectibus* (Desiring with Supreme Ardor) promulgated by Innocent VIII in 1484.

LAWYERS

Lawyers, broadly defined as men trained or educated in the law, played a variety of roles in witchcraft prosecutions. Their most visible function was as judges in witchcraft trials, especially in the central or upper-level courts of European states. Many of the court officials who assisted in the investigation and prosecution of witchcraft also had legal training. Some of the most prominent authors of witchcraft treatises, including Jean Bodin, Benedict Carpzov, Henri Boguet, Nicolas Rémy, and Christian Thomasius, possessed law degrees and had served in some official judicial capacity. In Germany, members of the university faculties of law regularly consulted with officials in local jurisdictions regarding witchcraft prosecutions.

The most controversial and sensitive role lawyers played in witchcraft trials was representing those accused of the crime. Although witches were entitled to defense counsel in all continental European and Scottish trials, few lawyers took such cases during the peak periods of witch hunting. Not only was legal counsel too costly for the typical lower-class witch (only the major Inquisitions provided lawyers gratis for defendants), but lawyers were reluctant to defend witches on the grounds that they might thereby encourage the Devil's activities and incur suspicion themselves. The *Malleus Maleficarum* (The Hammer of Witches), while admitting the right of the judge to appoint an advocate for the accused, insisted that those appointed be convinced of the justice of their client's cause. If a lawyer were to unduly defend a person accused of heresy or witchcraft, he would become a patron of that crime and would come under strong suspicion himself. Concerns regarding the religious

orthodoxy of lawyers reinforced the old German saying, "Lawyers are wicked Christians" (Stolleis 2002, 1).

Although we cannot gain any kind of accurate figures regarding the number of witches who had the benefit of counsel, there is a sufficiently large record of legal representation in the seventeenth century to suggest that the number of cases in which lawyers defended the accused was increasing. The large volume of business that was directed to the appellate courts of France by itself accounts for a great part of this increase, because legal representation at appeals was mandatory. Even in trials in the first instance, however, lawyers started pleading for witches in greater numbers during the seventeenth century. In Scotland, lawyers began to defend witches in the Court of Justiciary in the 1620s, and they succeeded in securing acquittals in some cases. Most of those acquittals came after 1670, such as that of the witch known as Maevia, whom Sir George Mackenzie successfully defended before the High Court of Justiciary. To this can be added the acquittals of Margaret Clerk in 1674 and Bessie Gibb in 1680, each of whom had an attorney, in Gibb's case, her husband. By the 1660s, the legal representation of German witches also seems to have become fairly common. In Hungary, counsel for accused witches appeared in the records as early as the 1650s and received frequent mention in eighteenth-century cases, when the number of trials finally began to decline. In England, lawyers could be assigned to defendants only to advise them on points of law. This happened occasionally, such as in 1630, when Chief Justice John Finch assigned four barristers to counsel a poor woman accused of witchcraft.

Legal assistance of this sort benefited witches more than those accused of any other crime, precisely because the evidence in witchcraft cases was so vulnerable to challenge by a person skilled in the law. Lawyers in witchcraft cases could easily raise doubts regarding the supernatural causes of alleged *maleficia* (harmful magic), demand evidence of the corpus delicti, and impeach the credibility of witnesses who would not have been allowed to testify in the trial of ordinary crimes. They could also point out the insufficiency of the evidence, especially when it was hearsay, and the irrelevancy of the evidence that was presented to the indictment or the libel. They could even go so far as to deny the existence of witchcraft and call for a ban on the trials, as one Hungarian lawyer did in 1671. No wonder that in the previous century, Martin Luther, in one of his outbursts regarding the crime of witchcraft, complained that lawyers wanted too much evidence and refused to accept clear proofs of witchcraft. It was doubtless a similar frustration with the tactics of lawyers that led members of the Spanish Inquisition to complain in 1526 that none of the jurists in Castile believed in witchcraft. Nor should it surprise us that the one

person acquitted of witchcraft in the central Scottish courts between 1605 and 1622 had been wealthy enough to hire no fewer than three lawyers.

LAYENSPIEGEL (1509)

Layenspiegel is a handbook for lay judges, written by Ulrich Tengler (1447–1511), a clerk serving both the chancery of the Bavarian duke and the imperial free city of Nördlingen, who later became high bailiff and even a count palatine (*Reichsgraf*). Recognizing the need for a vernacular manual on practical juridical matters, in 1509 Tengler published his *Layenspiegel* (A Mirror [of Law] for Laymen; *Spiegel*, “mirror,” was a frequent title for such books), which he dedicated to Holy Roman Emperor Maximilian I. It was an eclectic compilation of helpful materials, written for his colleagues and selected from many sources chosen among German, Roman, and canon laws. The humanist Sebastian Brant, author of the famous *Ship of Fools*, contributed an introduction of recommendation. The first edition, embellished by interesting woodcuts of high quality, was printed by Johann Rynmann in Augsburg and was followed by a second edition only a year later. It was reprinted, with alterations, thirteen times before 1560 and was much used both by Catholics and Protestants during the sixteenth century (there is, however, no recent edition nor any modern translation). The first part of the *Layenspiegel* comprised civil and police law; the second dealt with civil legal process; the third was about criminal law. How firmly Tengler was rooted in the traditional Catholic mentality that saw law as a religious problem became evident through several additions to the legal text, for example, a poem about the *Processus Sathanæ contra genus humanum* (an invention of fourteenth-century Italian jurists dealing with the sinfulness of mankind, the Devil’s rights, and redemption, in the form of a canonical trial) or a religious play about the last judgment (another fourteenth-century text). The book’s main impact for

the history of Germanic law consisted in its dissemination of Roman jurisprudence.

Tengler was the first layman to deal with the witchcraft trials in form of a textbook. Given his practical concerns, in part 3 he discussed the subject “*Von kätzererey, warsagen, schwarzer kunst, zauberey, unholden, etc.*” (On heresy, soothsaying, black magic, sorcery, witches, etc.) (Tengler 1511, chap. CIV, p. v). In the second and later editions, he was much more severe against these crimes, having been influenced by his son Christopher, a theologian at the university of Ingolstadt. Whereas Tengler saw necromancy as being based on forbidden contact with demons, he saw astrology and similar arts as possibly being regarded as legal as long as they were practiced as natural sciences and without superstition. Regarding witchcraft, the *Layenspiegel* transmitted the teachings of the *Malleus Maleficarum* (The Hammer of Witches), which it recommended for further details on this subject. Tengler offered a *Forma Citation wider Unholden*, that is, a schedule for bringing witches to trial, with a list for questioning them: “Why do your cows give more milk than the neighbors’ cows? What did you do in the field during a thunderstorm? Do you believe in witches? Why do you think people are scared of you? Why did you do this or that during your neighbor’s delivery?” and so on. It also showed how to record the witnesses’ testimonies, how to search the house of the accused, how to interrogate the alleged sorceress, and the like. Many details of the practice of German criminal courts when dealing with witches were codified here, for example, the use of blessed salt, water, and wax; the practice of fetching the accused into court with her back to the judge; or the complete removal of all hair.

Through Tengler’s *Layenspiegel*, both the idea of a pact with the Devil and the inquisitorial procedure of canon law were spread far and wide among juridical practitioners in sixteenth-century Germany. Undoubtedly, this book did much to intensify and brutalize the persecution of witches by offering an abridged vernacular version of the *Malleus Maleficarum* to everybody who could read but remained an *illiteratus* with no Latin.

LAYMANN, PAUL (1574–1635)

Laymann was the Jesuit author of the *Theologia Moralis* (Moral Theology; Munich, 1625), a standard textbook on witchcraft and magic that influenced the great critic of witchcraft trials, Friedrich Spee. Born near Innsbruck in Tyrol, Laymann joined the Jesuit order in 1594 and spent most of his life in Bavarian Jesuit colleges. He was a novice in the college of Landsberg on the Lech, a student in Ingolstadt, and a gymnasium teacher in Dillingen, capital of the prince-bishops of Augsburg. From 1603 to 1609, he taught philosophy at Ingolstadt, then, from 1609 to 1625, he taught moral theology at the large college in Munich, and he then became professor of canon law at the University of Dillingen, where he stayed from 1625 to 1632. Fleeing from Swedish invaders during the Thirty Years' War, Laymann died of plague at Constance.

The *Theologia Moralis* was reprinted many times well into the eighteenth century. Whereas its first edition touched only briefly upon how confessors should treat witches, Laymann's third edition (Ingolstadt, 1630) borrowed widely from Adam Tanner, as did all subsequent editions. Laymann's foreword to the 1630 edition emphasized that its section "De iustitia" (Of Justice) had been enlarged to discuss witchcraft trials. Like his Bavarian fellow Jesuit Tanner, Laymann recommended utmost caution, because the Devil could deceive the senses, and very many cruelties had occurred. Laymann denied that denunciations had any legal value in witchcraft trials and suggested that many innocent people had already fallen victim to illegal witch hunts. Clearly distancing himself from Martín Del Rio, Laymann copied whole passages verbatim from Tanner. In 1631, Spee, in his *Cautio Criminalis seu de processibus contra sagas liber* (A Warning on Criminal Justice, or a Book on Witch Trials), used Laymann to double the number of Catholic authorities he could quote to support his position. Laymann's works were present in every better monastic library, where it was well known that his arguments about witchcraft were in fact Tanner's; usually they were quoted like twins, "Tanner and Laymann."

In 1629, at the climax of witch hunting in Germany, Laymann's chapter on witchcraft in his *Theologia Moralis* was allegedly published separately at

Aschaffenburg, in German, although under a Latin title. However, as its subtitle demonstrated (a translation into German, amplified with useful examples and other things), Laymann had little to do with this pamphlet. Someone (probably Hermann Goehausen, a lawyer serving Ferdinand of Bavaria, archbishop-elect of Cologne) used Laymann's authority in moral theology to justify the massive witch hunts in the Rhineland by translating, amplifying, and reshaping some bits of text from the first edition of Laymann's *Theologia Moralis*. It was merely a forgery, not a translation, possibly commissioned by the printer Quirin Botzer, who published other pamphlets of similarly dubious quality. Presumably the interests of Goehausen and some authorities coincided perfectly with Botzer's. The absence of approval by the Jesuit superiors demonstrated clearly that this publication was unauthorized.

This misuse may have provoked Laymann to reshape and clarify his ideas on witchcraft trials in his third and subsequent editions of his *Theologia Moralis*. After three years of intensive witch hunting in many parts of Germany, witchcraft trials had expanded beyond moral theology into a political and partisan issue. By clearly articulating that he and Tanner approved a lenient attitude and opposed Del Rio's rigidity (Laymann 1630, 1:524), Laymann repudiated any claim that the 1629 pamphlet represented his ideas. Nevertheless, the false claims to authenticity of Botzer's Aschaffenburg pamphlet, reprinted in Cologne, confused Laymann's first Jesuit biographers and provoked a sharp debate around 1900 between a Jesuit historian and a liberal Catholic about Laymann's real position, where the Jesuit's interpretation was more nearly correct. In 1909, Henry Charles Lea (who owned a copy of Botzer's pamphlet) was careful enough to notice that the same text, with few additions, was reprinted in Cologne in 1629 under Goehausen's name; his discussion (Lea 1939, 2:670–689) remains the most extensive account in English. However, a medical historian and early biographer of Johann Weyer (Binz 1901) found that an eighteenth-century bibliographer ascribed the pamphlet to Dr. Johannes Jordanaeus, a canon and parish priest at Bonn, who reportedly assembled the text anonymously, commissioned by Archbishop-Elector Ferdinand. In any case, the evidence points to the authorities of electoral Cologne, and it seems more likely that Goehausen was the author.

But Sigmund Riezler emphasized that Tanner was clearly the primary precursor of Friedrich Spee, especially considering Laymann's defense of the imperial Edict of Restitution (March 6, 1629) during a bitter feud among Catholic orders. And even without confusing Laymann's ideas with those of the 1629 pamphlet, "we do not have to look far elsewhere in Laymann's writings to find complete demonological orthodoxy" (Clark 1996, 206). Laymann was indeed

conventional about magic and witchcraft. However, it was significant that he supported Tanner's criticisms of witch hunting in 1630, thereby providing another major Jesuit authority for Spee.

LE FRANC, MARTIN (1410–1461)

Le Franc was one of the most accomplished French-language poets of the fifteenth century, secretary of Duke Amadeus VIII of Savoy, provost of the cathedral of Lausanne, and later administrator of the monastery at Novalesse. While attending the Council of Basel (1431–1449) in the service of Amadeus VIII (whom the council elected pope as Felix V), Le Franc wrote his long (24,384 lines) poem *Le Champion des dames* (The Defender of Ladies). It included an important discussion of contemporary ideas of diabolical sorcery and witchcraft within the context of a poetic debate on women's virtues and vices. A Paris manuscript of Le Franc's poem, copied around 1450 for Philip the Good,

Duke of Burgundy, to whom the entire poem is dedicated, contained the earliest known illustration of witches riding broomsticks. Around the turn of the twentieth century, first the Cologne archivist Joseph Hansen and then the great Dutch historian Johan Huizinga, in his classic study *The Autumn of the Middle Ages* (1919), recognized Le Franc's importance in the development of ideas of witchcraft (Huizinga 1996, 286–293).

The 823-line discussion of witchcraft (Le Franc 1999, 4:113–146) between the "Adversary" (of women) and "Free Will," the "Defender" (of women), was part of Le Franc's contribution to the fifteenth-century moral and poetic debate known as "the quarrel over the *Roman de la Rose*," a series of literary works dealing with the misogynistic treatment of women by the thirteenth-century poet Jean de Meung, in which Christine de Pizan was one of the most notable participants.

In Book 4 of Le Franc's poem, as the Defender describes the achievements of illustrious women of antiquity and later ages in metalwork, painting, and other arts, the Adversary interrupts, insisting that the Defender also consider women's sorcery, flight to the Sabbath, and cannibalism. The Defender abruptly dismisses the challenge with the argument that men invented sorcery and says that the charges made by the Adversary are only delusions. Instead of responding with traditional misogyny, however, the Adversary begins to cite recent trial records and confessions concerning the recently formulated idea of "classical" witchcraft: flight to the Sabbath, apostasy (renouncing Jesus), idolatry (demon worship), sexual orgies, demonic discipline, and the infliction of various injuries upon humans. Among the latter, the Adversary cites sexual impotence and infertility, injurious weather magic, and sexual intercourse with demons.

The Defender responds with what becomes the initial skeptical argument, citing St. Augustine, Gregory the Great, St. Ambrose, and St. Jerome—as well as the life of St. Germanus from *The Golden Legend*—to insist that these were only mental illusions created by the demons, who were in Hell and could not roam the world seeking the ruin of souls. But the Adversary responds with the biblical story of Simon Magus, reinforced with references to Apuleius of Madaura, the legendary Circe, the Roman ethnographer Solinus, the Sybil, the fairy Melusine, St. Augustine, and Albertus Magnus (Albert the Great), to emphasize that such things may be done with God's permission.

The Defender then launches a long and fierce attack on contemporary clerical ignorance, corruption, and incompetence that have permitted such erroneous beliefs to flourish, citing a number of recent instances of misguided laity, including the very recent case of Gilles de Rais, to which the Adversary responds with his past point: that the case of Gilles de Rais only proved that it was easier for the Devil to tempt men than women.

These arguments located Le Franc in the broad contemporary movement of ecclesiastical reform of the clergy and laity and attacks on what they termed “superstition” associated with Jean Gerson, who had also participated in the debates over the *Roman de la Rose*.

EDWARD PETERS

LEA, HENRY CHARLES (1825–1909)

Lea was the most erudite American historian of the nineteenth century; author of still-valuable studies of the Inquisitions of the Middle Ages and early modern Spain, sacerdotal celibacy, and auricular confession and indulgences; and compiler of an immense, posthumously published collection of sources for the history of witchcraft, *Materials Toward a History of Witchcraft*. Lea was born into a publishing family in Philadelphia in 1825, was tutored at home until he joined the firm in 1843, and was a productive and frequently published literary critic and scientist until he suffered a breakdown from overwork in 1847. Lea turned his attention to history, first historical memoirs and then chronicles, developing a serious interest in medieval Europe, to which his considerable intellectual energies turned as he spent his days working in and then directing the publishing house until his retirement in 1880. During his life, he was politically active in the Union cause in the Civil War and subsequently in both local and national civic affairs until his death.

Lea's early historical works focused on the history of law, which he considered the most reliable guide to what he termed the “inner life” of past peoples, and the history of the Latin Christian Church. His early works on legal procedure and sacerdotal celibacy were remarkable for their period, and extraordinary for a scholar working in the United States, using information taken exclusively from his own growing private library and a network of European libraries and booksellers.

Lea kept a sharp eye on political Roman Catholicism in his own time, both in the United States and in Europe, and he strove in his historical work to distinguish between dogma and personal devotion, on the

one hand, and institutional history and prelacy, on the other. Lea criticized both the Episcopalian bishop of Vermont for justifying slavery on the basis of arguments from the Bible and Catholic bishops for their separation from society and the danger of their powers of ecclesiastical discipline in civil matters. From 1884 until his death, Lea turned these subjects into material for his historical works, *A History of the Inquisition of the Middle Ages* of 1888 and *A History of the Inquisition of Spain* in four volumes of 1906–1907. Lord Acton, who admired Lea greatly, invited him to write the chapter “The Eve of the Reformation” for the first volume of *The Cambridge Modern History*.

Lea wrote several other long and important works during the last quarter of the nineteenth century, but his last great project was to have been a history of witchcraft, which he died without having completed. Arthur C. Howland edited his notes, and the work was published as *Materials Toward a History of Witchcraft* in three volumes in 1939. *Materials* is a treasure trove of both original sources and Lea's reading notes, including extensive translations into English from many languages. Lea's range of reading was immense, and he read original sources closely, since he argued that only from these could reliable history be written. His work remains invaluable for students and historians of the subject.

The first of the three consecutively paged volumes contains Parts 1 and 2 of Lea's notes: Part 1 deals with demonology, magic, and sorcery from antiquity to the sixteenth century, and with learned and popular beliefs, including the Sabbat. Part 2 treats the assimilation of sorcery to heresy and provides brief accounts of all known trials for witchcraft to the mid-sixteenth century. The second volume contains the beginning of Part 3, on the demonological literature, canon law, and secular legal procedures, as well as the literature of the Roman Inquisition. The third volume contains the rest of Part 3, demonic possession and a survey of witchcraft by regions, as well as Part 4, texts illustrating the decline of the beliefs, final controversies, and survivals of witchcraft beliefs into the nineteenth century. The entire work offers eloquent testimony to Lea's astonishing scholarly energy and to the genius of one of the greatest historians who ever investigated this subject.

LEMNIUS, LEVINUS (1505–1568)

An Erasmian and Galenist physician, Lemnius gave preference to natural causes and cures in cases of diseases that were usually attributed to demonic interference. Born in Zierikzee, a town in the Dutch province of Zeeland, he matriculated at the University of Louvain in 1521, first studying arts and letters. In addition to Latin, Lemnius also learned Greek and Hebrew, probably at the Collegium Trilingue, an independent institute outside the university. Founded in 1517, it was instrumental in spreading the humanist study of classical letters in northwestern Europe. Lemnius also studied medicine at Louvain, but he received his medical doctorate elsewhere, probably from an Italian university. He returned to Zierikzee around 1527, where he married and began practicing medicine. He stayed Catholic, while maintaining contact with Protestants. After ending his practice, Lemnius traveled to London in 1560 to visit his son Willem, who had turned Protestant and therefore moved to England. There, Lemnius met the humanist Thomas Newton, who later translated one of Lemnius's books, and probably also the botanist William Turner, who was in close contact with Dutch Protestant exiles. In 1560, Lemnius also traveled to Italy and Switzerland. He died at Zierikzee.

As a physician, Lemnius was a convinced Galenist but also an admirer of Vesalius, whom he had met personally, probably in 1558. His publications showed that he knew the works of such contemporary physicians as the Frenchman Jean Fernel, the Swiss Conrad Gesner, and the Italian Girolamo Fracastoro. He was also familiar with the work of Girolamo Cardano, but he never mentioned Paracelsus. In his view of astrology, Lemnius was a typical transitional figure. He rejected the idea that one could predict future events by interpreting the position of the planets. Nor did he believe that the time and location of medical interventions such as bloodletting should be chosen on the basis of astrological calculations. Nevertheless, he accepted that comets could change the physical and mental condition of human beings—but believed that the influence of food and drink, rest, physical exercise, sleeping and waking, or the quality of the air was far more important. Their effects

depended on individuals' constitution, the character of their humors, the geographic circumstances in which they lived, and their mental state.

A similarly mixed attitude characterized his ideas concerning demonic possession. While admitting that this affliction could occur, he preferred purely somatic explanations such as "melancholy, frenzy, madness, epilepsy and horrible diseases that in the case of young women and widows clearly result from uterine disturbances, either when their first menstruation begins very late, or when they marry at advanced age. Then their mind is so afflicted by dark and dense vapors that they seem to be harassed by an evil spirit, as if the devil has conquered their mind and has driven them to abnormal fantasies" (Lemnius 1593, 573). To free patients of these "poisonous vapors, or the devil, or fantasy," they should be bled and treated with herbal medicines. Not demons but unbalanced humors caused illness. Demons could, however, mingle with the humors to incite the mind to things wicked. The use of superstitious prayers or strange formulas was quite unacceptable. Concerning witchcraft, Lemnius admitted its existence in principle and even acknowledged that witches should be burned. But he also stressed that the effects of witchcraft should be cured by the use of the appropriate herbal medicines, whose effectiveness resulted from God's benevolence and not from some superstitious ritual.

In the course of the sixteenth and seventeenth centuries, Lemnius's books were frequently reprinted. French, German, and Italian translations of his main work, *Occulta naturae miracula* (The Secret Miracles of Nature), first printed in 1559, already appeared with variations in the title by the sixteenth century. An English version was published in 1658. In his *Anatomy of Melancholy*, Robert Burton frequently quoted Lemnius's Latin original, which apparently also influenced views on melancholy, the philosophy of Horace, and the prophetic power of dying human beings as they were presented in Shakespeare's *Hamlet*.

LEVACK, BRIAN (1943–)

Brian P. Levack is a leading historian of the European witch hunt. He studied at Yale under the legendary J. H. Hexter, earning his PhD in 1970. The work that he did for it later emerged as his first book, *The Civil Lawyers in England, 1603–1641* (1973). He has continued to publish extensively on legal history, with a particular interest in the Anglo-Scottish union; a book on this appeared in 1987.

He was appointed to the University of Texas at Austin, where he became John Green Regents Professor of History. He began teaching on the European witch hunt in the 1970s, a subject related to his judicial interests. The appearance of Christina Lerner's *Source-Book of Scottish Witchcraft* in 1977 aided his research for "The Great Scottish Witch-Hunt of 1661–1662," a seminal article of 1980 on the last and greatest of Scotland's witchcraft panics.

Then came *The Witch-Hunt in Early Modern Europe* (1987), the book that established his reputation as a leading scholar on the subject. Several syntheses on the witch hunts were published in the 1980s, but Levack's was arguably the best and was reissued in a revised edition in 1995. Noted for the clarity and accessibility of its exposition and for the breadth of up-to-date knowledge that it displayed, it proved invaluable in teaching and research. By showing that witch hunting could not be ascribed to a single cause but arose from a conjunction of factors, it cleared up much misunderstanding and placed subsequent research on a firmer footing. Levack paid much attention to the complex origins of the witch hunt, analyzing intellectual, legal, and religious causes and well as the social context. His emphasis on the judicial nature of witch hunting was welcome, and his dissection of the composite intellectual stereotype of the witch has stood the test of time particularly well. Levack stressed most of all the legal changes that led to the witch persecutions, especially the transition from accusatorial to inquisitorial procedure and the growing use of torture to extract confessions. He set such legal developments against the background of state building and saw a correlation between state control of the judiciary and the absence of witch persecution. Thus, witch hunting was most severe where local courts could act without hindrance from appellate courts and central governments. Levack later developed this theme extensively (1996).

More than a synthesis, *The Witch-Hunt in Early Modern Europe* is noteworthy because many of its approaches and theses have become the standard explanations for scholars. Levack paid close attention to geography, including all of Europe in his discussion, whereas previously scholars had let England, Scotland, and western Europe drive discussions of witchcraft, ignoring, for the most part, Scandinavia and eastern Europe. This close scrutiny of regions enabled him to

develop more accurate totals for the number of witchcraft cases, reducing the number of executions to 60,000 (a figure that other historians have subsequently reduced further).

By contrast, the way this book distinguished between magic and religion was arguably outdated, and the book was sketchy on the crucial question of women and witch hunting. But these are minor criticisms of a comprehensive book that offers a great deal both to beginners in the subject and to experts. At the time of the writing of this entry, a third edition is in the press, further developing a number of themes, including demonic possession and the revival of witch hunting in the modern world.

Levack has remained in the forefront of the trends in witchcraft scholarship, as his more recent articles and the second edition of *The Witch-Hunt in Early Modern Europe* demonstrate. He has recognized the importance of community pressures and has taken a particular interest in the decline of witch hunting—something that earlier scholars had neglected. As befits a scholar who is a specialist in other fields too, he has always taken a broad view of the subject of witchcraft. Some of his recent publications have explored related areas, notably judicial torture and demonic possession.

In 1992, he compiled *Articles on Witchcraft, Magic, and Demonology*, a multivolume collection of reprints of articles on witchcraft, containing some of the best recent work as well as a number of gems of older scholarship. A second multivolume collection, published in 2001, made accessible some of the many works on the subject from the 1990s. Each collection contained well over 100 articles in English. Levack's most recent work is *The Witchcraft Sourcebook* (2004), a collection of sixty-one selections of primary sources, ranging from antiquity to the late seventeenth century and including selections from literature and drama, theologians, demonologists, and skeptics. This work is one of the two major collections of primary documents available in English, the other being Alan Kors and Edward Peters's *Witchcraft in Europe, 400–1700: A Documentary History*

LILITH

Lilith was a female demon that preyed on unsuspecting men and infants. Her origins are linked to Mesopotamian mythology, which made references to male and female demons called *Lilu* and *Lilitu*, respectively. These were storm or wind demons, with names that are etymologically based on the Sumerian word *lil*, literally meaning "wind." Lilith, the Hebrew form of *Lilitu*, occupies an important position in Jewish folklore and demonology. Hebrew Scripture contains one reference to Lilith, the night hag (Isaiah 34:14), in a passage describing Yahweh's day of retribution. In the aftermath of this vengeance, when the land is turned into a wilderness, Lilith is referred to as one of the creatures that will be tamed.

In postbiblical literature, Lilith was mentioned in the Babylonian Talmud. It was there that her demonic characteristics were developed: She had long hair (Erubin 100b); she had the form of a woman but was winged (Nidda 24b); she preyed on men who slept alone (Shabbat 151b). The story of Lilith as the wife of Adam was first evidenced in the *Alphabet of Ben Sira*, which was in part a version of earlier accounts of Lilith from the Midrashic tradition. Of uncertain

The female demon Lilith, who stole and killed children. Terracotta relief, Mesopotamia, ca. 300 B.C.E. (Art Archive/Christies/Eileen Tweedy)

date, possibly between the eighth and tenth centuries C.E., the *Alphabet* named Lilith as Adam's original wife and stated that she refused to submit to his authority, particularly in terms of sexual union (disobeying his expectation that she lay beneath him). Lilith eventually fled, pursued by three angels (Senoy, Sanseoy, and Semangelof) who, at God's behest, explained that she must return or have 100 of her offspring perish each day. Lilith defied the order and exclaimed that she was made to bring death to infants.

The story went on to describe the existence of amulets designed to protect the young from child-stealing demons such as Lilith, which suggests, to some extent, its etiological nature. Protective charms against Lilith are evidenced in archaeology, particularly in the form of incantation bowls, from a Jewish community at Nippur, dating from the early centuries C.E. It may be assumed that these bowls had a function similar to that of the amulets mentioned in the *Alphabet*, although they usually functioned in a broader context, namely to keep Lilith or other demons from harming the household in general. From these traditions developed the role of Lilith in the Kabbalah. In the thirteenth-century

kabbalistic text *Treatise on the Left Emanation*, for example, Lilith was born as one half of an androgynous being, the other half of which was Samael (the diabolic angel who, on falling from Heaven, assumed the name Lucifer or Satan). This text also named a second Lilith, the wife of Asmodeus, another demon king; hence, the two female spirits were distinguished by the titles Lilith the Elder and Lilith the Younger.

The collection of fourteenth-century writings known as the *Zohar* augmented Lilith's demonic aspects. In *Zohar* 3:76b–77a, Lilith and the demon Naamah (Charmer), were presented as succubi who appeared to men as they experienced wet dreams and collected their semen for the purpose of producing demonic offspring. Here Lilith's role as a baby-snatching demon was also reiterated. A combination of both the amulet and the Kabbalistic traditions concerning Lilith was best exemplified in the *Book of Raziel* written in about 1100 C.E., which contained several amulets to ward off evil spirits, particularly Lilith, who threatened to harm mothers and their newly born. These recipes were to be inscribed on parchment or on the door and walls of the room occupied by the mother and child. Less detailed rituals involved a protective spell for a boy-child in which a circle was drawn on the wall of the birthing room with the words "Adam and Eve. Out Lilith" inscribed within; this practice continued until the nineteenth century.

LILLE NUNS

In 1612–1614, possession cases at a Brigittine convent in Lille, in the Spanish Netherlands, generated controversial but largely ineffectual witchcraft accusations.

In a case of convent possession that began as an attempted "copycat" of the notorious Aix-en-Provence case of 1609–1611, two possessed "nun-witches" accused their convent almoner of witchcraft. A papal nuncio defended the priest in Rome, and the pope rejected the accusations. The French lay author Jean Le

Normant described the Lille cases in 1623 in a controversial book that depicted the outbreak of diabolical activities at the convent as evidence of the Antichrist's coming.

Early in 1612, several nuns at the convent started to go into convulsions, to dance on the altar of their chapel, and to fall into states of torpor. Following accusations by the possessed nuns, Marie de Sains, a nun who had been renowned for her piety, confessed she was a witch. She in turn accused a young novice, Simone Dourlet, of being her accomplice. Both were imprisoned at the *officialité* (diocesan prison) of Tournai but soon retracted their confessions. Nicolas de Montmorency, a powerful local noble and a patron of the convent, requested the *official* (presiding judge of the diocesan court) of Tournai to invite Sebastien Michaelis and François Domptius, the Dominican exorcists made famous by the recent Aix-en-Provence case, to exorcise the possessed women at the convent. In May 1612, three prominent possessed nuns alleged that Marie de Sains had caused their possessions by means of charms. De Sains was obliged to confess and display Devil's marks on her body. But events now took a different turn from similar cases: Although a self-confessed witch, de Sains began to play the role of the prophetic possessed, while her possessed sisters received less public exposure.

Under exorcism, de Sains delivered revelations about the coming of the Antichrist and claimed to have participated at a Sabbath with Father Louis Gaufridy, the priest executed at Aix-en-Provence in 1611. She had been vowed to the Devil at birth, and a governess had made her "princess of magicians" (thus the companion of Gaufridy, "prince of magicians"). Her devil, she said, had been infuriated by the foundation of the Brigittine house in Lille and had ordered her to enter it to undermine it. She claimed that she and Dourlet had caused all the illnesses and other problems at the house, the possession being their crowning achievement. She also admitted to making Nicolas de Montmorency and his wife infertile.

In mid-1613, de Sains made a witchcraft accusation against Canon Jean Leduc, almoner of the convent and *écolâtre* (priest in charge of teaching at a cathedral) of the chapter of St.-Pierre in Lille. The chapter persuaded the papal nuncio, Guido Bentivoglio, to intercede with Rome. In early autumn of 1613, Bentivoglio appointed the *official* of Malines, Father Jacques Boonen, to investigate the case, over the protests of Montmorency, who simply wanted the alleged witches prosecuted. Boonen cleared the canon of witchcraft, and Pope Paul V pointedly gave Leduc a more important benefice. While Montmorency pursued avenues of appeal against the decision, Bentivoglio had Michaelis's account of the Aix-en-Provence case, *Histoire admirable de la possession et conversion d'une pénitente, séduite par un magicien* (The Admirable History of the Possession and

Conversion of a Penitent Woman, Seduced by a Magician, 1614) examined by the faculty of theology of Louvain, who put it under interdict. The bishop of Tournai ordered all copies surrendered to him. In 1623, when Jean Le Normant published his account of the Lille case, the *Histoire véritable et memorable de ce qui c'est passé sous l'exorcisme de trois filles possédées és païs de Handre* (True and Memorable History of What Took Place in the Exorcism of Three Possessed Girls in Flanders), the Sorbonne censured it.

The nuns were much less fortunate than the canon. Although Bentivoglio informed Rome that he was returning the women to their convent, he was unable to effect this, and subsequently he suspected Montmorency of harboring them. Marie de Sains probably died in custody in 1630, after spending many years in the episcopal prison in Tournai and subsequently at a prison in Vilvorde. The claim that Simone Dourlet was burned for witchcraft has been refuted (Lottin 1984, 170–177), but she probably spent the remainder of her life in prison. They were, however, far more fortunate than two of their convent sisters in nearby Artois, who really were burned as witches immediately afterwards, in 1615 (Muchembled 2003, 250–265).

This episode revealed two deeply contrary tendencies in the upper echelons of Catholicism at this time. On the one hand, a vigorous and at times lethal passion for the fruits of exorcism was at work, and, on the other hand, a humane and skeptical spirit existed. To be sure, jurisdictional differences could from time to time affect who was on which side, but it remains that this division was representative of the tensions within early modern reforming Catholicism. Beyond this, the role of Montmorency and the layman Le Normant show that a Church-secular distinction, which might assume the Church to be the more likely to accuse witches, did not apply here. The caution of the papacy also seems to have been characteristic.

LIPPE, COUNTY OF

A small county (*Grafschaft*) of the Holy Roman Empire, Lippe was an important center of witch hunts. It covered approximately 1,200 square kilometers and had about 40,000 inhabitants around 1600, of whom some 10,000 lived in small towns (Lippe became a protoindustrial region in the seventeenth and eighteenth centuries). Its capital, Lemgo, preserved a certain autonomy from the count, including the right to condemn criminals to death; there were bitter conflicts between Lemgo and its lords. Around 1540, Lippe became Lutheran and then, about 1600, under Count Simon VI (ruled 1563–1613), Calvinist, although Lemgo remained Lutheran. Simon VI carried through important reforms in Lippe, including of its law courts. Simon's heirs quarreled, and the administration of his lands was partly divided.

Apart from Lemgo, we can find 221 persons involved in witchcraft trials between 1550 and 1686, including 41 in the town of Horn. Half of the 221 were tried during the most intensive hunt, which occurred between 1653 and 1661; only 8 were accused later, between 1670 and 1678. In Lemgo, the number of victims was about 250, with great waves of trials taking place in 1565, 1583–1605, 1628–1637, and 1653–1681.

Apart from trials of women, the usual victims, Lemgo also saw many trials against both men and children. More than fifty children were arrested between 1654 and 1676; some were imprisoned for eleven years, and some were even tortured. Most, but not all, were connected with the trial against a sorcerer-teacher, Hermann Beschorn, who had worked in Lemgo. Children "seduced" by him were usually re-educated by the teacher Henkhausen, but some children (older than fourteen) were executed as hopeless witches. Some of the Lippe clergy gave infamous advice in this difficult matter. When the clergy suggested these children be killed secretly while they were praying, in order to secure their salvation, the government did not follow their counsel.

The trials in Lemgo were Lippe's most famous because they were connected with the fight among political factions. They were also expressions of economic depression and of political upheaval during the Thirty Years' War. Lemgo's mayor, Hermann Cothmann, whose mother had been executed as a witch, was a main figure in the persecution. The previous mayor, Heinrich

Kerkmann, had also persecuted witches relentlessly. Lemgo's *Hexenbürgermeisterhaus* (house of the witch mayor), today a museum, is a witness to Cothmann's activities.

The Lippe witchcraft trials are well documented. There are comprehensive depositions of witnesses, making a microanalysis possible. The surviving protocols of the lower courts allow us in many cases to observe the "career" of a witch before her trial, sometimes for decades. These documents make it possible to show the behavior of both accused and accusers. We can discover whether or not the accused women had shown deviant behavior, compared with other suspected women who were not prosecuted. These patterns have been described in detail (Walz 1993). Witch finders played a great part in the defense against witches, but gypsies were also consulted. The Lippe population frequently consulted one of the most famous witch finders around 1650, Wicken Klaus; his magical practices were described in detail at his trial.

The local criminal procedure, codified in 1593, provided the foundation of the trials. The procedure was split into inquisition and accusation. Advocates were permitted. By about 1600, their counsels already showed arguments similar to those used by Friedrich Spee von Langenfeld some decades later, but they had no visible effect. Though Simon VI had forbidden the water ordeal (swimming test), it was applied in many trials, very often in order to shock the accused person into making a confession. Before a person was arrested and again before torture was employed, officials consulted universities, generally the law faculty of the nearby University of Rinteln. After being sentenced to death by fire, convicted witches were often "pardoned" to death by sword. In all probability, the slowdown in Lippe's witch hunts after 1660 was due more to the dysfunctional contradictions of an out-of-control epidemic than to any kind of "enlightenment."

LITERATURE

Texts provide the bulk of our information about the place of witchcraft in larger cultural contexts, particularly for the past. Witchcraft has achieved a relatively stable range of definitions in recent decades. But careful interpretation requires defining the spectrum of relations between texts and the themes or topics of witchcraft they display. Most importantly, do literary texts present witchcraft reliably? And what do we mean by *literature* and *literary*? The terms evade succinct definition. Equating literature with fiction oversimplifies many witchcraft texts: As wholes or in part, they resist categories like "factual," "historical," "fictive," or "fictitious." Understanding how texts represent witchcraft requires considering how they are produced (including conventions of genre and rhetoric) and how actual or plausibly conjectured audiences "consumed" them.

PRODUCTION

Witchcraft has been called a species of narrative, a statement that opens two possibilities.

The first possibility is that witchcraft always implied a narrative: It was a kind of "story" told about physical causation or human deviance, so "witchcraft literature" could comprise all texts mentioning *maleficium* (harmful magic), interaction with demons, and so on. By this definition, instructions for performing witchcraft could qualify as a hypothetical narrative in the second person and the future tense: "If you do this, that will happen." Similarly, an indictment for witchcraft would be a hypothetical second- or third-person narrative in the past tense: "You/She did this." These examples seem forced, however, and such an all-inclusive category would be useless.

The second possibility is that only explicit narratives—stories—describing *maleficium*, interactions with demons, or the like qualify as witchcraft literature. This is not strictly true; versified instructions about such activity would strike most readers as literature. Besides, many actual charms and spells had meter and rhyme. Yet many witchcraft texts were narratives. They told stories about persons not identifiable as the reader's (though the displacement may have been minimal, if events were presented as "news").

Stories have, in Aristotle's phrase, a beginning, a middle, and an end. The chronological sequence required by a story differentiates witchcraft narratives from witchcraft treatises, which depended on criteria other than temporal sequence, such as typologies of behavior or appearance. Analytical precision and classificatory arrangement precluded ambiguity and indeterminacy, the basis for many aesthetic effects characteristic of narrative, as well as indulgence in emotion for ends other than condemning specific individuals or groups.

These are not absolute distinctions. In fact, few witchcraft treatises were entirely analytical; most presented anecdotes about witches as evidence. Yet anecdotes never simply illustrated witchcraft analyses: They frequently told something more or something different. Narrative rhetorically exploited conditioned responses (such as the evil witch, the innocent victim), it rescued or replaced analysis when logic broke down, or threatened to (Stephens 2002, 235–238). But narrative’s richness can derail analysis. Often in Francesco Maria Guazzo’s *Compendium Maleficarum* (A Summary of Witches, 1608), so many various and strange anecdotes were cited to illustrate an argument that they blurred or even contradicted it.

In summary, witchcraft was not reducible to narrative, but narrative was essential to writings about witchcraft, even at their most unliterary. For the purposes of this encyclopedia, “witchcraft literature” has been separated from theatrical texts about witchcraft. Excluding theatrical texts from a conventional history of literature would be indefensible: Tragedies and comedies are no less literary than narrative poems, romances, or novels. And theatrical texts about witchcraft were numerous, as the entries on Drama attest.

But differences in consumption between theatrical texts and other storytelling media are unusually crucial for witchcraft. On stage, theatrical texts are intensely appropriate to witchcraft. In Aristotelian terms, theatrical texts predispose impersonation by their almost exclusively mimetic character. They display little diegesis—descriptive or explanatory narration—and abundant mimesis, or lines intended to be spoken, with accompanying gestures, by impersonating actors. Therefore, when a text presents its characters as *dramatis personae* to be physically impersonated by actors, even a solitary reader experiences the text differently from narrative. Early modern demons also engaged in a kind of theatrical impersonation, through possession or apparition, animating bodies perceptible by human senses.

Film presents comparable characteristics, but amplified and expanded. Constant technological advances make cinematic special effects ever more appropriate for presenting the wonders and illusions (*praestigia*) of demons.

Conversely, narration evokes readers’ experience of listening to a single “voice.” Voice and the illusory presence of a narrator are effects of grammar, produced by scenic description and indirect reportage of dialogue. Here again, differences are not absolute: A narrating voice can create mental “theater” when the reader visualizes the scenes it describes.

The dialogue, a genre adopted by many writers on witchcraft, presents a special case. Dialogue resembles theater by minimizing or excluding the utterances of a narrator, yet it must be consumed like narrative: An

abundance of direct speech and a paucity of action make impersonation difficult or impossible. Dialogues, like treatises, approached witchcraft scientifically. By replacing sequential analysis with debate, dialogue added a dimension of lifelikeness, and some early authors, such as Ulrich Molitor, even cast historical persons as interlocutors. Most witchcraft dialogues became treatises in disguise by preordaining the triumph of one viewpoint: The subject required that they either defend or oppose its reality. Gianfrancesco Pico della Mirandola’s dialogue *Strix, sive de ludificatione daemonum* (The Witch, or the Deceptions of Demons, 1523) accomplished this through a strong narrative line (three interlocutors successfully convince a fourth that witchcraft is real) and novel characterization (the pro-witchcraft interlocutors include an inquisitor and a confessed witch).

Understanding how texts were consumed requires identifying their implied readers. What knowledge do texts require for comprehension: Latin? specialized legal, medical, or theological expertise? Pico della Mirandola’s *Strix* was written originally in Latin, and its cultural references implied an erudite, skeptical humanist reader. It made arcane references to classical scholarship and mythology, but presupposed only superficial acquaintance with contemporary controversies over witchcraft. A year later (1524), Leandro Alberti translated *Strix* into vernacular Italian for a bourgeois and peasant audience, paraphrasing difficult vocabulary and explicating most of its arcane references. Along with implied readers, Alberti envisioned implied listeners, unable to read even simple Italian yet capable of comparing their folkloric witchcraft ideas with Pico della Mirandola’s “scientific” explanations.

The implied reader of a text exists symbiotically with an implied author. Even when the empirical author—the historical individual who put pen to paper—remains anonymous, his or her intellectual and attitudinal profile remains. If the knowledge presumed or explained identifies an implied reader, it also delineates an implied author, as does the rhetorical temperature of the writing—objective and confident, hysterical and overwrought, compassionate, judgmental, skeptical, ironic, and so on. The implied author necessarily forecasts a reader receptive or resistant to the reality of witchcraft.

The implied author attempts to influence the implied reader’s presumed reaction, in part by accepting or manipulating the conventions of genre. As treatise, Heinrich Kramer’s *Malleus Maleficarum* (The Hammer of Witches, 1486) presupposed an audience of magistrates and inquisitors schooled in syllogistic argument and worried about such things as heresy or infant mortality. The *Malleus*’s third book, demonstrating how to entrap, prosecute, and execute witches, presumed that its previous demonstrations of witches’ responsibility

had been convincing. The skeptical implied reader of Pico della Mrandola's *Strix* was expected to come to prize witchcraft for plausibly explaining the realities behind classical myth by revealing pagan deities as the demons of Christianity. Thus, he or she should have more readily accepted the reality of witchcraft, for Pico della Mrandola's classical erudition should have salvaged the intellectual respectability of the supernatural order. The scholarly alternative, a euhemeristic "deconstruction" of pagan gods as mythologized kings and warriors, would have damaged the case for witchcraft.

Aristotle's *Poetics* required probability or verisimilitude in representation. In modern philosophical terms, literature creates possible worlds. A possible world maximally resembles the actual reader's experience but is not identical to it, differing in one or more aspects. The extent of difference has generic implications for texts about witchcraft. In a treatise, an implied reader was fully expected to identify the world outside as the one described in the witchcraft text. "How-to" manuals for conjuring demons and demonological tracts describing how to discover and prosecute witches shared this trait. When a text postulated less perfect accord between the implied author's world and that of the implied reader, the latter was expected to modify belief, not take action: Rather than become a witch or witch hunter, he or she had to choose sides in the witchcraft controversy.

Two conditions make witchcraft texts seem fully "literary": The worlds of text and implied reader coincided quite imperfectly, yet ambiguity, allusion, and indirection prompted the reader to entertain an indecisive attitude toward witchcraft, neither accepting nor rejecting its reality.

Recognizably literary witchcraft texts characteristically encouraged this attitude by exploiting the theme of imagination, systematically refusing to present phenomena as either factual or imaginary, real or unreal. Nathaniel Hawthorne's "Young Goodman Brown" (1835) described a possible world where beloved elders and ethereally pure newlywed wives may be witches, the Devil may be lurking on every footpath, neighbors may be flying above the overcast clouds, and the outward appearances of "Faith"—the newlywed wife or the Christian religion—may mask the perfidious reality of witchcraft. Updated, sensationalized, and gender-reversed, the same premise animated Ira Levin's *Rosemary's Baby* (1967), in which husband, neighbors, and physician seemed to be conspiring against the heroine.

These examples display individualized psychology, attention to such aesthetic factors as narrative coherence and linguistic appropriateness, and other commonly agreed upon indices of literariness. However, witchcraft narrative necessarily explored ambiguous appearances, so literary features were not always indispensable. Though crude, anecdotes in

witchcraft indictments and treatises often resembled modern literary modes of uncanny or fantastic narration, such as in Franz Kafka's *Metamorphosis* (1915).

If the implied author suggested that witchcraft described an impossible world, his narrative would be recognizable as satire or parody. An example is Laurent Bordelon's *Histoire des imaginations extravagantes de monsieur Oufle: Causees par la lecture des livres qui traitent de la magie, du grimoire, des demoniaques, sorciers* (The History of the Ridiculous Extravagances of Monsieur Oufle, Occasioned by His Reading Books Treating Magic, the Demonic Arts, Demoniacs, Witches, 1710), whose protagonist lost his reason by reading demonologies, as Don Quixote had a century earlier with chivalric romances. Oufle's name, an anagram of *le fou* (madman), reflects his upside-down worldview.

Is a precise typology of witchcraft and literature necessary? Would a laundry list of texts with witchcraft content be more useful? Literary genres are notoriously fluid; characteristics of "literariness" itself formerly occasioned endless, fruitless wrangling. Other classifications (such as ones accounting for gender, social class, or religious creed) might be equally or more valid. But to discuss literature in the specialized context of witchcraft, some concept of "literariness" is necessary.

Implied authors, implied readers, possible worlds, and modes of production and consumption vary considerably in any cultural context. Curse-tablets, Tacitus's description of the maleficent objects found after Germanicus's death, and Lucan's episode of Erichtho are all datable to early imperial Rome, but they differ literarily as well as magically. Even greater divergence is observable among medieval necromantic manuals, the fifth book of Caesarius of Heisterbach's *Dialogus Miraculorum* (Dialogue on Miracles, ca. 1225), and Giovanni Boccaccio's story (1352) of Bruno, Buffalmacco, and Maestro Simone (*Decameron* 8.9). Since the consolidation of witchcraft mythology around 1500, the range of variation has expanded constantly: Consider, among writers included in this encyclopedia, the sixteenth-century works of John Dee, Jean Bodin, Reginald Scot, and Torquato Tasso. The twentieth-century books by Aleister Crowley, Montague Summers, Arthur Miller, and Aldous Huxley differ among themselves comparably, and the decades since the 1950s have witnessed a publication explosion in witchcraft texts, including Wiccan how-to manuals, barely disguised demonologies like Daniel Ryder's *Breaking the Circle of Satanic Ritual Abuse*, novels such as Leslie Wilson's *Malefice*, and Umberto Eco's best-selling *The Name of the Rose*.

Outside of film (one thinks of the "witch" sketch in *Monty Python and the Holy Grail*), burlesque and satirical treatments of witchcraft appear to have declined; as in the Romantic period, witchcraft is now a subject for

nostalgic or exploitative treatment. J. K. Rowling's Harry Potter novels offer the singular case of a fantasy world of "witchcraft" (mostly natural magic), in which the supernatural allegorized questions of diversity and adolescent development. Anne Rice's witch and vampire fiction performs a comparable service for a more urbane or disenchanting audience.

Historical change rearranges typologies and recontextualizes texts. Capital examples are trial records and news-mongering pamphlets or broadsheets, such as the Fugger newsletter about Walpurga Hausmännin (1587) and the numerous Elizabethan and Jacobean pamphlets. Pamphlets originally provided news and entertainment; scholars now read them for purposes of cultural anthropology, to recover neglected information about women, the poor, and the legal system. Since the 1980s, trial records have inspired microhistory, the narrative, sometimes novelistic reconstruction of common people's lives and lived realities.

Literary study is increasingly interdisciplinary, ever less purely aesthetic, ever more anthropological. In the 1960s and 1970s, structuralism, poststructuralism, and feminism prepared the revolution in attitudes to literary canons that triumphed in the 1980s and 1990s: *Literature* and *great* no longer imply each other in professional literary study. Even in literature departments, university courses increasingly scrutinize ephemeral and legal texts.

The motives of inquisitors, prosecutors, and magistrates who constructed the stereotype of the witch are overdue for attention comparable to that accorded defendants and accusers. Scholars have often regarded these men's motives as obvious, but what counts as "obvious" has changed over time. From about 1700 until the 1960s, condescension and sarcasm often inflected scholarly descriptions of inquisitorial ideology. More recently, Carlo Ginzburg has taken the opposite position, suggesting that witchcraft scholars involuntarily reproduce the inquisitors' and magistrates' ideologies and positions of power, asking the same questions they asked (Ginzburg 1989, 162–163).

But neither unintended sympathy nor facile contempt is inevitable. The concepts of the implied author and implied reader, coupled with more traditional techniques of close reading and rhetorical analysis, sharpen our perception of the type of person likely to write a particular text or set of assertions. Underneath overt expressions of smugness and prejudice, assertions about witches frequently imply enthusiasms, concerns, or dreads that remain unarticulated. Assertions are repeated within a text or among several texts; variations—or the lack of them—in witchcraft commonplaces could yield social insight under literary analysis. Texts contemporary or anterior to a given witchcraft text may discuss witchcraft only marginally or not at all, yet demonstrate related concerns and worries. More highly

literary (or philosophical or theological) texts can provide valuable perspective on unadorned official documents (Stephens 2002, 1–11, 27–31).

In *Europe's Inner Demons* (1975), Norman Cohn provided a model for tracking witchcraft stereotypes from culture to culture over many centuries, revealing submerged or implicit anxieties. Continued attention to the specific literary means used to express (or repress) such anxieties can further enrich our understanding of why witchcraft accusations were so seductive to writers in the literate subcultures of early modern Europe.

Any attempted census of witchcraft and (or in) literature will be partial—both too brief and somewhat biased. Recent collections of texts and histories of witchcraft, listed below, make the task less daunting.

LITHUANIA, GRAND DUCHY OF

From the thirteenth until the eighteenth century, the Grand Duchy of Lithuania covered the entire territory of what is now Belarus, Ukraine, Lithuania, Latvia, and parts of Russia (Smolensk and Briansk provinces), Poland (Belastok province), and Latvia (Daugavpils province). This vast and thinly populated region, with its bewildering variety of religions and complicated mixture of law courts, recorded remarkably few witchcraft trials. It is difficult to offer complete statistics, but even allowing for lacunae, no more than fifty witches perished throughout the whole territory between the fifteenth and eighteenth centuries.

Although most of these Slavic regions were soon converted to Orthodox Christianity, the Baltic territories

of the Grand Duchy of Lithuania remained pagan—in 1394, visiting missionaries noted that the local population practiced a cult of fire—until the end of the fourteenth century, when its ruler, Grand Duke Jahaila (Jogaila), became Catholic in order to acquire the crown of Poland in 1386. Protestant ideas had spread over the grand duchy by the mid-sixteenth century. The majority of noblemen (*shlyachta*) and part of the petty bourgeoisie became Protestant. Beginning in the late sixteenth century, Catholicism's influence grew. Although Catholicism became dominant, Orthodox, Protestant, and Greek Catholic Christian Churches, Islam, Judaism, and paganism still were practiced. This religious pluralism did not result in serious conflicts like those that occurred between different religions in western Europe.

One reason we know of so few witchcraft trials in the Grand Duchy is that we have only erratic records from most of its courts. A more important reason is the fact that there were fewer trials: Although the rulers were Catholic, much of the population was Orthodox—a religion that virtually ignored diabolical pacts and therefore very rarely prosecuted witches. The temporal power of the grand duchy's rulers was great, and they practiced toleration of Lithuania's inhabitants owing to its multinational society and the diversity of religions.

In the Grand Duchy of Lithuania, secular tribunals, without any ecclesiastical interference, tried all cases of witchcraft. Defendants were judged solely for damage caused by sorcery. But the system of courts in the grand duchy was complex. From the bottom up, it included communal *Kopny* courts for peasants; town council courts for municipal citizens; and *Zemski* courts for district nobles. Regional castle courts handled appeals from both nobles and commoners, and at the top sat the grand duchy's highest tribunal, the Court of Appeal.

The Grand Duchy of Lithuania had no laws against witchcraft until the sixteenth century. In 1529, the first statute dealing with witchcraft held that a criminal who through sorcery did not feel pain when tortured had to pay a fine to the plaintiff. In 1566, another statute confirmed the 1529 law. After the Third Statute of 1588 (part 4, article 30) defined sorcery as a criminal charge, these provisions passed into judicial practice. A special provision (part 14, article 18) allowed the use of torture three times a day. In Lithuania, where sorcery remained a criminal offense until 1776, Roman or canon law and Magdeburg law (which provided for towns' having their own courts) occasionally supplemented such statutes (see, for example, Collection of Early Texts 1867b, 119–120).

The date of the very first witchcraft trial in the grand duchy is unknown. One of them first happened in 1436, but there is little information preserved about witchcraft trials until the sixteenth century, when the Catholic Counter-Reformation changed the situation

and the number of trials increased. A statement that there had been damage was necessary to initiate a case. Overall, evidence about witchcraft trials is sparse. Even in the seventeenth century, for which evidence is relatively abundant, we know of only thirteen trials between 1615 and 1699 that definitely ended by burning a witch.

Complaints varied greatly. At a trial held in the castle court of Brest in 1614, Rafal Andreeuski and his wife's brothers testified that Matsei Matseevich Rakitski's wife had killed Rafal's wife with a doll (Schedule of Documents 1913, 434–435). In 1630, the *wiski* (a court official in *Zemski* courts) of Pinsk and his wife complained in Pinsk's castle court that Fyodora Vysotski, the wife of the *vozny* (a court official) of Pinsk, had given her maidservant "sorcery" (bones, nails, and sand from a village grave) to injure them (Acts of Vilna Commission 1891, 304–310). In 1638, at the *Kopny* court of Balotchychy, Homa Zhylechovets blamed a maidservant for killing his wife by putting a toad in her mistress's food (Acts of Vilna Commission 1891, 333–334). Witches used many methods of sorcery, ranging from taking milk from cows by gathering dew from fields to causing illness or death to others. Many different complaints about damage caused by witches reached courts in the Grand Duchy, but few of them explain the beginning of a trial.

Interrogation was used in witchcraft investigations. A list of questions (which have rarely been preserved) from 1630–1631 shows two *voznies* of Navahradak, Adam Tseraivich and Mikalai Petrovich, and other noblemen asking Raina Gramychyna about witchcraft. Questioned about other witches, she named two men and a woman. Raina had met them at Andrei Afanasovich's estate, because his wife had skills in sorcery. They had tried to prevent the *marshalok* (an official at the Diet) Jan Sapega from marrying by injuring his health. Raina herself admitted putting the evil eye on the *marshalok*. When the *voznies* asked why she had not confessed this before, she answered that her mouth had been shut (Collection of Early Texts 1867b, 99–100, 143–146). At the end of the interrogation, she admitted that she could heal and gave recipes. Raina was burned, but the other witches she named were not arrested.

A statute from 1566 (part 11, article 16) stipulated that defendants who had magical spells in their mouth, armpits, or hair must pay a fine. In a 1595 incident, an executioner removed the shirt of a peasant accused of stealing horses and oxen; a crust of bread fell from the peasant's armpit. This constituted proof of sorcery; without the protection of the spell, the defendant died under torture (Schedule of Documents 1913, 254–246, 248, 276).

As in neighboring Latvia, witches were sometimes "ducked" in the grand duchy. In 1615, Jurgel's wife

Sofia Sunyan, her son Gasul, and Tumelis Paulavich Daradyndzenas underwent the ordeal by water (swimming test) in a peasant or *Kopny* court in a village in Braslau province—and all three of them floated, leading to the execution of Sofia and Tumelis. Torture was usually necessary to make a witch admit guilt.

Some documentary information suggests that here, as in Russia, men were considered more powerful sorcerers than women. At least half of those burned were men. The first, Tumelis Paulavich Daradyndzenas, was accused of belonging to a clan of notorious sorcerers. Sources show Maxim Znak (burned in 1691) to have been a powerful sorcerer who named other witches; Rasol from Vertialishki was both the oldest and strongest magician in the Grodno region in 1691 (Jodkowski 1932).

Witchcraft trails ended in different ways. Some well-known sorcerers were banished from the region and burned elsewhere. Condemned to death by fire were Jurgel's wife Sofia Sunyan and Tumelis Paulavich Daradyndzenas (1615), Barys Slavinavich (1622), Hanna Paulukova Krotka (1629), Fyadora Vysotskaya (1630), Raina Gromychyna (1631), Vasil Brykun (1643), Maxim Znak (1691), Kiril Adamovich, his son Fyodor, and Palashka Seiginava (1699), and others. Lithuanian witches often remained unpunished because peasants' owners refused to present them in court; for example, in 1670, Ieranim Buchavecki protected his peasant Charchykha from a *Kopny* court.

In the Grand Duchy of Lithuania, pagan beliefs strongly influenced everyday life among nobility, townspeople, and peasants alike, but pacts with the Devil were practically unknown. For both pagans and Orthodox, as a criminal act "witchcraft" meant sorcery, and people of all strata were seldom put on trial for causing harm by such methods.

LITTLE ICE AGE

The core period of the Little Ice Age coincided exactly with the climax of witch hunting in central Europe.

Not yet well defined, the concept of a Little Ice Age was invented in 1939. Subsequently, its proposed duration—originally large parts of the Holocene (the present geological epoch, beginning about 10,000 years ago)—has shrunk to an epoch between 1300 and the 1880s, in recognition of the fact that these almost 600 years of coldness were interrupted by more favorable periods. Using Swiss data, Christian Pfister and others (1996) have identified two core phases of the Little Ice Age in the fourteenth and the seventeenth centuries. The periodizations are usually drawn from remains of the physical environment (dendrochronology, glaciology, sedimentation, pollen analysis, and the like), but witch hunts also seem to be a sensitive indicator. Climatic deterioration in the Northern Hemisphere had its greatest impact between 1560 and 1630, when the effects of global cooling were worsened by an increase in precipitation, a combination that severely hampered both wine making and wheat harvests. It has frequently been remarked that marginal wine-growing areas (Franconia, the Rhineland, Alsace, Franche-Comté, the Valais, Styria) were particularly prone to severe witch hunting.

Though persecutions for heresy were known already in high medieval Europe (circa 1000–1300), persecutions of internal enemies for their supposed influence on the physical environment began after 1300: In the early 1320s, lepers and Jews were held collectively responsible for the poisoning of wells, and Jews were held responsible for the Europe-wide epidemics of 1348–1350 known as the Black Death and for the subsequent recurrences of plague later in the fourteenth century. Famine, flooding, and high mortality in the early 1340s preceded the arrival of the Black Death in December 1347. During these decades of the first half of the fourteenth century, when a sequence of cold and long winters indicated the return of Little Ice Age conditions, the interdependence among climatic factors, crop failures, rising prices, hunger, the outbreak of epidemics, and the classical pattern of subsistence crises of Old Europe became more visible. Thus, attention shifted from epidemics to weather, and it is striking to see that the gradual emergence of the new crime of cumulative witchcraft was closely connected to the waves of climatic hardship and agrarian crises during the earlier phases of the Little Ice Age, particularly the 1420s and 1430s, when the new cumulative idea of witchcraft was fabricated in the western Alps, or the 1480s, when the *Malleus Maleficarum* (The Hammer of Witches, 1486) was compiled.

The impact of the Little Ice Age began to be felt again in the 1560s. Contemporary chroniclers such as Johann Jacob Wick from Zurich reported that the summer of 1560 was unusually wet. The following winter was the coldest and longest winter since

1515–1516. For the first time in generations, large Alpine lakes like Lake Constance froze (“*Seegfrömi*”), and the vegetation period shortened decisively. The following winter (1561–1562) was not only similarly cold but also included an immense snowfall, mentioned in a broadsheet printed at Leipzig in 1562. Orthodox Lutheran theology interpreted these events as signs that God was furious at the people because of their sins. The coincidence of coldness and wetness harmed this agrarian society by damaging the harvest, while rising prices worsened the living conditions for poorer people. During the spring and summer of 1562, a thaw and heavy rainfall caused flooding in various parts of Germany, poisoned the fields, and led to cattle diseases, rising infant mortality, and the outbreak of epidemics. After unusually severe thunderstorms hit central Europe, a fierce debate on weather making involved some leading Lutheran reformers in Germany (Johann Brenz, Thomas Naogeorgus, Jacob Heerbrand) and Johann Weyer, who exchanged the principal arguments on the subject. Simultaneously, severe witch hunts started in southwestern Germany. The mechanism of torture, confession, and denunciation turned single cases of witchcraft into witch hunts. The largest hunt occurred in the small territory of Wiesensteig, belonging to the Lutheran counts of Helfenstein, where sixty-three women were burned as witches within a year. A contemporary newsletter reported this event, making the witch hunt well known throughout the Holy Roman Empire.

Starting in the 1560s, a series of witch panics shook several European societies, followed by attempts to legalize witchcraft persecutions (for example, the English and Scottish witchcraft statutes of 1563). After the initial witch hunts of 1562 and 1563, a wave of persecutions followed the hunger crisis of the years around 1570, following the catastrophic coldness of the previous two years. But a totally new persecutorial zeal could be observed during the 1580s. At the end of the 1570s, crop failures and price increases again caused hunger in parts of central Europe, stimulating witch burnings in many places. After 1580, the persecutions began to reach levels previously unknown. Between 1580 and 1620 in the Pays de Vaud, which was under the rule of the reformed Swiss city-state of Bern since 1536, subject of the reformed Swiss town of Bern, more than 1,000 persons were burned for witchcraft. Between 1580 and 1595, hundreds of witches were burned in the duchy of Lorraine, subjects of their Catholic dukes who were heavily involved in the power struggles of the French Wars of Religion. The Lorraine witch hunts closely coincided with those in the neighboring Spanish Netherlands and in the archbishopric of Trier, where hundreds of witches were also burned between 1581 and 1595. A local chronicler, Johann Linden, canon of

St. Simeon in Trier, explains in his *Gesta Treverorum* (The History of Trier) the reasons for that witch hunt, the largest in German-speaking territories in the sixteenth century, which occurred under Archbishop Johann VII von Schönenberg (governed 1581–1599):

Hardly any of the Archbishops governed their diocese under such hardships, such sorrows and such extreme difficulties as Johann. . . . During the whole period he and his subjects had to endure a continuous shortage of grain, a rigorous climate and crop failures. Only two of these nineteen years were fertile, 1584 and 1590. . . . Since everybody thought that the continuous crop-failure was caused by witches from devilish hatred, the whole country wished for their eradication. (Linden 1964, 7:13–14)

Until recently, this explanation was not taken seriously, but research has demonstrated that the persecution was indeed not only demanded but also organized by the population. Because the legal administration of this territory was inefficient and officials were reluctant to prosecute, village committees began to extend their competence and organized the witch hunts themselves. Elected committees collected information, captured and tried the suspected witches, and delivered them to the authorities only after they had already confessed. The persecution thus resembled a popular uprising in which the people usurped functions usually reserved to state authorities. Only in 1591, when popular acceptance of the persecution in his archbishopric declined, did the electoral prince try to deprive the local committees of their power and recover his authority. A woodcut on a contemporary broadsheet hinted at the reason for these persecutions: It showed a panorama with three tremendous thunderstorms falling on villages and fields while witches flew through the air casting their spells (*Sigfriedus*, ca. 1590). Similarly, a broadsheet printed in 1590 about the witch hunt in southern Germany reads like a collection of meteorological disasters and their consequences on physical and mental health (*Erweyterte Unholden Zeyttung* 1590).

After 1586, long and cold winters were complemented by cold and wet springs and summers, thus causing hunger and epidemics and creating enormous psychological stress. In 1586, the famous collection of Fugger newsletters reported a “great fear” among ordinary people, terminology that reminds us of *la grande peur* preceding the French Revolution. These early witch hunts indeed acquired revolutionary dimensions, implicating some members of the ruling oligarchies—magistrates, clerics, even noblemen. Unlike the hunger crisis of 1570, the crisis of the 1580s endured for ten or more years. Socioeconomic explanations of the crises

indicate that since the 1560s a general decline in living standards resulted from a combination of continuous population growth and a diminishing food supply because of ecological crisis. In addition, the wine-growing areas of central Europe, from Hungary, Austria, Switzerland, and Germany into northern France, experienced a permanent decline in income due to the deterioration of wine harvests (*Landsteiner*). Basket-of-goods calculations on the basis of statistical data from the imperial city of Augsburg demonstrate that after 1586, an average craftsman with a family of four could no longer earn the necessary living costs without help from other members of his family.

The socioeconomic disaster affected society as a whole. But meteorological disfavor fell hardest on such disadvantaged areas as the Bernese highlands, the Scottish highlands, the mountainous regions of Lorraine and Alsace, the archbishopric of Trier, or the Ardennes in northern France. In these marginal agricultural regions, increasing wetness, falling temperatures, shorter growing seasons, and the increased frequency of hailstorms endangered the production of cereals and wine. After 1586, the impact of a series of cold and prolonged winters was sharpened by a period of wet and cold springs and summers. In Switzerland, snow covered the ground until late spring in 1587; snowfall returned on July 4 down to 400 meters on the Swiss plateau. Again, 1588, the year the Invincible Armada failed in heavy mid-September storms, was one of the rainiest years in history. A Swiss chronicler, Renward Cysat, reported severe thunderstorms almost daily, starting in June. It was during these two years, 1587–1588, that witchcraft accusations reached their climax in England and northern France, while large-scale witch hunts began in Scotland and Germany.

The synchronicity of accusations and persecutions in countries that were not connected by dynastic, confessional, or economic links demonstrates the importance of the climatic factor for explanation. Many individual witchcraft trials show that meteorological events contributed decisively to suspicions and accusations. These events were often supraregional or even supranational. Areas of low pressure can cover large regions; the advance of arctic air can at times harm the northern part of the Continent or even the Northern Hemisphere. What we can learn from this is that contemporary laments about decreasing fruitfulness of the fields, of cattle, and even of people were far from merely rhetorical devices; rather, they rested on empirical observation. The rising tide of demonological literature reinforced such lamentations. By the 1590s, members of contemporary elites, such as the famous French jurist Jean Bodin, the suffragan bishop of Treves Peter Binsfeld, the chief public prosecutor of Lorraine Nicolas Rémy, or the king of Scotland James VI (soon to become James I of England), all shared

the idea that witches could be responsible for the weather. In his *Daemonologie* (Demonology, 1597), James claimed that witches

can raise stormes and tempestes in the aire either upon Sea or land, though not universally, but in such a particular place and prescribed boundes, as God will permit them so to trouble. Which likewise is verie easie to be discerned from any other naturall tempestes that are meteoeres, in respect of the suddaine and violent raising thereof, together with the short induring of the same. And this is likewise very possible to their master to do
(James VI 1597, 46)

Rémy, like an ethnographer, reported detailed weather magic from Lorraine witchcraft trials that he had judged. Although Binsfeld certainly emphasized theological reasons for bad weather, his best arguments came from empirical data from his persecution in the archbishopric of Trier.

At the end of the sixteenth century, a few European states managed to escape the circle of witch belief and witchcraft persecution, since their elites stopped feeling threatened and became strong enough to suppress popular demands for witch hunts. In central Europe, however, where demographic pressure and economic depression lingered on, unstable governments remained vulnerable to new demands for persecution. Large-scale witch hunts occurred, for instance, around 1600 in Franche-Comté and some ecclesiastical territories in Germany, in the Basque region and parts of Germany from 1608–1612, and in Franconia between 1616 and 1618. Contemporary court records and broadsheets described the importance of meteorological events as triggering factors behind these persecutions.

During the third decade of the seventeenth century, when the Thirty Years' War preoccupied governing elites, organized witch hunts reached their peak in the ecclesiastical territories of the Holy Roman Empire. Once again the climax of witch hunting coincided with some extraordinarily dramatic meteorological events. It is noteworthy that contemporary accounts almost never connected these witch hunts with war, confessional strife, state building, changes in the medical or judicial system, gender relations, or whatever historians might imagine. Instead, court records dwelled upon disease and death of children and cattle, destruction of crops and vineyards. Chroniclers related such misfortunes to general meteorological developments. And historians of climate confirm their observations, in general as well as in particular. The 1620s were characterized by long and cold winters, late springs, and cold and wet summers and autumns, leading to crop failures and price increases. In 1626, during the last week of May, in the middle of the vegetation period, winter returned; temperatures

fell so low that lakes and rivers froze overnight and trees and bushes lost their leaves. Severe frost destroyed cereals and grapes, and even the grapevines. Such an event had not been recorded in the preceding 500 years (Pfister et al. 1996). The uniqueness and devastating effects of this climatic anomaly confirmed contemporary impressions that it was an “unnatural” event.

A chronicler in the Franconian town of Zeil reported:

On 27th May 1626, all the vineyards were completely destroyed by frost within the prince-bishoprics of Bamberg and Würzburg, together with the dear grain which had already sprouted. . . . Everything was frozen, which had not happened as long as one could remember. And it caused a great rise in prices . . . consequently, pleading and begging began among the rabble, questioning why the authorities continued to tolerate the destruction of crops by witches and sorcerers. Therefore the prince-bishop punished these crimes, and the persecution began in this year. (Behringer 2001, 250)

In the following years, broadsheets emphasized the supposed responsibility of witches for these severe frosts, adding later events like hailstorms, cattle diseases, and epidemics. Confessions under torture claimed to have detected a devilish conspiracy to destroy vineyards and grains for several years in order to create hunger and disease to the extent that people would be forced to eat each other. Only drastic measures by the authorities seemed capable of stopping these plans—and the measures taken were indeed dramatic. In the tiny prince-bishopric of Bamberg, 600 persons were burned for suspected witchcraft; in the neighboring prince-bishopric of Würzburg, 900; in the electorate of Mainz, another 900; and under the rule of prince-archbishop and elector Ferdinand of Cologne in the Rhineland and Westphalia, nearly 2,000.

Wherever the power of central governments, prosperity, and Cartesian rationalism increased, witch hunts were terminated during the seventeenth century. However, in large areas of central Europe, the link between climate and witch hunting remained intact. While scientists have debated the causal effects of the Maunder Minimum (the near absence of sunspot activity between 1645 and 1715), which occurred alongside the coldest part of the Little Ice Age, persecution of witches peaked around 1690, reaching its climax then in Austria, the Baltic region, and Scandinavia, and in Poland and Hungary during the first decades of the eighteenth century. In some Catholic areas of central Europe, every year with Little Ice Age types of events led to another cycle of witchcraft trials. It is more than just a metaphor that the sun of

Enlightenment melted the cold era of witch hunting. From the 1730s on, the climate, though still cold, was more stable than during previous decades. In a few backward areas of Germany, France, and Austria, witchcraft trials lasted into the 1740s, and in remote corners of Switzerland, Hungary, and Poland even into the 1770s.

Above all in central Europe, the age of witch hunting seems congruent with the era of the Little Ice Age. The peaks of persecution coincided with years of sharp climatic deterioration. Witches were traditionally held responsible for bad weather that was so dangerous to the precarious agricultural surpluses of the preindustrial period. But only in the fifteenth century did ecclesiastical and secular authorities accept the reality of this crime. The 1420s, the 1450s, and the last two decades of the fifteenth century, well-known to historians of climate, were decisive times when secular and ecclesiastical authorities increasingly accepted the existence of weather-making witches. During the “cumulative sequences of coldness” in the years 1560–1574, 1583–1589, 1623–1630, and 1678–1698 (Pfister 1984, 150), people demanded the eradication of the witches they held responsible for such climatic aberrations. The impact of the Little Ice Age increased the pressure from below and convinced some members of the intellectual elites of the existence of witchcraft. Therefore, we can conclude that witchcraft was the characteristic crime of the Little Ice Age.

LIVING SAINTS

Many religions have revered people who, for different reasons, were venerated by their contemporaries as living saints. Some experienced extraordinarily intensive contacts with the deity; some worked miracles, especially healing; sometimes their position within the religious hierarchy assimilated them to the gods. We know about such individuals in Europe since pre-Christian antiquity. The sacred kings of the Celts and Germans had some qualities of living saints, upon whom the welfare of their peoples depended. Nor was the phenomenon unknown to Jews or early Christians (Brown 1981), but its heyday was the Middle Ages. The fame of many a saint, like Bernard of Clairvaux (1090–1153), lay in his thaumaturgic miracle-working powers. When he left his monastery to visit a town, we are told, the faithful thronged around him praying for help, mostly to relieve illness or demonic obsession, and trying to pluck threads from his robe as relics. The number of living saints increased with the flowering of mysticism from the thirteenth century onward; from then until the eighteenth century, most living saints were women. Their charisma often included, besides the power to heal, stigmata, anorexia, telepathy, or the gift of prophecy. What mattered most, however, were their ecstasies, during which they received divine revelations. One can hardly imagine the throngs of admirers assembled to greet a famous visionary like Catherine of Siena (1347–1380). The phenomenon was especially widespread in Latin countries, where many kings kept a living saint at court, as Louis IX and Charles VIII of France did with the famous thaumaturge Francesco di Paula.

In the thirteenth and fourteenth centuries, such saints encountered little resistance from ecclesiastical authorities. Later, however, things changed; a general skepticism arose toward their charisma, in part because visionaries propagandistically supported both popes (at Avignon and at Rome) during the Great Schism (1378–1417) of the Catholic Church. Especially from discussing the authenticity of the revelations of Bridgit of Sweden (1307–1373), the clergy developed an "art of discernment of the spirits," a set of theological rules to discover whether a revelation came from divine intervention or from an evil spirit. From then on, living saints were carefully tested for the possibility of human deception or, more menac-

ingly, diabolical fraud. The Holy Office tried many living saints because it seemed so difficult to separate thaumaturgy from witchcraft. A charismatic leader, Joan of Arc was burned as a witch in 1431, but many thought her to be a saint (and it took nearly 500 years to certify that she was). The papacy had Girolamo Savonarola, who had claimed divine inspiration while criticizing the pope, burned in 1498.

When Reformed theologians denied the possibility of private revelations and rejected the cult of saints, the phenomenon of living saints ceased in large parts of Europe. Meanwhile, in Catholic territories, the post-Tridentine clergy exerted strict control over women who manifested charisma, and only the cults of a few mystics such as Teresa of Avila or Theresa of Lisieux found official acceptance. Now, ecstasies and revelations mattered less in the canonization processes than obedient subordination to male ecclesiastics.

Because the phenomena on which the pious based the veneration of living saints were so ambiguous, many living saints were considered demoniacs or were accused of heresy and witchcraft, even if exonerated later. This happened, for instance, to Dorothea of Montau (d. 1394), Colomba of Rieti (d. 1503), Gentile of Ravenna (d. 1530), and Domenica da Paradiso (d. 1553), all of whom the Church beatified or canonized after many centuries. Why was it so easy to mistake a living saint for a witch? Because both operated similarly in many respects and because the Devil could appear disguised as an angel, one could never know which a person was. Both pious visionaries and malignant sorceresses encountered apparitions of nonhuman men. Both told of erotic encounters: the saints of the mystical union, often narrated in undeniably sexual terms, and the witches of intercourse with an incubus. The result might even be an extranatural pregnancy—for example, St. Bridgit of Sweden showed bodily signs of bearing the Christ child each Christmas—but there were also cases of alleged pregnancies by incubi, including the Catholic claim that the Devil had impregnated Martin Luther's mother. Saints and witches both received painful corporal marks from nonhuman lovers: the saints the stigmata, and the witches the Devil's mark. Whereas the saints often claimed to have been wedded ceremoniously to Jesus (the "mystical marriage"), the witches, too, confessed to have made a solemn pact with the Devil. Both often met their supernatural or superhuman lover at a feast, be it in heaven or at the Sabbath. The same kinds of miracles were associated with both groups, especially paranormal healing and flight experiences.

In the late Middle Ages and the early modern period, therefore, a woman who manifested paranormal faculties had a chance of being seen as a living saint, but she also ran the risk of being mistaken for a heretic and witch. How she was judged depended very strongly on

her social situation and whether or not she had supporters in the ecclesiastical hierarchy.

LÖHER, HERMAN (1595–1678)

Herman Löher has left us a detailed account of his personal involvement, both as a judge and as a victim, with the brutal witch hunts that swept over the German Rhineland in the second quarter of the seventeenth century in an extremely rare book of 1676. The book is one of extremely few ego-documents (memoirs, autobiographies, diaries, or personal correspondence where the writer is continuously present in the text) containing firsthand information about the ways people experienced the terror of the witchcraft trials. Born in Munster Eifel, a small town in the duchy of Jülich not far from Bonn, Löher moved with his family in 1601 to nearby Rheinbach in the lands of the archbishop of Cologne. At fifteen, Löher joined his father in the textile trade. In 1621, he was elected burgomaster (chief magistrate) of Rheinbach; ten years later, he became one of its seven aldermen. In that year, 1631, Rheinbach became the scene of a real witch hunt under the direction of the *Hexenkommissar* (Witch Commissioner) Franz Buirmann. After 1626, witch commissioners like Buirmann played a major role in many of the trials in the archbishopric of Cologne. Local courts were powerless against these commissioners.

The first two people executed at Rheinbach in 1631 were poor and powerless. This changed, however, with the third defendant, the widow of a former burgomaster and alderman. She died during the horrible torture Buirmann had ordered. After her, an alderman and the wife of another alderman fell victim to the commissioner's brutality. As the hunt went on, it became clear that it was being used to replace the town's governing oligarchy with a new faction. During interrogations,

Buirmann forced the accused to name members of this elite as accomplices.

After a few months, when the wave was already slackening, rumors spread that there were also witches within the household of Herman Löher. By bribing Buirmann's superior, Löher could prevent himself or other members of his family from being arrested. However, in August 1636, a new series of trials began under the direction of another commissioner, Johann (Jan) Möden, and Löher realized that he had to flee if he wanted to survive. He, his wife, and his mother-in-law left Rheinbach secretly on August 3, 1636. They went first to Cologne, in order to collect the money Löher had stashed away there, before moving to Amsterdam. In the Dutch Republic, no witch had been executed since 1608, and in Amsterdam none for over forty years. Amsterdam was nominally a Protestant city, but Löher always remained Catholic. He had already acquired full citizenship in Amsterdam in November 1636 and repeatedly showed pride in the commercial success of his new hometown in his book, but this did not lead him to change his religion. In Amsterdam, all sorts of religions and confessions could worship God as they saw fit. Even though the city magistrates were required to be Reformed, they never questioned the loyalty of citizens whose beliefs differed from theirs.

Löher published his autobiographical *Höchnötige Unterthanige Wemütige Klage der Frommen Unschültigen* (Much Needed, Humble, and Woeful Complaint of the Pious Innocent) in 1676. Any hope that it would persuade authorities in the Rhineland to allow his return proved futile. In his discussion of the supporters of the trials, Löher concentrated on the works of Agricola of Sttard, Jean Bodin, and Pseudo-Laymann (so-called because a book advocating harsh treatment of witchcraft suspects was incorrectly attributed to Paul Laymann)—the same authors that his Mennonite friend and fellow textile trader Abraham Palingh had singled out in his book. In appealing to the authorities to prevent witchcraft trials, Palingh had summarized Löher's experiences. Löher in turn borrowed stories from Palingh's book. Unlike Palingh, Löher also quoted the work of such opponents as Adam Tanner, Friedrich Spee, and Daniel Jonctys, and he inserted a treatise from the Catholic priest Michael Stappert, who as a confessor had observed firsthand the injustice and cruelty with which so many witchcraft trials abounded.

At the time of his death in 1678, Löher's financial situation was rather difficult. After his death, all remaining copies of his book were confiscated by a creditor, a paper trader who probably recycled them; thus, only two copies survive today. In his book, Löher repeatedly admitted that he had little formal education, which helps explain why his book was written in a

peculiar mixture of Dutch and Low German, making it a valuable source for sociological linguists as well as for historians of witchcraft trials.

LOOS, CORNELIUS (1540 TO 1546–1596?)

A Dutch Catholic theologian, Loos was one of the most prominent opponents of witch belief and witchcraft trials. His written criticism of the persecution of witches, entitled *De vera et falsa magia* (On True and False Magic, perhaps partially published in 1592), was confiscated in 1592 by the censor; he was forced to recant his arguments in 1593. Thereafter, every criticism of the belief in witchcraft was regarded as heresy.

The son of a distinguished citizen of Gouda, Loos was born in the early 1540s. He studied theology at Louvain, earning the degree of licentiate in 1564. Ten years later, he was banished permanently after his family was involved in an unsuccessful royalist conspiracy. By 1578, Loos was apparently studying with the theology faculty of the University of Mainz. He published two anti-Protestant polemics in 1579, calling for a war of annihilation against the rebellious Dutch provinces. Around 1585, Loos moved from Mainz to Trier. Probably by autumn 1589, he was working on a rebuttal of the *Tractatus de confessionibus maleficorum et sagarum* (Treatise on Confessions of Sorcerers and Witches, 1589), which had been recently published by the suffragan bishop of Trier, Peter Binsfeld, in favor of witch hunting.

Binsfeld wanted to silence Loos's criticisms and to ensure that the *De vera et falsa magia* was not published. The official Catholic party was on Binsfeld's side; in April 1590 in Munich and Ingolstadt, it drew up statements of principle that, based partially on Binsfeld's *Tractatus de confessionibus maleficorum et sagarum* and with the participation of the Jesuits, favored severe witch persecutions and recommended the application of strict legal criminal procedures in witchcraft trials.

Binsfeld also found support in Cologne from the papal nuncio Ottavio Frangipani, who asked the archbishop of Trier to intervene and stop the publication of *De vera et falsa magia*, which Loos had already sent to a publisher in Cologne. Loos had also written letters to the city council of Trier, to highly placed churchmen, and to other unnamed individuals in which he questioned both the legality of the witchcraft trials that had taken place in Trier and the belief in witches generally. He specifically accused the elector of Trier of tyranny. Frangipani accused Loos of having sent his book—which allegedly contained both errors and new ideas—to be published without the approval from the censor, and he demanded that he be given a copy to examine. After the nuncio had read the text, he ordered that its printing cease immediately.

Nothing remains of *De vera et falsa magia* except a few publisher's proofs, discovered in 1888. The complete manuscript has disappeared; only one handwritten section survives in the City Library in Trier, which contains the first two of what the index indicates would have been four books. In his text, Loos referred to witchcraft trials that had occurred in Trier and also attacked Binsfeld's arguments with scathing derision. Drawing almost exclusively on the Bible, the Church Fathers, and classical authorities, Loos argued that it was impossible for the Devil to appear to humans in corporeal form or to have sexual intercourse with them; he also denied such other elements of witchcraft belief as the supposed ability of witches to fly and to cause bad weather. In a radically critical rejection of the scholastic mode of thinking adopted by Binsfeld, Loos showed himself an adherent of humanist philological textual analysis.

Loos was particularly skeptical about the value of the confessions and denunciations against their alleged coconspirators made by accused witches, thus destroying the basis of Binsfeld's arguments in favor of witch hunts. In Loos's opinion, such confessions and denunciations either came from mentally disturbed individuals or were the result of horrible torture. In emotional tones, Loos emphasized that by means of the witch-trial "machine," innocent people had been executed. He also hinted at the possibility that accusations of witchcraft and witchcraft trials could be manipulated for purposes other than the ostensible persecution of witches. Territorial lords who tolerated witch hunts Loos labeled tyrants. For this Dutch theologian, witch beliefs—along with Protestantism—constituted tools by means of which the Devil sought to imperil the spiritual welfare of true Christians. Those who persecuted witches were thus, according to Loos, the real adherents of the Devil, who damned their souls by shedding innocent blood.

Arrested and imprisoned in the prince-abbey of St. Maximin, Loos had to recant his ideas formally on

March 15, 1593. In 1599, Martín Del Rio published a copy of the recantation, attested by a notary. Its consequences are clear: Together with the theological statements drawn up at Munich and Ingolstadt in 1590, Loos's recantation made it impossible for any Catholic to criticize witch belief without being branded a heretic. New ways of arguing against witchcraft trials thus had to be found, such as those presented by other Jesuits, by Adam Tanner, and especially by Friedrich Spee in his fundamental criticism of witchcraft trials, *Cautio criminalis* (A Warning on Criminal Justice), in 1631. Banned from the diocese of Trier, Loos went to Brussels, where he was given a prebend in the cathedral. Here, he repeated his arguments against belief in witches and witchcraft trials; as a result, he was again incarcerated and was put on a diet of bread and water, although he was released after a relatively short time. Loos died before action could be taken for a third time against his criticisms of witchcraft trials.

LORD'S PRAYER

In the New Testament, the Lord's Prayer is transmitted in two versions: Matthew 6:9–13 and Luke 11:2–4. It is related to Jewish prayers (for example, the Kaddish). The last bidding (numbered as the sixth or seventh) is "but deliver us from evil." *The evil* is a genitive (*apo tou ponerou*), so it has been discussed since ancient times whether it should be understood as a masculine form (referring to the Devil) or as a neuter form (referring to evil in general). The Greek Fathers interpreted it as

masculine, St. Augustine as neuter. Even during the Reformation, the debate continued.

Prayer, in general, is related to incantation. And the prayer of a developed religion, which is communication with a god as supplication or thanksgiving, can easily be used in magical contexts, giving it the primitive function of a spell. The bidding mentioned above suggests that the Lord's Prayer was especially suitable for use in apotropaic contexts, and it was used so in many functions and forms against demons and witches. It could be spoken, written on amulets, or even buried in the ground. It could protect harvests from hailstorms by speaking only the fourth bidding ("Give us this day our daily bread"). It was also prayed to protect newborn children. Above all, it was thought efficacious for driving away demons and witches, often combined with the sign of the cross. Inscribed in a magic circle around a person, it would protect him from demons.

Its magical function became especially clear if it was prayed backward: Then, it worked as black magic, causing harm to somebody. The magical function is also shown in the fact that it usually worked only in combination with a certain rite, for instance, spitting or using rue against witches. Often it was said as a conclusion to a series of incantations. Its use in incantations against disease was very common and departed from the normal form by leaving out the "Amen." Repetition (three, seven, nine times) also shows its magical function; there was even a superstition that praying it seventy-seven times healed every disease. It was often used against fever and for stopping blood, but it was also used for the salvation of the dead. The exceptional holiness of this prayer is shown in the belief that if a person interrupted it by noise when it was being spoken in church, he or she would die.

LORRAINE, DUCHY OF

Records of nearly 2,000 trials and over 1,400 executions for witchcraft have been preserved from the duchy of Lorraine, omitting the duchy of Bar and numerous enclaves belonging mainly to the prince-bishops of Metz, Toul, and Verdun (for which relatively few records survive). Such figures place this independent

bilingual duchy, a buffer state separating the Holy Roman Empire from the Kingdom of France, with a total population of approximately 400,000, among the worst witch-hunting regions of Europe; Lorraine's rate of executions per thousand population in its French-speaking heartland ranks second in French-speaking Europe. Lorraine was permanently united after 1506 with the smaller duchy of Bar to the west, and the dukes of Lorraine owed feudal allegiance to the Holy Roman Empire for most of their lands, but they also owed homage to the kings of France for half of Bar.

Unusually rich local financial records record expenses from over 1,000 executions in Lorraine between the 1470s and 1630s. During the peak era of trials (1570–1630), these records are almost 90 percent complete for Lorraine's Francophone parts, and because every execution represented a justifiable public expense, local officials invariably recorded whenever witches were burned. Included among these same financial records, in order to justify claims for reimbursement, are partial trial records for over 350 defendants. Lacunae push the probable total number of executions to about 1,600—slightly more than half as many as previously supposed. Although Lorraine's probable overall total of witchcraft executions matched or even exceeded the estimated totals from many of the “superhunts” sponsored by Catholic prelates in western Germany, the numbers from its French-speaking heartland were lower than those from the Pays de Vaud in French Switzerland. During the peak of witch hunting in both places (1590–1630), Protestant Vaud, with a population much smaller than that of Francophone Lorraine, averaged thirty recorded witchcraft executions per year against only eighteen for Catholic Lorraine.

Several scholars have demonstrated recently just how heavily this region was affected by witchcraft trials (Biesel 1997; Briggs 2002). Its earliest known executions for witchcraft occurred in both the duchy of Bar and Lorraine itself, from the 1470s until the beginning of the sixteenth century. After a long hiatus, a few dozen witchcraft executions took place in mid-sixteenth-century Lorraine. Apart from these episodes, Lorraine's witchcraft executions were spread uninterrupted over two generations (1570–1635). However, these executions were distributed unevenly across its three principal geographic parts. Most of them occurred in the Francophone heartland *bailliages* (bailiwicks) of Nancy and Vosges; there were hundreds more in the Germanophone *bailliage d'Allemagne* in the northeast. However, there were relatively few executions in the western duchy of Bar, about half of which belonged to the huge zone supervised by the *Parlement* of Paris (a sovereign judicial court, with jurisdiction over approximately one-half of France).

There is one key explanation for Lorraine's grim record. This bilingual but solidly Catholic duchy produced a

well-known demonologist, Nicolas Rémy. Rémy composed his witch-hunting manual, the *Daemonolatria* (Demonolatriy), soon after being appointed Lorraine's *procureur-général* (public prosecutor), in 1591, and he published it four years later at Lyons. Having previously served fifteen years on the duchy's highest court, the *Change de Nancy*, he had practical experience that no other author on witchcraft could match. (Lorraine had no true appellate court: The *Change* merely exercised an ill-defined supervision over the proceedings in the local courts, which regarded its comments as advisory and occasionally disregarded them.)

With typical late-humanist bombast, Rémy boasted in his preface that he had prosecuted more than 900 people who had been executed as witches during the previous fifteen years, but he named only about 125 defendants, extremely few of whom can be traced in Lorraine's abundant fiscal archives (and some of them were not executed). Instead, Rémy's significance lies in the fact that he and his son Claude-Marcel occupied the post of *procureur-général* to the duchy of Lorraine for forty consecutive years after 1591, thereby making it the largest European state with chief prosecutors who consistently encouraged rather than curbed witchcraft prosecutions throughout the worst period of witch hunting in western Europe. The influence of both Rémys was indirect but real: Their commitment ensured that the dukes would not question the persecution, while the *Change* was highly unlikely to challenge local courts on witchcraft when the public prosecutor held such a high-profile public position.

Lorraine's remarkably abundant local financial records, supplemented by hundreds of trial fragments, describe more than twenty trials and executions for witchcraft between 1477 and 1486 and another cluster of witchcraft trials in its Francophone heartlands between 1544 and 1552: Ten witches were burned in four districts in 1545, six more in 1550. After stopping completely between 1555 and 1569, witchcraft trials resumed there during the 1570s; for the first time, they included Germanophone Lorraine. Despite very incomplete financial records, at least seventeen different districts recorded witch burnings during the 1570s; overall totals averaged almost six executions annually. In the following decade, financial records improved and the number of recorded witch burnings more than doubled, accelerating to about thirteen victims per year across Lorraine's Francophone areas, with Germanophone districts adding another four or five executions per year. For the first time, more than ten people were burned as witches in one year in a few districts (in St.-Dié in 1583; in Homburg in 1586; in Bitche in 1588; and possibly in Dieuze in 1586).

After Rémy's appointment as *procureur-général*, nearly complete financial records show a further increase to about eighteen executions per year from 1591 to 1600 in Francophone Lorraine, although the

highest totals of the early 1590s came from Germanophone districts (Dieuze, Wallerfangen, Val-de-Lièpvre, and Homburg). While the two generations of Rémys ran Lorraine's prosecutorial apparatus, recorded executions for witchcraft in Francophone Lorraine remained at approximately constant levels: From 1591 until 1630, one can locate almost 740 recorded burnings, over eighteen per year. As in the neighboring bilingual duchy of Luxembourg, Lorraine's Germanophone districts, the sparsely populated *bailliage d'Allemagne* (Hiegel 1961), seem proportionately more heavily affected by witchcraft trials than its Francophone regions, especially in the early 1590s and again from 1618 to 1621. Meanwhile, far sketchier financial records from the autonomous duchy of Bar, where the Rémys had no authority, suggest a probable total of fewer than four witchcraft executions per year between 1580 and 1630, in a region midway in size and population between Lorraine's Germanophone districts and its Francophone heartland.

One southeastern district, produced a disproportionate share of Lorraine's executions for witchcraft. St.-Dié, with less than 10 percent of Lorraine's Francophone population, accounted for over 35 percent of the recorded totals of executed witches from two dozen Francophone districts during the major persecutions between 1591 and 1630. Overall, 300 people from this single district were burned as witches, all but ten of them between 1580 and 1632. One possible explanation for this grim record is that, unlike most other parts of Lorraine, much of this district belonged to three great ecclesiastical lords (the cathedral chapter of St.-Dié and the abbeys of Etival and Moyeu-moutier). Each possessed the right of high justice and hunted witches enthusiastically, but they all used ducal officials to endorse their sentences and—because ecclesiastical officials should never shed blood—paid them to carry out the actual burnings.

In Lorraine, witchcraft persecutions extended upward to the ducal household after 1600 and became notable for the high rank of those accused. In 1604, after Bernabite experts, a cardinal and a papal legate, had been brought from Italy to conduct prolonged exorcisms on the duke's crippled second son, a minor court official was finally accused and burned for bewitching the child. A few years later, the same monks exorcised the cardinal's cousin, a bishop of Verdun who had been bewitched into marriage (because of his kinship with the ducal house, the bishop's career was unaffected by this peccadillo). In the 1620s, as Lorraine's annual averages of witchcraft executions dropped off to about ten per year before their final surge in 1629–1630, two other prominent men were burned for this offense. The first, a physician attached to the ducal family, was convicted of causing the demonic possession of an extremely devout noblewoman with pretensions to sainthood (Delcambre

and Lhermitte 1956). During her exorcisms, she also accused a high-ranking Franciscan, who fled to France in order to avoid arrest and then defended himself in a pamphlet. In a transparently political trial of 1625, a courtier and key adviser to the former duke was burned soon after his patron's death, charged with bewitching the new duke's marriage to the previous duke's heiress four years before; another official of the former duke met the same fate in 1631.

Lorraine's new ruler soon confronted the novel problem of a demonically possessed village, Mattaincourt. Its parish priest, a key adviser to Duke Charles IV and now venerated as a saint, ultimately had to resign because neither he nor anyone else could control the Devil's public scandals in his church whenever Mass was celebrated. Before this scandal ended, it had evolved from unsuccessful exorcisms into the largest single witch hunt in Lorraine's history. Over forty people were burned for witchcraft, most of them accused by demonically possessed adolescents. In order to end this panic, eight underaged witches, too young to be executed, had to be quarantined for over a year. Mattaincourt's hitherto-unknown tragedy offered a Catholic version that foreshadowed the all-too-famous developments sixty years later among the Puritans of Salem village in Massachusetts. Widespread attacks of plague, coupled with the French invasion and occupation of Lorraine, effectively ended Lorraine's prolonged witch hunts in the early 1630s.

LOUDUN NUNS

The spectacular exorcisms of Loudun's Ursuline nuns in the 1630s played an essential role in the most famous

witchcraft trial of seventeenth-century France. It is arguably the best-known witchcraft case in European history, its historical fascination paralleling that of the Salem witchcraft events in America. Recent generations have portrayed the nuns' torments on stage, in films, and even in an opera. The episode became so famous for at least two reasons: in part because thousands of people observed the extraordinary recorded behavior of the nuns in very unusual public exorcisms, and in part because a prominent priest, whom many believed innocent, was executed for causing the possessions. Moreover, there has been continuing debate ever since over what roles the principal characters played and why, up to and including King Louis XIII and his first minister, Cardinal Richelieu. Furthermore, this case does not stand alone; it was the second of four connected French cases of convent "possessions," preceded by one in Aix-en-Provence and followed by cases in Louviers and Auxonne.

In the western French town of Loudun, the Ursuline convent began experiencing multiple assaults of demonic possession in 1632. Led by their mother superior, Jeanne des Anges, the nuns accused a local parish priest, Urbain Grandier, of being the author of these possessions. He fought against these accusations but was eventually arrested, tried, and, in the words of his sentence, found guilty "of the crime of sorcery, evil spells, and the possession visited upon some Ursuline nuns of this town" (Bibliothèque Nationale, Fds fr. 24163).

Grandier was a brilliant young parish priest assigned to Loudun in 1617. At this time the town was part Catholic, part Huguenot, each fearing the strength and intentions of the other. Catholics hoped that the handsome, charismatic young priest would win many converts. For twelve years he was a great success; but then, almost certainly, he seduced Philippe, the daughter of his friend, Louis Trincant, one of Loudun's foremost citizens and a man whose widespread family connections reached up to Cardinal Richelieu. The whole Trincant clan suddenly became Grandier's implacable enemy. He could not be accused of Philippe's seduction without ruining her name; Trincant avoided this by accusing him of a hidden life of lechery with his female parishioners. The priest, constantly under attack during the coming years, ultimately fought off these accusations. But in the meantime, his reputation and the stories about him had reached inside Loudun's Ursuline convent.

The convent had opened in 1626 and had grown quickly. The nuns were very young, including their mother superior, Jeanne des Anges, who at the beginning of the possessions in 1632 was still only thirty years old. She was a clever, strong-willed leader, ambitious and determined to make her convent a great success. She was also a manipulator and had a tendency to severe nervous problems under stress, for which she had to be treated from time to time by Loudun doctors.

In late September 1632, one of her young nuns had a nighttime apparition. The priest who gave religious direction to the convent had recently died of the plague; one night his ghost appeared to the nun and begged for prayers. Shaken, she reported this the following morning. Jeanne des Anges accepted the apparition as genuine. The frightened nuns, obsessed by the thought of the specter night and day, prayed earnestly, but within a few days the old priest was forgotten and the charismatic but supposedly libertine Grandier, whom the nuns had never met or even seen, had taken his place in their thoughts. From now on, the nightly invasions became decidedly erotic. Jeanne des Anges said in her autobiography that "after the demons had fully aroused in us the passion of love for this man, he did not fail to come at night into our house and into our chambers to solicit us to sin" (Legué and Tourette 1985, 67). Soon the nuns began to experience extraordinary convulsions, uncontrolled laughter, running, swearing, screaming, and blaspheming. They lost all self-possession. They spoke in strange voices. These shocking events were happening to young women who were related to leading families in the town. Clearly, in the minds of most observers, they were possessed by devils. Exorcisms were begun, and Jeanne des Anges's "demons" accused Grandier of having brought all this about.

One of the chief exorcists was Trincant's nephew. It was he who first compared the case of Grandier to that of Louis Gaufridy, the priest who had allegedly caused the demonic possession of another convent of Ursuline nuns at Aix-en-Provence in 1611. The Loudun exorcisms, initially started in secrecy, were then extended to include an audience of local gentry and ultimately became public extravaganzas open to crowds from far and wide. The onlookers, as many as 2,000 at a time, were amazed at the contortions, the obscenities, and the immodesty of the young women. A highlight of one performance came when Jeanne des Anges vomited up a piece of paper, allegedly a pact that Grandier had made with the Devil and signed with his blood. It still exists in the Bibliothèque Nationale in Paris (BN, Fds fr. 7618). Many believed everything they saw and were told, although some were skeptical and thought the exorcists were manipulating the nuns. Then the exorcists claimed that the Devil could be forced to tell the truth under exorcism—a proposition opposed by leading Catholic theologians of the time. This led to accusations of witchcraft against some of Grandier's friends, made by devils under exorcism, and created a widespread fear that a general witch hunt was about to begin. Fortunately, Grandier's friends were too powerful to be successfully attacked. Meanwhile, Grandier fought back against his accusers. By late 1633, the case was becoming a national drama.

Trincant and his supporters now appealed to Richelieu and the king to intervene. The question as to

The 1634 execution at Loudun of the French parish priest Urbain Grandier, the victim of the most famous witchcraft trial in Europe. To the left are the demonically possessed nuns being exorcized. (TopFoto.co.uk)

why the Crown acted is still unresolved. Perhaps it was important to avoid widening a breach between Huguenots and Catholics in Loudun; perhaps the moral issue of a priest seducing a parishioner and going unpunished was a factor. Whatever his motivation, the king ordered an inquiry, with the explicit purpose of finding Grandier guilty as a sorcerer and punishing him. In the trial some months later, seventy-two witnesses came before an assembly of experienced judges and testified against Grandier. The court found him guilty, and he was burned at the stake the same day before a crowd of thousands.

It was thought the possessions would end when their alleged instigator was dead, but they did not. This raised some doubts about the validity of all that had happened. Meanwhile, the nuns were left in poverty, with their school closed, no money coming in, and their reputations in tatters. They were exorcized for months and sometimes years; Jeanne des Anges was only finally cured in 1638. Some supporters came to their aid, but it was Jeanne des

Anges who saved her convent. As she recovered, “miracles” occurred, and she became famous. To those who believed her, she was no longer a woman attacked by the Devil for her weakness and sins but rather a prey chosen as worthy of all he could inflict. Her convent, and she herself, became a center for visitors and pilgrims. Many regarded her death as that of a saint. Like many other French convents, the Loudun Ursulines later fell on hard financial times, and their house closed in 1772.

UNRESOLVED ISSUES

Since the day of Grandier’s execution on August 18, 1634, debates have raged over this case. Time has answered some questions; many are still in doubt. The very first issue raised was whether the nuns were truly possessed or sick or charlatans—or some combination of these. If they were sick, what was the cause? If they were charlatans, who was instructing them and teaching them what to do? Then there are questions about why Richelieu involved himself so deeply in this

case. Were his primary concerns reasons of state, moral issues, or personal revenge? All have been put forward.

And was Grandier really the libertine he was accused of being? Both direct and indirect evidence suggests that he was, but was that sufficient reason to put him to death if he had not caused the possessions? Was he eliminated to avoid an open and perhaps murderous rift developing in Loudun between the Huguenots and Catholics? Then there are the questions relating to the Church. Why was his bishop so determined to ruin him? Why were the exorcists permitted to perform public exorcisms, contrary to well-established general practice? To what extent were all these events simply reflections of family and personal conflicts in a provincial town at a time of great tension?

What we do know is that the questions raised about the case played their part in the eventual decline of witch hunts in France.

LOUVIERS NUNS

An outbreak of demonic possession in a convent at Louviers in Normandy in the 1640s became the last in a French series of incidents in which possessed nuns made successful accusations of witchcraft against their spiritual directors.

In late 1642, at the Hospitaller convent of Ste.-Elisabeth and St.-Louis, several nuns began to display symptoms of demonic possession. They claimed the cause was the body of their recently deceased spiritual director, Father Mathurin Picard, who they said had been a witch. They also accused another nun, Madeleine Bavent, of witchcraft. Public exorcisms

ensued, at which the nuns accused another priest, Father Thomas Boullé, and a former mother superior, Françoise de la Croix. The *Parlement* (sovereign judicial court) of Rouen executed Father Boullé for witchcraft in 1647; Father Picard's bones were exhumed and burned with Father Boullé. The case against Madeleine Bavent was left unresolved; she died in an asylum in 1653. The accusations against Mother de la Croix never reached court. For exorcists, the case was a *succès de scandale* that promoted the value of exorcism.

Major possessions at Ursuline convents in Aix-en-Provence (1609–1611) and in Loudun in the 1630s provided a model for the incidents at Louviers. For nearly two years, exorcists flocked to the convent from Normandy and beyond to confront the possessed nuns, performing over 100 public exorcisms. These were scenes of high drama, in which the women writhed and wailed—behavior supposedly signaling torture by demons. Exorcists themselves also resorted to violence at times, seeing the women as no longer human but merely shelters for devils who must be obliged to submit to the Catholic Church. Manuscript and printed accounts of the case appeared over a period of twelve years (1643–1654). It inspired around thirty-five printed works, a number exceeded only by the Loudun case, which led to fifty-four works. The tragedy of Louviers is that of the considerable literature the possession generated, very little concerned Thomas Boullé, its chief victim. Instead, exorcists, their supporters, and their opponents brought to Louviers their own polemic agendas, and a widespread fascination with lurid possession cases in this period ensured a readership for their works. Some major texts merit analysis.

According to one exorcist, Esprit du Bosroger, a Capuchin priest, the trouble had started in the 1620s, when the convent's first spiritual director, Father Pierre David, had supposedly spread "diabolical" devotional practices of "illuminism" (meaning overzealous, mystical, and unapproved spiritual practices) in the convent. Bosroger published a full account of the case in 1652, entitled *La piété affligée, ou Discours historique & theologique de la possession des religieuses dites de Sainte Elizabeth de Louviers* (Piety Afflicted, or Historic and Theological Discourse of the Possession of the St. Elizabeth Nuns of Louviers). The supposed illuminism–witchcraft link became a distinctive feature of this case. Both illuminism and public exorcism are typical aspects of the intense Catholic spiritual revival characteristic of baroque France.

Another exorcist, Father Thomas Le Gauffre, saw the possessions as an opportunity to promote the cult of his deceased friend, the influential Father Claude Bernard (d. 1641), known as the "poor priest." Bernard had successfully performed exorcisms in his lifetime, and Le Gauffre sought both to emulate and venerate Bernard

by using some of his personal relics to exorcise the nuns of Louviers. Le Gauffre published several accounts of successful exorcisms using Bernard's relics, but the sainthood campaign did not advance very far.

After Boullé's execution in 1647, Madeleine Bavent remained in jail, her own fate still undecided despite her confessions of witchcraft. An Oratorian priest named Charles Desmarets undertook to defend her reputation—and make his own—by publishing *Histoire de Magdelaine Bavent, Religieuse du Monastère de St. Louïs de Louviers* (The Story of Magdelaine Bavent, Nun of the St.-Louis Convent of Louviers). The book mixed excerpted interrogations of Bavent with a long autobiographical piece, reputedly dictated by Bavent at her request. Desmarets's account tried to demonstrate, first, that Bavent's confessions to the *Parlement* of Rouen had been obtained under duress due to the pressure of continuous new accusations put forward under exorcism by the convent's "demons" (principally the demon of sister Anne Barré, named "Leviathan"); and second, that her new confession was in effect the first time Bavent had been able to confess fully and honestly, having been obstructed by a succession of corrupt spiritual directors and hostile female superiors at her convent.

Some French critics again argued, as at Loudun, that exorcists were frauds, exploiting exorcism for malicious or self-promotional ends. Pierre Yvelin, a doctor at the court of the regent, Anne of Austria, had visited the convent early in the case and wrote two short skeptical accounts. At this time, French physicians were divided over the question of possession, all allowing it as a possibility but often refuting individual cases. Two local Norman doctors, Pierre Maignart and Jean Lempèrière, who supported the diagnosis of possession at Louviers, replied aggressively to their Parisian colleague in print. The increasingly spiteful debate was only curtailed when the court in Paris intervened.

LOVE MAGIC

Multifarious magical rituals devised to gain power over other people's emotions (especially sexual desire) through the subversion of free will constituted love magic. As the term reveals, love magic was commonly used to arouse passion and to bind unwilling lovers. In more aggressive forms, it was aimed at destroying unfaithful lovers. The experiments or techniques of love magic could be learned by anyone, female or male, young or old. In practice, however, one can detect a noticeable gender bias: The practitioners and users of love magic in Mediterranean Europe were commonly female laypeople, or less frequently, male ecclesiastics; only in southern Italy do users seem to have been predominantly male and from the laity. Its many practices make it difficult to draw any strict boundary here between learned and popular culture or between religion and magic. Everything rests on the beliefs that feelings can be manipulated through external events and that lovers can be entirely controlled by the arousal of discomfort and love sickness. The rituals rely on both holy and demonic sources.

FUNCTIONS AND USERS

Love magic functioned as a means to cope with emotional insecurity and with the anxieties of everyday life by transforming unlucky circumstances into better ones. Often love magic involved a threat of physical distress: Victims should suffer and be deprived of food, drink, sleep, and power until the user's desires were met. Love magic was an attempt to gain power over the feelings and actions of another person with the aid of the supernatural. Behind this aspiration at gaining such power stood emotional anxieties, especially of women in Mediterranean Europe. Their amorous anxieties were reflected through a wide array of practices that revealed the "different stages of love" and the "psychological states" (Sánchez Ortega 1991, 63) experienced in a sexual relationship or in marriage.

Divinatory experiments promised useful information after a lover, or more rarely a husband, had disappeared. More generally, a woman could assess her chances on the marriage market. Primarily, however, practitioners of love magic sought to arouse affection, love, or even hatred. They intended to compel unwilling lovers to appear and to fulfill their erotic and amorous desires. Love magic was used not only to bind people (and male members) and force them into marriage but also to destroy already-existing relationships. Rituals of love magic were appropriate when a man and a woman had just met, but they could be applied at any time during a partnership or marriage. Married women relied on love magic to bind their lovers or to make their husbands treat them with greater respect and care; prostitutes used different techniques to attract and hold clients.

BELIEFS AND PRACTICES

Love magic covered a multitude of differing practices that are not easily categorized because they often overlapped. Divinatory experiments, for example, encompassed elements of necromancy or conjuration; others were merely superstitious rituals. They all had, however, the advantage of being simple and cheap. The easiest way was to count out a handful of beans while chanting “He loves me, he does not love me.” Another, even more popular experiment in northern Italy and Spain was casting beans or casting a rope. The pattern in which the beans or the rope landed after being thrown into the air symbolized the degree of intimacy between two lovers. This ritual was commonly preceded by a prayer to St. Helen or to St. Ursula and by making the sign of the cross over the beans. Alternatively, other fortunetellers used fire, a sieve, special cards, or scissors for the same ends.

Charms, incantations, and conjurations were more acquisitive in nature. Some of them were spread throughout Europe, whereas others were particular to a specific place. Some love charms and incantations were inspired by official rituals of the Church, such as praying on a rosary or saying a “prayer” (Key of David). They might call on the Virgin Mary, the saints, or the Holy Spirit, and they might require the use of blessed candles or other religious apparatus for their efficacy. They might appeal to events of religious legends or sacred history, pleading, for example, that the Virgin Mary make a certain person feel the love she felt when giving birth to her son. Like this example of sympathetic magic, many recitations were based on well-known aspects of biblical teachings and Christian doctrine. In early modern Venice, for example, Jesus’s holy passion became a common cultural image to induce pain and make the beloved suffer for the lover just as Jesus had suffered for mankind. Additionally, devotional or simple wax or pasta statutes were made (or bought) in the name of the person against whom the magic should work. They were punctured with pins or bound with string, but the action was always accompanied by words—such as the incantation of Sant’Orsola to cause impotence—creating an analogy between the object and the victim. In this cosmology, “Emotions, like physical pains, could be the result of external events and could readily be ascribed to other people, their source sought outside rather than in the self” (Roper 1994, 213).

Assistance was sometimes sought from priests—not always with their knowledge. “Prayers” were secretly spoken during Mass when the priest was making the sign of the cross over the Eucharist. Objects and magical formulas were placed under the altar, attempting in this way to absorb the liturgical power of the Mass. Some priests also willingly performed masses over magical objects or baptized profane things, most commonly a magnet. Baptized in the name of the

desired person, such magnets would attract the beloved through their innate power. Bodily fluids, like menstrual blood, were mixed with the wine of the Eucharist or with herbs like sage or rue (picked at dawn). When drunk by the desired person, they were believed to be an excellent aphrodisiac. Alternatively, a consecrated host was added to the food or wine of the desired person. Not only the ritual expertise of priests but sacramental objects in general (holy oil, holy water) were central to a variety of love magical practices.

Other magical rituals, conjurations especially, derived their power more clearly from demons and spirits (demonic magic). Unlike necromancy, which appealed to God in order to force the demons into obedience, in conjurations God and Christian elements were excluded from the ritual proceedings. Images of saints were removed from the room where the conjuration took place, as was the cross from the rosary. It was by the power of words alone that the evil spirits fulfilled the sorceress’s will. Spells that were placed on body and mind would command the spirits (with variations) to make a certain person unable to eat, sleep, think, write, read, or have sex unless he came to the woman and complied with her will. The aggressiveness of these practices lay in the attempt to destroy the will of another person entirely through especially violent metaphors.

PROSECUTION

The vast bulk of documentation of prosecution for love magic comes from Mediterranean Europe, mainly from northern Italy and the Iberian peninsula in the late sixteenth and early seventeenth centuries. However, love magic was a common allegation in fourteenth-century France and in medieval England. Two women were burned for using love magic in 1390 by the *Parlement* of Paris (sovereign judicial court, with jurisdiction over approximately one-half of France). The Mediterranean Inquisitions prosecuted love magic with increasing frequency in the climate of the post-Tritendine reform and convicted people of various offenses, from the holding of heretical opinions to coercion of free will to apostasy. These “superstitions” were prosecuted with a comparatively lenient approach by the Holy Office, which distinguished between professional sorceresses (who often claimed economic motives) and simple users of love magic. Whereas the former had to endure exile and whipping, the latter were commonly freed after an abjuration.

LOWES, JOHN (CA. 1565–1645)

Vicar of Brandeston in Suffolk, the most prominent victim of the 1645 panic instigated by the self-appointed "Witch Finder General," Matthew Hopkins. Although male defendants were relatively rare in English witchcraft cases, and men of gentry status rarer still, the case of John Lowes fits patterns from continental witch panics by proving that no one was exempt from accusation when faced with an investigator of Hopkins's tenacity at a time of enormous unrest in England.

Lowes was a highly unusual vicar. Educated at St. John's College, Cambridge, he began preaching at Bury St. Edmunds in 1594. Appointed to a living at Brandeston in 1596, he married a local woman in 1599. In the next half-century, Lowes was rarely at peace with his neighbors. He insisted on a type and intensity of preaching that annoyed his parishioners. Accusations of Catholicism and sorcery were made against Lowes when he was in his forties, and he was later accused of accompanying a cunning man to a fair to buy "popish" trinkets. But these charges were probably unfounded; it seems more likely that his leanings were Puritan. As early as 1594, he had been summoned before a synod at Ipswich for failing to adhere to the rites of the Church of England. Complaints from his parishioners about his preaching and doctrine even reached the prestigious Court of the Star Chamber in Westminster.

Although Lowes was indicted (and acquitted) twice for witchcraft, his offenses were mostly secular. In the Star Chamber, it was alleged that Lowes fought with his neighbors and launched many lawsuits. In the early 1630s, he was also indicted in the Court of King's Bench for "barratry," or vexatious litigation. In 1642, a pamphlet entitled *A Magazine of Scandall* noted that a petition had been raised to eject Lowes as a scandalous minister. It also damned Lowes as a "common Barrettor," adding that he kept company with witches and used their services. It even alleged that he had threatened to burn the houses of anyone who accused him of witchcraft. The fact that he had protected an accused witch in Brandeston thirty years earlier made him even more suspicious.

The arrival of Matthew Hopkins at Brandeston in 1645 provided the catalyst for accusations that would destroy Lowes. His neighbors charged him with a range of *maleficia*. For example, a Brandeston deponent, Nathaniel Man, testified that Lowes had threatened him. Man's child sickened and died soon afterward, a direct result of the witness's previous dealings with Lowes.

Lowes—by this time in his eighties—was taken to Framlingham Castle, where he underwent the swimming ordeal in the moat. Subsequently, he was chased around a room until exhausted and, like other East Anglian suspects in these trials, deprived of sleep so that delirious confessions could be extracted. Lowes finally admitted that he kept seven diabolical imps, the largest of which he suckled, but he denied sealing a contract with the Devil. He used the imps to kill cattle and imperil shipping out of Great Yarmouth. To Hopkins himself, Lowes reportedly confessed that he had indeed compacted with Satan and that to test out his imps, he had sunk a ship, drowning fourteen men. Lowes was indicted and convicted at Bury St. Edmunds. Devoutly maintaining his innocence to the last, he was hanged on August 27, 1645, with several others condemned at the same trial. Lowes read the lesson at the execution himself.

Afterward, the steward of the manor noted that everyone was glad Lowes was finally out of the way. Others upheld his innocence but recognized the power of the parish to get its way against a common enemy.

LUTHER, MARTIN (1483–1546)

Luther's attitude toward witchcraft is significant not only in itself but particularly because of its influence on early modern Protestantism. Luther was undoubtedly the greatest Protestant authority of early modern times. Abundant sources permit a comprehensive review of Luther's statements on the subject. This, however, does not facilitate a straightforward assessment of his views and his role in the history of witchcraft trials. The background to Luther's attitude to almost everything, including witchcraft, was that of the late Middle Ages. Early academic biographies contained a few vague references to his parents, particularly his mother, being superstitious, but they provided no explanation for Luther's lifelong preoccupation with theologically complicated issues associated with witchcraft.

Luther's first academic encounters with the subject of witchcraft must have occurred while he was studying theology in Erfurt. There is a marginal note "*Incubus*" in the copy of St. Augustine's *De civitate Dei* (On the City of God) that Luther used in 1509. Luther's sermons on the Ten Commandments, which he preached at Wittenberg's municipal church in 1516–1517, provide an abundance of material. They contain an extensive rendering of contemporary views; such detailed knowledge presupposed a thorough investigation of the subject, including some witchcraft manuals. Luther explicitly mentioned the Strasbourg clergyman Johann Geiler von Kaysersberg and employed motifs from his *Die Ameis* (The Ants, 1516–1517). One can assume that Luther was familiar with expositions of the Decalogue by such other Augustinian friars as Gottschalk Hollen. Luther's *Decem praecepta Wittenbergensi praedicata populo* of 1518, printed in German in 1520 as *Der Zehn Gebot ein nützliche Erklärung* (A Useful Explanation of the Ten Commandments), seems to represent the tenth-century "*Canon Episcopi* tradition," recognizing the possibility of the evil arts (*maleficium*) while rejecting the idea of witches flying.

Like other contemporary representatives of this tradition, such as Martin Plantsch or Ulrich Molitor, Luther claimed that harmful magic was possible only with God's permission. The Devil and his witches had no independent and autonomous power. Luther retained this fundamental attitude toward *maleficium* and witches flying throughout his life, as he also maintained his attitudes toward two other key elements of witchcraft: the pact with the Devil and sexual inter-

course with demons. Basing his understanding on scholastic demonology, Luther considered intercourse with demons a possibility, whereas making a pact with the Devil played a subordinate role in his work.

Luther never demanded punishment for witches in any of his early sermons on the Ten Commandments. Later in life, Luther repeatedly approached the subject of sorcery and witchcraft with reference to the first (and sometimes the second) commandment, but never with the same intensity as in 1516. In his catechisms of 1529, Luther briefly prohibited sorcery: In the Large Catechism, he related it to the first commandment, and in the Small Catechism, to the second commandment. This context obviously makes sorcery a primarily religious offense to Luther, eventually resulting in demands for increasingly severe penalties for witches.

Luther's exegetical works provide a continuous but less accessible source for the evaluating of his views on witchcraft. He discussed the crucial biblical references to witchcraft in many sermons, university lectures, and Bible commentaries, interpreting them both traditionally and with a new accentuation. For example, in both sermons and lectures, Luther used Genesis 6:1–4 to support the incubus notion. In a sermon expounding Exodus 7 (Pharaoh's sorcerers and Moses), he mentioned the fundamental fact that magic could only be performed with God's permission. In his treatise *Misuse of the Mass*, Luther used 1 Samuel 28 (on the witch of Endor) to support his rejection of physical metamorphosis, indicating that Samuel appeared to Saul only as a spirit but not *corporaliter* (bodily). In this way, Luther never abandoned the framework of medieval demonology derived ultimately from St. Augustine.

Commenting upon Deuteronomy 18:10–12, which deals with the subject of witchcraft and magic in more depth, Luther applied the Hebrew terms for magical practices to witchcraft practices of his time. Within this context, he translated the word *Mecasheph* as *witch* and explained: "Witches are the evil whores of the devil who steal milk, make bad weather, ride on goats and broomsticks, . . . slaughter infants in their cribs, bewitch the marriage bed, etc." (*Kirchenpostille*, in Luther 1883ff, vol. 10, book I/1, 591). This statement did not prove, despite previous claims, that Luther believed in the reality of witches' flying. Rather, it defined the term *witch*, as used by both theologians and ordinary people in the sixteenth century.

In 1526, in a series of sermons on Exodus, Luther devoted one sermon to a detailed exposition of the best-known biblical text about witchcraft, Exodus 22:18 ("You shall not permit a sorceress to live" [*The Holy Bible*, Revised Standard Version. London: Nelson, 1966]). Without discussing flying, metamorphosis, or the witches' Sabbats, Luther repeatedly demanded the death penalty for sorcery, because of the *maleficium* and the pact with the Devil but above all because it violated

the first commandment. This sermon was not printed and had no further impact. It is important that Luther did not use the word *Hexe* (witch) in any of his Bible translations.

The Wittenberg reformers rarely took public action on such matters. It is of particular interest that Luther personally excommunicated two supposed witches in Wittenberg after preaching on witchcraft in 1529. Apparently, however, no secular prosecutions ensued. In 1540, a witchcraft trial did take place in Wittenberg; four people were condemned to death and burned at the stake. Luther was not involved directly but may have expressed approval. In his *Table Talk*, Luther occasionally mentioned magic and witchcraft but introduced no new aspects. It is striking that none of Luther's numerous letters ever mentioned witchcraft.

Luther's attitude toward witchcraft did not agree with the new "cumulative" picture propagated by the *Malleus Maleficarum* (The Hammer of Witches, 1486), which Luther never read. Throughout his entire work, Luther rejected the notions of flying, metamorphosis, and the Sabbat. Like Ulrich Molitor and other "conservative" witchcraft theorists, Luther followed the *Canon Episcopi* tradition. It must be stressed, however, that Luther was no moderate representative of this tradition: He was not reluctant to condone punishment for witches. The essentially theological crimes of witches and sorcerers (who violated the first commandment and turned to other gods, in this case to the Devil) demanded prosecution and punishment—in most cases, death. Among Lutherans, this aspect provided sufficient encouragement for witchcraft trials, as could Luther's uncompromising opposition to and repeated criminalization of "white magic," that is, harmless sorcery with Christian motives.

However, in his sermons and catechistic writings, Luther deprived early modern witchcraft trials of one of their essential motives: He forbade hunting for scapegoats in the form of sorcerers when unexplained misfortune struck; instead, he referred the afflicted person to the will of God. Thus, he applied the theological notion that sorcery required God's permission to everyday life. Luther was not interested in "witch hunting" but in the existence of man before God. Since his own attitude remained ambivalent, responses to his position varied; both supporters and opponents of witchcraft trials claimed allegiance to Luther. His rejection of the notion that witches flew and held Sabbats required Lutheran advocates of severe prosecutions for witches and sorcerers to avoid discussing these issues when citing the biblical commandment to put such offenders to death.

In the late nineteenth century contexts of "Higher Criticism" and the *Kulturkampf* (culture war), Luther's position on witchcraft became the subject of heated controversy between Catholic and Protestant church

historians. In 1888, Johannes Diefenbach first put the main responsibility for witchcraft prosecutions on Luther; twelve years later, Rudolf Ohle denied Luther's involvement entirely; finally, a Catholic scholar, Nikolaus Paulus (Paulus 1910), succeeded in pronouncing a comparatively fair-minded judgment by placing Luther within the theological framework of his time.

LUXEMBOURG, DUCHY OF

Between 1560 and 1683, approximately 2,500–3,000 witchcraft trials took place in the duchy of Luxembourg, one of the seventeen provinces of the Habsburg Netherlands. At least 2,000 ended with the execution of the accused, making Luxembourg's witch hunts among the most savage anywhere in western Europe. The figures cited in older research are either far too high (van Weverke 1983–1984 claimed 20,000–30,000 executions) or far too low (Dupont-Bouchat 1978 listed only 355). The rate of execution was clearly lower in the Walloon, the French-speaking parts of Luxembourg, than in the German-speaking regions, where witch hunts were pursued by special secret committees (*monopoles, Hexenausschüsse*) working in conjunction with minor territorial lords. Often, only marginal notes in account books documented trials in the so-called *Oberpropsteien* (Luxembourg's seventeen administrative districts), but manuscript records survive from some trials in small territorial lord-

ships, such as Neuerburg and Hamm. The richest source on Luxembourg's witchcraft trials is the *Fonds van Werueke*: At the start of the twentieth century, the archivist and historian Nicolas van Werueke collected around 1,700 references to witchcraft trials from the records of Luxembourg's Provincial Council (*Provinzialrat*), portions of which have since disappeared.

TERRITORIAL AND CONSTITUTIONAL HISTORY OF LUXEMBOURG

In order to understand Luxembourg's severe witch hunts, it is essential to look at the duchy's territorial and constitutional history. From 1441, Luxembourg belonged to the Netherlands, which was divided into seventeen nominally sovereign territories or provinces in 1531, with its central government in Brussels and its highest court, the *Grand Conseil* (Great Council), in Malines (Mecheln). King Philip II of Spain inherited this loose confederation of provinces in 1556.

At the apex of Luxembourg's government was a governor, holding office for life. The Ducal Council, its highest administrative and legal authority, became a Provincial Council. It served as the highest appellate court in civil cases; families or individuals could bring nullity suits before it on account of legal abuses in criminal cases. The Provincial Council received many petitions and supplications; it issued so-called *lettres de purges*, certificates confirming the good reputation of individuals who had been cleared of witchcraft slanders. It was not a sovereign court: Its verdicts could always be appealed before the *Grand Conseil* in Malines. Although we have no documented evidence that the Carolina Code (the 1532 code of criminal law procedure for the Holy Roman Empire) was observed even in Luxembourg's German-speaking areas, the influence of French as well as German law was apparent in Luxembourg. Through its ad hoc promulgation of numerous administrative and criminal law ordinances that shaped local practice, the Provincial Council ensured that Roman law had wide influence in Luxembourg.

At the end of the sixteenth century, the province was divided into seventeen administrative districts (*Oberpmpsteien*), each headed by a subgovernor (*Propst*), who also presided over its criminal law court. Within these districts lay more than fifty territorial enclaves belonging to minor lords, over whose courts the Luxembourg government only gradually obtained influence during the sixteenth and seventeenth centuries, partly as a result of the witch hunts. In these courts, uneducated jurors, mostly illiterate, judged cases on the basis of a still mainly oral tradition of customary law. Witchcraft trials occurred more frequently in these small lordships, often containing from one to three villages, than in areas belonging to an *Oberpmpstei*. Furthermore, some of these minuscule

noble or monastic lordships were fragmented by subdivision or mortgaged portions. In addition, some village communities also possessed criminal law rights, and the provosts (appointed by Luxembourg's governor) were often local noblemen using their position to further their private interests. Ecclesiastically, most of the provinces belonged to the archdiocese of Trier. Luxembourg was divided linguistically into German- and French-speaking areas.

LEGAL PRACTICES IN LUXEMBOURG WITCHCRAFT TRIALS

In Luxembourg, accusations in criminal cases (including witchcraft trials) could be made by a private individual (*partie formelle*), who had to produce evidence and witnesses and pay costs if his accusation was rejected. At the beginning of a criminal trial, both accuser and accused were imprisoned by court authorities. The accuser was released only after providing sufficient sureties for the duration of the trial. In German-speaking parts of Luxembourg, private accusation was the more common method for making witchcraft accusations; in French-speaking areas, judges or other officials initiated most such cases.

In both systems, however, the peasantry played a significant role in spreading witch hunts. In Walloon districts, witchcraft trials were initiated by a so-called *enquêtes generales* (general investigations) ordered by the authorities, requiring their subjects to denounce people who were reputedly witches to local courts. Local officials could then begin witchcraft trials on the basis of these denunciations. Some evidence suggests that *monopoles* (committees formed at the village level for the express purpose of bringing alleged witches to court) were formed in both German- and French-speaking parts of Luxembourg belonging to the archdiocese of Trier even earlier than in electoral Trier or the prince-abbey of St. Maximin. These committees were characterized by secret deals, corruption, and bribery (to the detriment of the accused witches), and they often used violent means to raise taxes in their villages to finance their witch hunts.

After being arrested, alleged witches were interrogated without torture and confronted with the witnesses against them. Sometimes an accused witch was allowed to name defense lawyers. However, many defendants did not use this opportunity, either because they believed firmly in their own innocence or because using a lawyer only increased the costs of the trial. In the end, it was the application of torture that produced the required confession from the accused. After implementation of the sentence, the convicted witch's property was confiscated and auctioned off. After the trial costs and a stipulated fine had been paid, a third of the property belonged to the lord who presided over the local criminal law court.

Records of Luxembourg's Provincial Council and ordinances issued by the Brussels government provide some detailed evidence about flagrant legal abuses occurring during witchcraft trials. At the beginning of the sixteenth century, Luxembourg's provincial government tried to restrain the autonomy of local courts in its administrative districts and minor lordships by stipulating that they risked punishment if they arrested or tortured an accused witch without first sending the pertinent evidence to the provincial government for approval, or if they used, paid, or bribed private accusers to circumvent the regulations of accusatorial legal procedure. For example, an ordinance of August 13, 1563, decreed that no one could be arrested and tortured merely on the basis of only one denunciation and without a legal opinion on the case being provided by a lawyer of the Provincial Council.

The mass persecutions of the 1580s and 1590s produced so many scandalous breaches of the law that on April 6, 1591, the provincial government published a lengthy decree that severely censured the corruption and abuses evident in making both private and official accusations of witchcraft at local courts. It explicitly prohibited consortia of accusers, *monopoles* (the witch-hunting committees) and "front men" who brought accusations on behalf of others. Guaranteeing the financial position of private accusers became punishable: Apart from official accusations, only private accusations made at the accuser's personal risk were allowed. It was again stipulated that legal advice must be sought from Luxembourg's Provincial Council at every stage of the pretrial investigation. In addition, torturers could not conduct interrogations in the absence of judges and the court scribe. Leading questions and particularly the suggestion of possible accomplices were prohibited, as was the public proclamation of lists of accomplices at executions. Trial costs were to be kept as low as possible.

Neither the Provincial Council in Luxembourg nor the central government in Brussels intended or desired a complete cessation of witchcraft trials. The latter issued decrees in 1592 and 1606 calling for the merciless persecution of soothsayers, workers of black magic, heretics, witches, and sorcerers. Of greater significance was a reorganization of criminal law implementation, aiming to deprive noble and ecclesiastical lords of their power to exercise criminal law by subjecting them more firmly to the authority of the provincial government.

However, the many nullity suits and petitions brought before the Luxembourg provincial courts show that the centralizing efforts of the provincial government did not enjoy rapid success. Both local lords with the right to exercise criminal justice and village witch-hunting committees continued to resist its decrees. The Provincial Council repeatedly issued new mandates—for example, in 1598, 1605, and 1606—

forbidding the use of consortia of accusers or paid private accusers and reminding local lords of their duty to send witchcraft trial records to them for scrutiny and to use only lawyers approved by them when drawing up and assessing such records. Finally, in 1623, the Provincial Council promulgated a general ordinance of criminal law procedure, placing particular emphasis on procedures used in witchcraft trials. In addition to repeating stipulations from previous ordinances, this decree sought to give clear preference to official accusations and to limit the practice of private accusation. However, evidence of significant legal abuses in Luxembourg witchcraft trials can still be found until the trials ceased in 1683.

COURSE AND END OF THE WITCHCRAFT TRIALS

After a few isolated cases in the middle and late fifteenth century, witchcraft trials in Luxembourg increased after 1500. The most severe phase of persecution began in 1560. From then until 1636, continual waves of persecution affected various areas. The Provincial Council's attempts to impose centrally stipulated norms and procedures on arbitrarily pursued local witch hunts were insufficient to stem the rising tide of trials. Crises caused by the sixteenth-century economic decline of the province and intensive attempts to impose new Counter-Reformation standards of discipline triggered repeated calls from the inhabitants of Luxembourg for the destruction of witches. Minor territorial lords, who felt themselves to be victims of witchcraft, hoped to grow rich on the proceeds of witchcraft trials, or wanted to further their political ambitions, supported the efforts of village witch-hunting committees in German-speaking Luxembourg. The result was a local environment in favor of persecution, which the provincial government could influence only with difficulty. Moreover, the provincial government's decrees were circumvented by an ordinance of Philip II in September 1592, urging that the vice of witchcraft be fought on all fronts: Ecclesiastical and secular authorities should zealously persecute popular magic, soothsaying, magical healing, and witchcraft. This ordinance by no means triggered the Luxembourg witchcraft trials, as older research suggested (Dupont-Bouchat 1978), but it did provide additional legitimacy for the persecution.

A woman was burned as a witch in Arlon as late as 1675; a final phase of witch persecution arose in Echternach around 1680, resulting in several executions before ending in 1683. After the partial occupation of Luxembourg by the French in 1684, Louis XIV's 1682 edict issued for France came into effect, decreeing that sorcery could be punished with death only when accompanied by sacrilege. At this point, trials for witchcraft

ended in Luxembourg, although cases of witchcraft slanders and possession continued to be heard. Belief that witches could work *maleficium* (harmful magic) remained widespread, however.

LYCANTHROPY

The theme of the transformation of human beings into animals can be found in the imaginary worlds of all societies. Lycanthropy is the special case of transforming a man into a wolf: The Greek-derived word *lycanthropy* means "wolf-man," as does its English, German, Danish, or Italian counterparts. The Romans used an especially telling word for werewolf, namely *versipellis* or skin-changer.

There seem to be several possible roots for this belief. It might derive from numerous myths, folktales, and rituals that postulate a time when humans felt no clear boundaries between themselves and the animal world, assuming, rather, some permeability between them. Second, it may be a relic of belief in an animal-shaped external double of the soul, which often appeared in Old Norse sources (*hamr*). Third, totemistic structures also seem to have existed in prehistoric European societies (compare the Greek *Hirpi Sorani* who, clad in wolf skins, venerated Apollo Soranus, originally a wolf god). Secret societies using wolf skins for disguise may have infested some European regions, like the cannibalistic secret societies in Africa whose members disguised themselves as lions or leopards in order to kill men. Fourth, lycanthropy is a known, specific form of mental aberration, a psychic disease akin to schizophrænia, forcing the patient to act like the animal. Fifth, animal transmutations also figure in dreams and drug-induced ecstasies.

In the European traditions, two versions of this transmutation are known: Either it happens spontaneously, or else it is induced by another person without the victim's approval. These were already the usual patterns in classical antiquity: for example, on the one hand, Virgil's Moeris, a shepherd-sorcerer who became a wolf by eating special herbs; or, on the other hand, King Lycaon of Arcadia, whose impiety Zeus punished by changing him into a wolf. Among the Vikings, transformation into a bear was more common than transformation into a wolf: Their most formidable troops, the berserkers, were clad in bear skins and, falling into a trancelike state, fought like bears. However, the *Hamldskvædhi* (Harold's Song; ca. 900 C.E.) also mentioned "wolf-frocks," warriors howling like beasts. *Egil's saga Skalla Grímssonar* (The Saga of Egil Skalla-Grimsson, ca. 1230) described a berserker named Kveld-Úlfr who lived as a man during daytime, while at night he became a wolf (as his name—Evening

Wolf—implies). According to Olaus Magnus (1555), werewolves had become an epidemic in the Baltic, where they gathered by preference during Christmas time in order to undertake raids against the foresters (probably cases of criminal gangs acting under folkloric disguise).

The wolf-man figured as the subject of several medieval literary texts, the most famous of which was the Old French poem *Bisclavet* by Marie de France (ca. 1200). When the hero's wife recognized that the knight Bisclavet changed into a wolf for three days each week, she has his clothing hidden so that he could not become a man again. The king, however, brought the wolf to his court and helped him punish his wife. The werewolf in the anonymous romance *Guillaume de Palerne* (early thirteenth century) was a positive figure, helping other persons several times. Small wonder, as he was the son of the king of Spain transformed by a malignant sorceress.

In perfect synchronicity with the increasing persecution of witches, the old beliefs about werewolves were adapted to demonological models. Once the doctrine of the pact with the Devil became prominent, werewolves brought to trial had to confess to have received their abnormal powers from the Devil. Theologians such as Heinrich Kramer, the author of the *Malleus Maleficarum* (Part II, Question 1, Chap. 8–9), and many others discussed whether the Devil caused real animals to perpetrate those cruelties that were supposedly committed by men and women in animal form, men and women who were in reality lying asleep and dreaming. Or should one rather think that the Devil, appearing in the form of a wolf, committed the crimes the lycanthrope only dreamt of? Or did he only cause an illusion to that effect in the people's mind? The problem was that any real transformation into a wolf had been declared impossible by the unsurpassable authority of St. Augustine.

From the early sixteenth century, records of a considerable number of trials against werewolves have been preserved, the common accusations being slaughter of animals and men, committed in lupine form, and pact with the Devil. An inquisitorial trial held in the diocese of Besançon in 1521 against two werewolves, Pierre Bourgot and Michel Verdung, mentioned by Johann Weyer, is one of the earliest instances, and one of the last seems to have been a trial before a jury of the archbishop of Salzburg in 1720. During the two centuries between these dates, dozens of such trials were carried out; the French judge Henri Boguet boasted of trying several lycanthropes in his *Discours des sorciers* (Discourse on the Execrable Speech of the Witches, 1602). Boguet's Franche-Comté, apparently, was the center of the early modern hunt for werewolves. It is remarkable that no juridical persecution directed against a real wolf has been found, whereas not a few

animal trials have been documented from the thirteenth to the eighteenth century in which dangerous animals, especially pigs, were hanged by secular courts for the homicide of small children. People molested by vermin and parasites regularly sought redress from ecclesiastical courts against noxious pests like cockchafers or mice. In the case of the werewolves, both the religious and the secular authorities could be interested. Though the trials against this kind of delinquents were clearly a special form of witchcraft trials, sometimes even combined with the accusation of participation in the Sabbath, a marked difference consisted in the fact that the accused were nearly all men, although some of the werewolves burned by Boguet were women.

An instance of a case clearly referring to pathological lycanthropy occurred in 1603 when the *Parlement* (sovereign judicial court) of Bordeaux proceeded against a fourteen-year-old shepherd, Jean Grenier, who confessed to using a wolf skin and an ointment when roaming through the woods and hamlets, killing animals and children. Both devices were given to him by a gentleman in black who had marked him. Other werewolves, including his father, accompanied him. Grenier's hands and his way of moving and of eating were described as congruent with that of a wild beast, and what pleased him most was watching wolves. Because he was under adult age, this apparently semi-imbecilic adolescent was not executed but sentenced to lifelong imprisonment in a monastery, where he died in 1610.

More common was the fate of one Peter Stumpf, who changed himself into a wolf through a belt that the Devil had given to him. Having murdered and devoured thirteen children—including his own son—two pregnant women, and many sheep and cows, he was hunted down, tortured, condemned, and executed with exemplary cruelty at Bedburg near Cologne in 1589, together with his lover and a daughter with whom he had had incestuous relations. This is an example of a werewolf confession by a man tortured on suspicion of multiple homicides. Generally recurrent patterns were the following: The transmutation was effected through magic formulas, an ointment, a skin, a shirt, a belt, a drink, all provided by the Devil; often the magic worked only for a certain time; there was some connection with the phases of the moon. The gravest crimes committed were the slaughter of men and animals and cannibalism. If such a being received a wound while a wolf, it appeared on the very same part of his human body.

Especially in the sixteenth century, the werewolf, or rather certain "historical" werewolves, became the subject of artistic treatment in the manner of handbills, the most famous example being a woodcut of 1512 by Lucas Cranach the Elder. The eighteenth-century

Enlightenment put an end to the persecution of werewolves, who were henceforth treated as madmen. Nineteenth-century romantic literature was full of such creatures, and in the twentieth century a number of films were produced about them.

LYNCHING

Illegal witch hunts, or lynchings, are an important yet poorly explored issue. It is difficult to provide sound overall estimates of the relation between legal and illegal executions of witches because official records documented exclusively the actions of secular and the ecclesiastical authorities, and refer to vigilantism only if *post facto* legal action was taken against the murderers. Surprisingly, this problem occurred right at the beginning of Europe's witch hunts, when a man named Gögler was punished for accusing women of witchcraft in Lucerne (Switzerland) in 1419. According to Joseph Hansen, this incident was the first time that the

German term for witchcraft—*Hexereye* (*Hexerei*)—appeared in court records. But there certainly were many earlier examples of lynchings of female and male sorcerers. As a general rule, lynchings served as a safety valve in areas where people believed in witchcraft but authorities would not, for whatever reasons (religion, law, laziness, Western rationalism), comply with their demand for persecution.

A number of spectacular lynchings are known from the period before legal witch hunting in Europe. In his famous sermon on hailstorms, Agobard of Lyons reported frequent lynchings of supposed *tempestarii* (witches who raise storms), as well as killings of sorcerers who were held responsible for diseases of livestock in the year 810. According to Agobard, the common people in their fury over crop failure developed the extravagant idea that foreigners were secretly coming with airships to strip crops from their fields and transport them to Magonia (the home of witches). Such anxieties led to severe aggression; on one occasion around 816, Agobard barely prevented a crowd from killing three foreign men and a woman, whom they considered to be Magonians. As their supposed airships and their country's name suggest, crop failures were blamed on magic. Bishop Agobard therefore emphasized that thunderstorms were always caused by natural or divine agencies. His account of the popular backdrop of these stories may have been distorted, since some of its details appear highly unusual for European witchcraft. For example, in 1080 Pope Gregory VII (ruled 1073–1085) admonished King Harald of Denmark not to hold old women and priests responsible for storms and diseases and not to slaughter them. The pope explained that these catastrophes were God's punishment for human sins and that killing innocent people would only increase his fury. No other source confirms these Danish witch hunts, but there is no reason to doubt the contents of this papal letter.

In 1090, a complex situation can be observed in Bavaria with the burning of three women, who had been convicted of harming or poisoning people (*veneficae*) and of having spoiled or destroyed the crops (*perditrices frugum*), presumably by causing hailstorms. According to the Benedictine chronicler of Weihestephan, only the fact that the nearby bishop's see was vacant, together with related political tensions, enabled the rabble to carry out their persecution. The chronicler considered this procedure as essentially illegal and called the victims "martyrs." Their corpses were recovered and buried by the monks within the walls of the monastery.

The report was sufficiently detailed to reveal that the supposed lynching must have been a rather elaborate procedure. After being captured, the suspected witches first had to undergo an ordeal by water, a swimming test. Unexpectedly, they passed it and could therefore

not be executed. Thereafter they were publicly tortured, in order to force them into confessions, again unsuccessfully. The villagers turned next to the nearby episcopal city of Freising, where two men of “high rank,” presumably nobles, summoned a public meeting. The women were transferred to Freising and tortured again. Although the suspects still refused to confess, they were carried to the banks of the river and ritually burned to death (*Monumenta Germaniae Historica, Scriptores*, XIII, 52). However illegal the procedure may now appear, the persecutors obviously respected some procedural rules. More important, the authorities remained passive in the face of a grassroots movement.

For the High Middle Ages, our sources are scanty and difficult to interpret. In 1115, for instance, a Styrian chronicle laconically reported that thirty women were burned at Graz in one day (*concr̄matae sunt triginta muliers in Greez una die*). Capital punishment for females was highly unusual throughout European history, and burning was restricted to a very few crimes, such as arson, sodomy, counterfeiting, or domestic incest. None of these, however, were typical female crimes; nor were they likely to trigger a large-scale persecution. In cases of heresy, a more even gender distribution could be expected. Witchcraft therefore was a likely candidate for the cause of this mass burning, particularly in conjunction with major subsistence crises or epidemics of “unnatural” diseases. The scarcity of surviving sources suggests that there were some sporadic witch hunts during the High Middle Ages. Given the tensions between popular witch beliefs and the reluctance of the authorities, ecclesiastical or secular, to accept demands for persecution, we would expect acts of lynching rather than legal persecutions, especially in Alpine regions, Scandinavia, or Russia.

In the early modern period, Denmark under King Christian III (ruled 1534–1559) offered the most surprising case of lynching. After a tumultuous period of civil war, territorial expansion, and rapid political, social, and religious reforms, a witch panic—the first one in a Protestant territory—became a major, large-scale persecution. Peasants hunted witches in the open fields “like wolves,” as was reported approvingly by Peder Palladius, royal adviser and leading Danish churchman of his age as superintendent of ecclesiastical affairs for Norway, Iceland, and the Faeroe Islands. In Jutland alone, fifty-two women were killed in 1543; lynchings were reported in other parts of Denmark and in Danish-ruled southern Sweden as well. By 1547, the government in Copenhagen tried to curb the persecution through restrictive laws.

Illegal persecutions were not confined to northern Europe. The relative leniency of the Spanish or Roman Inquisitions also led to occasional lynchings. One finds them, for instance, at Reggio Emilia in Italy, where a

woman was stoned to death in 1599 after the inquisitors had released her after her public abjuration. In Spain, the same scene was repeated almost a century later, in 1691, in the Canary Islands. Meanwhile, in the “Enlightened” Netherlands, where capital punishment of witches ended sooner than anywhere else in Europe, lynchings took place in Amsterdam in 1624, in Rotterdam in 1628, and in Huizen, a village southeast of Amsterdam, in 1746. In “enlightened” England, a woman was lynched in 1751—five years later than in Huizen.

Lynchings are known from France to Poland, wherever legal systems made it difficult or impossible to punish known witches with death. The famous skepticism of French lawyers and the reluctance of judges in most French *parlements* to confirm death penalties for witchcraft left the rural population dissatisfied and apparently provoked numerous illegal executions, which we now call lynchings. In the 1580s, processions of “White Penitents” in the Ardennes and Champagne triggered massive but often illegal witch hunts. Many similar instances occurred over a wide zone from Languedoc to the Ardennes during the last great French witch panic in the 1640s, when the crime of witchcraft had been virtually “decriminalized” by the *parlements* (sovereign judicial courts). Sometimes sheer cost seems to have triggered such behavior. For example, in the easternmost zone subject to the *Parlement* of Paris, the *Barrois mouvant* (that area in the French sphere of influence in the duchy of Lorraine), from which it was prohibitively expensive to appeal to Paris, sporadic lynchings have been recorded in pardons from the dukes of Lorraine.

Eastern Europe saw much illegal witch hunting. For example, in the parts of Hungary under Ottoman rule, lynchings were the only way of punishing witches, because the Turkish authorities never accepted accusations of witchcraft in the courts. Incidents like the lynching in Wolhynia of a nobleman, who was put to the stake by an agitated rabble, led by the parish priest, because he was blamed for an epidemic, were recorded only because his widow afterward sued the murderers. A Polish historian, Janusz Tazbir, claimed that half of all victims in Poland and the Ukraine were burned in lynchings, although he provided no supporting evidence.

If lynchings occurred in Europe long before witchcraft became a capital crime, one could expect that they did not stop after witchcraft laws were repealed. Previously, Church law had denied the capacity of supposed witches to cause harm, and now secular law did so, in both instances leaving people alone with their misery and fear and punishing those who dared to challenge the authorities. The results were predictable. In England, numerous incidents of swimming witches—the swimming test—illustrated the

continuing discrepancy between popular perceptions and legal practices (Davies 1999). In 1808, Cambridgeshire villagers broke into the cottage of Ann Izzard, restrained her husband from protecting her, dragged her out of bed, threw her naked into the yard, scratched her arms with pins, and beat her stomach, breasts, and face with a length of wood. The parish constable refused to help, but a compassionate neighbor, Alice Russel, gave her shelter. On hearing this, the villagers returned, arguing that “the protectors of witches are as bad as a witch and deserve the same treatment” (Davies 1999, 111)—an argument reminiscent of the demonologist Martín Del Río—and attacked Russel as a harbinger of witches; she died a few days later from her wounds. The mob threatened Izzard with ducking, but the fifty-six-year-old woman managed to flee from the village and subsequently sued her attackers. The murderers received short prison sentences, and the constable remained unpunished. In Dorset, a young farmer named John Bird was tried as late as 1871 for severely beating Charlotte Griffin, an eighty-five-year-old woman, with a stick because he believed she was bewitching him and “hag-riding” him at night. A surgeon classified Bird as a “simple, weak-minded, monomaniac,” (Davies 1999, 41) but the judge found that Bird acted mainly because he believed in witches. Four years later, Ann Tennant was killed in Warwickshire with a pitchfork because her attacker, James Haywood, believed that she had bewitched him. The killer claimed that he had not intended to kill the old woman but had meant merely “to draw her blood in order to break her power over him” (Davies 1999, 41). On a different occasion he said that he considered it his duty to kill witches and that there were fifteen more in his village. Haywood was charged with murder, but a surgeon considered him insane, and the jury acquitted him on that ground. If all believers in witchcraft had been diagnosed as insane, English asylums would have been overflowing with inmates.

In the United States, witch killings were not confined to the Native Americans. A man and his wife, both citizens of Texas, attributed his incurable disease to Antonia Alanis, a woman in a neighboring village. In February 1860, his father, one of the wealthiest Mexican landowners in the area, hired several men to kidnap the witch. They killed one of her daughters, who was trying to protect her mother, wounded another, “lassoed” the suspected witch, and “dragged her on the ground” (*The Times*, April 17, 1860, 12) toward the village of Camargo (Nueva Villa). There she was kept prisoner for two weeks and repeatedly beaten. Because the bewitched man’s health failed to improve, a witch doctor suggested that the witch had to be burned (*The Times*, April 17, 1860, 12). Another lynching was reported from Arkansas, where a widow named Hill had been murdered together with a slave woman and

her house burned down in order to conceal the murder. The *New York Tribune* reported that a slave was forced through severe torture to confess to the murders in November 1859. He was subsequently burned at the stake. But the report strongly suggested that he had indeed been innocent and that the instant execution had been staged to protect the true culprits.

Witch huntings were frequently reported from Mexico and Russia in the second half of the nineteenth century—both countries at the periphery of Western civilization but certainly both independent, or post-colonial and governed by elites educated in the spirit of the Enlightenment. However, among Russian peasants, belief in witchcraft remained strong. Lynchings were mostly linked to crop failures, drought, epidemics, lack of milk, or love magic, particularly around 1880, with four killings recorded in this year alone. These lynchings often included a swimming test, severe beatings, and mutilation of the corpse of the deceased. Although there is no consistent body of sources, researchers have collected over 100 cases of lynchings from ethnographic, juridical, psychiatric, and newspaper reports, reaching from urban areas in the Ukraine to remote rural areas of European Russia. Countermeasures against witchcraft included disinterring the bodies of suspected witches and transporting their dangerous remains to remote forests. The witch craze was fueled by cases of demonic possession (*klikushestvo*), which could be seen as an antiwitchcraft movement, because the aim of the female peasant demoniacs, that is, “shriekers,” was to identify witches.

Some recent postcolonial African examples show extreme discrepancies between Western and native perceptions. The South African Witchcraft Suppression Act of 1895, refurbished in 1957 and amended in 1970, seemed completely pointless from an African point of view. Instead of persecuting the evildoers, it prevented their chiefs from handling cases of witchcraft properly, thus damaging their authority. Traditional healers, diviners, or other people who could detect witches were outlawed, and the witches were protected instead. As a consequence, the people took the law into their own hands and started to kill those whom they suspected of having harmed their children or livestock, either secretly or in mob lynchings. Gruesome dimensions were reached in Tanzania, where antiwitchcraft movements had already been active during the colonial period. According to Simeon Mesaki, an anthropologist from the University of Dar es Salaam, between 1970 and 1984 3,692 persons were killed as witches in Tanzania, 69 percent of them female. In this Swahili-speaking country, the Bantu people of Sukuma, living under traditional conditions in the northern provinces of Mwanza and Shinyanga, were particularly affected. With 2,246 witch killings, plus another 826 lynchings between 1985 and 1988, Mesaki offered a

grand total of 3,072 from this area between 1970 and 1988 (Mesaki 1994, 52).

Mesaki considered the “witch-killing in Sukumaland” as an indirect result of the villagization program imposed in the 1960s by the socialist government of Julius Kambarage Nyerere (party leader until 1987). However, there are many parallel examples from other parts of sub-Saharan Africa. In the late 1970s, the persecution in the People’s Republic of Benin (formerly Dahomey) was linked to a tetanus epidemic, and the witch hunts in Ghana in 1997 accompanied an outbreak of meningitis. Protests by human rights organizations against these lynchings caused the military government of Jerry Rawlings (ruled 1981–2001) to allocate four camps, or “sanctuaries,” for the protection of suspected witches in October 1997, presumably following the example of South Africa. Like sub-Saharan Africa, Southeast Asia seems to count among contemporary hotspots of witch hunting. Newspaper reports mentioned mob lynchings in the late 1980s in both Java and Papua New Guinea.

M

MACFARLANE, ALAN (1941–)

Alan Douglas James Macfarlane's place among witchcraft historians was established in 1970 by his first (and subsequently reissued) book, *Witchcraft in Tudor and Stuart England: A Regional and Comparative Study*, the published version of his Oxford DPhil thesis. This thesis was completed under the supervision of Keith Thomas, who then published his own major work on witchcraft and related beliefs in 1971. Macfarlane has published extensively on both history and anthropology and has, among other things, written works challenging standard interpretations of English historical development. Macfarlane was educated at Worcester College, Oxford, where he earned his BA, MA, and DPhil degrees, subsequently gaining an MPhil at the London School of Economics and a PhD at London University's School of Oriental and African Studies. He subsequently worked at the University of Cambridge, where he has been professor of anthropological sciences since 1991.

Macfarlane's *Witchcraft in Tudor and Stuart England* reestablished witchcraft as a serious topic of study among historians of England and has proved influential among historians of witchcraft more generally. It was a work that entirely changed perceptions of early modern European witchcraft. Its novelty lay in three main directions. First, Macfarlane had worked through all of the main court records for England's most witchcraft-ridden county, Essex. The courts in question included the assizes, which tried most cases of witchcraft, defined as felony by statutes of 1563 and 1604; Essex borough courts; the county Quarter Sessions; and the Essex ecclesiastical courts. These court records, together with a series of pamphlets about Essex witchcraft trials, provided him with a massive body of evidence. Second, on the strength of these materials, he demonstrated that the motivating force for witchcraft accusations lay not in the activities of clergy or judges but rather in disputes between villagers. Most frequently, Macfarlane argued, a witchcraft accusation occurred after a slightly richer villager had turned away a poorer, and usually female, neighbor who had come begging at his door. The woman, possibly with an existing reputation for being a witch, would go away muttering or cursing in her disappointment. If misfortune befell the household of the person refusing charity a little later

(for example, the inexplicable death of cattle or illness of a child), that misfortune would be attributed to the suspected witch's malevolence. Macfarlane argued further that this pattern of witchcraft accusations was attributable to changes in the nature of the village community. Population pressure was increasing competition for resources, and the spread of market forces and agrarian capitalism was eroding traditional community values. More particularly, richer villagers were ambivalent in their attitudes toward an ever more numerous poor, a situation that eased as the poor law became an established part of English culture in the seventeenth century. The accuser of the witch thus transferred any guilty feelings about not giving charity by accusing the person to whom he had refused alms of witchcraft. Third, Macfarlane added anthropological insights to historical materials, not least those that interpreted witchcraft in terms of the breaking and reformulating of social relationships.

Macfarlane's thesis can be criticized on a number of levels. He tended, perhaps, to write the elite too much out of his model of accusations. The supposed relationship between witchcraft and socioeconomic change is rendered problematic by the experience of a number of other counties in southeastern England, notably Kent, Surrey, and Middlesex, that underwent essentially the same socioeconomic changes as Essex but experienced massively lower levels of witchcraft accusations. And the applicability of essentially non-Western anthropological models to early modern European witchcraft evidence has been questioned (it is noteworthy that little subsequent work on early modern witchcraft has followed Macfarlane's lead here). Indeed, Macfarlane has retreated from some of the positions he established in 1970, especially those suggesting links between witchcraft accusations and the supposed breakup of the traditional village community. Nevertheless, the originality of his focus on village disputes and interpersonal tensions as the background to witchcraft accusations remains a major conceptual breakthrough that has informed numerous subsequent studies.

MACHIAVELLIANISM

Machiavellianism was a political doctrine that venerated the power and security of the state, disparaging religion and religious morality except insofar as they proved useful to the state, thus contributing to a perspective that regarded the belief in witchcraft as superstitious nonsense.

The printing revolution created new audiences that the Church could not control and fostered the rise of public opinion. Administrative institutions of emerging European states, such as courts, councils, academies, and universities, provided platforms for discussion and bred new attitudes toward spiritual affairs. Niccolò Machiavelli (1469–1527) saw the full potential of Renaissance politics. His classic *Il Principe* (The Prince), written in 1513 and published posthumously in 1531, reduced religion to an instrument of a rational ruler. In his *Discourses* (also published in 1531), the former Florentine official implied that religion served only to frighten and discipline the populace. The implications of such an attitude marked a paradigm shift, whereby politics moved to the center of history and divine predestination became irrelevant, if not nonexistent. Machiavelli's contemporary, the Paduan philosopher Pietro Pomponazzi, who denied the immortality of the soul and the existence of hell, similarly emphasized the political usefulness of religion for rulers. In such a context, magic and witchcraft were just other inventions, ridiculous to a man of virtue, a rational ruler, or an official who acted from necessity and "reason of state." Machiavelli's books, although put on the Roman Catholic Church's *Index librorum prohibitorum* (Index of Prohibited Books), molded the debate about politics throughout the early modern period. Even in the confessional age of the sixteenth and seventeenth centuries, religious zealots continually complained about Epicureans, Pyrrhonians, libertines, or atheists, usually meaning anyone conspicuously lacking in religious zeal, and displayed a common-sense attitude toward such things as witchcraft.

The antagonism between religious zeal and "politics" was already visible in Italy during Machiavelli's lifetime. The bishop of Brescia triggered a large-scale persecution of witches in the Valcamonica in the summer of 1518. The valley's worldly overlord, the Republic of Venice, stopped the persecution almost as soon as the news arrived. The Council of Ten summoned the inquisitors to Venice, provoking conflict between the republic and Pope Leo X, who tried to protect the authority of his inquisitors. Venetian politicians like Vice-Doge Luca Tron bluntly branded all stories of

flying witches as "nonsense," and lesser citizens like the famous diarist Marino Sanudo called the executed people "martyrs." The conflict dragged on for three years, with local inquisitors continuing to capture "witches" and the Venetian government immediately blocking any trials, until July 1521, when the Venetian government finally managed to terminate all trials (Decker 2003, 55–66). By then Italy's leading jurist, Andrea Alciati became the first secular author to brand the witch hunts as a *nova holocausta* (new holocaust) in his essay *De lamiis et strigibus* (On Witches and Evil Spirits). Alciati, inspired by Machiavellianism, indeed invented the almost Durkheimian interpretation that the Inquisition was not fighting witchcraft but was creating the witches instead (see Hansen 1901, 310–312).

It seems unnecessary here to summarize the early modern debates on Machiavelli, who was considered an atheist by theologians of all denominations and could therefore hardly be used officially as a source of interpretation in the confessional age. Admirers of his way of analyzing politics thus resorted to quoting Cornelius Tacitus, whose *Historiae* Machiavelli had commented upon in his *Discorsi* (Discourses). This indirect reference to Machiavelli is usually called "Tacitism," a hidden form of Machiavellianism. Meanwhile, religious authors of all confessions condemned any predominantly political decision as inspired by Machiavelli, in contrast to decisions motivated by religious considerations. Around 1600, when the first chairs of politics were established at universities (a consequence of the progressive formation of national bureaucracies), the term *politician* was equated with *Machiavellianism* by religious authors. For Martín Del Río, himself a former chief prosecutor of the Spanish Netherlands before joining the Jesuit order and becoming a leading demologist, *politici* were officials and advisers who tried to stop witch hunts for secular or "political" reasons.

Del Río certainly knew of the contemporary attack on Machiavellianism launched by his fellow Spanish Jesuit Pedro de Ribadeneira (1526–1611). However, in his *Disquisitiones Magicae libri sex* (Six Books on Investigations into Magic, 1599–1600), Del Río also referred to debates about witchcraft in Bavaria, where the opponents of witch hunting were called "cold and political Christians" or "politicians." In Counter-Reformation Bavaria, it is striking to see the sharp rift between two parties—zealots and moderates—within the Catholic camp. The same "politicians" who opposed witch hunting domestically also suggested entering negotiations with their Protestant enemies to prevent further bloodshed. The hard-liners, however, whom even Pope Urban VIII labeled *zelanti*, preferred to have their enemies killed first and to make peace afterward. The *politici* employed an Erasmian interpretation of the parable of the wheat and the tares (Matthew 13:29), later adopted by the Jesuits Adam

Tanner and Friedrich Spee, whereas the zealots wished to root out the weeds regardless of the damage, in order to prevent future heresies and crimes and avoid God's vengeance. It seems fair to call their approach radical, because the idea of getting to the root (Latin *radix*) of crime, or heresy, dominated their thinking. The interdependence of their fantasies of eradication and their adherence to radical measures, whether unlimited torture in criminal trials or wars of conquest in foreign policy, linked these ideas with a certain type of religiosity.

In contrast, the politicians sought balanced judgments in the service of their prince and country. Bavaria's politicians were led by such jurists as the chancellor of the privy council, Dr. Johann Georg Herwarth von Hohenburg (1553–1626), who was succeeded by his ally Dr. Joachim Donnersberger (1565–1650). Both came from urban patrician backgrounds, Donnersberger from the Bavarian capital of Munich and Herwarth from the imperial city of Augsburg. Both had received a solid academic education at foreign universities, a doctorate in France or Italy, and had practiced law at the *Reichskammergericht* (imperial chamber court). The Herwarths were a banking dynasty, with Protestant branches in Augsburg, France, and England, and the Catholic branch had entered princely service in Bavaria, eventually joining the landed nobility and becoming leaders of the Bavarian parliament. Herwarth recruited able officials from the Bavarian high nobility as well as members of the imperial aristocracy, including the Hohenzollern and Wolkestein dynasties. Herwarth personified an open Catholicism, keeping international contacts even beyond confessional boundaries. These "cold and political Christians" managed to end Bavarian persecution and launched a political debate instead.

Machiavellianism played an important role throughout Europe during the period of witch hunting and, for obvious reasons, frequently encountered the burning issue of witchcraft as an extreme symbol of religiously inspired policy. Beyond Italy, it was France where secular policy developed first; for example, Guillaume Farel equated Machiavellism, libertinism, and Epicureanism (Schneider 1970, 105). We must understand Jean Bodin's attacks against Epicureans, skeptics, and Pyrrhonists in these terms. Clearly the insult "politique" emerged to censure those, like Chancellor Michel de l'Hôpital, who shunned religious radicalism (either Catholic or Huguenot) during the French Wars of Religion, following the maxim that peace with two religions was preferable to war with none. After a generation of civil war, religious radicalism became more discredited in France than anywhere else in Europe. Clearly the strongest opponents of witch hunting in France are to be sought among "libertines" like Gabriel Naudé, the defender of accused sorcerers (Naudé 1625).

In England, similar conflicts emerged during and after the Civil War, when a high-ranking member of the

Royal Society, Joseph Glanvill, defended the existence of witchcraft. Even before a last series of witchcraft trials occurred under heavy popular pressure in the early 1680s, several intellectuals, embarrassed by Glanvill's equating disbelief in witchcraft with atheism, attacked him harshly. Aggressive rebuttals came from John Wagstaffe, who sailed in the waters of Machiavellian and Hobbesian atheism. Suddenly it was no longer the question of witchcraft alone that was being debated, but a much wider issue: religion. More credibly, John Webster, a Nonconformist chaplain in the Civil War, and later a physician, attacked Glanvill for attempting to "defend these false, absurd, impossible, impious and bloody opinions" (Webster 1677, 36).

Ironically, those considered godless by Christian theologians—Machiavellians, libertines, atheists—were moderate in their attitudes toward unnecessary bloodshed, whereas ardent supporters of confessional orthodoxies were responsible for the worst persecutions. But in western Europe the witch hunts faded or were forcibly stopped as the powers of the central governments increased. France was, of course, the model case, where political centralization successfully suffocated not only popular unrest but also popular witch hunting. French *parlements* usually controlled their districts tightly, and the *Parlement* of Paris upheld few death penalties after 1625. Louis XIV (ruled 1643–1715) brought these executions to an end by royal decree in 1682. By and large, France mirrored general European developments, somewhere in the middle ground.

All over western Europe, executions of witches petered out in the 1680s, in England as well as Denmark, Norway, and Iceland; in the formerly panic-stricken duchies of Holstein and Mecklenburg; in all of northern Germany; in the Swedish realm in the Baltic; in the Spanish Netherlands; and in the Rhineland and the Saar region, where particularly fierce hunts had been common only decades before. National, regional, or parochial historians offered tales of local heroes—professors, theologians, lawyers, or princes—successfully fighting the sea of superstition. However, the executions even stopped in places without a single hero. A new generation of politicians, educated at the same universities—whether Catholic or Protestant—and usually raised in the spirit of Cartesian rationalism, suppressed any attempt at witch hunting, if necessary by sending in troops, an instrument of power their predecessors had lacked. With the rise of nation-states, "reason of state" replaced religious zeal. However, the term *politician* retained connotations of Machiavellianism, still visible in works by other authors on witchcraft like Christian Thomasius or even in the articles in Johann Heinrich Zedler's *Universal-Lexicon* in the mid-eighteenth century.

**MACKENZIE, SIR GEORGE
(CA. 1636–1691)**

As lord advocate of Scotland, Sir George Mackenzie of Rosehaugh played a crucial role in the decline of Scottish witch hunting. Sometimes called “Bloody Mackenzie” for his relentless persecution of the

Presbyterian Covenanters, Mackenzie was far more sympathetic to accused witches. More than anyone else, he was responsible for the decline in the number of witchcraft convictions and executions in Scotland during the late seventeenth century.

Mackenzie’s initial involvement in witchcraft trials occurred during the large Scottish witch hunt of 1661–1662, when he was appointed to serve as a judge at a number of trials in Midlothian and East Lothian. This hunt was marked by a great many procedural abuses, including the pricking and torturing of witches by local authorities. Mackenzie made frequent references to these trials in his writings, and it is likely this experience shaped his conviction that only trained judges should try witches. In *The Laws and Customs of Scotland in Matters Criminal* (1678), he objected that many witches were tried by “country men” who received conciliar or parliamentary commissions to try witches in the localities. He also attacked the trade of the prickers who were employed to locate the Devil’s mark as a “horrid cheat” (Mackenzie 1678, 90–91).

Mackenzie served as an advocate in the High Court of Justiciary during the 1670s and in 1677 was appointed lord advocate, a position he held until 1686. In this capacity he secured a number of acquittals of accused witches. In 1680, for example, he directed the acquittal of Bessie Gibb, mainly on the grounds that the magistrates and the bailie of the burgh of Bo’ness who had proceeded against her were not competent to try her. Mackenzie was likewise critical of the use of torture in Scottish witchcraft trials. Upon his recommendation in 1680, five witches whose confessions were shown to have been the product of several types of torture were set at liberty. Mackenzie did not object to torture as such: he defended his own use of the practice in treason trials on the basis of reason of state and claimed that its use was authorized by the law of nations. But he insisted that its use be restricted to the Privy Council and the justice general (who presided over the Justiciary Court, the central court at Edinburgh), a policy similar to that declared by the *Parlement* of Paris in 1624.

Mackenzie apparently harbored no doubts regarding the existence of witches. He introduced the section on witchcraft in *Laws and Customs* by responding to the sixteenth-century skeptic Johann Weyer, whom he referred to as “that great patron of witchcraft” (Mackenzie 1678, 81). Mackenzie claimed that witches should suffer death, not just for poisoning and murder but also for “enchanted and deluding the world.” Even charmers, who served as healers, were in his eyes guilty of at least apostasy and heresy. Nevertheless, he claimed that witches were not so numerous as in the past, and as an advocate and judge he tended to doubt the validity of the charges brought against most witches. This judicial skepticism underlay his demand for adherence to due process and the use of caution in the trial of

witches. He would accept confessions only if they were in no way extorted, if they contained nothing that was impossible or improbable, and if the person confessing was neither melancholic nor suicidal. His skepticism was particularly apparent when he defended the accused witch Maevia before the High Court of Justiciary during the 1670s. In this pleading, he argued that acts of maleficent magic could only be proved by either confession or the testimony of two respectable eyewitnesses. He also insisted that diseases could not be said to have been inflicted by magical means just because those diseases had no known natural causes.

In defending Maevia, Mackenzie relied heavily upon Scripture and the works of theologians to support his client's cause. He made an eloquent statement of the Protestant belief in the sovereignty of God, citing scriptural passages regarding Jesus's casting out of the Devil and asked rhetorically how God could have allowed Satan "to reign like a Sovereign, as our fabulous representations would now persuade us" (Mackenzie 1672, 185). In discrediting the belief in witches' flight, he invoked the authority of the *Canon Episcopi*, St. Augustine, and even the Jesuit Martín Del Rio, insisting that flight, like metamorphosis, was the product of illusion. These citations were calculated to disarm his critics and ward off charges of atheism, but they also reveal how critics of the trials could use religious arguments to reinforce their positions.

MAFFEI, SCIPIONE (1675–1755)

An Italian skeptic about witchcraft and an Enlightenment thinker, born into a noble family of Verona, Maffei is probably best known as the editor of the periodical *Giornale de Letterati d'Italia* (Journal of the Literati of Italy). His life was filled with wide-ranging activities. He devoted several years to

archaeological investigations and artistic studies, including poetry; he also joined the Bavarian army and participated in a battle. Following contemporary aristocratic fashion, he traveled around the European continent seeking antiques for his collections. Like his contemporary, Voltaire, he was a famous playwright who was also fascinated by scientific research.

Maffei engaged in empirical research and read widely; his interests reached from philology to natural science and from archaeology to tragedy to magic. Jonathan Israel called Maffei called "one of the chief heralds of the Venetian Enlightenment" (*Radical Enlightenment* 2001, 142); his rich correspondence reveals various sides of the Italian and European Enlightenment. Maffei's eclectic approach to culture typified Italy's emerging Enlightenment, that had as its main concerns the discovery, encouragement, publication, and advancement of rational scholarship. After composing short essays on various scientific topics, Maffei wrote about the causes of lightning (*Della formazione dei fulmini; or On the Formation of Lightning*) in 1747. Meanwhile, he engaged in religious controversy, defending the Jesuit point of view against the Jansenists in 1742 with his *Theological History of the Doctrines and Opinions Expressed by the Church on Divine Grace, Free Will and Predestination*.

Before analyzing his polemics against superstition and magic between 1749 and 1754, it seems useful to recall that Maffei engaged in controversies among scholars and historians on many different subjects. For example, he argued about history with Montesquieu and debated tragedy with Voltaire. Maffei's polemical talents were also displayed in three works against magic. The first, *Arte magica dileguata* (Magical Arts Vanished, 1749), argued mainly against Girolamo Tartarotti (whom Maffei appreciated, as did Ludovico Muratori). Maffei contested Tartarotti's main assertions about the definition and reality of demonic magic; he claimed that fourteen other authors had also opposed its existence. The second, *Arte magica distrutta* (Magical Arts Destroyed, 1750), was written under a pseudonym to defend his previous work. The third, *Arte magica annichilata* (Magical Arts Annihilated, 1754) refuted accusations of heresy by Tartarotti and others. His polemic against Tartarotti went beyond the witches' Sabbath (or *congresso notturno*) to attack the whole theory. Maffei denied the existence of both witchcraft and magic because both were impossible in nature. Maffei also rejected any apparent proof from scriptural sources, stressing the deep diversity of practices described there. According to Henry Charles Lea (1957: III, p. 1449), he overcame Johann Weyer's inconsistencies by asserting that, even before Jesus, there was no magic and no witchcraft. Maffei defined all such evidence as fables and ridiculed anyone who defended their reality. No sane intellect can believe in

magic or witchcraft, he claimed; all “miracles” can be explained by natural laws. Maffei claimed that Pliny the Elder, to him the most important ancient author, rejected magic on the basis of his philosophical theories rather than because of atheism, as Tartarotti asserted. But when Maffei tried to persuade his opponents to reject tales of magic and witchcraft found in ancient sources, they charged him with impiety.

Maffei was anxious to provide plausible natural explanations for all supernatural phenomena. Rejecting any moderate position about magic and witchcraft, he employed skeptical arguments and offered natural explanations in pursuit of a scientific theory. Maffei was particularly acute in denouncing supposedly rational judgments that were shaped as orthodox. Hidden fables, as he showed in surveying both scriptural and literary sources, were utterly unreliable. His position was original for his time and place.

MAGIC AND RELIGION

Both the words *magic* and *religion* are products of a specific process of historical development within a specific culture, and attempts to employ them as generalized categories of human activity have generated increasing controversy. The word *magic* has proved particularly problematic because of its negative moral connotations. The common assumption that magic represents a binary opposite to religion, a practice in which spirits can be coerced, whereas religion more modestly supplicates its god(s), has been found inadequate because not all religions involve a conscious deity, and even when they do,

the line between coercion and supplication is difficult to discern or is even explicitly crossed.

Such difficulties have led many scholars to focus on elucidating the words' specific meanings in the circumstances in which they were employed. Although this solution threatens to leave us with no vocabulary for discussing phenomena that, however ill-defined, are generally acknowledged to be more or less universal, this approach seems justified in the current context because the “Western tradition” is the culture from which these words derived their meanings and within which the opposition between them was defined. Furthermore, the latest chapter in the relationship between them in the Western tradition is the social sciences' attempt to formulate them as generalized categories of human activity and apply them to other cultures—an approach that ultimately leads back to the issue of their general applicability.

Even within Western tradition, definitions of magic and religion pose difficulties because both concepts changed over time and have meant different things to different groups in society. In order to proceed with this entry, minimal definitions will be required as a basis for the following discussion of their specific development. Here, *magic* will signify the manipulation of spirits and occult forces to produce material effects, whereas *religion* involves the worship of god(s) and obedience to their moral instructions with the hope of gaining material rewards and a favorable situation in the afterlife. It should be noted that although these definitions preserve the Western tradition's formal polarization of magic and religion, the ambiguity and overlap between the concepts of manipulation and worship open up the possibility of magical practices within religion, which in fact frequently occurred.

JUDAISM, PAGANISM, AND MAGIC

One root of the Western distinction between magic and religion and of their antagonism was the Hebrew God's insistence that his people worship only him. The Hebrew Bible contains numerous prohibitions of divination and other activities presumed to involve other gods and spirits, which are often interpreted as a repudiation of magic. However, the Bible also contains stories of Hebrew priests producing magical effects in competition with foreign magicians in order to demonstrate the superior power of their god, and the Hebrew people from the lowest to the highest levels of society engaged in prophesy, divination, exorcism, incantations, cursing, protective spells, use of amulets, oaths, and ordeals similar to the magic forbidden by the Bible. The religious authorities accepted these practices so long as their acknowledged source of power was Yahweh and they did not compromise the priests' dominance of the community's spiritual life. Similar magical or folk-religious practices persisted in Jewish popular

culture through the Middle Ages into modern times, and the learned mystical tradition embracing Merkavah and Kabbalah was open to magical influences as well. Both the folk and the mystical traditions existed at the edge of Jewish orthodoxy, always in danger of straying from monotheism or of presuming too much power, so their existence only added ambiguity to, instead of undercutting, the biblical injunctions against magic.

The other root of the Western distinction between magic and religion, and the specific root of the term *magic*, lies in Greco-Roman culture. Specifically, the English word “magic” derives from the Latin *magia*, borrowed from the Greek *mageia*, which itself came from the Persian *magu*, or priest. The Persian term entered Greek as *magos* around the time of the Persian Wars as an insult associating Greeks who practiced magical arts like healing or belonged to ecstatic cults with hostile foreigners. The term *mageia* came into common use during the Hellenistic period and was adopted by the Romans during the last century B.C.E. Although not always used in a derogatory way originally, over time magic’s negative connotations became fixed, gradually increasing both cultural opprobrium and legal restrictions. As with the Hebrew proscription of magic, the Greco-Roman denigration did not imply denial of its power, although the potential of fraud was noted; nor did it amount to a repudiation of its practices and beliefs, which were quite similar to those of official religion. Instead, the issue was the danger that unregulated spiritual activity was perceived to pose to the community. The earliest Greek condemnations concerned the disruption it threatened to introduce into the community’s relationship to its gods, whereas the Romans were concerned with its potential damage to private citizens’ health and property, the way it empowered women and thereby undercut patriarchy, and, later, its potential to damage imperial authority.

Not all magicians accepted this intensifying vilification. Philosophers interested in magic, Neoplatonists in particular, called their practices *theurgy*, differentiating them from lesser traditions called *goetia*. They argued that magic and prayer alike work through the natural sympathetic bonds that permeate the universe and emphasized the extent to which magic operates through occult natural processes, thereby beginning a tradition known as “natural magic.” At its extreme, their concept of magic resembled a form of mysticism. However, by the time they developed their theories, their main opposition no longer came from traditional pagan religions but instead from a new creed, Christianity, which would prove far more hostile to magic.

MAGIC AND CHRISTIANITY

Christianity inherited Judaism’s rejection of magic, but Jesus, the early Apostles, and Christian saints also followed Hebrew tradition by producing magical effects,

and the Christian sacraments had magical connotations as well. The resolution of this paradox was to assert that magical effects produced by Christian actions were miracles, manifestations of God’s power freely exercised, whereas magic depended on evoking the power of demons. The concept of demons was derived from both Greco-Roman *daimones*, spirits that could be good, bad, or indifferent, and that played a significant role in magic, and Jewish demons, who were inherently bad spirits (angels were good ones) that undermined God and harmed humans. Early Christianity associated demons with Satan, who acquired increased prominence as the leader of God’s enemies, and turned magicians into the Devil’s foot soldiers.

While this process of demonization increased the moral menace posed by magic, Christianity simultaneously argued against its practical threat. The difference between miracles and magic was not simply that miracles were good and magic was bad but also that miracles were genuine and magic was false. For centuries, some pagan philosophies had questioned the efficacy of magic, attributing its effects to fraud, illusion, and natural processes, but Christians, who believed in miracles, denied its efficacy on different grounds. Like the Jews, they considered their God to be omnipotent: therefore he, and only he, could contravene the laws of nature. Borrowing arguments from the pagan philosophers, they emphasized the extent to which magic relied on natural processes, illusion, and fraud and argued that any additional power demons had was granted them by God.

These two intertwined themes—that magic involves the idolatrous worship of evil demons and that its power is ultimately illusory—were developed in late antiquity and reiterated and elaborated down through the Middle Ages. However, their exact implications were subject to changing interpretations, and the balance between them shifted as well. Focusing on the demonic basis of magic could heighten the threat it posed, whereas emphasizing its illusory nature could diminish its importance. However, just because magic often involved natural processes and trickery and demons deceived people into thinking they, not God, had power, did not mean magic could not harm people: it was perfectly possible to see magic as both illusory and dangerous. Similarly, the demonic element could be seen as either a purely moral issue (idolatry) to be punished with penance or excommunication, rather than as a public danger requiring criminal prosecution and secular punishment. Thus, in late antiquity, Christian emperors, influenced by the clergy’s desire to expurgate paganism and confident in their own power, made all practice of magic a capital offense. In the Early Middle Ages, in contrast, St. Boniface declared belief in witches and werewolves to be un-Christian, and the *Canon Episcopi* condemned the belief of some women that they flew at night on the backs of animals with the goddess Diana as an illusion and

punished it with penance. Such variations in emphasis reflect not only changing intellectual fashions but also the worldly power available to Christian authorities: when the opportunity permitted it, they readily suppressed magic by force as well as decrying it as vain; where secular rule was weak, they simply disparaged it and punished its practitioners with penance.

Even with the might of the Roman Empire at their disposal, the Christians could not expunge magic or magicians from their midst. By the time the western empire fell, they had largely succeeded in eradicating formal pagan cults, but they were far less successful in eliminating magic from popular culture. Furthermore, the conversion of the Germans, while similarly eliminating formal pagan opposition, was even less successful at the popular level, because in the process of conversion, Christian missionaries pragmatically tried to win acceptance by superimposing their religion on existing forms as much as possible. To some extent, Christian clergymen took over magical roles previously played by pagan priests, like blessing fields and animals, and to a much greater extent they simply continued time-honored practices after purging them of explicit paganism. For its part, the European populace gradually accommodated its traditions to the new creed, substituting God, Jesus, the Virgin Mary, and the saints for pagan deities in their spells and Christian symbols for pagan signs in their charms. This process introduced significant changes into both popular magic and Christianity. Because popular magic was amorphous and routinely adapted to and adopted from other spiritual systems, whereas Christianity was more rigid, these changes created a disjunction between formal doctrines and accepted rituals and actual beliefs and practices. The resulting tensions remained latent for centuries but eventually came to a head when secular power reached levels that made their resolution seem practicable.

Before that day of reckoning, though, new elements entered the mix in the High Middle Ages, when the importation of Arabic scholarship and revival of classical learning prompted a revival of learned natural magic. This system claimed to avoid demonic agency by manipulating hidden forces of nature rather than spirits. Alchemy and astrology, in particular, lent themselves to this interpretation, and generations of learned magicians from the twelfth-century Renaissance through the Neoplatonic movement in the High Renaissance to the early Scientific Revolution in the seventeenth century dreamed that they could gain acceptance in the Christian community. They pointed to the value of their arts in revealing the secrets of nature and argued that their cultivation would lead to a fuller understanding of the Christian God.

Unfortunately, natural magic posited that the universe is an organic, living whole bound together and permeated by an incorporeal spirit that seemed suspiciously close

to a god. Furthermore, a certain amount of natural magic involved invocation of spirits that, despite the magicians' protestations that they were neutral, almost mechanical connectors in the celestial system, sounded much like demons to the uninitiated. The Christian community already had a variety of less dubious means of approaching its God and understanding nature and an array of specialists engaged in them. Theologians therefore reiterated that any invocation of spirits was idolatry, that there were no good or neutral demons, that no form of magic leads to knowledge of God or the Holy Spirit, and that there is a fundamental difference between miracles and magic. For several centuries, natural magic enjoyed general acceptance as a body of knowledge within natural philosophy concerned with hidden processes in nature, but it never gained general acceptance as a set of practices or as a legitimate source of more general wisdom or approach to God.

The refutation of natural magic's religious claims formed one part of a much larger process by which medieval Christianity rationalized its beliefs, the intellectual movement known as Scholasticism that systematized ideas about the supernatural dimension of evil into the demonology that underlay the early modern persecution of witches. Belief in the immanent operation of a hierarchy of demons working against the Christian community under the overall dominion of the Devil became an integral part of late medieval culture even as it became more aware of the disparity between approved and actual beliefs and practices. Not just malevolent witches, who were thought to be primarily women, but all practitioners of magic, no matter how beneficent their activities or high-minded their intentions, were perceived as human agents of this dangerous diabolic conspiracy. Even among the elite, only a minority followed this reasoning to its logical conclusion, so at the height of the witch persecutions, local healers and learned astrologers and alchemists continued to practice, and ordinary people continued to employ a vast array of magical remedies and protections, but nevertheless, the demonological paradigm shaped law codes, informed jurists and magistrates, inspired artists and writers, frightened ordinary peasants and townspeople, gave malicious or vengeful people a weapon against anyone (particularly women) who could plausibly be accused of magic, and forced everyone (and again particularly women) to be more conscious of gaps between the dictates of their religion and their actual beliefs and practices. The witch persecutions reflected a number of trends and tensions in European society: one of the most important was the desire, inherited from late antiquity, to purge the culture of magic and society of its various practitioners.

Even as the early modern witch persecutions got underway, Europe was rent by the Protestant Reformation, which affected the relationship between

religion and magic in several important ways. To begin with, by replacing the Church, with its sacraments, saints, and good works, with individual faith as the key to salvation, Protestantism heightened the importance of the purity of each individual's beliefs and practices. It became more problematic for Christians to go to a cunning woman on Thursday and church on Sunday if they could not just confess and do penance in between. Second, just as Protestantism eliminated the spiritual hierarchy that mediated between the individual and God, so too it reduced the importance of demons in magic in favor of the direct involvement of the Devil, strengthening the connection between magic and evil. Third, the religious conflict intensified the scrutiny of popular practices on both sides of the confessional divide, as Protestants and Catholics competed in their zeal to prove their spiritual superiority. Finally, by denigrating Catholicism as rife with magical rituals and doctrines and minimizing its own magical elements, Protestantism codified the division between religion and magic. Some Protestant sects tried to eliminate all traces of magic, regarding rituals as symbolic only, consigning miracles to biblical times, and disparaging any claims of miraculous processes or supernatural effects in the present as rank magic no different from the pretenses of marketplace charlatans.

The decline of the witch persecutions in the seventeenth century involved another shift in the relationship of Christianity to magic. Faced with the disorder and injustices the witch persecutions created and perhaps reacting to their success in curbing if not eliminating magical practices, Europe's civil and, somewhat more reluctantly, its religious authorities gradually abandoned their concern about the danger posed by the Devil and malevolent magicians and placed increasing stress on the illusory nature of magic, both in terms of its efficacy and of its ultimate cause. While maintaining the theoretical possibility of magical effects and the Devil's involvement in human affairs, they increasingly questioned the likelihood of magic having caused harm in any particular instance, and they emphasized that since the Devil is subservient to God, any power he or his servants manifest is a sign of God's displeasure and should lead people to scrutinize their own consciences rather than punish the apparent perpetrators. They still opposed magical practices, but now (again) for their impiety and fraudulent claims. Without abandoning their fundamental belief in magic and the reality of the Devil, they shifted emphasis away from the danger they posed to their illusory nature—this time not because they lacked the power to combat them forcefully, but rather because they realized that they had too much of it.

MAGIC, RELIGION, SCIENCE, AND THE SOCIAL SCIENCES

As the witch persecutions ended because of a shift of emphasis within the traditional framework bequeathed

by antiquity, the relationship between magic and religion soon began to be affected by a radically new factor, the rising importance of science and, particularly, the new mechanical philosophy. Recent research has shown that the traditional Whig interpretation of the rising scientific worldview as the implacable foe of magic contains considerable oversimplification, for natural magic was an integral part of the natural philosophy out of which science emerged and played a role in scientific thought well into the eighteenth century. However, mechanical philosophy rejected the notions of occult causation, spiritual agency, and an organic unity to the physical universe, putting it at odds not only with magic but with Christianity as well. To some extent, this common opponent pushed magic and religion together, so, for example, defenders of witchcraft beliefs argued that denial of witches' magical powers and the Devil's immanence logically undercut other supernatural beliefs more central to Christianity, like miracles, angels, and the afterlife. Religion enjoyed the protection of powerful social patrons, though, whereas magic was a social orphan, so Enlightenment thinkers could rebut and lampoon magical beliefs far more openly and caustically than they could religious ones. Disbelief in magic (though not in religion) became a sociocultural marker of membership in the intellectual elite, and social pressure, class snobbery, and sycophantism played at least as great a role as experimentation and reasoned argument in the ultimate triumph of science. The *philosophes* used the vulnerability of magic, which Christianity had done so much to create, not only to deprecate magic but also to attack religion indirectly. Theologians generally responded to this scientific assault by de-emphasizing the magical aspects of religion and highlighting its moral message. During the eighteenth century magic disappeared entirely from learned discourse, and Christianity lost its central place in intellectual life, relegated to the role of metaphorical narrative and ethical adviser.

Rumors of the death of God and assumptions about the end of magic have proved greatly exaggerated: belief in the reality and power of both survived education, ridicule, and repression (in the case of magic) in popular culture, and both have revived in recent decades—even, in the New Age movement, together. Nevertheless, what intellectuals contested in the eighteenth century, their descendants in the nineteenth and twentieth centuries assumed they had won, and so they turned from scientific debates about the reality of magic to social-scientific explanations of magical and religious beliefs. Individual belief in magic and religious enthusiasm were pathologized by the emergent discipline of psychology, and psychologists competed with philosophers, historians, sociologists, and anthropologists in constructing sociocultural theories to explain magico-religious thinking's long hold on

human consciousness and to celebrate its eventual demise. Nineteenth-century theorists like Auguste Comte, G. W. F. Hegel, and Karl Marx pioneered an etic approach to the problem, proposing grand narratives in which different formulations of magic, religion, and science formed succeeding stages in the evolution of human cognition linked to the development of material civilization. Somewhat later, Max Weber championed a more emic approach that insisted on the need to understand what peoples' religious beliefs meant to them, and, in opposition to Marx, pointed to the ways they could shape the development of socioeconomic structures.

By the late twentieth century, at least eight major interpretive approaches had emerged, which have been termed the intellectualist, the emotionalist, the phenomenological, the structural-functional, the symbolic, the structuralist, the feminist, and the cognitive (Cunningham 1999).

The intellectualist interpretation (whose exponents include Herbert Spencer, E. B. Tyler, J. B. Frazer, and a number of British anthropologists since World War II) regards magical and religious thinking as prescientific attempts to explain otherwise inexplicable phenomena and magical and religious rituals as attempts to influence otherwise uncontrollable processes. Early intellectualists distinguished magic from religion as different stages in the evolution of conceptualization, whereas later ones were more concerned with the relationship of both to science. The emotionalist approach (exemplified by R. R. M. Ma rrett, Sigmund Freud, and Bronislaw Malinowski) explains both magical and religious beliefs as ways of coping with stressful emotions, whether the frustration caused by an inability to control an important situation, long-repressed infantile conflicts, or the need to express feelings generated by significant life events. The phenomenological approach (including Rudolf Otto, Karl Jung, and Mircea Eliade) seeks to study the contents of consciousness as people experience them, with Otto treating the transition from magic to religion not as a product of material development but as a widening of the range of human feelings, whereas Jung and Eliade treat magic and religion as a unitary set of symbols either inherited or recognized in nature that represent and help resolve critical life events and foster psychological development.

Although these three schools of thought have made contributions that have been assimilated into the current understanding of magic and religion, the mainstream of contemporary thought focuses on their relationship to the larger society and culture. The first such approach, structural-functionalism, began with Emile Durkheim's insistence that social phenomena be explained in social rather than psychological terms. He applied that idea to religion by saying it symbolizes social structures in a way that serves as a general

classificatory system linking individual consciousness, social relations, and the larger environment and that integrates society by reaffirming social identity. Durkheim paid less attention to magic because he felt it was distinguished by its private intent and secret execution from religion's public purpose and open practice and therefore revealed relatively little about the larger social reality. Following Durkheim's sociological approach, Marcel Mauss, his nephew, actually first worked out this distinction between religion and magic. A. R. Radcliffe-Brown took the tradition in another direction, opposing any distinction between religion and magic and focusing on the relationship between their rituals and other aspects of society, an approach that became the norm among anthropologists in the mid-twentieth century. Radcliffe-Brown's student E. E. Evans-Pritchard continued to link religious forms to social structure but broadened his approach to include the idea that the Africans he studied utilized two modes of thought, mystical and empirical, in explaining events and reacting to them, for he found that structural-functional explanations clarified only limited aspects of his subjects' magico-religious beliefs.

Evans-Pritchard's theory about two complementary modes of thought echoed the ideas of Lucien Levy-Bruhl, who first proposed an evolutionary schema involving a progression from primitive mystical consciousness into modern rational thought but later modified it to the notion that the two modes of understanding coexist. Because of his focus on the content of thought, as opposed to the process of thinking, Levy-Bruhl was an early exemplar of the symbolist approach in anthropology. From this point of view, structural-functionalism's portrayal of religion as an expression of social structure is just one possible type of symbolization. Anthropologists like Mary Douglas, J. H. M. Beattie, Victor Turner, Arnold Van Gennep, and Clifford Geertz broadened symbolic interpretations to include the ways that the rituals and beliefs of magic and religion symbolize basic biological and psychological processes, social transitions, and the cosmic order. They also emphasized that symbol systems can actually shape the social order. The anthropologist S. J. Tambiah has gone one step further by approaching magic as a rhetorical art in which performative acts and utterances do not just symbolize or guide but actually constitute transferences of (social) qualities and changes of (social) state.

Tambiah's focus on magico-religious symbolism as a form of performative rhetoric is rooted in semiotics, the science of symbol systems, which is the basis for the approach called structuralism. Primarily associated with Claude Levi-Strauss but also including Edmund Leach and Maurice Godelier, it approaches culture from the point of view of Saussuran linguistics, treating it as a set of communications systems exemplified by language in which the relationship of symbols to each other is

paramount. Leach's early work was characterized by a particularly direct reliance on linguistic structuralism, but Levi-Strauss put more emphasis on the unconscious structures of the human mind, and Godelier attempted to synthesize structuralism's focus on culture and language with Marxism's concern for socioeconomic realities. Following Marx's repudiation of religion as the "opium of the people," Godelier regarded religion and magic as inextricably linked, with religion an illusory explanatory system and magic an imaginary method for causing effects. Levi-Strauss also regarded magic and religion as complementary, although in very different terms: he posited that religion involves treating physical reality as if it has human characteristics, whereas magic involves treating human ritual actions as if they have a direct connection to physical reality. Lesch, in contrast, came to question whether words like *religion* and *magic* can be used to discuss cultures that do not include cognates, and has expressed doubts whether *magic* in particular has any meaning at all.

Feminist interpretations of magic and religion focus on the links between gender, power, and the legitimacy of spiritual activity. Because religions since antiquity have been patriarchal, both in their conceptualizations of spiritual reality and in their secular structures, women have tended to be particularly linked to magic, the illicit, or at least unofficial, practice of spirituality. Furthermore, because men dominated scholarship on this topic until the 1980s, early theories about religion and magic overlooked the role of and the impact on women. Feminist scholars in a variety of disciplines have worked to correct this imbalance, with a historian of religion like Ross Shepard Kraemer, for example, critiquing classicists' traditional reliance on male-centered sources when studying Greco-Roman religion; the anthropologist Julia Kristeva critiquing anthropology for its neglect of matriarchal Neolithic religions and the process of repression by which patriarchal cults supplanted them; and the theologian and philosopher Mary Daly launching a much broader attack on patriarchal religion as part of a broader critique of patriarchal institutions generally.

Finally, the cognitive approach has developed from dissatisfaction with Saussurean assumptions about the workings of the human mind, in particular, the reliance on semiotics and privileging of linguistics. Instead of seeing meaning as coming from the relationship between signs, it adopts generative linguistics' focus on the relationship between deep structures rooted in the brain and their specific manifestations in speech. Furthermore, it rejects the assumption that language determines people's perception of reality, instead treating language as one of several specialized mental processes that structure perception and mentation. For example, Dan Sperber argues that symbolism is a mechanism for handling irregular types of information that

makes use of a specialized cognitive process separate from language that interacts with perceptual and conceptual mechanisms in constructing knowledge and consolidating memories. E. Thomas Lawson and Robert McCauley have focused more specifically on religious and magical ritual, arguing that specific rituals are surface manifestations of three underlying cognitive mechanisms. Pascal Boyer argues that many ideas about magical causation and the resultant ritual actions are relatively mundane consequences of the normal functioning of our system for making inferences, while Patrick McNamara suggests that perception of the hidden workings of spirits, gods, or karma is triggered by our mechanisms for detecting intentionality and the subsequent application of our "theory of mind." What these last two theories, in particular, indicate is that magico-religious beliefs may stem not from some malfunction of the nervous system but from its regular functioning. We repeat things associated with success, avoid things associated with failure, and deal with the world on the assumption that it is sentient, because in a dangerous world it is safer to treat something as smart than vice versa.

One final approach goes beyond cognitive psychology to explore the physiology of trance states and mystical communion. For example, the recent research of Eugene d' Aquili and Andrew Newburg has found that if either the sympathetic (arousing) or the parasympathetic (quieting) nervous system is pushed too far, it activates the other, and this simultaneous activation of the two opposing systems results in an ecstatic state and the suppression of the brain center that maintains our awareness of the border between ourselves and the external world. This, in their estimation, accounts for the sensation of mystical communion, and it can be achieved, as experience suggests, by either an overload or prolonged deprivation of activity and sensory stimulation. A different approach to trance states has been pursued by Michael Winkelman, who has connected the physiological, psychological, and anthropological dimensions of shamanistic healing to develop a rich understanding of how that form of magic works. Finally, in an older set of studies, d' Aquili and another set of collaborators focused on the effects of rhythmic group rituals on their participants, arguing that they "tune" the participants' nervous systems to common neural rhythms, inducing group harmony to facilitate collective action or promote intramural accord. This concept of "tuning" the nervous system seems to hold particular promise for expanding our understanding of religion and magic, suggesting that ritual actions, incantations, fasting, hallucinogenic drugs, meditation, and similar practices provide an array of techniques for physiologically "tuning" our processes of perception and cognition so that we apprehend and interact with the world in different and, in different contexts, useful ways.

More generally, the physiological and cognitive approaches together suggest that although the distinction between magic and religion may be an artifact of the historical development of the Western tradition, and specific magico-religious practices and beliefs are manifestations of specific cultures, the terms refer not simply to cultural constructs, but rather to cultural constructs built upon the common foundations of more basic human processes and experiences.

MAGIC CIRCLE

A sacred space creating a physical barrier to the environment within which many magical rites, such as invocations of demons and other similar ceremonies, are performed is called a magic circle.

Embodying wholeness, perfection, and unity, the circle had not only magical but also universal religious significance. Remnants of cult circles, not unlike the well-known Stonehenge, exist throughout the world, proving their ancient origins. Circular forms were used in old Babylonian magic. Medieval and Renaissance ceremonial magicians employed them; Rembrandt van Rijn's famous etching of Dr. Faustus shows the scholar focusing on a magical circle on the ground, which is reflected in the window panes. Some American Indian tribes or, for that matter, today's Wiccans, have used magic circles, but for different reasons.

ANCIENT AND MEDIEVAL MAGIC CIRCLES

To summon an angel, a spirit, or a demon, a magician generally requires a magic circle. The German monk Caesarius of Heisterbach, a rich source for both learned and folk magic, included a story in his *Dialogus Miraculorum* (Dialogue on Miracles, ca. 1225) about a knight who denied that demons exist and was dramatically refuted by a monk, who drew a magic circle and conjured demons. In his *Autobiography*, Benevenuto Cellini vividly described experiencing a similar episode in the Roman Colosseum in the 1520s.

Handbooks of ceremonial magic from late antiquity to the present dealt repeatedly with the matter, although the form of the circle was not invariable and almost every *grimoire* showed a different form of magic circle. The well-known, widely adapted, and relatively ancient *Key of Solomon* described the essential clothing and requirements (knife, rings, scepter, fire, parchment, ink) needed to create a properly equipped magical circle from which an operator might safely evoke a demon. As the book instructed, the circle had to be 9 feet in diameter and traced with the consecrated knife. Four pentacles were to be engraved with the names of the Creator, inscribed with the same knife. The characters inscribed in the circle were Greek and Hebrew; the formula "alpha-omega," the first and last letters of the Greek alphabet, had to be repeated several times.

Johann Georg Faust invoking a demon while inside a magic circle. (Stapleton Collection/Corbis)

A few other examples show how more recent imitators have twisted this formula. The *grimoire* *Le Dragon rouge* (Red Dragon), supposedly dating from 1522 but originally printed in 1822, called the circle the "Triangle of the Pacts." It had to be made with the skin of a kid lamb nailed with four nails, and the triangle within the circle had to be traced with an enameled stone. *The Magus*, published in London in 1801 by Francis Barrett, who attempted to renew occultism in England, instructed the operator to engrave the letters *alpha* and *omega* and various divine names. His pentacles inscribed within the circles contained mostly Hebrew names and formulas.

MAGICAL CIRCLES IN NEOPAGAN RITUALS

In much of Wicca today, a circle becomes a sacred space to meet the gods and goddesses. Human mental energy creates the circle, which restricts negative energy and spirits. The circle, usually 9 feet in diameter, simply marks the point where the sphere

touches the earth (or floor) and continues beneath. Some kind of marking is often placed on the ground to show where the circle bisects the earth: a cord laid in roughly circular shape, a lightly drawn circle of chalk, or objects (even tarot cards) showing its outlines. Details like knives and pentacles recall Solomon's ancient key.

MAGIC, LEARNED

Since the Early Middle Ages, European culture has contained a tradition of literate or “learned” magic as well as the orally transmitted traditions of “popular” magic. The two differed both in their content as well as their mode of transmission, but they were connected by a reciprocal exchange of influences. Furthermore, like popular magic, learned magic encompassed a number of disparate traditions. Although written texts were fewer and more interconnected than the innumerable local and regional popular traditions, they were more widely accessible, particularly after the invention of the printing press in the late Middle Ages brought a quantum jump in the availability of texts. The printing press also accelerated the interaction between learned and popular traditions, gradually merging them to the point at which they are barely distinguishable today.

The roots of the learned tradition lay in antiquity, with magical techniques and theories transmitted directly through a small number of texts preserved in the European provinces of the western Roman Empire and indirectly through a much larger number of texts preserved and elaborated on in Byzantine, Arab, and Jewish cultures, which western Europeans increasingly encountered in the High and late Middle Ages. During the Renaissance, learned magic reached a high point in the Neoplatonic movement, which saw “natural” magic, or knowledge of the hidden forces of nature, as a route not simply to power but also to transcendent knowledge, comparable in many ways to religious mysticism. At the same time, western European learned magic descended into necromancy, or the deliberate summoning of demons through complex esoteric rituals, which contributed significantly to fears of a conspiracy of diabolic magicians that motivated early modern witch persecutions. Such fears put a significant damper on open involvement with many forms of learned magic, especially those involving spirits as opposed to occult natural mechanisms. Forms of the latter, like astrology and alchemy, continued to be practiced openly through the early modern period, and popular magical practitioners utilized books drawn from the learned tradition with increasing frequency, but in elite circles, open involvement with spiritual magic virtually disappeared. Covert practices probably declined as well, given the dangers involved, but some residual activity appears to have remained. In the nineteenth and twentieth centuries, the open practice of learned magic revived and evolved,

mixing with non-Western traditions, popular practices, mysticism, and fringe science to form the magico-religious New Age movement.

ROOTS OF EUROPEAN LEARNED MAGIC

Early medieval culture, including magic, combined two basic influences: the traditions of the Germanic peoples who overran much of the western Roman Empire and the traditions of the “Romans” themselves, that is, the earlier inhabitants of the late western empire. Germanic traditions were almost exclusively oral and affected early medieval popular culture more than they did the learned culture. Much of Roman culture was also oral, but two of its strands were written and became the basis of medieval learned culture: the texts of pagan writers and of the Judeo-Christian tradition.

Of the two, pagan writers contributed more substantially to early medieval learned magic. The Bible, of course, confirmed the existence and power of magical forces, chiefly in the form of miracles, and some late Roman Christian commentators recorded some magical practices with evident approval. In general, though, the Judeo-Christian tradition, from the Hebrew Bible to the late-Roman Church Fathers, disparaged the apparent power of magic as illusory and warned its adherents to shun such practices as deliberate or implicit trafficking with demons. A few pagan authors similarly disputed the power of magic, but the vast majority accepted the existence of hidden, or occult, forces that directly influenced the material world. They recorded some of the wide variety of beliefs and practices held across the Mediterranean world, including both simple popular practices and complex learned systems like astrology. Proponents of philosophically grounded systems typically valued their magic as far superior to the mundane practices of village healers and marketplace fortunetellers, theurgy as opposed to goetia, which anticipated the divide between learned and popular magic in later European culture. The pagan writers whose writings influenced learned medieval magic included not only philosophers, historians, and others who intended to record and evaluate actual magical practices but also poets and storytellers whose fictional accounts (whether or not they reflected actual beliefs and practices) were accepted as real during the Middle Ages.

EARLY MEDIEVAL LEARNED MAGIC

Only a small number of texts survived the collapse of the Roman Empire in the west, so no coherent system of learned magic was preserved there. The few miscellaneous surviving works containing knowledge of magic were consulted, and through use, their knowledge gradually diffused into popular culture. They were supplemented by a growing body of texts recording popular practices, often mixed with classical knowledge, so

rather than forming a distinct tradition, the surviving texts contributed a learned component to what has been called the “common tradition” of medieval magic, which included healing, divination, talismans, love magic, and sorcery (Kieckhefer 2000, 56).

With the twelfth-century Renaissance, this situation changed. Growing contact with the Byzantine and especially the Arab world introduced educated Europeans to increasingly specialized knowledge, including complex and sophisticated forms of magic rooted in antiquity and further elaborated over the intervening centuries. These techniques required highly developed literacy and mathematical skills, and they were grounded in Aristotelian physics, Ptolemaic astronomy, and Galenic medicine. In particular, astrology (fortune telling based on the relative positions of the stars), astral magic (harnessing the power thought to emanate from the heavens), and alchemy (transmuting one element into another, particularly, changing base metals into gold) all required intensive study of texts, careful calculations, and, in the last case, elaborate equipment. Later, practice of the Jewish magical and mystical tradition known as the Kabbalah required a precise knowledge of Hebrew, and necromancy, the conjuring of spirits, involved complex rituals following elaborate written scripts. Such arts both influenced and were influenced by popular practices, but each of these traditions constituted an intricate, autonomous system. Together, their content as well as their mode of transmission made them a separate variety of magic, distinct from the popular traditions practiced in innumerable European localities.

APOGEE OF LEARNED MAGIC: THE RENAISSANCE

The high point of learned magic undoubtedly came during the Renaissance, when a group of humanists revived Neoplatonism and linked it to writings ascribed to a mythical ancient *magus*, Hermes Trismegistus. Neoplatonism, founded by the philosopher Plotinus in the third century C.E., held that a network of natural sympathetic bonds connects all things in the universe and can be manipulated through complex rituals. The Hermetic writings were thought to go back to ancient Egypt but were actually a collection of second- and third-century-C.E. Greek treatises on philosophy, astronomy, alchemy, and magic. The leaders of the Renaissance movement included Marsilio Ficino, who translated Hermetic manuscripts and wrote original works on astrological medicine and astral magic, and Giovanni Francesco Pico della Mirandola, who went to Rome and set forth for public debate 900 theses that asserted the underlying compatibility of all religions, defended the value of Neoplatonic magic as a means of understanding the inner workings of nature, and claimed to have found a higher and more potent form

of magic in the Jewish Kabbalah, in which the magician, speaking God’s own language (Hebrew), can gain both wisdom and power. For Renaissance magi such as Ficino and Pico, magic was a quasi-mystical way to approach God.

Such Renaissance magi practiced and publicized their magic in the face of Christianity’s traditional hostility to any supernatural phenomenon beyond the miracles ascribed to God and subsumed within the doctrine and rituals of the Church. They argued that their magic was fundamentally different from the magical practices that the Church opposed. These had traditionally relied on spirits, conscious incorporeal entities, which in Christian doctrine could only be agents of God, angels, or demons (agents of the Devil); and, because God’s supernatural work was generally done through the Church, any independent operator working through nonapproved spiritual channels was almost certainly working consciously or unconsciously with demons. However, the tradition in which these Renaissance magi worked styled itself as “natural magic” or the “occult sciences,” the study and manipulation of hidden natural forces. This concept of magic dated from the introduction of the learned magical systems during the twelfth-century Renaissance; it was one aspect of that much larger reintroduction of classical knowledge, particularly natural philosophy. While conceiving the universe as an organic, living whole permeated and bound together by incorporeal spirit, natural magic de-emphasized the role of individual conscious spirits in favor of a more mechanistic concept of the occult dimension of nature. To the extent that Renaissance magi still invoked spirits, they insisted that they were not demonic and could be manipulated like any other natural phenomenon, without recourse to a diabolical pact. Natural magic was, in their estimation, the alternative to demonic magic and hence was perfectly compatible with Christianity. Ficino, in particular, attempted to fuse Christianity and magic in what he called “Platonic theology.”

NECROMANCY AND THE PROSCRIPTION OF WITCHCRAFT

Although natural magic won widespread acceptance as the branch of natural philosophy that dealt with hidden processes in nature, learned magicians still faced formidable obstacles in their broader quest to gain legitimacy for their practices. One barrier was the Church’s deeply rooted suspicion of any heterodox spiritual system. Another was the fact that, as the learned magicians had to admit, their beliefs and practices were closely related to other forms of magic that were malign or even explicitly demonic, some of which also belonged to the learned tradition—particularly necromancy, which originally meant divination by conjuring the spirits of the dead but had come to mean conjuring

spirits, including demons, for any magical purpose. Necromancy, which involved complex rituals contained in illicit books, enjoyed considerable popularity in the late Middle Ages, especially in an underworld on the fringe of clerical and courtly circles. Many necromantic rituals appealed specifically for God's permission, and most necromancers probably rationalized their activities as within the bounds of Christian behavior, but many of their rituals were unquestionably performed for destructive or exploitative ends, and some explicitly invoked evil spirits.

The witch persecutions that began in the late Middle Ages and climaxed in the early modern period stemmed from multiple causes, but one was surely the actual practice of necromancy by members of the educated elite. A good number of the late medieval sorcery trials that contributed to the growth of witch fears and the consolidation of belief in a conspiracy of Devil-worshipping evil magicians involved people who had actually practiced harmful magic. Necromancy was particularly important, both because it tended to be practiced by people with the wealth to buy books and the education to read them and because it made the link between malefic magic and diabolism particularly clear. Not only did it involve the explicit invocation of demons, but also it often made illicit use of Christian symbols, prayers, and rites in the process. Furthermore, at times, necromancy was practiced by small groups of people, supporting the notion that evil magicians met in secret. There is no evidence that necromancers formed a widespread underground conspiracy that had renounced God and signed on with the Devil, but their actual beliefs and practices helped make fears about such a sect plausible.

LEARNED MAGIC, WITCHCRAFT PERSECUTIONS, AND THE SCIENTIFIC REVOLUTION

Necromancy was not the only way that learned magic contributed to witchcraft beliefs, for learned magicians participated vigorously in the sixteenth-century debate about witchcraft. Several voiced skepticism about the notion that witchcraft was a diabolic counterreligion of malevolent magicians, like Cornelius Agrippa, who defended a peasant woman accused of witchcraft in 1519 and who reportedly called witchcraft a delusion and a dream; Paracelsus, Girolamo Cardano, and Jean-Baptiste Van Helmont all tried to explain witches' powers in nondemonic terms. After a "witch" let him observe her anointing herself with a mixture (which he described), then fell into a profound sleep and upon awakening, claimed to have flown away, Giambattista Della Porta argued that witches' flights to Sabbats were hallucinogenic dreams. Of course, all of them accepted that magic could work, and their opposition to witch beliefs was at most conditional. Other learned magicians, like Johannes Trithemius, denounced witches and

witchcraft as vehemently as any demonologist, whereas Johann Weyer, who had once been Agrippa's assistant, coupled skepticism about witchcraft and defense of accused witches with a harsh condemnation of learned magicians! In the end, the position each took probably mattered less than their collective contribution to the sheer volume of discussions of witchcraft, for quibbles about the source and extent of witches' powers or the nature of their congress with the Devil mattered less in the late sixteenth and early seventeenth centuries than the apparent consensus that some people had given themselves over to the Devil and sought to harm others by practicing *maleficium* (harmful magic).

Weyer's attack on learned magicians was echoed by numerous demonologists, who denounced their activities as frequently as they denounced their popular counterparts, insisting that their magic probably involved demons, whatever the magicians claimed about natural magic, and arguing that even if it did not, it was still irreligious and probably fraudulent. In this age, even benign magic, although less serious than witchcraft, was still subject to penalties like fines, incarceration, and banishment, and there was always a chance that it could lead to an accusation of witchcraft. Consequently, being known as a learned magician became increasingly dangerous during the sixteenth century, and the number of prominent men who identified themselves as such appears to have declined significantly during the height of the witch persecutions from 1550 to 1650. Astrologers and, to a lesser extent, alchemists continued to practice, for their occult arts clearly involved natural forces, and local cunning folk and provincial wizards continued to offer their services, increasingly furtively, but learned magicians practicing the invocation of spirits had largely disappeared from the European stage by the seventeenth century. Nostradamus, for example, insisted that he was not a magician and claimed he had burned his magic books even as he cultivated a European-wide reputation for prophesying. Similarly, John Dee insisted that he was not a magician even as he studied the occult arts and employed scryers to communicate with spirits in hopes of attaining transcendent insights. In all probability, a few individuals on the fringes of upper-class society secretly practiced learned magic, hoping to harness occult powers for their own or their clients' purposes, but they kept a low profile and have left few traces.

Although natural magicians disappeared rather abruptly from the European scene, natural magic did not. As a body of explanations about the more obscure workings of the physical world, it held a respected place in natural philosophy. Natural magic played a role in all medieval philosophies of nature and continued to do so in the professional activities and conceptual schemes of many early modern scientists. Both William Gilbert and Van Helmont took magic very seriously, and

Johannes Kepler and Galileo Galilei cast horoscopes professionally. Kepler was deeply influenced by Hermeticism and Neoplatonism, and his research on planetary motion was encouraged by his faith in the existence of a magical geometry of the planets and a unifying spirit in the universe. Isaac Newton studied alchemy as well as optics, and his greatest achievement, the universal laws of gravitation, involved the acceptance of an essentially occult force in nature, gravity. However, because natural magic was so closely integrated into medieval natural philosophy, its explanatory power declined as science changed. Astrology, for example, had been explained in terms of Aristotelian cosmology, and the idea of occult influences on health and disease fit with Galenic medicine, but the magical systems lost their intellectual underpinnings as venerable scientific systems fell out of favor. Furthermore, the most vehement advocates of the new mechanical philosophy objected to any notion of action at a distance, so even though gravitation and magnetism made this position impossible to sustain in the long run, in the short run, mechanical philosophers argued strenuously against magical notions like the physical power of sympathy and antipathy or the ability of the heavens to directly influence human affairs. More fundamentally, and perhaps most importantly, the magical notion of a purposive universe held together by conscious forces ultimately could not be reconciled with the new scientific conception of an inanimate universe governed by mechanical processes.

LEARNED MAGIC AFTER THE WITCH PERSECUTIONS

Except for astrology, the practice of learned magic languished in Europe for the better part of two centuries, from the mid-1600s to the mid-1800s. The devout regarded it as irreligious if not diabolical; scientists rejected it as they embraced the new mechanical philosophy; the *philosophes* ridiculed it; and the upper classes in general adopted disbelief as a cultural marker distinguishing themselves from the common herd. Popular practitioners now used books, including texts adapted from learned magical traditions, but it is uncertain how many indulged in the more complex and arcane rituals. Whatever they did, like whatever isolated members of the elite did, was furtive and left few traces. A few famous eighteenth-century figures like Emanuel Swedenborg and Franz Anton Mesmer are sometimes considered magicians, but Swedenborg was a mystic who did not practice magic, whereas Mesmer combined modern technology and magnetic instruments with instinctive showmanship rather than practicing any esoteric tradition. Figures like Casanova and “Count Cagliostro” were merely adventurers and charlatans who used magic to perpetrate conscious frauds. Of course, their ability to perpetrate frauds demonstrates the con-

tinuing attraction of magical beliefs, even for a significant portion of the elite. It seems certain that some people read surviving treatises on learned magic and attempted to practice what they read, but learned magic had been pushed to the outermost margins of European intellectual life by the combination of religious disapproval, intellectual disregard, and social disdain.

The open and serious practice of learned magic only revived in the middle of the nineteenth century, when Alphonse Louis Constant began publishing books on learned magic under the pseudonym of Eliphaz Levi and quickly gathered a circle of disciples and pupils. This revival gained momentum when it was institutionalized in a number of secret societies modeled on Freemasonry, which was at that point already well over a century old. The first of these, the Societas Rosicruciana, was founded in 1866 to study the Kabbalah, the Hermetic texts, and other ancient traditions. It was soon followed by the Theosophical Society, which started in 1875 and focused on introducing non-Western esoteric traditions to Europe and the United States. The process culminated in 1888 with the founding of the Hermetic Order of the Golden Dawn, which had the express purpose of practicing the magic that such older groups were merely studying. In the following decades, books about the practice of venerable magical traditions spread gradually, stimulated by a series of charismatic magicians like Aleister Crowley and George Ivanovitch Gurdjieff and supported by attempts to study occult phenomena scientifically that appeared to confirm their existence. However, their following and impact remained limited until the passing of the Fraudulent Mediums Act that eliminated witchcraft from British law in 1951 and the rise of the psychedelic “counterculture” in the late 1960s opened the floodgates to widespread incorporation of a variety of magical traditions, including those that had made up European learned magic, into the New Age culture that involves a range of magical practitioners and whose books comprise a section of virtually every contemporary bookstore.

MAGIC, NATURAL

A set of beliefs and practices relating to the ability of human beings to affect their condition for the better and to create helpful objects through the manipulation of natural forces. *Natural* magic, which worked with and within the laws of nature for useful and licit purposes, was distinguished by its practitioners from *artificial* magic, which made use of machines and technological processes, and from *demonic* magic, which superseded natural laws through intervention of supernatural beings and was considered wicked and illicit. (*Divine* magic, through which God created miracles and prodigies, had no relation whatsoever to human understanding.) The natural magician, or magus, was a learned man who sought to explore the workings of nature for speculative or mystical purposes (e.g., Marsilio Ficino in the fifteenth century), for domestic or utilitarian aids (e.g., Giambattista Della Porta in the sixteenth century), or as a pseudoscientific experimental research program (e.g., Athanasius Kircher in the seventeenth century). The philosophical roots of natural magic grew out of the same mystical Hermetic and Neoplatonic tradition that

inspired astrology, geomancy, and alchemy. Many of the recipes, spells, and beauty and household tips that we presented in Books of Secrets (as works on magic we're sometimes called) also passed into manuals of natural magic. Its practical, use-oriented bias and the organized appearance of the discipline in early modern academies, along with publications that allowed for verification and repeatability of experiments, have led some historians to view natural magic as a precursor to science proper. Apart from a shared belief in hidden forces affecting objects at a distance, the forms of curative and love magic practiced by wise women and the black magic practiced by witches had little or nothing to do with the aims of natural magic, which sought not to influence people or fate but rather to understand better the workings of nature and to create useful products for the benefit of human society.

BASIC BELIEF STRUCTURE

At the base of natural magic lies the founding belief that the world is infused with a soul, or *anima mundi* (world soul), emanating directly from the Divine Mind and endowing all material forms with spirit. According to this Hermetic and Neoplatonic tradition, there is a correspondence between microcosm (all earthly things and beings as well as the little microcosm of the human body) and macrocosm (the planets and stars) that links all things together through sympathies and antipathies, creating a harmonious cosmic consensus. These resonances between sublunary and celestial beings are similar in their workings to how we understand modern physical forces like gravity, causing things to be attracted to or repelled by each other.

Magnetism, as described by Athanasius Kircher (1667), for example, was an immaterial sympathy that bound all beings and all levels of existence together in a hierarchical chain held in the hand of God. According to Kircher, the same force governed the declination of the magnet, the resurgence of plants, the association of animals with sun (cock) and moon (stag), the phenomena of heliotropic and selenotropic flowers, and the virtues of the snake-stone, a homeopathic remedy for snakebite (Godwin 1979, 74). Parts and qualities of earthly things, including the organs of the body and their ailments, were classified along with their corresponding celestial counterparts according to various theoretical schemas based on active versus passive, male versus female, solar versus lunar, and so forth. A magus strove to identify hidden "signatures" that revealed the exact place of things in the cosmic order so as to be able to manipulate their properties for his benefit.

For example, the early Renaissance practitioner of natural magic might construct a talisman out of gold (a solar metal) in the shape of an animal under the celestial reign of the sun's influence, such as a rooster or a hawk. By engraving an image of the sun on it with characters to

signify Jove (representing the penetrative solar power) and setting a solar gem like a carbuncle or ruby into it, he could induce healthful influxes into the formed metal. In order to benefit from the solar spirit thus called into the talisman, he could wear it around his neck, thereby allowing the celestial influence to permeate his body.

The art of the magus lay in gathering particular natural materials while the planet whose influx they contained was reigning; he then formed them according to their planetary resonance and obtained for himself the gifts that the heavens had to offer. What nature provided, he manipulated or operated on, turning it to his uses. This interventionist attitude toward nature and natural products, which the magus saw as being perfected by human knowledge and skill, is also at the basis of the technological attitude. In fact, by the end of the seventeenth century, natural magic had a solidly technical bias to it and gradually became assimilated into the new sciences.

THE MAGUS

Natural magicians took pains to distinguish their arts from the diabolical crafts of common conjurers, witches, and diviners, although the distinction was not always clear to some contemporaries who marveled at their arcane feats. Giambattista Della Porta, for instance, was denounced to the Inquisition several times, along with his fellow members of the Academy of the Secrets of Nature, for dabbling in the occult and resorting to demonic aid. Like others who were accused of straying into impious and dangerous practices in their pursuit of knowledge, he responded to the charges by pointing out that all technological inventions are classified as magic by the vulgar until their functioning is explained and their prodigious quality subsides.

Perhaps that is why, in the late sixteenth century, Della Porta also described the preparation and learning needed to become a natural magician as very arduous and wide-ranging: the adept must be “a very perfect Philosopher” and “a skillful Physician”: “moreover it is required of him that he be an Herbalist,” “and as there is no greater inconvenience to any Artificer, than not to know his tools that he must work with,” he must be equally proficient “in the nature of Metals, Minerals, Gems and Stones.” “Furthermore, what cunning he must have in the art of Distillation . . . no man will doubt of it: for it yields daily very strange inventions, and most witty devices.” Beyond that, “he must also know the Mathematical Sciences, and especially Astrologie,” and, finally, optics (Della Porta 1957, 3).

As is apparent from this curriculum, the late Renaissance magus was typically a scholarly person engaged in experimental research with his colleagues or working alone in his laboratory. Some examples of the experiments of a natural magician from this period include stuffing live geese into boiling water, building

furnaces for coloring plates, fabricating damask knives, preserving apples in sawdust, transforming spectators into monsters by boiling an ass's head in oil, constructing a talking head, breeding animals to produce creative hybrid races, or creating a quasi-perpetual motion machine.

MAGIC, POPULAR

Witchcraft beliefs belong to a larger constellation of magical concepts that were articulated in related but distinct ways by learned and popular traditions in literate premodern societies. Magical concepts take many different forms but share a belief that the world is influenced by occult or hidden forces (spirits) that can be manipulated through words, ritual actions, or spiritually potent objects. Popular magic describes the set of beliefs current among the general populace (as opposed to specialist magical practitioners in the literate elite) about the nature of these forces and the rituals and objects that can be used to influence them. Magic was a pervasive part of early modern European popular culture, and early modern witch beliefs were strongly influenced by this tradition both directly and through its interaction with Christian theology.

THE CULTURAL CONTEXT OF POPULAR MAGIC

Magic is the oldest system for understanding and influencing the unseen processes that affect human life and has been an important part of almost all cultures. It has traditionally been distinguished from science by its belief that the nonmaterial forces that drive the universe are re conscious, and from religion by the belief that these forces can nevertheless be controlled rather than merely supplicated, although this distinction is less clear-cut

than it once seemed. Both religion and science condemn magic as superstitious, and social elites have sometimes tried to suppress it, but traditions of popular magic have generally adapted and endured.

There is not much distinction between learned and popular magic in simple societies, although there are often adepts with special knowledge and powers (shamans) in them. As class structures and literacy developed, specialists (priests) dedicated their lives to mastering esoteric knowledge and ritual skills, creating a body of written records that preserved and elaborated them. Learned magic thus separated from popular practices, though they remained heavily interconnected. However, not all specialists necessarily became part of the elite, so in many civilizations popular magic involved both the beliefs and practices of low-status practitioners who performed services that the formal priesthood either could not or would not, and the everyday magical beliefs and practices of the general populace.

The rise of the world religions challenged the learned magic of earlier priesthoods and popular magic alike. In addition, sleight-of-hand and other forms of illusion that were often used by magical specialists as part of their rituals were also utilized and developed by entertainers and con artists to amuse paying audiences and defraud the credulous. By the late Middle Ages in Europe, the popular magic of local practitioners and ordinary people thus existed alongside a tradition of conjuring as entertainment and theft, in a mutually enriching relationship with learned magic (although learned magicians often scorned their popular counterparts) and in an antagonistic relationship with the official religion (even though popular magic contained many religious elements and the priesthood participated semiofficially in some popular practices).

POPULAR MAGIC IN EARLY MODERN CULTURE

Popular magical beliefs and practices in early modern Europe were extraordinarily diverse. Peasants in the British Isles, for example, believed that fairies or elves, diminutive people with magical powers, lived in the wild areas between and beyond the cultivated fields. Hungarian peasants believed that babies born with teeth would grow up to be magically adept shamans capable of rendering diverse magical services to the community. Peasants in other parts of the Balkans nearby believed that such infants would die and come back as vampires unless decapitated before being buried. The poor of Venice frequently named their children "Nane" and "Marita" because they believed people with these names could not be bewitched, and Scandinavians believed that the ghosts of victims of infanticide haunted watery places unless they were baptized. Such examples could be multiplied a thousandfold and would still convey only a partial impression of

the range of magical beliefs particular to specific places and times across Europe.

Although the content of early modern popular magic varied enormously, certain common purposes, modes of thought, and practices can be discerned. First, popular magic sought both agricultural productivity and human health and reproduction. Agricultural productivity was fostered through a series of rituals tied to the yearly cycle, supplemented by additional rituals to deal with specific problems like adverse weather and disease in animals. Similarly, human health and reproduction were promoted through rituals tied to the life cycle, especially the points of greatest vulnerability: birth, infancy, marriage, procreation, pregnancy, and death (to help the soul's transition to the afterlife). A huge array of additional magical rituals supplemented these to combat specific maladies. Diagnosis often involved some form of magical divination, which was also used to identify thieves, locate lost objects, and foretell the future. Other common forms of popular magic were used to foster love, promote good luck, locate hidden treasures, ward off evil magic, or inflict harm on others. Across the Continent, these activities involved the ritual use of words, gestures, and objects (sometimes combined with natural agents), which were understood to operate through nonmaterial spirits.

Within particular localities, popular beliefs tended to comprise an aggregate of long-standing local traditions, more recent arrivals from adjacent territories via oral transmission, elements of learned magical traditions conveyed by a combination of written and oral communication, related religious notions imported by the clerical elite, innovations developed by authoritative practitioners, and mutations introduced by the vagaries of oral transmission and unconscious adaptation to changing circumstances. Individual beliefs existed in the context of the local magical cosmology and the larger popular culture, and they both expressed and helped shape social relationships.

POPULAR MAGIC, CHRISTIAN AUTHORITY, AND WITCHCRAFT FEARS

Because Christianity supplied early modern Europe's overall cosmology, popular beliefs and rituals, even those that originated in paganism, were at least loosely framed in Christian terms, or their implications were simply ignored. A larger intellectual framework for popular magic remained largely unarticulated, for any attempt would have constituted heresy. Meanwhile, working in the opposite direction, late medieval theologians assimilated both learned and popular magic into Christian doctrine by asserting that both inherently involved evil spirits or demons, thus making all magic diabolical and all magicians agents of the Devil. Only a minority of Europeans accepted this line of reasoning entirely, and civil authorities generally treated beneficent magicians

less harshly than people thought to practice harmful or explicitly diabolical magic, but this reductionist process of systematic diabolization nevertheless became an important part of the early modern belief in a widespread conspiracy of diabolical witches.

There was, as far as we can determine, no conspiracy of Devil-worshipping sorcerers in late medieval Europe. Nor was there any underground pagan religion with a theology and priestly hierarchy. There was, however, an immense body of popular magic that existed outside, and in some cases against, the formal doctrines of the established church. The desire to root this out, as disobedience and moral laxity if not as diabolism, was incorporated into many law codes. From this point of view, the witch persecutions were only the most severe component of a much broader campaign to suppress popular magic, which itself was a component of an even broader campaign to rid popular culture of all non-Christian elements. This campaign achieved only partial success overall, but it made life difficult for generations of specialized practitioners and distanced the sociopolitical elite from magical beliefs and practices, perhaps thereby contributing to the decline of magic and the rise of science during the same period.

Popular magic contributed in two other ways to early modern European concerns about witchcraft. First, fear of witchcraft, in the sense of hostile magic rather than diabolism, was a long-standing element of popular culture and “un-witchers,” or healers who specialized in detecting and countering witches, were common among popular practitioners. Second, popular magical traditions contained techniques that people could use to attempt to inflict harm on others—and some people used them, either alone or in combination with other agents like poisons. Consequently, the accusation that a person was a victim of some form of harmful magic, while difficult to prove and open to significant abuse, was neither inherently absurd nor necessarily wrong. In fact, popular magical traditions also included many other elements of the witchcraft demonology. Not only did people believe that some people flew through the air, congregated with other similar people, and could raise storms or change into animals, but also some people thought they themselves did these things. Popular magic was no mere backdrop for witchcraft beliefs, helping to make them plausible; it was the source for most of them. The demonologists did not invent their evidence, but rather they conflated many disparate and disjointed elements of popular magic and mixed them with literate traditions about magic and deviancy and with Christian theology in a way that distorted both their significance and their substance.

MAGNUS, OLAUS (1490–1557)

Magnus was a Swedish geographer and historian whose chapters on sorcery and supernatural powers, even though occupying only miniscule space in his vast description of the Nordic peoples, *Historia de Gentibus Septentrionalibus* (History of the Northern Peoples, 1555), received the most attention in Europe and stunned readers.

Born in Lindköping, Sweden, Olaus Magnus was a Catholic who chose to live in voluntary exile after Sweden's conversion to Lutheranism in 1524. Together with his elder brother Johannes Magnus, he traveled and studied widely in Europe. From 1544 onward, he performed the duties of a titular Swedish bishop from Rome, where he had settled by 1541, and died sixteen years later.

The original Latin edition of *Historia de Gentibus Septentrionalibus*, made of 22 parts comprising nearly 770 chapters in 816 folio pages, actually began as a detailed commentary to the *Carta Marina* (sometimes called the *Carta Gotica*), a 1539 map that Magnus had made and published in Venice, showing the vast territory the Catholic Church had lost through the Reformation. This work was based upon a journey that Magnus took to Norrland (the northern part of Sweden) in 1518–1519. He visited Nidaros (Trondheim) in Norway and traveled as far north as Pello, in Övertorneå. He described Torneå as a meeting

place for people trading in northern Scandinavia. Olaus Magnus was one of the first to mention and to locate Blåkulla, a famous Nordic mountain believed to be the site of witches' meetings.

Following typical conventions of the time, his book had an extensive subtitle: readers would learn about the northern people's "different positions, customs, habits, ways of life, superstitions methods of instruction, activities, government, food, wars, buildings, implements, metal mines, and marvels, together with almost all the living creatures that dwell in the North, and their characteristics." Scandinavia had been called the septentrionale region since ancient times in Europe. Its literal translation is "The History of the Peoples Living Under the Seven Plow-Oxen or Under the Plough [the Big Dipper]." It was the first report that thoroughly described the Nordic countries to a geographically interested Renaissance Europe, and it remained the most important work on Scandinavia until the mid-eighteenth century. It contained about 500 illustrations, many made by the author, some of which are still used to illustrate Nordic customs and witchcraft. Abridgements of the original text were translated into French, Italian, Spanish, German, Dutch, and English during the sixteenth and seventeenth centuries, although no Swedish translation appeared until the 1920s, and the first complete English translation appeared quite recently (Magnus 1996–1998).

Magnus emphasized three characteristics of the Nordic countries: they were the cradle of warfare, the haunt of demons, and the realm of immeasurable cold. The author wrote about everything Scandinavian: about the rich catches of fish off the coast of northern Norway, Lofoten's engulfing maelstrom, the invincible Vardø fortress, the lifestyle of northern Scandinavia's Sami, and sea monsters that tore human beings apart with their teeth. Exceptional depictions abound; the North was both the Arctic Eden and the ancient home of evil. Its climate produced a hardy people known for their courage, bravery, and strength. Knowledge and control of the natural elements not only helped the Swedes in warfare but also assisted northern Norwegian fishermen, who avoided shipwreck by their knowledge of the winds. By showing the reciprocal interactions between nature and northern peoples and their talents in the arts of war, Magnus wished to warn European leaders of what they faced if they planned to invade his homeland.

The book was published at the right time to fill geographical gaps in sixteenth-century demonological information. Nordic witches had permanent meeting grounds for holding Sabbats, and throughout northern Scandinavia, wrote Jean Bodin in 1580, alluding to Magnus's work, one could hear incantations and the tongue of the Devil. Sorcery was particularly widespread among the inhabitants of Lapland. They were

adept at fortunetelling, wind magic, and other shameful works of the Devil. Satan reigned over the people of the North, and evil and misfortune arrived on the northern winds. Lycanthropy plagued vast regions of the Nordic countries, and many werewolves resided in the Baltic nations—and all this came from Magnus.

MAINZ, ELECTORATE OF

With approximately 2,000 victims in a territory of approximately 7,000 square kilometers, the ecclesiastical electorate of Mainz ranks among the most strongly affected states of the Holy Roman Empire (Pohl 1998, 41; Gebhard 1991, 65). Its main period of witch hunting lasted only from 1593 to 1630, in four main waves, until the occupation of the electorate of Mainz by Swedish troops brought the trials to an abrupt end as Elector Anselm Kasimir fled to Cologne. Under his successor, Johann Philipp von Schönborn, who was influenced by Friedrich Spee, only a few trials occurred. It is not true, as one often reads, that under his rule witchcraft trials ended; the last executions took place in 1684 at Worbis (in the district of Eichsfeld in Thuringia) (Pelizaeus 2004). Afterward, Mainz had individual trials for witchcraft insults until 1739.

The electorate of Mainz, whose territorial lord was not only an elector but also an archbishop and the imperial arch-chancellor, had an outstanding position within the Holy Roman Empire; therefore, witchcraft trials in this territory possessed a certain model character for other ecclesiastical territories. Like the other two archbishop-electors, his territory was scattered across possessions on the Rhine (the Unterstift, or lower

a rchbishopric), in the Spessart, Odenwald, Main, and Tauber River area (the Oberstift, or upper archbishopric), in Hesse and around Efurt, and in Thuringia (Eichsfeld). The witchcraft trials affected the upper archbishopric more than its possessions in the Unterstift, in Hesse, and in Thuringia. Most trials were promoted by local populations and local officials, whose zeal the electoral government tried repeatedly to moderate. However, the archbishop's government made no serious attempt to prevent the trials.

The principal literature agreed that there were four waves of pursuit but dated them differently, although agreeing that the last and largest wave occurred from 1627 to 1629, parallel to those in the Franconian dioceses of Würzburg and Bamberg. Most victims died during these waves. Pohl (1998, 39) dated the first wave from 1593 to 1595, the second one in 1603, and the third in 1615–1616; Gebhard (1991, 303) dated the first wave from 1601 to 1604, the next from 1611 to 1614, and the third in 1616–1617. However, Gebhard ignored the trials in the 1590s and overestimated the intensity of pursuit, so Pohl's dates seem preferable. Due to the unsatisfactory state of sources (only 404 criminal procedures survive), estimates of the distribution of the victims for the entire electorate are impossible and must be limited to certain districts. The large majority of those executed were female and married, although the proportion of men seems relatively high at 17–30 percent (Pohl 1998, 212–219). Victims were most commonly aged 41–60, followed by the 26–40 year olds. In the city of Dieburg, the average age of victims was about 55 (Gebhard 1991, 239–249; Pohl 1998, 214–219). Trials against children leading to execution were very rare.

The electoral government made no profits from these trials, particularly because a 1612 regulation expressly forbade the confiscation of goods intended for the victims' children. Many professions were involved in Mainz witchcraft trials. As elsewhere, outsiders like shepherds, musicians, or groups like migrants or widows (who because of their social status were in greater danger than other groups) were affected first. Midwives are repeatedly mentioned in trials, but no firm statistics exist about the frequency with which they were tried. Some large-scale trials of the final wave, particularly in the city of Dieburg, also reached into the urban upper class, including councilmen. However, clergy, scholars, or noblemen were never affected, even by the final wave of pursuit. Therefore, the majority of victims were artisans or came from rural groups. Although there is no evidence that special Counter-Reformation attacks lie behind these trials, it is noteworthy that districts bordering Protestant areas were particularly affected, as was Dieburg, where tensions between Catholic clergy and the partially Protestant population ran high.

LEGISLATION

Because Elector and Arch-chancellor Berthold of Henneberg (1484–1504) had a relevant role in planning what became the Carolina Code, already introduced in the electorate of Mainz during the reign of Albrecht of Brandenburg (1514–1545) in 1527–1528, five years before its official proclamation for the entire Holy Roman Empire, the Carolina Code always regulated criminal procedure at Mainz. All witchcraft trials had to be judged by the archbishop's *Weltlicher Rat* (Secular Council), which, despite its name, included a majority of clergymen. Nevertheless, during the seventeenth century such lower territorial instances as the *Keller* (Cellar) tended to accomplish many measures on their own. In order to cover themselves, they dispatched documents to the Secular Council in Mainz or at least corresponded with higher authorities before passing judgment. However, law faculties, including the University of Mainz, were almost never consulted. Therefore the influence of lawyers on the trials remained comparatively small, especially because only two lawyers generally sat on the Secular Council.

In 1612, Elector Johann Schweickart von Kronberg (1604–1626) published a detailed questionnaire and regulations about detention and confiscation. Although the new procedures were intended to provide greater equity, in fact they aggravated the situation. The questionnaire, consisting of 113 questions, enabled even lower local instances to proceed against witches without any legal advice and to convict suspects simply for confessing under torture to the questionnaire. This change allowed very rapid procedures and condemnations of suspects, which proved particularly fatal during the waves of 1612–1613 and 1627–1629. The new regulations for detention did improve the situation in individual cases, but with mass trials, the situation remained catastrophic after 1612. Therefore only the regulations for confiscation, compared to the previous regulations of Elector Wolfgang von Dalberg, may be regarded as beneficial.

CHRONOLOGY

In 1511, the first provable witchcraft trial before the city council of Mainz still involved nondiabolical *maleficium* (harmful magic), as did everything else until the last quarter of the sixteenth century. Only in the city of Steinheim did executions occur before 1550. In the last quarter of the sixteenth century, the behavior of the authorities changed fundamentally; from that point, they felt themselves obliged to intervene directly in cases of witchcraft accusations. Around 1570, during the reign of Elector Wolfgang von Dalberg (1582–1601), pursuit began to intensify, first in the upper bishopric. From there it reached the whole electorate, where trials occurred continuously after 1590, with varying intensity.

During the short reign of Johann Adam von Bicken (1601–1604), trials received a sharp stimulus. Bicken continued von Dalberg's proceedings, and trials multiplied rapidly, particularly in the upper bishopric and especially in some places that would also be affected later: Dieburg, Aschaffenburg, Miltenberg, and Lohr. After Bicken's sudden death, trials came to a nearly complete halt for about six years. The new elector, Johann Schweickart von Kronberg, responsible for the 1612 regulations, held himself back at first, apparently giving special attention to steering the trials into better-regulated courses. But when the population and local authorities again demanded trials, the elector complied with their desires. These trials gained momentum through re-arresting people already accused in 1604 and now included the lower bishopric as well.

Toward the end of Schweickart von Kronberg's reign, the trials decreased again, probably because of the parallel decrease in the neighboring bishopric of Würzburg. However, the largest wave, with the most victims, began immediately under his successor, Georg Friedrich of Greiffenclau (ruled 1626–1629). Like Schweickart von Kronberg, he yielded to local demands for resumption of the witchcraft trials. After his death in 1629, trials decreased substantially under Anselm Kasimir Walmbold of Umstadt (ruled 1629–1647) and almost stopped with the conquest of the electorate by Swedish troops in 1631. After the elector fled to exile in Cologne, only isolated trials continued; with his return, they did not revive. His successor Johann Philipp von Schönborn (ruled 1647–1673), who was also prince-bishop of Würzburg from 1642, marked a clear break. His government prevented the wave of trials from 1660–1670, which afflicted most of the Holy Roman Empire, from again disturbing the electorate. Isolated trials still occurred under Schönborn, but the elector always made an exact examination of each case and thereby prevented any expansion of the trials. Schönborn's actions were on the one hand considerably affected by the views of Friedrich Spee's *Cautio Criminalis seu de processibus contra sagas liber* (A Warning on Criminal Justice, or a Book on Witch Trials, 1631) and on the other hand by his political support from Louis XIV's France. The last two executions for witchcraft occurred in 1684 at Worbis; accusations can be found afterward, but they never led to executions.

MALDONADO, JUAN (1534–1583)

Known in France as Jean Maldonat, this Jesuit became a significant figure in the development of European demonology. His well-attended Paris lectures of 1571–1572, which presented a militant, highly political approach to demons and witches, became very influential in France and helped shape Jesuit thought on these subjects before the great synthesis by his former student, Martín Del Rio, early in the seventeenth century.

A native of Seville, Maldonado studied at the University of Salamanca, where he became a professor of philosophy and theology in 1562. Ordained as a priest in the Jesuit order in 1563, he was soon sent to Paris to become professor of theology at the newly founded *collège* of Clermont. Staffed by Jesuits and patronized by the powerful Guise family, it was able to open its doors only after winning a bitter lawsuit brought by their French enemies.

Maldonado soon proved a popular and successful teacher. His ability to attract students probably explains the vehemence of his opponents in the University of Paris. But even those who opposed his intellectual and political positions considered his learning and holiness impeccable. Maldonado tried to create a revived Aristotelian Catholic theology and trained men to argue and defend it. Typically for a Spaniard, he described himself as a soldier in the religious combat of his age, and from his first days in Paris, he joined the Catholic polemicists who attacked the growth and spread of the French Reformed Church.

In 1569, during the third French War of Religion, Maldonado participated in a Catholic mission to reconvert people to Roman Catholicism in a region near Poitiers that had been deeply penetrated by Protestant heresy. After returning to Paris, he gave a series of public lectures that became crucial to the development of a confessionalized French Catholic demonology. We

know their contents only because one of his students published them thirty-five years later. Delivered in simple Latin to appeal to a wide audience and informed by his recent mission in Poitou, his lectures were enormously popular, attracting hundreds of auditors.

The theological thread running through all Maldonado's Paris lectures, including his series on witches, was the immortality of the soul. Seeing this doctrine as central to Christian belief, he accused Protestants of denying or seriously underplaying it; for him, that could only be diabolically inspired heresy. Maldonado tied the growth of heresy closely to the spread of demons. "In Bohemia and Germany," he claimed, "the Hussite heresy was accompanied by such a storm of demons that witches were busier than heretics" (Maldonado 1605, 156). Then Geneva became infected, then France. One of the greatest sins of contemporary heretics was to deny the reality of demons and angels; Maldonado considered doing so equivalent to atheism. He emphasized the reality and orthodoxy of beliefs like the transportation of witches to Sabbats. To deny such things, as he accused Calvin's followers of doing, only confirmed their heretical and diabolical atheism.

A brilliant lecturer and inspiring teacher, Maldonado's influence stretched far beyond his 1571–1572 lectures. His auditors and students included several men who

became important Catholic spokesmen and carried his ideas about the connections between witchcraft and heresy well into the seventeenth century. The prolific Jesuit author Louis Richeome was Maldonado's student, as was Ma rín Del Rio, the best-known Jesuit authority on witchcraft, whose subsequent career took place mainly in Flanders and whose influence was greatest in the Holy Roman Empire. Another listener at Clermont in 1571–1572 was Pierre de Lancre, who subsequently conducted the biggest witchcraft trials in French history; he was then in Paris studying law.

MALE WITCHES

The crime of witchcraft was sex-linked, but it was certainly not sex-specific. With the large amount of scholarship devoted in recent years to the connections between women and witchcraft, we have almost lost

A male witch frolics with demons, who dance and play music around a magic circle at a Sabbat. From Olaus Magnus, Historia de Gentibus Septentrionalibus (History of the Northern Peoples), 1555. (Cornell University Library)

sight of the fact that a great many witches were men. In fact, probably somewhere around 6,000 men were executed for witchcraft in early modern Europe, which means that far more European men were burned as witches than were executed for heresy during the Protestant Reformation. Men were well-represented in the very earliest European witch hunts; for example, men formed at least one-third of the identifiable witches tried in Valais in 1428 and 28 percent of the 250-plus witches tried in the Alpine valleys of Dauphiné between 1424 and 1448. In a few places, like Neuchâtel in French Switzerland, men even formed a majority of the earliest recorded witches. If the *Malleus Maleficarum* (The Hammer of Witches, 1486) insisted that witches were almost invariably women, the (probably forged) papal bull that preceded it specified that men and women alike were guilty of witchcraft.

Although the link between women and witchcraft accusations remained strong almost everywhere in Europe during the most intensive period of witch hunting between 1570 and 1660, some men were punished for practicing witchcraft almost everywhere. Very few places imitated the Inquisition of Siena, which heard testimony about male witches, or *stregoni*, but arrested only women; indeed, other branches of the Roman Inquisition behaved quite differently toward men who were magical healers, as the well-known history of the mostly male Friulian *benandanti* (do-gooders) testifies. At the opposite extreme from Siena was Europe's westernmost outpost, Iceland, where women comprised less than 10 percent of witchcraft defendants, and only one of the twenty-two people executed for witchcraft in the seventeenth century was a woman, burned together with her son. We need to realize that there were places as extreme as Siena or Iceland about gendering witches, but in fact, almost everywhere else fell somewhere in between—and they were usually much closer to the example of Siena than of Iceland.

In order to shed some light on the problem of male witches, it seems helpful to start by trying to answer some simple questions, such as *where* men were most frequently found among accused witches, and *what kinds* of men seem to have been most frequently accused of witchcraft, before trying to tackle the ultimate problem of *why*, despite the opinions of some witchcraft theorists and some modern authors, so many thousands of men were punished for witchcraft. If we imagine a geographical list that reverses the usual gender priorities about witches and proceeds from Iceland toward Siena rather than vice versa, we encounter a few places with sizable samples of recorded witchcraft trials where men comprised a clear majority of accused witches: seventeenth-century Muscovy, with about 150 men in 200 witchcraft trials (Zguta 1977;

Kivelson 1991), and Normandy in northwestern France, with almost 300 men in 400-plus witchcraft trials between 1560 and 1700 (Monter 1997). If seventeenth-century Muscovy saw three men arrested for witchcraft for every woman, this disproportion was even greater in seventeenth-century Normandy, with at least four male witches for every female witch; by mid-century, when this province averaged one or two witchcraft cases per year, women had almost disappeared.

In the areas discussed in this paragraph, men and women were represented approximately evenly among accused witches. They include two places near Muscovy: Finland, with almost-equal numbers of men and women, and Estonia, with a majority of men among its 200 indicted witches (Ankarloo and Henningsen 1990, 321, 267)—but in both places, the majority of executed witches were women. In some Austrian provinces, particularly Styria and Carinthia, men also comprised a majority of people arrested for witchcraft (Labouvie 1990, 57–58). In western Europe, we find similar percentages on Normandy's borders among the 1,000-plus witches judged by the *Parlement* of Paris between 1560 and 1640 (Soman 1977, 798–799); here, if we combine witchcraft with maleficent magic, men comprised a majority of those condemned to death by Europe's most prestigious appellate court.

Beneath such widely scattered half-male samples, we find a cluster of contiguous states along what were then the western edges of the Holy Roman Empire, west of the Rhine and extending south from modern Belgium to the French Alps, where men comprised a sizable minority of the very large groups of people tried and frequently burned as witches. Men accounted for between 27 percent and 33 percent of all witches in such German-speaking places as Luxembourg or Saarland and such French-speaking places as Lorraine, Franche-Comté, or the Pays de Vaud in western Switzerland; smaller samples from Alsace and the electorate of Trier confirm the impression that we are dealing with a regional phenomenon. Farther east, in the Germanic heartlands of the witch hunts, the percentage of men usually drops below one-fourth; for modern Germany as a whole, it was probably around 20 percent. And, of course, there were also several places, including the British Isles, Sweden, or parts of modern Belgium, where male witches were very rare, comprising less than one-tenth of accused witches.

In the handful of places where most witches were men, the *kinds* of men arrested for this crime seem extremely different. In Muscovy, the single most common feature among men charged with witchcraft is that they were vagrants, recent immigrants, or often-fugitive serfs; several other witches were non-Christians, Finns, or Turks. However, in Normandy, a cheese-producing region, by far the most feared male witches were

shepherds, some of whom possessed veritable arsenals suitable for performing both offensive and defensive magic. Unlike Muscovy, Normandy's witches included many priests, at least seven of whom were burned for *sonilège* (diabolic magic), while another went to the galleys and several more were permanently banished (Monter 1997, 582–583). Normandy's blacksmiths provided a third dangerous occupational category because of their skill in harming as well as healing horses.

There was, however, one important characteristic shared between seventeenth-century Muscovite and Norman male witches: Many men in both places practiced magical healing. Early modern European folk healers included large numbers of both men and women; it seems significant that the ordinary English phrase for them, "cunning folk," is not sex-specific. Male healers could be found throughout Europe, including Sieneese *strigoni* who, unlike many of their counterparts elsewhere, were never charged with witchcraft by the inquisitors. However, we should realize that male magicians rarely tried to heal very young children; in the age of witch hunting, "neonatal medicine" and "pediatrics" were almost exclusively female specialties. And because the very worst crimes attributed to witches involved harming or even killing very young children (for example, this was almost the only reason for hanging witches in England), women were overwhelmingly predominant among the usual suspects in such circumstances. Almost the only way men killed young children was in the form of werewolves, and such cases were extremely rare almost everywhere in Europe.

But if men rarely practiced pediatrics or inflicted *maleficia* (harmful magic) on small children, they had a near-monopoly on veterinary medicine, especially in connection with horses and cows, the largest and most valuable animals on any farm in early modern Europe. The whole western Alpine zone, where men comprised upwards of one-third of all witches, were afflicted with bewitched cattle. The blacksmiths of Normandy (and perhaps elsewhere) also fit here.

There were certainly other reasons why men were targeted as witches. Many men were drawn into the net of witchcraft suspects through being related to female witches, their mothers or sisters as well as their wives. In places such as England where men comprised an extremely small share of accused witches, kinship with other witches through blood or marriage provides the principal explanation for which men were accused. As with women, various personal attributes such as spitefulness, a penchant for making threats, or some other forms of criminal behavior, also increased some men's vulnerability to charges of witchcraft.

It has been demonstrated (Midelfort 1972, 182) that men even became a majority of those executed during the latter phases of some of the very largest German witch hunts in the 1620s, as traditional stereotypes of

witches began to break down; but it has also been argued that this very development led to a crisis of confidence in the legal system. Even more remarkably, the final phase of witch hunting in present-day Austria, the *Zauberer-Jackl* (Sorcerer-Jack) panic of Salzburg at the end of the 1670s, involved mostly very young men rather than old women, and this pattern carried over into some of eighteenth-century witchcraft trials in Bavaria (Behringer 1997, 336–344). But a great deal of work remains to be done on this topic, as the exploratory nature of this sketch shows.

MALEFICIUM

Maleficium, harm inflicted through occult means, was one of the two main ingredients of early modern witchcraft, along with a pact with the Devil. In theory, any harmful magic required the assistance of the Devil and therefore implied a pact with him, but in practice the

two were generally distinguished. Learned commentators stressed the primacy of the pact, and some law codes made it alone a capital offense, but generally evidence of both diabolism and some form of *maleficium* was needed for prosecution to be carried through to execution. Commoners, who made most accusations and testified about prior offenses, focused on *maleficia*, which included both sorcery, or harmful ritual magic, and witchcraft, an inherent ability to cause magical harm. While diabolism was a particular, and in many ways peculiar, feature of early modern European witchcraft, *maleficium* linked it to the much broader fears of harmful magic that haunt people in many societies worldwide. No good evidence of the kind of widespread Devil-worship feared by the demonologists has been found, but there is no question that malefic magic was practiced, and there is reason to think that some of the activities it involved constituted a real threat to other peoples' health and well-being.

FORMS OF MALEFICIUM

As in many other cultures, harmful magic took two main forms in Europe: ritual magic intended to cause various sorts of damage, which social scientists call sorcery, and an inherent power to inflict harm that certain people were thought to have, called witchcraft. The specific rituals employed in sorcery vary widely from culture to culture, but the basic elements and forms of damage they are thought to inflict do not. Sorcerers, in early modern Europe as elsewhere, worked through the use of spells and incantations, ritual actions and gestures, potions (poisons), and spiritually potent objects. The damage they were thought to cause included first and foremost bodily injury (illness, impotence, and death in people and animals) and disruption of natural processes (storms and hail; stunted crops; and impeded production of butter, cheese, or beer). Love magic was sometimes considered a form of sorcery but could also be regarded as beneficent magic, depending on the circumstances.

Innate witchcraft was thought to manifest the witch's ill will directly, but as in many other cultures it was transmitted via a look (the evil eye), a touch, or a spontaneous word or gesture. Some cultures held that it could occur without the witch being aware that he or she was causing injury or even consciously wanting to do so, but early modern Europeans generally treated it as a manifestation of the witch's conscious desire to cause harm. In fact, the witch demonology insisted that the power came from an explicit pact with the Devil, and magistrates used torture to compel suspects accused of manifesting this power to confess to having made one. This innate witchcraft was held responsible for damages similar to sorcery, although bodily maladies and small-scale, localized physical effects like butter not churning were featured more prominently

than larger-scale natural processes like storms and stunted harvests, which were more likely to be ascribed to ritual magic.

MALEFICIUM, THE DEVIL, AND THE LAW

The idea that malign magical powers are closely related to a malign personality is deeply rooted. The word *maleficium* originally meant simply "wrongdoing" or "mischief," yet it was linked specifically to harmful magic even in pagan Rome. This association intensified with the rise of Christianity, which saw any recourse to magic as a moral failing. Roman law had proscribed sorcery as a source of injury to individuals from the earliest times, and the Roman Empire prosecuted magic as a source of politically destabilizing intrigue as well; Moses had enjoined his people not to "suffer a witch [or magician; the Hebrew is ambiguous] to live amongst you," and the Vulgate frequently referred to *maleficium*. The Theodosian Code joined these two traditions together, using *maleficium* in place of the earlier, more neutral *magia*.

Early medieval Germanic law codes contained punishments for sorcerers both because of the injuries they caused and because they employed pagan rites, and trials focusing on the harms caused by sorcery took place sporadically through the Middle Ages. The connection between harm and moral character was not lost, however, and late medieval theologians strengthened it considerably by reviving the argument first made in late antiquity that all magic requires some sort of spiritual agent, and illicit, especially malevolent, magic therefore must involve demons and at least an implicit pact with their master, the Devil. In the fifteenth century, this pact became linked with the notion that the Devil organized his followers into an underground conspiracy with perverted nocturnal orgies and the power and obligation to perpetrate various forms of *maleficium*.

The gradual adoption of this image of witchcraft by much of Europe's elites over the next century had the effect of not only making allegiance to the Devil a capital offense, on par with *maleficium*, but also, more subtly, changed the legal nature of *maleficium*. Until this point, prosecutions for *maleficium* generally concerned sorcery, magic that by definition had to be practiced deliberately, with some sort of external manifestation. Now, with the suspect's moral orientation the focus of attention, prosecution no longer hinged on proof of an explicit ritual attack or even the evidence of a reputation for practicing magic. Evidence of *maleficium* remained important, but in sixteenth- and seventeenth-century trials, this requirement was frequently met with allegations (and tortured confessions) of apparently spontaneous infliction of harm with no ritual mechanism specified or implied. In some cases this may reflect just an oversight in the investigation or the record, but in many it seems clear that the

MALINOWSKI, BRONISLAW KASPER (1884–1942)

Polish-born British social anthropologist, regarded as the father of modern social anthropology, Malinowski explored the rationality of witchcraft and magical practices in contemporary "primitive" societies. He was among the first to argue for the centrality of fieldwork in anthropological research, and his method of "participant-observation" is now canonical in social and cultural anthropology. This technique enabled him to produce ethnographic writings steeped in the rhythms of daily life and to articulate a theory of magic as a "sacred" yet fundamentally pragmatic activity, distinct from, yet tightly entwined with empirical knowledge and techniques surrounding everyday "profane" practices.

Born in Krakow, Malinowski earned his doctorate in philosophy from Jagiellonian University in 1908 and later trained in social sciences at Leipzig and in anthropology at the London School of Economics. Having spent the better part of World War I conducting fieldwork in southeastern New Guinea, he occupied teaching posts at the London School of Economics and the University of London before taking a position at Yale University in 1938. Malinowski's insistence that the world was sensible "from the native's point of view" contradicted Lucien Lévy-Bruhl's *mentalité primitive*, his appeal to a psychological and sociological "functionalism" emergent from the "psycho-physiological" needs of individuals broke openly with the holistic and evolutionary sociology of Émile Durkheim, and his insistence on the centrality of ethnographic fieldwork would later be considered a decisive break from the "armchair" methodology of Victorian anthropology. A quarter-century after Malinowski died at New Haven, Connecticut, the 1967 publication of his private diaries caused a scandal by revealing that this seemingly egalitarian and tolerant ethnographer was, in fact, often frustrated by and condescending toward his subjects in explicitly racist terms. Far from unseating Malinowski from his central position in anthropology, however, this gap between professional presentation and private life has only served to heighten the mystique around the man and the methodology he championed.

Malinowski's interest in magic was present in his early ethnographic works, *Argonauts of the Western Pacific* (1922) and *The Sexual Life of Savages in Northwestern Melanesia* (1929), which described the *kula* magic invested in objects of ritual trade and aspects of sexual magic. However, his most significant material about magic and its practitioners came in *Coral Gardens and Their Magic* (1935), an ethnographic narrative that painstakingly delineated the everyday "monotony" of magic in the cycles of productive life. Malinowski's pragmatic theory of magic was most explicitly presented in his posthumously published *Magic, Science, and Religion* (1948), which argued against prevailing understandings of magic as a clumsy and inefficient proto-science. This conventional wisdom, best articulated by Sir Edward Tylor and Sir James Frazer, structured magic as the lowest rung on a developmental sequence rising through religious to scientific means of knowing the natural world. Malinowski never conflated magic with religion (magic, he insisted, was always a pragmatic *means*, whereas religion was an end in itself), but he took great pains to separate magic from such "primitive" scientific practices as the empirical knowledge of fluid dynamics involved in Trobriand canoe-building. Such everyday, predictable concerns were placed in the sphere of the profane, but magical activities occupied the affect-laden domain of the sacred. He illustrated this with an account of Trobriand fishing practices: boating in the lagoon was safe and its yield relatively predictable; such trips involved no magic at all. Yet fishing on the open seas, which could result in a fantastic bounty, an empty net, or the death of all involved, was associated with extensive magical ritual to secure safety and good results. Magic was therefore a complement to, not a substitute for, empirical knowledge, useful in situations involving extreme risk, high stakes, emotional commitment, or lack of control.

Although Malinowski's functional explanations of human behavior have been criticized for their "thinness" and transparent teleology, it is important to note that his ethnographic descriptions are rich with details not explained by his theories. Furthermore, Malinowski argued strongly for the importance of context in understanding magical practices, and his explicitly performative analysis of magic—in particular, his linguistic theory of the power of magical words—can be seen as prefiguring the ordinary-language philosophers. Malinowski's willingness to generalize from the Trobriand Islands to humanity at large led him to construct a general theory of the "meanings of meaningless words" and the "coefficient of weirdness" necessary to elevate magical discourse beyond mundane levels without rendering it completely unintelligible. Malinowski used this principle to suggest magical belief as a human universal, equally present in the advertising and "beauty magic of Helena Rubinstein and Elizabeth Arden" as

in the practices of medieval Europeans or early twentieth-century Trobrianders.

Perhaps more far-reaching than his own writings, however, was Malinowski's impact as an educator. If he has retrospectively been dubbed the father of modern anthropology, it is chiefly because he tutored many of the best minds of the next generation of British social anthropologists. In the context of anthropological debates on rationality and magical belief, it seems particularly significant that he taught E. E. Evans-Pritchard, whose *Witchcraft, Oracles, and Magic Among the Azande* would become a landmark in the field.

MALLEUS MALEFICARUM

Some late medieval theologians, like the Dominican inquisitor Heinrich Kramer (Institoris), author of the *Malleus Maleficarum* (The Hammer of Witches, 1486), imagined witches to be members of a vast conspiracy directed against Christian society that was allowed by God to cause immense physical and spiritual hardship. The witches' power, supported by the Devil with God's permission, was real. Witches therefore had to be physically eradicated, according to divine and secular law, by virtually any means, because exceptional crimes require exceptional measures. The *Malleus* was the result of Kramer's experience with witchcraft trials in his designated area as a papal inquisitor for "Upper Germany" (i.e., southwestern Germany, western Austria, Switzerland, and his homeland, Alsace).

Evidence survives from some of his trials in this region, particularly from 1482 to 1484. Kramer's activities were generally not well received by the local

Title page of the 1669 edition of Heinrich Kramer's *Malleus Maleficarum* (The Hammer of Witches), 1486, the most notorious book on witchcraft. (Fortean Picture Library)

authorities, who disliked his interference with their administration of justice, and the populace, who sometimes initially welcomed him, soon tired of his persecutory zeal. Annoyed by such resistance, Kramer obtained papal authorization for his inquisitorial rights over the prosecution of witchcraft from Innocent VIII (ruled 1484–1492) through the papal bull *Summis desiderantes affectibus* (Desiring with Supreme Ardor, 1484), which authorized formal inquisitions against witches in all German Church provinces. Now invested with carte blanche, Kramer decided to start a paradigmatic witch hunt. Innsbruck, capital of the duchy of Tyrol, was a significant place, since its Archduke Sigmund was a powerful Habsburg prince, ruling over a patchwork of territories stretching from northern Italy and southwestern Germany into Alsace (present-day eastern France). Innsbruck was Kramer's gateway to the Holy Roman Empire.

Kramer's Inquisition in Innsbruck, starting in July 1485, employed intimidation, brutal force, and unlimited torture; denied legal defense; and issued distorted reports of his interrogations: scandalous conduct, even by late-fifteenth-century legal standards. Therefore, not only

the relatives of the accused but also citizens of Innsbruck, together with the clergy, the Tyrolean nobility and eventually the local bishop, protested against his illegal procedures. Bishop Georg II Golser, successor of the philosopher Nicolaus of Cusa at the see of Brixen, appointed a commission to scrutinize Kramer's Inquisition. Despite desperate resistance from the inquisitor's side, the bishop stopped the persecution immediately, nullified its results and (after having secured the archduke's support), liberated all suspected women.

It is worth remembering that both the secular and ecclesiastical authorities of Tyrol decided to resist this papal inquisitor and that they successfully prevented a witch persecution within their jurisdiction. Kramer was branded a fanatic, and Bishop Golser (who called Kramer senile and crazy in his correspondence) even threatened him with force if he failed to leave his diocese voluntarily. The prince-bishops of Brixen never allowed a witch persecution in their territory, and, even more importantly, the Tyrolean government had learned a lasting lesson and subsequently suppressed any attempts by lower courts to launch witch hunts. In short, the Innsbruck Inquisition was a crushing defeat for the papal inquisitor.

His failure at Innsbruck and his apocalyptic fears drove Kramer to develop his ideas further. Starting from his reports to Bishop Golser (Ammann 1911), he hastily systematized his notes into a lengthy manuscript. This papal inquisitor was among the first of his profession to recognize the importance of the printing revolution, and with this manuscript he tried to turn his defeat into victory by demonstrating the existence of witchcraft. Using his authority and experience, he urged the necessity of a campaign to eradicate witchcraft. The result was the *Malleus Maleficarum*.

Much confusion persists about the author, place of print, and date of print of this crucial publication on witchcraft. Even recently, scholars have claimed that the *Malleus* was at least coauthored by Jacob Sprenger (1437–1495). Only in 1519, decades after Sprenger's death, was he named as author on a front page, first in an edition by the Nuremberg (Nürnberg) printer Friedrich Peypus. Two generations later, in 1574, Giovanni Antonio Bertanus, a Venetian printer, even named Sprenger as its sole author. Later German and French printers adopted Bertanus's mistake. However, no contemporary evidence suggests that Sprenger had anything to do with the *Malleus*, or with witchcraft trials, or with executions of any kind as a result of inquisition trials.

The author of the *Malleus* stated that forty-eight women had been burned as witches in the diocese of Constance; there is no reason to doubt this number, especially because he indicated that he himself had searched this diocese more than any other. All these remarks pointed directly to "frater Henricus de

Sletstat," or "Heinrich Institoris," as Kramer often Latinized himself. The historian Sönke Lorenz found a hitherto unknown letter of this inquisitor from 1484, announcing his arrival at Wolfegg, a Swabian castle of Count Johann von Waldburg-Trauchburg (ruled 1460–1505)—close relatives to the ruling prince-bishop of Constance—for the purpose of witch hunting. Numerous documents survive concerning Kramer's inquisition in the Imperial City of Ravensburg, mentioned in the first (Speyer 1486) edition of the *Malleus* (fol. 44r). After his crushing failure at Innsbruck, Kramer turned his attention toward Alsace, particularly in the vicinity of his convent. The expulsion of the Jews from his hometown of Séléstat should be placed in this context. In 1488 Kramer tried to incite witch hunts in the neighboring diocese of Trier; that year, thirty-five witches were burned in the nearby imperial city of Metz. In an expert opinion for the imperial city of Nuremberg, "Bruder Heinrich Kramer Pädiger Ordens" boasted in October 1491 that "more than 200 witches" had been burned thus far due to his inquisitions, and in the same document he revealed his single authorship of the *Malleus* (Jerouschek 1991).

Further actions of this inquisitor remain shrouded in darkness, and recent research suggests that his own superior may have silenced him. Jacob Sprenger turned out to have been Kramer's most bitter enemy. In complete contrast to the Alsatian fanatic, a maverick who managed to get into trouble wherever he went and who had developed into a wandering inquisitor and persecution specialist, Sprenger was a prominent figure among the "observant" reform wing of the Dominicans. He was appointed prior of the large Cologne convent, then leader of the "Teutonic" province; Sprenger was also an influential theologian, promoting veneration of the Virgin Mary and introducing rosary brotherhoods organized by friars and secular clergy for lay people. It seems likely that Sprenger was involuntarily included in both the papal bull of 1484 and the foreword of the *Malleus* in 1486. Wilson (1990, 130) doubted that Kramer tried deliberately to deceive the public and Sprenger, but this must have been the case. Sprenger had tried to suppress Kramer's activities in every possible way. He forbade the convents of his province to host him, he forbade Kramer to preach, and even tried to interfere directly in the affairs of Kramer's Séléstat convent. Not one single fact or incident associated Sprenger with witchcraft prosecutions, and he apparently managed to drive the author of the *Malleus* from his province. Kramer spent his final years in Italy and Moravia, where he died. Kramer successfully deceived many modern scholars with his misrepresentations and outright lies. But one need only read the surviving Innsbruck trial records (Ammann 1890) and compare them with his accounts of the Innsbruck inquisition in the *Malleus* to realize that Kramer was ready to use any deception that served his purpose. His

career offers numerous examples, but this one seems sufficient (Segl 1988).

As to date and place of print, a printer's account book (Geldner 1964) demonstrated that the *Malleus* was first printed in autumn 1486 in the imperial city of Speyer, by then a medium-size town on the Rhine with about 8,000 inhabitants. The printer was Peter Drach (ca. 1450–1504), who delivered the “treatise against sorcerers” to booksellers by December 1486. The original text of the *Malleus* comprised 129 leaves (258 pages) in folio; given the usual production of a small printer (about 900 folio pages a day), Drach could have printed 150 copies a month. If the first edition was meant to have 300 copies, the manuscript must have been delivered to Drach by mid-October 1486, with more copies even earlier. Like many early books, it had no title page at that stage, so descriptions of the *Malleus* vary in the account book. The *Malleus* was called a “treatise against sorceresses,” or “against sorcery,” until Kramer added a foreword to the text, his *apologia auctoris in malleum maleficarum*, around Easter 1487 (Behringer and Jeroschek in Kramer 2000, 22–31). Afterward, the book's title was fixed and appears regularly this way in the account book, even without the *Malleus* having a title page.

Kramer promoted his publication in every possible way, notably by adding the papal bull of 1484 and a reference to its approval by the University of Cologne from April 1487. The latter was at least partly a forgery, because two of its supposed authors (Thomas de Scotia and Johann von Wörde) later denied any participation. These additions were not printed by Drach but by an immediate apprentice of Johannes Gutenberg at Mainz, Peter Schöffer (ca. 1425–1503), with a separate pagination. These parts were probably added in late May 1487 and bound together with the existing main body of the text. Henceforth, the author's *Apologia*, the papal bull *Summis desiderantes affectibus*, and the Cologne *Approbatio* remained part of the *Malleus*. In early December 1486, when Speyer hosted a meeting of representatives of the imperial cities (*Städtetag*), and Emperor Frederick III (whom Kramer had insulted some years earlier, to the great displeasure of the Dominican order) was due to arrive, Kramer apparently traveled to the Burgundian capital at Brussels in order to obtain a privilege from King Maximilian I (1459–1519), the future emperor. The response must have been so unfavorable that it was not inserted into the foreword, although it was mentioned there, thus conveying the impression that the highest ecclesiastical, academic, and secular authorities backed the *Malleus*. Kramer's strategy was aimed at the princes and their law courts. However, educated theologians and lawyers must have noticed that authoritative authors, like St. Augustine and St. Thomas Aquinas, as well as Roman law, were deliberately twisted and misquoted in the

Malleus. Moreover, Kramer brazenly emphasized the success of his inquisition at Innsbruck and even thanked the archduke for his support. He was correct in assuming that few would check his claims.

By reconstructing Kramer's itinerary, it becomes clear that the *Malleus* was assembled hastily, within nine months. Starting with his opinions and apologies to the bishop of Brixen and the archduke of Tyrol, Kramer, after his expulsion from Innsbruck in February 1486, mined some standard textbooks of scholastic theology (Thomas Aquinas, Antonius of Florence), a few inquisitors' manuals (Nicolas Eymeric), and earlier sermon notes. These indispensable texts were only available in the libraries of larger Dominican monasteries like Salzburg, Augsburg (Siemer 1936), Speyer, or his own convent at Séléstat. At one of these places, the *Malleus* must have been assembled. In the first edition (Speyer 1486, fol. 44r), Kramer told us that at least parts of it were written in the imperial city of Speyer, where he was physically present in autumn 1486, because Peter Drach had agreed to publish his text without delay. Kramer may have been unable to publish it at a more important printing center like Augsburg or Strasbourg.

Kramer's haste explains why the *Malleus* bristled with inconsistencies throughout. Contradictions and mistakes of all kinds (meaning, grammar, spelling) abounded; even the gender of the witches (*malefica/maleficus*) varied continuously, although the text was clearly directed against female witches. The most striking evidence for this haste comes from the *Malleus* itself. According to its contents, forty-eight questions were to be treated, but Kramer completely ignored this structure and ended with eighty-six chapters, unevenly distributed over three “parts,” two of them further subdivided. Part 1 supposedly contained sixteen chapters, but it actually had eighteen. The additional chapters, with new examples, were obviously added afterward; Chapter 17 claimed to be an extension of chapter 14, which had presumably been printed already. Part 2 supposedly contained sixteen chapters but ended up with twenty-five. Large chunks of its text were never mentioned in its table of contents; its headings hardly ever matched; whole chapters advertised in the contents were lacking; some were wrongly numbered; cross-references usually led nowhere.

It was obviously a work in progress, its author continually adding more evidence until the last possible moment, but without proofreading. The practical difficulties of compiling such a massive text under extreme time pressure and premodern conditions can hardly be underestimated. We can only guess why the maverick inquisitor became a maverick author and wrote a desperate book under such desperate conditions. Perhaps he feared more important dangers from the approaching emperor or from Jacob Sprenger, whose name he was again about to misuse and whose election as

provincial superior of the German Dominicans was imminent. The same day Sprenger became successor to Jacob Strubach as provincial superior (October 19, 1487), he obtained permission from his general, Joaquin Turriani, to lash out *adversus m[agistrum] Henricum Institoris inquisitorem* (against Master Heinrich Kramer, inquisitor). But perhaps the source of Kramer's haste should be sought in the realm of the irrational; apocalypticism seemed a good guess, if we took the author's *Apologia* seriously. If the end of the world was nigh, grammar became unimportant.

Kramer's main concern was witchcraft, or the heresy of witchcraft, but we must still explain his particular obsession with female witches. One likely explanation is the legacy of Christian theology, with its long-standing assertion of increased female susceptibility to temptations of the Devil, starting with Eve. This was certainly the starting point for the misogyny of the *Malleus*, whose author devoted several pages to explaining female inclinations to witchcraft, and recommended the subject for preaching, because women had a particular desire for instruction. His first demonstration of the malice of females was the Bible; he then cited instances of female credulity and their physical qualities, in particular the changeability of their complexion, leading to a vacillating nature. He then referred to their slippery tongues, which made them share their magic with friends, with whom they employed *maleficium* (harmful magic) because they were too weak to take revenge otherwise. Worst of all, however, because of their changeability, women were less inclined to believe in God. At this point, Kramer inserted a unique "realist" etymology of *femina*: "fe" is taken as an abbreviation of "fides" (belief); combined with the suffix "minus," it literally translates into "she who believes less." In the eyes of the Dominican inquisitor, a woman's lack of belief was the basis for her apostasy and witchcraft (Speyer 1486, fol. 20–21).

Kramer's paranoid emphasis on the dangers triggered by females contrasts strikingly with the attitude of his main opponent within the German Dominicans, the Cologne prior Jacob Sprenger, who instead emphasized the positive aspects of female religious devotion, recruiting them for the veneration of Mary. It is characteristic to find Kramer—a persecution specialist whose obsessions might be described in terms of "purity and danger"—engaged in an inquisition in Augsburg against women who desired the Eucharist too frequently, who were in turn defended by a local supporter of Sprenger (Koeniger 1923).

The *Malleus Maleficarum* was divided into three parts. The first treated theological issues and the second practical problems; the third offered advice on legal procedures, referring constantly to the author's extensive experience with witchcraft trials. The first part of the original edition (fols. 4r–43r) on theological

questions, designed to prove the reality and danger of witchcraft, was interesting in several respects and showed Kramer's erudition as an educated Dominican. Founded upon Augustine and Aquinas, its description of the crime of witchcraft was entirely conventional: witches could not themselves harm anyone through magic, but their abilities derived from a contract with a demon, which in turn was empowered by God. Both the *permissio Dei* (God's permission), and (wo)man's free will were crucial elements. At the core of witchcraft theory lay Augustine's semiotic theory that demons and (wo)men communicated via signs, amplified here by Kramer's perception that human deeds and natural phenomena were hardly ever what they appeared to be, but must rather be interpreted through a demonological theory of signs.

Like postmodern theorists, Kramer concluded that human beings could never be certain about reality; any phenomenon could be different from what it appeared to be and could be a demonic delusion. In contrast to modern philosophers, who denied the reality of demons, Kramer denied the reality of reality. He suspected demons were omnipresent and (with God's permission) extraordinarily powerful. Although witches believed they could do harm, it was actually demons who conducted supernatural interventions in order to fulfill their pact and to seduce them. The witch's crime thus in fact became her desire to harm. But no secular law imposed the death penalty for mere intentions, so witchcraft must therefore be considered essentially as heresy. For Kramer, heresy and apostasy lay at the core of witchcraft; although the witches themselves might have thought otherwise, their basic crime was spiritual. His conclusions were subsequently developed through examples of specific aspects of witchcraft, including sexual intercourse between humans and demons (either succubi or incubi), shape shifting, the sacrifice of babies, and the preparation of witches' unguents. According to Kramer, witches intended their harm to be real, although the demons actually did the damage by interfering in the real world in order to deceive the witches.

Kramer's conclusions were theologically correct but entailed serious practical contradictions. If harmful magic had no physical agent, it could not be prosecuted. If witches were seduced and deceived by demons, they became victims rather than perpetrators. If circumstantial evidence or direct observations could be discarded as devilish illusions (*praestigia daemonum*, as Johann Weyer later called them), witches could never be tried by a secular court because it was impossible to prove they had committed any crime whatsoever.

Surprisingly, after denying the possibility of judging the reality of evidence, Kramer's sharpest weapon (as he must have thought) was his reference to personal experience. Besides theological authorities, firsthand examples provided Kramer's foremost evidence for the

reality of witchcraft. Among roughly 250 examples in the *Malleus*, mostly from the Bible or ancient authors, at least 75 (nearly 30 percent) refer to recent events, which Kramer took from trustworthy contemporaries or from personal experience. About 10 percent of them came from Speyer or its immediate vicinity, further indication that Kramer completed the manuscript of the *Malleus* in this imperial city. Most of the rest came from Swabia, Alsace, or Tyrol; a few examples came from further abroad, usually towns with Dominican monasteries where Kramer had stayed (Rome, Cologne, Augsburg, Salzburg, Landshut in Bavaria).

The second part of the original *Malleus* (fols. 43r–92v) was split into two sections. The first (2.1) described how to protect oneself against witchcraft, specifically against impotence and infertility, weather making, and milk theft; the second (2.2) treated how bewitching could be cured. Again Kramer discussed demonically caused impotence, infertility, and weather magic, as well as love magic and demonic possession. The third part of the *Malleus* (fols. 92v–129v) explored the legal treatment of witches in great detail, recommending inquisitorial procedure as superior to trials based upon accusations, and paying attention to circumstantial evidence. In this part, Kramer literally copied large chunks of text from such inquisition manuals as Nicolas Eymeric's *Directorium Inquisitorum* (Directory of Inquisitors) of 1376 to provide the necessary legal formulas for inexperienced judges.

Pioneers of the intellectual history of demonology like Joseph Hansen emphasized that the *Malleus* contained almost nothing that could not be found in earlier demonologies or inquisitors' manuals. Because Kramer was a Dominican doctor of theology and papal inquisitor, and considering the conditions under which he assembled the *Malleus*, that was hardly surprising. However, five points in his *Malleus* could be called original. First, it stressed that witchcraft was a real crime, not just a spiritual one, and that witches therefore must be prosecuted and deserve capital punishment. Among earlier inquisitors, this had been a minority position. Second, Kramer claimed that witchcraft is the worst of all crimes because it combines heresy, including apostasy and adoration of the Devil, with the most terrible secular crimes such as murder, theft, and sodomy. Again, this point was not entirely new, but Kramer focused attention on it.

Third, because witchcraft was not only the worst of all crimes but also occult and difficult to trace, legal inhibitions must be abandoned. This idea was original in the sense that no serious lawyer in Europe normally suggested transgressing legal boundaries. His conflicts with local authorities had made Kramer keenly aware that this position was completely unacceptable under normal circumstances. Therefore, he resorted to the claim that witchcraft was an exceptional crime, in whose pursuit persecutory zeal was preferable to routine

legality. Thus Kramer claimed the superiority of apocalyptic theology over law.

Fourth, witches were primarily women. Despite the misogyny of the times, this idea was still uncommon in theology but was widespread in popular thought, so here Kramer's personal obsessions might have gained some popular support. Finally, he believed that secular courts should prosecute the crime; here again, the inquisitor drew conclusions from his own experience because he knew how unpopular inquisitors often were in Europe north of the Alps. However, this idea was also paradoxical because secular courts were reluctant to prosecute spiritual crimes.

A curious, literate public welcomed the *Malleus Maleficarum* as the first printed handbook of witch demonology and persecution. Although largely dependent on earlier theologians and inquisitorial handbooks, it was a fresh product by an erudite and experienced author. With twelve Latin editions printed in Germany and France between 1486 and 1523, *The Hammer of Witches* could be considered a success, although public interest was clearly strongest in the first ten years when the subject was still novel and the book was almost a best seller. Just after the Protestant Reformation, the demand for reprints broke down completely. Two generations later, with the Counter-Reformation accelerating, two Venetian printers saw a renewed demand for the *Malleus* in 1574 and 1576; in the 1580s, three new editions were reprinted in Protestant Frankfurt, followed by a fourth in 1600.

It was France that became the stronghold of *Malleus* reprints after the Reformation. Demand grew in the 1580s, with two editions printed at Lyons in 1584 and 1595; after 1600, seven further editions were published at Lyons, the last in 1669. Significantly, the *Malleus* was never translated fully into any vernacular language during the period of witch hunting; the partial translation into Polish in 1614 omitted its legal parts. Its reception remained confined to highly educated theologians, physicians, and lawyers. Its contents had to be spread, if at all, through sermons.

The upsurge of witchcraft trials in the early 1490s in central Europe has traditionally been interpreted as a result of the publication of the *Malleus*, and some incidents indicate that it had a direct impact. A monastic chronicler at Eberhardsklausen, on the Mosel River, reported that witches had plagued this region for some time, but great uncertainty about the matter had made it impossible to prosecute them. Only after reading the *Malleus* did local authorities see how they could proceed against witches—which they did. Here we see a kind of “conversion experience,” but that was a rare example, and how the *Malleus* was generally received remains unclear (Rummel 1990).

It is noteworthy that an early opposition publication was reprinted even more frequently in the 1490s.

Ulrich Molitor, a lawyer for the bishop of Constance and a minor official at Archduke Sigmund's court in Innsbruck, challenged the central assumptions of the *Malleus*. Molitor fashioned his text as a conversation between a fanatic believer in witchcraft, Molitor himself as an opponent, and Archduke Sigmund as the wise arbiter, always reaching reasonable conclusions and bluntly denying the possibility of the witches' flight, the witches' Sabbat, and shape shifting. Molitor merely repeated the traditional attitude of the Catholic Church and indeed promoted a conservative attitude toward sorcery. But this attitude had hitherto prevented witchcraft persecutions. Moreover, Molitor went one step further. By excluding theologians from his discourse, he implies that Dominicans or inquisitors should not interfere with legal questions. Illustrated by many exciting woodcuts, Molitor's dialogue quickly went through ten reprints in the 1490s, including, unlike the *Malleus*, translations into vernacular German. Molitor presumably witnessed Kramer's inquisitions in both the diocese of Constance and the diocese of Brixen. If this *juris utriusque doctor* (doctor of both laws, i.e., of canon and civil laws) opposed the *Malleus*, it was presumably because he knew its author and his illegal methods.

And there are other examples of people rejecting Kramer's views, either after reading the *Malleus* or after meeting him personally. In 1491, the imperial city of Nuremberg ordered a summary of the *Malleus* from Kramer because of some serious cases of sorcery; the famous publisher Anton Koberger, who printed three editions of the *Malleus*, was an immediate neighbor of Nuremberg's Dominican convent. However, Nuremberg's magistrates never followed Kramer's advice, and it may not be coincidence that the ideas of the *Malleus* were ridiculed publicly by leading Nuremberg humanists like Willibald Pirckheimer. In the imperial city of Augsburg, where Kramer stayed when traveling between Italy and Alsace and where he became involved in serious quarrels with the local representative of Jacob Sprenger's rosary brotherhood, the inquisitor was labeled a drunkard by the leading humanist Konrad Peutinger, and it may be no coincidence that the *Malleus* was never printed in this leading Upper German communications center. One of the most interesting reactions came from a close friend of the recently deceased Jacob Sprenger, who sharply rejected the idea that Sprenger had any connection to the *Malleus* (Klose 1972). By the early sixteenth century, the *Malleus* had clearly become a point of reference in intellectual debates: in 1509, defending a woman accused of witchcraft at Metz against the machinations of the local Dominican inquisitor, Agrippa von Nettesheim reacted equally sharply against the nonsense proposed in the *Malleus*. About the same time, Erasmus of Rotterdam satirized a zealous inquisitor in his *Praise of Folly*, and leading Italian jurist Andrea

Alciati, labeled witch hunts in northern Italy as *nova holocausta*. It was certainly not an arbitrary decision of the Spanish Inquisition in 1526 to deny any authority to the *Malleus*.

Rather than provoking the rising witchcraft persecutions at the end of the fifteenth century, the publication of the *Malleus* by this troublesome inquisitor may have simply tried to exploit preexisting popular fears. Between the 1480s and about 1520, witch burnings or small panic trials occurred not only in places where Dominican inquisitors incited the populace or where the town council had purchased a copy of the *Malleus*, but in many places throughout upper Italy, northern Spain, eastern France, Switzerland, western Germany, and the Burgundian Netherlands, even prior to its publication. In the decades between 1470 and 1520, there were severe mortality crises, and scapegoats were sought. In the early 1480s, plague raged widely through Upper Germany, Switzerland, and eastern France, and the original edition of the *Malleus* even linked witchcraft to plague in one particular case, in which a deceased witch had spread the disease from her grave (fol. 38r–38v). Imperial cities like Memmingen or Ravensburg lost much of their population in these years, and fears of sudden death were justifiably widespread.

Not only witchcraft anxieties but popular piety in general soared, as we can see in the iconographical representations of the "Dance of Death," or in the rise of millennial fears, with the idea that humanity was living in the last age—a time characterized by bitter hardships and terrifying signs of the end of the world. Like other fundamentalist prophets, the author of the *Malleus* points to the book of *Revelation* in his *Apologia* to argue that the emergence of the witches' sect was one sign of the imminence of the Antichrist.
