Dianetics (the "Bible" of Scientology)

"Hubbard reveals a deep-seated hatred of women....When Hubbard's Mama's are not getting kicked in the stomach by their husbands or having affairs with lovers, they are preoccupied with AA [attempted abortion]-usually by means of knitting needles" (Gardner, 267).

In 1950, Lafayette Ronald Hubbard published *Dianetics: The Modern Science of Mental Health*. [Published by The American Saint Hill Organization, Los Angeles. All page references are to this hard back edition.] The book is the "bible" for Scientology, which calls itself a science, a Church and a religion. Hubbard tells the reader that dianetics "...contains a therapeutic technique with which can be treated all inorganic mental ills and all organic psychosomatic ills, with assurance of complete cure...." He claims that he has discovered the "single source of mental derangement" (Hubbard, 6). However, in a disclaimer on the frontispiece of the book, we are told that "Scientology and its sub-study, Dianetics, as practiced by the Church...does not wish to accept individuals who desire treatment of physical illness or insanity but refers these to qualified specialists of other organizations who deal in these matters." The disclaimer seems clearly to have been a protective mechanism against lawsuits for practicing medicine without a license; for, the author repeatedly insists that dianetics can cure just about anything which ails you. He also repeatedly insists that dianetics is a science. Yet, just about anyone familiar with scientific texts will be able to tell from the first few pages of *Dianetics* that the text is no scientific work and the author no scientist. Dianetics is a classic example of a [pseudoscience](#).

On page 5 of *Dianetics*, Hubbard asserts that a science of mind must find "a single source of all insanities, psychoses, neuroses, compulsions, repressions and social derangements." Such a science, he claims, must provide "Invariant scientific evidence as to the basic nature and functional background of the human mind." And, this science, he says, must understand the "cause and cure of all psycho-somatic ills...." Yet, he also claims that it would be unreasonable to expect a science of mind to be able to find a single source of all insanities, since some are caused by "malformed, deleted or pathologically injured brains or nervous systems" and some are caused by doctors. Undaunted by this apparent contradiction, he goes on to say that this science of mind "would have to rank, in experimental precision, with physics and chemistry." He then tells us that dianetics is "...an organized science of thought built on definite axioms: statements of natural laws on the order of those of the physical sciences" (Hubbard, 6).

There are broad hints that this so-called science of the mind isn't a science at all in the claim that dianetics is built on "definite axioms" and in his *a priori* notion that a science of mind must find a *single* source of mental and psychosomatic ills. Sciences aren't built on axioms and they don't claim *a priori* knowledge of the number of causal mechanisms which must exist for any phenomena. A real science is built on tentative proposals to account for observed phenomena. Scientific knowledge of causes, including how many kinds there are, is a matter of discovery not stipulation. Also, scientists generally respect logic and would have difficulty saying with a straight face that this new science must show that there is a single source of all insanities except for those insanities that are caused by other sources.

There is other evidence that dianetics is not a science. For example, his theory of mind shares little in common with modern neurophysiology and what is known about the brain and how it works. According to Hubbard, the mind has three parts. "The analytical mind is that portion of the mind which perceives and retains experience data to compose and resolve problems and direct the organism along the four dynamics. It thinks in differences and similarities. The reactive mind is that portion of the mind which files and retains physical pain and painful emotion and seeks to direct the organism solely on a stimulus-response basis. It thinks only in identities. The somatic mind is that mind, which, directed by the analytical or reactive mind, places solutions into effect on the physical level" (Hubbard, 39).

According to Hubbard, the single source of insanity and psychosomatic ills is the *engram*. Engrams are to be found in one's "engram bank," i.e., in the reactive mind." The "reactive mind," he says, "can give a man arthritis, bursitis, asthma, allergies, sinusitis, coronary trouble, high blood pressure, and so on down the whole catalogue of psycho-somatic ills, adding a few more which were never specifically classified as psycho-somatic, such as the common cold" (Hubbard, 51). One searches in vain for evidence of these claims. We are simply told: "These are scientific facts. They compare invariably with observed experience" (Hubbard, 52).

An engram is defined as "a definite and permanent trace left by a stimulus on the protoplasm of a tissue. It is considered as a unit group of stimuli impinged solely on the cellular being" (Hubbard, 60 note). We are told that engrams are only recorded during periods of physical or emotional suffering. During those periods the "analytical mind" shuts off and the reactive mind is turned on. The analytical mind has all kinds of wonderful features, including being incapable of error. It has, we are told, standard memory banks, in contrast to the reactive bank. These standard memory banks are recording all possible perceptions and, he says, they are perfect, recording exactly what is seen or heard, etc.

What is the evidence that engrams exist and that they are "hard-wired" into cells during physically or emotionally painful experiences? Hubbard doesn't say that he's done any laboratory studies, but he says that

in dianetics, on the level of laboratory observation, we discover much to our astonishment that cells are evidently sentient in some currently inexplicable way. Unless we postulate a human soul entering the sperm and ovum at conception, there are things which no other postulate will embrace than that these cells are in some way sentient (Hubbard, 71).

This explanation is not on the "level of laboratory observation" but is a false dilemma and [begs the question](#). Furthermore, the theory of souls entering zygotes has at least one advantage over Hubbard's own theory: it is not deceptive and is clearly metaphysical. Hubbard tries to clothe his metaphysical claims in scientific garb.

The cells as thought units evidently have an influence, as cells, upon the body as a thought unit and an organism. We do not have to untangle this structural problem to resolve our functional postulates. The cells evidently retain engrams of painful events. After all, they are the things which get injured....

The reactive mind may very well be the combined cellular intelligence. One need not assume that it is, but it is a handy structural theory in the lack of any real work done in this field of structure. The reactive engram bank may be material stored in the cells themselves. It does not matter whether this is credible or incredible just now....

The scientific fact, observed and tested, is that the organism, in the presence of physical pain, lets the analyzer get knocked out of circuit so that there is a limited quantity or no quantity at all of personal awareness as a unit organism (Hubbard, 71).

Hubbard asserts that these are scientific facts based on observations and tests, but the fact is there hasn't been any real work done in this field. The following illustration is typical of the kind of "evidence" provided by Hubbard for his theory of engrams.

A woman is knocked down by a blow. She is rendered "unconscious." She is kicked and told she is a faker, that she is no good, that she is always changing her mind. A chair is overturned in the process. A faucet is running in the kitchen. A car is passing in the street outside. The engram contains a running record of all these perceptions: sight, sound, tactile, taste, smell, organic sensation, kinetic sense,

joint position, thirst record, etc. The engram would consist of the whole statement made to her when she was "unconscious": the voice tones and emotion in the voice, the sound and feel of the original and later blows, the tactile of the floor, the feel and sound of the chair overturning, the organic sensation of the blow, perhaps the taste of blood in her mouth or any other taste present there, the smell of the person attacking her and the smells in the room, the sound of the passing car's motor and tires, etc" (Hubbard, 60).

How this example relates to insanity or psycho-somatic ills is explained by Hubbard this way:

The engram this woman has received contains a neurotic positive suggestion....She has been told that she is a faker, that she is no good, and that she is always changing her mind. When the engram is restimulated in one of the great many ways possible [such as hearing a car passing by while the faucet is running and a chair falls over], she has a feeling' that she is no good, a faker, and she will change her mind (Hubbard, 66).

There is no possible way to empirically test such claims. A "science" that consists of nothing but such claims is not a science, but a pseudoscience.

Hubbard claims that enormous data has been collected and not a single exception to his theory has been found (Hubbard, 68). We are to take his word on this, apparently, for all the "data" he presents are in the form of anecdotes or made-up examples like the one presented above.

Another indication that dianetics is not a science, and that its founder hasn't a clue as to how science functions, is given in claims such as the following: "Several theories could be postulated as to why the human mind evolved as it did, but these are theories, and dianetics is not concerned with structure" (Hubbard, 69). This is his way of saying that it doesn't concern him that engrams can't be observed, that even though they are defined as permanent changes in cells, they can't be detected as physical structures. It also doesn't bother him that the cure of all illnesses requires that these "permanent" engrams be "erased" from the reactive bank. He claims that they aren't really erased but simply *transferred* to the standard bank. How this physically or structurally occurs is apparently irrelevant. He simply asserts that it happens this way, without argument and without proof. He simply repeats that this is a scientific fact, as if saying it makes it so.

Another "scientific fact," according to Hubbard, is that the most harmful engrams occur in the womb. The womb turns out to be a terrible place. It is "wet, uncomfortable and unprotected" (Hubbard, 130).

Mama sneezes, baby gets knocked "unconscious." Mama runs lightly and blithely into a table and baby gets its head stoved in. Mama has constipation and baby, in the anxious effort, gets squashed. Papa becomes passionate and baby has the sensation of being put into a running washing machine. Mama gets hysterical, baby gets an engram. Papa hits Mama, baby gets an engram. Junior bounces on Mama's lap, baby gets an engram. And so it goes (Hubbard, 130).

We are told that people can have "more than two hundred" prenatal engrams and that engrams "received as a zygote are potentially the most aberrative, being wholly reactive. Those received as an embryo are intensely aberrative. Those received as the foetus are enough to send people to institutions all by themselves" (Hubbard, 130-131). What is the evidence for these claims? How could one test a zygote to see if it records engrams? "All these things are scientific facts, tested and rechecked and tested again," he says (Hubbard, 133). But you must take L. Ron Hubbard's word for it. Scientists generally do not expect others to take their word for such dramatic claims.

Furthermore, to get cured of an illness you need a dianetic therapist, called an auditor. Who is qualified to be an auditor? "Any person who is intelligent and possessed of average persistency and who is willing to read this book [*Dianetics*] thoroughly should be able to become a dianetic auditor" (Hubbard, 173). The auditor must use "dianetic reverie" to effect a cure. The goal of dianetic therapy is to bring about a "release" or a "clear." The former has had major stress and anxiety removed by dianetics; the latter has neither active nor potential psycho-somatic illness or aberration (Hubbard, 170). The "purpose of therapy and its sole target is the removal of the content of the reactive engram bank. In a release, the majority of emotional stress is deleted from this bank. In a clear, the entire content is removed" (Hubbard, 174). The 'reverie' used to achieve these wonders is described as an intensified use of some special faculty of the brain which everyone possesses but which "by some strange oversight, Man has never before discovered" (Hubbard, 167). Hubbard has discovered what none before him has seen and yet his description of this 'reverie' is of a man sitting down and telling another man his troubles (Hubbard, 168). In a glorious non sequitur, he announces that auditing "falls utterly outside all existing legislation," unlike [psychoanalysis](#), [psychology](#) and [hypnotism](#) which "may in some way injure individuals or society" (Hubbard, 168-169). It is not clear, however, why telling others one's troubles is a monumental discovery. Nor it is clear why auditors couldn't injure individuals or society, especially since Hubbard advises them: "Don't evaluate data....don't question the validity of data. Keep your reservations to yourself" (Hubbard, 300). This does not sound like a scientist giving sound advice to his followers. This sounds like a guru giving advice to his disciples.

What Hubbard touts as a science of mind lacks one key element that is

expected of a science: empirical testing of claims. The key elements of Hubbard's so-called science don't seem testable, yet he repeatedly claims that he is asserting only scientific facts and data from many experiments. It isn't even clear what such "data" would look like. Most of his data is in the form of anecdotes and speculations such as the one about a patient who believes she was raped by her father at age nine. "Large numbers of insane patients claim this," says Hubbard, who goes on to claim that the patient was actually 'raped' when she was "nine days beyond conception....The pressure and upset of coitus is very uncomfortable to the child and normally can be expected to give the child an engram which will have as its contents the sexual act and everything that was said" (Hubbard, 144). Such speculation is appropriate in fiction, but not in science.

[Faculty cult expert helps explain Smart case](#)

[Cults in our Midst by Margaret Thaler Singer](#)

cults

The term 'cult' expresses disparagement and is usually used to refer to unconventional religious groups, though the term is sometimes used to refer to non-religious groups which appear to share significant features with religious cults. For example, there are some who refer to [Amway](#) and [est](#) as cults, but I think the term is best reserved for groups such as [Scientology](#), the [Rev. Sun Myung Moon's Unification Church](#), [Aum Shinrikyo](#), the [Hare Krishnas](#), [David Koresh's Branch Davidians](#), [the Order of the Solar Temple](#) (74 suicides in 1984), [Elizabeth Clare Prophet's Church Universal and Triumphant](#), [the Unarians](#), [Heaven's Gate](#) (39 suicides in 1997), [the Raëlians](#), [the Maharishi Mahesh Yogi's Transcendental Meditation](#) group and the group that followed the [Rev. Jim Jones](#) to Guyana where more than 900 of them joined in a mass murder/suicide ritual in 1978.

Three ideas seem essential to the concept of a cult. One is thinking in terms of **us/them** with **total alienation from them**. The second is the intense, though often subtle, indoctrination techniques used to recruit and hold members. And the third is the charismatic cult leader. Cultism usually involves some sort of belief that outside the cult all is evil and threatening; inside the cult is the special path to salvation through the cult leader and his teachings. The indoctrination techniques include

- 1) **Subjection to stress and fatigue**
 - 2) **Social disruption, isolation and pressure**
 - 3) **Self criticism and humiliation**
 - 4) **Fear, anxiety and paranoia**
 - 5) **Control of information**
 - 6) **Escalating commitment**
 - 7) **Use of auto-hypnosis to induce 'peak' experiences**
- [\[Kevin Crawley\]](#)

Of course, there is a positive side to cults. One gets love, a sense of belonging, of being special, of being protected, of being free from the evils of the world, of being on the path to eternal salvation, of having power. If the cult did not satisfy needs that life outside the cult failed to satisfy, cults would not exist.

One common misconception about cults is that their members are either insane or [brainwashed](#). The evidence for this is pretty slim. It consists mainly of the subjective feeling that no one in their right mind could possibly choose to believe the things which cult members believe. For example, the 39 members of the Heaven's Gate cult believed a space ship was coming to get

them to take them to a "higher level." They believed that their leader, Marshall Applewhite (aka *Do*), was Christ coming to take the chosen few to a better life somewhere in outer space, perhaps to work on a starship like the *Enterprise* one sees in movies and on television. They believed they would be given new bodies in the new world, asexual bodies with no hair or teeth, but vestigial eyes and ears, not those gross bug eyes one sees in so many alien pictures. To many people, these beliefs sound like the delusions of lunatics and it seems inconceivable that anyone in his or her right mind would accept such beliefs unless they were crazy or brainwashed.

Examined closely, however, the beliefs of Heaven's Gate or Scientology are no stranger than the beliefs which billions of "normal" people hold to dearly in their sacred religions. As has been noted by others, delusions held by one is insanity, by a few a cult, and by many a religion. To ask why anyone would believe such non-sense as the Scientologists or Heaven's Gate cult believe regarding alien beings and space ships, fallen angels, [thetans](#), etc., but not ask why anyone would believe in heaven and hell, angels, devils, crucified gods, resurrections, messiahs, [transubstantiation](#), the trinity, etc., seems inherently self-deluded.

It is true that the cult leader or religious founder usually shows signs of brain disease, such as hearing voices or having delusions of grandeur. But the followers need not be mad. Some are undoubtedly deranged, but the vast majority are not likely to be crazy or the cult would not function. The cult leader must be extremely attractive to those who convert. He or she must satisfy a fundamental need, most likely, the need to have someone you can totally trust, depend on and believe in: someone who can give sense and direction to your life; provide you with purpose and meaning. But above all, life with the messiah and the other cult members must fill you with bliss. It should be obvious that people stay in cults because they feel better in the cult than they did outside the cult. Some studies have found that a significant number of cult members are depressed before joining and the cult lifts their spirits, makes them feel much better. Even if they aren't depressed, cult membership must be more satisfying than life in the real world with one's real family and real friends.

Why do people stay in cults? To do so gives them pleasure. They may be deluded and manipulated. Severe control tactics may be used to keep them in the flock, like cutting them off from the rest of the world, especially from their family and friends, communally reinforcing the cult's dogmas, and inculcating paranoia. Isolation, communal reinforcement and the inculcation of paranoia as a control tactics are used by some parents over their children, some political leaders over their citizens, and even some therapists over their patients. So, cults are not unique in attempting to control people using these tactics..

Cult members may gradually become paranoid and be led to believe that the

government, their family and former friends can't be trusted. They may gradually become more isolated and militant. They may even begin to [stockpile weapons](#) for the coming Armageddon. They may turn themselves over completely to their savior and be willing to kill or die for him or her. But they stay because they like it. That is not to say that they are leading meaningful lives, but they are not lunatics, morons or zombies. They are deluded and misguided, to be sure, but they are not stupid or crazy. When they commit crimes in the name of their leader we should not treat them as insane but throw the book at them. When they commit suicide we should be thankful that they turned their hatred of the world against themselves rather than against the rest of us.

See **related entries** on [communal reinforcement](#), [dianetics](#), [mind-control](#), [Rama](#), and the [Urantia Book](#).

est and Werner Erhard

"In life, understanding is the booby prize." -- Werner Erhard

Werner Erhard's **est** [Erhard Seminar Training and Latin for "it is"] was one of the more successful entrants in the human potential movement. **est** is an example of what psychologists call a [Large Group Awareness Training program](#).

The first **est** seminar was held in October, 1971, at the Jack Tar Hotel in San Francisco with nearly 1,000 in attendance. Erhard and **est** were known for training people to get "It", a concept taken from author, teacher and expert communicator [Alan Watts](#). At the time Erhard arrived in the Bay Area, Watts was teaching his version of Zen to small groups on his houseboat in Sausalito. Erhard, like Watts, would teach people to "Get It." Watts, however, did most of his teaching through books. His seminars were small. Erhard would not teach through books, but in large hotel ballrooms to hundreds at a time.

(Writing about a program that no longer exists and that was taken by hundreds of thousands of people is risky, to say the least. Clearly, the experiences of those who took the program varied greatly. Whatever I say that resonates with one group of participants will seem false to another group. What follows is an attempt to reflect the background and the experience of **est**, but the reader should realize that whatever I say will be inadequate, perhaps even false, for some participants.)

est adopted, in part, the Zen master approach, which was often abusive, profane, demeaning, and authoritarian. (One of my favorite Zen stories is of the master who asks his disciple a series of questions. No matter what the disciple answers, the master hits him with a stick. Even contradictory answers are met with the stick.) While many participants did not perceive the training as particularly abusive, some were not used to the discipline requested of them. Some have claimed that one typically abusive approach was the requirement of extraordinary bladder control in **est** training. Participants were advised not to leave the room, even to go to the toilet, during training. According to one **est** participant, however, "bathroom breaks were scheduled at regular and reasonable intervals....Two or three rows at the back of the room were reserved for those who required more frequent bathroom breaks (and I think either some sort of documentation or personal insistence were required to qualify). No one was ever physically required to stay in the room at any time" (*personal correspondence*). (This aspect of **est** training was humorously ridiculed in the movie ["Semi-Tough"](#) (1978) with Burt Reynolds and Kris Kristoferson.) In any case, one should expect some sort of discipline and required order for this kind of training. Having people come and go as

they please is distracting and not conducive to the concentration necessary for such a program.

Erhard and Scientology

In the late 1960s, Erhard studied Scientology and [L. Ron Hubbard](#) became a significant influence. Scientologists to this day accuse Erhard of having stolen his main ideas for **est** from Hubbard. We do know that when Erhard set up **est** he considered making it a church, as Hubbard had done with [dianetics](#) and the Church of Scientology. But Erhard decided to incorporate as an educational firm for profit in a broad market.

Erhard and his supporters accuse Scientology of being behind various attempts to discredit Erhard, including hounding by the IRS and accusations of incest by his children. Erhard won a lawsuit against the IRS and the incest accusations may have been based on [false memories](#) induced in therapy.

Erhard has even claimed that Scientologists have hired hit men to kill him, though the most logical explanation for his continued survival is probably that no one is really trying to kill him.

est is not dianetics

est bears little resemblance to *Dianetics* or Scientology, however. **est** is a hodgepodge of philosophical bits and pieces culled from the carcasses of existential philosophy, motivational psychology, Maxwell Maltz's Psycho-cybernetics, Zen Buddhism, Alan Watts, Freud, Abraham Maslow, L. Ron Hubbard, Hinduism, Dale Carnegie, Norman Vincent Peale, P.T. Barnum, and anything else that Erhard's intuition told him would work in the burgeoning Human Potential market. What did Erhard promise those who would shell out hundreds or thousands of dollars for his programs? He promised he would "blow their minds" and raise them to a new level of consciousness. In short, he would make them *special*. He would first tell them that their problem was that they needed to have their consciousness "rewired" and his program would do the rewiring. Once they got their consciousness on straight, life would be good or at least *different*. They would be powerful, confident, successful because they would be independent and in control. They would learn to see things in radically different ways. Nothing would change and yet everything would change. (The same promise was made by Watts for the disciples of Zen .) Nothing could stand in their way and deprive them of all those opportunities in life they had heretofore been denied because of bad programming or wiring. Through **est** they would be set free and born again! All problems and limitations are in the mind. Just rewire the mind, i.e., deconstruct personality, exorcise all negativity, quit blaming others, and learn to accept things.

Erhard's self-training

Where did Erhard get his training? Mostly, he is self-taught. His study was undirected and accidental. In 1960 he was John Rosenberg, a 25-year-old married with children. Apparently dissatisfied with his life but with no Large Group Awareness Training available to him, he did what many unhappy men have done: he abandoned his family. He left Philadelphia and went to St. Louis, changed his name and sold cars. Some might find it interesting that a Christianized Jew (his parents had him baptized in the Episcopal church) would come to identify himself with a German name. Of more interest to his transformation, however, are the books he read and was influenced by. William Warren Bartley III (*Werner Erhard: the Transformation of a Man*) tells us that Erhard was "profoundly dissatisfied with the competitive and meaningless status quo" and was deeply affected by Napoleon Hill's *Think and Grow Rich*.

Hill's three basic principles are: every achievement begins with an idea; plans call for their implementation and; what you think is what you do. Think positive, you will do positive deeds.

Hill also advised visualizing objectives and selecting similar-minded friends. Hill gives good advice, but it is very vague and is not very systematic. It doesn't offer much to people who haven't got a clue what their objectives are or should be. Some of his ideas can be harmful, if not properly applied. For example, some people are taught that they should always talk positive, even if this means lying. Even if you haven't made a sale in two years, you must put on a positive front and tell everyone that business couldn't be better. Even if you know nothing about the product you are selling, you must praise it beyond belief. Even if you are experiencing one failure after another, you must lie to yourself and tell yourself that you are doing great. You must never blame the product for not selling. You must try harder, have more faith, be more positive. Maybe you need to take advanced courses to help you succeed. By the time you wake up, you are bankrupt and those who were cheering you on (your "sponsors") are nowhere to be found.

Another significant influence on Erhard was Maxwell Maltz's *Psycho-cybernetics*. As a young man, Erhard apparently had a lot of negatives in his self-image and was deeply affected by Maltz who emphasized, among other things, self-hypnosis. Erhard put his new ideas and new self to work as a traveling salesman for a correspondence school. His interest in hypnotism had been stimulated by Maltz, but Erhard's focus would be on "programming" and "reprogramming." The idea is not without merit, though the language is unnecessarily cumbersome. The basic idea he came to espouse is that bad habits are programmed into us: we have been "hypnotized" during normal consciousness and that's where our problems arise. Unconsciously, we've developed debilitating habits and beliefs. The point is to get rid of them by replacing them with positive and life-enhancing beliefs and habits. Again, however, the language is very vague, probably too vague to do any meaningful scientific appraisal of them.

By the time Erhard arrived in San Francisco, he'd had jobs selling and managing salespersons for *Great Books* and *Parent's* magazine. He became part of the self-help movement after hiring Robert Hardgrove, who introduced Erhard to the work of [Abraham Maslow](#) and [Carl Rogers](#). Maslow and Rogers were unique in psychology at the time, for they emphasized not the disturbed or ill person, but the healthy, happy, satisfied, accomplishing person. The Human Potential Movement was just getting started and Erhard would be in on the ground floor.

It is estimated that some 700,000 people did the training before the seminars were halted in 1991, when Erhard packed up and left the country [\[Faltermayer\]](#). He sold the est "technology" to some followers who established [Landmark Forum](#). Erhard's brother, Harry Rosenberg, heads Landmark Education Corp. (LEC), which does some \$50 million a year in business and has attracted some 300,000 participants. LEC is headquartered in San Francisco, as was est, and has 42 offices in 11 countries. Apparently, however, Erhard is not involved in the operation of LEC.

Rama (a.k.a. Frederick Lenz 1950-1998)

Zen Master Rama was Frederick P. Lenz, Ph.D. (in English literature) and businessman (Advanced Systems, Inc.). Lenz parlayed his knowledge of Hinduism and Buddhism into a cult. In the early 1980s he started calling himself after Rama, the last incarnation of the Hindu deity Vishnu. He started giving seminars in 1982 in Malibu, California. Eventually, thousands of people would pay as much as \$5,000 per seminar to be enlightened by this self-proclaimed guru, psychic, and miracle worker. Here is what one of his followers said he learned from his master: "Spiritually advanced people work with computers because it makes a lot of money. The more money you make, the better you meditate" (Clark and Gallo 1993, 102).

Rama used a variety of so-called [mind-control](#) techniques to seduce his disciples. He had his subjects stare at him for long hours until they would hallucinate and "see" Lenz begin to glow or change shapes. Lenz told his followers that having these "visions" meant they were [psychic](#).

Rama seduced many of his female followers by telling them that he only has sex with women who have a rare sort of [karma](#). He also told women that having sex with him would elevate them to a higher plane of consciousness. It is hard for a skeptic to believe that such a line would work with any woman, but apparently it does.

Rama took religious freedom and [tantric](#) gullibility to new heights in his book *Surfing the Himalayas: A Spiritual Adventure* (1997). There he tells us of his adventures "snowboarding through Tantric myetiolem" and offers such bits of wisdom as

Ultimately, thinking is a very inefficient method of processing data...

And,

The relational way of doing things is to move your mind to a fourth condition, a condition of heightened awareness. In a condition of heightened awareness, you elevate your conscious mind above the stream of extraneous data -- out of dimensional time and space, so to speak -- and you meld your mind instead with the pure intelligent consciousness of the universe.

Bob Frankenberg, Chairman and CEO of Novell, claims the book "entertains and enlightens" and calls it "a wonderful contrast of Eastern spirituality and Western pragmatism." Phil Jackson, coach of the Chicago Bulls, said the book "Brings levity and humor to a subject often relegated to a mundane, boring prospect." The book became a best-seller. Within a year Rama published another cult classic: *Snowboarding to Nirvana*.

Unfortunately, all his Tantric wisdom couldn't save him and the day before taxes were due in 1998, Rama drowned in Conscience Bay near his residence in the exclusive Old Field section of Setauket on Long Island, New York. Rumor has it that he was stoned when he fell off the dock. An unidentified woman described by police as "incoherent" was found to be in Lenz's house at the time his body was recovered by police divers. Lenz was 48 at the time of his death. [Cult](#) expert Joe Szimbart claims that Lenz was suffering from liver cancer and committed suicide by overdosing on Phenobarbital (*Skeptical Inquirer*, July/August 1998). The Suffolk County Medical Examiner's office said it was Valium. Either way, Rama snowboards with the fishes.

inedia (breatharianism)

Inedia is the alleged ability to live without food. Some inediates become breatharians, like the [stigmatic](#) Therese Neumann (1898-1962) of Bavaria, who said “one can live on the Holy Breath alone.” She claims to have done this from 1926-1962, during which time she says she only consumed her daily serving of [transubstantiated](#) bread.

Fasting has long been considered a way to purify one’s body and mind. Fasting reminds us of our dependence and weakness, and links us to those who suffer hunger as part of their daily lives. Inediates strive to be spiritual beings and carry fasting to an inhuman level. If restraint, self-control, and reducing one’s intake of food and water are good, then eliminating all physical nourishment must be better. Spiritual beings don’t need food, water, or sleep. Maybe so, but food, water and sleep are not optional for human beings.

One inediate who has been attracting followers to [breatharianism](#) is Australian Ellen Greve, a.k.a. [Jasmuheen](#). According to Greve, a former financial advisor, we can get all the nutrition we need from [prana](#), the universal life force. She is the author of [Living on Light: A Source of Nutrition for the New Millennium](#), a 21-day program that will allow the body to stop aging and attain immortality by living solely on [light](#).

Greve claims she hasn’t eaten since 1993; yet, she admits “she drinks herbal teas and confesses to the occasional ‘taste orgasm’ involving chocolate or ice cream.”* She also admits “if I feel a bit bored and I want some flavour, then I will have a mouthful of whatever it is I’m wanting the flavour of. So it might be a piece of chocolate or it might be a mouthful of a cheesecake or something like that.”* Several interviewers have found her house full of food, but she claims the food is for her husband, who once went to prison for misappropriating a pension fund. Apparently he hasn’t seen the light and is unable to live on prana yet ([Walker and O’Reilly 1999](#)).

Greve runs the [Cosmic Internet Academy](#) (C.I.A.) and claims to have 5,000 followers worldwide. People pay over \$2,000 to attend her seminars. There are many, apparently, who are not bothered by the contradiction of saying one needs only prana (or is it light?) but admits to the odd sweet and cup of tea, and has a house full of food. This “diet” is changing her chromosomes, she says. Her “DNA is changing to take up more hydrogen and is developing from 2 to 12 strands.”* Greve also claims that the starving of the world would be just fine if they could only be “re-programmed”. They starve to death, she says, because the mass media has tricked them into thinking they need food.* Such gibberish would get some people into treatment; instead, she makes

world tours promoting her book. At least three of Greve's followers have [starved to death](#) while trying to purify themselves with total fasting. Despite the dangerousness of her insane teachings, in the fall of 1999, the Australian television program "60 Minutes" tested her ability to live on prana, the "light of God."

After four days of fasting, Dr Berris Wink, president of the Queensland branch of the Australian Medical Association, urged her to stop the test. According to the doctor, Greve's pupils were dilated, her speech was slow, she was dehydrated and her pulse had doubled. The doctor feared kidney damage if she continued with the fast. The test was stopped. Greve claimed that she failed because on the first day of the test she had been confined in a hotel room near a busy road, which kept her from getting the nutrients she needs from the air. "I asked for fresh air. Seventy per cent of my nutrients come from fresh air. I couldn't even breath," she said. However, the last three days of the test took place at a mountainside retreat where she could get plenty of fresh air and where she claimed she could now live happily.* Clearly, had the test continued, she would have died. Instead, she lived to lead others to their deaths.

Another inspiration for breatharianism is [Wiley Brooks](#), who heads The [Breatharian Institute of America](#). For the past thirty years or so, Brooks has been claiming that we don't need food, water, or sleep. He asks "if food is so good for you, how come the body keeps trying to get rid of it?...Man was not designed to be a garbage can." He claims that adepts and yogis have been living on air for millennia. Brooks offers weekend [workshops](#) at a [Sierra Nevada mountain retreat](#) for \$425, meals included.

stigmata

The stigmata are wounds believed to duplicate the wounds of Christ's crucifixion that appear on the hands and feet, and sometimes on the side and head, of a person. The fact that the stigmata appear differently on its victims is strong evidence that the wounds are not genuinely miraculous (Wilson).

[St. Francis of Assisi](#) (1182 - 1226), devoted to imitate Christ in all ways, apparently inflicted himself with wounds and perpetuated the first stigmatic fraud. There have been several hundred others since, including Magdalena de la Cruz (1487-1560) of Spain (who admitted her fraud when she became seriously ill) and Therese Neumann of Bavaria (1898-1962). The latter reportedly survived for 35 years eating only the "bread" of the Holy Eucharist at mass each morning. She was also said to be [clairvoyant](#) and capable of [astral projection](#). One of the more recent stigmatics, Fr. James Bruce, claimed not only to have Christ's wounds but also that religious statues wept in his presence. This was in 1992 in a suburb of Washington, D.C., where strange things are common. Needless to say, he packed the pews. He now runs a parish in rural Virginia where the miracles have ceased.

Self-inflicted wounds are common among people with certain kinds of [brain disorders](#). Claiming that the wounds are miraculous is rare and is more likely due to excessive religiosity than to a diseased brain, though both could be at work in some cases.

The likelihood that the wounds are [psychosomatic](#) (psychogenic purpuras), manifested by tortured souls, seems less likely than hoaxing in most cases. There are two main reasons for believing the stigmata are usually self-inflicted, rather than psychosomatic or miraculous. One, no stigmatic ever manifests these wounds from start to finish in the presence of others. Only when they are unwatched do they start to bleed. ([There is one apparent exception to this rule: Catia Rivas.](#)) And two, Hume's rule in "Of Miracles" is that when an alleged miracle occurs we ask ourselves which would be more miraculous, the alleged miracle or that we are being hoaxed? Reasonableness requires us to go with the lesser of two miracles, the least improbable, and conclude that we are witnessing not miracles but [pious frauds](#). All 32 or so recorded cases of stigmata have been Roman Catholics and all but four of those cases were women. No case of stigmata is known to have occurred before the thirteenth century,* when the crucified Jesus became a standard icon of Christianity in the west. Reasonableness seems to require the non-miraculous explanation.

One of the latest to be added to the list of alleged stigmatics is [Audrey Santo](#),

a child who has been in a coma since 1987 when she was three years old. What kind of people are inspired by the concept of a God who would render a child comatose and then inflict wounds on her? [Joe Nickell thinks he has the answer.](#)

People seem to hunger for some tangible religious experience, and wherever there is such profound want there is the opportunity for what may be called "pious fraud." Money is rarely the primary motive, the usual impetus being to seemingly triumph over adversity, renew the faith of believers, and confound the doubters.

People also don't want to think God would allow purposeless and gratuitous pain. They like to feel important and please those with power over them. What could be more special than being chosen to suffer the Savior's wounds and torments? What could please God more than being a living proof of God's existence? Well, being honest and truthful might be a good start.

[Alien-ated Youth -
They're the next step
in human evolution.
But they're just like
everybody else. by
Dylan Krider](#)

The Indigo Children

The Indigo Children is a book by Lee Carroll, a [channeler](#) for an entity he calls [Kryon](#), and his wife [Jan Tober](#).

Kyron has revealed such important messages as "love is the most powerful force in the entire universe." Carroll and Tober travel the world putting on Kryon seminars. Kryon has many interests, including the [Universal Calibration Lattice and EMF Balancing](#) (empowerment through knowledge of your electromagnetic nature, i.e., how to manage your energy field which consist of "fibers of light and energy").

The main thesis of *The Indigo Children* is that many children diagnosed as having attention deficit disorder (ADD) or ADHD (attention deficit hyperactivity disorder) are actually space aliens. These children don't need drugs like Ritalin, but special care and training. The [book](#) consists of dozens of articles by [authors](#) from many walks of life. It is, accordingly, inconsistent and uneven in quality of analysis and advice. One of the authors is Robert Gerard, Ph.D., whose piece is called "Emissaries from Heaven." He believes his daughter is an Indigo Child. He also thinks "Most Indigos see angels and other beings in the etheric." He runs [Oughten House Foundation, Inc.](#), and sells angel cards. Another contributor is Doreen Virtue, an advocate of [angel therapy](#). Still another is Nancy Ann Tappe who wrote a channeled book called *Understanding Your Life Through Color*. Not all the contributors are on the fringe of New Age metaphysics, however. For example, Dr. Judith Spitler McKee is a former preschool and elementary teacher and retired Eastern Michigan University professor. She spends her time trying to interest children in reading.

by their fruitiness you will know them

The Indigo Child is recognizable by his or her [aura](#) and by certain other traits, according to [The Indigo Children website](#) (owned by Kryon Writings).

- **They come into the world with a feeling of royalty (and often act like it)**
- **They have a feeling of "deserving to be here," and are surprised when others don't share that.**
- **Self-worth is not a big issue. They often tell the parents "who they are."**
- **They have difficulty with absolute authority (authority without explanation or choice).**
- **They simply will not do certain things; for example, waiting in line**

is difficult for them.

- They get frustrated with systems that are ritually oriented and don't require creative thought.
- They often see better ways of doing things, both at home and in school, which makes them seem like "system busters" (nonconforming to any system).
- They seem antisocial unless they are with their own kind. If there are no others of like consciousness around them, they often turn inward, feeling like no other human understands them. School is often extremely difficult for them socially.
- They will not respond to "guilt" discipline ("Wait till your father gets home and finds out what you did").
- They are not shy in letting you know what they need.

As with most other purveyors of non-sense, Carroll and Tober often have seemingly reasonable advice to give, such as the following [advice](#) to parents and students:

Parents: Know what your children are doing and thinking. Find out how they feel. Show them you care. Pester them until they tell you! Then listen.

Classmates: Befriend an outcast or loner at school. Start including them, not excluding them. Take a stand on this! It isn't easy, but it will make a big difference in another's life

One doesn't need an entity name Kryon to tell you that.

One [reviewer](#) of the book writes:

As a parent of child with ADD, I have read a great deal of material about children with these types of problems. Unfortunately, this book was very disappointing in its discussion of these issues. The definition of an indigo child was confusing and incoherent. The suggestions for discipline didn't begin to touch on the special needs for these children and things that really can be done to help them. Some of the essays negated research findings without providing any evidence. For example, research has shown for a long time that diet doesn't impact ADD. This was disproved by numerous studies over 30 years ago. This book reflects the feeling of some people on these issues. It has some really far out ideas, like these children come from another planet. I don't believe my daughter comes from another planet. She is a beautiful gift from God, and there are lots of resources out there to help her and others like her. But this book isn't one of them.

Another writes:

As a teacher I picked up this book and thought it may have some new approaches to helping kids. It does alright. According to this book, children with ADD or ADHD have come from another planet to prepare us for the new age. There are many techniques that are known to work and help these children, but this book doesn't go that far. It scratches the surface of how to really help these children and deals more with this our kids are from another planet philosophy. Unless you are into believing this idea that our children are aliens, don't waste your money.

Apparently, however, there are many people who are open to this idea. After all, it is not any further out than the belief that angels and other entities that talk to special people know better than teachers and doctors what is right or wrong with our children and how best to treat them.

One can understand why many parents would not want their child to be labeled as ADD or ADHD. The label means your child is not perfect. Some may even take it to mean the child is "damaged." Specifically, it means your child's behavior is due to a neuro-biological condition. To some, this is the same as having a malfunctioning brain or a mental disorder. Understandably, emotions are going to run high here. Also understandably, there is going to be a lot of hype here, especially from the "alternative" treatment and "[natural](#) is good/drugs are bad" lobby. Their claims will be inflated rather than clarified by the mass media.

Furthermore, the mass media, attack lawyers, and talk show hosts are not known for their role in clarifying complicated scientific or medical matters (witness their handling of [Prozac](#), [silicone breast implants](#), [cell phones](#), [mental illness](#), [spirituality and health](#) and [environmental issues](#)). Why should we expect them to improve our understanding of ADD, ADHD and treatment with drugs like Ritalin ([methylphenidate](#))? It is more likely they will take the simpler and safer path: they'll jump on the bandwagon and attack the drug industry, psychiatrists, etc., who are [over-drugging our children](#). Nobody will oppose outrage at "abuse" of children. Fewer still will bother to investigate to see if you know what you are talking about.

The National Institute of Mental Health says that ADHD is the most commonly diagnosed childhood disorder. It affects some 3 to 5 percent of all school-age children. ([David Kaiser](#) says 10% of school-age children have been diagnosed with ADD/ADHD and that in some parts of the country 50% of the children are so diagnosed.) With so many children affected, it should be

easy to find cases of misdiagnosis, inappropriate treatment, adverse drug reaction, etc. Anecdotes of abuse, however, should not substitute for scientific studies or clinical observations by the professionals who treat these children on a daily basis. But we all know that an anecdote told on Oprah or Larry King Live by [Arianna Huffington](#) or Hilary Clinton is much more powerful than a controlled scientific study. Yet, those scientific studies must be done. Ritalin has been around since 1950, yet there are no long-term studies I am aware of that show it is safe, effective, or better than any alternative. The support for its prescription comes mostly from those in the trenches, the practitioners who treat the millions of children and adults with AD/HD. Support also comes from Ritalin's manufacturer, New Jersey-based Novartis Pharmaceuticals Corp., which says the drug "has been used safely and effectively in the treatment of millions of ADHD patients for over 40 years," attested by the results of 170 studies (Donohue). However, Novartis is hardly a disinterested party.

Just as many women with real medical problems were encouraged by [each other](#) and by their lawyers to blame their conditions on breast implants, even though the scientific evidence was heavily against the connection, so too there will be many who have problems or get into trouble who will blame Ritalin. First, I took Ritalin and then this happened. Ergo, [Ritalin caused it](#). Next stop, the talk show circuit. And no matter how many long-term studies are done that find nothing spectacularly wrong with Ritalin, there will always be the possibility that the next one will find something horrible. For example, "researchers at the University of California, Berkeley, say their study, tracking ADHD youths into adulthood, has found a connection between Ritalin use and later abuse of tobacco, cocaine and other stimulants (Donohue). Is the connection strong enough to warrant worry? Will further studies be unable to replicate this one? It won't matter to the general public and the enemies of "unnatural" pharmaceuticals. They will continue to promote such "natural" therapies as blue-green algae, even though there are both [pros](#) and [cons](#) to taking the stuff, and even though there are no long-term studies on what effects algae might have on a developing child's brain. They have [anecdotes](#) and that's enough for the media, the lawyers, the talk-show hosts, and their audiences. Anecdotes are sufficient to get the government involved as well. Republican Congressman Henry Hyde of Illinois is riding this one. Hyde has heard that kids are using Ritalin for recreation and has asked the General Accounting Office to investigate the illegal use of Ritalin in public schools (Donohue).

It seems that the hype and near-hysteria surrounding the use of Ritalin has contributed to an atmosphere that makes it possible for a book like *Indigo Children* to be taken seriously. The whole situation reminds me of a poster I once saw on a bulletin board at Sacramento City College. The poster was promoting the [Berkeley Psychic Institute](#) and declared in bold letters: YOU MAKE NOT BE PSYCHOTIC, YOU MAY BE PSYCHIC. Given the choice, who wouldn't rather believe they are [psychic](#) than that they are psychotic?

Likewise, given the choice, who wouldn't rather believe their children are special and chosen for some high mission rather than that they have a brain disorder?

Too Good to Be True

Inset Fuel Stabilizer

Some people wonder why aliens with more time than intelligence would come to earth to mutilate cattle or abduct people for genetic engineering projects. Others ponder more serious questions, such as, what kind of engineering do these creatures have? Do they use leaded or unleaded? Paper or plastic? What kind of gas mileage do they get? Does their spacecraft meet California's rigid emission standards? How did they get here on just one tank of fuel, and how do they keep hovering around for all these years without making a pit stop at Exxon or BP? There can only be one explanation: they use the Inset Fuel Stabilizer!

They must use the Inset Fuel Stabilizer (IFS) [no trademark because they were denied one on July 31, 1997]. There is no other explanation for it. What else could possibly explain how they continue to hover around the earth undiscovered, year after year, without making a single pit stop for gas? How else can we explain how they traveled billions of miles without any sign of polluting the atmosphere? The gas mileage the aliens get and the clean air their craft emits cannot possibly be explained by any of the known laws of physics, or chemistry, or biology, or California. The aliens are using the Inset Fuel Stabilizer.

This amazing device, according to its inventor, Bob Pearson, is able to align fuel and air molecules "in an energy field" so that they completely burn inside the Stabilizer. How does it do this? Bob has no idea, but it works. Of course it does. Only a perverted skeptic could mistrust such a claim. John Nacco of Inset Industries claims that the molecules that make up hydrocarbon fuels are surrounded by a positive charge. He claims this positive charge tends to attract other fuel molecules and that removing the positive charge causes the molecules to repel each other. This, he says, allows oxygen molecules to attach themselves to individual fuel molecules instead of having to bond to clusters of fuel molecules. The increased level of oxygen in the mix produces a more even burn, he claims, resulting in close to 100 percent combustion of the fuel molecules. Of course, Mr. Nacco does not explain why positively charged "molecules" would attract other positively charged molecules. Nor does he explain why a negatively charged molecule would repel rather than attract a positively charged one. Nor does he explain why oxygen molecules, which have no charge, would be attracted to negatively charged fuel "molecules". Given such a flawed account of chemical bonding, why should we believe him when he claims near 100 percent combustion of fuel molecules? Why should we believe him when he says that the longer the fuel stabilizer is in use, the lower the emissions readings become? Why should we believe another Inset person named Marshall who said he installed a stabilizer in his wife's 1990 Honda and within 11 days, hydrocarbon counts dropped from 145 parts per million to 9 parts per million and carbon

monoxide emissions were eliminated completely (*Chicago Tribune*, May 3, 1994)? We can believe Marshall, but what does his data mean? Very little, since we do not know if he did anything else on his wife's car or if he had it tested on the same equipment or if the car had the same fuel in it for both tests.

What is the Stabilizer, then? This much we can say: it is a 7-inch long piece of stainless steel. It has been described as looking like a slim beer can with a bolt-like valve on each end. That's it. There is no more. It is just a stainless steel tube that is designed to be inserted in your vehicle's fuel line. How does a stainless steel pipe align molecules or change their charges? No one knows. How does it keep them aligned once they leave the pipe? No one knows. Why would their alignment or charge have anything to do with whether they would burn or emit polluting particulates? No one knows. Trust Bob, John, and Marshall though, because they say it works!

Ray Hall read about the Inset Fuel Stabilizer in his local newspaper in Naperville, Illinois. The city of Naperville had shelled out \$1,500 each for Stabilizers for the city's maintenance and police vehicles. Mr. Hall has some background in chemistry and physics. The claims reported by local journalist Susan Trudeau did not have the ring of verisimilitude, so Mr. Hall contacted her. She passed the buck to a Mr. Morris of Inset Industries. Morris told Hall that even the inventor did not know how it works, but the results speak for themselves. The results, unfortunately, were all in the form of anecdotes and uncontrolled studies of negligible scientific merit.

Mr. Morris told Hall that the Stabilizer was not patented because the workings were a trade secret and they didn't want to reveal this information in a patent application. This seems patently absurd, not to patent such a revolutionary device. Morris did not appreciate having the claims of Inset challenged and "condemned me for my negative attitude," says Hall. Morris said that Inset was only trying to save the world from pollution and they had many satisfied customers, including police departments. Maybe these were the same police departments who were conned into buying the [Quadro Tracker](#). Mr. Hall was disappointed that the reporter hadn't checked out Morris's claims, including the claim that an endorsement from the Environmental Protection Agency was forthcoming in the near future. Hall's own investigation revealed that the EPA does not endorse products.

I must admit that I was very skeptical of Mr. Hall's claims. I checked out the WWW home page of Inset [www.insetfuelstabilizer.com/, which is now defunct] and, sure enough, it claimed that this tube can align molecules and thereby save you money on gasoline and make your engine run virtually pollution free. There were [testimonials](#) from cops, garbage truck drivers and others, as to the wonders of the Stabilizer. There was also a table which one could use to calculate how much money you can expect to save on gas by using the Stabilizer. There was another unskeptical newspaper article for perusal. What you did not find, though, was any evidence that the Stabilizer had been tested under anything that might vaguely resemble a controlled study. A recent visit to the Inset homepage revealed that the mileage chart is no longer there. Inset has since stopped touting the fuel economy/gasoline savings angle. Since such companies do not usually voluntarily remove such claims, it is likely they did so as a result of being taken to court. In any case, the main angle now is emission control. Despite all the hype about how it increases gas mileage and

power and reduces emissions, the only thing guaranteed by Inset is that "the Fuel Stabilizer will reduce air pollution emissions to the level required by the Federal Clean Air Act and State emissions standards." For most cars, this guarantee means nothing, since they already are at that level or can be made so with a minor tune up. The Inset sells for about \$1,600. For those cars which are in such bad shape that they can't meet these standards, the cost of the Inset would be more than the car is worth.

The main evidence presented by Inset Industries for their product is in the form of testimonials and some indecipherable charts. It is easy to dismiss testimonials by company executives, but how can we dismiss the testimonial of an unnamed municipality in Texas which has tested some 340 diesel vehicles and reports that "the opacity on 340 diesel powered vehicles met State of Texas pollution standards while fuel economy increased approximately 19%"? Well, for one thing, fuel economy is not guaranteed when you buy the product. Secondly, there are no established emission standards for diesel engines, according to an unnamed supervisor involved in the purchase and testing of the IFS. The municipality is unnamed, though why it should be is puzzling. The unnamed source is also quoted as saying: "We had 97 to 99 percent opacity of particulate matter from our diesels, which was causing black smoke. I was getting more than 30 calls per week from residents complaining about the smoke coming from our garbage trucks. With the stabilizer installed, particulate matter dropped to 25 percent. When we shifted to low sulfur diesel, particulate matter dropped to 10 to 12 percent. We're not getting any more complaints about black smoke from our trucks." We have the word of unnamed source, probably an interested party, since he may have been responsible for asking the municipality to buy 340 of these devices at a total cost of something like half a million dollars. He gives us no report or indication that there is any report, no idea of how these tests were conducted. We're to take his word that "particulate matter" dropped significantly. This is not reliable evidence; it's hearsay. We have no idea how he got his numbers. We don't know whether the reduction in smoke and the decrease of complaints was due to switching to the stabilizer or to the low sulfur fuel, or to some other factor. What looks like a significant amount of supportive evidence vaporizes under analysis. This is just the testimony of an unnamed source in an unnamed community making undocumented claims.

But what about the race car driver who swears by the IFS. In an article in *Trackside* magazine, NASCAR racer Dean Gullik reportedly felt that his race car had more power with the IFS. A test of horsepower with and without the IFS revealed there was no difference. Rather than admit that his perception of more power was wrong, Gullik came to agree with John Nacco of Inset who said that the increased power wasn't from increased horsepower but due to a change in "the torque curve." In any case, NASCAR officials let Gullik use the IFS because it had no measurable effect on the car's power. They consider it a "pollution control device". What is the evidence for that? A test was performed by Al Connors of Alan and Son Car Care Center (NJ State License # 06227) on Hwy. 202 in Branchburg, N.J. With the engine idling normally on 110 octane leaded racing fuel, readings taken from the left side exhaust showed the following emissions levels:

CO = .04%
HC = 62 ppm (parts per million)
C02 = .0%

Unfortunately, no comparable data were given for the car without the device, for typical emission readings on other race cars with similar engines and using the same gasoline. And, we have no idea of how accurate the testing equipment was. Inset claims that "Race cars with this type of engine and fuel typically produce hydrocarbon readings of around 1000 PPM and carbon monoxide readings in the 6.0% range. This race car, stripped of every pollution control device except the Fuel Stabilizer, is the first one with emissions significantly lower than the New Jersey Inspection standards for pollutants. New Jersey standards are: Hydrocarbons below 220 PPM and Carbon Monoxide below 1.2%." If this data is accurate, then why is the Inset guarantee so paltry? The only thing that Inset guarantees with its product is that your car will meet these New Jersey standards with the IFS. You would think they would be willing to guarantee something as dramatic as their testimonials.

Relying on peoples' perceptions of things is not very scientific. Relying on testimonials by interested parties is unreasonable, even if the testimonial is couched in terms of scientific data. Tests of single vehicles or small numbers of vehicles are notoriously unreliable. Faulty equipment or faulty use of the equipment becomes a significant problem. Finally, there is a good reason for doing controlled experiments. They reduce the probability that other factors are actually responsible for the data. In the case of testing a device for pollution control several things must be controlled for:

1. The testing equipment itself must be thoroughly tested. Vehicles without the device must be tested several times, using the same kind of gasoline with the tank similarly filled, to see how much variation occurs. Temperature control is essential for this test, since temperature may affect the performance of the equipment and the vehicle, especially if the test is done at a time of year and in a location where the morning temperature may differ significantly from the afternoon temperature.

2. Once the variance of the equipment is established, controls must be made over the fuel and maintenance of the vehicles.

a) The same fuel from the same batch must be used throughout, to insure that any difference in data is not due to differences in fuel

b) No changes in the auto equipment other than the device being tested can be allowed: no changes in spark plugs, no adjustments of the carburetor, no cleaning of the fuel injector system, no adjustment to the timing, etc. Everything must remain the same in the vehicles except for what is being tested.

c) Vehicles must be tested under the same conditions: thus if vehicles are to be tested months after the first test, making it unlikely that the later tests will be able to use fuel from the same batch as the first test, there must a comparative test made of both the equipment and vehicles without the device at the beginning test and the later test. A baseline of variance must be established.

Testing vehicles months later introduces special control problems. Temperatures under which testing is done may differ radically in summer and winter in some places. Making sure that the drivers of the vehicles do not have any work done on the car in the interval is a logistical problem of varying magnitude. In a municipal fleet, for example, no maintenance can be allowed on vehicles between tests: no oil changes, no tune-ups, etc.

In reading the testimonials provided by Inset, there does not seem to be anything like a controlled experiment they can report. The only controlled experiment known to be done on their device proved negative and they reject the results. That is understandable, but why should we agree with Inset rather than the New Jersey Institute of Technology who did a controlled experiment on the Inset and found it to be of no value?

The New Jersey Institute of Technology in consultation with Stevens Institute tested the Stabilizer at the request of State Senator Robert Littell, who reported that he was getting great results with the device. Their tests showed that the device made no difference in gas mileage or emissions. The report was published in the December 1995 issue of the trade journal *Fleet Executive* magazine. The report was signed by NJIT Professor and Vice President of Research and Graduate Studies Dr. Robert Pfeffer; NJIT Professor Dr. John Droughton; Stevens Institute of Technology Professor and Director of the Center of Environmental Engineering Dr. George Korfiatis; and NJIT Professor of Engineering and Science Dr. Richard S. Magee. Senator Littell said he was "perplexed by the findings of the report" and refused to accept the findings. So did Inset and they filed a lawsuit against NJIT. A large scale test of the Inset and four other air pollution control products was conducted by researchers at the Armament Systems Process Division of the U.S. Army's laboratories at Picatinny Arsenal for the New Jersey Department of Transportation, but the report was not released because of major problems with the testing equipment. There has been an ongoing controversy in New Jersey regarding the reliability of the equipment they use to test emissions. In August 1996, the state of New Jersey charged Inset with violating the Consumer Fraud Act and state securities laws. But Inset continues to flourish on the Internet.

I asked a friend of mine who used to own an auto repair shop if he had ever heard of the Stabilizer. He said that he had but it was called the *Vitalizer* when he was in business. He thinks it might be the same thing being marketed under another name. He even suggested the unthinkable: there might be fraud involved here! I couldn't believe my ears. Fraud on the internet! What a concept! Anyway, I asked him: why, if this were fraud, would anyone be so blatant about it? Weren't they afraid of being caught and severely punished by the very law enforcement agencies who were giving testimonials for them? Not very likely, he said. By the time law enforcement catches up with these kinds of frauds, says my friend, they have moved on, changed their name, and are doing business as usual somewhere else with the same product but a new name. It happens all the time in the [fuel and oil additive industry](#), he said. So, it wouldn't surprise him if it happened in the steel tube/fuel efficiency industry, too.

Well, I was shocked. I had been getting a lot of mail from people who were feeling sorry for me because I was such a negative person. I had vowed to be more positive

just to make them feel better. So I looked for the silver lining in the Inset Stabilizer story and thought I had found it in the alien fuel efficiency angle. Now, I have to rethink my hypothesis. But wait. Maybe I can still find something positive here. I can say that if there are aliens hovering around earth looking for some good beef to mutilate or some tasty humans to experiment on, then they are probably using the Inset Fuel Stabilizer. And maybe Bob Pearson doesn't have to worry about a patent because he has one on his home planet.

I don't know if they have an environmental protection agency on Bob's planet, but here on earth [the EPA did tests on the Inset Fuel Stabilizer](#) and found that it neither reduces vehicle emissions nor increase fuel mileage. What a shock!

Postscript: For those of you who balk at the \$1,600 price tag on the Inset Fuel Stabilizer, don't fret. For a mere \$239.95, plus tax and shipping and handling, you can get the [Mileage Wizard™](#). This device, we are told on the authority of those who are selling it, is a gadget which utilizes "cutting edge technology." According to its promoters, "the gasoline is introduced into the thermal magnetic vaporization chamber creating an almost vapor state prior to entering the fuel injectors, creating greater fuel efficiency." If you do not trust their data on fuel efficiency you can call the "Energy Efficiency and Renewable Energy Clearinghouse at 1-800-363-3732." This offer is exclusively made directly to the public rather than to car manufacturers because, we are told, those big bad greedy corporate types would put owning this device "out of the reach of the average person." It is much better to allow greedy average people rip off each other in an [MLM scheme](#), where the opportunity to make over \$80,000 a month is made available to each and every one of us by the kind founders of the Mileage Wizard™. Or so they say.

[Hiclone](#) promises fuel savings of up to 20%, power increase of up to 15%, and hydro carbon emission reductions of up to 30% with prices from \$160-\$215 (Australian). They'll even sell you something called Fuelmax which "is a magnetic frequency resonator which clips onto the fuel line and 'fractures' the passing fuel, allowing it to mix with oxygen more readily and thus burn more efficiently." This should keep you laughing for up to ten minutes.

Finally, the [Fuel Saver](#) is guaranteed to increase your fuel mileage by up to 27%. It costs only \$89.95 and is available only via the Internet. The device is said to consist of "Neodymium Super inductors that generate a frequency resonance between its two faces." The Fuel Saver "Operates on the principle of resonance, utilizing a double chamber frequency with phased frequency modulation." This device allegedly has three patents. Each of them is for some sort of magnet. So, what you are buying is a magnet that clamps over your fuel line. According to the seller, the magnet will fracture hydrocarbon chains, "molecules that cluster and grow causing molecules to be trapped from air during the combustion." This makes more oxygen available and the fuel burns cleaner, we are told. Furthermore, the Fuel Saver will remove carbon and varnish deposits from your engine. If you are wondering why auto manufacturers don't include these handy devices on their new cars, the Fuel Saver people have the answer. "Car manufactures are...in the business of selling cars, they really focus more on design and safety features, rather than improving fuel mileage."* What

seems clear is that the Fuel Saver people are in the business of selling Fuel Savers and focus more on marketing gobbledygook than truthful advertising.

[Schacter, Daniel L.
The Seven Sins of
Memory : How the
Mind Forgets and
Remembers
\(Houghton Mifflin
Co., 2001\).](#)

memory

Memory is the retention of, and ability to recall, information, personal experiences, and procedures (skills and habits).

There is no universally agreed upon model of the [mind/brain](#), and no universally agreed upon model of how memory works. Nevertheless, a good model for how memory works must be consistent with the subjective nature of consciousness and with what is known from scientific studies ([Schacter 1996](#)). Subjectivity in remembering involves at least three important factors:

1. **Memories are constructions made in accordance with present needs, desires, influences, etc.**
2. **Memories are often accompanied by feelings and emotions.**
3. **Memory usually involves awareness of the memory** (Schacter 1996).

Two models of thinking which are popular with [materialists](#) are the behaviorist model (thinking is a set of behaviors) and that of cognitive psychology (the brain is like a computer). Neither can account for the subjective and present-need basis of memory (Schacter 1996). The Freudian model posits an area of the [unconscious](#) where memories of traumatic experiences are stored. Though unconscious of them, such memories are claimed to be significant causal factors in shaping conscious thought and behavior. This model is not consistent with what is known about the memory of traumatic experiences. There is a great deal of supportive evidence for the claim that the more traumatic an experience, the *more likely* one is to remember it. Novel visual images, which would frequently accompany traumas, stimulate the hippocampus and left inferior prefrontal cavity and generally become part of long-term memory.

Current studies in neuroscience strongly support the notion that a memory is a set of encoded neural connections. Encoding can take place in several parts of the brain. Thus, neural connections are likely to go across various parts of the brain. The stronger the connections, the stronger the memory. Recollection of an event can occur by a stimulus to any of the parts of the brain where a neural connection for the memory occurs. If part of the brain is damaged, access to any neural data that was there is lost. On the other hand, if the brain is healthy and a person is fully conscious when experiencing some trauma, the likelihood that they will forget the event is nearly zero, unless either they are very young or they experience a brain injury.

Furthermore, the Freudian model often assumes that childhood sexual abuse is usually [unconsciously repressed](#) and that psychological problems in adulthood are caused by the unconscious memory of childhood abuse. There is, however, no body of scientific evidence to support either that such abuse is *unconsciously* repressed or that [these experiences are significant causal factors of adult psychological problems](#).

Finally, the model of memory that sees the brain recording everything one experiences is a model that contradicts what is known about how memories are constructed. Even so, in a survey of psychologists by Loftus and Loftus, 84% said they believe every experience is permanently stored in the mind (Schacter 1996, 76).

a popular model of memory

One of the most popular models of memory sees memory as a present act of consciousness, reconstructive of the past, stimulated by an analogue of an engram called the "retrieval cue." The engram is the neural network representing fragments of past experiences which have been encoded. The evidence is strong that there are distinct types and elements of memory which involve different parts of the brain, e.g., the hippocampus and ongoing incidents of day-to-day living (*short-term* or *working* memory); the amygdala and emotional memories (Schacter 1996, 213). Memories might better be thought of as a collage or a jigsaw puzzle than as "tape recordings," "pictures" or "video clips" stored as wholes. On this model, perceptual or conscious experience does not record all sense data experienced. Most sense data is not stored at all. What is stored are bits and fragments of experience which are encoded in engrams. Exactly how they are encoded is not completely understood.

This popular model of memory rejects the idea that individual memories are stored in distinct locations in the brain. That idea seems to have become solidified by Wilder Graves Penfield's experiments done in the 1950's. He placed electrodes on the surface of the exposed temporal lobes of patients and was able to elicit "memories" in 40 of 520 patients. Many psychologists (and lay people) refer to these experiments as proof that memories are just waiting for the right stimulus to be evoked. Schacter points out that the Penfield experiments are not very good evidence for this belief. Not only could Penfield only elicit "memories" in about 1 out of every 8 patients, he did not provide support for the claim that what was elicited was actually a memory and not a hallucination, fantasy or [confabulation](#).

forgetting

On the model described in the previous two paragraphs, forgetting is due to either

1. **weak encoding (why we forget most things, including our nightly dreams);**
2. **lack of a retrieval cue (we seem to need something to stimulate memory);**
3. **time and the replacement in the neural network by later experiences (how many experiences do you remember from many years ago?);**
4. **repetitive experiences (you'll remember the one special meal you had at a special restaurant, but you won't remember what you had for lunch a year ago Tuesday), or**
5. **a drive to keep us sane. (Imagine the brain overload that would occur if we were to never forget anything, the stated goal of L. Ron Hubbard's [dianetics](#). His followers should read Jorge Luis Borges "Funes, the Memorious," a story about such a being.)**

The chances of remembering something improve by "consolidation," which creates strong encoding. Thinking and talking about an experience enhance the chances of remembering it. One of the better known techniques of remembering involves the process of [association](#).

source memory

Many people have vivid and substantially accurate memories of events which are erroneous in one key aspect: the *source* of the memory. For example:

In the 1980 presidential campaign, Ronald Reagan repeatedly told a heartbreaking story of a World War II bomber pilot who ordered his crew to bail out after his plane had been seriously damaged by an enemy hit. His young belly gunner was wounded so seriously that he was unable to evacuate the bomber. Reagan could barely hold back his tears as he uttered the pilot's heroic response: "Never mind. We'll ride it down together." ...this story was an almost exact duplicate of a scene in the 1944 film "A Wing and a Prayer." Reagan had apparently retained the facts but forgotten their source (Schacter 1996, 287).

An even more dramatic case of *source amnesia* (also called *memory misattribution*) is that of the woman who accused memory expert Dr. Donald Thompson of having raped her. Thompson was doing a live interview for a television program just before the rape occurred. The woman had seen the program and "apparently confused her memory of him from the television screen with her memory of the rapist" (Schacter 1996, 114). Studies by Marcia Johnson et al. have shown that the ability to distinguish memory from imagination depends on the recall of source information.

Tom Kessinger, a mechanic at Elliott's Body Shop in Junction City, Kansas, gave a detailed description of two men he said had rented a Ryder truck like the one used in the Oklahoma City bombing of the Alfred P. Murrah Federal Building. One looked just like Timothy McVeigh. The other wore a baseball cap and a T-shirt, and had a tattoo above the elbow on his left arm. That was Todd Bunting, who had rented a truck the *day before* McVeigh. Kessinger mixed the two memories but was absolutely certain the two came in together.

Jean Piaget, the great child psychologist, claimed that his earliest memory was of nearly being kidnapped at the age of two. He remembered details such as sitting in his baby carriage, watching the nurse defend herself against the kidnapper, scratches on the nurse's face, and a police officer with a short cloak and a white baton chasing the kidnapper away. The story was reinforced by the nurse, the family, and others who had heard the story. Piaget was convinced that he remembered the event. However, it never happened. Thirteen years after the alleged kidnapping attempt, Piaget's former nurse wrote to his parents to confess that she had made up the entire story. Piaget later wrote that "I therefore must have heard, as a child, the account of this story...and projected it into the past in the form of a visual memory, which was a memory of a memory, but false" ([Tavris](#)).

amnesia and implicit memory

Though all forgetting is a type of amnesia, we usually reserve that term for forgetting that is caused by the effects of drugs/alcohol, brain injuries, or physical or psychological traumas. One of the more interesting types of amnesia is what psychiatrists call the *fugue* state. An otherwise healthy person travels a good distance from his home, and when found has no memory of how he got there or who he is. The fugue state is usually attributed to recent emotional trauma. It is rare and is typically neither permanent nor recurring.

Limited amnesia, however, is quite common. Limited amnesia occurs in people who suffer a severe physical or psychological trauma, such as a concussion or being rendered unconscious. Football players who suffer concussions, and accident victims who are rendered unconscious, typically do not remember what happened immediately before the event. The scientific evidence indicates, however, that some sort of *implicit* memory may exist, which can be troubling to one whose amnesia is due to having been rendered unconscious by an assailant. Schacter notes the case of a rape victim who could not remember the rape, which took place on a brick pathway. The words 'brick' and 'path' kept popping into her mind, but she did not connect them to the rape. She became very upset when taken back to the scene of the rape, though she didn't remember what had happened there (Schacter 1996, 232).

Implicit memory is memory without awareness. It differs substantially from [repressed memory](#). Implicit memories are not necessarily repressed, nor are

they necessarily the result of trauma. They are weakly encoded memories which can affect conscious thought and behavior. Retrieval cues do not bring about a complete memory of some events because most of the event was not encoded.

Daniel Schacter and Endel Tulving introduced the terms 'implicit memory' and 'explicit memory' in their attempt to find a common language for those who believe there are several distinct memory systems and those who maintain there is only one such system. Schacter writes: "The nonconscious world of implicit memory revealed by cognitive neuroscience differs markedly from the Freudian unconscious. In Freud's vision, unconscious memories are dynamic entities embroiled in a fight against the forces of repression; they result from special experiences that relate to our deepest conflicts and desires. . . .[I]mplicit memories . . . arise as a natural consequence of such everyday activities as perceiving, understanding, and acting" (Schacter, 1996, 190-191).

Most lost memories are lost because they were never elaborately encoded. Perception is mostly a filtering and defragmenting process. Our interests and needs affect perception, but most of what is available to us as potential sense data will never be processed. And most of what is processed will be forgotten. Amnesia is not rare, but is the standard condition of the human species. We do not forget simply to avoid being reminded of unpleasant things. We forget either because we did not perceive closely in the first place or we did not encode the experience either in the parietal lobes of the cortical surface (for *short-term* or *working* memory) or in the prefrontal lobe (for *long-term* memory).

Long-term memory requires elaborative encoding in the inner part of the temporal lobes. If the left inferior prefrontal lobe is damaged or undeveloped, there will be grave difficulty with elaborative encoding. This area of the brain is undeveloped in very young children (under the age of three). Hence, it is very unlikely that any story of having a memory of life in the cradle or in the womb is accurate. The brains of infants and very young children are capable of storing fragmented memories, however. Such memories cannot be explicit or deeply encoded, but they can nevertheless have influence. In fact, there are numerous situations--such as [cryptomnesia](#)-- where memory can be manifested without awareness of remembering.

semantic, procedural, and episodic memory

Memory researchers distinguish several types of memory systems. *Semantic* memory contains conceptual and factual knowledge. *Procedural* memory allows us to learn new skills and acquire habits. *Episodic* memory allows us to recall personal incidents that uniquely define our lives (Schacter, 1996, 17). Another important distinction is that between *field* and *observer* memory. Field memories are those where one sees oneself in the scene. Observer

memories are those seen through one's own eyes. The fact that many memories are *field* memories is evidence, as Freud noted, of the reconstructive nature of memories (Schacter, 1996, 21).

accuracy of memory

How accurate and reliable is memory? Studies on memory have shown that we often construct our memories after the fact, that we are susceptible to suggestions from others that help us fill in the gaps in our memories. That is why, for example, a police officer investigating a crime should not show a picture of a single individual to a victim and ask if the victim recognizes the assailant. If the victim is then presented with a line-up and picks out the individual whose picture the victim had been shown, there is no way of knowing whether the victim is remembering the assailant or the picture.

Another interesting fact about memory is that studies have shown that there is no significant correlation between the subjective *feeling of certainty* a person has about a memory and the memory being *accurate*. Also, contrary to what many people believe, [hypnosis](#) does not aid memory's accuracy. Because subjects are extremely suggestible while hypnotized, most states do not allow as evidence in a court of law testimony made while under hypnosis (Loftus, 1979).

Furthermore, it is possible to create [false memories](#) in people's minds by suggestion, even false memories of [previous lives](#). Memory is so malleable that we should be very cautious in claiming certainty about any given memory without corroborative evidence.

How does memory work?

We do not know exactly how memory works, though there are many explanatory models for memory. Some of these models identify memory with brain functions. On this model, for example, memory diminishes with age because neurons die off as we get older. There are only three ways to overcome this fact of nature: 1. figure out a way to stop neurons from dying; 2. figure out a way to stimulate the growth of new neurons; or 3. figure out a way to get the remaining neurons to function more efficiently and pick up the slack. So far, it looks like options 2 and 3 are the most promising. Some positive results have been reported regarding the stimulation of the growth of new brain cells by fetal implants. Fred Gage of [The Salk Institute](#) has reported that recent research in neurogenesis is encouraging. They have observed the growth of neurons in the dentate gyrus, a portion of the hippocampus (which controls learning and short term memory), in mice that were placed in a stimulating environment. Gage has also grafted immature cells from the spinal cord to the hippocampus and found that they produced new neuronal cells. There is also growing support for the notion that exercising the body and the brain tend to preserve neurons. "Use it or lose it" turns out to be

literally true for brain cells.

Neurological research has also produced some success getting neurons to work better with *ampakines*, chemical compounds sometimes called "memory drugs." The first tests with humans showed excellent results, but the samples were too small to justify drawing any conclusion except that more studies are needed.

For those who think that memory is a function of some non-physical reality, such results should cause some reflection, though I doubt that a non-physical model of the mind will lead to any significant research which will benefit humankind. For those who posit that memory is a brain function, there is not only a direction for research to follow, but hope of success for discovering something truly useful.

SkepDic.com

bunyips

Bunyips are legendary spirits or creatures of the Australian Aborigine. Bunyips haunt rivers, swamps, creeks and billabongs. Their main goal in life is to cause nocturnal terror by eating people or animals in their vicinity. They are renowned for their terrifying bellowing cries in the night and have been known to frighten Aborigines to the point where they would not approach any water source where a bunyip might be waiting to devour them.

There are many reports by white settlers who have witnessed bunyips, so [cryptozoologists](#) may still be searching for these creatures. They may have some difficulty in locating their prey, though, since Aboriginal tribes do not all give the same visual description of the creature. Some say the bunyip looks like a huge snake with a beard and a mane; others say it looks like a huge furry half-human beast with a long neck and a head like a bird. However, most Australians now consider the existence of the bunyip to be mythical. Some scientists believe the bunyip was a real animal, the *diprotodon*, extinct for some 20,000 years, which terrified the earliest settlers of Australia.

According to Oodgeroo Noonuccal (Kath Walker) in *Stradbroke Dreamtime*, the bunyip is an evil or punishing spirit from the Aboriginal Dreamtime. Today the bunyip mainly appears in [Australian literature for children](#) and makes an occasional appearance in television commercials.

cabala

03 Dec 2000

I just wanted to respond to the way you described cabbalism. Cabbalism isn't just about trying to read a hidden meaning behind every word and every letter in the Bible; actually it's a whole philosophical system that tries to explain the universe, the world and our own minds in an actually very reasonable, scientific manner. Just look for the [Cabbalistic Tree of Life](#) w/ the Ten Emanations of God and you'll see that it's not as much bilge and balderdash as you make it sound like on your web page. In fact, the cabbalistic belief is the only one that doesn't try to credit God with JUST positive traits, but also 'negative' ones like destruction and death. Since destruction is a necessary part of creation (since if only things were being created and nothing ever disappeared, this would be a problem :) it is also a necessary part of God. I'm not saying God causes wars, or allows people to starve. WE do these things. WE start wars. WE allow people in Africa to starve through a mad hierarchical system that puts 20 % of the world population in ideal circumstances while the rest of humankind rots. And of course God cannot REALLY interfere because we have free will. Things came to be this way because humans wanted it. Not really all of it, but they can't see how it should be otherwise. God can't just set the world to rights because he's SO GOOD, or something. It is up to US. We can only ask for help every now and then, and guidance, and wisdom. Anyway... perhaps for all you sceptics out there, it's a good idea to read [Daniel Quinn's](#) books. He has a very refreshing view on the world as it is now and the ways people are trying to delude themselves. Really, give it a try. If you don't like his books after all, blame me.

Jenneke

reply: Well, I'd say these things are open to a different interpretation.

12 May 1998

For a professor, I find your misunderstanding of the Kabbalah and its principles to be, at the least, a manifestation of ignorance, and at the most, a blatant disrespect for both Kabbalists and your students by teaching such misinformation.

If you had bothered to study the Notes on the Kabbalah by Colin Low, to which your page has a link, perhaps you would not have made such statements such as, " The purpose of the cabala is apparently to read God's

mind and thereby become one with the divine," or "This transcendental quest represents to the atheist a rejection of the earthly realm of facts, suffering, uncertainty and impotence in favor of a fantasy realm of the imagination and a sharing in eternal bliss and omnipotence."

The Kabbalah does not attempt to understand the mind of God, if God in fact has a "mind". Please see the concept of En Soph-the unknowable God. The Kabbalah also does not reject the earthly realm of facts and suffering. Please see the section on Malkuth-the sephira dealing with the earthly, physical world. I have no intention of trying to influence your beliefs; if rationality and atheism are your gods, so be it. But out of respect for what some people find sacred, and out of respect for your students who are undoubtedly influenced by what you tell them, please do not spread this misinformation.

Mary Jarrett

reply: With all due respect, the Cabala is an attempt to understand the mind of God, even if you do not use those words, even if you maintain that God is ineffable.

As Colin Low writes:

If Kabbalah means "tradition", then the core of the tradition was the attempt to penetrate the inner meaning of the Bible, which was taken to be the literal (but heavily veiled) word of God. Because the Word was veiled, special techniques were developed to elucidate the true meaning....Kabbalistic theosophy has been deeply influenced by these attempts to find a deep meaning in the Bible.

The Bible is understood to be the word of God. The word of God is understood to express the will of God. The will of God is an aspect of the mind of God.

Furthermore, whatever recognition the mystic makes of human suffering, it is always only a means to the true goal of existence, which is union with God, if not literally, then figuratively as existing in the presence of God. In fact, all actions in the physical world, including the scientific study of nature, are, from the mystic's viewpoint, of value only as a means to getting closer to God the Creator through imminent Creation.

The Cardiff Giant

The Cardiff Giant is a fake fossil of an antediluvian giant some ten feet high with 21 inch feet. The "fossil" is actually a carved slab of gypsum, sculpted a year or two before its "discovery" in 1869. The fake was the idea of George Hull, a cigar manufacturer and atheist, and a distant relation Stubb Newell, who owned the farm in Cardiff, New York, where the hoax was perpetrated. Experts almost immediately suspected the "fossil" was not a fossil, but their warnings went unheeded. Scientists declaring the fake a fake did not deter visitors, who shelled out 50 cents each to see the "Goliath." Rumor had it that the "fossil" was proof of the Bible's accuracy about giants such as Goliath. The curious came in the hundreds per day to the remote upstate New York farm for a view of Biblical history.

Within a week of its "discovery," Newell sold three-fourths of his interest in the Giant to a syndicate in Syracuse, New York, for \$30,000. Business was so good that P.T. Barnum wanted to get in on the action. He offered to rent the giant for just three months to take on the road with his circus, but Newell and the syndicate wouldn't deal. So Barnum had a duplicate made and charged people to see a fake of the fake. It is said that when both were displayed in New York City at the same time, Barnum's fake of the fake outdrew the real fake (Feder, 36).

Kenneth Feder, in his book on myths and frauds in archaeology, sees the Cardiff Giant episode as a familiar one:

Trained observers such as professional scientists had viewed the Giant and pronounced it be an impossibility, a statue, a clumsy fraud, and just plain silly. Such objective, rational, logical, and scientific conclusions, however, had little impact. A chord had been struck in the hearts and minds of many otherwise levelheaded people, and little could dissuade them from believing in the truth of the Giant. Their acceptance of the validity of the giant was based on their desire...to believe it (Feder, 37).

In short, often the skepticism toward scientific experts is not rooted in the desire to believe only what the evidence supports, but in a desire to believe what one wants to believe regardless of the evidence.

The "fossil" is now on display at the [Farmer's Museum](#) in Cooperstown, New

York, where it is labeled "America's Greatest Hoax."

[the "Carlos" hoax](#) 

[SkepDic.com](#)

Search the Skeptic's Dictionary

"Carlos"

"We like to be deceived." - Blaise Pascal

"Carlos" was the name of a 2,000-year-old spirit allegedly [channeled](#) by José Alvarez when he toured Australia in 1988. Channeling was all the rage in Australia and an Australian television program contacted [James Randi](#) about finding someone who might show Australians that channeling was something doubtful. Randi approached Alvarez, a performance artist and friend who had long toyed with the idea of creating such a character. The rest, as they say, is history. Alvarez

looked at videotapes of other people speaking in strange voices, pretending to be in touch with other worlds, and he picked it up right away.

Eventually he went to Australia, took the performance into the Sydney Opera House before a rapt audience there, all handling crystals and beads and whatnot, and with charmed looks on their faces, attracted and enthralled by this man onstage, José Alvarez, doing the Spirit of Carlos that was claimed to be 2,000 years old. His performance was very convincing, and actually better than the "real" channellers!

However, all of the material that he produced was spurious. In the press releases he invented magazines and newspapers, he invented towns and cities and radio stations and TV channels and whatnot, that didn't even exist. He prepared videos of radio interviews and theater appearances that never happened. And just one phone call by the media back to the United States would have revealed the whole thing as a hoax. Even after it was all revealed on the Australian Sixty Minutes TV show, a week after the Opera House appearance, many continued to believe in "Carlos" and his uninspired messages. (Randi, personal correspondence.)

For Alvarez, the creation of the character "Carlos" was a performance/experiment to see how far he could take his creation, but his purpose was not to make people look foolish. He hoped to liberate them from

a false belief. However, the result of the performance seemed to demonstrate how easy it is to create a cult from scratch and how, even when the truth is revealed to them, some still refuse to accept it. The "Carlos" hoax also demonstrated how gullible and uncritical the mass media are when covering paranormal or supernatural topics. Rather than having an interest in exposing the truth, the members of the media were obsessed with "Carlos" the phenomenon and transformed his character from a hoax to a myth. The character Alvarez had so arduously created was transmogrified by the press. The media didn't even need to do any research to have determined that "Carlos" was not genuine. The biggest clue was handed to them on a silver platter: "Carlos" performed for free. He offered crystals from [Atlantis](#) for sale, but took orders rather than cash. Every journalist should know that the first sign of an authentic fake guru is greed.

José Alvarez had hoaxed an entire continent with his art. But he had created something that the media and his audiences would take from him and recreate to suit their own needs. One lesson here has to be the magician's refrain: deception requires cooperation. Another lesson might be that the need to believe in something like a "Carlos" is so great in some people that we must despair of them ever being liberated.

Alvarez continues to travel the world performing "Carlos" in a malleable manifestation of his initial "incarnation." He appears on global network TV, and performs before large live audiences, engaging them in discussions regarding gurus and the dangers of passive acceptance of unquestioned belief. His goal? To bring people real enlightenment.

His ongoing exploration of the nature of belief, charisma, and power, and how they intersect, was featured at the 2002 Biennial Exhibition at the Whitney Museum of American Art in New York City.

tarot cards

"The tarot is one of the most wonderful of human inventions. Despite all the outcries of philosophers, this pack of pictures, in which destiny is reflected as in a mirror with multiple facets, remains so vital and exercises so irresistible an attraction on imaginative minds that it is hardly possible that austere critics who speak in the name of an exact but uninteresting logic should ever succeed in abolishing its employment." --Grillot de Givry

Tarot cards are used today mainly in [fortune-telling](#).

A few years ago, tarot cards would have conjured up images of Gypsies, but today the cards are popular among occultists and New Agers in all walks of life.

The modern tarot deck has been traced back to fifteenth century Italy and a trick-taking game called triumphs (*tarots* in French) (Decker). The traditional tarot deck consists of two sets of cards, one (the [major arcana](#)) having 22 pictures, such as the Fool, the Devil, Temperance, the Hermit, the Sun, the Lovers, the Juggler, the Hanged Man and Death. The other set has 56 cards (the [minor arcana](#)) with kings (or lords), queens (or ladies), knights, and knaves (pages or servants) of sticks (or wands, cudgels or batons), swords, cups and coins.* Gypsies didn't begin using tarot cards until the twentieth century. Today, there are many different tarot decks used in [cartomancy](#). The meanings of the figures and numbers on tarot cards vary greatly among tarot readers and advocates, many of whom find connections between tarot and the [cabala](#), [astrology](#), [the I Ching](#), ancient Egypt, and various other occult and mystical notions.

The oldest playing cards date back to tenth century China, but the four suits of tarot and modern playing cards probably originated with a fourteenth century Muslim deck. [Decker] According to de Givry, in the modern 52-card deck of ordinary playing cards, sticks or wands = clubs (and announce news); swords = spades (and presage unhappiness and death); cups = hearts (and presage happiness); coins = diamonds (and presage money). According to Decker, the Muslim sticks represented polo sticks. As Europeans were not yet familiar with polo, they changed the suit of sticks to that of wands, cudgels or batons.

Tarot cards are usually read by a fortune-teller, though in these days of New Age Enterprise, anyone can buy a deck with instructions on [how to discover your real self and actualize your true potential](#). Why anyone's fate would be mysteriously contained in playing cards is a mystery indeed; although,

[sympathetic magic](#) seems to play a role.

There is a romantic irresistibility to the notion of shuffling the cards and casting one's fate, to putting one's cards on the table for all to see, to drawing into the unknown, to having one's life laid out and explained by strangers who have the gift of [clairvoyance](#), to gamble on the future, etc. The idea of staring at a picture card and letting it reveal the future or mirror the soul is not one that austere critics are likely to find tantalizing, but the thought of such visionary mysticism obviously has its attraction. Centuries of scientific advancement and learning have not diminished the popularity of occult guidance systems such as the tarot, [ouija boards](#), [astrology](#), [the I Ching](#), [palmistry](#), [iridology](#), [reflexology](#), [ink blots](#), [graphology](#), [enneagrams](#), crystal balls, tea leaves, etc. The need to be guided, to have assistance in making decisions, to be reassured, may have their roots in unfulfilled childhoods. For, it is in childhood that one needs guidance, assistance and direction. It is in childhood that one needs to be comforted and reassured that it is acceptable to be master of your own destiny. Perhaps the many adults seeking occult guidance represent generations of children not guided and directed but tyrannically commanded, not reassured but demeaned, not taught to be masters of their own destiny but taught to be insecure and dependent. In any case, some of the cards are very pretty and many of those who use them swear that they have come to a deeper and greater understanding of themselves by letting the cards stimulate their imagination. It helps them produce a self-narrative which gives sense, direction, and meaning to their lives.

Carlos Castaneda (1925?-1998)

*"All paths are the same: they lead nowhere."
---Don Juan*

Carlos Castaneda was a best-selling author of a number of books centering on a Mexican Yaqui shaman's pharmacologically induced visions. He called the character Don Juan Matos. Castaneda claimed he was doing anthropology, that his books were not fiction. He was granted a Ph.D. by the UCLA Anthropology Department in 1973 for his third book, *Journey to Ixtlan*. Critics say the work is not ethnographically accurate and is a work of fiction.

Castaneda's books are full of stories of magic, sorcery, out-of-body experiences, etc. His first books hit the market during the 1960s when American culture was fascinated by Druglords such as Timothy Leary. These Druglords believed that the chemical changes in their brains which caused them to perceive the world differently and to perceive different worlds, were entering into a "divine" realm. Getting high meant opening the doors of perception to a higher reality.

Castaneda claimed that he met Don Juan in 1960 at a bus station in Nogales, Arizona. Castaneda was a graduate student in anthropology doing research on medicinal plants used by Indians of the Southwest. He claims that Don Juan made him a sorcerer's apprentice and introduced him to the world of peyote, etc. It is unlikely that a great shaman would pick someone up at a bus stop and make him a disciple, but we'll never know since no one but Castaneda ever met Don Juan. Was Don Juan a hoax? Maybe, but Castaneda's books have sold over eight million copies. How?

Castaneda obviously filled a need. He told good stories and gave enigmatic advice. He gave people hope, especially those who believe that the more modern civilization has become the further it has driven human beings from their spiritual or true nature. But these old shamans still know the way! They know truths your modern scientist has not even dreamed of! And they do hallucinogenics, too! Maybe that is why they thought they could fly and transmogrify into birds and other animals.

In his later years, Castaneda introduced a new way to get high: [Tensegrity](#). It involves meditation, exercises, a luminous egg, an assemblage point, depersonalization, dreaming, and other New Age magic. Tensegrity allegedly leads to the perception of "pure energy," breaking down the barriers to higher consciousness. It is supposed to be based on some ancient magic, known to Indian shamans centuries ago.

"Cattle Mutilations" -- Severe Lactic Acidosis?

copyright 2003 Kevin Sterns

The "cattle mutilation" phenomenon has proved a puzzling mystery over the past several decades. Official answers cite predators or decomposition; but these explanations do not match the evidence. Alternatively, popular explanations invoke UFOs or satanic cults. My own hypothesis might lack drama, but it does fit all the facts.

Several factors characterize so-called "Cattle Mutilations". I'll list these, then see which can be explained as an extreme case of lactic acidosis.

Common features of "Cattle Mutilations"

- 1) A cow turns up dead with missing tissues / organs.
- 2) The dead cow is always missing the same or similar parts of its body -- lips, tongue, anus, genitals, ears, and often specific internal organs, such as the lower intestine. All missing tissues are either in close proximity to the cow's digestive tract or are connected to it via internal "plumbing". For example, the cow's ears are connected to the esophagus via the Eustachian tubes.
- 3) The amount of missing tissue varies from case to case. Damage to various parts of the cow appears to be scaled proportionally -- for instance, if a cow is missing a lot of skin around its anus, then it is likely to be missing a lot of skin around its mouth, etcetera.
- 4) Although the cow is missing plenty of skin and internal organs, no blood is found near the carcass.
- 5) The edges of the wounds are perfectly smooth and gently curved, sometimes showing a serrated pattern. There are no cut marks or teeth marks, though investigators always look for these signs.
- 6) Often, investigators remark that the wounds appear to have been chemically burned. Laboratory testing has confirmed that tissues have been subjected to high temperatures.
- 7) There are no signs of decomposition. In some cases the cow was seen alive less than a day before it was found dead.
- 8) There are no animal, human or vehicle tracks around the cow. There are no signs of a struggle. Investigators have been so far unable to find conclusive signs

that sedatives were used on the cow.

What is Lactic Acidosis?

Lactic Acidosis is a well-studied phenomenon, and numerous links can be found on the internet. Here is a quote from

<http://www.ars.usda.gov/is/pr/1997/970328.htm>

“When cattle switch from a high-forage diet to a grain-rich finishing ration, millions of *S. bovis* in the cattle’s rumen--a stomach compartment--gobble up more glucose from the grain than they need and, in turn, spew out an abundance of lactic acid. The animals can develop lactic acidosis--a giant stomachache.

Sometimes life-threatening, lactic acidosis inhibits animals’ weight gain and can lead to liver abscesses and other abnormalities. The result: Losses of up to \$100 million annually for the U.S. cattle feeding industry.”

And from

<http://www.westerndairyscience.com/html/ADM%20articles/html/Acidosis.html>

“Rumen acidosis is the number one metabolic disorder diagnosed by the University of Wisconsin Veterinary College. Two types of acidosis are reported in the field: acute and subacute. Acute acidosis is less common but more severe. Affected animals are depressed, off-feed, have an elevated heart rate, diarrhea and may die.”

Lactic Acidosis is an affliction usually associated with feedlot cows. But it can strike any cow that experiences certain types of sudden change in diet. A cow suffering from severe Lactic Acidosis is often very hungry and gorges itself. The more the cow eats, the more fuel is available for fermentation. In severe cases, so much acid is produced that it kills the cow.

Point by Point: “Cattle Mutilations as Lactic Acidosis”

1) "A cow turns up dead...."

-- As quoted above, lactic acidosis is known to kill cattle. The missing tissues and organs are burned off by the runaway production of acid by bacteria within the cow's rumen.

2) "The dead cow is always missing the same or similar parts...."

-- The acid travels through the cow via diarrhea and vomiting. As acid washes over various tissues, it gradually burns them down. ALL of the lost tissues are

located such that they would be subject to acid burns from diarrhea and vomiting.

3) "The amount of missing tissue varies..."

-- The amount of acid produced would be directly proportional to the severity of the acidosis, which varies.

4) "...no blood is found near the carcass."

-- The burning effects of the acid would cauterize the wounds.

5) "The edges of the wounds are perfectly smooth and gently curved, sometimes showing a serrated pattern..."

-- Acid burns do not leave knife marks. Because acid is a fluid, it produces wounds with perfectly smooth edges. A serrated pattern occurs because the acid is not all released simultaneously. Rather it is vomited up (or expelled as diarrhea) in successive waves, causing serrated wound marks.

6) "...tissues have been subjected to high temperatures."

-- When acid reacts with a material, the ensuing chemical reaction produces heat as a byproduct. That's why injuries from acid are referred to as "burns".

7) "There are no signs of decomposition..."

-- The cow's tissues were burned by acid. There is no need to credit predators, parasites or bacteria to account for the missing tissues.

8) "There are no animal, human or vehicle tracks around the cow..."

-- The cow died on its own because it ate the right type of food at the wrong time.

Observations

ALL aspects of so-called Cattle Mutilation can be explained as severe Lactic Acidosis. People are thrown off track by the unusual severity of the symptoms. Because the dead cow has missing parts, investigators understandably assume that those parts were cut off. This becomes the premise for investigations that unfortunately are doomed by definition.

Lactic Acidosis is typically associated with feedlot cattle, not range cattle. From <http://vetgate.ac.uk/browse/cabi/detail/b47fbd8545c1dcbc2bf9394c0c78aca2.html>

“Most feedlot managers readily recognize the effects of acute acidosis. Many cattle diagnosed as "sudden death" may have died from acute acidosis. “

Thus range cattle with the affliction are more likely to be misdiagnosed. In extreme cases, the cows are thought to be mutilated.

reader comments:

cattle mutilation

13 Mar 2003

First, let me thank you for your description of "Extreme Lactic Acidosis" as a rumination. I still have coffee-induced rhinitis from that. Second, as a vet student, etc., your readers may rest assured that lactate, in all it's forms, isn't likely to directly cause that type of physical injury. Specifically, the pH of an incredibly acidotic rumen wouldn't fall below that of an average monogastric mammal. I'd give cites, but I am up to my elbows (literally -- ha!) in horses right now. I'd bet the Merck Manual of chemicals, etc, would be instructive.

Greg Griffeth

Kevin Sterns replies: So what? The digestive juices in our stomachs are quite capable of breaking down most animal tissues. Suppose the acid in my stomach becomes over-produced and is continuously expelled over a 24-hour period? The tissues around my mouth (for example) would be destroyed, and remaining tissues would show signs of chemical burns.

1 Nov 2002

Your entry on cattle mutilations was very myopic and downright insulting to the farmers which it happens to. I happen to fall into that category. I've lost several cattle over the years from this. I've also lost many cattle over the years to natural causes, predators, stupid city folk trying to be big white hunters, etc. My family has been in the cattle business for generations and this phenomena is something new. Blowflies don't do their work when it's 10 degrees below zero. I don't think it's UFOs, but it damn sure isn't buzzards and blowflies, either.

(unsigned)

29 Sep 1999

*I recently came across your **Skeptic's Dictionary** and have spent the last three nights, and several hours, enjoying your insight of several topics that have been of interest to me. When I saw your reference to cattle mutilations I had to respond. In the spring of 1975 I was in the Army (Military Police) stationed at Ft. Hood, Texas. As with civilian police agencies, Military Police do basic*

police duties (patrol, criminal investigations, traffic control, etc.) and other military requirements when directed. Holding the rank of Private First Class (E-3) I did not have much input, if any, in the assignments I received and usually drew the least desirable duties.

In the latter part of April, 1975, I was on patrol with another young soldier Specialist 4th Class (E-4) driving a 4 WD Jeep. Our patrol area was in one of the most remote areas of the base (North Fort as I believe it was called) and we spent most of the evening testing the jeep on the many "tank trails" which were in abundance in that area and just enjoying (as best as possible under the circumstances) the spring weather. Late in our shift, early morning about 4:00 A.M., we came across a dead cow in the middle of one of the well used tank trails. Tank trails are not paved and it was easy to determine that several tracked vehicles had recently been in the area. Finding a cattle carcass was not uncommon (at least until that day) as local ranchers leased grazing areas from the military and cattle were often wandering onto main roads, where they were struck by military or privately owned vehicles, and into live munitions testing/training areas.

After a few minutes of debate (my partner had read in the local paper, Killeen Daily Herald, about recent "cattle mutilations" found on and around the Ft. Hood area and did not want to do the paperwork he assumed would follow) we decided to call it in and, as it appeared to me to be a young "bull", move the carcass off the trail. It wasn't long before I realized I should have kept my mouth shut. It was just a matter of seconds before every vehicle with a radio on our frequency was asking for our location. After giving directions as best as possible it wasn't long, about thirty minutes, before several vehicles began to arrive including "agents" from our Criminal Investigation Division. We had been told, over the radio, while we waited, not to touch anything and to treat the area as a Crime Scene! I listened in complete awe as various people discussed the possible reasons as to this unfortunate animals demise. The most prevalent was a "satanic cult." I should note at this point that parts of the cows ears, anus, eyes, nose and tail were missing but being from Texas I attributed this to local predators (coyotes, feral packs of dogs) and voiced this opinion. When I observed a photographer taking photographs of "mysterious" black spots in and around the grassy area I again voiced my opinion by attributing this to the exhaust of idling diesel engines from the many large vehicles that use the trail. I guess this was too much for someone, as I was soon assigned the job of directing traffic from the main road.

While doing this task a civilian pickup truck approached and a local rancher stopped and asked if there had been an accident. I told him about the young calf and he replied "yeah I found him about 6:00 last night and left him for the coyotes." When I explained what the prevalent thinking was as to the cows demise he laughed and said "Hell, coyotes' killed it, I saw one pulling on his nose when I drove up and was coming back to bait the carcass." I guess some type of predator bait but didn't inquire as I was laughing too hard and the rancher shook his head and drove off. As it was becoming daylight a Major

arrived and ordered everyone to leave as, in his words "there is nothing here worth our time." So everyone left, I made an entry in the patrol log and that was that.

How wrong I was. After returning to work the next day I found that this incident had grown to mythic proportions. For awhile I tried to enlighten people as to the truth but found, on the most part, that it was not possible. I then put the incident behind me and tried to forget about it although when I wanted a good laugh I would relate this to people who were hooked on this story until I related the ending. I even had someone a few years ago accuse me of being "part of the cover-up" when I interrupted a conversation about this subject between some co-workers and related this incident. So be it. Very sad but true.

P. McDermott

reply: You wouldn't be handing us a line of bull, would you?

26 Sep 1997

I am a civil engineer, non-theist, amateur evolutionary biologist, law abiding, tell it like it is citizen. Having said that I thought I would inform you of a local story that just broke a few weeks ago about cattle mutilations in the Lassen National Forrest at Papoose Meadow. According to the article, which was in the Valley Post from Anderson, CA, there have been several mutilations with all the signs of the classic cattle mutilation. Fish and Game, and other local officials concluded that some type of non-traditional religious group was involved with the first few mutilations. The ranchers think this is unlikely according to the article.

Reply: If Fish and Game and other "officials" concluded (a) that there were "mutilations" and that (b) these were done by some "non-traditional religious group", then you should become suspicious. Traditional religious groups are the ones who started butchering animals as part of their worship. To qualify as an official non-traditional religious group you have to sign an oath not to harm animals, except other humans, and then only in self-defense, unless, of course the animal signs a release form.

Also a good friend of mine who raises lamas actually saw a round object moving silently over his meadow near the Lassen area last April. The amazing thing is that he took pictures and is going to show them to me next week. If we assume that the pictures are real and that only the US military or aliens possess such vehicles and that all US military flights are strictly controlled and that aliens have an interest in animals for nutrition or experimentation then I would conclude that what he saw was an alien vehicle inspecting his livestock because I doubt if secret US military vehicles wonder around meadows as part of their flight path.

Reply: It's been two months since I first heard from you and no word on these photos yet. You might consider not making so many assumptions and try drawing some other inferences from the data. Even if the photos are "real", there might be another explanation besides military planes and alien rancher-experimenters.

Sounds a bit crazy but the evidence for an alien presence on this planet is mounting and I suspect will eventually become trivial. It seems somewhat surreal when unusual things happen locally.

Reply: I agree on the "sounds a bit crazy", "trivial" and the "surreal" parts, but the only thing that seems to be mounting is the evidence that people believe there is mounting evidence for all kinds of strange things. We skeptics are not quite as impressed by these stories, however.

Also, the ranchers claim that one cow was found dead with one horn buried in the ground and another bull was found dead sitting on its back legs. There were no signs of any vehicles or human activity according to the article. The ranchers believe that the animals were dropped from the air.

Reply: Don't rule out ball lightning or a cattle seance that went awry. But the theory that aliens are dropping cattle to see what happens is right up there on top of my list of possibilities that make life so interesting to explore.

It's a fascinating subject.

Barry Sutter, PE

reply: Yes, it certainly is.

It's interesting. I just read your segment on cattle mutilations, and I find that though you are critical of Linda Howe's program, you offer no alternative explanations, other than the possibility that the government is probably perpetuating the phenomena. This would be an attractive idea, and would go far in explaining away the phenomena, if it weren't for the fact that the government has a great deal of its own land on which it could perform these mutilations, relatively safe from the public eye. I don't claim to know what is behind this phenomena, but after looking at the evidence, I do not find predators, cultists, the government, or even Newt Gingrich to be very compelling explanations. My recommendation is that you address yourself to this topic more seriously, for it would behoove us all to know the truth of the matter.

Steve Thompson

reply: I state that there are plenty of alternative explanations (as you yourself note near the end of your note when you reject the alternatives), all of them naturalistic and normal (e.g., human and other animal predators).

I can't understand how you read my article and think that I say that the government has anything to do with either cattle mutilations, cover-ups of cattle mutilations, or anything having to do with cattle at all.

I don't think I need to get more serious than I have been. I think we probably already have the truth of the matter, but let me know what you dig up with your research.

A couple of years ago though, I reached a different conclusion as I stared down upon the carcass of a dead horse that my neighbor had found in his pasture. The only thing missing from this horse (beyond any blood whatsoever, either within the carcass or on the ground surrounding) was its genitals. Forgetting the lack of blood for a second, what predator is this selective?

Steve

reply: The human predator would be my guess, or insects [see the next letter].

20 Dec 96

I have been enjoying your Skeptic's Dictionary website and in general I find it to be quite broad. Lots of ground covered. And you seem to (usually) keep a level head and respect opposite points of view. And all the hotlinks were no doubt quite a bit of work to add... So, good site overall and I'm sure the world needs more like it. Maybe if you shouted from rooftops.

Anyway, I'm sure you also get plenty of criticism along the lines of what I'm offering -- it seems that some of your entries lack depth.

reply: Some lack width and height, too. Anyway, I'm not sure all readers would agree that I respect opposite points of view. If I've given that impression, I apologize.

But then I'm not out there putting all this stuff on the net. The piece on cattle mutilations seemed to me to really miss the boat.

reply: Maybe you should read the entry on Noah's Ark. He's the one responsible for all these cattle, anyway.

Your article focused on mostly the inanity of the conspiracy theories about cattle mutilations without really offering any solid debunking or concrete

counter-explanations. In short, your piece could be summed up as, "That's a lot of crazy talk. I don't know what's doing it, but it sure ain't UFO's." That's true. But I know there's some more information out there on the subject.

reply: You've hit the nail on the head! I know some of my readers expect me to have the answers to all questions. They are not satisfied with a plain debunking; they want a solid one, one which includes the one, true, final, correct explanation for whatever. Unfortunately, I am not The Answer Man, nor do I pretend to be. I have tried to explain this in several entries, but I'll try again. If someone tells me that she has been having migraines ever since aliens implanted a sonar detector in her brain, I will give the best argument I can to persuade her that her headaches are probably not due to alien implants. I will not try to persuade her that she does not have headaches and I will feel under no obligation to try to find an explanation for either her headaches or for her belief that aliens implanted a sonar device in her head. As to the cause of her headaches--the "real" explanation--I don't feel qualified to try to answer that question. I suggest she see a medical doctor. Likewise, if you want to know why your cattle are dead and "mutilated" call a veterinarian, don't call me. As to explaining delusional beliefs, I'd just have to speculate, like any good philosophical psychologist. Sometimes I feel like speculating, sometimes I don't.

In one of Cecil Adams' "Straight Dope" books, there was an article on cattle mutilations in which he mentioned a series of experiments performed with dead cattle left exposed to the elements. The short answer is that insect scavengers, specifically blowflies (if I remember right), do a very nice job approximating the "surgical mutilations" reported by the UFO theory community. Moreover, the experiment observed that the insect predators frequently attack the exposed mucous membranes of the dead animals -- they're the easiest and choicest bits, I suppose. This goes a long way to explaining the aliens' fascination with cattle genitals.

reply: Well, there you have it, then. I don't need to give the answers, since Cecil Adams has already done so and you have been kind enough to pass on this solid explanation. I am sure it explains many cases of "surgical precision," but don't expect the UFOers to take too kindly to this attempt at an earthly account of the matter.

Anyway, hope you find the time to flesh this entry out. Thanks for a great website, though, and keep preaching to the converted.

Dr. Paul Vetter

reply: Thank you, doctor! [Say, you're not a veterinarian, are you?] I'll remember to mention the blowflies in my next sermon.

8 Mar 1997

Some comments regarding your page on cattle mutilation: Linda Moulton Howe says:

The cuts were made rapidly, probably in two minutes or less, because there is no inflammatory cell destruction which typically begins in a few minutes after any trauma to tissue.

Now, I'm not a biologist or a doctor, but it seems reasonable that, if the cows were already dead, any mutilation done to them wouldn't cause inflammation, since the dead body wouldn't be reacting any more (but then again, maybe making cuts to dead bodies does cause inflammation).

About the lack of blood, if the cow was dead of a while before being mutilated, the gravity would settle blood to the parts of the cow lowest to the ground, so making a cut to pretty much anywhere on the body wouldn't result in bleeding.

As to why 'why beings with the intelligence and power to travel billion of miles to our planet would spend time mutilating cows': who knows? They're aliens. If I were trying to make up a reason for a SF story, I might say "it's how they get their kicks" or "its part of their religion" or something like that. But speaking seriously, we humans sometimes have a hard time understanding our fellow humans from other cultures (or even fellow humans from the same culture), even though our fellow humans have the same physiology and have the same physical structure and mechanisms in their brains as we do. How much more difficult would it be to understand aliens who don't share our physiology and the way our brain works? In other words, if someone claims that aliens are doing something totally bizarre and beyond reason, that can't be used to argue against their claims.

Matthew Cline

reply: I was following you until your last sentence. If making claims which are "beyond reason" can't be used against you, what can?

11 Mar 1997

I would like to submit a possible explanation for these odd occurrences of mutilated cattle being found with very little or no blood stains, and surgically removed organs. It seems that when cattle die, their large bovine hearts stop beating. Go figure, they work just like humans in that respect. Bear in mind that without a beating heart to propel it, blood has nothing but gravity and perhaps a bit of internal gas pressure to coax it out of an opening, so if someone were to cut into a dead cow, he or she shouldn't necessarily expect huge pools of blood to spew forth.

With that in mind, if a rancher or farmer has a cow that dies, he's out some money, and insurance companies don't sell life insurance for cows (Or maybe Lloyds does. Wouldn't be the weirdest thing they've ever insured.) At any rate, insurance companies do cover vandalism damage.

It is entirely likely that, upon finding a dead cow in the field, some farmers have turned that sad news into happy profit by doing a bit of nip & tuck, and blaming (aliens, the government, horny teenagers, whatever.)

Joseph Betz

11 Mar 1997

As I recall, in the 1970's, there was a remote controlled surgical table developed for NASA. It was considered undesirable to staff future space stations with medical staff, when it could be run remotely from ground control. The table utilized two tightly generated directional high frequency beams. Individually, each beam passes through flesh and bone without harm. Where the beams intersect, the frequency is changed. Depending on the modulation, the intersect can fuse or cut. This allows surgery without an incision. The example shown in a promotional film was an appendectomy. Before each cut, the tissue on each side is fused to prevent internal bleeding. The removal of the disconnected appendix could then be performed by a small incision by a fellow astronaut with minimal direction.

reply: Laser surgery is quite common, today. I'll bet you're going to suggest that mutilated cows have been operated on by lasers!

Assuming there are satellites in orbit and they can generate such beams of energy, it would be fairly simple to target an animal that stands in an open field and sleeps on its feet. Fusing certain nerves or portions of brain might effectively disconnect the animal from pain. A number of surgical procedures can then be performed invisibly to the casual viewer. The destruction of blood and body parts may be possible through a remodulation of the beams or through the use of multiple beams. Even unusual atmospheric effects might be generated incidentally or purposely.

reply: Hell, NASA is lucky if their rockets don't explode on the ground. But I'll grant you what you say and even add that it is possible that there are invisible guys sitting on the satellites dropping fertilizer pellets.

The purpose of cattle mutilations might simply be the unauthorized use of satellite technology by those with the day to day responsibility for satellite maintenance and care.

reply: It might be. Then again, it might not be.

In the wee hours of the morning, a bright and bored technician might find it, as amusing as, a video game. Chopping up hamburger might not seem unduly cruel to technicians trained to conduct a nuclear war, remotely.

reply: Maybe. Maybe not.

It's not so much a conspiracy, as it is taking advantage of resources. A weapon you don't use is a useless weapon. If, you had the power of US nuclear technology at your fingertips, cattle mutilation might not seem so serious to a 23 year old technician.

John Grisham

reply: I'm sure the military could find some live cattle of their own to practice on, if they so desired. Do you think we used lasers on the Iraqis just for practice?

21 Mar 1997

Here's an interesting addition to the Cattle Mutilations section:

First, I'll point out at this point that this is a paraphrase of a story told at lecture my friend attended, and then repeated to me. Hardly a "substantiated" story, but a lot more plausible than alien haggis lovers.

The story: In an area of cattle country (Texas I think) there was a rash of "weird cow deaths". The cattle would be found dead in the fields without any apparent reason. Obviously concerned that whatever had killed the cattle would get the rest, the ranchers had autopsies performed on the deceased bovines. What they found made it to the front Pages in the area. The cattle had vital internal organs removed without any external incision! Horrors! Quirky BEM's no doubt (that's "bug-eyed monsters" if you're not familiar). The story caused a lot of stir and got a lot of attention for a while and then died down.

Later, someone actually decided to do a scientific investigation and the answer turned out to be a lot weirder than aliens in my opinion, if only because it was true: weasels. The cattle had died of some disease (which wasn't discovered earlier because of the distraction caused by the missing livers and so on). After their death the local weasels, which apparently like those tasty cow insides, would take the opportunity to go get some fresh ones. Naturally they went in the easiest way, which happened to be the cows anuses. They'd squirm in, eat to their hearts content and squirm out. This was much easier than chewing past all of that hide and muscle just to get to the good bits.

Typically, though reported, this revelation got far less attention than the "Cows

Missing Livers: Alien?" type stories, thus many still came away thinking that extra-terrestrial origins were not just probably but confirmed in some official way. The "Weasel Retraction" was probably buried way in the back.

I can't confirm any of this, so I'll present it for entertainment only, but I trust my friend and the lecturer she went to see struck me as trustworthy at the time, though I can't remember who it was (a naturalist of some sort). Keep up the good work.

Victor Allen

reply: hmmm. I've heard of weasels sucking the egg from the shell and leaving the shell behind, but never of sucking the livers out of dead cows. The story is entertaining, I suppose, but I can't say whether it is true or not. I'll say that the burrowing weasel story is at least as plausible as the alien rustler theory. But I still think insects and natural forces are more likely than anal burrowing weasels.

1 Apr 1997

I wasn't aware that this was still considered open. I'm sorry I don't have references to hand, so this will be purely anecdotal.

Somebody finally realized that veterinarians don't deal with carcasses, and called in pathologists. They report that the so-called mutilations are the normal result of decomposition and scavengers on carcasses that are not buried or burned.

Do not read this paragraph while eating! Scavengers eat soft parts, (ears, eyes, tongue, and penis or udder), rather than attack the hide proper. Decomposition later tightens the muscle fibers, drawing the wounds of the avulsions back inside the carcass. Meanwhile, the gasses of decomposition evert the anus and in female animals the womb, more soft parts for scavengers to scavenge. The gasses then escape, and further decomposition draws these wounds inward also. If all this happens during the fly season, the maggots eat the edges of the wounds and leave them smooth. If it happens outside fly season, the wounds remain jagged. Descriptions of "typical" cattle mutilations follow this pattern, especially the matter of fly season.

Once the pathologists had cleared out the normal carcass deterioration, the very few cases that did not follow the pattern could be isolated and quickly solved. These were unstable individuals with a background of torturing urban animals (dogs, cats, squirrels, &c) who were inspired by the "cattle mutilation" story to hunt bigger game. Copycat crimes, though the first actual crimes of their type, because they were copying unsubstantiated rumors of crime rather than reports of actual crimes committed.

If all this is old hat, and I simply missed the reference, I apologize for taking up everyone's time.

Lee Burwasser

15 May 98

I read your piece on cattle mutilations. This is in response to those who argue that the behavior of extraterrestrials is inherently inexplicable, and this is why they mutilate cattle instead of asking the government (with whom they supposedly have a treaty or agreement) to buy them a herd to breed and utilize.

Beings who are truly alien in behavior and psychology would be incapable of making a treaty with the government of any country. They might not even be capable of realizing or understanding that the bustling bipeds in large conglomerations are intelligent beings. If they did, they would still face difficulties in making themselves understood to humans, and in understanding human concepts. So any treaty or agreement, unless pared down to the most basic concepts, would be improbable (if not impossible). This same 'alienness' would effectively prevent any efforts at 'reverse engineering' of extraterrestrials' technology in reciprocation for body parts of dead cattle.

Juliet Fischer

reply: Those who believe possess the ultimate trump card for all objections to their notions: the ways of the aliens (gods, etc.) are incomprehensible, therefore anything goes except what makes the most sense. We might call this *the fideist's non sequitur*.

13 Jul 1998

*Re the cattle mutilations sections and comments, I happen to have a copy of **Operation Animal Mutilation Report of the District Attorney, First Judicial District, State of New Mexico** by Kenneth M. Rommel, Jr., Project Director, published in June of 1980. Mr. Rommel investigated all 177 reported cases of animal mutilation in the state of New Mexico from 1975 to 1980, and so can hardly be accused of drawing his conclusion -- that there was nothing 'mysterious' about the mutilations -- on the basis of an insufficient number of cases. I won't quote the whole shebang, but yes, incisions to a carcass by the teeth of predators/scavengers can indeed resemble knife cuts (even in bone, as I can personally attest as a zooarchaeologist-in-training), while the characteristic pattern of removals listed as indicative of 'classic' mutilation -- sexual organs, tongue, eyes, ears, and anus -- are indeed precisely those normally attacked by scavengers, as these organs are vulnerable, tender, and provide comparatively quick and easy access to the interior of the carcass. Rommel cites a study performed with a newly-dead calf in 1980, in which many of these 'classic' mutilations were seen to occur during a 30-hour period of*

continuous observation. The culprits were blowflies, skunks, and buzzards. Rommel also found that the apparent lack of blood within the mutilated animals was not substantiated by necropsy reports, but seemed to be based on the lack of blood observed at the scene. As other letters to you have noted this is often due to blood settling after death; but the experiment with the calf above also noted that blood found within the carcass and the very little spilled to the ground was quickly consumed, particularly by the blowflies.

Mr. Rommel goes into other claims, including the failure of the family dogs to bark in the night, mysterious fly deaths, unusually slow rates of decay or arrested decay, avoidance of the carcasses by other animals, etc., etc. As you might expect, where such phenomena were observed to occur, they were generally readily explainable, while the more mysterious elements proved to be scientifically explicable (the most unusual element being a peculiar but known fungal disease of scavenging flies, which was observed to cause mass fly deaths in at least one otherwise unremarkable case).

It's an excellent report, and deserves to be more widely known. But then again, it's the tripe that sells.

osteopathy

Osteopathy is a medical practice based on the theory that diseases are due chiefly to loss of structural integrity which can be restored to harmony or equilibrium by manipulation. The manipulation allegedly allows the body to heal itself. Osteopaths use manipulation for diagnosis, treatment, *and* prevention of disease.

[Andrew Taylor Still](#) (1828-1917), a Civil War surgeon in the Union army, is credited with discovering osteopathy as an alternative to the medical practices common in his day, practices which failed to save his three children from spinal meningitis. Still became convinced that he could cure diseases by shaking the body or manipulating the spine. In his autobiography, he says he could "shake a child and stop scarlet fever, croup, diphtheria, and cure whooping cough in three days by a wring of its neck" ([Barrett](#)). He also advocated clean living, including abstinence from alcohol and medically prescribed drugs. Surgery was to be avoided, if possible. Today, D.O.s (doctors of osteopathy) complement manipulation with standard medical methods of diagnosis and treatment, including recommending drug therapy and surgery if appropriate. D.O.s have four years of medical training at a college of osteopathic medicine and do a one-year internship in primary care. Some continue their education in an area of osteopathic specialization. Nevertheless, there has still not been scientific validation of Still's theory of shaking and manipulating to remove obstructions.

See related entry on [chiropractic](#) and [craniosacral therapy](#).

reader comments:

Edgar Cayce

9 Jul 1999

I just ran across your page on Edgar Cayce. I disagree with your views, of course. In particular, your suggestion that an excerpt, taken from a reading of a woman with tuberculosis, was a 'miss', rather than a 'hit'.

You stated that his followers felt it was a 'hit' only because he mentioned the lung, and that his mentioning of the dorsals, lumbar, floating lesions, solar plexus and stomach were incorrect diagnoses. You go on to question his recommendations of osteopathic treatment for people with tuberculosis, epilepsy and cancer.

In response, one must wonder if you believe that the lung(s) is just sitting there in one's body all alone, not connected, in any way, to any other part of one's body. You must believe that imbalances of any kind in one's body only effect that one particular part of one's body.

reply: No, believe it or not but I believe that the lungs do not just sit there in one's body and that an imbalance in one part of the body often affects other biological functions.

I hope you understand that I am saying that your whole body is one system made up of sub-systems. Any imbalance within any system that is within the whole system can and does effect any or all the systems. For, it is all connected.

Most of the time, his suggestions for treatment did seem to be far from the stated problem or complaint. However, this was because he was actually directly addressing treatment to the 'first cause' or root of the problem, rather than merely treating the symptoms, as do so many of our doctors, today. In only treating the symptoms, the problem stands, only masked, and either resurfaces as before or finds new outlets. This fools most doctors into believing the one problem is 'cured' only to be replaced by a new one. And so, the cycle begins with the body becoming more and more debilitated. All unnecessary, when one considers the logic of Cayce's method.

reply: I see it all very clearly now. So, when a chiropractor identifies a need for lumbar alignment when a person really has cancer, the chiropractor is treating the root of the problem. Very interesting. How do we test this theory?

I must say that you, obviously, have not studied and researched Edgar Cayce as thoroughly as you should have to earn credence in your work as a skeptic. I say this because, if you had, you would have discovered that, on numerous occasions, he gave readings on persons that were, at the time of the readings, in other cities or even states.

reply: Many people do psychic medical readings of people in other cities. But are their diagnoses correct? Where is the proof that anyone can diagnosis illness by telepathy?

This is not so convincing, you say. However, he would occasionally provide an aside remark about what the person was, at that time wearing, doing, saying, as well as, describe the surroundings, furnishings, rooms, houses, and even streets. These were, of course, recorded by a stenographer and later substantiated by the person the reading was given for, as well as others. You say that he gleaned the information from assistants and letters from the people asking for the readings. These people would not and did not describe these things in simple requests for readings.

reply: Is this kind of credulity what you consider to be "thorough research"?

I know you say that these things were not proven by the mere testimonials. I say to you that, as Jesus said, and I paraphrase, one should say only yea or nay to be believed.

reply: At least you were making sense up to here. What does Jesus have to with Cayce's claims?

Believe me please, when I say to you, that not only is everything in one's body connected, therefore effected through any given cause, but so is everything and everyone connected in all of creation. Please don't ever think that anything or everything you think, desire, feel or do does not effect any or all of the rest of creation. It does, it does.

reply: I believe you, but I don't see what is so interesting or important about everything being connected. Most of the effects in the universe are immeasurable and of no interest to anyone except vain occult speculators.

This is not meant, in any way, to cause offense, but to encourage reconsideration. I submit to you a formal and personal request to perform a new, more thorough study of all of the Cayce material before publishing your skeptic views.

I wish you Happiness, Joy and Laughter
Lynn Giddens

reply: Thank you. I promise to be at least as thorough and critical as you have been.

31 Mar 1998

I enjoyed reading your comments on my grandfather, Edgar Cayce. While I never knew him, I'm probably as skeptical as anyone re: the data he gave. Yet I've seen application of some of the concepts save and change people's lives - physically.

The ARE [Edgar Cayce Resource Center] is not doing what it should and is completely ignoring research - research into 63% of that material of physical ailments. The medical profession refuses to touch it because M.D.'s in this area can have their medical privileges taken from them at hospitals if too closely associated with information they know nothing about!

Dr. Brainard based most of his research on the pineal on hypotheses from the readings and can give you both an interesting and funny lecture on the subject. But when asked to appear on T.V., he couldn't - he'd lose his professorship.

I know the sting of it all because I'm married to an M.D. One who is interested, but very secretive about his interest. He has to make a living and the AMA is a pretty strong arm.

*People seem to forget that all Cayce gave were "readings" - basically an enormous amount of psychic data. It was not all correct. I refer you to a book by my father, Edgar Evans Cayce and Hugh Lynn Cayce on the cases that seemed to be wrong **OUTER LIMITS OF EDGAR CAYCE'S POWER**. Do take a look at it.*

*My father is an electrical engineer and probably wished the subject "Atlantis" never came up in the psychic data given. But he wrote a book after studying all the readings that mentioned Atlantis in 1968 - **EDGAR CAYCE ON ATLANTIS**. He later co-authored a book with Dr. Douglas Richards and myself **MYSTERIES OF ATLANTIS REVISITED** which tries to objectively look at what Cayce gave and at geological and archaeological evidence up to 1988. A more recent version was recently published by St. Martins. You can take a look at it at <http://www.edgar-cayce.com>.*

*If you're a good skeptic - take time to look at the book **MYSTERIES OF ATLANTIS REVISITED** - at least so you can be skeptical in an intelligent way. I would be quite interested in your comments on the book - as well as the others mentioned here.*

Finally, a good deal of the crap ARE is publishing at present is just that - crap.

*But there are some good books. The best on my grandfather's life is **THERE IS A RIVER** by Thomas Sugrue. Sugrue was my uncle's roommate in college and was given up for dead by the doctors when he came to the beach. Pop said he weighed all of 80 pounds when they carried him in. At any rate, he recovered to the extent that he could take up his job again - reporting for the **Chicago Herald** - in the 2nd World War, though I believe he had to use a wheelchair. His account of Cayce was done after his recovery. He thought he was a bunch of crap before then. Check out his book too. He almost was kicked out of the Catholic Church when he wrote **A CATHOLIC SPEAKS HIS MIND** - but that's another story.*

*Sincerely yours,
Gail Cayce Schwartz*

reply: I don't know what to say. I don't know if I'm a "good" skeptic or not. Only time will tell. Will I revisit this great mystery of Atlantis? Only time will tell. Will I go through the thousands of Cayce readings to separate the wheat from the chaff? I may leave that task to others. Does it help a psychic's case to admit that he was not infallible? I don't think so. You mention some tempting books; I'm afraid my reading list is already quite long but maybe some readers will be interested and have the time to explore these great mysteries further.

The Celestine Prophecy

The Celestine Prophecy is the title of a novel by James Redfield. The novel is seen as a spiritual guide for the New Age. One devotee describes it this way.

This book is very simply about how we get and use energy. When we get enough energy, in the right ways, we can "raise our vibration." With a higher vibration we are better able to tap into our psychic and intuitive skills, and thus are better able to discover and live our true purpose in life.

Even Redfield treats his novel as a spiritual guide and basis for a spiritual and material industry. He's started a newsletter for his followers: [*The Celestine Journal: Exploring Spiritual Transformation*](#). He has a sequel, [*The Tenth Insight*](#), said to be "a trip that will take you through portals into other dimensions." And a further sequel, [*The Secret of Shambhala; In Search of the Eleventh Insight*](#). He also has [audio tapes and CDs for sale](#).

Redfield starts with a notion shared by many New Age gurus: the world is emerging into a new spiritual awareness. He puts it this way:

For half a century now, a new consciousness has been entering the human world, a new awareness that can only be called transcendent, spiritual. If you find yourself reading this book, then perhaps you already sense what is happening, already feel it inside.

What is the evidence for this New Age? Vague references to *vibrations* and *energy*. For those who don't get it yet, there is vague advice to avoid the negative (you can tell good people by their eyes), stop doubting, follow your intuitions and premonitions, flow with coincidences, believe in the purposiveness of everything, join thousands of others on the quest, tune into your feelings and evolve to a higher plane.

In the novel, the meaning of life is revealed in an ancient Peruvian manuscript written in Aramaic. It predicts a massive spiritual transformation of society in the late twentieth century. We will finally grasp the secrets of the universe, the mysteries of existence, the meaning of life. The real meaning and purpose of life won't be found in religion and it won't be found in material wealth, but rather in things like [auras](#). The manuscript is full of insights like this and these insights are the way to the transformation. How do we know this? Just look at the *restlessness* all around you. That's the key. The dissatisfaction and restlessness we feel is the key. We're like caterpillars ready to

metamorphosize into butterflies, to burst forth together into the New Age. After all, you can't seek fulfillment if you're fulfilled! Do you think it is a coincidence that coincidences are happening more and more frequently?

...the Manuscript says the number of people who are conscious of such coincidences would begin to grow dramatically in the sixth decade of the twentieth century. He said that this growth would continue until sometime near the beginning of the following century, when we would reach a specific level of such individuals--a level I think of as a critical mass.

I'm not sure but I think he meant to say the *seventh* decade, not the sixth. The sixth decade of the twentieth century would be the 1950's. Nobody seems to think that the '50s were a time of restlessness. The sixties, however, has entered historical consciousness as a very restless period: the Vietnam War and the anti-war movement; marijuana and LSD, the Civil Rights Movement, assassinations of the Kennedy brothers and Martin Luther King, the Beatles, etc. In any case, the novel has some good advice. Make love, not war. Be neither intimidator, interrogator, aloof nor pitiable. We don't need fear, humiliation, guilt or shame. Contemplate, meditate, and follow your intuitions and dreams as you go through your spiritual evolution. Fact or fiction, it doesn't matter. Truth is what you make it. Life's too short and too complicated to deal with reality. Make your own reality. [Subjective validation](#) and [communal reinforcement](#) lead to bliss.

This New Age subjectivism and relativism encourage people to believe that reality is whatever you want it to be. The line between fact and fiction gets blurry and obscured. Of course, fiction has its place in a satisfying life, but so should fact. The methods of science may not be perfect, but when it comes to getting the facts straight, they are better than any of the methods developed by New Age gurus.

A Course in Miracles

All you need is love....love is all you need.
--the Beatles

A Course in Miracles [ACIM] is the name of an allegedly [channeled](#) book dictated by [Jesus](#) to [Helen Schucman](#) (1909-1981), "a highly respected research psychologist." ACIM is Christianity Corrected of its Errors. Jesus wants less suffering, sacrifice, separation, and sacrament, and he wants more love and forgiveness. To many Christians, this is not Christianity corrected, but true Christianity.

ACIM is also a minor industry. To find out what Jesus really had in mind when he came to save the world, you can buy the channeled book or one of a dozen or more similar books, or audio and video tapes, through [ACIM.org](#). About 1.8 million copies of *ACIM* have been sold worldwide since 1976. *ACIM* is now available in ten different languages.

At [MiracleCenter.org](#) one can sign up for a study group or conference, or join in a discussion group. [The Foundation for A Course in Miracles](#) has an [Academy](#) where you can get the Holy Spirit to help you understand the real message of Jesus and then return to your everyday life situation with a deeper appreciation for the difference between appearance and reality, illusion and truth. The Academy is now known as "The Institute for Teaching Inner Peace Through A Course in Miracles" (ITIP).

Why should anyone believe that the words of Helen Schucman are the words of Jesus? She was a clinical psychologist by training (Ph.D. 1957 from New York University). She claims that from 1965-1972 an inner Voice dictated to her the three books which comprise ACIM. She was assisted in her work by a colleague, [William Thetford](#) (1923-1988). In 1972, another psychologist, [Kenneth Wapnick](#), assisted Schucman with her work. Later, Wapnick's wife Gloria would offer her assistance. The Wapnicks are the ones who started FACIM.

To the tremendously numinous question, *Why is it called "A Course in Miracles"?* the answer is that that is what the Voice told her to call it. According to those who should know, the Voice said unto Helen: "This is a course in miracles, please take notes." According to Joe R. Jesseph, Ph.D., Coordinator, [Miracle Studies](#),

Essentially, in ACIM, the term "miracle" refers to that change of mind that makes it possible for the Love of God

to be somehow expressed in the world. This expression of love is referred to as forgiveness in the Course and it is reasonably accurate to say that the miracle spoken of in the Course (and indicated in its title) is forgiveness.

ACIM got a big boost when [Marianne Williamson](#), one of America's most popular New Age spirituality writers, began promoting her version of it in the 1990s. Williamson might be called Oprah's patron saint. She's all about love and healing, [yin and yang](#), being wounded, and using love and [prayer](#) to heal all wounds. *A Return to Love: Reflections on the Principles of A Course In Miracles* (1992) was number one on the Publishers Weekly non-fiction best-sellers list for eleven weeks. Williamson promoted her book and *ACIM* when she appeared on the Oprah Winfrey Show, an episode that received more pro viewer mail than any other show for 1992. She also plugged the book and the course when she was interviewed by Barbara Walters on the ABC television news show 20/20.

The teachings of *ACIM* are not new. They have been culled from various sources, East and West. That does not make them false or worthless. But to claim that they were dictated by someone who has been dead for 2,000 years is a bit much to swallow. Maybe Schucman was imitating Moses who probably said to himself "They'll never believe a schmuck like me unless I tell them I'm just passing the word from on High." Frankly, I am much more sympathetic to the approach of a [Leo Buscaglia](#) (1924-1998), another psychologist who taught love and forgiveness, but who took responsibility for what he claimed and seemed to say: *This is what I've learned; take it or leave it.*

Jean Houston and The Mystery School

"As we encounter the archetypal world within us, a partnership is formed whereby we grow as do the gods and goddesses within us." -- Jean Houston

**"She sees through those who are charletans [sic] and hucksters, ripping people off with New Age drivel or playing on fear instead of engaging in loving play."
--The Hon. William R. Bryant, Jr., Republican Leader Emeritus, Michigan House of Representatives**

"We only have these times we're living in." --[Kate Wolf](#)

Dr. Jean Houston's *Mystery School* is another in a long line of New Age self-help or personality transforming programs. According to Dr. Houston, "the purpose of the Mystery School is to engender the passion for the "possible" in our human and global development while discovering ways of transcending and transforming the local self so that extraordinary life can arise!" Her premise is that we are all unhappy because we have suffered and have not achieved our full potential. Here is an excerpt from Houston's Mystery School Lecture One:

Regardless of how difficult and estranged your life may have been, you've done that one. You've done estrangement. You've learned from it. You've done difficulty. You've even done derangement probably. You've done angst and anxiety and existential dread. You've done toxic mayhem. Yes? You've done breakdown. Now it's time to try the next level.

You've had all this suffering. Great! It has given you a wealth and depth of experience and compassion, if you frame it that way. If you don't frame it that way, then all you've got is galloping angst.

Your energies, your powers, your stamina, your moral force seem limited only because you and your habituations and the habituations and expectations of your culture set limits. Therefore, what Mystery School tries to do here, is to go beyond the limits and create a consensual reality in which the horizon of the limits is greatly expandable and More becomes possible. (Note: this lecture used to be available free online; you may now order it for \$140 from JeanHouston.org)

The lecture only gives a glimpse of what is in store for the disciple on the road to self-transformation. On her hook is some common New Age bait: the pain, suffering and dissatisfaction with life that needs to be relieved. Houston tells her listeners: "You've been wounded up the gazoo. I always say - 'You're so full of holes from being so wounded, you're holy.' You're utterly available now." She speaks again and again to the pain and suffering of her audience, of their dissatisfaction with their lives. She tells them that this is necessary for the transformation, that out of the evil she will bring good. Hers is the true way to the New Resurrection.

As New Age self-realization plans go, the Mystery School must seem a bargain. On the WWW for only about \$200 you can get the lessons, which include nine "sessions" of edited transcripts of the Mystery School. Each written lesson promises to be the length of a small book. In effect, you are paying about \$22 a pop for chapters of a work in progress.

Here is Jean's own blurb on her Mystery School

It is my 20th Century version of an ancient and honorable tradition, the study of the world's spiritual mysteries. Once upon a time there were such schools in Egypt, Greece, Turkey, Afghanistan, Ireland, England, France, Hawaii, India, China, Japan and many other places on the globe. We harvest what is available (or can be imagined) of the knowledge and traditions, rites and rituals of these ancient studies, imbuing them with new realities and applications in order to live more freely and more fully.

Mystery School is intellectually vigorous, psychologically challenging and spiritually demanding . . . It is celebrational and transformational. It is also frequently hilarious and zanily satiric.

Mystery School is both experiential and experimental. I weave together the things I love most: sacred psychology, music, history, theatre, cultural wisdom, science (fact, fiction and fantasy), neurophysiology, philosophy, anthropology, theology, poetry, laughter, cosmology, metaphysics and innovative ideas to provide a multi-faceted, multi-level Time out of time.

Exercises include psychophysical work, psychospiritual exploration, creative arts, energy resonance, movement and dance, altered states of consciousness, ritual and ceremony, high drama, high play and mutual empowerment.

She claims that her school is part of a tradition that has probably existed ever "since humans have been humans." This claim seems to imply that the mystery schools have made very little progress. There is ample evidence she is correct about that. The reason for this is obvious: mystery schools don't exist to discover the mysteries of life, but to encourage *belief* that life is a mystery. The only thing they transform is the mind, not by providing a better understanding of reality but by encouraging people to create their own reality. Mystics are warriors against the world and their weapons are the weapons of the imagination. They are enemies of reality. Rather than engage the world they despise, rather than try to change the world, they withdraw from the world and turn the world into an idea and they play with that idea until the game is to their liking.

According to Houston, "The traditional question of all Mystery Schools is - How do you place the local self, your local historical self, in the service of the Self? How do you place it in the psyche where the Immanent God resides? How do you respond to the Lure of Becoming and keep up sufficient energy, passion, momentum, delight, engagement, fascination, that you agree to be constantly lured? Unfortunately the stuff of everyday life often inhibits the Lure." In short, how do you become one with God and how do you avoid the snares distracting you from this divine union? There's nothing new here in terms of goals. The goal is the goal of all ecstatic mysticism: how to escape the world into transcendent glory.

Still, one wonders why, if all the schools she mentioned have failed to get beyond the beginning of comprehension, what makes her think her school will be any better? She may be right in saying that her Mystery School is intellectually vigorous. Maybe it's even more intellectually vigorous than the ancient schools of Egypt, Greece, etc. But what superior methods, what New Age weapons, has Jean Houston got that will at last allow deliverance to those lured by the desire to transcend all that they can be? How will she succeed where so many others have failed to unlock the secrets of the universe and provide a sure path for those who are so full of potential, who are striving so hard to burst forth and transform into something wonderful, something great, something celebrational, transformational, empowered? The only way to find out for sure is to pay your money and go to school. In the meantime, we can inquire into the history and mythos of Dr. Houston herself.

Jean Houston would probably be just another successful New Age motivator had not Bob Woodward in *The Choice* let the world know that she met with Hillary and Bill Clinton, and that Hillary had imaginary "conversations" with Eleanor Roosevelt and Mohandas Ghandi. Woodward also notes that in the past Houston had been known to use LSD and hypnosis to help her clients converse with the great personages of the past. However, neither drugs nor hypnosis were used with the Clintons, according to Woodward.

There is nothing particularly weird about imaginary conversations with the dead (or with the living, for that matter). In fact, such a practice could be

beneficial, if not enlightening. Steve Allen did a wonderful book and television series where he brought together for conversation groups of four historical persons from different eras. Many of the best writers and thinkers who have ever lived have had many imaginary conversations with dead people. It is a wonderful way to explore ideas, to vivify notions, to think.

It seems unfair to compare Hillary Clinton with Nancy Reagan, as some in the media have done, comparing Houston to the psychics and astrologers the Reagans consulted. Houston is no astrologer. Nor does she claim to be psychic, yet that is how *Newsweek*, *the Sacramento Bee* and the CBS evening news referred to her. An AP story ambiguously referred to her as a "psychic researcher."

Jean Houston is a Ph.D. in philosophy of religion from Columbia University, according to *Newsweek* (July 1, 1996). According to the *Washington Post*, she has a Ph.D. in psychology. In an interview with Stone Phillips of NBC's *Dateline* she claimed to have several doctorates but was most proud of the one in psychology from Union Graduate School. Off camera she admitted that this is really the only doctorate she has. She said she made a mistake and blamed it on something like overwork or stress, but it seems obvious that she lied. She might forget how many doctors she has, but not how many doctorates. How much of her biography is lie? or "mythos," as she might call it? Was she really chums with Einstein and Teilhard de Chardin? Was she really Margaret Mead's adopted daughter? Did she really meet and get the inspiration for her primary teaching method from Edgar Bergan and Charlie McCarthy when she was eight years old? It should not surprise anyone if it turns out that Jean Houston's autobiography is a piece of fiction, a heroic myth spun by her imagination out of the fabric of her desires. She is one of the New Age philosophers for whom "deep" truth is something you create. In fact, she sounds like the perfect political advisor! She expressed her concern to Phillips that she would lose business because of the bad press. I doubt it. If anything, her business will probably expand exponentially and demands for her mystic presence will most likely come to exceed even her Athenic potentiality. The only thing that might hurt her is her lying. Americans will tolerate lying for God and Country, or about sex, but are a bit harder on those who lie for greed or self-aggrandizement. If, indeed, it turns out that Jean Houston is a congenital liar, there will be the inevitable cynics who will claim that Bill or Hillary is Jean's guru, not the other way around. They would be wrong, of course.

In any case, Houston is certainly a prolific author. She is also past-president of the Association for Humanistic Psychology, director of the Human Capacities Training Program, and ran [The Foundation for Mind Research](#) out of Pomona, New York, where she and her husband, Robert Masters, tested the ESP of subjects under the influence of LSD or psilocybin. Houston is also on the editorial board of the *Journal of Mind and Behavior*. She offers distance learning courses through the [Entelechy Institute](#). The titles of some of her

books reveal something of the author:

Beloved
Godseed
Lifeforce
Mindgames
The Hero and the Goddess
The Possible Human
Odyssey of the Soul
The Search for the Beloved: Journeys in Sacred Psychology
Listening to the Body (co-authored with Robert Masters)
The Varieties of Psychedelic Experience (co-authored with Robert Masters)
Psychedelic Art (co-authored with Robert Masters)

In her books and lectures she frequently aligns herself with the Great Traditions. "In all the great traditions - Christian, Buddhist, Hindu, Sufi, Jewish - it's all about waking up. Mystery School is essentially about the wake up call from Central and putting you not in attunement with it, but in alignment with it. You can always tune, but alignment is forever." This distinction between a tune up and an alignment may seem profound in context, but out of context it is obviously false. Alignments are no more forever than tune ups are. You can go out of alignment as easily as going out of tune. She calls fundamentalists "Fundis" and she likes metaphors that have proven successful in similar eclectic transformational endeavors by [L. Ron Hubbard](#), [Richard Bandler](#), [Werner Erhard](#), [Frederick Lenz](#) and [Tony Robbins](#). For example, she says that her Mystery School "provides practices which have the effect of both rewiring your brain, body and nervous system, and eliciting the evolutionary latencies in your physical instrument. These latencies have been there like a fetal coding for perhaps tens of thousands of years, but could not be activated until various aspects of complexity emerged, joined to crisis. We find that emergence generally only occurs in emergencies. It's only when you really have to survive that you really turn on enough mindfulness and wakefulness to activate these different latencies."

What Jean Houston has done is create her own mythos. She has probably gotten enough [communal reinforcement](#) to encourage her to believe in the reality of her mythos. Like so many others in New Age movements, she seems to find the distinction between myth and reality a hindrance to the truth. For their view of truth is entirely subjective: truth is whatever you want it to be.

You . . . are probably at this point every race that ever was, as well as every species, as we know from the development of the brain that contains most of the species coded in us. . .

.

Once you start living out of that Depth Life, you're living a Mythic Life and life gets very juicy!

"Body/Being/Blissing. Bodying/Blissing/Beingness. You are in it. You are in the utter Suchness of it, and you have lost the great divide." You need the divide only when you're driving. You don't need it when you're cooking.

...you have within you not only all the evolutionary past, but another reality altogether, a depth reality. . . . It is the great creative archetypal realm: hyperspacial, hypertemporal, but co-existent with consciousness in some way. The Depth Realm, the realm of gods, goddesses, angels, numinous borderline persons, creative principles, archetypal patterns.

You are the mystery, and the job of the Mystery School is to school you in your own depths.

The problem is that when we lost myth, we lost the rest of the story. We got stuck in television

I knew all these things and more....once upon a time.

The Celestine Prophecy

18 Mar 1998

I hope you don't mind an unsolicited email, but I just finished reading your piece on the Celestine Prophecy and I wanted to write a quick note thanking you. I must have sounded like a Southern Baptist with my shouts of "amen" and "preach on" as I read it. There were more than a few raised eyebrows among my co-workers. As soon as I was done reading it through I printed it off and waited anxiously for lunch so I could run a copy to my partner.

The fact is I was spending a lot of time today on the web looking for information on James Redfield (it's spring break here at IU-Bloomington where I work so things are a bit slow in the office). I'll explain why I was looking for such information in a moment.

I've been active in various progressive issues since I was 18. Most of my energies have been devoted to various labor and environmental issues. Currently I am going back to school for a second degree (in GIS) and I've found myself working closely with a great group of people who focus on our public forests. This organization serves as an umbrella group for a wide variety of grassroots activists throughout the central hardwood region. In June of this year we are having our annual meeting, down in the Smokeys, and I just discovered that James Redfield is going to be the keynote speaker.

Now, another member of this group has been a friend of mine for years. She is a very intelligent, caring and valued friend. Her advice, assistance and friendship have meant a great deal to me over the years. Some time ago she came across the Celestine Prophecy. She loved the book and wanted all of her friends to check it out as well. She knew a group of us were headed down to Kentucky for a backpacking trip and she encouraged us to take along her copy for campfire reading.

Well, that particular trip was the worst of my life! We ended up getting hit hard by a freak storm. One of our tents was demolished during the deluge and we ended up spending a miserable, freezing, water-logged night under a makeshift shelter. Somewhere around 3 a.m. the rain lightened up enough for my partner to decide we could all do with a nice fire. The only thing that was dry, however, was the Celestine Prophecy. I was thankful for James Redfield at least that night.

We replaced the book when we got back to town and have tried to avoid any deep discussions about Redfield's "ideas" with our friend. The fact is, who hasn't bought into fuzzy-thinking at one (or two) times in their life? I didn't want to appear judgmental, and I certainly didn't want to upset a dear friend. So, I kept my opinions to myself (normally, not an easy task for me).

But now my friend is very excited that James Redfield is coming to address a major meeting of hundreds of environmental activists. Why we are not having a speaker address the issues of zero-cut, or the role of multinational corporations in our society, or the effect of GATT, NAFTA and MAI on the environment, working people and democracy in general, I do not know. Instead, we have an astrologer who wrote some very bad prose and apparently has some nebulous connection to a few "green" organizations.

*So, I've decided to find out what I can about this fella and make sure the tools in my skeptical toolbox are in good repair. Your **Skeptics Dictionary** has been a fantastic resource. Sorry to go on an on, but I wanted to know you've really brightened up the day of this Hoosier Skeptic! I send my best wishes to you and yours.*

Todd Barnell

reply: There seems to be a trend among "leaders" to invite astrologers, psychics, spiritual novelists, etc. to speak to "followers" and "workers". I suppose the idea is to inspire the troops. James Randi wrote recently about Lucent (formerly Bell Laboratories) inviting a paranormalist to inspire their scientists. I'd be worried if my scientists were inspired by James Van Praagh or James Redfield.

14 Apr 1997

*I think that you have clearly missed the message of the **Celestine Prophecy**. If you really would give it an honest chance you would find that these insights are truly just a guide. The meaning of life isn't the same thing for everyone. This book is not leading up to one worldwide solution. This book inspires people to think for themselves and to find their own personal meaning of life. You are entitled to your opinion but I firmly believe that no harm can come from this book if it is understood correctly.*

Michelle McGonnell

reply: I agree that people find the meaning of life in a variety of ways, including science fiction and fantasy literature. If the Celestine Prophecy inspires people to think for themselves, then I have misjudged the book completely. If, on the other hand, you think that disregarding facts in favor of fiction and fantasy is "thinking for oneself," then I stand by my original evaluation.

25 May 1998

I am writing in regards to your skepticism towards The Celestine Prophecy. I am an adolescent, who is constantly struggling to survive. My goal is to create a clearer picture of who I am in this society we have made. This picture is added to and given more depth as I encounter different people and situations in my life. I choose what to admire and what to frown upon, who to follow and who to guide. These are decisions that I, along with everyone else, wake up in the morning pondering.

Just like religion, it is suggested to many of us, to follow a leader, or their ideas on life. So too, is The Celestine Prophecy. If you read the book, looking for guidelines to criticize, you will have found them. However, if you were looking for an alternative suggestion to dealing with this confusion we live in, and hope to come out alive, then you might begin to understand where James Redfield is coming from.

The Celestine Prophecy opened my eyes to a beauty that I had never seen before. This was an indescribable beauty that could only be seen through an open mind. My life has been changed since reading this novel for reasons that you, a skeptic, will find empty. I'm not sure what proof I can offer you, except for the fact that I am not a weak person looking for guidance from a stranger. I am a proud, strong willed, open-minded teenager. I pity those adults, who have not yet realised that maybe science is just a theory and theories may be wrong.

I do appreciate you giving me the opportunity to voice my opinion. I'm sorry if I've insulted or offended anyone along the way. My bottom line, however, is that maybe you're a little to quick to judge us who see auras as delusional. My good sir, instead of opening your eyes to the hate in our world, open your eyes to the beauty that is left.

Sincerely,

Meghan Edmonds - Age 15

British Columbia, Canada.

reply: Your letter is very touching. I am glad that you have found truth and beauty in this novel. I wasn't much older than you are when I felt the same way about Kahil Gibran's The Prophet. I still open my eyes to the beauty in the world, but I no longer see it in this book.

19 Jul 1998

I understand your skepticism, I truly do. I, too, am a skeptic of anything that seems to make sense or challenges me to feel happy and blissful. How can we not be skeptical, having been raised in a society where the key to happiness is only an infomercial away? And upon entrusting our faith and our soul (not to mention our pocketbooks) to such gurus, we soon find ourselves crashing down

from this high, a little lighter in the wallet, and a lot more anxious than we were before.

The Celestine Prophecy, however, does none of those things. In your own writing on the topic, it is quite easy to see (for someone who is looking), that there is perhaps a part of you that wants to believe in such things. Your eloquent and detailed account on the state of the world, on the violence and hatred and scheming and lies, could not have been written by someone purely poking fun at the idea. You know that the world is not utopia. You know that something has to change in order for civilization as a whole to move forward, to survive at all, for that matter.

For argument's sake, what if it is the Celestine Prophecy? What if all we have to do is focus on our energies, on our surroundings, on ourselves to be happy? Of course, it's simplistic and childlike. Ever wonder why children are basically inherently happy?

This book is not meant as a bible. The nine insights are not commandments. They are simply ideas meant to stimulate thought and examples as to how each of us, personally, can obtain a feeling of peace and happiness in our lifetime, and how we can help others to feel peaceful and happy. It is a message for our times, and really, it doesn't call for any sort of skepticism. Not only doesn't it ask you to purchase any products or ask for tithing in order to obtain this underlying sense of peace, but it doesn't demand that you live by a stringent set of guidelines - it's different for each individual.

Look at the world around you. Reread the book. Ask yourself if any of the messages in it help you to make sense of what is going on in the world around you. Don't believe that we'll pay each other for insights in 500 years - that's not the real point of the book, as I think you know. The point is that it is possible for humankind to be decent and loving to one another, if each individual takes the time and makes the effort to better his own outlook and existence.

Robin Page

reply: Of course I do not object to love and peace, decency, etc. However, I don't think we need James Redfield's added metaphysical baggage to promote those things.

cellular memory

28 Oct 1999

A speculation for the cellular memory page. As you will notice from my e-mail address and my signature line, I work for the National Marrow Donor Program. As such, I'm familiar with the business of bone marrow transplantation (BMT) using unrelated donors. It's known in the BMT community that a donor's allergies can be transferred to the marrow recipient (see citation, below). Some marrow recipients also say that their food preferences have changed post-transplant, but this has not to my knowledge been reported in the medical literature. You speculate that the origin of the cellular memory belief may be the chitlin joke told in 'Brian's Song' or in L. Ron Hubbard's 'engrams.' May I suggest that a more likely origin may be the allergy transfer phenomenon I refer to?

Now, a bone marrow transplant is much different from a solid organ transplant, because in a marrow transplant one is in effect transplanting the entire immune system of one person to another, so it's not surprising that allergies are also sometimes transferred. An in any event, this phenomenon is much different from the idea that transplanted organs contain the coding of life, but since you are speculating about the possible beginnings of this wacky idea, I suggest that this phenomenon encountered in BMT may be a more likely starting point.

If you're looking for a film source for such things, you can go back much farther, to "[Mad Love](#)" aka "[The Hands of Orlac](#)", starring Peter Lorre. In it, the insane Dr. Gogol (Lorre) transplants the hands of a murderer onto pianist Stephan Orlac (Colin Clive), and convinces Orlac that the murderer's

personality is taking over. Orlac finds that he has abilities he never had before -- such as knife-throwing -- related to the murderer's profession.

pyramid schemes

04 Jan 2001

Thanks for an excellent and truly informative site.

A few years ago, the government of Sali Berisha in Albania ran a pyramid scheme which many Albanians invested in. The scheme subsequently collapsed driving the a large section of the populace into abysmal poverty, indirectly provoking the unrest which led to Berisha's fall. It is important to note that this pyramid scheme was part of a larger criminal operation run by the Albanian government (and incidentally involving the Kosovo Liberation Army) which involved heroin smuggling, gun running, the smuggling of contraband and an extremely lucrative prostitution racket in nearby Italy. Pyramid schemes are not only illegal, but also tend to be run by hardened criminals.

However, the gullibility of the public, and especially those in dire financial straits, is almost bottomless. In my country, South Africa, there is currently a con man who fleeced thousands of investors of their hard earned money by means of a pyramid scheme. However, it has turned out that his most ardent supporters during his trial were precisely those who had lost all of their money. In fact, his level of support was such that he actually went on to launch a small political party!

Eric Goodwin

reply: Go figure. I suppose, in part, denial is a matter of saving face and partly a matter of trying to sucker others into making the same mistake with you that you made with others.

4 Jan 2001

In your reply to a letter posted on 1/4/2001, you express some surprise at the fact that some people still support the scammers who took all their money in pyramid schemes.

Actually this is not a rare occurrence at all. As the (excellent) antifraud web site www.quatloos.com shows, it is more a rule than an exception. Almost every financial scam has its "true believers" - the original Mr. Ponzi included (irate investors almost lynched the cops when they came to arrest Ponzi for fraud.)

An extreme example of such behavior is at:

<http://www.quatloos.com/cm-omega/cm-omega.htm>

It has to be seen to be believed. Not only did the scammers in this case sell the "lenders" (investors) worthless bonds called "Omega", but EVEN AFTER "Omega" didn't pay one cent, they managed to get the SAME people to sign up to another identical scam called "Destiny". When that scam didn't pay out one cent either, they STILL got the SAME people to invest in what they called "refund units" for their original Omega "investment" - e.g., sending the same scammers MORE money on the promise that THIS time they will get their money back. Currently, the same scammers are trying to raise yet more money from the scammed - this time, to contribute to the main scammer's defense fund (he was finally arrested and charged with fraud.)

How on earth can some people be so stupid as to be scammed again and again and again? www.quatloos.com have their opinion:

"The promoters of Omega chose well in their victims, being either fundamental Christians who "keep the faith" no matter what, or New Agers who are so stupid that they will believe in anything (Omega today, pyramid power tomorrow!)."

This choosing of victims is not, of course, limited to the crooks in Omega. As Allen Henderson says in his book, "How Con Games Work", religious people are prime targets for scams. Scammers take advantage of religious people's capacity for blind faith and their trust in the authority of their clergy. They know that all they have to do is to get the community's local religious leader scammed, and they have it made:

"Ironically, the very qualities that distinguish [Mormons] as fine, upstanding citizens proceed to be their financial downfall at the hands of con artists. Because they were religious, law-abiding and community- and church-oriented, they tended to be sheltered and trusting... if the preacher [who was scammed] said yea, who were they to say nay?"

This is food for thought, for those who think that there is no downside to religious beliefs and new-age wackiness.

08 Nov 2000

Hi, I am really puzzled. I was approached by a friend to join a "Gifting Club" which I immediately recognized as a pyramid scheme. I warned my friend to avoid this. I even found many sites on the web that explained these scams and warned against them. Well, My friend didn't listen. She got involved for 5000.00 as did her daughter and many other family members that I know well. I warned

them all. The amazing thing is that within a very short period of time she and several family members all made a lot of money as promised. They were paid amounts ranging between ten and twenty thousand. I saw the cash. Now I look like a chump to them and they are having a good time gloating. I don't understand. I know this shouldn't work and I understand why it is a scam. Everything I've read says that at best a few people get paid but most lose their money. However, so far I have seen at least 7 people get paid big money. In fact, everyone that I know that got in on the deal got paid and they tell me they have witnessed several others get paid substantial amounts of cash at their weekly "birthday" parties where the people get together to watch others get their money. I'm not thinking of joining. I still see it as a scam but I'm sitting here looking like a chump to them and, quite frankly, feeling like one. What gives? Any ideas that would explain why this is working even though it shouldn't? I would appreciate your comments.

Louis

reply: Give it time. What they're doing may be violating state law and is violating federal law if they don't plan to pay taxes on the money. They can call it a "gift" but the IRS will recognize it for what it is and want its share. If they give the money with the intention of getting more money in return, the IRS will not consider their behavior "gifting." Many people will get burned down the line and some are bound to report the scheme. You were wise to stay out of it.

read the following response:

13 Nov 2000

This is in response to Louis and the money his friends are receiving, just wanted to let you know that a friend of mine tried to get me into a pyramid scheme years ago, and also showed me lots of money that he had received from it. As it turns out, he had received no money from his venture, but he had showed me the cash in order to induce me to join, since if no one signed up after him, he would surely loose all of his money. I always wondered that if it was such a great deal, why the people who do get money don't just put it all right back in under their children's (or other relatives) names, and really make a lot of money.

Rob

9 Aug 2000

My name is David Brookshier and I find your website outstanding. I receive at least 3 chain letters every week and a few pyramids as well. Of course the get rich quick systems are to good to be true. Real businesses don't start out rich I know I am attempting to run my own photography business and it's hard. I have also lost all of my patience with fraudulent people I don't have time to sift

through 5 billion pieces of worthless mail get rich quick schemes. After visiting sites of the BBB and Us postal inspection I now can stop these con artists from sending me their junk. I now can tell any cons I come in contact with "Thank you very much for the great system you sent me, unfortunately I believe only in hard work and actually earning my money by the way I have sent your fraudulent info to my local postal inspector, have a nice day." Please tell the readers of your website to do the same with any con mail they receive so that the authorities can track them all down as recommended by the US postal service turn in any fraudulent schemes to your local post office inspector and crack down on fraud.

sincerely,
David Brookshier

17 Mar 2000

I noticed in your Ponzi Scheme listing that Social Security was not mentioned.
S Ruth

reply: Good observation. I don't list insurance companies, either. Anyway, I think Social Security is only something like 80% a pyramid scheme. Remember, if the government steals or gambles it's ok because they make the rules.

22 Aug 1997

Dear Critic,

I found your page after I searched "pyramid scam" in Yahoo. I read the whole thing. Thank you for writing all that. I didn't know the file Winca\$h was a pyramid scam, or what a pyramid scam was. I downloaded the file from the millionth page I saw it posted on. None of the other links worked--I didn't know why. I read the instructions and thought it sounded great. I sent out my \$5, which makes me a victim to some, and posted the file on LOTS of online message boards like the instructions said, which also makes me the criminal, even though I had no idea. Then someone who owned one of the message boards said it was a scam and such and I didn't believe him because the file states the exact postal lottery laws which make it legal. More and more people I talked to told me it was illegal and I got scared. I'd even made a websight to get the file out. After I read your page on pyramid schemes I quickly deleted the file and the page from my directory at Geocities. But it's too late. I've already posted my name and the file and everything on lots of BBS's, even a websight that gets many hundreds of hits a day. And my address is in the file. I wish I

would've read your file sooner. I'm just a kid, almost 14 and I'm afraid of going to jail. Well, thanks for having that page up so things don't get any worse than they are. I'd like you to mention WinCa\$h too. I thing that's the biggest one out there.

PLEASE DO NOT MENTION MY NAME OR ADDRESS ON YOUR PAGE!!!

Thanks again.

['Pyramidiot' earning new accolades By Dana Bartholomew](#)

pyramidiocy

Pyramidiocy is characterized by having an outlandish, farfetched theory about the origin, nature or purpose of the Egyptian pyramids. The theories of pyramidiots are barely supported by slender threads of evidence. They serve little purpose except to stand as bad examples of speculative thought and fanciful imagination.

Some pyramidiots, such as [Erich von Däniken](#) and [Zecharia Sitchin](#), claim that the ancient Egyptians were too backwards to have constructed the pyramids without the help of [extraterrestrials](#). [Edgar Cayce](#) claimed that beings from [Atlantis](#) helped the Egyptians build the pyramids by showing them how to levitate stones. Charles Berlitz claimed that Atlantis lay beneath the [Bermuda Triangle](#) and had a pyramid the same size as the Great Pyramid at Giza.* Pyramidiots think Atlantis is the link between the pyramids of Egypt and the pyramids of Mexico. They are not dissuaded by the fact that the one was primarily funerary while the other was primarily used for ceremonies, including some which involved human sacrifice. Arguments demonstrating that the ancient Egyptians or Mexicans were intelligent and resourceful enough to build pyramids are to no avail.

Other pyramidiots ascribe super technological or paranormal powers to the ancient Egyptians. Traditional explanations in terms of religion, tombs for pharaohs and their families, belief in immortality, slave labor or paid workers, slipways, canals, etc. are rejected by pyramidiots in favor of theories claiming that the pyramids were [power stations](#) or [water pumps](#).

Some pyramidiots claim that the pyramids were built according to some sort of [mystical numerology to contain coded messages](#). Some believe that the Great Pyramid at Giza is at the [center of the world](#). Some think the pyramids are a [map of the heavens](#). Mystical [mathematical notions](#) about the pyramids [abound](#). Some believe [only God](#) could have designed such a [numerical mystery](#). Still others have believed that [razor blades could be kept perpetually sharp](#) by being placed under a pyramid of the same proportions as the Great Pyramid at Giza (by focusing cosmic energy and realigning crystals in steel!). That almost anything in the universe can be found to have interesting mathematical proportions or be related to several interesting mathematical formulae is of little interest to pyramidiots.

Some pyramidiots think [pyramids have healing power and are foci of spiritual energy](#). That there is no evidence for such beliefs seems to cheer rather than dishearten pyramidiots.

According to a Gallup poll, belief in ghosts has increased from 25% to 38% over the last decade of the 20th century.

ghosts (poltergeists)

A **ghost** is the alleged [spirit](#) of a dead person. Ghosts are often depicted as haunting places, especially houses where murders have occurred. Why some murder victims would stick around for eternity to haunt a place, while others seem to evaporate is one of the great mysteries of existence better left to literary types to ponder. Most philosophers consider the concept of ghosts to be on par with that of [fairies](#).

A **poltergeist** (literally, a noisy spirit) is a noisy ghost. Poltergeists make their presence known by rapping sounds and are considered by some to be the first "rap" artists. These are the ghosts who like to cause disturbances by doing such naughty things as throwing furniture or pots and pans around.

Most nations have a love of ghost stories, but the [English](#) seem to be especially fond of their ghosts.

hystero-epilepsy & Dr. Jean-Martin Charcot (1825-1893)

Charcot was one of the founders of modern neurology. Students came from all over the world to study under him in Paris, including [Freud](#) in 1885.

Charcot used [hypnosis](#) as a diagnostic tool in his study of hysteria and influenced Freud's views on the origin of neurosis. Charcot made a number of important medical discoveries and even has a disease named after him ([neurogenic arthropathy](#) is also known as Charcot's joints).

At one point in his illustrious career, Charcot believed that he had discovered a new disease, which he called "hystero-epilepsy." The symptoms included "convulsions, contortions, fainting, and transient impairment of consciousness."^{*} He showed his students several examples of this new disease during his rounds at Salpêtrière Hospital.

A skeptical student, Joseph Babinski, decided that Charcot had invented rather than discovered hystero-epilepsy. The patients had come to the hospital with vague complaints of distress and demoralization. Charcot had persuaded them that they were victims of hystero-epilepsy and should join the others under his care. Charcot's interest in their problems, the encouragement of attendants, and the example of others on the same ward prompted patients to accept Charcot's view of them and eventually to display the expected symptoms. These symptoms resembled epilepsy, Babinski believed, because of a municipal decision to house epileptic and hysterical patients together (both having "episodic" conditions). The hysterical patients, already vulnerable to suggestion and persuasion, were continually subjected to life on the ward and to Charcot's neuropsychiatric examinations. They began to imitate the epileptic attacks they repeatedly witnessed (McHugh).

Babinski convinced Charcot that hystero-epilepsy was not a disorder and that doctors can induce symptoms in their patients. They separated the "hystero-epileptic" patients from each other and from staff members who had treated them. The patients were moved to the general ward of the hospital. The doctors then treated the patients by ignoring their hysterical behavior and encouraging the patients to work on their recovery. "The symptoms then gradually withered from lack of nourishing attention (McHugh)."

The lesson of Charcot seems lost on many therapists today, in particular the [trauma-search \(repressed memory\) therapists](#) who assume even before meeting their patients that they have probably been sexually abused, repressed the traumatic abuse and will suffer until the memories of abuse are brought to the surface in therapy. These therapists have no difficulty in finding patients who respond to their diagnoses and treatment, even though there is growing evidence that many of the memories of abuse that they elicit are [false memories](#).

News Item:

08/14/98, AKRON
BEACON JOURNAL

**ILLINOIS TO
DISCIPLINE
PSYCHIATRIST
ACCUSED OF
BRAINWASHING
PATIENT**

Illinois has moved to discipline a prominent psychiatrist accused of convincing a patient that she was a child molester, a cannibal who ate human flesh meatloaf and the high priestess of a satanic cult.

Depressed after the birth of her second son, Patricia Burgus sought therapy from Dr. Bennett Braun. Burgus says the doctor, through [repressed-memory therapy](#), led her to believe among other things that she

multiple personality disorder [dissociative identity disorder]

....students often ask me whether multiple personality disorder (MPD) really exists. I usually reply that the symptoms attributed to it are as genuine as hysterical paralysis and seizures....

--Dr. Paul McHugh

Multiple personality disorder (MPD) is a psychiatric disorder characterized by having at least one "alter" personality that controls behavior. The "alters" are said to occur spontaneously and involuntarily, and function more or less independently of each other. The unity of consciousness, by which we identify our selves, is said to be absent in MPD. Another symptom of MPD is significant amnesia which can't be explained by ordinary forgetfulness. In 1994, the American Psychiatric Association's DSM-IV replaced the designation of MPD with DID: [dissociative identity disorder](#). The label may have changed, but the list of symptoms remained essentially the same.

Memory and other aspects of consciousness are said to be divided up amongst "alters" in the MPD. The number of "alters" identified by various therapists ranges from several to tens to hundreds. There are even some reports of several thousand identities dwelling in one person. There does not seem to be any consensus among therapists as to what an "alter" is. Yet, there is general agreement that the cause of MPD is repressed memories of childhood sexual abuse. The evidence for this claim has been challenged, however, and there are very few reported cases of MPD afflicting children.

Psychologist Nicholas P. Spanos argues that repressed memories of childhood abuse and multiple personality disorder are "rule-governed social constructions established, legitimated, and maintained through social interaction." In short, Spanos argues that most cases of MPD have been created by therapists with the cooperation of their patients and the rest of society. The experts have created both the disease and the cure. This does not mean that MPD does not exist, but that its origin and development are often, if not most often, explicable without the model of separate but permeable ego-states or "alters" arising out of the ashes of a destroyed "original self."

A rather common view of MPD is given by philosopher Daniel Dennett.

possessed 300 personalities and sexually abused her children.

[Braun's license to practice in Illinois has been suspended.](#)

...the evidence is now voluminous that there are not a handful or a hundred but thousands of cases of MPD diagnosed today, and it almost invariably owes its existence to prolonged early childhood abuse, usually sexual, and of sickening severity. Nicholas Humphrey and I investigated MPD several years ago ["Speaking for Our Selves: An Assessment of Multiple Personality Disorder," *Raritan*, 9, pp. 68-98] and found it to be a complex phenomenon that extends far beyond individual brains and the sufferers.

These children have often been kept in such extraordinary terrifying and confusing circumstances that I am more amazed that they survive psychologically at all than I am that they manage to preserve themselves by a desperate redrawing of their boundaries. What they do, when confronted with overwhelming conflict and pain, is this: They "leave." They create a boundary so that the horror doesn't happen to them; it either happens to no one, or to some other self, better able to sustain its organization under such an onslaught--at least that's what they say they did, as best they recall.

Dennett exhibits minimal skepticism about the truth of the MPD accounts, and focuses on how they can be explained metaphysically and biologically. For all his brilliant exploration of the concept of the self, the one perspective he doesn't seem to give much weight to is the one Spanos takes: that the self and the multiple selves of the MPD patient are social constructs, not needing a metaphysical or biological explanation so much as a social-psychological one. That is not to say that our biology is not a significant determining factor in the development of our ideas about selves, including our own self. It is to say, however, that before we go off worrying about how to metaphysically explain one or a hundred selves in one body, or one self in a hundred bodies, we might want to consider that a phenomenological analysis of behavior which takes that behavior at face value, or which attributes it to nothing but brain structure and biochemistry, may be missing the most significant element in the creation of the self: the sociocognitive context in which our ideas of self, disease, personality, memory, etc., emerge. Being a social construct does not make the self any less real, by the way. And Spanos should not be taken to deny either that the self exists or that MPD exists.

But if thinkers of Dennett's stature accept MPD as something which needs explaining in terms of psychological dynamics limited to the psyche of the abused rather than in terms of social constructs, the task of convincing therapists who treat MPD to accept Spanos' way of thinking is Herculean. How could it be possible that most MPD patients have been created in the therapist's laboratory, so to speak? How could it be possible that so many people, particularly female people [85% of MPD patients are female], could have so many [false memories](#) of childhood sexual abuse? How could so

many people behave as if their bodies have been invaded by numerous entities or personalities, if they hadn't really been so invaded? How could so many people actually experience past lives under hypnosis, a standard procedure of some therapists who treat MPD? How could the defense mechanism explanation for MPD, in terms of [repression](#) of childhood sexual trauma and dissociation, not be correct? How could so many people be so wrong about so much? Spanos' answer makes it sound almost too easy for such a massive amount of [self-deception](#) and delusion to develop: it's happened before and we all know about it. Remember [demonic possession](#)?

Most educated people today do not try to explain epilepsy, brain damage, genetic disorders, neurochemical imbalances, feverish hallucinations, or troublesome behavior by appealing to the idea of demonic possession. Yet, at one time, all of Europe and America would have accepted such an explanation. Furthermore, we had our experts--the priests and theologians--to tell us how to identify the possessed and how to exorcise the demons. An elaborate theological framework bolstered this worldview, and an elaborate set of social rituals and behaviors validated it on a continuous basis. In fact, every culture, no matter how primitive and pre-scientific, had a belief in some form of demonic possession. It had its shamans and witch doctors who performed rituals to rid the possessed of their demons. In their own sociocognitive contexts, such beliefs and behaviors were seen as obviously correct, and were constantly reinforced by traditional and customary social behaviors and expectations.

Most educated people today believe that the behaviors of [witches](#) and other possessed persons--as well as the behaviors of their tormentors, exorcists, and executioners--were enactments of social roles. With the exception of religious fundamentalists (who still live in the world of demons, witches and supernatural magic), educated people do not believe that in those days there really were witches, or that demons really did invade bodies, or that priests really did exorcise those demons by their ritualistic magic. Yet, for those who lived in the time of witches and demons, these beings were as real as anything else they experienced. In Spanos' view, what is true of the world of demons and exorcists is true of the psychological world filled with phenomena such as repression of childhood sexual trauma and its manifestation in such disorders as MPD.

Spanos makes a very strong case for the claim that "patients learn to construe themselves as possessing multiple selves, learn to present themselves in terms of this construal, and learn to reorganize and elaborate on their personal biography so as to make it congruent with their understanding of what it means to be a multiple." Psychotherapists, according to Spanos, "play a particularly important part in the generation and maintenance of MPD." According to Spanos, most therapists never see a single case of MPD and some therapists report seeing hundreds of cases each year. It should be distressing to those trying to defend the integrity of psychotherapy that a

patient's diagnosis depends upon the preconceptions of the therapist. However, an MPD patient typically has no memory of sexual abuse upon entering therapy. Only after the therapist encourages the patient do memories of sexual abuses emerge. Furthermore, the typical MPD patient does not begin manifesting "alters" until *after* treatment begins (Piper 1998). MPD therapists counter these charges by claiming that their methods are tried and true, which they know from experience, and those therapists who never treat MPD don't know what to look for.*

Multiple selves exist, and have existed in other cultures, without being related to the notion of a mental disorder, as is the case today in North America. According to Spanos, "Multiple identities can develop in a wide variety of cultural contexts and serve numerous different social functions." Neither childhood sexual abuse nor mental disorder is a necessary condition for multiple personality to manifest itself. Multiple personalities are best understood as "rule-governed social constructions." They "are established, legitimated, maintained, and altered through social interaction." In a number of different historical and social contexts, people have learned to think of themselves as "possessing more than one identity or self, and can learn to behave as if they are first one identity and then a different identity." However, "people are unlikely to think of themselves in this way or to behave in this way unless their culture has provided models from whom the rules and characteristics of multiple identity enactments can be learned. Along with providing rules and models, the culture, through its socializing agents, must also provide legitimation for multiple self enactments." Again, Spanos is not saying that MPD does not exist, but that the standard model of (a) *abuse*, (b) *withdrawal of original self*, and then (c) *emergence of alters*, is not needed to explain MPD. Nor is the psychological baggage that goes with that model: repression, recovered memory of childhood sexual abuse, integration of alters in therapy. Nor are the [standard diagnostic techniques: hypnosis](#), including [past life regression](#), and [Rorschach tests](#).

It should be noted that books and films have had a strong influence on the belief in the nature of MPD, e.g., *Sybil*, *The Three Faces of Eve*, *The Five of Me*, or *The Minds of Billy Milligan*. These mass media presentations influence not only the general public's beliefs about MPD, but they affect MPD patients as well. For example, Flora Rheta Schreiber's *Sybil* is the story of a woman with sixteen personalities allegedly created in response to having been abused as a child. Before the publication of *Sybil* in 1973 and the 1976 television movie starring Sally Fields as Sybil, there had been only about 75 reported cases of MPD. Since *Sybil* there have some 40,000 diagnoses of MPD, mostly in North America.

Sybil has been identified as [Shirley Ardell Mason](#), who died of breast cancer in 1998 at the age of 75. Her therapist has been identified as Cornelia Wilbur, who died in 1992, leaving Mason \$25,000 and all future royalties from *Sybil*. Schreiber also died in 1988. It is now known that [Mason had no MPD](#)

[symptoms before therapy with Wilbur](#), who used hypnosis and other suggestive techniques to tease out the so-called "personalities." *Newsweek* (January 25, 1999) reports that, according to historian Peter M. Swales (who first identified Mason as Sybil), "there is strong evidence that [the worst abuse in the book] could not have happened."

Dr. Herbert Spiegel, who also treated "Sybil", believes Wilbur suggested the personalities as part of her therapy and that the patient adopted them with the help of hypnosis and sodium pentothal. He describes his patient as highly hypnotizable and extremely suggestible. Mason was so helpful that she read the literature on MPD, including *The Three Faces of Eve*. The Sybil episode seems clearly to be symptomatic of an iatrogenic disorder. Yet, the Sybil case is the paradigm for the standard model of MPD. A defender of this model, [Dr. Philip M. Coons](#), claims that "the relationship of multiple personality to child abuse was not generally recognized until the publication of Sybil."

The MPD community suffered another serious attack on its credibility when Dr. Bennett Braun, the founder of the International Society for the Study of Disassociation, had his license suspended over allegations he used drugs and hypnosis to convince a patient she killed scores of people in SATANIC RITUALS. The patient claims that Braun convinced her that she had 300 personalities, among them a child molester, a high priestess of a satanic cult, and a cannibal. The patient told the Chicago Tribune: "I began to add a few things up and realized there was no way I could come from a little town in Iowa, be eating 2,000 people a year, and nobody said anything about it." The patient won \$10.6 million in a lawsuit against Braun, Rush-Presbyterian-St. Luke's Hospital, and another therapist.

defenders of MPD

The defenders of the MPD/DID standard model of genesis, diagnosis and treatment argue that the disease is underdiagnosed because its [complexity makes it very difficult to identify](#). Dr. Philip M. Coons, who is in the Department of Psychiatry at the Indiana University School of Medicine, claims that "there is a professional reluctance to diagnose multiple personality disorder." He thinks this "stems from a number of factors including the generally subtle presentation of the symptoms, the fearful reluctance of the patient to divulge important clinical information, professional ignorance concerning dissociative disorders, and the reluctance of the clinician to believe that incest actually occurs and is not the product of fantasy." Dr. Coons also claims that demonic possession was "a forerunner of multiple personality."

Another defender of the standard model of MPD, Dr. Ralph Allison, has [posted his diagnosis](#) of Kenneth Bianchi, the so-called Hillside Strangler, in which the therapist admits he has changed his mind several times. Bianchi, now a convicted serial killer serving a life sentence, was diagnosed as having

MPD by defense psychiatrist [Jack G. Watkins](#). Dr. Watkins used hypnosis on Bianchi and "Steve" emerged to an explicit suggestion from the therapist. "Steve" was allegedly Bianchi's alter who did the murders. Prosecution psychiatrist [Martin T. Orne](#), an expert on hypnosis, argued successfully before the court that the hypnosis and the MPD symptoms were a sham.

Allison claims, but offers no evidence, that the controversy over MPD is one between therapists, who defend the standard model, and teachers, who deny MPD exists.* The battle took place in committee when preparing the [DSM-IV](#), he claims. The teachers won and MPD was removed and DID replaced it. The [DSM-IV](#) is the current version (1994) of the American Psychiatric Association's *Diagnostic & Statistical Manual of Mental Disorders*. It lists 410 mental disorders, up from 145 in DSM-II (1968). The first edition in 1952 listed 60 disorders. Some claim that this proliferation of disorders indicates an attempt of therapists to expand their market; others see the rise in disorders as evidence of better diagnostic tools. According to Allison, MPD was called "Hysterical Dissociative Disorder" in DSM-II and did not have its own code number. MPD was listed and coded in DSM-III, but removed in DSM-IV and replaced with DID.

psychology

Psychology is the science of mental processes and behavior.

One view of psychology sees the discipline much the way Neil Postman (1992) characterizes it: psychologists are capable of saying with a straight face, and no doubt thinking that they are contributing greatly to scientific knowledge, things like: "Depression is almost always a factor in the estimated 30,000 suicides in the United States each year." Or, "In two new major studies of depression, researchers have discovered that stressful events--death, divorce or other emotional crisis--may cause otherwise healthy people to develop symptoms of depression as early as a week later." These two "major" studies "Tracked the time between stressful events and depressive episodes and found that 60 percent of the first-time depressions were linked to a stressful event." "In those patients considered to be otherwise healthy, more than a quarter became depressed within a week of the event, and the majority reacted by four weeks on average" (National Institute of Mental Health, cited in "Everyday life may cause depression," by Trisha Gura, *Chicago Tribune*, printed in the *Sacramento Bee*, July 31, 1994, p. A8). To many people, it is not news that people get depressed when a loved one dies or when they go through a divorce. This seems to be a matter of "commonsense" and no scientific study is needed to verify it.

Another view of psychologists is that they are trained at accredited institutions of higher learning, and must be well-versed in statistics and the logic of scientific experimental methods. Much of the research done by psychologists is as rigorous as that done by anyone in any of the sciences. In fact, it is probably very disconcerting to many young psych majors to discover that they are expected to think logically, understand the manipulation of variables and concepts such as $p = 0.05$, the necessity of [control groups](#), [the placebo effect](#), standards of deviation, etc. Many of them no doubt got their idea of psychology from the mass media. They think Dr. Joyce Brothers, Dr. Ruth, Shere Hite and the hosts of author/social workers or parapsychologists making the talk show circuit are the "real" psychologists. Or they think of speculative philosophers like [Freud](#) or [Jung](#) as their archetype of The Psychologist. It must be very disappointing to many would-be shrinks to discover that their teachers expect them to think like scientists rather than philosophers or creative writers.

It must be even more disheartening for research psychologists than for their students to see their field dominated in the public eye by incompetents and frauds. The public is treated to a continuous feast of wild-eyed and dangerous [New Age therapies](#), illogical [alien abduction](#) therapists, incompetent and fraudulent [parapsychologists](#), inept [facilitated communication](#) advocates,

overzealous [repressed memory](#) & [child abuse therapists](#), bogus self-esteem studies, etc.

Why doesn't the mass media pay more attention to the psychologists who are conducting properly controlled studies? Where is the hype spreading the news that there is no evidence that highly religious people are more altruistic and honest than less religious people? [R. F. Paloutzian's *Invitation to the Psychology of Religion* (Scott Foresman; 1983) or "Faith Without Works," in the *Journal of Applied Social Psychology*, (1975)]. Where is the mass media spreading the word about studies which have shown that the [full moon](#) does not stimulate people to commit crimes or that blind people have especially acute hearing? Who gets all the attention when a competent research psychologist challenges some commonsense notion about childhood memory or testimony put forth as truth by some New Age therapist testifying in a court of law?

Finally, it must be shocking for many young students, contemplating a career of helping people and the human race through psychology, to discover that most academic psychologists don't think [psi](#) exists and that most standard psych textbooks do not consider [parapsychology](#) worthy of even an honorable mention. According to Wagner and Monnet, in a 1979 study of 1,100 college professors in the United States, only 34% of psychologists surveyed believe that [ESP](#) is either an established fact or a likely possibility. The comparable figures for other disciplines are: natural scientists (55%), social scientists [excluding psychologists] (66%) and for academics in the arts, humanities, and education (77%). However, less encouraging was the report that 34% of the psychologists surveyed believe psi is an **impossibility**. Only 2% of the other respondents maintained this logically untenable position ("Attitudes of College Professors toward Extra-sensory perception," *Zetetic Scholar*, 5, 7-17, 1979).

[The people who believe that Satanists might eat your baby](#)

By Damian
Thompson (Filed:
22/03/2002)

satanic ritual abuse (SRA)

Satanic ritual abuse (SRA) is the name given to the allegedly systematic abuse of children by Satanists.

Since the mid 1970s, there have been widespread allegations of the existence of a well-organized intergenerational satanic cult whose members sexually molest, torture and murder children across the United States. In the 1980s there was a panic regarding SRA, which was largely triggered by a fictional book called *Michelle Remembers* (1980). The book was published as fact but has subsequently been shown to be a hoax by at least [three independent investigators](#). No hard evidence of Satanic Ritual Abuse in North America has been found. Nevertheless, the allegations were widely publicized on radio and television talk shows, especially on [Geraldo Rivera's show](#).

A four-year study in the early 1990s found the allegations of satanic ritual abuse to be without merit. The study was conducted by University of California at Davis psychology professors Gail S. Goodman and [Phillip R. Shaver](#), in conjunction with Jianjian Qin of UC Davis and Bette I. Bottoms of the University of Illinois at Chicago. Their study was supported by the National Center on Child Abuse and Neglect. The researchers investigated more than 12,000 accusations and surveyed more than 11,000 psychiatric, social service and law enforcement personnel. The researchers could find no unequivocal evidence for a single case of satanic cult ritual abuse.

Another [study by Kenneth V. Lanning, a Supervisory Special Agent at the FBI Academy](#), published in 1992 came to the same conclusion: there is no good evidence of a single case of SRA. Lanning has investigated SRA since 1981.

If there are thousands of baseless accusations, how do they originate? Most of them are said to originate with children. Since there is a widespread belief that children wouldn't make up stories of eating other children or being forced to have sex with giraffes after flying in an airplane while they were supposed to be in day care, the stories are often taken at face value by naive prosecutors, therapists, police officers and parents. Yet, the researchers found that children are unlikely to invent stories of satanic ritual abuse on their own. So, where do the stories come from? They probably come from the therapists, the district attorneys, police and parents. There is ample evidence that therapists and law enforcement personnel encourage and reward children for accepting the suggestions of bizarre abusive behavior. They also discourage truth by refusing to accept no for an answer, forcing children to undergo interrogations until the interrogator gets what he or she is after.

A summary of the Goodman et al. study may be obtained for free by calling the National Center on Child Abuse and Neglect at 1-800-394-3366.

Ica stones

"In the vicinity of the village of Ocucaje and Ica, in Peru, a collection of rounded stones . . . has been amassed by Dr. Javier Cabrera....The people are shown hunting or struggling with a variety of monsters that resemble BRONTOSAURS, TRICERATOPS, STEGOSAURS, AND PTERODACTYLS . . . human beings are portrayed as having domesticated animals that appear to be DINOSAURS and are using them for transportation and warfare. People are shown using telescopes, looking at the stars, and performing surgery" (Charles Berlitz, *Atlantis, the Eighth Continent*, 1984, pp.193-194).*

The Ica stones are a collection of stones allegedly discovered in a cave near Ica, Peru. The [andesite](#) stones have had their oxidized surfaces engraved with depictions that call into question just about everything science has taught us about the origin of our planet, ourselves, and other species. For example, some of the stones depict men (who look like ancient Incas or Aztecs) attacking huge stylized monsters with axes. The monsters are said to be dinosaurs. (One [film production company](#) goes so far as to claim that the monsters on the stones are "realistic depictions of Stegosaurus, Tyrannosaurus Rex and Pterodactyls.")

The cave where the stones were allegedly discovered has never been identified, much less examined by scientists. Skeptics consider the stones to be a pathetic hoax, created for a gullible tourist trade. Nevertheless, three groups in particular have endeavored to support the authenticity of the stones: (a) those who believe that extraterrestrials are an intimate part of Earth's "real" history; (b) fundamentalist [Creationists](#) who drool at the thought of any possible error made by anthropologists, archaeologists, evolutionary biologists, etc.; and (c) the mytho-historians who claim that ancient myths are accurate historical records to be understood literally.

The Ica stone craze began in 1996 with Dr. Javier Cabrera Darquea, a Peruvian physician who allegedly abandoned a career in medicine in Lima to open up the Museo de Piedras Grabadas (Engraved Stones Museum) in Ica. There he displays his collection of several thousand stones. Dr. Cabrera claims that a farmer found the stones in a cave. The farmer was arrested for selling the stones to tourists. He told the police that he didn't really find them in a cave, but that he made them himself. Other modern Ica artists, however, continue to carve stones and sell forgeries of the farmer's forgeries. In 1975, Basilio Uchuya and Irma Gutierrez de Aparcana claimed that they sold

Cabrera stones they'd graved themselves and that they'd chosen their subject matter by copying from "comic books, school books, and magazines" (Polidoro 2002).

Dr. Cabrera's museum is listed as a tourist site by the Peruvian National Chamber of Tourism, though the authenticity of the stones is left open. According to the Chamber of Tourism, the museum has an

exhibition of engraved stones depicting -supposedly - thousand of years of human activities. Based upon the found pieces, collection owner doctor Javier Cabrera, holds a theory according to which Ica was the seat of the first Peruvian culture.*

Dr. Cabrera's authority in the matter of the stones seems to have originated from his declaration that a particular stone (shown above) depicts an extinct fish. The depiction is stylized, as are most of the drawings of ancient Peruvian cultures. It must be admitted that knowledge of extinct fish is rare among physicians, even those who have studied biology. Those who are impressed with this knowledge of extinct fish don't seem to be interested in exactly what fish this is supposed to be, when it became extinct, or what the telltale marks are that allow for this identification.

It is argued by the Extraterrestrialites and the Creationists that this depiction of an extinct fish proves either that the Indians who made these stones were given information by aliens about extinct fish (for they could not possibly have found any fossils and copied the fossils) or that the timeline that places extinctions of animals like this fish millions of years in the past are clearly wrong. The Indians lived within the past millennium or two, and so the extinctions must be recent.

It is argued by the Myth-Is-Historyites that since the stones depict men attacking monsters, monsters must really have existed and men must really have attacked them. Thus, either humans existed during the Jurassic period or dinosaurs existed until very recently. It is argued by all of the above that this means that evolutionists are wrong. Furthermore, the fact that they won't admit that they are wrong proves that there is a conspiracy among scientists to keep the truth from the public in order to dupe us into believing things that are inconsistent with both the notion that God created all species a few thousand years ago and that we are all descendents of aliens. (Note: these are the same scientists who have kept the truth from us about the reality of the monsters depicted in stories, on vases, and on temples in ancient Greece, India, etc. They have also kept from us the truth about the ancient Egyptians building pyramids as radio towers. There are many other things these [wicked scientists](#) have hidden from us, such as that in 75,000,000 B.C. [Xenu](#) ordered a nuclear attack on our planet.)

Cabrera has his own theory about the creators of the stones. His theory is based upon the premise that the stones are not a hoax. This is understandable, since, if the stones are a hoax, Cabrera is one of the key hoaxers. Cabrera's theory is that the stones depict the first Peruvian culture as an extremely advanced technological civilization. How advanced? The stones allegedly depict [open-heart surgery](#), brain transplants, telescopes, flying machines, etc. When did they exist? They came from the Pleiades about one million years ago. How does he know this? That is anybody's guess, but you can read about it in Cabrera's book [The Message of the Engraved Stones of Ica](#).

Why don't scientists simply date the stones and settle the matter? Stones without organic material trapped in them can only be dated by dating the organic material in the strata in which they are found. Since Cabrera's stones come from some mystery cave which has never been identified, much less excavated, there is no way to date them.

That no one has ever found any other remnant of this great culture should be troublesome, however. Such a great society might have left at least some garbage or some ruins, maybe even a bone or two, a grave here or there, or a temple, a hospital, an observatory, an airport. But this great civilization, unlike every other great civilization of the past (except [Atlantis](#), of course!) has vanished without a trace, except for Cabrera's stones. Of course, there are the [Nazca](#) lines. Unfortunately, the creators of the Nazca figures didn't depict any Indians attacking dinosaurs or doing brain transplants, something which might have tied the Ica stones to the Nazca lines in this exciting new field of "alternative science".

There is, of course, an explanation for the cleanliness of this great people. They were able to exist long enough to hunt dinosaurs and build spacecraft (when they were not doing brain transplants) and yet leave nothing behind but a cave full of artistic scratches on stones because they were not from this planet. They left (and presumably took everything with them), leaving behind only the stones as a kind of puzzle for later generations of stupid humans to solve. Maybe they went on to [Nazca](#) or to [Lubaantun](#) to create more puzzles. Maybe these aliens are giving us an I.Q. test. Or the stones may be another test of faith given to mankind by the God of the Bible. Or maybe they're just a hoax.

The proof that the stones are not a hoax, says Dr. Cabrera, is in their number. There are too many stones for a single farmer, or even a collective of hoaxers, to have scratched out. He claims that the locals have unearthed about 50,000 stones and that they showed him a "tunnel" where there are another 100,000. However, so far no scientific expedition, or even a film crew led by [Charleton Heston](#) of the mysterious "Mysterious Origins of Man" spectacle, has set out to explore this tunnel.

Furthermore, says Cabrera, who apparently fancies himself an expert on

volcanic stone as well as on extinct fish, andesite is too hard to carve well by mere mortals using stone tools. True, but the stones aren't carved. They are graved, i.e., a surface layer of oxidation has been scratched away. Dr. Cabrera assumes that the creators of the stones only had stone tools available to them. The Inca, Maya and Aztec cultures all had advanced metallurgy by the time the Spanish arrived. Cabrera and the Ica locals certainly have more than stone tools available to them. Basilio explained how he and Irma achieved the "ancient" look on their stones: They laid out the graved stones in a chicken pen and the "chickens did the rest" (Polidoro 2002).

Are the stones authentic? If by *authentic* one means that they were engraved by pre-Columbians, then the answer has to be an unqualified "not all of them." Some engraved stones are said to have been brought back to Spain in the 16th century. It is possible that some of the stones are truly examples of pre-Columbian art. However, it is known that some such stones are forgeries. Tourists, not just in Peru, but everywhere on earth where there are antiquities, have been suckers for forgeries. Local con artisans are aware of the market for "forbidden" antiquities. (I myself am the proud owner of a shard sold to me in Arizona by a young Native American as an authentic "illegal" piece of [Anasazi](#) pottery. A colleague has some nice forgeries from Egypt made to look old by dipping them in motor oil and torching them.) Pre-Columbians certainly were fascinated with monsters, as were ancient European cultures, but do the stones depict dinosaurs? That is open to interpretation. If they do depict dinosaurs and humans together what is more likely? that they are accurate historical documents or that they are part of a clever hoax? In light of the lack of corroborating evidence, a reasonable person must conclude that the stones are a hoax.

Cabrera's story does not have the ring of verisimilitude about it, though it does have a certain charm. The story certainly has found several ready audiences who have found a niche in their own belief systems for the stones. Never mind that the belief systems not only contradict one another, but are also contrary to the preponderance of the scientific evidence. Creationists, mythohistorians, and extraterrestrialists are in a *jihad* against belief in evolution where apparently it is one's duty to make the preposterous seem plausible.

fetishes

Fetishes are objects such as stones, teeth, or carvings, supposedly possessing magical powers that can protect one from harm, cure disease, etc. Some fetishes are thought to be magical in themselves; others get their magic from some divinity. Some fetishes are believed to be so powerful that only special individuals are allowed to handle them. For all others, the fetish is taboo.

chelation therapy

26 Oct 1997

The Skeptics Dictionary is very necessary and contains some good information about all forms of medicine etc. The only problem I see is that there is no critical overview given about CABGS and angioplasty, it is assumed that these are THE standard of care for ASHD, and are in the neighborhood of 90% curative.

reply: Who assumes that bypass surgery or angioplasty are 90% curative? This seems rather high to me, but you may be right. The "standard treatment" for vascular diseases would depend, I would assume, on the condition of the patient and would be determined by the physician. You make it sound like anyone with a vascular problem will be advised to have bypass surgery or angioplasty. You're creating a straw man argument by distorting the practice of "standard" medicine to make it appear foolish.

The very arguments presented against chelation therapy can be used against bypass surgery and angioplasty, i.e. double blind, cross-over, placebo controlled studies have not been done. If these studies have been done, might we be given same?

reply: I would assume that you know the purpose of control studies: to test causal hypotheses. Your comparison of chelation therapy to bypass surgery and angioplasty is a false analogy. You ought to compare it to a new form of chemotherapy, whose causal efficacy is in question. As a physician, I imagine you are familiar with the setting of broken bones. Are you troubled that there are no double-blind, cross-over, placebo controlled studies showing that people with broken bones are more likely to heal better than those whose bones are not set? If there is no good reason to suspect causal efficacy, tests of causal hypotheses are unnecessary. Our knowledge and experience, including that gained from experimentation on animals, as well as basic knowledge of physiology, anatomy, biochemistry, etc., often provide sufficient evidence for establishing the reasonableness of certain medical procedures. I assume, as a physician and as someone with some scientific training, that you are well aware of this and bring up the false analogy in order to enhance your straw man caricature of "standard" medicine.

It is stated that Medicare does not pay for chelation therapy, but nowhere does it mention that Aetna does pay. John Hancock insurance also pays for CT. Would it be possible for you to tell the public why these companies pay for the therapy?

reply: I can't answer for the insurance companies, but I can tell you why I would pay for chelation therapy if I were an insurance company: it would save me bundles of money. I would much rather have my clients choosing a cheaper therapy. However, I wouldn't sell these same people life insurance.

A discussion of mortality statistics for these forms of therapy would also be of great benefit, as well as costs for them.

reply: in theory this sounds reasonable, but before mortality statistics for two therapies should be compared, it would have to be established that the patients receiving the therapies were very, very similar. This may be easy to do in terms of age, gender, weight, smoking, etc., but may not be feasible in terms of general health or actual state of disease. I would like to see a study with a large number of patients involved which takes patients recommended for a bypass and divides them into two groups: those who refuse the bypass and go for chelation therapy and those who have the bypass. If the groups were large enough, studying their mortality figures would be very useful. I think it would be ethical as well, since the only patients one would send for chelation would be those who refused surgery. Maybe someday such a study will be done.

Ask physicians who have used chelation therapy about their results, not people who have only read about it or heard about it, but ask those who have actually experienced the use of it. All that is asked, is, be fair, leave off the hype (both sides), and the talk of "bozoid" therapies etc. It is my belief that this therapy is headed for universal approval very soon. Chelation therapy does indeed work, albeit much to the chagrin of the scalpel & balloon proponents, not that they aren't needed, they are, just not as first line therapy.

reply: I have read material from physicians who use chelation therapy and I am not as convinced as they are of their results. Their scientific studies are not well conducted. Their anecdotes are not scientific evidence, their correlations often illusory.

Here is something to ponder, if CT does work 90% of the time, and is used first, before cabgs, then cabgs would drop in this country from \$30 Billion / yr. to \$3 Billion/ yr. Is it not reasonable to think that the loss of \$27 Billion / yr. would affect the thinking of most? What is the saying? Money talks?

Ron Davis, M.D.

reply: \$30 billion!! I don't know where you got your numbers but I can see

why you would like some of that CABGS money thrown your way. As Sen. Dirkson once said, a billion here, a billion there, pretty soon it adds up to a lot of money!

17 Jul 1996

Just a clarification for your edification... Chelation is a chemical process by which a large molecule such as EDTA binds smaller minerals. The form of the chelating agent can be designed to bind various valences (e.g. calcium ions carry a charge of +2 and are easily bound by disodium EDTA as is Lead). The substances chelating agents bind must inherently be in solution, for they only bind ionized or solubalized substances. Therefore, it seems rather bizarre that anyone should claim EDTA can bind a precipitate such as a cholesterol plaque. (Cholesterol is a lipid... thus.... nonionic, carrying no charge, thus not bound by a chelating agent)

--S. Durrenberger MD, also registered Pharmacist

reply: it may seem bizarre to you and me, but one common feature of alternative health practitioners is that they have some bizarre ideas about science. One common theme is belief in notions which ignore established scientific facts and theories.

28 Jul 1996

*I have enjoyed your **Skeptic's Dictionary**. I have used your resources with some of my patients. I am an internist at a rural hospital in upstate NY. I found your piece on chelation a nice concise view--as a skeptic would see it. The new addendum by S. Durrenberger MD, however, changed the article from being skeptical to bizarre.*

At our hospital we are investigating the concept of Complementary and Alternative Medicine Program and I have been getting material for presentation to the Medical Staff. Nowhere in the all the readings of Free Radical pathology, anti oxidation, and chelation literature did I come across claims that EDTA can bind a precipitate such as a cholesterol plaque.

[The writer recommends:

"Free Radical Pathology in Age-Associated Diseases: Treatment with EDTA Chelation, Nutrition and Antioxidants," JOURNAL OF ADVANCEMENT IN MEDICINE, vol. 2, Nos. 1,2, spring/summer 1989 by E.M.Cranton, J.P.Frackelton. This issue is in print and available through Human Science Press, inc., 233 Spring Street, New York, NY 10013-1578.]

Before you post any other assumption you owe it to your readers to check the sources. In the world of innovation it is easy to slip from innovative therapies to snake oil. Also beware it is just as easy or more easy to be myopic and prejudicial with rhetoric of a skeptic to mask the deception. Please accept this critical analysis in the spirit it is given.

*My respects to you for tackling a large field.
All the best and I hope to benefit by your dictionary.
Sincerely yours*

L.T.Parker, MD

reply: I think my readers are intelligent enough to know that what is printed as a reader comment is to be read just as critically as anything I write. I hope no one reads this or any other material on these subjects thinking that someone else has done all the checking on sources so they don't have to think about it.

15 Nov 1996

Two years ago my mother, age 85, went to a doctor for an analysis of a problem with her feet. She had developed horrible open sores all around her toes. The physician determined that she had no pulse or circulation in her lower legs and feet, had gangrene, and said that the only solution was amputation of both legs.

My sister and I went for a second opinion. We went to a physician who used chelation therapy in his practice. After a consultation, we permitted him to started chelation intravenous feedings immediately, twice a week at first, then once a week for about three months. Very soon we saw results. First a pulse returned, then color returned, the sores started to heal, then the gangrene disappeared. My mother's complexion improved significantly, she started feeling healthier than she had felt in years. Her hair became so dense that my sister had trouble cutting it. Now, two years later, when my sister and she go to the mall, my sister (age 45) gets tired before my mother (age 85).

*The bottom line is that the licensed physician who used chelation is the healer. The licensed physician who recommended amputation is terribly ignorant, he is the snake oil practitioner. But they both are licensed physicians. What do they call the student who graduates at the bottom of the class in medical school?
Doctor!*

p.s. The cost of the chelation therapy was \$3,000, paid for out of her savings. Medicare would have paid for the amputations.

Jim Hicks
Santee, California

2 Dec 96

Just a short clarification: the "claw" that chelation refers to in its Greek roots is seen in the shape of the molecule. Unfortunately, I can't represent it real well with this simple text editor, but it does look like a crab's claw. That is also how it works. Ionic (i.e., atoms with an electric charge) atoms can be held in the cage and transported around.

EDTA does work real well in a chemistry reaction in a test tube. But there are hundreds of thousands of reactions that work in a test tube and not the human body.

It's most unfortunate that test tube reactions can't be easily done in the body. It would be so much easier to develop all sorts of medications.

And as has already been pointed out, cholesterol and plaque are non-ionic molecules. They cannot be chelated.

John

03 Jun 1997

I am pleased to see the issue openly discussed. As a cardiologist in an open-minded research environment (Johns Hopkins) we welcome new ideas and concepts, but those ideas must then be tested both by the originators and by independent centers as well. ONE MUST NOT ACCEPT ANECDOTES TO ALTER THE PRACTICE OF MEDICINE. Let me explain: If upon leaving my home each morning, I first walked around the fire hydrant three times before getting into my car to drive to work, I might then make some observations. If after six months of this repetitive behavior I never had a car accident (and I never even came close), I might conclude that walking around the fire hydrant three times prevents automobile accidents. Clearly this is ludicrous as the entire world knows you only have to walk around fire hydrants TWICE to prevent car accidents. (Facetious, of course!)

[Testimonials](#) are useful for sales and marketing, but they have no place in a dispassionate scientific evaluation.

The data on Chelation Therapy emphatically demonstrates NO VALUE WHATSOEVER! I urge the strongest caution in evaluating the training, credibility, licensing and disciplinary record of those who are "Marketing" such therapy. I urge your readers further caution regarding any practitioner from any discipline who is more involved in the business of medicine, rather than in the practice of same.

With the managed care and cost considerations of 1997 medicine, if insurance companies had one iota of credible evidence that this therapy could prevent expensive surgery (Carotid Endartarectomy, Coronary Artery Bypass, or Aorto-Femoral Bypass) or even treat or prevent heart attacks, strokes or prevent additional hospitalizations, they would be first in line to do so! They emphatically are not! No company pays for chelation therapy because it doesn't work for cardiovascular disease. Its only clinical utility is in the treatment of lead poisoning.

CAVEAT EMPTOR! (Let The Buyer Beware!)

I would be pleased to entertain questions or comments, and thank you for your attention.

[Mickey Mouse & feng shui](#)

feng shui

Feng Shui (pronounced "phung schway" and meaning literally "*wind water*") is part of an ancient Chinese philosophy of nature. Feng shui is often identified as a form of [geomancy](#), divination by geographic features, but it is mainly concerned with understanding the relationships between nature and ourselves so that we might live in harmony within our environment.

Feng shui is related to the very sensible notion that living *with* rather than *against* nature benefits both humans *and* our environment. It is also related to the equally sensible notion that our lives are deeply affected by our physical and emotional environs. If we surround ourselves with symbols of death, contempt and indifference toward life and nature, with noise and various forms of ugliness, we will corrupt ourselves in the process. If we surround ourselves with beauty, gentleness, kindness, sympathy, music and various expressions of the sweetness of life, we ennoble ourselves as well as our environment.

Alleged masters of feng shui, those who understand the five elements and the two energies such as [chi](#) and sha (hard energy, the opposite of chi), are supposed to be able to detect metaphysical energies and give directions for their optimal flow. Feng shui has become a kind of architectural acupuncture: wizards and magi insert themselves into buildings or landscapes and use their metaphysical sensors to detect the flow of good and bad "energy." These masters for hire declare where bathrooms should go, which way doorways should face, where mirrors should hang, which room needs green plants and which one needs red flowers, which direction the head of the bed should face, etc. They decide these things on the basis of their feel for the flow of chi, electromagnetic fields or whatever other form of energy the client will worry about. (If you and your lover are having trouble in the bedroom, call a feng shui master. You probably need to move a few things around to get the bedroom chi flowing properly. Only a person with special metaphysical sensors, however, can tell what really needs to be done.)

In short, feng shui has become an aspect of interior decorating in the Western world and alleged masters of feng shui now hire themselves out for hefty sums to tell people such as Donald Trump which way his doors and other things should hang. Feng shui has also become another New Age "energy" scam with arrays of metaphysical products from paper cutouts of half moons and planets, to octagonal mirrors to wooden flutes, offered for sale to help you improve your health, maximize your potential and guarantee fulfillment of some fortune cookie philosophy.

According to Sutrisno Murtiyoso of Indonesia, in countries where belief in

feng shui is still very strong, feng shui has become a hodgepodge of superstitions and unverified notions which are passed off in the university curriculum as scientific principles of architecture or city planning. Mr. Murtiyoso wrote me about a university lecturer who had written an article in Indonesia's biggest newspaper "advocating feng shui as a guiding principle to Indonesia's future architecture." This upset Mr. Murtiyoso: "if it is done by a so-called 'paranormal', I wouldn't be that mad. But a 'colleague', an architect . . . I just can't imagine how my people can face the next millennium still under this ancient spell. How can we progress....through this techno-jungle." If I were Mr. Muriyoso, I wouldn't worry until the architects start advocating ignoring the laws of physics in favor of metaphysical principles. We still bring in our priests to sprinkle holy water and utter incantations at the dedications of skyscrapers. So far, none have collapsed that I know of. And if being superstitious were a hindrance to progress, we'd all still be wandering the savannas with our hirsute ancestors.

koro (shook yang)

Koro is a psychological disorder characterized by delusions of penis shrinkage and retraction into the body, accompanied by panic and fear of dying. This delusion is rooted in Chinese metaphysics and cultural practices. The disorder is associated with the belief that unhealthy or abnormal sexual acts (such as sex with prostitutes, masturbation, or even nocturnal emissions) disturb the [yin/yang](#) equilibrium which allegedly exists when a husband has sex with his wife, i.e., during "normal intercourse." This disturbance of metaphysical harmony (loss of yang) manifests itself in penis shrinkage. Yang is the vital essence of the male and when inappropriately expelled, it is believed, the result is a potentially fatal dose of koro.

Koro is also thought to be transmitted through food. In 1967, there was a koro epidemic in Singapore after newspapers reported cases of koro due to eating pork which came from a pig that had been inoculated against swine fever. Not only did pork sales go down, but hundreds of koro cases followed. The power of the press to cause panic was matched by their equal power to quell the imbalance they had caused. They gave ample access to the Singapore Medical Association and Ministry of Health who convinced the people that koro was a result of fear, thus ending the epidemic.

ch'i and Chi Kung

1 Nov 2000

Regards your skeptics web site reference to Qi Gong, I thought you might be interested to know of my experiences.

My background is physics and maths and I work in IT, my real passion however is playing Sax (jazz etc) and it was in my constant search for knowledge regards breathing over the last ten years that led me to the [Alexander Technique](#) (first stop of my pre-amble). The benefit that Alexander Technique has brought into the quality of my playing is huge, of course I cant prove that some other development was not responsible but my single mindedness applies to Sax not Alexander Technique and I am not particularly inclined to award credit where it is not due.

If you aren't familiar with Alexander Technique then the basic premise is that our "use" of our bodies starts off near perfect and declines from the age of 4 or 5. The technique does not seek to "add" to a person but simply to remove the bad habits which start as soon as we start to sit in chairs, experience stress etc. I think the "western" mind can relate to this more easily - once people accept that they have accumulated detrimental baggage then the claim that you will "feel better" or have more energy translates only to "you will feel as good as you were meant to be before your life-style interfered".

I would describe the impact of Alexander Technique on my life as huge - it started only in a quest to sound better but the mental and emotional benefits are also there and not to be under-estimated. Its estimated that over 80% of adults do not breathe correctly - some even exhibit a phenomenon called reverse breathing which is detrimental if continued for extended periods. Even the most skeptical doctors readily admit the link between depression and low energy levels and poor shallow breathing.

It seems a shame that modern reductionism has moved us into a position where we separate the mind and body. I was once part of this way of thinking - I now view it as analogous to a mechanic who is only willing to try and repair cars by looking at the engine - unwilling to examine the wheels, suspension etc. I don't accept "new age" beliefs without subjective proof - basically it either makes me sound better (perhaps feel better) or its rejected. Also as a musician I do have

a very sensitive scale - there are enough judges out there to determine quality in the tone of a musician accurately but not necessarily objectively or quantitatively.

I despair that Alexander Technique books are so often found next to books on Crystal Healing - many doctors advocate Alexander technique - it's respectability amongst the acting/musical and general rational community is high. Why do we insist on bagging anything not within the realms of hard science in the "quack" bag - especially since disciplines such as Alexander actually show the limitations of traditional medicine. A case in point - my neighbour is suffering from a severe upper back condition associated with the degenerative condition of the spine - at no point has any doctor or surgeon examined how she uses her body - in other words the possible causes of the condition are neglected - only the physical implications of restorative surgery is considered. I helped this neighbour relieve pain and possibly slow the degeneration simply by showing her how much unnecessary stress she was placing on the upper back through tension and misuse.

If I had encountered Qi Gong before Alexander Technique I would neither have regarded it of value or even understood it (by the way the understanding here is largely physical not cerebral). Now I understand and practice Qi Gong. If you read about it in a Chinese text then the cultural differences may be a problem, on the other hand if you already have learnt a technique suited to Westerners such as the Alexander technique then you may be able to "read through" the descriptive terms such as "Chi" and actually equate them to terms more meaningful to a western frame of reference. I don't buy all the philosophies embodied in Qi Gong but the underlying principles of breath may be translated directly into Alexandrian terms. I certainly experience something which we could call "Chi" and indeed I associate energy with it - but a life force or electrical activity - No ? I don't need these concepts I have already learnt that kinesthetic feedback is faulty - one doesn't need to believe (in the religious sense) in these imagery devices - anyone who learns Alexander Technique has already learnt that due to faulty kinesthetic feedback we often have to resort to imagery - it doesn't mean we believe in it - we just know its a means to an end - the end being enhanced mental and physical well being.

I would humbly suggest that some eastern disciplines will always "suffer in translation" and are also severely compromised when examined by the westerner who already may have totally divorced the mental and physical sides of his being - such a person is not really qualified to comment on the validity of the techniques (except perhaps to raise an eyebrow at some of the more bizarre claims). I am still not sure whether Qi Gong will one day allow me to break bricks in my hands etc - in some ways it doesn't really matter - it helps me breath and play sax better - also I feel better for it.

Personally I am just relieved that I have found a route which is rational and non-quasi religious which has enabled me to rediscover the link between my physical and mental self in a way I could accept. Alexander has done the

Westerner a huge favour by giving us a way in which we can perhaps understand and even benefit from some Eastern techniques whilst maintaining our flavour of objectivity.

Anyway I found your site interesting and probably agree on your prognosis of many "quack" beliefs, I think however you should consider whether a mild skeptical report of a technique such as Qi Gong (over 2000 years old) really deserves to be considered in the same frame of reference as the "Elvis is an Alien" type stuff that seems so popular in contemporary America ?

Jon (Cambridge UK)

reply: I would have no problem if it were simply claimed that Qi Gong can help you breathe better. It's the chi harnessing stuff that belongs right there with Elvis the Alien.

06 Jan 01

Here's something that happened to me that I'd like explained in terms of a scientific paradigm : I'd been practising t'ai chi for perhaps a year and had gone to work on a cruise ship. One night, I was asked what I'd been doing on the beach, and I explained it was a t'ai chi form. The discussion continued and one of the guys offered to show us all our 'third eye'. He pressed his thumb hard into the centre of our foreheads and asked us if we felt anything when he took it away. Hmm. I decided to try something, but had absolutely no idea whether anything would happen, and if anything were to happen, what it might be. I stood in the prescribed chi gung posture and did my best to achieve and maintain the precise body alignments required. None of the people in the room were prepared in any way - and I repeat, I had no idea what might happen myself. I then extended my forefinger to touch the 'third eye' spot of one of the other guys, and stood and waited.

After perhaps 60-90 seconds I felt quite distinctly a squirting sensation in the first joint of my forefinger and also in the centre of the fingertip, about 1/4 inch under the skin. The sensation was directly comparable to the feeling we experience when urinating. At precisely the same moment, the other guy swore quite violently and jerked his head back. Now I know I didn't move externally when this happened - I was concentrating quite hard on relaxing my body and there was no muscle movement. Darren (that was his name) was unable to speak for some moments and when we could get him to try to describe what had happened, all he would say was 'It felt like the back of my head came off'.

I have to say that up to that point I'd been firmly agnostic about the nature/reality of chi (and had clung tenaciously to that agnosticism in the face of many subtle but odd experiences) but this was enough to take me off the fence somewhat. Nobody in the room - least of all myself - had any preconceptions about what would happen, and yet, with no external cues, I experienced a

definite sensation that produced a violent reaction with no external movement.

I also have to say that I prefer an agnostic attitude to that of a skeptic. Skeptics seem to resort to personalities very early in the game, plus experiences such as the one I've just described are written off as 'anecdotal' - if it didn't happen in a lab IT DIDN'T HAPPEN - and there is a real danger that because something doesn't fit with our current model of the universe it's dismissed as either theoretically impossible or fraudulent. Anyone investigating in this field is written off as a nutter.

That doesn't seem especially rational to me. If you can explain the above described incident without calling me deluded or a liar, I'll be really interested. I suspect, however, from other entries in your dictionary, that you won't be able to resist that temptation.

Richard Macnamara

reply: What temptation? I can't explain what happened, but I wouldn't jump to the conclusion that chi was involved. how many times were you able to repeat the experience? If it only happened the once, I'd look for some other sort of explanation. Maybe your friend was struck by [ball lightning](#) and a bit passed over to you (though you thought it was the other way around).

*Mr. Macnamara replies:
8 Jan 2001*

This is the kind of non-answer that gets skeptics a bad name. You see what I mean ? T'ai chi people at least have a model for this stuff - and if you do the exercises, results happen. No, I haven't since tried to repeat the experiment because it seemed as if it might not be healthy for the other person concerned. My sense-data gets written off as unreliable anecdotal evidence and nobody has to look for a proper explanation. Because everybody knows everything already, everybody knows that sort of thing can't happen. Further, by insisting that the sort of thing you look for conforms to the reproducible, mechanistic model you don't look at what is actually there. The trouble with Occam's razor is that it begs the question of what data to include in the first place.

reply: I don't know what to say Richard. All I said was that I can't explain what happened to you and your friend. I suggested one possible explanation, but didn't push it. I don't think the concern over reproducibility is unreasonable, in light of the extraordinary claim being made by you that somehow you tapped into chi and sent a blast that felt like you were urinating out of your finger and it went into your friend's third eye, where it stopped and made him feel like the back of his head was blown off.

You haven't even begun to address the question I posed and by being flippant about it you ensure at least that I don't have to take you seriously either.

reply: Flippant? I don't think so, but you may be an especially sensitive soul. I have consulted my astrotherapist and she is convinced that you and your friend had an OBE or an angel experience. Either that or you were dipping into the booze or LSD.

A book I would recommend is ['Biology as Ideology'](#) in which the whole business of science as religion substitute is addressed with remarkable clarity by a leading geneticist (whose name I forget [Richard Lewontin], but he's big mates with Stephen Jay Gould).

reply: I'm sure it's a great book. I always read books recommended to me by people after they hurl an insult or two. If anything, for some people religion is a substitute for science, i.e., knowledge.

I'm sorry, but you guys display the same inflexibility of thought and the same 'we have the TRUTH dammit' mentality of religious fundamentalists. I make no such claims, but in my experience of these matters, the practise of chi gung or t'ai chi, when taught by someone who actually knows what they're doing, produces results for which our models cannot account. To deny these results is simply to deny what is.

reply: Well, I'm glad to see you aren't dogmatic about it.

Fortunately there are enough people of genuine curiosity out there to begin investigating this stuff without getting hung up on issues of 'scientific correctness' which I'm beginning to identify with its political counterpart as Just Another Limiting Ideology.

reply: Investigate? How can anyone investigate something properly when you consider it demeaning to request that you do it again? You don't want an investigation; you want an affirmation of your preconceived beliefs.

Unfortunately folks like yourself and most egregiously James Randi, the mujaheddin of the scientific community, need to attack anyone doing work in this field and get down to personalities, dismissing their enemies as frauds and/or deluded madmen. Take a look through your database and check out how many personal slurs there are. If you write these people off as loonies, you don't have to look at the data.

reply: I may have been abusive in the early days, but if you look carefully I think you will find that I rarely get personal first. It is usually in response to someone like yourself who first takes it to the personal level. There is no reasoning with some people, so why bother? We might as well have some fun, but only when the other guy starts it. You started it and you've

continued it. You seem to have some preconceived idea as to how I would respond and you responded to your own notion of my response.

And to briefly deal with the nature of the results produced by t'ai chi, why don't you invest some time in this yourself before you deny its existence. I've been paying the exorbitant sum of five pounds sterling per weekly lesson which is a complete waste unless you actually PRACTICE. As a musician, I understand the commitment and discipline required to get the best out of something like this : in my experience, most people don't. When you've spent many hours a day just running scales, which at the time can seem a totally meaningless activity, you begin to understand your own nervous system in a whole new way, and you realise that progress comes in a series of leaps followed by plateaux [?].

reply: Well, it certainly seems to me like you're wasting your money. You're rude, insensitive and don't seem to be able to read.

The other thing is to find a good teacher. If you're genuinely interested, I could recommend one. Our correspondence thus far makes me doubt that you'd have the openness of mind required to make much progress.

Be happy in your certitude,

Richard Macnamara

reply: Do other people take your recommendations seriously after you've insulted them? Do others mistake your attitude for open-mindedness? What did you expect me to say? You know, Richard, I see now that chi is real. You have persuaded me by your anecdote. I will henceforth abandon all criticisms of chi. Maybe you do have a blockage somewhere and maybe you have progressed from where you began, but your response indicates that you are not in any position to give others advice on how to evaluate anything.

4 Sep 00

Just thought I would put my 2 cents worth on the subject of chi.

I agree that that chi does not exist but it seems that those who think it does can do some nifty things. I would point out the Shaolin Monks as one example and this guy who keeps showing up on "Ripley's Believe it or Not" as another.

The Monks can raise or lower body temperature at will take all sorts of physical punishment with nary a mark. This Ripley's guy has (under scrutiny) used the "touch of death" to render people unconscious. Now, I know that they aren't tapping in to some otherworldly force, but shouldn't some study be done

to see how these things happen?

reply: Yes. Somebody should also try to determine if the claims are true.

Chances are that the monks have superior physical conditioning and are more aware of what their bodies are capable of and the touch of death fellow knows some nifty pressure points, yet I can't help but be intrigued. Your page on chi wasn't to clear on who debunked what and where. I would be interested in knowing more about the tests and how they were conducted. You picked the easy ones, (well, breaking a brick isn't easy per se) how about some of the harder parlor tricks? I'm sure in all cases that it is explainable, but I want to know how to do these things without the religious mummery that surrounds them.

Paul MacDonald

reply: Conjuring is not my specialty. See [The Psychic Mafia](#), [Secrets of the Psychics](#), [All the Secrets of Magic Revealed: The Tricks and Illusions of the World's Greatest Magicians](#), [A Magician Among the Spirits](#), [Miracle Mongers and Their Methods](#), [Indian Skeptic](#), and a great documentary on Indian miracle workers called "Guru Busters."

24 Aug 2000

I haven't tried reviving flies but I have revived wasps and an ant. Both have quite amazing powers of recovery.

The wasps were drowning (i.e. running out of oxygen due to being immersed in a liquid - lack of lungs notwithstanding!) in a public fountain. I lifted out as many as I could and set them to dry on the stone rim of the fountain. Almost all of them recovered enough to fly away. The ant was one I stood on, on sandy ground, with my full weight, and twisting my foot. Over a few minutes, it recovered and went on its way, apparently unharmed.

Just goes to show that it is one thing to do an experiment, it is quite another to interpret the results. The fly experiment you cited (March/April 1994 issue of "Karate International") is, of course, useless as an experiment because there is no control fly that does not get exposed to chi, let alone a reasonable number of flies to allow for variation between individuals. In short, it was crap, not science.

Norman Paterson, University of St Andrews

22 Aug 2000

I have just been reading some of your readers' comments on chi. The defensive and angry stance of skeptics is interesting to me - why feel so threatened by something just because you don't understand it? There is in fact nothing mystical about chi, it is simply life energy. I don't know anything about transferring knowledge via chi or bringing flies to life - that does sound like codswallop to me - but until you have felt chi move through your body as a direct result of simply moving your hand, you can hardly claim to know what you are talking about. And no, this is not "runner's high", or the result of releasing tensed up muscles - I have experienced chi while simply relaxing, standing still first thing in the morning and practising basic chi gung hand exercises. And no, it hasn't taken me years to learn how to do this - more like months. And no, it didn't cost much. The school where I learn Shaolin Kempo and Chen style tai chi provides straightforward instruction at a cost that would compare favourably to gym memberships and many sports. The point you seem to be missing is that nobody who practises chi gung, acupuncture, acupressure and the like claim there is anything mystical about it. Chi is no more supernatural than the air we breathe. There will always be opportunists who try to capitalise on people's ignorance and give those with real knowledge a bad name. The sad thing is, your skepticism is just ignorance in another form.

Krista Huls

reply: Thank you for setting the record straight and helping me gain knowledge and remove my ignorance about chi. But I am a bit puzzled. On the one hand you dismiss out of hand the beliefs of others who, like you, think chi is real. Yet, you say you've never heard of such notions. Then, you say that there is nothing mystical about chi. I agree. But then you say that those who have not felt chi can't know chi; or, in short, to know chi is to feel chi. I agree with that, too. But it is a giant epistemological leap to conclude that one's subjective experience defines reality, which is what you seem to be claiming. For, despite your subjective feelings of energy, no objective detection or measurement of energy has ever been made of chi. I find this mysterious. Every other energy we can feel, we can also detect and measure objectively.

You say that chi is no more supernatural than the air we breathe. Well, if you followed that up with the claim that chi is just the feeling we get when we breathe a certain way and introduce more oxygen to blood stream, etc., then I might think you were a serious investigator of these things. As it is, you come across as someone who is easily satisfied with an explanation that fits what you want to believe and who does not seek contrary evidence in an effort to avoid error. Your observations are unlikely to assist anyone investigating these matters.

Krista replies

23 Aug 2000

Feel free to stay ignorant about chi or anything else, it is you who is missing out. You too are letting your subjective experience (or rather lack of) define

your idea of reality by claiming there is no such thing as chi just because you haven't seen, felt or measured it. People just like you once denied the existence of germs, molecules, the earth being round and many other things that they had not seen, felt or measured. My point was that it's pretty closed-minded to attack something if you have never experienced it or tried to experience it. You have every right to doubt phenomena that you have no proof of, I too doubt a lot of things I hear, but I am not so arrogant as to completely dismiss them just because they are outside my realm of experience. I was pretty skeptical about chi when I first started chi gung (energy cultivation) practise - my objective was to improve my kempo through relaxation and grounding my stance in tai chi, but I have felt something called chi, prana, life force, energy, call it what you will, that flows through my body when I do certain tai chi exercises, it's not something I can explain any other way.

Krista Huls

reply: I believe you.

10 Dec 99

First off, I like the page. I tend to be a skeptic. I don't try to be, but basically I just have a hard time buying all that crap. For things I'm not informed enough to dispel in my mind, but doubt anyway, the dictionary is really enlightening.

Basically I read the comments on Chi power and Chi gung, and although I don't want to spend too much time on this, I felt I had something to add for the side of skepticism. So if there's room to post this, and it sounds worthy, I'd appreciate it.

Hasn't anyone who ever took any Chi based arts ever had a decent working knowledge of physiology? Chi-based arts have been around for hundreds of years with thousands of people practicing it for many hours. All these Chi effects a result of the fact that over all these years Chi practitioners have learned to manipulate the body to create a variety of physiological effects. I took Tai Chi and Kung Fu from the same instructor and I could tell that a lot of the effects I felt were simply results of changes in blood flow and muscle tension resulting from precise exertion. Even my instructor admitted these things played a role. Increased blood flow causes heat; releasing of tensed muscles causes what can be interpreted as waves of pleasure. I could try to give specific examples from my experiences, but I guess the most well known example would be how you get a head rush or things get dark when you stand up too fast from sitting because of blood flow. It's augmented because people really want to believe and that affects their interpretations and memories of what happens. If they weren't, they might assume their muscles, circulatory, and nervous systems were reacting to strange positions instead of attributing it to a mystical power. The whole mystical power idea probably comes from the origins of the Chi arts when so little was known about physiology that appropriate explanations were

beyond their capacity so it was attributed to mystical powers. Bigger arms, legs, and strength as well as the burn from weight lifting aren't considered to originate from mystical sources and neither should the sensations of Tai Chi and similar exercise.

Scott Hartl

For several years I practiced Asian martial arts for fun and fitness. Last year, however, I quit altogether when the claims made by certain practitioners about the extraordinary feats of Chi Kung (Qi-Gong) they had performed or witnessed became too much for me to remain silent about, and I was made unwelcome for not sharing the belief they had in them.

In my city, London, Ontario, Canada, there are more than thirty-five martial arts schools, teaching over 3,000 students, many of them children. Not all of these schools cultivate a mystical approach to martial arts, but many of them do. One local teacher claimed that his own instructor could teach merely by touching - the transmitted chi contained the day's lesson!

Martial arts literature is resplendent with claims about Chi K'ung. A full page advertisement in "Inside Kung-Fu" magazine boasts that the "Scientific Premium Company USA" can "instruct you how to develop Chi Power." For a mere \$47.95 (plus shipping and handling) you receive a "Chi Power Poster, Chi Power Plus Booklet...plus instructions of how to create a Chi Power Voice." An additional \$29.95 gets you a "Pressure Point Chart." Says the blurb, "Move objects with Chi Power without touching them. Move an object with your eyes only. Extinguish a candle flame with your eyes only. Lift a bowl of water with Yin Chi...repel birds, dogs, with your eyes only...erase pain completely with Pressure Points...for most, it works the first day! But if you need help phone us toll free!"

I have so far resisted the lure of learning these "dark secrets of the Orient," but it is heartening to know that there is a 1-800 customer service line available in the event I am unable to perform such feats of Chi K'ung as "repelling birds." (Which reminds me of comedian Steven Wright's line that he "can levitate birds - but nobody cares.")

What's distressing is that this advertisement ran monthly in this magazine and a few others for more than a year. For all I know, it still is running. So it seems likely that the Scientific Premium Company is getting at least enough responses to pay for their ad.

The March/April 1994 issue of "Karate International" contains an article in which the author, James Patrick Lacy, having courageously chosen to "let science decide" describes an experiment where a master of Chi-Kung brought a fly back from the dead using his chi. Lacy describes,

"A fly is caught and put inside a small ginseng bottle...the bottle is filled with water...the fly becomes lifeless looking and the water is drained. The fly is put on a piece of paper while I watch (the Qi-Gong master) wave his healing Qi over the fly about seven times. We sit back and wait a few minutes...the experiment is concluded as I watch the fly start to walk around again."

Lacy breathlessly concludes, "many speak about authentic Qi, but few attempt to prove it in such authentic classical experiments." One can scarcely imagine why.

The consequences of all this are not insignificant. While the belief in chi is deeply rooted in Asian culture, in the west, many people are being persuaded to believe that Chi Gong can impart psychokinetic powers, invulnerability to physical injury, illness, even HIV, according to one recent article in "Inside Kung-Fu".

Students at one martial arts school I attended performed exercises to cultivate "inner power" and "body hardness," which included permitting others to strike their stomach, shins, thighs, and forearms, even solar plexus and rib cage with full power punches and kicks. Since I was not paying \$75 a month to receive internal injuries, I stopped going.

Many of those being punched over and over in the stomach to develop their "Chi power" were minors, and nothing was ever said about what the long-term consequences of such beatings might be, not to mention the immediate risk of allowing oneself to be hit. Students who were injured were admonished that they must redouble their efforts to prevent further injury!

I even know a physics major who insisted that his teacher could use his chi to send a student "flying across the room" with the merest touch. I admonished him that slugging a student and causing him to fall over is hardly evidence of psychokinetic abilities, but he was quite adamant that such a thing was possible. I put it down to [communal reinforcement](#).

Graham Broad

01 Jan 1997

I was just reading your wonderful dictionary when I came across the "bringing the fly back from the dead" story in the entry on Chi. This is an old bar bet I've done many times. Try it to impress your friends. Here's how it goes:

First catch a fly without injuring it, (this is harder than you might think!). Then you must "drown" the fly in water, (this is

also rather tricky, it's hard to keep the little guy under the water. This will take a while). Next put the "dead" fly on a paper towel. If you like you may add some magic powder (salt). Soon the fly will come back to life, (and you didn't even have to use CPR!). Now declare yourself a god and demand to be worshipped.

The reason this works is that a fly has no lungs, it can't drown. Being submerged just puts it into shock. When the fly dries out, (the salt helps to draw out the water) it seems to come back to life. I learned this trick from some old TV movie. I can't remember what it was called or what it was about, but I thought the trick was really cool.

Thanks for providing one of the best sights on the net!
Peter Sosna

30 Mar 1998

Hi Mr. Carroll, I just read your article about the Qi-Gong article, and I'm wondering why you never gave any explanation for the feats, which I've personally seen and inspected, of breaking chopsticks with paper, or bending a pole of real steel with their necks. They have offered the explanation of Qi-Gong but you have not offered any other scientific explanation. Why is that? Until you do, shouldn't we assume that they're right? I have personally inspected with my hands the bent steel, and found that it was real steel, and I inspected the chopsticks before they were broken and found them to be real and normal chopsticks as well. Where's your "scientific" explanation of these seemingly impossible feats?

Winston

reply: You don't need a "scientific" explanation of these events. They are "seemingly impossible" only because you know nothing about magic tricks and deception. Furthermore, why do you conclude that because you have been given a metaphysical explanation of an event, you should assume that explanation is the best possible until proved otherwise?

17 Jun 1996

I read what was written about "chi" in your dictionary. I think your skeptic attitude is justified. For every good thing, there is someone else who will attempt to control it or profit from it. There are many who prey on the gullibility of others. I have my own thoughts on what chi may indeed be, being a

skeptic also. After training in Kenpo and kung-fu for over a decade, I believed I have experienced many times the wonderful feeling that chi can bring. It's not supernatural but it is powerful. Probably, every athlete has experienced chi power at one time. Basically, it's just runner's high. That super juiced up feeling that comes with hours of training and pushing the body and mind to its limits. The body merely releases an adrenaline dump through the system... increasing ones strength and endurance. However; adrenaline contains cortisone like properties which, in larger than normal amounts(like those from intense exercising), can cause psychotic like reactions and illogical thought processes. An adrenaline HIGH. Just like a weak hit of LSD that only lasts 10-20 minutes.

The same thing can happen during stressful events or in individuals that suffer from panic attacks. The feeling one gets during an adrenaline high while in a controlled state like a breathdown after an intense workout can be overpowering. One is truly at one with their body. The practitioners of chi feel as though they are stronger (which they are for a little bit) and faster (which they temporarily are as well). The effect on their mind allows them to block out background stimuli and focus on their goal more effectively. All of this is what any athlete is aiming for, because it allows them to perform better. A chi master would merely be an individual who can control when their adrenaline dumps. i.e.: like a boxer when the bell rings or a swimmer seconds before the starting signal. No big mystery... The shit about healing? Refer to acupuncture or else read about how aliens brought the ancients great healing powers from Atlantis and gave us magic beans! I never give much credit to the great healing powers of chi. Better immune system? That's probably because chi practitioners are suppose to be really healthy athlete's. Know anyone who claims these powers who sits around all day snarfing back beer and cheetos?

Incidentally, this same response that describes chi as an adrenaline rush also describes the Christian feeling of "the holy spirit". From all accounts that I have heard they merely describe their brush with god's power and do no more than to describe a body's defensive response to a nervous situation. Keep up the good work.

palmistry or chiromancy

Palmistry is the practice of telling fortunes from the lines, marks, and patterns on the hands, particularly the palms.

Palmistry was practiced in many ancient cultures, such as India, China and Egypt. The first book on the subject appeared in the 15th century. The term 'chiromancy' comes from the nineteenth century palmist who went by the name of Cheiro. (The Greek word for hand is *cheir*.)

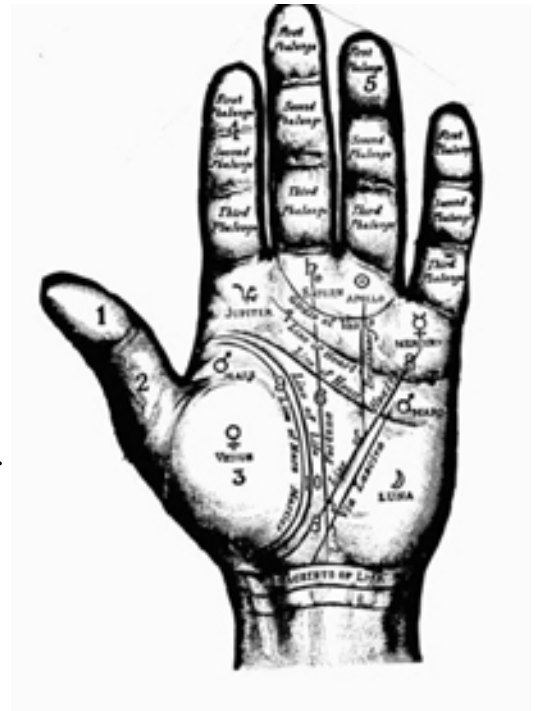

Palmistry was used during the middle ages to detect witches. It was believed that certain spots on the hand indicated one had made a pact with the Devil.

Palmistry was condemned by the Catholic Church but in the 17th century it was taught at several German universities (Pickover, 64). Britain outlawed palmistry in the 18th century. It is popular enough in America in the 20th century to deserve its own book in the [Complete Idiot's Guide](#) series.

According to Ann Fiery (*The Book of Divination*), if you are right handed, your left hand indicates inherited personality traits and your right hand indicates your individuality and fulfillment of potential. The palmist claims to be able to read the various [lines on your hand](#). These lines are given names like the *life line*, the *head line*, the *heart line*, the *Saturne line*. The life line supposedly indicates physical vitality, the head line intellectual capacity, the heart line emotional nature, etc.

Some palmistry mimics [metoposcopy](#) or [physiognomy](#). It claims that you can tell what a person is like by the shape of their hands. Creative people have fan-shaped hands and sensitive souls have narrow, pointy fingers and fleshy palms, etc. There is about as much scientific support for such notions as there is for [personology](#) or [phrenology](#). All such forms of divination seem to be based on [sympathetic magic](#) and intuition.

The authors of *The Complete Idiot's Guide to Palmistry*, Robin Giles and Lisa Lenard, claim that "palmistry works because your hand changes as you do." They claim to have a few anecdotes to back them up on this, but fail to produce any scientific support for the claim. They also think that cloning

makes it much easier for us to understand how palmistry works. "Palmistry is possible because you are represented in your hand. No two hands are alike because you--and your cells--are unique." True, and they are as likely to discover whether I will marry a rich woman or find the job of my dreams by looking at my cells as by looking at my palms.

Although you can often tell a lot about a person by examining his or her hands, there is no scientific support for the claim that you tell such things as whether you will inherit money or find your true love from the lines or marks on your hands. I suspect that many of those who think they have found support for palmistry are guilty of [confirmation bias](#) and have found it in the form of [anecdotes](#).

The desire for knowledge of the future seems to be at the root of palmistry and other forms of [divining](#) secret knowledge through paranormal revelations. Also, fortune tellers relieve us of the obligation to gather evidence and think about that evidence. Our palmists and [graphologists](#), etc., also relieve us of the difficult task of evaluating the consequences of taking various actions. They absolve us of the responsibility of decision-making. They are great comforts, therefore, to the insecure, the lazy, and the incompetent. Of course, they can also be data points, i.e., they provide one more piece of data that a person can use to make a decision. Some writers even use divination such as the [Tarot](#) or the [I Ching](#) to give them ideas for characters or plots (Pickover, 40-41). They probably could do just as well by thumbing through the Bible, a newspaper, a poetry anthology, an encyclopedia, or a skeptical dictionary.

metoposcopy

Metoposcopy is the interpretation of facial wrinkles, especially those on the forehead, to determine the character of a person. It is also used as a type of [divination](#) and has been used in conjunction with [astrology](#). This [pseudoscience](#) was invented by the great 16th century mathematician, physician, and astrologer Gerolomo Cardano (1501-1576). Legend has it that Cardano starved himself to death at the age of seventy-five rather than live and run the risk of falsifying his horoscope and thereby discredit his beloved astrology.

The drawing reproduced here is from Cardano's [Metoposcopia](#) and shows the position of the planets on the wrinkles of the forehead. Cardano's science of forehead reading did not catch on, unlike the typhus fever of which he gave the first clinical description.

In all, Cardano worked up about 800 facial figures, each associated with astrological signs and qualities of temperament and character. He declared that one could tell by the lines on her face which woman is an adulteress and which has a hatred of any lewdness. Long, straight furrows indicate nobility of character. He claimed to be able to tell the generous from the trickster by their distinct lines and noted that having three curved furrows on the forehead proves one is a dissolute simpleton. The strongest feature of metoposcopy is that it is a non-invasive method of quickly assessing character. Its weakest features are that it has no scientific merit, although it can be easily verified by [confirmation bias](#), and it is very cumbersome to have over 800 character traits to consider.

physiognomy

Physiognomy is the interpretation of outward appearance, especially the features of the face, to discover a person's predominant temper and character. Physiognomy has also been used as a kind of [divination](#) and is often associated with [astrology](#). The faces depicted here are from Barthélemy Coclès *Physiognomonica* (1533) and show eyelashes of men who are proud, vainglorious and audacious.

Coclès, like others before and after him, tried to create a science out of something each of us does from time to time: judge a person by his or her facial characteristics. Physiognomists like Coclès are wont to say things such as "people with snub noses are vain, untruthful, unstable, unfaithful and seducers." The snub-nosed of the world tend to snub their noses at such [pseudoscientific](#) drivel.

In the 18th and 19th centuries, physiognomy was used by some of its proponents as a method of detecting criminal tendencies. Many bigots and racists still use physiognomy to judge character and personality. This is not to say that there are not certain physiognomic features associated with certain genetic disorders such as [Down's syndrome](#) or [Williams Syndrome](#). The advocates of physiognomy, however, probably wouldn't know what a genetic disorder is.

personology

People with thin, soft, looser or porcelain-like skin tend to be more impressionable both emotionally and physically....Those with thin, fine hair are refined emotionally....A thick, full lower lip indicates spontaneous generosity to friends and strangers as well as talkativeness....A ski-slope upturned nose person will usually be...a poor money manager.

--[George Roman](#), personology expert

Personology is a New Age variation of the ancient pseudoscience of [physiognomy](#), which holds that outward appearance, especially the face, is the key to a person's predominant temper and character. The theory of personology, like [graphology](#), seems to be based on [sympathetic magic](#) and intuition.

Personology was developed in the 1930s by Edward Jones, a Los Angeles judge, according to [Naomi Tickle](#), author of *It's All in the Face -The Key to Finding Your Life Purpose* (1997). She is also the founder of the International Centre for Personology (not to be confused with the Personology Institute of San Diego nor the [Institute for Advanced Studies in Personology and Psychopathology](#) in Coral Gables, Florida). According to Ms. Tickle, the judge "became fascinated by the relationship between facial features and behavior patterns of the people who appeared before him in court." Then, like many naive people, he thought his personal observations were free of bias and constituted scientific data. Judge Jones even taught his "new science" to the public.

Judge Jones may have been very good at [cold reading](#), but he did not do [controlled experiments](#) to minimize the effects of the [self-deception](#) and [confirmation bias](#) that hinder all of us from properly evaluating our experiences. He should have been especially concerned about the [Forer effect](#), given the history of other similar attempts at [divining](#) character, such as [astrology](#) and [phrenology](#).

Judge Jones made the same mistake that Franz-Joseph Gall, the creator of [phrenology](#), made: he thought he observed a pattern and made no effort to scientifically test his thought. Gall thought he saw a pattern between bumps on the head and types of insanity and criminality. Jones thought he saw a pattern of facial similarities of people charged with similar crimes. Neither considered that once they came to believe in these notions, they would find it easy to confirm their beliefs.

According to Ms. Tickle, the "science" was done by Robert L. Whiteside, a newspaper editor, who "used 1068 subjects and found the accuracy to be better than 90%." Whiteside is the author of *Face Language* (New York, F. Fell Publishers; 1974). Whiteside became an advocate after watching Jones do a cold reading of his wife at a public lecture. Whiteside was amazed that Jones could know so much about his wife without knowing her. One searches in vain, however, for publications by Mr. Whiteside in scientific journals. Although Whiteside and his work have been universally ignored by the scientific community, the growth of personology has not been hindered.

Further "science" has been added by another Whiteside. According to [Bill Whiteside](#), who says he was trained by Robert Whiteside, there is a scientific connection between genetics and behavior and genetics and physical appearance. Therefore, he concludes in a lovely non sequitur, there must be a connection between behavior and physical appearance.

Over the years, [scientists] have conclusively proven that our genetic inheritance shows up in our structure and, therefore, so do our behavior patterns.

He might as well argue that since eye color is genetically determined, eye color is a key to understanding personality.

According to Bill Whiteside,

There are 68 behavioral traits in Personology. A trained observer identifies each one with sight, measurement or touch. There are five trait areas: Physical, Automatic Expression, Action, Feeling and Emotion, and Thinking. The placement of each trait into an area develops logically from its location and relationship to a corresponding area of the brain

This all sounds very scientific, but nothing we know about the brain supports these notions.

In short, personology is attractive because its proponents are amazed at how accurate it is. Their amazement is largely due to lack of understanding of such things as [the Forer effect](#), [cold reading](#), and [confirmation bias](#). The belief in personology is strengthened by the fact that its advocates seek only confirmatory data for their belief. They not only ignore all the data from the neurosciences that contradict their beliefs, they do not systematically attempt to test them in ways that might prove them false.

See related topics on [graphology](#) and [sympathetic magic](#).

[At the DOE, Dowsing
for Dollars The feds
make an investigation
into the paranormal](#)

Leon Jaroff, *Time*,
April 23, 2002

dowsing (a.k.a. water witching)

Dowsing is the action of a person--called the *dowser*--using a rod, stick or other device--called a *dowsing rod*, *dowsing stick*, *doodlebug* (when used to locate oil) or *divining rod*--to locate such things as underground water, hidden metal, buried treasure, oil, lost persons or golf balls, etc. Since dowsing is not based upon any known scientific or empirical laws or forces of nature, it should be considered a type of [divination](#). The dowser tries to locate objects by occult means.

Map dowsers use a dowsing device, usually a pendulum, over maps to locate oil, minerals, persons, water, etc. However, the prototype of a dowser is the field dowser who walks around an area using a forked stick to locate underground water. When above water, the rod points downward. (Some dowsers use two rods. The rods cross when above water.) Various theories have been given as to what causes the rods to move: electromagnetic or other subtle geological forces, suggestion from others or from geophysical observations, [ESP](#) and other paranormal explanations, etc. Most skeptics accept the explanation of William Carpenter (1852). The rod moves due to involuntary motor behavior, which Carpenter dubbed [ideomotor action](#).

Does dowsing work?

Of more interest than why the rods move, however, is the issue of whether dowsing works. Obviously, many people believe it does. Dowsing and other forms of divination have been around for thousands of years. There are large societies of dowsers in American and Europe and dowsers practice their art every day in all parts of the world. There have even been scientists in recent years who have offered proof that dowsing works. There must be something to it, then, or so it seems.

The [testimonials](#) of dowsers and those who observe them provide the main evidence for dowsing. The evidence is simple: dowsers find what they are dowsing for and they do this many times. What more proof of dowsing is needed? The fact that this pattern of *dowsing and finding something* occurs repeatedly leads many dowsers and their advocates to make the causal connection between dowsing and finding water, oil, minerals, golf balls, etc. This type of fallacious reasoning is known as [post hoc](#) reasoning and is a very common basis for belief in paranormal powers. It is essentially unscientific

and invalid. Scientific thinking includes being constantly vigilant against self-deception and being careful not to rely upon insight or intuition in place of rigorous and precise empirical testing of theoretical and causal claims. Every controlled study of dowsers, including the "[Scheunen](#)" study [see below], has shown that dowsers do no better than chance in finding what they are looking for.

Most dowsers do not consider it important to doubt their dowsing powers or to wonder if they are self-deceived. They never consider doing a [controlled scientific test](#) of their powers. They think that the fact that they have been successful over the years at dowsing is proof enough. When dowsers are scientifically tested and fail, they generally react with genuine surprise. Typical is what happened when James Randi tested some dowsers using a protocol they all agreed upon. If they could locate water in underground pipes at an 80% success rate they would get \$10,000 ([now the prize is over \\$1,000,000](#)). All the dowsers failed the test, though each claimed to be highly successful in finding water using a variety of non-scientific instruments, including a pendulum. Says Randi, "the sad fact is that dowsers are no better at finding water than anyone else. Drill a well almost anywhere in an area where water is geologically possible, and you will find it."

Some of the strongest evidence for dowsing comes from Germany and the so-called "Scheunen" or "Barn" experiment. In 1987 and 1988, more than 500 dowsers participated in more than 10,000 double-blind tests set up by physicists in a barn near Munich. (*Scheune* is the German word for barn.) The researchers claim they empirically proved "a real dowsing phenomenon." [Jim Enright of the Scripps Institute of Oceanography evaluated the data](#) and concluded that the so-called "real dowsing phenomenon" can reasonably be attributed [to chance](#). His argument is rather lengthy, but here is a taste of it:

The long and the short of it is that dowsing performance in the Scheunen experiments was not reproducible. It was not reproducible inter-individually: from a pool of some 500 self-proclaimed dowsers, the researchers selected for their critical experiments 43 candidates whom they considered most promising on the basis of preliminary testing; but the investigators themselves ended up being impressed with only a few of the performances of only a small handful from that select group. And, even more troublesome for the hypothesis, dowsing performance was not reproducible intra-individually: those few dowsers, who on one occasion or another seemed to do relatively well, were in their other comparable test series usually no more successful than the rest of the "unskilled" dowsers (Enright "Water Dowsing: the Scheunen Experiments," *Naturwissenschaften*, vol. 82 1995).

The Barn study itself is curious. It seems clearly to have been repudiated by

another German study done in 1992 by a group of German scientists and skeptics. The [Gesellschaft zur wissenschaftlichen Untersuchung von Parawissenschaften \(GWUP\)](#) [Society for the Scientific Investigation of the Parasciences] set up a three-day controlled test of some thirty dowzers, mostly from Germany. The test was done at Kassel, north of Frankfurt, and televised by a local television station. The test involved plastic pipe buried 50 centimeters in a level field through which a large flow of water could be controlled and directed. On the surface, the position of the pipe was marked with a colored stripe, so all the dowzers had to do was tell whether there was water running through the pipe. All the dowzers signed a statement that they agreed the test was a fair test of their abilities and that they expected a 100% success rate. The results were what one would expect by chance (Randi, 1995). Defenders of dowsing do not care for these results, and continue to claim that the Barn study provides scientific proof of dowsing.

another German study

Further evidence for dowsing has been presented by the Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) [the German Society for Technical Co-operation] sponsored by the German government. They claim, for example, that in some of their water dowsing efforts they had success rates above 80% "results which, according to responsible experts, could not be reached by means of classical methods, except with disproportionate input." Of particular interest is a report by University of Munich physicist Hans-Dieter Betz, "[Unconventional Water Detection: Field Test of the Dowsing Technique in Dry Zones](#)," published in the *Journal of Scientific Exploration* in 1995. (This is the same Betz who, with J.L. König, authored a book in 1989 on German government tests proving the ability of dowzers to detect [E-rays](#).) The report covers a ten-year period and over 2000 drillings in Sri Lanka, Zaire, Kenya, Namibia, Yemen and other countries. Especially impressive was an overall success rate of 96 percent achieved in 691 drillings in Sri Lanka. "Based on geological experience in that area, a success rate of 30-50 percent would be expected from conventional techniques alone," according to Betz. "What is both puzzling yet enormously useful is that in hundreds of cases the dowzers were able to predict the depth of the water source and the yield of the well to within 10 or 20 percent. We carefully considered the statistics of these correlations, and they far exceeded lucky guesses."

Betz ruled out chance and the use of landscape and geological features by dowzers as explanations for their success. He also ruled out "some unknown biological sensitivity to water." Betz thinks that there may be "subtle electromagnetic gradients" resulting from fissures and water flows which create changes in the electrical properties of rock and soil. Dowzers, he thinks, somehow sense these gradients in a hypersensitive state. "I'm a scientist," says Betz, "and those are my best plausible scientific hypotheses at this point....we have established that dowsing works, but have no idea how or

why."

There are some puzzling elements to Betz's conclusions, however. Most of his claims concern a single dowser named Schröter. Who observed this dowser or what conditions he worked under remain unknown. Betz is a physicist and what knowledge he has of hydrogeology is unknown. Furthermore, Betz's speculation that dowsers are hypersensitive to subtle electromagnetic gradients does not seem to be based upon scientific data. In any case, the hypothesis was not tested and I am not sure how one would go about testing such a claim. At the very least, one would expect that geological instruments would be able to detect such "electromagnetic gradients."

When others have done controlled tests of dowsers, the dowsers do no better than chance and no better than non-dowsers (Vogt and Hyman; Hyman; Enright 1995, 1996; Randi 1995). Some of Betz's data are certainly not scientific, e.g., [the subjective evaluations Schröter](#) regarding his own dowsing activities. Much of the data is little more than a report that dowsing was used by Schröter and he was successful in locating water. Betz *assumes* that chance or scientific hydrogeological procedures would not have produced the same or better results. It may be true that in one area they had a 96% success rate using dowsing techniques and that "no prospecting area with comparable sub-soil conditions is known where such outstanding results have ever been attained." However, this means nothing for establishing that dowsing had anything to do with the success. Analogous sub-soil condition seems to be an insufficient similarity to justify concluding that dowsing, rather than chance, or use of landscape or geological features, must account for the success rate.

Betz seems to have realized that without some sort of testing, reasonable people would not accept that it had been established that dowsing is a real phenomenon based upon the above types of data. He then presents what he calls "tests" to establish that dowsing is real. The first test involves Schröter again. A Norwegian drilling team dug two wells and each failed to hit water. The dowser came in and allegedly not only hit water but predicted the depth and flow. Apparently, we have the dowser's own word on this. In any case, this is not a test of dowsing, however impressive it might seem.

In the second test, Betz asserts that dowsers can tell how deep water is because "the relevant biological sensations during dowsing are sufficiently different to allow for the required process of distinction and elimination." He has no evidence for this claim. In any case, in this "test" Schröter again is asked to pick a place to dig a well and again he is successful. This time his well is near a well already dug and known to be a good site. Betz claims that there were some geological formations that would have made the dowser's predictions difficult, but again this was not a scientific test of dowsing.

The third test was a kind of contest between the dowser and a team of hydrogeologists. The scientific team, about whom we are told nothing

significant, studied an area and picked 14 places to drill. The dowser then went over the same area *after* the scientific team had made their choices and he picked 7 sites to drill. (Why they did not both pick the same number of sites is not explained.) A site yielding 100 liters per minute was considered good. The hydrogeologists hit three good sources; the dowser hit six. Clearly, the dowser won the contest. This test does not prove anything about dowsing, however. Nevertheless, I think Herr Schröter should knock on [James Randi's](#) door and be allowed to prove his paranormal powers under controlled conditions. If he is as good as he and Betz say he is, he should walk away a very rich man.

Betz has written a very long report, which is little more than a testimonial to the paranormal dowsing powers of Herr Schröter and a reiteration of the claims made for the Barn study. He would have done better to have set up a controlled, double-blind experiment with the dowser, one which does not allow the dowser himself to determine the conditions of the experiment and one which did not have as many uncontrollable variables as those rampant in the ten-year project.

dreams

Dreams are mental activities occurring during sleep. Most dreams occur in conjunction with rapid eye movements; hence, they are said to occur during [REM-sleep](#), a period typically taking up 20-25% of sleep time. Infants are believed to dream during about 50% of their sleep time. Dreams occurring during non-REM periods are said to occur during NREM-sleep.

Sleep researchers divide up sleep time into stages, mainly defined by the electrical activity of cortical neurons represented as [brain waves by an electroencephalograph \(EEG\)](#). The EEG records electrical activity in the brain by connecting [surface electrodes to the scalp](#). The stages of sleep occur in sequence and then go backward to stage 1 and REM-sleep about 90 minutes later. This cycle recurs throughout the night with the REM period typically getting longer at each recurrence. Typically, a person will have four or five REM periods a night, ranging from 5 to 45 minutes each in duration. There is some evidence, however, that REM-sleep evolved before dreaming and that the two are independent of one another.¹

The REM-dream state is a neurologically and physiologically active state. When a person is in deep sleep there is no dreaming and the waves (called *delta* waves) come at a high amplitude about 3 per second. In REM-sleep, the waves come at a rate of about 60-70 per second and the brain generates about five times as much electricity as when awake. Blood pressure, heart rate, breathing rate, etc. can change dramatically during REM-sleep. Since there is generally no external physical cause of these states, the stimuli must be internal, i.e., in the brain, or external and non-physical. The latter explanation--that dreams are a gateway to a paranormal or supernatural realm--seems to be largely without merit, although it is very ancient. Each of the following may have contributed to this misconception: dreams of dead persons, dreams of being in distant places or of traveling back or forth in time, dreams that seem prophetic, and dreams that are so strange, curious or bizarre that they call out for a paranormal interpretation. The fact that the part of the brain that controls REM is the pons, a primitive section of the brain stem that controls reflexes like breathing, would support the notion that the stimuli for the physiological changes that take place during REM originate internally.

Nowadays, hardly anyone believes that dreams are messages from the gods.

But some parapsychologists, such as [Charles Tart](#), believe that dreams offer entry into another universe, a [paranormal](#) universe of [OBEs](#), cosmic messages, and blissful nirvana. His main evidence for this seems to be his personal faith and an anecdote about his baby sitter. He claims the unnamed baby sitter (he calls her "Miss Z") had the power to leave her body during sleep. He claims he tested his [flying babysitter](#) in his sleep lab at UC Davis after she told him that she "thought everyone went to sleep, woke up in the night, floated up near the ceiling for a while, then went back to sleep." Other psychologists might have been concerned for the mental well-being of "Miss Z" and the safety of his or her children. Tart was intrigued. He put a number on a shelf, hooked up "Miss Z" to an EEG machine and put her to bed. She claims that even though she didn't read the number on the shelf, she flew around the room the first few nights. She didn't get the number right until the fourth night. Skeptics think either Tart is making up the story or it took the girl four nights to figure out how to trick the scientist. (See Tart's 'A Psychophysiological Study of Out-of-the-Body Experiences in a Selected Subject,' *Journal of the American Society for Psychical Research*, 1968, 62, pp. 3-27.) Others have investigated the question of whether the mind is open to telepathic input during sleep and have failed to find evidence of psychic ability while dreaming. Scientific research by psychiatrist Montague Ullman and parapsychologist Charles Honorton in the early 1970s at Maimonides Hospital in Brooklyn, New York, obtained chance results after an initial testing that looked positive for [psi](#) (Baker).

It is possible that dreaming may be related to the OBE. In some dreams, the dreamer is an observer, even an observer of himself. Perhaps, the brain mechanism that controls spectator dreams versus first-person dreams is the same mechanism that controls the illusion of leaving one's body in the OBE.

Tart and other parapsychologists who think that the dream state is a gateway to another world² seem to think that the key scientific evidence for this is the distinct brain waves of the various stages of sleep. They seem to think that brain waves represent states of consciousness and that sleep is an [altered state of consciousness](#). However, sleep is not a state of consciousness, but unconsciousness. Furthermore, brain waves represent not states of consciousness but electrical activity in the brain. Brain activity during dream-sleep is indeed curious. While dreaming, not only do we experience the equivalent of *hallucinations*, some of which would qualify as psychotic if we had them while awake, most of us feel like we are physically moving, acting and being acted upon, without the body actually moving. Brain stem mechanisms protect us during sleep from motor activities that could lead to self-injury or injury to others. That is, most of us are *paralyzed* during sleep. However, some people suffer a weakness or disruption of the brain stem that causes a sleep disorder where motor activities are not prevented. People who suffer from this disorder flail, sleepwalk, etc., and can be a danger to themselves or others. Such people do not leave their bodies, but they often leave their beds during sleep.

Another curious quality of brain activity during dreaming is that almost all dreams are forgotten. Dream *amnesia* is the norm. This is not due to anything paranormal or supernatural, but to weak encoding. [Memory](#) depends upon encoding the data of experience. Encoding depends upon connections in parts of the brain, which in turn depend upon connections in experience. An event with a strong emotional component is more likely to be remembered than one with no emotional component because emotional memories are recorded in one part of the brain while visual components are recorded in another. Neural connections link them. We are likely to remember dreams if we wake shortly after they occur. Even so, if we do not encode the dream by making some effort to remember it, we are likely to forget it. Some people assist memory by getting up and writing down the dream. Others find that an easier method is to stay in bed and create some associations. The easiest association is made by giving the dream a title and a purposive description. For example, a dream of being chased by a polar bear across the snow into a library might be labeled "Research the Polar Bear." Go back to sleep and you are likely to remember the dream by recalling the title.

Perhaps the most curious quality of dreams is that most of us most of the time are not aware that we are dreaming *while* we are dreaming. PET scans during dreaming have shown that there is reduced activity in the prefrontal cortex during REM-sleep and this might account for several features of the dream-state.

The prefrontal cortex lies near the front of the brain and is where the planning of behaviour and self-awareness reside. By dampening activity in this region, a person might not realise that impossible or bizarre events in a dream are unreal. This may also account for distortions in the dreamer's perception of time, the inability to reflect on their plight, and the forgetfulness that often follows waking.³

Some researchers cite the lack of prefrontal activity as a sign that the function of sleep is restorative. Sleep gives a rest to the frontal lobes, the most active part of the brain while awake.⁴ And, it may well be that [lucid dreaming](#)--being aware of dreaming while dreaming--is possible for some people because their frontal lobes don't completely shut down during dreaming. Most parapsychologists, however, are not interested in the physiology of dreaming. They focus instead on the *content* of dreams, which they believe reveals a passage to the paranormal or the supernatural.

The prophetic or clairvoyant dream is perhaps the strongest reason for believing that dreaming is a gateway to another world. Some dreams seem uncanny. They seem to foretell events. If a significant number of dreams of just a single person corresponded to future events, this would be a great benefit to humankind and we should try to find out what mechanism is at

work here. However, no such person has yet been found. Individual dreams that occasionally seem clairvoyant provide very weak evidence for clairvoyant dreams. I once had a very vivid dream of an airplane crashing nose first in San Diego (where I lived for 20 years). About ten years after the dream an airliner went down in San Diego. Am I clairvoyant? Would the case be stronger for clairvoyance if the airliner went down the day after I had my dream? I don't think so.

While it is admitted by most parapsychologists that some amount of coincidence is to be expected between what a person dreams and what actually happens, it is argued that there are too many cases of seemingly prophetic dreams to reasonably explain them all away as due to coincidence. It is true that not all prophetic dreams can be explained away as being due to coincidence. Most of them probably should be so understood, but many of them may be explained away as due to filling in memories of dreams after the facts and many others should be explained away as cases of lying. But the vast majority of prophetic dreams are probably coincidences. Such dreams are impressive to those who lack understanding of [The Law of Truly Large Numbers](#), [confirmation bias](#), and how [memory](#) works. If the odds are a million to one that any given dream is truly prophetic, then, given the number of people on earth and the average number of dreams people have during each sleep period (250 dream themes a night, according to Hines, p. 50), we should expect that every single day of our lives there will be more than 1.5 million dreams that seem clairvoyant. That is not including all the dreams had by cats, dogs and other animals, who may well be having apparently psychic experiences while they sleep, though to what purpose we can only guess. Furthermore, one would think that if dreaming were a gateway to the paranormal or supernatural, blind persons would not have their dream time restricted by their physical limitations any more than those with sight. Yet, people blind from birth do not have visual dreams.⁵

There are also those who think that the dream-state is a gateway to [past lives](#). There are some who even think that the dreams we have today are due to the fears our hunter-gatherer ancestors had. Universal dream themes, such as *being chased* or *falling* are said to harken back to our hunter-gatherer days. We have these dreams because our ancestors were chased by saber-toothed tigers and slept in trees. The evidence for such beliefs is negligible, if not non-existent, although a strong case can be made that the *form* rather than the content of such dreams might well be due to an evolutionary development linked to exercising instinctive behavior necessary for survival.

If the dream-state is a gateway to anything, it is probably a gateway to *current* personal fears and desires, rather than to ancient ones of other people. We assume dreaming has a purpose, but that purpose is more likely to be rooted in this life than in some other one. Any decent theory of dreams must try to explain why the brain stimulates the memories and [confabulations](#) that it does. It is most likely that dreams are a result of electrical energy that

stimulates memories located in various regions of the brain. Why the brain stimulates and confabulates just the memories it does remains a mystery, though there are several plausible explanations. Explanations in terms of the paranormal and supernatural are not as likely to have merit as those that limit themselves to biological and emotional mechanisms linked to brain activity.

One such hypothesis for sleep-related rhythms is that they are the brain's way of disconnecting the cortex from sensory input. When we are asleep, thalamic neurons prevent penetration of sensory information upward to the cortex.⁶ This gives the cortex a bit of a rest and explains why people who suffer sleep deprivation suffer a loss of critical thinking abilities and are prone to poor judgment. Another hypothesis is that dreaming plays a role in memory processing, especially with emotional memories. During REM-sleep, the amygdalae, which play a role in the formation and consolidation of memories of emotional experiences, are quite active.⁷ A related theory is that dreams are "watchdogs of the psyche" (Baker). Dreams are mechanisms that inform and guide our feelings and emotions. In short, this theory maintains that dreams are a way for us to express our desires and fears that, for whatever reason, need to be expressed but are not expressed when awake. If this is true, it would seem to follow that only one very intimate with the dreamer should attempt to interpret a particular dream. Dreams are very personal and speak to the specific emotional life of the dreamer. The "surest guide to the meaning of a dream is the feeling and judgment of the dreamer himself or herself, who, deep down inside, knows its real meaning" (Baker). This theory seems to be based upon the fact that most dreams are about things that have occurred within the past day or two and reflect the dreamer's present life and concerns, including unresolved feelings. This theory also implies that the interpretation of dreams can play a significant role in self-discovery; for, dreams reflect feelings and desires of which we are not conscious when awake. We may have anxieties or desires that only our dreams can reveal.

Most of us would have little difficulty in finding examples of "anxiety dreams" or "wish-fulfillment dreams" from our own experience. We may not have been aware of our desires or fears until they were awakened by the dream. Sometimes our symbolic dreams are so clear that we do not need outside assistance to help us interpret their meaning. Yet, many dreams are so strange, irrational or bizarre, that we are at a loss to find meaning in them. We seek others who claim expertise in dream interpretation to help us ferret out the hidden meanings of our dreams. Those who engage in the interpretation of dreams should be especially careful not to impose their own pet theories onto the dreams of others. For example, the dream mentioned above of being chased by a polar bear into a library might be interpreted in many different ways, but only I, my wife and one or two other persons familiar with the experience that that dream is rooted in are in a position to interpret it "correctly." I don't doubt that there are many possible interpretations and that some of them might seem quite plausible. But the "correct" one is one that has meaning for the dreamer. It was a frightening dream, just as the experience of dealing with a close relative with bipolar disorder (manic depression) was

frightening. The experience led me to the library and to bookstores to get as much information about this brain disorder as I could. I have no doubt that a Freudian or Jungian could find some latent or symbolic meaning here that I do not note, but I have no interest in their interpretations because I have no way to check them against reality and do not share their assumptions regarding the psyche. I have no idea why my brain confabulated this dream, arousing fear and disturbing sleep. Reality is bad enough without having our brains arouse more fears during sleep.

There are some people, however, who have experienced much more horrible things than I have, who dream about them every single night of their lives (Sacks). Why the brain should terrify its owner by repeating horrifying memories during sleep seems beyond comprehension. Such obsessive dreaming is of no more value than obsessive-compulsive behavior. Such people don't just have nightmares; they are too terrified to go to sleep. They need the help of a good therapist, but they are not in need of dream interpreter. If such dreamers are to be helped they must learn to control their dreams. There are various methods used to control dreaming, most of them involving visual or auditory preparations prior to sleep. Some therapists claim success with victims of recurrent nightmares by treating what is loosely called "post traumatic stress disorder." Some patients claim that they have been helped to overcome the experience of repetitious nightmares by [lucid dreaming](#). None have been helped by treating dreams as a gateway to some higher realm of consciousness.

See related entries on [clairvoyance](#), [lucid dreaming](#), and [memory](#).

mentalist

A mentalist is a performer who uses trickery and deception to create the illusion of having paranormal or supernatural powers.

Mentalists and [psychics](#) rely on their subjects' [selective thinking](#). For example, James Randi tells the story of Peter Hurkos, who was astonishing people with his ability to recite intimate details about their homes and their lives. Two of the persons who had their minds read by Hurkos and who were amazed at his accuracy were invited by Randi to watch a tape of the mind readings. It was "discovered by *actual count* that this so-called psychic had, on the average, been correct in *one out of fourteen* of his statements.... Selective thinking had led them to dismiss all the apparent misses and the obviously wrong guesses and remember only the 'hits.' They were believers who *needed* this man to be the genuine article, and in spite of the results of this experiment they are still devoted fans of this charlatan" (*Flim-Flam!*, 7).

oracles (prophecies *and* revelations)

An oracle is a shrine or temple sanctuary consecrated to the worship and consultation of a prophetic god. The person who transmits prophecies from a deity at such a shrine is also called an oracle, as is the prophecy or revelation itself.

Oracles are usually presented in the form of an enigmatic or ambiguous statement or allegory. "Socrates is the wisest of men." "A great king will achieve victory." Such statements can have several meanings, thus affording a greater chance of being interpreted in such a way as to make them accurate than if they were more clear and precise, such as "Socrates has seven toes" or "Cyrus will defeat the Persians at Salamis on Tuesday."

The belief in oracles can be traced to the desire to know the future. There are literally dozens of strange techniques humans have developed in an effort to [divine](#) events before they occur. Unfortunately, the only sure guide to the future is the past, and even that isn't always reliable.

runes

Runes are the characters of ancient [alphabets](#): Teutonic (24 letters), Anglo-Saxon (32 letters), and Scandinavian (16 letters). Runic characters are similar to Latin letters, except that they tend to have few curves and consist mostly of straight lines, suitable for carving with knives. Runic letters were used for over one thousand years. For most people, the runic alphabet died out sometime between the 13th and 16th centuries. But for those special New Age people with one foot in the world of secrets and the other in the world of mysteries, runes are used as a form of [divination](#).*

The Norse used Runic characters mostly for practical purposes, such as [marking graves](#), identifying property, or for defacing other's graves and property with graffiti, such as at [Maes Howe in Orkney](#). New Agers ignore these uses and prefer to side with superstitious 12th century

Norsemen and women who thought they could [see the future in alphabetic characters on wood or stone](#). Somehow, the image of Viking warriors, worshippers of Thor and Odin, kneeling down to cast runes to decide whether or not to invade Ireland, seems incongruous.

The word 'rune' derives from the Old Norse and Old English *run* which means "mystery." The real mystery is why anyone would think that writing the letters of an alphabet on little pieces of wood or stone, putting them in a bag, and then drawing them out and throwing them or laying them down in certain ways, would answer their questions, give them direction for the present, guide them to see the future or help them make good decisions. Runes may have gotten their reputation for being tools of divination when Christian Church leaders claimed they were used to cast magic spells or communicate with the devil. Many New Agers seem to like Tolkein, so the fact that his [Hobbits used a kind of runes](#) in their writing may have enhanced the association of runic letters with magic and mystery.

It is said that [rune reading](#) is useful for gaining spiritual insight. No doubt, it is as good as any other method. Dr. Martin D. Rayner, a professor of

physiology at the University of Hawaii School of Medicine, claims that by gazing at the runes one can tap into the subconscious and find great knowledge about oneself.

How can the random selection of marked stones tell you anything about yourself? Perhaps these Rune Interpretations are simply so evocative that each contains some point, which can be accepted as relevant to some part of what is happening at the limits of consciousness any day, any time, to anyone. That is the easiest possibility to accept from a strictly scientific standpoint. [\[The Runes Explained\]](#)

The good doctor is giving new meaning not only to his life but to *science* as well. Nevertheless, he says he has found rune reading to be "transformational" and leading to "breakthroughs", which are common goals of New Agers.

How is it that random alphabetic stone selection can be so useful? Easy. *Anything* can be a source of transformation and breakthrough if you decide to let it be. Runes, [tarot cards](#), [the I Ching](#), [enneagrams](#), [Myers-Briggs](#)...*anything* can be used to stimulate self-reflection and self-analysis. *Anything* can be used to justify coming to a decision about an unresolved matter. Coming to a decision brings relief, reduces anxiety, and may well seem like a breakthrough and transformation. Using something like rune stones to help make your decision relieves you of responsibility for it. The choice was made for you by the stones and your subconscious mind, so you are off the hook if anything goes wrong. Furthermore, since there is no standard interpretation of any of this stuff, you can always change your initial interpretation to fit new facts or desires.

When you are the oracle yourself, it is always a win-win situation.

note: Tacitus, in Ch. X of his *Germania*, describes a form of divination used by Germanic tribes:

"To divination and casting of lots, they pay attention beyond any other people. Their method of casting lots is a simple one: they cut a branch from a fruit-bearing tree and divide it into small pieces which they mark with certain distinctive signs and scatter at random onto a white cloth. Then, the priest of the community if the lots are consulted publicly, or the father of the family if it is done privately, after invoking the gods and with eyes raised to heaven, picks up three pieces, one at a time, and interprets them according to the signs previously marked upon them."

Though the signs are not described as letters of the runic alphabet, some New Agers have interpreted this passage as evidence both of the existence of runes in the first century and their use in divination. Neither seems justified from this passage alone.

There is evidence that the Norse used runes for divination before the 12th or 13th centuries, however.

scrying

Scrying is a type of [divination](#). To scry or descry is to spy out or discover by the eye objects at a distance. In occult literature, the term is used to describe the act of gazing at a shiny stone or mirror or into a crystal ball (anything which reflects will do), to see things past and future. (When a crystal is used, scrying is known as *catoptromancy* or *crystallomancy*.) Occultists claim that if one concentrates hard enough while gazing, one can conjure up the dead because scrying allegedly clears out the consciousness and opens a direct line to the other world.

See related entry on [Raymond Moody](#).

Please edit the section on Chiropractic: "a grocer from Davenport, Iowa" to indicate that DD Palmer was from Port Perry, Ontario. Yes, he was a grocer in Iowa, but he was from Port Perry Ontario.

Give Port Perry that. It's all they have.

See: http://www.chiro.cc/health_info/ddpark.htm

Gilbert Boehm

reply: It's true. Palmer was born in Canada and I should have been more careful not to try to give an American city credit for this great man. My patriotic fervor may have gotten the best of me!

8 Feb 2000

In the reader's comments on chiropractic, one of the comments contains this gem

Now, how does our body interact or communicate with itself and with the environment. Guess what, 100% through the nervous system. By manipulation of the articulations of the spinal column the interference is removed and the body is let to heal on its own. We as chiropractors are not healing the body, but letting the body heal on its own.

Your paragraph in reply to that misses the fact that a huge amount of the body's communication with itself is done via hormones and other chemicals, which travel through the blood, not the nervous system.

Another one is this: "Yes, I admit, the research in this area is just beginning, but also remember, the chiropractic profession is only 100 years old and it's not like we had the government and other funding money we do today"

You might wish to point out that other areas of medicine are also less than 100

years old, and have overwhelming scientific evidence and have saved and improved countless lives. Insulin comes to mind.

Paul Murray

24 Aug 1999

I read with interest your information about chiropractic. The philosophy of chiropractic has truly been a stumbling block for my educational development as a chiropractic physician. The concept of a subluxation is difficult to swallow I admit; however, it is the antiquated theory that has many rational individuals up in arms, including myself. A chiropractic consensus panel defined subluxation as "a motion segment, in which alignment, movement integrity, and/or physiological function are altered, although contact between joint surfaces remain intact." (Gatterman M, Hansen D. "Development of chiropractic nomenclature through consensus," Journal of Manipulative Physiological Therapy 1994;17:302-9.) Granted, this definition is very broad in nature, but improved.

I do recognize this entity; however, I do not utilize the verbiage. Instead, I use terms such as joint complex dysfunction with dysafferentation or segmental dysfunction to recognize the neurological sequelae (maybe too strong of a word) that occurs (segment=joint). These references are used in the J Manipulative Physio Ther and/or the ICD-9 to describe the improper term subluxation. The neurological sequelae include but are not limited to pain, loss of intersegmental motion, muscle spasm, muscle hypertonicity, aberrant joint biomechanics, trigger points, and local biochemical changes. These states affect the neuraxis (central nervous system) in that compensation to normal biomechanics has to occur in order for function to be maintained. Additionally, the neuraxis undergoes plastic changes to compensate. Lastly, pain and dysfunction affect the patient in such a way as to lead to psychological problems as depression and sleep disturbances. Granted, the last statement is more prominent in chronic cases, but these problems do occur.

My attitude may chap many of my fellow chiropractors' asses. Yet, this is where chiropractic research is heading.

Of course, as you point out, chiropractic is not merely for low back pain, but it includes the treatment of other type-M disorders, which is true. As a matter of fact, the recent Manga report from Canada reports that chiropractors should be considered equal to primary care physicians in the treatment of Type-M disorders. I do agree with this. We, as chiropractors, treat neuromusculoskeletal disorders well if we do not limit our practice to the "acme" of chiropractic, the adjustment. It is a powerful tool/treatment in our arsenal; however, physiological therapeutics (heat, ice, and electrical modalities; manual resistance techniques; and rehabilitative exercises), education, and nutrition are utilized as well in the treatment of patients. Using these tools in the treatment paradigm allows DC's to more effectively treat their

patients. Of course, history, appropriate diagnostic testing, and diagnosis must precede treatment.

By the way, [Barrett](#) and his followers and the national committee on health care fraud [[National Council on Health Fraud](#)] are questionable additional sources. (I do understand why they are present.) From my reading of their information, I find their resources to be outdated; hence, many of their arguments are fallacious based upon updated literature. Granted, some chiropractors fall into the path as Barrett, et al., ad hoc hypothesis(?) and other fallacies. Solutions: links to the [American Chiropractic Association](#), [Federation \[Foundation?\] of Chiropractic Education and Research](#), [Pubmed](#) with Key Terms as Chiropractic, Seamen, Rosner, J Manipulative Physiol Ther, etc.

Todd Hostetler, Senior Chiropractic Intern

reply: Since some of your colleagues seem to base their practices and theories on questionable sources, I think I'll keep my links to Barrett and the National Council on Health Fraud. In addition to their outdated critiques, they also critique some of the newfangled notions emerging in your profession.

31 Aug 1996

In regard to your comments on chiropractic:

First, your understanding of chiropractic philosophy is only partially correct. It is true that D.D. Palmer believed subluxations (vertebrae out of alignment or not showing proper biomechanical motion) could cause nervous "irritation", and that this, in turn, could cause a disturbance of normal physiologic function. This is only part of a bigger picture, however. The basic chiropractic philosophy is that the human body is inherently healthy and has the ability to heal itself when needed. This is apparent when you think about it--is it the band-aid that heals your finger when you cut it, or is it the cast that heals a fracture when you break a bone? Of course not, the body will heal itself--as long as there is nothing to interfere with the healing process.

reply: The human body is "inherently healthy?" You're kidding, right? Why do we get sick and die, then? Anyway, if by saying that the human body has the ability to heal itself you mean that healthy people have functioning immune systems, blood will coagulate and scab when we are cut, etc., who could disagree with that?

Now, how does our body interact or communicate with itself and with the environment. Guess what, 100% through the nervous system. By manipulation of the articulations of the spinal column the interference is removed and the body is let to heal on its own. We as chiropractors are not healing the body, but letting the body heal on its own.

reply: If the body can heal on its own, why does it need your manipulations of articulations? The idea that without your manipulations, the body would not heal on its own, does not seem to be supported by the empirical evidence of most people's lower back pain going away on its own. Comparing your manipulations with putting a cast on a broken arm is misleading. We know what function the cast plays; you are *assuming* the role played by manipulation.

Palmer did suggest that nerve irritation was mostly due to a subluxation impinging on a nerve, and this would then lead to nerve dysfunction. This bone pinching nerve theory has been proven to be a factor only under certain circumstances such as when there are advanced degenerative changes. There have been numerous studies, however, that found many indirect pathways for subluxation to cause nerve irritation. These are too complex and technical to discuss here but can be made available.

reply: Very interesting, but if nerves are "irritated" or damaged and this irritation causes pain, why wouldn't manipulation cause further irritation and damage and, therefore, more pain?

Remember also that this is only a philosophy, and as such should be changing as new data support some ideas and refute others. The philosophy of today is different although core components still remain. I also know that the accredited colleges or American Chiropractic Association would not endorse chiropractic treating heart disease, diabetes, cancer, and other serious and life-threatening situations--these are beyond our scope of practice. But who is to say these conditions and others such as asthma, ulcers and other GI troubles to name a few, could not be helped by chiropractic--at least in the beginning stages, or even prevented.

reply: Sounds like wishful thinking to me.

Yes, I admit, the research in this area is just beginning, but also remember, the chiropractic profession is only 100 years old and it's not like we had the government and other funding money we do today. Also, let me remind you about a recent New England Journal of Medicine article that stated only 15% of medical practices are validated by double-blinded, controlled clinical trials. Am I saying because the medical profession doesn't have the research that chiropractic does not need it either? Of course not. What I am relating is that in order to do research you must first have an idea to study. Also remember that research in not everything, clinical results are just as important. What is probably going to end up happening is that chiropractic will be used in conjunction with other therapies in a "multidisciplinary" approach for these visceral conditions. A typical chiropractic practice is made up of only a few percentage (five or less) of these "organic" conditions.

reply: I'm not one for trying to predict the future of such things as chiropractic, but I do have some opinions about spending our tax dollars testing metaphysical hypotheses and empirical possibilities. The government should stay out of metaphysics and before spending money on a possible cure for cancer by meditating underwater while injecting bee pollen there should be some solid empirical or theoretical evidence that such a practice is likely to prove beneficial. I'm not opposed to "pure" research, or experiment by trial and error, but with limited resources to spend, decisions on how to spend it should be based on some sort of merit system. The minimal requirement of such a system should be the ability to establish empirical or theoretical probability that a medical intervention will be effective. I don't say that this minimal probability be as high a standard as "beyond a reasonable doubt." Such a high standard would end all funding. But some proof beyond mere possibility should be required.

Now for your comment about low back pain. Apparently you have absolutely no idea what you are talking about here because an overwhelming body of evidence supports the superior outcomes (subjective, objective, clinical, whatever you want) of manipulation for low back pain. Perhaps you fail to understand the scope of low back pain in the United States and around the world. About 80% of adults will experience disabling low back pain at some point in their lives. While it is true that low back complaints are generally self-limiting, I would like you to name the majority of conditions seen in clinic or hospitals that are not. That is not even relevant whatsoever as to whether a condition should be treated or not. What determines a treatments effectiveness is if it can effect the condition in less time than that condition's natural history. The natural history for low back complaints is four weeks (not 2 as you stated). Now can you imagine having low back complaints for four weeks--or even two. Remember low back complaints affect PEOPLE. These people have lives, jobs, kids, hobbies. What happens to a person when they are not able to do these things.

reply: Well, it depends on the person. Some people have chronic back pain and are also employed as roofers or in jobs requiring a lot of lifting. They may have to find another line of employment or make sure they wear a back support and take care in how they bend to lift things (learn to squat instead of bending over with the legs stiff). Getting "cranked", as one of my friends calls it when he goes to his chiropractor, provides little more than temporary relief. This friend used to be a roofer. He once called me at about 5:30 in the morning to help him. His back pain was so great he couldn't even get out of bed to go to the bathroom. He was lying on the floor when I came over and he was still there in the afternoon when I returned after work. He was taken by ambulance to the hospital. He's been going to a chiropractor for years but this time he consulted a surgeon. The thought of going under the knife was so unpleasant that he eventually changed professions rather than deal with another potential paralysis episode. He took so long to decide what to do that eventually he healed on his own. He wears a back brace whenever he does lifting and has a job

which puts very little strain on his lower back. As far as I know, he hasn't needed to go to his chiropractor since he changed jobs. I think it was changing jobs, not the years of "cranking" that relieved him of his pain.

Low back complaints are the second largest reason for a visit to a primary care physician. Low back complaints cost more than AIDS, heart disease, and cancer combined in terms of cost of medical treatment and indirect costs from work loss/decrease in productivity. Low back complaints are the leading cause of disability in Americans ages 25-45. Low back complaints are the number one reason for medical discharge from the military. Low back complaints are the number one reason for claims to worker's compensation, and these claims (30% of total claims) make up 80% of worker's compensation costs, again, because of high cost of medical treatment and work loss. In short, low back pain is a MAJOR, BIG-TIME problem in America and around the world. For you to make it sound as if low back pain is no big deal and will disappear without a problem is a gigantic mistake and just goes to prove your lack of understanding or research on the subject. By effecting the complaint in a faster time period than natural history you get that person back on the job faster, you take that person out of pain and suffering, you decrease the chance of that condition becoming chronic, and overall, you increase that person's quality of life. Apparently you have dealt with little or no people who experience chronic low back pain, or increased pain because of failed back surgery. These people's entire lives are affected.

reply: I'm sorry if you took my meaning to be that lower back pain "is no big deal." I did not intend to imply that nor did I intend to imply that no one ever benefits from treatment by chiropractors, physicians, massage therapists, exercise class, etc. If you want to bring in worker's compensation complaints, however, then we'll have to discuss fraud, which is beyond the scope of this article or these comments. Anyway, I have known people who've had successful back surgery. It changed their lives--- for the better.

They are depressed, some cannot work, some can barely walk, and some have lost their families because of it. Even if you can reduce that person's pain by two weeks you have done a great service. Also by getting treatment instead of just leaving it, other more dangerous causes of low back pain (cancer, organ disease, etc.) can be ruled out, and healing can be supervised to ensure a more complete job with less chance of chronicity or repeat back complaint.

reply: The question is, though, if someone is seriously disabled, would they get equal or better results elsewhere. You haven't convinced me that if I ever find myself in such a condition I would be better off consulting a chiropractor than an M.D.

You also made reference to some of the above conditions as other causes of back pain (cancer, etc.) as a reason people should not go to a chiropractor.

This is absolutely ridiculous. Chiropractors are trained to diagnose and rule-out other causes of back pain such as these. If the diagnosis falls outside of our scope of practice we make the appropriate referral. This is no different than the general MD who make the referral to the heart surgeon or other specialist.

reply: There is one difference between a general M.D. and a chiropractor, and it is that difference which leads many people to seek the services of the latter: the M.D. sees back pain as a sign that something is wrong with the body and it is possible that the M.D. will recommend drugs or surgery to relieve the pain. The chiropractor is likely to see back pain as a sign that something is out of alignment and is unlikely to recommend surgery.

Anyway, who do you think is more likely to know that a back complaint may have a more serious cause. An MD who sees a few back cases a week, or a chiropractor who sees a hundred backs a week. To become a chiropractor it takes at least 7 years of schooling. We are DOCTORS, Doctors of Chiropractic, and we are recognized with all the other powers and rights of other physicians. While you're at it I think you need some work on the chiropractic education.

reply: I don't say that "it is more likely" that back complaints have a serious cause. I just say that the cause may be serious. And, I'm sure you've come a long way from the days of Dr. Palmer.

Back to chiropractic documentation for low back pain. Recently the Department of Health's Agency for Health Care Policy and Research released a guideline entitled "Understanding Acute Low Back Pain in Adults". This is a major guideline with the purpose of defining what treatment(s) should be used for certain conditions. These guidelines are used by our government as well as in other countries, by health care professionals around the world, and by third-party payers. These guidelines are made by gathering a multidisciplinary panel of experts in that particular field and then finding and evaluating all the research for a particular topic. For low back pain the panel said that spinal manipulation is the best early treatment. What do you mean there are no reports on chiropractic and back pain--they reviewed all the valid studies from every discipline in the world!!!

reply: I don't mean anything by "there are no reports on chiropractic and back pain," because I never said such a thing.

Now why should chiropractic be the first method of therapy for low back pain? There are basically 3 reasons:

1. Chiropractic specifically, and spinal manipulation generally, has been proven to be the most effective early treatment. This fact can simply not be refuted, period.

reply: Well, since it can't be refuted there is no need to try. But some

people believe that to exclude contrary evidence a priori is not good scientific technique. I believe that taking all the evidence, including the reports you cite, the case is not as strong as you think and it certainly isn't irrefutable.

2. Chiropractic is very safe. There have been no reports of complications from low back manipulation by chiropractors in the literature, although the risk has been estimated as a complication per 200 million manipulations. That would make chiropractic 10,000 times safer than anesthesia alone. Even taking aspirin is far more dangerous than having spinal manipulation. Now why would surgery or medications be indicated for a condition that you call self-limiting. In this case medical treatment is much more dangerous than no treatment alone. Now please don't get me wrong, medical and surgical treatment is necessary sometimes, but only in very specific and well-defined circumstances.

reply: I can't argue with you here. (Except for your reference to me claiming something about a condition being "self-limiting;" I don't say that. In fact, I don't even know what you are talking about.) The dangers from drug reactions or potential addictions, anesthesia, surgical misadventures of high magnitude (euphemism for "killed the patient") are greater than the dangers of chiropractic. This is one of the main attractions of chiropractic and other alternative health practices. Unfortunately, being safer does not equate with being better. It would, if you were talking about comparing two interventions used for exactly the same conditions which produce very similar results. Then, the safer would be the wiser choice.

3. Chiropractic is without a doubt less costly than medical treatment. It is true that we have a larger number of visits or treatments per condition, but that does not matter one bit. The name of the game is COST-EFFECTIVENESS.

reply: I'll take your word for it. Again, though, being cheaper would be better only if we were comparing interventions for the same conditions which produce the same results.

Now let's hear you respond to this. If you refute anything I say all I ask is that you SHOW ME YOUR DATA. If you want any information from me I will gladly get it to you.

Brian V. Jongeward, D.C.

reply: You have already claimed that you can't be refuted. So, I won't try to refute you, but thanks for the offer.

24 Sep 1996

Interesting stuff. As a fully paid up skeptic/cynic from my early teens, I found some of the stuff very interesting indeed. Not that I agree with all of your

comments. I found your article on Chiropractic rather extreme - and noted the many responses from those who benefit temporarily from the "realignment". I visit a chiropractor from time to time, and believe me, the temporary relief is worth the cost (no more expensive than the painkillers the regular medics would prescribe). I don't think its any more bizarre to believe in the therapeutic effects of chiropractic than the therapeutic effects of regular exercise.

reply: My main concern with chiropractic is the theory of subluxations and other theoretical explanations given for a variety of ailments extending way beyond lower back pain. As far as treating lower back pain goes, your testimony supports that of many other people who go to chiropractors and massage therapists on a regular basis.

*My second reason for writing is to ask - why only discuss 'alternative medicine'? How about regular medicine? Having seen two people die recently from cancer, I was less than impressed with their treatment by the medics. For a start, no one pointed out to them that they were probably going to die (I suspect they stood a snowball's chance in hell of living). Instead they applied 'therapy' - chemotherapy. This seems to be the modern equivalent of bloodletting as a curative practice, except it is undoubtedly more painful and distressing. You will note I provide only anecdotal evidence here. I have not actually counted the proportion of chemically treated bodies which actually walk out of hospitals *cured*. So when are we going to see 'Chemotherapy' and 'Radical Mastectomy' in the index?*

Bob Sugden

reply: I discuss only alternative medicine because of its general pseudoscientific or unscientific approach. Alternative medicine is generally based upon untested claims and is mainly appealing to desperate people. A dying person is easy prey for charlatans, not that there are not charlatans in traditional medicine. In fact, many of those offering miracle cures for cancer are physicians who were trained in traditional medicine. I don't discuss alternative medicine because the field is dominated by charlatans. It is because their cures are based more on hope than on evidence, that I discuss alternative medicine. Of course, treatment with chemotherapy involves hope on the part of both patient and physician. But, anyone who expects traditional medicine to stop people from dying will be disappointed. I don't criticize alternative medicine because it is fallible and imperfect. I, too, have lost some loved ones to cancer. Chemotherapy did not help them. Would they be alive today if they had taken shark cartilage and coffee enemas? There is no way to know, but I doubt it. However, your characterization of chemotherapy to bloodletting is unfair. I wouldn't even compare coffee enemas (an alternative medicine therapy for cancer) to bloodletting. I understand your implication that traditional medicine sometimes recommends therapies that turn out to be useless or harmful. I do not agree, however, that that fact puts traditional medicine in the same class as alternative medicine.

Finally, I discuss only alternative medicine because its very nature encourages people to experiment on themselves with either no theoretical guidance or with faith in the guidance of untested and purely speculative notions. If people want to do this to themselves, that is their business. And it is not difficult to see why a dying person would seek out any therapy, no matter how ridiculous it might seem. At death's door, you and I might be tempted to wear a pyramid hat and let cats rub our bellies, if someone told us that it might help us survive a little longer. We might also be tempted to continue with chemotherapy, even though the prospects are not promising. That fact does not put chemotherapy in the same class as wearing a pyramid hat.

20 Nov 96

Would it be fair to say that some alternative therapies are "marginal" therapies - acknowledged to have favourable effects, but also steeped in nonsense? Shouldn't the skeptical community hold two views on these therapies, not just one all-encompassing negative view, and acknowledge that they possibly do have some value?

reply: I think it's fair to say that some alternative or complementary therapies are "marginal" but I can't speak for the skeptical community, if there is such a thing. I don't know how other skeptics feel, but I think anybody should be able to offer and receive not only "marginal" but "non-sensical" therapies as well...as long as they don't endanger anybody's life but their own and as long as they don't expect the taxpayer or insurance company to foot the bill.

Chiropractic and Acupuncture spring to mind, but because I know more about chiropractic I will concentrate on that. The view that correction of subluxations can correct a wide range of diseases, including what might be called "non-mechanical" - ear infection for instance - is patently ludicrous. Nevertheless, apparently intelligent people, qualified chiropractors, will diligently represent these views if you ask them. I know, because I have asked, and I have been given these ludicrous answers.

(I am reminded of mentioning to my chiropractor that I had a heavy cold, and it might be fairer on his other patients if I avoided breathing directly on his HiLo treatment table. He explained that it wasn't a problem if you didn't believe in the "Germ Theory.")

But chiropractic therapies most certainly do create a sense of well-being, relaxation, cessation of muscle tension, correction of mechanical injury like whiplash, and relief of muscle spasm like a "crick in the neck." Anecdotal evidence suggests that chiropractic therapy really is good for lower back pain. I don't expect chiropractic to correct my back problems, but I do expect and I do

receive significant symptomatic relief from manipulation. Pretty much the same effect as a good sports massage, but in different areas:

- a) There seems to be genuine benefit - beyond the placebo effect.*
- b) Correction of subluxation to relieve muscle spasm doesn't intuitively seem unreasonable.*
- c) Chiropractic (by trained practitioners) seems not to be inherently risky.*

(Yeah, I know I said "seems" three times then. Lack of hard evidence.)

So long as we can ignore the other rubbish, (difficult, I know) perhaps the skeptical community can afford to be not quite so dismissive of Chiropractic. By all means trash stuff like Iridology and Aromatherapy; but let's be a little more agnostic about some therapies which at least partly have some basis in common sense.

I guess it comes back to the old skeptical quandry - where do you draw the line between "Prove it to me" and "Don't waste my time trying to prove it to me." I'm happy to place Iridology in the "Don't waste my time" basket, but let's be a little more generous to Chiropractic.

Mark Roberts, Auckland, New Zealand

reply: I don't think I've been that unkind to Chiropractic, but then I'm not a chiropractor. In any case, I'm sure the iridologists and aromatherapists would disagree with your assessment of their arts. And I guarantee that when I get around to writing entries in the *Skeptic's Dictionary* for those subjects I will get some unfriendly mail blasting me for criticizing what I haven't tried and extolling the virtues of their sciences whose proof is in their many success stories.

1

October 8, 1995. "Who is abusing the children of Wenatchee?" by Armin Brott (Knight-Ridder News Service Columnist) in *The Sacramento Bee*, **Forum**, tells a pathetic story, too often repeated in recent years. The United States Supreme Court has recently (Nov. 1994) refused to hear an appeal of [Bill and Kathy Swan](#) who have spent 50 months in prison and had their daughter taken away from them based on the hearsay testimony of day-care workers. The children did not testify and there was no physical evidence of abuse. The court did not comment on their refusal to hear the appeal but in 1990 they ruled that defendants can be convicted of child abuse without confronting their accusers when there is assurance of the reliability of the hearsay testimony. Such a broad ruling opens the door to abuse by overzealous prosecutors and other alleged defenders of children. Professor Charles Nesson of Harvard, an expert on the law of evidence who submitted a brief supporting the appeal, called the Court's refusal to hear the appeal "the most extreme example of erosion [of the constitutional guarantee that criminal defendants have a right to confront witnesses against them] of which I am aware. It seems that the Court is saying that people can be convicted of child abuse without making a reasonable effort to discover whether the abuse even happened. Hearsay evidence from a "reliable source" is all that is needed. The emotional nature of this issue probably guarantees that clear thinking and fairness will be subordinated to the desire to defend innocent children.

The Supreme Court ruling also opens the door for overzealous prosecutors and law enforcement who are prone to the same kinds of misguided abuses as the trauma-search therapists. These trauma-search cops have destroyed more than one community, including pastoral Wenatchee in rural Washington state. There, a local group has formed to fight back against trauma-search cops and therapists. The group calls itself [Concerned Citizens for Legal Accountability](#), but it is much more than that. It is a kind of WWW [clearinghouse for stories](#) of legal and psychological abuse by police, child protective services and therapists. The people of Wenatchee realize that what happened to their community could happen anywhere in America. All it takes is one zealous cop--in this case Detective Bob Perez--to get things started and he can turn a troubled youth's lies and fantasies into a sex ring involving 30 to 50 children led in orgies in church by a local Pentecostal pastor and his wife. It is good news that Pastor Robert Roberson and his wife, Connie, were found innocent of all charges in December 1995. The bad news is that their lives and the lives of many children have been damaged by a crusading cop and his accomplices in Child Protective Services and the District Attorney's office. Perez and Gary Riesen, prosecuting attorney, have charged more than 80 adults with having weekly orgies with children. More than 25 have pleaded guilty to various offenses, though some, like the Rev. Roberson and his wife, have fought the charges, risking imprisonment and loss of their children. Eleven people have been convicted after trials; fifteen plea

bargained, though most of them have since recanted. Many of those charged are illiterate and on welfare. Five are developmentally disabled, two have severe emotional problems, two have physical disabilities and two others are mentally ill. "These conditions don't exclude the possibility that all are guilty of child abuse, but they certainly underscore the fact that Perez and his cohorts have been prosecuting some vulnerable people." [Brott, *Bee*]

Unlike the Swans, who lost their daughter and have been imprisoned for more than four years, the Wenatchee witchhunt did not begin with charges from a mentally ill day care worker. In Wenatchee they began with charges from a 15-year old girl with an IQ of 60 who tried to kill her foster father because he wouldn't let her have sex with her boyfriend in the house. By the time Perez finished interrogating the troubled teen, she had accused her foster father of years of sexual abuse. She later recanted her charges. Then Perez went after her 10-year old foster sister and by the time he was finished interrogating her she had identified 22 places where she said she'd been molested, including Pastor Roberson's church. Roberson made the mistake of speaking publicly about Perez and his methods of interrogation. Five days after his public denunciation of the detective's tactics, Roberson and his wife were in jail on charges of running weekly orgies in their church.

One would think that with all those convictions, there must be some truth to Perez's accusations. However, besides his word for it and the testimony of children who been interrogated by Perez, the evidence for a child abuse ring is non-existent. Perez keeps no notes and has no audio or video tapes of any of his interrogations. Perhaps he learned from the McMartin trials that such tapes can be damaging as they are likely to show zealous cops and therapists leading on and coercing children into tales of abuse. Plus, there is the testimony of the children who have refused to go along with him. One says he threatened to arrest her mother if the child didn't admit she'd been abused. Another claims that he made her lie. Another was tracked down in California by Perez himself, brought back to Washington and placed in a mental facility in Idaho where she was given "treatment" because she wouldn't testify that her parents had abused her. When she kept denying that she'd been abused she was told by the "counselors" that she was in denial and that she'd "come around soon." [Brott, *Bee*]

Prosecutor Riesen notes: "look at the convictions we've got. If Perez wasn't going by the book, the courts would have had something to say about it." [Brott, *Bee*] The courts may have something to say about it eventually, but I wouldn't count on it being right. No judge wants to appear to be a friend of child abusers. Few crimes are more repulsive than child abuse. I'm sure Perez and Riesen come off as saintly guardians of children battling the evil abusers because they really believe that is what they are. And they are not alone in their delusion: they are joined by physicians, nurses, day care workers, social workers, judges and juries. Evidence doesn't matter here. The children are what matter. And, yes, it is the children who are being abused here, but they are not the only ones. It should terrify anyone in this society to realize that they could be next in line to be guilty even if proven innocent and that they and their children might be next to be abused by a legal system gone crazy.

In California, the first and, as far as I know, only criminal trial based on recovered

memory was that of George Franklin Sr. Dr. Lenore Terr was the prosecution's expert witness. In 1990, Franklin was found guilty of murdering a child twenty years earlier. The main witness against him was his 30-year-old daughter, Eileen Lipsker, who said she repressed the memory of the murder until one day when she had a "flashback" while looking into her own daughter's eyes. Suddenly, she said, she remembered her father molesting her 8-year-old girl friend and smashing the child's skull with a rock. Eileen had told Terr that as a child she had torn out her hair, creating a bloody bald spot on her head. In her book, *Unchained Memories*, Terr writes: "Most likely, young Eileen unconsciously set out to duplicate the horrible wound she had seen on Susan Nason's head." Eileen's mother Leah Franklin, however, says she does not remember seeing a bald spot on her daughter's hair during her childhood years when she combed, braided and cut her child's hair. Leah Franklin also says she gave prosecutors more than forty photographs of Eileen as a child and that none of them showed any hair problems.

Eileen Lipsker also said that she now remembers her father threatening to kill her if she told anyone about his crime. She now also claims to remember that her father sexually abused her numerous times. She says that she learned to protect herself by "forgetting" what had happened. Maybe. Or maybe the idea of being abused and forgetting it were suggested to her by her therapist during a hypnosis session. "In August 1989, Eileen confided in her brother that she was in therapy and had been hypnotized. The next day, she told her brother that while she was under hypnosis she had visualized her father killing Susan Nason. In September 1989, Eileen told her mother about the memory, confiding that it had come back to her during a hypnotherapy session." She later recanted the hypnosis story. [[Loftus](#)]

Defense lawyers argued that the daughter could have unconsciously fabricated the whole story out of anger and fear of her father. They even suggested she may have made up everything for the \$500,000 book and movie deal she's signed. Maybe. In any case, Franklin's conviction was overturned in 1995 on the grounds that the jury had been prevented hearing testimony that the source of nearly every detail which Eileen remembered about the murder could have been newspaper accounts readily accessible to her. Elizabeth Loftus concluded

I have little doubt that Eileen Franklin believes with every cell of her being that her father murdered Susan Nason. But I believe there is a very real possibility that the whole concoction was spun not from solid facts but from the vaporous breezes of wishes, dreams, fears, desires. Eileen's mind, operating independently of reality, went about its business of collecting ambiguities and inconsistencies and wrapping them up into a sensible package, revealing to her in one blinding moment of insight a coherent picture of the past that was nevertheless completely and utterly false.

In short, it is likely that Eileen's memory is a confabulation based upon newspaper accounts, possible discussions of those accounts which she overheard or participated in, and her own fears and desires perhaps given a big boost by therapy which included hypnosis, and finally reinforced by a distinguished expert.

March 2, 1995. The Associated Press reports that a California state appellate court has ruled that consumers may no longer sue for property damages stemming from invisible power emissions. Jean and Marin Covalt had argued that the perception that electromagnetic fields are dangerous had driven down the value of their San Clemente property. They lost their home due to foreclosure and wanted San Diego Gas and Electric Co. to reimburse them for their loss. Also, although the Covalts didn't claim they had been made sick by EMFs, they did claim that their fear of contracting cancer in the future was an "injury" to them and they wanted to be compensated for their "injury."

The 4th District Court of Appeals in Santa Ana is to be commended for its ruling.

March 18, 1993. *The Wall Street Journal* ("Chiropractors Seeking to Expand Practices Take Aim at Children," by Timothy K. Smith p. A4) reports on a chiropractor who had treated a five-year-old boy and his four-year-old sister for mastoiditis. The boy's infection had invaded his skull; the girl's was so severe that part of her face was paralyzed and pus was pressing against her brain. The children's parents were using a chiropractor as their primary care doctor. The doctor of chiropractic correctly diagnosed the ear infections and tried to cure the children by manipulating the bones of their spines. Because they were not treated with antibiotics, the girl is now deaf in one ear and the boy is still under observation for neurological damage. The author reports on the systematic efforts of chiropractors to recruit children as patients. One company, Peter Pan Potential, holds seminars for chiropractors to teach them how to get more children as patients. Their advertisements for chiropractors in trade magazines tell the chiropractors to "Do your part to change the perception of chiropractic with patients who aren't negative or skeptical--they're children!"

The American Chiropractic Association (ACA) responded to this article with a full page ad in *The Wall Street Journal* (March 22, 1993, p. A11). The ACA ad stated that "It deeply regrets and condemns the unfortunate, although isolated, conduct reported by *The Wall Street Journal*." To its credit, the ACA didn't deny that some chiropractors are dangerous quacks. The ad further stated that "Chiropractic manipulation is not a substitute for routine vaccinations, and our Association considers any contrary suggestion to be unethical, unprofessional and wrong." The ad made no comment on the practice of treating day old babies for spinal misalignment.

The Smith article notes that chiropractic colleges are accredited and their services are covered by Medicare, Medicaid and some private insurance plans. This gives chiropractic an "authoritative resonance" which other non-traditional treatments do not have. The same article in the *Wall Street Journal* which describes these children gives an account of children with cancer who have been treated by chiropractors who made inappropriate diagnoses which "resulted in delay of correct medical diagnoses and treatment."

Dr. John Bolton, a San Francisco pediatrician, put it best when he said, "It's criminal to tell kids not to get immunizations because somehow cracking their backs can prevent infectious disease. It's not reportable as child abuse, although it's certainly abusive."

Dr. Jennifer Peet thinks differently. She and her husband founded The Baby Adjusters in 1992, a chiropractic clinic mainly for children. She says her clinic adjusts the spines of 150-200 people a day, most of them children and some of them infants. "We check them when they're 24 hours old. Very gently, it's almost just a tapping, we push the bone back into alignment." She claims she's cured infections, asthma and allergies. She's written a book, has a newsletter, pamphlets and posters, gives lectures and sells audio taps. Next she hopes to start a magazine. Soon, no doubt she'll be on the talk shows. She'll be recognized as an "expert" and quoted by others like her who will also write books and quote each other and reinforce their non-sense until it all has the ring of verisimilitude about it.

chupacabra

The *chupacabra* ("goat sucker") is an animal said to be unknown to science and systemically killing animals in places like Puerto Rico and Mexico. The creature's name originated with the discovery of some dead goats in Puerto Rico with puncture wounds in their necks and their blood allegedly drained. According to *UFO Magazine* (March/April 1996) there have been more than 2,000 reported cases of animal mutilations in Puerto Rico in the last two years attributed to the chupacabra.

Puerto Rican authorities maintain that the deaths are due to attacks from groups of stray dogs or other exotic animals, such as the panther, illegally introduced in the island's territory. The director of Puerto Rico's Department of Agriculture Veterinary Services Division, Hector Garcia, has stated that there is nothing unusual or extraordinary about the cases they've observed. One veterinarian said "it could be a human being who belongs to a religious sect, even another animal. It could also be someone who wants to make fun out of the Puerto Rican people."

Like other creatures in the cryptozoologist's barnyard, the chupacabra has been variously described. Some have seen a small half-alien, half-dinosaur tailless vampire with quills running down its back; others have sited a panther like creature with a long snake-like tongue; still others have seen a hopping animal that leaves a trail of sulphuric stench. Some think it may be a type of dinosaur heretofore unknown. Some are convinced that the wounds on animals whose deaths have been attributed to the chupacabra indicate an alien presence. However, they do not attribute the "mutilations" to the aliens themselves, but to one of their pets or experiments gone awry. Such creatures are known as *Anomalous Biological Entities* [ABEs] in UFO circles.

Those who think the chupacabra is an ABE also believe that there is a massive government and mass media conspiracy to keep the truth hidden from the people, probably to prevent panic. This view is maintained despite the fact that the President of the Puerto Rico House of Representatives Agricultural Commission, Mr. Juan E.[Kike] Lopez, has introduced a resolution asking for an official investigation to clarify the situation. And *Inside Edition* sent a crew to Puerto Rico to investigate the ABE story. They allegedly ridiculed the Mayor of Canavanas, a witness to the chupacabra, and basically made fun of the whole idea. In any case, there have been [numerous published stories and reports regarding the chupacabra](#).

[Jorge Martin](#), a Puerto Rican journalist, reports that it has been brought to his

attention that the U.S. and Puerto Rican governments have captured two of the creatures. Perhaps there will soon be a film on the ABE autopsy to rival the [discredited alien autopsy film](#). Martin cautions us not to exclude other reasonable possibilities.

The ABEs can also be the product of highly sophisticated genetic manipulations by human agencies. A Chinese-Russian scientist by the name of Dr. Tsian Kanchen, has produced genetic manipulations which have created new species of electronically-crossed plant and animal organisms. Kanchen developed an electronic system whereby he can pick up the bioenergetic field of the DNA of living organisms and transfer it electronically to other living organisms. By these means he has created incredible new breeds of ducks/chickens, with physical characteristics of both species; goats/rabbits, and new breeds of plants such as corn/wheat, peanut/sunflower seeds and cucumber/watermelons. These are produced by linking the genetic data of different living organisms contained in their bioenergetic fields by means of ultra-high frequencies biological linking. If the Russians have created this technology, then without doubt the US and other powers have too. Therefore, it is quite possible that the "Chupacabras" or ABEs could have been developed by humans. [Martin]

Martin goes on to report that a chupacabra has been killed and blood tests have been done on the creature.

The genetic analysis so far has revealed that the blood is in no way compatible with human blood nor with any animal species known to science. The traces ratio of magnesium, phosphorous, calcium and potassium are incompatible with those of normal human blood, they are much too high. The albumen/globulin [RG ratio] was also incompatible. The ratios found do not allow the results of the analysis to be compatible with those of any known animal species.

At present, we can't place the sample with any earthly organism. Therefore it could well be the product of a highly sophisticated genetic manipulation, an organism alien to our own environment or perhaps extraterrestrial. [Martin]

On the other hand, the sightings may not be all that accurate, the "mutilations" not all that strange, and the evidence for these bodies, autopsies and blood tests remains little more than speculation.

Winking Alien promotional graphic for program on pseudoscience

November 19, 1997. *Scientific American Frontiers* took on pseudoscience in "Beyond Science?," one of a series of science specials currently being shown on public television stations. The host, Alan Alda, the mischievous Hawkeye of *M*A*S*H* fame, joined in a fake alien autopsy, a [dowsing](#) experiment, a fake [palm reading](#), a [graphology](#) test, a simple test of a claim made by those who practice [therapeutic touch](#), and a visit to Hal Puthoff's latest project on ["zero-point energy."](#) Several skeptics, including Ray Hyman, Barry Beyerstein, Stephen Weinberg and Philip Klass, offered their views, but the main focus was not on debunking specific pseudosciences. The purpose of the program was to explore the differences between scientific and pseudoscientific methods, between "rational" and "irrational" thinking.

The main lesson, it seems to me, was that the scientific method is characterized by skepticism and mistrust of human nature. Of course there is no such thing as *A Scientific Method of Discovery*, but there is a method to scientific thinking and it includes being constantly vigilant against self-deception and being careful not to rely upon insight or intuition in place of rigorous and precise empirical testing of theoretical and causal claims.

While each of the examples of pseudoscience treated in this program was aptly chosen, I think the segment on dowsing exemplifies one of the more significant characteristics of the difference between science and pseudoscience. Three dowsers were featured and each was extremely confident of his ability to find water with a dowsing rod. Each claimed to have had many successful dowsing experiences over

the years, which was proof to them that dowsing "works."

Alda tried the dowsing rods and sure enough they crossed over where it had been suggested to him that there would be water. It is thought that the authentic dowser is unaware of subtle movements in his hands which cause the rod to bend. The movements occur when the dowser thinks he is near his target. There may be a variety of sensual clues which suggest the target. The dowser, however, does not reflect on those clues and is essentially unaware of their influence. In any case, none of the dowsers considered it important to doubt their dowsing powers or to wonder if they were self-deceived. They had never considered a scientific test of their powers; for, each of them thought that the fact that they had been successful over the years at dowsing was proof enough. Furthermore, when each dowser failed--the one in a controlled experiment and the others on the job of a well site that went over 600 feet for naught--they did not consider for a moment that the failure could be indicative that their beliefs in dowsing were in error. One of the dowsers who had led a drilling company to a dry site blamed the failure to find water on himself, not dowsing. He didn't do it right, didn't follow the right method or correctly interpret the signs. Or, they had drilled just a little off, barely missing the fracture he knew had to be there at 161 feet. The man doing the drilling commented that he didn't think there was anything to dowsing and dowsers. He'd seen dowsers proved wrong too many times to believe in dowsing. The driller also claimed, however, that 99% of the time you'll get water no matter where you drill. The driller was skeptical because the evidence seemed to falsify the dowsers' claims. That skeptical attitude, plus the fact that perhaps the odds are very great of hitting water in most places one might consider drilling, plus the concern over self-deception, would have led a scientist to devise a test of dowsing's claims, a test which would not rely on subjective impressions or selective memory and which would eliminate as far as possible the likelihood of chance being a factor in the outcome.

One of the dowsers claimed he could find metal objects, as well as water. He agreed to a test which involved randomly selecting numbers which corresponded to buckets which had been placed upside down in a field. The numbers determined which buckets a metal object would be placed under. The one doing the placing of the objects was not the same person who went around with the dowser as he tried to find the objects. This [double-blind method](#) is typical of science, to avoid the possibility that the investigator's knowledge might influence the outcome of the test. The exact odds of finding a metal object by chance could be calculated. (For example, if there are 100 buckets and 10 of them have a metal object, then getting 10% correct would be predicted by chance. That is, over a large number of attempts, getting about 10% correct would be expected of anyone, with or without a dowsing rod. On the other hand, if someone consistently got 80% or 90% correct, and we were sure he or she was not cheating, that would confirm the dowser's powers. *After* confirming such powers, scientists would proceed to try to come up with a theoretical explanation. Pseudoscientists are wont to offer explanations for phenomena which have not even been established to exist.) The dowser walked up and down the lines of buckets with his rod but said he couldn't get any strong readings. When he selected a bucket he qualified his selection with something to the effect that he didn't think he'd be right. He was right: he was never right! He didn't find a single metal object despite several attempts. As Alda pointed out, this didn't disprove dowsing. What it did prove, though, was that nothing could shake the faith of the dowser. He couldn't explain why he couldn't perform, but that fact didn't dampen his belief in dowsing or in his

ability to dowse. The impression was that no amount of empirical evidence would ever convince him that he was wrong. Such an attitude is typical of pseudoscience.

Each of the dowzers claimed that the mind plays a role in influencing the dowsing rods. But rather than accept Ray Hyman's explanation that the rods move to fit the dowser's expectations, one of the dowzers proffered that [ESP](#) is what influences the mind to influence the hands which move the rods. Alda commented that that claim is truly beyond science, for there is no way to test the claim that it is ESP which is influencing the dowser. Still, one could do a double-blind test to discover whether the dowser using dowsing rods could find water or metal at a greater than chance rate, but none of the dowzers felt such a test was necessary.

The attitude of the pseudoscientist was also demonstrated in the segment on therapeutic touch (TT). Those who practice TT believe they are able to move "energy," some sort of psychic force field or [chi](#) which they believe permeates the body and surrounding [aura](#). They move their hands a few inches above the body, appearing to be pushing or moving some invisible body surrounding the physical body. TTers claim they can feel the energy flowing in their patients. They claim we all have this energy and that they can feel it. Like the dowzers, they know TT works from experience. They've seen it work again and again. And it never occurs to them that they could be self-deceived or that they should devise a scientific test to rule out self-deception as being the main force at work here.

A young girl devised a simple test for the TTers. Our young scientist had a randomly generated list of trials to perform which consisted of the words 'right' or 'left.' These referred to the right hand or the left hand of the TTer who was on the other side of a thin wall with holes near the bottom for her hands to go through. The young scientist would tell her subject when she (the scientist) had placed one of her hands under the TTer's right or left hand. The scientist would record what hand she had placed her hand under and what hand the subject had claimed she felt "energy" coming from. This is a very simple test to determine whether the feeling of energy the TTer has is objective or subjective, based on really feeling energy or on *thinking* she was feeling energy. Of course, this test does not test the main claims of therapeutic touch. Those claims are untestable; for, the energy allegedly measured is not physical energy and can only be *felt* by people, not measured by any machine. Still one could devise a controlled study where patients being treated in the same way for the same illness are divided into two groups, one which gets TT and one which doesn't. Several physicians could evaluate the patients before and after their treatments. These physicians would not be the ones providing the treatment, to avoid their knowledge of who was getting TT from influencing their patient evaluations. A third group might also be studied, one which was given "fake" TT, i.e., TT by a skeptic who thinks this stuff is metaphysical non-sense. The point of the Scientific American program was not to do such a test, but to demonstrate what methods scientists would use to investigate and inquire, as opposed to the lack of interest in such methods by pseudoscientists, who think they already know the truth from personal experience and insight. [Double-blind tests](#) are part of the scientific method of inquiry. Such tests are considered unnecessary by pseudoscientists and thus they risk being self-deceived and in error in a profound and fundamental way.

The palm reading segment was interesting because it involved getting a subject who

did not believe in palm reading to have readings done by skeptic Ray Hyman. Dr Hyman used to do this stuff for a living when he was a young college student. He got so good at [cold reading](#) that he came to believe that he *was* psychic. The skeptical subject was so impressed by Hyman's abilities that she started talking like a true believer before the interview was over. She obviously tuned in to certain claims Hyman made about her. She focused on what she liked hearing. She didn't even seem to notice when Hyman was fishing (using general knowledge about people of her gender, age, etc. and specific knowledge based on what she was wearing, how she presented herself and how she responded to his questions, etc.). Nor did she notice that most of the claims he made about her were based on information she had provided herself by her words and gestures in response to his questions. Like the dowser, she used [selective perception](#) and focused on the "hits" and ignored or downplayed the "misses." A scientific method of inquiry requires that the "misses" not be dismissed, but recorded and evaluated. This segment of the program seems to have been designed to remind us of the danger of letting down our guard against self-deception and wishful thinking. It is a danger which scientists must constantly battle. Even the wisest amongst us must be careful not to deceive ourselves into thinking that we are too clever to be tricked or too smart to be led by suggestion to believe things which are questionable. That is one reason why scientists devise rigorous tests of claims: to prevent personal desire or beliefs from affecting outcomes.

The most amusing sequence of the program was the fake alien autopsy. There was a little evaluation of the Alien Autopsy film promoted on the Fox Alien Network last summer, demonstrating the poor quality of the fraud, especially the poor quality of the dummy alien itself. The fake alien used by Scientific American was designed in Hollywood and was very realistic. It seemed to have a skeletal structure and be a real body, while the Fox Fake was more like a rag doll stuffed with sausages. This segment of the program discussed the [Roswell](#) phenomenon: that thousands of people reject the simple story of a weather balloon used in an Air Force experiment which crashed in the desert. The Roswell crowd are convinced that there is a government conspiracy to hide the truth that aliens crash landed on earth in 1947. It is encouraging to see so many skeptical people, but the skepticism of the Roswell crowd is skepticism gone awry. Testimony from reliable sources is rejected in favor of testimony from unreliable sources. Facts are ignored if they support the simple explanation. General distrust in the government is taken as sufficient reason to believe in the alien story and reject any explanation, however plausible, which supports the weather balloon story. The mass media, especially the Fox Alien Network, has done its share of encouraging and promoting the Roswell phenomenon. Roswell is an example of what happens if the imagination is allowed to run wild without a check in reality. (As one young boy on a holiday with his parents in Roswell put it: "if nothing happened, then they probably wouldn't have all this stuff.") Scientific skepticism is not the blank check to doubt everything which does not fit with one's beliefs, as the Roswell skeptics seem to think. Scientific skepticism requires that the physical evidence be taken for what it is, not rejected on general grounds of distrust of the government. Scientific skepticism requires that one not speculate about evidence which is not available on the general suspicion that such evidence is being concealed. Scientific skepticism requires that one consider *all* the testimony from everyone who was present or involved in the original project, and that that testimony be evaluated against the actual evidence which exists, not against speculative evidence which some claim existed.

Praising [Occam's razor](#), Alda presented the explanation which Phillip Klass and others have made regarding project Mogul. He interviewed Charlie Moore who was part of the original Air Force project and laid out the non-alien explanation. For the Roswell crowd, however, this issue of aliens crash landing on earth is truly beyond science. No amount of scientific evidence or reasoning is likely to convince the true believer that what happened at Roswell was nothing extraterrestrial. Belief in such matters is akin to religious faith in God. I am struck by the similarity in pose between William F. Buckley's response in a recent interview promoting his new book on God and that of the Roswell crowd. "What's the evidence for the resurrection of Christ?" asked the interviewer. Buckley gave two pieces of evidence. One, there were eyewitnesses who testified to it. Two, the Jews and Romans did not deny it. The latter is the *argumentum ad ignorantiam*: it is so because you don't prove or argue that it isn't so. To the former, the skeptic responds with a question: why trust such testimony? With David Hume, we ask "what is more likely? that these witnesses got it right or that they are deluded, mistaken or lying?" And we wonder why some people use the methods of science when it suits their purposes but reject those methods in favor of faith, also when it suits their purposes. We ascribe such a pose to *the will to believe*, but we are nevertheless left nonplused at such loyalty.

Barry Beyerstein, who has written extensively on the pseudoscience known as graphology, joined Alda for a graphological personality evaluation by [Datagraph](#), a major player in this business. [Datagraph seems to be a *former* major player; they seem to be defunct as of Oct. 2000.] Their spokesman claimed that their analysis of 420 handwriting features is accurate to 90% and is used to create a unique "mindprint" of each individual evaluated. (Alda noted that psychologists consider psychological personality profile tests to be "moderately reliable.") They submitted eight handwriting samples for analysis and then reviewed the profiles, trying to figure out which one was their own. They couldn't. Alda did an assessment and of the 14 personality traits Datagraph uses, he thought they were right on 4 of his, wrong on 8, and 2 were maybes. He noted to Beyerstein that it would be easy to be influenced by what you would want to be true of you, even if it weren't, and how you could be influenced by the printed judgment to engage in a bit of selective memory to validate the claim. Furthermore, the *content* of the writing could influence the evaluator's judgment. A scientific analysis would not rely on such sloppy techniques and subjective measures to do the evaluation. When an evaluator, John Nezelek, was asked to comment on the reliability of Datagraph by comparing its profiles of some subjects who also took a standard psychological personality profile test, he refused to commit, saying that there were not a significant number of cases studied to warrant drawing any conclusions. Such tentativeness is typical of good science, and generally lacking in pseudoscience. Nezelek is currently doing [further study](#) on the subject.

The oddest segment on the program was a visit to a place in Texas called the Institute for Advanced Studies, run by Scott Little and Hal Puthoff (of [remote viewing](#) fame). Their main interest seems to be "zero-point energy" in particular, and finding a source of unlimited energy in general. Puthoff claimed that there is enough zero-point energy in a coffee cup to evaporate the oceans. Physicist Stephen Weinberg claimed that there might be the energy equivalent of a gallon of gasoline in the entire earth. Since this debate seems to be a scientific one, rather than beyond science, one might wonder why it was featured in the program. I'm not sure myself except that Little offered some comments on the importance of scientists to be wary of fooling

themselves, especially when they are looking for the "most fabulous object in the universe" or some such thing. People can easily fool one another, as well as themselves, intentionally and unintentionally, and significant steps must be taken to prevent self-deception. In one experiment which hadn't even gotten off the ground yet, the instruments started to give readings that energy was being produced from some mysterious source. Little commented that you have to assume it's an error and "tear it down" before breaking out the champagne.

In the meantime, I think we can break out the champagne and congratulate Scientific American for a program which represents one small step for public television, and one giant leap for rationality and scientific skepticism.

- [Alien Autopsy - Faked or Fiction?](#)

November 12, 1997. ["Athletes swallow expensive doses of hope"](#) was the title of an article by Chris Hays in the *Sacramento Bee*. The article did an excellent job of explaining why it is so difficult to get unbiased information about body building supplements: the main source of information comes from body building magazines which are all owned by the supplement manufacturers themselves. Even so, Hays claims that "everyone agrees" that *creatine* "works." A typical ad on the internet reads

Creatine monohydrate provides safe nutritional support for athletes seeking peak performance in short-duration, high intensity workouts. By supporting the body's natural ability to regenerate the primary energy immediately available to working muscle, creatine monohydrate has the potential to increase optimal work output in activities such as weight-lifting and sprinting.

Creatine is a nitrogenous organic acid, $C_4H_9N_3O_2$, found in the muscle tissue and which supplies energy for muscle contraction. Joseph Clark has written an scientific paper on [the use of creatine in sports](#). It is very technical sounding but he notes that "30% of the population have a diet and metabolism such that they do not benefit from creatine supplementation." The only negative side effects mentioned were water retention and heat intolerance. The positive benefits include such things as an *increase in muscle peak torque production while decreasing plasma ammonia accumulation*. The author does note that a healthy body self-regulates the production of chemicals (creatine is synthesized in the liver and kidneys, using three amino acids derived from food intake) and will shut down production when more of the chemical would be redundant. Furthermore, beyond a certain amount of some chemicals the body simply will not use them; hence, further supplementation is pointless or harmful (if the body can't eliminate the excess, for example). (This is why certain supplements are probably pointless, such as [DHEA](#). Taking a supplement may shut down its natural production by the adrenal glands.)

October 26, 1997. An article in the *New York Times* by Jane E. Brody reported the results of a 13-year study involving over 10,000 Americans which "found no evidence of increased longevity among vitamin and mineral supplement users in the

United States." This is especially bad news, since most of the people who take vitamins are non-smokers who don't drink heavily and who eat more fruits and vegetable than the rest of us. (The study also found that supplements failed to help the longevity of smokers, heavy drinkers, and those with chronic diseases.) The results of the study have been out for four years. Nevertheless, it is estimated that some \$6.5 billion a year is being spent by Americans on vitamin and mineral pills. Why? I suppose because there is a chance that the pills might help fight cancer, give one more energy, help one live longer, etc. It is true that the information regarding nutrition, vitamins and minerals is bewildering, confusing and contradictory; that uncertainty gives some wishful thinkers hope that the stuff will do them good. Maybe. And maybe that is why vitamins and minerals are so popular among [MLM programs](#). But why ignore the possibility that these pills might be doing some harm? Vitamin E can interfere with the action of vitamin K (which promotes blood clotting). Too much calcium can limit the absorption of iron and too much zinc can reduce the level of copper in the body (decreasing "good" cholesterol). Folic acid can react adversely with anticonvulsants and each year the greatest number of poisoning deaths among children is from iron supplements meant for adults.

It might seem like \$6.5 billion is a lot of money, but consider that Americans spend about \$2.5 billion on Halloween candy and costumes.

August 21, 1997. In a repressed-memory case, the 2nd District Court of Appeals overturned a ruling by Los Angeles Superior Court Judge Wendell Mortimer, saying testimony is inadmissible if procured by administering the drug sodium amytal, a so-called "truth-serum." Holly Ramona was given the drug by Marche Isabella, who had assured Ms. Ramona that she was incapable of lying while under the influence of sodium amytal. Isabella also told Ramona, who sought treatment for bulimia and depression, that 80% of those with eating disorders had been sexually abused. The evidence for this claim was not presented. Soon after being given this dubious information and the drug, Ramona began having "flashbacks" of childhood abuse by her father. Assured by another therapist, Richard Rose, that she could not lie while under sodium amytal, Ramona became convinced the "flashbacks" were genuine memories. She accused her father of molesting her. He denied it and she sued him for damages. Her father, Gary Ramona, sued the therapists for planting false memories in his daughter. He was awarded \$500,000 by a Napa County, California, jury. Even so, his wife divorced him and he was fired from his \$400,000-a-year job as a wine marketing executive as a result of the charges made by his daughter.

The unreliability of testimony influenced by sodium amytal has long been recognized in the scientific community. Such testimony has been barred from use in California courts since 1959. According to scientific experts, the drug makes subjects suggestible and prone to talking, but is not a "truth-serum." Subjects can lie, confabulate, fantasize, etc., as well as tell the truth while under the influence of sodium amytal.

[More Mass Media Funk](#)

SkepDic.com

The comments here are mostly letters from readers who think they have had psychic or paranormal experiences. I do not believe that everything can be explained, nor do I believe that whatever alternative explanations I give for these experiences must be true. Nor do I feel that it is the skeptic's duty to "prove" that these experiences either never happened as described or did happen but there is a naturalistic explanation for them. I offer these only as an example of how easy it is for people to have an unusual experience, seek out a paranormal explanation for it and delude themselves into thinking they have experienced something really

reader comments:

17 May 2001

Perhaps you can help me. I have always considered myself a skeptical, intelligent person. I have grounded my analysis of experience in solid science as much as possible and have attempted to cultivate critical thinking. James Randi is somewhat of a role model for me. Given this, you can understand why I find the following experiences particularly disturbing.

Sometime ago I was ruminating idly, when a thought of my grandfather crossed my mind. It was an inconsequential thought, perhaps of him in his garden, but it had the tone -- for want of a better way to put it -- of someone who was deceased. Nothing blatant, mind you, but inescapable. Despite a lifelong pooh-poohing the validity of such phenomena, I could not help but wonder if my grandfather had indeed died. At that time, I had very little interaction with my mother, and had not heard from her in eight or nine months. There had been no information at all about any deterioration in my grandfather's health. He was almost never mentioned in our sparse communication. When I had heard nothing from her in a week, I put the experience out of mind. Then, about three weeks later, I did receive a letter. I wondered uneasily to the woman I was with if there was some news of my grandfather's passing. When the first page held only the usual chatter, I dismissed the idea. Then, on the second page, was inconceivable information that my grandfather had indeed died in hospital, about a week before receiving my impression!

Then, just last summer, I was in my bedroom when the thought, very strong, came, "Call Dad, he is not going to live forever!" In those exact words. I ignored it, saying to myself that we Edwards' live well into our nineties, which is quite true. From the direction of my letter, you may guess what happened. The following day, in the late afternoon or early evening, my brother called to say that our dad had died while resting and reading a newspaper, of an apparent heart attack. It turns out he suffered from arrhythmia, of which I had no knowledge -- for two reasons: one, our relationship was just coming to the point where communication, sorely disrupted in my teenage years, was being re-established; two, he was an extremely taciturn man, particularly when it came to his health.

Mr. Carroll, I have not spoken of these instances to anyone out of embarrassment, as everyone knows my position. I am hoping that you may be able to give me some way to rationally account for my experiences. It seems that the level of coincidence for two such events bearing fruit must be more than astronomical. And, they were subjectively dissimilar.

special which sets them apart from the rest of us and which makes life oh so interesting and mysterious.

High Regards, Bruce

reply: Dear Bruce,

Here's another coincidence for you: you caught me on a good day...I'm up early and because it is final exam week I don't have to go to work until 10 am today. In short, I have time to reply.

The uncanny are uncanny! The first thought that came to mind regarding your story is how little most of us understand chance, probability, odds, etc. This leads us to give significance to the insignificant....not that these events are insignificant...the deaths of a father and grandfather (I am both!) are significant....it is the sense of "astronomical odds" that I am referring to: these events seem significant in the sense that they seem to defy the [laws of chance](#). But they don't.

You can see, however, why so many people believe in the psychic realm. Humans don't have an intuitive sense for what is statistically significant. Hence, many coincidences seem to us to be connected in some mysterious way. I've written about this on [several occasions](#).

Also at work in giving these experiences their sense of being special is [selective thinking](#): we remember such events and don't remember the times we feared for dad or mom or uncle, etc. and nothing happened. When this happens twice in a relatively short period of time, the odds seem even more astronomical, like somebody winning the lottery twice (which also seems more unlikely than it really is, by the way).

I don't suppose I need mention that thoughts of the death of loved ones is quite common, especially elderly loved ones.

26 Jan 2001

Dear Bob, I was wondering if you could put my question to the skeptics below on some experiences with psychics that my dad told me about, in your reader's comments section of psychic experiences, and then respond to it there? I think I have some pretty irrefutable cases here. Your readers who are paranormal sympathizers would love this one! Here it is. You can change the "Dear Skeptics" part to "Dear Bob."

Winston

Skeptics, 2 mysteries from my dad for you to explain

Dear Skeptics,

I've got two new psychic mysteries from reliable sources for you to ponder! Recently I talked to my dad and explained to him the whole skeptic vs. paranormal/psychic debate we've been having, and he related to me some amazing firsthand stories (meaning that he was there at the time!) involving psychics that are so inexplicable but true that I just had to share them with you too. One of these stories was from a long time ago, the other was more recent. Don't worry, these are short and simple.

The first one involves a psychic that he, my mom, and her friend saw a long time ago back in Taiwan (I think it was during the early 70's, before I was born). There was this blind psychic who gave readings based on voices he heard. And my mom went to see him at the spur of the moment. One of the first things that he told her was that when she was little, her mom tried to give her away for adoption to another family, but she later ran away from that family back to her own mom, which was TRUE! My mom was so amazed at the time, that it got her attention. He also told her other things that were true too. Now guys, something like being given away for adoption and then running back home are NOT things that would fit most people, only a very few! My dad and my mom's friend was there too. All three of them can confirm this story! In fact, my mom's friend was so amazed that she tried to push her aside to get a reading herself! Skeptics, how do you explain something like this? But before you do, please keep these things in mind:

- 1. My dad does NOT make up things. He is one of the most down to earth people I know, and he has almost no imagination either! It's unlikely that he is remembering this wrong, especially since the two people with him at the time can confirm this.*
- 2. This psychic reading was NOT prearranged. The blind psychic didn't know my mom and didn't know that she was coming. It was a spur of the moment thing. So no record checking was possible.*
- 3. This took place in Taiwan during the early 70's, which was a very poor country at the time, and the record keeping system there was terrible and sloppy, so it is unlikely for a person, especially a blind one, to look up records on someone's childhood. Plus, like I said in # 2, the reading was not prearranged, but spur of the moment. (Or are you going to say that he has millions of people's records in Taiwan memorized? lol [chat room talk for "lots of luck"?!])*
- 4. Also, remember that the notion of "being given away for adoption by your mother and then running back to her" is NOT something general that applies to most people, but SPECIFIC and only applies to a few.*

So how do you guys explain this? How is this possible? What if this happened to you and there was no logical explanation?

reply: I doubt if Winston will like my response, but here goes. One possibility, of course, is that the "psychic" really is psychic and somehow tapped into some mysterious realm like your mother's mind ([telepathy](#)) or the [Akashic](#) record. One wonders, though, if the psychic had this ability why would he only tell your mother what she already knew? In other words, if this man was truly psychic, he was not very useful. He might as well have told her that she was a woman and was married. However, there may be another explanation. Perhaps this psychic said the same thing to many of the women of your mother's age in those days. If so, I would guess that he said it because he knew the practice was not rare at the time your mother would have been a child. And it would not have been unusual for children to have run away from the home they were put into...or at least to have wanted to. Had she not run away, her *desire* to run would probably have been counted by all as a "psychic hit." One way to have tested this "psychic" would have been to have sent about ten different women of your mother's age to see him at intervals of two or three months and see if the adoption tale came up again.

Of course, there is another possibility. The psychic may have overheard your parents in conversation and picked something up. Or he may have actually gotten the information from your parents during the reading, but they simply don't recall that it was *they* who told the psychic about the adoption and running away. This happens often in "psychic" readings and people are often amazed when they see a video tape of the reading that it really was the subject who told the psychic the "amazing" items, rather than the other way around.

Ok here's the second story that happened more recently. My dad said that a few years ago, he and a co-worker, Eileen, went to a psychic fair once. When Eileen picked one of the psychics there for a reading, she sat down. Immediately the psychic said that she was in the process of moving. This was true because at the time, Eileen had ALREADY sold her house and was in the process of moving! She was very amazed, and my dad was too. They both arranged for a personal reading later on. Skeptics, what do you make of this? Again, keep the following in mind:

- 1. This was NOT prearranged. This was at a psychic fair open to the public, where anybody could have showed up, so there was no way the psychic could have checked her records beforehand.*
- 2. Also, again my dad is not someone who makes up things or has a wild imagination. Plus, the other coworker, Eileen, can confirm this story. Plus, it was more recent too.*
- 3. Also, keep in mind that most people are not in the process of moving at any given point in time, therefore this is not something that would have been true for most people.*

4. Finally, keep in mind that the "you are in the process of moving" thing was the **FIRST** thing that the psychic said **WITHOUT** any cold reading or fishing for clues!

I dare you to explain this one!

(:::::grinning::::: right now because I know that your backs are against the wall and every legal move you have on the "chessboard" is legally blocked. It looks like there is no escape this time for our skeptical heroes! :))

Winston

reply: This one is a little easier, Winston. "You are in the process of moving" is vague and ambiguous. The client interpreted it to mean moving from one house to another home. At any given time, the statement "you are in the process of moving" could be made to be a true statement by relating it some aspect of your life. Literally, hundreds of events could count as "hits" and it is not the psychic who creates the hit; it is the subject who does so by putting an interpretation on the psychic's statement that "fits."

Your stories remind me of one sent to me by another reader (one who is a bit more critical and skeptical than you are, Winston). Melody McGowan worked as a telephone psychic but got caught plying her trade while at her real job as a civilian career advisor at Scott Air Force Base in Illinois. She was asked to resign from her post. She is also accused of using a government credit card to charge some \$2,000 in calls she made last year to the psychic hot line she now works for. Her comment on her troubles was: "I had a premonition of something, but I didn't know what."

retrocognition

Retrocognition is a type of [clairvoyance](#) involving knowledge of something *after* its occurrence through psychic means.

My sister related an apparent case of retrocognition to me. She was watching television when a report came on about a woman (Susan Smith of Union, South Carolina) who claimed that her two young children had been kidnapped by a black man who carjacked her in some small town in the south. She claimed the black man drove out near a lake and let her out of the car and drove off with the two children. My sister said she immediately sensed that the children were dead and that they were in the lake. About a week later, the world was told that the woman herself had driven her car to the lake and with the children alive and strapped into the back seat, she put the car in drive and watched as the car sunk into the lake with her sons, drowning them.

It is a sad commentary on our times, but false reports of crimes are not uncommon and mothers killing their children are not uncommon. They are probably more common than black carjackers kidnapping little boys. In any case, the suspicious feelings which my sister had concerning the mother/murderer were probably shared by many people who saw the broadcast. It is evident that the police in the small southern town were skeptical too, not because they are clairvoyant but because they know a little bit about human nature and human behavior. If one was suspicious of the mother's story, the fact that she said she was driven to a lake leaves little to the imagination to fill in the blanks.

I'll admit that I've had similar feelings myself. About a year ago an alleged rape victim was interviewed on television. I had a feeling she was lying while I watched the broadcast. It turned out that she had been lying. Other people I talked to had seen the news broadcast, too, and also weren't convinced that her story was true. Were we clairvoyant? I don't think so. We all make judgments about people's stories. Sometimes we're right and sometimes we're not. We tend to forget the times we're not. If we didn't, we wouldn't find the occasional correct "feeling" to be so surprising.

[Becoming
a Critical Thinker](#)

by Robert T. Carroll

the clustering illusion

The clustering illusion is the intuition that random events which occur in clusters are not really random events. The illusion is due to [selective thinking](#) based on a false assumption. For example, it strikes most people as unexpected if heads comes up four times in a row during a series of coin flips. However, in a series of 20 flips, there is a 50% chance of getting four heads in a row (Gilovich). It may seem unexpected, but the chances are better than even that a given neighborhood in California will have a statistically significant cluster of cancer cases (Gawande).

What would be rare, unexpected, and unlikely due to chance would be to flip a coin twenty times and have each result be the alternate of the previous flip. In any series of such random flips, it is more unlikely than likely that short runs of 2, 4, 6, 8, etc., will yield what we know logically is predicted by chance. In the long run, a coin flip will yield 50% heads and 50% tails (assuming a fair flip and a fair coin). But in any short run, a wide variety of probabilities are expected, including some runs which seem highly improbable.

Finding a statistically unusual number of cancers in a given neighborhood--such as six or seven times greater than the average--is not rare or unexpected. Much depends on where you draw the boundaries of the neighborhood. Clusters of cancers that are *seven thousand times* higher than expected, such as the incidence of mesothelioma in Karian, Turkey, are very rare *and* unexpected. The incidence of thyroid cancer in children near Chernobyl was *one hundred times* higher after the disaster (Gawande).

Sometimes a subject in an [ESP](#) experiment or a [dowser](#) might be correct at a higher than chance rate. However, such results do not indicate that an event is not a chance event. In fact, such results are predictable by the laws of chance. Rather than being signs of non-randomness, they are actually signs of randomness. ESP researchers are especially prone to take streaks of "hits" by their subjects as evidence that psychic power varies from time to time. Their use of [optional starting and stopping](#) is based on the presumption of psychic variation and an apparent ignorance of the probabilities of random events. Combining the clustering illusion with [confirmation bias](#) is a formula for [self-deception](#) and delusion.

A classic study was done on the clustering illusion regarding the belief in the "hot hand" in basketball (Gilovich, Vallone, and Tversky). It is commonly believed by basketball players, coaches and fans that players have "hot streaks" and "cold streaks." A detailed analysis was done of the Philadelphia 76ers shooters during the 1980-81 season. It failed to show that players hit or

miss shots in clusters at anything other than what would be expected by chance. They also analyzed free throws by the Boston Celtics over two seasons and found that when a player made his first shot, he made the second shot 75% of the time and when he missed the first shot he made the second shot 75% of the time. Basketball players do shoot in streaks, but within the bounds of chance. It is an illusion that players are 'hot' or 'cold'. When presented with this evidence, believers in the "hot hand" are likely to reject it because they "know better" from experience.

In epidemiology, the clustering illusion is known as the [Texas-sharpshooter fallacy](#). Kahneman and Tversky called it "belief in the Law of Small Numbers" because they identified the clustering illusion with the fallacy of assuming that the pattern of a large population will be replicated in all of its subsets. In logic, this fallacy is known as the *fallacy of division*, assuming that the parts must be exactly like the whole.

optional starting / optional stopping

Optional starting and stopping refers to a common practice among [psi](#) researchers. In many tests of psychic powers the subject is allowed to start or stop whenever he or she feels like it. For example, the subject may go through some warm-ups trying to psychically receive numbers or [Zener card](#) icons being psychically transmitted by another person. The responses of the warm-ups are recorded, however, and if they look good (i.e., seem to be better than would be expected by chance) then the responses are counted in the experimental data. If not, then the data is discarded. Likewise, if the psychic has had a good run at guessing numbers of card suits and starts to have a bad run, he can call it quits.

This phenomenon seems to be related to another common factor in psi testing: optional keeping and optional disregarding of data. You get to keep all data favorable to your hypothesis and you get to disregard all unfavorable data. Psi researchers consider this practice to be justified since psychic powers may come and go.

Any reasonable test of psychic powers should have a protocol which specifies exactly when the experiment will begin and when it will end. Imagine letting a card player have a few practice rounds and if he's winning he gets to declare that those weren't practice rounds, but if he's losing he gets to declare that those really were practice rounds.

Optional starting and stopping should not be confused with *displacement effects*, a practice of counting an event as a "psychic hit" not only if one guesses the target card, but also if one guesses either the one *before or after* the target card, thereby significantly increasing one's odds of a "correct" guess.

See related entry on [parapsychology](#).

Texas-sharpshooter fallacy

The Texas-sharpshooter fallacy is the name epidemiologists give to the [clustering illusion](#). Politicians, lawyers and some scientists tend to isolate clusters of diseases from their context, thereby giving the illusion of a causal connection between some environmental factor and the disease. What appears to be statistically significant (i.e., not due to chance) is actually expected by the laws of chance.

Of the thousands of studies of cancer-clusters investigated by scientists in the United States, "not one has convincingly identified an underlying environmental cause" (Gawande).

The term refers to the story of the Texas sharpshooter who shoots holes in the side of a barn and then draws a bull's-eye around the bullet holes. Individual cases of disease are noted and then the boundaries are drawn (Gawande).

codependency

*You're codependent for sure if, when you die,
someone else's life flashes in front of your eyes.*

Codependency is a term used to describe a kind of addiction, a relationship addiction. A person is said to be suffering from codependency when they exhibit caring for a loved one who is suffering from a real addiction to drugs or alcohol. The behavior of the caring individual is said to hinder recovery of the real addict by enabling the addict to continue the addiction. Codependency makes it seem as if all caring for addicts is pathological.

....the codependency movement...does not recognize or confront the social and economic realities in people's lives. It does not distinguish the dependencies that are healthy and desirable (loving and needing others) from those that are economically imposed (such as not having the financial resources to leave a violent marriage). It speaks of self-esteem as if it were air in a balloon, something that can be inflated and deflated with sheer willpower, unrelated to anything that people do, to their experiences in the world, to the context of their lives. --Carol Tavris

This model of codependency has been made popular by the writings of several people, especially Melody Beattie (*Codependency No More*), Pia Mellody (*Facing Codependency*), Robin Norwood (*Women Who Love Too Much*) and Anne Wilson Schaeff (*Codependency, Misunderstood, Mistreated*). According to these people, the codependent suffers from low self-esteem due most likely to child abuse, and is caring mainly to keep the addict addicted so she (it is usually a woman) can feel worthwhile by caring for the sick one. The codependent, they believe, can be helped, as can other addicts, by the [12-step plan of Alcoholics Anonymous](#).

Some see codependency as pathological itself, indicative of a trend among certain therapists, especially those who call themselves "family counselors," to see child abuse as the root cause of most personal problems. The model these counselors follow seems to be something like the following: child abuse causes low self-esteem, which leads people to abuse drugs or alcohol and other people as well. If only one had a happy childhood, free from abusers, one would have a wonderful life as an adult. The person with problems--the drug addict, the relationship addict, the sex addict, the *name-your-craving* addict--is a victim. Addict/victims need help. Insurance should pay for this help. Counselors should never be without long lines of addict/victims covered by insurance policies for treatment for their "disease." Society should support

the work of these counselors because they have good intentions and, unlike the rest of us, are not in denial. They are especially not in denial about the likelihood that one model, the model of the diseased addict, could adequately fit all alcoholics, all substance abusers, and all other abusers of any craving.

substance abuse treatment

"The now tenacious attachment of the disease model and 12-step philosophy to caring behavior, commonly known as codependency, represents to me the most confusing and iatrogenic ideas in the realm of clinical psychology." ----[Robert Westermeyer, Ph.D.](#)

Substance abuse treatment is a behavior modification therapy for those who use drugs or alcohol to the detriment of themselves and others.

Law enforcement officials, politicians, and religious leaders often cite drug and alcohol abuse as evils so great that they threaten the survival of our society. Countless individuals worry constantly about their own and others' drinking or drug behaviors. Waiting to help all those with substance abuse "problems" are thousands of professionals in the "helping" professions. But are they really helping substance abusers? Or is substance abuse treatment (SAT) a racket designed primarily to make money or to promote some other selfish goal, with little regard for the health or well-being of patients? Or is SAT a mixture of good and evil, much like the people it avers to help?

the road to Hell is paved with good intentions

Criticizing those who profess to help substance abusers is unlikely to be welcomed either by those who see substance abuse as a subversive activity or by those who believe their own lives or the lives of loved ones have been or are now being destroyed by drugs or alcohol. The psychologists, psychiatrists, interventionists and aides who work in treatment facilities are unlikely to welcome criticism. Likewise for the owners and managers of such places. Nevertheless, it is unconscionable to allow an industry to go unchecked simply because they claim to have good intentions.

[Charles Dederich](#) (1913-1997), who created [Synanon](#), had good intentions. He would help drug addicts. In a little over twenty years, from 1958 to 1980, Synanon grew to an authoritarian cult with perhaps between \$30 million and \$50 million in assets. Instead of saving families, Synanon destroyed them. Of the 6,000 to 10,000 residents of Synanon between 1958 and 1968, only 65 people were rehabilitated (Ofsche 1980, 110). His empire collapsed when he pleaded no contest to a charge of conspiracy to commit murder. How do the Dederichs of the world get away with it? In his case, he was doing society's dirty business of helping drug addicts. To attack a person or an organization which is helping people is to show bad form and will generally be unrewarded. Furthermore, we all want such endeavors to succeed and are more apt to seek out confirmation of their successes than to criticize their failures. Programs like Synanon are the darlings of the media--and politicians

in election years--until their warts become too obvious to ignore. Unfortunately, these natural tendencies gives the unscrupulous carte blanche to abuse the rest of us.

The goals of SAT may be noble, but that does not justify using any means necessary to achieve those goals. To allow treatment which denies a person his or her human as well as civil rights should not be tolerated. To treat people for questionable diseases should not be tolerated. To use therapeutic techniques with little or no substantive evidence for their effectiveness should not be tolerated. While there are many SAT programs that respect the basic humanity of their patients and do a good and decent job of helping substance abusers, there are also programs that are not being monitored carefully by anyone, thus inviting abuse.

professional interventionists

Interventions are commonly used on those thought to be drug or alcohol abusers by concerned relatives and friends. The element of surprise is often used in these interventions. Several people including, in some cases, a professional interventionist confront the subject, who is immediately on the defensive. Not that it much matters, for any defense is taken as "being in denial." The shock of the intervention, its humiliating aspects, the intimidation of numbers, all combine to prevent any sort of rational exploration of the situation. This is of little importance, since the intervention is to be an *emotional* experience, not an intellectual one. The subject must *feel* (a) how much he or she is loved and (b) how alcohol or drugs is ruining their lives. Presumably, at an *intellectual* level, the abuser already knows these things, but the *value* of this knowledge has no effect on their behavior.

The interventionist is a paid professional. He or she is paid not for caring for the person admitted but for getting the person admitted. The interventionist takes on the role of Grand Inquisitor and deliverer, rather than that of counselor. But what justifies such a position? Why are there interventionists at all? They're needed to assist families in convincing a loved one to seek treatment. They are there to offer professional support to those who want their loved one treated. But why do people need an outsider, a stranger, to help convince their loved one to seek treatment? Is it because the interventionist plays the role of the *independent* facilitator, a *disinterested* professional? If so, then the position is a fraud. For the interventionist is not independent or disinterested, but is (a) primed to believe the subject is an abuser and (b) paid for delivery of a live customer to the treatment facility.

Should the subject agree to enter a treatment facility, he is also entering a world of ideas, the main one being that drug or alcohol abuse is a *disease*. Many subjects will join a group such as Alcoholics Anonymous, where they will also enter a world of ideas known as the [12-step program](#). That program, however, sees alcohol abuse as a matter of a weak will. Some may even end

up in a facility which tries to treat the *disease* of alcoholism with the 12-step program of character building, even though these approaches seem contradictory. Diseases cannot be controlled by the will, despite what “alternative” healers like [Deepak Chopra](#) and others might claim. Diabetes is not a character flaw. You cannot *will* your cancer away.

Those familiar with AA will recognize that the “disease” model of substance abuse contradicts the AA model of the weak-willed sinner who needs a “Higher Power” (which can mean anything from the AA group itself to the God of the Bible) to conquer the mighty forces of satanic booze. These clashing metaphors of the victim and the sinner are contradictory: the one makes the victim passive and not responsible for being an abuser; the other puts the burden of responsibility on the alcoholic. But it is a meager responsibility, since all the sinner must do to be redeemed is admit he or she is a sinner and turn oneself over to a “Higher Power”. Yet, there are even some AA programs which give the nod to the “genetic disease” model of alcoholism. Contradictions apparently do not matter when your goal is noble, however.

The disease model of alcoholism

What are the signs of this disease? In addition to craving drink and an inability to stop drinking after one or two drinks, one symptom of this disease is *quantity* of alcohol consumed. An alcoholic may require rather large amounts of drink before he or she feels a buzz much less feels drunk. If you drink no more than the average American, then you *probably* do not have this disease. If you drink more than that, then you are probably an alcoholic. The [National Institute on Alcohol Abuse and Alcoholism](#) defines a moderate drinker as someone who drinks an average of 3 to 14 drinks a week. A heavy drinker has an average of more than two drinks a day. A drink is 12 ounces of beer, one glass of wine or one shot of liquor. (In case you are wondering, if you drink 3 or more drinks a week you are in the minority: only 27% have that many drinks.)

Another symptom of this disease is *when* you drink. If you drink when stressed or depressed, lonely or bored, to get motivated or amorous, to test yourself or to feel good, then you are *very likely* an alcoholic. A better sign, however, is suffering from withdrawal symptoms. If you get nauseous, the cold sweats or the shakes when you don't drink, you are without doubt an alcoholic.

One of the unique features of this disease is that the effects of the disease are usually first felt by people *other* than the one suffering from the disease. For most diseases, the sick person feels bad. If the sick person doesn't feel bad, nobody else feels bad. If alcoholism is a disease, it must be a *mental illness*. The mentally ill often deny they are ill and the first identification of a mental illness is often when others notice that the afflicted person is behaving in

unconventional, bizarre or self-destructive ways. Like other mental illnesses, there is no blood or urine test for alcoholism. There is no physical marker the healer can look for to identify the disease. All the signs are behavioral.

Unlike mental illness, however, alcohol abuse is self-inflicted and might better be called *brain abuse*.

One cynical view of the matter is that alcoholism as a disease is not a matter of discovery, but of definition. It is a disease because it has been declared to be so by the very ones who profess to have the cure for the disease. How fortunate for the world that those who define the disease also define the cure! Actually, they don't have a "cure." They have a remedy. The inventors of the disease also declare that no one can be cured of this disease. Once an alcoholic, always an alcoholic. You haven't had a drink in fifty years, you say. That is not evidence that you are no longer an alcoholic. A cure would mean an end to treatment. A remedy means a lifelong income for the SAT provider.

The treatment usually begins by being repeatedly told that the first step to recovery is the declaration: *I am an alcoholic*. For the sinner to be saved, the sinner must first admit he is a sinner. To refuse to do so is proof the sick one is "in denial" and without grace. The only way to prove you are not in denial is to admit you are an alcoholic. This is only phase one. The next phase is public confession: the subject must declare before others how they have degraded themselves and betrayed their humanity through substance abuse. The point, I suppose, is to get the substance abuser to believe he or she is hopelessly addicted or diabolically possessed (or both) and can be helped only by abandoning oneself to a "Higher Power."

Neither A.A. nor many other SATs are based on science, nor do they seem interested in doing any scientific studies which might test whether the treatment they give is effective. A.A. members *know* A.A. works, so they don't need studies to verify the effectiveness of the program. They have very vivid [testimonials](#) from people like [Bill Wilson](#), the founder of AA, of hopeless alcoholics whose only salvation was a religious experience. But others might like to know how many don't stay and go through the program? How many go through it, but leave? We only hear about the successes, not the failures, because the failures aren't counted; they aren't around to be counted. We won't read about any comparisons with non-AA programs, nor will we hear about those substance abusers who quit drinking or drugs without any treatment at all. They didn't need a "Higher Power" or the group's help to quit; they did it on their own. How is that possible? If alcoholism is a disease for which there is no cure, and which requires the substance abuser to give oneself over to a "Higher Power," how do some people quit abusing alcohol or drugs on their own? This should not be possible if either the AA philosophy or the disease theory is correct. If alcoholism isn't a disease, then it is foolish to seek a "cure" for it. It is foolish to have treatment centers with

patients who are “suffering from alcoholism.”

Even if alcoholism is a sin and a matter of self-control, it is especially foolish to treat all alcoholics with the AA 12-step program. All alcoholics don't come from the same mold. They are not all physically addicted. They are not all psychologically addicted. They are not all addicted. They are not all victims. They are not all diseased. They are not all hopelessly without any self-control. They are not all completely irrational and incompetent. They are not all mentally ill. They don't all need therapy or medication. There are probably many good programs besides those based on the “disease” or the “sinner” models of the alcoholic. Substance abusers who want to get back some control in their lives might check out some of these other programs and not feel it's either AA or a “chemical dependency” program or nothing.

One final note: it seems rather curious that [Bill Wilson](#), founder of AA, credited people like [Carl Jung](#) and William James' [Varieties of Religious Experience](#) for helping him see that “ego collapse” is the common denominator in conversion experiences and that such an experience was the one the alcoholic must have in order to reform. (Wilson also wrote fondly to Jung that some in AA had become devotees of [psychic](#) powers and the [I Ching](#), a favorite of Jung's.) Jung had simply thought that some people were hopeless and therapy could do them no good, but perhaps religious devotion could help them. James catalogued experiences as part of his pragmatism: the truth of religion is in its fruits, its effects on a person's life. The idea is attractive is you keep one eye shut and ignore the Jim Jones, Jerry Falwells, David Koreshes and Pat Robertsons of the world. The idea might seem true to someone whose selective memory ignores all the alcoholic priests, priestesses, and devoted churchgoers.

codependency

6 Jul 1996

Since the 70's, the number of family counselors has grown by 50,000. Educated in social work, pastoral training, women's studies, with a very strong anti-patriarchy orientation, we now have a psychological model that sees abuse and addiction behind every curtain. Both addiction and abuse have been redefined to include almost any touch in the one case, or any consumption in the other. I suspect that men in particular have been labeled in this new scheme of things as unfit fathers in divorce proceedings. In the 12 step framework, one is either in denial or recovery. There is no other state. Similarly, one is either an enabler or a controller in the codependency model. Both are all encompassing systems, based on simplistic assumptions.

Fires are fed by the puritanical and "spiritual" bent of much contemporary new age social thought, particularly in California. Feminist psychological theory adds its own ingredients to the mix with the notion that the only way to "recovery" is through group grope identity as victims. Sex therapists and psychiatrists speak against the metaphor of addiction, only to be subject to witch hunts. The 12-step framework is firmly entrenched in social and legal institutions in the US, despite the fact that AA only claims a 10% success rate. The framework delegates context to a matter of derivative concern, so that poverty or unemployment or other social conditions become secondary.

Another question is what defines addiction. This psychological notion of addiction, as opposed to the physiological, came up mid 70's. Do we now have more alcoholics than before? And if so, why? Because we have redefined the term? Or is it simply a device of a very powerful social force and medical industry?

We live in a very effeminate culture with little respect for the truth or for the men who would speak it. Have AA and the codependency movement become new sacred cows? I suspect they have.

law of truly large numbers

07 Mar 2003

Some of your statistics under subgroup "coincidences" are a bit misleading. In regards to a person winning the lottery twice, The probability is not 1 in 40 that they will win the lottery a second time. Obviously, the odds of winning the lottery just don't diminish if you have already won. Numbers don't play favorites. The correct probability is that IF You win the lottery a second time, the odds of winning it twice within a two month period are 1 in 40 compared to winning it twice over a several year period. If it were not, You would see a lot more mathematicians playing the lotto. Also, it might be interesting to note that in order for two people to have the same birthday on any given SPECIFIED day, you need to have a group of at least 250 people in order for the probability to be 50-50. One wouldn't want to accuse you of selective thinking. Either way, as you have noted, with a large enough sample, truly large coincidences will happen. It is just a lot more enjoyable when you happen to be making several million dollars in the process.

G. Gotham Smith

25 Sep 2001

In "lawofnumbers.html" there are some problems in the table "Geller's Mysterious Number 11". Here are eleven errors I found:

- 1.) "Twin Towers - standing side by side, looks like the number 11" - "looks" s/b "look" - There is an unneeded line break after the work "like".*
- 2.) "*The first plane to hit the towers was Flight 11 by *American Airlines or AA -> A=1st letter in alphabet so we have again 11:11" - unneeded line break after the word "by". - unneeded star before "American Airlines. - How do we get "11:11"? Is this from AA:11-> 11:11?*
- 3.) "The # of story is 110 (2x) 110 - 110 Remember that the zero "0" is not a number, so we have 11:11" - "story" s/b "stories". - How about "The # of stories in each tower was 110, 110:110. Since zero, "0", is not a number we have 11:11"*
- 4.) "The house where they believed to have lived had # 10001 again don't count the zero....." - They who? - The five periods s/b three*

5.) "Skyscrapers, American Airlines AA = 11" - This is a little confusing, why not just add "Skyscrapers" to the eleven letter words list. - AA = 11 is a repeat of an early point. ----- Here's another eleven letter group "Bob T. Carroll", not to mention how the last two letters of "Carroll" form an eleven, "ll". Are you ready to come clean about your connection with the bombing?

And one more eleven letter group "Eleven Errors", (treat the "o" like a zero and don't count it).

[In which the author struggles to escape the psychological shackles of a self-help seminar by Kirsten Marcum](#)

[Cults in our Midst by Margaret Thaler Singer](#)

Large Group Awareness Training programs

Large Group Awareness Training (LGAT) programs are personal development training programs in which dozens to hundreds of people are given several hours to several days of intense instruction aimed at helping participants begin to discover what is hindering them from achieving their full potential and living more satisfied lives. LGAT programs have also been developed for corporations and public agencies, where the focus is on improving management skills, conflict resolution, general institutional strengthening, and dealing with the eternal problem of employees who drink too much or use too many drugs.

LGAT gurus claim to know how to help people become more creative, intelligent, healthy, and rich. They focus primarily on the role interpersonal communication plays in self-esteem and in defining our relationships with others.

LGAT gurus claim to know why their participants are not happy or why they are not living fulfilled lives. They assume everyone is being hindered by the same things and that one approach will suit all. Some LGAT gurus use public television and books as their vehicles. Others give seminars in hotel ballrooms. Some use infomercials and peddle books and tapes to the masses to help get them on the path to self-realization and success.

The U.S. Army might think it takes a few years to "become all that you can be," but the gurus of self-help think it can be done in a few hours or days.

These gurus might all take the one-size-fits-all cookie cutter approach to self-help, but the founders of such programs as [est](#), [Landmark Forum](#), [neuro-linguistic programming](#), [Tony Robbins seminars](#), etc., use their own unique cookie cutters.

Though some advocate visualization, self-hypnosis, and other techniques for achieving self-realization, most LGAT programs focus on *communication* skills and the effect of language on thought and behavior. Those running the programs must excel in those skills. The trainers are motivators. They must use their powerful communication skills to persuade others to believe that (a) they (the trainers) know something valuable about fulfilling one's potential; (b) the valuable knowledge can be transmitted to the participant in a short time; (c) the trainee can expect to reap tangible, even if subjective, benefits in a short time (such as improved relationships with others or feeling better about oneself); and (d) the trainee has only experienced a small taste of the wonderful pleasure and fulfillment that awaits those who sign up for

advanced training. In short, the trainers are not just teachers; they are sellers. Their main job is to motivate participants to buy more services, i.e., sign up for more courses. The fact that trainers are unlikely to do any follow-up on their trainees, except to try to persuade them to take more courses, indicates that their main interest is not in helping people lead more fulfilling lives. The trainers have a sales job to do. They are paid commissions for the number of people they recruit and train, not for the number of people they truly help. It is not in their interest to do follow-up studies on their trainees. It is in their interest to do follow-up recruiting calls.

A short amount of reflection should make it apparent that the gurus of personal development training are like those infomercial stars who promise to share with you their secrets on how to make millions of dollars by taking out classified ads or by buying repossessed properties. The real money is not in taking out classified ads or buying repossessions; otherwise, that is what the infomercial star would be doing instead of making infomercials. The real money is in selling the idea to others. If the trainers who work for Tony Robbins or Landmark Forum could realize their true potential in a meaningful, lucrative way, would they take a sales commission job? Would they work for a guru for a relatively small sum of money, while investing a rather extensive amount of time in the hopes of some sort of breakthrough? No. If they want to reach their own true potential they must break away and start their own personal training program. Which is exactly what many of them do.

Personal training programs are likely to be successful, however, if only because (a) the participants are strongly motivated toward self-improvement and (b) the trainers force participants to reflect on themselves, their lives and their relationships. Such motivation and reflection will result in either perceived insights or renewed effort to gain such insights. Being surrounded by many others in search of the Promised Land serves to energize participants and to give them hope. Ultimately, the main product being sold by human potential gurus is hope itself. It should be obvious that in itself this is not a bad thing. We all need hope. Without hope, there is no point in making plans for the future. Without hope, there is no point in working on a relationship or setting goals. Thus, insofar as participation in Large Group Awareness Training increases one's hope for finding one's way and for achieving one's goals, it is good. Even false hope may be better than no hope at all.

Since fear is a major obstacle to hope, the human potential trainers must help participants overcome those fears which hinder development. For example, there can be no hope of achieving a goal if the fear of failure is so strong that one avoids setting goals in order to avoid failing. After all, if you don't try something, you can't fail at it. Likewise, no troubled relationship can improve if one fears rejection by the other to such a degree that one will not even try to heal the wounds. One must overcome fears of failure, rejection, ridicule, humiliation, etc., if one is to have any hope of achieving a very meaningful existence as a human being. One is powerless to achieve anything if one is

paralyzed by fear. Empowerment to achieve requires empowerment to overcome one's fears and thereby gives one hope. The most direct way to empower someone would be to convince them that if what they most fear were to happen not only would nothing be worse than it already is, but most likely things would be even better than they are. Another way is to convince people that their own beliefs are hindrances to success and that they can replace those beliefs at will.

No one knew this better than [Leo Buscaglia](#), one of the more successful LGAT gurus of the 1970s and 1980s. He used books, lectures and public television programs to promote the idea that the key to everything is *love*. He popularized notions that Nietzsche, Bertrand Russell and B. F. Skinner had written about, e.g., the psychological power of loving those you fear. "Love your enemies," he would say. "It'll kill them!" Your enemy doesn't have to be another person, however. Your own fears can be your enemies. Embrace your fears, it'll kill them. If your relationship fails, what is the worst that can happen? The relationship ends. You can dwell on it, crawl into yourself, withdraw, surrender. Or you can learn from it, grow, develop, be prepared for a better relationship in the future. It's up to you. As the Stoics said: know what's in your power and what is not. Don't try to change what is not in your power to change. You can't control what others say or do, but you can control your attitude, your emotional response, to what they say or do. In short, if you don't try, you can't succeed. If you try and fail, you can still succeed. It's up to you. It is up to the human potential guru or trainer to convince you of this.

Self-growth programs such as [est](#), [Landmark Forum](#), [neuro-linguistic programming](#) (and even [cults](#) like [Scientology](#)) can point to many "successes." They can demonstrate that their programs "work." They can bring forth to testify on their behalf hundreds, if not thousands, of satisfied customers, many of them famous celebrities such as John Denver, John Travolta, Yoko Ono, Cher, Valerie Harper and others. Many people apparently find that their lives are better after they get involved in est, NLP, Landmark Forum, or Scientology. Those of us who have been trained to study philosophy and psychology, who have a deep sense of the nature of speculation and empirical research, are able to recognize the [pseudoscientific](#) nature of such programs. We know that [testimonials](#) do not validate a self-help program. We know that there is significant [post hoc reasoning](#) by both gurus and their followers. We are aware of the role of [subjective validation](#), [confirmation bias](#), [wishful thinking](#), [the regressive fallacy](#), and [communal reinforcement](#) in the success of such programs. We know there is little or no research done by the promoters of these programs to (a) test causal claims that might establish some degree of effectiveness to their methods; (b) establish clear criteria for what counts as "successful" training; (c) keep records of "failures" or those who feel ripped off or harmed by the program.

Nevertheless, despite the lack of proof that these programs work the way their advocates claim, and despite the fact that many trainers are overly zealous in

their recruitment of participants in seminars and advanced seminars, many participants feel they benefit greatly from such programs. However, research has shown that the *feelings* of having benefited greatly from participation in an LGAT do not correspond to beneficial changes in behavior (Michael Langone, "Large Group Awareness Training Programs," *Cult Observer*, v. 15, n. 1, 1998). Also, many of those who feel they have benefited do not understand that others may not feel they benefit at all from such programs. To their healthy friends and family members, the zealot may appear to have been brainwashed. Their enthusiasm seems unnatural and disproportionate. If they were unbalanced before taking the program, they may appear to have gone beyond "breakthrough" into "breakdown."

collective hallucinations

Where belief in miracles exists, evidence will always be forthcoming to confirm its existence. In the case of moving statues and paintings, the belief produces the hallucination and the hallucination confirms the belief. --D.H. Rawcliffe

Collective hallucinations are sensory hallucinations induced by the power of suggestion. They generally occur in heightened emotional situations, especially among the religiously devoted. The expectancy and hope of bearing witness to a miracle, combined with long hours of staring at an object or place, makes certain religious persons susceptible to seeing such things as weeping statues, moving icons and holy portraits, or the Virgin Mary in the clouds.

Those witnessing a "miracle" agree in their hallucinatory accounts because they have the same preconceptions and expectations. Furthermore, dissimilar accounts converge towards harmony as time passes and the accounts get retold. Those who see nothing extraordinary and admit it are dismissed as not having faith. Some, no doubt, see nothing but "rather than admit they failed...would imitate the lead given by those who did, and subsequently believe that they had in fact observed what they had originally only pretended to observe....(Rawcliffe, 114).

Not all collective hallucinations are religious, of course. In 1897, Edmund Parish reported of shipmates who had shared a ghostly vision of their cook who had died a few days earlier. The sailors not only saw the ghost, but distinctly saw him walking on the water with his familiar and recognizable limp. Their ghost turned out to be a "piece of wreck, rocked up and down by the waves" (Parish, 311; cited in Rawcliffe, 115).

Kabalarian Philosophy

The Kabalarian Philosophy (KP) was the brainstorm of Mr. Alfred J. Parker. Since the death of Mr. Parker in 1964, the Kabalarians, headquartered in Vancouver, B.C., have been led by Ivon Shearing who was sentenced to five years in prison in 1997 for sexually abusing several teenage girls over a twenty-five year period. He was convicted of two counts of rape, three of sexual assault, four of indecent assault, and three of gross indecency. Two of the indecent assault convictions were overturned by an appeal court in 2000, and a retrial ordered.* In 2002, after serving only 16 months of his five-year sentence, Shearing was granted a retrial on his rape and sexual assault conviction of a fifteen-year old girl.*

KP "teaches a concept of constructive living which provides the key to understanding how to control life to bring into reality the happiness, mental freedom, and personal success that everyone seeks." The Kabalarians have a [website](#) where they offer for sale many of Mr. Parker's books.

Why KP rather than any of the other million and one solutions to the riddle of existence? Because the others lack "tangible reality." One tangible reality which KP has is "Name Analysis." According to the KP,

Every alphabet has a consistent mathematical order, which allows it to be measured. An analysis of the letters in your name will determine the qualities of your personality.

Your name determines your every experience. It defines your personal strengths [sic] and weaknesses both mentally and physically. It interprets your whole nature. It shows your position in life and your measure of success or failure. When you are named your destiny is created.

This sounds similar to another tangible reality known as [numerology](#). According to KP my destinies are:

The name of Bob gives you the desire to be original and independent, and to utilize your abilities in leadership. You are inclined to be candid in your expression, saying things straight-to-the-point but without intending offence [sic]. If this name is used a great deal, you would be practical, skeptical, and very individual in your approach to life. With a desire to assume responsibility early in life. The weaknesses would show through head tension causing sinus

trouble, headaches or headcolds.

Your name of Robert creates a refined, diplomatic nature that elicits the co-operation and respect of others. You appreciate a high standard of living and the attendant luxuries and comforts; however, the name does spoil ambition and confidence, and creates a self-depreciating quality that is a deterrent when you must force an issue or even carry out an important decision.

For some reason, middle or last names are not important, but I couldn't resist looking mine up anyway.

The name of Todd has some very fine characteristics but it does not give you verbal expression. You have profound thoughts on life but do not always express them for fear of being misunderstood. This name makes you fond of nature and you appreciate being by yourself where you can relax and ponder over life's mysteries. As you desire peace and harmony, you avoid people when there is anything you find unpleasant. Thus you appear somewhat unsociable and aloof. You have to guard against a jealous nature which causes misunderstanding and wrong feelings in close association. You also tend to take a know-it-all attitude and to be domineering, which others feel and resent. Reading, writing, and art are forms of expression that you most appreciate. Worry and responsibility are causes of frustration. The greatest lack in this name is in verbal expression, which is so necessary for success. Physically, you could be affected in the respiratory system, lungs and heart, etc.

Your name of Carroll creates extreme sensitivity to the thoughts of others and a total lack of expression of your own thoughts and feelings, except through the medium of writing. Under this name you seldom find anyone who, you feel, understands you. You are easily embarrassed and then you become quiet and secretive in order to avoid being laughed at or misunderstood. You keep your thoughts and feelings inside and only feel really relaxed and at peace at such times when out in nature or listening, alone, to beautiful music. This name also gives you a weakness in your chest which could lead to pleurisy or heart murmurs, or any trouble affecting the bronchial organs.

Of course, some of these descriptions are correct. They would be true of almost anybody. Some of the more specific claims are correct, but most are

not. An analysis of this sort of personality profiling is taken up in the entry on [the Forer effect](#).

What is unique about KP is its advocates believe that you can change your destiny by changing your name. You can call them and they will help you do this, should you find another name with a better destiny than the one your ignorant parents unwittingly strapped on you at birth. For example, maybe the following describes a destiny you would not like to have:

The name of ----- gives you sensitivity and refinement, an appreciation of nature, and cultural interests. You are able to express yourself through writing, more so than verbally. You abhor vulgarity, and any signs of friction or violence disturb you. You want to work in a position with a refined atmosphere, rather than one of noise and confusion. You can be affected by the thoughts of others. Uncontrolled feelings and moods of depression are the result. This name does not give you the strength of mind and body to carry out your plans. In fact, the high-strung nature resulting from use of this name has a physically weakening influence, robbing you of vitality and limiting your endurance for hard work. Your health could be adversely affected by this name, giving rise to weaknesses in the respiratory organs, kidneys, and bladder.

If the fate of this name is not to your liking, change your name from Adolph to Adolf. It will make a world of difference and will be good for your bladder.

See related entries on [cold reading](#), [the Forer effect](#), [selective thinking](#), [self-deception](#), and [wishful thinking](#).

reader comments:

The Mineral Doctor

30 Sep 2000

Wallach states that he did 17,500 autopsies, 3000 of which were on humans. He states at <http://www.wellnesspublications.com/about.htm> that the autopsies were done between 1962 and 1967. That implies a rate of 2,500 to 4,300 autopsies per year or 8-12 autopsies per day, depending upon whether the period in question is from the beginning of 1962 through the end of 1967 (6 years) or from the end of 1962 through the beginning of 1967 (4 years).

David Feustel

reply: Whatever he claims, it is probably a lie. He ought to call himself Dr. Pinocchio.

29 Aug 1998

Regarding your skepticism on Dr. Wallach, I was profoundly impressed with his tape "Dead Doctors Don't Lie."

reply: Good, but I must say I am not very impressed with the segue from my skepticism to your profound admiration for the Mineral Doctor.

So far, it has been the only source of material I've read from Dr. Wallach, but I have to say that when I read your Web Article regarding his claims, I noticed that there was very little on your part to support your skepticism.

reply: Are you trying to flatter me, or what?

There were 'numerous' references on his tape to studies that were done by both respected sources and organizations both private and governmental.

reply: Which study were you most impressed with? the Senate document (undated but probably 30 or 40 years old) or the AMA study done in 1939?

I have worked in the medical field for over 10 years and have seen these pitiful sick people taking grocery bags full of this medicine and that medicine, sometimes prescribed by a half dozen different doctors.

reply: Well, you certainly have the credentials to recognize a charlatan when you see one.

I can admit, unbiased, that the only way I would believe his claims 100% is if I lived to be over a hundred years, but at the same time, I see no reason to disprove him.

reply: Neither do I, but I have good reasons for doubting his claims that just about everyone dies from some sort of mineral deficiency and there are five cultures where people live over one hundred years on average.

Although, he says the only place in the U.S. to get these vitamins is in a pit in Utah, do you know of another U.S. location where someone has found a source?

reply: Someone with your experience in the medical field should know the difference between minerals and vitamins. Anyway, I see good reason to doubt that the only minerals that are any good are "colloidal" minerals. Furthermore, I have good reason to be skeptical that only colloidal minerals which come from a place that the good doctor has an economic interest in are going to do me any good. I don't doubt, by the way, that [many people have very good reasons for taking vitamin and mineral supplements.](#)

I know there are several in the world and Dr. Wallach states more than once in his tape that you can get these supplements at most health food stores. I also contend that Dr. Wallach doesn't state that all you have to do is drink the "magic elixir" and all will be well. He never states that exercise, good eating habits and non-smoking will not affect your longevity. He doesn't even imply that. He refers to the "supplement" as a "supplement." Remarking that it is to be added to your daily regimen and not the cure-all for everything that ails you.

reply: He never mentions that his audience ought to exercise, not smoke, and eat healthy foods. In fact, he implies that it is pointless to try to eat healthy foods because most of the minerals have been depleted from the soil. I guess he doesn't know anything about modern agriculture. As for calling a supplement a supplement, I assume he meant that a person still has to eat, but he seems clearly to imply that what you eat isn't all that important, as long as you are getting everything you need in your colloidal elixer.

We all have our own opinions and in mine, I believe that above all, "hope" is a very powerful tool. It makes you pay attention, feel good and have a positive outlook. Doctors tend to "be honest" with their patients and sometimes try not to give (false?) hopes. In fact, they try to not to give much hope at all. Some do though. Some give a great deal of hope. It helps promote better outcomes in the patient and those who are interested. I would be less likely to struggle through

a bad illness if I thought there was no reason in trying.

reply: Hope is what Dr. Wallach and every other snake oil seller in the world is selling. It is a long way, however, from encouraging someone when they are facing a difficult obstacle, to defrauding and manipulating them with false hope.

I think Dr. Wallach deserves some credit. He was right on the money about many things. One of these was the study done with salt and HTN. People who took medicine for HTN and cut out the salt, had no clinically relevant change in blood pressure. Salt was not the thing that needed to be changed. Even today, doctors are suggesting people with HTN cut down on salt. Are doctors telling patients to stop taking homogenized dairy products and homogenized oils? Food products which are physically altered to the point where the microscopic particles are sharp and scar arteries? I bet not.

reply: I don't think he deserves much credit. You seem to think that if someone is right about one thing, we should trust him in all other things, even if the evidence is against him. I don't doubt that the medical establishment will be proved wrong about many things. However, no matter how many errors are made by medical doctors, the sum of those errors will never make a sufficient case to justify the Mineral Doctor's claims about colloidal minerals.

If you are really interested in salt, you might want to read Gary Taube's article, "The (Political) Science of Salt," in the [August 14, 1998](#), issue of *Science*.

I believe that Dr. Wallach took a proactive role in health research. He left out medicine and other means and just concentrated on the mineral aspect. Of course, there wasn't enough room on the tape to cover "every" possible mention to health control and longevity -- he concentrated just on the mineral aspect. I believe he made his point. I believe he was credible and I believe that until someone can disprove him with more than conjecture and hearsay, I believe him and most people that see what he is trying to do, will believe him, too. In my humble opinion.

reply: Yes, he and every other quack and medical con man in the universe takes a proactive stance in health research, if by that you mean that they invent data at will to support their claims. I don't believe for a minute that the reason he focused only on minerals was because he was running out of tape. He spend a good deal of time ridiculing doctors, telling anecdotes about obituaries of medical doctors, etc. If he had anything else to say, he could have figured out a way to fit it on an hour-long tape.

The fact that you and others like you believe he is credible reflects your desire to believe him. He banks on your gullibility and desires. Literally.

Believe it or not, I am also an incredible skeptic.

Brian Olson

reply: You don't have to tell me. You are truly an *incredible* skeptic.

16 Sep 1997

I found your OPINIONS to be very interesting on the subject of Dr. Wallach's tape and Colloidal minerals etc. But just as with Dr. Wallach's ideas, your rebuttal was nothing but opinion as well.

You're not implying that all opinions are equally reasonable, are you?

As for my reason to write you, I have been taking what you call the UNNECESSARY colloidal minerals for the last year. I am 32 years old and have, without fail, gotten a cold at least 3 times per year for the last 15 years of my life..sometimes 4. I am a teacher who works in enclosed rooms and buildings with hundreds of germ carrying kids 5 days a week. During the last year I have had no colds, flu, allergies, or any other health ailment that may be spread by a bug going around a school. You the eternal skeptic, may just call that a coincidence, I do not. And if you think that I may just be having a "Placebo effect" from the supplements I take, I say Who Cares? I'm not getting sick, I feel great and yes, even some of the premature gray hair on my head is going away.

Thanks for sharing the good news! I hope you haven't jinxed yourself by writing to me, the eternal skeptic. The last person who did so contracted yellow fever. Anyway, far be it from me to suggest you are having a placebo effect. You seem to be sure it is the colloidal minerals that is causing your change in health. Yet, you also suggest that you don't care if it is the minerals or not. Your cavalier attitude does not seem to me to be one I would want taught to my children. I would want my children to be curious as to whether it was the minerals that were making my hair change colors and making me feel so good. I'd want to encourage them to do a controlled study, to make sure it wasn't some other change I had made in lifestyle or diet, or that it wasn't a fluke, or that I wasn't self-deceived (if everone else thinks your hair is as gray as ever, you need a reality check), etc. In short, I would care and I would want the teacher of my children to care. This will teach them the difference between unscientific/uncritical thinking and sceintific/critical thinking. Or, perhaps you teach science from the Bible and do not wish to contaminate the minds of your young charges with such filth as science and critical thinking.

I don't know what kind of doctor you are, but even you must agree that you cannot receive the nutrition you need from just food alone. Have an open mind, and besides if you don't like what Dr. Wallach says....DONT LISTEN

(remember the 1st amendment)

Sincerely,

Paul C. Stensrud

Average Joe Teacher

Colloidal Mineral Taker

Well, I have to admit that I am not a real doctor like Dr. Wallach, the naturopath/veterinarian, but I do agree that you can't receive all the nutrition you need from food alone. That is why I firmly advocate at least one Sierra Nevada Pale Ale a day. It will help you deal with people who confuse the First Amendment with the attempt to stifle criticism.

Lysenkoism

Lysenkoism refers to an episode in Russian science featuring a non-scientific peasant plant-breeder named Trofim Denisovich Lysenko [1898-1976]. Lysenko was the leading proponent of Michurianism during the Lenin/Stalin years. I. V. Michurin, in turn, was a proponent of Lamarckism. Lamarck was an 18th century French scientist who argued for a theory of evolution long before Darwin. Lamarck's theory, however, has been rejected by evolutionary scientists because it is not nearly as powerful an explanation of evolution as natural selection.

According to Lamarck, evolution occurs because organisms can inherit traits which have been acquired by their ancestors. For example, giraffes find themselves in a changing environment in which they can only survive by eating leaves high up on trees. So, they stretch their necks to reach the leaves and this stretching and the desire to stretch gets passed on to later generations. As a result, a species of animal which originally had short necks evolved into a species with long necks.

Natural selection explains the long necks of the giraffes as a result of the workings of nature which allowed the species to feed off of the leaves which grow high on trees rather than graze as short-legged, short necked animals are prone to do. There was no purposive behavior which was a response to the environment which was then passed on to later generations. There was simply an environment which included trees with leaves up high and that was a favorable food source to long-legged, long-necked animals such as the giraffe. In fact, according to natural selection, if that were the only food source available, only animals with long- necks, or animals which can climb or fly, would survive. All others would become extinct. There is no plan here, divine or otherwise, according to natural selection. Furthermore, there is nothing special signified by the fact that a species has survived. *Survival of the fittest* means only that those who have survived were fit to survive. It doesn't mean that those who survive are *superior* to those species which don't. They've survived because they were fit to adapt to their environment, e.g., they had long necks when there was a good supply of food readily available high up in the trees and there were no other catastrophic disadvantages to their height. For example, if a species got so tall that it became impossible to mate, it would become extinct. Or, if the only food source on high happened to have a substance in it which rendered giraffes sterile, there would be no more giraffes, no matter how hard they tried to will themselves potent.

Lamarckism is favored by those who see *will* as the primary driving force of life, e.g., the 20th century French philosopher Henri Bergson. Darwinism, or natural selection, is hated by many of those who believe God created

everything and everything has a purpose: the fundamentalist teleologists of the world. One might think that Marxists would prefer Darwinism with its mechanical, materialistic, deterministic, non-purposive concept of natural selection. Lamarckism looks like it might be preferred by free market advocates with their emphasis on will, effort, hard work and choice. But then Russia and the Soviet Union weren't really Marxists. They turned the dictatorship of the proletariat into the dictatorship of the professional dictator (Lenin, then Stalin). And even with the death of Stalin, the dictatorship of the communist party leaders who controlled everything, including the economy, took over.

In any case, Michurin's views on evolution found favor with the party leadership in the Soviet Union. When the rest of the scientific world were pursuing the ideas of Mendel and developing the new science of genetics, Russia led the way in the effort to prevent the new science from being developed in the Soviet Union. Thus, while the rest of the scientific world could not conceive of understanding evolution without genetics, the Soviet Union used its political power to make sure that none of their scientists would advocate a genetic role in evolution.

It was due to Lysenko's efforts that many real scientists, those who were geneticists or who rejected Lamarckism in favor of natural selection, were sent to the gulags or simply disappeared from the USSR. Lysenko rose to dominance at a 1948 conference in Russia where he delivered a passionate address denouncing Mendelian thought as "reactionary and decadent" and declared such thinkers to be "enemies of the Soviet people" (Gardner 1957). He also announced that his speech had been approved by the Central Committee of the Communist Party. Scientists either groveled, writing public letters confessing the errors of their way and the righteousness of the wisdom of the Party, or they were dismissed. Some were sent to labor camps. Some were never heard from again.

Under Lysenko's guidance, science was guided not by the most likely theories, backed by appropriately controlled experiments, but by the desired ideology. Science was practiced in the service of the State, or more precisely, in the service of ideology. The results were predictable: the steady deterioration of Soviet biology. Lysenko's methods were not condemned by the Soviet scientific community until 1965, more than a decade after Stalin's death.

Could something similar happen in the U.S.? Well, some might argue that it already has. First, there is the [creationist](#) movement which has tried, and at times been successful, in banning the teaching of evolution in public schools. With Duane Gish leading the way, who knows what would happen if Pat Robertson became President of the United States and Jerry Falwell his secretary of education. Then, of course, there are several well-known and well-financed scientists in America who also seem to be doing science in the name

of ideology: not the ideology of fundamentalist Christianity but the ideology of racial superiority. Lysenko was opposed to the use of statistics, but had he been clever enough to see how useful statistics can be in the service of ideology, he might have changed his mind. Had he seen what J. Philippe Rushton, Arthur Jensen, Richard Lynn, [Richard Herrnstein or Charles Murray](#) have done with statistical data to support their ideology of racial superiority, Lysenko might have created a department of Supreme Soviet Statistics and proven with the magic of numbers the superiority of Lamarckism to natural selection and genetics. For these social pseudoscientists have never seen a statistical correlation they couldn't turn into a causal claim fitting their racist ideology. Lysenko might have done the same for his Michurian/Lamarckian ideology.

[Japanese Exorcist
Given Death Penalty](#)

May 11, 2002

According to a Gallup poll, belief in possession by the devil has decreased from 49% to 41% over the past decade.

exorcism

If ignorance is bliss, demon chasers must be in nirvana.

An exorcism is a religious rite for driving [Satan](#) or evil spirits out of a possessed person, place or thing. In ancient times, many cultures had such rites. Today, the [Roman Catholic Church](#) still believes in diabolic possession and its priests still practice what is called "real exorcism," a 27-page ritual involving the use of holy water, incantations and various prayers, incense, relics or Christian symbols such as the cross, to drive out evil spirits. The Catholic Church has at least ten official exorcists in America today (Cuneo). The Archbishop of Calcutta, Henry Sebastian D'Souza, says he ordered a priest to perform an exorcism on Mother Teresa shortly before she died in 1997 because he thought she was being attacked by the devil.

Most [Protestant sects](#) also believe in satanic possession and exorcism. Michael Cuneo, a sociologist at Fordham University, claims "By conservative estimates, there are at least five or six hundred evangelical exorcism ministries in operation today, and quite possibly two or three times this many." Reverend Brian Connor, of South Carolina, says "dealing with animate evil is the single most overlooked component of the biblical mandate." * Connor was featured on NBC's "Dateline" program on exorcism (November 13, 2001). He and several friends spent an entire day trying to talk the demons out of the body of a 50-something man with a history of depression and aimlessness. The exorcists held Bibles, which they read from occasionally, and crosses. They huddled around their subject for hours, chanting prayers and ordering the demons to leave. The subject occasionally howled like an animal and grimaced at his benefactors. It was all great drama and eventually cathartic enough for the subject to vomit a little. Connor declared that he was spitting out Satan and that all the demons had left. A follow-up done two months later, however, found that the group had to repeat the exercise six more times. Now they were sure the demons were gone and the subject was sure he was fine and a new man.

Michael Cuneo watched a film of the exorcism and concluded that the group was suggesting to their subject how he should respond and that he saw no evidence of either demonic possession or of demons being exorcized. A psychiatrist was shown the same film and he announced that he couldn't evaluate what he observed as a psychiatrist but as a "believer" he thought that there might be something real going on involving demonic possession. When asked what he based his belief on, he replied tersely: faith. This man was a member of the American Psychiatric Association's Committee on Religion and Psychiatry.

As a layman, I found the behavior of the exorcists at least as interesting as that of the subject. Believing in demons is one thing; believing you have the ability to call up a supernatural being with infinite power and perfection who will cause demons to move on at your behest, seems certifiable. The whole coven of exorcists and exorcized are deluded. The former clearly felt great pride at their achievement and shared in a glorious victory over Satan. The latter was coddled and cuddled, hugged and loved, and eventually praised and rewarded with the good feelings of caring people when he released Satan and said "Jesus is Lord." There doesn't seem to be anything deeply complicated about what happened. The group convinced the subject he was possessed. They cued him as to how to behave and they rewarded him and themselves when he let the demon go. [Communal reinforcement](#) and [self-deception](#) will go a long way towards explaining how the group came to believe they could exorcize demons. The exorcists clearly enjoy their work and get great satisfaction out of "helping" people in this powerful way. I am sure that many evangelicals who saw the program are wondering where they can sign up to be exorcist's helpers.

traditional exorcisms

Exorcisms can be done on [inanimate objects or places](#) as well as on people. These need not be "real exorcisms" but can be "simple exorcisms" (usually thought of as baptizing the infant or "blessing" the house or place). Satan is everywhere, it seems, but the specialist in real exorcism is only needed when The Evil One starts acting up.

Most, if not all, cases of alleged demonic possession of humans probably involve either people with brain disorders ranging from epilepsy to schizophrenia and Tourette's syndrome, or people whose brains are more or less healthy but who are unfortunate enough to be sucked into playing a social role with very unpleasant consequences. In any case, the behaviors of the possessed resemble very closely the behaviors of those with electrochemical, neurochemical or other physical or emotional disorders.

A secularized version of exorcism is practiced by some therapists who specialize in unveiling and ridding their patients of "entities" which, the therapists believe, are the cause of the patient's troubles. [Entity release therapists](#) engage in this work even though there is about as much evidence for the "entities" as there is for the devils exorcised by Catholic priests and Protestant evangelicals. Many people, however, are very resistant to the idea that demonic possession is a myth, especially since they have seen or read fictional works such as *The Exorcist* or *the Amityville Horror*. They can't imagine how anyone could make such stuff up; yet, it would seem to take much *more* imagination to give credence to such tales.

Many people fear possession by demons, but the exorcists themselves can cause great damage.

Exorcism has caused a number of real-world tragedies over the years, including several deaths.

Pentecostal ministers in San Francisco pummeled a woman to death in 1995, as they tried to drive out her demons.

In 1997, a Korean Christian woman was stomped to death in Glendale, Calif., and in the Bronx section of New York City, a 5-year-old girl died after being forced to swallow a mixture containing ammonia and vinegar and having her mouth taped shut.

In 1998, a 17-year-old girl in Sayville, N.Y., was suffocated by her mother with a plastic bag, in an effort to destroy a demon inside her.*

In 2001, a 37-year old woman, Joanna Lee, was strangled to death in an exorcism by a Korean church minister working in New Zealand. The minister, Luke Lee, was found guilty of manslaughter.

An MSNBC program on [exorcists](#), featuring evangelicals [Tom Brown](#) and [Bob Larson](#), warned viewers not to try this at home because they might end up being arrested for botched exorcisms such as those mentioned above. The evangelicals' game is to bring groups of troubled people together and look for demons that are causing the trouble so they can exorcize them. Brown and Larson have never killed anyone, as far as we know, but whether they help or harm people was not possible to discern from the program, since the "reporters" did no background checks or follow-ups on the people exorcised.

The exorcists only prop is a Bible, which is held in one hand while they talk down the devil in very dramatic episodes worthy of Jerry Springer or Jenny Jones. The "possessed" could have been mentally ill, actors, mentally ill actors, drug addicts, mentally ill drug addicts, or they may have been possessed, as the exorcists claimed. All the participants shown being exorcized seem to have seen the movie "[The Exorcist](#)" or one of the sequels. They all fell into the role of husky voiced Satan speaking from the depths, who was featured in the film. The similarities in speech and behavior among the "possessed" has led some psychologists such as Nicholas Spanos to conclude that both "exorcist" and "possessed" are engaged in learned role-playing.

What was disappointing about the MSNBC program was that no effort was made to get anyone's opinion as to what was going on except for the opinion of the televangelists and their subjects. Wouldn't a serious journalist get a third opinion? Why should we take the word of interested parties like Brown

and Larson that their subjects really were possessed and that they really released [Satan](#) from all these bodies? These evangelical exorcists might be [self-deceived](#) and be guilty of [confirmation bias](#). Even if their intentions are good, they are most probably deluded and certainly causing harm to those they exorcize who should be under psychiatric care.

Santa Claus

Santa Claus is one of the most famous IFOs (identified flying objects) in history. The hirsute gift giver with the levitating reindeer has had more sightings than all [UFO](#), [Bigfoot](#), and [Virgin Mary sightings](#) combined. The innocent and pure witnesses to the jolly one decked out in sartorial crimson flailing away at his flying reindeer are legion. Who can mistrust a child, much less billions of children? Surely these witnesses are reliable. There is no proof that they are suffering from any mental derangement. They have no motive for lying. The only plausible explanation for these sightings is that they are genuine. There is no reason to think that all these witnesses are [confabulating](#). If there is nothing to this belief, then why do so many people believe it? There is no way this could be an example of [communal reinforcement](#) of a false idea or delusion. This must be a [genuine vision](#).

Cynical skeptics are wont to note that the belief in the Christmas gift giver requires acceptance of the hypothesis that in a single evening the infrequent flyer visits all the homes in America and the homes of Americans everywhere else on Earth. Even if the speedy one spent a single second at each home and took no time to travel between homes, it would take him several years to complete his rounds. Obviously, a [miracle](#) happens every Christmas! That is the only logical explanation for flying reindeer traveling at [takionic](#) speed carrying hundreds of thousands of pounds of weightless presents. That is the only logical explanation. [What else could it be?](#)

Mass Media Bunk

21

March 23, 2003. *Parade* magazine, the Sunday supplement that used to feature articles by the likes of Carl Sagan but which now favors articles on natural healing and complementary medicine, features a cover story with the teaser "Can Prayer Really Heal?" It is described as a "report" by Dianne Hales, an author of several books on health. The *Parade* cover leaves open the nature of this report: "In the last 10 years, hundreds of scientific studies--at some of the nation's top universities--have probed a link between health and religious faith. The data may surprise you." But the article itself, which begins on page 4, has a more suggestive, even if misleading, title: "Why Prayer *Could* Be Good Medicine [my emphasis]." Note the weasel word "could." The teaser reads "New research exploring the connection between biology and spiritual practice--once derided as scientific heresy--*may* offer insight into how the body heals [my emphasis]."

My main reason for calling this article bunk is not, however, because the author weasels. No. The main problem with this article is that is biased and selective in what it presents. You don't need to do any studies at all to know that prayer *might* be good medicine. And if the best that hundreds of scientific studies can show is that new research *may* offer new insight into how the body heals, then this article is clearly overhyped.

The article also fails to clarify what is meant by prayer. Did the researchers in the hundreds of studies define prayer? Did they all use the term to mean the same thing? She notes early on in her article that a particular man and his family prayed for his recovery from a heart attack and the man believes that "God answered those prayers." We are to infer from this, I suppose, that prayer is a request to God. This seems reasonable since she later distinguishes between petitionary prayer (for oneself) and intercessory prayer (for others). But what about those who don't believe in an anthropomorphic god who listens to requests and grants some but not others? I'm not talking about atheists, either. Furthermore, she mentions meditation studies in her article. But meditation is not prayer, at least not prayer that involves making requests of a god. Should studies that involve meditation be clearly separated from those involving prayer?

I would like to say that I have nothing against prayer. I used to pray in my younger days. I prayed to give thanks for what I thought were my blessings. I prayed to God to do things for me and for others. I even prayed for general things like peace and good will. I know that prayer can be beneficial. It can make one feel good, especially in situations where things are really not in your control. I also think that those who pray to bring about good things to themselves, their loved ones, or total strangers are affecting their attitudes in a good way. The benefits of a good attitude are tangible and not to be scoffed at. I have no doubt that prayer or meditation can be an integral part of some people's daily health regime.

But I do have problems with trying to measure something like the effect of prayer on healing. I also have problems with writers who claim to be giving a report on an issue when they don't tell the whole truth and nothing but the truth.

The article begins very strangely. It starts off in common fashion with an inspirational story about a man, his family, and how he thinks prayer cured him of a serious heart condition. Then Hales takes a strange twist by claiming that researchers at the Geisinger Medical Center in Danville, Pa., are going to monitor this man "to see whether his faith and prayers do indeed have a measurable impact on his long-term recovery." If this is an indication of what the "hundreds of studies" are like that have been done on the healing power of prayer, then any intelligent person should stop reading the article after this first paragraph. Anyone who thinks you will learn anything important about the relationship of faith and prayers to health recovery by studying one man over a period of time doesn't think. If this man dies of a heart attack tomorrow, what would that prove? Nothing. If he lives to be one hundred, what would that prove? Nothing. No scientist worthy of the name would monitor a single individual in hopes of learning whether faith and prayers have a measurable effect. I assume that the people at Geisinger have set up some sort of meaningful controls for their study and that there will be hundreds of individuals in the study, not just this one heart patient. But Hales gives no indication that this is the case or that such details might be important to the issue she is writing about.

She just tells us that this study--whatever it might actually consist of--"represents a new frontier for medical research." Let's hope that the researchers are a little clearer about what they are studying than Hales is.

Hales mentions that "investigators at Johns Hopkins are studying a group of women with breast cancer who say a meditative prayer twice daily." She doesn't bother to define "meditative prayer." Nor does she mention anywhere in her article that one of the leading researchers on prayer and healing died of a rare form of brain cancer while conducting a study on prayer and that particular rare form of brain cancer.* It is hard to imagine anyone having more prayers said for her by more people around the world than Elisabeth Targ had said for her. But not only did the prayers not save her life, they have not been able to save her reputation, either. Her famous study on prayer and AIDS patients, published in the *Western Journal of Medicine* in 1998, has come under fire for [not being what it claimed to be](#) and for committing the [Texas sharpshooter's fallacy](#). Victor Stenger comments:

Targ's paper is not the only questionable study on the efficacy of prayer that has been published by medical journals. The editors and referees of these journals have done a great disservice to both science and society by allowing such highly flawed papers to be published. I have previously commented about the low statistical significance threshold of these journals (p-value of 0.05) and how it is inappropriate for extraordinary claims (*Skeptical Briefs*, March 2001). This policy has given a false scientific credibility to the assertion that prayer or other spiritual techniques work miracles, and several best selling books have appeared that exploit that theme. Telling people what they want to hear, these authors have made millions.

One of the people who has made millions by claiming prayer heals is Larry Dossey, who is mentioned favorably by Hales. No mention is made of his critics such as [Vic Stenger](#) or [Robert Baker](#). Only one skeptic is mentioned by Hales, John Chibnall, who is quoted as saying that "the premise behind distant healing isn't scientific." Hales makes no effort to explain what that premise might be or why Chibnall, a psychologist at St. Louis University, might think it isn't scientific.

Hales claims that "dozens of studies have shown that individuals who pray regularly and attend religious services stay healthier and live longer than those who rarely or never do--*even when age, health, habits, demographics and other factors are considered.*" I would like to know the name of just one such study. I have seen studies that have shown, for example, that people of faith who frequently attend religious services have a significantly lower mortality rate than those who don't. But I have never heard of such a study that found this result when health, habits, and other factors were considered. The Duke University study that Hales mentions is briefly evaluated in my article on [prayer](#). My view is that Dr. Koenig, who directed the study, may well have found a causal connection between being healthy and attending religious services, but the evidence doesn't demonstrate that spirituality causes good health. In any case, there is a big difference between studying the effects of different lifestyles on health and studying the healing power of prayer. The two may be related but the relationship is certainly not self-evident.

Here is a summary of some of the studies mentioned on the [Parade](#) web site:

A nine-year study of the mortality rate among 21,000 adults found that those who attended religious services more than once a week lived up to seven years longer than those who did not.

In a study of 108 women with gynecological cancers, researchers at the University of Michigan discovered that 93% said religion bolstered their hopes for treatment.

Researchers at the Institute of Gerontology at the University of Michigan, studying self-esteem in seniors, found that religious faith was the most important factor linked to feelings of self-worth. The study of 1005 seniors over age 65, who did not live in nursing homes, found that those with low self-esteem tended to be nonreligious.

A review of more than 80 studies on the link between religion and depression found that people who are not involved in organized religion are 20 to 60% more likely to experience a major depression.

These are interesting results but what do they have to do with the healing power of prayer? The studies Hales mentions are of the same type. However, having hope or good self-esteem, or feeling good are not what we usually mean by *healing*.

On-line, *Parade* listed the following links, presumably so the reader could get better informed:

[Center for the Study of Religion/Spirituality and Health](#)

Located at Duke University, the center is leading research into religion's effects on health. Find out about speaking engagements by the center's scientists and read about the center's past and present research.

[International Center for the Integration of Health and Spirituality \(ICIHS\)](#)

Founded by the late Dr. David Larson, a pioneer in the study of spirituality and health, the ICIHS coordinates research efforts among doctors and other investigators. The center's site offers research summaries on a vast number of health topics.

[Research News & Opportunities in Science & Theology](#)

Contributors to this independent monthly newspaper include many of the top names in the fields of science, medicine and theology. The journal's site offers several free articles each month.

[John Templeton Foundation](#)

Through the foundation that bears his name, retired Wall Street tycoon John Templeton is a major funder of research into the nexus of spirituality and science. Learn more about the foundation's many programs and awards.

It is not surprising that none of these links offer anything skeptical about the studies of prayer and healing. But, if the reader wishes to see the other side, read my article on [prayer](#) and the articles I link to there, which I will post here:

confabulation

A confabulation is a *fantasy* that has unconsciously replaced *fact* in memory. A confabulation may be based partly on fact or be a complete construction of the imagination.

The term is often used to describe the "memories" of people claiming to have been abducted by aliens, as well as "false memories" induced by therapists or interviewers, memories that often involve bizarre notions of satanic ritualistic sexual abuse of children.

See related entries on [alien abductions](#) and [memory](#).

[New parapsychology
center open in
Durham](#)

parapsychology

"...the founders of parapsychology were mostly people who, having lost their religious faith, were searching for a scientific basis for believing in the meaningfulness of life and the possibility of life after death..." [\(David G. Myers\)](#)

The *search* for [paranormal](#) phenomena, such as [ESP](#) and [psychokinesis](#). Most sciences try to explain observable phenomena. Parapsychologists try to observe unexplainable phenomena.

Scientific methodology in this field dates from at least 1882 at the founding of the Society for Psychical Research in London, which continues to flourish. Its initial members sought to distinguish psychic phenomena from [spiritism](#), and to investigate [mediums](#) and their activities. They studied [automatic writing](#), [levitation](#), and reports of [ectoplasmic](#) and [poltergeist](#) activity. In America, Joseph Banks Rhine (1895-1980) conducted [psi](#) experiments at Duke University in the 1930s. His work continues at the [Rhine Research Center](#) and at various labs across the country where experiments have concentrated principally on [extrasensory perception \(ESP\)](#), [psychokinesis](#), [remote viewing](#), and [astral projection](#). There are at least half a dozen peer-reviewed journals of parapsychology. However, research in this area has been characterized by deception, fraud, and incompetence in setting up properly controlled experiments and evaluating statistical data (Alcock 1990; Gardner 1981; Gordon 1987; Hansel 1989; Hines 1990; Hyman 1989; Park 2000; Randi 1982).

Americans [Charles Tart](#) and [Raymond Moody](#), among many others continue to expand upon Rhine's work. [The CIA and the U.S. military have hired parapsychologists](#) and studied alleged psychics such as [Ingo Swann](#).

Parapsychological research continues at many places, including [Maimonides Hospital Dream Laboratory in Brooklyn, New York](#); the [University of Nevada at Las Vegas](#); the [Princeton Engineering Anomalies Research](#); and the University of Edinburgh, whose psychology department has the Koestler Chair of Parapsychology, and publishes the *European Journal of Parapsychology*. Parapsychologists have [many other publications](#), as well.

Psi researchers often find evidence for psi, but a yearlong study done by the United States Air Force Research Laboratories (the VERITAC study, named after the computer used) was unable to verify the existence of ESP. A careful and properly designed study by Richard C. Sprinthall and Barry S. Lubetkin published in the *Journal of Psychology* (vol. 60, pp. 313-18) found no

evidence of ESP. Some parapsychologists, such as [Susan Blackmore](#), have abandoned the search for psi after years of failing to find any significant support for paranormal phenomena (Blackmore 1987, [2000](#)).

Despite the fact that psychologists have been in the forefront of paranormal studies, a study of 1,100 college professors in the United States found that only 34% of psychologists believe that ESP is either an established fact or a likely possibility. Comparable figures for other disciplines are much higher: natural scientists (55%), social scientists [excluding psychologists] (66%) and for academics in the arts, humanities, and education (77%). Of the psychologists surveyed, 34% believe psi is an impossibility, while only 2% of the other respondents maintained this position (Wagner and Monnet 1979).

Parapsychologists who claim to have found positive results often systematically ignore or rationalize their own studies if they don't support psi. Rhine discarded data that didn't support his beliefs, claiming subjects were intentionally getting answers wrong ([psi-missing](#)). Many, if not most, psi researchers allow [optional starting and optional stopping](#). Most psi researchers limit their research to investigating parlor tricks (guessing the number or suit of a playing card, or "guess what [Zener card](#) I am looking at" or "try to influence this random number generator with your thoughts"). Any statistical strangeness is attributed to paranormal events.

From the standpoint of physics there seems to be a major problem with the assumption and alleged discovery by some parapsychologists that spatial distance is irrelevant to psi. Each of the four known forces in nature weakens with distance. Thus, as Einstein pointed out in a letter to Dr. Jan Ehrenwald, "This suggests...a very strong indication that a non-recognized source of systematic errors may have been involved [in ESP experiments]" (Gardner 1981, 153). The skeptic would rather believe that ESP doesn't exist than that there is some very strong and powerful force that is undetectable even though we're able to detect what must be a much weaker force, gravity, without any trouble at all.

Recently, the work of Charles Honorton and his [ganzfeld](#) experiments have been put forth as examples of proper scientific studies whose integrity cannot be doubted. Maybe. But the data from these experiments illustrate another problem with much research in parapsychology: *correlations don't establish causality*. Finding a correlation which is not what would be predicted by chance does not establish a causal event, much less that if it is a causal event it must be a paranormal event. Furthermore, even if there is a causal event, the correlation itself isn't of much use in determining what that event consists of. What you think is cause may be the effect. Or, there may be some third, unknown, factor which is causing the effect observed. Or, the correlation may be due to chance, even if it is statistically unlikely in a certain sense. The apparent chance correlation may actually be statistically likely over the long run. So, the fact that a group of test subjects identifies correctly which of four

pictures someone else has seen at a .36 rate when .25 is what chance predicts doesn't establish a causal event. Nor does it, of course, establish ESP as the cause, if there is a cause. The event may well be causal, but the real cause may be something quite ordinary, such as fraud, unintentional cues, or some tendency to bias in the subject matters selected by chance. If other researchers can duplicate the results with more and more rigorous tests, then it will become highly probable that causal events are being measured. Then, the problem will be to find the cause. Maybe it will turn out to be a psychic force hitherto undetected by physics, but this seems unlikely.

curse

A curse is a prayer or invocation expressing a wish that harm, misfortune, injury, great evil, etc., be brought upon another person, place, thing, clan, nation, etc. People are also said to be cursed if harm comes to them regularly or in seeming disproportion to the rest of us.

Curses seem to have been a regular part of ancient cultures and may have been a way to frighten enemies and explain the apparent injustices of the world. There is no evidence that anyone has successfully invoked occult powers to do harm to others, but there is evidence that those who *believe* they have been cursed can be made miserable by exploiting that belief. Fear and the human tendency to [confirmation bias](#) and [selective thinking](#) can sometimes lead the believer to fulfill the curse.

Belief in curses may make it easier to explain why bad things often happen to good people: they are cursed because of some bad thing an ancestor did. A little bit of reflection, however, should reveal that this is not a very satisfactory explanation. Whether it is God or Nature doing the cursing, neither seems very just in punishing the children for the sins of their mothers or fathers.

The curse is a favorite literary theme in Greek mythology. Modern writers such as William Faulkner use the family curse theme to great effect. The Old Testament is a litany of curses. In the New Testament, even a fig tree gets cursed.

The curse is also a favorite theme of the mass media whenever something bad happens to one of the Fitzgerald/Kennedy (FK) clan. The [so-called "Kennedy curse"](#) is a media creation. The FK clan is no more cursed than any African family destroyed by slavery or any Jewish family destroyed by Nazism was cursed. The media would have us believe that the FK clan have suffered a disproportionate amount of harm. Their harm is certainly disproportionately public, but that is because the clan is rich and famous, not because they are cursed. Their harm has been disproportionately influential because some members of the clan have been extremely influential.

In their attempt to bolster the myth of the Kennedy curse, the media have included self-caused harms as "tragedies." Getting drunk and leaving a girl to drown is a tragedy for the girl's family, not the FK clan. Dying in a plane crash when you shouldn't be flying a plane, date rape, reckless behavior on a ski slope, having an affair with your babysitter, being arrested for possession of heroin, and dying of a drug overdose are not tragedies.* The womanizing, the Bay of Pigs fiasco, working for Joe McCarthy, and involving the United

States militarily in Vietnam were chosen behaviors. If there is a curse here it is the curse of too much money, power, and leisure time combined with a disposition for risk taking.

If one considers the size of the FK clan, their wealth, their extraordinary achievements and their propensity for taking risks, then their misfortunes do not seem disproportionate. The media would have us believe, however, that if a member of this clan dies in war, gets cancer or has a mental disorder, it's because they're cursed.* If they are cursed, then so are the millions of others who suffer the same fate.

If anyone in the family was cursed, it was Rose Fitzgerald Kennedy who lived to be 104.

See related entries on [the evil eye](#), [incantations](#), [the law of truly large numbers](#), [spells](#), and [zombies](#).

intuitive (noun) & intuitive healers

An intuitive is a person who claims to have [psychic](#) abilities. An *intuitive healer* is someone who allegedly can heal and teach others to heal without the bother of empirical medicine. Instead, they use "insight" to diagnose illness. *Intuitive healers are sometimes called medical intuitives or psychic healers.* Intuitives are sometimes called *sensitives*.

Some, like [Rachel Kohler](#), claim that their abilities allow them to make accurate diagnoses over the telephone. Some, like [Linda Salvin](#), prefer the radio or the Internet, for their healings.

Some, like [Judith Orloff](#), claim they can [diagnose mental illness intuitively](#). She calls her ability "[second sight](#)" and has written some books about it.

Some intuitives call their work "science" and name their chicanery after themselves, such as the [Barbara Brennan Healing Science](#). Barbara claims she can do [Astral Healing](#) psychic surgery on your [aura](#).

Some, like Dr. [Carolyn Myss](#) (she has a doctorate from [Greenwich University](#) in Intuition and Energy Medicine), have abandoned healing for less dangerous and more lucrative endeavors like giving lectures and workshops, and writing books. (Her web site says she's booked for the next two years.)

One thing intuitive healers seem to have in common--besides a nose for desperate disciples--is an implicit awareness of the role [confirmation bias](#), [communal reinforcement](#) and [wishful thinking](#) play in the construction of meaning and belief. Many "intuitives", no doubt, have an explicit understanding of the [placebo effect](#). But they and the people who follow them do not understand how easy it is to [deceive ourselves](#) about these things. They do not test their alleged abilities under clear and controlled conditions and their followers don't require this of them. What is worse, so-called intuitives seem to think they are able to use their intuition to understand such things as quantum mechanics and biochemistry. Others simply ignore science in favor of metaphysics. Some intuitive healers could be tested, since they claim to be able to diagnose real disorders such as cancer. Others could never be tested since they diagnose non-empirical causes such as [aura imbalance](#), [chi](#) blockage, or some sort of "[energy](#)" disharmony or misalignment.

The Sokal Hoax

But why did I do it? I confess that I'm an unabashed Old Leftist who never quite understood how deconstruction was supposed to help the working class. And I'm a stodgy old scientist who believes, naively, that there exists an external world, that there exist objective truths about that world, and that my job is to discover some of them. --[Allan Sokal](#)

In its 1996 Spring/Summer issue (pp. 217-252), *Social Text* journal published an article by Allan Sokal, Professor of Physics at New York University, entitled "[Transgressing the Boundaries: Towards a Transformative Hermeneutics of Quantum Gravity.](#)" The article was a hoax submitted, [according to Sokal](#), to see "would a leading journal of cultural studies publish an article liberally salted with nonsense if (a) it sounded good and (b) it flattered the editors' ideological preconceptions?" It would. Needless to say, the editors of *Social Text* were not pleased.

Sokal claims that the editors, had they been scrupulous and intellectually competent, would have recognized from the first paragraph of his essay that it was a parody. The physicist says he was "troubled by an apparent decline in the standards of intellectual rigor in certain precincts of the American academic humanities." The hoax was his way of calling attention to this decline.

In his article, Sokal attacks "the dogma imposed by the long post-Enlightenment hegemony over the Western intellectual outlook" that there is an external world governed by laws of nature which we can understand imperfectly using the scientific method. He also claims that "physical 'reality' ... is at bottom a social and linguistic construct." Furthermore, he says,

Throughout the article, I employ scientific and mathematical concepts in ways that few scientists or mathematicians could possibly take seriously. For example, I suggest that the "morphogenetic field" -- a bizarre New Age idea due to Rupert Sheldrake -- constitutes a cutting-edge theory of quantum gravity. This connection is pure invention; even Sheldrake makes no such claim. I assert that Lacan's psychoanalytic speculations have been confirmed by recent work in quantum field theory. Even nonscientist readers might well wonder what in heavens' name quantum field theory has to do with psychoanalysis; certainly my article gives no reasoned argument to support such a link.

In sum, I intentionally wrote the article so that any competent physicist or mathematician (or undergraduate physics or math major) would realize that it is a spoof. Evidently the editors of Social Text felt comfortable publishing an article on quantum physics without bothering to consult anyone knowledgeable in the subject.

Such lax editing might be expected in a New Age magazine, where preposterous and unfounded claims about paranormal "energies" being validated by quantum mechanics are commonplace. But Sokal thinks we should expect more of a prestigious journal edited by distinguished scholars in the humanities. But why did he pick on this particular journal?

Sokal hoaxed *Social Text* for political reasons. Both are "leftist" politically, but Sokal considers the New Left to be guilty of "epistemic relativism." (Is this another hoax?) He seems particularly peeved that the New Left promotes the notion that reality is a social construction. Furthermore, the New Left has created "a self-perpetuating academic subculture that typically ignores (or disdains) reasoned criticism from the outside." So, apparently Sokal wanted to criticize the "epistemic relativism" and "social constructivism" of the New Left in a New Left journal but felt the only way they would let him do so would be if he pretended to share their ideology.

Many have pointed out the profound implications of this hoax. At the very least, articles should be reviewed by experts in the field covered by the article. Sources and references named in the article should be checked by the editors.

Above all, however, the Sokal hoax demonstrates how willing we are to be deceived about matters we believe strongly in. We are likely to be more critical of articles which attack our position than we are of those which we think supports it (Gilovich). This tendency to [confirmation bias](#) affects physicists as well as professors in the social sciences and the humanities.

thought field therapy

Thought field therapy (TFT) is a type of cognitive therapy dressed up in the garb of traditional Chinese medicine. It was developed in 1981 by [Dr. Roger Callahan](#), a cognitive psychologist. While treating a patient for water phobia, he asked her to think about water as he tapped her stomach. He says that the patient claimed she suddenly overcame her lifetime fear of water. He attributes the cure to his tapping, which he thinks unblocked "energy" in her stomach meridian.

TFT allegedly "gives immediate relief for post traumatic stress disorder (PTSD), addictions, phobias, fears, and anxieties by directly treating the blockage in the energy flow created by a disturbing thought pattern. It virtually eliminates any negative feeling previously associated with a thought."[*](#)

The theory behind TFT is that negative emotions cause energy blockage and if the energy is unblocked then the fears will disappear. Tapping acupuncture points is thought to be the means of unblocking the energy. Allegedly, it only takes [five to six minutes](#) to elicit a cure. Dr. Callahan claims an 85% success rate. He even does cures over the phone using "Voice Technology" on [infants and animals](#); by analyzing the voice he claims he can determine what points on the body the patient should tap for treatment.

For [\\$145](#) and one day of your time, Dr. Callahan's staff will train you to successfully treat people suffering from post traumatic stress disorder, trauma, phobias and addictions. The training is restricted to "licensed or certified mental health, medical professionals, social workers, massage therapists, acupuncturists, or homeopathic physicians actively employed in their field."

For [\\$280](#) and two days of your time, Dr. Callahan's staff will train you to also successfully treat people with obsessive compulsive disorder, depression, and panic attacks.

Dr. Callahan has a theory that thoughts have fields and these fields have an effect on the body. He also claims that there is a one-to-one correspondence (isomorphism) between perturbations caused by negative emotions and specific energy meridian points on the body. He claims to know the exact algorithm (where to tap) for each kind of perturbation. How he knows any of this is not clear, though it appears he made up the theory to fit with ancient Chinese beliefs in [chi](#) and meridians, and he seems to have figured out the algorithms by trial and error. He seems not to have done any controlled studies to rule out [confirmation bias](#) and [self-deception](#). He relies on

anecdotes to support his beliefs and hence he cannot be sure that the effects he observes are not due to standard cognitive therapy techniques (including having the patient think about what frightens him or her) rather than to the tapping on particular pressure points.

confirmation bias

3 Dec 1998

Very well. Are you actively seeking data and information that would tend to contradict Skepticism?

Robert

reply: Glad you asked, Robert. Would you ask me if I am seeking information that would tend to contradict bananas? No. Why? Because such a question would not make sense. Why? Because bananas are things, not beliefs. Now, I know that skepticism is not a thing, but it is not a belief either. If you are truly seeking to discover how I approach Skepticism, you should read my [FAQ](#) and my entry on [Skepticism](#).

ectoplasm

Ectoplasm is the stuff oozing from ghosts/spirits which makes it possible for them to materialize and perform feats of [telekinesis](#). For some strange reason, ectoplasm is often not visible to the naked eye but appears in [photographs](#). This may be due to the fact that most cameras are more sensitive to the spirit world than most people. Or, it may be due to a number of physical factors having to do with reflection, refraction, film processing, and other natural phenomena usually ignored by the truly psychic.

In the heyday of [séances](#)--the 19th and early 20th centuries--ectoplasm was often produced by the [medium](#). James Randi claims that in such cases what was produced was painted cheesecloth and other rather usual physical substances. In short, he thinks the psychics cheated. Of course, Randi cannot prove that every psychic cheated every time; therefore, some psychics may not have cheated. This *possibility* is enough to warrant belief in the reality of ectoplasm for those suffering from [true believer syndrome](#). A true skeptic, however, would have to conclude that the probability of some ectoplasm being real material from the spirit world is near zero.

See related entries on [automatic writing](#), [channeling](#), [electronic voice phenomenon](#), [medium](#), [ouija board](#), [séance](#), and [spiritualism](#).

Illuminati, The New World Order & Paranoid Conspiracy Theorists (PCTs)

What is at stake is more than one small country [Kuwait], it is a big idea - a new world order, where diverse nations are drawn together in common cause to achieve the universal aspirations of mankind: peace and security, freedom, and the rule of law. Such is a world worthy of our struggle, and worthy of our children's future. --President George Bush in his state of the union address, January 16, 1991

The Illuminati was a secret society in Bavaria in the late 18th century. They had a political agenda that included republicanism and abolition of monarchies, which they tried to institute by means of "subterfuge, secrecy, and conspiracy," including the infiltration of other organizations.* They fancied themselves to be "enlightened" but they had little success and were destroyed within fifteen years of their origin (Pipes 1997).

Paranoid conspiracy theorists (PCTs) believe the Illuminati cabal still exists, either in its original form or as a paradigm for later cabals. Many PCTs believe "that large Jewish banking families have been orchestrating various political revolutions and machinations throughout Europe and America since the late eighteenth century, with the ultimate aim of bringing about a satanic New World Order."* What George Bush was talking about in his state of the union address in 1991 was no less than the establishment of a single world government with the anti-Christ (whom some say is [Bill Clinton](#), but could be [Pat Robertson](#)) at its head.

In the paranoid mind, the Illuminati succeeded in their goals, and have now infiltrated every government and every aspect of society. They are responsible for every evil and every unjust act that ever occurs anywhere; the fact that absolutely no evidence of their existence can be found only serves to make them stronger and more frightening. They are the demon in the closet, and will probably never disappear from the paranoid fantasy world of right-wing conspiracy theorists.*

--New England Skeptical Society

Although there are two main "sects" of PCTs, the militant Christian

[The oil behind Bush and Son's campaigns](#)
By [Ranjit Devraj](#)

[Taliban Abuses Ignored for Oil Money, Drug War](#)

[Anthrax attacks 'work of neo-Nazis'](#)

fundamentalist branch and the UFO/alien branch, and although they each think the other is evil or nuts, their paranoia has the same focus: the end is near.

the Illuminati and the anti-Christ

The Illuminati are hastening the coming of the anti-Christ and the end of the world.

For those of us who still accept the Bible as God's revealed will to man, it's a matter of great concern to see the increasing propaganda for, and emergence of, a New World Order.... both Old and New Testaments warned us that the culmination of history would be marked by the reunion of the nations of the old Roman Empire in Europe; the restoration of the state of Israel (and the increasing hostility of all nations toward her); the implementation of a one-world governmental system; the imposition of a world-wide cashless monetary system; the development of a syncretistic [sic] world religion, based upon man, and presided over by a false prophet; the rise to power of a benign world dictator, who (once firmly in control) would eliminate individual freedoms, demonstrate iron-willed ferocity and cruelty, and make himself the object of worship; and world-wide apostasy [sic], coupled with active persecution and execution of believing Jews and Christians. --[Jay Whitley](#)

Mr. Whitley is prepared for Armageddon, however. He sells Emergency Dehydrated Food Kits.

the major players

Here is a typical set of the PCT's notions, extolled in a review of an author who claims he has exposed the Illuminati:

Who really controls world events from behind-the-scene? Years of extensive research and investigation have gone into this massively documented work [*Bloodlines of the Illuminati*]. In almost 600 pages, Fritz Springmeier discloses mind-boggling facts and never before revealed truths about the top Illuminati dynasties. Discover the amazing role these bloodlines have played--and are now wielding--in human history, with family names such as Astor, DuPont, Kennedy, Onassis, Rockefeller, Rothschild, Russell, Van Duyn, and Krupp. You'll also learn of the secretive, Chinese Li family, which operates with impunity in the

U.S.A. and around the world. Along the way you'll find out why President John F. Kennedy and actress Grace Kelly were killed; who created the United Nations; who controls the two major U.S. political parties; how the Rothschilds invented and control modern-day Israel; who secretly founded false religions such as the Jehovah Witnesses; and much, much more. A literal encyclopedia of rare, unbelievable information!*

The "information" is certainly unbelievable, but it is not rare enough. Another PCT "sect" holds that it is the aliens who rule the Illuminati who rule the world, etc.

David Icke

David Icke, another pundit of the Illuminati, gets messages from alien "Illuminati-reptilians" who explain to him such things as the Gregorian calendar.

The whole senario [sic] was planned centuries ago because the reptilians, operating from the lower fourth dimension, and indeed whatever force controls them, have a very different version of "time" than we have, hence they can see and plan down the three-dimensional "time"-line in a way that those in three-dimensional form cannot.*

Icke fancies himself "The most controversial author and speaker in the world."* For him, the origin of the Illuminati is extraterrestrial. He knows this because he is contacted regularly with messages from beyond by the alien lizards. He puts these messages into books (at least five, so far).

There was a time when a man who claimed to be in contact with alien reptiles would have been shunned by the world. In today's open society, such a man is as likely to become a cult hero, guest lecturer at universities, or an author featured on talk shows, as he is to be committed to an asylum.

Jim Keith

Another expositor on these hidden agendas and worldwide conspiracies is [Jim Keith](#), who [died on September 7, 1999, during surgery](#) to repair a leg he injured at the [Burning Man Festival](#). Keith, a former executive Scientologist and author of nine conspiracy books (including *Saucers of the Illuminati*) could see things the rest of us don't. Was this because he was better at seeing or because his imagination ran wild? He watches a Coke ad and sees fellatio and anal penetration.* You can imagine what he sees or hears when he gives his attention to [world history](#).

Ken Adachi

[Ken Adachi](#) has a fine conspiracy page. He leaves no event unaccounted for as part of the plot to take over the world and hasten the Apocalypse. The Illuminati, however, is only one aspect of the occult cabal. He has transmogrified the New World Order into a cabal itself. According to Mr. Adachi

An extremely powerful civilian dominated cabal, the New World Order, includes [Majesty Twelve \[MJ-12\]](#), [The Illuminati](#), [Order of the Quest](#), [The Bilderberg Group](#), [The Trilateral Commission](#), [The Executive Committee of The Council on Foreign Relations](#), [The PI-40 Committee](#), [The Jason Group](#), [The Club of Rome](#), [The Group](#), [The Royal Institute of International Affairs](#), [The Open Friendly Secret Society](#), [The Rosicrucians](#), [The Brotherhood of the Dragon \(or Snake\)](#), [The Russell Trust](#), [The Black Families \(of Europe\)](#), [Skull & Bones](#), [the Scroll & Key](#), [The Knights of Malta](#), the Illuminati arm of [The Freemasons](#), and many, many other secretive groups.

What is most amusing about Mr. Adachi's page is that even though the end is near, he still asks us to please support his sponsor, an organization that can help with debt consolidation or a home loan. What is not so amusing is his identification of the [Freemasons](#) as a subversive cabal. This idea is popular among PCTs, especially with those on the religious right like [Pat Robertson](#), who are also prone to be [anti-Semitic](#).

Myron Fagan

Mr. Adachi may have a fine conspiracy WWW page but he seems to have borrowed everything from [Mr. Fagan](#), who undertook to explain all of world history as a plot of the Illuminati to establish the New World Order. Waterloo, Diamond Jim Brady, the French Revolution, any war you care to name, homosexuals in the State Department, JFK, the United Nations, the ACLU, Jewish bankers, the Communist conspiracy to control Hollywood and make films that would hasten the arrival of the New World Order, etc. ad nauseam. Fagan's audiotape, "The Illuminati," is available [online](#).

Fagan, born ca. 1888, was a playwright, director, producer, editor and public relations director for Charles Hughes, Republican candidate for president in 1916. In 1930, Fagan came to Hollywood and worked as a writer and director. In 1945, he says he saw some secret documents which led him to write *Red Rainbow* and *Thieves Paradise*. The former portrays Roosevelt, Stalin and others at Malta plotting to deliver the Balkans, Eastern Europe and

Berlin to Stalin. The latter portrays the same group plotting to create the United Nations as a Communist front for one world government. Until his death, Fagan relentlessly uncovered plots for almost every historical event of any note. Fagan is the archetype for the PCT.

Milton William "Bill" Cooper

[Cooper](#) was a leader of the Arizona militia movement until his death in a shootout with a sheriff's deputy. Cooper opened fire on the deputy when he tried to issue a warrant for assaulting his neighbor. Cooper wrote [*The Secret Government: a Covenant with Death - The Origin, Identity, and Purpose of MJ-12*](#), a paper given in Las Vegas at a [MUFON](#) meeting in 1989 focusing essentially on his belief of a cover-up of an alien crash at [Roswell](#). He also wrote *Secret Societies/ New World Order*. He claims that he got his information "directly from, or as a result of my own research into the TOP SECRET/MAJIC material WHICH I SAW AND READ between the years 1970 and 1973 as a member of the Intelligence Briefing Team of the Commander in Chief of the Pacific Fleet." (PCTs seem to like to use CAPS for EMPHASIS.) Cooper's veracity about his career in the Navy and his access to secret documents has been questioned publicly on alt.alien.visitor, as have [other aspects](#) of his [personality](#). Cooper ran [williamcooper.com](#), a site which promotes his many rants, including an [autobiographical page](#) that might be of interest to certain mental health professionals.

Cooper's "investigations" uncover the usual conspiracies, although he also includes some of the new ones such as the conspiracy to use AIDS to thin out the population of blacks, Hispanics and homosexuals, a notion he put forth in a book called *Behold a Pale Horse*. What Cooper lacks in hard evidence he oversupplies in detail and imagination.*

Robert Gaylon Ross, Sr.

[Ross](#) is owner of Ross International Enterprises (RIE) and is the author of nine books in progress. RIE is "a private company chartered to do anything that is legal, ethical and moral, anywhere in the world." Ross started RIE when he couldn't find a publisher for his manuscript, *Who's Who of the Elite*, an expose of the elite. Says Ross, after you visit his site

you will have been exposed to the REAL TRUTH about the conspiracy behind the Bilderbergs; Council on Foreign Relations; Trilateral Commission; Skull & Bones Society; Bohemian Grove and Bohemian Club; the CIA's involvement in trauma based mind control, drug smuggling and money laundering; where are the Wealthiest in the World; who really owns the Federal Reserve System; and the more accurate theories found in "Logical Physics".

Ross's unique twist is to relate "[alternative physics](#)" to the world of conspiracies and to offer for sale a [rifle with scope](#) from his conspiracy pages. If only he had had tales of UFOs in his books, he would have no trouble getting them published with [Illuminet Press](#), a publishing house devoted to nothing but conspiracy books involving aliens of some sort.

Why?

To enter the world of the PCTs is to enter Bedlam. It would be pointless here to examine, much less attempt to refute, the delusions of people who think they have been turned into assassins by mind-control techniques so that they can carry out the will of inbred dynasties, that aliens are controlling the world, that none of the laws of science are actual, that the imagination and the thought of what is possible are better guides than the "physically manifested world," etc. A rational person might think many of the PCTs are joking. There are Internet sites that seem to be [parody sites](#) but it is difficult to tell, since there seems to be no belief, however inane or absurd, that the PCTs can't fit into their bizarre worldview. A rational person who never heard of Pat Robertson might well read his *New World Order* (Word Books, 1994) and think it must be a joke. Could anyone actually believe his rambling paranoia regarding Jewish bankers, Freemasons, Muslims, homosexuals, foreigners, etc.? Apparently so. Still, one wonders why PCTs exist and their numbers seem to be growing.

Of course, governments and some of the very rich have conspired to rule the world in one form or another. There are enough real conspiracies to satisfy even the greatest Pollyanna that one's government and the extremely rich and powerful don't play by the same rules, if they play by any rules at all, as decent folk. Those of us who have watched the U.S. government support one fascist dictator after another because he was "anti-communist" are uncomfortable to find that there are people who are so far to the right of the right-wing that they too want to expose the cover-ups. It is of no use to point out to the PCTs that our government led coups of democratically elected governments, assassinated leaders of nations and provided military and financial aid to thugs and murderers around the world, in a misguided belief that they were saving the world from communism, as well as opening up new markets for capitalist expansion. Many of the leaders and top agents in our government are and were evil and incompetent, but, as inept as they tend to be, even they would recognize the limits of their ambitions.

But, it is pointless to argue here because the PCTs are expert [pseudohistorians](#): contradictory evidence is used to support rather than refute their notions. Does the U.S. Government go after the world's richest man, Bill Gates? Hah! It's a charade, aimed at getting us off the scent. Wasn't Hitler the one who thought he could rule the world and didn't the Allies stop him? Hitler was a dupe, used to advance the sinister plot to rule the world by the

Illuminati.

some speculation

One can only speculate as to why PCTs exist. It is easy to explain their proliferation: modern mass communications has made it possible for anyone to become his or her own press and propaganda machine. But why PCTs in the first place? The only other experience I've had with such thinking was when I had to get involved with some mentally ill people. I am not joking here. A relative had a "psychotic break" and severe paranoia. We (a group of relatives) were all targets of assassination by some unknown evil people. They could be partially identified by their license plate numbers. If the number started with a "5" then they were evil. No amount of logic or reasoning as to the preposterousness of the notion that anyone would want to kill a person of absolutely no significance was of any use. No amount of reasoning as to how license plate numbers are assigned was of any use. Phone calls could only be made from "secure" lines, which involved either going to the fire department or talking your way up through a series of supervisors until you got a "good one." Through my ill relative I met others who were also afflicted with delusions and incredibly faulty judgment. They did not lose their ability to reason--in fact, my relative seemed even more intelligent in some ways when manic--but their assumptions were taken from sources inaccessible to the ordinary mind. They put vast faith in their intuitions and thought their ideas were brilliant insights when they were little more than the fancies of diseased brains. When I compare reading the literature of the PCTs to entering Bedlam, I mean to be taken literally.

For example, many PCTs consider the Great Seal of the United States and the motto *Novus Ordo Seclorum* to be Masonic and to mean New World Order. These "facts" are considered evidence in the argument to prove the vast conspiracy of the Illuminati. It is useless to argue against these "facts" with PCTs. They consider us dupes who would note that the Latin is usually translated as [New World of the Ages](#) and that the symbol of the eye in the pyramid relates to a poem in the Egyptian Book of the Dead.* Even granting that the Great Seal of the United States and the symbols on our dollar bill are Masonic (which they are not) and that *novus ordo seclorum* means New World Order (which it does not), nothing significant follows, certainly not that there is a vast conspiracy to take over the world.

Providence and eschatology

I think it is likely that many PCTs in the West are initiated into their peculiar way of thinking by their religious training, in particular by their study of the Bible. They have been taught or they assume that everything happens for a purpose and that God ultimately has a reason for every event occurring just as it does. As it becomes more and more difficult to see this world as designed for anything, the theories get more and more preposterous to keep the

teleological delusion alive. The war on evolution and homosexuality--encouraging the abandonment of science and stimulating murderous assaults--so obviously disproportionate by any rational standard, is difficult to explain without seeing the militant fundamentalists as beyond the last stages of desperation. The intense campaigns to expose possible alien abductions, UFOs, and mind-control is likewise preposterously disproportionate to any rational standard. It is becoming nearly impossible to account for the events on this planet with the assumption of a Divine Creator who has a plan and a rationale for everything. The systems of thought that must be created in order to maintain Divine Providence get more insane by the minute. (Explain Hitler, Slobodan Milosovich, or [Ishii Shiro](#). Or, for that matter, explain WACO, Gulf War Syndrome, or any of a number of actual conspiracies engaged in by businessmen such as Bill Gates or political leaders such as Oliver North and his "neat" idea of a government within the government answerable to nobody, or Richard Nixon and the Watergate conspirators, or our formerly secret biological warfare programs.) There is, in fact, a New World Order emerging: the world of Alternative History, Alternative Physics, Alternative Medicine and, ultimately, Alternative Reality.

It is a very natural trait to try to make sense out of the world. The PCTs are trying desperately to make sense out of a world they can no longer relate to. The world is too complicated, too mean, too cold, too unsatisfying for them. In the real world, they are considered nothing and despair of ever being anything but on the outside looking in. They see science as telling them they are an accident and their lives are without meaning. In their alternative world, they rule and are hopeful. Everything is in its place or will be put in its place. There is order and meaning. Life is significant.

the end is near

The actual mechanism by which PCTs arrive at their weird notions is not that difficult to ascertain. The mentally ill people I came to know couched their paranoid fears in terms of the F.B.I. and the C.I.A. They had no [communal reinforcement](#) of their delusions, however. No talk show host or publisher invited them to share their delusions with the world. They are under treatment, have been hospitalized, arrested, etc. They know that those around them will not accept their delusions. This is not true of religious or UFO groups. They reinforce each other and strengthen each other's resolve. They encourage each other to accept possibility as equal to probability, material experience as inferior to dreams, hallucinations, and out-of-body experiences, etc. They have no watchdog equivalent to [I. F. Stone](#), and the mass media is too busy chasing tabloid rumors and celebrities to serve as a watchdog of anything. And since the PCTs function almost completely outside of the normal arenas where they would be challenged and forced to produce evidence in place of speculation, they flourish relatively unscathed and await their next appearance on the [Art Bell or Mike Siegal](#) or [Pat Robertson](#) show, seemingly oblivious to the absurdity of such behavior during the final days of

planet earth.

[Fezzes, Sphinxes and Secret Handshakes](#) by Peter Carlson, November 25, 2001

Freemasons

The Freemasons comprise an international secular fraternal order. Freemasons are organized into lodges. Groups of lodges belong to a Grand Lodge or Grand Orient, but there is no single governing body that directs all the Grand Lodges. The origins of the Freemasons are disputed, but the first organized lodges date from 1717 in England. Members consider others in their lodge as "brothers" or "brethren," but consider members of other lodges as brothers only if their lodges officially recognize each other. Freemasons are sometimes accused of being secretive societies because they have "signs of recognition such as handshakes, passwords, and references that only initiated members would understand."*

Freemasonry is not a secret society, [cult](#), religion or anti-Christian sect, nor is it behind the [Illuminati](#), although it is often accused of being such.

Membership does require belief in a Supreme Being and there is a Masonic Bible, usually the King James Version of the same book accepted by those Christians who accuse the Masons of being anti-Christian.

Much anti-Masonic sentiment has been aroused by various tracts and books. In 1827, for example, [William Morgan](#), who had been denied membership, joined with printer David Miller to published a diatribe entitled "Freemasonry Exposed." The tract itself may not have caused as much anti-Masonic sentiment as did the ensuing stories in the press that Morgan had been kidnapped and murdered by Masons in retaliation for exposing their secret beliefs and rituals. (The evidence strongly indicates that Morgan escaped from jail, where he was being held for a bad debt, and left town unscathed.)

Typical of recent attacks on Freemasonry are the works of Jim Shaw (1988: *The Deadly Deception: Freemasonry Exposed by One of Its Top Leaders*) and Charles Madden (1995: *Freemasonry - Mankind's Hidden Enemy: With Current Official Catholic Statements*). These malicious writings seem primarily motivated by opposition to Masonic beliefs in the brotherhood of man and the belief that strong moral character has nothing to do with organized religion. The hatred of the group is kept alive by Christian evangelists such as [Pat Robertson and talk show hosts like Art Bell](#) (Goeringer 1998).

In 1868, the [National Christian Association](#) (NCA) was formed in Pittsburg for the sole purpose of blaming secretive societies for most of the world's ills. The NCA still exists and still puts the Freemasons at the top of their list of secret societies [behind political assassinations, promotion of sexual immorality, and other evils](#).

Despite this long history of attack and abuse, the Freemasons [continue to flourish](#). There are over 4 million members worldwide. There are also [several Masonic affiliated organizations](#), including the [Shriners](#), which extend the social and charitable work of the Freemasons. Notable Masons include George Washington, Harry Houdini, Benjamin Franklin, and Thurgood Marshall. If Freemasonry has a flaw it is this: women are not allowed to be members of a Masonic lodge.

creationism and creation science

*...the evolution of the cosmos is more than just "compatible" with
theism. Faith in a God of self-giving love...anticipates an evolving
universe.** [John F. Haught](#)

Nothing in biology makes sense except in the light of evolution.
[Theodosius Dobzhansky \(1973\)](#)

*We do not know how the Creator created, what processes He used, for
He used processes which are not now operating anywhere in the natural
universe. This is why we refer to creation as special creation. We cannot
discover by scientific investigations anything about the creative
processes used by the Creator.* Duane Gish, *Evolution? The Fossils
Say No!*

Creationism is a religious [metaphysical](#) theory which claims that a supernatural being created the universe. Creation Science is a [pseudoscientific](#) theory which claims that (a) the stories in *Genesis* are accurate accounts of the origin of the universe and life on Earth, and (b) *Genesis* is incompatible with the Big Bang theory and the theory of evolution. "Creation Science" is an oxymoron since [science](#) is concerned only with [naturalistic](#) explanations of [empirical](#) phenomena and does not concern itself with supernatural explanations of metaphysical phenomena.

Creationism is not necessarily connected to any particular religion. Millions of Christians and non-Christians believe there is a Creator of the universe and that scientific theories such as the theory of evolution do not conflict with belief in a Creator. However, those Christians calling themselves 'creation scientists' have co-opted the term 'creationism', making it difficult to refer to creationism without being understood as referring to Scientific Creationism. Thus, it is commonly assumed that creationists are Christians who believe that the account of the creation of the universe as presented in *Genesis* is literally true in its basic claims about Adam and Eve, the six days of creation, making day and night on the first day even though He didn't make the sun and moon until the fourth day, making whales and other animals that live in the water or have feathers and fly on the fifth day, and making cattle and things that creep on the earth on the sixth day, etc.

Creation scientists claim that *Genesis* is the word of God and thus infallibly true. They also claim that *Genesis* contradicts the Big Bang theory and the theory of evolution. Thus, those theories are false and scientists who advocate such theories are ignorant of the truth about the origins of the universe and life on Earth. They also claim that creationism is a scientific theory and

[Stephen Jay Gould: Darwin's Revolution In Thought](#) (video)

[Blueprints : Solving the Mystery of Evolution by Maitland A. Edey and Donald C. Johanson](#)

should be taught in our science curriculum as a competitor to the theory of evolution.

One of the main leaders of creation science is Duane T. Gish of the [Institute for Creation Research](#), who puts forth his views mainly in the form of attacks on evolution. Gish is the author of *Evolution, the Challenge of the Fossil Record* (San Diego, Calif.: Creation-Life Publishers, 1985), *Evolution, the Fossils Say No!* (San Diego, Calif.: Creation-Life Publishers, 1978), and *Evolution, the Fossils Still Say No!* (Spring Arbor Distributors, 1985). Another leader of this movement is Walt Brown of the [Center for Scientific Creation](#). Despite the fact that 99.99% of the scientific community considers evolution of species from other species to be a fact, the creation scientists proclaim that evolution is not a fact but just a theory, and that it is false. The vast majority of scientists who disagree about evolution disagree as to *how* species evolved, not as to *whether* they evolved.

Scientific creationists are not impressed that they are in the minority. After all, they note, the entire scientific community has been wrong before. That is true. For example, at one time the geologists were all wrong about the origin of continents. They thought the earth was a solid object. Now they believe that the earth consists of plates. The theory of plate tectonics has replaced the old theory, which is now known to be false. However, when the entire scientific community has been proved to be wrong in the past it has been proved to be wrong by other scientists, not pseudoscientists. They have been proved wrong by others doing empirical investigation, not by others who begin with faith in a religious dogma and who see no need to do any empirical investigation to prove their theory. Erroneous scientific theories have been replaced by better theories, i.e., theories which *explain more* empirical phenomena and which increase our understanding of the natural world. Plate tectonics not only explained how continents can move, it also opened the door for a greater understanding of how mountain ranges form, how earthquakes are produced, how volcanoes are related to earthquakes, etc. Creationism is not a scientific alternative to natural selection any more than the stork theory is an alternative to sexual reproduction (Hayes 1996). The theory has not and is unlikely ever to lead to a serious understanding of biological phenomena in the natural world.

Darwin & Gish

Darwin's theory of how evolution happened is called natural selection. That theory is quite distinct from the fact of evolution. Other scientists have different theories of evolution, but only a negligible few deny the fact of evolution. In the *Origin of Species* Darwin provided vast amounts of data about the natural world that he and others had collected or observed. Only after providing the data did he demonstrate how his theory accounted for the data much better than the theory of special creation. Gish, on the other hand, assumes that whatever data there is must be explained by special creation,

because, he thinks, God said so in the Bible. Furthermore, Gish claims that it is impossible for us to understand special creation, since the Creator “used processes which are not now operating anywhere in the natural universe.” Thus, Gish, rather than gather data and demonstrate how special creation explains the data better than natural selection, must take another approach, the approach of apologetics. His approach, and that of all the other creation scientists, is to attack at every opportunity what they take to be the theory of evolution. Rather than show the strengths of their own theory, they rely on trying to find and expose weaknesses in evolutionary theory. Gish and the other creation scientists actually have no interest in *scientific* facts or theories. Their interest is in defending the faith against what they see as attacks on God’s Word.

For example, creation scientists, mistaking the uncertain in science for the unscientific, see the debate among evolutionists regarding how best to explain evolution as a sign of weakness. Scientists, on the other hand, see uncertainty as an inevitable element of scientific knowledge. They regard debates on fundamental theoretical issues as healthy and stimulating. Science, says evolutionary biologist [Stephen Jay Gould](#), is “most fun when it plays with interesting ideas, examines their implications, and recognizes that old information may be explained in surprisingly new ways.” Thus, through all the debate over evolutionary mechanisms biologists have not been led to doubt that evolution has occurred. “We are debating how it happened,” says Gould (1983, 256).

"creation science" and pseudoscience

Creation science is not science but [pseudoscience](#). It is religious dogma masquerading as scientific theory. Creation science is put forth as being absolutely certain and unchangeable. It assumes that the world must conform to its understanding of the Bible. Where creation science differs from creationism in general is in its notion that once it has interpreted the Bible to mean something, no evidence can be allowed to change that interpretation. Instead, the evidence must be refuted.

Compare this attitude to that of the leading European creationists of the 17th century who had to admit eventually that the Earth is not the center of the universe and that the sun does not revolve around our planet. They did not have to admit that the Bible was wrong, but they did have to admit that human interpretations of the Bible were in error. Today’s creationists seem incapable of admitting that their interpretation of the Bible could be wrong.

Creation scientists are not scientists because they assume that their interpretation of the Bible cannot be in error. They put forth their views as irrefutable. Hence, when the evidence contradicts their reading of the Bible, they assume that the evidence is false. The only scientific investigation they do is aimed at proving some evolutionary claim is false. Creation scientists

see no need to test their theory, since God has revealed it. Infallible certainty is not the hallmark of science. Scientific theories are fallible. Claims of infallibility and the demand for absolute certainty characterize not science but pseudoscience.

What is most revealing about the creation scientists' lack of any true scientific interest is the way they willingly and uncritically accept even the most preposterous of claims, if those claims seem to contradict traditional scientific beliefs about evolution. For example, any evidence that seems to support the notion that [dinosaurs and humans lived together](#) is welcomed by the creationists. And the way creation scientists treat [the second law of thermodynamics](#) indicates either gross scientific [incompetence](#) or deliberate dishonesty. They claim that evolution of life forms violates the second law of thermodynamics, which "specifies that, on the macroscopic scale of many-body processes, the entropy of a closed system cannot decrease (Stenger)."

Consider simply a black bucket of water initially at the same temperature as the air around it. If the bucket is placed in bright sunlight, it will absorb heat from the sun, as black things do. Now the water becomes warmer than the air around it, and the available energy has increased. Has entropy decreased? Has energy that was previously *unavailable* become available, in a closed system? No, this example is only an apparent violation of the second law. Because sunlight was admitted, the local system was not closed; the energy of sunlight was supplied from outside the local system. If we consider the larger system, including the sun, entropy has *increased* as required (Klyce).

Creation scientists treat the evolution of species as if it were like the bucket of water in the example above, which, they incorrectly claim, occurs in a closed system. If we consider the entire system of nature, there is no evidence that the second law of thermodynamics is violated by evolution.

Finally, although Karl Popper's notion that falsifiability distinguishes scientific from metaphysical theories has been much attacked by philosophers of science (Kitcher), it seems undeniable that there is something profoundly different about such theories as creationism and natural selection. It also seems undeniable that one profound difference is that the metaphysical theory is consistent with every conceivable empirical state of affairs, while the scientific one is not. "I can envision observations and experiments that would disprove any evolutionary theory I know," writes Gould, "but I cannot imagine what potential data could lead creationists to abandon their beliefs. Unbeatable systems are dogma, not science" (Gould, 1983).

Creationism can't be refuted, even in principle, because everything is consistent with it, even apparent contradictions and contraries. Scientific

theories allow definite predictions to be made from them; they can, in principle, be refuted. Theories such as the Big Bang theory, the steady state theory, and natural selection can be tested by experience and observation. Metaphysical theories such as creationism are “airtight” if they are self-consistent, i.e., contain no self-contradictory elements. No scientific theory is ever airtight.

What makes scientific creationism a **pseudoscience** is that it attempts to pass itself off as science even though it shares none of the essential characteristics of scientific theorizing. Creation science will remain forever unchanged as a theory. It will engender no debate among scientists about fundamental mechanisms of the universe. It generates no empirical predictions that can be used to test the theory. It is taken to be irrefutable. And it assumes *a priori* that there can be no evidence that will ever falsify it.

creationism as a scientific theory

Religious creationism could be scientific, however. For example, if a theory says that the world was created in 4004 B.C. but the evidence indicates that Earth is several billions of years old, then the theory is a scientific one if it is thereby taken to be refuted by the evidence. But if, for example, the [ad hoc hypothesis](#) is made that God created the world in 4004 B.C. complete with fossils that make the Earth look much older than it really is (to test our faith, perhaps, or to fulfill some mysterious divine plan), then the religious theory is [metaphysical](#). Nothing could refute it; it is airtight. Philip Henry Gosse made this claim in Darwin’s time in a work entitled *Creation (Omphalos): An Attempt to Untie the Geological Knot*, published in 1857.

If the age or scientific dating techniques of fossil evidence is disputed, but considered relevant to the truth of the religious theory and is prejudged to be consistent with the theory, then the theory is a metaphysical one. A scientific theory cannot prejudge what its investigative outcomes must be. If the religious cosmologist denies that the earth is billions of years old on the grounds that their own “scientific” tests prove the Earth is very young, then the burden of proof is on the religious cosmologist to demonstrate that the standard scientific methods and techniques of dating fossils, etc., are erroneous. Otherwise, no reasonable person should consider such an unsupported claim that would require us to believe that the entire scientific community is in error. Gish has tried this. The fact that he is unable to convert even a small segment of the scientific community to his way of thinking is a strong indication that his arguments have little merit. This is not because the majority must be right. The entire scientific community could be deluded. However, since the opposition issues from a religious dogmatist who is not doing scientific investigation but theological apologetics, it seems more probable that it is the creation scientists who are deluded rather than the evolutionary scientists.

metaphysical creationists

There are many believers in a religious cosmology such as that given in *Genesis* who do not claim that their beliefs are scientific. They do not believe that the Bible is to be taken as a science text. To them, the Bible contains teachings pertinent to their *spiritual* lives. It expresses spiritual ideas about the nature of God and the relationship of God to humans and the rest of the universe. Such people do not believe the Bible should be taken literally when the issue is a matter for scientific discovery. The Bible, they say, should be read for its spiritual messages, not its lessons in biology, physics or chemistry. This used to be the common view of religious scholars. Allegorical interpretations of the Bible go back at least as far as [Philo Judaeus](#) (b. 25 BCE). Philosophical analyses of the absurdity of popular conceptions of the gods were made by philosophers such as [Epicurus](#) (342-270). Creation scientists have no taste for allegorical interpretations.

creationism and politics

Advocates of creation science have campaigned to have their Biblical version of creation taught as science in U.S. public schools. One of their successes was in the state of Arkansas, which passed a law *requiring* the teaching of creationism in public schools. This accomplishment may seem significant but it must be remembered that until 1968 it was [illegal](#) to teach evolution in Arkansas! In 1981, however, the law was ruled unconstitutional by a federal judge who declared creationism to be religious in nature (*McLean v. Arkansas*). A similar Louisiana law was overturned by the United States Supreme Court in 1987 ([Edwards v. Aguillard](#)). In 1994, the Tangipahoa Parish school district passed a law, under the guise of promoting “critical thinking,” requiring teachers to read aloud a disclaimer before they taught evolution. This dishonest ruse was [thrown out](#) by the 5th Circuit Court of Appeals in 1999. Another tactic was tried by creationist biology teacher John Peloza in 1994. He sued his school district for forcing him to teach the “religion of evolutionism.” He lost and the [the 9th Circuit Court of Appeals ruled](#) that there is no such religion. In 1990 the Seventh Circuit Court of Appeals ruled that school districts may forbid the teaching of creationism since it is a form of religious advocacy (*Webster v. New Lenox School District*). Many religious leaders support this ruling. They recognize that allowing school districts to teach creationism is to favor one group’s religious views over the religious views of others and has nothing to do with critical thinking or fairness in the science curriculum.

Creation scientists may have failed in their attempts to have evolution banned from the classroom and to have creationism taught alongside evolution. However, politically active creationists have not given up; they have just changed tactics. Creationists have been encouraged to run for local school boards to try to gain control of the teaching of evolution that way. School boards can determine what texts the schools may and may not use.

Creationists who complain to school boards about the teaching of evolution are more likely to be successful in their efforts at censoring science texts if the school board has several creationists.

In Alabama, biology textbooks carry a warning that says that evolution is “a controversial theory some scientists present as a scientific explanation for the origin of living things. . . .No one was present when life first appeared on earth. Therefore, any statement about life’s origins should be considered as theory, not fact.” In Alabama, it seems, if you wake up to snow on the ground, but no one saw it snowing, then you may only propose a theory as to the origin of the snow.

In August of 1999 the Kansas State Board of Education rejected evolution and the Big Bang theory as scientific principles. The 10-member board voted six to four to eliminate these topics from the science curricula. The Kansas Board did not ban the teaching of evolution or of the Big Bang Theory. The Board simply deleted any mention of evolution and the Big Bang theory from the science curriculum and from the materials used to test graduating students. Creationists, such as Board Member Steve Abrams, a former head of the state Republican Party, hailed the decision as a victory in the war against evolutionists. A new Board restored the scientific theories to their previous place in February 2001. Creationists want children to believe that God made them and every other species individually for a purpose. They do not want children to think that a divine power might be behind the Big Bang or evolution of species.

At the same time that militant creationists are trying to censor textbooks that treat evolution properly, they complain of censorship against creationist works.* This tactic of fighting fire with fire has led creationist Jerry Bergman to argue that evolution (unlike *Genesis*?) teaches that women are inferior to men. The goal of militant creationists is to debunk evolution wherever possible, not to forward scientific knowledge. (See [Revolution Against Evolution](#).) One of their favorite tactics is to blame all sin and crime on lack of proper Bible study and the teaching of “godless” theories such as evolution and the Big Bang theory. Marc Looy of the group **Answers in Genesis** says that the 1999 Kansas vote was important because

students in public schools are being taught that evolution is a fact, that they're just products of survival of the fittest. . . .It creates a sense of purposelessness and hopelessness, which I think leads to things like pain, murder, and suicide.

That there is no scientific evidence to support these claims is a matter of indifference to those who believe them. When science does not support their beliefs, they attack science as the handmaiden of **Satan**. I wonder what Mr. Looy has to say about [Christian Identity](#) (Buford Furrow Jr.) or [Erich Rudolph](#) or Operation Rescue ([Randal Terry](#)) and other Bible-loving groups

that preach hatred and inspire violence and murder. What would he say about Matthew and Tyler Williams who, in the words of their mother, "took out two homos" because that's what God's law [[Leviticus 20:13](#)] demands? (*Sacramento Bee*, "Expert: Racists often use Bible to justify attacks," by Gary Delsohn and Sam Stanton, Sept. 23, 1999.*)_ These killers have certainly found a purposeful existence, but there is clearly no connection between purposefulness and the end of pain, murder, or suicide. Had more people been forced to read Biblical quotations on their schoolroom walls or in their textbooks, for all we know, there would be more, not less pain, murder, and violence.

The desperation of many creationists is evident from the fact that despite numerous corrections by evolutionists, they still try to get the public to identify evolution with [Social Darwinism](#). This [straw man tactic](#) is common and is exemplified in the following letter to the *Sacramento Bee*. The letter was in response to an article on an expert who claims that racists often use the Bible to justify their hate.

**It is Darwinian evolution, not holy Scripture, that justifies racism.... evolution teaches survival of the fittest, including (as Hitler recognized) survival of the fittest "branch" of the human family tree. Genuine evolution has no place for true equality. This same evolutionist thinking underlies the hatred that racist groups display toward homosexuals. They view homosexuals as defective and thus inferior. (-----
10/3/99)**

The view that Darwin's theory of natural selection implies racism or inequality is a claim made by one either ignorant of Darwin's theory or by one who knows the truth and thinks a lie spread in the name of religion is a morally justified lie.

militant creationism evolves

The creation science folks accept microevolution but not macroevolution. This allows them to account for development and changes within species without requiring them to accept the concept of natural selection.

Macroevolution is the direct attempt to explain the origin of life from molecules to man in purely naturalistic terms. In doing so, it is an affront to Christians because it deliberately tries to get rid of God as the creator of life. The idea that man is a result of millions of happy accidents that mutated their way from slime through the food chain to monkeys should be offensive to every thinking person (Sharp)._*

What should be an affront to many Christians and non-Christian creationists

is the insinuation that if one does not adhere to this Christian's interpretation of the Bible, one is offending God. Many creationists believe that God is behind the beautiful unfolding of evolution (Haught).^{*} There is no contradiction in believing that what appears to be a mechanical, purposeless process from the human perspective, can be teleological and divinely controlled. Natural selection does not require that one "get rid of God as the creator of life" any more than heliocentrism requires one to get rid of God as the creator of the heavens.

Protocols of the Elders of Zion

"The only statement I care to make about the *Protocols* is that they fit in with what is going on. They are sixteen years old, and they have fitted the world situation up to this time. They fit it now." --Henry Ford, 2-17-21, whose newspaper, the *Dearborn Independent*, cited the *Protocols* as evidence of an alleged Jewish threat until at least 1927

"To what extent the whole existence of this people is based on a continuous lie is shown incomparably by the *Protocols of the Wise Men of Zion....*" --Adolph Hitler, *Mein Kampf*

The *Protocols of the Elders of Zion* is a forgery made in Russia for the Okhrana (secret police), which blames the Jews for the country's ills. It was first privately printed in 1897 and was made public in 1905. It is copied from a nineteenth century novel by Hermann Goedsche (*Biarritz*, 1868) and claims that a secret Jewish cabal is plotting to take over the world.

The basic story was composed by Goedsche, a German novelist and anti-Semite who used the pseudonym of Sir John Retcliffe. Goedsche stole the main story from another writer, Maurice Joly, whose *Dialogues in Hell Between Machiavelli and Montesquieu* (1864) involved a Hellish plot aimed at opposing Napoleon III. Goedsche's original contribution consists mainly of introducing Jews to do the plotting to take over the world.

The Russians used big chunks of a Russian translation of Goedsche's novel, published it separately as the *Protocols*, and claimed they were authentic. Their purpose was political: to strengthen the czar Nicholas II's position by exposing his opponents as allies with those who were part of a massive conspiracy to take over the world. Thus, the *Protocols* are a forgery of a plagiarized fiction.

The *Protocols* were exposed as a forgery by Lucien Wolf in *The Jewish Bogey and the Forged Protocols of the Learned Elders of Zion* (London: Press Committee of the Jewish Board of Deputies, 1920). In 1921, Philip Grave, a correspondent for the *London Times*, publicized the forgery. Herman Bernstein in *The Truth About "The Protocols of Zion": A Complete Exposure* (1935) also tried and failed to convince the world of the forgery.

The *Protocols* were published in 1920 in a Michigan newspaper started by Henry Ford mainly to attack Jews and Communists. Even after they were exposed as a forgery, Ford's paper continued to cite the document. Adolf Hitler later used the *Protocols* to help justify his attempt to exterminate Jews

during World War II.

The *Protocols* hoax continues to fool people and is still cited by certain individuals and groups as [the cause of all their woes](#).

illuminati

11 Nov 2002

The phrase "new world order" actually may originate from the statements made by Franklin D. Roosevelt and Winston Churchill. The outcome of WWII was clearly going to dictate the new world order and balance of powers, and the establishment of the U.N. was seen as a means of continuing the unprecedented cooperation and merging of national interests by providing an ongoing diplomatic forum that would continue to operate in peacetime, and the establishment of the Security Council with unilateral veto powers a means of further refining who the conquering powers felt they had to keep close counsel with. The allied military command of WWII headed by Eisenhower as Supreme Commander (directing both British and American forces) kind of laid the foundations for NATO.

A speech given by Franklin D. Roosevelt shortly after he signed the Lend-Lease Act (committing resources and aid to Britain in order to fend off the Nazi onslaught) remarks of Nazi Germany -

"These men and their hypnotized followers call this a new world order. It is not new, and it is not order." (Washington, D.C., March 15, 1941)

In the years following WWII, Winston Churchill made several remarkable speeches concerning the newly globalized community and the direction it should take, the role of the U.N. as a policing force, etcetera, most notably in his "Sinews of Peace" speech wherein he warns of an "Iron Curtain" falling over the Soviet held territories of Eastern Europe.

So, if the paranoid Illuminati conspiracy buffs really want to find who to blame for the international shadow government with its fleet of black helicopters, they need look no further than Winston Churchill and FDR (followed by Truman), the men who conceived of and implemented their own New World Order, which may not actually look so bad compared to the Nazi version that would have chiefly entailed the death or enslavement of most of the world's population.

Edward

07 Dec 2000

First of all I am not religious in any way, do not believe in the paranormal, I

am not paranoid and I am certainly not mentally disturbed.

What does disturb me is the way in which you have everyone stereotyped into categories i.e. PCT's just because they happen to believe in a theory that is not taught or mentioned at school or college, or is not mentioned in written and broadcasted media.

reply: I hope I've given more justification for my belief that the illuminati are no longer real than that this notion is not taught in school or a topic in the mainstream mass media.

I happen to believe that maybe there is some truth in the concept of the "Illuminati" and it's goals i.e. total control, one world government etc. Although I do not believe in the witchcraft or the paranormal side of this theory. The reason for me believing this is not only due to the fact that everything in the media, written and broadcasted, fits in with the Illuminati theory even to this day. i.e. the election in the States, the way in which the election of the so called most powerful man in the world is being reduced to a farce. I also happen to live and work in UK for an American investment company (the companies insignia is the same as that can be found on the dollar bill and the same as that of British Intelligence, maybe coincidence) It is supposedly the largest in the world in terms of assets. Whilst working for this company within the IT department I have come to notice on numerous instances certain things that don't add up, all of which tie in with the theory. I can not go into detail, not because of facts or evidence (which I could get) but because I have signed certain confidentiality agreements and I'm sure you could find out who I am quite easily.

So please do not class me as a PCT's, but please try to maybe be a bit more open minded. And for all we know you and your web site could be set up to discredit the theorist anyway, by the way isn't all known science based on theories? Have you tested all these theories yourself, or do you dismiss them all as well?

Dan, UK

reply: Dan is right. I could be part of the Illuminati conspiracy. Perhaps I haven't written all this material in *The Skeptic's Dictionary*. Maybe it's just a front used to hook people or a smokescreen to set them off track. Dan's got his evidence he can't tell us about, so I can't comment on that. I will say, though, that (a) it is easy to find evidence to support just about any theory; and (b) some PCTs may turn out to be right once in a while, like Hillary Clinton's "vast right wing conspiracy." the ideomotor effect

The ideomotor effect refers to the influence of suggestion on involuntary and unconscious motor behavior. The term "ideomotor action" was coined by William B. Carpenter in 1852 in his explanation for the movements of rods and pendulums by [dowers](#), and some table turning or lifting by [spirit mediums](#) (the ones that weren't accomplished by cheating). Carpenter argued that muscular movement can be initiated by the mind independently of volition or emotions. We may not be aware of it, but suggestions can be made to the mind by others or by observations. Those suggestions can influence the mind and affect motor behavior.

Scientific tests by American psychologist William James, French chemist Michel Chevreul, English scientist Michael Faraday, and American psychologist Ray Hyman have demonstrated that many phenomena attributed to spiritual or paranormal forces, or to mysterious "[energies](#)," are actually due to ideomotor action. Furthermore, these tests demonstrate that "honest, intelligent people can unconsciously engage in muscular activity that is consistent with their expectations" (Hyman 1999). They also show that suggestions that can guide behavior can be given by subtle clues (Hyman 1977).

The movement of pointers on [Ouija boards](#), of a facilitator's hands in [facilitated communication](#), of hands and arms in [applied kinesiology](#), and of some behaviors attributed to [hypnotic suggestion](#), are due to ideomotor action. Ray Hyman (1999) has demonstrated the seductive influence of ideomotor action on medical quackery, where it has produced such appliances as the "[Toftness Radiation Detector](#)" (used by [chiropractors](#)) and "black boxes" used in medical [radiesthesia](#) and [radionics](#) (popular with [naturopaths](#) to harness "[energy](#)" used in diagnosis and healing.) Hyman also argues that such things as [Qi Gong](#) and "pulse diagnosis," popular in both Traditional Chinese Medicine and Ayurvedic medicine as practiced by [Deepak Chopra](#), are best explained in terms of ideomotor action and require no supposition of mysterious energies such as [chi](#).

See related entries on [cold reading](#) and [spiritism](#).

cosmobiology

26 Jun 2000

My name is Veronica Chlap and I have my article entitled "[Some points on Cosmobiology](#)" linked to your skeptic site. I cannot recall giving you permission to link to my article, and hereby ask you to take out your link to my article on your site.

reply: You don't have anything linked to my skeptic site. However, I do have a link on my cosmobiology page to the article you mention.

Permission is not needed to link to anything on the WWW. Hence, I have not made requests to the 2,000 or so people whose web pages I link to. You didn't give permission because it was never asked for.

I hope you will understand my position and comply with my wishes.

reply: Not really. I would think that you have put your article on the WWW because you want others to read it. The more links to your article, the more likely it is to be read by more people.

Thanking you in anticipation,

Sincerely,

Veronica Chlap

reply: If you want to try to control who reads or refers to your writings, you should remove them from the WWW. Your request is not reasonable. It is like hanging out your laundry and demanding that people not look at it or refer to it unless they get your permission first.

27 Jun 2000

And your reply is not reasonable either. You have in a clever manner twisted your arguments to suit your own opinions. If you can do that then so can I. We could go on doing that forever. But who would decide on the outcome so that a resolution to this difference of opinions could be found?

You are in no position to judge my opinions and wishes, just as I am in no position to judge yours.

reply: I don't know what world you live in, but in my world anyone is free to judge anyone else's opinions. As for wishes, why would I want to

judge your wishes? Wish as you please.

So I will shed a different light on the matter in order to move forward on this issue.

I own the intellectual property to the article.

If you wish to prove your points regarding cosmobiology then please do so, but write your own articles or comply with web protocols which do exist to recognise the intellectual rights of authors- namely ask for the author's permission before using articles in any manner whatsoever.

reply: I'm not *using* your article. I don't quote from it or reproduce it. I don't even refer to it. I *link* to it. I have no control over your material and unless I post your material on my page I can't infringe on your "intellectual rights." You obviously have no clue as to what rights you have as an author of material posted on the Internet. I suggest you consult a lawyer knowledgeable in these matters, so you don't continue to make a fool of yourself.

Web pages have intellectual property - your site and associated pages have them.

reply: These claims make no sense. A person can have a trademark and the trademark is the owner's intellectual property, but the *trademark* cannot have intellectual property.

You have taken my intellectual property without my permission and placed it into your site (which is your intellectual property).

reply: Again, I remind you that I have taken nothing and placed nothing in my site except a *link* to your site. You should understand that once you put material on the Internet and do not protect it with passwords or use other means of controlling access, anyone in the universe can link to it and there is nothing you can do about it.

So you have taken something which belongs to me and used it to add value to something which belongs to you and not asked me. Now is that reasonable?

Veronica

reply: I've taken nothing of yours, and the link to your page certainly has not added any value to my material. I wonder how many people would even bother to find out more about cosmobiology once they read about its essential inanity. There were only ten hits on my cosmobiology page last week, and half of those were probably from bots and crawlers.

Your page is linked to because I wanted my readers to have easy access

to how the other side thinks. Any reader who so desires could leave my page, do a search using any one of many search engines, and find your page. The link makes it convenient for those who should desire to see firsthand how the other side thinks. I wonder. Have you written to all the owners of search engines and demanded that they stop finding your page and linking to it?

28 Jun 2000

I just read the email war between yourself and Ms. Chlap in the cosmobiology comments section. Her insistence that you remove the link to her site struck me as just plain silly, and her arguments supporting her position seemed extraordinarily illogical ... even for a cosmobiologist. In my view, a hypertext link is analogous to a bibliography reference, which pretty obviously does not violate anyone's IP rights.

*Anyway, I thought you might be interested in the following article (see URL below) which describes a legal precedent on the issue. The judge in *Tickmaster Corp. vs. Tickets.com* ruled that "[Hypertext linking does not itself involve a violation of the Copyright Act.](#)"*

Rob Long

28 Jun 2000

I think Veronica Chlap's letters are perhaps the funniest things I've read in a long time. Is she for real? Does she really think that another site's link is her intellectual property?

Clearly, she doesn't even understand how Internet links work, and that's the root of her problem. I suppose she thinks that when you take a photograph of someone, you're stealing their soul, too. Someone needs to sit down with her and draw her a nice colorful picture of how the Internet works. I wonder if they sell those "Internet For Dummies" books in Australia?

Hey, here's an idea for a fun project: Turn the cosmobiology page into a frameset, and link her page from the inner frame without the "target=_top" tag. Then she'll really get mad, thinking you stole her page outright.

Tony Fabris

reply: Cruel, cruel, cruel. No need to compound her problems.

[Investigating the Power of Prayer A San Francisco researcher looks into whether prayer can heal even if the person doesn't know he's being prayed for](#)

prayer

*If the sick recover because they pray or are prayed for audibly, only petitioners should get well. --Mary Baker Eddy**

*Change only takes place through action, not through meditation and prayer. The Dali Lama**

Q. "When did you realize that you were God?"

A. "While praying. I realized I was talking to myself."

--The 14th Earl of Gurney (Peter O'Toole), who has the delusion that he is Jesus Christ in [The Ruling Class](#)

Prayer is attempted communication with supernatural beings (SBs) such as God. The word derives from a 14th century French word (*preiere*) meaning *to obtain by entreaty*. The most common use of the word *prayer* is *asking an SB for some favor*. This type of prayer is called *intercessory prayer* because it is done to ask an SB to intercede on behalf of oneself or someone else. There are some people who believe that such prayers are effective in curing diseases, reducing crime, defeating enemies, and winning high school football games. Some religions require parents to ignore medical treatment for their children, even if to do so is likely to prove fatal, in favor of prayer, e.g., Congregants of Church of Christ, Scientist, the Followers of Christ Church, and the General Assembly and Church of the First Born.* (These religions may not ban medical treatment altogether, but they try healing prayer first, a practice which sometimes proves fatal to their children.) The prayer of such people, however, is not *intercessory* prayer, but the prayer of total submission to the will of God, and [faith](#) that whatever happens only happens because God wills it. Such was the belief of the founder of Christian Science, Mary Baker Eddy (1821-1910), expressed in *Science and Health with Key to the Scriptures* (1875), the Bible of faith healing.

For an SB to intercede would be for a being from the supernatural world to cause things to happen in the natural world that would not happen naturally. This might sound like a good thing. After all, who wouldn't like to be able to contradict the laws of nature whenever it was convenient to do so? However, there are at least two reasons for believing that beseeching an SB to intervene in the natural course of events is absurd.

SBs, if they exist, would not be SBs if anything mere humans or other earthly creatures did could please or displease them. [Epicurus](#) made a most elegant argument centuries ago demonstrating this point. He argued persuasively that men make their gods in their own image rather than the other way around ([anthropomorphism](#)) and that the gods would not be perfect if our antics or

pleas could affect them in any way. Mary Baker Eddy obviously agreed with Epicurus, for she asked rhetorically, "Do we expect to change perfection?"* and asserted "God is not influenced by man."*

Secondly, and more importantly, if SBs could contravene the laws of nature at will, human experience and [science](#) would be impossible. We are only able to experience the world because our perception of it is orderly and lawful. If SBs could intervene in nature at will, then the order and lawfulness of the world of experience and of the world science attempts to understand would be impossible. If that order and lawfulness were impossible, then so would be the experience and understanding of it.

[David Hume](#) gave an elegant argument on [miracles](#) that applies to intercessory prayer (IP); for, by asking an SB to intervene in the ordinary course of natural events one is requesting an SB to perform a miracle. As Hume argued, to believe miracles have been witnessed is to go against all one's experience that there is an inexorable order and lawfulness to our sense perceptions. All our rules of reasoning are based upon this experience. We would have to abandon them to believe in miracles. Likewise, we would have to abandon any hope of experiencing, much less understanding, the world we perceive, if it were possible that any event could follow any other event based on the will of SBs. Only if our experience of events following other events is constant and consistent can we perceive and understand the world. And, if you don't like Hume's approach, there is [Kant](#)'s: only if we experience events as causal can we have any experience at all.

Testing causal hypotheses would be impossible if SBs could interfere with the regular course of nature. Scientists test causal hypotheses. Thus, for a scientist to do a causal test on intercessory prayer would be absurd. Then what are we to make of those scientists who design [controlled, double-blind studies](#) to test the effectiveness of IP? For example, what should we make of Elisabeth Targ's study on "distance healing"? The [National Institutes of Health](#) granted Targ \$243,228 as the first installment on what is likely to "amount to more than 2 million dollars of federal funds over the next few years." She is recruiting "healers" for her study. Here are [her requirements](#):

1. Five years experience as a healer (meaning that close to half of their professional time has been spent providing energy healing, spiritual healing, prayer, or shamanic healing to individuals who are not family or close personal friends).
2. At least 10% of their healing work is done at a distance (not in person).
3. They have worked with people with AIDS or cancer in the past.

Targ's study of the effectiveness of prayer on healing seems to be self-refuting. That is, if God were to answer prayers and heal some patients but not others, depending upon which patients had prayers said for them, then we could never know whether anything occurred due to natural causes or due to divine intervention. No causal study could rule out the possibility that its results were not due directly to God interfering with the course of nature. In short, it would be pointless to do causal studies, and hence, pointless to study whether prayer is effective in healing.

There are other problems, as well. Those who are not healed may not have died due to natural causes; it is always possible that some malevolent but powerful SB interfered with natural processes and caused the deaths. Once you introduce the possibility of SBs being the cause of events, there is no justification for assuming that only God can be that cause or that God only interferes when prayers are involved. In any case, if God is infinitely perfect, it would be impossible for Him to be affected by our requests or desires. Thus, there are logical, scientific, and metaphysical reasons for not seriously investigating such a notion as the healing power of prayer. The idea is logically contradictory, scientifically preposterous, and metaphysically demeaning. It requires God to be perfect and imperfect, it makes a mockery of the notion of scientific tests of causality, and it belittles the Omnipotent Infinite God, if such exists.

So, why are such studies being done and being published in "reputable" scientific journals? For example, *The Archives of Internal Medicine* (October 25, 1999), a publication of the American Medical Association, published a paper entitled: "A Randomized, Controlled Trial of the Effects of Remote, Intercessory Prayer on Outcomes in Patients Admitted to the Coronary Care Unit." Five M.D.s, two Ph.D.s, one M.A. and one doctor of divinity signed their names to this peer reviewed paper. One of the more interesting things about this paper is that even though the authors found no significant difference in time spent either in the hospital or in the coronary care unit for the experimental and control groups, they still managed to come up with some sort of scoring system (what they call a "CCU course score") that satisfied them that the group that was prayed for didn't suffer as much as the no-prayer group!

The study took place at the Mid America Heart Institute in Kansas City, Mo., over a 12-month period. There were 466 patients in the the experimental (prayer) group and 524 in the control (usual care) group. The patients were randomly assigned and prayed for by five of randomly assigned (from a pool of 75) intercessors for 28 days. The prayer was to be for "'a speedy recovery with no complications' and anything else that seemed appropriate." The intercessors knew only the first names of their victims, excuse me, subjects, and had to believe in the efficacy of prayer, among other things.

Despite the fact that the prayers were aimed at a speedy recovery with no

complications, the authors did not consider it important that there was no significant difference in either hospital or coronary care unit stay between the prayer and control groups. William Harris, Ph.D., concluded that "prayer *may* be an effective adjunct to standard medical care" (emphasis added to the weasel word). He could just as well have concluded that prayer *may not be* an effective adjunct to standard medical care.

The authors claim that "it was anticipated that the effect of prayer was unlikely to be evident in any specific clinical outcome category (e.g., the need for antibiotics, the development of pneumonia, or the extension of infarction), but would only be seen in some type of global score." Why a specific outcome, like length of time in the hospital or death, was considered irrelevant is unclear. The researchers do admit, however, that the CCU score they devised was "intuitive" and "has not been validated."

The authors write:

Since the score itself is only an estimate of overall CCU course, there is no known way to ascribe a clinical significance to it, other than to say that as a group, the patients in the prayer group "did 10% better." The score should be viewed only as a summary statistic designed to detect the impact of a mild global intervention on overall health in large groups, not in individual patients.

If they were honest, the authors would have concluded: **Study Shows Prayer Does No Harm!** Dr. Harris and his colleagues nosed around with the data until they found a list of factors that made it appear that the group receiving prayers fared better than the group that didn't. This isn't even junk science; it's joke science.

Dr. Harris is in good company, however. According to the University of Maryland, [John A. Astin, Ph.D.](#), assistant professor in the School of Medicine's Complementary Medicine Program, analyzed 23 clinical studies involving prayer, [therapeutic touch](#), and some other "unconventional forms of spiritual intervention" and found that 57 percent of the studies showed a positive impact on the patients. "Statistically speaking, the figure of 57 percent is highly significant," says Astin. "This is far more than one would expect to see by chance alone." How he came to this conclusion is anybody's guess. Most published studies find a [positive effect](#). Astin's devotion to science seems evident in his statement: "There is certainly no evidence that attempts to heal from a distance cause any harm."[*](#)

praying for pregnancy

The [Journal of Reproductive Medicine Online](#) (vol 46. no. 9, September 2001) published an article called "Does Prayer Influence the Success of in

Vitro Fertilization–Embryo Transfer? Report of a Masked, Randomized Trial" by Kwang Y. Cha, M.D., Daniel P. Wirth, J.D., M.S., and Rogerio A. Lobo, M.D. The answer, say the authors, is "yes, quite a bit." For example, "The IP [intercessory prayer] group had a higher pregnancy rate as compared to the no-IP rate (50% vs. 26%, P=.0013)." We expect this kind of stuff from the ["alternative" health/energy medicine folks](#), but not from "real" scientists.

I don't question that the researchers were able to establish a "statistically significant difference" between the IP and no-IP groups. The researchers went to quite a bit of trouble to do their [controlled, double-blind](#) experiment. They even had the one's doing the praying in a different country from those getting the in vitro fertilization. One thing they didn't do, however, was define "prayer" or explain how it might influence anything in the universe, much less the outcome of their little experiment. Nor did they address the issues noted above. If prayer works by influencing God to influence the outcome of an experiment, then God can interfere with the laws of nature at any time. If God can interfere with the laws of nature at any time, then no controlled, double-blind study can be sure of the meaning of whatever outcome results. Any result could be the result of direct influence by God. In other words, the assumption the study is based on is self-defeating. No science at all would be possible if God could be interfering with the laws of nature at will. Science requires a backdrop of lawfulness in Nature in order to discover any causal connection between anything and anything else.

What has happened to scientific research when magical thinking is considered within the bounds of reasonable empirical study?

Science or Religion?

These IP studies are what is passing for *scientific* study these days. What are we to make of it? At the very least, I think it is safe to say that these studies are not done out of scientific curiosity and are most likely done out of some sort of misguided religious zeal.

Another plausible explanation for this pathetic attempt to find empirical support for religious faith is that there is a great deal of money around to support this kind of study. There are private foundations ready to throw money towards anyone who can show how science supports religion. For example, there is the [Templeton Fund](#), the [PewForum](#), and the [Fetzer Institute](#), to name just three. Government money is also available and apparently in large quantities. Can anyone really justify giving Elizabeth Targ \$2 million of taxpayer's money to study the "distance healing" of shamans?

As more money becomes available from both the federal government and from private donors for the study of the health benefits of prayer, we can expect more institutions like Harvard Medical School to be sponsoring events like its sixth annual [Spirituality and Healing in Medicine](#) conference. The

event brings together several hundred health professionals, clergy members, social workers and insurance providers "to discuss the integration of mind/body medicine into mainstream health care."

[Dr. Harold Koenig](#), founder of the Center for the Study of Religion/Spirituality and Health at Duke University Medical Center in Durham, N.C., claims that there have been about 1,200 studies on the healing power of faith and the health effects of spirituality. Koenig thinks these studies have proved such things as that people who frequently attend religious services have lower death rates, are more likely to stop smoking, exercise more, have more social contacts and stayed married longer than those who do not. Koenig, however, seems to be uninterested in the fact that these studies don't take into account that people who attend religious services are necessarily more healthy than those who don't, since those who can't because they are too ill to attend, don't attend. Only those who are healthy enough *can* attend. There may well be a causal connection between being healthy and attending religious services but the evidence doesn't demonstrate that spirituality causes good health.

[Dr. Herbert Benson](#), conference founder and president of the Mind/Body Medical Institute at Beth Israel Deaconess Medical Center in Boston, claims that "60 percent of physician visits are due to stress-related illnesses that can be remedied or improved with the physiologically soothing effects of chanting and [meditation](#), or 'the relaxation response'." One can see why insurance companies would be drooling over such claims. If they are true, less money will have to be shelled out for medical services. Most sick people can just stay home and chant or meditate instead of making an office visit or using prescription drugs. Benson claims that prayer

...even works for agnostics. The body possesses a physiological response to the repetition of a phrase or action. You can leave belief up to the patient. They can say 'Hail Mary, full of grace,' 'Shema Yisroel,' or 'Om,' but when they evoke this response they feel more spiritual.

When they feel more spiritual they get sick less, he says. Not everyone agrees, however. [Richard Sloan](#) of the Columbia University College of Physicians and Surgeons in New York says that he is "troubled by the uncritical embrace of this trend by the general public, individual physicians, and American medical schools" to link prayer with health. Sloan and several colleagues criticize the studies cited by Koenig and Benson, saying that the studies "have not been well designed, produce vague conclusions, and generate sometimes conflicting results."

One such study was led by [Dr. Amparo Castillo-Richmond](#), assistant professor of Medicine at Maharishi University of Medicine College of Vedic Medicine, home of [Transcendental Meditation](#) (or is it Transcendental

Medication?). The study found that of 60 African-Americans who stayed in a program for from 6-9 months, those who meditated (using TM) "showed a significant decrease of -0.098 mm (95% CI -0.198 to 0.003 mm) [of carotid intima-media thickness (IMT)] compared with an increase of 0.054 mm (95% CI -0.05 to 0.158 mm) in the control group (P=0.038, 2-tailed)." The study used TM. Advocates of TM claim that TM can only be learned by studying with TM masters. Thus, there is an economic interest in arriving at these results. That in itself does not invalidate the study, but it should make one cautious of accepting on faith that proper protocols and controls were used throughout the study. In any case, Castillo-Richmond says that "We expect to use this treatment as an adjunct to current pharmacological therapies. We don't want the patient to think they can replace current medical therapies with this type of meditation."^{*}

The TM study may be statistically significant but how that translates into a significant change in health is not clear. Do people who meditate for 40 minutes a day live an extra minute for every minute spent meditating? If so, then what's the advantage of meditating? Do people with a coronary IMT that is 0.15 mm larger than others suffer a significantly greater number of heart attacks? I don't know, but it seems to me that at the very least those doing these kinds of studies should make a clear distinction between scientific studies and those which abandon the assumption upon which all science and experience is based upon. The latter include all studies on intercessory prayer.

On the other hand, if I were a cynic I would say that these faith-healing "scientists" are knowingly selling false hope. They know they are lying but they believe that their lies relieve anxiety and make people happier in their sickness. And, in some odd way, perhaps they believe they are doing God's work.

[A Course in
Miracles](#)

reader comments:

A Course in Miracles

13 Nov 1997

*I did want to express my personal experience with **A Course in Miracles**. I have studied the material very intensively for about 5 years. It would be absolutely impossible to write any kind of a summary with any understanding unless you have spent a great deal of time and especially practice with the material. To scan the book and pick out a few passages and then announce to the whole world what it says does enormous injustice to this incredibly beautiful and life changing material.*

Reply: Why distort what I have done? Why twist my words into something they are not and do not claim to be? I do not say any more about the content of the book than that it calls for more forgiveness and less suffering. I focus on the deluded or dishonest method your hero uses to get her message across. If she has a problem with Christianity why doesn't she have the courage to come out and say it? Christianity is not a religion of forgiveness and it has always preached the necessity of suffering. If she thinks this is a bad message, why doesn't she come right out and say it, instead of pretending that the book was dictated to her by an Inner Voice.

The Course is in its entirety a perfect practice of forgiveness. It is a step by step process by which you break down the walls of separation between yourself and your fellow man. And it works. It does not claim exclusivity or specialness, it is not a religion or a cult. It is a completely individual practice of learning to love your fellow man through forgiveness. It is a book in complete self-responsibility. And that is what it is. How could anyone criticize that?

Reply: It is an allegedly channeled book. That is where I aim my criticisms. I have no problem with a message of forgiveness. I can tell you straight out that a person who does not know how to forgive will be miserable all her days. As Spinoza said: "To understand is to forgive." I don't need to pretend to hear voices to get this message across, nor do I think that the voices give the message any validity. The validity is in the utility of the message, not in the self-anointed messenger.

I have gone from being a very selfish, self-centered, angry, irritable person who blamed everyone one else for my problems to someone who has complete peace and many moments of great joy. I feel joined and connected with my

fellow man. I see innocence where I used to see evil. The world has not changed, but I look at it differently. How could anyone criticize a practice that leads to this except through ignorance and lack of understanding.

reply: Again, I reiterate that I do not criticize the practice of forgiveness. You may not be selfish, etc., anymore, but you certainly have not learned how to treat fairly another's criticisms. I guess I just don't understand why anyone would want to make a business out of encouraging others to be more forgiving and less troublesome. To behave with kindness and sympathy towards others seems to me such an obviously wise thing to do that I guess I am incapable of understanding the need to sanction such behavior with any higher authority, whether that authority be an inner voice or a multitude of like-minded reformers.

I urge you not to be so "skeptical" - open your eyes and your heart to everything that speaks of good out there.

Susan Sturm

reply: And I urge you to continue being unselfish and loving. I will try to do the same.

5 Nov 1997

*Although I am a theist, I cannot help but cringe over what passes for 'spiritual truth.' In applying the techniques found in *A Handbook of Hypnotic Suggestions and Metaphors*, ed. by D. Corydon Hammond, Ph.D. (W.W. Norton & Co. New York, 1990) to the 'channeled', *A Course in Miracles*, it is so blatant that ACIM is nothing but the presentation of gnosticism in a self-hypnotic script.*

Helen Schucman, Ph.D., the 'channeler', both taught psychology and maintained her own clinical practice. She would have knowledge of gnosticism and Christianity, and most assuredly would have practiced hypnotherapy. True, she felt or believed she was channeling "the Voice", but "the Course" obviously lacks original content.

Or maybe, I'm wrong and Jesus was a hypnotherapist after all. It's not the gnosticism I object to, it's the slick packaging of circular logic, self referencing definitions, redundancy and needless repetition to get the message delivered to the "unconscious". Advertising, propaganda, and seduction use the same techniques. Old Fred Nietzsche was right in comparing the uncritical public to sheep. I may be a slave, but I am fat, easily entertained, and have a convenient god to follow. God bless the remaining skeptics, may this small band multiply.

Sarah Nordholm

reply: I can't speak for other skeptics, but even blessings from theists are welcome here.

IQ and race

The three great strategies for obscuring an issue are to introduce irrelevancies, to arouse prejudice, and to excite ridicule.... ---Bergen Evans, *The Natural History of Nonsense*

"IQ" stands for "intelligence quotient." A person's IQ is supposed to be a measure of that person's intelligence: the higher the IQ number, the greater the intelligence. This is inaccurate, however, since it assumes that there is only one kind of intelligence. Most people recognize that there are some people with fantastic memories, some with mathematical minds, some with musical genius, some with mechanical expertise, some with good vocabularies, some good at seeing analogies, some good at synthesizing, some at unifying, etc. Some people excel at more than one of these behaviors. It would be more accurate to speak of human *intelligences* than of intelligence. An IQ test, therefore, should be considered a measure of *some* kinds of intelligence, but not all. The most accurate claim one can make about an IQ test is that it measures IQ.

The research on IQ and race by [Arthur Jensen](#), [William Shockley](#), Herrnstein and Murray (*The Bell Curve*) and others have not found any significant correlations between race and intelligence. They have found correlations between race and IQ, which has been used to support the notion that some races are inferior to others.

The term 'race', however, is even more problematic than the term 'intelligence.' While all humans are members of the human race, few deny that there are many races or that there are obvious physical and cultural differences among different ethnic groups. But it has become a widespread belief that race is genetically determined in much the same way as, say, eye color. Having a certain gene or set of genes means you have blue eyes. Likewise, it is thought, having a gene or set of genes makes one Caucasian. However, there is no such thing as a racial gene or *set of race genes* any more than there is such a thing as an intelligence gene or set of intelligence genes. This does not mean, of course, that a person's genetic makeup is not a significant factor in *individual* intelligence in particular areas or in physical features associated with different races, such as skin color, breadth of nose, shape of eyes, etc. It should be obvious, however, by the tremendous variation in intelligences among individuals of any race, that environment is a much more significant determinant of racial features than it is of intelligence. This seems to imply that whatever genetic differences exist among the races are most likely due to natural selection and sexual selection. It also seems to imply that the notion of a "pure" race is an absurdity. Even if the fundamentalists are right and there was an original Adam and Eve, no race

can claim to be "pure." Each race evolved according to natural processes such as natural selection.

some race data

"There's about a 15 percent genetic variation between any two individuals," according to science writer Deborah Blum. "Less than half of that, about 6 percent, is accounted for by known racial groupings....A randomly selected white person, therefore, can easily be genetically closer to an African than another white" (Blum).

Joseph Graves, an African-American evolutionary biologist at Arizona State University-West in Tempe, notes that most people and researchers who try to establish correlations between various natural abilities and skin color are not geneticists.

These people don't know evolutionary genetics. They talk about interesting issues in race and biology. And since, I think, there are no real races, I wonder what these issues are. It makes me angry that I have to take time from my research (on the genetics of aging) to argue about something that shouldn't even need to be discussed (Blum).

C. Loring Brace, an anthropologist at the University of Michigan, claims that "race is a four-letter word with no basis in biological reality" (Blum).

Of course, physical features such as skin color, shape of eyelid, color of eyes, texture of hair, etc., are genetically determined. It is also true that an individual's capacity for any particular kind of intelligence is largely dependent upon genetic factors. What isn't true is the notion that whole races of people have *sets of genes* which make them as a group more intelligent than other races. The genes which affect musical talent, the power to visualize or to think abstractly, for example, are not established as the same ones which affect those characteristics which are associated with being Caucasian, Mongoloid or Negroid. If you want to find out why Asians are over-represented in California's universities while blacks and Hispanics are underrepresented, you will probably search in vain for a genetic answer. Those who are interested in such things would do better to look at family structure, ethnic traditions, and social conditions.

spurious correlations

To correlate race and intelligence in the name of science and have the world pay attention to you is no small feat. Could it be the numbers, the statistics, which impress people? Not likely. Even the most sophisticated numerical analysis which showed a correlation between *phlogiston* and *ether* wouldn't get a hearing today. So, why does the race/intelligence bit get a hearing? How

can any rational person take seriously notions such as the *Aryans* or *racial purity*? Some probably assert these things as a matter of establishing power. Being a member of a pure race is a quick and simple way to establish one's superiority. Membership is easy. You're born into it. Being the right race gives one a *right* to superiority and justifies inequality, regardless of one's individual deficiencies. It also justifies racism, since if inferior people are succeeding they must be cheating the truly superior people out of their just inheritance. It also justifies believing things about oneself that have no objective validity. A truly inferior being can justify thinking of himself as superior because of his race membership. He can rationalize any failures or inadequacies and attribute them to the unfair advantage given to those he considers inferior. He can even fool himself into thinking his non-white skin is white and that he somehow deserves to share in the accomplishments of anyone in his "white" race. (I have been expected to check "white" on a number of forms concerned about my "race", although when compared to a white sheet of paper, my skin color is clearly not white, but light brown. I have met very few "white" people who are white. At least they are not white in the skin areas generally exposed in public.)

However, even if there were such a thing as a pure race, that fact would not justify considering that race superior to any other. One might even make a case for the *inferiority* of such a race. Nature clearly favors variation. Chances of survival under varied and changing conditions increase as the species is more varied. Too much similarity could mean racial disaster, extinction; while variation could mean the survival of some members of the species if disaster should strike. Likewise, a species with several varieties of intelligences, as well as individuals with varying degrees of those intelligences, could well be a sign of *superiority*, at least in terms of the survival potential of the race.

Are the studies of no value that show African-Americans or Asians doing differently than so-called "white" Americans on standardized IQ tests? That is, is the work of people like Herrnstein and Murray worthless? No. It is valuable data, but it is also explosive data because of our racist political history. Such data will inevitably be exploited by white supremacists, twisted for their own political goals and used not to improve racial relations in America but to encourage further racial strife. Such data consists mainly of correlations. And while correlations should convince orthodox empirical scientists of nothing, to the racist researcher, correlations are the heart and soul of their work. The furor that *The Bell Curve* caused died down quickly because there occurred an ongoing saga which usurped its political and entertainment value: the O.J. Simpson trial. In fact, Herrnstein and Murray, in chapter after chapter, call for social reforms to improve the status of blacks in America. They may be disingenuous calls, but they are nevertheless inconsistent with the notion that the social condition of blacks in America is due to genetic factors. If genes led to the black underclass of young thugs who murder each other on a daily basis in almost every city in America, then there would be no point in calling for educational or vocational programs, no point in urging a change of focus for black men and women in their families, as

even the black supremacist Louis Farrakhan has recommended with his million man march.

One can't deny that the majority of young men killing each other in gang wars are minorities. But one can deny that the reason they are so violent and immoral is because of their race. That is false and an insult to the majority of blacks and other minorities who are decent, law-abiding persons. One can't deny that minorities are undereducated as a group and underrepresented in our colleges and universities, and in the professions and skilled trades. But one can deny that the reason minorities are underrepresented is because their race makes them genetically inferior and incapable of competing with "white" America. It is true that many minorities are not in college or working as doctors or lawyers or teachers or auto mechanics, etc., *because of their race*. They have been discriminated against and deprived of educational and employment opportunities *because of racial prejudice*.

It is possible that some day we may be able to look at people of different races and see them as human beings without losing sight of what is special and unique about racial or ethnic membership. We do not need to be colorblind, nor should we strive to ignore racial differences. But they should be seen in a proper perspective: significant in forming us, but irrelevant to our status as human beings capable of both the highest moral and intellectual behavior and of bestial depravity and moronic incompetence.

In the meantime, we should heed Peter Singer's words:

...the genetic hypothesis does not imply that we should reduce our efforts to overcome other causes of inequality between people.

...the fact that the average IQ of one racial group is a few points higher than that of another does not allow anyone to say that all members of the higher IQ group have higher IQs than all members of the lower IQ group....

And, having a higher IQ does not justify racism (Singer, 1993), or any other kind of -ism, for that matter.

naturalism

Naturalism is a [metaphysical](#) theory which holds that all phenomena can be explained mechanistically in terms of [natural](#) (as opposed to supernatural) causes and laws. Naturalism posits that the universe is a vast machine or organism, devoid of general purpose and indifferent to human needs and desires.

Naturalism is often confused with [atheism](#), [materialism](#), [logical positivism](#), [empiricism](#), [determinism](#) and [scientism](#).

The Deistic founders of the United States of America were advocates of naturalism. Deism admits a transcendent creator of the universe, but denies that the creator interferes with Nature. Hence, understanding God is unnecessary to understanding the world.

[Pantheistic](#) philosophies--such as that of the ancient [Stoics](#), John Scotus Eriugena (Ireland, 9th century), [Giordano Bruno](#) (Italy, 16th century), and [Spinoza](#) (Holland, 17th century)--are naturalistic. In pantheism, God *is* the world.

Thus, naturalism neither denies nor affirms the existence of God, either as transcendent or immanent. However, naturalism makes God an unnecessary hypothesis and essentially superfluous to scientific investigation. Reference to moral or divine purposes has no place in scientific explanations. On the other hand, the scope of science is limited to explanation of empirical phenomena without reference to forces, powers, influences, etc., which are supernatural.

The difference between naturalistic and supernaturalistic views in Western philosophy might best be understood by noting that the former favors mechanistic explanations, while the latter favors teleological ones. Mechanistic explanations are *dysteleological*, i.e., they make no reference to purposes or design, except metaphorically as in biology (e.g., the heart was designed to pump blood).

The difference between mechanistic and teleological views may best be understood by considering a few examples.

the sex drive

From a teleological point of view, the sex drive is designed to reproduce the species. The pleasure which accompanies sex is the main inducement to carry out the purpose of reproduction. If sex were generally painful, it would be

avoided by most members of the species, and hence the species would become extinct. Some Catholic theologians maintain that to engage in sex for the purpose of reproduction is the only proper sexual motive. To frustrate the reproductive purpose of sex is to act contrary to divine purpose and is immoral. Birth control and homosexuality, therefore, are morally wrong *because they are unnatural*.

From a mechanistic point of view, the sexual urge is purposeless. It was not designed to motivate animals to reproduce. Rather, animals with a strong sexual drive reproduce, and hence flourish. A species with a weak sexual drive would be unlikely to survive. According to this view, the purpose of sex can't be frustrated, since sex, in general, has no purpose. (Of course, the *desire* to have sex with a particular person is purposive. That *is* the purpose: to have sex with a particular person, whatever gender that person might be.) Since nothing has been designed to fulfil a particular purpose, moral goodness and evil cannot be determined by their being natural or not. Some other ethical principle, such as *utility*, must be invoked. In any case, naturalism does *not* imply that all things are good since all things are natural.

bee pollination

From a teleological point of view, bee pollination of orchards is purposive and part of a design. To the mechanist, bees just do their thing and, as a result, orchards get pollinated. If no animals existed which do what bees do, orchards wouldn't exist. The world would be a different place, but it would still be a world. Different mechanisms mean different worlds. The choice is not between this world or none at all, but this world or some other one.

pedophilia

To the teleological supernaturalist, pedophiles and sexual predators exist for some sort of divine purpose. To the mechanistic naturalist, child molesters and child murderers are purposeless. Their desires may be natural but that does not mean that they should be fulfilled. Both the supernaturalist and the naturalist hold pedophiles and sexual predators accountable for their evil behavior. The naturalist, however, need not feel any need to try to explain why such evil exists. Some naturalists might seek causal explanations which deny that evil is chosen behavior by evil persons with evil desires. All naturalists might agree that the *desires* themselves are explicable entirely by causal mechanisms outside the scope of personal responsibility. But, not all would agree that acting on the desires is completely explicable without reference to the freedom and responsibility of the evildoer.

What is the purpose of evil?

The supernaturalist, with his moral and spiritual purposes inherent in every aspect of reality, must come up with some sort of explanation for the

existence of evil. The branch of theology which tries to explain such things is called *theodicy*. In theodicy it is considered reasonable and acceptable to say of evil, "the ways of the Lord are mysterious, indeed." Or, as God allegedly said to Job when he dared to ask "Why me?": "*Hath thou an arm like the Lord?*" In short, "I'm God; I don't have to explain myself to anybody." Evil exists and since God is good you can be sure that there is a good reason for evil. Take it on faith.

teleology according to Spinoza

Spinoza maintained that teleological thinking represents the primitive thinking of our pre-scientific ancestors. The pursuit of "final causes" led nowhere in the human quest to understand Nature. Only when humankind gave up the anthropomorphic way of thinking, which understands the weather, geology, physics, etc., in terms of divine purposes, could progress in knowledge of Nature be made. History has proved Spinoza right. Teleological theories, such as supernaturalism, are scientifically superfluous.

On the other hand, Spinoza's attack on teleology was complete: he did not believe that human behavior was to be explained differently from anything else in Nature. Human behavior is to be explained in terms of mechanistic causes, just as the behavior of all natural phenomena are to be explained. Humans are no more free to change their behavior than falling stones are free to change their direction. And neither humans nor falling stones are responsible for their behavior or movements. However, Spinoza's denial of [free will](#) is no more a necessary consequence of naturalism than is his pantheism. That is, neither [determinism](#) nor [pantheism](#) is entailed by naturalism.

See related entry on [science](#).

empiricism

Empiricism is a theory which holds that the origin of all knowledge is sense experience. The term also refers to the method of observation and experiment used in the natural sciences. Often, empiricism is contrasted with *rationalism*, a theory which holds that the [mind](#) may apprehend some truths directly, without requiring the medium of the senses.

Empiricists tend to emphasize the tentative and probabilistic nature of knowledge, while rationalists tend to be dogmatic and assert they have found a method to discover absolutely certain knowledge. Empiricists see [philosophical skepticism](#) as limiting what the human mind can hope to accomplish and as a guide to those areas of inquiry we can usefully apply our talents towards. Rationalists see skepticism as something which must be refuted on every count in order to establish a sure footing for absolutely certain knowledge.

There is great irony here since historically it was the rationalists (Plato, Descartes, Spinoza, Leibniz) who had the vision of a knowable universe, of laws governing all the parts of the whole, of a unified whole, of minds made for knowing this universe, which is essentially today's vision of science. On the other hand, the empiricists' (Locke, Berkeley, Hume) vision of subjective perceptions limiting knowledge, of the need for faith to believe anything beyond immediate perceptions, of minds incapable of knowing much of anything, of dire skepticism, is the vision of anti-science.

reader comments:

creationism

29 Dec 2000

Dr. Robert Gentry, Geophysical Scientist and author of Creation's Tiny Mystery. Read the book then take up his challenge. Or do the laws of Empirical methodology only apply when they support your accepted belief system and not when they can seriously challenge them. How do you make a lie its most deadly.... Mix it with a little Truth. (Spiritually discerned)

David Taggart

reply: The real mystery is why Gentry continues to have followers such as yourself, David.

For those who may not have heard of [Gentry's big mystery](#), here it is in a nutshell:

Evidence that something is drastically wrong [with the scientific theory of the origin of the universe] comes from the fact that this basic evolutionary premise [viz., that the universe evolved to its present state only by the unvarying action of known physical laws] has failed to provide a verifiable explanation for the widespread occurrence of Po halos in Precambrian granites, a phenomena which I suggest are in situ evidences that those rocks were created almost instantaneously in accord with Psalm 33:6,9: "By the word of the Lord were the heavens made; and all the host of them by the breath of his mouth. For he spake, and it was done; he commanded, and it stood fast."

Several geophysicists have taken up the bait and studied the sites where Gentry got his granite samples and the specific type of granite Gentry used. They were not impressed. I refer you and other readers to an article by [Curtis Severns of the North Texas Skeptics](#), where he cites the following:

- Ellenberger, C.L., with reply by Gentry. R.V. 1984. "Polonium Halos Redux," *Physics Today*. December 1984. p. 91-92

Collins February 3, 1997

- Osmon, P., 1986, "Gentry's pleochroic halos: Creation/Evolution," *Newsletter*, Feser, Karl D., Editor, v. 6, no. 1, Concord College, Athens, West Virginia
- Schadewald, R., 1987. "Gentry's tiny mystery, Creation/Evolution" *Newsletter*, Fezer, Karl D, Editor, v. 4, no. 2 & 3. Concord College. Athens. West Virginia, p 20.
- Wakefield, J. R., 1987-88, "Gentry's Tiny Mystery - unsupported by geology," *Creation/Evolution*, v. 22, p. 13-33.
- Wakefield, J. R., 1988, ["The geology of 'Gentry's Tiny Mystery,'"](#) *Journal of Geological Education*, v. 36, p. 161-175.

Wakefield (1988) concludes:

The geology of the sites at which Po halos are found clearly shows that Gentry's proof of instantaneous creation and a young Earth is nothing of the sort. Gentry's Po halos simply do not occur in primordial granites, but instead were formed in relatively young dikes that demonstrably crosscut older sedimentary and igneous rocks. Gentry claims to be an objective scientist but he has, in fact, ignored the very extensive published evidence that disproves his hypothesis. In addition, when confronted with this evidence he simply denies its existence. Such behavior is not characteristic of scientists, but of pseudoscientists.

In short, others more knowledgeable than I have already read the book and taken up the challenge, only to be ignored by the creationists. Apparently, you are correct. The creationists seem to think that, as you say, "the laws of Empirical methodology only apply when they support your accepted belief system and not when they can seriously challenge them." Gentry must have an abundance of spiritual discernment, for he seems to know well your formula: "How do you make a lie its most deadly.... Mix it with a little Truth."

30 Aug 2000

One question for you: If you are so positive that evolution is a fact and that you know (or have a theory) of how it happened, why are you afraid to introduce students to differing ideas? I thought the whole point of becoming a "critical thinker" was to weigh all the sides of an argument and decide for yourself what you believe to be the truth. By not introducing students to creation science along with evolution, you are implying that either 1) they are not able to make a wise decision for themselves, or 2) you are afraid that they might believe in a

theory that is not your own. Why not give them the opportunity to make the choice?

Jennifer

reply: What makes you say I'm afraid of introducing students to differing ideas? Just because I wouldn't give cooking instructions in my philosophy class doesn't mean I'm afraid of introducing my students to cooking. Cooking belongs somewhere else. So does religious instruction. So does the teaching about different creation stories. In fact, I think children should be instructed in public schools about the creation stories of many different cultures, but such instruction should be done in a world religions or cultural anthropology course, not a science course.

Jennifer replies

I thought that the origins of life on earth falls under the category of biology, which, if I am not mistaken, is a science.

reply: Well, you have part of it right. Biology is a science and the study of the nature and origins of living things falls under the category of biology, but the idea of special creation by a "Creator" is not scientific. You are making a false assumption when you assume that any theory about the origins of life is a biological theory. Only scientific theories about the origins of life are biological theories. Non-scientific theories about the origins of life are metaphysical theories. (You might take a look at the entry on [science](#).)

To make this easier to see, consider a metaphysical theory of, say, electricity. This theory might claim that invisible beings from another dimension carry electrical impulses on their invisible backs. They read our minds and carry electricity as if our belief in electrons, etc., were true. Thus, to us the world looks like there are electrons, etc., but in fact, the whole realm of electrical phenomena functions according to the will of these invisible beings. Such a theory should not be taught alongside the theory offered by modern physicists. Just because it is a theory of electricity doesn't make it a scientific theory of electricity. In science class, we should teach science. In the philosophy class we teach metaphysics.

Just because you don't agree that there is any "scientific evidence" for creation doesn't mean there is none.

reply: The notion of "scientific evidence" is not a simple one. You might think that you have scientific evidence if you can point to many things in the universe that seem to you to be (a) consistent with the theory of special creation, and are (b) explainable only by assuming a Creator. However, being able to fit facts to a theory is very easily done for almost any theory (see my entry on [confirmation bias](#)) and is no indication that the theory in

question is scientific. Furthermore, being scientific does not mean that a theory explains everything. If we gave up on a scientific theory every time something seemed puzzling to us and seemed "miraculous" or "a result of divine intervention", we wouldn't have any scientific theories left standing.

Scientists didn't think that the world was round for hundreds of years, but that didn't make them right, either.

reply: The fact that scientists err is irrelevant to the issue. It is not a matter of either (a) the way a particular group understands the Creation story in Genesis must be true or (b) some current scientific theory must be true. Both could be wrong, but that fact does not make them both scientific. Furthermore, the vast majority of those who believe God created the universe do *not* find the creation story in *Genesis* to conflict with the theory of evolution. But they recognize the difference between divine revelation and scientific discovery.

It would be somewhat hard for students to equate what they learn in a comparative religion class to what they learn in biology class about the origins of life. Why not teach them together?

reply: Why assume the students should "equate" what they learn in comparative religion and in biology any more than they should learn to equate what they learn in history and what they learn at Sunday school or at home? Don't tell me you would want children to study history and religion in the same class?

If you are concerned about the children being confused by being taught contradictory things in biology and comparative religion, you shouldn't be. The children will recognize that the one is taught as a science and represents the most reasonable beliefs at a given time, while the other represents the various faiths of many different peoples.

I would be more concerned about teaching my child that a story in *Genesis* says there is no evolution and that that story was given by God directly to the Jews who didn't even recognize Him when He came to save them. Why were they smart enough to get the first story right but not the second? If God had been talking to the Hebrews for thousands of years, how come they couldn't recognize Him when lived with them? That would confuse any child, to believe that such unreliable people could be the recipients of infallible truth.

Besides, some would argue that religion is taught in science classes already...the religion of humanism.

Jennifer

reply: True, some would say this....and they'd be wrong. To not teach the

viewpoint of one particular religion alongside science, history, etc., leaves it open for the student to pursue any religion in the universe. Only those who believe that theirs is the one and only true religion would think that one is promoting *humanism* (by which I suppose you mean *atheism*) when one is not teaching that religion alongside everything else.

Jennifer replies again

4 Sep 2000

There is only one statement in your answer worthy of a reply. The rest are proof that you, along with most "non-creationists" are simply unwilling to introduce students to alternative theories on the origins of the earth and life on it. The one statement is this:

"Don't tell me you would want children to study history and religion in the same class?"

Of course religion (or at least as it pertains to the cultures and history of the world) should be taught in a history class. Are you going to tell me that King David was not a historical figure? How about Nebucadnezzar and the other kings of Babylon? Pontius Pilate was a historical governor of Judah, and proof has been found that the Israelites did indeed pass through the land of Midian (now Saudi Arabia) in vast numbers. Even secular historians agree that Jesus was a real person. Not only Biblical figures, though. Confucius was a real person. Zoroaster was a real person. All these people and events are a part of history. Just because some hold them to be religious, doesn't mean that students shouldn't be taught who they were, what they taught, and how they affected the history of the world.

As for the rest, I realize that your site is for skeptics. But just remember, God himself calls you a fool for your beliefs: "The fool has said in his heart there is no God."

I feel pity for you and all your readers.

Jennifer

reply: You're too kind.

04 Sep 2000

Re Jennifer's argument that if you're not teaching creationism in science class, you're teaching humanism:

I know some people who believe little pink unicorns hold up the clouds (well, OK, not really). Now, if teachers refuse to teach this in meteorology class, does this mean they are really teaching the religion of non-little pink unicornism?

What about ignoring the science of astrology in astronomy class? Or reincarnation science in medical school? If I'm not a Kabbalarian philosopher, am I practicing the religion of non-Kabbalarianism? Do I have to fit my non-Kabbalarianism with my non-little pink unicornism into some religious world-view?

Atheism is not a religion. Creationism is not science.

Evelyn (blasphemous non-little pink unicornist)

Mass Media Funk

6

August 22, 1999. I received an anonymous e-mail today from someone identified only as RandiExpert@Hotmail.com, directing me to a WWW site devoted to attacking James Randi, Paul Kurtz, the False Memory Foundation, CSICOP, and Prometheus Books, while defending Uri Geller and someone called Riley G. The site, misleadingly called [The Truth About James Randi and others](#), is particularly vicious in its defamation of Randi, making slanderous if not libelous claims of child molestation in explicit, obscene terms. The others attacked are implicated in pedophilia, as well. For instance, Kurtz is said to be chairman of Prometheus Books, which is said to publish "books about children's sexual encounters with adults." The anonymous attacker does not mention that the book in question is titled [Children's Sexual Encounters With Adults : A Scientific Study](#). According to BookNews, the study

Assesses the social constructs of sexuality and examines the various motivations behind sexual encounters between adults and children, presenting the findings of two important research projects on pedophilia: that of C.K. Li, who conducted voluntary interviews with men who admitted to a sexual interest in young girls or boys; and that of D.J. West and T.P. Woodhouse (co-authors, with Li, of this volume), who questioned groups of adult males, both students and others, about their recollections of sexual encounters when they were boys (and compared the findings with those of a similar survey of women).

The implication is that anyone who would study pedophilia or children's sexual behavior, or be in any way connected to the publication of such a study, or challenge conventional wisdom about the traumatic nature of all sexual experience for children, or support any organization who has at least one member who does any of the above, is a pedophile and a child molester.

The deeper implication is that characters like Riley G, Uri Geller and their supporters may abandon argument and defense against charges of fraud, charlatanism, etc., and simply accuse their critics of being child molesters. Their hope would be that the masses are uncritical and unknowing, would assume that where there's smoke there's fire, and would then ignore the skeptics and their claims. Above all they would hope that several bottom feeders in the mass media would pick up the story and try to make it another Monicagate. *Anyone* expressing skeptical views about the paranormal or creationism will be subject to this kind of defamation. I mention politically active creationists because these fanatical fundamentalists will use any means necessary to stifle criticism and attack any view they think implies that their

fairy tale about God and creation is false. If slander works for the paranormal frauds, you can be sure the politically active creationist charlatans will imitate them.

The offensive site is being hosted by [Freeyellow.com](http://freeyellow.com) whose e-mail address is tos@freeyellow.com

I filed a complaint with Freeyellow.com and within 24 hours the offensive anti-Randi site was removed. If you are interested in what was there, I suggest you write to the coward who will not identify himself but accepts e-mail at RandiExpert@Hotmail.com Perhaps he will expose himself.

August 11, 1999. Reuters reported today that the Kansas Board of Education has rejected evolution as a scientific principle. The 10-member board voted six to four to eliminate evolution from the science curricula.

The Kansas Board did not ban the teaching of evolution. Only the legislature has that kind of power. The Board simply deleted any mention of evolution and the Big Bang theory from the science curriculum and from the materials used to test graduating students. [Creationists](#) such as Board Member Steve Abrams, a former head of the state Republican Party, hailed the decision as a victory in the war against evolutionists. Creationists want children to believe that God made them and every other species individually for a purpose. They do not want children to think that a divine power might be behind the Big Bang or evolution of species because that opens the possibility that God might not exist. Creationism maintains that God created everything, a belief which leaves no room for an explanation of the existence and nature of things without reference to God.

Creationists do not accept the fact that species evolved from other species. Nor do they accept Darwin's theory of natural selection, which asserts that individual members of species, as well as species themselves, survive and multiply if they find themselves within an environment that supports their survival and prosperity. Otherwise, they die and die out. Natural selection occurs without preference for some individuals or species over others, and appears to occur without purpose. Steve Abrams wanted to add to the science curriculum standards the assertion that "the design and complexity of the design of the cosmos requires an intelligent designer," but he was voted down.

Nevertheless, the Kansas Board recognized "micro-evolution" as a fact: natural selection *within* a species. Perhaps the six who voted for the new standards do not understand that natural selection within species was what stimulated Darwin to his general theory of evolution. Nor do they seem to understand that you can't have a *theory* of evolution without the *fact* of evolution (any more than you could have a theory of planetary motion without the fact of planetary motion). Scientific theories are explanations as to how things happen. You don't try to explain how something happened unless it happened. Natural selection is one theory as to *how* evolution happened. It assumes evolution is a fact.

Politically active creationists failed in their attempts to have creationism taught alongside evolution as a science. The Supreme Court ruled that compelling the teaching of creationism was tantamount to teaching religion, which state schools may

not do under the First Amendment right to freedom of religion. The so-called creation science movement, however, is not dead. They have just changed tactics. The goal now is to debunk evolution wherever possible, using any means necessary. One of their favorite tactics today is to blame all sin and crime on lack of proper Bible study and the teaching of "godless" theories such as natural selection and the Big Bang theory. Listen to one of the bright lights of this movement, Marc Looy of the creationist group Answers in Genesis. The Kansas vote was important, Mr. Looy said, because

students in public schools are being taught that evolution is a fact, that they're just products of survival of the fittest...It creates a sense of purposelessness and hopelessness, which I think leads to things like pain, murder, and suicide.

That there is no scientific evidence to support these claims is a matter of indifference to those who believe them. When science does not support their beliefs, they attack science as the handmaiden of Satan. I wonder what Mr. Looy has to say about [Christian Identity](#) (Buford Furrow Jr.) and the [World Church of the Creator](#) (Benjamin Nathaniel Smith), or Operation Rescue ([Randal Terry](#)) and other Bible-loving groups that preach hatred and inspire violence and murder. I wonder what Mr. Looy has to say about all the violence and evil going on around the world in countries where the Bible has never had a stranglehold. It's all part of God's mysterious plan, no doubt. Insanity is part of God's plan. Evil is part of God's plan. Everything is part of God's plan. God is inscrutable. Nobody can know why God does anything. Thus, even evolution and the Big Bang could be part of God's plan. Anything can be part of God's plan. Thus, the idea of God's plan is completely vacuous. It explains nothing and justifies nothing because it explains everything and justifies everything.

In Alabama, biology textbooks carry a warning that says that evolution is "a controversial theory some scientists present as a scientific explanation for the origin of living things. . . .No one was present when life first appeared on earth. Therefore, any statement about life's origins should be considered as theory, not fact." Right. In Alabama, I guess, if you wake up to snow on the ground, but no one saw it snowing, then you may only propose a theory as to the origin of the snow. The great state of Alabama apparently is banking on their students being too dumb to recognize language that tries to deceive and manipulate them.

Some of these creationists are the same people who hail as "scientific" the "discovery" of stones depicting humans attacking dinosaurs. The idea of climbing on the back of a dinosaur while one's comrades attack from below with stone axes does not even get a raised eyebrow. The idea that scientists might be wrong about timelines and that dinosaurs and humans might have co-existed far outweighs the preposterousness of this proposition for creationists. Any port in a storm, I guess.

As for myself, I'm beginning to have some doubts about natural selection. If it were true, wouldn't these creationists have been picked off by now?

You can write to the Board members to express your thoughts on the decision. Their names and addresses are listed at www.knea.org/strengthen/sboecontacts.html

(**August 12, 1999.** *Sacramento Bee*, "Kansas: No more evolution in school - creationists alter science curriculum," by Pam Belluck *New York Times*; the story is also in the [Nando Times](#): "Kansas bars evolution from classroom" by Carey Gillam).

comment from Cathy George:

When creationists talk about "micro-evolution," they're trying to account for the fact that there are breeds among domestic animals -- different type of sheep, dogs, horses, and cats. Even the most died-in-the-wool fundamentalist has a hard time denying that all dogs, for example, are offshoots of the same original stock, and that new breeds continue to appear. So they've created the concept of "micro-evolution," which admits that intensive human breeding (not natural selection) can alter the characteristics of a species, while still denying that natural selection, without human agency, can create new species from existing ones. Micro-evolution is used to explain diversity within a species, not speciation itself, so God's toes are not trod upon. No new species, AND no natural selection.

I don't deny that this is wacky, but it's wackiness of a slightly different nuance than you describe.

(reply: Thanks for the correction.)

August 1999. Homosexuality is rampant among God's creatures, it seems. [New Scientist](#) reports on the work of several researchers that should have Jerry Falwell and the Mormons scratching their Holy Books. (Both are well-known for their campaigns to rid the world of the sin that dares not speak its name.) Penguins, giraffes, seagulls, manatees, bonobos (pygmy chimps), etc., are pairing off for same sex pleasuring despite the many human campaigns by God's chosen preachers to stamp out the sin of homosexuality. It will be interesting to hear from the evangelists as to the divine purpose of all these queer creatures.

July 5, 1999. ZDNet has an [extensive article](#) on [Amway's](#) entry into e-tailing which will be known as [Quixtar](#). All Amway agents (now to be known as IBOs: independent business owners) have been invited to open up their own e-mall, selling not only Amway products but products of other manufacturers as well. The emphasis, as with Amway, will be on [multi-level marketing](#), i.e., recruiting new Quixtar agents who are encouraged to recruit agents ad infinitum. Agents will get a cut of sales made by those they recruit, and by sales of recruits of recruits, ad infinitum theoretically.

Why would the 5th and 6th richest men in the world, Rich DeVoss and Jay Van Andel, founders of Amway, want to get involved with Internet sales? For one thing, there is a lot of money to be had in e-commerce: they're hoping for \$1.5-\$2 billion in sales the first year...better than Amazon.com or E-Bay. Secondly, [sales at Amway have dipped recently](#) (18.5% drop in the last year).

Why not call the new company E-Amway instead of Quixtar? That might have something to do with name repulsion.

Will it work? It will certainly work for Devoss and Van Andel. They will have millions of agents to sell products, including their Amway products, from the day they open on September 1, 1999. Unlike Amazon.com, who had to spend some time recruiting agents to sell their products, Quixtar will be able to bank on Amway agents to aggressively market their products from the getgo. How much money will the Quixtar agents make? They may think they will become nanosecond millionaires but my guess is that they will fare about as well as they did as Amway agents.

July 23, 1999. According to the [Nando Times](#), *Science Now* reports that Robert P. Liburdy's scientific work, which established a strong correlation between [electromagnetic radiation](#) and cancer, has been based on faked data. Liburdy has been forced to resign from the Lawrence Berkeley National Laboratory.

"Liburdy's studies, reported in scientific journals in 1992, provided the first plausible biological mechanism linking electromagnetic fields exposure to disease." However, he omitted any data that did not fit with his hypothesis. The Office of Research Integrity of the U.S. Department of Health and Human Services found that Liburdy was guilty of scientific misconduct for "intentionally falsifying and fabricating" his data to support his claim of cellular effects from electric and magnetic fields. Liburdy denies the charges and says there is no problem with his data, only with how he interpreted it.

Liburdy, who has received several millions of dollars in federal money to conduct his research, has been banned from receiving any federal funds for the next three years.

June 29, 1999. A Los Angeles county mental health worker has been accused of using county phones to make over 2,500 calls to psychic hotlines at a cost of over \$120,000. Who said there's no harm in a little fun? [Read all about it.](#) [submitted by Glen Green]

June 26, 1999. The Federal Trade Commission (FTC) issued a warning to consumers using the Internet to find health information. The focus of [the FTC's report](#) is on false or misleading advertisements for products claiming to cure serious illnesses such as cancer or heart disease. According to Jodie Bernstein, Director of the FTC's Bureau of Consumer Protection, surfing the Web uncovered many sites that could prove dangerous to consumers.

Our survey of the web sites found that too many make deceptive, unproven and fraudulent claims. Miracle cures, once thought to be laughed out of existence, have found a new medium. Consumers now spend millions on unproven, deceptively marketed products on the Web.

Gary Dykstra, the Federal Drug Administration's Deputy Associate Commissioner

for Regulatory Affairs admits that the "Internet can be a very powerful and useful tool for consumers - but it must be used carefully." He advised consumers "to check out medical products or services offered on the Internet with physicians, pharmacists and other health care professionals." The FDA and the FTC vowed to work together and with healthcare and consumer groups "to help broaden consumer awareness about the Internet - its potential benefits and possible risks."

Some of the risks are serious. For example, Body Systems Technology, Inc. (BST) marketed shark cartilage capsules and a liquid containing a Peruvian plant derivative as being shown by scientific studies to be effective treatments for cancer, HIV/AIDS, and arthritis. BST has agreed to quit making such unsubstantiated claims and to refund money to the people they defrauded.

Jim B. Richardson's Magnetic Therapeutic Technologies, Inc. (MTT) claimed that his magnetic therapy devices are effective in the treatment of a multitude of medical problems and diseases, including various types of cancer, HIV, and high blood pressure. MTT agreed to quit making such unsubstantiated claims. A similar agreement was made with Sande R. Caplin's Pain Stops Here! Inc., which also promoted magnetic therapy as a cure for cancer, high blood pressure, and other serious ailments.

Some of the risks are the usual ones people in pain are exposed to. For example, John and Melinda Sneed's Arthritis Pain Care Center (APCC) marketed CMO, purportedly a fatty acid derived from beef tallow, as a cure for most forms of arthritis. They claimed that CMO permanently modifies the immune system, making it beneficial in treating numerous other diseases as well. The Sneeds also claimed that scientific studies supported their claims. APCC has agreed to quit making such unsubstantiated claims and to quit misrepresenting the results of scientific research.

Bernstein offered the following list of things for consumers to look for in identifying quackery:

The product is advertised as a quick and effective cure-all for a wide range of ailments.

The promoters use words like scientific breakthrough, miraculous cure, exclusive product, secret ingredient or ancient remedy.

The text is written in "medicalese" - impressive-sounding terminology to disguise a lack of good science.

The promoter claims the government, the medical profession or research scientists have conspired to suppress the product.

The advertisement includes undocumented case histories claiming amazing results.

The product is advertised as available from only one source.

In short, if it sounds too good to be true, it probably is.

June 25, 1999. Exposing psychic fraud became more difficult today, as the California Supreme Court ruled unanimously that an investigative journalist for ABC who used a hidden camera and microphone when she posed as a psychic invaded the constitutionally protected privacy of the "psychics". ABC was working on an exposé on fraud in the telephone psychic industry. The fruit of the investigation was broadcast on "Prime Time Live", which led to alleged emotional devastation and a lawsuit by two of the "psychics". The decision opens the door to reinstating a \$1.2 million judgment for damages and attorney's fees made by a lower court.

June 2, 1999. The *Journal of the American Medical Association* ([JAMA](#)) reports on a study which found that taking androstenedione ('andro') does *not* build muscles, but it may increase the risk of heart disease, pancreatic cancer, and breast enlargement.

Andro is taken by many athletes, such as major league baseball player Mark McGwire who hit 70 home runs last year. It is sold in "health food" stores, where it is touted as a natural and safe alternative to anabolic steroids.

The researchers, led by Dr. Douglas S. King of Iowa State University, found that "testosterone levels did not increase immediately after androstenedione administration or during 8-week resistance training with androstenedione supplementation. Increases in muscle strength during training were similar in androstenedione and placebo groups..."

The researchers also found a significant lowering of high density lipoprotein (HDL) cholesterol in the blood in those receiving androstenedione. HDL is the "good" cholesterol which helps take away plaque from the walls of arteries. In addition, certain estrogen levels in the blood increased in the men taking the supplement. In men, increased blood estrogen levels are associated with the development of enlarged breasts, as well as with increased risk of cardiovascular disease and pancreatic cancer.

Shrewd self-medicators will not mistake [Androstenone Pheromone](#) (AP) for the real thing. AP is applied externally to attract women who like the smell of dirty socks.

May 3, 1999. *THE STAR* (a National Newspaper in South Africa) reports on some questionable police work which demonstrates how harmful so-called [psychics](#) can be.

About ten years ago, police in WkaDukuza in KwaZulu Natal identified a pedophile (Gert van Rooyen) who had kidnapped and murdered some ten children. Upon discovery, the pedophile and his lover (Jouy Haarhof) killed themselves. Several of the murdered children's bodies were never found. Recently, an unnamed local psychic told the police that he/she had a "vision" that the bodies are buried on the property of a local man. The man, who had no connection with van Rooyen or Haarhof, is, understandably, very upset. Nevertheless, he is cooperating with the police in what ought to be recognized by any reasonable person as an "unreasonable search." The local police do not determine reasonableness on the basis of the source of their information, but on the "gravity of the case" and on the (false) hope the psychic has given to the parents of the missing children.

reader comments:

crop circles

27 Oct 2002

One of the reasons for the increasing complexity (and number) of crop circles since 1990 could be the access to high performance personal computers and graphic design programs/algorithms. Armed with step-by-step instructions, even amateur hoaxers would be able to create the complex fractal designs (if they are not doctored photographs) that have wowed croppies, with unprecedented ease and speed.

sujai

The following criticisms are from Randall Eades of Danville, Kentucky:

*I recently browsed **The Skeptic's Dictionary**. After scanning several articles in it, I had to conclude that your thinking is no more critical and your reasoning is no more rational than that of a True Believer. You make much of the fact that otherwise brilliant people are "deluded" in their belief in things for which there is little evidence, yet you seem to feel that you are immune to delusions of non-belief in things for which evidence exists.*

Reply: I'm not sure I understand what it means to have a "delusion of non-belief in things for which evidence exists," but if you mean that I think I am not susceptible to wishful thinking and self-delusion, then I disagree. I don't, however, believe that I have disbeliefs about things for which there is strong evidence. There may be evidence that supports the belief that crop circles are the intentional designs of intelligent aliens who have chosen to communicate to us by writing Sumerian symbols in wheat fields, but in my view that evidence is pretty weak. The "evidence" is little more than the crop circles themselves and the proffered explanations of those who consider the "complexity of the circles" to be evidence of alien origin. Such "evidence" is on par with von Daniken's "evidence" of alien engineers building pyramids, etc. The complexity of the work indicates aliens were involved. If complexity implied alien origin then I suppose we'd have to say that aliens are behind the U.S. tax code. (Actually, now that I think about it....)

I have neither the time nor the inclination to give you a point-by-point argument, but I'll take three articles that are of particular interest to me.

CROP CIRCLES: In just a couple of lines you curtly dismiss this whole phenomenon as obviously attributable to either natural causes or human hoaxers. For further reading, you suggest only "Crop Circles: A Mystery Solved," by P. Fuller and J. Randles, published in 1990. Considering that the patterns in the crops have dramatically increased in number and complexity since 1990, it would seem that the mystery is far from solved and your thinking less than critical.

If you are truly the rational, critical thinker you claim to be, I suggest you read "Circular Evidence," by Pat Delgado and Colin Andrews, published in 1989. It is a look at the early evidence that avoids much theorizing, and has become a standard reference on the phenomenon. Then you might do a Web search on "crop circles," and look at some of the more recent patterns. If you are going to think critically, you have to look at the evidence. To criticize without looking is the mark of a True Disbeliever.

Reply: If you have a problem with a book written in 1990 because it isn't up to date, why recommend that I read a book written even earlier? In any case, you misunderstand the point of the *Skeptic's Dictionary*. It was not written to give a "fair" or "unbiased" account of paranormal, occult or supernatural beliefs and theories. It was written to provide references to skeptical material on such topics, as well as to offer a few skeptical thoughts on some of the subjects covered. (The purpose of the book is described in the introduction.) I do not claim to give nor do I intend to give a rational, critical evaluation of topics such as crop circles, etc. You might liken my purpose to that of those pamphlets on smoking in health clinics: the pamphlets don't claim to be open-minded, rational, critical examinations of the pros and cons of smoking; and they certainly don't examine the "evidence" published by the Tobacco Institute. To criticize such pamphlets as being biased or unfair would be to miss the point. My accounts are all biased, i.e., they all take a position. I don't claim to be a clearinghouse for ideas, but a source for skeptical information. The world is full of non-skeptical info on all the topics I take up. The skeptical info is infinitesimal by comparison. If I can be of assistance to someone in finding the skeptical info and skeptical arguments, then I have accomplished my purpose.

Still, thanks for the suggestion to update my bibliography. I found some recent stuff on the net and have added links to them.

You discount the accounts of multiple eyewitnesses as delusions, yet those same eyewitnesses would be credible enough to get you sent to the death chamber in a court of law. Why is their collective eyewitness testimony credible in one circumstance and not in another? Why do they suddenly become delusional when they witness events that don't fit into your paradigm? Is that rational thinking? Or is that just blind faith in a paradigm?

Reply: I wouldn't say that multiple eyewitness testimony is necessarily more credible in murder trials than in such things as mass visions of the Virgin Mary. But evidence in a murder trial may not have to depend solely on the eyewitness testimony: physical evidence and other circumstantial evidence can also be presented to corroborate or challenge the eyewitness testimony.

As far as paradigms go, I do not think that mine is based on blind faith but on experience and knowledge. If I can't find my wallet in the morning I start looking for it, I don't start praying to St. Anthony to help me find it. I don't wonder what the pixies did with it. I don't fear that aliens have picked my pocket. Am I irrational? If a friend comes out of a store with a diamond ring in his pocket that he didn't pay for, I'll ask him why he took it. I don't wonder how the ring got there without his knowledge. I don't wonder why the fairies would play such a mean trick on him. I don't consider that maybe the devil put it there. Am I irrational? If I wake up in the morning and see snow on the ground, I assume it snowed during the night. Am I irrational? After all, snow could be an alien form of communication.

If a priest utters a benediction over a dying patient and the patient recovers, I don't thank God for allowing me to witness a miracle. On the other hand, when the patient dies, I don't blame the priest or God, either. Am I irrational? If a fire destroys someone's home, I don't wonder what evil they did to deserve such a fate; if a person wins the lottery, I don't wonder at what good they've done to deserve such a fate. Is that irrational? If, whenever it suited me, I were to abandon my knowledge and experience of religious fraud, the unpredictability of diseases, and the chances of life, that would be irrational.

If a certain person who has lied to me and deceived me repeatedly, should now ask me to trust him when he tells me that my father is not really my father but is an alien being sent here to spread intergalactic warfare, should I be "open-minded" and "fair" and "unbiased" and give his proposal serious thought and examination before rejecting it? Under your notion of "rational" I would have to ignore my past experience and the general principles of reasonableness that have helped me and billions of others (including yourself, I would say) to live lives that have some semblance of order, continuity and predictability in them.

Do I have faith in my paradigm? You bet. Is it blind faith? I don't think so. Is it irrational? I don't think so.

Perhaps it's time you really earned your Ph.D. in critical thinking. Every summer for the past few years, a couple hundred complex patterns are imprinted into the fields of England. The only relevant question is: Do those patterns, in fact, exist, as reported in "authoritative" news media and captured in hundreds of photographs? Has there been a fantastic hoax pulled on the

media, a virus of disinformation run amok on the Information Highway, or do those patterns really exist?

Reply: I think there are other relevant questions, much more relevant and significant than do the crop circles exist. Of course they exist. The question is how did they get there? Some think aliens put them there. I think they are probably the result of human hoaxers.

If they do not exist, if it has all been a hoax of doctored photos and outright lies, your critique is justified and we can all rest easy at night. But if they do exist, and if the photographs are accurate portrayals of them, then you must integrate them into your religion of Science. Tell us how they are made, and why, and by what natural force or hoaxer. Perhaps when you have figured out the trick, you and Mr. Randi can create one on live TV.

Reply: They have been reproduced live on TV, and some of the hoaxers have come forth and admitted to their misdeeds, as you no doubt well know. Even so, no one can rest easy at night because of this. Hoaxers will probably continue to hoax and true believers will continue to set up institutes in Sedona or the U.K. Randi may try to create a crop circle on TV, but I won't. That's not my style. I admire Randi for taking the time and spending the money to do empirical tests of paranormal claims, etc. I'm satisfied with pointing people in Randi's direction. I admit that my goal is rather modest compared to his, but it's the one I've chosen and it suits me fine. While Randi spends a month testing dowsers to see if they can really find water with a stick, I'll work on my golf game or take a hike on a glacier, read his report, and then put a pointer to it in my *Skeptic's Dictionary*.

26 Jun 1996

I think there is some possibility that small circles might be caused by plasma globes or ball lightning. I think a recent PBS program brought this up as a theory, in addition to hoaxing of course.

--Mike Johnson

Plasma globes or ball lightning? I'll have to look into those topics. You must have watched Arthur C. Clarke. He seemed to like the ball lightning explanation for a lot of stuff.

12 Jul 1996

A point that has been totally overlooked with respect to crop circles is the

artistic merit in the design of many of them. Whatever is causing them -- and I neither support nor refute any explanation of them -- is producing designs of great artistic merit. Some are much better than others (from an artistic perspective) and some are absolutely brilliant.

reply: It's been said before, but it bears repeating: beauty is in the eye of the beholder. Some urban graffiti has artistic merit, also. To the farmers whose fields are being carved up, crop circles are little more than rural graffiti, though it can't be denied that some of these designs are very clever, well executed, clear and rich with deep symbolic meaning and worthy of a much higher place in the New World Order.

The merit of these designs has been totally squashed flat by the arguments between the Skeptics and the Believers. This is a pity. I just wish people would enjoy them and not get so flustered.

reply: I've been working on my fluster ratio. Any tips on how to decrease flustering are greatly appreciated. I've been working on developing my aesthetic sense ever since I read Kant's *Critique of Judgment* in second grade, but maintaining disinterestedness while perceiving graffiti is still hard for me.

If circumstances were different, and the artist who created these designs were publicly recognized, I'd hope that there would be a Nobel prize for art created and bestowed on them.

reply: Nobel prize for crop circle art? What category would that be under? Cereal design? Interpersonal Communication?

If these designs were generated by natural forces such as whirlwinds or armies of ants, then Wow! If they were created by aliens, then those aliens appear to be consummate artists.

reply: Armies of ants? Now that's an hypothesis I hadn't heard before. You may be on your way to a Nobel Prize yourself, for Creative Explanation! As to the aliens being consummate artists, I'm afraid you were beaten to the punch on that claim by [von Daniken](#) and others who tell us that the aliens have been here from the beginning of human civilizations and taught our ancestors everything they know about art and architecture.

*I really DON'T CARE though. They are *NEAT*. That's all.
--Stephen Wray*

reply: They're not only 'neat', they're 'swell.' And 'tidy', too.

23 Apr 1997

I do believe that most of the circles found in England (i.e those with symbols & patterns) are the result of hoaxers. However, I think some of the smaller ones are the result of a type of "whirl wind" or mini-tornado. In 1990 I was traveling in England with a college group when myself & two other group members witnessed a circle being formed. We saw grains of wheat being spun around in the air in a counter clock-wise rotation in an area of around 6 feet in width. This was on a very hot day in mid-afternoon. That's the whole of the story, didn't see any space aliens, or a UFO or a plasma vortex for that matter. I can assure you that the three of us who saw this are all very rational members of society. I myself am a Police 911 Operator & the other two are a hospital E.R. nurse & a college instructor.

Jan Bassett Dallas,Tx

4 Jun 1997

As for the crop circles being formed by man, I can easily believe it in the case of poorly done circles like --

<http://www.artbell.com/images/nebcir.jpg>

<http://www.artbell.com/images/logan.jpg>

<http://www.artbell.com/images/rocan.jpg>

But in the more elaborate circles like --

<http://www.artbell.com/images/windmill.jpg>

<http://www.artbell.com/images/double.jpg>

<http://www.artbell.com/images/stone.jpg>

I find it harder to believe that someone could make something that elaborate without leaving plenty of signs behind that they did it. Since there are people to claim that they created the crop circles, I would like to see them duplicate one of these nice patterns at night without leaving a trace.

The idea that some swirling windstorm could form patterns like these is personally even harder to accept than human action. I would assume that there should be half-formed and mangled circles all over the place where the weather patterns were not quite right to do a nice circle. Besides, how could the wind do the lines like some have?

But all these doubts do not make me an automatic believer in UFOs sweeping down and playing Etch A Sketch with the crops. I see crop circles as good fodder for late-night bull sessions, but not much more. I'll just have to keep a skeptical eye on the whole thing until definite proof steps forth.

Curtis Houghton

reply: No doubt intelligent creatures made the design at Windmill Hill in Wiltshire. Who do you think is more likely to have done this without leaving plenty of signs behind that they did it: aliens in spacecraft or humans on foot?

Curtis Houghton's reply:

I agree that an intelligent (but probably whimsical) mind was behind the Windmill Hill crop circle. And if the people responsible for that crop circle would identify themselves, I'd love to have them come over to the US and do a few on my land. This offer does not apply to aliens unless they can get their own visas and make sure their UFOs pass the proper emissions checks.

reader comments:

Aleister Crowley

07 Apr 1997

"Thelema" wasn't dictated by "a spirit called Aiwass".

**"The book of the law"* was a book dictated by "Aiwass".*

Crowley always refers to Aiwass not as a "spirit", but as a "praeter-human intelligence". With that he used a true skeptical view, that is: Aiwass can be anything, even himself, a higher-self, an angel, etc.

"Do what thou wilt shall be the whole of the law" wasn't his motto for OTO. It is not a personal motto, it is used by anyone in contact with the thelemic doctrine. And it came from RABELAIS (you know him?) through AIWASS.

....in South Brazil, there exists a popular writer (biggest selling in Brazil) named PAULO COELHO, who was a follower of Aleister Crowley. Now he is against him, but he was imprisoned and BEATEN in the years of dictatorship because of a "Alternative Society", a "Thelema Abbey".

In USA, Timothy Leary and Robert Anton Wilson are good examples of perpetrators of Crowley ideals.

But read Nietzsche, you may find the same values Crowley praised.

Nietzsche is another kind of Beast, a philosophical Beast. Crowley is a religious one.

Eduardo Pinheiro crowley@vortex.ufrgs.br

reply: thanks for setting the record straight. I think Nietzsche predicted Crowley somewhere in Zarathustra. Or was it Timothy Leary?

9 Feb 1997

Just FYI since you seem to be aiming at accuracy here..

Crowley DID NOT form Ordo Templi Orientis. It had been around for a while before he got his hands on it.

Point of fact: OTO was founded by Karl Kellner in 1895, and Crowley became Outer Head of the Order in 1922 when Theodor Ruess (its second OHO) resigned.

Also, Crowley also claimed that he had no awareness of the Order's existence prior to 1912 when Ruess approached HIM with accusations of revealing the Order's "secret" in a publication.

JR Brown

reply: According to an unauthorized blurb for the inaugural edition of the [Official Journal of the Ordo Templi Orientis in Australia](#).

Although officially founded in 1902, the Order Templi Orientis (OTO) represents the surfacing and confluence of the divergent streams of esoteric wisdom and knowledge which were originally divided and driven underground by political and religious intolerance during the dark ages. Its traditional lineage extends through the Freemasonic, Rosicrucian and Illuminist movements of the 18th and 19th centuries, through the crusading Knights Templar of the middle ages and into early Christian Gnosticism and the Pagan Mystery Schools.

The efforts of Karl Kellner and Theodor Reuss resulted in their obtaining charters to operate two systems of high-grade Freemasonry. These rites, along with the Swedenborgian Rite, included a version of the craft degrees, and the Cernau Scottish Rite and the Rites of Memphis and Mizraim provided a selection of workable higher grades as nearly complete as had ever existed. Together, they provided a complete system of Masonic initiation. With the incorporation of these rites, the Order was able to operate as a completely independent Masonic system and the OTO was officially proclaimed in 1902.

The most widely known involved in the Order is, of course, Aleister Crowley. It was his discomfort with the Masonic Charter of the OTO that led to the radical changes around 1920 and to his succeeding Reuss as head of the OTO in 1922. After his death, and in accord with his wishes, he was succeeded by Karl Germer.

When Germer died without nominating a successor a degree of chaos ensued culminating in the legal battles of the eighties. It was McMurtry's efforts to ensure the legal recognition of the OTO that finally led to the current period of harmony

with Hymenaeus Beta as Caliph.

cryptomnesia

Cryptomnesia is, literally, *hidden memory*. The term is used to explain the origin of experiences that people believe to be original but which are actually based on memories of events they've forgotten. It seems likely that most so-called [past life regressions](#) induced through hypnosis are [confabulations](#) fed by cryptomnesia. For example, Virginia Tighe's hypnotic recollections of [Bridey Murphy](#) of Cork, Ireland (Bridie Murphey Corkell), if not deliberately fraudulent, are most likely recollections of events that happened in this life but which she had forgotten.

Cryptomnesia may also explain how the apparent plagiarism of such people as Helen Keller or George Harrison of the Beatles might actually be cases of hidden memory. Harrison didn't intend to plagiarize the Chiffon's "He's So Fine" in "My Sweet Lord." Nor did Keller intend to plagiarize Margaret Canby's "The Frost Fairies" when she wrote "The Frost King." Both may simply be cases of not having a conscious memory of their experiences of the works in question.

[The Truth About the Loch Ness Monster, the Giant Squid, Sea Serpents, Mermaids, and Other Fantastic Creatures of the Deep](#)

Loch Ness monster ("Nessie")

"Nessie" is an alleged creature living in Loch Ness, a long, deep lake near Inverness, Scotland. Many sightings of the "monster" have been recorded, going back at least as far as St. Columba, the Irish monk who converted most of Scotland to Christianity in the 6th century. Columba apparently converted Nessie, too; for it is said that until he went out on the waters and soothed the beast, she had been a murderess.

The modern legend of Nessie begins in 1934 with Dr. Robert Kenneth Wilson, a London physician, who allegedly photographed a plesiosaur-like beast with a long neck emerging out of the murky waters. That photo created quite a fuss. Before the photo, Loch Ness was the stuff of legend and

myth. The locals knew the ancient history of the sea serpent. But people came to the lake more to relax than to go on expeditions looking for mythical beasts. After the photo, the scientific experts were called in. First, they examined the photo itself. Could be a plesiosaur. Yes, but it could be a tree trunk, too. Or an otter. Later, there would be explorations by a submarine with high tech sensing devices. Today, we have a full-blown tourist industry said to have generated about \$37 million in 1993, complete with submarine rides (about one hundred bucks an hour in 1994) and a [multi-media tourist center](#). For those who can't go to Scotland, there is a [webcam site](#) for your viewing pleasure with cameras placed both above and below the water.

photos and tabloids

There have been other photographs of Nessie, as well. The tabloids will pay good money for a photo of Nessie, and some enterprising souls have camped out for years in hopes of capturing the elusive beast on film. One good photo and they can retire for life! The Smithsonian even has a [WWW page on Nessie](#), where it advocates continued scientific investigation into the matter. According to the Smithsonian,

Even though most scientists believe the likelihood of a monster is small, they keep an open mind as scientists should and wait for concrete proof in the form of skeletal evidence or the actual capture of such a creature.

We suggest...that those individuals interested in such a phenomenon...join the International Society of Cryptozoology, a scientific organization that critically looks at issues involving unknown creatures of unexpected form and size, and subjects them to technical review.

Keep on looking! Of course, this is the same Smithsonian which, in the January 1996 issue of its monthly magazine, ran a highly uncritical article on [dowsing](#). We have come to expect the disingenuous defense of open-mindedness from the tabloids as they exploit our love of mystery and wonder; but we thought the Smithsonian would take a higher road and present empirical studies instead of uncritical wishful thinking. It may be the case that the Smithsonian has found that in order to compete and survive it must cater to the tabloid mentality of the general public and elected officials. What's next? Bigfoot T-shirts as part of their annual membership drive?

sightings and testimonials

In addition to the photographs of Nessie, there have been numerous sightings reported in the [testimonials](#) of unquestionably reliable witnesses. How could anyone look at all this "evidence" and dismiss Nessie as a figment of people's imagination, as just another case of [pareidolia](#) (another Virgin Mary in the tortilla)? Easy. Let's start with the photographs.

In a story not nearly as fascinating or obscure as the [Piltown man episode](#), but at least on par with the [faked fairy photos](#) that gulled Arthur Conan Doyle, the most famous photo of Nessie as a relative of the long-extinct plesiosaurs was reported to have been faked. David Martin, a zoologist, and Alastair Boyd were members of a scientific project to find Nessie. They are credited by the London *Sunday Telegraph* [March, 12, 1994] as having dug up the story of the faked photo, which was staged using a toy submarine. Christian Spurling, who died in the fall of 1993, was said to have made a deathbed confession of his role in the prank. The fake photo was not taken by Wilson--his name was used to give the photo stature and integrity--but by Spurling's stepbrother, Ian Wetherell. Ian's father, Marmaduke ("Duke") Wetherell, had been hired by the London *Daily Mail* to find the monster. Wetherell was a filmmaker who described himself as a "big game hunter." What bigger game could there be than Nessie? Except that the big game was actually a small model of a sea serpent made of plastic wood attached to a 14-inch toy submarine! Actually, the game did get big as the little prank created such a huge fuss that the pranksters decided that the best thing for them to do would

be to keep quiet.

Alastair Boyd, mentioned above as one of the researchers who uncovered the photo hoax, claims he made a genuine sighting of Nessie in 1979. His Nessie didn't look like a dinosaur, though. More like a whale, he said. It was at least 20 feet long and he says he saw it roll around in the water. Now, it's not likely that there are any 20-foot otters, but there are 20-foot logs. There are also errors in guessing at the size of things seen in the distance for a few seconds under less than ideal conditions. No matter, Boyd is convinced there are 20-foot long creatures in the loch. One would think they'd be hard to miss.

Is it a fish, a wake, a wave?

Since the Loch Ness monster story has been around for more than 1500 years, if there is a monster it is not likely that it is the same monster seen by St. Columba. Or, are we to believe that not only is Nessie very big, she is very old as well, a veritable Methusala among beasts? In short, there must be more than one monster. I'll leave it to the zoologists to calculate how many monsters are necessary to maintain the species over the years. One report I read claimed that a minimum population of ten creatures would be needed to sustain the population. The same report claims that Loch Ness is incapable of sustaining a predator weighing more than about 300 kg (about 660 pounds) [*The Naturalist*, winter 1993/94, reported in *The Daily Telegraph*]. Adrian Shine, head of the [Loch Ness Project](#), once said the monster could be a Baltic sturgeon, a primitive fish with a snout and spines which can grow up to nine feet long and weigh in at around 450 pounds. This may sound like just another fish story to some, but there is scientific evidence that Nessie is, at best, a big fish in a big lake, or a big wake in a big lake. Shine, who has been studying the Loch Ness story for some twenty-five years, now thinks that what people see when they think they see the "monster" is actually an [underwater wave](#). A similar view has been presented by Luigi Piccardi, an Italian geologist "who is convinced that seismic rumblings far below the famous Scottish lake cause the roiling waves, deep groans and explosive blasts that have for centuries led people to believe that a giant beast lurks below the loch's murky surface ("Mystery unlocked? A scientist says he's solved a monster controversy -- the 'beast' in Loch Ness is merely an illusion created by earthquakes," *San Francisco Chronicle*, June 27, 2001 by Chuck Squatriglia)."[*](#)

some bare bone facts

The Naturalist reported on extensive studies of the lake's ecology that indicate that the lake is capable of supporting no more than 30 metric tons of fish. (The food chain of the lake is driven by bacteria, which break down vegetation, rather than algae like most lakes.) Estimating that a group of predators would weigh no more than 10 percent of the total weight of the fish available for them to consume, researchers arrived at the 300-kg (660-lb.)

statistic. It strikes me as extremely odd that with all the sophisticated technology, the submarines, and the thousands of voyeurs that after all these years we still don't have a single specimen. We don't have a carcass; we don't even have a bone to examine. With at least ten of these huge monsters swimming around in the lake at any given time, you'd think that there would be at least one unambiguous sighting by now. You would think so, that is, unless you want to keep the hoax/myth/legend alive. I can't deny that there are good economic reasons for keeping the Loch Ness monster myth alive. It's good for tourism. And there are all those "scientific" investigations to be paid for with government funds and private donations: full employment for [cryptozoologists](#). Then, of course, there is all that film sold to photographers in search of The Big One. But tourism grew out of the myth, not the other way around. This story would be told with or without multi-media centers and gift shops full of Nessie mementos.

Besides the photo which Mr. Boyd and others have exposed as a fake, there are many other photos of Nessie to consider. Not all photos of Nessie are fakes. Some are genuine photos of the lake. These photos are always very gray and grainy, taken of murky waters with lots of shadows and outlines. There is no question that in some of these there does appear to be a form which could be taken for a sea serpent. The form could also be taken for a log, a shadow on a wave, a wave itself, driftwood or flotsam. Anyone who has traveled around Loch Ness will not be disappointed in the variety of forms which one will see when looking out upon the waters. The lake is very long, and on the day I was there it was very turbulent, even though the day was a rather pleasant one as far as Scottish summer days go. Obviously, since I was there for only one day, I had not come to Loch Ness to do any serious research into the monster. I'll confess that I didn't even bother to stop in Drumnadrochit to take in the Loch Ness Monster Exhibit, which, according to Fodor's guide book to Scotland, "presents the facts and the fakes."

I was on vacation, traveling with my wife, daughter, future son-in-law, and a dear friend. We headed down the B862, which affords intermittent views of the lake from the east side. It was a pleasant drive among moors and conifer spikes, but nothing spectacular in a land of glorious spectacles. The drive northward on the west bank along the A82 takes you right along the lake in many places and past the famous Urquhart castle, a "favorite monster-watching spot" (Fodor's).

Urquhart is on the tourist bus trail and gets more than its share of visitors. I had wanted to stop there and take advantage of its excellent location for monster watching but I couldn't get into the parking lot. I drove north past the castle, looking for a place to turn around, and after many miles finally found one. I drove south, past the castle again, as the parking lot guard waved me on by the castle: the lot was still full. I drove for miles looking for a place to turn around again, finally found one, and made a third pass with the same result. Was it a sign from Nessie? We had to do most of our viewing of Loch Ness from the road. While we didn't see any monsters that day, I still have a vivid

memory of one of Scotland's longest (24 miles) and deepest lakes (750, 800, or 900 ft. in places, depending on which source you pick). I have no doubt that anyone who stared across those murky, wavy, shadowy waters would see many things that could be Nessie. I don't doubt that many, if not most, of the thousands of witnesses who testify to having seen Nessie are honest, decent folk who have interpreted their perceptions according to their wishes. They have come to the lakeside and they have been blessed with a visitation! They are truly special and their lives are now marked forever as unique. Best of all: they have a story to tell for the rest of their lives. In many ways they are like the young lady who declared that the highlight of her life was when she saw music icon Michael Jackson being whisked through a department store: "it was like seeing a *UFO*," she declared! I'll bet she'll be telling the story of her Michael Jackson sighting for years to come. Who knows to what epic proportions the young lady's tale might grow? Perhaps it will grow as big as Loch Ness itself, like the legend of Nessie.

finds no 'consistent
evidence' Sept 19,
2002](#)

electromagnetic fields (EMFs)

All known cancer-inducing agents — including radiation, certain chemicals and a few viruses — act by breaking chemical bonds, producing mutant strands of DNA. Not until the ultraviolet region of the electromagnetic spectrum is reached, beyond visible light, beyond infrared and far, far beyond microwaves, do photons have sufficient energy to break chemical bonds. Microwave photons heat tissue, but they do not come close to the energy needed to break chemical bonds, no matter how intense the radiation. --Dr. Robert L. Park of the American Physical Society ([New York Times](#) Oct. 1, 2002)

An electromagnetic field is a region through which a force produced by electric current is exerted.

Many people fear that EMFs cause cancer; however, a causal connection between EMFs and cancer has *not* been established. The [National Research Council \(NRC\)](#) spent more than three years reviewing more than 500 scientific studies that had been conducted over a 20 year period and found "no conclusive and consistent evidence" that electromagnetic fields harm humans. The chairman of the NRC panel, neurobiologist Dr. Charles F. Stevens, said that "Research has not shown in any convincing way that electromagnetic fields common in homes can cause health problems, and extensive laboratory tests have not shown that EMFs can damage the cell in a way that is harmful to human health."

In 1997, [The New England Journal of Medicine](#) published the results of the largest, most detailed study of the relationship between EMFs and cancer ever done. Dr. Martha S. Linet, director of the study, said: "We found no evidence that magnetic field levels in the home increased the risk for childhood leukemia." The study took eight years and involved measuring the exposure to magnetic fields generated by nearby power lines. A group of 638 children under age 15 with acute lymphoblastic leukemia were compared to a group of 620 healthy children. "The researchers measured magnetic fields in all the houses where the children had lived for five years before the discovery of their cancer, as well as in the homes where their mothers lived while pregnant." The study was criticized because it is impossible to know exactly what the EMFs were at the times the mothers or their children were exposed. All measurements must be done after the exposure has taken place and assumptions must be made that the level of EMFs was not substantially different during exposure. It is unlikely, however, anyone except the intellectual descendants of Nazi doctor Joseph Mengele will ever do a control

study on humans which systematically controls exposure to EMFs from the moment of conception through early childhood.

A report published in the Journal of the American Medical Association on a study of 891 adults who used their cell phones between 1994 and 1998 found that there was no increased risk of brain cancer associated with cell phone use (Muscat 2000). Yet, many people believe that living near power lines or using cellular phones causes cancer. Why? Some lawyers, the mass media and a scientifically illiterate public can take the credit here.

[Robert Pool](#) claims popular opinion has been aroused against EMFs by unscientific sources such as *The New Yorker* magazine (Pool 1990). The fear that cell phones might be causing brain tumors was also aroused by [ABC's "20/20" \(October 1999\)](#) in a story focused on the claims of Dr. George Carlo who, for the previous six years, ran the cell phone industry's research program on the effects of radiation from cell phones. Gordon Bass also relied heavily on Carlo for his alarmist piece in *PC Computing*, "Is Your Cell Phone Killing You?" (November 30, 1999). Carlo contradicts the conclusions of most other researchers in the field and maintains that "we now have some direct evidence of possible harm from cellular phones (*italics added*)." Contrast Carlo's view with the following:

The epidemiological evidence for an association between RF radiation and cancer is found to be weak and inconsistent, the laboratory studies generally do not suggest that cell phone RF radiation has genotoxic or epigenetic activity, and a cell phone RF radiation-cancer connection is found to be physically implausible. Overall, the existing evidence for a causal relationship between RF radiation from cell phones and cancer is found to be weak to nonexistent (Moulder et al. 1999).

In a press release on October 20, 1999, the [FCC](#) responded to "20/20" and claimed that the "values of exposure reported by ABC were well within that safety margin, and, therefore, there is no indication of any immediate threat to human health from these phones." Furthermore, the "20/20" story claimed that cell phone antennae emit microwave radiation into the brain, which is misleading. [Microwaves](#) are emitted by the antennae of cellular towers that transmit the messages, as well as by the phone's antennae. Cellular phones and towers emit in the 800-900 MHz range, according to the FCC. (For comparison, microwave ovens have a frequency of about 2450 MHz; radios and TVs are in the 1-100 MHz range.)

Similar arousal has been evoked by talk show hosts such as Larry King who introduced the nation to a widower who claims that his wife's fatal brain tumor was caused by the EMF emitted from her cellular phone. There is a lawsuit, of course. The evidence? The tumor was located near where she held

the phone to her ear. The major networks reported the story about the lawsuit and the brain tumor and the cellular phone. Scientists were interviewed to give the story more 'depth' and credibility. However, no scientist has yet found a causal connection between EMF and cancer, much less between cellular phones and brain tumors. So, a scientist who has exposed *existing* tumors to EMF was interviewed. He reported that his research indicates that tumors grow faster when exposed to EMF. Sales of cellular phones dropped and stock in companies that manufacture them dropped. Because tumors exposed to EMF grow more rapidly than tumors not so exposed does not indicate that EMF causes tumors, cancerous or otherwise.

It is possible that cellular phones are causing brain tumors, but the likelihood is small. The phones emit very low EMF levels and exposure to them is intermittent. It is possible that a person with a brain tumor who uses a cellular phone is running a significant risk that the tumor will grow faster than it otherwise would. As yet, however, there is no evidence to support the view that there is a reasonable probability of either.

Lawyers representing claimants who blame their cancers on power lines cite a Swedish study that found leukemia rates were 400% higher among children living near power lines. Another study, done by the University of Southern California, found increased leukemia rates in children living near power lines. According to Robert Pool,

The study examined 232 leukemia patients under than age of 10, and a group of control subjects that were matched for age, sex, and race. The amount of EMF exposure for each child was determined in a number of ways. No correlation was found between the incidence of leukemia and the electric field exposure as measured by spot checking. An insignificant correlation was noted between incidence of leukemia and levels of exposure to magnetic fields, as measured by a continual measurement over a 24-hour period. A significant correlation was seen between the EMF exposure, as measured by wire coding, and an increased risk of leukemia. Those with the highest level of exposure had a 2.5-fold greater risk of developing leukemia. It is not understood how these differences in correlation depend on the way the EMFs are measured. It is possible that some types of EMF exposure may lead to an increased risk of leukemia. On the other hand, measurements taken by wire coding may be more sensitive. Further study is needed to see what factors are being measured by the wire coding and not by the other methods. Until that is understood, it is not clear if exposure to high levels of EMFs is related to an increased risk of leukemia (Pool, 1991).

Also, Pool reports, "there have been numerous scientific reports of elevated levels of leukemia in people who are exposed to high EMF levels on the job, such as power-line repairmen and workers in aluminum smelters." While the scientific jury is still out on the causal connection, if any, between living near power lines and cancer, the lawsuits are starting to come in. Over 201 challenges to utility projects were made in 1992 in which EMF was an issue. At least three suits have been filed in federal courts claiming exposure to utility lines caused cancer (Pool, 1991). Utility companies are running scared. They are pouring billions of dollars into efforts to cut EMF exposure from their power lines. Dr. Robert Adair, a physicist at Yale University, calls the reaction "electrophobia" and says that it would take EMF levels 150 times higher than those measured by the Swedish researchers to pose a hazard.

Lawyers will be able to take their cases to court long before the scientific evidence is anywhere near conclusive. And the standards of proof in a court of law are appallingly much lower than those in science. For example, a few years ago Judith Richardson Haines of Philadelphia was awarded more than \$1 million by a jury because they believed she lost her psychic powers after having a CAT scan performed on her at Temple University Hospital. (A judge later reduced the award to \$1, which is probably 98 cents more than her psychic powers were worth.) "All it's going to take is one or two good hits and the sharks will start circling," says Tom Ward, a Baltimore attorney who is suing Northeast Utilities Co. and its Connecticut Light & Power Co. unit over an alleged EMF cancer.[*ibid.*] There is currently a great push to bury all power lines. Better safe than sorry? The cost goes up twenty-fold to bury the lines. Then what? Lawyers claiming their clients' cancers were caused by EMFed water? It was bad enough trying to sell a house with power lines nearby when people cared about the ugliness of the view. But try to sell the same house when people are afraid of getting *cancer* from the ugly lines! In any case, we will have to bury our electrical wires even deeper than our power poles are high if we are to make a significant difference in shielding us from the magnetic fields of power lines.

It is not very likely that the average person has anything to worry about from power lines. Most of us do not get that close to them to be significantly affected by their EMFs. Our exposure to them, even if they are nearby, is not direct, up close and constant. We're probably in more danger of EMF pollution from the wiring in our homes and the electrical appliances we use, than from the wires overhead. No one can avoid electromagnetic radiation. It is everywhere. We are constantly exposed to it from light, radio and television transmissions, police 2-way transmissions, walkie-talkies, etc. Furthermore, "while electrical fields are easily screened, magnetic fields make their way unimpeded through most substances" (Pool, 1990). In fact, it is curious that while fear of EMFs is on the rise so is [magnet therapy](#).

crystal skulls

"I personally feel that the Crystal Skulls are not only here to share ancient knowledge and wisdom, but to assist in awakening our race to higher spiritual laws and understanding of itself....If the Crystal Skulls were not brought by extraterrestrials then certainly we must conclude their [sic] have been civilizations much more technologically or spiritually advanced than our own today."

--[Joshua "Illinois" Shapiro](#)

"[The] crystal stimulates an unknown part of the brain, opening a psychic door to the absolute." -- [Frank Dorland](#)

Crystal skulls are stone carvings in the shape of human skulls. The sculptures vary in size from a few inches to life-size. Some are made of pure quartz crystal, but many are made of other types of stone found in abundance on Earth. Some stone skulls are genuine artifacts from Mesoamerican cultures such as the Aztecs and are known as [skull masks](#) or *death heads*. But the crystal skulls that interest New Agers are extraterrestrial in origin or come from [Atlantis](#). They allegedly are endowed with magical powers such as the spontaneous production of holographic images and the emission of weird sounds. Today, millions of skulls, made of various types of stones and metals, are [manufactured](#) in a variety of sizes for the New Age [paratrinket](#) market, as well as for the [museum replica](#) market. And, despite the fact that [replicas are easily made](#) and are available from a [variety of sources](#), advocates of the paranormal nature of crystal skulls like [Nick Nocerini](#) claim that no one knows how these skulls were made and that they are impossible to duplicate. Nocerino is the founder of the [The Society of Crystal Skulls, International](#). His society uses [psychometry](#), [remote viewing](#), and [scrying](#) as part of their research methodology.

The myth of crystal skulls as extraterrestrial and extra-powerful seems to have begun with F. A. "Mike" Mitchell-Hedges (1882-1959) and his adopted daughter Anna. Their creative fictions have been uncritically promoted by [Frank Dorland](#), author of *Crystal Healing : The Next Step*, and [Richard Garvin](#), author of *The crystal skull; the story of the mystery, myth and magic of the Mitchell-Hedges crystal skull discovered in a lost Mayan city during a search for Atlantis* (1973). The myth has been carried on by [Ellie Crystal](#), who likens the quest for crystal skulls to the quest for the [Holy Grail](#), and [Josh Shapiro](#), co-author (with Nocerino and Sandra Bowen) of [Mysteries of the Crystal Skulls Revealed](#).

the skull of doom

The most famous crystal skull is the Mitchell-Hedges "skull of doom," allegedly discovered by a 17-year old Anna Mitchell-Hedges in 1924 or 1927 while accompanying her adoptive father on an excavation of the ancient Mayan city of Lubaantun in Belize, where the elder Mitchell-Hedges believed he would find the ruins of [Atlantis](#). The evidence collected by Joe Nickell proves beyond a reasonable doubt that Mitchell-Hedges bought the skull at a Sotheby's sale in 1943 for £400.

This clear quartz skull is about 5.25 inches high and weighs about 11 pounds. It superficially resembles stone skulls made by the Aztecs. The Aztec skulls are stylized, however. The Mitchell-Hedges skull is realistic with a detachable jaw.

Much of the occult and sinister legend surrounding the so-called skull of doom originated with Mitchell-Hedges, who claimed that the

Skull of Doom is made of pure rock crystal and according to scientists it must have taken over 150 years, generation after generation working all the days of their lives, patiently rubbing down with sand an immense block of rock crystal until finally the perfect Skull emerged.

It is at least 3,600 years old and according to legend was used by the High Priest of the Maya when performing esoteric rites. It is said that when he willed death with the help of the skull, death invariably followed. It has been described as the embodiment of all evil ([F.A. Mitchell-Hedges](#)).

The age of the object, as well as the other claims made about its making and history, were fabricated by Mitchell-Hughes. The man who owned the piece, Sidney Burney, and those who were on the Lubannatun expedition, denied that Mitchell-Hedges found the skull. Mitchell-Hedges himself never mentioned the skull until just after he bought it in 1943.

Anna has continued the hoax. Even though there is no evidence that she was even at Lubaantun when the discovery was supposedly made, she has maintained that Burney only had the piece on loan from her father until he could pay off a debt he owed Burney. If so, why didn't her father just pay Burney back instead of bidding for the item in an auction? Anna has received some attention and made a few dollars over the years by putting her skull on display, claiming it came from outer space and was kept in Atlantis before it was brought to Belize.* She is still in possession of the skull, but seems to have tired of the publicity and has retired it from public viewing.

In 1970, Anna let Frank Dorland, a crystal carver, examine her skull. Dorland declared that it is excellent for [scrying](#) and it emits sounds and light, depending on the position of the planets. He claimed that the skull originated in [Atlantis](#) and was carried around by the Knights Templar during the crusades. He claims they had the skull examined at a Hewlett-Packard lab. D. Trull uncritically reports that the lab found that the skull

had been carved against the natural axis of the crystal. Modern crystal sculptors always take into account the axis, or orientation of the crystal's molecular symmetry, because if they carve "against the grain," the piece is bound to shatter -- even with the use of lasers and other high-tech cutting methods.

To compound the strangeness, HP could find no microscopic scratches on the crystal which would indicate it had been carved with metal instruments. Dorland's best hypothesis for the skull's construction is that it was roughly hewn out with diamonds, and then the detail work was meticulously done with a gentle solution of silicon sand and water. The exhausting job -- assuming it could possibly be done in this way -- would have required man-hours adding up to 300 years to complete.*

Dorland's claims formed the basis of Garvin's book on crystal skulls.

The questionable origin of the Mitchell-Hedges skull has not deterred belief in the skull's mysterious properties. Rather, at least 13 other skulls have mysteriously appeared over the years. Some of these [skulls](#) are claimed to have magical origins and healing powers. However, a study of several crystal skulls by the British Museum in 1996 indicates that the only magic involved in the creation of these skulls was in keeping their fraudulent origin a secret. The study concluded that the skulls were made in Germany within the past 150 years. The recent origin explains how they were made with tools unavailable to the ancient Mayans or Aztecs.

Using electron microscopes, the researchers found that two of the skulls possessed straight, perfectly-spaced surface markings, indicating the use of a modern polishing wheel. Genuine ancient objects would show haphazard tiny scratches from the hand-polishing process.*

A similar result occurred in 1992 when the Smithsonian received a crystal skull from an anonymous source who claimed it was an Aztec skull that had been bought in Mexico City in 1960. Research by the Smithsonian concluded that several crystal skulls popular with the New Agers originated with Eugene

Boban, a Frenchman of dubious character. Boban dealt in antiques in Mexico City between 1860 and 1880, and seems to have acquired his skulls from a source in Germany. Jane MacLaren Walsh of the Smithsonian concluded that several crystal skulls held in museums were manufactured between 1867 and 1886.*

More skullduggery?

Other so-called ancient crystal skulls have had histories as dubious as the Mitchell-Hedges skull. For example, a skull called "[Max](#)" was supposedly given to the people of Guatemala by a Tibetan healer. Another pair of skulls, known as the [British Skull](#) and [The Paris Skull](#), was allegedly found in Mexico in the late 19th century by mercenaries. They are very similar and one may have been the model for the other. The Paris skull is said to represent [Mictlantecuhtli](#), the Aztec god of the dead. It is not known to have any occult powers, however.

[The Mayan Skull](#) and the [Amethyst Skull](#) were allegedly found in Guatemala early in this century. "Nick" Nocerino claims he met a shaman in 1949 while traveling in Mexico who led him to a Mayan priest who said he was authorized to sell the skulls because the village needed money for food. Nick didn't buy them, but he studied them scientifically and found some startling things such as "its true origin is cloaked in mystery"* and it had the power to give him hours of meaningful visions.*

There isn't a shard of evidence that these crystal skulls are mysterious in any way. What is mysterious is their continued popularity and the continued mythology as to their origins and powers.

See related entry on [crystals](#).

Mass Media Bunk

3

March 28, 1997 (Good Friday).

It is clear to all of us, that to the Anti-Christ -- those propagators of sustained faithfulness to mammalian humanism -- we are, and will be seen as, their Anti-Christ. This is certainly to be expected, and it will not delay our return to our Father's Kingdom. It might even accelerate that return.

We will, between now and our departure, do everything we can for those who want to go with us. But we cannot allow them to interfere with or delay our return to Him.

The Present Representative Do a.k.a. **Marshall Herff Applewhite**, a.k.a. **Bo** of "The Two" Bo and Peep a.k.a. **Bonnie Lu Trousdale**

By now everyone has heard of the suicides by [39 members](#) of a UFO [cult](#) known as "Heaven's Gate," but sure to be deemed the Comet Cult by the media. The news reports focus on the cult's "weird" beliefs in such things as [space ships trailing the Hale-Bopp comet](#) coming to pick up the cult members and take them to a "higher level." This is reported with a straight face during Easter week, when millions of people around the world will be commemorating the death of God by crucifixion and his resurrection into heaven after three days in the tomb.

The cult's leader, Marshall Herff Applewhite, 65, was among the dead. His cult was a part of the UFO cult phenomenon, and apparently took the side of those who believe the aliens are good and here to help us. The other side believes the aliens are evil and busy abducting humans and mutilating cows. Applegate's group apparently wasn't taking any chances, though, for each member was insured for a million bucks against alien abduction.

"We came from the Level of Above Human in distant space and we have now exited the bodies that we were wearing for our earthly task, to return to the world from whence we came -- task completed." So reads a note allegedly left behind. But news reports note that the group, which made much of its money by designing web pages and which maintained its [own web site](#), had posted a position against suicide. That is not quite true. They posted a message entitled "[Our Position Against Suicide](#)," but in that message they speak favorably of the mass suicide of Jews at Masada in 73 A.D. and claim that "The true meaning of "suicide" is to turn against the Next Level when it is being offered." The 39 dead believed that they were being offered a trip to the

"next level" in a space ship. Is that belief truly any more bizarre than belief in Jesus as God or in the resurrection of the body? I don't think so, but during this Easter season don't expect any major news organization to make this claim.

Also, the news reports already have noted that Heaven's Gate felt a union with the people killed at Waco and with the Montana Militia movement, mainly because they hated the government and were persecuted for it. Will any comparison be made with historical Christianity, Judaism or any other religion on this count? The idea that the body is just a vehicle or shell, that this life is just preparation for the next life, that worldly kingdoms are inferior to the City of God, etc., are not new ideas, nor is the idea that celibacy is a morally superior way to deal with one's sexuality and humanity. The nihilism expressed in the belief system of the Heaven's Gate cult is no different from the nihilism expressed in early Christianity and which has resurrected itself many times throughout history. [St. Augustine](#), one of the great Christian apologists for the notion of a City of God distinct from a City of Man, was also called upon to write an essay against suicide to keep devoted Christians from killing themselves in order to get into the next world. Will our journalists note the similarities between some of the fundamental beliefs of these cult members and the beliefs of members of mainstream religions? Don't count on it. (Actually, an article in the *Sacramento Bee* did note some fundamental similarities between traditional Christian belief and the beliefs of the Heaven's Gate cult. However, the article was quick to note that Christianity should be considered superior because it has lasted a long time and has a large following. The same argument has been made for the validity of astrology and a flat earth.)

Of course, the main difference between the Heaven's Gate believers and mainstream religionists is the use of suicide to get out of here. That act ends not just their lives, but their cult. As one of my students so eloquently, if unintentionally, put it: *suicide is self-defeating*. It is said they killed themselves with a lethal cocktail of pills and alcohol. In truth, they were killed by a cocktail whose main ingredients are religion, New Age non-sense and science fiction. In themselves, religion, New Age metaphysics and science fiction are harmless enough, and even beneficial to some people, as they provide them with amusement and meaning. Given to people alienated from their society, however, this mixture can be lethal.

Finally, I may have to reconsider my belief that Scientology is not a religion. Perhaps all religions began as amusements, as bizarre tales of miracles and heroes from other worlds. The storytellers and mythmakers knew their tales were fictions and for amusement only, but perhaps some people came to take them literally and built creeds, rituals and dogmas around the stories. All that would be needed to turn a campfire amusement into a religion would be a charismatic leader. The wildest science fiction could become sacred dogma. [Communal reinforcement](#) of the alienated, and devotion to their leader, would keep the group together and, if not *too* kooky, allow it to expand. (*Kooky*, of course, is an extremely relative term.) Perhaps a cult creating dogmatic delusions out of the fabric of television programs such as Star Trek and other fantasy and science fiction amusements is not so strange after all.

Postscript [4-18-97]: Actually, it has turned out that a significant amount of mass media coverage of this cult has compared it to other religions in just the ways I predicted it would not. In fact, there has been a reaction by some in the media to the "religion bashing" of liberals. Frank Rich, in a commentary in the *New York Times*,

expresses this reaction in a piece called "When religion is mind control." He thinks that too much focus has been put on the belief system of the cult and not enough on the charismatic leader and the methods of [mind control](#) practiced by this and other "true" cults (as opposed to "true" religions, which, I gather, he thinks do not use mind control). What this mind control consists of, apparently, is stripping the individual of his or her sense of individuality; isolating him or her from the rest of the world so that he or she can express beliefs in rote fashion but can't express a personal opinion about anything.

I don't know, but my reading of the Bible has Jesus telling his followers that he will divide father from son and mother from daughter, brother from sister, etc. His followers have been willing to die for him to gain eternal bliss in heaven. Islam has many stories of devout muslims willing to die for Allah. Other "real" religions have similar tales to tell. If these cult characters are brainwashed, then so are the devout followers of mainstream religions.

April 8, 1997. Montel Williams in probably one of the most shameless displays of gullibility or dishonesty (hard to tell which) by a talk show host, hosted for the duration of his show (broadcast here in Atlanta, GA on Tuesday April 8, 1997) 'World Renowned Psychic' Sylvia Browne. Throughout the show, Ms. Browne answered questions from members of the audience about the whereabouts of missing loved ones, financial future, and thoughts of dead loved ones. At one point in the show a woman asked Ms. Browne to solve the mystery of her 'haunted house'. Thank goodness, Ms. Browne was able to point out that the ghoul who haunted this woman's house had been brought in by a toy!!! Most amazing about the show, was not Ms. Browne's supposed ability, but that among the studio audience, not one question was of a skeptical nature, not one! Furthermore, Williams did not have on a representative of the opposing side on (something which is customary on some of the better more credible talk shows). One must wonder if Williams saturated the audience with only people who uncritically accepted psychic phenomena, or he edited the final product. At the end of the show a list of Ms. Browne's future lecture appearances was shown.

15 Oct 1996. Here's an example of mass media bunk shown on British TV on 14 October 1996:

The Channel 4 program "Cutting Edge" is a weekly documentary which often provides no-frills vignettes on 'real life' grey tales of how horrible some people's lives are. Regular people talk about their problems. For example, a Catholic living on a Protestant housing estate

in Northern Ireland, the parents of hyperactive children, or a homeless person might be shown. There are no studios, presenters or explicit questionings.

Last night's programme was about family feuds. Three of the four stories were what you'd expect: close relatives with small disagreements blown up into resentment, hatred and sometimes violence. But in amongst these awful tales was one about an elderly lady and her children isolated from her family because she was the 'cause' of a poltergeist phenomenon!

The story as she told it was that her immediate family (children) and her sister (living with them) had been subjected to a haunting with various physical manifestations, including a flying vase. The sister, with other relatives (members of a Spiritualist church) had concluded that a recently-deceased dead uncle had been summoned by this lady, was understandably upset at being dead, and was intent on causing trouble from beyond the grave. It wasn't clear whether this summoning was deemed intentional and malicious or not, and the mechanism of calling forth the invisible ghosts of dead uncles was not discussed. Nevertheless, the rest of the family had rewritten their wills and cut off this poor woman purely on the word of relatives that she was necromantically at fault.

While feeling sympathetic to her plight, I found the whole thing rather ludicrous. She herself accepted the judgement that her dead uncle was petulantly smashing up the crockery from 'the other side', denying only that she had in some way set him off. She was a believer. The obvious moral was that belief is powerful, and that if your relatives believe you have disturbed the spirit of dead Uncle George, have cast a curse on their washing machine or can turn into a hamster when they aren't looking, then you are in for a hard time regardless of your guilt or innocence. It was a sad commentary on how people can sometimes behave.

More subtly, the whole programme lent credence to the poltergeist myth. No attention was called to the fact that poltergeists are, er, scientifically invalidated at this time. Everybody interviewed in that segment wholeheartedly believed in the phenomenon and were presented as ordinary folk, Mr and Mrs Joe Public. The viewer was left to make her own judgement and I suspect that the presence of a poltergeist would go unquestioned in the minds of many. Since the other family feuds presented were of the *your-son-broke-my-camcorder-so-pay-up/no-he-didn't* variety, the *you-summoned-our-dead-uncle/no-it-wasn't-me* story seemed to me incongruous. The segment was a valid inclusion in the programme (after all, a family breakup had obviously occurred) but the uncritical presentation and blind acceptance of the 'haunting' as background to the feud was perturbing. It was, I suppose, 'merely detail', but as 'mere detail' it added one more item to the list of unrefuted manifestations-of-forces-beyond-our-ken which believers use to support their claims. That such

a tale could be presented with a straight face on a straight-talking documentary without a single contrary opinion was a sad commentary on how such things go unremarked because they make good television.

[Submitted by Zak Hanley, Durham, England]

Oct. 11, 1996. *USA Weekend Magazine*, "America's Religious Mosaic," by Bill Moyers, who is quickly establishing himself as the PBS guru for pseudoscience (Chinese medicine) and religion (first, Joseph Campbell, and now his "Genesis: A Living Conversation"), though he has a long way to go to catch up to [Deepak Chopra](#). Mr. Moyers is seen smiling against a religious mosaic backdrop on the cover of *USA Weekend*, which proclaims THE RESURGENCE OF FAITH. In bold letters at the head of the article, Moyers is quoted as saying "Religion is breaking out everywhere." Imagine, an epidemic of religion! What a concept! The Gallup Organization is brought in to back up the claim that religion is spreading like wildfire. However, in what has become all too common among pollsters, Gallup reports not just on whether people are practicing a religion, but on whether we *think* the influence of religion is increasing. The percentage of Americans who *say* the influence of religion is increasing has gone up 12% in the last three years. But, despite the claims of religion's growth, the facts don't bear out the hype. The article itself gives the data for "estimated membership of principal religions in the USA & Canada" as rising 4.8% between 1990 and 1995 (from 249.7 million to 261.7 million). The population of the USA & Canada rose about 5.8% during that time (from about 277 million to about 293 million). So, if the numbers for religious membership is correct, membership has not even kept pace with population increase. Also, the article itself states that weekly attendance of religious services has stayed about the same for the past thirty years: at about 40%. If fewer than half the population attend a religious service at least once a week and religious membership isn't even keeping up with population increases, it seems a bit of an exaggeration to claim that there is "resurgence of religion in America," as Moyers does.

October 7, 1997. *Newsweek*, "First Born, Later Born," by Geoffrey Cowley (with Karen Springen). What do Adolph Hitler, David Letterman, Howard Stern, Michael Jordan and Jack Kevorkian have in common? Well, for one thing, they probably never heard of Frank Sulloway, the author of *Born to Rebel*, or of Geoffrey Cowley, who got to use six pages in *Newsweek* to tell us all about Mr. Sulloway's book. The thesis of the noteworthy book is that birthrank is destiny, or some such rubbish. If you think Darwin's accomplishments are singularly phenomenal, think again: we'd still be clinging to Eve's fig leaf if he hadn't been the fifth of sixth children. If he'd been the firstborn, he'd have ended up like Bill or Hillary Clinton, whatever that means. And whatever it means, it obviously means a lot to Mr. Cowley, who thinks Sulloway's work is truly the work of a late-born.

On the surface, Sulloway's work seems to be just one more attempt to find a statistical correlation between variables and then yell, "Eureka!" Who cares if first-borns tend to be mass murderers? What will you do with this "knowledge?" Excuse mass murder in first-borns? Keep a wary eye out for signs of tendencies to kill people in first-borns? Well, if the former, you are a moron. If the latter, I guarantee you will find what you are looking for, even if it isn't there.

On a deeper level, it looks as if Sulloway has given us astrology and biorhythms as pop history. It is hard for me to fathom a historian spending years ignoring the usual motives that drive people to do what we do. Instead, he looks for a correlation between birthrank and "tendency to rebel." The mindblowing conclusion of this life's work is that you can retrodict rebels really good if you know their birthrank. Wow! Of course, what constitutes rebellion may be a foggy notion, but this kind of research is best done in the fog. Cowley, no doubt a rebel, claims that Sulloway makes "a compelling case" for this useless notion. He then notes that "it's an audacious claim...and not one that social scientists will flock to embrace." There is hope, then, after all.

Even so, Cowley was able to haul in a couple of scholars to join in the adulation. An anthropologist from UC Davis, Sarah Blaffer Hrdy, is quoted as saying that Sulloway's magnum opus will "change the way all of us think about ourselves and our families." Nothing like a bit of hyperbole to temper the scientific soul. Another anthropologist, John Tooby of UC Santa Cruz is quoted as saying that Sulloway "attacks questions that could not be more contingent...why some countries ended up Protestant, why France resisted Darwinism...and shows that they fit into larger patterns." Apparently, we can explain the Catholicism of Ireland and Italy by studying the birthranks of Sts Patrick and Peter or some such non-sense. Maybe so, but I think there are some more interesting and plausible explanations out there.

Of course, no pandering to the pseudoscientific would be complete without a self-test. Newsweek reprints Sulloway's quiz: Are You a Rebel? I took the test and was disappointed to find that I am "resistant." I wanted to be "enthusiastic" or at least "supportive." I guess I should be thankful that I am not "intolerant of new ideas." That would have made me mad enough to write a really nasty article about this book.

Just in case you're wondering, I'm a firstborn, like Saddam Hussein, Marcia Clark, Steve Forbes and Adam.

p.s. Sulloway's book is published by Pantheon. I'll really get cynical if I find out that the same company that owns Pantheon also owns Newsweek.

Oct 3, 1996. (more on Sulloway's book) Cheryl Russell, writing in *USA Weekend* (May 9-11, 1997), claims "If Sulloway is right, this may help to explain welfare reform, the Contract With America, the rise of the religious right and the crackdown on drugs and smoking." Indeed. Then again, if he isn't right, this may neither help nor not help explain anything or everything. If you want to read something akin to an astrological forecast, read Russell's article. Here is one more gem: "The firstborns of firstborn boomers may try to counteract some of the changes instituted by laterborn boomers. But their younger siblings, along with the firstborns of laterborn boomers, soon will stir things up." I wonder if Ms. Russell is a middleborn, trying to stir things up between the firstborns of firstborns and the laterborns of laterborns.

Raëlians (Raelians)

The Raëlians are UFO-[cult](#) members who follow Claude Vorilhon, a Frenchman and former motor sport journalist and race-car driver who calls himself [Raël](#). He claims that on December 13, 1973, he was in a volcano near Clermont-Ferrand, France, when he saw a [UFO](#) "7 meters in diameter made of a very shiny silver metal and moving in a total silence." He says a radiant being emerged and entrusted him with a message revealing the true origin of mankind. They told him that henceforth he would be known as Raël, which means "messenger."

His followers consider him to be "the prophet of the third millennium." Like all good religious leaders, Raël expects his followers to support him. A 10% tithe is the norm.

He explains his mission in his book, [The True Face of God](#). According to Taras Grescoe of [Salon.com](#), Vorilhon claims that

he was taken to the planet of the Elohim in a flying saucer in 1975, where he was introduced to noted earthlings such as Jesus, Buddha, Joseph Smith and Confucius. The Elohim, small human-shaped beings with pale green skin and almond eyes, were apparently the original inspiration for the Judeo-Christian God. They informed Vorilhon that he was the final prophet -- sent to relay a message of peace and sensual meditation to humankind under his new name of Raël -- before the Elohim would return to Jerusalem in 2025.

Raël claims that the Elohim have taught him that the human race was created from the DNA of aliens some 25,000 years ago. (In fact, *all* life on earth was created in alien laboratories.) Among other things, Raël has also learned that cloning is the way to immortality and there is no God or soul. According to Raël, our alien creators want us to be beautiful and sexy and enjoy a sensuous life, free from the restrictions of traditional Judeo-Christian morality.

According to Grescoe, "Raël's success seems to derive from providing a structured environment for decadent behavior: He offers a no-guilt playground for hedonism and sexual experimentation." Fortunately, the Raëlians are big on using condoms. They won't spread as much disease that way. However, using condoms won't suffice to deplete their numbers,

Raël believes, since he has formed a cloning company called [Clonaid](#) which promises to

provide assistance to would be parents willing to have a child cloned from one of them. This service offers a fantastic opportunity to parents with fertility problems or homosexual couples to have a child cloned from one of them.

Scientists say that there is no possibility of Clonaid actually working in the near future and dismiss its goals as pure fantasy (Cohen). However, Clonaid should be a reminder of what might happen in the distant future if controls on genetic engineering are not developed to prevent religious fanatics and lunatics from gaining more control of the planet than they already have.

The Raëlian headquarters are in Montreal but the cult is international and claims to have some 50,000 members in 85 countries. They have an "Evidence Page" on their Web site where they offer proof of their prophet's claims, thus relieving us of the burden of having to believe on pure faith. Unfortunately, the evidence provided is likely to satisfy only those eager for delusion and self-deception. For example, the [historical evidence](#) is of the type [Velikovsky](#), [von Däniken](#) and other mytho-historians have provided: they take ancient legends, stories, and [religious texts](#), and fit them into their preconceived theory. The Raëlians also consider [UFO sightings](#) as proof of their messenger's claims.

Their attempt at ["scientific" evidence](#) will have some appeal to the scientifically illiterate and the logically-challenged. The scientific evidence is nothing more than speculation and assumption in juxtaposition to facts. Their evidence consists of claiming that we are about to create life in our laboratories and our creations will probably think we are gods. Therefore, it is reasonable to conclude that we were created in laboratories and think of our creators as gods. The rest of the "scientific" evidence consists of a list of scientific accomplishments which, I suppose, are imagined to have to have occurred elsewhere before the living things on our planet could have been created in the lab. All of which begs the question as to whether this occurred elsewhere 25,000 years ago.

Apparently, the Raëlians are not bothered by the rather absurd image of a race of superior beings working for thousands of years in a laboratory to create all our insects, fungi, bacteria, viruses, etc., not to mention all their lovelies that have gone extinct. Why would any beings do such a thing? And why would they wait 25,000 years to reveal their handiwork to a French race car driver who spots their UFO in a volcano? And then tell him that the message is to clone ourselves so we can be immortal. Then again, is this story any stranger than the ones in the Bible?

The kicker in their argument is their proof that [evolution could not have occurred](#). They claim scientists have discovered that genes have a DNA repair mechanism ([p53](#)) which prevents mutation, an important process in evolution. Species couldn't have diversified if this mechanism were present. p53 was at first thought to be an oncogene but is now thought to be anti-oncogenic. It is of little interest to the Raëlians, I suppose, that p53 itself mutates. And it is pure speculation on their part that the entire genetic code of all species always consists of genes which prevent mutation from occurring. Even if they're right, however, it wouldn't follow that Vorilhon's preposterous UFO tale is true. Just ask the so-called [creation scientists](#), the [Scientologists](#), the [Urantians](#), the followers of [Barbara Marciniak](#) or [UFO Billy](#), the remaining members of [Heaven's Gate](#), or the surviving members of other [UFO religions](#).

Anyway, if the Raëlians are right, I am looking forward to asking the Elohim why they created the mosquito. In the meantime, I may take up Raël's offer of \$2,000 to anyone who starts a new religion.

The Sound of One Mouth Blathering

review of

The Rediscovery of the Human Soul

by L. Ron Hubbard
Scientology, 1996

by
Robert T. Carroll
October 22, 1996

Which of the following does not belong? *The Talmud, the Upanishads, the New Testament, the Vedas, Dianetics?*

Here is an even easier question: which of the following does not belong?
Judaism, Islam, Taoism, Buddhism, Scientology?

Despite what its founder and its advocates say, Scientology is not a religion. It has no creed, no rituals, and no hope of becoming a major social institution for the transmission of values. It has no cosmological myths and offers nothing new or interesting in ethical teachings. What it does have is philosophical dogma which it claims is scientifically validated by its practice of *auditing*. And while these dogmas do assert belief in a soul which is independent of the body and which usually resides in a person's head, the origin of the soul is obscure while its destiny is vaguely described in Buddhistic terms of escape from the cycle of rebirth. Scientology is an eclectic collage of philosophical and religious notions imaginatively brought together in a loose system by a man with a gift for fantasy.

I know, in 1993 the Internal Revenue Service of the United States of America declared that Scientology *is* a religion. The IRS had initially denied Scientology the tax-exempt status of a religion. But after years of war which featured numerous lawsuits and tit-for-tat harassment techniques by scientologists, the IRS surrendered. What they should have done, in my humble democratic secular opinion, is eliminated the tax-exempt status for *all* religions. Or they should have continued to deny Scientology status as a

religion, as the [German government](#) continues to do.

Which of the following does not belong: Einstein, Darwin, Newton, Feynman, Hubbard? Too easy? Yet scientologists claim that Scientology is a science. It isn't. *The Rediscovery of the Human Soul*, a collection of essays by L. Ron Hubbard, founder of Scientology, along with background essays provided by the institute which bears his name, is a hostile collection of anti-science literature.

If Scientology is neither a religion nor a science, what is it? It is an eclectic collection of metaphysical notions which are "applied" in counseling sessions called *auditing*. If a label must be given to Scientology, I would call it a philosophical cult and its teachings applied metaphysics. It shares in common with other ancient philosophical schools, such as [Stoicism](#), the offering of an alternative to traditional religion. In common with many ancient mystery cults such as Mithraism and early Christianity, it offers a refuge from a turbulent, heartless world while promising immortality. Scientology claims to be able to improve a person's happiness, intelligence, well-being, etc. Maybe so. I can't speak to the issue of its benefits or harms to people who have been audited. But I can speak to the ideas upon which Scientology is based, especially to the claim that these ideas are "scientific." Not only are the fundamental notions of Scientology not scientific but metaphysical, there is a basic hostility to science at the heart of Hubbard's teachings.

I received an unsolicited copy of *The Rediscovery of the Human Soul*. It was sent to my office in the Philosophy Department at Sacramento City College. I also received an invitation to think about it from Kaye Copley, the L. Ron Hubbard Public Relations Director. Copley writes that the book was sent to me to "provide an understanding of some of the fundamental principles of Scientology and an insight into what lies behind its phenomenal growth." And, "We look forward to receiving your thoughts on [Scientology]." Well, here goes.

Slick but unimpressive

I'll begin with the positive. This book is beautifully done: slick, glossy pages, colorful photos, artistic black and white shots and graphics. It's pretty enough to go on the coffee table.

Now to the content and the negative.

The book is a collection of articles either by or about Hubbard. In "An Introduction to L. Ron Hubbard" we're told that no "single philosophic work" is as large as the materials of Scientology. This is unimpressive. Bigger is not necessarily better, or even good, for that matter.

Scientology is also called a "major religion" with solutions to criminality,

drug addiction, illiteracy and social unrest--concerns which set Scientology apart from most other religions. Scientology is also called "an *applied* religious philosophy" based upon "axioms derived from precise observations," not "theory or assumptions." These claims, however are based on epistemological ignorance or arrogance. Hubbard uses the term 'axiom' himself in describing the "truths" of [dianetics](#). He uses the word to mean "absolutely certain truths." Axioms are self-evident propositions such as "the whole is greater than any of its parts", or postulates (essential presuppositions), or universally accepted principles such as "everything has a cause." Axioms are either statements which are true by definition, or they are assumptions or based on assumptions. [Observation](#), by its very nature, cannot yield axioms. Any data derived from sense observation must be organized and interpreted by our fallible human organs and consciousness, and cannot yield absolutely certain empirical truths. If there is anything epistemologists and philosophers of science are in agreement on it is this: sense perception can, at best, lead to probabilities, not absolute certainties. Hubbard did not understand this and neither do his followers. Those who practice science recognize that axioms cannot be reasonably derived from sense observations or experiments.

Scientology might best be described as Irrefutable Pragmatism. The only criteria for truth, we're told, is "workability." Did procedures "better our capacity to survive, actually make us happier, more causative and more able?" The beauty of such imprecise concepts is in their slipperiness: there is no need to invent [ad hoc hypotheses](#) to explain disconfirming evidence because the concepts are so vague that one can fit any data to them. I fear that the "axioms" of Scientology which are not false or trivial are likely to be so vague as to be useless.

In the introductory essay, we are presented with another example of philosophical ignorance when metaphysical materialism is identified with the philosophy of "get what you can before you die." I suggest that Scientologists read some [Epicurus](#) or [d'Holbach](#) for starters. Not only is collecting material possessions irrelevant to metaphysical materialism, it is in fact a predominant motif among many "spiritual" leaders and their flocks, including Scientology which may one day rival the wealth of the Catholic Church. The Epilogue to the book claims that Scientology is growing at the rate of 10,000 a week. (At that rate, if there is no population increase on earth, everyone will be a Scientologist in about 10,000 years.)

Somebody needs auditing

With a foundation so flawed, so evidently comprised of philosophical falsehood and ignorance, it is hard to take the rest of Hubbard's claims seriously. He says that we are all "troubled." We need "auditing" to find the cause and cure of our "troubles." Most people tremble at the thought of being audited, but L Ron H turned auditing into a rich concept. He even added a

spiritual touch to auditing: his own version of *reincarnation*. We have past lives which need auditing to get at the root of our "troubles." Past lives is mentioned as if it were an axiom. It is not an assumption or article of faith. In fact, *faith* is never mentioned in this "religion." At least other religions, even the minor ones, usually admit they are based on faith. By the way, auditing is not free, like confession, and may require many sessions to get through all those past lives. If nothing else, the convert will learn the true meaning of eternal giving.

In Hubbard's "A Note on Excalibur," we are introduced to what he calls his fundamental insight into the secret of life. Unfortunately for those who actually know something about philosophy, this turns out to be little more than a rehash of *naive vitalism*, a philosophy whose adherents have dwindled to near none since the time of Aristotle. Briefly, L Ron H's vitalism holds that there is a basic Life Force which directs living things in a purposive fashion towards survival and survival only. He claims that he demonstrated that this Life Force exists in each living cell by a grand experiment he did in 1937. The same experiment, he says, proved Darwin was wrong about inheriting learned responses. By implication, I suppose, L Ron H might be thought to have vindicated Lamarck, who had argued that evolution occurred by a process of passing on learned behavior to progeny. In either case, Hubbard's claim must come as a great surprise to the whole evolutionary biology community, including any Lamarckians still around since Lamarck was as mechanistic and non-vitalistic as Darwin in his explanations.

What was this great experiment which has been systematically ignored by every biology text book since its alleged occurrence? He claims he proved that bacteria can mislearn from experience and pass on their mislearning to their progeny.

- 1. He subjected bacteria to jets of steam and there was no effect.**
- 2. He subjected the bacteria to jets of "toxic cigarette smoke." The bacteria "retreated" from the threat.**
- 3. He continued to "taunt" the bacteria with smoke.**
- 4. He substituted steam for smoke. The bacteria "retreated" because they mistook steam for smoke.**
- 5. Second and third generation bacteria retreated from steam, proof that they mistook steam for smoke like their dumb parents.**

L Ron H claims that the new generations had inherited their parents and grandparent's inability to tell the difference between steam and smoke. He

also claims that all generations of bacteria "retreated" from smoke in an effort to survive. I find this experiment extremely interesting for several reasons.

1. How does he know the bacteria were retreating? Was there a door marked "exit" on the edge of the petri dish? How can he be sure that they weren't actually seeking the source of the smoke because they enjoyed getting high? This anthropomorphizing of bacteria is charming, I suppose, but not too scientific.

2. No reputable biologist has ever heard of this crucial experiment.

3. He expects us to believe he "taunted" bacteria with jets of steam and got no response until he first "taunted" them with smoke. Maybe the bacteria were "taunting" L Ron H by faking a retreat.

4. He thinks that if bacteria mistakenly retreat from something which is no threat to their survival, this proves there is "an intelligence behind the scheme of life--an `X-Factor'....that shapes and gives meaning to life in ways that Darwin simply could not explain." Perhaps, but it must be a pretty dumb intelligence if it can't tell the difference between what's harmful and what's harmless. If survival is the only thing this Life Force is aiming at, as L Ron H claims, then it is amazing anything has survived since it doesn't even have the ability to distinguish between what is and what is not a threat to survival.

In Hubbard's attempt to refute what he considers to be the Darwinian notion that life is "directed by chance, by a dumb roll of genetic dice as it were" he cites an experiment on dumb bacteria who get dumber with each generation! "Directed by chance" is an oxymoron, of course, but we get the idea: Darwin's view is that there is no purpose to existence or to evolution; Hubbard's view is that even cells have purposes and act intentionally, if unintelligently. I suppose I should not be amazed that such an "experiment" and such reasoning would be the foundation of a body of notions which many people would accept, not on faith, but because they think it is scientific.

Contempt for science

If there is one constant throughout the musings of L Ron H presented in this little volume it is that he had a profound contempt for science. In essay after essay, he presents metaphysical ideas about Mind or Soul or Life and calls them scientific. He repeatedly claims that he has scientific proof that the soul exists, that the soul goes through many incarnations, that even minerals have

souls, etc. I wonder if the trustees of Scientology sent a copy of these notions to any scientists. The science is nearly non-existent, and what science there is, is bad science. But the philosophy is there for all to see, and what is visible is a metaphysical belief in the soul as a directing force in all of nature and whose direction is toward "survival." This idea is no more scientific than the notion L Ron H opposes to it, viz., that nature is nothing but material (i.e., non-spiritual) entities and forces, following mechanistic laws, and is essentially without direction or purpose. There is nothing new about this debate. The opposition of mechanistic materialism to teleological spiritualism has a long and interesting history. Unfortunately, L Ron H adds little of note to this debate.

With the foundation laid in an inept experiment, we are now ready to delve more deeply into L Ron H's wisdom and insights. In "The Birth of Dianetics," an introduction to Hubbard's "Original Thesis," we discover that our scientist is really a metaphysician who thinks teleologically in terms of final causes, an idea abandoned by most scientists and philosophers after [Spinoza](#). He caricatures mechanistic materialism as the view that feelings and emotions are nothing but "a consequence of physiology." His view is that "mind regulates body" because "function monitors structure," a view which might be of interest to certain naive vitalists. He also seems to think that because he can apply his metaphysical notions to the empirical world that his notions are therefore scientific and result in axioms. But his main supportive reason for opting for naive vitalism as opposed to a mechanistic materialism seems to be that he thinks materialism is bad. For example, he thinks the popularity of metaphysical materialism led to the excessive use of drugs to treat both physical and mental illness. He ignores any benefits which come from drug therapy to such people as diabetics, those who've had their thyroids removed, and even the mentally ill. In a very real sense, what Hubbard offered was the ultimate in alternative medicine. The mind regulates the body.

I can see how these ideas might be attractive to someone who is ill but who does not want to deal with medical doctors or who does not want to admit that there may be nothing he or she can do about the illness. No one wants to be a *patient*, a passive recipient of disease: we'd like to be in control. But L Ron H has ignored the benefits of drugs and he has misrepresented mechanistic philosophy when he claims that drugging people to get them to act "normal" is a consequence of materialistic conceptions of human reality. If anything, the idea of a "normal" state for human behavior is rooted in teleological systems which posit that there is a goal or purpose which each being must strive to achieve in order to fulfill its nature.

To his credit, though, L Ron H does cite an empirical reason for rejecting materialism and the attempt to reduce consciousness to brain processes. However, his empirical reason is suspect. In the title essay (written in the 1930's) of this collection, he tells the story of a how a biology student told him that "the brain contained an exorbitant number of molecules of protein and that each molecule `had been discovered' to have holes in it." Our

scientist then muses: "It seemed to me that if molecules had holes in them to a certain number, then memory, perchance, might be stored in these holes in molecules." He then says he did some mathematical calculations "done with considerably higher math than psychologists or biologists use" and discovered that "the brain did not have enough storage for more than three months memory." Apparently, it did not occur to Hubbard that there might be a hole in his theory. While we can't blame him for not knowing much about the brain, we can criticize his followers for not keeping up to date in sciences such as neurology. If Scientology were truly a science, it would be a major scientific research institution. Not only is Scientology not a science, it is **anti-science**. Science studies the material world and attempts to understand Nature on its own terms. A neurologist might believe in souls, but as a scientist the neurologist notes that the brain's 10,000,000,000,000 or so neurons ought to be enough to hold even a memory the size of L Ron H's. (Actually, it's at least 500 times more neurons than is needed if one neuron were required for each memory and could not be used again, and if he had a new memory every second of his life for 80 years.) This fact seems to be of little interest to scientologists, who think that because we do not have a good understanding of how memory works at the neuronal level, that believing in a spiritual mind with its apparently infinite capacity for memory is a better option. There is no scientific value to this metaphysical assumption. On another level, how many scientologists do you suppose will be reading papers on their current research on memory at the next symposium of the National Academy of the Sciences? It won't take too many neurons to figure that one out.

In addition to trying to pass off his metaphysical notions as if they were scientific, L Ron H tried to pass off himself as a great scientist who, while working independently, had made great discoveries. He even wrote to the American Medical Association and the American Psychological Association, informing them of his progress. The letter, written in 1947, is reprinted in this collection. It is not hard to understand why his letter was ignored. He sounds like a crank at best or a rambling lunatic at worst. In the letter he claims he's treated 20 people, though he does not say where or what qualifies him to treat anyone. He says he's cured migraine headaches, ulcers, asthma, sinusitis and arthritis by uncovering their chief cause in *prenatal or birth traumas*. He mentions *attempted abortion* as a main factor in four of his cases. After writing this strange letter, he then complains that there is a conspiracy against his genius which has continued to this day. Yet, it seems rather reasonable to ignore someone who claims he is doing research on his own and has cured migraines and ulcers by finding the cause in the patient's mother's attempted abortion while the patient was in the womb decades ago!

Shocked!

In an interview with Stillson Judah in 1958, Hubbard expresses a genuine shock that sciences (i.e., psychology) could not answer all his questions. Neither could philosophy. "We didn't even know what a spirit was," he says. "Whether it was [Nietzsche](#) or Schopenhauer, [Kant](#), or any of the rest of them.

These men were all groping. So I said, here's a wide-open field." Nietzsche and Schopenhauer groping to know what a spirit is? I don't think so. Unlike Nietzsche and Schopenhauer, Hubbard was looking for "the principle of existence," i.e., the purpose of life. He says he found the answer: *to survive!* Nietzsche and Schopenhauer had determined that there is no purpose to life. To them, beings don't exist *to survive*, they exist *because* they survived. Beings which did not have a strong urge to preserve themselves would not survive unless by chance they found themselves in an environment friendly to them. Beings which did not have reproductive urges would become extinct. We don't have sexual urges to preserve the species; the species is preserved because we have sexual urges. In any case, why Hubbard found the desire for self-preservation so profound is elusive.

Hubbard jumped from his "discovery" that everything is striving to survive to the notion that something is "entangling man." What was it? "He was tangling himself up with combinations of mental image pictures." He claims he measured these pictures in 1953, using a meter ([the E-meter](#)) he built to measure the response of the soul "while exteriorized from a being." In 1951, he says, he found out who was looking at the pictures: "the human soul was the fellow."

In the introduction to "Scientology Fundamentals," we are told that the claim "you are a spirit" is "a unique statement, and factually found nowhere else in the whole of philosophic, religious or scientific thought." This seems like an odd statement coming from one who also claims to have studied in depth Buddhism and Taoism. I guess he never read George [Berkeley](#), either. This is the essay which is supposed to be his "definitive introduction to philosophy." Its main virtue is that it is short and can be read in lieu of *Dianetics* to get an idea of what scientology is all about. I'd love to go into all the details about Thetans (spirits) and the difference between astral projection and true separation of the soul from the body, how the reactive mind takes pictures when a person is unconscious, etc., but I've dealt with that elsewhere. [\[SD, "Dianetics"\]](#) I will share with you a quote or two, however, and comment briefly on Hubbard's lack of connection to the history of philosophy.

In the insect kingdom it is not established whether or not each insect is ordered by a spirit or whether one spirit orders enormous numbers of insects....the general authorship of the physical universe is only speculated upon, since Scientology does not invade the eighth dynamic.

I guess we can all be thankful for that. In any case, another dynamic which Hubbard does not invade is the fray over interactionism, a central problem in [dualistic philosophies](#): how do mind and body interact? Since they are defined as independent and completely unlike substances, this question needs to be answered. Descartes "solved" the problem by declaring that the mind resides in the pineal gland and it is there that connection is made to the body.

Hubbard's problem is even more difficult than Descartes since Hubbard's is a [pluralistic](#) philosophy with three substances to deal with: spirit, mind and body. However, he is oblivious to the fact that after defining these types of being, each completely distinct in nature from the other, that it is a major puzzle as to how the three interact. He seems so sure that they do interact that it does not seem to occur to him that there is a major philosophical problem here. His obliviousness to central philosophical issues is matched only by his obliviousness to scientific issues. One thing he was not oblivious to, however, was what buttons to push to arouse sympathy and interest in his philosophy.

One of the main attractions of Scientology must be its promise of immortality. In the "The Demystification of Death" we learn of the internal strife caused by the doctrine of past lives, which L Ron H asserts is "not the same as the theory which has been called 'reincarnation' in Hinduism," ("A Note on Past Lives"). There was opposition to the idea from some of Scientology's Board members because it was in opposition to Christian orthodoxy and the materialistic creed of the psychologists. In any case we are supposed to believe that the doctrine was accepted because it is true and the truth must prevail. He claims in "A Note on Past Lives" that "Dianetics gave impetus to [Bridey Murphy](#)." He also asserts a belief that some scientologists have been dogs and other animals in previous lives.

In "The Phenomena of Death," Hubbard claims that "It has only been in Scientology that the mechanics of death have been thoroughly understood." What happens is this: the Thetan (spirit) finds itself without a body (which has died) and then it goes looking for a new body. Thetans "will hang around people. They will see a woman who is pregnant and follow her down the street." Then, the thetan will slip into the newborn "usually...two or three minutes after the delivery of a child from the mother. A thetan usually picks it up about the time the baby takes its first gasp." This is the truth about death which only Scientology has understood. On what basis we are supposed to believe this "truth," I can only guess. He says in "A Note on Past Lives" that "Evidently the newborn child has just died as an adult. Therefore he or she, for some years, is prone to fantasy and terror and needs a great deal of love and security to recover perspective of life with which he or she can live." Evidently.

In "Dianetics, Scientology & Beyond" we are told by Hubbard that those who reach "total spiritual independence and serenity" are called Operating Thetans or OTs. The OT has "personal and knowing immortality and freedom from the cycle of birth and death." But this is not the Buddhist doctrine of nirvana.

In "Philosophy Wins after 2000 Years" Hubbard explains why all previous philosophy has been a failure until Scientology. Materialism is again caricatured as the doctrine that "one is merely meat and all life arose by spontaneous and accidental combustion from a sea of ammonia." Contrast this with the good news that "Scientologists are seldom ill" and their intelligence

is increased. This is done without "persuasion or hypnosis or 'faith'." Or superstition. Hubbard modestly concludes that Scientology "delivers the answers to the eternal questions and delivers immortality as well." I think it would be more accurate to say that it *promises* these things but it is unlikely it can deliver the goods.

The collection would not be complete without at least one accusation that the CIA and the FBI have conspired for years not only to discredit Scientology and Hubbard, but to "appropriate the materials of Scientology." I assume he is not talking about tax records, but his philosophical and fanciful writings. The Scientologists believe that Hubbard's lectures on "the state of the OT" now reside within National Security Agency vaults. This fear is only believable because our intelligence agencies have demonstrated in the past their gullibility regarding paranormal, occult and spiritual claims.

The penultimate essay is modestly titled "My Only Defense for Having Lived." It is of little interest but in it Hubbard claims that he was not motivated by fame, fortune or power. His only motivation was to understand man. This essay will have to do in lieu of an autobiography because such a tale "would sound far, far too incredible." Nobody would believe his tales, he says. Still, he can't help but tell a few. For example, there is the story about how as a boy he was expelled by the governor of an island on a charge of "always being happy and smiling."

Finally, in the last essay of this collection of Scientologist writings, we are given "My Philosophy" by L. Ron Hubbard. It is notably uninteresting except for a curious anecdote he shares. He tells us that his service record states that "This officer has no neurotic or psychotic tendencies of any kind whatsoever." Presumably this information is shared so we can appreciate how he cured himself of his war wounds, including blindness. But it might be interpreted as a protest to an anticipated criticism.

cults

7 Jul 1999

It's funny, but the definition you use for a cult, and especially the indoctrination techniques, fits very well with Basic Training for the military. The military/civilian distinction fits the "us vs. them" mentality, and as far as a charismatic leader goes, well we had a Drill Instructor that was pretty high and mighty. (It was more fear and respect than love and admiration though!) As far as the seven techniques of indoctrination go:

1) Subjection to stress and fatigue -NEVER enough sleep or time to do what we were supposed to. 2) Social disruption, isolation and pressure- Isolation from everything and everyone nonmilitary. 3) Self criticism and humiliation- If only you had heard what the Drill Instructor would say to us! 4) Fear, anxiety and paranoia- There was always someone watching and waiting for you to screw up. 5) Control of information- No news, censored mail. 6) Escalating commitment- Well after all, they want you to die for God, country, and the guy next to you. 7) Use of auto-hypnosis to induce 'peak' experiences-Physical training and mindless, repetitive tasks (although I don't remember ever "peaking".)

Perhaps it's not an exact analogue, but it is a very similar model of behavior modification to the ones practiced by cults. Thankfully, however, Basic Training actually ends, unlike cult practices. Most people snap out of the basic training mode when they get back into a more normal routine. (I think the ones who don't go on to become Drill Instructors themselves.)

the evil eye

The evil eye is a kind of curse put on a child, livestock, crops, etc., by someone who has the "evil eye." There does not seem to be any particular reason why some people are born with and others without the evil eye. The curse is usually unintentional and caused by praising and looking enviously at the victim. In Sicily and southern Italy, however, it is believed that some people-- *jettatore*-- are malevolent and deliberately cast the evil eye on their victims. Belief in the evil eye is not necessarily associated with witchcraft or sorcery, though Evil Eye was something Church inquisitors were instructed to look for. Pope Pius IX was reputed to be a *jettatore*, not because it was thought he was malevolent but rather because it seemed that disasters fell upon persons and places he had blessed.

The superstitious belief in the evil eye is ancient and widespread, though certainly not universal. It is thought to have originated in Sumeria. Its origins are obscure but the belief may have its roots in fear of strangers or other social concerns and simple [post hoc reasoning](#), e.g., praise is given or a stranger passes and later a child is sick or the crops fail. Various rituals have developed to counteract the effects of the evil eye, such as defusing the praise, putting spit or dirt on a child who is praised, averting the gaze of strangers, reciting some verses from the Bible or the Koran, etc. The belief is especially prevalent today in the Mediterranean and Aegean, where apotropaic amulets and talismans are commonly sold as protection against the evil eye. Some folklorists believe that the evil eye belief is rooted in primate biology (dominance and submission are shown by gazing and averting the gaze) and relates to our dislike of staring.

The evil eye is known as *ayin horeh* in Hebrew; *ayin harsha* in Arabic, *droch shuil* in Scotland, *mauvais oeil* in France, *bösen Blick* in Germany, *mal occhio* in Italy and was known as *oculus malus* among the classical Romans.

déjà vu

Déjà vu is an *uncanny feeling* or *illusion* of having already seen or experienced something that is being experienced for the first time. If we assume that the experience is actually of a remembered event, then déjà vu probably occurs because an original experience was not fully attended to and elaborately encoded. If so, then it would seem most likely that the present situation triggers the recollection of a *fragment* from one's past. The experience may seem uncanny if the memory is so fragmented that no strong connections can be made between the fragment and other memories.

Thus, the feeling that one has been there before is often due to the fact that one has been there before. One has simply forgotten most of the original experience because one was not paying close attention the first time. The original experience may even have occurred only seconds or minutes earlier.

On the other hand, the déjà vu experience may be due to having seen pictures or heard vivid stories many years earlier, as in the case of [Virginia Tighe aka Bridey Murphy](#). Those experiences may be part of the dim recollections of childhood, mistakenly believed to have occurred in past lifetimes because one "just knows" they did not occur in this lifetime.

However, it is possible that the déjà vu *feeling* is triggered by a neurochemical action in the brain that is not connected to any actual experience in the past. One feels strange and identifies the feeling with a memory, even though the experience is completely new. That is, *déjà vu* (French for *already seen*) may not involve the faulty recognition of something one has seen before.

The term was first applied by Emile Boirac (1851-1917) who had strong interests in psychic phenomena. Boirac's term directs our attention to the past. However, a little reflection reveals that what is unique about déjà vu is not something from the past but something in the present, namely, the strange feeling one has in experiencing déjà vu. We often have experiences whose novelty is unclear and have been led to ask such questions as, Have I read this book before? Is this an episode of Inspector Morse I've seen before? This place looks familiar; have I been here before? Yet, these experiences are not accompanied by an uncanny feeling. We may feel a bit confused, but the feeling associated with the déjà vu experience is not one of confusion but of strangeness. There is nothing strange about not remembering whether you've read a book before, especially if you are fifty years old and have read thousands of books over your lifetime. In the déjà vu experience, however, we feel strange because we don't think we should feel familiar with the present perception. That sense of inappropriateness is not present when one is simply unclear whether one has read a book or seen a film before.

Thus, it is possible that the attempt to explain the déjà vu experience in terms of lost memory, past lives, clairvoyance, etc., may be completely misguided. We should be talking about the déjà vu *feeling*. That feeling may be caused by a brain state, by neurochemical factors during perception, that have nothing to do with memory. It is worth noting that the déjà vu feeling is common among psychiatric patients. The déjà vu feeling also frequently precedes temporal lobe epilepsy attacks. And, when [Wilder Penfield](#) did his famous experiment in 1955 in which he electrically stimulated the temporal lobes, he found about 8% of his subjects experienced "memories." He did not provide support for the claim that what was elicited were actually memories. They could well have been hallucinations and the first examples of artificially stimulated déjà vu.

déjà vu

09 Oct 1998

Congratulations on a wonderful piece of work! I regularly spend my lunchtime or an evening reading through the entries in your dictionary, and use your arguments often in discussions with less sceptical friends and acquaintances. Also, while in my case you're generally preaching to the converted I admit that there have been a few occasions (particularly the MBTI entry) which caught me unawares. I have certainly changed my perception of that "psychological indicator" now. I may write more on that later, but just quickly I'd like to comment on your Deja Vu entry. You write "There is nothing strange about not remembering whether you've read a book before, especially if you are fifty years old and have read thousands of books over your lifetime. In the déjà vu experience, however, we feel strange because we don't think we should feel familiar with the present perception. That sense of inappropriateness is not present when one is simply unclear whether one has read a book or seen a film before. "

I feel that this is not a good example, in that with my experience of deja vu I have found myself thinking "I knew you were going to say that next!" "And that ... and that ..." like I was running through a conversation I had already had. There is a reason for feeling strange in this scenario. With a book or a movie it would be normal for me to experience exactly the same dialogue etc. With a conversation, not so - unless there was some conspiracy to instigate the response! I certainly don't think I actually have experienced these conversations before, but the book/movie comparison was for me a small weakness in an otherwise convincing article.

Chris Solnordal, Melbourne, Australia

reply: I don't know what to say. I often find myself reading a book that I can't remember having read before and when things start to click that make me think that I have read the book before, I do not feel anything uncanny. I just feel more poignantly the years that have gone by that are filled with experiences I don't remember. Perhaps you have an exceptional memory, or are much younger than I am.

2 May 1997

I wanted to expand on your theory of déjà vu. Another theory, which has some

scientific merit, shows that the brain occasionally has chemical misfires. What happens is that you may experience something for the first time, for example, seeing a certain building; however, your brain misclassifies your current memory (the last few seconds) into your past memory (several years ago). Because of this, you instantly perceive, with great clarity, that this has happened to you before. Well it has! Except it was only a few seconds ago.

dermo-optical perception (DOP)

Dermo-optical perception (DOP) is the alleged ability to "see" without using the eyes. DOP is a conjurer's trick, often involving elaborate blindfolding rituals, but always leaving a pathway (usually down the side of the nose), which allows for unobstructed vision.

See **related entry** on [extraordinary human functions](#).

extraordinary human function (EHF)

An extraordinary human function would be something like the ability to read messages with one's ears, forehead, fingers or some other part of the anatomy besides the eyes. There have even been accounts of reading by sitting on the message. The latter was popular in China in the late 1970's, when the study of EHF became a major research topic at Beijing University and the Chinese Academy of Sciences. The scientists seemed particularly interested in finding a link between EHF and *qi (ch'i)*, believed by many Chinese to be the fundamental life force. Their research, like similar research in the Soviet Union and U.S., covered everything from using paranormal powers to catch criminals to the training of astronauts to use such powers for spying or for guiding missiles. There are still reports from Russia alleging people can read while blindfolded and that techniques have been developed in [dermo-optical perception](#) (DOP) to teach blind people to read through their forehead or fingers using paranormal powers. Braille is a much better bet.

devadasi

Devadasi is a religious practice in parts of southern India, including Andhra Pradesh, whereby parents marry a daughter to a deity or a temple. The marriage usually occurs before the girl reaches puberty and requires the girl to become a prostitute for upper-caste community members. Such girls are known as *jogini*. They are forbidden to enter into a real marriage.

Joginis are recognised by their copper bangles, the band they wear round their necks with a leather pendant and a long necklace with several pendants which have the image of Goddess Yellamma.*

The practice was legal in India until 1988, yet it still continues as is evidenced by the testimony of a 35-year-old former jogini named Ashama. She ran away from her village and returned to lead the fight to abolish the illegal practice. The local police do not enforce the law and the villagers themselves make no effort to abolish the heinous practice.

Since the day of the initiation, I have not lived with dignity. I became available for all the men who inhabited Karni. They would ask me for sexual favours and I, as a jogini, was expected to please them. My trauma began even when I had not attained puberty.*

Ashama was seven when her parents married her to the local god. She was recently awarded the [Neerja Bhanot award](#) for courage.

The practice of religious prostitution is known as *basivi* in Karnataka and *matangi* in Maharashtra. It is also known as *venkatasani*, *nailis*, *muralis* and *theradiyan*.*

It has been the [Atheist Centre of Vijayawada, India](#), that has been most instrumental in the movement to eradicate this pernicious religious custom.

DHEA

27 Oct 2000

I suggest linking to <http://www4.ncbi.nlm.nih.gov/PubMed>, the best source of truly scientific information on DHEA and other research in biology and medicine. This is an archive of government and private research articles from the major biology and medical journals around the world, as well as online and other government sources. Often the articles are cited in advance of publication. And lately, there is an explosion of legitimate research on DHEA, which is proving to have many uses. Simply enter DHEA into the search field.

These articles on preventative medicine and DHEA (and many other topics in medicine, of course) are by real scientists, Ph.D. and masters endocrinologists, physiologists, microbiologists, geneticists, zoologists, and MDs with additional training, not quack MDs writing for 'wellness' letters about prevention, a subject on which they have little useful to say. (Remember MDs have less than a year of real scientific training on average, and that very low level. Not to mention as little as 3 years of post grad work (where the 'doctor' title comes from.))

The abstracts are from primary research. Hundreds of research projects can be accessed here. including much of the recent very interesting research on DHEA. If you wish you can order full articles and data with a credit card.

Were you to actually read the primary research on DHEA, not summarizations by MDs with no applicable specialized knowledge, you might change your opinion of the supplement. Real detailed knowledge is so much more useful than uninformed skepticism.

Take a look at the opinions of doctors for a moment. One would do well here to avoid the opinions of people who have a financial interest in fighting alternative and preventative medicine, and at the same time use in their practice very dangerous drugs with commonplace side effect rates of anywhere up to 100%. These same MDs have themselves issued advice on prevention without any research to back up their prescriptions, often doing more harm, and often using normal protocols with 0% success or results lower than placebo rate once investigated. It has been estimated that as much as 50% of medical practice has no basis in scientific research. Often these procedures actually do verifiable harm, though.

Yet our US FDA seems to exist to promote their practice. That, and promote

the dubious dietary advice required by the clients of their parent department, the Agriculture department, advice which helps to cause many of the problems that the prescription drug industry then makes money from. (Does this strike you as too skeptical?)

Take for instance prescribed diets, with an effectiveness of 2%. Or for example, the prescription, patented artificial steroids still being given to upper GI ulcer sufferers, which can actually cause ulcers while damaging the rest of the body, patients whose problem is nearly always bacterial infection, curable with standard antibiotics with low side effects. Take for example the expensive statins [?], the low salt diets and the other drugs being given to high blood pressure and high cholesterol patients in a situation where the usefulness of these treatments is in doubt, and where sometimes serious side effects of the drugs are admitted to be about 25% in frequency. These are patients who mostly can be (or could have been) helped with lifestyle changes and some much gentler herbal treatments in use for centuries.

When it comes to drugs, the drug companies are interested in patentable products, even refusing to manufacture proven previously accepted and patented remedies if the number of customers for them falls below the hundreds of thousands, if they have fallen out of patent and become generic. Interestingly, one runs across references now to natural hormones like DHEA that are having chemical side groups and other nonsense added to them in an attempt to come up with compounds that are patentable. Presumably, none of these products will be featured on your skeptics page, though they deserve it.

MDs are the very worst source of advice on prevention, because they resent the intrusion of governments or anyone else on their perceived domain, and because they have an undeniable financial interest in seeing people getting sick enough to need cures, the post facto product of modern medicine. Go to them if you have a heart attack, a broken leg, a need for a new genetic protocol, an antibiotic. Otherwise, question their advice very closely.

Reject the guilt-by-association tactics that lump the health supplement industry and the millennia-old herbal pharmacopoeias in with psychic surgery. Remember that the MDs are the same folks that until very recently described any symptom they didn't think they understood, e.g. most allergies, as 'psychosomatic.' And remember that the self admitted rate (far too low) of iatrogenic (doctor-caused incompetence and mistakes) disease is the third leading cause of death in the US. This was 100,000 per year in 1990, close to 200,000 per year in more recent research published by the AMA. It is probably much higher, because physicians do not blame themselves for the negative effects of standard procedure, e.g. the several percent of patients who die or have severe brain damage during surgery, surgery that often could have been mooted by better prevention protocols or earlier intervention.

If health supplements and alternative medicine, widely popular, were killing a

thousand people a year, let alone 100,000 to 300,000 in the US, health supplements would not be sold in stores. It is a testament to the power of the Doctors union that they can kill so many with impunity while attempting to reduce their competition. I have witnessed this personally, as a person born into a medical family, and as research, technical and laboratory staff in hospitals, and am completely dismayed by it.

Much that alternative medicine, including DHEA use, has to offer, could save you from your doctor's dubious attentions.

Thank you for your attention, Charles Hughes USA

reply: I have followed Mr. Hughes advice and did a search on PubMed. I found articles with names like "Basal plasma dehydroepiandrosterone sulfate level: a possible predictor for response to electroconvulsive therapy in depressed psychotic inpatients" and "The Role of Atypical and Conventional PKC in Dehydroepiandrosterone-Induced Glucose Uptake and Dexamethasone-Induced Insulin Resistance." Unfortunately, I couldn't find any articles that claimed to have found good evidence that DHEA stops the aging process, reduces obesity or works as the panacea its advocates think it is.

dianetics, L. Ron Hubbard & Scientology

22 Sep 2000

Several times recently it seems you've made statements that scientologists don't believe in evolution, that we are all planted here by aliens. That's about half right. In one of his earliest books "The History of Man" Hubbard claimed to have proven evolution. This 'proof' was obtained the same way as all his other 'research' (when any was actually done), by using their hypnotic regression techniques of auditing. So a scientologist would say evolution is a fact, LRH proved it.

Not being a scientologist I might not be understanding this correctly, but his story is there are two parts to a person, the spirit or thetan, and the genetic entity. The genetic entity evolved here on earth, the thetans after billions of years of reincarnation in various alien civilizations were captured and imprisoned on this planet.

As for the model of 'evolution' given in the book, I understand it is one of the most laughable books claiming to be scientifically proven. According to the book the evolutionary branch leading to humans also included such things as clams and the Piltdown man. You can read a nice commentary on the book [here](#):

<http://www.skepticfriends.org/dawnscireview.html>

Marc Berard

reply: The reference to aliens has to do with [Xenu](#) and some sort of hydrogen bomb attack on earth 75,000,000 years ago. But there is also a work of Hubbard's called "A Note on Excalibur" in which he denies evolution and Darwinian natural selection in favor of some sort of teleological vitalism.

The whole Xenu story is from OT III, which I have read, and even have scans of. It wasn't an attack on earth, he just solved the Galactic Confederations' overpopulation problems by having all 13 trillion people captured (called them in for tax audits and captured them that way) frozen, transported in space ships resembling DC 3s without the propeller. Dumped on the volcanoes, nuked, their

spirits captured by electric ribbons, show confusing 3-D films for 36 days. (guess it was the first MST3K marathon) These films implanted people with all kinds of delusions and problems, including ALL of the worlds religions. And today our bodies contain thousands of these abused spirits. All our problems and illnesses are supposed to be caused by these 'body thetans', and OT III is supposed to teach you how to telepathically contact them and make them let go.

Marc Berard

Mr. Carroll,

I just finished reading from your Skeptics dictionary on the WWW, specifically the section concerning dianetics. Yours was a view I had not heard about dianetics and scientology. After working for a scientologist who attempted to coerce me into a dianetic class, I have never picked up the book and therefore couldn't tell you about its scientific claims. I can, however, tell you that the scientologists I met while in this woman's employ did not think they were doing God's work. Quite the opposite. They were solely interested in recruiting more scientologists.

A representative from a "management" company would come to the office whenever the doctor's "engrams" kicked in (this was usually when she had difficulty with her father, who was vehemently opposed to her being a scientologist). This representative, who called himself a counselor, wanted me to allow him access to patient files so he could see which ones were likely candidates for scientology auditing. For each person the doctor convinced to sign up for classes, she received a discount on her own auditing. I know of at least two patients who did agree to taking a dianetics course on the doctors "recommendation." However, access to patient files are protected by federal law, and I wasn't about to be the one to open them to him.

The same management company wanted me to try to get blank "counter" checks from patients to keep in their files, just in case they forgot to bring their checkbook to the clinic. After double checking it with a local bank manager friend, I informed this "counselor" that such action was illegal.

Medicare patients were routinely lied to about their coverage, all under the authority and supervision of the "management" company. Also under this company, the doctor was hard pressed to get new patients. She was to turn in her "statistics" each week. These statistics consisted of me making a chart of how many patients she saw each week. No calculations of means or any other even basic statistical analysis, just a chart of the number of patients each week. They gave the doctor what the "mean" was supposed to be, and if she didn't reach it, then there was obviously a problem with the engrams and more counseling was needed. At one seminar, we were instructed on how to get patients to pay in advance for treatment, preferably in cash. While that is legal,

the doctors were told they didn't need to put such cash in a trust fund for that patient, which is illegal.

We were also taught how not to let the patients say no to treatment. We were told that anyone who believed that patients had the right to free thought should never come in contact with the patients. We were instructed to "ruin" any argument the patient had concerning their treatment. This seminar cost the doctor approximately \$1000. Naturally, this is only one account of the character of scientologists. But I don't think my opinion is solitary. Not only is dianetics not a science, but scientology is not a church. It's a mass-marketing scheme to make money. Hubbard's son wrote a book called "L. Ron Hubbard: Myth or Madman?" In it, L. Ron Hubbard is quoted as saying to a convention of science fiction writers, "If you want to make money, start a religion."

To me, that says it all.

Julie Richard

Mr. Carrol, Thank you for your reply. If you have not already done so, you may want to contact Time magazine for more information about scientologists tactics. A few years ago, they did a rather extensive cover story on scientology, and the author received numerous threats, both physical and legal in nature. So do not be surprised if you receive the same. Personally, I have no objection to your including my story to your dictionary, nor do I object to my name being used. Although I am fully aware of what scientologists can do to people who oppose them (ask the former mayor of Clearwater, Florida, who was framed and later exonerated on a hit-and-run murder charges), I have no intention of hiding behind anonymity.

Thank you for your time and effort in exposing the likes of scientologists.

Julie Richard

reply: I have only received a few notes from Scientologists, none of them threatening.

Mr. Carrol,

As far as prosecutions go, there were several high-ranking members of scientology who were arrested during a raid on scientology headquarters by the IRS. It was during this raid that the evidence was found that they had framed the mayor of Clearwater. There was also a reporter who was framed for arson. One of the scientologists arrested was Hubbard's wife. This was several years

ago (I want to say late 70's, early 80's), but the article in Time had all the details. If you ever are in Clearwater, Florida you won't believe your eyes. It looks like a navy base, with all the low level scientologists walking around in their white and blue uniforms. These are the members of the "Sea-Org" and have to sign million year contracts. They're usually people who don't have professions that will bring in thousands of dollars to the "church," so they're essentially slave labor for the hotels and stores. There are several stories of the way they live, and none are pretty.

Julie Richard

23 Jul 1997

*I just read your **Skeptic's Dictionary** entry on Dianetics with interest. I think I can add a bit to the history of this "science" and "religion."*

*Dianetics came out before the book you cite; Hubbard introduced it in the May, 1950, issue of **Astounding Science Fiction**, the earlier version of the magazine now called **Analog**. He was a popular contributor to **Astounding**, and I was a fan of his writing.*

At the time, I was friendly with the late Theodore Sturgeon, a distinguished science-fiction writer whose work I admired. Ted knew Hubbard fairly well, and told me that at a sci-fi convention the previous year Hubbard had told him and several other writers something like this: "You guys just wait. I've thought up a racket that's going to make me very rich. You'll hear about it in a few months."

Nevertheless, we were intrigued, and Ted and I tried "auditing" each other a few times. We dropped it partly because we didn't think it made much sense and, I have to admit, because Ted was much better at it than I was; he'd have made a good psychotherapist.

As to the Church of Scientology, I remember how that came about, though I'm a bit hazy on the details. The organization was then known as the Hubbard Dianetic Institute, and he had moved the headquarters several times, as it ran into tax and legal troubles of one kind or another. At some point in the 1950s, I believe it was, the Institute was headquartered in Wichita, Kansas, and having a lot of trouble with the state and Federal tax authorities. Then Hubbard had the bright idea of turning the institute into a church, which would be tax exempt! And he got away with it. So far as I know, only Germany refuses to recognize Scientology as a religion, and the "church" is fighting the German government with everything it has.

*By the way, Hubbard didn't start by using the term "engram," which of course he borrowed from biochemistry. In the **Astounding** article that introduced*

Dianetics, he called them "Norns," after the witches of Norse mythology. When the book was published, his Norns had been transmogrified into engrams.

*Thanks for the **Skeptic's Dictionary**. I love it. It's my belief that the current popularity of every kind of nonsense from acupuncture and astrology to reflexology, homeopathy, naturopathy, therapeutic touch and all the other "holistic" therapies is the result of a breakdown in our educational system some time after World War II. People who have been taught to think aren't susceptible to this kind of stuff.*

Keep up the good work.

Al Berger

reply: I wish it were simply a matter of a broken educational system. We might be able to fix that. I think the tendency to magical thinking is rather basic and universal. Compulsory education for the masses has been somewhat successful in mitigating the spread of weird beliefs and irrational thinking. But it is nearly impossible to counteract the power of the mass media to glamorize and exaggerate; to distort and pervert; to prey upon irrational desires, fears and hopes; to mystify the mundane and validate the irrational as it entertains. Traditional religions used to satisfy the thirst for the magical, but they have been unable, for the most part, to modify themselves sufficiently to compete with forces which can make an Andrew Cunanan seem more significant and interesting than a Justice William Brennan who died on the same day as the mentally ill killer but who received much less publicity.

23 Oct 96

I'm someone who's been fascinated (even morbidly so) by Scientology for many years now. The following comments may be a bit of a quibble but after reading the text I can't just put them aside.

In the third paragraph you mention that Scientology has no 'cosmological myths.' What, however, of the various stories of past star-spanning civilizations such as the Marcab Confederacy; the space-tyrant Xenu (or Xemu, take your choice); the 'loyal officers' who defeated and imprisoned him in the so-called 'Wall of Fire' (the notorious incident which happened 75 trillion years ago which involved detonation of h-bombs near well-known volcanoes which didnt even exist and is supposed to be the root cause of all humanity's current travail) and who are echoed today by the Scientology 'monastic' order, the Sea Organization? Would those not suffice as such myths, or do I misuse the defintion?

reply: These stories sound like the stuff of fantasy and science fiction. Some might find such stories interesting, entertaining or even enlightening. The

stories may even be myths. But they're not *cosmological*, i.e., they are not an attempt to answer fundamental ontological questions about the nature or origin of the cosmos (universe), such as "Why is there something rather than nothing?" Or "How did the cosmos originate?" "Is there a creator of the universe?" etc.

As I said, the above is really quibbling on my part, I'm sure. On the whole, the entry draws connections I've only speculated about with my limited (and largely self-) philosophical training. To put a point on it, I've always understood that LRH really only badly reinvented the wheel, just not exactly how. Now, however, I have a clue. Thanks.

And I cannot but agree that no matter how Scientology positions itself in the lives of its followers, it is not a religion at all.

Justin the Blue

23 Dec 1996

I just want to say that Scientology got me off drugs when I was a teenager and has given me a purposeful direction in life.

I have a strong desire to actually DO something about some of the problems of our society rather than just talk about them. I know that [Narconon](#) (the drug rehab that uses L. Ron Hubbard's technology) is an effective solution to addiction since it saved my friend's life from alcoholism. While I worked there, it also saved the life of a man who had been addicted to injectable methadone for 14 years! I also know that Criminon (the criminal rehab that uses LRH technology) is effective, as is Applied Scholastics (LRH's education technology and teaching method) in combatting illiteracy. These are just a few of the solutions that LRH discovered and made available to anyone who wishes to use them. For more details, have a look at <http://www.scientology.org>.

By telling people about these solutions (incidentally, none of which have anything to do with religion or belief in anything), I know I can make the world a safer, saner and happier place for all.

John Wood

Read on for some more comments from Mr. Wood.

28 Jan 1997

According to the US government, courts in many countries around the world and academic experts, Scientology is a bona fide religion.

reply: According to our Constitution, the U.S. government is not supposed to make any laws respecting religion, which I take to mean that the government is not legally allowed to define what is or isn't a religion. I've never taken a vow of silence on the matter of defining religion. Neither did L. Ron Hubbard. As for the rest of the world, they can call Scientology anything they want. Finally, I have yet to see an academic expert who has published a book on world religions which even mentions Scientology, much less considers it to be a religion. When the historians of religion start calling Scientology a religion, I may change my mind.

Who says myths have anything to do with it?

reply: Scientology has fantasies, not myths. A religion without myths is a mythtery to me.

Our creed can be found at the back of the "What is Scientology" book. It redefines the word "ethics" and puts the subject to practical use for individuals and helps countless organisations around the world succeed in business.

reply: Secular humanists have a creed, too. That doesn't make secular humanism a religion. I have to admit, though, that if your new ethics is aimed at making money, then you are in harmony with many Christians who seem to think that God shows His love by making people rich.

There is nothing obscure in Scientology - it is all extremely precise and exact. There is no dogma in Scientology. Yes, LRH was a science fiction writer. So what? Jesus was a carpenter.

reply: There is nothing obscure in the kabbala, either. And I used to be a taxi driver.

I haven't had a chance to read the rest of this page but if it is as inaccurate as the first paragraph, I urge you to delete it immediately. The information I have provided is not difficult to find. It's available on our web site and is in the "What is Scientology" book which can be found in almost every library in the world! You are, therefore, simply speading lies, knowingly, about my religion. You're not anything to do with the German government are you by any chance?

Regards,
John Wood

reply: Be careful, John. There are scientologists in Germany, too. Some of them may even be in the government. As for deleting this page, sure John. Why not? I'll delete it just for you.

papyromancy

Papyromancy is [divination](#) by folding paper.

According to some [psychics](#), those who know how to divine the future with paper could have forewarned us of the attacks on September 11th by [folding a \\$20 bill](#). A proper folding would also have revealed who was the main man behind the attacks.

Some consider folding money to retrodict the past to be nothing more than a parlor game. A true papyromancer, they say, can crumple up any piece of paper, unfold it, and predict the future from the creased lines in much the same way a [palmist](#) reads the lines of the palm or a [metoposcopist](#) reads the lines on your face.

Search the Skeptic's Dictionary

SkepDic.com

scapulimancy

Scapulimancy is a decision procedure used by the Naskapi Indians whereby the shoulder of a caribou is held over hot coals causing cracks in the bone which are then used to direct a hunting party.

What is interesting about such decision procedures as this and reading [crystal balls](#), entrails, livers, [palms](#), [ouiji boards](#), [biorhythms](#) or [astrological charts](#), [polygraphs](#), "scientific jury selection," the "[blue sense](#)", "etc., is that they "work!" A decision is always made after using them. It may not be the *right* decision or the *best* decision, but it is a decision nonetheless.

The fact that a decision is made is a relief, a comfort; it is satisfying to remove uncertainty and indecision. Occult and questionable decision procedures are likely to be especially attractive in situations where logic and rational thinking appear useless, such as in deciding whether to marry someone or where to go hunting when it doesn't seem that there is any game anywhere or where to invest in the stock market.

Irrational decision procedures can seem quite rational to their users not only because they "work" in the sense of arriving at a decision but they "work" in the sense of arriving at an acceptable or demonstrably satisfactory outcome, i.e., you're happy with your wife (or glad you didn't get married); the hunters find some game; your stock portfolio isn't much worse than anyone else's, maybe even a little better, etc.

divination

29 Feb 2000

Regarding your 'Skeptic's Dictionary' entries on divination and cold reading, I notice a certain lack of the usual reader comments telling you that you don't know what you're talking about. Please allow me to get in the first 'personal experience' shot on this occasion: You are absolutely right on the basics of fortune-telling. Allow me explain why I say this with such a degree of confidence. A few years ago I had me fortune told with uncanny accuracy and was deeply impressed. Only afterwards did I think back and realize that everything I had been told was either 'fishing' with a fair degree of inspired guesswork, or consisted of things I had already told the fortune teller, which he then recycled back to me. Intrigued, and eager to find out whether my skeptical interpretation was correct, I bought a pack of Tarot cards and learnt a bare minimum of the jargon. I had just moved to a foreign country to work, which gave me a huge advantage in being 'exotic and mysterious' and also meaning that nobody knew about my skepticism: I could safely claim to have learnt cartomancy from my [fictitious] gypsy grandmother [or some such nonsense] without anyone calling me out. Within a short time, I had developed a reputation as a brilliant fortune teller and had people coming round to my house offering me money for readings (which I did not take). Two points stand out from all this: firstly, the secret of accurate fortune telling is a trick, more 'sleight of thought' than 'sleight of hand' but using a similar distraction technique; and secondly, it relies almost wholly upon the querent's wishful thinking and lack of accurate self-perception. Nothing that I have seen since my fortune-telling days has convinced me otherwise. If anyone does write to you saying 'Yes, but I really can tell fortunes', refer them to this answer from me: 'So can I, and there's nothing mystical about it at all, however much you may delude yourself'.

Tim Byard-Jones

31 Mar 1997

*I like your entry on divination. I was especially intrigued by **aeluromancy** (dropping wheatcakes in water and interpreting the result) which I guess is not to be confused with dropping cats in water and interpreting the result (which I would think would also be "aeluromancy" or maybe "ailuromancy" or "eluromancy"). Speaking of which, for a suitable fee, I could tell you with amazing accuracy what the results of dropping a cat in water would be. Does*

that mean I'm psychic?

Personally, I think oinomancy would be a lot more fun.

Karl Jennings

reply: Actually, I think dropping cats in water is a type of *hydromancy*, though it depends on what kind of water is used. I think the practice of throwing women into rivers to divine whether they were witches or not (if she sinks and drowns, then she's not a witch) falls into this same category.

As far as being psychic goes, I feel safe in saying that you are probably as psychic as the next person.

the divine fallacy

The divine fallacy is a species of non sequitur reasoning which goes something like this: *I can't figure this out, so God must have done it. Or, This is amazing; therefore, God did it. Or, I can't think of any other explanation; therefore, God did it. Or, this is just too weird; so, God is behind it.*

This fallacy is also a variation of the alien fallacy: *I can't figure this out, so aliens must have done it. Or, This is amazing; therefore, aliens did it. Or, I can't think of any other explanation; therefore, aliens did it. Or, this is just too weird; so, aliens are behind it.*

Another variation of the fallacy goes something like this: *I can't figure this out, so paranormal forces must have done it. Or, This is amazing; therefore, paranormal forces did it. Or, I can't think of any other explanation; therefore, paranormal forces did it. Or, this is just too weird; so, paranormal forces are behind it.*

Dogon and Sirius II

11 Feb 99

*Hi, I got to your site from Hotbot, while looking for information about the Dogon tribe. I don't know how long it's been since you updated the page but you may be interested to know that the Dogon tribe investigators had (publicly, since 1976) claimed that they also had knowledge of a third star in the Sirius system. And that in 1995, that third star **was** found.*

In 1995, the French Astronomers Daniel Benest and J. L. Duvent published the results of years of study in the journal Astronomy and Astrophysics ["Is Sirius a Triple Star?" Volume 299, 1995 pages 621-628. Article received 11th Oct 1994, and accepted for publication on 8th November 1994.] stating that a small red-dwarf star seems to exist in the Sirius star system. They have detected a perturbation in the orbit that cannot be explained by any other means.

*I'm all in favor of critical thinking. Loved Sagan's book, *The Demon Haunted World*. But information like this is readily verifiable and bears consideration before you dismiss Temple's work as that of a crank.*

John Finnan

reply: OK, I've considered this new information and I still dismiss Temple's work as that of a crank.

1 Apr 1996

Upon reading the piece on the Dogon and the Sirius connection I was disturbed at how quickly you dismissed seven years of research. I wonder if you have actually read the book. As far as Carl Sagan is concerned, his explanation of a local connection is rather feeble.

For one thing, the Dogon have had the Sirius based traditions for many generations before Carl Sagan or the French anthropologist happened upon their existence.

There is a big difference between a "transmission" of a concept (i.e.. white dwarf = heavy) and the actual tracking of an "invisible" star. As I mentioned above, these people had information on Sirius A and B long before Griaule and Dieterlan came onto the scene. Unless Europeans can travel back in time and affect several generations of the Dogon (i.e.. "transmitting" scientific

cosmology in terms the Dogon could translate into entire cultural identity), Sagan's explanation is unfounded. Sagan's reputation as the debunker's debunker may shed some light on the incredulous explanation given. I would like to ask you that given the more than remote possibility that he is incorrect, how would you explain the Dogon knowledge of Sirius B. I would also like you to know that the Sirius B was not even photographed until 1970 by Irving Lindenblad of the US Naval Observatory. Also, According to Arthur C. Clark'

"...Sirius B is about magnitude 8 - quite invisible even if Sirius A didn't completely obliterate it"

Temple transcribed Griaule and Dieterlen's article called "A Sudanese Sirius System". It describes the Sigui ceremony which occurs every 60 years. Below is a sample:

*"More consistent evidence of the celebration of the Sigui is provided by the large wooden mask, whose carving is one of the major concrete purposes of the ceremony. This mask -usually of considerable size - is seldom used and is kept in some shelter or hideaway in the rocks, along with those which have been carved at previous ceremonies. The care with which these masks are treated - for in some ways they are the village archives - means that it is not uncommon to come across series of three or four of them, the oldest of which date back, respectively ***to 1780 and 1720***, give or take a year or two. In exceptional cases, when the shelter has been well selected and under constant surveillance, the series may be longer still; thus at Ibi, in 1931, nine poles were counted, and these must have succeeded three more which had been reduced to a few fragments and piles of dust and were still visible; as were the special places earmarked for them at the back of the shelter, all perfectly protected from damp, vermin and animals. The oldest in the series of nine, which showed a continuous progression of ageing in the course of time, thus date from the beginning of the ***fifteenth century***; and if the three others are taken into account, the remnants of the earliest would date back to the first half of the ***thirteenth century.***" *The Sirius Mystery* pg.37-39*

Since neither the Europeans or anyone else had access to a telescope in the thirteenth century let alone the 1700s, Sagan's "transmission" idea is laughable. Now, one could dismiss the accounts presented by the French anthropologists or even that the Dogon people quickly developed ageing techniques to wood in order to fool all of us that the world was visited by advanced beings. What a terrific hoax this would be.

My annoyance here is not with the possibility that Temple's idea is wrong for

he states that he could very well be wrong, but with the blindness and pseudo-intellectualism burped up by skeptics. If you are a true skeptic then you would withhold your judgments until the facts present themselves. Either you didn't read the book or you simply dismissed the idea before it had a chance, for the facts within this book are extremely difficult to dismiss or counter.

As far as Temple's "one" piece of evidence (the sand diagram), by reading Griaule and Dieterlen's account you would see that there is more than "one" piece of evidence. In fact there are many and in several different places (this being the individual villages that house the masks and poles).

I find it difficult to understand why someone would be so entirely close-minded. This particular book could only be dismissed by the most narrow of minds. Do you also dismiss the scientific attitude that life on other planets is not only probable but the chances of no other life is improbable.

Dr Su-Shu Huang of the Goddard Space Flight Center, Maryland has written,

*"planets are formed around the main-sequence stars of spectral types later than F5. Thus, planets are formed just where life has the highest chance to flourish. Based on this view we can predict that nearly all single stars of the main sequence below F5 and perhaps above K5 have a fair chance of supporting life on their planets. Since they compose a few per cent of all stars, life should indeed be a common phenomenon in the universe."
The Sirius Mystery pg.14*

There is an quick history of Sirius B discovery on page 33-34 of Sirius Mystery. 1862 was the first time, using a telescope, that Sirius B was seen with the human eye. Unless the Dogon have supereyes or some superhuman ability it is impossible for them to have developed their calendar without help.

*I wonder if you would be laughing at Galileo....
--Jason Gray*

reply: As Sagan once noted, remember that they also laughed at Bozo the Clown.

04 Aug 1996

Although Mr. Jason Grey's tone was a tad on the condescending side, he makes some essentially valid points. From my limited knowledge of this mystery (Reader's Digest mystery type books:), I do recall mention of Dogon religious doctrine proclaiming that a single inhabited planet orbits the Sirius binary system. Wouldn't the space telescope be able to detect with some degree of accuracy a wobble in the orbits of both stars if a planet did indeed

exist in that star system? I think it would be well worth the tax payer's money to point the space telescope at the Sirius system and validate/invalidate this mystery once and for all!!!

Steven Rutter

reply: I can think of a few other projects I'd rather see our taxes supporting, like an Institute for Higher Skepticism.

28 Oct 1996

I don't know whether there's a real mystery involving the Dogon and Sirius B or not. I do know that Randi has made an absolute fool of the "skeptics" who take his critique of Temple's book at face value.

Firstly, Temple never claims that the Dogon themselves have or have had contact. He hypothesizes that the contact took place at around 3000 BCE.

*Second, the famous sand drawing. On page 47 of Temple's book you can find the "censored" version of the diagram--a full-page reproduction, no less! While Temple does also give versions omitting some elements (to remove symbols irrelevant to his particular point), neither of the two corresponds with the version Randi gives--one includes less, one more. So, why haven't any of the "skeptics" had the skepticism to check Randi's reference? Just flipping through Temple's book would fully discredit what Randi says. Why don't any of them call Randi on this: shouldn't they want to expose this kind of fraud? Or should we have taken Randi's title [**Flim-Flam!**] at its word?*

The Demon-Haunted World - Science as a Candle in the Dark

by [Carl Sagan](#)

(New York: Random House, 1995)

The Demon-Haunted World is a collection of twenty-five essays, several written with Sagan's wife, Ann Druyan. The essays range in scope from eloquent paeans to science to impassioned denunciations of bigotry, from humorous accounts of a variety of pseudoscientific endeavors to serious attempts to understand the nature of alien abduction delusions. With intelligence and wit, and the rational calmness that is his trademark, Sagan takes on a wide variety of topics, among them: alien abductions, astrology, Atlantis, the *Bell Curve*, channeling, crop circles, demons, electromagnetism, ESP, the face on Mars, fairies, faith healing, magic, miracles, prayer, religion, Roswell, satanic rituals, therapy, and, of course, one of his favorite topics, UFOs and extraterrestrials. Only Velikovsky gets ignored this time around. Through each of his essays he extols the virtues of skepticism, empirical evidence and control studies, while uncovering a multitude of errors and weaknesses in the positions of occultists, paranormalists, supernaturalists and pseudoscientists. And he does so with extreme grace, gentility and civility.

In fact, if there is anything I disagree with in Sagan's book it is probably his encouragement of skeptics to be as civil as he is in dealing with what skeptics see as the dark that extinguishes the candle. He writes

...the chief deficiency I see in the skeptical movement is in its polarization: US vs. Them--the sense that *we* have a monopoly on the truth; that those other people who believe in all these stupid doctrines are morons; that if you're sensible, you'll listen to us; and if not, you're beyond redemption. This is unconstructive....whereas a compassionate approach that from the beginning acknowledges the human roots of pseudoscience and superstition might be much more widely accepted.

If we understand this, then of course we feel the uncertainty and pain of the abductees, or those who dare not leave home without consulting their horoscopes....such compassion for kindred spirits in a common quest also works to make

science and the scientific method less off-putting, especially to the young.

Many pseudoscientific and New Age belief systems emerge out of dissatisfaction with conventional values and perspectives--and are therefore themselves a kind of skepticism.

I can't deny that there is a strong appeal in this call for compassion, for seeing the occultists of the world as after the same thing skeptics are after, and for recognizing the skepticism in those who adhere to pseudoscientific or New Age spiritual notions. If the goal were to try to get the true believer to give up his or her beliefs, then I would agree that an aggressive campaign which arrogantly maintains that it is better to live according to evidence than according to wishes might not be the best tactic. But, the aggressive, blunt, seemingly arrogant approach might be best if the goal is not to convert true believers to skepticism but to provide ideas which will counterbalance the plethora of occult, pseudoscientific, supernatural and paranormal notions which pervade just about any atmosphere in America, or the world, for that matter.

These aggressive methods may be the best ones if the goal is not to help persons who have been encouraged by therapists to think they've been experimented on by aliens, but rather to deter present and future therapists from encouraging patients to accept such beliefs as true and from using hypnosis to recover repressed memories. Such methods can evoke false memories of terrible things which probably never occurred. There is little to be gained, I think, in being compassionate with therapists who have no regard for truth and who encourage their patients to remember childhood abuses regardless of whether the abuses happened or not. Therapists who care for the truth are more likely to get aroused and make some effort to halt the abuses of their colleagues if we make a loud enough noise. And perhaps a future patient of one of these abusive therapists will have heard our angry voices and remember what we've said and question the therapist's methods.

Blunt and direct methods may be called for if the goal is not to persuade someone to give up astrology, crystals or tarot cards, but rather is to try to prevent someone in the future from seriously considering such things as reasonable guides to life.

I agree that it is unconstructive to be dogmatic, to call other people 'morons' or their ideas 'stupid.' I also agree that compassion is the appropriate response for people who have been duped by deluded therapists into believing incredible and harmful things. But I don't think it is the appropriate response to the therapists. We should go after them, and go after them aggressively with the bluntest instruments our language can muster. Likewise for the purveyors of pseudoscientific and New Age rubbish. To the L. Ron Hubbards,

Helen Schucmans, Aleister Crowley's, John Macks, Budd Hopkins and Wade Quattlebaums of the world I say *show no mercy!*

Although some skeptics may take issue with Sagan's genteel style and grandpaternal tone, none of us will find fault with his skilful and recurring emphasis on critical thinking. The more blunt and vulgar among us refer to the need for a crap detector; Sagan provides instruction for building one's "baloney detection kit." He covers several common fallacies and ways to avoid them. He emphasizes the need for skepticism in critical thinking and the necessity for verification and corroboration of claims before accepting them. And he returns again and again to the role of the mass media in forming our characters and opinions. He is especially concerned with the fact that more and more mass media operations are coming into the possession of fewer and fewer individuals or groups. The potential for abuse of power is obvious but, as Orwell said, we have to keep pointing out the obvious. Sagan is hopeful that the internet will be an antidote for this concentration of control over information. So am I.

Another favorite theme of Sagan's is the need for scientists to be communicators, to use the media and the classroom to explain to the masses the truths and beauties of science, instilling in them the sense of wonder which drives people like himself. His criticisms of typical science instruction in America and the paucity of science writers for popular markets are right on target and worth studied perusal by science educators.

It is easy to recommend a book so reflective of one's own views, especially views which are skeptical of belief in God and an afterlife. It is even easier to recommend a book which, even though it covers topics and ideas the reader has gone over a thousand times, does so in a style which makes them seem fresh, is rarely dull, and quite frequently stimulates the reader to want to think about these issues more deeply and wonder if there isn't more he could be doing to make this world a better, saner, more rational place for our children and grandchildren.

R.T.C.
July 10, 1996

postscript: Carl Sagan died on December 20, 1996, and it now seems apparent that *A Candle in the Dark* was meant to be his epitaph. Nothing could be more fitting, for if anyone has been light in these Dark Ages, it was [Carl Sagan](#). But he was more like one of [Velikovsky's](#) comets, showering the earth with gifts as he passed through.

08 Nov 1996

I have visited your page several times in the past 6 months, especially the skeptic's dictionary -- it's great! But today I discovered and read your review of Sagan's book, *The Demon-Haunted World*, and I just had to write and let you know that I think your review is accurate and very well-written. I am about two-thirds of the way through the book now and I agree with everything you said. I have been the most surprized by the amount of criticism Sagan levels at religion. He is usually careful not to offend the religious too much, but in this book he writes some scathing observations on various aspects of religion through the ages. At this point (I have just finished reading chapter 16), the only criticisms of the book I would make are that I don't like the way Sagan refers to nature as Nature (too New-Agey for me) and I think he is far too kind to those who cling to irrational beliefs in the supernatural, paranormal, and pseudoscientific and to the likes of John Mack and the other so-called therapists who plant false memories in susceptible people. I prefer the Randi approach myself - blunt and direct. In closing, thanks for the outstanding web page - a candle in the dark.

ley lines

Ley lines are alleged alignments of ancient sites or holy places, such as [stone circles](#), standing stones, cairns, and churches. Interest in ley lines began with the publication in 1922 of *Early British Trackways* by Alfred Watkins (1855-1935), a self-taught amateur archaeologist and antiquarian. Based upon the fact that on a map of Blackwardine, near Leominster, England, he could link a number of ancient landmarks by a series of straight lines, he became convinced that he had discovered an ancient trade route. Interest in these alleged trade routes as sources of mystical energy has become very popular among New Agers in Great Britain.

Today, ley lines have been adopted by New Age occultists everywhere as [sources of power](#) or energy, attracting not only curious New Agers but aliens in their UFOs and locals with their [dowsing](#) rods. These New Age occultists believe that there are certain sites on the earth which are filled with special "energy." [Stonehenge](#), Mt. Everest, [Ayers Rock in Australia](#), [Nazca in Peru](#), the Great Pyramid at Giza, [Sedona \(Arizona\)](#), [Mutiny Bay](#), among other places, are believed to be places of special energy. There is no evidence for this belief save the usual subjective certainty based on uncontrolled observations by untutored devotees. Nevertheless, advocates claim that the alleged energy is connected to changes in magnetic fields. None of this has been scientifically verified. Maps have been produced, however, with lines on them which allegedly mark off special energy spots on earth. For example, the Seattle Arts Commission gave \$5,000 to a group of New Age dowsers, the Geo Group, to do a [ley line map of Seattle](#). Photographs of the result, which looks like a defaced satellite photo of the Seattle area, can be purchased for \$7.00 from the group. It proudly proclaims that the "project made Seattle the first city on Earth to balance and tune its ley-line system." The Arts Commission has been criticized by skeptical citizens for funding a New Age, pagan sect, but the artwork continues to be displayed on a rotating basis in city-owned buildings within Seattle.

Citizens had every right to be skeptical. Here is what the Geo Group has to say about their project:

The vision of the Seattle Ley-Line Project is to heal the Earth energies within the Seattle city limits by identifying ley-line power centers in Seattle, neutralizing negative energies and then amplifying the positive potential of the ley-line power centers. We believe the result will be a decrease in disease and anxiety, an

**increased sense of wholeness and well-being
and the achievement of Seattle's potential as a
center of power for good on Spaceship Earth.**

The Geo Group's vision is little more than a profession of faith. It is reminiscent of the claim of [Transcendental Meditation](#) that group meditation could reduce local crime rates. The Geo Group's methods have been just as effective.

The Quadro QRS 250G "Detector"

"If it works, I think it could be a real good tool and deterrent in our school system," said one high-school principal. *Gastonia Gazette*, April 6, 1995

The Quadro QRS 250G (the Quadro Tracker) is a plastic box with an antenna which was sold by Quadro Corp of Harleyville, South Carolina, as a detector of just about anything: drugs, weapons, golf balls, even lost coon dogs. Wade Quattlebaum's invention sold for about \$1,000 each. Some schools and government agencies spent as much as \$8,000 for the device which turns out to be good only at detecting suckers who can be easily parted with other people's money (i.e., our taxpayer dollars). Sandia Labs of Albuquerque, New Mexico, took one apart and discovered that there is nothing inside. It probably costs about \$2 to make. For their trouble, Sandia labs was threatened with a lawsuit by Quadro. Quadro did not threaten to sue the FBI, however, when its tests determined that the Quadro Tracker was incapable of detecting anything. According to the FBI, the device was little more than a piece of plastic. Quadro may have had nothing in their Tracker but they certainly had chutzpah in their marketing: the FBI was one of their target markets.

On January 19, 1996, the FBI Economic Crimes unit seized the merchandise and records of the Quadro Corporation and arrested its officers. In April, 1996, a federal judge issued a permanent injunction against Quadro Corp, which was convicted of engaging in a mail and wire scheme to defraud customers, under statutes 18 U.S.C. 1341 and 1343. In court it was pointed out that the Quadro Detector had been carefully examined and that no "inductors, conductors, or oscillators" were found, though Quadro advertised those as the working parts of its "secret technology." Quadro claimed that theirs were not "ordinary" inductors, conductors, or oscillators. Theirs are of an advanced sort not yet known to "regular science."

The FBI sent out a bulletin to their branches warning that "A device marketed to law enforcement agencies nationwide, the Quadro Tracker...is a fraud. All agencies should immediately cease using the device...." Even so, several law enforcement officers, as well as several school principals, still swear by their QRS 250G Detectors.

How could such smart people be so easily deceived? Perhaps it was the technical sounding literature sent out by Quadro Corp. Quadro claimed that the device uses "tuned frequency chips" to hone in on its target:

The frequency chip is oscillated by static electricity produced by the body [of the user] inhaling and exhaling

gases into and out of the lung cavity. This static electricity is propagated on the surface of the body to the tracker which utilizes the charge to oscillate the chip....[A]ll matter contains exact molecular frequencies. When a magnetic field is created by a contained electrically charged body moving through space at a perpendicular angle moving to its direction, and that field is brought into alignment with another exact field, resonating at the identical frequency modulation, then both objects attract, just as two bodies are attracted toward each other in a gravitational field.

Most purchasing agents would be ignorant of electrical engineering and would not know that the above gobbledygook is gibberish.

Perhaps potential buyers were impressed by the names of the people who endorsed the device:

William Koopman, Val-Comm Inc., Albuquerque, NM

Steve Lassiter, Drug Task Force, Albuquerque, NM

Larry DeWees, Principal, Farmington High School, NM

Clifford Weber, School Supt., Bloomfield, NM

Nancy Radford, Vice-Principal, Bloomfield H.S., NM

Troy Daniels, Resource Officer, Bloomfield H.S., NM

Ralph Navarre, Principal, Mesa Alta H.S., Bloomfield, NM

Capt. Ben Boozer, Dept. of Corrections, Crozier, VA

Raymond Gomes, Inspector General, Richmond, VA

Sgt. Marilyn Chambers, National Guard, Richmond, VA

Jim Morrison, National Guard, Richmond, VA

Brian Clements, Dir.of Security, Galena Park, Houston TX

Lt. Bill Munk, Police Department, Austin, TX

Don Plybon, US Customs, Charleston, SC

Cpl. Billie Johnson, North Charleston PD, SC

Bruce Parent, FL Dept. of Trans., West Palm Beach, FL

Pip Reaver, Adlerhorst Training School, Riverside, CA

Pete Blauvelt, Nat. Alliance for Safe Schools, Lanham, MD

Michael Ferdinand, Interquest Group, Inc., Houston, TX

Any intelligent investigator should know that [testimonials](#) are not scientific evidence. Such testimony should be considered worthless when considering the purchase of allegedly high-tech commercial products.

James Randi, in one of his Hotline reports, noted that he had heard from Interquest Group, Inc., Vice President Michael Ferdinand. Interquest, says Randi, is "a reputable and well-known company which train dogs for use in contraband detection." Their endorsement of the Quadro Detector quoted them as saying

"Using the Quadro as a stand-alone unit certainly locates the drugs..."

and

"Since I discovered the Quadro unit, I have introduced it into my K-9 teams with great effect. In fact, I am now helping schools to acquire their own units..."

Randi continues:

But after Interquest personnel attended the mandatory training session in Harleyville, S.C., and had the device examined by Southwest Research Institute (SRI) in San Antonio, Texas, the tune changed. Says Ferdinand now:

We, too, fell victims to the hustle of the 'Quadro Tracker'.... we now recognize that the entire training mission was staged.... based upon the conclusions of [the SRI] report and our inability to achieve any form of consistent results with the product, we disassociated our company from the Quadro Corporation. At present, we remain some \$10,000 in the hole as a result of our encounter with the Quadro Corporation as well as sustaining a certain degree of damage to our otherwise flawless reputation....

The SRI lab report stated in its conclusion that:

the tracker is not functional and the operating principle suggested by the manufacturer is scientifically highly questionable at the very least. Both analyses support the suspicion that the tracker is a fake device.

SRI tested the two "Training Samples" sold to Interquest with the Quadro,

and found nothing inside but "epoxied scrambled dead ants."

One of the other people listed in the Quadro list of testimonials denies he ever said what they say he did. Corporal Billy Johnson, a K-9 officer with the North Charleston police department, was quoted by Quadro as saying, "There is no doubt that the Quadro Tracker can do everything the dogs can do, and from a much greater distance." Corporal Johnson told Randi that he never said any such thing and that his department did not purchase the Quadro Detector.

Randi also heard from the boss of Don Plybon, the U.S. Customs agent listed as endorsing the Quadro toy. Writes Randi:

Quadro had published a quotation from Plybon in which he related an account of a "positive for gunpowder alert" that the stick gave him when pointed at a Russian plane at Charleston, SC, airport. The customs agent, said the Quadro ad, decided that "the plane was loaded with used guns." But when they then unloaded the cargo and searched the plane, they found nothing. So, says the ad, they "checked the grease on the ramp" and decided that the Quadro couldn't be wrong, that there must have been "something in the grease" that made it "alert." What really happened? Gee, could it be that the customs agent made a boo-boo, because he was naive enough to think that the thing actually worked? Why else would his boss call me and forbid me to write to agent Plybon any more? And where does he get the colossal nerve to forbid me to do anything? I made my opinion quite clear to him, I assure you. When the boss has to call me to tell me to stop challenging his employee, I begin to wonder... In any case, Quadro has been warned to stop using agent Plybon's name in the advertising they can no longer send out.

Quadro may be closed down but there are others waiting in the wings to surpass even Quadro's wildest claims. [DielectroKinetic Laboratories \(DKL\) brought out its LifeGuard](#), with models ranging from \$6,000 to \$14,000. DKL claimed its device could identify a human heartbeat 500 yards away, through concrete, earth, or water. The DKL LifeGuard was tested by [Sandia Labs](#) in April, 1998. The device failed to perform any better than expected by chance. In October 1998 Sandia took a DKL LifeGuard apart and found that the [electronic components could not possibly function as advertised](#).

Finally, there is the Super-Sensor Dowsing Rod which can be ordered from [Psi-Tronics Visions](#). Here is what Psi-Tronics says you can do with their device:

You can dowse the past, present or future. Future events

are subject to the laws of probability and free will so it doesn't always work for the lottery. But in other uses you are limited only by your imagination. Locate underground water, pipes, minerals, oil, etc. Locate fish and game animals, or missing persons. I know people who use it to predict the stock market, marketing trends, business opportunities, and to isolate production problems. I know mechanics who dowse to determine mechanical problems in cars, and other machinery and maintenance workers who use dowsing to find underground water lines, leaks, and electrical problems. Professional health workers, chiropractors, dieticians, and people who diagnose illness use dowsing to check their findings. Holistic healers and herbalists use it to prescribe vitamins. In the home, use it to find lost articles and to make decisions. Dowse the telephone book to find a number or the yellow pages to determine who will serve you the best. Check up on your kids to see if they are all right. Check to see if the weather will be good, and what clothes you should wear.

How many public agencies will spend taxpayer money on this magical dowser or other equally useless devices marketed with equally preposterous claims?

reader comments:

dowsing

14 Jul 2000

Your book is very interesting. I have been a skeptic most of my life. As I get older, I seem to find more cases where valid problem and solutions are being presented with totally false explanations. It is quite easy to toss out the solution because the explanation is wrong. A case in point which you have covered: dowsing.

A couple years back I needed to locate some pipes and wires on my country home. A friend offered to dowse for them, I declined. My brother offered an electronic cable finder which works by inducing a radio current in the cable or pipe and uses a sensitive detector to locate the path and depth of the cable. It works wonderfully. While using it, my brother told me that while it works well at following a cable, its not very good at initially locating from distances more than 10 feet or if the detector is not at right angles to the cable. He said they often use a simple dowsing rod to find the approximate cable location. I thought, oh sure.

After we found the pipes and wires, he pointed out that you could see where they ran. A simple explanation: the dirt used to fill in the trench did not match the surrounding topsoil and so the vegetation had a slightly different color. But not enough to clue in a dowser I would guess. A few days later, I was driving my tractor over one of the marked locations, when I noticed a pronounce bump. The lights came on in my head: my 3 ton tractor was a dowser and I was a dowsing rod.

It is impossible to fill a trench level with the surrounding land. The dirt does not compress enough, so you end up with a mound and if you fill it level, it will settle and you get a depression. So any buried object will leave a mark, albeit very slight. If you are walking balancing a dowsing rod, it will respond faster than you can correct your stance (unconsciously usually) as you step up or down on the trench. The rod does not move, you do. A simple matter of gravity and inertia. So now I would say dowsing is a valid way to find buried objects, though certainly not by any of the explanations usually offered. Quite obviously, a cup of coffee would work just as well and I would not doubt somebody would explain the coffee is attracted to water or something just as goofy. I also suspect that underground streams and other forms of water may cause depressions or be caused by depressions. This may explain the long time use of dowsing to find water.

My real point is that I had dismissed dowsing because of the way it was explained. If I had tried it and it had worked, I might have deduced my theory earlier or at least admitted I did not know how it worked. Perhaps skeptics need to look more closely at widely held notions even when the explanations are impossible.

Al Ruf

reply: The skeptics I've read maintain that some successful dowsing is the result of using visual cues, including, but not limited to, depressions.

16 Nov 1998

I used to sell water conditioning equipment to farmers. After being in an area for a while I usually had a pretty good idea of how deep and what kind of water was available. I encountered a newly built house [whose occupants were] very impressed that the dowser was able to tell them that they would find 50 gallons per minute of water a 80 feet. I further impressed them by holding my test kit over the place the well was to be drilled and announcing that their water would have 8 grains of hardness and 5ppm of iron. After the well was drilled I came back to a sure sale. I was able to sell them the same equipment I sold to all their neighbours who tapped into the same aquifer. Scientific dowsing!

(After all, there were TEST TUBES in my test kit)!

Tim Boettcher

I must begin by giving my applause for an informative and insightful web site. I too consider myself a skeptic on such matters; however, I have witnessed certain phenomena for which I can provide no rational explanation.

reply: The absence of a rational explanation doesn't mean there isn't one. On the other hand, there may be some things which we cannot explain rationally. It doesn't follow from either of these premises that there is always a paranormal explanation, if only we were clever enough to grasp it.

During the summer of 1993, I visited Stonehenge where I observed a man and woman using divining rods to determine the whereabouts and intensity of "lei (?) lines" around the monolith. I approached the couple and enquired about their activities and, after some discussion, I was invited to "try out" the divining rods.

reply: You probably don't recall all the details of the discussion, but my guess would be that what was said to you by the couple influenced you

when you tried to do what they were doing. You may not have been conscious of their influence...you may even have consciously tried to resist being influenced. The mind is a funny thing. When I play golf, I sometimes get paired with someone who analyzes everything. I tell myself that I am ignoring what is said, that I will just hit the ball and not think about what I am doing, yet I inevitably find myself responding to my partner's analysis, despite all my efforts to ignore him.

Holding a rod in each hand, I was instructed to walk past the headstone. As I did so, the rods, which were both pointing directly forward, moved distinctly in an outward direction; as I passed the stone, they then moved back to their original position. I can assure you that I made no active effort whatsoever to influence the movement of the rods.

reply: Even experienced dowsers do not consciously make an effort to influence the movement of their sticks, wires, rods, etc. Yet, influence them they do, nonetheless.

While this experience does not make me a "believer," I am quite interested in any insights you might provide.

reply: I doubt if what I've said counts as an insight into anything, but my guess would be that you were influenced by what the couple said, even though you were unaware of this influence.

10 Jul 1996

I thought I would comment on dowsing. I'm a Hoosier by birth and upbringing and worked as a geologist in KY before earning my Ph.D. at Ind. Univ. While in Ky I was exposed to "dowsing." I thought you might be interested in knowing that in KY practitioners are called "water witches" and they use a "divining rod."

--Clay Harris

*Asst. Prof. of Geology
MTSU*

reply: I'm surprised they don't call it a "bedeviling rod."

Fri 8 Nov 1996

First, I have really enjoyed your dictionary, I don't always agree but it is most interesting.

Secondly, I take some issue with your position on dowsing. Having worked for

20 plus years in the construction business, it is not unusual for two pieces of copper wire (solid - #10) to be used as divining rods in order to find a pipe. Both plumbers and electricians have used this method with a high degree of success. I have personally used the method both on job sites and at homes to locate a buried pipe when the approximate location is known within 10' to 15'.

The use of the copper wires narrows the search to within a foot on either side of the location where the wires cross. The best explanation I have heard is that both water and/or conducting metals in the pipe create a small localized flux in the magnetic field thus enabling dowsing to be possible. I don't claim to have the final answer but it works for me.

John

reply: Your experience has been duplicated thousands of times, so why do I remain skeptical? What is "a high degree of success"? You and other dowsers found water or wires most of the time you used this method. If you do not compare how often you find water or wires *without* using this method, you do not have strong evidence that it was the dowsing that was responsible for your success. It may have been something else, such as the knowledge that comes from experience. I am sure it has occurred to you that electricians and plumbers have had numerous non-dowsing experiences in their trades and that what they learned from those experiences have helped them locate wires and pipes numerous times.

I don't doubt that the best explanation you have heard is that conducting metals in pipes causes a small localized flux in the magnetic field. But I doubt if this theory has been tested. If you decide to test it, I suggest you let non-plumbers and non-electricians do the dowsing. That will silence the skeptical critics who will claim that it was knowledge, not magic, that accounts for the success, if there is any.

14 Jan 1997

I am by my own admission, at least an agnostic and probably an atheist. I am very skeptical of the "supernatural". However, there are undoubtedly many things in this universe that are unknown to us.

reply: Well, we at least agree on that!

If I may continue. When I was a child some 40+ years ago, my grandfather bent 2 pieces of wire into "L" shapes and witched for water. When I was 16 (30 years ago) I worked for the Soil Conservation Service for the summer. Much of there work had to do with tiling on farms in the county. We had to go out and use long metal probes to locate tile. I was not as "smart" as I am now, so I bent two pieces of wire into "L" shapes, held one in each hand and walked in a

straight line until the wires crossed. Then I would probe at that point and locate the drainage tile. So rather than poking many holes in the ground probing for the tile, I would locate the tile within a foot. That summer, I worked with different teams of surveyors on many farms in the county. I would always witch for the tile and always locate it.

Great! Did you ever try any other techniques, e.g., did you ever look to see where the drainage tile drained? Did you do any visual observation of the lay of the land? Did you ever try just poking holes using "intuition" or coin toss?

Now, I realize that this should have been impossible and maybe it was. But, I was there and did that.

Why should it have been impossible? People stick holes in the ground and find what they are looking for all the time. I've even seen it done myself. If one has a little knowledge and experience, one tends to be "luckier" than those who lack both.

I've thought of trying it again, maybe when the snow departs the Midwest I go out in the country and again try it. Although, now I know it can't work.

Forever Skeptical,

Jim

reply: A better reason for not trying it might be that farmers might frown on your digging up their tile to prove the impossible! You'd be looked upon just like those pranksters who make designs in wheat fields.

2 Feb 1997

As a natural born skeptic myself I usually set out with the purpose of debunking claims that don't seem plausible. However, when it comes to witching or dowsing my grandfather had a widely known reputation as a successful witcher and my father also the ability to a high degree. Growing up I was always skeptical of his claims that the green branch he preferred to use was actually moving of its own accord, mainly because I had tried it on numerous occasions with no success. The branch never made any movement for me whatsoever. Then one day my father was using two brass rods bent at 90 deg. for a hand hold and the hand hold was inserted inside two short pieces of copper tubing thus allowing the brass rods to pivot freely inside while one held the pieces of tubing. Well, I decided to try this method and sure enough when I used them they would swing back and forth across each other in the exact same places where my Father had the rods move. Power of suggestion probably?

That was my first thought however upon further experimentation we noticed that over some places the rods would cross back and forth 15 times, sometimes

in another spot maybe 25 times before becoming still etc. Well, this made me wonder if it had anything to do with the depth or size of the body of water we were supposedly detecting. So we did further experimentation to try to see if there was a connection in this phenomena. We had a 3rd. party blindfold us and take us to various bridges over creeks , rivers etc. He did not tell us where we were at any time. Upon arrival at each location he would give one of us the rods and point us toward the stream , we would walk and stop as soon as he saw the rods make a complete swing. Then the process would be repeated with the other of us. He also silently counted the number of swings of the rods each time. Anyway, to shorten the story after the experiments we measured the height from the place we were standing each time to the water's surface. In each case there was a direct correlation between the number of swings of the rods and the number of feet to the water, it always worked to approximately 13 something inches for each swing of the rods.

Several years later I decided to have a well drilled on my property. I and my father both witched till we found the strongest and broadest area. Using my calculations I determined we should hit water at 42 ft. The driller hit water on the 1st attempt at approximately 40ft. and, no, I did not know of any other wells in the area at that depth. Most in the area were at approx. 72ft. I can't explain these effects but do know from my experiences that there is some kind of physical phenomena occurring

Thank You Sincerely **Doug Conaway**

reply: Most readers will probably recognize the flaws in your "controlled" experiment. You may have been blindfolded but your other senses were working as you "dowsed" for bodies of water. As for your personal well, well there is not much to say. If your story is true, all we know for sure is that you hit water and you were only off by two feet in your calculations. Was this luck, coincidence, application of knowledge and experience, or magic? We'll never know.

22 Apr 1997

We agree that the rod turns because of the person holding it. Why? I think it is quite simple. Make yourself a rod, preferably from a young tree with the sap flowing. I guess you know that one has to hold the rod in a special way. Do so. Now put some pressure inwards-upwards. Not too much: essentially it is enough to tighten the grip on the rod. It will turn downwards. The force is such that the bark will come off in your hands.

I once played a joke on a "rod-skeptic". I "found" water by the method above. He then passed the same patch without the rod moving. I got into a spiel about how I could transfer my powers to him. We walked the path again and when we came to the place I put my hand on his arm and whispered: "don't you feel it". Sure enough, the rod moved. Because he unconsciously tensed up and increased pressure.

Regards, **Pelle Nilsson**

lucid dreaming

...in order to dream, You gotta still be asleep.

--Bob Dylan, "When You Gonna Wake Up?" (1979)

The seventh type of dreams, which I call lucid dreams, seems to me the most interesting and worthy of the most careful observation and study. Of this type I experienced and wrote down 352 cases in the period between January 20, 1898, and December 26, 1912.

In these lucid dreams the reintegration of the psychic functions is so complete that the sleeper remembers day-life and his own condition, reaches a state of perfect awareness, and is able to direct his attention, and to attempt different acts of free volition. Yet the sleep, as I am able confidently to state, is undisturbed, deep and refreshing. I obtained my first glimpse of this lucidity during sleep in June, 1897, in the following way. I dreamt that I was floating through a landscape with bare trees, knowing that it was April, and I remarked that the perspective of the branches and twigs changed quite naturally. Then I made the reflection, during sleep, that my fancy would never be able to invent or to make an image as intricate as the perspective movement of little twigs seen in floating by. ---Frederik van Eeden, *A Study of Dreams* (1913)

Lucid dreaming is dreaming while being aware that you are dreaming. Lucid dreaming advocates strive to control and guide their dreams. Some desire to avoid recurring nightmares. Others desire fun. Some New Age lucid dreamers, however, believe that lucid dreaming is essential for self-improvement and personal growth.

Stephen LaBerge, Ph.D., claims that lucid dreaming is

a priceless treasure that belongs to each of us. This treasure, the ability to dream lucidly, gives us the opportunity to experience anything imaginable -- to overcome limitations, fears, and nightmares, to explore our minds, to enjoy incredible adventure, and to discover transcendent consciousness.

Ordinary dreams give a hint of these possibilities, through their regular violation of the rules of waking life, and their occasional offering of insights into our lives. The art of dreaming is a learnable skill, and I believe the highest level of that skill is found in lucid dreaming. Lucid dreams are dreams in which you know that you are dreaming, and are

aware that the dream is your own creation.

With lucidity comes an astonishing, exhilarating feeling of freedom -- the knowledge that you can do anything, unbound by any laws of physics or society. One of the first joys of many lucid dreamers is flying: soaring like a bird, freed from the restraints of gravity. From there, people can go on to discover the vast power of lucid dreaming for transforming their lives.

If you need help with your lucid dreaming, you can purchase books, tapes, scientific publications and induction devices, such as the DreamLight (\$1,200), the DreamSpeaker (\$150) or the NovaDreamer (\$275), from [LaBerge's Lucidity Institute](#). For \$2,000 you can attend a [seminar](#) at a beautiful tropical resort where you can learn all the latest techniques to help you tap into your "[unconscious mind](#)," an absolute necessity for living the good life. For an additional \$35 you can even get 2.0 units of nursing continuing education credit through the [Institute of Transpersonal Psychology](#).

Why Dr. LaBerge doesn't just advocate daydreaming to do all this wonderful transcendent stuff is explained by Frederick van Eeden. When we're awake, we are logical and feel restricted by conventional social rules and oppressive laws of nature. Our imaginations would be too repressed by our waking consciousness to allow us to let go and fly with spirits or view intricate twigs. So, we must sleep to free the imagination.

Although, LaBerge seems to advocate learning to control the *content* of our dreams so we can enjoy such experiences as *flying*, he claims that is not the case.

Lucidity and control in dreams are not the same thing. It is possible to be lucid and have little control over dream content, and conversely, to have a great deal of control without being explicitly aware that you are dreaming. Nonetheless, becoming lucid in a dream is likely to increase your deliberate influence over the course of events. Once you know you are dreaming, you are likely to choose some activity that is only possible in dreams. You always have the choice of how much control you want to exert, and what kind. For example, you could continue with whatever you were doing when you became lucid, with the added knowledge that you are dreaming. Or you could try to change everything--the dream scene, yourself, other dream characters, etc. It is not always possible to perform "magic" in dreams, like changing one object into another or transforming scenes. A dreamer's ability to succeed at this

seems to depend a lot on the dreamer's confidence. If you believe that you cannot do something in a dream, you will probably not be able to. [\[FAQ\]](#)

LaBerge seems to believe that our goal be to live in a dreamworld. Yet, the evidence is lacking that the more lucid dreams a person has the better off he or she is. The proof is not in on how having more flying or surfing dreams will transform one's life for the better. Such dreams may be fun but perhaps could they be had without spending thousands of dollars on Dr. LaBerge's dream aids.

For some lucid dreamers the main goal of lucid dreaming is to have lucid dreams that are indistinguishable from [OBEs](#). Flying free from the restraints of gravity in one's dreams takes some people out of their bodies to hover and watch themselves dreaming lucidly.

Some skeptics do not believe that there is such a state as lucid dreaming [e.g., Norman Malcolm, *Dreaming* (London: Routledge, 1959)]. Skeptics don't deny that sometimes in our dreams we dream that we are aware that we are dreaming. What they deny is that there is special dream state called the 'lucid state.' The lucid dream is therefore not a gateway to "transcendent consciousness" any more than nightmares are. But [LaBerge](#) claims that he has proved the skeptics wrong:

We provided the necessary verification by instructing subjects to signal the onset of lucid dreams with specific dream actions that would be observable on a polygraph (i.e., eye movements and fist clenches). Using this approach, LaBerge, Nagel, Dement & Zarcone (1981)[*"Psychophysiological correlates of the initiation of lucid dreaming," Sleep Research, 10, 149.*] reported that the occurrence of lucid dreaming during unequivocal REM sleep had been demonstrated for five subjects.

Well, that's a start. However, one should consider that self-awareness resides in the prefrontal cortex, which shows [reduced activity during sleep](#) for most people most of the time. This reduced activity may well be why we can dream of the most bizarre things without being aware of how bizarre they are until we wake up and remember them. Perhaps lucid dreaming is possible for some people because their frontal lobes don't rest during sleep.

dreams

5 Nov 1998

Mr. Carroll, I have a small correction. You wrote "With 5.9 billion people having an average of 250 dreams each per night," I believe that, on average, people have 5 to 7 dreams per night.

Bob Novella

The New England Skeptical Society

reply: There are typically several distinct periods during sleep when dreaming occurs. Most dreaming takes place during the four or five REM periods. If we relied on reports of dreamers to determine how many dreams per night a person has on average, the number would probably be smaller than 5. That is, I doubt if most people remember 5 to 7 dreams per night. A further difficulty in counting dreams is the fact that dreams are often so incoherent that a number of disconnected "themes" might be counted as one dream by one person, while another might count the same dream as ten or twenty distinct dreams. Since it is the "theme" rather than the exact dream that will be counted as a clairvoyant hit by those who believe in such things, I agree with Terence Hines that dreams ought to be counted by "themes" not by REM periods. I grant that the number of themes he arrives at is partly guesswork. In any case, he seems to have based his number on *The Mind in Sleep: Psychology and Psychophysiology* (Hillsdale, N.J.: Lawrence Erlbaum Associates, 1978) edited by A. Arkin, J. Antrobus and S. Ellman.

Hines writes: "In a single REM period, there are upwards of fifty dream 'themes'--snippets of more or less (often less) coherent 'story.' Thus, a normal individual will have at least two hundred fifty (five REM periods times fifty dream themes per period) dream themes per night." One might quibble about the exact number of dream themes on average a person has each night, but it is certainly much greater than the average number of REM periods.

17 Aug 1998

I enjoyed your recent article on dreams, and I wanted to share a story with you.

My father, the late Dr. Silas White, taught Physiological Psychology at Muhlenberg College for over twenty years. He discussed dreams and their lack of relation to the future in his class. He was frequently asked questions along the lines of, "But how can you explain that I dreamed that my brother broke his leg, and I found out the next day that he broke his leg at summer camp?" His stock response was, "How can you explain that I've dreamed dozens of times that I was walking around downtown Allentown, and I panicked when I realized I wasn't wearing any clothing, but it has never happened to me?"

Also, doesn't every graduate student dream at some point that somebody offhandedly asks them, "So, are you ready for that final in Electro Theology?" Of course, you then realize that you signed up for the class but forgot to ever go to it. I never had it until my father told me about it. Then I had it all the time.

druids

The druids were the "wise men" of the Celts. Although dozens of books have been written about them, almost nothing is known about the druids. Their beliefs were esoteric and passed on orally. Their practices, for the most part, were not public. With no written tradition and no major temples where art might provide a key to some of the druids' activities, we must rely upon the words and speculations of foreign observers.

The druids are mentioned by the ancient Roman authors Strabo, Diodorus, Posidonius and Julius Caesar, who portray them as overseeing bloody religious rituals. Hence, the druids are often thought of as having primarily a religious function and are often called 'priests.' Diodorus calls them 'philosophers.' Strabo calls them bards and soothsayers with a reputation for mediation. Whatever they were, the druids enjoyed a position of high status in Celtic society very unlike the position of modern "druids" who find solace communing with grass or the wind while parading around stone circles.

Modern "druids" treat [Stonehenge](#) and other megalithic monuments of the British Isles as places of worship. All of the stone circles, menhirs, dolmens, etc., of the British Isles were constructed by peoples who antedated the Celts by one to three thousand years. Stonehenge, for example, was built over a period of centuries, from 2800 BC to 1550 BC. The Celts did not arrive in the British Isles until long after the great megaliths had been erected.

It seems likely that the Celtic druids were a class apart from the warriors in Celtic society. "They served the tribes and clans as judges, prophets, soothsayers, wise men and as keepers of the collective memory" (Herm, 61). They were the intellectuals in a warrior society and have been compared to the Brahmins of the Indian caste system.

The word 'druid' is thought to derive from the Greek *drus* (oak) and the Indo-European *wid* (wisdom), "which produces the apparent absurdity of 'oak-knower' (Herm, 57). In any case, druids are typically associated with oak trees. Some say they held assemblies in sacred groves, that they prized the mistletoe growing on the oaks, or that they worshipped the trees themselves. However, the modern druids' nature worship is a fanciful connection to the ancient Celts. Finally, there is no direct historical connection between the Celtic druids and modern [Wicca](#).

Wicca

Wicca is a nature religion based upon beliefs and rites believed to be rooted in ancient practices. Wicca claims a direct connection to the ancient Celtic tradition, which is thought to be more in tune with natural forces than Christianity and other modern religions of the West. However, rather than see Wiccans as members of a religion, it might be more accurate to see them as sharing a spiritual basis in nature and natural phenomena. For Wiccans have no written creed which the orthodox must adhere to. Nor do they build stone temples or churches to worship in. They practice their rituals in the great outdoors: in parks, gardens, forests, yards or hillsides. According to a Wicca FAQ page

"Wicca" is the name of a contemporary Neo-Pagan religion, largely promulgated and popularized by the efforts of a retired British civil servant named Gerald Gardner [late 1940's]. In the last few decades, Wicca has spread in part due to its popularity among feminists and others seeking a more woman-positive, earth-based religion. Like most Neo-Pagan spiritualities, Wicca worships the sacred as immanent in nature, drawing much of its inspiration from the non-Christian and pre-Christian religions of Europe. "Neo-Pagan" simply means "new pagan" (derived from the Latin paganus, "country-dweller") and hearkens back to times before the spread of today's major monotheistic (one god) religions. A good general rule is that most Wiccans are Neo-Pagans but not all Pagans are Wiccans. [[Wicca FAQ](#)]

A good general rule seems to be that there is no single set of beliefs or practices which constitutes Wicca, though one belief seems to recur: *An' it harm none, do what you will*. Also, some rituals seem to recur.

Wiccans practice a number of rituals associated with such natural phenomena as the four seasons, the solstices and the equinoxes. Their symbols are based on the connectedness of Nature to human life. For example, they celebrate summer in a fertility rite known as Beltane. Rather than pray to some unnatural god beyond all experience, Wiccans seem more concerned with self-awakening, with arousing their connectedness to nature and nature gods, female as well as male. Their rituals seem to be metaphors for psychological processes. They sing, they dance, they chant. They burn candles and incense. They use herbs and [charms](#). Often, Wiccans favor herbs to traditional medicines. In group rituals they express their desires to the community. They don't cast [spells](#). They ask for blessings from north, south, east and west.

They meditate. They don't cook weird poisonous stews in cauldrons. They don't fly off on brooms. They don't pray for harm to their enemies. Because Wiccans seem to worship nature and nature goddesses and gods, they can be called [pantheists](#).

Wiccans do share one thing in common with Christians, however. Both believe that the indifferent destructiveness of Nature is essentially something good. We should be thankful for the blessings of Nature (or God), including the pumiced humans at Pompeii, the children swept away in flash floods, those sucked out of their homes by the tornado and thrown into the Guinness sky of the volcano, the millions who bake under an uncaring sun in parched lands, the innocent monsters deformed by uncaring biological laws, those devoured by great cracks in the earth, those drowned in hurricanes, the millions left homeless each year by indifferent forces ravaging an indifferent landscape. Only in their mythologies have Wiccan [magick](#) or Christian prayer stopped the flood, doused the lightning bolt, stilled the whirlwinds of tornado and hurricane, calmed the quaking earth, or put to sleep the tsunami.

The attractiveness of Wicca may be due to its friendliness towards women, its naturalistic view of sex and its promise of power through magick. It is very popular among women, and it is tempting to say that Wicca is women's revenge for the centuries of misogyny and "femicide" or "gynicide" practiced by established religions such as Christianity. Wicca, like the Celtic religion, allows women full participation in the practice. Women are equals, if not superiors, of men. Women in Celtic mythology are unusual, to say the least. They are intelligent, powerful warriors, ruthless, sexually aggressive, and leaders of nations.

Finally, it should be noted that Wicca is not related to [Satan](#) worship. That practice is related to the persecution of "[witches](#)" by Christians, especially during the medieval and Spanish Inquisitions, though not necessarily by the Inquisitors themselves. (See the [Malleus Maleficarum](#), 1486, which describes "the three necessary concomitants of witchcraft," namely, "the Devil, a witch, and the permission of Almighty God.") The spirit of the witch hunters, however, lives on in the hearts of many devout Christians who continue to persecute Wiccans, among others, as devil worshippers. The modern witch hunters do not demand purgations. Rather, they try to abolish Halloween, school mascots, books which mention witches, and any sign, symbol or number the Christians associate with Satan. (One local pizza house was even hounded for some markings it had on its delivery boxes. Local witch hunters claimed the markings were satanic signs. The pizza house changed its boxes rather than deal with adverse publicity.)

On the first day of spring in 1996, our local newspaper ran an article about a local coven of witches. The story portrayed the all-female group as harmless nature worshippers who dance in circles and ask for blessings from the north, south, east, west, etc. The article prompted a long letter to the editor decrying

the naiveté and ignorance of the author of the story on the local coven. Witches are in cahoots with Satan, said the letter writer, who signed off as "a survivor of [satanic ritual abuse](#)." The sincerity of the letter writer seemed as genuine as the sincerity of the women of Salem who confessed to being witches. Are the modern day victims of satanic ritual abuse as deluded as the witches hunted down by pious Christians through the centuries who truly believed that they were as evil as their persecutors said they were? Are the Wiccans of today part of a satanic conspiracy? I doubt it. If there are Christians who are being systematically abused by Satan worshippers, their abusers are not part of an international conspiracy known as Wicca.

true-believer syndrome

The need to believe in phony wonders sometimes exceeds not only logic but, seemingly, even sanity.

--The Rev. Canon William V. Rauscher

The true-believer syndrome merits study by science. What is it that compels a person, past all reason, to believe the unbelievable. How can an otherwise sane individual become so enamored of a fantasy, an imposture, that even after it's exposed in the bright light of day he still clings to it--indeed, clings to it all the harder?

--M. Lamar Keene

True-believer syndrome is an expression coined by M. Lamar Keene to describe an apparent cognitive disorder characterized by believing in the reality of paranormal or supernatural events after one has been presented overwhelming evidence that the event was fraudulently staged. Keene is a reformed phony psychic who exposed religious racketeering--to little effect, apparently. Phony faith healers, psychics, channelers, televangelist miracle workers, etc., are as abundant as ever.

Keene believes that "the true-believer syndrome is the greatest thing phony mediums have going for them" because "no amount of logic can shatter a faith consciously based on a lie." That those suffering from true-believer syndrome are consciously lying to themselves hardly seems likely, however. Perhaps from the viewpoint of a fraud and hoaxer, the mark who is told the truth but who continues to have faith in you must seem to believe what he knows is a lie. Yet, this type of [self-deception](#) need not involve *lying* to oneself. To lie to oneself would require admission that one believes what one knows is false. This does not seem logically possible. One can't [believe](#) or disbelieve what one *knows*. (*Belief* is distinct from *belief in*, which is a matter of *trust* rather than belief.) *Belief* and *disbelief* entail the possibility of error; *knowledge* implies that error is beyond reasonable probability. I may have overwhelming evidence that a "psychic" is a phony, yet still believe that paranormal events occur. I may be *deceiving* myself in such a case, but I don't think it is correct to say I am *lying* to myself. It is possible that those suffering from true-believer syndrome simply do not believe that the weight of the evidence before them revealing fraud is sufficient to overpower the weight of all those many cases of supportive evidence from the past. The fact that the supportive evidence was largely supplied by the same person exposed as a fraud is suppressed. There is always the hope that no matter how many frauds are exposed, at least one of the experiences might have been genuine. No one can prove that all psychic "miracles" have been frauds; therefore, the true believer may well reason that he or she is justified in keeping hope alive. Such thinking is not completely illogical, though it may seem pathological to

the one admitting the fraud.

It does not seem as easy to explain why the true-believer continues to *believe in*, that is, *trust* the psychic once he has admitted his deception. Trusting someone who reveals he is a liar and a fraud is irrational and such a person must appear crazy to the hoaxer. Some of them may well be mad, but some may be deceiving themselves by assuming that it is possible that a person can have psychic powers without knowing it. Thus, one could disbelieve in one's psychic ability, yet still actually possess paranormal powers. Just as there are people who *think* they have psychic powers but don't really have any such powers, there are people who have psychic powers but think they don't.

In any case, there are two types of true believers, though they are clearly related. One is the kind Keene was referring to, namely, the type of person who believes in paranormal or supernatural things contrary to the evidence. Their faith is unshakeable even in the face of overwhelming evidence against them, e.g., those who refused to disbelieve in "[Carlos](#)" once the hoax was revealed. Keene's examples are mostly of people who are so desperate to communicate with the dead, that no exposé of fraudulent [mediums](#) (or [channelers](#)) can shake their faith in [spiritualism](#) (or [channeling](#)). The other is the type described by Eric Hoffer in his book *The True Believer*. This type of person is irrationally committed to a cause like [murdering doctors who perform abortions](#) or to a guru like [Jim Jones](#).

True-believer syndrome may account for the popularity of [Uri Geller](#), [Sai Baba](#) or [James Van Praagh](#), but the term does not help us understand why people believe in the psychic or supernatural abilities of such characters, despite the overwhelming evidence that they are frauds and make their living by bilking people of great sums of cash. Since by definition those suffering from true-believer syndrome are irrationally committed to their beliefs, there is no point in arguing with them. Evidence and logical argument mean nothing to them. Such people are by definition deluded in the psychiatric sense of the term: they believe what is false and are incapable of being persuaded by evidence and argument that their notions are in error.

Clearly, if there is any explanation for true-believer syndrome, it must be in terms of the satisfaction of emotional needs. But why some people have such a strong emotional need to believe in immortality, racial or moral superiority, or even that the latest fad in management must be pursued with evangelical zeal, is perhaps unanswerable. It may have to do with insecurity. Eric Hoffer seemed to think so. He said

The less justified a man is in claiming excellence for his own self, the more ready he is to claim all excellence for his nation, his religion, his race or his holy cause....

A man is likely to mind his own business when it is worth

minding. When it is not, he takes his mind off his own meaningless affairs by minding other people's business....

The fanatic is perpetually incomplete and insecure. He cannot generate self-assurance out of his individual resources -- out of his rejected self -- but finds it only by clinging passionately to whatever support he happens to embrace. This passionate attachment is the essence of his blind devotion and religiosity, and he sees in it the source of all virtue and strength.... He easily sees himself as the supporter and defender of the holy cause to which he clings. And he is ready to sacrifice his life.

Hoffer also seemed to think that true-believer syndrome has something to do with the desire to give up all personal responsibility for one's beliefs and actions: [to be free of the burden of freedom](#). Perhaps Hoffer is right for many of the more severe cases, but many of the lesser ones may have to do with little more than [wishful thinking](#).

A study done by psychologists Barry Singer and Victor Benassi at California State University at Long Beach illustrates the will to believe in psychic powers in the face of contrary evidence. They brought in a performing magician, Craig Reynolds, to do some tricks for four introductory psychology classes. Two of the classes were not told that he was a magician who would perform some amateur magic tricks. They were told that he was a graduate student who claimed to have psychic powers. In those classes, the psychology instructor explicitly stated that he didn't believe that the graduate student or anyone else has psychic abilities. In the other two classes the students were told that the magician was a magician. Singer and Benassi reported that about two-thirds of the students in both groups believed Craig was psychic. The researchers were surprised to find no significant difference between the "magic" and "psychic" classes. They then made the same presentation to two more classes who were explicitly told that Craig had no psychic abilities and that he was going to do some tricks for them whereby he pretends to read minds and demonstrate psychic powers. Nevertheless, more than half the students believed Craig was psychic after seeing his act.

Singer and Benassi then asked the students whether they thought magicians could do exactly what Craig did. Most of the students agreed that magicians could. Then they asked the students if they would like to change their estimate of Craig's psychic abilities in light of the negative data they themselves had provided. A few did, reducing the percentage of students believing in Craig's psychic powers to 55 percent. Then the students were asked to estimate how many so-called psychics were really fakes using magician's tricks. The consensus was that most "psychics" are frauds. The students were again asked if they wished to change their estimate of Craig's psychic powers. Again, a few did, but the percentage believing in Craig's psychic powers was still a

hefty 52 percent. [Benassi and Singer; Hofstadter]

For many people, the will to believe at times overrides the ability to think critically about the evidence for and against a belief.

reader comments:

electro-magnetic fields

11 Jan 2001

I'd like to add a reader's comment to topic Electromagnetic Fields. I recently co-authored a book on electrical accidents, covering legal aspects, and included a chapter on this topic.

It is quite true that the plaintiff's bar did file a number of lawsuits, and many more were waiting at the first sign of success. It looked like the next mass tort. But a funny thing happened. Science won out. There were some early settlements, but no successes after that. The National Research Councils' 1966 report and similar consensus reports were persuasive even on juries. Most cases were dropped, and the very few that went to trial resulted in defense verdicts. Even the notorious cancer cluster case in Guilford, CT, hyped by "investigative reporter" and non-scientist Paul Brodeur, was dropped just before trial in 1993 when the plaintiff's best experts witnesses backed out.

Paul Hill
Omaha, Nebraska

6 Nov 2000

Hey SkepDic, What you had to say about electromagnetic fields really pissed me off. I've watched too many people deal with depression, sweets cravings, insomnia, and cancer due to EMF stress.

reply: I don't doubt you've watched people with these and many other problems, but what makes you so sure that the cause is EMF stress?

It's a problem that the public is left relatively uninformed of unless they study it for themselves, and your uninformed opinion doesn't do it justice. I've learned that much of the research published is false information because it is funded by the people who will not profit from anyone finding out that electromagnetic fields truly are damaging to the human body.

reply: Where did you get this information?

In all states but California, it is code that the power box in residences be grounded out on the water line. In some houses, this creates a measurable

current through the building, I know this because I used to live in a house that ran a charge of 3 milligauss. I cut off the current between the water line and the street after I spent a week carrying a Trifield gauss meter everywhere I went, and observing how my body and mind felt in different fields.

reply: I'm sorry for your troubles, but how can you be sure your problems are caused by EMFs? Have you seen a doctor? Maybe you have some other sort of disorder.

Even if cancer is not necessarily proven to be caused by low frequency EMFs, there is plenty of proof that the body's moods and balances are affected through altering the pineal gland's production of the hormone melatonin, and also the balances of the neurotransmitters dopamine and serotonin. These effects show themselves in different ways in different bodies, but put your head on straight. What we understand about the true nature of the human body equals dick. Please don't further the dismissal of an item that I know is an important step towards the growth of the entire human race. Make an attempt at your own understanding before you listen to someone else's bullshit.

-Adam from MN

reply: I will if you will. But first read the following letter.

Adam from MN writes:

> In all states but California, it is code that the power box in residences be grounded out on the water line.

The reason for grounding the fuse box is to provide a path for electrical current should a fault develop. This current will trip the breaker in the fuse box. If the ground path were not present, a person can be killed by touching the faulty equipment. It is vital for safety.

> In some houses, this creates a measurable current through the building, I know this because I used to live in a house that ran a charge of 3 milligauss.

If grounding the fuse box causes a measurable current to flow in the ground line, there is a fault in the electrical system which must be corrected. To state that the '[current] ran a charge of 3 milligauss' makes no sense because (a) a current is not a charge (b) charge is not measured in Gauss (c) the earth's magnetic field alone is about 500 milligauss at ground level, and therefore 3 milligauss is negligible.

>I cut off the current between the water line and the street after I spent a week carrying a Trifield gauss meter everywhere I went, and observing how my body and mind felt in different fields.

I don't know what this means but I hope it does not mean that he lifted the ground connection from the house wiring, which is illegal and potentially fatal.

electronic voice phenomenon

20 Aug 2000

Dear Professor Carrol, it is good to be skeptical, and indeed it seems to have become a necessary survival tool in these times.

Regarding EVP however, there is more to be said than what you may have heard from Mrs Estep et al.

I have researched the subject in some depth and with a background in applicable subjects. I am not, however, offering opinions.

The waveforms of EVP speech sounds are the "same" as those in natural speech, though with certain deficiencies. This is EVP produced in my own experiments under defined and controlled circumstances.

This is not a subject to be dismissed with a cursory glance at the written outpourings of the scientifically illiterate. That is all I am saying. And email is really not a suitable vehicle to take the matter further. Besides, you and I may have some lively ceilidhs to attend to instead ... or, in my case, at the moment, to recover from....

G. I. Gurdjieff (1872?-1949)

[George S. Georgiades](#) was a Greco-Armenian charismatic con man who was born in Russia but made a name for himself in Paris as the mystic George Ivanovitch Gurdjieff. In Russia he established what he called "The Institute for the Harmonious Development of Man" (1919), which he re-established in France in 1922. It was at his Institute that Gurdjieff promoted a litany of preposterous occult and mystical notions about the universe, which he claimed he was taught by wise men while traveling and studying in Central Asia. He put down his "insights" in books with titles like *Meetings with Remarkable men*, *All and Everything*, and *Beelzebub's Tales to his Grandson: an objectively impartial criticism of the life of man*. Gurdjieff's mostly uninteresting or unintelligible musings were presented in more accessible language by his disciple [Petyr Demianovich Ouspensky](#).

To some devotees of Gurdjieff, Ouspensky was an incomplete mystic. Other disciples find Gurdjieff and Ouspensky to be co-gurus.

Their current disciples presumably ignore Gurdjieff's more ridiculous claims, such as the following comment on the moon:

All evil deeds, all crimes, all self-sacrificing actions, all heroic exploits, as well as all the actions of ordinary life, are controlled by the moon.

What makes a guru such as Gurdjieff attractive as a spiritual conquistador is rather his more cynical beliefs, such as the notion that most human beings who are awake act as if they are asleep. Gurdjieff also observed that most people are dead on the inside. I think he meant by these claims that most people are trusting, gullible, easily led, very suggestible, not very reflective or suspicious of their fellow creatures, and need a guru to give their lives vitality and meaning. That is to say, I believe Gurdjieff correctly noted that most people are neither skeptics nor self-motivated, and that many are easily duped by gurus because they want someone to show them the way to live a meaningful life. He offered to show his followers the way to true wakefulness, a state of awareness and vitality which transcends ordinary consciousness. He was able to attract a coterie of writers, artists, wealthy widows and other questing souls to work his farm for him in exchange for sharing his wisdom. He offered numerous claims and explanations for everything under the moon, rooted in little more than his own imagination and never tempered with concern for what science might have to say about his musings.

Gurdjieff obviously had a powerful personality, but his disdain for the

mundane and for natural science must have added to his attractiveness. He allegedly exuded extreme self-confidence and exhibited no self-doubt, traits which must have been comforting to many people. His teachings, however, often seem like the delusions of a Gnostic madman, such as Dr. Daniel Paul Schreber, whose *Memoirs of a Neuropath* were analyzed by Freud. (Available in [Three Case Histories](#))

My favorite Gurdjieff story is told by Fritz Peters. To explain "the secret of life" to a wealthy English woman who had offered him £1,000 for such wisdom, Gurdjieff brought a prostitute to their table and told her he was from another planet. The food he was eating, he told her, was sent to him from his home planet at no small expense. He gave the prostitute some of the food and asked her what it tasted like. She told him it tasted like cherries. "That's the secret of life," Gurdjieff told the English lady. She called him a charlatan and left. Later that day, however, she gave him the money and became a devoted follower.

To those on a quest for spiritual evolution or transformation, guides like Gurdjieff and Ouspesky promise entry into an esoteric world of ancient mystical wisdom. Such a world must seem attractive to those who are out to sea and rudderless. There are [Gurdjieff Ouspensky Centers](#) in over 30 countries around the world; they are operated by the [Fellowship of Friends](#).

See the related entries on the [enneagram](#) and [Ouspensky](#).

Petryr Demianovich Ouspensky (1878-1947)

Ouspensky was a mathematician and mystic who played the St. Paul to [Gurdjieff's](#) Christ, taking the occult and often unintelligible notions of the master and making them palatable, if no more comprehensible in works such as *In Search of the Miraculous--Fragments of an Unknown Teaching* and *The Fourth Way---A Record of Talks and Answers to Questions based on the teaching of G. I. Gurdjieff*.

Unlike St. Paul, however, Ouspensky eventually lost faith in his master. Perhaps as his answer to Gurdjieff's Institute for the Harmonious Development of Man, Ouspensky founded the Society for the Study of Normal Man and developed his own following. Ouspensky is likely to remain a favorite among New Agers since he wrote books with titles like *The symbolism of the tarot : philosophy of occultism in pictures and numbers* and *Tertium Organum: the third canon of thought: a key to the enigmas of the world*, an attempt to reconcile the mysticism of the east with the rationalism of the west .

See related entry on [Gurdjieff](#).

Oscar Ichazo

From an Interview with Sam Keen, *Psychology Today*, July, 1973

...Ichazo: When I was 19, a remarkable man found me in La Paz. He was 60 years old and when he began to teach me, I knew from the beginning that he was speaking the truth. This man, whose name I have pledged not to reveal, belonged to a small group in Buenos Aires that met to share their knowledge of various esoteric consciousness-altering techniques. I became the coffee boy for this group. I would get up at four a.m. to make their coffee and breakfast and would stay around as inconspicuously as possible. Gradually they got used to my presence and they started using me as a guinea pig to demonstrate techniques to each other. To settle arguments about whether some particular kind of meditation or mantra worked, they would have me try it and report what I experienced.

Keen: What kinds of disciplines were being shared in the group?

Ichazo: About two thirds of the group were Orientals so they were strong on Zen, Sufism and cabala. They also used some techniques I later found in the Gurdjieff work.

Keen: Where does the story go from there?

Ichazo: One day when I was serving coffee, an argument arose between two members of the group. I turned to one and said, "You are not right. He is right." Just like that. Then I explained the point until both of them understood. This incident changed everything. They asked me to leave and I thought I was being kicked out for being pretentious. But after about a week, they called me back and told me they had all decided to teach me. They worked with me for two more years and then opened doors for me in the Orient. After a time of remaining at home in Chile, I began to travel and study in the East; in Hong Kong, India and Tibet. I did more work in the martial arts, learned all of the higher yogas, studied Buddhism and Confucianism, alchemy and the wisdom of the I Ching. Then I went back to La Paz to live with my father and digest my learnings. After working alone for a year, I went into a divine coma for seven days. When I came out of it I knew that I should teach; it was impossible that all my good luck should be only for myself. But it took me two years to act on this decision. Then I went to Santiago and started lecturing in the Institute for Applied Psychology. Things got so busy and crowded there that I decided to move to the remote little town of Arica and filter out all except the really committed persons who would follow me there. At first I worked with a group of 10. Then in 1970, a group of Americans -- about 50 -- came and stayed for nine months. Fifteen of these were from Esalen. It was clear to me that the time had come to move to North America. So here we are -- The Arica Institute with centers in New York, Los Angeles and San Francisco....

Golf and the Enneagram

It has recently been discovered that the [enneagram](#) is the layout of an ancient nine-hole golf course. In fact, I have met each of the nine types on the golf course. For example, type One is the Perfectionist. Anyone who plays golf knows what a pain playing with the Perfectionist can be. First of all, the One is never satisfied. Not only does he take a mulligan on perfectly good drives, he complains about something on almost every shot. "Fuck! I pulled it." "Shit! I pushed it." "Goddammit! Wrong club." "Christ! Too much fade." "Jesus fucking Christ! Not enough draw." The One is often very foulmouthed in an uncontrollable sort of way and always talks as if his body just didn't follow his mind's orders. This is the guy who slams his club into the ground as the ball is in flight right at the pin. He is also the one who keeps giving you unsolicited advice, such as "you should've aimed more to the left" or "you need to adjust your grip." The Perfectionist also takes forever to hit his ball. He throws up grass on the fairway about six times to check the wind. He adjusts his grip about five times before hitting. He keeps looking down the fairway to make sure his alignment is right. And when putting he walks all over the green, holds his putter up like a plumb bob, and generally takes forever before actually putting the ball. The One is no fun.

The Two is the Giver. This is the guy who says "nice shot" as soon as you swing at the ball. Even when you shank, slice, duck hook, chili dip...."nice shot." When you putt six feet past the hole, he says "great stroke; you were robbed." He's just looking for you to say "nice shot" every time he hits the ball. He gives all this approval because he seeks it in return. When the Two says "nice shot" as you put one in the water, you just want to punch him. The Two is a pooh.

The Three is the Performer. This is the guy who holds his finish for ten seconds so everybody can see what great form he has. He is forever giving the pumped fist in the air sign to let everyone know what a great shot he just made. He runs around the green when he chips one in. He pretends his putter is a sword and he fences an imaginary opponent after he sinks a putt. He drops to his knees and falls on the ground when he lips out a three-footer. Whereas the Giver is forever heaping praise, the Performer is forever demanding it. "Did you see that shot!" (His own, of course.) "Am I good, or what?" is the Three's favorite question. The Three's favorite words are me, me, and me..

The Four is the Romantic. This is the guy who's forever talking about the time he played the Old Course in St. Andrews. He's always telling stories about the

time he was playing Ballybunion in gale force conditions coming in off the Atlantic and he had to hit to a 180-yard three par running parallel to the Ocean and the hole was across a canyon and the smart shot would have been to hit to the bottom of the canyon and chip up onto the green under such conditions but no, he had to aim out at the beach and whack a 2-iron and his ball carried at least 150 yards eastwards into another canyon and this happened three times until he was hitting 7 off the tee and he finally got smart and put it into the canyon in front of him and chipped on and one-putted for a nine, the best nine he ever had. The Four is a bore.

The Five is the Observer. This guy can be a pleasure to play with since he doesn't say a word the whole round. He just kind of grunts every once in a while but generally he maintains a totally detached attitude throughout the round. He seems to be intensely interested in your shots, as he seems to glare right through you from time to time, but he never says anything. It's kind of fun to watch a Giver and an Observer together. The Giver keeps telling the Observer what a great shot he just made and the Observer doesn't respond. He just quietly goes about his business of mishitting the golf ball. The Five is a good ride.

The Six is the Trooper. To this guy, the golf course is a battleground and every bunker, every tree, every blade of grass has been placed there specifically as an obstacle to him. Even the wind decides to blow only when it can oppose him. The Six is the guy who aims fifty feet right of the green because there is a bunker guarding the left approach. When he putts, he always seems to tap his ball over a spike mark that diverts his ball from the hole. If he mishits a ball, he looks up for the cause of his distraction. When he lips out, he stands over the hole, staring it down as if to say that he knows someone put a dip in front of the hole deliberately to stop his ball short. The Six gets no kicks.

The Seven is the Epicure. This is the guy who gets pleasure out of every golf shot, *his* when the shots are good and *others'* when the shots are bad. The Epicure is a pleasure to play with. He really enjoys the game and his enjoyment can be contagious if you are not playing too poorly. He sees every shot as an opportunity to try something out. If he hits behind a tree, it's a chance to try some shot with the face turned in a bit while aiming right of the tree, hoping for a draw around the tree towards the green just like the shot he read about in a book last week. This guy's always talking about books he's read or videos he's bought. He can't wait to hit into a sand trap to try out the new Greg Norman tip he saw on a television show. He loves to hit over water and takes great pleasure in pretending he sees dirt where there is water. The Seven also likes to drink beer while he plays, and is forever stopping the refreshment cart for a beer or a hotdog. I like a game with the Seven. If he's having a good round, he'll usually offer to buy you a beer during one of his many stops for refreshments. The Seven is from heaven.

The Eight is the Boss. This is the guy who's always telling everybody whose

turn it is. "You're away," the Eight will say when no one asks for his opinion and everyone knows who is away. The Eight insists on honors when he has honors, otherwise it is "ready golf." The Eight knows the rules of golf and insists that everyone play as if they were in the Masters. If he doesn't know the rules of golf, he'll make them up as needed. The Boss is actually handy when one or two of the other players don't know the rules of golf. If the Boss sees you hit one out of bounds, he reminds you right away to hit another ball from the same spot. If you're in a hazard and look puzzled, he'll let you know that you can play it from there or even pick and clean it if winter rules are in force. I don't mind playing with an Eight. The Eight can be great.

Finally, there is the Mediator. Nothing seems to bother the Nine; at least he doesn't show his emotions when things are going bad. But he does tend to apologize frequently. "Sorry I'm not playing well today." The Nine loves to yell "Fore" whenever he hits a ball within 100 yards of any living being. And he loves to console the other player who has just bungled another shot. The Mediator is especially fond of complimenting you on your third shot out of a bunker. "That's the way to do it," he'll shout as you ask yourself why you couldn't have done that on the previous two tries. The Mediator is forever trying to make you feel better. "You've been just missing them all day." "A foot to the right or left here or there and you'd have had a hell of a good round!" Nines are fine.

Without the enneagram as a guide, where would golf be today? How could anyone not see that the enneagram, when understood properly, is a source of great understanding about people and relationships?

E-rays

18 Sep 1998

The claims about Erdstrahlen are closely related to the claims of Wasseradern, which could be translated as "water veins". Water veins are said to be the paths that groundwater runs in. They are said to be responsible for cancer, insomnia, and several other illnesses, especially when they cross under your bed.

Wasseradern emit E-rays. Roads where accidents occur more often than elsewhere are found to be strongly "E-ray emitting". Certain animals can "feel" these E-rays. Cats for instance would never lie down where E-rays occur; bees are attracted to these places. And so on.

The claims about Erdstrahlen and Wasseradern are indeed very popular in Germany and the German-speaking countries like Austria and Switzerland. "Wasseradern" have a tradition of some hundred years, whereas "Erdstrahlen" seem to be connected to the 20th century. At least I found no older source.

It is interesting that almost everybody [in Germany] knows about things that do not exist. Ask anybody about Wasseradern and Erdstrahlen, everybody has heard about it and accepts it as a fact. Ask them about what groundwater really does in the ground, and no one will be able to tell you.

Heiko Diekmann, Hamburg, Germany

reply: There are many people everywhere who know about things that do not exist. Psychologist Thomas Gilovich wrote a book about them called [*How We Know What Isn't So: The Fallibility of Human Reason in Everyday Life*](#) (New York: The Free Press, 1993) [\\$12.76](#) I highly recommend it.

Landmark Forum/Landmark Education Corporation

[Landmark Forum](#) is a [Large Group Awareness Training program](#) in which up to 150 people take a seminar together aimed at helping them realize their true potential.

Landmark Forum began in 1985 by those who had purchased the [est](#) "technology" from Werner Erhard. In 1991 the group changed its name to Landmark Education Corporation (LEC), which continues to offer the Landmark Forum training, along with several other programs emphasizing communication and productivity. Erhard's brother, Harry Rosenberg, heads LEC, which does some \$50 million a year in business and has attracted some 300,000 participants. LEC is headquartered in San Francisco, as was est, and has 42 offices in 11 countries. Apparently, however, Erhard is not involved in the operation of LEC.

LEC is aimed at New Age explorers of the 1990s, not the Flower Children from the 60s and 70s who were attracted to est. The search for "It", which characterized est, is out. Also out is the Zen master approach of est, which was often abusive, profane, demeaning and authoritarian. The Forum is apparently just as authoritarian as est but not as profane or abusive.

LEC aims to help people transform their lives by teaching them specific communication and life skills along with some heavy philosophical training. The advertised goals of LEC seem very grand and very vague. The programs are hailed as "original, innovative and effective." They "allow participants to produce extraordinary and even miraculous results, and provide a useful, practical new freedom which brings a quality of effectiveness and plan to one's everyday life." Landmark is dedicated to "empowering people in generating unlimited possibilities and making a difference. Our work provides limitless opportunities for growth and development for individuals, relationships, families, communities, businesses, institutions and society as a whole." They are "successful" and "internationally recognized." They are "committed to generating extraordinary communication --powerful listening and committed speaking that results in self-expression and fulfillment." Landmark is "exciting, challenging and enjoyable." "Well being, self-expression, accountability and integrity are the tenets upon which we stand. This stand leads to our extraordinary customer, assistant and employee satisfaction." And, of course, LEC wants to help you fulfill all your human potential, your "capacity to create, generate, invent and design from nothing." [Landmark Education Charter]

I have never attended a session of either est or Landmark but from what I can gather from those who have, the experience is not likely to be dull. [Jill P. Capuzzo](#) writes that "Other seminars may offer supportive hugs; this one hits you between the eyes." She also claims that "One of the most irritating aspects of The Forum is the hard sell to sign up future participants. Leaders encourage people to bring friends and family to [a] session to help celebrate their newfound love of life and invite them to enroll in the next available weekend." Capuzzo claims that 20 percent of the participants in her sessions brought visitors to the open session and nearly half the original participants signed up for an advanced course.

[Andy Testa](#), on the other hand, posted an account of his experience with Landmark Forum, in which he claims that he was hounded by recruiters who insisted that his resistance was proof he needed their help.

Some people claim to have had breakdowns after attending such programs as Landmark Forum [see Lell, who had one after attending Landmark sessions, and [Abstracts of Articles in Psychological Journals concerning est and The Forum](#)]. According to Robert Howe, [Stephanie Ney](#), 45, claims that a two-day Landmark Forum seminar "stripped her of her natural psychological defenses and unleashed the specter of a failed relationship with her father," leading to a nervous breakdown and commitment to a psychiatric clinic. Yet, many of those who seek out [cults](#) like [Scientology](#) or self-help programs such as Landmark are troubled already. Some are deeply troubled and the training might send them over the edge. But whose fault is that? Such people might have gone to the movies and been pushed over the edge, like "Heinrich Pommerenke, who was a rapist, abuser, and mass slayer of women in Germany." He "was prompted to his series of ghastly deeds by Cecil B. DeMille's *The Ten Commandments*."*

[Another participant](#) describes his Forum experience as "the most powerful and dangerous experience in my life." He claims that he was so disoriented after the seminar that he couldn't work for three days. He claims that those "three days after my Forum were a living hell, unlike anything I had experienced in 21 years of formal training and six years of medical residency in New York City." However, this participant also said that he would do it again!

A [Hare Krishna devotee](#) advises fellow spiritual travelers to take the LEC training. He claims that the average person reports that Landmark seminars change lives for the better by bringing about improved effectiveness in relating to others, increased personal productivity, greater self-confidence, help in making good decisions by learning how to identify what's really important in life, and help in learning how to live a more satisfying life without making life more complicated. He thinks Landmark can help people achieve transcendental realization. Paul Derengowski, formerly of the

Christian cult-watch group Watchman.org, thinks that Landmark "has theological implications." Since the training seems to emphasize that one's past and current beliefs are hindering self-growth, it is easy to see why defenders of traditional religions would fear such programs as Landmark Forum. In effect, to those who are members of traditional faiths, programs such as Landmark are saying: your religion is a hindrance to becoming your true self.

There is evidence that many of those who sign up for LGAT programs such as Landmark Forum are having major problems in their lives. Y. Klar, R. Mendola, J. D. Fischer, R. C. Silver, J. M. Chinsky and B. Goff, reported in the *Journal of Consulting & Clinical Psychology* [1990;58(1):99-108] that

A study was conducted to assess the psychosocial characteristics of individuals who become involved in large group awareness training (LGAT) programs. Prospective participants in The Forum, which has been classified as an LGAT, were compared with nonparticipating peers and with available normative samples on measures of well-being, negative life events, social support, and philosophical orientation. Results revealed that prospective participants were significantly more distressed than peer and normative samples of community residents and had a higher level of impact of recent negative life events compared with peer (but not normative) samples.

People who are having problems, are dissatisfied, feel unfulfilled, desire direction, etc., are the kind of people who sign up for seminars that will help them. It is almost inevitable that the vast majority of people who would get involved be in some sort of distress. Likewise, by "[regression](#)" we would expect many people to have upswings and experience fewer problems, be more satisfied and fulfilled, feel less lost, etc., after periods of distress. It is predictable that many participants in self-growth programs will attribute their sense of improvement to the programs they've taken, but much of their reasoning may be [post hoc](#). Furthermore, their sense of improvement might not be matched by improved behavior. Just because they feel they've benefited doesn't mean they have. Research has shown that the *feelings* of having benefited greatly from participation in an LGAT do not correspond to beneficial changes in behavior (Michael Langone, "Large Group Awareness Training Programs," *Cult Observer*, v. 15, n. 1, 1998).

While some Landmark participants may have had breakdowns after their training, it would be a mistake to infer that large numbers of emotionally

unbalanced people are signing up for the program. "Based on psychic distress (symptoms) and impairment measures, those who sought out growth groups were not overly represented by those who were particularly disturbed or impaired in their lives" (Leibermann in Fuhriman and Burlingame 1994).

In fairness, it is also post hoc reasoning to assume that very disturbed individuals who deteriorate rapidly after attending LGAT seminars, do so because of their participation. Those in need of psychotherapy should not participate in LGAT programs. They may be too intense for the emotionally fragile. It is not without good reason that Landmark Forum requires prospective participants to sign a statement declaring that, to the best of their knowledge, they are mentally and physical well. This gives notice that the program is not for the mentally or physically unstable. It also may protect Landmark from legal action should a client have a breakdown after attending the Forum, but there is no guarantee that such a signed statement would necessary exculpate Landmark should it be charged with causing someone's mental or physical breakdown.

The training emphasizes not only how to communicate better but how to relate better to those around you, as it forces the participant to reflect on and examine his or her life. Such courses, if they are really good, will inspire many people to create themselves anew. Many will see positive effects immediately. In fact, many are so impressed that they want to share the experience with others. They become zealots and recruiters for the program. Part of their zealotry, however, derives from the intense pressure put on them to bring their friends and family into the program, and to sign up for follow-up courses. The main marketing tool Landmark uses is high-pressure direct contact with participants, including phone calls that border on harassment, according to some participants. Some critics even think that recruitment is the main goal of the program ([Faltenmayer](#)).

the varieties of the LEC experience

From what I have read by those who have been involved in **est** or Landmark Forum, the experience is at minimum disrupting and provocative, at best life transforming. This would indicate that something reaches deep into the emotional life of some participant's. Some, like Rabbi Yisroel Persky, claim that what they are being given are little more than "common-sense concepts cloaked in esoteric packaging" ([Faltenmayer](#)). But what is common-sense to an educated and well-read person (in the fields of psychology, philosophy, and communication arts), may seem like golden insights to others. Yet, while there must be something of substance to the content of the message (culled from the great minds, after all) the importance of the messenger and the way the message is delivered cannot be overestimated. The messenger must be believable. He or she must appear sincere. He must exude confidence. She must know how to use her voice and body to get her message across. He must be a master of communication skills. She must have wit and humor. He must

be a raconteur. She must not only talk the talk but appear to clearly walk the walk as well. And he must do it with a large group and utilize the energy and enthusiasm of the group members to infect each other. If she or he is successful, the participants will leave charged up and ready to take on the world. The *revival* will have *revived* them. They will leave running on sixteen cylinders. They will be tuned up, turbocharged, and empowered to change their lives.

That is why so many people feel they have benefited from programs such as Landmark Forum, [neurolinguistic programming](#), est (or even [Scientology](#) or [Amway](#)). The programs have given people a positive direction and focus, and surrounded them with like-minded folks for reinforcement. They have helped them achieve peace of mind or to accomplish goals they had been unable to accomplish heretofore. They have helped with personal relationships with spouses and children or helped them justify getting out of relationships with their friends and family. The program has forced them to be more self-conscious, forced them to think and examine their lives, something most people don't do on an ordinary Tuesday. Any time a rational person reflects on his or her life, or on some of the bigger issues in life, it feels good or it puts things in perspective. Either way, it is usually satisfying.

Many who take the LEC training feel that Landmark Forum has given them the power and self-esteem they lacked. Some of the good feeling and carryover in behavior may be long-lasting, or it may be temporary, like the rush that follows an inspirational meeting, or the new perception of reality that follows an intense emotional experience. Much of the improvement in feeling may be due to predictable [regression](#) and might explain the urge of many participants to want to take the follow-up courses and advanced seminars. These can get quite costly. For example: LEC offers an advanced course for \$700 and two advanced courses on Communication and Power for \$1,050. LEC charges \$1,700 for The Wisdom Program.

[KFC crew gets
burned too](#)

[Burger King 'team-
builders' get burned](#)

BY ELAINE
WALKER, Oct 6,
2001

Is it safe? Eli Tyler of El Cajon, California, was one of seven people hospitalized with severe burns to the bottoms of their feet from a fire-walking ceremony at an American Association for Nude Recreation convention in August, 2000.

Fred Gilbert, a professional fire-walker, apparently told a bare naked lie when he said that he was providing "a safe and spiritual experience where you walk through your past to arrive at your future."

Tyler is suing Gilbert for "using the wrong type of

firewalking

Firewalking refers to the activity of walking on hot coals, rocks or cinders without burning the soles of one's feet. In some cultures [e.g., India], firewalking is part of a religious ritual and is associated with the mystical powers of [fakirs](#). In America, firewalking is part of New Age religion, i.e., self-empowering motivational activity.

[Tony Robbins](#) popularized firewalking as an activity for demonstrating it is possible for people to do things which seem impossible to them; the firewalk is a technique for turning fear into power. Robbins doesn't consider the power of the mind to overcome fear of getting burnt as [paranormal](#), however.

Overcoming this fear is presented as a step in restructuring one's mind, almost as if this trial by fire was some sort of initiation into an esoteric and very special group of risk-takers. To the timid and those who feel powerless amongst all the dynamic firebrands around them, such a feat as walking on hot coals must seem a significant event.

Robbins may have popularized firewalking but Tolly Burkan, founder of [The Firewalking Institute for Research and Education](#), claims he was the first to introduce the practice to North America. According to Burkan, firewalking is "a method of overcoming limiting beliefs, phobias and fears."

Walking across hot coals without getting burned does seem impossible to many people, but in fact it is no more impossible than putting your hand in a hot oven without getting burned. As long as you keep your hand in the air and don't touch the oven, its metal racks or any ceramic or metal pots, you won't get burned even if the oven is extremely hot. Or, if you do touch the oven, metal racks or pots, and are wearing insulating gloves or using "hot pads," you won't get burned. Why? Because "the air has a low heat capacity and a poor thermal conductivity...." while "our bodies have a relatively high heat capacity...."(Leikind and McCarthy, 188). And an insulator will insulate! Thus, even if the coals are very hot (1,000 to 1,200 degrees), a person with "normal" soles won't get burned as long as he or she doesn't take too long to walk across the coals and as long as the coals used do not have a very high heat capacity. Volcanic rock and certain wood embers will work just fine.

Also, "both hardwood and charcoal are good thermal insulators.... Wood is just as good an insulator even when on fire, and charcoal is almost four times better as an insulator than is dry hardwood. Further, the ash that is left after the charcoal has burnt is just as poor a conductor as was the hardwood or charcoal" ([Willey](#)).

wood, starting the fire walk before ash formed on the wood and failing to have medical personnel present, among other things."*

Nevertheless, some people do get burned walking across hot coals, not because they lack faith or willpower, but because the coals are too hot or are have a relatively high heat capacity, or because the firewalker's soles are thin or he doesn't move quickly enough. But even very hot coals with a high heat capacity can be walked over without getting burned if one's feet are insulated, e.g., with a liquid such as sweat or water. (Think of how you can wet your finger and touch a hot iron without getting burned.) Again, one must move with sufficient speed or one will get burned.

However, even armed with this knowledge, it still takes courage to firewalk. When Michael Shermer of *Skeptic* magazine did a firewalk for "The Unexplained" television program, he had the knowledge but the fear was obviously still there. Our instincts are telling us: *don't do this, you idiot!* Firewalking requires some faith as well as knowledge: faith that the coals were prepared properly, that you can move fast enough to avoid getting burned, and that something will work in practice as you know it should in theory. Even so, whether the firewalker gets burned depends on how the coals were prepared and on how fast the firewalker moves, rather than on willpower, the power of the mind to create a protective shield, or any other paranormal or supernatural force.

neuro-linguistic programming (NLP)

I think the more you want to become more and more creative you have to not only elicit other peoples' (plural) strategies and replicate them yourself, but also modify others' strategies and have a strategy that creates new creativity strategies based on as many wonderful states as you can design for yourself. Therefore, in a way, the entire field of NLP™ is a creative tool, because I wanted to create something new.

--Richard Bandler

Neuro-linguistic Programming (NLP) is one of many New Age [Large Group Awareness Training](#) programs. NLP is a competitor with [Landmark Forum](#), [Tony Robbins](#), and legions of other enterprises which, like the [Sophists of ancient Greece](#), travel from town to town to teach their wisdom for a fee. Robbins is probably the most successful "graduate" of NLP. He started his own empire after transforming from a self-described "fat slob" to a [firewalker](#) to (in [his own words](#)) "the nation's foremost authority on the psychology of peak performance and personal, professional and organizational turnaround." The founders of NLP, [Richard Bandler](#) and [John Grinder](#), might disagree.

NLP has something for everybody, the sick and the healthy, individual or corporation. In addition to being an agent for change for healthy individuals taught *en masse*, NLP is also used for individual psychotherapy for problems as diverse as phobias and schizophrenia. NLP also aims at transforming corporations, showing them how to achieve their maximum potential and achieve great success.

What is NLP?

NLP was begun in the mid-seventies by a linguist (Grinder) and a [mathematician \(Bandler\)](#) who had strong interests in (a) successful people, (b) psychology, (c) language and (d) computer programming. It is a difficult to define NLP because those who started it and those involved in it use such vague and ambiguous language that NLP means different things to different people. While it is difficult to find a consistent description of NLP among those who claim to be experts at it, one metaphor keeps recurring. *NLP claims to help people change by teaching them to program their brains.* We were given brains, we are told, but no instruction manual. NLP offers you a user-manual for the brain. The brain-manual seems to be a metaphor for NLP training, which is sometimes referred to as "software for the brain." Furthermore, NLP, consciously or unconsciously, relies heavily upon (1) the notion of the [unconscious mind](#) as constantly influencing conscious thought and action; (2) metaphorical behavior and speech, especially building upon the methods used in Freud's *Interpretation of Dreams*; and (3) [hypnotherapy](#)

as developed by [Milton Erickson](#). NLP is also heavily influenced by the work of [Gregory Bateson](#) and [Noam Chomsky](#).

One common thread in NLP is the emphasis on teaching a variety of communication and persuasion skills, and using self-hypnosis to motivate and change oneself. Most NLP practitioners advertising on the WWW make grand claims about being able to help just about anybody become just about anything. The following is typical:

NLP can enhance all aspects of your life by improving your relationships with loved ones, learning to teach effectively, gaining a stronger sense of self-esteem, greater motivation, better understanding of communication, enhancing your business or career... and an enormous amount of other things which involve your brain. [2](#)

[Some advocates claim](#) that they can teach an infallible method of telling when a person is lying. Some claim that people fail only because their teachers have not communicated with them in the right "language". One [NLP guru](#), Dale Kirby, informs us that one of the presuppositions of NLP is "No one is wrong or broken." So why seek remedial change? On the other hand, what Mr. Kirby does have to say about NLP which *is* intelligible does not make it very attractive. For example, he says that according to NLP "There is no such thing as failure. There is only feedback." Was NLP invented by the U.S. Military to explain their "incomplete successes"? When the space shuttle blew up within minutes of launch, killing everyone on board, was that "only feedback"? If I stab my neighbor and call it "performing non-elective surgery" am I practicing NLP? If I am arrested in a drunken state with a knife in my pocket for threatening an ex-girlfriend, am I just "trying to rekindle an old flame"?

Another NLP presupposition which is false is "If someone can do something, anyone can learn it." This comes from people who claim they understand the brain and can help you reprogram yours. They want you to think that the only thing that separates the average person from Einstein or Pavarotti or the World Champion Log Lifter is NLP.

NLP is said to be the study of the structure of *subjective experience*, but a great deal of attention seems to be paid to observing *behavior* and teaching people how to read "body language." But there is no common structure to non-verbal communication, any more than there is a common structure to dream symbolism. There certainly are some well-defined culturally determined non-verbal ways of communicating, e.g., pointing the back of the hand at another, lowering all fingers but the one in the middle, has a definite meaning in American culture. But when someone tells me that the way I squeeze my nose during a conversation means I am signaling him that I think his idea stinks, how do we verify whether his interpretation is correct or not? I deny it. He knows the structure, he says. He knows the meaning. I am not aware of my

signal or of my feelings, he says, because the message is coming from my subconscious mind. How do we test these kinds of claims? We can't. What's his evidence? It must be his brilliant intuitive insight because there is no empirical evidence to back up this claim. Sitting cross-armed at a meeting might not mean that someone is "blocking you out" or "getting defensive". She may just be cold or have a back ache or simply feel comfortable sitting that way. It is dangerous to read too much into non-verbal behavior. Those splayed legs may simply indicate a relaxed person, not someone inviting you to have sex. At the same time, much of what NLP is teaching is how to do [cold reading](#). This is valuable, but an art not a science, and should be used with caution.

Finally, NLP claims that each of us has a Primary Representational System (PRS), a tendency to think in specific modes: visual, auditory, kinaesthetic, olfactory or gustatory. A person's PRS can be determined by words the person tends to use or by the direction of one's eye movements. Supposedly, a therapist will have a better rapport with a client if they have a matching PRS. None of this has been supported by the scientific literature.*

Bandler's Institute

Bandler's First Institute of Neuro-Linguistic Programming™ and Design Human Engineering™ has this to say about NLP:

"Neuro-Linguistic Programming™ (NLP™) is defined as the study of the structure of subjective experience and what can be calculated from that and is predicated upon the belief that all behavior has structure....Neuro-Linguistic Programming™ was specifically created in order to allow us to do magic by creating new ways of understanding how verbal and non-verbal communication affect the human brain. As such it presents us all with the opportunity to not only communicate better with others, but also learn how to gain more control over what we considered to be automatic functions of our own neurology." [3](#)

We are told that Bandler took as his first models [Virginia Satir](#) ("The Mother of Family System Therapy"), [Milton Erickson](#) ("The Father of Modern Hypnotherapy") and [Fritz Perls](#) (early advocate of Gestalt Therapy) because they "had amazing results with their clients." The linguistic and behavioral patterns of such people were studied and used as models. These were therapists who liked such expressions as 'self-esteem', 'validate', 'transformation', 'harmony', 'growth', 'ecology', 'self-realization', 'unconscious mind', 'non-verbal communication', 'achieving one's highest potential'-- expressions which serve as beacons to New Age transformational psychology. No neuroscientist or anyone who has studied the brain is mentioned as having had any influence on NLP. Also, someone who is not mentioned, but who

certainly seems like the ideal model for NLP, is Werner Erhard. He started [est](#) a few miles north (in San Francisco) of Bandler and Grinder (in Santa Cruz) just a couple of years before the latter started their training business. Erhard seems to have set out to do just what Bandler and Grinder set out to do: help people transform themselves and make a good living doing it. NLP and est also have in common the fact that they are built up from a hodgepodge of sources in psychology, philosophy, and other disciplines. Both have been brilliantly marketed as offering the key to success, happiness, and fulfillment to anyone willing to pay the price of admission. Best of all: no one who pays his fees fails out of these schools!

the ever-evolving Bandler

When one reads what Bandler says, it may lead one to think that some people sign on just to get the translation from the Master Teacher of Communication Skills himself:

One of the models that I built was called strategy elicitation which is something that people confuse with modeling to no end. They go out and elicit a strategy and they think they are modeling but they don't ask the question, "Where did the strategy elicitation model come from?" There are constraints inside this model since it was built by reducing things down. The strategy elicitation model is always looking for the most finite way of accomplishing a result. This model is based on sequential elicitation and simultaneous installation.

Many would surely agree that with communication like this Bandler must have a very special code for programming his brain.

Bandler claims he keeps evolving. To some, however, he may seem mainly concerned with protecting his economic interests by trademarking his every burp. He seems extremely concerned that some rogue therapist or trainer might steal his work and make money without him getting a cut. One might be charitable and see Bandler's obsession with trademarking as a way to protect the integrity of his brilliant new discoveries about human potential (such as [charisma enhancement](#)) and how to sell it. Anyway, to clarify or to obscure matters--who knows which?-- what Bandler calls the real thing can be identified by a license and the trademark™ from [The Society of Neuro-Linguistic Programming™](#). However, do not contact this organization if you want detailed, clear information about the nature of NLP, or [DHE \(Design Human Engineering™\)](#) (which will teach you to hallucinate designs like Tesla did), or PE (Persuasion Engineering™) or MetaMaster Track™, or Charisma Enhancement™, or Trancing™, or whatever else Mr. Bandler and associates are selling these days. Mostly what you will find on Bandler's page is information on how to sign up for one of his training sessions. For example,

you can get 6 days of training for \$1,800 at the door (\$1,500 prepaid). What will you be trained in or for? Bandler has been learning about "the advancement of human evolution" and he will pass this on to you. For \$1,500 you could have taken his 3-day seminar on Creativity Enhancement (where you could learn why it's not creative to rely on other people's ideas, except for Bandler's).

Grinder and corporate NLP

John Grinder, on the other hand, has gone on to try to do for the corporate world what Bandler is doing for the rest of us. He has joined Carmen Bostic St Clair in an organization called [Quantum Leap](#), "an international organisation dealing with the design and implementation of cross cultural communication systems." Like Bandler, Grinder claims he has evolved new and even more brilliant "codes".

...the New Code contains a series of gates which presuppose a certain and to my way of thinking appropriate relationship between the conscious and unconscious parts of a person purporting to train or represent in some manner NLP. This goes a long way toward insisting on the presence of personal congruity in such a person. In other words, a person who fails to carry personal congruity will in general find themselves unable to use and/or teach the New Code patterns with any sort of consistent success. This is a design I like very much - it has the characteristic of a self-correcting system.

It may strike some people that terms like "personal congruity" are not very precise or scientific. This is probably because Grinder has created a "new paradigm". Or so he says. He denies that his and Bandler's work is an eclectic hodgepodge of philosophy and psychology, or that it even builds from the works of others. He believes that what he and Bandler did was "create a [paradigm](#) shift."

The following claim by Grinder provides some sense of what he thinks NLP is:

My memories about what we thought at the time of discovery (with respect to the classic code we developed - that is, the years 1973 through 1978) are that we were quite explicit that we were out to overthrow a paradigm and that, for example, I, for one, found it very useful to plan this campaign using in part as a guide the excellent work of Thomas Kuhn (*The Structure of Scientific Revolutions*) in which he detailed some of the conditions which historically have obtained in the midst of paradigm shifts. For example,

I believe it was very useful that neither one of us were qualified in the field we first went after - psychology and in particular, its therapeutic application; this being one of the conditions which Kuhn identified in his historical study of paradigm shifts. Who knows what Bandler was thinking?

One can only hope that Bandler wasn't thinking the same things that Grinder was thinking, at least with respect to Kuhn's classic text. Kuhn did not promote the notion that not being particularly qualified in a scientific field is a significant condition for contributing to the development of a new paradigm in science. Furthermore, Kuhn did not provide a model or blueprint for *creating* paradigm shifts! His is an *historical* work, describing what he believed to have occurred in the *history of science*. Nowhere does he indicate that a single person at any time did, or even could, create a paradigm shift in science. Individuals such as Newton or Einstein might provide theories which require paradigm shifts for their theories to be adequately understood, but they don't create the paradigm shifts themselves. Kuhn's work implies that such a notion is preposterous.

Grinder and Bandler should have read Kant before they set off on their quixotic pursuit. [Kant's "Copernican revolution"](#) might be considered a paradigm shift by Bandler and Grinder, but it is not what Kuhn was talking about when he was describing the historical development of scientific theories. Kuhn restricted his concern to science. He made no claim that anything similar happens in philosophy and he certainly did not imply that anything NLP did, or is doing, constitutes a paradigm shift. Kuhn claimed that paradigm shifts occur over time when one theory breaks down and is replaced by another. Scientific theories break down, he claimed, when new data can't be explained by the old theories or when they no longer explain things as well as some newer theory. What Bandler and Grinder did was not in response to any crisis in theory in any scientific field and so cannot even be considered as *contributing* to a paradigm shift much less being one itself.

What Grinder seems to think Kuhn meant by "paradigm shift" is something like a gestalt shift, a change in the way we look at things, a change in perspective. Kant might fit the bill for this notion. Kant rejected the old way of doing epistemology, which was to ask 'how can we bring ourselves to understand the world?' What we ought to ask, said Kant, is 'how is it possible that the world comes to be understood by us?' This was truly a revolutionary move in the history of philosophy, for it asserted that the world must conform to the conditions imposed on it by the one experiencing the world. The notion that one has the truth when one's mind conforms with the world is rejected in favor of the notion that all knowledge is subjective because it is impossible without experience which is essentially subjective. Copernicus had said, in essence, *let's see how things look with the Sun at the center of the universe, instead of the Earth*. Kant said, in essence, *let's examine how we know the world by assuming that the world must conform to the mind, rather than the mind conform to the world*. Copernicus, however, could be considered as

contributing to a paradigm shift in science. If he were right about the earth and other planets going around the sun rather than the sun and the other planets going around the earth--and he was--then astronomers could no longer do astronomy without profound changes in their fundamental concepts about the nature of the heavens. On the other hand, there is no way to know if Kant is right. We can accept or reject his theory. We can continue to do philosophy without being Kantians, but we cannot continue to do astronomy without accepting the heliocentric hypothesis and rejecting the geocentric one. What did Grinder and Bandler do that makes it impossible to continue doing psychology or therapy or semiotics or philosophy without accepting their ideas? Nothing.

Do people benefit from NLP?

While I do not doubt that many people benefit from NLP training sessions, there seem to be several false or questionable assumptions upon which NLP is based. Their beliefs about the unconscious mind, hypnosis and the ability to influence people by appealing directly to the subconscious mind are unsubstantiated. All the scientific evidence which exists on such things indicates that what NLP claims is not true. You cannot learn to "speak directly to the unconscious mind " as Erickson and [NLP claim](#), except in the most obvious way of using the power of suggestion.

NLP claims that its experts have studied the thinking of great minds and the behavior patterns of successful people and have extracted *models* of how they work. "From these models, techniques for quickly and effectively changing thoughts, behaviors and beliefs that get in your way have been developed."⁴ But studying Einstein's or Tolstoy's work might produce a dozen "models" of how those minds worked. There is no way to know which, if any, of the models is correct. It is a mystery why anyone would suppose that any given model would imply techniques for quick and effective change in thoughts, actions and beliefs. I think most of us intuitively grasp that even if we were subjected to the same experiences which Einstein or Tolstoy had, we would not have become either. Surely, we would be significantly different from whom we've become, but without their brains to begin with, we would have developed quite differently from either of them.

in conclusion

It seems that NLP develops models which can't be verified, from which it develops techniques which may have nothing to do with either the models or the sources of the models. NLP makes claims about thinking and perception which do not seem to be supported by neuroscience. This is not to say that the techniques won't work. They may work and work quite well, but there is no way to know whether the claims behind their origin are valid. Perhaps it doesn't matter. NLP itself proclaims that it is pragmatic in its approach: what matters is whether it [works](#). However, how do you measure the claim "NLP

works"? I don't know and I don't think NLPers know, either. Anecdotes and testimonials seem to be the main measuring devices. Unfortunately, such a measurement may reveal only how well the trainers teach their clients to persuade others to enroll in more training sessions.

See **related entries** on [Werner Erhard and est](#), [firewalking](#), [hypnosis](#), [Landmark Forum](#), [Large Group Awareness Training](#), [Frederick Lenz \(Rama\)](#), [memory](#), [paradigm](#), [psychoanalysis](#) and [reverse speech](#).

postscript: On a more cheerful note, [Bandler has sued Grinder for millions of dollars](#). Apparently, the two great communicators and paradigm innovators couldn't follow their own advice or perhaps they are modeling their behavior after so many other great Americans who have found that the most lucrative way to communicate is by [suing](#) someone with deep pockets. Grinder has [published a statement on the WWW](#) regarding this unfortunate state of affairs. NLP is big on metaphors and I doubt whether this nasty lawsuit is the kind of metaphor they want to be remembered by. Is Bandler's putting a trademark on half a dozen expressions a sign of a man who is simply protecting the integrity of NLP or is it a sign of a [greedy megalomaniac](#)?

For more on more lawsuits, see [ANLP News](#).

reader comments:

Werner Erhard, est and Landmark Forum

17 May 2002

I'll mention a few memories, but I agree with [Paulette Caswell's](#) comments. First, people signing up for the course are required to fill out a detailed questionnaire, which you can't leave blank; you must tell them your reasons for taking the training (friend/problem/stress/etc.), and your medical history including psychiatric, if you are or have been in therapy, etc. (Paulette is slightly incorrect - only if you are currently in therapy must you provide a note from your shrink saying that he/she will be available for you, not everyone who's ever had therapy.) It is stressful and they do an appropriate screening before letting someone take it.

I took the "training" in D.C. in 1977. What I want to detail is the rationale behind some of the "harsh" treatment. The whole thing might be described as forcibly raising your consciousness, so you see the dumb things you do to screw your life up (the trainer does not attempt to tell 250 people what their dumb mistakes are; through interactions [a person wanting to speak raises their hand and is handed a microphone], he argues for the person to see his point for themselves, in their own minds, to their own satisfaction, of whether or not the point is true). To that end, at the beginning we were told we were "assholes"; but only the first day; once he had everyone's willing attention and willingness to participate (as he said, "if you're an 'observer,' we don't want you here), then that "abuse" was dropped. Most of the time is spent in 2-way dialogue, and "processes"; and each person is free to disagree. They tell you not to "believe" in est; hence the use of the word "get". If you "get" something then you see what they're talking about; if you don't understand something, then just "sit with it". I remember as I write this the comment that being in "mystery" about something (e.g., if you begin to wonder, "why do I spend my whole paycheck at the bar every Friday?") it's actually a high state of consciousness, and to just "sit with it."

Making one sit in a room for 3-4 hours between breaks, with no books, watches, food or snacks, deprives one of distractions, and this is what you learn: very often when some little (or big) unpleasantness happens, we reach for a crutch - food, cigarettes, drink, drugs, etc. They state emphatically that all these things are "suppressants", that food/drink/smoke/whatever is what our mind

automatically uses to smooth over discomfort, to avoid dealing with something, to avoid it. So is going to the bathroom. When you're sweating under the collar, nervous before a meeting with the boss, etc., you think you need to go to the bathroom, yet when things are fine you don't. The training informed us we act like, but are not, "tubes" (as in food goes in one end, out the other). Participants begin to see their own destructive behaviors, be it chain-smoking, compulsive shopping, overeating, or senseless base to phobias, etc.

The "processes" are hour-or-longer guided concentration exercises, sitting upright in chairs with eyes closed, are obviously similar to yoga, though there is no mention whatsoever of anything tied to religion. ("God" was only mentioned a couple times, and then only in passing; the time I remember well is when the trainer told us he could only tell us one thing about God: "She's black". No offense intended; for a WASP like me, the description of God as "the Black Lady" was an interesting thought, something of course I never heard in my several years at seminary.)

The "responsibility" thing is heavy. If you're a drunk on skid row ... if your spouse just divorced you ... if you just lost a fortune on the stock market, who's responsible? The liquor companies (maybe I should sue them)? The guy she ran off with (maybe I should put a contract on him)? Those wall-street high-fliers that used us like tools? No, dear, you are. Wherever you are today, you're there because you put yourself there. You did it. And you're now just as free, and able, to do something right, something constructive. The answer to a lot of the arguments we use to convince ourselves that we can't change something in our lives, is: Bullshit. In est lingo, the point is that instead of being "at cause" you can be "at effect." This is an example of the rumored "brutality," just dialoguing with people who want to argue for hours that they weren't responsible for whatever has happened to them. [I am aware that this idea and style has ties to Buddhism; however as I said, it is wrong to imagine that est purports to be a religion, it has no religious content.]

If all this sounds like a bunch of elementary first-aid for idiots (or, well, assholes), then I'd have to say ... that's the idea. The concept behind the est training was [and now as the Landmark Forum it is] exactly that. The people who take it of course vary from more to less credible, and more to less sane.

jim

28 Apr 2002

I really enjoyed your spot-on comments in response to the General Counsel of Landmark Education Corporation (LEC). I had the misfortune of attending a LEC guest event, and I've never seen such smug, self-absorbed and self-congratulatory people. Much like the general counselor above, many LEC types

bristle at equating EST to Landmark. Yet I've heard more than one LEC trainer and life-long forum junkie declare--between emotional gasps(!)--that that they've been involved with landmark "for over 20 years!" Clearly if, one does the math about when EST supposedly ended and LEC began, it certainly makes for a very revealing Freudian slip!

I also totally agree with your observation that LEC's true motive is to stifle all comments that it perceives as negative towards LEC. You clearly do listen and edit your webpage when appropriate, yet even this is not enough for the cult-like forum fanatics. The disproportionate hostility really does remind me of the insidious political correctness that is infesting our schools and universities. They are so concerned with teaching our students "what" to think that they've neglected teaching "how" to think. But we should be able to do so on our own, for when one cannot say what is truly on their mind without fear of reprisal from forums freaks or PC Nazis we're no longer a democracy. Thankfully we have people like you.

And as far as disproportionate hostility is concerned: I should know, for I lost a best and beloved friend of over ten years to LEC. In less than 3 days they transformed her into a jargon-babbling forum freak, who, when I presented her with your excellent site and also that of Mr. Rick Ross, she summarily dismissed all negative empirical research, magazine articles and personal anecdotes culled from over the past 30 years as merely rare psychological meltdowns or a conspiracy. She said that I "wasn't ready to 'get it.'" It's funny how all of LEC's personal responsibility mantras turn into finger pointing when they feel everyone isn't being "positive" enough. Sadly, only as long as my friend thought there was a chance that I'd do the forum, she was still in communication. But as soon as I showed her the evidence that I based my nonattendance on and told her to stop talking in the annoying forum jargon, she got cold and uncommunicative. She then told me that people at her forum who'd voiced similar criticism were yelled at, and she said that "everybody hated them." And that last statement was from one of the most loving people I'd ever known, and I'd NEVER EVER heard her use the word "hate" before.

So as you can see from your own experience, LEC seems to engender a very hostile reaction towards any criticism (and sometimes critics) in its converts similar to its own. It's been nearly a year now and I haven't even gotten so much as an e-mail from my old friend. We used to e-mail daily, call weekly and meet at least twice a month. After my experience and reading [Rick Ross's site](#), no one will ever be able to convince me that LEC isn't a cult or at least cult-like, for I agree that it should be avoided--exactly as the cult expert Dr. Margaret Singer in her book [Cult's in Our Midst](#) stated in no uncertain terms. It's expert opinions like hers and Mr. Ross's that carry far more credibility than any dubious forum apologist who may contribute the occasional--between emotional gasps(!)-- pro LEC comments here from time to time. Nevertheless--unlike LEC and Politically Correct Nazis, I defend their right to express their opinions, but I totally condemn their hypocritical efforts to silence those whose

views offend their overly sensitive sensibilities.

Proud to sign my name:

shoehorning

Shoehorning is the process of force-fitting some current affair into one's personal, political, or religious agenda. So-called [psychics](#) frequently shoehorn events to fit vague statements they made in the past. This is an extremely safe procedure, since they can't be proven wrong and many people aren't aware of how easy it is to make something look like confirmation of a claim *after* the fact, especially if you give them wide latitude in making the shoe fit. It is common, for example, for the defenders of such things as the [Bible Code](#) or the "prophecies" of [Nostradamus](#) to shoehorn events to the texts rather than truly predict anything.

After the terrorist attacks on the World Trade Center and the Pentagon on September 11, 2001, fundamentalist Christian evangelists Jerry Falwell and [Pat Robertson](#) shoehorned the events to their agenda. They claimed that "[liberal](#) civil liberties groups, feminists, [homosexuals](#) and [abortion rights](#) supporters bear partial responsibility...because their actions have turned God's anger against America."* According to Falwell, God allowed "the enemies of America...to give us probably what we deserve." Robertson agreed. The American Civil Liberties Union has "got to take a lot of blame for this," said Falwell and Robertson agreed. Federal courts bear part of the blame, too, said Falwell, because they've been "throwing God out of the public square." Also "abortionists have got to bear some burden for this because God will not be mocked," said Falwell and Robertson agreed. [Hear these demonic demonizers talk it out in [mp3](#).]

Neither Falwell nor Robertson has any way of proving any of their claims, as they are by their nature unprovable. But such claims can't be disproved, either. Their purpose is simply to call attention to their [agenda](#) and to get free publicity in the news media. It is a way to take advantage of the fear and anger of people, without fear of being proved to be a liar. It is a hit and hide tactic, as no rebuttal is possible, except to say that if there is an omniscient, all-powerful Being who governs the universe, the likelihood that such a being would be allied with people like [Falwell](#), [Robertson](#) or suicide killers seems absurd on its face and unworthy of serious discussion by people who call themselves human beings. Unless, of course, the Almighty is all-Evil, which is possible according to Falwell's logic; for, otherwise, he and his kind should have been struck dead long ago. At least, in some quarters demonstrating and inciting hatred is not considered good.

After one has been roundly criticized by nearly everyone on the planet for egregious shoehorning of the Falwell/Robertson type, it is typical of the hypocrites to issue denials and claim their statements were taken out of

context. Falwell issued the following statement: "I sincerely regret that comments I made during a long theological discussion on a Christian television program yesterday were taken out of their context and reported, and that my thoughts--reduced to sound bites--have detracted from the spirit of this day of mourning."* Robertson, however, is unrepentant, and has added [Internet pornography](#) to his list of things that have so angered his God that He had to murder thousands of innocent people to express His Almighty displeasure. If we don't change our ways, he says, God is going to kill a lot more of us. Thus, when the carnage mounts in the years ahead as the U.S. and its allies try to eliminate terrorism and the terrorists continue murdering the innocent, we can look back at the dead and say that Pat Robertson predicted it.

retrospective falsification

D.H. Rawcliffe coined this term to refer to a situation in which a story of the extraordinary is told, then retold with embellishments and remodeled with favorable points being emphasized while unfavorable ones are dropped; the distorted version becomes part of memory, fixating conviction in a remarkable tale.

The term is also used in psychology to describe the process used by the paranoid as he recalls selective incidents from the past, reshaping them to fit his present needs.

Rawcliffe, Donovan Hilton, *Illusions and Delusions of the Supernatural and the Occult; the Psychology of the Occult* (New York: Dover Publications, 1959).

The Princeton Engineering Anomalies Research (PEAR)

The brainchild of Robert G. Jahn, who, in 1979, when he was Dean of the School of Engineering and Applied Science at Princeton University, claimed he wanted “to pursue rigorous scientific study of the interaction of human consciousness with sensitive physical devices, systems, and processes common to contemporary engineering practice.” In short, he wanted to be a [parapsychologist](#) and test [psychokinesis](#). Not so unbelievably, he has found several others at Princeton who also were tired of humdrum work in the humanities, social sciences, engineering, and physics, and have joined the quest to prove that the mind alone can alter matter.

Jahn, six of his associates, and PEAR even have a patent ([US5830064](#)) on an “Apparatus and method for distinguishing events which collectively exceed chance expectations and thereby controlling an output.” This patent is based on their experiments where human operators try to use their minds to influence a variety of mechanical, optical, acoustical, and fluid devices. In short, the PEAR people are doing what many drivers do when they try to use their thoughts to make a red light turn green.

PEAR claims to have attained results that can't be due to chance and "*can only* be attributed to the influence of the human operators" (emphasis added). This is an extraordinary claim, especially coming from such scholars at such a [distinguished institution](#). I would think it would be impossible to rule out all of the following explanations for such statistics not likely due to chance:

1. deliberate cheating
2. errors in calibration
3. unconscious cheating
4. errors in calculation
5. software errors
6. self-deception

Of course, they could be hedging here. After all, fraud, unconscious cheating, errors in calculation, software errors, and self-deception could be considered as “influence of human operators.” In any case, the folks at PEAR are confident that there is only a one in 5,000 chance that the very small effect they have measured--about 0.1 percent--is due to chance. Jahn thinks he has found an [anomaly](#) that indicates that his operators' minds are influencing random systems at an average rate of about once every thousand tries.

One anomaly in the PEAR studies was noted in 1985 by parapsychologist

John Palmer of Durham University, North Carolina. Of the many operators used "operator 10," believed to be a member of the PEAR lab staff, accounted for a disproportionate amount of the success of the experiments. "On the most recently available figures operator 10 has been involved in 15 percent of the 14 million trials, yet contributed a full half of the total excess hits ([McCrone 1994](#)). Also, Stan Jeffers, a physicist at York University, Ontario, has replicated the Jahn experiments but with chance results.

The PEAR people are so convinced of the breakthrough nature of their work that they have incorporated as [Mindsong Inc.](#) They claim their corporation "is developing a range of breakthrough products and research tools based on a provocative new technology -- proprietary microelectronics which are responsive to the inner states of living systems." One of their breakthrough products is some software for \$55.95 "that allows you to influence, with your mind, which of two images will be displayed on your computer screen." They also sell a device for \$425 that lets you do your own testing of mental influence of randomized outputs.

psi-missing

Psi-missing is an [ad hoc hypothesis](#) invented by parapsychologists to explain away failures to demonstrate [ESP](#). The tests usually involve trying to use ESP to identify various targets, such as [Zener cards](#), pictures, etc. which are hidden from direct view of the subject. The failure to do better than would be expected by chance is explained away as due to unconscious direction to avoid the target. [J.B. Rhine](#) even claimed that persons who didn't like him would *consciously* guess wrong to spite him (Park 2000, 42).

psychic photography

Whoever thinks the camera doesn't lie doesn't think.

Psychic photography is the alleged production of images on photographic media by [paranormal](#) means such as [psychokinesis](#) or of paranormal phenomena such as [ghosts](#) or [astral bodies](#).

Faked photos, like the [Billy Meier UFO photos and the alien autopsy film](#), or those of [the Cottingly fairies](#), [the Loch Ness monster](#), or [Bigfoot](#), are not considered *psychic* photos. While there are many faked psychic photos, some are simply paranormal interpretations of natural events such as various flaws in camera or film, effects due to various exposures, film-processing errors, lens flares (caused by interreflection between lens surfaces), the camera or lens strap hanging over the lens, effects of the flash reflecting off of mirrors, jewelry, etc., light patterns, polarization, chemical reactions, etcetera (Nickell 1994, 1997).

The first psychic or spirit photographs appeared almost immediately after the first photographs. "As early as 1856, prints of ghostly looking ethereal figures sitting next to the person being photographed were being sold as joke novelties" (Williams 2000, 205). In 1862, William Mumler made a good living in Boston using double exposure to produce photographs with alleged spirits of dead people in them (Williams, 326). Many have followed in Mumler's footsteps.

Some paranormal researchers, apparently unaware of or unwilling to accept that spirit photos are faked or misinterpretations of ordinary phenomena, try to chase down and photograph spirits. Still others claim that they can transfer their thoughts to film directly, a trick known as *thoughtography*.

Thoughtography was made popular by psychiatrist Dr. Jule Eisenbud. He wrote a book about a Chicago bellhop name Ted Serios, who claimed he could make images appear on Polaroid film just by thinking of an image. Since the publication of Eisenbud's *The World of Ted Serios: 'Thoughtographic' Studies of an Extraordinary Mind* (1966), others have claimed to be able to perform this feat. Eisenbud claimed that Serios made his thoughtographs by [psychokinesis](#) and that some of them were instigated during [out-of-body experiences](#). Charlie Reynolds and David Eisendrath, both amateur magicians and professional photographers exposed Serios as a fraud after spending a weekend with him and Eisenbud. Serios claimed he needed a little tube in front of the camera lens to help him concentrate, but he was spotted slipping something into the tube. Most likely it was a picture of

something that the camera would take an image of, but which Serios would claim came from his mind rather than his hand. Their exposé appeared in the October 1967 issue of *Popular Photography*. Serios' psychokinetic powers began to fade after the exposure and he has remained virtually unheard from for the past thirty years.

Many years after Serios faded from the paranormal spotlight, [Uri Geller](#) began doing a trick in which he produced thoughtographs. Geller would leave the lens cap on a 35mm camera and take pictures of his forehead. He claimed the developed film had pictures on it that came directly from his mind. There is no doubt that the images came from Geller's mind, but perhaps they took a more circuitous route than he says. James Randi, magician and debunker of all things paranormal, claims that psychic photography is actually trickery done using a handheld optical device (Randi 1982, 222ff.; 1995, 233) or by taking photos on already exposed film. Intelligent people who are ignorant of photography are susceptible to being duped about psychic photographs and photographs of prehistoric monsters or [fairies](#), as was Sir Arthur Conan Doyle, the creator of Sherlock Holmes.

It does seem strange that spirits and other paranormal forces have the power to appear on film or on [electronic devices](#), or [communicate to a select few in cryptic noises](#) that must be deciphered by [shotgunning](#) in a game of 20 questions. The spirits never simply sit down at the table and say directly what is on their minds. In this they are very much like God. Perhaps this explains our love for *hide and seek*, the children's game that may hold the key to understanding human nature and the great secrets of the universe.

[House of Horrors -
Dream House Turns
Out to Be Haunted —
Or Was It?](#)

According to a Gallup poll, belief in haunted houses has increased from 29% to 42% over the last decade of the 20th century.

haunted houses

When [Satan](#) or [poltergeists \(ghosts\)](#) take up residence in a house the house is said to be "possessed" or "haunted." While it is quite common for a Catholic priest to bless a house or perform what is called a "[routine exorcism](#)", "[real exorcisms](#)" are not usually done on houses, despite what was depicted in *The Amityville Horror*, a fictional movie based on a true fraud.

It is not clear why Satan or ghosts would confine themselves to quarters, since with all their alleged powers, they could be anywhere or everywhere at any time. If they really wanted to terrorize the neighborhood, they could take turns haunting different houses. In the case of Amityville, the real devils were George and Kathy Lutz who concocted a preposterous story made into a book and a movie, apparently to help them out of a mortgage they couldn't afford and a marriage on the rocks. [Schick & Vaughn, p. 269-270]

Besides the fraudulent cases, there are those cases where otherwise normal people hear strange noises or have visions of dead people or of objects moving with no visible means of locomotion. Hearing strange noises in the night and letting the imagination run wild are quite natural human traits and not very indicative of diabolical or paranormal activity. Likewise for having visions and hallucinations. These are quite natural, even if unusual and infrequent, in people with normal as well as with very active imaginations. [Sagan]

There are "ghostbuster" types who go to allegedly haunted houses for television programs such as *Sightings*. They walk around with some electronic device that picks up electromagnetic fields, and if the needle jumps around they claim they have evidence of poltergeist activity. Why electromagnetism should be identified with ghosts or devils, I have no idea. Just about everything gives off some level of electromagnetic radiation. [Some animals](#) even have the ability to sense electric fields.

There are also a number of cases of reported haunted houses which turn out upon thorough investigation to have been instigated by disturbed teenagers trying to get attention by scaring the devil out of their parents and siblings. [Randi, 1985, 1995]

Haunted houses are great fun at Halloween, though certain devout Christians

find them, along with [witches](#) and goblins, to be diabolical. No one really thinks these Halloween houses are haunted. People go to them because we like to be scared out of our wits. Why? I have no idea. Maybe we think of being scared to death as a way to get close to death without really endangering ourselves. But whatever the reason is, I suspect it is behind the popularity of ghost stories and tales of haunted houses.

Many people report physical changes in haunted places, especially a feeling of a presence accompanied by temperature drop and hearing unaccountable sounds. They are not imagining things. Most hauntings occur in old buildings, which tend to be drafty. Scientists who have investigated haunted places account for both the temperature changes and the sounds by finding sources of the drafts, such as empty spaces behind walls or currents set in motion by low frequency sound waves produced by such mundane objects as an extraction fan.

Eye Movement Desensitization and Reprocessing (EMDR)

....what is new in EMDR does not appear to be helpful, and what is helpful is what we already know about relaxation, education, and psychotherapy.*

EMDR is a therapeutic technique in which the patient moves his or her eyes back and forth, hither and thither, while concentrating on "the problem." The therapist waves a stick or light in front of the patient and the patient is supposed to follow the moving stick or light with his or her eyes. The therapy was discovered by therapist [Dr. Francine Shapiro](#) while on a walk in the park. (Her doctorate was earned at the now defunct and never accredited Professional School of Psychological Studies. Her undergraduate degree is in English literature.*) It is claimed that EMDR can "help" with "phobias, generalized anxiety, paranoid schizophrenia, learning disabilities, eating disorders, substance abuse, and even pathological jealousy" (Lilienfeld 1996), but its main application has been in the treatment of post traumatic stress disorder (PTSD). No one has been able to adequately explain how EMDR is supposed to work. Some think it works something like [acupuncture](#) (which allegedly unblocks [chi](#)): rapid eye movements allegedly unblock "the information-processing system." Some think it works by a sort of ping-pong effect between the right and left sides of the brain, which somehow restructures memory. Or perhaps it works, as one therapist suggested, by the rapid eye movements sending signals to the brain which somehow tame and control the naughty part of the brain which had been causing the psychological problems. I heard the latter explanation on a television news report (December 2, 1994). The television station provided a nice visual of a cut-away head with sparks flying in the brain. The anchorman warned us not to try this at home, that only licensed mental health professionals were qualified to give this kind of therapy. One such professional is [Dr. Ann T. Viviano](#) who thinks EMDR works this way: "The client, by following a moving light with their eyes, activates the healing process of the brain, much as what occurs in sleep. As a result, the painful memories are re-processed and the original beliefs which sprang up from them are eliminated. New, healthy beliefs replace these." The healing occurs by activating the healing process.

Evidence for the effectiveness of EMDR is not much stronger than the theoretical explanations for how EMDR allegedly "works." The evidence has the virtue of being consistent, unlike the theoretical explanations, but it is mainly [anecdotal](#) and very vague. It has not been established beyond a reasonable doubt by any [controlled studies](#) that any positive effects achieved

by an EMDR therapist are not likely due to chance, the [placebo effect](#), patient expectancy, posthypnotic suggestion, other aspects of the treatments besides the eye movement aspect, etc. This is not to say that there have not been controlled studies of EMDR. [Dr. Shapiro cites quite a few, including her own.](#) The reader is invited to look at her summaries of the research and determine for him or herself just how adequate the evidence is in support of EMDR as the main causal agent in recovery from PTSD. The latest study by Wilson, Becker and Tinker is to be published in [The Journal of Consulting and Clinical Psychology](#). It reports a "significant improvement" in PTSD subjects treated with EMDR. The study also provides significant evidence that spontaneous healing cannot account for this improvement. Nevertheless, the study is unlikely to convince critics that EMDR is the main causal agent in measured improvement of PTSD subjects. I suspect that until a study is done which isolates the eye movement part from other aspects of the treatment, critics will not be satisfied. It may well be that those using EMDR are effecting the cures they claim and thereby benefiting many victims of horrible experiences such as rape, war, terrorism, murder or suicide of a loved one, etc. It may well be that those using EMDR are directing their patients to restructure their memories, so that the horrible emotive aspect of an experience is no longer associated with the memory of the experience. But, for now, the question still remains, whether the rapid eye movement part of the treatment is essential. In fact, one of the control studies cited by Shapiro seems counter-indicative:

In a controlled component analysis study of 17 chronic outpatient veterans, using a crossover design, subjects were randomly divided into two EMDR groups, one using eye movement and a control group that used a combination of forced eye fixation, hand taps, and hand waving. Six sessions were administered for a single memory in each condition. Both groups showed significant decreases in self-reported distress, intrusion, and avoidance symptoms ([Pitman et al. 1996](#)).

Maybe hand taps will work just as well as eye movements. According to one EMDR practitioner, Dr. Edward Hume,

...taps to hands, right and left, sounds alternating ear-to-ear, and even alternating movements by the patient can work instead. The key seems to be the alternating stimulation of the two sides of the brain.*

According to Dr. Hume, Shapiro now calls the treatment Reprocessing Therapy and says that eye movements aren't necessary for the treatment! Maybe *none* of these movements are needed to restructure memory. In short, EMDR is a scientifically controversial technique at present. This has not prevented thousands of practitioners from being certificated to practice

EMDR by Shapiro and disciples.

EMDR is controversial and not accepted practice by the American Psychological Association. Advocates disagree, of course, and claim that EMDR is "a widely validated treatment for Post Traumatic Stress Disorder" and other ailments such as "traumatic memories of war, natural disaster, industrial accidents, highway carnage, crime, terrorism, sexual abuse, rape and domestic violence." [David Drehmer, Ph.D., Licensed Clinical Psychologist & Director, Performance Enhancement Laboratory, Associate Professor of Management, DePaul University, personal correspondence.] So far, the validation referred to by Dr. Drehmer is mainly in the form of unconvincing research studies and testimonials by practitioners relating anecdotes and their interpretations of those anecdotes. What is needed is not proof that PTSD subjects are being helped by the treatment, but that it is the eye movement part of the treatment that is essential. Once that is established, a theory as to how it works would be most gratifying. At present, we are being given theories to explain something which we can't yet be sure is even occurring: that eye movements are restructuring memory. If it turns out that that claim is true, I suggest it will have significance far beyond the treatment of PTSD subjects.

Finally, when evidence came in that therapists were getting similar results to standard EMDR with [blind patients](#) whose therapists used tones and hand-snapping instead of finger-wagging, Shapiro softened her stance a bit. She admits that eye movement is not essential to eye movement desensitization processing, and claims attacks on her are *ad hominem* and without merit.

update (Dec 20,2000): [Ranae Johnson](#) has founded the [Rapid Eye Institute](#) on a blueberry farm in Oregon where she teaches Rapid Eye Technology. This amazing new therapy is used "to facilitate releasing and clearing of old programming, opening the way to awareness of our joy and happiness." It helps us "find light and spirituality within us that has always been there." Apparently, people are paying some [\\$2,000 for the training](#) and all the blueberries you can eat.

See related entry on [thought field therapy](#).

unicorns

The unicorn is a creature from fables, usually depicted as a white horse with a spiraled horn protruding from its forehead. The unicorn is also a symbol of virginity and in Christian iconography is sometimes used to represent the Virgin Mary. Medieval and Renaissance tapestries often feature the unicorn.

[Cryptozoologists](#) have been alerted to sightings of the unicorn throughout the world, but especially in India, where it was once thought to be a native beast.

EMDR

2 Jan 2000

Dr. Richard Spates, a behavioral psychologist out of Western Michigan University, presented a component study of EMDR at the annual convention of the Association for Behavior Analysis, several years ago. He found that the crucial component for therapeutic success was exposure to the feared stimulus. This is consistent with over 40 years of published research in behavior therapy. The eye movements and all other forms of wiggling are just artifact.

Robert M. Stein, Ph.D.

Center for Neurobehavioral Health, Ltd. Lancaster, PA

1 Sep 1997

I read your material on EMDR questioning its validity and veracity. Whereby your skeptics approach in many situations is refreshing and well needed, in this case you missed the boat. I have been an EMDR therapist for the last four years, following 15 years as a conventionally trained clinician, and I can prove to you it is an remarkably effective clinical tool when correctly incorporated into a diagnostically sound treatment situation.

I have successfully treated 30 engineers from the Long Island Railroad in the last two years suffering from PTSD (Post Traumatic Stress Disorder) resulting from accidents and suicides in front of their trains (which occur every 2 to 4 weeks). In one two three extended sessions (1 1/2 to 2 hours) I have been able to resolve not only acute but chronic trauma, in some cases resulting from up to six such incidents. EMDR is now the accepted mode of psychotherapeutic treatment for PTSD by both the LIRR EAP (Employee Assistance Program) and the union local (Brotherhood of Engineers) and most importantly the engineers themselves. Any I have treated would be available to speak with you.

In addition, through the EMDR HAP (Humanitarian Assistance Program) I have led Pro Bono Trainings of 150 therapists in EMDR in Northern Ireland (in October 1996 and June 1997). So many trauma sufferers have accordingly been helped in such a short time that the Central Government of Northern Ireland and their Department of Health is recommending that EMDR should be available to all its citizens as a treatment for PTSD.

Dr. Bessel Van Der Kolk, a world famous Harvard University psychiatrist and

researcher is conducting pre and post EMDR SPECT SCAN studies with PTSD sufferers and is showing positive changes in brain activity after the treatment.

Bob, I have heard you on the radio and been very impressed by your observations. However, this time your arrow has missed the target completely. I am challenging you to either personally experience EMDR administered by myself or observe me working with a PTSD sufferer of your choice.

If you do not agree to this at a convenient time and place, perhaps you should have your skeptics spotlight turned on yourself!

Will you accept the challenge?

Sincerely,

David Grand

reply:Do you have evidence that the effects you observe are not due to chance, the placebo effect, patient expectancy, posthypnotic suggestion, etc. Have you done any controlled studies that demonstrate that any positive effects achieved by EMDR are not likely due to some other factor?

You mention the successful treatments you have witnessed. I don't doubt your claims. How can you be sure that what you are effecting is due to EMDR?

Even if changes in brain activity are detected, how will you know that those changes were caused by EMDR or that they were significant changes in bringing about a "cure"? Changes in brain activity may indicate that memory has been restructured, but the issue is whether using eye movements, ear or hand taps, etc, had anything to do with it. The other aspects of the therapy may be more significant, particularly any attempt to change the patient's memory or belief system by encouraging association of pleasant or neutral thoughts with a traumatic experience or the dissociation of unpleasant thoughts with a traumatic experience. It may be that EMDR therapy is replacing or disconnecting the emotional memory of a traumatic experience. It may be that EMDR therapy is providing new associations with memory fragments that are now interconnected with emotional memory and that this diminishes the potential stimulation effect of the memory fragment to bring back horrible feelings. But the study which isolates the eye movement, hand taps, etc., from the other aspects of the treatment still needs to be done before we start speculating as to *how* EMDR works. For all we know, EMDR therapists may be doing things very similar to what is done in cognitive therapy, along with their eye movement treatment.

I don't deny that EMDR might in fact be doing all the things you say it does, but until we have more evidence, I will remain skeptical about what is effecting the cure.

2 Sep 1997

I don't know why you believe EMDR has not been validated by controlled studies. Many have been conducted (I can send you reprints) with the major study by Wilson, Becker and Tinker (Eye movement desensitization and reprocessing [EMDR] treatment for psychologically traumatized individuals) published in the Journal of Consulting Psychology in 1995 63(6) pp 928-937. They have also followed up with a larger sample yielding similar results.

People with EMDR expertise have observed that in addition to left/right eye movements, alternating tactile (hand tapping) or auditory (tones) elicit the same rapid reprocessing effect. I have recorded an stereo audiotape which has pleasant music with tones that alternate to the left and right ears. In error, a batch of these tapes were recorded in mono. When I used these defective tapes in session, unbeknownst to me, I received no clinical response. I was baffled and I checked the tapes to discover that the tones were not being delivered bilaterally. Dr. Sandra Shapiro (no relation to Francine Shapiro) a research psychologist in the graduate psych program at Queens College will be using the stereo and mono tapes to conduct research on the validity of EMDR.

You question whether chance, the placebo effect, patient expectancy, posthypnotic suggestion could result in the hundreds of patients who have brought full blown PTSD symptoms into my office and left without them, oftentimes in one or two sessions. These results have never been accomplished in the past, even by chance, the placebo effect, patient expectancy, posthypnotic suggestion. How can that be explained?

Face validity reflects the idea, I saw it with my own eyes. If you saw a man steal a woman's purse in the street five feet away from you, would you need to prove to someone that it happened. You could come up with alternate explanations (someone slipped you LSD at lunch) but what we see in front of our eyes should carry some weight. Again, I invite you to personally experience or observe me work with someone of your choosing. Can seeing something with your own eyes have any validity to you?

David Grand

reply: Shapiro summarizes the Wilson, et. al. study as follows:

S. Wilson, Becker, and Tinker (1995). A controlled study randomly assigned 80 trauma subjects (37 diagnosed with PTSD) to treatment or delayed-treatment EMDR conditions and to one of five trained clinicians. Substantial results were found at 30 and 90 days and 12 months post treatment on the State-Trait Anxiety Inventory, PTSD-Interview, Impact of Event Scale, SCL-90-R, and the SUD and VOC scales. Effects

were equally large whether or not the subject was diagnosed with PTSD.

Apparently not all psychologists agree that either these "substantial results" proved anything significant or that this study demonstrated the significant effectiveness of EMDR. You seem to think that the issue is whether subjects score lower on a stress inventory test or whether subjects report that they are better or whether you perceive them as better after treatment. My questions are not about those issues, but about *what* in the treatment, if anything, is effecting the "cure"? The treatment seems to involve many things, some of which are not new in treatment, and I am waiting for the evidence that controlled studies have isolated the "eye movement desensitization reprocessing" as the new and improved clinical method effecting these successes.

16 Oct 1997

Bob,

I picked up this quote on the internet: It may be a good illustration of the difference between negative bias and skepticism.

Real skeptics would have been curious about unexpected findings, they would not have ignored them and they would not have been distressed by them. About 95% of the people I've encountered who described themselves as skeptics had committed themselves to a viewpoint way too early to claim the title. Real skeptics, people who are able to reserve judgment, are rare.

I am available for an open, honest comprehensive examination of all the data from all sides of this issue. Are you?

David Grand

reply: I take it that your point is that I am not a "real" skeptic because I have come to a conclusion about EMDR (and many other things). Either that, or you are implying that I have ignored the "findings" of therapists such as yourself about the successes treating PTSD subjects and that I have come to my conclusions "way too early." I'll try to clarify my position one more time.

I do not challenge the claim that many people with PTSD are helped significantly by EMDR. I am skeptical of the explanations given for the successes, both theoretical and practical. The theoretical explanations as to how EMDR "might" work are, to be charitable, unconvincing. They amount to little more than contrived speculation with no basis in research

or testing. The practical explanations, however, are what I most take issue with. Let's start at the beginning.

Francine Shapiro announces she has a "new" therapy which can be a tremendous help to millions of people around the globe who suffer emotional distress due to witnessing or experiencing severely disturbing events such as acts of war, violent deaths, etc. She hasn't done any scientific research yet, but she has studies underway. This great new therapy which can help millions is not announced in a reputable scientific journal, backed up by reputable scientific studies. Instead it is announced as an invitation to get in on the ground level. The therapy is for sale. You pay your money to get trained and certified by the founder and you promise not to teach others this latest boon to all humankind. Eventually some studies get done but they are all done by those who have paid their fees and got trained in EMDR. What a shock that all the studies validate the therapy and have not the slightest bit of skepticism in them! Every one of us has to be concerned about selective perception, but researchers who set out to validate what they are doing are especially prone to ignoring counter-evidence because they simply are not looking for it. They don't try to disconfirm a hypothesis but to prove one. If you do not understand why this is not considered good method, then I am probably wasting my time communicating with you. Not only did the cart get put before the horse, but because this therapy has not been explained in detail in reputable scientific journals, independent researchers can't test it. By the time independent researchers get enough information about this therapy to do some meaningful testing, it is already well-established and can point to the fact that it is successful. What it can't point to is evidence that this "new" therapy isn't just an "old" tried and tested therapy wrapped in some new metaphysical swaddling or psychobabble gobbledygook. When one tried to find a controlled study where a group of PTSD patients are given EMDR treatment and others are given exactly the same treatment minus the eye movements, ear taps, or knee taps, one searches in vain. Instead, one sees study after study which show that compared to some other treatment, EMDR is more successful.

I don't know who you got your quote from, but I wonder what kind of skeptic admires a person who claims she can help humankind with her new treatment but won't reveal it unless you pay her to take her course in the treatment and agree not to teach anyone else the method? Does this sound like a "real" scientist to you? Is this the kind of person you admire and wish to follow? I guess so.

24 Nov 1997

I read with interest your correspondence regarding EMDR. You appear to be basing your views on a great deal of misinformation.

1) *EMDR was not offered as a treatment without research. EMDR was announced to the field of psychology with the publication of a controlled study published in the Journal of Traumatic Stress (Shapiro, 1989). The data were subsequently reported in another article in the Journal of Behavior Therapy and Experimental Psychiatry (Shapiro, 1989). At the time of these publications there were few studies of treatments for post traumatic stress disorder (PTSD) and all the other reviewed treatments (Solomon, Gerrity and Muff, 1992) were regarded as marginally effective.*

reply: from [Hearst & Milkewicz](#): "Although her research was encouraging, there were limitations to this study. All of the treatment and assessment was done by Shapiro, hence demand or other non-specific effects could account for part of the treatment effect. Heart rate was only monitored for the treatment group, which may have created a difference in expectations. Furthermore, the diagnostic criteria were unclear and the only standardized measures were self-reports (Greenwald, 1994)."

2) *The instructions regarding the method were not hidden. Both Shapiro articles contained instructions regarding the procedure as it had been developed at that time. At that point it was viewed simplistically and called EMD.*

3) *EMDR was not offered as "therapy for sale" or held hostage. Specialized training was deemed mandatory for client protection when the complexity increased and sufficient feedback was received (see Shapiro, in press, Innovations in Clinical Practice). This need for training was declared ethical and preferable by an independent discussant at an APA symposium (Nurse, 1996). People were asked not to teach others when it was found that participants had taught their versions to lay hypnotists and massage therapists and clients were getting hurt. As a psychological method, EMDR should only be used by a trained and licensed mental health professionals.*

reply: *ibid.* "Soon after EMDR's discovery, Shapiro began holding workshops at hotel conference centers around the country. These workshops included the eye-movement technique, a package of clinical skills, and 7 hands-on practice sessions. Since 1991, the training has been revised to include "Level I Basic" and "Level II Basic". Shapiro's possessiveness of EMDR techniques has been controversial. She insists on personally conducting the workshops and having the trained individuals sign a contract stating that they will not teach anyone else these skills. This restriction has been viewed negatively by many clinicians. For example, Herbert and Meuser (1992) argued that "... such a restriction of information runs counter to the principle of the open and free exchange of ideas among scientists and professionals" (p. 173, as cited in Acierno et al., 1994)."

4) *Validation was not produced because researchers were biased by fee*

payments. Pro bono EMDR training has been provided to all researchers upon request.

reply: I haven't suggested that validation was produced because researchers were paid. In fact, I haven't questioned that EMDR has helped many people. What I have questioned is whether EMDR really is a "new" therapy or just old wine in a new skin. I have no doubt that EMDR works as well as or better than most psychotherapies. I guess I should have asked what other discipline would have granted a doctoral student a Ph.D. on the basis of such work? I have also questioned the validity of all the hype that EMDR is a panacea: "Another controversial point has been the proliferation of EMDR workshops for a wide variety of clinical problems (Marquis, 1991). The list includes agoraphobia and panic disorder, child trauma, learning difficulties, sexual abuse, multiple personality disorder, somatic disorder, obsessive-compulsive disorder, smoking cessation, and eating disorders (Greenwald, 1994)." [ibid.]

5) EMDR has not been inadequately researched. The fourteen controlled studies completed on EMDR as a treatment for PTSD make it the most heavily researched and supported method for the treatment of trauma.

6) The four most recent, rigorously controlled studies consistently indicate that 84-90% of single trauma victims no longer have PTSD after the equivalent of three 90 minute sessions (Marcus, Marquis & Sakai, in press, Psychotherapy; Rothbaum, 1997, Bulletin of the Menninger Clinic; Scheck, Schaeffer & Gillette, in press, Journal of Traumatic Stress; Wilson, Becker & Tinker, 1995 and in press, Journal of Consulting and Clinical Psychology)

Yes, but there are studies which are not so supportive: "However, several studies attempting to replicate earlier findings of EMDR's apparent efficacy failed to do so. Oswald, Anderson, Hagstrom and Berkowitz (1993) reported that the technique was successful with only 3 of 8 people volunteering for treatment to relieve traumatic memories or anxiety related to traumatic memories. Furthermore, the most seriously disturbed participants, whose intrusive memories included scenes of chronic child abuse and being raped at knifepoint, showed the least benefit. In fact, 4 of the 5 hospitalized participants failed to complete the single-session treatment because their memories were too distressing and the EMDR was having no ameliorative effect. The 3 college student participants who reported significant decreases in their SUDS ratings had much milder memories of breaking up with a boyfriend, witnessing a confrontation between family members, and fainting during an operation on an animal." [ibid.]

7) EMDR is not currently viewed as merely a simple eye movement technique. EMDR has been described as an integrated method of treatment that contains a blend of the major psychological orientations (Hyer, 1997; Shapiro, 1995;

Shapiro & Forrest, 1997). The stimulation such as eye movements, handtaps or tones is simply one component of a complex method. Component analyses to consider the weighting of this one factor in the therapy have nothing to do with its overall effectiveness. Since no other peer reviewed studies of PTSD treatments reveal the substantial clinical treatment effects consistently reported in independent controlled studies of EMDR, explanations such as placebo, expectancy, or "old wine in new bottles" is untenable.

reply: Perhaps EMDR therapists could get the same dramatic results without the eye movements, handtaps or tones. If so, that would indicate that it is the other elements of the therapy that are efficacious. But no one has claimed any of those other elements are unique to EMDR.

8) Training is no longer restricted since standards of practice have been established and since it is no longer considered experimental. The EMDR International Association is a non-profit professional organization independently established by EMDR clinicians and researchers (www.emdria.org). It now oversees EMDR training policies worldwide. In addition to multiple training organizations, numerous graduate programs have incorporated EMDR courses.

I hope you will take the initiative in checking the veracity of this information, and informing your readers.

Charles Shapiro

reply: Suffice it to say that studies are ongoing.

[Expert Confronts
Controversy
Surrounding Virgin
of Guadalupe - Feb
10, 2003](#)

[Myth Versus Miracle -
Debate Rages Over
Likely Canonization
\[of Juan Diego\] by
Kevin Sullivan,
February 5, 2002](#)

Our Lady of Watsonville

Our Lady of Watsonville is a foot-high image of the Virgin Mary seen in the bark of an oak tree in Watsonville, California. Anita Contreras was the first to see Our Lady of Watsonville. On June 17, 1993, the Virgin appeared while Contreras knelt to pray for her children. Since then, thousands of pilgrims have flocked to the site, hoping for a miracle.

Mary is worshipped by many Roman Catholics as the Mother of God. Mexicans have been especially fond of her since her apparent apparition in

1531 to Cuauhtlatoatzin, a Nahuatl peasant and Christian convert who took on the name of [Juan Diego](#). ([Watsonville](#) is about 62% Mexican-American.)

The story of Our Lady of Guadalupe is a bit more dramatic than that of Our

Lady of Watsonville. Legend has it that Juan Diego was a bit of an ascetic mystic, who frequently walked barefoot the 14 miles from his village to church in Tenochtitlan (Mexico City). It was on these walks that he had several visions of the Virgin Mary. He allegedly brought to the bishop his cloak on which an image of the Virgin had been painted (Our Lady of Guadalupe, shown here, is the centerpiece of the Basilica of the Virgin of Guadalupe in Mexico City). Many believe that the painting is of heavenly origin. Skeptics believe it was done by a human artist and passed off as being of miraculous origin in order to win more converts to Christianity.

The name "Guadalupe" is Spanish and is a bit mysterious, since there was no town or shrine near Cuauhtitlan, Juan's village, by that name when the legend began. It is thought that the word derives from a Nahuatl word, *coatlxopeuh*, which supposedly sounds like Guadalupe in Spanish and means something like "one who crushes the serpent." (The serpent can be identified with Satan or with the Aztec serpent-god Quetzalcoatl.) It is also possible that the legend has Juan saying that the Virgin was to be called Our Lady of Guadalupe because the one who invented it was Spanish. The creator of the name may have been intrigued by a statue of Our Lady of Guadalupe in Estremadura, Spain. In any case, it is easy to understand how a mystical Indian could become enchanted with Christianity. Not only did the new religion abound in stories of the miraculous, but the Spanish Christians had put an end to the Aztec empire. The Aztecs had conquered the Nahuatl and perhaps had even sacrificed a few of Juan's relatives to the hungry gods.

The improbability of the story of Juan Diego, his visions, and the miraculous painting has not deterred the faithful from belief. In fact, only a deep [religious faith](#) could account for the continued popularity of [Virgin Mary sightings](#). The skeptic understands the [desire](#) to have a powerful ally in heaven, one who will protect and guide, console, and love you no matter what troubles you have here on earth. The skeptic also understands how easy it is to find [confirmation](#) for almost any belief, if one is very [selective in one's thinking and perception](#). We understand how easy it is to [see things that others do not see](#). Having visions also makes one feel special. Thus, it is not difficult to understand how many people see the Virgin Mary in the clouds, in a tortilla, in a dish of spaghetti, in patterns of light, and in the bark of a tree.

The cult of the Virgin Mary probably has its roots in goddess worship, which has its roots in the desire for a Good Mother, one who loves and nourishes, protects and guides, comforts and encourages. The Virgin is pure, clean, generous with her time, infinitely patient, unlike so many people one meets. She is often the harbinger of peace. The Mother gives birth and through [sympathetic magic](#) brings fertility to the tribe, the crops, etc. The Virgin Mary is the mother of Jesus who is believed by many to be God, making her the mother of God, even though God is eternal and has no beginning. She is also said to have been impregnated by the Holy Spirit, rather than by her husband, Joseph. She is not divine, according to the Catholic Church, but her devotees certainly seem to view the Virgin Mary as a goddess.

A shrine to Our Lady of Watsonville has been set up near the soccer fields and playgrounds of Pinto Lake County Park. Father Roman Bunda celebrated Mass at the site on the 6th anniversary of the Contreras' discovery of the image in the bark. "For those who believe, no explanation is necessary," said Fr. Bunda. "For those who don't believe, no explanation is possible." He's right about the first part.

See **related entries** on [confirmation bias](#), [faith](#), [pareidolia](#), [saint](#), [selective thinking](#), [victim soul](#) and [wishful thinking](#).

[facilitated
communication](#)

reader comments:

facilitated communication

Love your home page. . . the Skeptic's Dictionary. . . SavvySearch.

I am a psychologist in NY. Graduate of SUNY Buffalo. I've become more skeptical over the years. I always used to enjoy Mark Crystal, James Randi and others debunking persons with claimed psi powers in the next lab.

I co-ordinate psychologists who work with the mentally retarded. I am in a battle trying bring some sanity to the apostles of Facilitated Communication, and other crazy fads....I often don't feel I am articulate or persuasive enough. At the same time, I keep trying to come up with treatments that can be empirically validated, primarily behavioral.

Interestingly, the psychologists I work with are the most skeptical and resourceful clinicians working at the agency.

The power of these people is scary.

Keep up the good work. . .

2 Oct 1996

You said of Facilitated Communication: "When facilitators have been tested under controlled conditions they fail miserably."

See Michael J. Salomon Weiss, Sheldon H. Wagner, and Margaret L. Bauman, "A Validated Case Study of Facilitated Communication," Mental Retardation Vol. 34, No. 4, 220-230, August 1996.

Extract: "The experimenter in the protocol (the first author) had been a consultant for Kenny's school program for approximately one year prior to Kenny's introduction to facilitated communication. It is noteworthy that the experimenter was originally quite skeptical about facilitated communication, as can be seen from the following newspaper account: Michael Weiss, a clinical psychologist who has worked with developmentally disabled children in New Bedford, is also concerned [about facilitated communication]. "There's a rich tradition in how we judge whether something is true.... It gets reviewed by peers and has to pass a certain standard," he said. "What I'm

unnerved about with the facilitated communication people is that there's almost a refusal to adhere to this standard." Asked why he thinks Dr. Biklen and company won't do such studies, Dr. Weiss replied, "What rings true in my ears is that the thing is a bloody hoax. (Experimental technique, 1992)" Weiss then went on to test it, did a study, and got positive results.

" Abstract: The case of a 13-year-old boy with autism, severe mental retardation, and a seizure disorder who was able to demonstrate valid facilitated communication was described. In three independent trials, short stories were presented to him, followed by validation test procedures with an uninformed facilitator providing physical support to the subject's arm. In Trials 1 and 3, several specific answers were provided that clearly indicated that the young man, not the uninformed facilitator, was the source of the information. Moreover, some responses seemed to imply that the subject was employing simple inferential and abstract reasoning. This case study adds to the small, but growing number of demonstrations that facilitated communication can sometimes be a valid method for at least some individuals with developmental disabilities."

There's also a larger study in the same issue of Mental Retardation, also recording positive findings.

*Well; does that count as an instance of a facilitator tested under controlled conditions (*where others beside the defenders of FC have set up the experiments*) who did not fail miserably? If not, what would? If so, does that open a crack to make the arguments?*

The basic point I'm trying to get across is that yes, if you put forward a proposition that goes against the accepted laws of physics then you're probably wrong. However, if you put forward a proposition that goes against the accepted laws of psychology you'd have to write them first.

Remember, we are talking about people who refer to FC as "...an inappropriate challenge to professional belief systems.." (Howard Shane). And those professional belief systems are pretty rigid. If you're not a member of one of those professions, FC doesn't sound particularly out of line.

Here's one basic starter, from Australia.

"A Rationale for the Use of Facilitated Communication Training

1. Many people with severe communication impairment (SCI) know more words than they are able to say.

2 People with SCI who know more words than they are able to say may be able to expand their expressive communication by using alternative and augmentative communication (AAC)

strategies.

3. Many people with SCI have hand function impairments which affect their ability to write or use manual sign or make selections from communication displays.

4. Some people with SCI and impaired hand function can use AAC equipment which does not require hand skills to expand their expressive communication. Some people with SCI and impaired hand function cannot use such equipment, either for practical reasons (because they walk, for example, and need less bulky devices) or because of the nature of their neuromotor impairments (because, for example, they have impulsivity).

5. People with SCI and hand function impairments who cannot use other AAC strategies may be able to use their hands to access communication aids if their hand function impairments are remedied either temporarily or permanently.

6 For some people with SCI, facilitation can provide a temporary remedy for hand function impairments affecting communication aid use, and when used as part of a structured teaching program may result in a permanent improvement in hand function."

Not exactly witchcraft.

Chris Borthwick

reply: No, not witchcraft. I don't deny that many people are helped by facilitators. I mentioned above that I have had students who use facilitators. I also noted that it is well-known that there is no necessary connection between a physical handicap and mental ability. It is not my intention to suggest a priori that no research in this area will prove fruitful. I think, however, that this is an area where self-deception and wishful thinking can be especially invasive. What parent would not want their child to be "normal?" I believe it is imperative that those doing research in this area propose a testable theory of FC. Someone needs to address the issue of *how* FC occurs, especially since it seems that physical communication between patient and facilitator cannot be happening in many "documented" cases of FC. It is not enough for science to provide a few case histories, or even a grand study indicating statistical improbability of chance explaining away one's therapeutic successes. An explanatory mechanism is needed. Until then, FC studies may not be witchcraft, but they cannot be considered much more scientific than, say, testimonials regarding golf aids or weight reducing programs.

[Fairy Tales \(in Santa Cruz\) By Rebecca Patt](#)

fairies

Fairies are mythical beings of folklore and romance. They are often depicted as diminutive winged humans with magical powers. The tooth fairy exchanges presents, usually coins, for teeth left out or under one's pillow at night. Fairy godmothers are protective beings, like guardian [angels](#).

Fairies should not be confused with *gnomes*, which are also mythical diminutive humans but are deformed and live underground. *Pixies*, on the other hand, might be considered a type of fairy known for their cheerful nature and playful mischievousness. An *elf* might be thought of as a big pixie, often depicted as a mischievous dwarf, such as the Irish leprechaun known for his pranks but also believed to know where treasure is hidden. Elves are sometimes depicted as helpers of magicians, e.g., [Santa's](#) helpers.

Belief in such mythical beings seems common in rural peoples around the world. Occasionally, a city slicker who should know better is duped into believing in fairies. An infamous example of such a dupe is Sir Arthur Conan Doyle who was conned by a couple of schoolgirls and their amateur photographs of paper fairies (known as the "Cottingley Fairies") taken in their Yorkshire garden. The faked photos are reminiscent of the most famous [Loch Ness Monster](#) picture, faked in a similar fashion by Ian Wetherell, as are many UFO photos, e.g., those of [Billy Meier](#). Doyle even published a book on the fairies: *The Coming of the Fairies*. He and a [theosophist](#) named Edward Gardner published the photos taken by sixteen year old Elsie Wright of her ten year old cousin, Frances Griffiths, with Elsie's cutouts of fairies. Doyle and Gardner proclaimed that the photos were not fakes, but the real thing. The real howler, though, was the debate which ensued over whether these were photos of real fairies or [psychic photographs](#) which recorded the thoughts of the girls projected onto the film! Doyle, like many who have come before and after him, longed for any proof of a world beyond the material world. His desire to find support for [spiritualism](#) led him to a number of delusions. Even so, he wrote great detective stories and in Sherlock Holmes created a mythical being much more interesting than any fairy, even if he didn't know the difference between induction and deduction.

[Paramount Pictures](#) has made a movie about Griffiths and Wright called **Fairytale: A True Story**. Harvey Keitel plays Houdini and Peter O'Toole

plays Sir Arthur Conan Doyle.

fairies

28 Jan 2000

I was just perusing your article "Fairies." And no, I will not berate you for your disbelief. I think we are all entitled to our own opinions- so long as we don't thrust them upon others, that is. What I wished to say was that I have gotten the impression that your arguments are decidedly one- sided.

reply: You are very perceptive.

You focus on the Cottingley Glen incident- was this your only source? How can you base total disbelief on one hoax? (Yes, I do admit that was what this was.)

reply: The Cottingley Fairies are mentioned to (a) ward off the critics who would point out that since a great writer like Conan Doyle believed in fairies, there must be something to it; and (b) to exemplify how even intelligent people can be deluded about the paranormal and occult. The disbelief in fairies is based on the lack of any good reason to believe in such creatures.

Would it not be more to your advantage to look into sources which discuss the reality behind faeries (yes, that is how many of us spell it), as you seem to believe that we all think faeries are tiny winged things like Tinkerbell? Such is not the case. I'm just suggesting that perhaps you need to broaden your spectrum before you dismiss something as a "dupe," as you so eloquently phrase it.

reply: And whom might these sources be? You had an opportunity to broaden my and my readers' "spectrum" but you didn't do it. Why?

I found your whole style to be rather offensive- you seem to be saying that anyone who believes in anything that can't be scientifically analyzed must be an absolute moron. Perhaps you ought to edit this. I respect your opinions, but maybe you ought to be more careful about offending others. To disbelieve is one thing; to scoff and mock is another. You appear to lack a total faith in everything. Things are not always scientific. There are many things out there which cannot be explained. While yes, some may be fakes, but others- well, how can you be so sure? I shall leave you alone now, before you start throwing a self- righteous fit over my liberal (what a concept!) views. All I shall say is that I do feel sorry for you. You must lead an extremely empty life. Except when

you're mocking and dashing the views and beliefs of others, that is.

Wendy Davis

reply: Thanks for not being offensive and not scoffing or mocking me. No doubt you have convinced many thoughtful people of your views by your perspicacious and detailed evidence.

27 Aug 1999

I really enjoy your website. It's extremely clear and well-written. I'm poking through the cryptozoology site today and found your brief entry on Fairies. While its a very clear explanation & delineation of modern concepts, it neglects the historical aspect found in the Arthurian cycle, wherein fairies and other so-called Green People are roughly the same size as humans, living in what we might call "another dimension" out of which they can step at will, and into which they can "abduct" or lure the unwary. This other dimension looks like, yet doesn't look like, its more 3-dimensional earthly surroundings.

I'm by no means a scholar and have only the armchair critic's interest in collecting this sort of information, so I'm afraid I can't refer you to sources beyond the Mabinogian and similar writings. I simply find it interesting that (1) these medieval (and possibly earlier folkloric) accounts are remarkably similar to modern alien abductions, minus the anal probing, and (2) these creatures were diminutized over time, perhaps by the Christians in their attempt to snuff out and render evil or irrelevant the religions and superstitions of native Europeans. As to (1), I don't assert that this parallel implies some inherent objective truthfulness, but rather some impulse that persists through time and across cultures to explain the initially unexplainable. I think of changelings as a way to describe mental retardation or other diseases, or even SIDS. Similarly, abductions by the Tuatha de Daanan or X-Files aliens can be some sort of mental defense to protect against recognizing some other event or activity that has, similarly, rendered a person disoriented in some deep way.

As for (2), well, I think enough's been said about that. Sorry to ramble on, and no need to respond. I know you have enough to do, and this email is in no way a criticism, merely a suggestion of some tiny tangent that can be expanded upon with interesting implications.

Jim Lancaster

reply: I think I'll leave the expansion to someone else, thanks, but if big fairies became wee people over time, it may have had something to do with trying to explain why they were so hard to see and how they could get into so much mischief, and how they were, in many ways, just like children. Christians have been accused of many things, but this is the first time I've ever heard them being accused of diminutizing fairies.

26 May 1996

While I was doing a little "surfing" on the Net, I came across your homepage here. Wow... aren't you the skeptic.

You definately have a negative outlook on just about everything... or that's how the text files seem to point. I'm not trying to be insulting, by the way. But I mean, you have to believe in SOME things. If life was as black and white as a heavy skeptic might want to believe, life would be very cold.

reply: Actually, we skeptics think more in terms of shades of gray, purple, blue, red, etc. Sometimes its hot, sometimes it's pretty cool, and, yes, sometimes it's very cold.

Tell you what... I have a small story for you. Even I question my sanity when I tell people about it, but I KNOW it happened. Here goes...

When I was about 10 (roughly), I woke up from my sleep for no reason. I heard nothing, but I looked up towards my window. I was quite awake at this point, and saw a fairy! She was at the top of my window between the ends of the top of the curtains. She was basically floating there. You know the fairy that flies around in Walt Disney cartoons? That's close to what I saw! When the fairy looked down and noticed I saw her, she got a surprised expression, covered her mouth with her hand, kinda tucked in her body like a jerky motion, and then vanished.

You probably think I'm just making this up, but I DID see this.

reply: I may be a skeptic but your story just rings with verisimilitude. How could I doubt it?

Just TRY to believe that life is more than logical.

John \"Magnus\" Altinger

reply: No problem. You and your fairy are proof that life is more than logical.

faith

Faith is a non-rational belief in some proposition. A non-rational belief is one which is contrary to the sum of evidence for that belief. A belief is contrary to the sum of evidence for a belief if there is overwhelming evidence against the belief, e.g., that the earth is flat, hollow or is the center of the universe. A belief is also contrary to the sum of evidence if the evidence seems equal both for and against the belief, yet one commits to one of two or more equally supported propositions.

A common misconception regarding faith--or perhaps it is an intentional attempt at disinformation and obscurantism--is made by Christian apologists who make claims such as the following:

A statement like "There is no God, and there can't be a god; everything evolved from purely natural processes" cannot be supported by the scientific method and is a statement of faith, not science (Richard Spencer, Ph.D., associate professor of electrical and computer engineering at UC Davis and faculty adviser to the Christian Student Union. Quoted in *The Davis Enterprise*, Jan. 22, 1999).

The error or deception here is to imply that anything that is not a scientific statement, i.e., one supported by evidence marshaled forth the way scientists do in support of their scientific claims, is a matter of faith. To use 'faith' in such a broad way is to strip it of any theological significance the term might otherwise have.

Such a conception of faith treats belief in all non-empirical statements as acts of faith. Thus, belief in the external world, belief in the law of causality, or even fundamental principles of logic such as the principle of contradiction or the law of the excluded middle, would be acts of faith on this view. There seems to be something profoundly deceptive and misleading about lumping together as acts of faith such things as belief in the Virgin birth and belief in the existence of an external world or in the principle of contradiction. Such a view trivializes religious faith by putting superstitions, fairy tales, and delusions of all varieties, and all non-empirical claims in the same category as religious faith.

an erroneous view of faith

If we examine Dr. Spencer's claims, this should become obvious. He claims that the statement 'there is no God and there can't be a god; everything evolved from purely natural processes' is a statement of faith. First, we must

note that there are *three* distinct statements here. One, 'there is no God'. Two, 'there can't be a god'. And three, 'everything evolved from purely natural processes'. Dr. Spencer implies that each of these claims is on par with such statements as 'there is a God', 'Jesus Christ is the Lord and Savior', 'Jesus' mother was a virgin', 'a piece of bread may have the substance of Jesus Christ's physical body and blood', 'God is one being comprised of three persons', etc.

The statement 'there cannot be a god' is clearly not an empirical statement, but a conceptual one. Anyone who would make such a claim would make it by arguing that a particular concept of god contains contradictions, and so is meaningless. For example, to believe that 'some squares are circular' seems to be a logical contradiction. Circles and squares are defined so as to imply that circles can't be square and squares can't be circles. James Rachels, for one, has argued that god is impossible, but at best his argument shows that the concepts of an all-powerful God and one who demands worship from His creations are contradictory. The concept of worship, Rachels argues, is inconsistent with the traditional Judeo-Christian God concept.

Rachels makes an argument. Some find it convincing; others don't. But it seems that his belief is not an act of faith in the same sense that it is an act of faith to believe in the Incarnation, the Trinity, [transubstantiation](#), or the Virgin Birth. The first three articles of faith seem to be on par with believing in round squares; for, they require belief in logical contradictions. Virgin births we now know are possible, but the technology for the implantation of fertilized eggs did not exist two thousand years ago. But the belief in the Virgin birth involves belief that God miraculously impregnated Mary with Himself. Such a belief seems also to defy logic. All arguments regarding these articles of faith are quite distinct from Rachel's argument. To defend these articles of faith, the best one can hope for is to show that they cannot be shown to be impossible. However, the consequence of arguing that logical contradictions may nevertheless be true, seems undesirable. Such a defense requires the abandonment of the very logical principles required to make any argument and is therefore self-annihilating. The fact that arguments such as Rachel's and those defending articles of religious faith are not empirical or resolvable by scientific methods hardly makes them equally matters of faith.

The statement 'there is no God' is quite different from the claim that there can't be a god. The latter makes a claim regarding possibility; the former is an actuality claim. I doubt that there are many theologians or Christian apologists who would claim that all their faith amounts to is a belief in the *possibility* of this or that. One can believe there is no God because there can't be a god, but one might also *disbelieve* in God while admitting the *possibility* of the Judeo-Christian God. Disbelief in God is analogous to disbelief in Bigfoot, the Loch Ness Monster, Santa Claus and the Easter Bunny. Yet, those who believe in Bigfoot and Nessie, for example, aren't known for claiming they believe out of faith. To say you have faith in Bigfoot or faith in Nessie sounds ludicrous. Believers in Bigfoot think there is good evidence for

their belief. Disbelievers argue that the evidence is not strong at all and does not deserve assent to the proposition that Bigfoot exists. Disbelievers in Bigfoot do not disbelieve as an act of faith, but because the evidence is not persuasive. Belief in God, on the other hand, could be either an act of faith or a belief based on conclusions from evidence and argument. If the theistic belief is an act of faith then the one holding the belief either thinks the evidence against belief outweighs or equals the evidence for belief, or the belief is held without regard for evidence at all. Otherwise, the belief is not an act of faith, but of belief that the evidence is stronger for belief than against.

naturalism

Finally, the claim 'everything evolved from natural processes' is not necessarily an act of faith. If the only alternatives are that everything evolved from either supernatural or natural forces, and one is unconvinced by the arguments and evidence presented by those who believe in supernatural forces, then logically, the only reasonable belief is that everything evolved from natural forces. Only if the evidence supporting a supernatural being were superior or equal to the evidence and arguments against such a belief, would belief that everything evolved from natural forces be a matter of faith.

Those of us who are atheists, and believe that everything evolved from natural forces, nearly universally maintain that theists and supernaturalists have a very weak case for their belief, weaker even than the case for Bigfoot, Nessie or Santa Claus. Thus, our disbelief is not an act of faith, and therefore, not non-rational as are those of theists and Christian apologists. However, if Christian apologists insist on claiming that their version of Christianity and the rejections of their views are equally acts of faith, I will insist that the apologists have a *non-rational* faith, while their opponents have a *rational* faith. Though I think it would be less dishonest and less misleading to admit that atheists and naturalists do not base their beliefs on *faith* in any sense close to that of *religious faith*.

faith

19 May 1999

While perusing your marvelous website--many, many thanks, by the way--I came across this recent segment:

'Dr. Sloan and his team acknowledge that faith can help patients deal with illness, but caution that "linking religious activities and better health can be harmful to patients, who already must confront age-old folk wisdom that illness is due to their own moral failure.'" I have long been curious about the true health value of faith.

So I thought you might be interested in the following:

Two quoted sections from the Skeptic Magazine Hotline. The first is part of a response by Steven B. Harris, M.D., a member of the Skeptics Society advisory board, to an article by Michael Shermer on the death of Susan Strasberg and her use of "alternative" medicine. Dr. Harris deals regularly with cancer patients. His position seems to reflect an increasingly accepted (by non believers) view of on the role of faith. .

"...Breast cancer is a long, drawn-out thing. You can spend 5 or 10 or 15 years in a constant agony of anxiety about having a fatal disease, or you can find a lie and be happy for the same time. Which is better? That's the conundrum facing all skeptics. Lies allay anxiety-- and too much anxiety, particularly about the future and death and pain, which are inevitable, is one of the things that makes life not worth living. Skepticism aims to find out the truth in all things. The lie which skeptics tell themselves is that the truth always, in the end, makes things better. Always. That lie is to relieve the anxiety THEY have that sometimes, occasionally, what they're doing AS skeptics, is not the kindest thing they can be doing. It's recursive and VERY ironic."

That was the setup for this--to me--startling view from Dr. William Jarvis, who Shermer calls "arguably one of the world's leading experts on alternative medicine (from a scientific perspective)". Dr. Jarvis was responding to a longer version of the above quote.

"The idea that cancer patients who delude themselves by attending miracle healers (whether of the psychic variety or otherwise) have a better quality of life than those who submit to standard therapies with their side-effects is not doubted by many (most?) in the medical community. However, the only test of

the idea that I am aware of, found this not to be the case.

Cassileth et al obtained the cooperation of Virginia Livingston-Wheeler, MD, who operated a fringe cancer clinic in San Diego circa 1990. Seventy-eight pairs of patients were matched according to sex, race, age, diagnosis, and time from the diagnosis of metastatic or recurrent disease, who were enrolled over a period of 3.5 years. All patients were followed until death. Livingston-Wheeler patients were given her dubious "vaccine," BCG injections, vegetarian diet, and coffee enemas. They All but six of the control patients were on chemotherapy. The patients' quality of life was assessed using the Functional Living Index-Cancer. Researchers expected to find a higher quality of life among the optimistic, deluded VLW patients, but it didn't turn out that way. The VLW patients scored consistently lower than those treated by standard methods. (New Engl J Med, 1991;324:1180-5).

This surprising finding was consistent with two other studies that demonstrated how faulty subjective experience can be when attempting to evaluate a cancer treatment program. The Bristol Cancer Self-help Center (BCHC) in the UK offered patients a stringent diet (partially raw and partially cooked veggies, with soya proteins, and pulses), active participation in the healing process, positive thinking, etc. The program directors and staff were so certain that their patients were doing much better than patients treated in the standard way that they asked a team of doctors and researchers to test their program. This was done, and much to the shock and chagrin of the BCHC people, the finding were that metastasis-free survival was significantly poorer among the BCHC patients, and survival of relapsed patients was significantly inferior as well. (The Lancet, 1990; 336:606-10.)

Bernie Siegel, MD, has made himself into a New Age guru by touting the superiority of his ECaPs (Exceptional Cancer Patients). He has written several books, and appeared on the media touting the idea that optimism, love, and social support are life-enhancing. Nevertheless, a ten-year follow-up of the ECaPs program found no benefit. (J Clin Oncology 1993;11:66-9)

reply: One added benefit of doing the book/talkshow/lecture circuit: you don't have to face those dying patients every day.

It is interesting that even health professionals with standard training can be fooled by the subjective clinical experience. This was documented by Roberts, et al, who looked at five different clinical procedures that had come into use based upon clinical reports, but which were later found to be ineffective when subjected to randomize, blinded clinical trials (Clinical Psychology Reviews, 1993;13:375-91). This review documented the deceptive clinical illusions that physicians can experience who rely upon clinical experience without blinded, objective testing.

Alternativist physicians have the same vulnerability, plus the added problems

imposed by their nonconformist personalities. They seem to know about the possibilities placebo effects, and other dynamics that can create clinical illusions on an intellectual level, but seem incapable of sorting these factors out experientially.

Or, like Herbert Benson, they don't think it is important to sort these things out because they believe that belief per se is the most powerful healing factor.

(I have accused Benson of having bumped his head on the cornerstone of the Mother Church of Christian Science there in Boston where he works). The "mind over matter" beliefs of the proponents of positive thinking are very often at the root of alternativism.

I believe these people, both patients and practitioners, are wishful thinkers who, as the old song says, "accentuate the positive, eliminate the negative, latch on to the affirmative, and don't mess with Mr. In-Between." They hate science because it attacks their delusions."

John H. Mazetier, Jr.

fakir

A fakir is an initiate in a mendicant Sufi order. The word derives from the Arab word for poverty. By extension, the word is used to refer to ascetic *Indian* holy men (*sadhus*). The term is also used, however, to refer to itinerant Indian conjurers and alleged god-men who travel from village to village and perform "[miracles](#)" such as materializing *vibhuti* (holy ash) or jewelry. They do other [conjuring](#) stunts such as walking on hot coals, laying on a bed of nails, [eating fire](#), sticking their hands in boiling 'oil', piercing their faces with long needles, putting large hooks through the flesh of their backs attached to heavy objects which they pull. Some conjurers are even said to [levitate](#) or to have performed the famous [Indian rope trick](#). Others are said to have been buried alive for months and lived to tell about it. Some cut off their tongues and restore them. Others can make fire materialize out of nothing. The conjurers sometimes have accomplices and they pretend to do [exorcisms](#) or other strange feats. After each performance, they pass the hat, collect what they can, and move on to the next village.

Some conjurers become very famous and are considered to be god-men, such as [Sai Baba](#).

[B Premanand](#) of Indian Skeptics has spent over fifty years exposing the tricks of the god-men. His method is simple. He demonstrates how the "miracles" of the fakirs are done by performing them himself. Abraham Kovoov and Prabir Ghosh of the Indian Rationalist Association have carried on the work of Premanand in exposing the deception of Sai Baba and those of his ilk, [astrologers](#), [psychics](#) and [clairvoyants](#). They were featured in the British documentary "Guru Busters" (Equinox)*, which followed Rationalists around India as they demonstrated how the god-men perform their "miracles" without doing anything supernatural.

The Discovery Channel's "Science Mysteries" series included an episode (October 20, 2001) entitled "Physical Feats" which was in part a rehash of "Guru Busters." The cameras followed members of the Indian Rationalist Association (IRA) as they went from village to village pretending to be fakirs. The IRA considers the god-men to be frauds who use trickery, legerdemain, [conjuring](#), deceit, and other unfair means of convincing ignorant villagers that they possess miraculous powers. The IRA [firewalk](#) and explain anyone can do it without a need for supernatural intervention. They walk on glass, lay on nails, pull cars with hooks poked through the flesh on their backs, jab long needles through their cheeks and tongues, etc. The goal of the IRA is to debunk the god-men and reduce superstition among their countrymen and women. They obviously have a long way to go, as is evidenced by the

monkey-man hysteria that gripped New Delhi in the spring of 2001. Witnesses reported to the mass media that they had seen "a giant ape that could jump 40 feet into the air and fly through windows."* Other claimed they saw a 4-foot monkey that turned into a cat. Mass hysteria led to deserted streets and panic. One pregnant woman fell down a staircase and died as a result of trying to escape from the monkey-man. It was all a hoax that played upon the religious superstitions of the people. One commentator put it bluntly:

had we not been a nation nurtured on Hindu epics to become Hanuman worshippers, most people would have laughed at the very idea of a monkey-man and would have considered the so-called "witnesses" liars or demented maniacs from the outset, instead of waiting for the scientific community to debunk this hoax in its own, soft way, and lay it to rest. For, when it comes to religion the first "principle" that is taught by preachers to believers is that of blind acceptance. One may not question any religious dogma if he/she is a believer, and, he/she must necessarily accept the dogma/doctrine *in toto*....([Mehul Kamdar](#))

***note: Equinox follows the activities of the Indian Rationalist Association in their grass roots campaign to debunk India's "God-men". They hold vast public meetings to expose the fraudulent tricks employed by local medicine men and gurus. The Indian Rationalist Association demonstrates the science behind a wide range of miracles seen everyday in India such as producing holy ashes, producing fire by mental power, inserting needles through the tongue, being buried head-first in sand and walking through hot embers. They even try to go one better, with volunteers pulling a jeep with hooks threaded through the skin on their backs, instead of a wooden chariot. In a disturbing section of the film, they shame a medicine man who has been selling a 'magic anti-cobra potion' to save a dog from a cobra bite. The Indian Rationalist**

Association hopes to prove that scientific rationalism is a better route to follow to escape from disease and poverty.*

the Indian rope trick

This alleged trick, reportedly witnessed by thousands of people, involves an Indian [fakir](#) who throws a rope to the sky, but the rope does not fall back to the ground. Instead it mysteriously rises until the top of it disappears into thin air, the darkness, the mist, whatever. Now, that would be trick enough for most people, but this one allegedly goes on. A young boy climbs the unsupported rope, which miraculously supports him until he disappears into thin air, the mist, the darkness, whatever. That, too, would be trick enough for most of us, but this one continues. The fakir then pulls out a knife, sword, scimitar, whatever and climbs the rope until he, too, disappears into thin air, mist, darkness, whatever. Again, this would a great trick even if it stopped here. But, no. It continues.

Body parts fall from the sky onto the ground, into a basket next to the base of the rope, whatever. Now, that's quite common in some neighborhoods and would not count as much of a trick. But the fakir allegedly then slides down the rope and empties the basket, throws a cloth over the scattered body parts, whatever, and the boy miraculously reappears with all his parts in the right places. That would be a great trick, especially since it must be done in the open without the use of engineers, technicians, electronics, satellite feeds, television cameras, whatever.

Actually, the only thing needed for this trick is human gullibility. According to Peter Lamont, a researcher at the University of Edinburgh and a former president of the Magic Circle in Edinburgh, the Indian rope trick was a hoax played by the *Chicago Tribune* in 1890. Lamont claims the newspaper was trying to increase circulation by publishing this ridiculous story as if there were eyewitnesses to the event. The *Tribune* admitted the hoax some four months later, expressing some astonishment that so many people believed it was a true story. After all, they reasoned, the byline was "Fred S. Ellmore." They hadn't reckoned that their audience, many of whom believed in [miracles](#) and [phrenology](#) and other weird things, wouldn't find this story that hard to accept.

Lamont has been researching the Indian rope trick for years. At one point he and Richard Wiseman wrote in *Nature* that the results of their investigation supported the notion that belief in the trick was due to the 'exaggeration effect': the greater the time between seeing something and telling a story about it, the more a person tends to exaggerate the impressiveness of the event.*

Of course, there are other possibilities, most of which have been offered in an attempt to explain *how* the trick is done: [mass hypnosis](#), [levitation](#), a magic

trick involving an invisible rope hanging above which the thrown rope hooks onto somehow, shaved monkey limbs for body parts, twins, whatever. Of the various explanations, the hoax seems most plausible.

[Is Sai Baba a pedophile?](#) by Michelle Goldberg, Salon.com

[Suicide, sex and the guru](#) by Dominic Kennedy *The Times* (UK)

Sai Baba

Sai Baba is Satyanarayana Raju, an Indian guru born in 1926 who goes by the name of Bhagavan Sri Sathya Sai Baba. He is believed to be divine by himself and his followers, who allegedly number in the several millions. He claims to have paranormal powers and to be able to work miracles. Two of his favorite "miracles" are to make ashes materialize for poor people and to make jewelry materialize for rich people.

The film "Guru Busters" (Equinox) demonstrated that these alleged miracles are little more than a magician's parlor tricks. One classic line from that film came from an Indian physicist who had been given a ring allegedly materialized by Sai Baba. The physicist said that he had a doctorate from Harvard and could not possibly be fooled by a magician. How many times have we heard brilliant, though deluded, people issue a similar declaration? The film depicts a group called the **Indian Science and Rationalists' Association [ISRA]** as they travel throughout India debunking and exposing as frauds local [fakirs](#), godmen and godwomen. The ISRA debunkers are to India what James Randi is to America and Canada. They utilize scientific and rational principles to expose the magical art of illusion used by Hindu mystics in performing feats of levitation and other alleged miracles.

reader comments: false memory

25 Apr 2002

RE: Repressed Memory Therapy Article. Please check your references against this article which provides an intelligent analysis of this issue, that contradicts your article as cited above. It appears that your research has fallen short: <http://www.feminista.com/v2n10/cutlerpage.html>

(name withheld by request)

reply: I'm afraid it is your research that has fallen short. The article you assert is an "intelligent analysis" of the issue is a diatribe and consists of little more than appeals to authority, straw man caricatures, and a litany of ad hominem attacks, including the vicious allegations against James Randi that have been making the rounds in low places for years. Juliette Cutler, the author of the article you cite, seems to have made no effort to find out if these allegations are true. She just passes them on because they fit her agenda. 'Randi is a bad man. If a bad man is on the board of the False Memory Foundation then that foundation must be bad. If it's bad, then their arguments about false memories must be bad.' In case you don't understand, that was a paraphrase of the reasoning underlying Cutler's "intelligent analysis." Of course, she does not state her poor reasoning so blatantly, because its inadequacy would be too obvious. She makes similar ad hominem attacks on Elizabeth Loftus and the founders of the FMF. Again, no effort seems to have been made to determine if these charges are justified, not that being so would make the charges any more relevant to the issue of whether false memory therapists have been abusing patients on a grand scale.

Cutler's straw man argument consists of her underlying assumption that one must deny there are *any* repressed or lost memories if one is to be critical of therapies based on the assumption that most emotional problems are due to repressed memories of childhood sexual abuse. Nonsense. Her appeals to "the literature" to support the claim that various mechanism have been used by psychologists to explain forgotten traumatic experiences is irrelevant. One does not need to deny there are any lost memories to be critical of repressed memory therapy. On the other hand, Cutler has made no effort to understand the issue in terms of what is known about memory and therapy. Where is her reference to "the literature" on what we know about how memory works? Where is her reference to "the literature" on abusive therapies? They are completely lacking from her diatribe.

Finally, to justify being critical of [repressed memory therapy](#), one does not have to deny that there are some people who have abused children but who claim those they abused suffer from "false memory syndrome." It has been said before by critics of repressed memory therapy, but it bears repeating: the real victims of bad therapy have been those who have had their memories of abuse created by therapists and those who have been abused but who are not believed because of the suspicions raised that they are just trying to evoke sympathy or attention, or that their memories, like so many others, are false memories.

postscript: I think you will find that of all the many charges of sexual abuse being made lately against Catholic priests, few, if any, of the accusations have come from those who have remembered the abuse while under treatment by a recovered memory therapist. Many of them have been in treatment *because* of their abuse. Most have remained silent, not because they forgot what happened to them, but because they were threatened, paid off or convinced that they should suffer in silence for the good of Mother Church.

post postscript: (April 28, 2002) Yesterday's [Sacramento Bee](#) had an article by Dorothy Korber regarding a 39-year-old woman who four years ago claimed to have had a recovered memory of five years of sexual abuse by her parish priest beginning in 1974. She claims that "the memories of her molestation first flooded back as she watched a television documentary on pedophiles during the late 1980s." Then, in 1988 she followed "the advice of sexual assault counselors in Washington" and reported the alleged molestation to the Vallejo police. The priest was never charged with any crime by the Vallejo district attorney. To this day, the priest denies the charges.

While it is impossible for us to know with absolute certainty whether the priest molested the girl, there are facts we do know.

- the alleged victim claims she was sexually abused by the priest from ages of 11 to 16
- for 20 years she did not remember the abuse and did not report it
- while watching a television program on abuse the memory of her own abuse "flooded back"
- her parents claim the priest babysat their daughters and that they walked in on the priest in bed with the girl
- the diocese of Sacramento and its insurance company paid the alleged victim \$350,000 in a confidential settlement that the alleged victim has not kept confidential
- the alleged victim's sister, who shared a room with her, does not remember any of this, including the night that the parents claim they saw the priest in bed with their daughter
- the priest married the daughter who doesn't remember the abuse

- of her sister, apparently without protest from the parents
- the parents invited the priest to their home for dinner and for counseling *after* they allegedly found him in their daughter's bed
- the priest denies he ever served as a babysitter for anyone
- he denies he abused the girl
- no other charges of abuse are known to have been made against this priest by anyone else in the thirty or so years he has been a priest ([see below](#): another charge has been made)

The fact that her parents, who are now separated, both claim that they saw the priest in bed with their daughter when she was 12 seems most damning. Why would they make up such a story? Who knows. Perhaps they are telling the truth. But perhaps they are protecting someone, another person who is called 'father.' Perhaps the girl was abused by her own father, but rather than face such a thought, she has transferred the source of her abuse to another 'father,' her parish priest.

I must admit it would be odd to find a parish priest babysitting teenage girls. It is even odder to think a child's parents would be so stupid as to invite an abuser to dinner, request that he counsel them, and allow him to marry their other daughter. And it is certainly not consistent with what we know about trauma and memory that a girl who was abused from the ages of eleven to sixteen would not remember it until her memory was jarred by a television program twenty years later.

It is not odd for people to lie to protect people they love or fear. It is not odd for people to be confused about [source memory](#), even about such things as sexual assault. Nor is it odd for the mind to reconstruct memories that distort the truth. Finally, it is not odd for insurance companies to settle cases, even when the accused is innocent.

I don't know who is telling the truth in this matter and neither does reporter Dorothy Korber. Yet, her story is clearly sympathetic to the alleged victim and her parents. Why? Perhaps because journalists have declared it open season on Catholic priests. The media did this once before with child care workers. This time there should be no excuse. There *is* a way to tell the John Geoghans and Cardinal Laws from others who are accused with evidence that is underwhelming.

I find it more than just interesting that the *Bee* placed the story of the allegations against the priest on the front page juxtaposed to the story about the the boy who killed 18 people in a German school. (I'd link you to the article but the *Bee* took it down the day after the story ran.) On the same day, a story about the arraignment of a local man who shot and killed his girlfriend, abandoned their 18-month old son by the San Francisco airport and then fled to France where he was caught a few days later and held for four years while he fought extradition, was buried

on the 3rd page of the Metro section.

update: (May 1) Dorothy Korber, the author of the Bee article responded to my criticisms by telling me "You're wrong" and "There were other instances over the years that were corroborated by her sisters and her parents." Korber thinks this strengthens the case against the priest, but I think it weakens it. If they knew of other instances over the years and these were corroborated by her sisters and parents, then it makes it more inexplicable why the parents would continue to invite the priest to the house and let him perform the marriage of one of their daughters.

update: (June 15) Jennifer Garza, Bee staff writer, had the lead story in [today's Sacramento Bee: Lincoln priest suspended over 2nd allegation](#). This is the same priest Korber wrote about. Very little information about the new charge is given by Garza. A woman alleges Brady "molested her" more than twenty-five years ago and the Bishop is reported as having called the allegations "credible." Garza writes that the charge is unconnected to the earlier charge by another woman and was received via a hotline set up last April "for victims to report allegations of sexual abuse to the diocese." "Law-enforcement officials" have been notified and are investigating the charge, according to Garza, as is the church. The priest has been put on "administrative leave" pending the outcome of the investigations.

searching for memory

the brain, the mind, and the past

by Daniel Schacter

New York: Basic Books, 1996

There is scarcely a human activity which is not affected by memory. To overestimate the importance of studies on memory seems impossible. Yet, all too often, we take memory for granted and make assumptions about memory without knowing whether our beliefs are based on fact or myth. Most of us can be excused for our ignorance, since studies of memory rarely attract the attention of the mass media. There are some notable exceptions, such as the "Memory Wars", as Schacter refers to the battle over recovered [repressed memories](#) of alien abductions or of childhood abuse and murder. Daniel Schacter makes accessible to the general reader the background information necessary to make sense of the "Memory Wars." (He devotes an entire chapter to the issue.) He provides an invaluable map of where we are in the quest to understand one of the most fundamental properties of the human mind. And he dispels a few myths along the way.

Some readers might be disappointed to find out that we don't really know how memory works. There is no universally agreed upon model of the mind/brain, and no universally agreed upon model of how memory works. Two models popular with materialists, the behaviorist model and that of cognitive psychology (the brain as computer), are rejected by Schacter because they cannot account for the subjective and present-need basis of memory. Lest dualists get their hopes up, Schacter's concern for a model which does justice to subjectivity has nothing to do with a concern for a "transcendental unity of apperception" or a "self" to be distinguished from the self's memories. Subjectivity in remembering, he says, involves at least three important factors. One, memories are constructions made in accordance with present needs, desires, influences, etc. Two, memories are often accompanied by feelings and emotions. Three, memory usually involves the rememberer's awareness of the memory. A good model of how memory works must not only fit with scientific knowledge but also fit with the subjective nature of memory.

In chapter two, "Building Memories," Schacter presents a sketch of a model which incorporates elements of both a neurological and a psychological model of memory. He notes that there should only be one correct neurological model (N-model), a model of how the brain and neural network function in

memory, a descriptive model of functions and causal connections. But there may be several psychological models (P-models) of memory, though each of them must be true to the N-model, as well as to subjective experience, to be adequate. P-models are explanatory models, trying to help us make sense out of the experiences of remembering and forgetting.

For example, one P-model sees memory as a present act of consciousness, reconstructive of the past, stimulated by an analogue of an engram called the "retrieval cue." The engram is the neural network representing fragments of past experience. Schacter elaborates throughout his book on studies supporting the notion that memories are reconstructions of the past and might better be thought of as a collage or a jigsaw puzzle than as "tape recordings," "pictures" or "video clips" stored as wholes. On this model, perceptual or conscious experience does not record all sense data experienced. Most sense data is not stored at all. What is stored are rather bits and fragments of experience which are encoded in engrams. Exactly how they are encoded is not completely understood, but what progress has been made in understanding the complexities of neural encoding is set out by Schacter in various chapters. For example, he discusses Wilder Penfield's experiments done in the 1950's which involved placing electrodes on the surface of the exposed temporal lobes of patients. He was able to elicit "memories" in 40 of 520 patients. Many psychologists (and lay people) refer to these experiments as proof that memories are stored in specific places and that even though we may not remember much of our past, the right stimulus would evoke a memory of things long forgotten. In a survey of psychologists by Loftus and Loftus, 84% said they believe every experience is permanently stored in the mind. [p. 76] Maybe so, but Schacter points out that the Penfield experiments are not very good evidence for this belief. Not only could Penfield only elicit "memories" in about 1 out of every 8 patients, he did not provide support for the claim that what was elicited was actually a memory and not a hallucination, fantasy or confabulation.

Other studies indicate that encoding involves various connections between different parts of the brain. In fact, what is being discovered is that there are distinct types and elements of memory which involve different parts of the brain. I will not attempt to report on any of those discoveries here, but the reader should be prepared to take a journey inside the brain. I will say, however, that Schacter does an excellent job of not getting overtechnical or burdening the reader with extraneous jargon. There is a lot of jargon used in his discussions of neuroscience and psychology, but in my view it is neither burdensome nor unneeded.

On the P-model described in the previous paragraph, forgetting is due either to weak encoding, to lack of a retrieval cue, to time and the replacement in the neural network by later experiences, to repetitive experiences (you'll remember the one special meal you had at a special restaurant, but you won't remember what you had for lunch a year ago Tuesday), or to keep us from going crazy. (Imagine never forgetting anything, actually achieving the stated

goal of L. Ron Hubbard's [dianetics](#): reaching the state of "the clear." His followers should read Jorge Luis Borges "Funes, the Memorious," a story about such a being.) The chances of remembering something improve by "consolidation," creating strong encoding. Thinking and talking about an experience enhances the chances of remembering it. One of the more well-known techniques of remembering involves the process of association. For example, today I attended a meeting which involved a discussion of security procedures. The phone number extension of the campus police was given. Such a number is easy to remember if associations are made. Most of us can remember a phone number long enough to dial it, but when you want to remember a phone number, even a 4-digit extension, six months or a year from now without ever having dialed the number, the task gets more difficult. In this case, the number is 2365. All our campus extensions begin with 2, so I only need to remember 3 digits. In this case, the three digits, 365, is the number of days in a year. Thus, if I reinforce the association with the days of the year--by occasionally reminding myself of the association when I look at the calendar--I think I'll remember the extension of the campus police a year or even five years from now.

The daily amnesia most of us suffer, awakening after a night of dreams but unable to remember any of them, is a bit more complex but weak encoding is at work here, too. Most of us can remember a dream which occurred just before awakening, but find that later in the day we've lost all memory of the dream. To remember dreams, some suggest that you get up immediately and write down the dream. An easier method is to stay in bed and create some associations. The easiest association is to give your dream a title and a purposive description. I tried this for a few nights and found that I could remember the title and the dream later in the day. I began writing the title of the dream down and then a brief description of what I thought the dream suggested. For example, I entitled one dream "The Mailbox" and described its purpose as "write to J.B." That little bit of information serves as a retrieval cue and I can now remember the dream: I am standing in front of a large number of mailboxes, the type they have at post offices or in department mail rooms. Next to me is a friend I've known since grammar school but haven't seen in ten or fifteen years. I notice that his brother also has a mailbox and indicate my surprise that R. is on the staff, too. My friend and I are obviously colleagues in the dream. J.B. says to me that R. isn't really on the staff; he works at the Shell gasoline station. The dream occurred during the Christmas holidays. I used to hear from J.B. at Christmas time...usually one of those form letters telling us about the kids, etc., but I haven't heard from him in several years. I took my dream to reflect some sort of uneasiness about the lack of communication between an old friend and myself and as a suggestion to write J.B. a letter and reestablish communication. (I have no idea what the part about his brother and the Shell station means. I knew his brother fairly well and there's no chance I was connecting the news stories about Shell executives being racists and J.B.'s brother. No one in J.B.'s family was bigoted or prejudiced to my knowledge.) Anyway, the point is that I have little doubt that I would have completely forgotten the dream if I had not

given it a title and a description and then later on wrote down both and tried to recall the details. (I must admit that I had forgotten the dream and the details until I looked at my notes which contain only the five words mentioned above. If I had written to J.B., I doubt that I would have forgotten the dream, for that activity would have been one more element of elaborate encoding of the memory.)

Of more interest than my dream is the discussion of Jonathan Winson's theory that during REM sleep, the brain is consolidating and strengthening some memories while discarding others. The hippocampus may be playing back experiences to various cortical regions where it will eventually be permanently stored. [p. 88]

In addition to dream amnesia, Schacter has much to say about other kinds of amnesia, including the kinds of cases which neurologist Oliver Sacks is famous for writing about. The effects of alcohol, brain injuries and physical or psychological traumas on memory are exemplified with case studies such as the Russian scientist who could remember his childhood but not his recent past. (He'd written an autobiography, so the accuracy of his childhood memories could be checked.) There is also the case of psychogenic amnesia of a man Schacter calls Lumberjack. He was a young man who didn't know who he was, who was found wandering the streets of Toronto. He could not remember anything of his past except the word Lumberjack and a few other details from a period in his life about one year prior to when he was found. He was in what psychiatrists call a *fugue* state. His amnesia had been triggered by his grandfather's death and was spontaneously cleared up while watching a television program depicting a funeral and a cremation.

One type of amnesia, what Schacter calls *limited amnesia*, is quite common. Limited amnesia occurs in people who suffer a severe physical or psychological trauma and are unable to remember the event. Several such cases are described by Schacter as he explores the possibility of a link between the different kinds of experiences which result in limited amnesia, as well as the connection between trauma-induced amnesia and the unconscious mind.

On the amnesia claimed for repressed memories, which has become popular with certain therapists in recent years, Schacter devotes a whole chapter. [Repressed memory therapists](#) have failed to provide an adequate model of memory to account for what they claim is happening in *repression*. The idea that all of us have memories we can't access, but which are causing mental and physical illnesses, is a popular one. The idea that some experiences are so traumatic that as a defense mechanism we suppress the thought of such experiences has been repeated so often as to be considered a fact by many people. But is it? Schacter does not think so. The scientific evidence for repression is weak. Even weaker is the evidence that specific disorders are caused by repression of specific kinds of experiences, such as the experience

of sexual abuse. Unlike cases of amnesia which involve alcohol, drugs, brain injury or disease, or psychological trauma, the cases involving repressed memories often depend on whether the patient really suffers from amnesia. The repressed memory therapists seem to start with the assumption that most of their patients suffer from amnesia, but the amnesia is very specific and always involves just the kind of thing most people would remember. On the other hand, there are cases where the amnesia is not in doubt, and the evidence indicates that some sort of implicit memory exists which is troubling to the amnesiac. Schacter notes the case of a rape victim who could not remember the rape which took place on a brick pathway. The words *brick* and *path* kept popping into her mind, but she did not connect them to the rape. And she became very upset when taken back to the scene of the rape, though she didn't remember what had happened there. [p. 232]

One of the more interesting areas of discussion in the "Memory Wars" is that of *memory distortion*. The distortion can be a distortion of attitude, whereby a present mood or emotion invades a memory and imbues it with one's present emotive state even though the original experience was not colored by the same mood. (This is the obverse of trying to put yourself in a good mood by remembering some pleasant experiences from the past.) The distortion might be of the content, especially source distortion. E.g., you're robbed. The police show you a photo of a man and ask is this the man. You say that you're not sure. Later, in a line-up you positively identify the robber, who turns out to be the man whose photo you had been shown. It turns out that he could not have robbed you, because he was in jail at the time you were robbed. Your memory was distorted by the photo; you remembered the robber but the source was not your perception while being robbed, it was your perception of the photo shown to you by the police. Studies on *source memory* (recalling precisely when and where an event occurred) indicate that such distortion is not uncommon. Distortions can also be caused by making assumptions or drawing inferences which creep into our encoding and associations. [ch. 4]

Memory distortion is dramatically exemplified by Schacter in a simple experiment. Pay attention to the following series of words: candy, sour, sugar, bitter, good, taste, tooth, nice, honey, soda, chocolate, heart, cake, eat, and pie. After looking at the list, turn away and write down all the words you can remember from the list.

Now take the following test. consider the three words printed in italics at the end of this sentence and, without looking back to the previous paragraph, try to remember whether they appeared on the list....*taste, point, sweet*. [p. 103]

Between 80-90 percent of those tested by Schacter in the "sweet experiment" claim erroneously that *sweet* was on the original list. Many not only believe *sweet* was on the list, they claim to remember it vividly. Amnesic patients, on the other hand, made many fewer false recognitions than did healthy subjects.

"This is because the amnesic patients did not successfully encode and retain the gist of the studied words. False recognition of *sweet* requires accurate retention of the general meaning of the words on the target list, which in turn depends on the hippocampus and other medial temporal lobe structures that are damaged in amnesic patients." [p. 104] But getting the gist of something does not guarantee that the details are remembered accurately. The implications of memory distortion can be enormous and are discussed at length by Schacter.

Schacter also takes up the issues of memory in children. If not misled, they give generally accurate info, though they have particularly poor source memory, perhaps due to their immature and undeveloped frontal lobes. [p. 128] He reminds us again and again of the fragility of memory and how it is often accompanied by an inappropriate feeling of absolute certainty. My favorite story here is the one regarding John Dean, President Nixon's White House counsel who was part of the Watergate coverup. Dean testified for days, giving enormous amounts of details to meetings that took place many months before his testimony. He seemed a veritable treasure trove of Watergate data. However, when the infamous tapes were discovered and played back, a comparison of what was actually said at the meetings and what Dean remembered as having been said, did not match up very well when it came to details. Hardly any of the details Dean testified to were correct, though he remembered general events pretty well, probably aided by his notes. [pp. 111-112]

Hypnosis and memory is another topic Schacter takes up. Studies on hypnosis show that hypnosis does nothing to enhance the accuracy of memory. Highly hypnotizable people are vulnerable to creating illusory memories when given suggestions. Hypnosis, he says, "creates a retrieval environment that increases a person's willingness to call just about any mental experience a 'memory'." [p. 108] Hypnosis heightens a person's subjective confidence in the veracity and accuracy of memories, however. The distorting power of hypnosis over memory has been documented since Freud, but recent studies show that those hypnotized have fewer illusory memories when either (1) they have a poor rapport with the hypnotist; (2) when the subject is given an incentive to carefully distinguish between real and imaginary events and (3) when the subject is led to believe he or she will be able to make such distinctions when hypnotized.

There are many other topics which Schacter takes up. An entire chapter is devoted to the role of emotions in memory. Fascinating case studies are presented of people whose memories are like visions and direct and control their lives. He presents the results of his own studies in implicit memory (memory without awareness) and "priming," and the practical applications of those studies for developing programs using a "vanishing-cues procedure" for training brain damaged amnesiacs. [ch. 6] There are discussions throughout the book on various types of memory from the familiar short-term vs. long-term memory to distinctions between implicit/explicit memory;

semantic/procedural/episodic memory; field/observer memory; lifetime/general event/event-specific memories; and more. Concepts such as "flashbacks", *deja vu*, and removing the effort to help remember something, are discussed, as is the topic of amnesia and dissociation (multiple personalities or dissociative identity disorder). In fact, the only topic not covered that I expected to be covered was "photographic memory."

Schacter has something to say to who wish to improve their memories and those who fear losing their memories as they grow old. You'll have to read the book to find out whether it would be worthwhile to invest in one of those memory courses advertised on infomercials. I'll only note that studies showed that people who could remember long lists of numbers by associating the numbers with familiar experiences or knowledge, could not carry over this ability to non-numerical tasks. As for the fear of losing memory with age, Schacter devotes his tenth and final chapter to the topic of aging and memory. I won't reveal what he says, but he does give this bit of advice: *if you forget where you put your car keys, don't worry. If you forget you own a car, worry.*

Finally, the book is illustrated throughout with works of art whose subject matter is some aspect of memory. Schacter collects such art and links the work of artists to that of scientists in an interesting and generally illuminating way.

[The Skeptic's Refuge](#)

falun gong (a.k.a. falun dafa)

"Falun Dafa cultivates a Falun in the lower abdomen area instead of Dan....Falun Dafa cultivates Zhu Yishi instead of Fu Yishi, He Who practices attains Gong. Namely, your Zhu Yishi or Zhu Yuansheng attains the cultivation energy." --Li Hongzhi*

The doctrines of the Great Law of Falun Dafa can give guidance to anyone in their cultivation including those who have religious beliefs. This is the Principle of the universe, the true Law that has never been revealed. In the past humans were not allowed to know the Principle of the universe (Buddha Law); it transcends all the sciences and moral principles of ordinary human society from ancient times to the present. What has been taught in religions and what people have experienced are only superficialities and phenomena, while its extensive and profound inner meaning can only present itself to and be felt and understood by the cultivators who are at different levels of their true cultivation, and they can really see what the Law is. --Li Hongzhi*

Falun gong (pronounced fah-luhn gung) is [Li Hongzhi's](#) version of [qi gong](#), which is an ancient Chinese practice of "energy cultivation". *Falun* means "wheel of law"; *falun dafa* is falun Buddha law.* According to Li, falun gong "is a cultivation system aiming at cultivating both human life and nature. The practitioner is required to attain enlightenment (open his cultivation energy) and achieve physical immortality in this mortal world when his energy potency and Xinxing [mind-nature] have reached a certain level."*

Li claims to have taken energy cultivation to a new level. He also claims to have some 100 million followers worldwide, though he also claims that he keeps no records and that falun gong is not a cult, religion or sect ("Followers defend falun gong as innocuous," by Brian Milner, *The Globe and Mail* (Canada), July 22, 1999.) His popularity is great enough in China to have led to the arrest of more than 30,000 practitioners and a formal ban on falun gong, apparently for little more than being popular and thereby posing a threat to the stability of the repressive Communist regime ("China arrests 30,000 members of spiritual group," *The Globe and Mail* (Canada), July 22, 1999, by Miro Cernetig.)

Li left China in the early 1990s and lives in New York City. He promotes his beliefs in books he has written. His teachings are available on the [Internet](#), which has significantly affected his status and popularity [internationally](#). While much of falun gong is a rehash of traditional Chinese notions regarding meditation and exercises, Li has emphasized an anti-scientific approach to disease and medicine. He says disease is "is a black energy mass" that he can dissipate with his powers. Those who use medicine for their illnesses lack

faith in falun gong. True believers don't need medicine. They understand that disease exists in some other space beyond physical space and that only those with "supernormal capabilities" can truly heal. True healing involves "cultivation energies...in the form of light with very tiny particles in great density."* He claims that he does not tell people not to use medicine, but that he has cured thousands of terminally ill people. He also claims that he advises terminally ill and mentally ill people not to practice falun gong. The former are too focused on their illness and the latter are not clear-minded enough to practice properly.

Li claims that falun gong is one of 84,000 cultivation ways of the Buddha's school. He claims that it has only been used once before, in prehistory, but that he is making it available again "at this final period of the Last Havoc."*

Falun is the miniature of the universe with all the abilities of the universe. It can automatically move in rotation. It will forever rotate in your lower abdomen area. Once it is installed in your body, it will no longer stop and will forever rotate like this year in and year out. During the time when it rotates clockwise, it can automatically absorb energy from the universe, and it can also transform energy from itself to supply the required energy for every part of your body transformation. At the same time, it can emit energy when it rotates counter-clock and releases the waste material which will disperse around your body. When it emits energy, the energy can be released to quite a distance and it brings in new energy again. The emitted energy can benefit the people around you....When Falun rotates clockwise, it can collect the energy back because it rotates forever....

Because Falun rotates forever, it cannot be stopped. If a phone call comes or someone knocks on the door, you may go ahead and take care of it immediately without having to finish the practice. When you stop to do your work, Falun will rotate at once clockwise and take back the emitted energy around your body.*

How Li knows about these rotations is a mystery, but he has many followers throughout the world who feel enlightened by these "teachings."

In short, falun gong is based upon the belief that the universe consists of

magical energies that can be tapped into by certain practices and which can eliminate the need for medicine, bringing one to a state of enlightenment and physical immortality.* Its popularity seems directly related to its claim to bring health and relieve stress while providing enlightenment. It is anti-science, anti-medical establishment, and anti-materialism; thus, falun gong is attractive to many people who are fed up with the world as it is and their position in it.

It is difficult to understand why the Communist party in China fears falun gong. Their practices would relieve the demand for medical assistance, thereby saving the government millions of yuan. They encourage truthfulness, forbearance and compassion. Of course, members may not be very useful to society, since they are not materialistic and would prefer to spend their days meditating and exercising in the park, cultivating energies, rather than working in factories. Then again, communists don't like competition.

note: During the last week of July, 1999, more than 1,200 government officials who practice falun gong were "detained" by Chinese authorities. China's Ministry of Public Security issued an arrest warrant for Li Hongzhi, blaming him for the deaths of 743 followers. According to Michael Laris of the *Washington Post*, China "provided no evidence linking Li to any of the alleged deaths."

feng shui

Sat, 16 Sep

Thanks for your article on Feng Shui. I'm an interior design student and took a Feng Shui class recently. The people in the class were really taking it a bit too seriously, worrying that their personal trigram didn't work with their husband's, etc. I was surprised that people who didn't know anything previously about Feng Shui took everything so seriously and literally. Not one question was asked about exactly how rearranging one's bedroom will bring one love. Maybe it's just a state of mind, I don't know, but they just went with it. Kinda reminded me of religion.

However, Feng Shui definitely has it's good points that should be incorporated into interior design. A few points include being organized, putting safety and comfort above style, getting rid of objects that bring back negative memories, and fixing broken things.

I think it's ridiculous that people believe they have to hire "Feng Shui" experts, when incorporating elements are simple and easy to learn from books. However, I took the class because people are always going to want to hire someone to do it for them. I'm not complaining!

Your site is wonderful, keep it up!!

Cheers, Meretricula

reply: I guess sometimes you just have to give the customer what he or she wants. But it is dismaying that there is so little skepticism about such things as feng shui.

firewalking

12 Dec 1999

I just tripped across you site this evening...and read your comments on fire walking which I have done...just a guest along on a Halloween Eve...no intention and really no need to know...but when I was asked to just place my hand over the coals to see there was no heat...NONE...as they burned red hot bright...I burst into laughter...however, I had no idea of the science which you refer to...or the limits of time...or one will get burnt...but we stood and danced upon the red hot embers for some 30 minutes...and even held the red hot beauties in our hands...felt no heat...none whatsoever...yet a sparking hot ember was in my hand...as I squeezed my hand into a fist around it...while we were still standing upon the coals...so much for the run fast or you will get burnt...only once did the embers feel hot...and that was when my logical and rational mind went to ponder the reason and science behind what I was experiencing...for I assure you that was a hot, hot fire as it burned on that brisk Halloween Eve...and I was told to snap out of it...or else I would get burnt...as evidently my mind was slipping into the concept of limits...

reply: Evidently.

However, I was really looking for something else on your site...as I continue to experience electrical jolts from objects...receiving extreme charges of some sort at times...more than a spark from the carpet...and looking for a scientific or otherwise anecdotal explanation of this...as they are very intense at times...I think anecdotes can lead one to more scientific reasons...as I have been experiencing so-called paranormal things for some time...

Virginia C. Cobler, M.A. (political scientist)

reply: Next Halloween Eve you should repeat your experience for [James Randi and collect a million dollars](#). Standing on, dancing on, and holding red hot coals for thirty minutes without feeling heat or getting burned seems paranormal enough for me. For the sudden experience of extreme electric jolts I would see a neurologist before I jumped to the conclusion that they are paranormal happenings.

27 Jun 1999

I agree with you to a certain extent regarding the explanation that you gave for

firewalking. Although I have never been firewalking I have done a similar thing by picking up a scoopful of hot coals in my bare hands without being burnt. I have done this on numerous occasions and whilst I have never held onto the coals for more than a second or so I yet to be burnt. The skin on my hands is not at all thick and the conditions of my hands (i.e. hot, wet, cold etc) makes no difference to being able to do it. However I have seen someone get burnt doing it, that being because there was a tin can submerged in the coals which he touched, thus rapidly conducting heat into his hand and burning him. I certain that if you sprinkled a couple of blunt nails (being metal they would conduct heat faster) into a fire pit and asked a fire walker to walk across it then no amount of "faith" would protect him.

However that being said I have also heard of people being burnt because they were convinced that they were going to get burnt. Something of a psychosomatic response, however I am unsure of the validity of this claim.

Duncan Gill

reply: And well you should be.

Come visit [my site](#). I just can not write off my experiences to low coal thermal conductivity. As you can see I present firewalks on real fire and not just coals, and as you can see, my participants don't look like they are having a bad time.

Can you even acknowledge that there might be a life force that could possibly protect you?

Ilmar Saar

response: All I can see is that you plan to make a lot of money raking people over the coals.

30 Jun 1996

This dictionary is clearly a bastion of logic, and I love it. One complaint, however--the ability to firewalk is not due, as you write, to the ability of coals to transfer heat to the human foot. The coals in my grill seem to do that just fine to a porterhouse! It's actually due to what's called the Leidenfaust (or something like that) effect. It's the same reason that if you lick your finger, you can extinguish a candle flame with your fingers without getting burnt. What happens is that the intense heat evaporates instantly the sweat on your feet, creating a layer of water vapor. Even though it is extremely thin, water vapor conducts heat very poorly, and so your feet are protected (as long as you don't stop for a hot dog!). In short, all the heat goes to evaporating the sweat and so doesn't give you third-degree burns. Those who are burned just don't have sweaty-enough feet (isn't that ironic? Being punished for having NONSMELLY

feet?). This is standard physical thought (See Jearl Walker--he's a physicist with. . .Princeton? I think?)

*Anyway, get your facts straight.
--Tyson C Burghardt*

reply: Our disagreement is not about facts, but about the explanation of facts. The liquid insulation explanation is mentioned in my entry but I don't think it is as good an explanation as the conductivity theory. However, it is true that sweat or liquid can briefly insulate the foot while prancing over hot embers. Some firewalkers systematically dip their feet in water before their incendiary strolls. Sweat and water may help make the firewalk less dangerous, but I don't think they explain how anyone can walk on coals. On the other hand, some firewalkers *dry* their feet before firewalking and dip their feet in water *after* the firewalk. That makes more sense to me. A dry foot may be less likely to pick up any loose embers and a wet foot will extinguish any embers that might be clinging to a foot.

16 Jul 1996

I was interested in your article about fire walking. The trick is simple, I have performed this act severel times:

- a) The feet must be dry,*
- b) The feet must be cold*

The latter is achieved by walking through a creek, water at the beach or (very effective) cooling ones legs in ice for about five minutes.

A simple example is as follows:

- a) Cool your thumb and index finger on a cold glass of ice water.*
- b) Wipe the fingers dry and hold a (red hot) burning cigarette between thumb and index finger, on any finger which you cooled down.*

You will be able to hold the hot cigarette between your fingers for an impressive period of time, without burning yourself.

*Again, the trick is: Feet, legs, hands or fingers must be cold and dry!
--H. D. Krebs*

reply: thanks for the cool tip.

19 Feb 1997

I recently walked over hot coals. I was fully prepared beforehand.

Two others in my group burnt their feet and were in hospital for over a week. One requires skin grafts. Forty others walked over with little or no ill-effect. Strange how the skeptics believe it is not really possible unless "their soles are thin, they don't move quickly enough, they spend too much time on the coals, the coals are too hot or because the coals are of a kind with a relatively high heat capacity." I might mention the two men went over once with no problem, but were burnt on the SECOND try (thereby proving that their soles are not too thin).

They agree that on the second try they were not mentally as prepared as their previous try. They, like you, thought that it was not a matter of mental preparation, just the way it is. How wrong they turned out to be.

Helene Comber

Curtin University Western Australia

reply: Did it ever occur to you that the explanation of the men who failed might be wrong? Declaring something to be the case does not make it so. By believing you succeeded because you were "mentally prepared" may be a delusion, even if a pleasant and harmless one. In any case, I fail to see how it is "thereby proved" that their soles were not too thin on the grounds that they made it through the first time and were severely burnt on the second run. In fact, I have no idea why you think sole thickness is a key issue here. They may have burnt off some layers of skin on the first run through; they may not have moved fast enough on the second try; the fire may have been hotter the second time through due to less ash covering the coals (the ash being moved and removed by the 40 who ran through the first time). There are quite a few alternative explanations besides lack of mental preparation to explain the burns.

flying saucers

7 Jan 1998

On your "flying saucers" page you state;

"The reason UFO's are often described as flying saucers seems to be due to Kenneth Arnold's claim in 1947 to an editor of the Eastern Oregonian that he'd seen nine round aircraft near Mount Ranier which were flying erratically at incredible speeds and that reminded him of saucers skimming over water."

Arnold never claimed to have seen disc-shaped or round craft at all, in fact he stated they were crescent-shaped as later photos of Arnold holding up illustrations show. (See photo at right).

I have often wondered why people then began reporting disc-shaped craft in light of his description. It seems that newspapers have a lot to do with the promulgation of a conceptualization as evidenced in the 1890's wave. (my pet area of investigation at the moment). The heuristic model of a disc-shaped craft seems to have more to do with mythology created by inexact newspaper reportage than any actual sightings. It also could be explained by people noticing balloons for the first time which can be construed as disc-shape given the single angle of observation.

Coming from a pro-UFO background, I have become a lot more skeptical since applying the principle of Ockham's Razor, and also not neglecting the other surrounding contemporaneous events that could explain reports of UFO's.

My daylight sighting with my father and his golf partner in the late 1960's still remains unresolved. I don't hold to any specific theory about what we saw and have tried in vain to resolve it in some prosaic way to no avail. It is by this thread alone that I don't dismiss the phenomenon all together.

I am convinced that the signal-to-noise ratio is probably close to 1 to 99 however. Since there is much more noise to study and plenty of data with which to study it, I have chosen this route of investigation. If there appears to be a signal after removing most of the noise, I deal with that then.

Drew Williamson

reply: This wouldn't be the first time the mass media created a myth. Witness the recent headlines in magazines such as *Newsweek* about the so-called *Kennedy Curse*. While it is true that the family of Joseph Kennedy has known a significant number of troubles, so have a lot of other large families. It is doubtful whether the Kennedys have had a disproportionate share of woe. Those who are not famous are allowed to suffer out of view of the mass media. It should not be forgotten that the Kennedys have also known a great deal of success, perhaps a disproportionate amount measured by what they might actually have deserved. But who would dare speak of Camelot now?

note: Miguel Estrugo has called attention to the similarity between Mr. Arnold's crescent shaped craft and the German [Gotha Go-229](#) built by the Germans during WWII.

Secrets of the
Supernatural, ch. 11
FIERY FATE -
Specter of
"Spontaneous
Human Combustion"

spontaneous human combustion (SHC)

Spontaneous human combustion (SHC) is the alleged process of a human body catching fire as a result of heat generated by internal chemical action. While no one has ever witnessed SHC, several deaths involving fire have been attributed to SHC by investigators and storytellers.

In the literature, spontaneous human combustion is almost exclusively reserved for corpses. One 17th century tale, however, claims that a German man self-ignited due to his having drunk an excessive amount of brandy. If drinking a great quantity of brandy caused self-combustion, there should be many more cases to study than this isolated report from Germany.

Many of the SHC stories have originated with police investigators who have been perplexed by partially ignited corpses near unburnt rugs or furniture. "What else could it be?" they ask. Many of the allegedly spontaneously combusted corpses are of elderly people who may have been murdered or who may ignited themselves accidentally. Yet, self-ignition due to dropping a lit cigarette, or ignition due to another person are ruled out by the investigators as unlikely. Even when candles or fireplaces present a plausible explanation for the cause of a fire, investigators sometimes favor an explanation which requires belief in an event which has never been witnessed in all of human history and whose likelihood is extremely implausible.

physical possibility of SHC

The physical possibilities of spontaneous human combustion are remote. Not only is the body mostly water, but aside from fat tissue and methane gas, there isn't much that burns readily in a human body. To cremate a human body requires enormous amounts of heat over a long period of time. To get a chemical reaction in a human body which would lead to ignition would require some doing. If the deceased had recently eaten an enormous amount of hay that was infested with bacteria, enough heat might be generated to ignite the hay, but not much besides the gut and intestines would probably burn. Or, if the deceased had been eating the newspaper and drunk some oil, and was left to rot for a couple of weeks in a well-heated room, his gut might ignite.

It is true that the ignition point of human fat is low, but to get the fire going would probably require an external source. Once ignited, however, some researchers think that a "[wick effect](#)" from the body's fat would burn hot enough in certain places to destroy even bones. To prove that a human being might burn like a candle, Dr. John de Haan of the California Criminalistic Institute wrapped a dead pig in a blanket, poured a small amount of gasoline on the blanket, and ignited it. Even the bones were destroyed after five hours of continuous burning. The fat content of a pig is very similar to the fat content of a human being. The damage to the pig, according to Dr. De Haan "is exactly the same as that from supposed spontaneous human combustion."

In their investigation of a number of SHC cases, Dr. Joe Nickell and Dr. John Fisher found that when the destruction of the body was minimal, the only significant fuel source was the individual's clothes, but where the destruction was considerable, additional fuel sources increased the combustion. Materials under the body help retain melted fat that flows from the body and serves to keep it burning.

Charles Fort and the Forteans

21 Mar 2000

Hi... Thanks for your website--it's comprehensive and quite professional.

Just in passing, I noticed your entries on Charles Fort, whose body of work I read and enjoyed many years ago. I was surprised, actually, that the Skeptic's Dictionary entry seemed so critical of Fort, with a few SD comments bordering on the defensive. If there was anything I gleaned from Fort's writing, it's that he took himself and his own "notions" even less seriously than he took the Scientific Method. An attentive reading of the "Complete Books of Charles Fort," for example, finds the author chuckling AT himself and the absurdity of his own theories more often than not. There are some hearty laughs in those pages, as Fort spoofs the Scientific Method at length before drawing his final, preposterous conclusions. If you're bogged down in questioning the reliability of Fort's "sources," you've missed the point of his writing altogether: Fort was guiding us through a stream-of-consciousness amusement park, bounding merrily along at a pace that blurred the temporal distinction between fact and fantasy. That's Charles Fort in a nutshell, and it's not rocket science---he wrote for the sheer fun of it.

Charles Miller

8 Jun 1997

*I read your article in **The Skeptics Dictionary** on the Forteans. Back in the 1960's I read **Lo!**, by Charles Fort. Yes, I know, I'm dating myself. I found many of his theories patently absurd. Even a teenager (as I was at the time) knows we do not live on the inner surface of a hollow sphere! However, I was left with one burning question which I still have to this day. When a verifiable fact does not mesh with the commonly accepted scientific theories, why do scientists all too often brush it aside rather than examine it and re-evaluate their theories. For instance, though I have found theories as to how fish can be caught up in a water spout and later dumped in a storm well inland, I have heard no theory as to how grapefruit size rocks (of non meteorite origin) can rain out of a clear sky. It would seem no scientist is interested in such intriguing phenomenon.*

Perhaps it is ego. If I had been working for 20 years developing one theory, I don't know how much I would like any data to come along that would challenge my theory. Perhaps it is dogmatism. Just as religion resisted having its dogma challenged by men like Galileo, scientists, too, seem on occasion to

resent having their dogma challenged (except, perhaps by a Ph.D. in an appropriate scientific field).

reply: I have never been caught in a stonestorm on a clear day, so I can't speak for those who have, but I am sure there are NASA scientists working on this problem as I type. Seriously, where is the issue here? Are you suggesting that if non-meteoritic rocks fall from the sky, scientists everywhere head for cover to protect their theories? Theories of what? Gravity? If a rockstorm occurred, I don't see why any scientist would go back to the drawing board. The rocks could fall from airplanes. They could be of volcanic origin. Tornadoes, hurricanes, cyclones or gale force winds could have brought them there. On the Orkney Islands when a cow flies by the window, the islanders don't wonder how scientists are going to explain it. They marvel at the power of the wind.

You might have picked a better example, say, Alfred Wegener's theory of continental drift which was ridiculed by scientists when it was first proposed. I have already written on this subject (in [*Becoming a Critical Thinker*](#)) so I will just insert the relevant material here:

Wegener's idea that continents move was rejected by most scientists when it was first proposed. Stephen Jay Gould notes that when the only American paleontologist defending the new theory spoke at Antioch college (where Gould was an undergraduate at the time), most of the audience dismissed the speaker's views as "just this side of sane." [Stephen Jay Gould, *Ever Since Darwin* (New York: W.W. Norton & Company, 1979), p.160.] A few years later, all the early deriders of the new theory would accept it as true. Why? Was it simply a matter of Wegener and a few others jumping the gun by accepting a new theory before the evidence was sufficient to warrant assent to it? Were the latecomers 'good' scientists, waiting for more facts to confirm the theory? Gould's view is that dogmatic adherence to the view that the ocean floor is solid and unchanging was the main stumbling block to acceptance of the new theory. Most scientists rejected continental drift because it did not fit with their preconceived ideas about the nature of the earth's crust. They assumed that if continents did drift they would leave gaping holes in the earth. Since there were no gaping holes in the earth, it seemed unreasonable to believe that continents move. The theory of continental drift, says Gould, "was dismissed because no one had devised a physical mechanism that would permit continents to plow through an apparently solid oceanic floor." Yet, "during the period of nearly universal rejection, direct evidence for continental drift--that is, the

data gathered from rocks exposed on our continents--was every bit as good as it is today."

Continental drift was considered theoretically impossible by some, even if it were physically possible for continents to move. The new theory could not be made to fit the theoretical model of the earth then universally accepted. The theory of plate tectonics was then proposed--the idea that the continents ride on plates which are bounded by areas where new crust is being created from within the planet and old crust is falling into trenches. This provided a mechanism for explaining how continents could drift. Continental drift, according to Gould, came to be accepted not because more facts had been piled up, but because it was a necessary consequence of the new theory of plate tectonics.

More facts were piled up, though--facts for the new theory of plate tectonics, of which the theory of continental drift is an essential element. Now it is taken as a fact that continents move. Yet, the exact mechanism by which plates are moved is still incompletely understood. This area of science will no doubt generate much debate and theorizing, testing of hypotheses, rejection and/or refinement of ideas. It is, as Gould says, a good example of how science works. To someone who does not understand the nature of science, the early rejection of the idea of continental drift might appear to show how dogmatic scientists are about their pet theories. If scientists had not been so devoted to their belief that the earth's crust is solid and immovable, they would have seen that continents can move. That is true. But the fact that Wegener's theory turned out to be correct does not mean that he and his few early followers were more reasonable than the rest of the scientific community. After all, Wegener did not know about plate tectonics and he had not provided an acceptable explanation as to how continents might move. [Wegener argued that gravity alone could move the continents. Gould notes: "Physicists responded with derision and showed mathematically that gravitational forces are far too weak to power such monumental peregrination." Alexis du Toit, a defender of Wegener's theory, argued for radioactive melting of the ocean floor at continental borders as the mechanism by which continents might move. "This ad hoc hypothesis added no increment of plausibility to Wegener's speculation," says Gould. *ibid.*, p. 163.] It is true that the idea that the earth's crust is solid and immovable has been proved wrong, but Wegener didn't prove that. What the new theory could explain (about rocks

and fossils, etc.) other theories could explain equally well.

But, in the end, the idea of continental drift prevails. It prevails because the dogmatism of science--the tendency to interpret facts in light of theories--is not absolute but relative. What distinguishes science from pseudoscience is not that scientists are not dogmatic while pseudoscientists are. It is that scientists stand ready to give up one dogma for another should the evidence warrant it. Pseudoscientists refuse to give up their dogmas regardless of the evidence against them. [Gould notes with obvious admiration that a distinguished stratigraphy professor at Columbia University (where Gould did graduate work) who had initially ridiculed the theory of drifting continents "spent his last years joyously redoing his life's work." *ibid.*, p. 160. It is hard to imagine a comparable scene involving a pseudoscientist.]

The Wegener episode in the history of science demonstrates an essential difference between science and pseudoscience. That difference is to be found not in the correctness or incorrectness of proposed ideas, but in the method used to gain acceptance for the ideas. It is to be found only over time. It is not to be found in the personality of the theorizer nor in his dogmatic adherence to an idea. It is to be found in the pseudoscientist's dogmatic adherence to an idea for which there is contrary evidence or for which there is not, nor ever could be, any test in experience.

[from Chapter 9, "Science and Pseudoscience," in *Becoming a Critical Thinker* by Robert T. Carroll]

However, in spite of some of their nutty theories, Forteans, Scientific Creationists and other crackpots can serve a useful purpose. They can act as gadflies pointing out the inconsistencies in scientific theories and the areas where observed phenomena conflict with or are unexplainable by current theories. Of course, that would require enough intellectual honesty from the scientists to admit to the limitations of their theory, the willingness to explore the implications of those observed phenomena and the humility to accept criticism from non-scientist sources. Unfortunately, it would seem all three qualities are all too often lacking.

reply: a truly useful gadfly should be knowledgeable in the field he buzzes. Unfortunately, this is often not the case with non-scientists who criticize scientific theories. Most of the criticisms of crackpots will turn out to be useless. It would be unreasonable to expect scientists to take seriously every crackpot idea thrown at science. Progress is more likely if

criticisms are made by people who have some understanding of what they are talking about.

It would seem that some scientists have made almost a 'religion' out of science, just as some skeptics have made almost a 'religion' out of skepticism. An agnostic, for instance, is a truer skeptic than is an atheist or a Christian. An agnostic says maybe there is a god, maybe not. Convince me. An atheist or a Christian makes an a priori assumption and closes his mind to anything that conflicts with that assumption -- he is therefore not a skeptic (at least on that topic). A true skeptic has an open mind. A true skeptic would question Einstein as much as he would question Charles Fort or Billy Graham. But I assume you know that.

Andy Rugg

reply: I can't speak for all skeptics and atheists, but my skepticism regarding occult, paranormal and supernatural phenomena is based on experience, study, observation, argument, analysis and evaluation of evidence. My atheism is not an a priori belief nor a matter of faith, but is a reasonable belief given the evidence before me. There term 'skepticism', of course, has several uses. As an epistemological skeptic, I would agree that no one can know with absolute certainty whether God exists. I would also maintain that it is more probable that God does not exist than that God does exist. I guess I am not a "true skeptic." Being open-minded means being willing to examine issues from as many sides as possible, looking for the good and bad points of the various sides examined. Being open-minded does not mean that once one has studied an issue one is not to come to a conclusion about it. I'll conclude with another passage from *Becoming a Critical Thinker*.

Being open-minded does not mean that one has an obligation to examine every crackpot idea or claim made. I have spent years examining occult and supernatural claims. When someone says they've been abducted by aliens, but they have no physical evidence of their abduction, I feel no need to investigate the issue further. If their only proof is that they can't remember what happened to them for a few hours or days--a common claim by alleged abductees--then my hunch is that there is a natural explanation for their memory loss. For example, they're lying because they don't want anyone to know where they really were, or they passed out from natural or self-induced causes; they then dreamt or hallucinated. When someone claims to be God or to hear voices he says come from God, I assume he is mistaken or a fraud. Am I closed-minded? I don't think so. However, many years ago, when I heard for the first time about UFOs and alien abductions, I would have been closed- minded had I not investigated the matters. I have also studied many cases of people who claimed to be divine or reincarnations

of dead persons. So, when a young man in Texas who thinks he's a god shoots at federal agents, it neither surprises me nor does it instill in me any urge to investigate the man's divinity claim. Am I closed-minded? Again, I don't think so. Once a person has studied an issue in depth, to be open-minded does not mean you must leave the door open and let in any harebrained idea that blows your way. Your only obligation is to not lock the door behind you. If someone claims to have alien body parts or vehicle parts, by all means let's examine the stuff. If someone is turning water into wine or raising the dead by an act of will, I'll be the first to reconsider my opinion about human divinities.

An open-minded person who is inexperienced and uninformed will need to be willing to investigate issues that an experienced and informed person need not pursue. A critical thinker must find things out for herself, but once she has found them out she does not become closed-minded simply because her opinion is now informed! So, the next time you hear some defender of astral projection, past-life regression or alien abductions accuse a skeptic of being "closed-minded," give thought to the possibility that the skeptic isn't closed-minded. Perhaps she has arrived at an informed belief. It is also possible that the accuser is a con artist who knows that charging opponents with being closed-minded is often a successful tactic in the never-ending quest to separate a fool from her money. It is more likely, though, that the accuser is simply gullible and that his or her belief is based on wishful thinking rather than on a thorough examination of all the evidence.

[from Chapter 1, "Critical Thinking," in *Becoming a Critical Thinker* by Robert T. Carroll]

08 Sep 1997

I've been reading the Skeptic's Dictionary and found it to be pretty good so far - enlightening and entertaining.

Just one teeny weenie criticism - I thought you were a little harsh on Charles Fort and the Forteans. While I respect what you say about Fort's personal theories, his problem with "standard" scientists was they way they are so ready to discard data that does not fit their expectations. Just because something does not look right does not mean it should be discarded out of hand. (Obviously, you have to draw the line somewhere, if scientists chased

up **every* spike in their data they'd never get anything done).*

I'm an atheist, and consider myself to be an open-minded skeptic - that is, I'm happy to listen to anyone's point of view, but I won't accept it at face value. Having been a regular reader of the Fortean Times has actually strengthened this - the magazine celebrates the weird and wonderful, but doesn't expect you to believe any of it. The reader is left to make up their own mind. It encourages critical thinking by presenting the different viewpoints for a particular subject, from the rational to the absurd. Naturally, many people will go for the absurd explanation, but I think the majority will recognise the rational, or at least recognise the absurd for what it is (which is a good start, anyway). It's also extremely amusing to read what bizarre stuff people will believe, or will get up to because of their beliefs.

I feel that Forteanism (when combined with critical thinking) is a very healthy attitude. You learn that there are more than two sides to a story, it helps you recognise dogmatism and it trains you to look for alternative explanations (preferably the rational ones).

But apart from that, I love the dictionary! (well, love might be too strong a word. Like, maybe.)

You might like to cast a skeptical eye over my own scientific theories (though you'll need a /really/ open mind to take them seriously!).

<http://www.abarnett.demon.co.uk/theories.html>

And my atheism page at <http://www.abarnett.demon.co.uk/atheism/index.html>

*(I'd just started my own Fundy/Creationist Dictionary when I came across your **Skeptic Dictionary**. You beat me to it! Ah, well...)*

Cheers,

Adrian Barnett

reply: I've checked out Mr. Barnett's pages and recommend them, especially his page on the [Tooth Fairy](#).

philosophical materialism (aka physicalism)

Philosophical materialism (physicalism) is the metaphysical view that there is only [one substance](#) in the universe and that substance is physical, empirical or material. Materialists believe that [spiritual](#) substance does not exist. [Paranormal](#), supernatural or [occult](#) phenomena are either delusions or reducible to physical forces.

Materialists are not necessarily atheists, nor do they deny the reality of such things as love or justice, beauty or goodness.

See related entries on [Baron d' Holbach](#) and [naturalism](#).

freewill

20 Feb 2001

Your analysis of free will and moral responsibility there runs thus:

To have free will, one must to some extent comprehend and have control over one's own acts.* One is morally responsible for an act only to the extent that the act was freely-willed.**

However, this analysis rests entirely upon notions of comprehension and control that are left unpacked.

reply: True, but I am not writing for the *Journal of Metaphysics*. I leave a lot of concepts "unpacked." My goal isn't to write a definitive piece on "free will & determinism" but to give the reader some idea of where I am coming from in the many articles where these issues arise.

*What sort of 'control' do mechanical, completely determined*** organic systems like humans have that make them 'free'?*

reply: You may as well ask why call someone who is not in jail "free"? Or, why do we say that someone who thinks she can fly and jumps off a cliff was "not in control of her senses"? Why do we distinguish between accidentally kicking somebody and intentionally kicking him? To assert all are equally unfree and determined is to assert what is either unknowable or true by definition. To assert that there seems to be some difference in control of actions may need unpacking but it doesn't beg the question, as hard determinism does.

What sort of 'comprehension' could be a contributing cause of 'freely-willed' (but pre-determined) effects? And how does this sort of 'freedom' make fully pre-determined moral agents morally responsible for their actions?

reply: The will is an abstraction. To talk of comprehension as a *cause* of freely-willed effects is nonsensical. The rest begs the question. The issue is whether any of us at any time is responsible for his or her actions.

These loose strands (1) leave the compatibilist reader free (!) to rely on vague intuitions about a determined-and-yet-somehow-free-willed-and-morally-responsible-self, while at the same time (2) keeping the free will skeptic (c'est moi) in the dark as to just what it is you mean when you say, e.g.,

"Determinism is compatible with 'free will'"

Mike Drake

reply: Free will does not mean a volition free of all causal connection to the past. A person is free insofar as they are not constrained by internal or external factors. Nobody is absolutely free and the degree of freedom anybody has seems determined in large part, if not completely, by factors beyond one's control, such as genetic, environmental, social and historical factors. Some constraints hinder one's ability to comprehend things. Others hinder one's ability to control one's thoughts or actions. I may be wrong, but I think this is clear enough for most of my readers.

23 Jan 2001

Thank you for creating and maintaining this wonderful resource. The Skeptic's Dictionary is a lifeboat of reason in the vast deluge of nonsense. Your articles and recommendations for further reading have been a joy and an education (and, occasionally, ammunition). Among the items I particularly value are the links for young skeptics, and I have introduced my enthusiastic nine-year old daughter to them.

One entry that I would like to share some comments about is the article on free will. This is an area I have thought much about, though I lack your formal education in philosophy.

In it you state that, "To claim that to be truly free one must not be bound by laws of cause and effect is absurd and unnecessary." Certainly I agree with your contention that it is absurd, an action cannot both happen without a pre-existing cause and also be non-random. If the action has cause, the cause precedes the action and leads to it. If there is no pre-existing cause to initiate the action it is causeless and random. I find little room for even a theist to insert a miracle.

But I disagree when you add unnecessary. If actions are the product of pre-existing causes, then they are inalterable. Though my conscious mind has "the ability to understand and control my thoughts and actions" it does so based upon opinions, preferences, knowledge, capacity, and situation that are all products of causation. Any straying from that causation would generate a random thought or action, and that would still not be free will. If you are arguing that I can be said to have free will if my conscious mind has control over my actions, even though my conscious mind is acting solely as a complicated conductor of causation (pardon the alliteration), then you are working with a very weak definition of free will. A definition of free will that can encompass actions that could not have been altered or omitted by the actor seems in fact, absurd itself.

I think that if modern views are proceeding along this line, it is for one reason. You point to it when you say, "All our concepts of praise and blame, punishment and reward, depend upon our belief in human responsibility." People accept a poor definition of free will in order to maintain their flawed concepts of justice, morals and responsibility. It is an argument from adverse consequences.

Perhaps, instead of trying to balance some cosmic, spiritual, scales of justice, we should accept the rational materialist view of determinism and alter our view of punishment, reward and responsibility. These have always been, at their roots, tools for enforcing conformity in matters important to society. Maybe if we recognize this, we can transform some of our baser laws from ones based on intolerant traditions to ones based on actual needs of a free society. And maybe we can transform our current criminal justice system, which is based on retribution, to one based on scientific research into what will stop crime. If we focus on proven methods of deterring crimes and/or segregating criminal where shown to be needed, rather than revenge, we might actually be able to improve things--and those consequences would not be adverse after all.

Jeff Omalanz-Hood

reply: I don't deny that actions are the product of pre-existing causes, but I deny that that is *all* they are. Focus on previous causes makes us lose sight of the obvious fact that some actions are more free than others and some people are more free than others. To assume otherwise would, as you note, require us to abandon notions of praise and blame. No doubt we praise and blame people who don't deserve it because they really are not in control of their actions or really don't comprehend what they have done. Likewise, we probably don't praise or blame some people because we mistakenly think they are not responsible for their actions. Nevertheless, I think it is obvious from observing human behavior that there are degrees of freedom.

I'm doubtful that either the libertarian or the determinist will do significantly better than the other in improving the criminal justice system.

reader comments:

psychoanalysis

17 Sep 1999

Dear sir,

As a psychology student I have to say that the skeptic definition of "psychoanalysis" in your dictionary is mistaken, to say the least. Maybe American psychoanalysts may use hypnosis, or try to "cure" schizophrenia (as if "regular" medicine could do it either), consider repressed memories and traumas the reasons for one's misfortunes (along with the many other misconceptions exposed there) but it's not like this in the rest of the world. [The author is from Brazil.] Maybe a deeper research in the works of Freud would be suggestible [?] (reading the originals would help).

reply: Maybe your reading of the entry is not quite accurate. I nowhere say or imply that American psychoanalysts use hypnosis. (It is well known that Freud used hypnosis early in his development of analysis, but gave it up because it is unreliable.)

The belief that psychoanalysis could "cure" schizophrenia died out decades ago. (This point is clear in the quote from Dolnick's book at the head of the entry.) But you do shock me by saying that psychoanalysts in the rest of the world do not consider repressed memories and traumas as a cause of "misfortune."

The tendentious writing found in the dictionary definition of psychoanalysis gets to the point of comparing psychoanalysis to scientology and resources itself into suggesting that psychoanalysis can't cure a broken bone (by the way, it's a good point to look at as doctors don't "cure" broken bones - they merely reduce unnecessary "symptoms" such as pain - but the bone itself heals up, with, without or despite the procedures of the doctor, but, as it's widely known, the relationship or confidence between doctor and patient helps speeding up the healing process, and making a very long story short, maybe you should take a look at the findings of doctor Robert Ader :

<http://www.urmc.rochester.edu/NeurosciGrad/fac/Ader.html> on the immunological system and depression - an induced depression, not a "genetic". The concept of cure doesn't exist in psychoanalysis, and I defy anyone showing real cure even in medicine (except for some very few exceptions, not possible by

any other means, while even a heart transplant is not a cure, it's a postergation [?], and we all know that the patient's quality of life has to be increased, or all will be lost). Try to cure a simple depression with Prozac and see what you get ("hide the baseball bat !!!") , and I mean CURE, not only making symptoms disappear, what seems to be the idea of "cure" for some doctors and some behavioral psychologists who may have never heard the word "methonymia", to say the least. If you could spare the time to take on some real research work, you could find yourself invited to many clinics around the world so as to check on their work. Furthermore, you could have a talk with some preeminent neuroscientists such as Antonio Damasio or Joseph Le Doux in order to have a "neutral" standpoint on psychoanalysis according to the latest findings in their fields. You could start by checking a site called "MEDLINE": <http://www.ncbi.nlm.nih.gov/pubmed/medline.html>, and searching for the topic "psychoanalysis and neuroscience" in order to read the most recent papers on the subject.

reply: I'm willing to grant that psychoanalysts don't cure anyone of anything.

We understand the feelings of anger towards psychoanalysis as it's a tried and tested form of therapy which returns a very good ratio of wellness to it's clients, despite all the attempts to prove it wrong (all said but nothing proved...and believe me, they have tried their hardest) all of the eulogies already made to Freud and it's findings, as it's said "the more obits declared, the more alive one is", or, as Mark Twain said "the rumors about my death have been greatly exaggerated"...all in all Freud is still alive and well, and experimenting some boosting thanks to the findings of the neuroscientists. Maybe one should read "a candle in the dark "by Carl Sagan to compare what he says about Psychoanalysis there with what he said in Broca's Brain...as a very intelligent man, he was able to change (also check Einstein's mail). I'm sorry if this email sounds a little too hard, but it's just that I would never expect intelligent people with such passionate blinding conceptions about something they have very scarce knowledge about, also, I think myself as a skeptic and I'm also an agnostic, while some skeptics aren't (well..one should read "The Future of an Illusion") so where does this leaves us ? It's ok to believe in something that is no more than a childish belief on nothing more than a wish (like Santa Claus) but it's wrong to take part on a scientific research of why we are the way we are - do we have double standards operating here ? I like the skeptical point of view, but it scares me to think that if they are not at all that well informed about this subject, it's only licit to thing the same of all the other topics.

Thank you.

Marcos Chimenti

reply: Sagan doesn't mention psychoanalysis in *The Demon-haunted World - Science as a Candle in the Dark*. He only mentions Freud to note that he

changed his belief about the cause of hysteria from *repression* of childhood sexual abuse to *fantasies* of such.

Sorry, but I don't have access to Einstein's mail.

01 Jun 1999

I have to say that I enjoyed many of the entries in your dictionary. There is too much sloppy thinking all about these days. I only found one entry rather irritating: the one on psychoanalysis. I agree that much of the psychoanalytic waffle is simply unreliable ad hoc theorising. This is bound to happen since a human life is a highly individual process and not an object that can be isolated from its environment.

That said it is no more proven that "mental illness" is caused by neurochemical disturbance than it is proven to be caused by the subject's experiences.

reply: I hope you are not insinuating that I think otherwise. Neurochemical imbalance can be caused by physical illness, diet, drugs, and certain experiences, such as extreme trauma, torture, or sleep deprivation. If the effects are long-lasting, and the person's behavior, thought processes or affective response is abnormal, the person, if diagnosed at all, is usually diagnosed as mentally ill.

The fact that a drug may make some one feel happy is not evidence that the lack of it (or it's effect) was the cause of their misery.

reply: That is true.

Much human suffering has its roots in a poor adaptation; that is, their model of the world doesn't serve them very well. The "mentally ill" are not simple victims of biochemistry. The failures of individual cognitive models are both individual and individually structured. It seems to be highly unlikely that a set of chemical aberrations could of them selves give rise to such specific and complex failures.

reply: You seem to suggest that being miserable or being unable to adapt to one's environment makes one "mentally ill." I disagree. If you are claiming that a delusional "model of the world" is simply a problem of adaptation, I think you're wrong. Maybe I don't understand what kind of "failures" you are referring to. However, a person may be unable to adapt to the world because of a brain disorder. Some brain disorders can be treated with medications that affect neurochemical production, reception or reuptake. The number of cases where this happens is too great to think it is an accident. For example, if a person with schizophrenia is hearing voices and a medication stops the voices, while stopping the medication brings the voices back, the likelihood that this is a problem of "adaptation" seems

negligible.

Aspirin may alter the sensation of pain but it doesn't alter the high level concept of what this pain means to me, so why would some other biochemically active substance alter an individual's individual concepts of his world?

reply: Why? Because medications such as [Clozapine](#), [lithium carbonate](#) or [Depakote](#), unlike aspirin, affect neurochemical production, reception or reuptake.

Neuroleptic medications may stop a schizophrenic's hallucinations by dulling down certain cognitive functions just as smashing the TV "gets rid of" bad programs. There undoubtedly are changes in brain chemistry involved in many "psychiatric disorders" but who is to say what is causative and what is mere correlation. There are real organic brain disorders which are an entirely separate kettle of fish. Autism cannot be bundled up with say schizophrenia or depression under the title of mental illnesses and treated as having common causes.

reply: Autism not only can, but is, "bundled up" with schizophrenia, bipolar disorder, depression, and other mental illnesses. See Bernard Rimland's *Infantile Autism* (1964). (Or see my review of [Madness on the Couch](#).) The fact that schizophrenia, autism, and bipolar disorder tend to run in families, even if those families do not all live in the same environment, indicates that the diseases are not likely caused by environmental factors.

Psychiatry and the dodgy medical science that go with it are not more valid than psychoanalysis as you seem to suggest. To compare the measurable fact of a broken limb to the psychological pain of "mental illness" is a profound injustice. There are no easy answers, drugs do not fix broken lives. Try talking to some "mental patients" rather than just reading books!

Mental illness is a misnomer, you have been misled, and you a philosopher too!

Alex Birkett

reply: Psychiatry has its share of pseudoscientific theorists and practitioners. I believe that biopsychiatry is not in the same league with psychoanalysis. Biopsychiatry may go overboard in its identification of all mental disorders with brain disorders or neurochemical imbalances that are biologically based in the same way as, say diabetes, is biologically based. But this science is correctable. Psychoanalysis has no way of weeding out errors, because it has no empirical checks besides purely subjective ones.

By the way, I have talked with mental patients, in addition to reading books on the subject. I have a great appreciation for the difficulties of persons who are psychotic at age three, not because of adaptive problems, but because of brain disorders. I know the anguish of parents who teens are suicidal because of the lack of control they have over their thoughts and actions, whose potent medications keep the voices away but do not "cure" them of their obsessions. These kids were not abused, except by Nature. Their adapting problems are an effect of their disorders, not a cause. Treating the effect by typical methods of disciplining, pleasure deprivation, physical punishment, kicking them out of school don't and won't help. Psychoanalysis would be about as useful as football practice or art lessons for these severely disturbed and *physically* diseased persons. I believe Dr. Freud would agree with me on this point. He did not think that psychoanalysis was useful for the treatment of psychotic disorders.

However, I agree that medication alone cannot help such people adapt to society. Special education and training programs, as well as community programs which involve local businesses and potential employers are also essential. Even cognitive therapy is appropriate in many cases. But not psychoanalysis.

paraskevidekatriaphobia or friggatriskaidekaphobia

Paraskevidekatriaphobia is a morbid, irrational fear of Friday the 13th. The term was coined by therapist [Dr. Donald Dossey](#), whose specialty is treating people with irrational fears. He claims that when you can pronounce the word you are cured.

Paraskevidekatriaphobia is related to *triskaidekaphobia*, the fear of the number 13.

Superstition about Friday the 13th may well be the number one superstition in America today. The number 13 is considered especially auspicious, though it was considered a lucky number in ancient Egypt and China. There were 13 people at the Last Supper. And several mass murderers have 13 letters in their names: Charles Manson, Jeffrey Dahmer, Theodore Bundy. Of course, millions of people who haven't committed any murders, such as Robert Carroll, have 13 letters in their names, too. As far as I know, nobody has studied how many dinner parties with 13 present went off uneventfully. Witches, perhaps to clearly oppose themselves to a Christian superstition, sometimes have groups of 13 known as covens.

Some think thirteen owes its bad reputation to Loki, the Norse god of evil, who started a riot when he crashed a banquet at Valhalla attended by 12 gods.

Some cities skip 13th Ave., but not the city I work in: Sacramento has an intersection where 13th Street crosses 13th Avenue. Some buildings skip from the 12th to the 14th floor, which, of course, means that the 14th floor is actually the 13th floor.

The ancient Egyptians considered the 13th stage of life to be death, i.e., the afterlife, which they thought was a good thing. The Death card in a [Tarot](#) deck is numbered 13 and represents transformation. Those cultures with lunar calendars and 13 months don't associate 13 with anything sinister.

Friday may be considered unlucky because Christ is thought to have been crucified on a Friday, for that was execution day among the Romans. Yet, Christians don't call it Bad Friday. Friday was also Hangman's Day in Britain.

Some even think that Friday was the day God threw Adam and Eve out of Eden.

Friday is Frigga's Day. Frigga (Frigg) was an ancient Celtic (Norse) fertility and love goddess, equivalent to the Roman Venus who had been worshipped on the sixth day of the week. The Celts (Norse) worshipped Frigga (Frigg) on Friday and like the ancient Romans thought it a particularly good kind of day. Christians called Frigga a witch and Friday the witches' Sabbath; modern [Wiccans](#) are [happy to oblige](#). Some call fear of Friday the 13th *friggatriskaidekaphobia*.

Is Friday the 13th a particularly unlucky day? It could be...if you believe it is. Some prophecies are self-fulfilling.

[Becoming](#)

[a Critical Thinker](#)

by Robert T. Carroll

the gambler's fallacy

The gambler's fallacy is the mistaken notion that the odds for something with a fixed probability increase or decrease depending upon recent occurrences.

For example, in California we have a state run gambling operation called *Superlotto*. The idea is to pick 6 numbers and match them to six selected from 51 numbers. Sounds easy. The odds of doing so? Here is what happens in a typical week. On July 25, 1998 the numbers were: 5, 7, 21, 32, 44, 46. The Jackpot was \$16,000,000. There were no tickets with all six numbers. 170 tickets matched 5 numbers and won \$1,588 each; 9,715 matched 4 of 6 numbers for \$72 each and 176,657 matched 3 of 6 numbers for \$5 each.

If you programmed a computer to randomly generate *six different numbers every second taken from the numbers 1 through 51*, you would have to wait nearly seven months before every combination came up at least once.

The odds of matching 6 of 6 numbers are 1 in 18,009,460; 5 of 6 are 1 in 66,702; 4 of 6 are 1 in 1,213; 3 of six are 1 in 63.

The odds of winning anything are 1 in 60.

If you buy 100 tickets a week, you can expect to win the jackpot on average every 3,463 years. If you buy \$25,000 worth of tickets a week, you can expect on average to win about every 14 years. If you expect to live 50 more years, you should buy \$6,927 worth of tickets a week if you want to have a good chance of winning the jackpot in this lifetime. Of course, if you do, you may not even break even. You could well be about \$2,000,000 in the hole, depending on when you win.

However, if you would be satisfied with getting 5 out of 6, you will have a much easier go of it. You are likely to get 5 out 6 every 12.8 years on average if you buy 100 tickets a week. However, you will have spent nearly \$67,000 to win about \$1,500.

If you want to "guarantee" yourself to be a "winner," buy about \$120 worth of tickets a week. On average, you are likely to take home, before taxes, about \$10 a week. Thus, to be a "guaranteed winner" you need only lose about \$110 a week. What could be easier? (This "guarantee" comes with a limited warranty of no value and is based upon payouts for the week of July 25, 1998.)

You might think that you can beat the odds by either selecting numbers that have not been chosen in recent drawings, or by selecting numbers that have

come up more frequently than expected in recent drawings. In either case, you are committing the gambler's fallacy. The odds are always the same, no matter what numbers have been selected in the past. This fallacy is commonly committed by gamblers who, for instance, bet on red at roulette when black has come up three times in a row. The odds of black coming up next are the same regardless of what colors have come up in previous turns.

Lotteries seem to share something in common with [illegal pyramid scams](#): in order for anyone to win big, many people must lose just about everything they bet.

(Note: None of the above math has any monetary value and has not been verified by our Statistician. Use at your own risk.)

gambler's fallacy

26 May 1999

I was fortunate to have read your essay on "The Gambler's fallacy" before I went to Reno on a gambling trip. I knew before going that "dice have no memory." I am also a hardcore skeptic. However, it is is easy for emotion to outweigh logic when gambling (it is for me at least).

I was playing craps and my friend and I noticed that 12 people in a row had not made their point (don't pass). My friend remarked, "it is time to make a huge bet on the pass line. There is no way 13 people in a row are going to not make their point." I agreed. My friend and I decided to put \$200 each on the pass line. My bankroll was \$500. Then I remembered your essay and immediatley stopped my bet and took my friend's chips off the pass line as well. "What the ___ are you doing!" shouted my friend. " Just wait," I replied. The shooter rolled a 12 on his first roll and we would have lost. Thanks for the essay. I saved \$200 and I got a free steak & lobster dinner from my friend. Also, I plan to buy your book and share some of my savings with you. Great job on the website! I spend hours there.

Steven Ashline

reply: What would you and your friend have done had the shooter rolled a "7"?

Uri Geller

"If Uri Geller bends spoons with divine powers, then he's doing it the hard way."

--James Randi

"Because a good magician can do something shouldn't make you right away jump to the conclusion that it's a real phenomenon."

--Richard Feynman

Uri Geller is a Hungarian/Austrian who was born in Israel and lives in England. He is most famous for his claims to be able to bend spoons and keys with his mind. Geller claims he's had visions and may get his powers from extraterrestrials. He calls himself a psychic and has sued several people for millions of dollars for saying otherwise. He has lost the lawsuits and a bit of money in his aggressive attacks on his critics. His arch critic has been magician James ("The Amazing") [Randi](#), who has written a book and numerous articles aimed at demonstrating that Geller is a fraud, that he has no psychic powers and that what Geller does amounts to no more than the parlor tricks of a [conjurer](#).

Geller has been performing for many years. The first time I saw him was in the late 60's or early 70's when he appeared on the Johnny Carson show. He was supposed to demonstrate his ability to bend spoons and stop watches with his thoughts, but he failed to even try. He squirmed around and said something about how his power can't be turned on and off, and that he didn't feel right. Others speculate that Randi conspired with Carson to change the spoons Geller would use, as there was suspicion that Geller likes to work (i.e., soften) his spoons before his demonstrations.

I have always been fascinated and puzzled by the attraction to Uri Geller. I suppose this is because nearly every one of our household spoons is bent and what I would like to see is someone who can *straighten* them out, with his mind or with anything for that matter. Likewise, with stopped watches. I have had several of those along the way and what I would have been amazed by would have been someone who could use his powers, psychic or otherwise, to make them start running again for good. (Even I can get my stopped watches to run again for a short while. A little movement is all that is necessary many times.) Thus, I must say that there is something magical about a person who has built a career out of breaking things.

Geller may have suffered defeat in the law courts but he says he is doing quite well in the world as a consultant for psychic detection. He even claims he is

being paid vast sums of money to use his special gift as a psychic geologist in search of things precious buried in the earth. He has even been tested by the great Puthoff and Targ, who deemed his remarkable gift as the "Geller effect." [For a detailed account of how easy it is to demonstrate incompetence and to commit fraud in this area, read James Randi's account of the Uri Geller experiments designed and executed by Russell Targ and Harold Puthoff of the Stanford Research Institute. See either chapter 7 of *Flim-Flam!* or *The Magic of Uri Geller*.] If you doubt his great powers or my account of them, you can read about them on the WWW by tuning in to Uri-Geller.com. The interactive part of his site is where you and I get to try to bend a spoon Geller has placed somewhere with a video camera on it, transmitting to his home page. Now this is what interactive computing should be about. People helping people. If you bend the spoon, you get a million dollars. I warn you, though, that if you are successful in bending Uri's spoon, you may have a difficult time proving your claim. You may even have to go to court to collect, but don't expect too much sympathy from judge or jury. Geller has been there and he knows what courts can do to people who claim they have psychic powers capable of bending tea spoons. He may publicly cast doubt upon your psychic powers, causing you great humiliation. You may sue him. But, remember; he's been there, done that, and he knows who will win. And he doesn't even have to use up any psychic energy to make that prediction.

Geller has also recently ventured into the lucrative New Age self-help/personal growth industry. For sale is his [Mind-Power Kit](#) for about \$30. The kit includes an audio tape, a crystal and a book with topics such as how to develop your [ESP](#), [dowsing](#), [crystal power](#), color therapy, and, of course, [telekinesis](#).

Many magicians do what Geller does, but they call themselves magicians or mentalists. Good magicians are good tricksters and good tricksters can fool the wisest of men. They can amaze people with their ability to seemingly move objects with an act of will, suspend objects in space, view objects which are remote, read your mind, predict the future, identify the content of hidden messages or drawings, etc. What is amazing is that they don't amaze people by winning the lottery or finding a cure for cancer. Why don't they bypass airports and paranormally transport themselves to their next gig? Why do they take their cars to a mechanic when it breaks down? Why do they waste their time moving a wire in a glass bottle instead of moving a waterfall over a forest fire? The answer is obvious. Such useful feats would require more than distraction and legerdemain. Why do the parlor tricks convince even very intelligent people that they have witnessed a paranormal event rather than a bit of magic? Because most really intelligent people are too foolish to realize that they are not so intelligent as to be beyond being fooled. One really intelligent person who would not be fooled was Richard Feynman, who met Uri Geller. Feynman said "I'm smart enough to know that I'm dumb." Feynman was intelligent enough to realize that a good magician can make it seem as if the laws of nature have been violated and even a great physicist

couldn't figure out the trick.

Uri Geller

04 Jan 2000

I need to tell you what I saw on the biggest TV-channel here in Sweden, TV 4, on New Years eve. They had an interview with Uri Geller in London and he talked about how he would stop the clock Big Ben at 11 something at night.

The interview was absolutely uncritical and the comments were "wow, I wonder if he can really do that". They also showed him bending a key the reporter gave him, with his mind of course. (Or with a trick, more likely.) They did ask him a critical question, "what if you don't succeed"? And he replied that he was not a miracle worker so that might happen. He got his airtime, they showed some book of his about healing or something.

I'm not sure if he actually was able to stop the clock, but my guess would be no.
Anderz

reply: I think that would be a safe guess.

Geller's been promoting his book in the U.S., too. He even got a spot on [the Tonight show](#)! He's also got his lawyers looking into a Pokemon character who carries a bent spoon and gives people headaches, according to the [NY Post.com](#).

9 Jul 1998

Subject: Uri Geller- The Skeptic's Dictionary - Putting you on notice

Mr. Bob Carroll,

Without Prejudice

*This office represents Uri Geller. Your Skeptic's Dictionary on the internet was brought to our attention. Your placing Mr. Geller's name under the heading **Frauds & Hoaxes** is highly libellous [sic], defaming and damaging. You should have consulted your international libel lawyers, since libel laws vary from country to country. We have passed your Skeptic's Dictionary page over to our attorneys both in the USA and Europe for immediate action.*

Yours Sincerely

D. Robertson

CC: Richard W. Winelander, Esq. Baltimore, MD

Bob Foglenest Esq. New York, N.Y.

Gordon Hausmann, Curry CH. Hausmann Popeck solicitors, London

Ruth Liebesman Attorney at Law, New York

reply: Thank you for calling my attention to what has been called to your attention. I have consulted with my specialist in international libel law about false accusations of libel being libelous. I am informed that interpretations vary on this issue and that I should consult a good psychic instead of a lawyer. My psychic tells me that my filing clerk is responsible for this egregious error and should be made to do an internship at your office as punishment.

In any case, immediate action has been taken and the error has been corrected. Uri Geller is now listed under the heading of the Paranormal and the Psychic. Would it please you if I were now to list my own name under the heading of Frauds and Hoaxes?

**Yours with all the respect you are due,
Bob Carroll**

p.s. Please feel free to pass on this e-mail to your illustrious colleagues. Remind them of what happened [the last time Geller claimed someone libeled him.](#)

11 Jul 1998

Be careful man, he could do the same thing to you that he did to his soccer team!

Brent Slenker

reply: The following might clarify Mr. Slenker's comment:

29 Apr 1998

Glen Hoddle (a noted born again evangelical Christian), the England World Cup Team Soccer manager/coach is now forcing his players to visit an "official World Cup Faith healer" called Doris, in order for her to lay hands on injured and uninjured players. This is big news here in soccer crazed Britain and has been widely and relatively uncritically reported in the UK press, with the knowledge that England supporters are desperate to win the World Cup for the first time since 1966. Many commentators (who should know better) and the

general public seem to be going along with it. Hoddle has great "faith" in Doris and apparently has used her "powers for many years both as a player (he was one, if not the greatest English players in the late 80's/90's) and as a coach/manager. I'm sure you can glean more information from the net on other sites, particularly those to do with football/soccer/England.

To my knowledge Uri Geller has not been used by Glen Hoddle to dowse for goals for the England team though he has publicly announced his services to the England organisation on more than one occasion. He is however a rabid Reading FC fan and goes to all games, both home and away, providing his "para"services. Reading have just been relegated from the 1st (note: not the Premier League) to the 2nd division 2 weeks before the end of the season. He also provides his services to Swansea FC who are in the bottom 5 of division 3 and also struggling to fight relegation.

Tim Gregory

reply: Mr. Hoddle seems like a fine fellow. The [BBC reports](#) that he is suing Uri Geller for libel and malicious falsehood. [Hoddle's faith healer](#) may be called to testify that [it is false that Hoddle sought Geller's help](#). Over here we call these kinds of lawsuits "frivolous."

16 Mar 1998

I agree almost entirely with your analysis of Uri Geller. I don't however accept that he simply performs magic tricks, as to say this is an insult to magicians everywhere. In November 1997 I interviewed Uri in his home and watched him bend a spoon. Any magician that had to turn his back on his audience twice and leave the room altogether during the performance would be derided, yet this is exactly what Uri did. Performing magic tricks requires skill and dexterity. From what I saw, Uri has neither.

Mark Lipczynski

15 Aug 1996

Here in GB we have a weekly Radio programme where a Psychiatrist, Dr Anthony Clare, interviews a national celebrity. This week it was Uri Geller. Amongst the facts I did not know about Uri were that he was injured during the 6 day war, was sent to Catholic school despite the Judaism of his family and he has suffered all his adult life from bulimia. (Just like Di!). Also live on radio he used his mental powers to bend the car keys of the producer of the programme who had been rudely sceptical of his powers.

He is also a supporter of Reading United (a soccer club) and used his powers to such an extent that Reading had the worst record of any top flight English

soccer club. He blamed the failure of his power during one televised three-nil defeat on "the weather". Perhaps Britain is not the best place for him.

I would add that I have much personal affection for Geller having met him three times and enjoy his skills much more than those of David Copperfield et al.

Tom Peach

18 Dec 1998

I recently met Uri Geller on a promotional tour of a biography, and thought you would be amused to hear of a few of the things which happened.

I attended a book promotion of Geller's at Waterstones bookshop in Manchester, UK. He was there with his biographer, Jonathon Margolis, who claimed to be a 'profound skeptic' who was converted by demonstrations of Uri's powers. Hmm... Anyway, we heard of Uri's remarkable work for Mossad, the CIA (he forced the Russians to sign peace treaties with the power of his own mind no less), his encounters with aliens, his hope to rid the world of nuclear weapons by a collective use of the world's psychic consciousness, and verification of his powers by any number of scientists, including a publication in Nature.

Margolis related how his 'profound skepticism' was worn away by Uri's ability to bend spoons and how 'wierd things happened when he was around'. I particularly enjoyed it when Margolis revealed that now he too had the ability to bend spoons! All this was met by the gasps of an audience of which, I fear, my companion and I made up the total of skeptical attendees. Still, the free wine and food was plentiful and my mood brightened when I began to realise just how comically farcical the man really is.

His few attempts at demonstrating any powers were dismal. His spoon bending took place just a few yards from me. After a few moments he claimed a very small bend was appearing; a bend which I could not see, but some onlookers (including a few at the other side of the room) confirmed. At this point he apologised for being very tired and suggested that he could use some help. Pointing to the back of the room, he invited someone to assist his psychic powers. Leading them to the front of the room he started to rub the spoon again. However, during this brief distraction the spoon was not in common view and I was hardly surprised when he almost immediately demonstrated a visible bend in the spoon. Visible maybe, but done in anything other than a conventional manner? My skepticism remains.

At one point in the evening, a banging was heard to emanate from upstairs. Uri stopped talking, and left a few dramatic moments of silence before saying "I

hope that wasn't me". Ha! In a busy city centre bookshop, he was trying to take credit for sounds which could come from any number of sources. During the entire performance, a saxophonist was heard to be playing from the street outside but I note Uri didn't try to put that down to his psychic powers.

The best was yet to come. Uri invited questions from the audience. After a few fairly sycophantic questions Uri pointed at a young lady with her hand up, exclaiming 'Now, let's have a question from the skeptic'. His intention, I guess, was to demonstrate some psychic skill by guessing the woman's question. However, I could barely conceal my amusement when she replied "Actually, I'm not a skeptic, I just wanted to ask... Isn't it true, that at any one point, there are 76 different types of aliens on the planet?"

Getting annoyed, I asked him (and his biographer) why they didn't prove their powers by taking part in [the Randi challenge](#). Their replies were classic ad hominem. Randi was persecuting Geller, he was a magician and an illusionist, and therefore to be distrusted (the irony of it!), his challenge was both 'babyish' and 'unfulfillable', and the legal contract required by the challenge entitled Randi to all earnings of successful challengers!

I would have concluded that the man is just a harmless fraud but for a rather unsavoury event at the end of the evening. Unprompted, an elderly married couple stood up and related to all present of Uri's kindness in visiting their terminally ill son in hospital. Tragically, their boy died in a car accident a few weeks later. However, after the funeral, Uri phoned them and told them their son would contact them. This message came, they told us. It came when Uri asked them if they had any watches that no longer worked. Sound familiar? Upon examining an old watch, it miraculously started working. This was their son's message.

Entertaining people by tricking them into thinking he can bend spoons with his mind is one thing; misleading vulnerable and bereaved people is quite another. Anyway, that's Geller for you.

*I apologize for the length of this mail, but I felt I had to illustrate my experience of this man. Please keep up your good work. As Shakespeare said 'Modest doubt is the beacon of the wise'. **Daniel Poxton***

ghosts

07 Jul 2000

I am glad that I managed to stumble upon your web page, it is rare to see the voice of sanity and reason on the internet these days. I am a chemist by degree, a computer programmer by profession and I used to be a magician's assistant so I have quite a good insight into the scientific world and the world of entertainment through deception. It amazes me how otherwise intelligent and rational people can believe such nonsense.

Two little stories which you may find amusing...

When I was a magicians assistant I would often listen to the conversations of people after the show, I would hear them talk about what they saw and how they thought the tricks were done. Quite often they would mention that they saw things that I knew could not be true because I knew how the tricks were done. They would report him doing something with the floating silver ball that, if he did it, I would have been shocked. It just goes to show that people are not the most reliable of witnesses.

My wife was convinced that something was not right in the house because every time she ran downstairs in the basement she would hear drawers being opened and closed upstairs. I am not sure if she was convinced there was a ghost in the house or not but I did a little bit of investigation. First of all I ran with her and I could also hear the drawers being opened and closed upstairs. Then I stopped running where I could here the noise and waited. The noise occurred every time she ran towards one end of the basement. After a couple more runs I pushed on one of the basement doors and latched it properly and the noise stopped. It turned out that as she was running into the narrow part of the basement she was pushing air in front of her which was moving the not properly latched door just enough to sound like a drawer opening. The noise came from the top of the door and thus sounded like it was upstairs. I am convinced that if I was not there she would have come to the conclusion that there was a ghost in the house.

Ian

22 Nov 1998

Recently, while surfing the web, I came across a site which featured a web

camera aimed at the wall of an old building in my home town of Portland, Oregon. It had been placed there to see if the appearance of ghostly writing on the wall could be detected. It was alleged that the building had been built on the site of an old cemetery, but no address was given.

I immediately emailed the operators of the site requesting a specific location, and also asking them if they were aware that at one time there were numerous small cemeteries under what is now downtown Portland, and that many buildings could now stand on those sites (including one I used to work in). I further asked if they were aware that as the city grew, all these small cemeteries were closed and the bodies moved to a new, larger cemetery across the Willamette River in the mid-1800s.

All this information (including the locations of the original cemeteries) is readily available to anyone who requests information from the department which manages pioneer cemeteries in Multnomah County. The literature that is provided indicates that it is possible that some bodies were missed when the small cemeteries were closed, and there is no mystery to this; simply poor records and primitive if nonexistent embalming.

Funny-- NOBODY has responded to my message. I guess it's more fun to set up a web camera than it is to do a little historical research!

Keep up the good work,

**Roger Voeller
Portland, Oregon**

glossolalia

Glossolalia is fabricated, meaningless speech.

According to Dr. William T. Samarin, professor of anthropology and linguistics at the University of Toronto,

glossolalia consists of strings of meaningless syllables made up of sounds taken from those familiar to the speaker and put together more or less haphazardly Glossolalia is language-like because the speaker unconsciously wants it to be language-like. Yet in spite of superficial similarities, glossolalia fundamentally is not language [Nickell, 108].

When spoken by schizophrenics, glossolalia are recognized as gibberish. In charismatic Christian communities glossolalia is sacred and referred to as "speaking in tongues" or having "the gift of tongues." In Acts of the Apostles, tongues of fire are described as alighting on the Apostles, filling them with the Holy Spirit. Allegedly, this allowed the Apostles to speak in their own language but be understood by foreigners from several nations. Glossolalics, on the other hand, speak in a foreign language and are understood by nobody.

Glossolalics behave in various ways, depending upon the social expectations of their community. Some go into convulsions or lose consciousness; others are less dramatic. Some seem to go into a trance; some claim to have amnesia of their speaking in tongues. All believe they are possessed by the Holy Spirit and the gibberish they utter is meaningful. However, only one with faith and the gift of interpretation is capable of figuring out the meaning of the meaningless utterances. Of course, this belief gives the interpreter unchecked leeway in "translating" the meaningless utterances. Nicholas Spanos notes: "Typically, the interpretation supports the central tenets of the religious community" [Spanos, 147].

Uttering gibberish that is interpreted as profound mystical insight by holy men is an ancient practice. In Greece, even the priest of Apollo, god of light, engaged in prophetic babbling. The ancient Israelites did it. So did the Jansenists, the Quakers, the Methodists, and the Shakers.

[God on the Brain By
Liz Tucker BBC
Horizon 3/20/03](#)

gods

Gods are beings created by humans and given supernatural powers or attributes such as immortality, omniscience, [telekinesis](#), and invisibility.

These creations serve many purposes, such as imaginary protection from enemies or explanations for the origin of such things as good and evil, fire and wind, or life and death.

Gods are often the central figures around which religions are built. It is often claimed that religion began in fear and superstition. The same might be said for gods.

Some religions maintain that there is just one God and that all the gods of all religions except theirs were created by human beings. Yet, everyone who believes in a god of some sort believes their god is real.

Since gods are supernatural, they exist outside the bounds and laws of space and time. They can possess any of an infinite array of magical powers. Hence, there is no way to prove or disprove their reality. One might say: If gods exist, anything goes!

polygraph ("lie detector")

**"I don't know anything about lie detectors other than they scare the hell out of people."
--Richard Nixon**

A polygraph is an instrument that simultaneously records changes in physiological processes such as heartbeat, blood pressure, and respiration. The polygraph is used as a lie detector by police departments, the FBI, the CIA, federal and state governments, and numerous private agencies. The underlying theory of the polygraph is that when people lie they also get measurably nervous about lying. The heartbeat increases, blood pressure goes up, breathing rhythms change, perspiration increases, etc. A baseline for these physiological characteristics is established by asking the subject questions whose answers the investigator knows. Deviation from the baseline for truthfulness is taken as sign of lying.

There are three basic approaches to the polygraph test:

1. **The Control Question Test (CQT).** This test compares the physiological response to relevant questions about the crime with the response to questions relating to possible prior misdeeds. "This test is often used to determine whether certain criminal suspects should be prosecuted or classified as uninvolved in the crime" ([APA](#)).
2. **The Directed Lie Test (DLT).** This test tries to detect lying by comparing physiological responses when the subject is told to deliberately lie to responses when they tell the truth.
3. **The Guilty Knowledge Test (GKT).** This test compares physiological responses to multiple-choice type questions about the crime, one choice of which contains information only the crime investigators and the criminal would know about.

Psychologists do not think either the CQT or the DLT is scientifically sound, but a majority surveyed by the [American Psychological Association](#) think that the Guilty Knowledge Test is based on sound scientific theory and consider it "a promising forensic tool." However, they "would not advocate its admissibility [in court] in the absence of additional research with real-life criminal cases." One major problem with this test is that it has no controls. Also, unless the investigators have several pieces of insider information to use in their questioning, they run the risk of making a hasty conclusion based on just one or two "deviant" responses. There may be many reasons why a subject would select the "insider" choice to a question. Furthermore, not responding differently to the "insider" choices for several questions should not be taken as proof the subject is innocent. He or she may be a sociopath, a

psychopath, or simply a good liar.

Is there any evidence that the polygraph is really able to detect lies? The machine measures changes in blood pressure, breath rate, and respiration rate. When a person lies it is assumed that these physiological changes occur in such a way that a trained expert can detect whether the person is lying. Is there a scientific formula or law which establishes a regular correlation between such physiological changes and lying? No. Is there any scientific evidence that polygraph experts can detect lies using their machine at a significantly better rate than non-experts using other methods? No. There are no machines and no experts that can detect with a high degree of accuracy when people, selected randomly, are lying and when they are telling the truth.

Some people, such as Senator Orrin Hatch, don't trust the polygraph machine, even if used by an expert like Paul Minor who trained FBI agents in their use. Anita Hill passed a polygraph test administered by Minor who declared she was telling the truth about Clarence Thomas. Hatch declared that someone with a delusional disorder could pass the test if the liar really thought she was telling the truth. Hatch may be right, but the ability of sociopaths and the deluded to pass a polygraph test is not the reason such machines cannot accurately detect lies with accuracy any greater than other methods of lie detection.

The reason the polygraph is not a lie detector is that what it measures--changes in heartbeat, blood pressure, and respiration--can be caused by many things. Nervousness, anger, sadness, embarrassment, and fear can all be causal factors in altering one's heart rate, blood pressure, or respiration rate. Having to go to the bathroom can also be causative. There are also a number of medical conditions such as colds, headaches, constipation, or neurological and muscular problems which can cause the physiological changes measured by the polygraph. The claim that an expert can tell when the changes are due to a lie and when they are due to other factors has never been proven. Even if the device measures nervousness, one cannot be sure that the cause of the nervousness is fear of being caught in a lie. Some people may fear that the machine will indicate they are lying when they are telling the truth and that they will be falsely accused of lying. Furthermore, even the most ardent advocate of the polygraph must admit that liars can sometimes pass their tests. One need only remember the spy [Aldrich Ames](#), who passed the polygraph test several times while with the CIA. This lesson was lost on the FBI, however, who started requiring polygraph tests of its employees after spy [Robert Hanssen](#) was caught. Heretofore, the FBI had only used the polygraph on suspected criminals. Apparently, the FBI thinks that they could have prevented Hanssen's betrayal if only he had been made to take the polygraph.

In California and many other states, the results of polygraph tests are inadmissible as evidence in a court of law. This may be because polygraph tests are known to be unreliable, or it may be because what little benefit may be

derived from using the polygraph is far outweighed by the potential for significant abuse by the police. The test can easily be used to invade a person's privacy or to issue a high-tech browbeating of suspects. Skeptics consider evidence from polygraphs no more reliable than testimony evoked under [hypnosis](#), which is also not allowed in a court of law in California and many other states. Also, in 1998, the U.S. Supreme Court argued that Military Rule of Evidence 707, which makes polygraph evidence inadmissible in court-martial proceedings, does not unconstitutionally abridge the right of accused members of the military to present a defense (United States, Petitioner v. Edward G. Scheffer).

The American Civil Liberties Union strongly supported the passage of the Employee Polygraph Protection Act of 1988 (EPPA) which outlaws the use of the polygraph "for the purpose of rendering a diagnostic opinion regarding the honesty or dishonesty of an individual." The EPPA doesn't outlaw the polygraph across the board, however. Federal, state and local governments can still use the polygraph. The federal government can give polygraph tests to government contractors involved in national security projects. In the private sector, security and pharmaceutical firms can still use the polygraph on current or prospective employees. Furthermore, any employer can administer polygraph tests

...in connection with an ongoing investigation of an economic loss or injury to his/her business on these conditions: The employee under suspicion must have had access to the property, and the employer must state in writing the basis for a reasonable suspicion that the employee was guilty ([ACLU](#)).

The ACLU supported the EPPA not only because of the lack of evidence for the accuracy of the polygraph, but because of abuses related with its administration, including, but not limited to, the invasion of privacy.

For example, in order to establish "normal" physiological reactions of the person being tested, "lie detector" examiners ask questions that purposely embarrass, frighten and humiliate workers. An ACLU lawsuit in 1987 revealed that state employees in North Carolina were routinely asked to answer such questions as "When was the last time you unintentionally exposed yourself after drinking?" and "Who was the last child that got you sexy?" Polygraphs have been used by unscrupulous employers to harass union organizers and whistle-blowers, to coerce employees into "confessing" infractions they did not commit, and to falsely implicate fellow employees ([ACLU](#)).

Why would so many government and law enforcement agencies, and so many

private sector employers, want to use the polygraph if the scientific community is not generally convinced of their validity? Is it just [wishful thinking](#)? Do the users of the polygraph want to believe there is a quick and dirty test to determine who's lying and who's not, so they blind themselves to the lack of evidence? Perhaps, but there are other factors as well, such as *the esoteric technology factor*. The polygraph machine looks like a sophisticated, space-age device of modern technology. It can be administered correctly only by experts trained in its arcane ways. Non-experts are at the mercy of the high-tech, specially trained wizards who alone can deliver the prize: a decision as to who is lying and who is not.

Another reason for the polygraph's popularity is *the pragmatic fallacy factor: it works!* Case after case can be used to exemplify that the polygraph works. There are the cases of those who failed the test and whose lying was corroborated by other evidence. There are the cases of those who, seeing they are failing the test, suddenly confess. What is the evidence that the rate of correct identification of lying corroborated by extrinsic evidence is greater than the rate of identification of lying by non-technological means? There isn't any. The proofs are anecdotal or based on fallacious reasoning such as thinking that a correlation proves a causal connection.

On the other hand, it is possible that one of the main reasons so many government, law enforcement and private sector employers want to use polygraphs is that they think the test will frighten away liars and cheats who are seeking jobs, or it will frighten confessions out of those accused of wrongdoing. In other words, the users of the machine don't really believe it can detect lies, but they know that the people they administer it to *think* the machine can catch them in a lie. So, the result is the same as if the test really worked: they don't hire the liar/cheat and they catch the dishonest employee.

graphology

9 Nov 2000

Robert:

Hilarious reading about how handwriting does not reflect a person's personality. The arguments presented conveniently do not explain what handwriting represents.

It's either something or nothing.

It can't be nothing by empirical conclusion. Therefore, it must be something.

I would suppose you would think an EKG pattern was of the same ilk. Just a meaningless pattern.

Some facts to ponder plus a challenge:

The brain is scientifically based because it is an organized system of repeatable functions called logic. That's what directs people's choices. Otherwise, it would be chaos. If you say, bunk, tell me how we could have developed the sciences without a scientifically based brain. The fact is that everything in the universe is scientifically based, which of course includes your brain.....and handwriting.

Handwriting is brainwriting. You should know that. Personality is in the brain. You should know that. Therefore, handwriting must reveal personality. And, as it turns out, many other things also like the physical condition of the writer.....to a degree. It's not an x-ray.

You know: $A=B$, $A=C$, $B=C$.

The "studies" you or whoever cite were performed by inexperienced graphologists many of whom I am quite aware. Your evaluators, not being experienced or knowledgeable, had no idea how poorly schooled these analysts had to have been. Did any of the analysts have 20 years experience?

As an engineer for 36 years, I can tell you I would not have been analyzing handwriting for 23 years if there was nothing to it. But, again, you or whoever, fail to explain the significance of handwriting. And, that is very telling. It takes

a long time to understand and gain insight into handwriting.

I was skeptical of handwriting when accidentally exposed to it. Wrote it off. Then investigated and realized it's tremendous significance. I can honestly tell you that what you write about handwriting analysis is totally incorrect. Beyerstein and the rest of those "skeptics" are simply not designing their protocols correctly because they have no REAL knowledge of handwriting or handwriting analysis.

Doesn't it strike you that this subject has been around for centuries, studied by scientists and some of the most intellectually acute people and continues? Universities throughout the world teach it and bestow degrees. These people are not stupid. They apparently can see what you cannot or inadequately test for.

The principles of Questioned Documents (forgeries) you seem to accept. But the principles are exactly the same for graphology. And, whether you realize it or not, when a document examiner is analyzing a document he/she is actually "looking" at their personality similarities or non-similarities. I do both.

Since I am short on time, this is the challenge. If you believe handwriting means nothing, then you should not be reluctant to submit a three page sampling of your handwriting on UNLINED paper for analysis. Signed and a copy of your drivers license with your signature on it for verification that the handwriting is yours.

Send to:

*Handwriting Analysis Inc 15740 Rockford Road Suite 220
Plymouth, MN 55446*

I predict you will not submit it out of fear of facing the fact that handwriting analysis is real and is, in fact, the most powerful psychological tool we have.

**Jack Cammarata
President Handwriting Analysis Inc.**

reply: Jack, you seem to be a logical person, though your reasoning seems a bit peculiar in places. For example, you say that personality is in the brain and therefore handwriting must reveal personality. This begs the question, Jack. Where is the evidence that the brain determines one's personality and one's handwriting in such a way that when one writes, one's handwriting reveals one's personality? We all know that in a trivial sense this is true: one's writing has content and that content can reveal aspects of one's personality. Given the fact that I have over 400 articles and several hundred comments posted on the Internet, my personality is an open book, so to speak.

Or do you propose to uncover aspects of my personality that even I am not aware of? If so, how do we determine whether you are right?

I have another proposal. I would like to submit to you a handwriting sample of a subject you know nothing about. I will have the subject copy three pages of a foreign language text, so you will not be given any hints about the subject from the content of the writing sample. You give me a list of personality traits that you think you can identify by graphology. I will work with the subject to determine which traits accurately describe him or her and send that list to three persons chosen by me. These persons will agree not to reveal to you the personality traits listed. You will then submit your analysis to these persons and they will determine how accurate you are. I will publish on my Skeptic's Dictionary site your analysis and their analyses of your analysis.

What do you say, Jack?

Here is Jack's reply:

Robert.

Your proposal sounds like what is going on in Florida. I know nothing of who you will "use" in this study and, frankly, knowing your subconscious "goal", I do not trust this proposal.

You may already "know" something of handwriting and have the writer try to deliberately confuse as would be the case in questioned documents.

Besides, you want a person who knows nothing about the foreign language being used to copy a text????? Obviously, you know nothing about handwriting or handwriting analysis. That is completely absurd. The writer cannot possibly execute spontaneously the unknown language of another system and would confound the display to support your ends. I presume this is the way you have determined that handwriting analysis does not work. Shame, Bob. A scientific investigator using such a ruse.

Further, you have not indicated, as is normal for skeptics, what handwriting means. There is constant avoidance of the issue.

It is interesting you say "trivial" sense. If you mean content, you are totally wrong as that is what is not used to analyze. You say you have 400 articles. There are thousands of other proponent articles which I am sure you are aware of but decline to articulate. Your proposal is simply a neutralizing tactic to avoid having your (angular) handwriting analyzed.

Is there anyone in your "group" that knows anything about handwriting or

handwriting analysis?

You say personality and handwriting (located in the brain) combined do not indicate a demonstration of major personality characteristics. Well then, I guess the "personality brain" and the "handwriting brain" are two different brains when we know the tremendous interaction of all the major brain areas are required to execute such an intricate display. Empirical evidence from thousands of observers over time plus the irrefutable concurrence by persons in your general peer group indicate an overwhelming recognition of handwriting properties.

What you are saying is "If it walks like a duck and looks like a duck, by golly, it isn't a duck." Saying so doesn't make it so.

If people followed your line of logic we would still be debating whether Einstein's notable equation was real. They proved it by accurate demonstration which is what handwriting analysis has accomplished time after time. Once a person seriously studies handwriting and its ramifications, it becomes quite clear the personality inferences that are possible. You must be aware of the elusiveness of the brain's nature making it one of the most difficult systems to analyze and that is where, I think, you have a problem.

Apparently you may not have reviewed the Handwriting Research Corporation's Manual of validity studies. You should do so.

I will not be part of this preposterous proposal. There is no control by HAI. And, how do we know your "analysis" is correct?

So, Robert, tell us what handwriting means.

Jack Cammarata

reply: Jack, you are very nimble and very quick, but I don't think your wick is burning very brightly. I avoided being too critical of your first letter, for fear I would scare you off, but I see I was worried about nothing. I don't think you are going to understand what I have to say, but here goes anyway.

You make a lot of assumptions and seem unaware that you are doing so. For example, you assume that handwriting must be representational. Handwriting (as a verb) is using one's hand to write. Handwriting (as a noun) is the product such writing. It need not be representational. One can write out a list, some notes, a letter, a book. You assume that since the brain is involved in writing and is a major determinant in one's personality that when one writes one's personality is represented. You do not understand that you need to prove that. Let me explain. Your personality is affected by the people you are around. You do not act the same in front

of your spouse, your children, your siblings, your buddies, strangers at a bar, a foreign dignitary, the pope, colleagues, etc. You will seem to be a different person to each of these people. Why? Because you act differently around them. You assume that none of these personalities is your "real" personality, but that underneath all these behaviors is some other layer of reality, the real person. Non-sense. You are the sum of all these different, even contradictory, behaviors. The foul-mouthed fellow who tells racist and sexist jokes to drunks at a party is the same fellow who appears to be a feminist saint to his daughter. There is no real you hiding in the subconscious mind, as you seem to think. The point is that everyone's personality is full of inconsistencies and contradictions. You don't have a different handwriting for your mother, your buddies, your colleagues, your priest, your colleagues, your president, etc. Yet, you have a different personality for each of them. Your handwriting could not possibly reflect your personality, or more accurately, your personalities.

You seem to have no sense of purpose when you fill up space saying things like 'it must be something or nothing and it's not nothing so it's something.' Do people pay you to respond with such gibberish?

Your comparison of handwriting to an EKG illustrates your ignorance. An EKG is a machine's response to physiological processes. Handwriting is a person's activity or product of that activity. Handwriting is not a response to a stimulus, as the EKG is. It is a conscious act (most of the time). The patterns of an EKG are meaningful because there is an agreed upon standard which allows us to read them. You graphologists have no agreed upon standard by which to read the patterns of handwriting and what's more you have no way of deciding whether any of you are uttering anything but sophisms and gobbledygook. You may refer to your *Handwriting Research Corporation's Manual of validity studies*, but the rest of the sane world laughs at your manual as nothing but arbitrary ramblings.

Your claim that *The brain is scientifically based because it is an organized system of repeatable functions called logic* is gibberish. You may think it is meaningful, but it is just patter. You say *That's what directs people's choices. Otherwise, it would be chaos.* You are right about predicting what I would say: bunk! But I say bunk because it doesn't make any sense. You say *tell me how we could have developed the sciences without a scientifically based brain. The fact is that everything in the universe is scientifically based, which of course includes your brain.....and handwriting.* We call this circular reasoning where I come from. The brain is scientifically based because everything is scientifically based. Therefore, handwriting is scientifically based. I think too many years of engineering has short circuited a few of your wires, Jack.

However, you did say at least one correct and meaningful thing in your first letter: handwriting can sometimes reveal something about a person's physical condition. A physician will sometimes ask a patient on certain

medications to give them a writing sample in order to see if they can detect any shakiness in the writing. And it doesn't take an expert to detect a flamboyant egomaniac or a self-conscious person with very low self-esteem from the size of their signature. But your ramblings about scientific brains are about as scientific as a wolf howling at the moon.

You say *As an engineer for 36 years, I can tell you I would not have been analyzing handwriting for 23 years if there was nothing to it.* **But putting in time is no guarantee you haven't wasted all of it, Jack. Many deluded people devote their lives to their fantasies and delusions. Their sincerity and devotion for dozens of years does not transform their endeavors into anything significant.**

You continue: *But, again, you or whoever, fail to explain the significance of handwriting. And, that is very telling. It takes a long time to understand and gain insight into handwriting.* **But Jack, you are the one who must show that handwriting is significant. And spending a long time trying to understand it doesn't guarantee anything.**

You say: *I can honestly tell you that what you write about handwriting analysis is totally incorrect. Beyerstein and the rest of those "skeptics" are simply not designing their protocols correctly because they have no REAL knowledge of handwriting or handwriting analysis.* **Jack, it is your job to provide evidence and arguments, not simply assert that you are the only one who truly understands and who truly knows how to design a proper test and who truly has real knowledge of things great and small. You are begging the question, Jack--assuming what you should be proving.**

Finally, Jack, you seem to live in some sort of fantasy world. Maybe because you own the company your employees pretend the emperor is wearing clothes, but some of your claims seem out of touch with the planet I live on. For example, you say *Doesn't it strike you that this subject has been around for centuries, studied by scientists and some of the most intellectually acute people and continues? Universities throughout the world teach it and bestow degrees. These people are not stupid. They apparently can see what you cannot or inadequately test for.*

What universities throughout the world offer a course in graphology? Where on our home planet can you get a degree in graphology? Lots of professions have been around for centuries, Jack. That doesn't make them any more respectable.

True handwriting analysts--[forensic or questioned document examiners](#)--are not analyzing personalities, Jack. They don't make ridiculous claims about being able to detect pedophiles by their handwriting. They don't claim to be able to tell when a person is lying by his handwriting. They don't claim to be able to tell whether a person is honest by his handwriting,

or whether he or she would make a good employee or is likely to abuse drugs. Only [pseudoscientists](#) make such claims, Jack. And graphology is a pseudoscience.....oh, I forgot.....it can't be since it comes from the brain and the brain is scientific, so pseudoscience must be scientific. Right, Jack?

Jack replies:

14 Nov 2000

Bob, your wick is out. Your pseudologic is laughable. Apparently you do not have an engineering background where reality lives. What is your background, Bob?

Anyway, there are many world universities conferring degrees which I will research and give you a list in a later email.

Regarding physical condition of a person. I have been doing that for 20 years. Nothing new, Bob. Where do you suppose the "information" came from to reveal these "conditions". Hmmm?

Also, questioned documents. In analyzing for forgeries and the known, one is using the exact same principles used in a profiling. The QDE is actually assessing the personality against the forgery. You know nothing about this business and have no insights. Saying we all have multiple personalities would make a psychologist cringe. What nonsense. These are behaviors which could only be "used" by a functioning brain not one with brain damage. That does not change the basic personality. Your mother's handwriting has not changed and neither has her personalityunless she changes behavior which is not the same as personality. Da!

You made no mention of the angularity word. Do you know what that means? How many possible strokes are there?

Also, you made some mistakes in your email which leads me to believe you are/were quite emotional writing it.

Finally, until next time, conveniently you dodge the question as to what handwriting means and throw the responsibility to proponents. That we have done by demonstration. Let's see your handwriting.

Will communicate later. Need to do business

Jack Cammarata

reply: Really? Are you a scatologist as well?

More from Jack:

As I promised, here is the list from an international association. As you probably know much of the original research work was performed in Europe. We (you) are still quite a bit behind as demonstrated by your last email.

reply: [note: Jack sent me something copied from an unidentified source, labeled 4. Training. It lists a large number of individuals or outfits that offer some kind of instruction in graphology. There aren't many universities listed, but there are some. For example, there is [Lumsa](#) in Rome and the university at [Urbino](#). There is the Naftali Institute in Israel, where graphology is very big. Also listed are Universidad de Valencia, Spain; Università di Porto, Lisbon, Portugal; Emerson University College in Buenos Aires, Argentina, and a few others in Italy. So, Jack is right about graphology being taught at some universities. But I couldn't find any listed from the U.S.A. Maybe there is hope for our country after all!]

Now, the rest of the story.

Einstein's formula was proven by demonstration. And, so has handwriting analysis. You can demand as many "tests" as you want but unless one can demonstrate by practical use the efficacy of any system saying something does not work is stupid, plain and simple.

In design engineering, all the concepts, drawings and talk mean nothing unless you can prove a concept works by demonstration. And, that has been done. Period.

Your ridiculous analogy about behaviors in front of various people is froth with error. You say the handwriting does not change but the behavior does. True. But that does not mean that the person has multiple personalities. My word, MULTIPLE PERSONALITIES???? Psychologists would go crazy with that statement. If that were true, there should be different handwritings for each behavior (or was it personalities, Bob?). There aren't. You're goofy, Bob. Fuzzy logic.

It just means that the intellect being as acute as it is will simply adjust BEHAVIOR, not basic personality characteristics like dominance, ego strength, analytical ability and the like. There is no way you are going to change that barring brain damage or severe onset of psychological circumstances such as clinical depression and then that is only for a short time. I know. I was there.

You sure were very emotional writing the last email having repeated phrases without checking and proofing plus other errors. I suspect that is the same emotionality you use in your logic also. Pretty bad, Bob.

You are so bent into this skeptic thing (which does have relevance but not in

handwriting analysis), that you can't see the forest for the trees. Having spent years debunking handwriting analysis there is no way you could admit error. I understand that. Too bad but that's what happens when the logic system is flawed.

(You say you are the sum of all your behaviors.)

Yet, there are behaviors which people haven't even used yet. So, does that mean they have "invisible" behaviors/personalities (which is it, Bob?)? No. It simply means they have not used their intelligence (creativity to you, Bob) yet to create whatever "other" behavior is engendered. In the case of a Down Syndrome person, there is one "behavior" and therefore only one possible handwriting. No multiples, Bob. How do you explain that??

An EKG IS a response to a stimulus which is ongoing. Your misunderstanding that graphologists have no standards is rationale on your part to defend your erroneous stance on you know what. If you could only "see" how ignorant you "look" to those who understand handwriting you would crawl into a hole and disappear. Pure ignorance or simple purposeful denial. The latter is suspected.

Funny how law enforcement uses handwriting analysis, Bob. The CIA, Interpol, Scotland Yard, Bob.. But we do not need any endorsements from them to prove it works.

Scientifically based. Repeat. Everything in the universe is scientifically based. Circular reasoning. Yes sir, you sure are going in circles. And, the brain is scientifically based because of what I indicated. Which makes handwriting scientifically based also. I think your apparent attempt to be the originator or at the forefront of this "skeptic" group has gone to your head. You have no more intelligence than those who acted in the movie "Planet of the Apes" and tried to deny the astronauts ability to speak and think better than they.

If you were living during Galileo's time you would have been the one insisting "the earth is flat" because he could not prove it EXCEPT by demonstration.

You are wrong about signatures which shows your ignorance again, Bob. Also, you are indirectly admitting that handwriting (signatures) reveals something about the personality. (You missed that boo boo, Bob. That's a contradiction in your argument.)

I submit that it is YOU who have wasted your time and effort trying to debunk handwriting analysis. I have verification everyday whereas you only have your "buddies" with hollow minds and no creative investigative qualities. You people are totally ignorant of relevance and have no real knowledge of handwriting or handwriting analysis. (And, avoid doing so for fear that you may discover you are incorrect.) Right, Bob?

Again, Bob, demonstration is the BEST proof and always has been of any system. We have proven it over and over through practical application and studies (which you people will not ever accept as it would prove you wrong.) You HIDE behind the reasoning that it is US who must prove it. Well, we have. Period. Now it's up to you to disprove it. Good luck as you will never accomplish it.

The principles of questioned documents are the same as for handwriting analysis. The principles are evaluated for different purposes but essentially the personality of the writer is being examined and compared to the "forger". Your ignorance is so blatant, Bob. Your trying to hide behind innuendoes and word attacks that bounce off like water off a duck.s back. Why? Because I have the everyday proof and you have no proof.

If there ever was a pseudo group it's yours Bob. At least for handwriting analysis. You can do tarot cards and horoscope denials but you are totally ignorant and, frankly, stupid about handwriting analysis.

You must a young fellow just learning and trying to make a name for himself. Do you actually go out and preach that handwriting analysis is bunk?? Shame, Bob.

I think you need to obtain a new disguise. One that would fit the movie. You are simply not a good investigator.

Maybe you should sign up at one of the Universities. There are others besides those listed from what I am told.

Contact Handwriting Research Corporation and ask them for their Manual so you can study what they have done. If you are not familiar with their million dollar computer system you should be. Think they would spent that much for handwriting analysis if it didn't work, Bob? Let's see what you have to say about that, Bob. But you won't do it because you are afraid of the truth. Right, Bob?

Don't bother replying as I do not want to corrupt my computer logic. I just wanted to see your "thinking?" on this subject. Myopic.

Happy denials, Bob.

15 Nov 2000

First a big thank you for the valuable resource that you have provided. I am a regular visitor to the site and have now perfected my thoughtful, intelligent look as I pass off much of your insight as my own in discussions with the more 'spiritual' people down the pub.

Just a quick note in response to to the ramblings of Jack Cammarta (readers comments - Graphology). I believe that he betrays his simplicity of approach when he states that -

"The brain is scientifically based because it is an organized system of repeatable functions called logic."

and

"Handwriting is brainwriting".

I hope that I am not being unfair to Jack in selecting these two remarks, but it is my understanding that Jack is attempting to portray a direct mechanistic correlation between brain function and output in the form of handwriting. He seems to believe that an engineering background qualifies him to quantify this correlation. Of course handwriting is a result of brain function, but to assume an understanding of cause and effect is quite a leap.

As it happens, the brain does not appear to operate as a deterministic machine let alone a logical machine. This observation stems from the mathematician Gödel's proof that any formal system is either inconsistent or incomplete. This limitation applies to all existing and theoretical computers (including theoretical quantum computers), but the method of proof has shown that this limitation does not apply to human reasoning. (I know this sounds a bit metaphysical, for a full explanation I would recommend 'Shadows of the Mind' by Roger Penrose and 'Gödel, Escher, Bach' by Douglas Hofstadter'). This is just one example of how the complexity of the brain currently precludes description. An engineering background does not enable anyone to map personality to different styles of handwriting, engineering methodologies are simply not applicable and to pretend otherwise is dishonest. Graphology can never be an exact discipline. Personalities are complex, subjective, unquantifiable and unique, giving a 1-1 mapping between personality and handwriting.

I am puzzled as to why anyone would pay for the services of a graphologist. Broad grouping into personality traits can provide little information about a person, especially when Jack points out that a person's behaviour is separate from their personality. If so much can be claimed for the analysis of static writing, surely more information can be gleaned from real time interaction with a person. I would be more concerned with the behaviour of a prospective employee than with the hidden personality trait that only Jack and his ilk could 'discover'.

Troy Craze

15 Nov 2000

Just a short note to tell you how much I enjoy your site. I found Randi's site a couple of months ago and after reading through that, I found a link to your site. What a great site this is. Not only are your entries interesting and informative, but the readers comments section is just a scream.

Your exchanges with Jack, the graphology expert, had me laughing out loud. Especially his reply to your challenge. It was exactly how Randi describes challengers who are interested in the \$1,000,000 challenge react when they hear the ground rules. How these people insist on others believing claims they themselves refuse to even try to prove is amazing.

I don't know how you have the patience to respond to so many e-mails, but I for one, am very glad that you do.

Lori

12 Mar 1999

Your report on graphology has a good side and a bad side. The good side is that you were very clear with the message that graphology is unproven and highly redolent of bunkum. The bad side is that you turned this into a liberal political screed [?]. Without getting too deep into discussions of civil rights and how that meaning has been distorted over the past few decades, let me point out that an employer has rights too. When we make a political statement that "there ought to be a civil right not to be discriminated against on the basis of handwriting", we're saying that we wish to take away the right of the employer to hire according to criteria that he or she deems proper- and he or she is the one laying out the money and taking the risk. Many (I am one) have the view that people ought to have the civil right to spend their money as they please, and that that civil right does not terminate when one is buying the time or expertise of another. Should I not have the right to exercise whatever arbitrary criteria I wish when I hire a doctor? Or an attorney?

Whether or not using graphology in hiring decisions is a stupid idea is certainly appropriate fodder for a skeptic to discuss. What the legal implications ought to be is a political discussion, not amenable to skepticism. A more cogent explanation of the view of employer's rights and the harm that comes from legal interference with those rights can be found in Thomas Sowell's "Knowledge and Decisions".

Stuart Yaniger

reply: I'm afraid you have me here, Stuart. I have no idea whether legal implications and political discussions are amenable to skepticism. I do know, however, that the Constitution of the United States guarantees certain rights, regardless of what you or I think about them. If you are a

hospital administrator, you are forbidden by law to have a hiring policy that illegally discriminates against applicant doctors. If by "hire a doctor" you mean going to one, then of course you are free to make your selection by discriminating in any way you choose. You could even ask a potential doctor to give you a writing sample to take to a graphologist (or perhaps you are a graphologist and could do the analysis on the spot).

21 Jul 1998

Just wanted to let you know how much I appreciate your remarks about graphology. I've found that a distressing number of people assume there must be "something to it" without thinking about it at all. Let me share an anecdote regarding my brush with graphology:

When I graduated from college in 1986 with a degree in chemistry, I went to an employment agency, which got me an interview with a local paint company I'll call FooBar Paint. The unusual thing was, they asked me to submit a handwritten essay about my hobbies before they would schedule the interview. I complied with this request, and a few days later was told they would not interview me since they had determined some unspecified character flaw through graphological analysis.

I was livid, of course -- Both because they had dismissed me without even talking to me, and they had been dishonest in failing to tell me what they planned to do with my essay. I wanted to do something, but I was an impoverished and unemployed 21-year-old. Unable to hire an attorney, I contacted the Seattle Human Rights department, who was very interested in my story. SHR filed suit against FooBar, and subpoenaed all of their documents regarding hiring policy. We were suing for a job and back pay. It was quite a heady feeling.

Two days later, I got a phone call from the president, Mr. FooBar himself, asking me to come in for a personal interview. Mr. FooBar wanted to "set things straight" as it was costing him time and money to comply with SHR's document subpoena. When I got to his office, he explained that graphology was their preferred method of determining who fits into the "FooBar mosaic," as he put it. I explained that this was a totally unsubstantiated method, and asked him why he didn't employ witch doctors or use a magic 8-ball to determine a candidate's fitness. He had no answer for that, instead offering me a job if I'd drop the suit and take another handwriting test. Apparently, one of the qualities FooBar likes in its "mosaic" is unmitigated gall.

I ended up dropping the suit after FooBar twisted in the wind for a while. I had to get on with my life, and the best I could get was a job working for those clowns. Still, I felt I had made my point.

I sincerely hope that people refuse to take workplace pseudoscience lying down. If this type of "new age" employer is given free reign to evaluate people on graphology, I Ching, auras, or whatever, they'll just keep doing it.

There wasn't that much at stake in my case, but there could have been much more if my circumstances were different. People need to educate themselves about pseudosciences like graphology, so they might have the conviction to stand up against it as well as the facts to win the fight.

Mike Cummings

26 May 1998

*First of all, let me just say that your **Skeptic's Dictionary** is one of the most comprehensive skeptical resources on the web, and I enjoy it a lot. I wish to contribute to your dictionary with my 17-year-old brother's brush with graphology, which I hereby give you permission to post on your web page, if you see fit.*

My brother is a skeptic, and subscribes to the Skeptical Inquirer. When his aunt and her two daughters told him that they found this AMAZING graphology "expert" and that he simply MUST have his handwriting analyzed by her, he decided to turn it into an experiment. He repeatedly asked his aunt whether the content of the writing matters to graphology, or whether it is (supposedly) "content free" and takes into account only the handwriting itself. Of course, he was reassured that he can write anything he wants, since all that matters is the shape of the handwriting. So he agreed to give my aunt a writing sample of his handwriting, to be analyzed by the graphologist.

As his writing sample, he deliberately wrote a page or two that looked as paranoid and schizophrenic as he could possibly make them--that he is hearing voices, that he wants to kill his parents, that he was abducted by aliens... you name it, it was there. Needless to say, two days after he told me about this little experiment, my aunt called my mother in total hysteria. As was to be expected, the graphologist "discovered" that my brother was showing signs of "paranoia," that he needs "immediate psychological treatment," and that this better be done SOON, before he kills someone.

The poor graphologist was so distressed that contrary to her regular custom she called my aunt late in the evening with the "horrible news" and they even discussed whether to call the police, but luckily for my brother they decided to call the little paranoid's mother first. This little experiment almost lead to a serious family feud, since my aunt could not comprehend WHY my mother was laughing so hard on the other side of the phone after hearing such terrible things about her son.

Why am I not surprised?

Avital Pilpel.

16 Mar 1998

*Just a short note on the content of your **Skeptic's Dictionary**. While I agree with most of your arguments, like most of these perpetrators, your arguments are lacking proof and scientific method. For example, in graphology, you state that there is no sound theoretical basis for it. That is an unsupported finite statement.*

reply: "an unsupported finite statement"? I've been accused of many things, but this is the first time I've been accused of making an unsupported finite statement. In fact, this is the first time I've ever been accused of making a *finite* statement, period. It sounds dangerous. What is it?

I think most of my readers would understand that what I mean is that those who practice graphology and defend it as a way of determining personality do not provide an adequate theory which would explain how people all over the world who are taught many different writing techniques and who bring to their writing their own personal quirks and eccentricities, would universally follow the same personality laws which allegedly govern handwriting. In fact, graphologists seem particularly uninterested in providing a theoretical basis for their work. If, however, you know of a theory which is generally accepted by graphologists which explains how it works, I would love to hear it so I could evaluate it.

Where is the proof that no theories exist? What did your research show and what were your research methods? (These are rhetorical questions.)

reply: I suppose it is bad form to respond to a rhetorical question; however, your calling it one doesn't make it so. Your question is a real question. It may even be a real *finite* question, for all I know. My research method is called *reading*. I have read the works of graphologists and while they are quick to establish all kinds of rules governing particulars of writing and personality traits, they do not seem concerned with providing a theory for graphology. But perhaps I am ignorant of the universally accepted theory among graphologists. Again, if you know of it, please send it to me so I can evaluate it.

Further, in the lie detector snippet, you explain how a polygraph works. What happened to galvanic response?

reply: As a person of your superior vocabulary must know, 'galvanic' refers to the production of electric current. For the record, though, the polygraph does measure, via electric current, various physiological

processes.

Your document is no better than the claims of the scammers. You offer very little definitive proof against these topics. Your arguments are loaded with authoritative speech whereby a reader is supposed to believe you because of who you are, not what is presented. Why not trying to back up your claims with scientific method. For the lie detector, conduct a study where known questions are purposely answered incorrect. With graphology, a similar study.

reply: thank you for the suggestions. However, I think you are making them to the wrong person. The one who should be conducting studies are the graphologists and polygraphers. You would think it would be a fairly simple thing to demonstrate the validity of both graphology and the polygraph. Why hasn't it been done, then?

I'd like to believe your arguments as you have covered the spectrum of bunk operations, but without sufficient proof, I am left feeling the same way as having read Tony Robbins' web page: Scummy. This is not intended to be a critique of you personally. Just your scientific methodology. Thanks for the entertainment though.

Chris Gebhardt

reply: you're welcome. I'm glad you at least have a sense of humor and get a kick out of feeling scummy. This is unusual, but any port in a storm, I guess. This is another first for me: being compared to Tony Robbins. Though I did have a student once proclaim that the first session of one of my introductory philosophy classes was "just like est!"

27 Oct 1997

Excellent job! It's about time somebody debunked some of the nonsense people are walking around with in their heads.

I have a great deal to say about your take on G-d and belief, but that's for another time.

Re: your entry on graphology. The practice of having a graphologist check your handwriting prior to employment is extremely common here in Israel. Many employers will accept only handwritten resumes.

David (Jerusalem)

08 Apr 1997

On handwriting analysis, I was always fascinated by the idea of knowing

people's characters by the loops and swirls of the writing. However, as a left-hander, I wonder how accurate that can be. I had to teach myself to write since the teacher had no experience teaching lefties. Now, I wonder how anybody's character could be discerned by handwriting. The question of disability is also not addressed. Senator Dole comes to mind. How could anyone tell his character from his writing? He has only the use of one arm, and had to be retrained to use his left hand. The only thing about his character that can be found from his writing is his war injury.

Virginia Carper

05 Jul 1996

Reviewing a student's paper (I teach human resources at a university in Atlantic Canada) on graphology, I was searching the web for information and ran across your site. The student's paper was light on skepticism and high on reported success (100's of companies in France, the US, Israel-- and "I'm sure lots in Canada but they don't report it") and I was gearing up for a full frontal rebuttal about validity.

Your item on graphology is a good basis for our discussion--focused, challenging. Thanks. I'll dip into more of your items.

Mass Media Bunk

6

July 17, 1998. "Revealing Penmanship - Handwriting analyst offers insight into potential employees," by Dave McNary, *Los Angeles Daily News* (distributed by the Associated Press and reprinted without comment in [The Davis Enterprise](#)). The article is a promotional piece for Sheila Lowe, "one of the nation's most prominent experts in the field" of [graphology](#). Lowe hires herself out to companies hoping for some magical way to determine if an applicant is likely to be reliable, honest, motivated, able to get along with fellow workers or customers, etc. Lowe eliminates the costly and timely process of the thorough interview, the detailed background check, etc. Instead, she does a "personality analysis" of the applicant based on a handwriting sample. Her fee ranges from \$95 to \$250. She also peddles a computer program to do the analysis. It sells for \$395 and is being bought especially by human resource specialists and psychotherapists, according to McNary.

There is no evidence that graphology is a valid instrument for evaluating character traits, yet employers in Europe and Israel, for example, commonly use graphologists. The practice is apparently growing in the U.S. According to McNary, there are hundreds of graphologists in Southern California and there are two organizations that certify graphologists (the International Graphoanalysis Society in Chicago and the American Handwriting Analysis Foundation in San Jose, California).

Lowe admits that what she does is "fairly intuitive" rather than scientific, which makes it difficult to challenge her results. If she says that your handwriting reveals that you are basically dishonest, what recourse do you have? Should you bring in another graphologist who will testify that your handwriting actually reveals that you are scrupulously honest, so honest that you might appear to be dishonest?

No evidence is given that Lowe has passed a fair and impartial test of her ability to accurately assess character by analyzing handwriting. Graphologists routinely fail such tests. Her accuracy is vouched for by the [testimonial](#) of Cheryl Nichols, who hired Lowe to evaluate employees of her accounting firm. Says Nichols: "Sheila's been spot-on about her evaluations." Such [subjective validation](#) is typical of the kind of support given in lieu of scientific validation for [pseudosciences](#) such as graphology. Lowe may be as good as most personnel managers in picking good employees, but graphology may have nothing to do with it. For example, she is quoted as saying: "I'm always looking for red flags, such as someone being extremely sarcastic." Evaluating the *content* of a writing sample is not evaluating the *handwriting*. In fact, "in properly controlled, blind studies, where the handwriting samples contain no content that could provide non-graphological information upon which to base a prediction (e.g., a piece copied from a magazine), graphologists do no better than chance at predicting...personality traits...." [[The Use of Graphology as](#)

[a Tool for Employee Hiring and Evaluation \]](#)

July 20, 1998. "Science Finds God," *Newsweek*, by [Sharon Begley](#). This article is primarily a soapbox for the [argument from design](#), still attractive to certain romantic minds, including eminent scientists such as [Allan Sandage](#). Three skeptics are mentioned. Carl Sagan is quoted as saying that since the laws of physics alone could explain the universe there is "nothing for a Creator to do." Nobel physicist Steven Weinberg's 1977 pronouncement is passed on: the more the universe has become comprehensible through cosmology, the more it seems pointless. And [Michael Shermer](#) is quoted as saying "Science is a method, not a body of knowledge" and science "can have nothing to say either way about whether there is a God." (For the record, I would say that science is both a body of knowledge and a set of logical and empirical methods, and science has a lot to say about God, though science is irrelevant to proving the existence of any non-empirical entity.) Most of the article has a reasonable, though hardly newsworthy, point: science and religion need not be opposed to one another. In short, one can believe in God without being a fundamentalist with a two-digit I.Q. and one does not have to be an atheist to be a scientist.

The author will probably be attacked by the Christian right, who think anyone who believes in the big bang and evolution is on the same path to hell as the sodomites. But she gives comfort to the New Age "energy" folks who think that quantum mechanics means anything goes. That light can appear as both wave and particle is taken to support the possibility of the Incarnation (the divine and human nature joined in one person, Jesus Christ). One physicist turned theologian (Robert John Russell) thinks that quantum mechanics "allows us to think of special divine action," i.e., miracles without violation of the laws of physics. Sure, but can quantum mechanics explain turning wine into water? Frankly, I like the old-time religion with its magical miracles. It has a kind of charm that seems lacking in the overintellectualization of religion.

June 29, 1998. "Inside Business," a weekly section in the *Sacramento Bee*, contains an article touting the wonders of magnetic therapy. Under the guise of an investigative report on an invention and its business potential, the article by Dale Kasler describes how a bankrupt building contractor, Rick Jones, is trying to cash in on the current boom in alternative therapies. He has formed a company called Optimum Health Technologies, Inc. to market his "Magnassager."

Magnets are especially hot right now among those seeking alternative ways to relieve pain or improve their golf game. Terry Gage, the company's marketing director says "we're here at the right time. People are looking for this type of product. Traditional medicine isn't answering everything." So true. There's probably never a wrong time to enter the alternative health care market, but right now seems especially attractive. *Newsweek* recently featured an article by Ellyn E. Spragins proclaiming "the days when alternative medicine meant quackery are waning" ("How to find the right doctor for alternative care," June 29, 1998). (See below for more about this gem.) Spragins cites an "alternative-care credentialing company" called Landmark Healthcare to support her claim that "nearly half of the adults in this country dabbled with unconventional therapies last year." That's a lot of dabbling, although how scientific this statistic is may be as spurious as many of the claims of the practitioners

Landmark Healthcare credentials.

Nevertheless, even if somewhat less than half of us are dabbling in alternative therapies, the market is huge and easy to exploit with the right gimmick. Right now magnets are the gimmick of choice of chiropractors and other "pain specialists." Mr. Jones hopes to cash in with his hand-held vibrator with magnets retailing for \$489. Jones claims his invention "isn't just another massage device." He says it uses an electromagnetic field to help circulate blood while it's massaging the muscles. *Bee* staff writer Kasler comments: "That's particularly noteworthy at a time when the use of magnets is gaining acceptance among [chiropractors](#), [massage therapists](#) and [health professionals](#)." Kasler's lack of skepticism is understandable since his job is to write positive pieces promoting local business ventures. Many readers, however, may not realize that journalists are often little more than vehicles of free publicity for potential advertisers and clever entrepreneurs who know how to manage the media. The final paragraph of the article should be a tip-off to the careful reader. It is a quote from Optimum Health's vice president of finance: "We need more capital to really ramp up. We're one of those hungry companies looking for people to invest."

Kasler notes that Jones already has spent about \$300,000 of a single investor's money. Where was the money spent? Not on [double-blind controlled tests](#), which not only would be easy to devise and implement, but would quickly determine whether there is any significant difference between the Magnassager and other vibrating massage devices. No, the money was spent on "product development and marketing." How do we know the magnets have anything to do with the alleged benefits from the Magnassager? We are told that "a massage therapist" told Ms. Gage that the Magnassager "is easing the pain from carpal tunnel syndrome." We are told that Jones spent \$20,000 to have the product evaluated by a physiologist "to make sure that it was not gimmicky." That's it. What did the unnamed physiologist do? We are not told. But we are assured by Jones that "the product is real" and that the company plans to have more extensive evaluations done later this year.

The greatest laugher of the article is a quote from Ms. Gage, the marketing director of Optimum: "The real challenge of our marketing is to educate the public."

(note: The most recent issue of the *Skeptical Inquirer* (July/August 1998) features an article by James D. Livingston, author of [Driving Force: The Natural Magic of Magnets](#). The article is called "Magnetic Therapy: Plausible Attraction?" Livingston teaches at M.I.T. in the Department of Materials Science and Engineering. Outside of testimonials to the effectiveness of magnets to have permanent therapeutic effects, most of which can be attributed to "placebo effects and other effects accompanying their use," there is almost no scientific evidence supporting magnetic therapy. One highly publicized exception is a study done at Baylor College of Medicine that claims magnets reduce pain in post-polio patients.)

June 29, 1998. *Newsweek* promotes alternative therapies in a section called "Focus on Your Health," with headings of "Patient Power" and "Frontier Medicine." The article, "How to find the right doctor for alternative care" by Ellyn E. Spragins, is especially deceptive since it mixes promotion of alternative therapies with advice to be skeptical because of the lack of research and regulation. Spragins describes nontraditional medicine as "still a mix of the good, the bad and the outlandish" and

gives advice on how to select the good. Her advice? Contact the [Office of Alternative Medicine](#), [Andrew Weil's](#) site, and the [Rosenthal Center for Complementary and Alternative Medicine](#) at Columbia University. Ms. Spragin does advise letting your traditional physician know of any alternative treatments you are using and recommends checking credentials and learning how many hours of training it takes to get credentialed. She quotes James Dillard, medical director for alternative medicine at Oxford Health Plans: "If anyone tells you they can cure a wide variety of ailments at a very high success rate, you should turn around and get the hell out of there." On the other hand, Spragin refers to "the new respectability" of alternative medicine and makes claims like "A supernaturopath is likely to know the best massage therapists or acupuncturists in the area." A "supernaturopath"?

No mention is made of skeptical resources such as

- [Quack Watch](#) - Dr. Stephen Barrett
- [The Expanded Dictionary of Metaphysical Healthcare: Alternative Medicine, Paranormal Healing, and Related Methods](#) by Jack Raso, M.S., R.D.
- [National Council Against Health Fraud](#)
- [Health Frontiers Center for Quackery Control, Inc.](#)
- [The American Council on Science and Health](#)
- [HealthCare Reality Check](#)
- [The Scientific Review of Alternative Medicine](#)
- [A Trip to Stonesville: Some Notes on Andrew Weil \(1998\)](#) Arnold S. Relman, M.D.

Needless to say Spragins makes no mention of the [alternative health](#) or any other entry in [The Skeptic's Dictionary](#).

May 14, 1998. *NBC* announces plans to do a [miniseries on Noah's Ark](#).

April 15, 1998. *The New York Times* reports, as did many other news agencies, that "Reactions to Prescribed Drugs Kill Thousands Annually, Study Finds." The study appeared in *Journal of the American Medical Association*. The news will no doubt bring smiles to the "alternative" medicine folks. To say the least, the news is misleading. Dr. Bruce Pomeranz, professor of neuroscience at the University of Toronto, claims that more than 100,000 people a year die in American hospitals from adverse reactions to medication. His conclusion is not an inference from a large prospective study, but rather is based on a meta-study, a method which lumps together a number of studies whose samples are small and whose significance varies. The authors of the study emphasized that its conclusions should be viewed with caution, but caution is a word the mass media no longer seems to recognize. The study did not examine a representative cross section of the hospital patient population. Most of those in the study came from large teaching hospitals with the sickest patients, where there is more drug use and where higher rates of drug reactions would be expected than in smaller community hospitals, according to Dr. David Bates, an associate professor of medicine at Harvard University who wrote an editorial in the journal about the study. The average person who is taking prescription drugs should not be frightened by the results of this study.

April 4, 1998. On March 21, 1998, the *Sacramento Bee* displayed a picture of an egg standing on end and reported "Credit for this balancing act goes to ... the equinox." Bob Callahan of Chico, CA, knew better. Today, Callahan's letter to the editor was published: "This is a persistent cultural myth and a great example of bogus science. Nothing occurs during the equinox that allows an egg to stand on end any better than on any other day. Think about it: The myth is essentially claiming that there is some change in the nature of gravitational force on that day. The bogus reasoning is that an equalizing of day and night causes an equalizing of gravitational forces. That no one at The Bee was able to reason this through and that many readers accept this blatant falsehood is ample evidence that we need to improve the quality of science instruction."

further reading: [Tom Burns \(Columbus Dispatch\): Spring egg myth tough to crack Sunday, March 12, 2000](#)

reader comments

Fri, 24 Mar 2000

You state that an egg will not stand on its end at the equinox because "The myth is essentially claiming that there is some change in the nature of gravitational force on that day. The bogus reasoning is that an equalizing of day and night causes an equalizing of gravitational forces." This statement is untrue. The reasoning is that the sun is closest to the equator at the equinoxes than any other time of the year. The increased gravitational pull of the sun is only felt at the equator of the earth at this time, which allows for an egg to stand on end. The only thing wrong with the statement is that the source did not specify it must be at the equator for this to occur.

Erin Suvada

reply: Sorry, Erin, but if your thinking were correct nothing would ever tip over on the equator at the equinox, which just is not the case. Eggs can be balanced anywhere, anytime, if you have the right egg and know how to balance things. The equinox, the sun, and the equator have nothing to do with it.

For all the astronomical details as to why the balance of eggs is independent of the equinox, see [Phil Plait's page on bad astronomy](#).

March 5, 1998. *Charles Grodin, CNBC.* Charles Grodin demonstrated how open-minded and gullible he is when he fawned over the man who talks to heaven, James Van Praagh, whom [Michael Shermer](#) calls "the master of [cold-reading](#) in the psychic world." Van Praagh has been making the talk show circuit plugging his new book about how all the dead people in the world are contacting him to talk to their living loved ones. His performance on Grodin's show was less than heavenly, but it was enough to satisfy Grodin and at least one couple in the audience who seemed to believe that their dead daughter was talking to Van Praagh. The only skepticism shown by Grodin was in wondering whether Van Praagh wasn't really reading the minds of the audience and the callers, rather than getting his messages from "the

other side". The only person on the show who stated her doubts about the authenticity of Van Praagh's contact was a woman who lost a daughter to murder by terrorist Timothy McVeigh in the Oklahoma City bombing. She stated that nothing Van Praagh said rang true about her daughter except some generalities. The woman claimed that her daughter communicates to her directly.

We can understand and sympathize with the woman who believes her dead daughter talks to her, but we have no affection for Mr. Van Praagh. He plays a kind of twenty-questions game with his audience. He goes fishing, rapidly casting his baited questions one after the other until he gets a bite. Then he reels the fish in. Sometimes he falters, but most of the fish don't get away. He just rebaits and goes after the fish again until he rehooks.

When he can't get a good bite, he reminds us that sometimes the message is in fragments, sometimes he doesn't understand it, sometimes he misinterprets it, etc. If he's wrong, don't blame him since he never claimed to be perfect.

But on this evening with Grodin, Van Praagh seemed particularly inept to me. Perhaps this is because I was looking for his tricks and already consider him a charlatan. Nevertheless, I think I can still appreciate good art, and he was not very artful. He used his usual bait: questions about girls and grandmothers, changes in the home, unresolved feelings, etc. He claimed to get messages about the usual stuff: angels, cancer, the heart, newspapers. What saves him much of the time are ambiguous questions he asks that end with "am I right?" and the client saying "yes", though we have no idea what the "yes" is in response to.

More pathetic that Van Praagh, however, was Grodin, who practically asked for his guest's blessing as he thanked him for his wonderful work. I don't know what was wonderful about it. Although it did leave me wondering why there wasn't more skepticism shown. If this is the kind of response Van Praagh gets on a bad night, no wonder he is so popular.

March 6, 1998. *Sacramento Bee*, ["She has firm roots -- past and present," by Anita Creamer](#). Columnist Creamer today wrote a panegyric to local radio personality Gina Miles who previously worked as a U.S. Air Force mechanic, a security guard and nurse's aide, but currently moonlights as a hypnotherapist specializing in [past life regression](#). These days Miles teaches a course in the local alternative education industry along with others such as Sylvia Browne who teaches a course on Healing Your Body, Mind & Soul. In one two-hour session Ms. Browne will teach anyone "how to directly access the genetic code within each cell, manipulate that code and reprogram the body to a state of normalcy." In an equally short period of time, Ms. Miles will take anyone into their past lives. She claims that she was a twig in a past life, a claim which endeared her to Ms. Creamer since most people claim to have been "Cleopatra or some other fabulous historical figure". In addition to this exciting bit of information about Ms. Miles past, we learn that she believes her husband was her father in a previous life and that she was molested twice in this lifetime.

Creamer defines hypnotherapy as "therapy that uses [hypnosis](#) to unlock the [subconscious](#)" but she shows no interest in exploring the validity of this non-sense.

Mass Media Bunk

2

September 28, 1996. The Discovery Channel, 9pm PDT, "Psychic Powers". This was an hour-long pseudo-documentary on precognition, dreams, remote viewing, auras, Kirlian photography, etc., with only one skeptical comment thrown in for balance at the end of the program when the viewer is given the three logical options: (a) believe in the paranormal as many intelligent people do (b) be open-minded and wait for the evidence to come in before making up your mind, or (c) be a stupid skeptic and miss out on all the fun. The show was little more than a rehash of claims that have been made before with a few more anecdotes to add to the "proof" of psychic powers. The only attempt at explaining how these powers might work was by reference to the "possibility of a fifth dimension." Right. Which brings to mind a new motto: *The Discovery Channel - Enter the Fifth Dimension!*

September 26, 1996. ABC, 9pm PDT, *Chariots of the Gods? Again?* Yes, it is that phoenix Eric von Daniken back on the trail of extraterrestrials teaching engineering to ancient Egyptians, Mayans and anyone else who would listen. This time, however, he is given legitimacy by the narrator, that great intellectual historian and archaeologist, Richard Karne, who has a day job as co-host on "Tool Time." There was little new in this round with theories of aliens in ancient times. Well, you might consider his claim that the aliens may have taught the Egyptians how to use electricity, a "startling new discovery." This claim was based on a find of a jar which "can't be explained as a regular jar" except by skeptics such as those who write for the *Skeptical Inquirer*. The claim of Egyptian knowledge of electricity was also supported by a tomb painting showing what looked like a flower and a snake which von Daniken says may be symbols for electricity. Maybe. A Freudian might view these symbols differently. Indeed, a car mechanic might see them as proof that the Egyptians "may possibly" have had dipsticks and the hieroglyph was a warning to change your oil every 7,000 cubits. It's bad enough to speculate on such flimsy "evidence" that the Egyptians has electrical power, but von Daniken has to go one step further and claim that if the ancients had such knowledge they must have been given it by smarter beings from another planet. Right. And no doubt we will see a new book from this master charlatan claiming that the pyramids were ancient power stations and colossal statues were actually poles holding up a vast network of power lines. It will probably be a bestseller.

September 2, 1996. The Discovery Channel, 9pm PDT, "Sci Tek - The Real X-Files". For those who think the Discovery Channel shows nothing but NOVA quality programs, this advertisement for [Puthoff and Targ's Stanford Research Institute, and their star psychic, Ingo Swann](#), should change their minds. In this program with nearly no skeptical questions asked and very few skeptical comments made, Jim Schnabel narrates and interviews an array of military officers who were involved in

the U.S. Army's twenty year waste of taxpayer dollars on "[remote viewing](#)" and other psychic garbage. At the end of the program, the credits noted that Mr. Schnabel has a book on remote viewing forthcoming. He has learned one trick from the "psychics": there's gold in them thar hills!

The program even featured Mr. Schnabel undergoing a remote viewing training session with Swann in which Mr. Schnabel correctly identifies the pictorial contents of a folder. With such irrefutable visible evidence, how could anyone doubt the truth about remote viewing? Easy. As someone once said, anyone who doesn't think the camera lies, doesn't think.

I suppose we could say that doubts were raised about remote viewing by the fact that the show noted that one Army officer had been booted out for his too intense interest in psychic phenomena, another's wife left him when he became obsessed with extraterrestrials, another was married to a psychiatrist who believes she was abducted by aliens, another was shown as a cross-dresser in Native American garb, another thought his target was a building when it was actually a train station but he convinced himself and others that what he had seen was a Masonic temple near the train station; plus, these assorted psychics were depicted as being skeptical of the channelers and fortune tellers that the Army brought into the program. But the overall impression and obvious intention of the program was to suggest in very strong terms that there it is very likely that there is something of value in remote viewing, which suggest further that places such as the Stanford Research Institute and people such as Ingo Swann are legitimate and deserving of public support. Let them do their "research" but let them fund it on their own. Furthermore, let the Discovery Channel show programs on remote viewing, but don't let those programs be thinly veiled advertisements for new books. Let the Puthoffs, Targs and Swanns have their say, but let their critics speak also. Encourage the general public to be critical and skeptical, rather than gullible, when dealing with paranormal claims. Maybe the people at the Discovery Channel think that encouraging critical and skeptical thinking about the paranormal wouldn't be good for business. We'll probably never know.

August 19, 1996. *The Davis Enterprise*, reprinted an UPI story on with the headline

New Bay Area code spiritually significant

The article stated that "residents of the San Francisco Bay area's Peninsula can put away any sadness over losing their 415 area code." The San Francisco Examiner consulted a psychic about the change to area code 650. Mary Kara, psychic and bookshop owner, claims the new number has "spiritual significance." Indeed. Here is her psychic reasoning: "take the number five and six and that totals 11." This has spiritual significance because Ms. Kara owns 11 bookshops. "That's a power number. That's a destiny number," says Ms. Kara, ambiguously, referring either to 650 or 11. Continuing on in the same psychic tone, she says that "It's a new-millennium number. It's like realizing a potential. It's very strong in a spiritual way."

I'm sure this is all very amusing to some readers, but I have to admit that I started to realize that maybe she was on to something when she noted that 415 is not so great. "It's different than 11, in that it's more self-absorbed." Stories like this should be deep

sixed. That's a power number, better than 11 any day.

July 1, 1996. *The Sacramento Bee* (front page), "Retired UCD professor looks for what none see," by Gary Delsohn, recalls [Charles Tart's](#) quest for ESP and God through psychology, drugs and Buddhism. Tart retired from the nearby University of California at Davis over a year ago, so the article wasn't a farewell to the area's best known parapsychologist. He still hasn't found what he's looking for, so it wasn't to tout his discovery of the true religion or God in the loins of an LSD capsule. It was just a story about Tart and his "long and controversial career." Why now? Perhaps because of Hillary Clinton's meetings with [Jean Houston](#). Perhaps because of all the alien movies which are now playing or about to be playing at your local theater. Maybe the *Bee* just wants to get on the bandwagon of the weird and wonderful.

Though the article had no apparent purpose other than to pander to the public's taste for the paranormal, there were a few interesting claims made. For example, Willis Harmon, a former Stanford professor of engineering systems was quoted as saying that "Charlie" insists on asking taboo questions such as "What happens after death?" and "What is the meaning of psychic phenomena?" *Taboo* questions?

Tart himself is quoted as saying that atheists think "'Hey, what do I give a damn about the ecology? I'll be long dead and gone before it all goes bad.' So we live only for the material, only for ourselves." He claims that atheists don't care about the environment and that all those who deny the existence of spirits (metaphysical materialists) are egoistic, selfish materialists (who only care about money, power, material possessions). He has as much evidence for these claims as he does for ESP, namely, none. One might as well claim that theists don't give a damn about the environment because the environment is part of the physical world and the only world that really matters is the spiritual one. The spirit will still be here when the world is long gone, so why give a damn about the world?

Tart was a tenured professor at UC Davis, where he taught for some twenty years. His first big book was *On Being Stoned* (1971). He is called "a rigorous scientist" by Delsohn, though his *rigor* has been characterized as *mortis* by the likes of Martin Gardner and James Randi. I'm sure he was very popular with the students who think that LSD is a holy sacrament and gateway to the divine. Tart is praised in the article by a colleague of mine who teaches his psychology students to read his aura. My colleague is quoted as saying that it is our *narcissism* which leads us to dismiss the paranormal and the spiritual. Yes, and I suppose we are *in denial* about it, too.

I wonder if Tart or Houston or others who have found phenomenological similarities, if not identities, between drug, paranormal and mystical experiences have ever considered that this indicates a strong probability that such experiences are *materially* based and probably are best explained by bio- and neurochemistry?

Anyway, I think I wait in vain if I wait for the *Bee* to run a gratuitous article about the wonders and beauties of science, or a day in the life of a skeptic.

For more on Tart, see the *Skeptic's Dictionary* entries on [ESP](#) and [hypnosis](#).

April 29, 1996. ABC Television: *Put to the Test II* - Billed as a test of psychic

powers, this show demonstrated little more than the lengths to which ABC will go to pander to gullible and credulous prime time television viewers. James Randi of the [Amazing Randi Hotline](#) sent out a missive blasting ABC. He wrote:

ABC-TV will not give a moment's thought as to whether viewers will be emotionally or informationally damaged by their show. They will only look at the ratings. Their ethics and honor are elements that are ignored in favor of giving trusting viewers a distorted, biased, and fictionalized view of what those viewers have every right to know is farcical. ABC-TV just doesn't care. The bottom line is the dollar-value of what they show the public, how many cars, how much toothpaste, and what acreage of water-beds leave the stores the next morning. Ethics be damned. We can always stick on a few more public-service messages to keep the FCC pacified and get the license.

He wasn't exaggerating. There was little effort to put anyone or anything to the test, except the patience of skeptics and honest people everywhere. The evening's entertainment consisted of three stooges acting as "objective" evaluators of (a) a "psychic detective," (b) a hypnotherapist who "cured" a woman of her fear of flying in an 18 minute session, and (c) a Russian human x-ray machine who claims to be able to diagnose diseased or injured organs and bones by "seeing" through clothes, tissue, etc., right into and through the body. He can even do this when the body he is "seeing" through is not present.

I will admit that the three stooges hosting the program did, at times, pretend to know what a real test of a psychic would involve, as when one of the stooges said to the other: "she wasn't fishing, was she?" We had all witnessed the [fishing](#) but the other stooge assured us that there had been no fishing. How did they fail to do any real testing? Let me count the ways.

The first to be tested was a woman who describes herself as a [psychic detective](#). She claims that she can solve a crime, committed anywhere in the world, without leaving her armchair. All she needs is the name of the victim and some article from the victim. The so-called test of her powers consisted of trying to see if she should retro-solve three crimes that had already been solved. The cop who had solved the crimes appeared on the show as a kind of fourth stooge. Instead of letting the "psychic" ramble on and on, the detective kept notes in front of her and let her know when she was on or not on by telling her "I can confirm that" or "I can't confirm that." Obviously, the tape was edited, not that it much matters, for there is little likelihood the ABC stooges had any interest in tallying up her hits and misses. They seemed satisfied to place a photo of the criminal next to a drawing based on the "psychic's" description and declare that they looked very similar when in fact they didn't look alike at all to me. They might have had a non-stooge, who had no idea what they were doing, compare the photo with several drawings, including the one based on psychic visions. Or they might have had several non-stooges examine several photos, one of which would be that of the criminal, and compare them to the psychic drawing. But to let the eager ABC stooge and the cop stooge be the judges of whether there was any resemblance defies all logical testing methods. One of the stooges finished off this segment of the 3-ring circus with a hopeful note that such psychics would soon be testifying in courtrooms as their methods become more

accepted!

I'll let somebody else comment on the sideshow involving the hypnotherapist "curing" the phobia of the Chino housewife. All I'll say is that I wanted to push her out of the airplane when she started acting like Rocky. I'm sure others were filled with joy at the heartwarming story of a woman who overcame her fears (on such short notice, too!). According to her hypnotherapist, she had been "reprogrammed." I'm sure she was. Plus, she was on national television. (The best part of this segment of the show was the claim by one of the stooges that the viewing audience would not witness the 18 minute session to prevent us from becoming hypnotized!)

The best test of all, though, was the test of the Russian x-ray machine. This guy claims to be an M.D., though no mention was made of where he was trained or got his degree. We were told, however, that he is not allowed to practice medicine in the U.S. Even so, this is such a great country that he is allowed to do psychic diagnoses of anyone he pleases. (I wonder if there are warnings when he does performances: this is for entertainment purposes only!) Anyway, this guy is so good that you do not need to be present to get diagnosed. The test consisted of having some middle-aged guy examined by a chiropractor (!), and two other guys who claimed to be doctors of some sort. Their evaluations were to be used as a standard against which to measure the "diagnosis" of the psychic who was doing his work in another room without ever having met the "patient." All he knew was the patient's name and age. Again, the psychic's evaluations were edited, but no interest was displayed in establishing some way to measure what counted as a hit and what was a miss, much less any concern at doing the actual counting. One of the stooges did tell us that a 70% accuracy rate is considered good and that in another session the psychic was only right 20% of the time, but I don't think even the stooge knew what that meant. Even more fascinating to me is the fact that none of the stooges showed the slightest interest in explaining how someone might solve a crime by feeling a victim's hearing aid or how a man might see through clothes and skin into organs and bones. I think they showed no interest because they realize such claims are ridiculous on their face and explaining them would involve preposterous assumptions. This was a show, pure and simple, not a test of psychic powers. It was bunk, pure bunk.

James Randi made the following comments on the show, for those of you who do not subscribe to his hotline:

Let me suggest that a proper test of the "police psychic" would have been to have her work one of the three cases, chosen at random, without anyone present who knew the answers to prompt her -- which was so obviously the case here -- and then ask an independent panel to decide which of the three cases she was talking about. That would require that clues in her "reading" identifying anything, be removed. It wasn't too tough to figure out that "Josephine" with a hearing aid was an elderly woman, nor that there was some sort of a slant to the roof of the house. It was appalling what the TV hosts oohed and aahed at. And that drawing looked more like Queen Victoria than the convicted killer. Amazing.

As for the Russian "doctor," I'd suggest that 5 men of roughly

similar age be placed in that room, that one of them be chosen at random as the subject, and the first name and age be given to the "psychic," and not identified to anyone but him. After his "reading," all the items would be presented to all the subjects and the "experts" who sat in, to decide which of the five persons was the chosen subject....

April 23, 1996. In an article titled "Who's write to be president? Handwriting gives clues," the *Kansas City Star* reports on the claims of two "handwriting analysts" regarding the suitability of Clinton, Dole and Buchanan to be president. Without a hint of skepticism, the article cites the completely unsubstantiated claims of Royce Smith, a former Marine who has analyzed handwriting for 37 years, and Paula Leighton, a handwriting analyst from Leawood, Kansas. I guess elections bring out the silliness in journalists. I thought the *San Francisco Chronicle* had hit rock bottom when it published an article based on the "face reading" of mayoral candidates by Rose Rosetree, self-proclaimed phrenologist, in October of 1995 (see the *Skeptical Inquirer*, March/April 1996, p. 5). But the *Kansas City Star* demonstrates that journalistic promotion of pseudoscience is not limited to the West Coast.

Smith is quoted as saying: "Your handwriting is a printout of your mind." The author of the article gives no indication that this claim is ludicrous, if it is even meaningful. Leighton is said to have earned her master graphological certification from the Institute of Graphological Science in Dallas. No indication is given by the author that such a diploma is meaningless.

According to the article, companies hire Smith to screen prospective employees and lawyers use him to study potential jurors and witnesses. The only thing he does which seems a legitimate use of his handwriting analysis skills is that he testifies in forgery cases. Yet, no mention is made of the potential danger of hiring pseudoscientific graphologists to evaluate people's character or inclinations based on the way they write.

What I found most interesting about the article was that for all their temerity in making outlandish, unprovable claims regarding slants, loops, sizes of letters and how they correlate with this trait or that, neither Smith nor Leighton would say who would make the best president. Leighton said she doesn't like politics. Smith said that Buchanan would be the best president because he's "a people person. He's sharp, he's got intuition. And he's independent." However, Smith also said that "on research and problem-solving, Dole or Clinton would probably be No. 1."

Why was this article written? Why was it published? Who knows, but without a hint of skepticism regarding the ancient pseudoscience of [graphology](#), this one qualifies as pure bunk.

(Thanks to Navin Kabra for bringing this article to my attention.)

April 7, 1996. *The Sacramento Bee* headline reads

Unabomber profile strikingly close to Kaczynski

The FBI profile, undoubtedly the work of master psychologists with help from a few CIA psychics, predicted that the Unabomber would be in his late 30's or early 40's. Kaczynski is 53. The profile was of a white male, 5'10"--6' tall, 165 pounds, with reddish-blond hair, a thin mustache and a ruddy complexion. Kaczynski is a white male, but he is 5'8", weighs 143, has brown hair, is bearded and has pale skin. The profile predicted he would be a blue collar worker with a high school degree. Kaczynski hasn't had a job in the last 25 years and has a Ph.D. in mathematics from the University of Michigan in addition to being a graduate of Harvard University. The FBI profile predicted the Unabomber would be a meticulously organized person, reclusive and having problems dealing with women. Kaczynski is a recluse who apparently did not deal with women at all, but he is slovenly and unkempt.

Outside of being right about him being a white male and a loner, this profile does not strike me as being "strikingly close to Kaczynski." The FBI profile seems about as accurate as a horoscope or a Myers-Briggs reading. Actually, the FBI profile is about as accurate as the [drawing of the Unabomber](#) which the FBI has been circulating for years. Side by side only an FBI agent could possibly see a resemblance between Kaczynski and the FBI drawing.

[The Skeptic's Refuge](#)

[More bunk](#)

reader comments:

Gurdjieff

09 May 2000

You know I can't sleep, I can't stop my brain You know it's three weeks, I'm going insane. You know I'd give you everything I've got for a little peace of mind. -Beatles, I'm so tired

Sleep, rest of nature, O sleep, most gentle of the divinities, peace of the soul, thou at whose presence care disappears, who soothest hearts wearied with daily employments, and makest them strong again for labour! -Ovid

Have you ever stood and stared it? marvelled at its beauty? - Agent Smith

I should first commend you for your effort towards skepticism. I should second be skeptical of your own reading of Gurdjieff, if I would be congruent with your own efforts. So, I will point out in a logical way the flaws in your argument against Gurdjieff, which you may post on your website if you wish to be humiliated to the general public you pretend to serve with your diatribes.

I will begin with the major points. You state:

Their current disciples presumably ignore Gurdjieff's more ridiculous claims, such as the following comment on the moon: "All evil deeds, all crimes, all self-sacrificing actions, all heroic exploits, as well as all the actions of ordinary life, are controlled by the moon."

*Indeed, it is you who are ignorant. Gurdjieff refers not to the physical moon orbiting Earth but rather to a cosmological concept that the moon represents in his metaphysical system. The moon to Gurdjieff is a complex symbol, perhaps too complex for people like you who take things literally and discredit any meaning that they don't understand. The moon represents the denser aspects of life, those extremes and norms which Aristotle referred to in *The Nicomachean Ethics*. Aristotle said that the virtuous man lives "in the mean," the reasonable median between extremes, or "the middle place" that Gurdjieff refers to. Jesus also refers to this as "the narrow place." The moon represents the extremes that are the norm in our world, since the incontinent man (I.E. yourself) obeys and trusts his senses and impulses, seeking not after rationality and truth but rather after what feels right and what is comfortable to his basic self. This man won't*

challenge his own deeply held notions and easily dismisses anything that isn't part of his moon, his own lunacy.

You continue to misrepresent his teachings throughout your essay:

What makes a guru such as Gurdjieff attractive as a spiritual conquistador is rather his more cynical beliefs, such as the notion that most human beings who are awake act as if they are asleep. Gurdjieff also observed that most people are dead on the inside. I think he meant by these claims that most people are trusting, gullible, easily led, very suggestible, not very reflective or suspicious of their fellow.

Gurdjieff is not a cynic, but an optimist. His analysis of the state of most people is not a condemnation but rather a suggestion of hope. No one in their right mind would say that most people are fulfilling their potential or are as open minded, conscientious, moral, or good as they could possibly be. Gurdjieff only invites people to take a look at their own lives and gives them a system by which to do so, just as many philosophical teachers in history have done. Indeed, elements of Gurdjieff's teachings bear uncanny resemblance to the teachings of Plato, Aristotle, Seneca, Lucretius, as well as many others with hundreds of years of philosophical instruction. Gurdjieff claims to have synthesized as much of this wisdom as he could into his system, and any in depth analysis of it yields credibility to this notion.

Your analysis that Gurdjieff thought most people to be trusting, gullible, easily led, etc. is a product of your imagination, of fitting Gurdjieff into your pre-formed idea of what a sophistic, swindling wise guy must be like. What he means by "mankind is asleep," is that most people have a system of built-up habits of thought and behavior from which it is nearly impossible for them to deviate, primarily because they identify with this system, taking it to be themselves. They do not consider that they learned these habits in the same way that they learned language: by imitation. They acquired this system, called the personality, mostly when they actually were impressionable, gullible, and easily trusting: when they were children. Gurdjieff offers a system by which a person may non-identify with this system in order to study it and determine which parts of it are not virtuous or beneficial to the individual as a whole, for any study quickly reveals many conflicts of interest within the self which impair the overall willpower.

Gurdjieff definitely recognizes that such ideas as this are dangerous and could be used for the wrong reasons, which is why he emphasizes that the work he teaches must be done according to a certain attitude of lightness and love, I.E. exactly the opposite of an intention to take advantage of someone and use them for something as petty as monetary gain. Perhaps you should add McDonald's to your dictionary, with such a theme in mind.

Your misinterpretation continues:

Gurdjieff obviously had a powerful personality, but his disdain for the mundane and for natural science must have added to his attractiveness.

Gurdjieff did not hold the mundane nor the natural sciences in contempt. Actually he emphasized the importance of melding the science of the West with the wisdom of the East. If anything, he held in disdain the secular view that religion and science are inherently separate and sought to find a way to reconcile the conflict between two otherwise valid ways of interpreting reality.

In any case, I have a biology final to continue studying for. I leave you with the following passages from the New Testament, which you probably also have a propensity for being skeptical towards.

Gurdjieff is not the first spiritual teacher to have been misunderstood:

"And they did not understand the saying which he spoke to them." - Luke 2:50

But they did not understand this saying, and it was concealed from them, that they should not perceive it; and they were afraid to ask him about this saying. - Luke 9:45

But they understood none of these things; this saying was hid from them, and they did not grasp what was said. - Luke 18:34

This figure Jesus used with them, but they did not understand what he was saying to them. ... Many of them said, "He has a demon, and he is mad; why listen to him?" - John 10:6, 10:20

He supposed that his brethren understood that God was giving them deliverance by his hand, but they did not understand. - Acts 7:25

... they did not recognize him nor understand the utterances of the prophets which are read every Sabbath, fulfilled these by condemning him. - Acts 13:27

Jonathan S. Gilbert

reply: Blessed are the meek, for they shall get what they deserve.

11 Aug 2000

I was reading the "Skeptic's Dictionary" and found some inaccuracies with your treatment of Gurdjieff and Ouspensky. One of the first ones is that, even though Gurdjieff brought the enneagram to the west, it had nothing to do with personality types. Unfortunately, people have gotten hold of the enneagram, not knowing what it means, and have used it for some purpose not related to the original one. The enneagram, which is a very ancient symbol, is a "book". It is

very much like a physicist who understands the symbol $E=MC^2$, and all its implications. It describes the psychology and cosmology of man as a specific "process" under various laws. These laws by the way are compatible with "all" scientific laws up until now. It is just the terminology that differs. Another point is that Gurdjieff never proclaimed himself a prophet or dismissed science as nonsense. What he did say was that the current "gaps" in science are made, not by the principles or methods of science, but by the way science approaches the "gaps" in question. His mission, was to try and merge "the wisdom of the east with the science of the west". He thought both were equally important. Also, you treat Ouspensky as a cult icon. This is not true. Ouspensky himself, when he was teaching in America, realized that people were starting to treat him like a cult symbol. This disturbed him, and during the last few years of his life he made all attempts, even telling people he never taught any system, to relinquish the image created. Both Ouspensky and Gurdjieff thought that the scientific method was the correct one to investigate the phenomena of the world. The reason why they wanted to merge western science with eastern wisdom was for one simple fact: science then, and now, regards "experience" of our psychology as less "real" than the "world out there", but as Kant pointed out, because of our perceptual apparatus, we "create" a picture of the world before us, and from this, if we are to fully analyse man's situation, one must start of our investigations here, how man experiences the world, not from a sensuous point of view (though important) but from a psychological view of himself. This is because even scientists have a perceptual apparatus, and will interpret "facts" as they perceive. Just look at quantum theory, it is one of the most accurate theories of the world we have, yet one of the most unexplainable!

P.S. I would like to know your thoughts on Thomas Kuhn's criticisms of science. As a sceptic, wouldn't it be prudent to be sceptical about science also?

(name withheld by request)

reply: Kuhn was not a critic of science. He was an historian of science. [Science](#) requires a healthy skepticism. I don't know what you are talking about when you say quantum theory is accurate but unexplainable.

7 Apr 2000

Thanks for the essay on Gurdjieff. It's more in line with his teachings than the efforts of some who insist they are students. There are probably more anecdotes along the lines of the "inter-planetary traveler and the prostitute" than we both could fathom. A lot of them make me laugh. It's funny in that it highlights the extent to which people are, and can be, gullible. It's a necessary component of spiritual teaching to expose the student's weaknesses (in Gurdjieffian terminology, "false personality") and the effort can manifest itself in otherwise abnormal ways.

While I read your article, I observed a crowd of inner disagreeers who felt and spoke like the ones in the two responses you published. As I was reading their responses, several things came to light. One respondent claimed that you had no right to write what you did. The only right I have ever heard mentioned in the Gurdjieff teachings came through the work of Dr. Maurice Nicoll. It is "the right to not be negative." The respondent was not exercising his right at that particular moment. Instead, his claim asserted that somehow, the system of Gurdjieff's teachings, which the respondent apparently appreciates, somehow did not account for you or your efforts. On the contrary, the core of the teachings, quite distinct from the bizarre anecdotes that are routinely filtered through subjective lenses, are

"Believe nothing; verify everything" "A healthy skepticism is a must."

The second respondent spoke of your having been gravely offensive. What a load to carry around, isn't it? These teachings are quietly taught, person-to-person, in settings so private that you wouldn't be able to tell your local grocery from a Fourth Way school. Gurdjieff's teachings are not affected by the surface debates, and the personality injuries and sufferings that the exoteric world seems to thrive upon. The teachings are evaluated by their effectiveness to actually transform a person's being from an unrefined patty of emotional, mental, and physical by-products to something completely different and much finer.

This is the nature of alchemy. This is how we find our deck of playing cards, and our periodic table. The outer world does take and use the things of the inner world for its own purposes and those living solely in the outer world are, fortunately, protected from this ignorance. Only something of a shocking nature can change this, but then we open up the floor to the debaters again when we talk this way. What kind of a shock do you mean? Is it ethical? How do I know that a person isn't going to do something abusive and justify it as a shock?

So many voices, all clamoring for the microphone. What to do...what to do? Well, anyways, that was a very nice essay indeed. And I thank you dearly for it, on behalf of myself and the other respondents who apparently forgot Gurdjieff's teachings at that moment.

Eric

reply: I'm sure they are as thankful to you as I am.

13 Sep 1999

First of all, I understand that all sides of any argument deserve to be heard, especially within this ever growing information glut known as the Internet. I do appreciate the balance you bring to the forum with your unobjective scepticism...it rightly balances out the equally unobjective "mooniness" of the

"true believers", and god knows there are enough of those out there. I suggest, as I'm sure many others have before me, that you do away with the name "Skeptic", as you obviously rely on it's somewhat vernacular popular meaning, and in no way reflect true skepticism (in my opinion, of course!).

reply: Actually, you're the first to make this suggestion. I was going to call it the *Doubter's Dictionary*, but the alliteration was too urbane. Anyway, you obviously have not taken the time to read either the entry on [skepticism](#) or the [Introduction](#) to *The Skeptic's Dictionary*. Otherwise you would have a better idea of how I use the work 'skeptic'.

In regards to the "entry" Gurdjieff in this dictionary of yours, I see nothing but undocumented slander.

reply: I usually document my slanders, but got lazy with the Great One. In any case, slander would require me to defame the Great One with lies and thereby do damage to his reputation. Referring to Gurdjieff as a con man is a compliment to his abilities to gull many otherwise quite intelligent and respectable people to respect his intellect and talent so much that they would gladly work for him for nothing in return for the privilege of being allowed to stay in the Great One's presence.

To call someone a "Con Man" without any sort of proof (and if you think the anecdote you post is any sort of evidence, I suggest you try to look a little bit harder at what is really being demonstrated within it), or evidence to back up such a claim is just simple minded.

reply: You might have done better to demonstrate that the proof I give is inadequate, false, misleading, etc., instead of simply asserting that I have no proof.

I am sorry to hurl little expletives like this, it is not out of a lack of respect. I just feel that you've done a disservice to something that is, I believe, a mite bit more complex and interesting than you've deemed worthy to investigate for yourself. There ARE serious thinkers out there, who propose ideas that might, on the surface, seem to contradict your world view....but not everyone speaks as "directly" as you think you do, I'm sure. Some, including the initiators of some of the worlds great religions, think that some truth is best occluded, just a little, below the surface of the words. While you might not deem this "Scientific", I don't think you have the right to hold such an argument against anything you dislike, as your own judgement and opinion of the things you write about in this forum is certainly very far from scientific or objective, or anything of the sort.

reply: I have no right to write about things I disagree with? Now there's an interesting concept. Is this an inference you draw from one of the Master's aphorisms: write not but that thee be right, or left, as the case may be, depending upon the position of the moon.

All that said, I know you've put the caveat of "My Opinion" on many of this site's disclaimers. The next disclaimer you need to make, in my small opinion, is to remove the word sceptic. It is, perhaps, unethically misleading.

With respect,

Jordon Flato

reply: I don't recall making any disclaimers and I don't plan to start with the one you suggest.

What is obscure, obscures what is.

31 Aug 1999

I came upon your entry on the topic of G.I. Gurdjieff in your "Skeptics Dictionary". I suspect your criticism of his words and his colorful history is a surface reaction to information designed to cloak the real content behind his teachings. I suggest you find a genuine guide who is knowledgeable about his methods, who can perhaps bring you to an understanding of your own mental aberrations which cause you to sit in judgment of things, of which you have no knowledge or experience of. Your remarks are offensive and inflict an injustice to those who have studied his intent with serious consideration. Some of these individuals who are familiar with these teachings, occupy very high positions in our society. You are obviously not ready for that crowd yet. I hope you find your way out of the illusions of your own mind and stop spreading these idiot statements that you may consider your own personal knowledge.

Any psychologist can enlighten you that madness has a logic all its own. Your self image of being a Pontifical Skeptic is healthy only to a point, beyond that point, without direct experience your knowledge is self delusion. You must seek understanding as a primary goal. Understanding has durability, knowledge is provisional at best.

Raymond J. Burke

reply: Thank you for the inspiring comments. I see things much more clearly now.

According to a Gallup poll, belief in witches has increased from 14% to 26% over the past decade.

[DR Congo's unhappy child 'witches'](#)

[Horrific murders in name of ritual medicine](#)

[HUNDREDS of women, men and children are charged every year with practising witchcraft in the Central African Republic, a crime punishable by execution or imprisonment.](#)

witches

"Thou shalt not suffer a witch to live," it says in the book of Exodus (xxii, 18). This and other Biblical admonitions and commands both defined the witch and prescribed his or her fate. A witch is someone in consort with [Satan](#), the Evil One, the spirit who rebelled against God but whom God suffered to live.

Today, the typical witch is generally portrayed as an old hag in a black robe, wearing a pointed black cap and flying on a broomstick across a full moon. Children dress up as witches on Halloween, much to the dismay of certain pious Christians. Hollywood, on the other hand, conjures up images of sexy women with paranormal powers such as [psychokinesis](#), [mind-control](#), hexing, and an array of other occult talents.

"Pagan" or anti-Christian New Age religions are sometimes identified with witches because some pious Christians think they practice witchcraft or because those in the religions claim to practice "[magick](#)" or "the craft." Some of the members of these groups refer to themselves as "witches" and their groups as "covens." (Some male witches are very touchy about being called "[warlocks](#)".) Some of the members of these groups call themselves "[sorcerers](#)" and worship Satan, i.e., they believe in Satan and perform rituals which they think will get them a share of Satan's supernatural occult powers. (Some are very touchy about being called "sorcerers".) Most New Age witches [do not worship Satan](#), however, and are very touchy about the subject. They would rather be associated either with the [occult](#) and magick or with attempts to re-establish a kind of nature religion which their members associate with ancient, pagan religions, such as the ancient Greek or the Celtic, especially [Druidism](#). The neo-pagans also refer to both men and women witches as witches. One of the largest and most widespread of these nature religions is [Wicca](#).

The witches of Christian mythology were known for their having sex with Satan and using their magical powers to do evil of all sorts. The culmination of the mythology of witchcraft came about from the 15th to the 18th centuries in the depiction of the witches' Sabbath. The Sabbath was a ritual mockery of the Mass. Witches were depicted as flying up chimneys at night on broomsticks or goats, heading for the Sabbath where the Devil (in the form of a feathered toad, a crow or raven, a black cat, or a he-goat) would perform a blasphemous version of the Mass. There would also be obscene dancing, a banquet and the brewing of potions in a huge cauldron. The banquet might

include some tasty children, carrion, and other delicacies. The witches' brew was apparently to be used to hurt or kill people or to mutilate cattle (de Givry, 83). Those initiated into the satanic mysteries were all given some sort of physical mark, such as a claw mark under the left eye. The Devil was depicted as a goat or satyr or some sort of mythical beast with horns, claws, tail, and/or strange wings: a mockery of angel, man, and beast. One special feature of the Sabbath included the ritual kiss of the devil's ass (de Givry, 87), apparently a mockery of the traditional Christian act of submission of kneeling and kissing the hand or ring of a holy cleric. Numerous testimonials to having witnessed the witches' Sabbath are recorded. For example, a shepherdess, Anne Jacqueline Coste, reported in the middle of the 17th century that during the night of the feast of St. John the Baptist she and her companions heard a dreadful uproar and

looking on all sides to see whence could come these frightful howlings and these cries of all sorts of animals, they saw at the foot of the mountain the figures of cats, goats, serpents, dragons, and every kind of cruel, impure, and unclean animal, who were keeping their Sabbath and making horrible confusion, who were uttering words the most filthy and sacrilegious that can be imagined and filling the air with the most abominable blasphemies (de Givry, 76).

Such stories had been told for centuries and were accepted by pious Christians without a hint of skepticism as to their veracity. Such tales were not considered delusions, but accurate histories.

Pierre de l'Ancre, in his book on [angels](#), [demons](#) and [sorcerers](#) published in 1610, claims he witnessed a Sabbath. Here is his description:

Here behold the guests of the Assembly, having each one a demon beside her, and know that at this banquet are served no other meats than carrion, and the flesh of those that have been hanged, and the hearts of children not baptized, and other unclean animals strange to the custom and usage of Christian people, the whole savourless and without salt.

The claims made in books such as de l'Ancre's and the depictions of Sabbath activities in works of art over several hundreds of years were not taken as humorous fictions or psychological manifestations of troubled spirits. These notions, as absurd and preposterous as they might seem to us, were taken as gospel truth by millions of pious Christians. What is even stranger is that there are many people today who believe similar stories about [child-eating and ritual killing of animals, combined with sexual abuse and satanic influences.](#)

I will leave it to the Freudians to interpret these persisting myths of satanic

creatures with horns, big red tails, and huge sexual appetites; of kidnapping and sexually abusing, mutilating or killing children; of women who put long sticks between their legs and rub on a magic unguent and fly to a sexual liaison with a demonic he-goat; and of creatures with supernatural powers such as metamorphosis. My guess is that witchcraft and sorcery were for the most part brewed in the cauldron of sexual repression and served up as a justification for the public trading in art and literature, if not in life, of Church-created, sanctified, and glorified pornography.

To be sure, there was undoubtedly some persecution of those, especially in the countryside, who maintained a connection with their pagan past. But it is difficult to believe that the descriptions of witchcraft wrenched from tortured and mutilated victims century after century were not mostly created in the imaginations of their tormentors. The inquisitors' power was so great, their tortures so varied and exquisitely sadistic, that they had thousands of their victims deluded into believing they were possessed and wicked. The cruelties and delusions went on for centuries. Witch-hunting was not abolished in England until 1682. The hunt spread to America, of course, and in 1692, in Salem, Massachusetts, nineteen witches were hanged. (In 1711, the Massachusetts State Legislature exonerated all but six of the accused witches. In 1957 the state legislature passed a resolution exonerating Ann Pudeator "and certain other persons," who were named in a bill exonerating them in 2001.)

The last judicial execution for witchcraft in Europe took place in Poland in 1793, when two old women were burned. A wizard, however, died as a result of an unofficial ordeal by water in England in 1865, and in 1900 two Irish peasants tried to roast a witch over her own fire (Smith, 295).

Whatever the psychological basis for the creation of an anti-Church with witches and sorcerers joined with Satan to mock and desecrate the symbols and rituals of the Church, the practical result was a stronger, more powerful Church. No one knows how many witches, heretics, or sorcerers were tortured or burned at the stake by the pious, but the fear generated by the medieval and Spanish Inquisitions* must have affected nearly all in Christendom. Being accused of being a witch was as good as being convicted. To deny it was to prove your guilt: Of course a witch will say she is not a witch and that she does not believe in witchcraft. *Throw her in the river! If she sinks and drowns that will prove she is not a witch; if she swims, we will know the devil is assisting her. Pull her out and burn her to death, for the Church does not like bloodshed!* In truth, the Church ran a Reign of Terror the superior in many ways to those of Stalin or Hitler. Their Terrors lasted only a few years and were restricted to limited territories; the Church's Terror lasted for several centuries and extended to all of Christendom. The Church's Terror was also aimed mainly at women. Thus, it is not strange that those religions today whose members call themselves witches or sorcerers should be anti-Christian, pagan and woman-centered, or satanic. It is not strange that these New Age

religions exalt whatever the Church condemned (such as egoism and healthy sexuality in adults whether homosexual or not) and condemn whatever the Church exalted (such as self-denial and the subservient role of women). Who could blame them?

Witchcraft and [sorcery](#) are still practiced in many countries around the world. For example, in Malaysia a witch, her husband and assistant were recently hanged to death for a grisly murder. Before killing their victim, they had him lie on a floor and wait for money to fall from the sky. "He was then beheaded with an axe, skinned and chopped into 18 parts before being buried in a hole and covered over with cement" (Reuters news service). In Tanzania, an elderly man was beaten to death after he claimed to have used witchcraft to cause a road accident in which 32 people died. The man had been collecting heads and other body parts of victims at the crash scene ([Reuters news story](#)). In [Saudi Arabia](#), Hassan bin Awad al-Zubair, a Sudanese national, was beheaded after he was convicted on charges of sorcery.

[Ramar Pillai admits
it was not herbal fuel](#)

(March 14, 2000)

herbal fuel

Ramar Pillai, from Tamil Nadu in India, claims he has found the [philosopher's stone](#) of the petroleum age. He says he has an herb that can turn water into a virtually pollution-free diesel fuel or kerosene for about 23 cents a gallon. Pillai has managed to convince a few zealous followers that he is the new Isaac Newton, but skeptics believe he has been exposed as a fake. In one demonstration of his magic herb, it was alleged that his stirring stick was hollowed out and filled with gasoline. When his mixture was heated up, a wax plug at the end melted and allowed gasoline into the mixture.

Pillai is a high school dropout from a village near Rajapalayam, but he has intrigued scientists at the Indian Institute of Technology (IIT) by his claims and demonstrations. He says he doesn't want a lot of money, that he only wants a processing plant built near his home village and some protection for his family. He claims he was kidnapped and tortured for several days for refusing to tell his tormentors how he turns water and herbs into fuel. Pillai says his abductors suspended him from a ceiling fan and burned him with cigarettes.

To produce his fuel, Pillai cooks leaves and bark from his special plant for about ten minutes in hot water. The mixture is cooled and stirred after adding a little salt, citric acid and traces of a few unknown chemicals. Once allowed to settle, the liquid fuel, which is lighter than water, floats to the top and is separated by filtering. The entire process takes less than 30 minutes.

According to the Department of Science and Technology (DST) at IIT, laboratory tests have conclusively shown that the herbal fuel is a pure hydrocarbon similar to kerosene and diesel fuel. Engineers at IIT in Madras conducted static tests in two-stroke engines and concluded that the herbal fuel offered better fuel economy than petrol. The fuel "will have good potential in a four-stroke petrol as well as diesel engines," according to the engineers in Madras.

If he is not using trickery, how is Pillai doing it? One theory, offered by Ratna Choudhury of IIT, is that atmospheric carbon dioxide is sucked in during the reaction. The carbon dioxide combines with hydrogen liberated from water and forms the hydrocarbon fuel. She admitted, however, that she was just guessing. The Times of India has a different theory. They published a report which claimed that the entire exercise of promoting Mr. Pillai was to legitimize the sale of stolen petrol and diesel from tankers of Indian oil companies in Rajapalayam. He has no magic powers and no magic herb.

[Baron d'Holbach](#)

[SkepDic.com](#)

Search the Skeptic's Dictionary

Paul Henri Thiry, Baron d'Holbach (1723-1789)

Holbach was German by birth (Paul Heinrich Dietrich) and education, but French by fortune (he inherited his uncle's money, estate and title). Holbach's estate was a meeting place for the leading French radical thinkers (the *philosophes*) of the late 18th century. He was an [atheist](#), a [determinist](#), and a [materialist](#): the universe is a complex system of physical substances organized according to mechanistic laws of cause and effect, rather than designed by God (the view of most of his contemporaries, though not the common view among the *philosophes*).

Holbach was an opponent of absolute monarchy, state religions and feudal privilege. It is fair to describe him as one of the most radical intellectuals of his time. He authored many works whose radical ideas had to be published in Holland without his name on the title page. His most famous work is [The System of Nature](#) (1770). A briefer account of his atheistic materialism was published in 1772: *Good (or Common) Sense, or Natural Ideas vs. Supernatural Ideas*.

Holbach tried to prove by his life that one could be virtuous and an atheist, contrary to a common view of the time. [Rousseau](#), who disliked Holbach, used him as the model of the 'virtuous unbeliever' in some of his fiction. Holbach held that atheism is a prerequisite for any valid ethical theory. Religion, he thought, is based on useless and meaningless dogmas and rituals; whereas ethics must be based on social utility and human cooperation.

What is perhaps most puzzling about Holbach is that he brought together in his life two seemingly inconsistent views; for he was both a hard determinist and a social reformer. He believed that human beings are not special in the sense of having [souls](#) or [free will](#). We're part of Nature and our choices and desires are as much determined by laws of cause and effect as are the movements of the planets. Even so, he devoted himself to trying to make the world a better place by ridding it of unjust and degrading institutions such as the Church and Absolute Monarchy.

hollow Earth theory

The hollow Earth theory holds that Earth is not a solid sphere but is hollow and has openings at the poles. Furthermore, an advanced civilization, the Agartha, exists within Earth. Their people include advanced spiritual and technological masters who sometimes foray into the atmosphere in their UFOs.

In the late 17th century, British astronomer Edmund Halley proposed that Earth consists of four concentric spheres and "also suggested that the interior of the Earth was populated with life and lit by a luminous atmosphere. He thought the [aurora borealis](#), or northern lights, was caused by the escape of this gas through a thin crust at the poles."^{*}

In the early 19th century, an eccentric veteran of the war of 1812 John Symmes (d. 1829) promoted the idea of interior concentric spheres so widely that the alleged opening to the inner world was named "Symmes Hole."^{*} In Hamilton, Ohio, his son erected a monument with a stone model of the hollow earth to commemorate his dad's incessant lobbying for an expedition to the North Pole to find the entrance to the world below. Martin Gardner writes that "It took Byrd's flight over the North Pole to deal a death blow to 'Symmes' hole'" (Gardner 1957, 41). However, later advocates hail Admiral Byrd as having actually gone into the hollow earth at both poles!^{*} This strange belief seems to be based on nothing more than the fact that Byrd referred to Antarctica as "The Land of Everlasting Mystery" and once wrote: "I'd like to see that land beyond the (North) Pole. That area beyond the Pole is the Center of the Great Unknown." Such evidence apparently suffices for the alternative scientist.

Edgar Allan Poe used the theme of the hollow earth in [The Narrative of Arthur Gordon Pym of Nantucket](#) (1838). Jules Verne wrote *Journey to the Center of the Earth* in 1864 and [Edgar Rice Burroughs](#) (1875-1950), the creator of Martian adventures and Tarzan of the Apes, also wrote [novels](#) set in the hollow earth. Legends often ignite the imagination of fiction writers and fiction often ignites the imagination of the [pseudoscientist](#).

In 1869, Cyrus Reed Teed, an herbalist and self-proclaimed alchemist, had a vision of a woman who told him that we are living on the *inside* of the hollow Earth. For nearly forty years, Teed promoted his idea in pamphlets and speeches. He even founded a cult called the [Koreshans](#) (Koresh is the Hebrew equivalent of Cyrus).

In 1906, William Reed published *The Phantom of the Poles* in which he

claimed that nobody had found the north or south poles because they don't exist. Instead, the poles are entrances to the hollow earth.* In 1913, Marshall B. Gardner privately published *Journey to the Earth's Interior* in which he rejected the notion of concentric spheres but swore that inside the hollow earth was a sun 600 miles in diameter. Gardner, too, claimed that there were huge holes a thousand mile wide at the poles. Byrd flew over the North Pole in 1926 and over the South Pole in 1929, but he didn't see these entrances to the nether world. It is pointless to point out this fact or to refer hollow earthers to satellite photographs that do not show holes at the poles. They are sure that there is a government conspiracy to cover up the truth.*

In the 1940s, Ray Palmer, co-founder of *FATE*, *Flying Saucers from Other Worlds*, *Search*, *The Hidden World*, and many other pulp publications, teamed up with Richard Shaver to create the [Shaver Mystery](#), a legend of a world of hollow earth people and an advanced civilization. Shaver even claimed to have dwelled with the inner Earth people. According to Richard Toronto, the FBI blamed Palmer and Shaver for concocting "[flying saucer hysteria](#)" in 1947, making them the true founding fathers of modern UFOlogy.*

The belief in a hollow Earth had some adherents in [Nazi Germany](#). There is even a legend which says that Hitler and his chief advisers escaped the last days of the Third Reich by going through the opening at the South Pole.

In 1964, Raymond W. Bernard, an esotericist and leader of the [Rosicrucians](#) published *The Hollow Earth - The Greatest Geographical Discovery in History Made by Admiral Richard E. Byrd in the Mysterious Land Beyond the Poles - The True Origin of the Flying Saucers*. The book is out-of-print but available on the [Internet](#). Bernard also authored *Flying Saucers from the Earth's Interior*. His real name was Walter Seigmeister. His doctoral dissertation was entitled "Theory and Practice of Dr. Rudolf [Steiner's](#) Pedagogy" (New York University, 1932). In his [Letters from Nowhere](#), Bernard claims to have been in contact with great mystics in secret ashrams and with Grand Lamas in Tibet. He was, in short, another [Gurdjieff](#). Dr. Bernard "died of pneumonia on September 10, 1965, while searching the tunnel openings to the interior of the Earth, in South America."* Bernard seems to have accepted every legend ever associated with the hollow Earth idea, including the notions that the [Eskimos](#) originated within the Earth and an advanced civilization dwells within even now, revving up their UFOs for occasional forays into thin air. Bernard even accepts without question Shaver's claim that he learned the secret of relativity before Einstein from the Hollow Earth people.

Finally, Diane Robbins has seen the light and claims that ADAMA receives [telepathic](#) messages from Telos, a city beneath Mt. Shasta in northern California, which are [channeled](#) by Laila and provide all kinds of wonderful

messages about perpetual peace and prosperity. You can read about it [online](#) or you can order "The Call Goes Out from the Subterranean City of Telos" for \$20 plus shipping. That seems like a small price to pay for such esoteric wisdom. There truly is a seeker born every minute.

*Denying History :
Who Says the
Holocaust Never
Happened and Why
Do They Say It?*](#)

Holocaust Denial and Nazism (National Socialism)

Nazism ('Nazi' is short for *Nationalsozialist*) is the term used to describe the nationalistic, anti-Communist, and anti-Semitic doctrines and policies of Goering, Goebbels, Himmler and Adolf Hitler's National Socialist German Workers' party. The Nazis ruled Germany from 1933 until 1945 when Germany surrendered and admitted defeat in their war of aggression which had initiated World War II. The Nazi party has been outlawed in Germany ever since.

The Nazis preached the superiority of the Aryan master race led by an infallible Führer (leader) who would establish a pan-Germanic Third Reich lasting a thousand years while annihilating the Jews and Communists, the main scapegoats for all Germany's problems. Millions of Jews, Poles, Russians, gypsies, Catholics, gays and handicapped people were interned in concentration camps where they died or were executed or experimented on. Millions more were used for forced labor.

Today, the term 'nazi' is used to designate anyone engaging in or ordering barbarous acts. The term is used to describe those who advocate force, including murder, of a variety of scapegoats whom they blame for their own, the nation's or the world's problems. Included in this list of scapegoats are homosexuals, blacks, liberals, foreigners, Muslims, Christians, Jews, Arabs, among others.

The term 'nazi' is also purposely chosen for self-description by groups of people who find solace and inspiration in the thoughts and actions of Adolf Hitler. The term is also used by anti-racists to describe groups such as the Ku Klux Klan, [Posse Comitatus](#), the [Gospel Broadcasting Association](#), and others who belong to the so-called [Christian Identity](#) movement. The danger of such people is not because they don't understand the evils of nazism, but because they do. They are part of a growing number of people who think there are conspiracies everywhere which can explain why their lives are so dreary and hopeless. They are part of a growing mass of deluded people who think they are superior because of a few genetic codes. They feel they should have a special place in the order of things, but are being denied because of a conspiracy to keep them down and elevate the weak and undeserving. Some neo-Nazis also pay homage to Satan and are great believers in the occult. However, it would be a mistake to think that occultism is the root of neo-Nazism. The causal connection is not a strong one.

It is true, however, that Nazism has sometimes been characterized by certain

skeptics as being significantly affected by occultists in high places. There were [occultists in high places in Nazi Germany](#). There were also Christians in high (and low) places in Nazi Germany. However, to find a causal link between belief in the occult and nazism is a stretch. Think of all the occultists, Christians and other supernaturalists, who have occupied the White House lately. Was Ronald Reagan another Adolf Hitler, and Nancy Reagan another Eva Braun? Is the CIA's waste of time and money on psychic spies proof that democracy in America is at an end? I think the historical evidence is overwhelming that belief in the occult, the supernatural, the paranormal and pseudoscientific knows no political boundaries. Nor does racial hatred.

The malicious treatment of the Jews and other "undesirables" at the hands of the Nazis is referred to as the Holocaust. It has become a symbol of evil in our times. Like many symbols, the Holocaust has become sacrosanct. To many people, both Jews and non-Jews, the Holocaust symbolizes the horror of genocide against Jews, homosexuals, "Gypsies," Soviet prisoners of war, and the handicapped. Some modern anti-Semites have found that attacking the Holocaust causes as much suffering to some Jews as attacking Jews themselves. The term for attacking any aspect of the symbology or mythology of the Holocaust is "Holocaust Denial." It seems to be the main motivation for the [Institute for Historical Review](#) and its *Journal of Historical Review* which since 1980 has been publishing articles attacking the accuracy of this or that claim about the Holocaust. Yes, one "historical" journal devoted almost exclusively to the issue of making the Holocaust seem like an exaggeration of biased historians. This institute was founded in 1978; it claims to be a "research, educational and publishing center devoted to truth and accuracy in history." If truth and historical accuracy were the *only* goals of this group, I doubt that it would cause such an uproar. However, it seems that its promoters are as concerned with spreading prejudice as they are with truth. Thus, even those inaccuracies which they correctly identify are met with scorn and derision. For they never once deal with the central question of the Holocaust. They deal with numbers: *were there six million or four million or 2 million Jews who died or were killed?* They deal with technical issues: *could this shower have been used as a gas chamber? Were these deaths due to natural causes or not? Did Hitler issue a Final Solution order or not? If so, where is it?* I am not saying that these are not legitimate issues, nor am I saying that such inquiries should be taboo. What I'm saying is that the Holocaust deniers do *not* deal with questions concerning the racial laws that led to the arrest and imprisonment of millions of Jews in several countries for the "crime" of race. They do not concern themselves with the policy of herding people like animals and transporting them to "camps" where those who did not die of disease were starved to death or murdered, or, if they were "fortunate," lived to perform forced labor. They don't address the moral issues of medical experimentation on humans, of persecution of homosexuals and the infirm. Why not?

Michael Shermer devotes two chapters of [Why People Believe Weird Things](#)

(1997) to the arguments of the Holocaust Deniers. (In *Denying History: Who Says the Holocaust Never Happened and Why Do They Say It?* [2000] Shermer and co-author Alex Grobman devote nine chapters to the subject.) He takes up many of their arguments and refutes them one by one. For example, one of the favorite appeals of the Holocaust deniers is to demand some proof that Hitler gave the order for the extermination of the Jews (or the mentally retarded, mentally ill, and physically handicapped). Holocaust deniers point to Himmler's telephone notes of November 30, 1941, as proof that there was to be no liquidation of the Jews. The actual note says: "Jewish transport from Berlin. No liquidation." Whatever the note meant, it did not mean that Hitler did not want the Jews liquidated. The transport in question, by the way, was liquidated that evening. In any case, if Hitler ordered no liquidation of the Berlin transport, then liquidation was going on and he knew about it. Hitler's intentions were made public in his earliest speeches. Even as his regime was being destroyed, Hitler proclaimed: "Against the Jews I fought open-eyed and in view of the whole world....I made it plain that they, this parasitic vermin in Europe, will be finally exterminated." Hitler at one time compared the Jews to tuberculosis bacilli which had infected Europe. It was not cruel to shoot them if they would not work or if they could not work. He said: "This is not cruel if one remembers that even innocent creatures of nature, such as hares and deer when infected, have to be killed so that they cannot damage others. Why should the beasts who wanted to bring Bolshevism be spared more than these innocents?"

In my view, however, the racist community doesn't believe its false notions about the Holocaust for any of the reasons for weird beliefs listed by Shermer. They believe them because such beliefs are empowering. They make the believer feel superior and they allow evil to be rationalized as good. Ultimately, many weird beliefs are the beliefs of groups, not isolated individuals. Understanding the dynamics of social belief is no small undertaking and certainly goes beyond wishful thinking and laziness. The Holocaust deniers feed off of each other's anti-Semitism. But what gave birth to their hatred of the Jews? Resentment and projection of their own inadequacies onto another race? Perhaps. That was Sartre's argument, following Nietzsche's lead, in *Anti-Semite and Jew*. The Holocaust Denial seems based upon wanting to believe because the belief fits in with the believer's prejudices.

Why People Believe Weird Things: Pseudoscience, Superstition, and Other Confusions of Our Time

by Michael Shermer
(W H Freeman & Co., 1997)

Skeptics have been treated to several publications in recent years which might indicate that there is some hope for rationality after all. Sagan's [*Demon-Haunted World*](#) and Randi's [*Encyclopedia*](#), for example, have done quite well. Michael Shermer's book is yet another attack on irrationality and unreason to find its way into print. Yet, lest we get too optimistic we might take a lesson from one of Shermer's debunking experiences.

In the prologue, Shermer gives an account of [James Van Praagh](#) whom he calls "the master of [cold-reading](#) in the psychic world." He describes Van Praagh's success and how he wowed audiences on NBC's New Age talk show *The Other Side*. Shermer then tells us how he debunked Van Praagh on *Unsolved Mysteries*. Yet, none of the others in the audience was sympathetic to Shermer. One woman even told him that his behavior was "inappropriate" because he was destroying people's hopes in their time of grief. (Van Praagh specializes in being contacted by anybody's dead relatives.) Van Praagh is still going strong, having appeared recently (Dec. 10, 1997) on the Larry King Live show. He said he could "feel" Larry's dead parents and even pointed out where in the room these feelings were coming from. James took phone calls on the air and, once given a name, he started telling the audience what he was "hearing" or "feeling". He fished for positive feedback and got it, indicating that he really was being contacted by spirits who wanted to tell their loved ones that being dead ain't so bad when you've got a guy like James to talk to on Larry King Live. Larry didn't ask Van Praagh why he thought that billions and billions of dead souls were turning away from eternal life to get inside Van Praagh's head. Had Van Praagh told Larry that his parents were sorry for abusing him as a child and now request that Larry go public about his sadistic sexual practices with animals, Van Praagh would be history. But the charlatans of the world wouldn't be where they are if they tried to tell people what they don't want to hear. As long as they feed the hopes and dreams of their victims, the psychics will flourish. Of course, if they can't handle their finances they'll go broke like the Psychic Friends Network did. Otherwise, if they keep feeding the fish, the fish will return.

So, why do people believe weird things? "More than any other, the reason people believe weird things," says Shermer, "is because they want to. . . .It feels good. It is comforting. It is consoling." Secondly, weird beliefs offer "immediate gratification." People like weird beliefs because they are simple. Weird beliefs also satisfy the quest for significance: they satisfy our moral needs and our desire that life be meaningful. Finally, he says, people believe weird things because weird things give them hope.

You would think Shermer would know, for he has walked through the valley of weirdness as a believer and a challenger. He's been abducted by aliens and had colonic irrigation. He's been to the chiropractor to get aligned and balanced. He's been to many alternative health practitioners to get "purified" and "detoxified". He's been Rolfed and wrongly diagnosed by an iridologist.

He's also been on a number of talk shows where he has faced not only psychics but those who deny that the Holocaust ever happened. He's confronted [creationists](#) and [spiritualists](#) on national television. He started [Skeptic magazine](#) and the [Skeptic's Society](#). He has written many articles on various weird beliefs. In short, Michael Shermer has entered the lion's den, walked through the valley of death and known firsthand the wailing and gnashing of teeth.

Even so, Shermer seems to have overlooked or underemphasized some fundamental reasons why people believe weird things. *Ignorance*, for example, seems to be the main reason many people believe weird things. They simply do not know any better. If they had some knowledge about physics, chemistry, biology, memory, the brain, the body, etc., they would not even consider many of the crackpot ideas put forth for their consideration. Only a person ignorant of physics and neurology could consider it reasonable that wearing a [takionic](#) headband will improve thinking or that [alpha waves](#) are a sign one is entering a transcendent state of consciousness. A great deal of New Age quackery about "energy" medicine depends upon people being ignorant of quantum physics. It is unlikely that Shermer would have tried the detoxification regimes he did had he been more knowledgeable.

Ignorance might explain why 90% of [Deepak Chopra's](#) followers believe him when he tells them that happy thoughts make happy molecules, but it doesn't explain why Chopra himself believes the mind can have a causal effect on the molecular level. He is a trained physician and knowledgeable of biology. It does not seem to be a very satisfactory explanation to say that he and other New Age gurus believe that disease can be controlled by thought because they *want* to believe so. The *will to believe* explanation seems too facile. Even William James, who has given us this expression from the title of an essay, did not try to explain most weird beliefs by claiming they were acts of will. James reserved using will alone to determine belief for those cases where (a) a decision must be made and (b) the evidence is equal on either side of the issue. Furthermore, he recognized that only some beliefs are *living options* for

each individual. A devout Christian could no more accept the possibility that Mohammed is the Prophet of God than a devout Muslim could accept Jesus Christ as his Lord and Savior. Not every claim is a living option for every person. Sheer willfulness should only be used to explain choosing one living option over another when the evidence for each is equal. Such a situation is definitely not the case for believing in the power of thought to control disease. The evidence is overwhelmingly against such a belief. What is of interest is why certain incredible and improbable claims are living options for some people and not for others.

It is obvious that the difference cannot be explained in terms of differing intelligences. Duane Gish and the creationists, Willis Carto and the Holocaust deniers, and physicists John Barrow and Frank Tipler--to name just a few of those Shermer takes on--are at least as intelligent as their opponents. When an intelligent person believes something for which there is little more than faith to support the belief, what else can you say except that the person believes simply because he or she wants to?

For example, Barrow and Tipler think they have a new and improved [argument from design](#) which uses only physics to prove God exists. And Tipler thinks he has proved the immortality and the resurrection by physics alone. Yet despite his enormous intellectual endeavors to prove Christianity by physics, Tipler comes off a bit disingenuous when he admits that the only thing really going for his theory at this point is its "theoretical beauty." Since beauty is in the eye of the beholder, that is not saying much. In short, for all his brilliance, Tipler's theory is an elaborate construction which can only be accepted on faith. Since there are probably only a handful of people who could even understand his argument, refuting it seems unlikely to be very rewarding, but Shermer gives it a go. The argument is very complicated and likely to produce more yawns than hurrahs.

Likewise for his essay on Ayn Rand and her cult of followers. Other than being an example of colossal self-deception and egoism, the debunking of a second-rate metaphysician and the cult of adoration which grew up around her is of little more than historical interest. He might as well have done an essay on the Beatles and their adoring fans. Rand did not claim Objectivism is a science, but a philosophy. It's not a very interesting philosophy, nor was it innovative, despite what she and her followers believed.

The argument against Carto and his anti-Semitic band is much easier to swallow and to follow, and the rewards are much more gratifying. For all those sucked in by the tempting arguments of the [pseudohistorians](#) of Nazism, chapter 14 of Shermer's book is a must read. He not only explains the methodology of the the Cartophiles, he responds with specific evidence to their arguments. For example, one of the favorite appeals of the Holocaust deniers is to demand some proof that Hitler gave the order for the extermination of the Jews (or the mentally retarded, mentally ill, and

physically handicapped). [Holocaust deniers](#) point to Himmler's telephone notes of November 30, 1941, as proof that there was to be no liquidation of the Jews. The actual note says: "Jewish transport from Berlin. No liquidation." Whatever the note meant, it did not mean that Hitler did not want the Jews liquidated. The transport in question, by the way, was liquidated that evening. In any case, if Hitler ordered no liquidation of the Berlin transport, then liquidation was going on and he knew about it. Hitler's intentions were made public in his earliest speeches. Even as his regime was being destroyed, Hitler proclaimed: "Against the Jews I fought open-eyed and in view of the whole world....I made it plain that they, this parasitic vermin in Europe, will be finally exterminated." Hitler at one time compared the Jews to tuberculosis bacilli which had infected Europe. It was not cruel to shoot them if they would not work or if they could not work. He said: "This is not cruel if one remembers that even innocent creatures of nature, such as hares and deer when infected, have to be killed so that they cannot damage others. Why should the beasts who wanted to bring Bolshevism be spared more than these innocents?"

In my view, however, the racist community doesn't believe its false notions about the holocaust for any of the reasons for weird beliefs listed by Shermer. They believe them because such beliefs are empowering. They make the believer feel superior and they allow evil to be rationalized as good. Ultimately, many weird beliefs are the beliefs of groups, not isolated individuals. Understanding the dynamics of social belief is no small undertaking and certainly goes beyond wishful thinking and laziness. The Holocaust deniers feed off of each other's anti-Semitism. But what gave birth to their hatred of the Jews? Resentment and projection of their own inadequacies onto another race? Perhaps. That was Sartre's argument, following Nietzsche's lead, in *anti-Semite and Jew*. We might say, though, that at least some weird beliefs are based upon wanting to believe them *because they fit in with one's prejudices*.

Shermer does an admirable job of presenting Duane Gish's case for "[scientific creationism](#)" and then dismantling it. Here, too, I think the creationists want to believe Gish because his claims fit in with their own prejudices. One of my correspondent's, Claud Roux of France, wrote me about an all-night debate he had with a creationist.

I started a dispute with this person which lasted until dawn...I was absolutely baffled by how much this person was insensitive to any arguments which would contradict his strong beliefs about a world made in 7 days... I couldn't find any flaw in his armor so that I could introduce a hint of questioning in his mind...If I gave him a scientific argument, this would be considered as a lie nourished by an army of scientists. In fact, there was a strong belief in all that he said that science was another religion opposed to the traditional

religions. The discussion with this person was not a debate over the pertinence of a theory, but rather a fight between two different religions, science being a religion invented by the devil to "disbalance [desequilibrer]" the world. His personal fight was not to prove that science was wrong but to prove that science was evil...

Science is evil because it is perceived to be very threatening to the creationist's religious beliefs. That intelligent people might adhere to weird beliefs mainly because they offer solace and refuge from other, terrifying beliefs, implies that the mind is often used to construct delusions as a kind of safety net. Let me give another example for another correspondent. Carol Lazetsky of Austria via England wrote me about a friend of hers who had received a Ph.D. in biology. The biologist's parents are also biologists and were pioneers in the legalization of euthanasia movement in Holland. Lazetsky writes that the daughter biologist with the Ph.D. was having a problem with her parent's stand on euthanasia.

. . . and she started to have some sort of therapy. I then moved to Ireland and we lost touch, however, I had a few letters in which she touched upon the fact that she had become involved with the church and seemed to be getting some relief from her problems. We lost touch even more and then I had a letter from her after moving to Austria. Her letters had become more and more frantic and her thoughts seemed to have become disjointed, until 2 years ago at Christmas I had a letter which was totally incomprehensible and muddled up. I was worried when I got the letter but didn't react much since I felt I could do little from so far away. However, the alarm bells really started to ring when I received a brochure from her a year later when she told me that she had started working from home and had set up a therapy studio for [reflexology](#). There was a whole load of glossy brochures with maps of feet and a résumé of her stating her qualifications as a biologist (which seemed to make her business sound believable). She then told me she was "studying" a lot to open up a "Spinal Correction" practice and was into all sorts of "New Age" theories including [crystals](#), [auras](#) and chanting. Her marriage had nearly fallen apart because of her new ventures, but her husband was getting used to it, she said.

I find this all very alarming and dangerous since it seems to me that these practices have robbed her of her identity and her reason. They nearly robbed her of her family and they are most definitely robbing her purse. I felt that as we had once been good friends that it was only decent of me to be honest with her and I

wrote and told her how I felt about what she was doing. I knew that I may not hear from her again, but I thought it would be insincere of me not to write and tell her what I thought. I never heard from her again.

One facile explanation is that the young biologist has gone mad. This may be true and it may explain her conversion from scientist to pseudoscientist, her new interest in religion and New Age mysticism, and her disjointed thinking. The chemicals in her brain may have become redistributed, causing her to have a serious thought disorder. This is possible and we should not dismiss this possibility out of hand just because there is a stereotype of the mad as out of control, completely irrational, babbling idiots. The mad are often quite intelligent and restrained, even polite or reclusive, even if their thoughts are illogical and their judgment unsound. However, there is another possibility here. Perhaps she is not mad, but deeply troubled. She had followed in her famous parent's footsteps and become a scientist. But her parents are leaders of the euthanasia movement and euthanasia is something which repulses her. Rather than risk becoming "evil" like her parents, she leaves science and goes into something much safer. She enters a world of deluded but very happy, hopeful and caring people. The reasons for choosing reflexology rather than iridology or some other form of quackery are probably unimportant. It is probably by sheer accident that she fell into one bit of nonsense rather than another. The point is that we search in vain for why she believes in reflexology if we search for a logical explanation. To say she believes because she wants to believe is trivial. She believes because she does not want to follow in the footsteps of her scientific parents, because she does not want to bring evil into her life, because she wants hope and wants to do good. Perhaps.

There is probably a long list of reasons why people want to believe certain things, but in the end they all amount to the same thing when looked at from the other side: it is generally pointless to produce counterarguments to their beliefs except to persuade some third party who might listen to both sides and realize which side has the stronger evidence.

Another significant factor in weird beliefs, not mentioned by Shermer, is **communal reinforcement**. If others believe the same non-sense, it is often very difficult or dangerous to challenge the beliefs. For example, I have my philosophy of law students read a racist essay by an intelligent, educated lawyer and leader of the Confederacy during the Civil War. The essay makes one false claim after another regarding the physical, intellectual and moral nature of black people. Each of the claims is put forth with comments indicating that everybody knows this and it is scientific fact. My students invariably ask: *How could anyone believe this stuff?* The answer is simple: if your parents, teachers, ministers, and everyone else in your circle believes it, and contrary opinions are banned, why wouldn't you believe it, too?

Other beliefs seem to be adhered to simply because they are *possible*. Even though the evidence is overwhelmingly against them, why do people believe in such things as dowsing? Many, of course, believe because they do not understand how easy it is to deceive ourselves. They do not understand the need for [controlled studies](#) to eliminate self-deception from influencing our beliefs. Yet, others seem to believe such things simply because they are possibly true. They are unaware of the fallacy of the [argument to ignorance](#). However, simply because a claim is *possibly* true--in the absolutely loosest sense of the term 'possibly'--does not mean it is reasonable to use an act of will alone to accept the claim. In fact, for reasonable people, such claims are not living options because they contradict what has been established beyond a reasonable doubt. However, even though the evidence seems to be preponderantly on one side, there will always be those who claim that they do not believe that the evidence against a belief is overwhelming. That was James' view of the evidence regarding belief in God; the evidence for was proportionate to the evidence against, he thought. But he never *proved* that the evidence was equal for atheism and theism. He assumed this to be the case. It seems to me, however, that it is only politeness which grants him this point. The evidence is overwhelmingly against anything like the God of the western religions existing. How a Bernie Segal or a Deepak Chopra or a John Mack can steadfastly maintain their weird beliefs in the face of overwhelming evidence against them seems explicable only if one assumes they are acting on *faith* alone.

Even so, why do some people have faith? Why do they choose to believe preposterous, incredible, improbable claims? Shermer's explanation in terms of hope, simplicity, immediate gratification, and providing meaning to one's life seems to cover most of the reasons for faith. But the desire for power should also be included in this list of fideistic motivators. Such beliefs give the illusion of control over things which are either out of one's control or which require diligent effort and intellect to effect reasonable control.

However, what is most valuable about Shermer's book is not his attempt at the psychology of belief, but his criticisms of specific weird beliefs. He has especially detailed criticisms of creationism and Holocaust denial. There are fairly straightforward chapters on Edgar Cayce, near-death experiences and alien abduction. There is a chapter on the repressed memory witch hunts, among other things.

He even has a section on [altered states of consciousness](#) (ASC) which he prefaces with a remark that most skeptics will question his account of ASC. Shermer considers the [hypnotic state](#) to be an ASC, for example. He doesn't do much to bolster his case by quoting a straw man argument from Kenneth Bowers who trivializes [Nicholas Spanos'](#) cognitive-behavioral explanation in terms of role playing by calling it "the faking hypothesis." Playing a social role is not the same as "faking." Next, he considers sleep to be a state of consciousness, rather than unconsciousness, because we dream while

sleeping. Finally, he produces a set of EEG readings to designate what he calls six different states of consciousness, one of which is the coma. He says: "If a coma is not an altered state, I do not know what is." Let me fill in the enthymeme using *modus ponens*. "A coma is not an altered state. Therefore, you do not know what an altered state is." On Shermer's criteria, sneezing would be an altered state. So would coughing. Each is likely to produce a distinct EEG reading. I find his argument puzzling, since he defends the view that sleep, deep sleep, drowsiness and coma are altered states of consciousness by appealing to the fact that they produce different squiggles on an EEG. But he defines an altered state *subjectively*, in terms of self-consciousness and self-control. "When there is a significant interference with our monitoring and control of our environment," he says, "an altered state of consciousness exists." People who are interested in altered states of consciousness, such as [Charles Tart](#), think they are gateways to transcendent truths. I would agree that ASCs are brain states, but not every brain state is an ASC. I certainly would not include sleep or coma as ASCs because they are not states of consciousness at all. I understand the term ASC to refer to an altered state of *consciousness*. Unconscious states, such as sleeping, coma, concussion, fainting, etc. are not ASCs because the person is unconscious by definition. I take it for granted that to have an altered state of consciousness one must be conscious. On Shermer's analysis, I suppose *death* would be the ultimate altered state of consciousness: the flatline EEG.

Overall, Shermer's collection of essays is a welcome addition to the growing body of skeptical literature that has for so long been wanting but is beginning to shed a little light in the darkness.

Holocaust Denial](#)

reader comments:

Nazism and Holocaust Denial

31 May 1997

They deal with numbers: were there six million or four million or ? Jews who died or were killed? They deal with technical issues: could this shower have been used as a gas chamber? Were these deaths due to natural causes or not? They deal with minor facts: did Hitler issue a Final Solution order or not? If so, where is it? What they do not deal with is the question of racial laws, of arresting and imprisoning millions of people in several countries for the crime of "race," of herding people together like animals and transporting them to "camps" where millions died of disease, malnutrition, or were murdered. What the Holocaust deniers do not deal with is racial hatred. I do not wonder why.

In regards to the above, if we do not make sure that we are telling the whole truth about the holocaust then eventually everyone may be "deniers". Were the showers used for gassing or not? What evidence is there either way? Did most victims die from disease and starvation or were they burned alive or gassed? I don't see how anyone could argue that Hitler's policies were ok or benign. Of course it is evil to do the things Nazi Germany did. Lying about the details only makes folks question the whole story. That is not the way to make sure it never happens again.

The evidence for using the showers for poisoning people is readily available. Your use of the word "lying" seems to reveal a less-than-sincere concern for the truth. You seem to assume that historians, politicians, journalists, survivors, witnesses and soldiers who reported the story of the Holocaust are all "liars." Why?

Stalin is said to have had 30 million of his citizens killed but we never hear anything about the crimes of the Soviet Union. Pol Pot is said to have had 4 million Cambodians killed just for being educated or appearing "smart", yet where is the outcry? I am not saying that these people were right in their actions, I am saying that these are evil manipulative mass-murderers. The policies advocated by these individuals cannot be "sugar-coated" into being anything less than evil defined. But we must get the details straight. So I ask again, was it 6,000,000 or 4,000,000 or (most likely) 1,500,000? Was it gas or neglect?

I don't know where you get your history or your news, but it is obviously not from the same sources with which I am familiar. I've never read a sugar-coated account of Stalin or Pol Pot. In any case, what does that have to do with your loaded question: "was it gas or neglect" that killed the victims of Nazism in the concentration camps? You've raised a false dilemma. Many died of neglect and many were gassed. You seem to think you have the data to prove that the number of those who died in the camps was 1.5 million. Publish your arguments for all to examine.

I don't see revisionism espousing the ideals of Nazism or race-hate. I do see revisionism as a healthy way to keep the facts straight as to what really did happen. I remember as a small child the number of Jews murdered by Hitler being 4,000,000. Now they all say 6,000,000 why would there be 2 million added in twenty years? Maybe the answer has something to do with the incomprehensibility of such large numbers, or for effect. We need to get the numbers right.

Lane Walker

If you think it is "healthy" to blithely call thousands of witnesses and authors "liars" because they haven't handed you a list with the names of every victim or a detailed order sheet for poison and notebooks from the death camp operators, then I suggest your criteria for truth are such that it is unlikely you will ever be satisfied with mere numbers. And I stand by what I wrote: Holocaust revisionists deal with minor details and ignore such major themes as "the question of racial laws, of arresting and imprisoning millions of people in several countries for the crime of "race," of herding people together like animals and transporting them to "camps" where millions died of disease, malnutrition, or were murdered. What the Holocaust deniers do not deal with is racial hatred."

4 Jun 1997 - Mr. Walker replies

In regards to your answer, The reason I (and others) do not concentrate on the legal and moral aspects of this event is because no one, unless they are deranged, thinks that race laws, herding, starving, torturing, imprisoning, even hating are acceptable. If your beef is with folks who condone Hitler's policies then I am in your corner. Whether it is in Russia, Cambodia, Germany, Bosnia, or even in America (Japanese in WW2, Indians) putting people in concentration camps and not caring for their needs is a crime against all humanity. I am not trying to "sugar-coat" what happened to the Jewish people. They were mistreated terribly and it was more than just wrong. But there should have been a near exact body count after the war. The Nazis were supposedly fanatical record keepers. That is where a lot of the evidence presented at Nuremberg came from. I cannot understand the addition of 2,000,000 victims since the 70's. The reason I said 1.5 mil is more

likely number is because the more you tell a story, the greater the numbers become. If there had been an "official" number given a few years after the war and it was still the same number then there would be no real way to question it. However, the number of victims has risen as the years have passed and there is no way to account for this unless you take deception (whether intentional or not) as a possible reason. I am not a Holocaust denier in the sense that I don't believe Jews were murdered at the hands of the Nazis and their allies. I only question the details because they are the only thing open to questioning. The rest of the story cannot be denied. It is established fact. I bear animus towards no race or even individual, all are God's creatures and I am no better than any other. But the fact that it is a criminal offense to say you question the details of the holocaust in most of Europe makes me suspicious that there may not be a solid defense when the details are questioned. I cannot trust any government to tell the truth. They have horrible track records when it comes to official versions and the like. I can easily be convinced that there were 6 million people. I do not need to see the documents, I do need to see the conclusions reached by the men who were on the scene immediately after Germany fell. I have read emotion heavy accounts of what happened - Anne Frank, Schindler's list, etc. I have never seen a transcript of those who found the camps but did not live there. I guess what I am saying is that I need to hear it from someone who was there, but has not sought to profit from it or tell it a million times a year for a fee. I want to hear it from the American and Soviet soldiers who found these camps and wrote letters home about what they saw. I want to read their reports. I will then be convinced if their story is the same as the one I hear everywhere else. I hope you will also post this clarification along with my previous letter.

Have a nice day!

PS If you know where I can get these reports on the net, I will look at them.

Lane Walker

Jesus is coming soon!! Are you ready?

reply: Was it also Jesus who said that *there are none so blind as will not see?* You have an interesting criterion for evidence. Do you expect someone to deliver the documents to your door?

May 9, 2000. [Reflexologists](#) better stay clear of Japan where their trade is considered a cult and can get them arrested, according to [YahooNews](#).

May 6, 2000. "Two million people died of AIDS in sub-Saharan Africa in 1999 - 85 percent of the total world deaths from the disease in a region that accounts for only 10 percent of the world's population," according to Andrew Selsky of the [Associated Press](#). [Dr Christian Fiala](#), however, thinks the numbers are greatly exaggerated and that there is no clear definition of AIDS being used to make these diagnoses. Furthermore, he believes that dirty needles rather than promiscuous heterosexual behavior (a Christian missionary myth) is the cause of much of the misery in Africa.

South Africa's President [Thabo Mbeki](#) seems convinced that HIV is not the cause of AIDS and current treatments cause rather than effectively treat AIDS. (The arguments for this view are posted at www.virusmyth.com/aids/index.htm). He refuses to provide the "anti-AIDS drug AZT to HIV-positive pregnant women. He declared the drug too dangerous to use even though it has been proved that AZT drastically cuts the chances of newborns contracting the deadly virus." At a recent conference in Pretoria, Mbeki invited "U.S.-based researcher Peter Duesberg, a scientific outcast for his theory that AIDS is caused not by the human immunodeficiency virus but by illegal drugs and AZT." I didn't know illegal drug use and AZT were that popular in Africa. Anyway, [Duesberg is not alone](#) in his [skepticism about HIV and AIDS](#). [Nicholas Regush of ABCNews.com](#) shares this skepticism and thinks that the current model of HIV and AIDS is propaganda put forth by "mediocre scientists" whom he challenges to a public debate.

The [Center for Disease Control and Prevention](#) and the [National Library of Medicine](#) have a different opinion.

[thanks to Tim Boettcher]

April 22, 2000. A study in Norway has found that chiropractic is ineffective in the treatment of colic, according to [VG Net](#).

Jon Henrik Gilhuus has provided a translation of the story:

"Chiropractic useless against colic"

Chiropractic treatment of children with colic has no impact on colic

pains, a new study at the pediatrics dept of Haukeland Hospital shows.

The study, which included 86 infants, is the largest ever done in this field, reports NRK (Norwegian State Broadcasting Company). The study was carried out by chiropractor Steinar Forshei and three doctors.

Forshei has treated infants himself and is surprised by the results. He believes that one reason why chiropractic can seem to work is that the treatment makes parents feel that they are taken care of.

April 21, 2000. The [chupacabra](#) is off the hook; dogs have been killing livestock in Chile, according to [Yahoo](#).

[thanks to Joe Littrell]

April 20, 2000. Dr. [Nicholas J. Gonzalez](#), an advocate of the Gerson coffee enema cancer treatment has been found guilty of negligence for the second time, according to [FoxNews.com](#). In 1997 he was ordered to pay more than \$2 million to the family of a patient. This time he was dinged only \$282,000. Yet, the National Center for Complementary and Alternative Medicine has committed over \$1.4 million of our tax dollars over five years to study Gonzalez's [crackpot](#) cancer "cure".

[thanks to Tony Fabris]

April 20, 2000. Two large studies published in *The New England Journal of Medicine* cast doubt on the anti-cancer benefit of eating low-fat, high-fiber diet, according to [Jeff Donn, Associated Press Writer](#). Another study published in January 1999 came to the same conclusion.

April 19, 2000. [Once again](#), a person of faith claims God put a gold crown on her tooth. Her dentist denies it, though he admits he misled her into thinking God had changed a porcelain crown to gold because "he didn't want to dash his patient's faith in a miracle," according to the [Birmingham News](#).

April 14, 2000. According to [Variety](#), Chris Carter, creator of the *X-Files*, a television drama given to uncritical acceptance of a world in which the laws of science and the rules of evidence need not apply, is said to be in negotiations to produce a full-length film on Ted Serios based on Jule Eisenbud's book *The World of Ted Serios: 'Thoughtographic' Studies of an Extraordinary Mind*. Mr. Serios claims he can produce images on film with his thoughts ([thoughtography](#)), a feat which would require rewriting the laws of physics.

[thanks to Joe Littrell]

April 13, 2000. [WebMD](#) reports that we're more likely to find vitamins conducive to good health in our kitchen than in our bathroom...if you have foods such as fresh fruits, vegetables and nuts in the kitchen. According to a recent report by the [Institute of Medicine \(IOM\)](#) pill supplements for vitamins C and E, selenium, and carotenoids have no proven role in preventing disease. IOM recommends a ceiling on daily consumption of selenium and vitamins C and E to reduce the risk of adverse side effects from overuse. The [full report](#) is available from IOM.

April 11, 2000. Holocaust denier David Irving lost his [libel suit](#) against American scholar Deborah Lipstadt, who had called Irving "one of the most dangerous" Holocaust deniers in her 1993 book [Denying the Holocaust: The Growing Assault on Truth and Memory](#).

According to [CNN.com](#)

Irving questioned the use of gas chambers, and claimed the number of Jews who perished was far lower than the 6 million generally accepted. He said most Jews who died at Auschwitz did so from diseases such as typhus, not gas poisoning.

Israel released the previously secret memoirs of Nazi war criminal Adolf Eichmann for use by Lipstadt and Penguin's legal team. The memoirs contained methodical descriptions of the genocide, including timetables of death transports.

Irving faces legal costs of some 2 million pounds (\$3.2 million). CNN reports that Irving does not plan to appeal. The L.A. Times reports that he called the ruling

"perverse" and said that it would be easy to win on appeal. The [Nando Times](#) reports that he will appeal.

According to Marjorie Miller of the *Los Angeles Times*, Lipstadt, a professor of modern Jewish and Holocaust studies at Emory University in Atlanta, Georgia, said "We hoisted him on his own petard. We tracked his footnotes and followed his sources." In Britain, the *accused* in a libel case must prove what he or she said is true. The defense convinced High Court Judge Charles Gray that Irving "has for his own ideological reasons persistently and deliberately misrepresented and manipulated historical evidence."

Most historians estimate that about one million people were gassed to death at Auschwitz-Birkenau. Irving calls Auschwitz a "tourist attraction" that was built after the war.

April 9, 2000. Today's [LATimes.com](#) has an interesting article about the rising belief in the paranormal and the mystical in China and the work of debunker [Sima Nan](#), for years a relentless critic of [qigong](#), and now a critic of [UFO](#) and [Bigfoot](#) sightings, which are on the rise in China. The Chinese government is obviously concerned about this rise in unscientific thinking and must think there is a causal relationship between it and the decline of interest in communism. Witness their [attack](#) on the [falun gong](#) movement.

Sima blames traditional Chinese thinking for making people susceptible to weird beliefs. "Chinese thinking is different from Western thinking," he said. "Westerners try to get at things very clearly, asking what, why and how much. Chinese are more interested in dealing with things using metaphors or intuitive comparisons." I don't know about Chinese thinking, but not all Western thinking is very clear; "alternative" thinking such as [homeopathy](#) and [astrology](#) seem based on metaphors, intuitions and [sympathetic magic](#) rather than on testable empirical evidence.

Nan is called the Chinese Houdini. He will need to be some kind of great magician to have a significant impact on such a formidable foe.

[thanks to Joe Littrell]

April 7, 2000. Archaeoraptor, proclaimed to be a possible link between dinosaurs and birds, "is really a composite of at least two different animals," according to the [National Geographic Society](#), which made the original announcement regarding the

fossil six months ago.
[thanks to Joe Littrell]

April 6, 2000. The Oklahoma House of Representatives passed a bill requiring science books used in Oklahoma public schools to acknowledge that "human life was created by the one God of the universe," according to [Yahoo!](#) The bill now goes to a committee to decide its fate, according to [The Oklahoman](#).

Such a bill couldn't get passed if the issue were religion texts, but science is a different matter. Just as there are still some sore losers in South Carolina who demand the Confederate flag be flown over the state capital (they consider the attempt to separate from the Union over a century ago to be an essential part of their heritage), there are still some sore losers who don't want to admit that science set itself free from religion centuries ago.

What next? A law making it punishable by up to five years in prison for denying that scientific theories need refer to God? That way we could catch up with Switzerland which has such a law for those who deny the Holocaust, according to the [Nando Times](#).

[thanks to Joe Littrell]

April 6, 2000. Two new types of cancer in sharks have been discovered, according to John C. [Harshbarger](#). Kidney cancer in the dogfish shark and lymphoma blood cancer in the sandbar shark have been added to the list of cancers already known to exist in sharks. This news would not be of interest to most skeptics were it not for the "alternative" quacks who claim that [shark cartilage can cure cancer in humans because sharks don't get cancer](#).

[thanks to Robert Long and Joe Littrell]

April 6, 2000. The Federal Trade Commission (FTC) has settled fraud charges with three Internet companies claiming that an herbal tea called Essiac is effective in curing cancer, diabetes, AIDS and feline leukemia or that cetylmyristoleate (CMO) can cure arthritis and a variety of other ailments.

Under the settlement, the three companies must pay refunds to their customers and are banned from making false claims for any food, drug or supplement and from misrepresenting the results of any research....

Two of the companies also used deceptive "metatags," hidden pieces of text on many Web pages that are often used by Internet search engines in pursuit of certain words or phrases. For example, a person searching for cancer treatment information may be pointed to a page if it includes the phrase "cancer cure" in a metatag.

[Jodie] Bernstein [director of the FTC's Bureau of Consumer Protection] said consumers should beware panaceas and be particularly wary of terms like "scientific breakthrough," "miraculous cure," "exclusive product," "secret ingredient" or "ancient remedy."
[\[CNN.com\]](#)

The companies involved are:

1. Natural Heritage Enterprises of Crestone, Colorado ([Michael D. Miller](#), president);
2. CMO Distribution Centers of America of Sarasota, Florida ([Kalon Samulonis](#), president); and
3. EHP Products of Ashland, Kentucky ([Elaine Parrish](#), president).

April 2, 2000. Farmers in the Philippines, unable to control a potato pest with chemicals, have turned to an ancient rite to save their crops: [pig burning](#) to appease the gods and stop deaths following pestilence or disease (*pakde*). Part of the ancient ritual involves the *mambunong* (tribal priests) slaughtering a black pig to study its liver for omens.

April 1, 2000. [The National Post](#) reports that Sister Jeanne O'Laughlin, a Catholic nun, believes that Elian Gonzales will be sacrificed in a witchcraft ceremony by Fidel Castro if the boy is returned to his father in Cuba. (Last November the boy's mother and her lover drowned along with eight others but the boy was rescued and has been held captive by the Cuban community in Miami ever since.) Any hope of reasoning with Elian's Miami captors will be futile, as he is now been mythologized into the new Moses who will set his people free. Many believe he has mystical powers and that the Virgin Mary appears regularly in his bedroom mirror.

[thanks to Joe Littrell]

April 1, 2000. Today, [Art Bell](#) retired [again](#). The details announced in his retirement message are too horrible to think this is an April Fool's day joke.

March 29, 2000. If you were psychic, you'd tell anyone who asked what numbers were going to come up in the next Lotto drawing, wouldn't you? Even though you are only charging \$2.50 a minute for a phone call, you'd tell the caller what numbers are going to win the jackpot of, say, \$80,000,000; wouldn't you? Apparently that's what some folks in Florida think, according to the [Miami Herald](#).

March 29, 2000. Since Muslims are allowed by law to use loudspeakers for three minutes each Friday to call people to prayer in Oslo, Norway, atheists have been given the ok to use loudspeakers to announce "God does not exist." It's a matter of fairness, according to [CNN.com](#).

[thanks to Jon Henrik Gilhuus]

March 29, 2000. A lawyer for the Japanese cult which released poison gas in a Tokyo subway in 1995 has been found guilty of attempting to murder a lawyer for the victims of the cult attack, according to the [Anchorage Daily News](#).

March 25, 2000. A [Urantia](#) sect called the Amadonians and led by Steve Arden, also known as Amadon Amadon, who was bankrupted by two female employees who won a sexual harassment lawsuit against him, is setting up a new shop in [Oregon](#). This odd group combines the spiritual with spirits: they help restaurants, bars and resorts apply for liquor licenses.

March 22, 2000. [DOnline](#) (the D is for Dallas as in Texas) reporter George Roffman writes that

D Magazine went to five area stores—Tom Thumb, Whole Foods, Drug Emporium, GNC, and Fresh Start—to compare the most popular supplements available. At each store we bought three identical bottles of [DHEA](#), ginger, ginkgo biloba, ginseng, melatonin, saw palmetto, St. John's wort, and milk thistle.

When tested, they found that half of the bottles did not meet their label claims and five of the bottles had no active ingredients at all. Solgar performed the worst of all the brands tested. The article points out that there is no industry standard or government regulation which would insure the customer of the accuracy of the labeling claims, whether those claims refer to ingredients or alleged properties such as "increases mental prowess."

[thanks to Joe Littrell]

March 22, 2000. Finally, alternative dentistry has arrived, according to [The Arizona Republic](#). Dr. Michael Margolis of Mesa, Arizona, doesn't do root canals because, he believes, they cause problems in other parts of the body. He just pulls the tooth. He also uses a "healing light" which shoots out a red laser beam at a frequency that, he claims, kills bacteria. "There is no doubt it works," he says. He also thinks that fluoridation of water is an evil plot of the government and the American Dental Association. We are being poisoned because of money, politics and power. In Mesa, where the issue of fluoridation of the water supply was put to a vote, Margolis is not alone. There are 16,478 others who don't want the stuff in their water.

[thanks to Joe Littrell]

March 21, 2000. Earlier in the week, [PETCO announced](#) that it would be opening a new store in New Jersey with the help of Norma Caesar who is a pet therapist and claims to be an animal psychic. She is being billed as "an expert on the psychic nature of pets" who "is able to communicate with all animals." Just as [James Van Praagh](#) acts as an intermediary between any human and any dead person, so Norma Caesar acts as an intermediary between any human and any animal. Both claim to get messages, one from the dead and the other from living animals, that seem beyond the reach of the rest of us ordinary mortals.

In Mass Media Funk, you will find articles about news stories, magazine articles or TV programs of interest to skeptics, which do not pander to the public's appetite for the occult and supernatural.

Note: because many of the sites linked to here are newspapers or magazines, it is impossible to maintain the links.

February 5, 2000. The head of the [Kabalarians](#) has lost his appeal and has been sent back to jail to finish his five-year sentence for the [rape of two teens and eleven other charges of sexual abuse](#) of five other teenage girls, according to the *Vancouver Sun*.

The court ordered a new trial on two counts involving two other women. Ivon Shearing was originally charged in 1997 with 20 offences involving 11 women in his [500-member cult](#) who complained they were sexually abused between 1965 and 1990. Shearing allegedly preached the need for sexual control to his minions.

February 4, 2000. New Zealand researchers claim to have an explanation for ball lightning: it's "burning dust" or "fluffy silicon" freed from minerals in the soil. Read all about it in [FutureFrame](#).

February 4, 2000. Homeopathy for horses: is it "veterinary voodoo"? Not according to the Alternative Veterinary Medicine Centre in Oxfordshire, England. So-called "alternative" medicine for pets and farm animals is apparently widespread and growing in the land of *All Creatures Great and Small*. (I know; James Harriot worked in the *Yorkshire* dales and that wasn't his real name.) Read all about it in the [Observer](#).

[thanks to Tim Boettcher]

February 3, 2000. Alfredo Barrago, an Italian magician, is busy demonstrating how to fake tears of blood on statues, according to [The Sunday Times](#). Who is responsible for this weeping statue hysteria? The Vatican should shoulder some of the responsibility. The Sunday Times reports that Since 1830, the Vatican has approved 15 "authentic apparitions" by the Virgin Mary one "authenticated weeping Madonna," a statue of the Virgin Mary at Siracusa in Sicily which allegedly "wept blood" in 1954.

[thanks to Jon Henrik Gilhuus]

February 1, 2000. The [Denver Post](#) reports that [Colorado College](#) is using Lego-building to help "identify initiative, leadership and an ability to work in groups" in lieu of the SAT and ACT test "in an effort to attract minority and disadvantaged students."

[thanks to Antonio Ramirez]

January 31, 2000. [The New York Times](#) reports on the growing acceptance of "alternative" medicine. It's claimed that some \$27.2 billion was spent by Americans in 1998 on such therapies as [chiropractic](#), [traditional Chinese medicine](#), [homeopathy](#), [naturopathy](#) and [massage therapy](#). The National Center for Complementary and

Alternative Medicine now has a budget of \$68 million a year, thanks to a Congress which knows which way the wind blows. It even has a "respected virologist," Dr. Stephen E. Strauss, as its director.

A 1998 survey of more than 2,000 adults was conducted by Dr. David Eisenberg, director of the Center for Alternative Medicine Research and Education at Beth Israel Deaconess Medical Center in Boston. Eisenberg "estimated that 46 percent of the American population had visited a practitioner of alternative health care in 1997, up from 36 percent in 1990."

Experiments are now being done with placebo [acupuncture](#), ginkgo biloba, [St. John's wort](#), [shark cartilage](#) and [qi gong](#).

The article notes that in 1994 Congress passed a law that "permits manufacturers to make claims about health benefits for herbal medicines whose safety and effectiveness have not been proved by the usual standards applied to prescription drugs." The need for testing the wild and unsubstantiated claims of alternatives became greater than ever.

There are a couple of sane voices in the wilderness, however. Dr. Victor Herbert of the Mount Sinai School of Medicine calls the center on alternative medicine "a worthless waste of money" that was "set up to promote fraud." And Dr. Marcia Angell, editor of *The New England Journal of Medicine*, said "the center had so far failed to publish any significant articles in scientific journals." "The proof is in the pudding," Dr. Angell said. "Just show me the papers."

Yes, the article does mention the [placebo effect](#).

January 28, 2000. [CNN.Com](#) reports that New York City is trying to get some people off its welfare rolls by giving them job training as "psychics." In case you're wondering, psychics make about \$10/hour and must have "a caring and compassionate personality" and the ability "to read, write and speak English." [thanks to John Collin]

Only hours after this story broke, NYC announced it was halting the psychic trainee program, according to [ABC.com](#). [thanks to Jon Henrik Gilhuus]

January 24, 2000. The [Independent News \(UK\)](#) reports that there are homosexuals in Scotland and some of them are priests. They also report that at least one Cardinal is not happy about this state of affairs.

January 23, 2000. [NYPost.Com](#) reports that "complementary" and "alternative" medicine is on the rise in the Big Apple, right down to using feng shui to decorate the offices. In another article, [the Post warns](#) that herbs can be hazardous to your health.

Meanwhile, [the \(London\) Sunday Times](#) reports that churchmen are outraged at a proposal to dump AD (as in Anno Domini, year of the Lord) for CE (the common era). Such a change would avoid the inconvenience of trying to find a new starting

date for the calendar, and while keeping dates in harmony with the Gregorian calendar the CE designation would avoid associating itself with the notion that the turning point in all history was the birth of Jesus Christ.

reader comment

26 Jan 2000

The AD vs. CE debate reminds me of what James Randi wrote about a talk he gave to a religious anti-cult group. Coming from a skeptical view point the talk he gave offended some of the members of the religious group, so his keynote address was not mentioned in the newsletter following the event. Randi remarked that by ignoring his participation the group was attempting to change the truth, just like the cults did.

Like it or not the reason the Gregorian calendar created the split in dates was because of Christ. Why does CE divide the dates at the same time? Only because that's what the Gregorian calendar does, so really it's based on the same thing. The year one was created because our society has been influenced by a belief in Christ (whether a true belief or not). To say change our dating designation to CE denies that a belief in Christ has influenced our society. Sounds like revisionist history to me.

Tim Boettcher

reply: I don't think the AD/BC dating system means Christ "influenced" western civilization, but that all historical time should be measured in terms of those who lived before salvation was possible and those who lived after the Savior arrived. Thus, those who do not accept Jesus Christ as their true Lord and Savior must nevertheless pay homage to this notion whenever they date an event as BC or AD. Using CE and BCE avoids the tediousness of having two dating systems while providing a "neutral" way of identifying dates, i.e., neutral with respect to the belief in Jesus Christ as the Lord and Savior of all mankind.

January 22, 2000. Real estate agents in London aren't too happy with the increasing popularity of [feng shui](#) experts being consulted by house seekers, according to the [Sunday Times](#).

January 21, 2000. [CNN.Com](#) reports that at least one pharmaceutical firm is treating herbal medicines like traditional ones. "CVS Corp. of Woonsocket is asking customers to tell their pharmacists what herbal supplements they use. The information is entered into a computerized program that cross-checks them for adverse combinations."

Probably of more importance is [another CNN report](#) that "version 5.0 of America

Online's Internet software -- which a national technology magazine this week suggested was "the upgrade of death" -- sometimes cripples existing Internet accounts with rival companies and prevents current AOL users from signing for service with competitors."

January 20, 2000. According to the [Nando Times](#), The Intercollegiate Studies Institute of Wilmington, Del., a conservative academic think tank, has named Margaret Mead's 1928 treatise, *Coming of Age in Samoa*, the worst nonfiction book of the past 100 years.

January 19, 2000. [The Washington Times](#) reports on how to cure skepticism: be declared the reincarnated spirit of a king and have a few thousand people worship you.

January 18, 2000. Britain is repealing part of the 1780 Sunday Observance Act and will now allow dancing on Sunday nights, according to the [Sunday Times](#). What next? the king to be coronated by a gay rights minister? [Not likely](#).

January 18, 2000. Any nut in a storm. That seems to be the motto of the National Center for Complementary and Alternative Medicine. They've committed over \$1.4 million over five years to study the crackpot cancer "cure" of Nicholas J. Gonzalez, who uses a variation on the [Max Gerson treatment](#) of coffee enemas and vitamins. Read all about it in the [WashingtonPost.com](#). The fact that Gonzalez has already been convicted of incompetence and malpractice does not seem to bother those spending other people's money on this bogus research.

January 12, 2000. The latest print issue (February 2000) of [Brill's Content](#) has a new look and a new motto: **Skepticism is a Virtue**. In a two-page promo for itself, the magazine lauds the many virtues of skepticism.

January 12, 2000. The UK [Sunday Times](#) reports on the Catholic Church's continuation of the Inquisition, now called the Congregation for the Doctrine of the Faith (CDF). A nun has quit her religious order rather than submit to the CDF's demand that she publicly recant her views on birth control and women priests. This should improve the Vatican's continuing efforts to ward off criticism that it is archaic, hopelessly outdated, and on the cutting edge of repression and invidious discrimination.

In an unrelated story, it is also [reported](#) that congregations in English churches are losing 2,000 members a week.

In another unrelated story it was [reported](#) that there are more divorces among America's born-again Christians than among atheists. Even Mormons (24%) have a higher divorce rate than atheists (21%). (Though, if one accounts for the margin of error--not given in the report--I'm sure that there is no significant difference between the divorce rate for Mormons and for atheists.)

[thanks to Jon Henrik Gilhuus]

January 12, 2000. Marjorie Miller of the *Los Angeles Times* reports that [David](#)

[Irving](#), an English historian and author of books on Hitler and Goebbels, and [hero to Holocaust Denial advocates and anti-Semites everywhere](#), is suing historian Deborah Lipstadt for libel. Professor Lipstadt of Emory University calls Irving "one of the most dangerous" Holocaust deniers in her 1993 book [Denying the Holocaust: The Growing Assault on Truth and Memory](#) (Free Press). She has also claimed that Irving twists historical evidence to fit his own political views, which have been described as akin to Nazism.

Though it has been nearly seven years since Lipstadt's book was first published, Irving has had to wait to sue her because the book has only recently been published in the United Kingdom, where libel laws are often successfully used to silence critics. The burden of proof is on the defendant and public figures are not treated any differently than private citizens. In short, Irving figures he has a chance to win in England, whereas if he sued in the United States, he would probably end up like [Uri Geller did when he sued critic James Randi for libel](#).

The trial is likely to end up being a public debate over Holocaust denial. In his opening remarks, Lipstadt's attorney said that Irving is "not an historian at all, but a falsifier of history" and "a liar." Irving read a 55-page statement listing his important contributions to understanding the Holocaust.

[Irving denies that he is a Holocaust denier.](#)

[But he admits that he was wrong about some things.](#)

January 9, 2000. "Don't Worry About Vaccinations" is the title of a *Parade* magazine article by Dr. Isidore Rosenfeld. The author lists the main objections to vaccinations and responds to each of them. The main concerns are safety, effectiveness and necessity. Weighing the risks of being vaccinated versus not being vaccinated, Dr. Rosenfeld and most practicing pediatricians recommend 21 vaccinations for children by the time they are in the first grade. There are risks with vaccination, but there are also risks with not being vaccinated and the latter far outweigh the former, according to the American Academy of Pediatrics.

January 5, 2000. According to the [Washingpost.com](#), people are angry at Ed Yourdon, the MIT graduate and computer consultant who wrote *Time Bomb 2000*. The blurb on the back of the book says: "Saturday, January 1, 2000. Suddenly, nothing works. Not your phones, not the cash machine, not even your fancy new VCR." Some 250,000 copies of the book were sold over the past two years.
[thanks to Jon Henrik Gilhuus]

January 3, 2000. China has a state-sponsored bimonthly magazine devoted to UFO research which has a circulation of some 400,000, according to [ABCNews.com](#). China also has a UFO Research Association with a membership of some 50,000. According to the traditional Chinese lunar calendar, we are entering the Year of the Dragon, a time of tumult. One researcher is even investigating a report of an alien abduction in Beijing last month. The same researcher believes that "aliens may find China attractive for the same reason foreign investors and tourists do." They may, indeed.

More on China and UFOs from the [Christian Science Monitor](#).

[thanks to Jon Henrik Gilhuus]

December 27, 1999. According to [BBC news](#), a survey of leading religious leaders in England reveals that only 3 of 103 believe in the Biblical version of creation, only 13 believe Adam and Eve existed, and 25% reject the Virgin Birth story.

In an unrelated story, The [The Sunday Times](#) reports that the Archbishop of York and other Church of England bigwigs are calling for some rethinking on the union of church and state and for allowing British monarch to marry Roman Catholics.

[thanks to Jon Henrik Gilhuus]

December 27, 1999. The end of the world may not occur on January 1, 2000, according to the [Washington Post](#). This should be a great disappointment to the many prophets who, by their constant predictions, gnashing of teeth and finger pointing, seem to wish life would end sooner rather than later. It may seem sick, but the end-of-the-world prophets seem to be motivated by *hope* rather than *fear*. Bad luck to them all! And a Happy New Year!

[thanks to Jon Henrik Gilhuus]

December 23, 1999. According to [CNN.com](#), a Denver judge has ruled that an unattended crèche in the Denver City and County Building is ok but an unattended sign is not. I wonder if the content of the sign had anything to do with her ruling. It said "The 'Christ Child' is a Religious Myth. The City of Denver Should Not Promote Religion" and "There are no gods, no devils, no angels, no heaven or hell. There is only our natural world." The sign was the gift of Julie Wells, a member of the Freedom From Religion Foundation.

[thanks to Jon Henrik Gilhuus]

December 21, 1999. [Joe Firmage](#) has donated \$1 million to the Carl Sagan Foundation (CSF), a not-for-profit organization founded by Sagan's wife, Ann Druyan. Firmage calls Sagan "one of the greatest visionaries who ever lived." In a recent e-mailing, Firmage writes that "CSF is presently raising capital for a pioneering effort to transform the healing environment within a new children's hospital in the Bronx. Images of Cosmos and new learning tools from science have been designed into its walls, floors, ceilings, and systems, turning the sterile and frightening landscape of the hospital into a place of discovery and inspiration."

December 15, 1999. [Deaths, Deceptions and Dubious Claims Haunt Chiropractors' Bid for Academic Acceptance](#) is the heading of CANOES' [Spin Doctors](#), a Canadian Internet Network. The article by Paul Benedetti and Wayne MacPhail is a detailed critique of chiropractic and recent criticisms of it in Canada. They give special attention to the attempt of the Canadian Memorial Chiropractic College (CMCC) to affiliate with York University, a merger that now appears to be less imminent after some recent bad publicity, including a study which claims that chiropractic manipulation may cause as many as 150 strokes a year in Canada.

December 15, 1999. An interesting [lawsuit](#) against Scientology has been filed for the

estate of [Lisa McPherson](#), who was 36, when she died Dec. 5, 1995, under circumstances that indicate, at the very least, bad judgment regarding a mentally ill person, or perhaps even criminal negligence on the part of [several scientologists](#). The lawsuit gives a history of L. Ron Hubbard's organization. Among its claims: "Scientology is both immoral and socially obnoxious... It is corrupt, sinister and dangerous. It is corrupt because it is based on lies and deceit, and has as its real objective money and power...." And these are the more positive remarks....

homeopathy

7 May 2000

Hi!, I'm an Englishman, married to an Indian and currently staying most of my time in India. As you would expect I am in the midst of all kinds of weird beliefs but none as great as Homeopathy although Astrology runs it close as does Ayurveda' Truly the Land of the Gullible. I want to take a little mild exception to the article on Homeopathy. I quote

If people want to buy and drink lemonade which some aquatic entrepreneur has called a tonic that can cure warts, boils and cancer, let them. As long as their products aren't dangerous in themselves, and the government isn't using tax dollars to subsidize the fiasco, then let the buyer beware and let the lawyers be quiet.

I have seen a couple of instances during the time I have been here where Homeopathy has killed. Of course I cannot name names. However I point out that where people are gullible enough to believe that Homeopathy can cure them there must be thousands of undocumented cases where people have died because they were not referred to scientific doctors in time.

The products are dangerous in themselves in that they frequently postpone qualified scientific intervention until the condition becomes chronic or terminal.

**Roy Eagleton
Chandigarh (U.T.) INDIA.**

20 Sep 2000

Although it is amply clear that homeopathy is bogus, please be aware that, biologically speaking, one molecule per million can be a very effective quantity of a substance. Many biological molecules are present and very active in nanomolar (1/billion) or even picomolar quantity. Drinking an ounce of 1 micromolar nerve gas or plutonium nitrate would make for a very bad day.

What is more important to note is that many homeopathic remedies have zero molecules per dose. It seems essential is that the concentration of the remedy's main ingredient may be much much higher in the ambient air or water.

I use Ca ion concentration as an admittedly slightly off-topic example. Intracellular fluids contain very few free calcium ions; specifically, about one one-thousandth the concentration of Ca in the highest purity water reasonably attainable in a laboratory. Pure water (a practical impossibility) would be made unusable for many studies simply being left unsealed for, say, an hour in a completely still, completely sterile room.

The point being that your one to one bazillion dilution of Goldenrod pollen extract (or whatever) used for hay fever would be fatally adulterated (undiluted?, strengthened?) in the moment you cracked the seal on the bottle. (Especially in fall, when you would be using it, in the South.)

Given the opportunity to discuss homeopathy, I usually use terms such as "one molecule in an Olympic swimming pool." Although folksy, it is technically more accurate.

Thank you for a wonderful resource.

Mass Media Bunk

11

March 16, 2000. "Homeopathy - It's not wizardry; in fact, it's based on the same principle as vaccination" is the title of an article by Debra Ollivier for Salon.com. Homeopathy is *not* based on the same principle as vaccination. Homeopathy is based on a metaphysical belief that *like cures like*; vaccination is based on empirical facts regarding bacteria, viruses and the immune system. This is just one of several errors Ollivier makes in her panegyric to a pseudoscience.

According to Ollivier, Dana Ullman, an advisory board member of alternative-medicine institutes at Harvard's and Columbia's schools of medicine, is a leading spokesman for homeopathy. Ullman uses a musical metaphor to describe the homeopathic law of "similars":

If one piano is at one end of a room and if one strikes the C key, the C notes in another piano in the same room will reverberate. This experiment works because each key is hypersensitive to vibrations in its own key. This is called 'resonance.'

It is also called a false analogy. The human body shares almost nothing in common with a piano string, and reverberation is unlike anything in the body's natural healing system. The analogy may make sense to Ullman because he buys into the notion that homeopathy is a type of "energy medicine." Disease is caused by blockage of energy and health is restored when the energy flows freely. Ollivier claims that according to Andrew Weil (whose bunk we have noted before), "energy medicine" like homeopathy is one of the major medical developments of the 21st century.

Ullman's finest false analogy, however, is when he compares the work of infinitesimal amounts, sometimes equalling zero, of homeopathic substances, to tiny atoms containing vast amounts of energy.

There are many phenomena in nature in which extremely small doses of something can create powerful, even very powerful, effects....One certainly cannot say that the atomic bomb is a placebo just because some extremely small atoms bump into each other.

From this he concludes that we shouldn't dismiss the "successes" of homeopathy to the placebo effect.

Ollivier's article does provide some useful information, however. For example, did you know that Oscilloccocinum is the biggest selling homeopathic flu "medicine" in the U.S. and France. The stuff is made from the heart and liver of Barbary ducks. (I have no idea how the flu and these duck organs are similar. We may have to consult Edgar Cayce on that one.) And did you know that there are 700 homeopathic

veterinarians in France and 17 student chapters of the American Holistic Veterinary Medical Association among the 27 U.S. veterinary schools? Neither did I.

The article does have one skeptical paragraph (about 4% of the overall article). In the middle of her piece, Ollivier quotes Dr. Michel Tramos, a Paris general practitioner, who claims homeopathy is psychobabble, unscientific and its successes are due to the placebo effect. Ollivier made no effort to find support for Dr. Tramos's claims, as she was obviously too busy resonating to the vibes of Ullman's moronic metaphors. [thanks to Joe Littrell]

Another piece of bunk on homeopathy appears in [Wired.com](#): "Homeopathy -- Dilute And Heal" by Andy Patrizio. The focus of Patrizio's article is a book by Dr. Bill Gray called *Homeopathy: Science or Myth*. [Gray](#) claims to have earned an M.D. from Stanford Medical School in 1970 and to have been a homeopath for 27 years and he has rubbed elbows with several Nobel Prize winners. Dr. Gray may be a bit confused, however, since he claims that George Vithoulkas of Athens, Greece, who trained Gray in homeopathy, was a "1996 recipient of Nobel Prize for Alternative Medicine in Stockholm, Sweden." There is no Nobel Prize for Alternative Medicine. (Vithoulkas did receive some kind of recognition from the Right Livelihood Award Committee and apparently he did [address the Swedish parliament](#) but as far as I can tell he never received a Nobel prize for anything.)

Vithoulkas has no medical training but his claims go way beyond advocating homeopathy. He claims that western medicine not only does not cure diseases, but is the *cause* of most diseases.

Multiple sclerosis, a disease that eventually leaves its victims totally paralysed, is one which thousands of people are suffering from in the western world. Yet it is entirely unknown to Africans, Asians or South Americans, who have not had the 'benefit' of the excellence of western medicine. Amyotrophic lateral sclerosis, a terrible disorder of the neuromuscular systems, is also unknown to all these people. Myopathy and muscular dystrophy is the same, known only to westerners. Epilepsy, which is rampant in the western world, is seldom encountered in these countries. Anxiety neurosis, compulsive neurosis, and in general mental disorders of a severe nature from which millions of patients are suffering in the western world, are almost unknown in these groups that have not had the 'benefit' of modern medicine and vaccinations. Chorea and a host of other nervous system disorders are also unknown to them.

The model suggests that all these chronic diseases, including hay fever, asthma, cancer and AIDS, are the result of wrong intervention upon the organisms by conventional medicine. It claims that the immune systems of the western population, through strong chemical drugs and repeated vaccinations, have broken down and finally admitted the diseases deeper and deeper into the human organism, to the central and peripheral nervous system.

In short, this model claims that conventional medicine, instead of curing diseases, is actually the cause of the degeneration of the human race.

He even claims that he predicted the AIDS epidemic.

I had already, in 1970, predicted the appearance of AIDS, saying to a group of medical doctors in Athens that if conventional medicine continued to use antibiotics the way it did, there would come a time when the immune system would break down and new incurable diseases would emerge. It was an unfortunate but precise and timely prediction of the appearance of AIDS.

I don't suppose that he's noticed that [measles is rampant in Afghanistan](#) and AIDS is rampant in Africa where people die and unnecessarily suffer every day because of the lack of vaccination against preventable diseases such as polio and measles. Withoukhas has predicted that if western medicine doesn't change its ways the result will be that "most of the population on earth will be mentally ill individuals."

Withoukhas is only one of Gray's heroes. Another is Shui Yin Lo. I wonder if this is the same Lo who has been mentioned in these pages before in connection with [Laundry Balls](#). Has Lo moved on from the worthless laundry balls scam to an outfit called [American Technologies Group, Inc.](#) (ATG)? ATG sells several items for the automobile, including something called **The Force Formula 1 & 2** which allegedly "super charges" air coming into your engine. You stick **The Force Formula 1 and 2** in your air cleaner compartment and it "modifies the air taken into your engine, enhancing combustion and begins to purge internal moving engine components of the carbon buildup that impedes performance and damages parts.

According to Wired.com's [Patrizio](#), while working on a way to clean car engines for ATG, Lo claims to have found that "water molecules, which are random in their normal state, begin to form a cluster when a substance is added to water and the water is vigorously shaken -- the exact process homeopaths use to create their medicine."

Lo said every substance exerts its own unique influence on the water, so each cluster shape and configuration is unique to the substance added. With each dilution and shaking, the clusters grow bigger and stronger. This water, which homeopaths call "potentized," is considered "structured water," because the water molecules have taken on a shape influenced by the original substance.

The clusters start to assume a form that mimics the structure of the original substance itself. So even though the chemical can no longer be detected, its "image" is there, taken on by the water molecules.

There is an interesting site on the Internet which lists selected [classic papers in chemistry](#). None of the papers mentions Lo or "structured water." One wonders why Lo hasn't won a Nobel Prize for this discovery. Why hasn't he shared his discovery with the rest of the world? Why no publications? Why toil in relative obscurity for a company that sells car washes and fuel enhancers? Shouldn't Lo's paper on

"structured water" be a classic by now?

Patrizio, rather than ask to see the paper on structured water with the data proving Lo's claims, notes that the American Medical Association declined to comment on Gray's book. Patrizio does note, however, that the AMA "stated in its charter it was formed 'to stamp out the scourge of homeopathy'." Patrizio also quotes another M.D., Richard Sarnat, who has turned to ["alternative" medicine](#) and who claims that the theory of structured water is now proven. It isn't proven, but it should be a simple matter to prove it. There are dozens of homeopathic products on the market that are nothing more than vials of water. It should be a simple matter to examine the water in the vials and determine if the water has a different structure in the different vials. [thanks to David Ready]

reader comments:

19 Mar 2000

In your March 16th update to Mass Media Bunk, you mentioned George Vithoulkas had "forecasted" the AIDS epidemic. Other than it not being an epidemic of any proportion. Antibiotics stop bacteria not viruses. Basically meaning, the introduction of widespread use of antibiotics has had absolutely no affect on any virus. Whether it be the common cold or AIDS. If this dumb-ass had the schooling of an average teen he would have known that AIDS is caused by a virus (HIV) and not bacteria. Therefore immune to any antibiotic that has been made and will ever be made.

Here is a link that does a decent job of explaining what an antibiotic is for you people "like" George Vithoulkas.

<http://falcon.cc.ukans.edu/~jbrown/antibiotic.html>

**George Sopko
GSSL**

reply: In fairness to Vithoulkas, he does not claim or imply that antibiotics affect viruses. Immunizations are given to protect against viruses, such as the poliovirus which causes poliomyelitis. Another example would be being vaccinated with cowpox virus to immunize one against smallpox.

It is especially strange that he opposes vaccinations such as that for smallpox since many homeopaths think such treatments are examples of like curing like, and hence give validity to their pseudoscientific notions.

It is probably safe to say that Vithoulkas opposes the use of antibiotics, but he does not seem to confuse antibiotics with vaccinations against viruses.

February 18, 2000. Bob Ballard, he who found the sunken Titanic, knows how to get publicity. Just claim you're looking for [Noah's Ark](#) and the investors may follow

such journalistic luminaries as the [NYPost.com](http://www.nypost.com).

reader comments:

I recently became aware of your web site, and after reviewing for a short time, found a great deal of information that I agree with.

However, I take issue with your attack on Dr. Robert Ballard

reply: Attack?

I feel that your attack should be leveled at the NY Post editorial staff, for their complete and total misrepresentation of Dr. Ballard's work in their headline.

Dr. Ballard's group has not been looking for the Ark, per se. They have been looking for proof of a cataclysmic flood some 7,000 years ago, a flood that would have been the factual basis for the myths (in many cultures, not just Judeo-Christian ones) of a world-wide flood.

Furthermore, I doubt Dr. Ballard needs either publicity or investors, certainly not investors that would be attracted by a newspaper article.

Greg Stitz

reply: Get a grip, Greg. You're taking things much too seriously. You must not have read much of my stuff if you think this little ditty was an attack.

January 31, 2000. Our Lady of Guadalupe has left the tree bark in [Watsonville](http://www.watsonville.com) and has landed in an ice-cream spill on the cement floor of an apartment complex in Houston, or so says the [Associated Press](http://www.associatedpress.com).

[thanks to Tim Boettcher]

January 30, 2000. The *Kansas City Star* is spreading fear by making claims about an AIDS epidemic among Catholic priests in the U.S. The *Star* is basing its baseless claims on a few anecdotes and a very, very unscientific survey which they did themselves. There are some 50,000 priests in the U.S. The *Star* made no effort to do a random sampling and get a good cross-section of that population for its survey. Instead, the *Star* bases its claims on the 801 responses it got to a survey about priests and their sexual behaviors that had been mailed to 3,000 priests.

How serious the AIDS problem is among priests will not be discovered by studying the *Kansas City Star's* report.

You can read about it in the [Nando Times](http://www.nandotimes.com). (The *Sacramento Bee* headlined the story with **AIDS ravaging U.S. priests, report claims**)

January 19, 2000. The [WashingtonPost.com](#) had nothing on feng shui today, I guess, so they wasted a lot of space with a story about a pet psychic. Speaking of [feng shui](#)....

January 18, 2000. [CNN.com](#) reprints a story from Catherine Rauch of [WebMD](#) that gives credence to the foolishness of William Harris, Ph.D. who claims: "Prayer *may be* an effective adjunct to standard medical care." (Note the weasel words.) His evidence? Harris and his team had people pray for the speedy recovery of some 500 cardiac patients who were compared to 500 who didn't have a special prayer group. The results? "In Harris' study, the length of the hospital stay and the time spent in the cardiac unit were no different for the two groups." So, how did he conclude that prayer might be "an effective adjunct to standard medical care"? He nosed around with the data until he found a list of factors that made it appear that the group receiving prayers fared 11 percent better than the group that didn't. This isn't even junk science; it's joke science.

My comments on this study when it was first published may be found at [Mass Media Bunk 10](#).

update (Aug. 11, 2001): According to [CSICOP](#): "On Monday, August 13, ABC will be airing segments featuring the intercessory prayer research of Dr. William Harris, professor and director of the Metabolism and Vascular Laboratory at St. Luke's Hospital in Kansas City, Missouri. The segments will appear on "Good Morning America" between 7 a.m. and 9 a.m., and on "20/20 Downtown" at 8pm EST."

[Thanks to Jon Henrik Gilhuus and Barry Karr]

further reading

- [Mass Media Funk 14](#) - "religious" people live longer!

January 14, 2000. On the front page of the *Sacramento Bee* today is a news article about a touring reliquary that is coming to town tomorrow. The bones of a nineteenth century French person, who died at the age of 24 from tuberculosis, are on tour in the United States. Over one million people have come to see these bones and chunks of hair dug up from her grave about a century ago. That doesn't make them quite as popular as the Beatles, but 75,000 showed up in Detroit to view the relics. That's up there with any rock band. (At least the *Bee* must think so. They had a full page story on the 15th and another story on the 16th, each with color photos, on the traveling religious freak show.)

The bones are traveling across the country in the "Therese Mobile" (named after the woman whose bones these used to be) driven by a priest who does interviews on the road via his cellular phone. The reliquary, a gilded jacaranda casket insured against fire and theft, is guarded by colorfully attired Knights of Columbus when it arrives at the various viewing stations on the itinerary. Commemorative T-shirts of the tour are available.

Who was this Therese? She was a girl of fifteen when she entered the Carmelite nunnery. The story is that her prioress ordered her to keep a spiritual journal while she was dying. The journal became a hit, numerous [miracles](#) were said to have occurred because of Sister Theresa's intercession, and in 1925 she was canonized by the Roman Catholic Church and has been known as *Saint Therese* ever since.

I wonder what this prayerful recluse would think of a taking her bones on tour like some rock star in a material world to juice up the faithful?

January 5, 2000. Fifty years ago, China banned [feng shui](#) as a pernicious superstition and many [geomancers](#) headed for Hong Kong where there are now some 10,000 practitioners catering to the 90% of the population who are believers, according to [CNN.com](#).

David Groves of the Los Angeles Times Syndicate, who wrote the CNN piece, gushed over a geomancer he interviewed: he was told he had a bad back, a bad temper, and bad nights. One out of three isn't bad: Groves has bad nights. The cure? He was told to place two jade statuettes and a brass icon in the corners of his room and to place a standing light fixture with nine bulbs in the center of his living room. He doesn't tell us whether he took the cure or not.

He was also told that his kitchen faucet must point away from the stove in order to control his temper by not allowing fire and water to meet. Groves doesn't mention whether he has a bad temper or not, nor does he show any skepticism about the [sympathetic magic](#) behind the advice.

[thanks to Jon Henrik Gilhuus]

December 27, 1999. [The Washington Post](#) is now serving up astrology big time ... and [CNN.com](#) is praising the rise of alternative medicine: They quote John Weeks, healthcare consultant and publisher of the *Integrator for the Business of Alternative Medicine*, as saying that "What was...considered quackery or fraud [in 1989]... is

now being viewed as a normal part of doing business among insurers and others in the delivery side of medicine." This is progress?

[thanks to Jon Henrik Gilhuus]

December 24, 1999. Ten people died and 753 survived the sinking of a ferry in the Philippines. According to [CNN.com](http://www.cnn.com), Philippine Defense Secretary Orlando Mercado said that the ten dead were "a Christmas gift from above" since they were all evil people anyway, especially the two children, who probably would have grown up to be murderers, drug dealers, or televangelists. Those who survived were described as deserving a brush with death to remind them who is in charge. "None of the survivors deserved to live," said a passerby. "They obviously didn't pray hard enough."

Actually, the survivors were claiming that God saved them because they are special and Mercado claimed the survivors were given a Christmas gift from God.

Such rationalizations are wondrous, indeed: searching for meaning in the meaningless and praising God when we should be blaming some of our own species. Such self-deception may have psychological value, but it diverts our attention from where it should be focused: on other human beings. It does get worse, though. Check out [Time's](http://www.time.com) story on Darrell Scott, father of Columbine murder victim Rachel or [ABCNews.com's](http://www.abcnews.com) story about a woman who awakes from a semi-coma after 16 years. It's a miracle when she awakes but nobody blamed God when she went to sleep for 16 years.

[thanks to Jon Henrik Gilhuus]

December 8, 1999. [NYPost.com](http://www.nypost.com) features Jane Seymour in defense of alternative medicine (AM). She played Dr. Quinn Medicine Woman on the popular TV series of that name. Her faith in AM is based on several anecdotes. She claims that an alternative therapy involving a massive injection of vitamin C into her father who was dying of cancer "saved his life." He died five months later of a heart attack. The fact that his traditional doctors didn't give the old man (he was 73 when he died) much time and the fact that he perked up for a few months after the AM treatment, convinced her that AM works. There's little doubt that the two-week treatment gave the old man hope and his depression lifted, making it possible for him to not just give up and die on the spot. But it didn't cure anything and the poor fellow died within months of his diagnosis. For all Seymour knows, the vitamin C injections weakened his heart and killed her father sooner than the cancer would have. (I'm only suggesting that the logic for such a conclusion would be as valid as the logic she used to reach hers.)

Were this just a matter of Seymour's personal beliefs, I'd ignore her, but she is on a campaign to get increased funding for research into herbal treatments and homeopathy, which she believes "can work miracles when combined with conventional remedies." She has also testified before a Congressional committee that "natural remedies saved her father when he was at death's door," a claim which at best is misleading and at worst is a lie.

Seymour's second anecdote involves her mother, who she claims had rapidly deteriorating eyesight due to [macular degeneration](#). Her mother was treated with [electro-crystal therapy](#), which involved placing crystals on her eyes and sending

electro-magnetic waves through the crystals. This alternative therapy was created by [Harry Oldfield](#) and is based on the belief in the healing power of [crystals](#). What wave frequency is used depends on one's [chakras](#).

Seymour does not mention what other treatments her mother was given, such as laser surgery, or how she knows the original diagnosis was correct. When she says that her mother's vision is "back to normal" what does that mean? Is this claim based on a vision exam or on her mother's word that she sees "fine" now? People with vision problems often report that they can see fine, either because they think they really can see fine or because they don't want to admit to themselves or let others know how serious their vision problem is.

Seymour's third anecdote comes from her sister, a homeopathic nurse, who reports that homeopathic remedies dramatically reduced swelling after brain surgery for an aneurysm. How she knows this is not clear.

A fourth anecdote involves Seymour's daughter. When she had her wisdom teeth extracted, Seymour "gave her the homeopathic remedy [arnica](#) and she had virtually no swelling." *Virtually* no swelling means she had swelling. I wonder if her daughter was given anything else besides arnica or if the surgery was done without anesthesia.

Let's hope Congress invites some real authorities and experts the next time it has hearings on how much of our tax dollars it should waste on homeopathy and other quack remedies.

[thanks to Jon Henrik Gilhuus]

December 1, 1999. [Reuters and ABCNews.com](#) announced that

Acupuncture relieves pain and a scan of brain activity proves it, researchers said today.

Huey-Jen Lee and a colleague studied 12 people, had no control group, but since they used high tech MRI equipment they must be doing good science. Here is what they did. They used

a filament to touch [the subjects'] upper lips, then detected the associated increases in brain activity with a magnetic resonance imaging device. As the subjects' pain was relieved with acupuncture needles placed between thumb and forefinger, images taken of their brains showed the activity diminishing. The pain-induced activity subsided in 60 percent to 70 percent of the entire brain during treatment with acupuncture needles, the researchers said.

What we will never know, because there was no control group, is what the brain would do in time when no acupuncture was applied. Perhaps it would show a decrease in brain activity as the pain subsided. In any case, we already know that [acupuncture can reduce pain](#).

[thanks to Jim Stroud and Jon Henrik Gilhuus]

November 30, 1999. PC Computing's Gordon Bass has jumped on the cell phone

alarmist bandwagon. [Is Your Cell Phone Killing You?](#) he asks in the title of his article. Yes, he answers in a maze of technical jargon that sounds impressive until you read between the lines. (Or *next* to them, where there was a link to the hottest selling cell phones, in case you are inspired to buy one while reading the article that tells you how you might be killed if you do so. The ads had been removed when checked later.)

Bass resurrects [George Carlo](#), still searching for research money, to stoke the fires of fear.

"We found evidence of genetic damage in human blood," said George Carlo, WTR's chairman. "We have suggestions of excessive mortality from brain cancers among wireless phone users, and we have very clear evidence of a statistically significant higher risk of neuroepithelial tumors. We now have more data suggesting problems with wireless phones than the FDA had when it banned silicone breast implants."

I certainly don't doubt the last claim, but I wouldn't brag about it. The FDA should not have banned [silicone breast implants](#). He's "found evidence" and there are "suggestions" and "clear evidence of statistically significant higher risk," etc. What he hasn't found is clear language that states that the research is very preliminary and that there is not a great body of evidence that warrants banning cell phones. I will agree that there is as much evidence to fear cell phones as there is to fear computers and their peripherals, as well as other household gadgets that emit electromagnetic radiation in doses that would make your breast implants curl.

What is most amusing about this article is how it represents the absurdity of modern journalism. The author claims that Motorola is suppressing evidence of cell phone harm, but there is a link to Motorola in the article which takes you to [another ZDNet page](#) where you can find out such things as the latest price of Motorola stock (118 9/16, up 1 5/8, apparently the news hasn't filtered down to the stockholders) and reviews of Motorola cell phones.

[More bunk](#) 

houris

*Surely those who guard (against evil) are in a secure place, In gardens and springs;
They shall wear of fine and thick silk, (sitting) face to face; Thus (shall it be), and We will wed them with Houris pure, beautiful ones. --The Qu'ran (44.51-54)*

Houris are beautiful black-eyed virgins believed by some Muslims to be waiting in heaven for the enjoyment of the faithful, especially men who die as martyrs. According to the [Qu'ran](#), the houris have never been touched by man or [jinn](#) (55.56).

Many Muslims and non-Muslims alike believe that terrorists who commit murder and suicide in the name of Islam commit their [sins](#) in order to gain instant admission to heaven, where they will enjoy many houris. According to [Sheikh Abdul Hadi Palazzi](#), an Islamic scholar and secretary general of [the Italian Muslim Association](#)., the belief in a sensuous afterlife filled with houris is based upon a [hadith](#)

collected by Imam at-Tirmidhi in “Sunan” (Volume IV, Chapters on “The Features of Heaven as described by the Messenger of Allah”, Chapter 21: “About the Smallest Reward for the People of Heaven”, hadith 2687) and also quoted by [Ibn Kathir](#) in his Tafsir (Koranic Commentary) of Surah Rhman (55), ayah (verse) 72:

It was mentioned by Daraj Ibn Abi Hatim, that Abu al-Haytham ‘Adullah Ibn Wahb narrated from Abu Sa’id al-Khudhri, who heard the Prophet Muhammad (Allah’s blessings and peace be upon him) saying, ‘The smallest reward for the people of Heaven is an abode where there are eighty thousand servants and seventy two wives, over which stands a dome decorated with pearls, aquamarine and ruby, as wide as the distance from al-Jabiyah to San’a.

This sounds like hearsay three times removed, but in any case the reward is obviously not restricted to those who die for the faith. Hence, it seems unlikely that anyone but the [terminally perplexed](#) would interpret this to mean that committing murder or suicide for Islam will automatically gain one many servants and a harem of houris.

reader comments:

Jean Houston

20 Aug 1999

I went to a Jean Houston weekend at Rowe Conference Center in Rowe Ma. I have to say I think she is a pathological liar. She was very entertaining, augmenting what amounted to a two day lecture with music and sound effects provided by a sound engineer. Every now and then we would get up and dance around or play some silly game. She carts an actress around with her who she improvises with.

We had a good time, fooling around, and all but I became convinced that her anecdotes and personal history were bogus. They were all very puffed up and filled with encounters with the famous or the notorious. She made some comment about Eleanor Roosevelt

" Who here lived in New York City in the 1950's? Well, then you knew Eleanor Roosevelt, right? Of course you did, everyone did, she was around....."

and although people looked bewildered they all nodded in agreement. In private conversations with Ms. Houston it became clear that she was only interested in people with advanced degrees or who spoke ancient languages....like she was collecting people so she could borrow glory. She also made this astonishing admission: She goes into child oriented chat rooms masquerading as a 12 year old boy.

I felt a sense of "buyers remorse" after this weekend. And to think...I passed up the Patch Adams session for Jean Houston!!

Janet Kingan

[The Hundredth
Monkey and Other
Paradigms of the
Paranormal, ed.
Kendrick Frazier
\(Buffalo, N.Y.:
Prometheus Books,
1991\).](#)

the hundredth monkey phenomenon

The hundredth monkey phenomenon refers to a sudden spontaneous and mysterious leap of consciousness achieved when an allegedly "critical mass" point is reached. For example, people start thinking about ending world hunger. One person gets another to start thinking about it who gets another who gets another not ad nauseam or ad infinitum but until suddenly a breakthrough is achieved when the "critical mass" point is reached. Then, spontaneously and mysteriously, everybody starts thinking about ending world hunger.

The expression "**hundredth monkey**" comes from an experiment on monkeys done in the 1950's. It was alleged by Lyall Watson in his book *Lifetide* that one monkey taught another to wash potatoes who taught another who taught another and soon all the monkeys on the island were washing potatoes where no monkey had ever washed potatoes before. When the hundredth monkey learned to wash potatoes, suddenly and spontaneously and mysteriously monkeys on other islands, with no physical contact with the potato-washing cult, started washing potatoes! Was this monkey telepathy at work or just monkey business on Watson's part?

It makes for a cute story, but it isn't true. At least, the part about spontaneous transmission of a cultural trait across space without contact is not true. There really were some monkeys who washed their potatoes. One monkey started it and soon others joined in. But even after six years not all the monkeys saw the benefit of washing the grit off of their potatoes by dipping them into the sea. Lyall made up the part about the mysterious transmission. The claim that monkeys on other islands had their consciousness raised to the high level of the potato-washing cult was a lie.

The notion of raising consciousness through reaching critical mass is being promoted by a number of New Age spiritualists, including Ken Keyes, Jr. Mr Keyes has published a book on the WWW which calls for an end to the nuclear menace and the mass destruction which surely awaits us all if we do not make a global breakthrough soon. The title of his treatise is [The Hundredth Monkey](#). In his book he writes such things as "there is a point at which if only one more person tunes-in to a new awareness, a field is strengthened so that this awareness is picked up by almost everyone!" Well, it seems to be working for spreading the word about the hundredth monkey

phenomenon! In fact, there seems to be no end to those seeking spiritual transformation of themselves and the universe. Witness the [M100 or Hundredth Monkeying! project](#). "Our prayer is to bring benefit to all of world society without prejudice or bias." Who could complain about such a goal? If you want more information on hundredth monkeying, you should read [Morphogenetics and Monkeys](#). It has all the latest stuff on *building up your inner-energy field*, *doors of perception*, *healing* and the *millennium*. It must be very exciting to be part of a global fellowship of soul nourishers. As the Monkey Man says: "...healing the human heart is central to all other necessary changes in the twenty-first century." Amen.

Too Good to Be True

[Truster \(DontLieToMe.com\) & Computer Voice Stress Analyzer](#)

"**Truster** is a fully computerized voice stress analyzer that allows you to detect the truth instantly."

Sound too good to be true? The best part is that it only costs \$89. It was \$189, according to the ad. According to a [competitor](#), the Truster used to sell for as much as \$2,500. Business might have dropped off when they issued a Hot Press Release announcing they'd analyzed President Clinton's denial of having had sexual relations with "that woman," Monica Lewinsky. According to the Truster, Clinton was telling the truth.

What is a voice stress analyzer, you might wonder? It is a machine that measures components of the human voice--frequency modulations--that are correlated with stress. No machine can detect stress directly, much less distinguish whether the stress is due to lying, guilt, stutter, fear, constipation, or some other emotion or physical condition. The frequency modulations, called "micro tremors" by those who measure them, must be interpreted by a human being. The machine doesn't do the analysis, the examiner does.

The Truster is manufactured by Makh-Shevet of Israel. It is not the voice stress analyzer of choice among American law enforcement agencies, however. That honor belongs to the machine manufactured by the swell-sounding [National Institute for Truth Verification \(NITV\)](#) of West Palm Beach, Florida, which sells its **Computer Voice Stress Analyzer (CVSA)** for [\\$9,250](#). NITV also charges \$1,215 per student for a six-day training session. NITV claims that over 800 law enforcement persons are using their machines. The CVSA is a digital device run with software on a laptop, making it very convenient and easy to take anywhere. Furthermore, it can be hooked up to a tape player, making it unnecessary for the subject to be present while getting a truthover. The computer "processes these voice frequencies and graphically displays a picture of the voice patterns." The display can be printed out, as well.

How accurate are the voice stress analyzers? According to Gary Baker of Baker Associates

Hundreds of professional studies in the fields of law enforcement, medicine, psychiatry, psychology, military, business, security, pharmacology, and government have consistently shown VSA validity,

reliability and accuracy at above 96%.*

Unfortunately, Mr. Baker doesn't mention any of these studies so I can't refer the reader to them. However, an expert in these matters did a [SCAN](#) of the above statement and determined that it is most probably false.

Just how deceptive is the advertising for the Deception Detector? NITV claims

Unlike the polygraph, drugs do not affect the results of the exam and there are no known counter-measures that will cause the ubiquitous "inconclusive" results associated with the polygraph.*

It's true that VSA does not allow an "inconclusive" reading. The investigator, however, has three options. He or she may conclude "Deception Indicated" or "No Deception Indicated", or " No Opinion - Additional Testing Required." Technically, having no opinion is not the same as being inconclusive, but the consequence is the same: the subject neither passes nor fails the Truth Test and gets the equivalent of an Incomplete grade.

Needless to say, NITV had no more difficulty finding law enforcement people to [endorse](#) this new device than did Wade Quattlebaum for his [Quadro Tracker](#). Again, we have to ask: why are law enforcement personnel especially gullible when it comes to pseudoscientific devices such as these? The fact is, it is not just law enforcement who are seduced by the promises of a quick and dirty test to tell who is lying. Devices such as these are used by retailers, law firms, small businesses, large corporations, and the military. One hopes this wide array of users is indicative of cynicism and a low opinion of those the device is used on, rather than a sincere belief in the scientific validity of the machines.

One would hope any scientist would recognize that since several equally plausible factors can cause what they are observing *in every single instance* there can be no theory to support a method for distinguishing "micro modulations" caused by the stress caused by lying. Such modulations will appear identical to those caused by constipation, fear, test anxiety, etc. It must always be the *judgment* of the investigator that identifies any voice modulation as due to lying and that judgment *of necessity* must be based upon something other than the output of the machine. What is it? Body language? The [blue sense](#)? Sometimes, no doubt. But the fact that many people who are subjected to Truth Detection tests actually believe in the validity of the tests and are often frightened into confessing may play a role in the popularity of these machines. Supporting this notion is [the kind of evidence NITV puts forth to demonstrate how their machine solves cases](#). In every case, the bottom line is that the suspect is confronted with the results of the CVSA exam and then confesses.

hypnosis

31 Dec 1997

Responding to your piece on hypnosis. I am in agreement with everything you say, especially with regard to all the repressed memory nonsense, trance-state theories, and the like. I use hypnosis in therapy with brain injured patients, chronic pain patients, and anxiety patients. Hypnosis, like you say, is not a special trance-like state, but it is an enhanced state of attention. Such a state can be induced by a good TV show, an interesting conversation, a good book, etc. In a hypnotherapy session, the therapist, with the help of the client, uses this state to help the client achieve behavior or emotional change. It is a client-centered process, and all clients are taught self-hypnosis, which is nothing more than teaching them how to gain better control of their own emotions, and apply it in the real world. Nothing mysterious. Well-controlled clinical experimental studies have shown that the addition of hypnosis to psychotherapeutic procedures makes them more effective.

You make a lot of good points, but don't throw it out entirely.

Robert M. Stein, Ph.D.

Center for Neurobehavioral Health, Ltd.

Lancaster, PA

reply: I agree that hypnosis has its uses in some forms of behavior modification. My main concerns are with claims that hypnosis brings about an altered state of consciousness and such associated claims as mind control or being able to communicate directly with the unconscious mind, reservoir of deep truths and memories of evil.

12 Sep 1997

I am greatly impressed by your lack of scholarly understanding of hypnosis. I would like to refer you to the work of the late Dr Milton Erickson and Dr Ernest Rossi as well as the American Society of Clinical Hypnosis (a nonprofit PROFESSIONAL organization). Regarding false memory syndrome: do you actually know of any hypnotherapist who "nurtures delusions of evil suffered" in their clients, thus doing "irreparable harm" ??? I think this is speculation on your part. People are motivated basically by two things: fear and/or self interest. It is obvious to me that you are misleading your readership.

Ken Steinmetz, CHT

San Francisco

reply: let me guess what motivates you: not fear. As for the reports of misuses of hypnotherapy, I refer you to Dr. Sanger's book on *Crazy Therapies*, to numerous reports from the American Psychological Association and to cases which have gone to trial and have been widely reported in the mass media.

14 Jan 1998

I wanted to respond to a comment made by Ken Steinmetz in his September response to the Hypnosis article. He said: "Regarding false memory syndrome: do you actually know of any hypnotherapist who 'nurtures delusions of evil suffered' in their clients, thus doing 'irreparable harm' ???? I think this is speculation on your part."

I know of one particular person who does precisely that: Budd Hopkins.

Well, OK, I don't know if he still uses hypnotism to do his dirty work, but I know that he used to. Perhaps he's been more careful lately to just "counsel" abductees rather than hypnotize them. I read a great book by Phil Klass (formerly of CSICOP) on the subject a few years back, and he detailed Hopkins' one-man crusade to convince the public that we were all abducted. Hopkins is one of those folks who are on my "people who should be stopped with a restraining order" list.

Budd fits Ken's description perfectly. He nurtures delusions of evil suffered, and does irreparable harm to his clients by making them think that they underwent horrible experiences that never really happened to them. People who've been convinced that they were abducted tend to be worse off than they'd be if they weren't. Would you hire somebody who put "anally probed by aliens" in the "extracurricular activities" section of his job application?

I know Budd is mentioned in the Skeptic's Dictionary, in the [review of the Nova program on Alien Abductions](#). I was surprised, however, that he didn't get a direct link in the "H" section of the index.

Tony Fabris

reply: Hopkins fits the bill but he is not a therapist.

Ica stones

16 Dec 1999

The subject of the authenticity of these artifacts and what they may represent has been a topic of debate at an online forum. There I have posted the following:

Reposting some very relevant info regarding these "Ica stones." Every time I see another photo of one, my eye catches design elements or direct copies of images published in African Designs from Traditional Sources by Geoffrey Williams (Dover Publications, 1971). Dover released many books of this type as source material for artists; they are copyright free. I see the same designs used many places - I have used them myself.

Helen earlier commented on the fact that the stone artists must have seen something to inspire them. They did - and the exact source has inspired many of us.

The people who recently carved these 'curios' for collector's market (good money in this) obviously liked the style of Senufo, Ivory Coast art. The fact that these stones also depict people with dinos tells me that they were commissioned to provide 'evidence' for someone with an agenda. They are fraudulent.

Feel free to check me on this... it is only [\\$7.96](#) at a well known online bookstore.

reply: I did, and I couldn't find any design in the book that even vaguely resembled any of the pictures of the stones I've seen.

While I have offered this 'witness' to fundamentalist Christians (who feel, for some reason, that their arguments are bolstered with questionable evidence), I am completely ignored. So it goes. The image you have placed with your article on this subject is a very close copy of a Senufo fish design of Ivory Coast. It is this one which first caught my attention - then I identified many more as Senufo. They are all from widely available Dover books. I am glad to be able to share this with you... before I myself lose interest due to the evident disinterest of others.

Michael Emory

reply: This Senufo fish design isn't in the book you recommend.

[Exhuming the Truth
Ben Erskine says he's
the swami's love child
and he wants a
chance to prove it.](#)
[BY RON RUSSELL](#)

incorruptible bodies

Incorruptible bodies are whole human bodies or parts of human bodies which allegedly do not decay after death because of some supernatural power which makes them apparently immutable.

The [Catholic Church claims](#) there are many incorruptible bodies and that they are divine signs of the holiness of the persons whose bodies they used to be. Perhaps, but they are more likely signs of careful or lucky burial, combined with ignorance regarding the factors that affect rate of decay.

For example, the severed head of King Charles I of England was exhumed after 165 years and according to the royal surgeon Sir Henry Halford

The complexion of the skin was dark and discolored. The forehead and temples had lost little or nothing of their muscular substance; the cartilage of the nose was gone; but the left eye, in the first moment of exposure, was open and full, though it vanished almost immediately: and the pointed beard, so characteristic of this period of the reign of King Charles, was perfect. [The head] was quite wet, and gave a greenish-red tinge to paper and to linen which touched it. The back part of the scalp . . . had a remarkably fresh appearance. The hair was thick . . . and in appearance nearly black. . . .*

The preserved head was due to accident and had more to do with how it was buried at St. George's Chapel in Windsor than to any special holiness of Charles I.

In 1952, there was a well-publicized case of an Indian Hindu in California who entered [mahasamdhi](#) and whose body, it was claimed, seemed incorruptible. [Paramahansa Yogananda](#) was the founder of the [Self-Realization Fellowship](#), which claims that

On March 7, 1952, Paramahansa Yogananda entered *mahasamadhi*....His passing was marked by an extraordinary phenomenon. A notarized statement signed by the Director of Forest Lawn Memorial-Park testified: "No physical disintegration was visible in his body even twenty days after death....This state of perfect preservation of a body is, so far as we know from mortuary annals, an unparalleled one....Yogananda's body was apparently in a phenomenal state of immutability."*

The statement of the director of Forest Lawn, Harry T. Rowe, is accurate, but incomplete. Mr. Rowe also mentioned that he observed a brown spot on Yogananda's nose after 20 days, as sign that the body was not "perfectly" preserved. In any case, the SRF's claim that lack of physical disintegration is "an extraordinary phenomenon" is misleading. (One wonders how much digging into the mortuary annals they did. Very little, I imagine.) The state of the yogi's body is not unparalleled, but common. A typical embalmed body will show no notable desiccation for one to five months after burial without the use of refrigeration or creams to mask odors. According to Jesus Preciado, who has been in the mortuary business for thirty years, "in general, the less pronounced the pathology [at the time of death], the less notable are the symptoms of necrosis." Some bodies are well-preserved for years after burial (personal correspondence, Mike Drake). Some, under extraordinary conditions, are well-preserved for [hundreds](#), even [thousands](#), of years.

Immutable human bodies are ultimately cases of apparent immutability. All human bodies and body parts disintegrate with time unless they are preserved by special conditions such as absence of oxygen, bacteria, worms, heat, light, etc.

Januarius a.k.a. St Gennaro

Januarius or St. Gennaro is the patron saint of Naples, Italy. His dried blood is said to miraculously liquefy twice a year: on his feast day of September 19 and on the first Saturday in May. On those occasions, a vial allegedly containing the saint's dried blood is removed from the cathedral in Naples and taken on procession through the city streets. The ritual used to be performed on December 16, "but the liquefaction occurred relatively rarely on those occasions--apparently due to the colder temperature--and those observances have been discontinued" (Nickell, 81).

This so-called [miracle](#) has been occurring for some 600 years without fail, according to the faithful. Believers and uncritical reporters repeatedly confirm that the powdery substance kept in the vial is blood and that scientists cannot explain why it liquefies. However, Italian scientists who examined the vial of blood in 1902 and in recent years were not allowed to take a sample of the stuff to the lab. They were allowed to shine a light through the vial and on the basis of a spectroscopic analysis concluded the substance is blood (Nickell, 78). It is not true, however, to say that scientists can't explain why the stuff in the vial liquefies regularly. A professor of organic chemistry at the University of Pavia, Luigi Garlaschelli, and two colleagues from Milan offered [thixotropy](#) as an explanation. They made their own "blood" that liquefied and congealed, using chalk, hydrated iron chloride and salt water. Joe Nickell did the same with oil, wax and dragon's blood [a resinous dark-red plant product].

The Neapolitans are a superstitious people. There are about 20 allegedly miraculous vials of various saints' blood and nearly all of them are in the Naples region, "indicative of some regional secret" (Nickell, 79). Neapolitans believe that if the blood fails to liquefy, disaster will soon follow. They claim that on at least five occasions after the blood failed to liquefy there were terrible events such as a plague in 1527 and an earthquake in southern Italy that killed 3,000 people in 1980. The proponents of this alleged miracle do not mention how many times disaster *didn't* happen after the blood failed to liquefy, nor do they note how many times disasters *did* happen after the blood *did* liquefy. Even though the vial is only taken on parade twice a year, apparently the powder liquefies more than a dozen times a year.* [Selective thinking](#) seems to be going on here.

According to traditional Catholic hagiography, Januarius was a bishop beheaded during the reign of the emperor Diocletian (284-305). Yet, there is no historical record of his alleged blood relic before 1389, more than a thousand years after his martyrdom. Some doubt that Januarius even existed (Nickell, 79).

Most skeptics are convinced that whatever is in the vial is reacting to some natural phenomenon, such as temperature change or motion. Even some religious thinkers consider such 'miracles' frivolous and unworthy of God.

incorruptible bodies

10 Feb 2000

First, a very minor correction: "According to Jesus Preciado, who has been in the mortuary business for thirty years, 'in general, the less pronounced the pathology [at the time of death], the less notable are the symptoms of necrosis.'" The quotes around the necrosis clause effectively attribute that language to Preciado. However, it is my own paraphrasing of Preciado's remarks, if my memory serves me.

Second, a quite interesting bit of trivia: SRF reported (as you quote): "On March 7, 1952, Paramahansa Yogananda entered mahasamadhi...." Of course, entering mahasamadhi elicits images of a peaceful event, the soul blissfully (even purposely) leaving the master's body, the God-illuminated master having readied himself for this supreme moment....

Well, it didn't go quite like that. As it happens, Yogananda died of a HEART ATTACK [Question: why would a heart-diseased body become incorruptible after a fatal heart attack?]. What's more, the heart attack occurred while he was giving a speech--in front of a large audience. The attack happened as he was about to introduce a colleague. He was 65--pretty young for a heart attack victim, even in 1952.

Also in the news: SRF is moving Yogananda's remains to a sarcophagus at the group's headquarters as part of a \$40 million expansion. Yep--that's seven zeros. [I wonder if they'll be publicly opening the old casket to look at the "incorruptible" remains?]

I guess the moral is this: Money corrupts, but incorruptibility enriches.
Mike Drake

Instrumental Transcommunication (ITC)

ITC is the alleged communication of spirits via various instruments such as the television, computer, fax machine, tape recorder, hard drives, video cameras, digital cameras, and so on. Skeptics consider these communications to be liberal interpretations of natural phenomena or hoaxes.

orbs

Orbs are allegedly ghost or spirit energies, or "[multi-dimensional beings](#)," invisible to the naked eye but visible as balls of light on film. Though some people believe orbs are [life-forms](#), they are most likely due to reflections caused by flash or other naturalistic light sources caught on film. One [orb enthusiast](#) claims that "the orb is the basic energy pattern of the spirit world," though how he knows this is unclear. [Another](#) thinks "the orb is the energy being transferred from a source (i.e. powerlines, heat energy, batteries, people, etc.) to the spirit so they can manifest." This explains why they are round, he says, because that is what one would expect from the laws of physics. He fails to mention which laws he has in mind, however.

IQ & Race

17 Dec 2000

The claim of advocates of IQ testing is that IQ measures innate ability. Actually, it measures (in part) the opportunities that the person has had to learn over his lifetime. Poor children get second-rate educational opportunities, and this is reflected in their achievement on all sorts of tests, including IQ tests.

Viewed in this way, the gap in IQ scores between blacks and whites is an indictment of the lack of opportunities to learn that blacks "enjoy". Having been systematically oppressed and deprived of the opportunities of acquiring those characteristics that society uses to measure success, blacks are undeniably inferior, as measured in a number of ways: Income, education, housing, and IQ as well. The claim that this gap arises from "inherent" inferiority is a pseudo-scientific way of justifying the existing lopsided distribution of wealth and power, which is widely believed because it flatters whites and the sense of racial superiority. In fact, the IQ gap, like the income gap, is really a measure of racism, not genetics.

I suggest that you include in your bibliography [Science and Politics of IQ by Leon J. Kamin](#), an old book (1974) but a good one. Kamin exposed the research of [Cyril Burt](#) as fraudulent. Burt researched identical twins, and "proved" that IQ was inherited. Burt faked his data over a period of decades, and for good measure also invented a nonexistent research assistant.

Although psychologists are embarrassed to talk about it now, Burt was (before Kamin exposed him) quite prominent in the field. He was not at all a marginal figure: His faked results were a standard in the field, and were incorporated into many widely used textbooks. Burt received high professional honors, and was knighted in his Britain, and given an award by the American Psychological Association.

The Bell Curve was an attempt to revive the genetic argument, after enough years have gone by that people have forgotten about Burt.

13 Dec 2000

I enjoy and approve of most of your site with the exception of the entry on intelligence and race. Consider this opening paragraph:

"IQ" stands for 'intelligence quotient.' A person's IQ is supposed to be a measure of that person's intelligence: the higher the IQ number, the greater the intelligence.' This is inaccurate, however, since it assumes that there is only one kind of intelligence.

Straw-man time!!! The remark that IQ assumes only one kind of intelligence is utterly false. How is it possible you could make such a statement? IQ tests measure a wide range of cognitive skills. You know this full well. Generally, most experts agree that the only things IQ test do not adequately measure are "creativity" and emotional sensitivity. Musical and some aspects visual art skills might also be inadequately valued. Memory, especially long term may also be neglected.

One of the strongest pieces of evidence of the race/IQ link is something as simple as the relationship to brain size, IQ and race. It's a taboo to talk about it but the relationships are well established. Finally, if you broaden the definition of IQ to include the overlooked skills, do you really think you can offset the wide racial gap? No one has been able to do it yet. One of the more pathetic attempts has been to include something called "kinesthetics" to give Blacks who can dance and play sports well, an edge. What a pathetic thing to imagine Black kids "studying" for an IQ test on a playground and dance hall, instead of a library.

John Field

reply: I've seen this kind of reasoning on the [David Duke](#) page. But you probably know that it is not how big it is, but what you do with it that matters. Anyway, [big is a relative thing](#). Brain mass is smaller in women than in men, but not in ratio to body weight. (Why doesn't an elephant's big brain translate into big intelligence? Because the big brain is needed to *control* those massive *muscles* and handle the enormous potential for *sensation* from the huge skin area, etc.) Men and women score about the same on IQ tests. It is probably pointless to direct you to [Stephen Jay Gould's *The Mismeasure of Man*](#) where these notions about race and brain size are evaluated and dismissed. (I think you meant to say that it is taboo to claim that there is a connection between racial brain size and racial intelligence, not that it is taboo to talk about these relationships. Gould certainly talks about these relationships. He just doesn't agree with people like you and [J. Philippe Rushton](#)). But, let's assume for the sake of argument that you and the scholars who attack Gould are right.

Even if it were true that one race has a smaller brain by some sort of measurement, what would follow from that? Nothing much. And even if it

were true that one race were found to be less intelligent by some measurement than others, what would follow from that? Even if it is true that American blacks score on average about 15 points below so-called "whites," what follows from that?

Do you think it follows that "superior" races are justified in enslaving "inferior" races? Are they justified in treating them as sub-humans? Are they justified in denying them equal protection of the laws? On what grounds? Even if an entire race or gender had smaller brains and IQs than other races and the other gender, it would not follow from that that a given individual of that race and gender had a smaller brain or lower IQ than a given individual of other races or the other gender.

I have never heard a white supremacist claim that it is justifiable to discriminate against whites whose IQs or brain size is smaller than other whites. Why not? Shouldn't there be a hierarchy of discrimination among whites themselves? The one with the biggest brain and highest IQ should get to discriminate against everybody else, while those below should get to discriminate against all those below them. And shouldn't it be justifiable for blacks with bigger brains or higher IQs to discriminate against whites with smaller brains or lower IQs?

By the way, how do you explain the fact that black northerners scored higher on IQ tests than white southerners when soldiers were recruited and tested during WWII? (Bergen Evans, *The Natural History of Nonsense* (New York: Alfred A. Knopf, 1957), ch. 14, "The Skin Game.")

Finally, does IQ measure one kind of intelligence? It seems that people who are probably your heroes, like [Arthur Jensen](#) and [Chris Brand](#), use the term "g factor" to mean "general intelligence" and they think that IQ tests measure this g factor, though defining it in a clear way has proved difficult.

p.s. A *straw man* is a kind of argument used in a refutation wherein one distorts an opponent's position or argument in order to make it easier to refute. You are guilty of the fallacy of *false charge of a straw man*. The next time you think someone is wrong, you should simply say "I think you are wrong" or "You are wrong and here is the evidence to prove it." Falsely charging people of straw man is a red herring unworthy of man with a g factor like yours. If you like fallacies, you might take some time to study the fallacy of division. This is the fallacy of reasoning that a property which belongs to a class or group also belongs to each individual in the class or group. You may belong to a group that has a higher IQ or larger average brain size, but *you* may have a low IQ and have a small brain. Nevertheless, we should treat you with the respect due every human being until you behave in such a way that justifies our treating you differently.

John Field replies

*Women's brains are smaller in part because they have smaller body mass, as you say. But women have a lower ratio of high neuron-density body tissue than men . That is, the lower demand for neuron service by their already smaller brains (due to smaller general body mass) is depressed *further* by the fact that their body tissue is disproportionately greater for low neuron-density tissue such as bone, fatty tissue and breast tissue, as compared to muscle tissue. Sexual sensory neurons (in the brain as well as the genitailia [sic]) for females also are less numerous. Furthermore, females score slightly lower on IQ tests due to their marginally weaker symbolic reasoning , and weaker spatial relationship comprehension and weaker physical coordination, all of which might be expected to be reflected in less brain tissue.*

Bob Carroll replies

1) Women have *greater*, not lower, neuron density than men. 2) Women score about the same as men on IQ tests because IQ tests are designed that way. 3) In [The g Factor - The Science of Mental Ability](#) Arthur Jensen reports on his factor analysis of a ton of data and concluded: "The sex difference in psychometric g is either totally nonexistent or is of uncertain direction and inconsequential magnitude."

In addition to [The g Factor - The Science of Mental Ability](#), you might want to read [Gender mender](#) by Dan Seligman. His article addresses the question "Are Men More Intelligent than Women?"

More John Field

Interspecific comparisons are much less meaningful than intra specific comparisons. Highly intelligent elephants could be expected to have larger brains than dull elephants, after adjusting for differences in relative body mass, just as highly intelligent humans have larger brains than dull humans, after appropriate body mass adjustments.

I read [Gould's Mismeasure of Man]. It's bogus. You need to read "The Mismeasure of Gould" - It is a scholarly debunking of the ideologue that Gould is....He is not much respected in the field of psychometrics. You might even consider a page at your site debunking him....He's a PC ideologue. And he's been caught in dishonesties....

The measurements [of brain size] are straightforward; cranial

capacity and organ mass - both easily determined by NMR [Nuclear Magnetic Resonance].

What follows [from one race having bigger brains than another race] is the suggestion that the smaller brains of the race in question would have less functionality, as would be expected for any other organs of smaller mass, e.g., smaller hearts, livers and lungs; all could be expected to function, on an absolute quantitative scale, more modestly.

There is no "if" about [some races having smaller brains and being less intelligent].... Blacks on average, measure dramatically less intelligent, with all that fairly means and implies. The results are manifest and glaring, in this society and in all others on earth. It is a fact of life you need to come to terms with in an intellectually honest and courageous way. It's essential, because the truth of the race/IQ/intelligence link will be incontrovertibly established with ongoing genome research. Science can be slowed, but not stopped by ideology.

The disparity is unquestioned among researchers. In the second place, the definitional issue of "whites" or "blacks" is of no import, since the majorities of each group are outside any ambiguous gray area. And the grey area (persons of mixed race), when considered, reinforces the validity of IQ/race linkages because the spread of the IQ differences correlates proportionally with the degree of racial intermixing. This is why mulattoes score higher, on average, than dark skinned Blacks, but lower than Whites. What the difference in race-linked deficiency in intelligence means is simply that they are seriously less intelligent, as IQ fairly measures broad (if not perfectly all inclusive) intellectual ability. There is plenty of research to demonstrate the great adaptive value that a fifteen point edge provides in the modern civilized world. The gap shows up in every imaginable aspect of Black culture except for musical and kinesethic skills. And it exists for all Black cultures everywhere on the planet and throughout human and history. (Please do not cite bogus Egyptology or Nubian Empire myths.) It reasonably accounts for their failure to adapt to modern society in America, as well as in any-and-all other mixed cultures. The comparison of Black nations to non Black nations, speaks for itself. Even the diversity ideals of Brazil and Cuba show a disparity in social adjustment along the B/W race and IQ-specific lines. There are no general exceptions, only individual ones.

[Are "superior" races are justified in enslaving "inferior" races?] No, not any more than low intelligence is justification for mistreatment for any group or individual.

[Are they justified in treating them as sub-humans?] No. Not in my opinion. But the problem with low black IQ is compounded by their at least equally debilitating cultural deficiencies. The term "Sub human" is terribly loaded and exaggerates the cultural and IQ differences for the purpose of dehumanizing them, as a group. What they are in reality, is a variety of humans with somewhat less sophisticated brain function, and a less adaptive culture, as a group.

[Are they justified in denying them equal protection of the laws?] Not in my opinion. On the contrary, I prefer strict equality of treatment regardless of race or excuses based on race. By this I mean no "affirmative action" with its double-speak for "leveling the playing field" by making it unlevel in their favor; aka "reverse discrimination"....judging people as individuals is the fairest policy. Don't you agree? One of the great injustices of ignoring the intelligence deficit as the cause for Blacks' maladjustment is that it falsely implies blame on White people, as in "four hindered [sic] years of discrimination" and "white privilege" or "racism".

Bob Carroll replies

You have already established above, in your claims about male/female differences, how accurate your claims are, so I am not going to bother with a point-by-point correction of your inaccuracies and falsehoods on race differences.

However, your insinuation that affirmative action programs are not a response to two hundred plus years of slavery, one-hundred plus years of segregation and invidious discrimination, racism and white privilege is as about as far from the truth as Mars is from Alpha Centauri.

It is a shame that people like [Ward Connerly](#) cannot oppose preferential treatment programs without being called an Uncle Tom and that whites cannot oppose them without being called racists. But the fact is that those programs are a direct result of centuries of oppression, much of it at the hands of the United States Congress and U.S. Supreme Court, as well as at the hands of many state and local governments.

More John Field

*....white supremacists, like most people everywhere *do* "discriminate" on the basis of intelligence. That's exactly what aptitude and admissions tests are meant to do. This is necessary*

to advance our civilization. It's called "meritocracy."

....There is...a hierarchy of discrimination among whites themselves The brightest people go to Berkeley and Stanford and get the best jobs and highest social prestige. The slightly less bright go to UCLA, and then San Francisco State, then City and Community Colleges, then semiskilled or unskilled trades, then sheltered employment settings. I'd call that a "hierarchy" wouldn't you?

A Black math teacher who flunks a white student discriminates against whites with smaller brains or lower IQs...(But of course, the more familiar juxtaposition is many times more likely for reasons herein presented).

Bob Carroll replies

I thought it was clear we were talking about *invidious* discrimination, not the kind of discrimination any thoughtful and reasonable person might use in making decisions. In any case, your examples of a meritocracy are just as much examples of a plutocracy.

More John Field

One explanation [for the fact that black northerners scored higher on IQ tests than white southerners when soldiers were recruited and tested during WWII] is that much of the cream of Southern White elite was killed off in the Civil War, where the mortality rate was much higher for NCOs and commissioned officers (high IQ types) than for enlisted men. Another reason is that military service for Blacks in the 1940's was seen within their culture as something of a status symbol, attracting the brighter blacks, while the stoop laborers were generally considered less desirable by the recruiters. In other words, Blacks generally had to have a little more on the ball than their racial/ demographic cohorts to get accepted. Yet another explanation is the explanation which accounts for why northern Blacks (on average) score higher than southern Blacks. Which is related to the explanation as to why rural people everywhere (on average) score lower than urban people regardless of race.

Bob Carroll replies

No one can accuse you of lacking imagination, but if you think too deeply about your last claim you might see why some people think the environment plays a significant role in

test scores.

More John Field

*The fact that a clear quantitative definition for "g" is not easy to formulate does not diminish its reality one iota. Whatever you call it, even in the most general terms, like "higher brain function", it is still an obvious and powerful assembly of cognitive functions. It distinguishes the brightest from the dullest. You **do** appreciate that, don't you? There are sweet people who are dull, but **bright** people who are sweet, too, and they are the superior people, for that reason, in general, are they not? Test scores measure it and it correlates very highly with educational success, social adaptability.*

Bob Carroll replies

Now here we have an example of a straw man, John. I never denied the *reality* of g. What I said was that those who use the term have difficulty in defining exactly what it is and that, whatever it is, it is some sort of "general intelligence." I don't deny its importance or its correlation with such things as educational success. What I deny is that g is the only kind of intelligence there is.

More John Field

I think your lead-in remarks met the definition [of straw man] by falsely implying an erroneous position held by me and/or others. That position, again, was that IQ does not represent a wide variety of cognitive skills. No informed person believes that, so why set it up if not for the purpose of easily knocking it down? Yes, I'd call that a straw man.

Bob Carroll replies

I said IQ represents one kind of intelligence, not that it doesn't measure several distinct skills (verbal, mathematical and spatial).

More John Field

The application of that fallacy [of division] test does not refute the fact that exceptions to rules do not necessarily invalidate the rules.

....remember, race correlates with IQ, IQ correlates with

intelligence, which correlates with social adaptivity, which correlates with behavior and attitudes, which correlate with crime, poverty, hostility, and failure.

Bob Carroll replies

And what follows from that, John? No, please, don't answer. Take it as a rhetorical question. I think you've said enough and I'm going to leave well enough alone.

Well, actually, I can't resist one or two more comments.

I have noticed a significant difference in head size between men and women, but I sure haven't noticed a significant difference among Asians (who are supposedly walking around with the biggest heads), Caucasians and Negroids. If there are racial size differences, they are subtle. But of course I may just not know how to classify people correctly.

What happened to your earlier attitude of let's treat everyone individually and on their merits? If you really believed that I don't think you'd be going around measuring everybody's head. oops, straw man again. I guess I just can't help myself.

On Scientific Racism

A review of *The Science and Politics of Racial Research* by William H. Tucker (Chicago: University of Illinois Press, 1994).

by A. C. Higgins

Below is my review of William H. Tucker's social history of racial research. Tucker provides a detailed history of the movement from its 19th century origins through contemporary Jansenism. Tucker's book appeared at nearly the same time as *The Bell Curve* and that book is not included in his review. However, the splendid thing about Tucker's exposition is that the Herrnstein/Murray kind of science fits right in; one can see its context.

My review is over long. Yet, I have omitted here detailing the telling descriptions of the battles over school desegregation in the 1950s, the Civil Rights Movement of the 1960s, and the reemergence of biological explanations of social behaviors in the 1970s and 1980s. The reader can savor those detailed tellings for himself or herself. Rather, here I would like to emphasize a major contribution made by Tucker to the major interests of this board: fraud in science. Tucker has exposed the mental gymnastics of the social scientist who abuses science in the name of ideology. That is precisely what Tucker sees scientific racists as doing: abusing science by using it as a mechanism of ideology.

The reasoning of scientific racists goes like this: science can tell us the facts and, once we know the facts, we will know what to do. However, science cannot provide a basis for human judgment precisely because science can never provide all the facts. Science is, at best, a statement of probabilities, an approximation, a contingency statement. The judgment that all men are created equal is not a scientific fact but a political and moral judgment about which science has nothing to say.

Attempts to use science as if to say something about the moral order are misunderstandings or worse. Science says nothing about the ought-to-be and science can say nothing about the moral order. If African Americans are short or tall, young or old, male or female, or whatever else, the knowledge says nothing about their rights under the Constitution.

But let me paraphrase and quote Tucker for he makes his points very well:

Scientists claim to be impartial, neutral, "value-free" investigators of the world around them; science is supposedly a procedure for arriving at truth. However, scientists have done wicked things down through history and done them in the name of science. One major example of what has been done in

the name of science is racial research and in this book, Tucker provides an overview of racial research from Condorcet (1795) to the present. Briefly, he finds that for two centuries "there have been scientists obsessed with proving that minorities, poor people, foreigners, and women are innately inferior to upper-class white males of northern European extraction." (p. 4) This has been an attempt, quoting Condorcet, "to make nature herself an accomplice to political inequality." (p. 5)

There is implied here a notion that science can, somehow, explain and justify political inequality. This, of course, appears to make scientific authority a powerful strategy for influencing public policy. If political inequality is seen as a natural consequence of biological inferiority, and biological inferiority can be demonstrated scientifically, it seems that rulers rule according to the laws of nature, not of man. Thus, rulers gave scientists the political task of demonstrating that biology determined their superiority and their subjects' inferiority. More, rulers want it clear there is "no injustice" in their rule. (p. 7) What this book shows is that the "effort to prove the innate intellectual inferiority of some groups has led only to oppressive and antisocial proposals; it has no other use. Indeed, there is no 'legitimate' application for such a finding." (p. 8)

Science is not and cannot be a source of moral authority but the pretense that science can be represents a politically appealing proposition that has become, over the years, a basis for an ongoing campaign to establish a scientific rationale for political and racial oppression. And it is worth reiterating Tucker's thesis: such scientific demonstrations have no other reason for existence than "proving inequality's moral basis." This might well be called the creation of an ideology by means of science but, please note, the ideology existed before the "science" got done and what got done was demanded by the ideology.

Thomas Jefferson put the matter this way concerning blacks: "whatever be their degree of talents, it is no measure of their rights." (quoted here, p. 11) But, in fact, in the name of science various scientists have eschewed that morality and political judgment preferring that their science prove the worthiness of citizens.

Scientists curry the favor of bigots by providing apparently useful data to them. Take one example: by the 1840s, the challenge to slavery had begun in earnest and so had the defenses of that peculiar institution. In the early part of the decade, the flawed data of the census of 1840 came to be used as a political weapon against the abolitionists. Data of the 1840 census seemed to indicate that blacks living in the North tended to suffer from mental illness at a rate far higher than slaves living in the South. Indeed, free blacks in the North had lunacy rates ten times the rates of slaves in the South. The conclusion was drawn by Southerners that the Negro suffered unduly from "mental activity and where there is the greatest mental torpor, we find the least insanity." (p. 15) Slavery, it would appear to those who looked at these data, was the appropriate social state of the Negro.

Well, the data were wrong. The inexperienced enumerators had erred. And the champions of the South knew well the data's flaws but, like politicians now, they used the data of incipient demography to their own advantage. Then, as now, ideologues used facts which suited their special perspectives. Science served perspective -- not the other way around.

The special perspective of racial researchers is the subject of Tucker's book. The special perspective

of these researchers, from the beginnings of their "research" until the present, is their use of "science" to promote political goals. For this perspective was born of the enthusiasm of the 19th century European scientist who imagined, wrongly, that science could save human beings from the need to make political judgments. The 19th century English scientist most particularly, imagined that biological science (a la Darwin) and philosophy (a la Spencer) had provided a method for escaping a society of human making: surely, science could save us by showing us the right, the natural, the biologically correct method of surviving as the fittest. And here, Tucker begins the development of the scientific racist perspective with the work of Francis Galton, Darwin's cousin. Sir Francis' views are based on the idea that science and mathematics can together provide an alternative "religion" -- a belief system -- which, by virtue of its methods, can be ever so much more effective than the old superstitions. That new religion of science applied to justifying Victorian England's social system by demonstrating clearly (and scientifically, of course) its "inevitability" -- and therefore the rightness -- of the class system as it existed in England, Europe's most advanced, progressive and evolved nation. (It also justified Francis Galton's claim to superiority over the hated aristocracy.)

Galton was not interested in the details of his cousin's evolution so much as he was fascinated by the idea of "controlling" evolutionary development through the techniques of proper breeding. Just as dog fanciers could control the development of breeds, so too could right thinking scientists develop a "new science" which would promote the proper sort of human being through scientifically controlled matings. He developed the "science" of Eugenics whose goal was just such control and he promoted quantification and mathematical measurement of "desirable traits" so as to provide the necessary data on the basis of which "truly proper breeding" could occur. The search for measurements of desired traits led directly to the IQ test and the enthusiastic embrace of Eugenics by those interested in the measurement of that trait. It was a truly symbiotic relationship: psychologists got money while the Eugenicists got the science of trait psychology.

Galton's work was picked up in the U.S. by politically and socially elite groups at, among other places, Harvard University where good WASP's sought to protect and defend the country against the incursions of "undesirables." It was at Harvard, in 1895, that the infamous Immigration Restriction League was formed. And, desiring data to prove the inferiority of recent immigrants to our shores, various wealthy Americans endorsed and supported the IRL and the research facility built at Cold Springs Harbor, New York, with Harriman money (also Carnegie and Rockefeller support). There, Charles B. Davenport conducted research and political activity over the first thirty years of this century. And all of the science was designed to promote the idea of biological justification for the social order. By demonstrating the "inferiority" of those at the bottom of the social heap, the upper classes presumptively justified their being at the top of the social scale. They could "prove" their superiority with the IQ test. And, with the same instrument, prove the inferiority of the black. Of course, their proofs ignored "All men are created equal..."

...(S)cientific evidence was, or ought to be, the prerequisite for political and moral conclusions. For the social scientists, there were no self-evident truths; all men (and most certainly women) were not born equal, nor were they endowed with any inalienable rights unless science could establish their existence. All "social and political institutions," proclaimed James McKeen Cattell, the psychology professor who coined the term mental test, had to be "based on the truths determined by science," and "no social system, no political theory ... can be maintained when it is not in accord with science." The Declaration of Independence was therefore to be honored in the same manner as other outmoded

scientific theories -- "as the dead bodies over which we have advanced." (p. 106)

And this kind of thinking was not limited to a few crackpots or protofascists. One had to submit to Nature and the natural order of things: George Barton Cutton, the president of Colgate, declared that "Democracy is just out of the question." The IQ test had:

...disclosed too many "mentally subnormal" for universal "manhood suffrage" to be realistic, and yet we were about to double "our greatest ... failure," wrote Cutten, contemplating imminent passage of the Nineteenth Amendment. Though it might be "a wise course to treat the people like children and let them play at governing themselves," he observed, what the country really needed was not elected "leaders: but "rulers" -- intelligent autocrats who would "rule and rule well" ... He anticipated that mental tests would produce a "caste system as rigid as that of India," on the one hand depriving "at least 25 percent" of citizens of the ballot while, on the other, returning "the burden and responsibility of government where it belongs ... to the rule of ... the real and total aristocracy." This caste system, Cutten emphasized, would not depend on any accident of birth, wealth, or favor, however; it would have a "rational and just basis." (p. 105)

And be clear on this: education was NOT viewed as an opportunity for the development of the individual's potential but rather as a mechanism for matching persons to the role for which they had been "conditioned by...nature." (p. 108) "A scientifically structured educational system was to be the servant of a scientifically structured society... giving to each "a fitting place in the state" while insuring social harmony, especially among those whose place would not be enviable." (p. 109)

The obsession with mental tests, however, left a scientific legacy that would continue to exert substantial influence on the field of education -- the belief that "intelligence" was biologically innate and hence unchangeable, that is growth ended at biological maturity, that it could be directly assessed by performance on a series of tricky little problems that must be solved as rapidly as possible, and that this assessment determined not only what one did know but also what one could know. This reluctance to explore the modifiability and diverseness of intellectual accomplishment has been partly responsible for the quasi- eugenic role that education still plays, channeling individuals, often from an early age, toward futures determined appropriate for them by the results of an IQ test. (p. 110)

The logical extension of the scientific assessment of differential ability occurred in Nazi Germany. Serving science meant excluding (exterminating) those "unfit" or "unworthy" of life. "The Nazis ... merely designed and implemented the mechanisms to attain the goals proclaimed scientifically necessary by the geneticists and anthropologists." (p. 129)

The Holocaust has commonly been conceived of as a revolt against reason, the ultimate example of the "irrational," designed and executed by the pathologically insane. But if reason was the object of the revolt, it was also the chief ally, a dialectic so monstrously rational that it could override all the traditional bounds of morality. The Holocaust was not so much the overthrow of reason as its triumph over morality. It allowed a scientific ultrarationality -- what Hitler called "ice cold logic" -- to provide murder with rational justification. (p. 133)

Whether murder or simple social inequity, the aim of this "scientific racism" is forever the same: the

explanation of political inequality with reference to biological inequality. To these thinkers, it is idiotic or paradoxical to think that all individuals are created equal when biology clearly indicates that "equality" ain't so.

Because eugenics had so often been intertwined with pseudoscientific assertions about race and nationality, the inaccuracy -- indeed, the plain foolishness -- of many of these claims became the principal focus of criticism, leaving the underlying assumptions unchallenged. The real problem of eugenics was not the commission of scientific errors, though these were certainly committed in abundance. The attention given to empirical questions largely overshadowed consideration of the more important error, however, the conviction the sociomoral tenets could appropriately be derived from science. Concepts of liberty, justice and equal rights are neither determined nor justified by scientific results but flow from agreements among human beings based on constitutional, religious and moral principles. The intrusion of science into this domain only impeded the Enlightenment's promise to free individuals from the coercive power of church and superstition, moving them out of the religious frying pan and into the scientific fire. Of course, this does not suggest that science has no role in social policy, but it is not in defining goals or rights, it is in developing techniques and methods for achieving principles that have been defined elsewhere.

Tucker details the sorry history of Galton's legacy in this century: the battles over immigration in the 20s, the growth of Nazi ideology both in Germany and here in the U.S., the battles over school integration and the Civil Rights Movement, and the apparently scientific contributions of Arthur Jensen.

This review is already far too long. Suffice it to say that Tucker does a thorough job of applying the insight revealed by his exposure of the racist assumption -- science can prove moral/political inferiority. Science cannot prove anything of the sort and attempts to use science in this way are, as is appropriate for this board, fraudulent.

Tucker touches on some fascinating characters in the history of scientific racism: Frank C. McGurk, Henry Garrett, Carleton Putnam, Wesley C. George, Robert E. Kuttner, Ernst van den Haag, William B. Shockley, Hans Eysenck, Raymond B. Cattell, Roger Pearson, and, of course, Arthur Jensen. These are men whose names and works should be identified.

The quote from Jefferson regarding the distinction between science and morality for blacks or the poor or anyone else is elegant: "whatever be their degree of talents, it is no measure of their rights." Amen.

karma

17 Dec 2000

*Like others I was a bit dismayed by your take on karma in the **Skeptic's Dictionary**, since apart from your unwillingness to accept rebirth (which is a reasonable doubt of course, however unknown to the ancients or some modern Buddhists), it coincides well with the Buddhist critique of the Hindu version of karma, but you weren't aware of that. The Buddha was deeply averse to the use of the theory of karma for creating castes, and insisted that all humans have equal capacity for attaining liberation, in part by at first accepting karma, then finally seeing its lack of inherent existence. The worst karmas are called inveterate negative propensities, and it takes a great deal of insight and discipline to get free of them. The worst of all of these is the deep-rooted grasping after the belief that individuals exist inherently without interconnection to the world, and it is on this delusion that karma rides. Buddhists are not saying karma is a law of nature, only that it is a consequence of our neuroses.*

The Buddha also argued that the vast majority of our karma is negative, and being born human is a precious opportunity not to be wasted with selfishness when a much better life is possible by developing compassion and other good qualities, which in his view were simply more realistic than our primordial delusions. Upon coming across a homeless person on the street, instead of feeling superior a Buddhist would try to look through that person's eyes and know that only a freak chance of timing differentiates the ripening of that homeless person's karma and one's own. And the Buddhist would also reflect that our karma is in large part collective, so to ignore that person's plight is to ignore one's own pain.

I am not trying to claim the theory is true, but that its social consequences are not as obvious as you assume. Certainly Buddhist societies are not above distorting their own doctrines in order to maintain social control, but this is not the fault of the Buddha or the doctrine. On the other hand, Buddhist monasteries are often wonderfully anarchical and democratic in structure, and their precepts enforce a communal way of life that puts the best social theories of the West to shame.

Even within the Buddhist tradition there is a spectrum of "strong" to "weak" versions of the karma. For instance, it seems self-evident dissipated actions like drinking yourself silly will have some deleterious effects on your life. To be

sure, the ancient traditions go way too far for us moderns in specifying particular karmic results to actions. But they also developed a detailed description of the many nuanced stages of karma that are at the least philosophically interesting. For instance, contrary to one of your assertions, according to doctrine karmic results do not exactly correspond to their causes. The karma tends to ripen and magnify in the continuum (like Raskolnikov's guilt in Crime and Punishment) but can be mitigated even when it is too late to prevent it from coming to fruition. Karma in this sense can be understood as a complex information process, a theory of memory that becomes extremely subtle when subjected to Buddhist philosophical debate, which often happens.

On another subject, you might be interested in the Buddha's own prescription for a healthy skeptical attitude, instructions he gave to the people of the village of Kalama when they asked him how to evaluate philosophy:

Kalama Sutta

1.Do not believe just because it is a tradition maintained by oral repetition. 2.Do not believe just because it is an unbroken succession of practice. 3.Do not believe merely because it is hearsay. 4.Do not believe just because it is in the scriptures. 5.Do not believe just because it fits with one's point of view. 6.Do not believe just because it is correct on the ground of metaphysical theories. 7.Do not believe just because it appeals to one's consideration. 8.Do not believe just because it agrees with one's opinions and theories. 9.Do not believe just because the speaker appears believable. 10.Do not believe just because the speaker is our teacher. Kalamas, whenever you realize by yourselves that these are unwholesome, harmful or are condemned by wise people, and whoever fully undertake or observe them, they will lead to uselessness or suffering, you should abandon them. Kalamas, whenever you realize by yourselves that these are wholesome, unwharmful or are admired by wise people, and whoever fully undertake or observe them, they will lead to usefulness or happiness, you should undertake them.

(lifted from http://www.mahasati.org/library/kalama_sutta.shtml)

All Buddhists worth their salt try to take these words to heart. School children in Thailand are forced to memorize them. In one unfortunate incident however, a Thai friend of mine was nearly thrown out of school for asking "why should we believe this then?" She stopped being Buddhist for 20 years, but returned to it later in life.

Alex Turner
University of Wisconsin -- Madison

07 Mar 1998

Your suggestion that the law of karma is "a law for sheep" hits the mark. How has it come to be a central tenet of a major religion? My suspicion has long been that the religious law of karma evolved as the perfect cover for a politically oppressive social system. Although I have not been able to trace the belief in karma to its roots (the old Hindu texts seem to accept karma as a given), it strikes me as a too-convenient justification for India's rigidly stratified caste system. Why wouldn't the elite support such a belief? They are who they are in society by virtue of their spiritual superiority.

"I am a Brahmin. This is my karma. You are an untouchable. That is your karma. Deal with it." This belief also works nicely for the prosperous therapy addict in suppressing his guilt over poverty in the third world.

Karma is the yoke worn by India's poor. Karma (and reincarnation) convince the poor that their lot in this life is a function of their sins in the last. If they accept it meekly, perhaps they'll do better in the next. Is it any wonder that over the centuries India saw so little progress, socially or economically, until the British arrived? And why it still remains largely impoverished and undereducated? Judeo-Christianity, on the other hand, may promise eternal bliss, and some may have used that belief to keep the masses in their place, but in practice its teleological view also suggests that if you only go around once in life, you've got to go for all the gusto you can get. One need only compare the social and economic differences between the two cultures to see how these beliefs work themselves out in practice.

Tom Sullivan

reply: Somehow, I don't think it's that simple. Western materialism developed in spite of Christianity, not because of it. As for the British imperialists in India, the only good I can see that came of that was the gin and tonic.

25 Feb 1998

Although I would classify myself as a skeptic and a devoted follower (?) of your dictionary, I have a suggestion to make about your recent entry on karma. The variety of differing views on karma make it incredibly hard to justify your overview. For example, Buddhists have a theory of karma which differs in some important respects from the theory you present.

For many Buddhists, karma becomes an ethical theory rather than one strictly of causation: "[Buddha's] great innovation was to say that the moral quality of an act lies in the intention behind it." (R. Gombrich, Theravada Buddhism)
Karma is the psychological seed planted by an action which results in a tendency to act a certain way in the future.

This might be quibbling a bit and may be as screwy an idea as the cause and effect karma you present, but I think it ought to be addressed in some fashion.

B.L.

reply: If I understand you correctly, Gombrich claims that for Buddha karma is a process whereby purifying our intentions affects our behavior so that we tend to become as we intend and act. Focusing on intentions as both the main factor in morality and in effecting future behavior seems in harmony with traditional Christian morality. There doesn't seem to be anything particularly untoward with this notion. Yet, as Fr Becker used to say, "the road to Hell is paved with good intentions." Does Gombrich deny that Buddha maintained that one's intentions in this life will have an effect on what one intends in some future life? Does he deny that Buddha maintained that the evil which befalls a person in this life is due to some evil intentions one had in a past life?

kirlian photography

18 Jun 1999

*I am aware of 2 errors of fact in your **Skeptic's Dictionary**.*

The first concerns your skeptical criticism of the Rorschach Inkblot. You criticize the putative scientific status of the Rorschach because the scientific evidence for its validity is based as it must be on correlation alone. You compare this to the efficacy of interpreting dreams. In point of fact the Rorschach has a more immediate source of validity: clinical usefulness. It is in fact a powerful tool in properly trained hands, and your skeptical criticisms amount to nothing more than "character assassination", that is, you have neither proven it to be useless or invalid, nor have you proved to be invalid the claims of those who find it useful and valid. Therefore, I consider your propositions regarding the inkblot to be errors of fact, in that they are speculation posing as proof.

reply: I don't criticize the ink blot test because the evidence for its validity rests on correlation alone. I criticize it because it is too subjective and its application and validation rests completely with the therapist's "insight" and intuition. As such, it is no different from making a diagnosis based on conversations with someone.

The attempt to standardize a projective test is akin to what Freud did in his *Interpretation of Dreams*. There is no objective set of rules for what either the ink blots or dreams mean.

I never claimed the ink blot test to be useless. A good therapist ought to be able to use *any* interaction with the patient to some purposeful and useful end.

I think, however, that you, like many therapists, don't know the difference between a statement of fact and an opinion.

The second error of fact is more egregious. You claim that the images seen on Kirlian photographs are due to "moisture" emanating from the object. Again you have not studied your subject in enough depth to offer better than speculative criticism. The moisture effect is your theory, nothing more, and it is disproved by two observations: first, that aura's have been captured from objects that were bone dry, such as stone or metal, and second, that if the

photographic emulsion is separated from the object by a thin layer of glass, the aura can still be detected even when it is impossible for moisture to have penetrated the glass. Finally, you are guilty of bad faith, because you essentially imply that persons reporting such things as phantom half leaves are either so foolish as to conduct the experiment sloppily so as to confound the results with the effects on which you speculate, or else that they are liars who misrepresent their technique. From what I have seen the people conducting both Kirlian photography research and those doing research on the Rorschach are working harder and more intelligently, and certainly with more good faith, than what you have done.

reply: Apparently, you have a difficult time reading. I claim that the "auras" in Kirlian photographs can be due to several things: pressure, electrical grounding, humidity, temperature, changes in moisture, barometric pressure, and voltage.

Moisture left behind by a section of a leaf that has been sliced accounts for the appearance of "phantom" sections of the leaf in Kirlian photographs. Moisture is not what is photographed. Electrical discharge is what is photographed.

I haven't heard anyone being accused of "bad faith" since my college days when existentialism was the rage. I don't doubt that your researchers work hard, nor do I challenge their intelligence. Whether they have good faith or bad faith, I can't say. However, I think your critical comments demonstrate the uselessness of such expressions.

21 Mar 1998

According to an article in Aerospace America, Kirlian methods can be used to achieve the same results as nuclear magnetic resonance. Just in case you want to explore: Lerner, Eric. "Kirlian Photos Find Hidden Flaws." Aerospace America, Vol. 24, pg. 11-12. Aug. 1986.

channeling & Ramtha

03 May 2002

Hi Robert, I have just gone to your site for the first time and was really amazed by your opinion of Ramtha and JZ Knight. I am sure I am not the first to say this... but you have got this entire situation completely incorrect.... although I will say that I don't doubt that for you it IS correct. Many many tests have been done on JZ Knight from skeptics, and I have seen that all tests done have proved that there appears to be a phenomenon happening. Haven't you seen this too??? I would like to assume that you have looked into this far enough, prior to such judgment, to know already of the scientific data that has been produced.

reply: There certainly does appear to be a phenomenon happening, but I don't think gullibility needs a scientific explanation.

Apart from this, I have noticed that you make some very large sweeping generalizations regarding her (JZ Knight) intent with the Ramtha existence. You say it is about fame and fortune.... and then you say that she only has a "few thousand followers". I question you then on the fame that you mean?? It seems to me that you have Ramtha's point of view so very incorrect. Afterall..... if the words that are spoken help people, then why is it so bad?

reply: The words aren't bad. The lie that they issue from an ancient spirit warrior from Atlantis is bad.

Do you judge every way of thinking with the same anger?

reply: Anger? How could I be angry at people who keep me in stitches?

I know that Ramtha is a very real entity and I have channeled him too!! Oh dear, won't that confuse you!!!!

reply: I don't think I'm the one who is confused, my dear.

The reality is, at the end of the day, that what you focus on DOES create your personal reality!!!! Don't take that away from other humans, just because YOU don't believe it to be so. Ramtha is trying to get that message across through JZ

Knight. The information is HIS knowledge and truth, NOT hers. HE speaks through HER..... don't you get it!!!

reply: What I get is that this notion that one creates one's own reality and truth is a dangerous delusion.

Anyway.... what I want to know is.... what do YOU believe in????? No skeptic ever seems to write back to me..... but stills proceeds to judge others!! Please write back.... I would love to hear your point of view.....

**Megan Carmody
(Australia)**

reply: See my [FAQ](#) page if you are really interested in what I believe in. Furthermore, I don't know what scientific test there is to determine whether a 25,000-year-old spirit has invaded the body of a Tacoma woman in her kitchen.

Megan replies:

Firstly Bob, Ramtha appeared to her, he didn't "invade" her as you say. I am not here to "convince" you, just trying to stop your incorrect judgment of her on the internet. Ramtha has indeed existed [?] for a "long" time, but that shouldn't seem so impossible to you. Why do humans think that they know everything about the entire universe? The truth is, that you don't know the truth really. What makes you really think that Ramtha is not an entity? Did you know that energy and matter are the same thing? Did you know that different energies can combine??? If you did a basic physics course you would better understand the meta-physical aspects of life. Try reading Barbara Brennan's book on "Hands of Light". She was a nuclear physicist for NASA who opened up her own school of healing. If you are "really" trying to find out the "truth" you would read her book. Something tells me you may not bother. Oh well.

reply: No, I don't claim to know everything, though I seem to appear that way to people who disagree with me. Is it possible that ancient spirits are using humans to convey bits of trivia that pass for wisdom these days? Sure. Is it probable. No.

I must admit that I don't see the connection between channeling and physics. I have taken a basic physics course and I have studied metaphysics but your claims about matter and energy, and combining energies, leaves me nonplussed.

Barbara Brennan is mentioned (not too highly) in my entry on [intuitives](#). She may have been a nuclear physicist for NASA at one time, but she is now a New Age [energy](#) healer. She may think there is some connection between nuclear energy and the metaphysical energies she thinks permeate

our organs, but to most of us with some understanding of physics and medicine, she's just another New Age quack. I've given her "Hands of Light" more time than it deserves.

22 Aug 2000

I noticed your emotional opinions on your web site and in the interest of objective scientific truth I am submitting the following correction of fact.

reply: Never let it be said that I stood in the way of "objective scientific truth." Blast away, O enlightened one!

You claim that J.Z. Knight "pretends" to go into a trance to channel Ramtha. Stanford Research Institute in conjunction with leading scientific authorities have established with extensive scientific and empirical evaluation that J.Z. Knight does, in fact, go into a deep trance provably engaging her autonomic nervous system to an astonishing extent, i.e. deeper than any yogi on nails, hypnotist, or prevailing New Age avatar, when she is channeling Ramtha.

reply: Wow! The Stanford Research Institute! The very place that Hal Puthoff, Russell Targ and Ingo Swann, parascientists extraordinaire emerged from? For more info on this illustrious hall of "objective science" see the following:

[Skeptic's Dictionary: mass media bunk 2](#)

[Skeptic's Dictionary: Uri Geller](#)

[Skeptic's Dictionary: remote viewing](#)

Furthermore, the measurable electromagnetic field of the Earth itself spikes upon the occurrence of the aforesaid channeling.

reply: You wouldn't mind producing proof of this extraordinary claim, would you?

So we have scientifically undisputable research that proves that J.Z. does, in fact, go into trance when she is channeling.

reply: Maybe you do, but the rest of us don't.

This leads to the obvious question of whether your highly prized "skepticism" is based upon scientifically provable fact or personal, emotional, ulterior motive.

reply: That's a false dilemma!

Such as, why are you so emotionally insecure about an unknown and challenging reality?

reply: That's a loaded question!

I dare you to cross the line into empirical, scientific evidence. Your intellectualism can explain anything to protect your belief and social programming, but when it comes down to real science where do you stand?

Expecting a reply, Bruce Weiskotten

reply: Geez, Bruce. I don't know what to say.

24 Apr 2000

This is pure FUD (fear, uncertainty and doubt) and not worthy of the site: (from Ramtha page)

One might say, then, that it would be good to leave the Ramthas of the world alone. After all, they're helping people, even if they are frauds. As long as they're not hurting anyone, let them be. Even if they are hurting people, the victims are adults who freely choose to be exploited and abused. Don't we have the right to be victims if we so choose?! Sometimes. But sometimes those adults bring their children. Sometimes those adults are not as free as the rest of us. Sometimes a Ramtha takes more than your money. No one should ever forget the reverend Jim Jones and the mass suicide in 1978 of more than 900 cultists in Jonestown, Guyana. Not that Ms. Knight is a threat to her followers' lives, only to their dignity.

This is appalling rhetoric and does the skeptic cause no good at all.

reply: I didn't know there was a "skeptic cause" or that I was supposed to be doing it some good. Sorry. I also don't think the rhetoric is as appalling as the recent events in [Uganda](#) where hundreds were murdered, including many children, over some miscalculated end-of-the-world prophecy by some defrocked priest who thinks the Virgin Mary is sending him messages. Frauds and deluded people can be dangerous to your health.

I am reminded of the di-hydrogen monoxide page as a kind of reductio ad absurdum of this argument. Did you know that people have died by inhaling di-hydrogen monoxide [water], but it is still legal to SELL it ??

reply: I'm sure this is of interest to somebody and that there is a connection between this paragraph and your opening sentence but don't expect me to

waste any time trying to figure out what your point might be.

The crap about protecting the children is the same argument used to justify installing rigorous censorship on the same medium (the internet) you are using to broadcast your messages.

reply: So that's what this about...censorship of pornography. Why didn't you just say so? Never say you are concerned about some fraud or delusional person harming children because that gives fuel to those who want to ban pornography from the Internet!

Oh yeah, the Ramtha crap pisses me off too, but you are stooping far to low here.

Peter Nicol

reply: I admit I am stooping pretty low to respond to you.

20 May 1999

Hi! I just read your thoughts on Ramtha & J.Z. Knight.

You sure have a lot of opinions! And it's great that you exercise them so well. However, I don't really get your idea of Ramtha's school being a "cult". I happen to find his & many others who teach the same ideas as beautiful entities who have much to teach us about life and ourselves.

What do you believe in? Most religions started out small. Does that make the huge religions today cults? Everything, everything can be seen as a form of brain washing. Even your most factual scientific findings. Things constantly change, new ideas are not insanities.

Niki Shay

reply: For some of my beliefs, see my [FAQ](#) and the other 338+ pages I've posted.

The old saw is that a delusion held by one person is a mental illness, held by several is a cult and held by many is a religion.

I just checked out Ramtha's "lofty thought of the day." Here it is: *What part of you do I love? The part that goes on in the face of all that says you shouldn't.*

Isn't that precious! I suppose if you find such drivel to be enlightening, you can see the universe in a grain of sand or Jesus in the clouds, or your innermost self in an inkblot.

9 Jun 1999

I have observed [Barbara Marciniak](#), [Lia Light](#) and others over the last 5 years or so because of my wife's involvement in the new age movement. And they are a bunch of money grubbing phonies. They add to their "message" when they need to move on. And it gets so absolutely incredible as to defy anyone believing it. But, unfortunately, there are a lot of lost "souls" out there searching for something better than their own drab existence. They are making money hand over fist and seem to have an innate ability to seek out those with "disposable" income. They continually have you buy books, oils, crystals, charts, drawing, and, of course, you must have a "reading" every month or so. I know one woman who, I would estimate, has spent over \$50,000 over her life on readings. Why?? To get an answer that matches what is in her mind. And no one ever has. You are right on with your site and information. Keep up the good work and if you want any specifics as to what these "channellers" are up to drop me a note.

Tony L.

reply: I think we can guess what they are up to.

28 Apr 1998

*I just checked out your definition of channeling in your **Skeptic's Dictionary** and was pleased to find that I clearly don't fit. Neither do most of the channels I know. Clearly you have done your research only among the largest hucksters in the field. Most channelers are decent thoughtful folks and good citizens. Therefore, I am inviting you (and it is a public list) to spend some time on channeling@intuition.org. I think you will be pleasantly surprised.*

Eileen H. Kramer

reply: The site you refer to claims that it is a "mailing list for those who want to learn more about the voices, visions, inspiration, and thoughts inside their heads that come from some place other than their mundane self. It is a list for people who speak to the dead, aliens, elemental and nature spirits, angels, other higher beings, and their higher selves." If you want to define channeling in such broad terms, then you will have to read my entries on [angels](#), [alien abductions](#), [the Celestine prophecy](#), [God](#), [spirits](#), and [theosophy](#), among others, as well as my comments on [James Van Praagh](#) and [Budd Hopkins](#). You may not want to associate with [Ramtha](#), but some of the greatest hucksters who have ever lived have been decent thoughtful folk and good citizens, e.g., [Edgar Cayce](#).

7 Aug 1998

I noticed a paragraph in your section on "Ramtha" regarding the classic New-Agean "people only use 10% of their brain" theory and that you weren't quite sure what it truly meant. In the past few years, this has been thrown by the wayside by "real" psychologists for the new theory that "people only use 10% of their brain for cognitive processing. The other 90% is to do stuff like breathe, see, digest, control muscles, etc." Newer psychology texts in college usually have this somewhere near the beginning of the "cognitive thought" chapters. If any of these New Agers find out how to use 100% of their brain for cognitive reasoning, I'd be interested to see what happens to the rest of their body.

Large Group Awareness Training

20 Nov 2000

You can add [Dale Carnegie](#) classes to this distinguished list. I was "given the opportunity" to attend a Dale Carnegie program at the expense of the company I was working for because it was highly recommended by the secretary who had previously taken it.

Being the logical minded engineer that I am I just couldn't understand and get comfortable with the strange goings on in this class and gave up after attending 6 of the 12 scheduled three-hour long classes. I think if I had read your article first I might have smelled this one out before attending.

It was quite similar to the others you describe, complete with perpetually smiling, always (artificially) cheerful group leaders. They actually did lead us in some short positive cheer at the end of each session that we were supposed to shout happily, several times, as if we really meant it.

The activities always consisted of spilling your guts, with some of your most intimate thoughts as directed in the assignment, in front of the nearly 100 other people in the room. All dutifully responded with rousing applause to make you feel good about what you had just done though I mostly just felt embarrassed. I think this portion of the program was designed to break you emotionally so you will more readily accept the 'positive ideas' the instructors want to pour into your head.

They also frequently advertised to their captive audience that there are more classes and plenty of books by the founder available for sale and suggested you buy more of each to get the fullest benefit from the course. It was only slightly less than high pressure.

There is one additional twist on the Dale Carnegie course that seems to make it different from the others. Part of the exercises and emphasis in the training is to pretend you are very interested in other people so you can impress and manipulate them. Clearly it is not advertised this way but they call it a great sales tool. This class is geared toward sales people.

You are taught that people love to talk about themselves and you should help them do that. If you can learn to remember things about them, especially the small details, you can use that to your advantage and hook them into buying more of what you have to offer. If you can sell them things that they don't need in order to enrich yourself then you are a great sales person! That was

essentially the gist of the book by the founder too. I found it absolutely disgusting.

The basic mantra of the course was "You can't live a happy and fulfilling life unless you have the Dale Carnegie secrets and use them daily in your personal life and your career." What finally got to me was when they used that statement to insult my wife and our personal relationship. We have a far better marriage than most from what I've heard so, after feeling insulted by that sentiment one too many times, I walked away.

Only an empty mind could be convinced that these total strangers can completely change and improve their close, personal relationships by talking to them one hundred at a time. Making phonies is their game. I just couldn't be someone I'm not.

Karl Black

reply: I read on their web site that they have eleven programs. You probably took the wrong one, Karl. Anyway, you'll probably hear from their lawyer telling you not to use 'Dale Carnegie' as a noun and to remember to put the ® in Dale Carnegie Training® and the ™ in Carnegie Coach™, right next to the \$\$\$.

Rama (Frederick Lenz)

19 May 1998

My name is Pam, I was married to Rama, known to me as Fred or Freddy, as his father called him. He was just a guy in his 20's with long-term acne and braces when I met him. Making dulcimers and coloured candles for head shops.....but reflective and intense....strangely disconnected to anything happening on this plane. We wed, moved to Storrs, Connecticut where he was majoring in English, got divorced about two years later, the rest is history. Believe it or not, he wanted to be celibate for purification purposes. "Give me a break." He stayed with [Sri Chinmoy](#) for enough time to see that that kind of a "gig" was very appealing. E.g., develop a powerful mystique, get a good promotion agent and a theme, bingo, you're self supported, wined, dined and sexually serviced. But, still it was too bad he went the way he did. I always felt he was just a lonely little boy, just like when he was growing up. Neglected and misunderstood and crying out for attention.

He definitely was one of the stranger men in my life.

ley lines

15 Apr 1998

If all the cities of the Earth were to follow the example of Seattle and neutralize negative energies while amplifying the positive, don't we run the risk of blowing the world apart because of all the resulting mutually repellant positive charges?

Just a thought.

Karl Jennings

reply: Maybe you have discovered the real meaning of the power of positive thinking.

23 Nov 2000

Karl Jennings' comment raised a smile, but be careful. If you equate positive energy and positive charge, you fall into the same trap as all those New Age people who distort quantum mechanics to mean precisely what they want it to mean. In fact, positive energy has no meaning unless you define a system, when positive energy becomes energy going into that system (and negative energy energy coming out, clearly). A little physics goes a long way.

Nick Kiddle

reply: I'm sure Karl will get a charge out of your negative comments.

reader comments:

polygraph

22 Nov 1999

I'm sure you don't like hearing this stuff, but I did take a lie detector test once (back in my less idealistic days, when I was applying for a summer internship at the National Security Agency) and they caught me lying in response to one of my interview questions. Before that, I was convinced that lie detectors couldn't possibly work reliably, and I was completely blindsided when they said they knew I had been lying.

(The question was about illegal activity, and at the time I was 19, and had gone to visit a 17-year-old girl that I had met on the Internet, and we, um, went to "second base". Due to the Christian church's powerful influence over laws governing such matters in the U.S., I wasn't sure if that was legal, although I have since found out that it probably was.)

*So I agree that polygraphs are not *reliable*, because they don't work on some people and others can learn how to fool them, but I would disagree with your statement that they are "no better than hypnosis".*

I did see a demonstration in a science museum once where one participant would pick a number from 1 to 10 and the other participant would ask, "Is it 1?", "Is it 2?", etc. and the first participant would always answer "No". It didn't work on everybody, but it did better than random guessing. That seems like a pretty well-controlled experiment for a science museum, in keeping with the principles of "Seeing is believing" that most skeptics would probably support. (name withheld by request)

reply: If there were not experiences like yours, I doubt if anyone would believe in the reliability of the polygraph. It is easy to find confirmation for the polygraph thesis, but the polygraph's failures demonstrate the reasonableness of not allowing polygraph results as evidence in our courtrooms. The courts are equally reasonable in not allowing as evidence any testimony first gained by using hypnosis, which has also been shown to be unreliable.

17 Sep 1999

I have worked for a law enforcement agency for over 25 yrs. Based on my

observations, I would never voluntarily submit to a polygraph examination. I've seen too many cases where the suspect showed "guilty knowledge" (while denying being involved in the crime) on the poly, and was subsequently cleared through further investigation.

That said, I must admit that there have been positive results from polygraph examinations. During the pre-examination interview (actually a form of interrogation), while the examiner is attempting to get the suspect to confirm in clear, unambiguous language what their story (alibi, etc) is. If the examiner is persuasive enough to convince them that the machine will detect untruths in their statement, many suspects will end up confessing to the crime without the test. In the same manner, during the post examination interviews other suspects, confronted with "evidence" of their untruthfulness, will confess to the examiner. While my attitude may be incorrect, I see little problem with prosecuting folks who voluntarily confess during a voluntary polygraph exam which cannot be used in court.

Perhaps this is a function of our Western Judeo-Christian culture ("Confession is good for the soul," and "Always tell the truth") that is the cause (providing a blame-free method) of the confessions. I'm not familiar (anecdotally) with any of the confessions gathered this way being found to have been false. I also wonder if someone raised in another culture that doesn't value truth and openness (e.g. USSR or possibly Japan) would show any of the reported physiological signs of lying.

In that I am still employed by the police dept (even though my thoughts are very [probably too] well known), I'd appreciate it if my name is withheld.

15 Sep 1999

Have you seen the article by Tim Beardsley entitled "[Truth or Consequences](#)" in the October [Scientific American](#)? It seems that the FBI wants to search for spies by giving "lie detector" tests to scientists at Los Alamos.

At the top of page 24, we read

... the most notorious spy of recent years, Aldrich Ames, passed routine polygraph exams as an employee of the Central Intelligence Agency, as did another former CIA employee and convicted spy, Harold J. Nicholson.

That turns out not to be evidence of polygraph inaccuracy, however, because near the end of the article, former FBI counterintelligence official, Edward Curran,

... hotly denies that the polygraph failed to raise suspicions

about Ames: the polygrapher in that case made errors, Curran maintains, because subsequent examination of Ames's polygraph charts shows evidence of deceptiveness.

Yeah, right; and Dixon predicted Kennedy's assassination, too. This is clearly an ad hoc hypothesis, especially in light of another thing that the article points out:

... when polygraphs are used to test suspects for involvement in specific crimes, the tests rate as deceptive more than 40 percent of subjects who are later positively cleared. Because examiners know they cannot fail 40 percent of those being screened for a sensitive post, they set the hurdles for deceptiveness higher.

It sounds to me like they "set the hurdles for deceptiveness" to get the results that they're looking for.

Bill Seymour

reply: I read an interview with Ames. He claims he was able to beat the machine by doing such things as squeezing his toes in tight. The unreliability of the device is well-known.

The Associated Press reported on a Sept. 14th meeting between more than a dozen researchers at Lawrence Livermore National Laboratory and a panel from the Energy Department. The scientists were said to have "vented their anger" at the government's plan to force top-security researchers to take lie detector tests in an effort to catch spies. Those who thought that what Bill Clinton lacks in moral character he makes up for in intelligence may have to reassess their opinion. This attempt to catch spies is inane.

The scientists noted that the results of a polygraph are not accepted in court and their value has been debated from the moment of their inception. Thomas Thomson, who has been designing weapons for more than 30 years, said:

The question is not about the veracity of polygraph screening-- they are well known to be useless for that purpose. The question is, what dissenting views are they now afraid of? It is a truism that institutions only worry about heresy when they have begun to rot from within. Just what rot is this administration trying to hide from the Congress and the American people?

Another scientist warned that the tests will make it harder to recruit and

retain talented scientists.

In case you haven't heard, the Clinton Administration has ordered the polygraph tests, which will pose these four questions:

- 1. Have you committed espionage?**
- 2. Have you committed sabotage or terrorism?**
- 3. Have you illegally disclosed classified information?**
- 4. Have you had any unauthorized contact with any foreign intelligence service?**

If the polygrapher thinks the subject has lied about any one of these questions, the subject will have to take "a more complex text" and be investigated by the FBI.

This sounds swell and is likely to attract all the best minds of our generation to want to work for the government. Guilty until proven innocent! The inmates have taken over the asylum.

I imagine Doug Williams will sell a few more copies of his manual on [How to Sting the Polygraph](#).

11 Sep 1999

Your page on the polygraph is outstanding! I have been researching the polygraph for about a year and every issue you addressed about lacking credibility is well supported.

I have my own web page at www.stopolygraph.com with my research.

Bill Roche

03 Sep 1999

While polygraph must never be absolutely relied upon for exactly the reasons outlined in your article, I have found it to be a useful tool in criminal investigation where objective questions can be formulated about the subject's own actions in a specific event. As with all tools, its limitations must be recognized. Aside from the most common use as a demonstration to the actor that he is detected, let me briefly relate an interesting case.

An adjacent row of shops found burglarized. Some clear theft (large quantity of expensive clothing) and some vandalism (beer bottle thrown into a fish tank) of a kind not normally associated with common burglary.

Ex-convict on parole for burglary identified as being parked behind the center at about 4:00 a.m. the night of the burglary. He left town (violating his parole conditions) when he learned inquiries were being made. Two young men who had been playing pool late in a shed behind the center were identified. They agreed to polygraph which showed one lied when he said he did not enter the shops in question that night but was truthful in denying that he took anything. One lied when he said he did not know who entered the shops or who took anything from them but was truthful about not entering himself. ("Lied" and "was truthful" refers to polygraph indications. Neither confessed to anything.

The ex-convict was induced to return after he decided it looked bad to run. He agreed to polygraph which showed he was truthful about knowing nothing of the burglary. (He stated he had parked behind the center to urinate.)

Months later, a very active traveling professional burglary was caught in another city and confessed to this one also (and many others) to get concurrent sentencing. He was a thorough professional who stated he kicked at a business door across town to set off the alarm to distract patrol officers, a fact that had not been known to be connected with the crime. He also never indulged in vandalism during a crime and was solely engaged in stealing the dresses.

It is reasonably certain that the pro did the burglary, and the pool player, finding the back door open, entered (drunk) and did random damage, his friend waiting outside out of fear of discovery.

My sample of polygraph experience over 12 years is not large enough to establish much more than its usefulness as a tool. But it was undeniably useful, even though results are not admissible evidence in Texas. The operators, state police employees, made no rash claims and were scrupulous and clinical in their approach. Much different from the pre-employment sort of private examiners I have known.

*It was also interesting to note that a significant number of true pedophiles who were known beyond any reasonable doubt to have engaged in intercourse with young children were able to lie about their acts without effect on polygraph, while their response to the directed control lie was normal for a lie. I have never been given a satisfactory explanation of the phenomenon. They are certainly not deluded to the point that they believe they are truthful when they answer "no" the question, "Did your penis contact any part of ****'s body?" or "Did you cause anything to penetrate ****'s vagina?"*

Terrific web site. Keep the faith (or perhaps, Keep the Doubt <g>).

Gerald Clough

05 Aug 1999

Visiting scenic if foggy Carmel-by-the-Sea on business, I found an article in the Carmel Pine Cone about the use of a voice stress analyzer by the Monterey County Sheriff's Office, in one of their criminal investigations. The article claimed that the device is a type of lie detector that is capable of 95% accuracy, evaluating yes-no answers, which may be used without the subject's knowledge (over the phone, for example). The article was completely uncritical of the claims.

Searching the Internet, I found some very interesting research conducted by the Defense Department Polygraph institute. In at least three scientific studies, the device yielded only about 50% accuracy (i.e. no better than random chance), both for detecting lying and truthfulness. Also, a lengthy article in the San Diego Union-Tribune (12/1/98) described abuses of the device by the San Diego police department, the dubious marketing practices of its manufacturer, and the shady past of the company's owner.

If you would like to see all the information I have on this matter, please let me know!

Thanks for all the good work,

Peter Nothnagle

15 Dec 1997

After reading your article, I felt you had left some very important points as to "WHY" polygraphs don't work:

- 1. People don't want to believe that someone or something can tell when they are lying!*
- 2. People don't want to be found out and exposed when they commit a crime!*
- 3. People don't want to be found out when they lie to their parents, friends, employer, the police, the government, the IRS, the courts and many others!*
- 4. People don't want to be found out when they steal from their family, friends, employer, their fellow Americans by cheating on their income tax and don't pay their fair share!*
- 5. People don't want to be found out when they commit crimes against fellow human beings or our children!!!!*
- 6. People, politicians, the Senate, the Congress, the rest of the government, and many others don't want to face their wrongdoing by being told by a simple instrument that they are lying!!!!*

reply: If these are the reasons the polygraph doesn't work, I can only guess that the reason they work is because polygraph examiners want to believe they work so they can keep their jobs.

Let face it, the only reason the polygraph was banned in 1988 was because President Reagan had suggested that many of our politicians (some in congress) should take polygraphs. It wasn't very long afterwards, that congress voted to ban the use of polygraph.

reply: You don't think it had anything to do with their being unreliable?

Their are bad and good people in this world. We certainly don't ban all humans from this earth because there are a few bad apples. Their are some good cars and some bad ones, but we certainly don't ban all vehicles. However, when it come to the word polygraph, the lie detector machine, well.....then it's another matter. So, to avoid having to tell the truth or be found out, we then created other lies to protect the lies we don't want people to know. So, we say that the polygraph can't tell a lie and doesn't work (God forbid it worked). We claim it invades our privacy and violates our rights. And, you are right... it invades our privacy because now everyone knows we have lied. It violates our rights because someone has established that we have lied and we can be held accountable.

reply: Actually, we know that sometimes the polygraph works and sometimes it doesn't. Unfortunately, we don't have any way to tell the difference when it really matters. Truth machines are as valid as truth serums: both are based on wishful thinking not evidence that they are reliable.

If the question is whether or not there are good or bad polygraph examiners...then I say yes. Let do something to weed out the bad ones with laws and professional guidelines that will ensure good polygraph results. But to ban or outlaw a procedure that it's main purpose is to establish the truth.....no, then I think there's sometime wrong with those who choose to be anti-polygraph. These types of people may be the ones that have a lot to hide and wouldn't want to be found out. If I was one of them, I wouldn't want polygraphs around either.

Bob Ferrer

Polygraph Examiner

reply: I think the question of competent and incompetent examiners is one we will have more success at than reliable and unreliable polygraph tests. Good intentions are not sufficient to warrant using the polygraph. People who rush to take a polygraph to prove their innocence are fools. Passing the test doesn't prove one's innocence. If it did, we could do away with trials altogether. People who refuse to take a polygraph may not be afraid of being caught in a lie; they may be afraid of having some machine say they are lying when they know they are telling the truth. Frankly, if I were running a business, I would not sleep any better knowing all my employees passed a polygraph test.

08 Apr 1997

My husband who has a seizure disorder has never passed a lie detector test. He worked in several jewelry stores that required all employees take periodic tests or be fired. His test results were always the same -- he told lies. What happened was the stress being tested was so great that he would have an absent seizure (nodding out) or go into a fugue state, where he was 'not here'. (His medicines can only control 80 percent of his seizures.) However, in his current job, he has a U.S. government clearance of 'Secret'. (The F.B.I. did the field work to detect his honesty.) He and I agree that lie detector tests are no measure of honesty.

Virginia Carper

28 Oct 1996

I thought this treatment of polygraph machines as "lie detectors" was pretty good. Let's face it: this is Gilligan's Island science, not real science.

You left out one interesting issue, though. How come Phil Klass, considered (by "skeptics") as "the leading UFO skeptic," puts such a pathetic credence in the things? If someone makes a claim Klass doesn't like, he wants the guy to take a "lie detector" test. Why don't the other "skeptics" wise up their colleague so he'll stop making such a fool of himself--and proving, by the way, to those who want to believe it, that the "skeptics" have no real arguments for their position? Or does he just keep doing it because he wants to cow people into submission, and not say they've had experiences he "knows" they couldn't?

Dan Clore

reply: I agree with you. Lie detector tests would not be of much value in testing alleged UFO sitings or alien abductions. I suppose the threat of such a test might scare some fabricators into owning up, but other than that I think such tests are of little interest.

Too Good to Be True

L.S.I. SCAN

The above mouthful of letters stands for **Laboratory for Scientific Interrogation Scientific Content Analysis**. It also stands for gullibility and wishful thinking. Its market is the same as the [Quadro Tracker](#) and the [polygraph](#): law enforcement, including the [FBI](#). L.S.I. claims that a linguistic analysis of a written statement by a suspect will reveal

--whether the subject is truthful or deceptive
--what information the subject is concealing, and --whether or not the subject was involved in the crime*

L.S.I. boasts that "while others are out searching for physical evidence, you have already solved the case--using only the subject's own words." And with SCAN you won't have to spend hours doing "stressful interviewing", doing [reverse speech analysis](#), or taking tedious courses in [neurolinguistic programming](#) or "how to read any size body language." Furthermore, anyone can learn the technique in 32 hours for only \$600.

The SCAN technique is now being used by the FBI and other federal agencies; by law enforcement agencies and military agencies throughout the U.S., Canada and Australia; by bank and insurance investigators; and by private industry.*

How does SCAN work? You begin by having the subject write a statement such as the following:

On February 22, 1989, a bundle of 10's totaling 5,000.00 dollars was found in locker #3, where my cash drawer is kept. The date stamped on the straps of the bundle is that of the 31st of January 1989, on this day as on most Tuesday I am responsible for balancing the vault. At approximately 2:00 p.m. I balanced the vault. The currency is then placed in vault locker #5. If #5 is locked then the currency is placed in any open locker and locked, if I am doing the vault then I will put it in locker #3. I did not have a chance to find someone to tell them before they went to the vault. If I placed the bundle in locker #3 then it was there from the 31'st of January until it was discovered on the 22'nd of February. I had no knowledge of the missing money. I've been with this bank for more than two years and if in that time you are unaware of my trustworthiness then I suggest we need to come to some sort of

agreement so this does not happen again.

You then solve the case by applying special scientific linguistic techniques to the statement. For example, you will learn that

People who work in banks work with "currency", "bundles", etc. They do not work with "money". People cannot spend "currency" or "bundles". They can only spend "money". When the teller referred to the "missing money", she incriminated herself.*

It's really that simple. An untrained investigator might think that more evidence would be needed before going to trial. In fact, SCAN makes trials unnecessary. Guilt or innocence is so much easier to discover by analyzing words than by the old fashioned method of having to prove guilt beyond a reasonable doubt. The [Governor of Illinois](#) would not have to wait for a complicated study before resuming the execution of those sentenced to death; he could do a SCAN for each of the 158 inmates on death row and have only the truly guilty executed.

The SCAN technique was the brainchild of Avinoam Sapir, who has done some work for the Jerusalem Police Department in Israel as a polygraph examiner and may even have been a member of the [Mossad](#). Sapir has bachelor degrees in psychology and criminology, but he picked up his linguistics on the job. "He developed the SCAN technique by conducting extensive research into verbal communication, looking into the linguistic behavior used by people in communication."*

Sapir claims to know that John Ramsey is "an abuser and knows who killed his daughter [Jon Benet]." He analyzed the CNN interview of the Ramseys done about a week after the murder of their daughter.* He knows this by Mr. Ramsey's choice of words. Sapir also claims that Magic Johnson got infected with HIV in a bisexual encounter. He knows this because Johnson never said he wasn't a bisexual, only that he wasn't a homosexual, and he said he was certain he got HIV from a woman. According to Sapir, using the word 'certain' indicates "a lack of certainty."*

I wonder if he's certain of that?

Maybe the FBI should inform the President of the United States that they have a quicker, cheaper method than the polygraph to ferret out spies and traitors in the Defense Department and related agencies.

It doesn't do much to instill faith in law enforcement when we see law enforcement officers taking classes from people they should be investigating. In their defense, law enforcers claim that things like SCAN, the polygraph and [the voice stress analyzer](#) "work." It helps them catch the bad guys because some of the bad guys are ignorant and think these things can really detect lies with some provable degree of validity. Some of the ignorant are intimidated into confessing. They "work" in the same sense that torture or extortion "work". They get the result you want some of the time.

in the name of science

Apparently, the only thing scientific about Scientific Interrogation and Scientific Content Analysis is in the names. The patterns that Mr. Sapir thinks he sees are not supported by any scientific studies. His folly has been seen before in cases like Judge Edward Jones and [personology](#). We should write our representatives and demand that before investing any taxpayer dollars in SCAN, a prospective client ought to be required to prove that he or she has a thorough understanding of [cold reading](#), [apophenia](#), [controlled studies](#), the [polygraph](#), [wishful thinking](#) and [self-deception](#).

In the private sector, it is buyer beware. If you've given up on [graphology](#) (too controversial) and [polygraphs](#) (too expensive and time consuming) yet want to spend your money a pseudoscientific Deception Detection Agency to find out if your spouse is cheating on you or whether a prospective employee is honest, you should be free to do so. They are waiting in line to take your money. Here's a couple you might try: [BPI Laboratories](#) or [Alpha Analysis](#). Happy Hunting!

[thanks to Brian L. Leininger]

positive-outcome bias (*publication bias*)

Positive-outcome bias is the tendency to publish research with positive outcomes much more frequently than research with negative outcomes. Negative outcome refers to finding nothing of consequence, not to finding that something affects us negatively. Positive-outcome bias also refers to the tendency of the media to publish medical study stories with positive outcomes much more frequently than such stories with negative outcomes. The media bias may be due to the scientific journal bias, but the latter seems to be mainly due to researchers not submitting negative outcome studies for publication, rather than bias on the part of publication or peer review editors.

Positive-outcome bias is also known as the *file-drawer effect* (for the filing away of negative-outcome research).

reader comments:

Loch Ness monster ("Nessie")

21 Sep 2000

I have read with interest the discussion on the Loch Ness events. I find the discussions interesting but believe that there may be a simpler answer. I live near Lake Ontario in New York state and have had the pleasure of spending a great deal of time there. (I have also visited Loch Ness but I digress) The wind is almost always present in this region due to the temperature differences between the lake and shore. However at dusk and dawn the wind has died down and lake is calm. One early fall evening just before sunset I was observing a wonderfully tranquil and flat lake surface. To my surprise a torrent "magically appeared" on the surface of the water about 30m offshore. The Lake churned and foamed and large ripples about .5m appeared and then turned to move away from shore. Ah the sea monster, you say! No I say a school of Salmon or Lake Trout following a smaller school of fish feeding on surface insects. As fall approaches the big fish come in closer and closer to shore, with the dropping water temperature they are able to do so with better feeding opportunities. They are also preparing to spawn. I believe the big fish followed the smaller in and all the fish scattered as the realized how close they came to the shore line. I have never seen the event again, but it easy to see how someone could have mistaken that for a humped creature who arose and then turned quickly out to sea.

Jim Baker

reply: There's just one problem. Loch Ness is not full of nutrients and as far as I know there are no large schools of fish in the lake, nor is it known as a great breeding ground.

15 Jul 2000

I think the mystery of the Loch Ness monster has been clearly solved: sightings tend to take place some years after there has been mass tree-felling. The theory relies on the fact that the trees are mainly pine and the water is cold. The trees go in the loch, become waterlogged and sink. The pine resin however seals the logs at a point at which there is still some microbial decompositional activity within what is now a log. The microbial gas creates pressure, which is eventually released, under pressure. The blackened slimy logs are now propelled to the surface and a monster is seen. Thus also accounting for foaming water and undulating movement.

Gary Mason

reply: You could be right, Gary. Then again, you could be wrong. How do the surfaced trees go back underwater? Adrian Shine thinks people have been seeing an [underwater wave](#). Maybe the underwater waves are bobbing the underwater trees. Then again, maybe not.

14 Jun 1999

Are you aware of [Richard Carter's simulation and analysis of the Loch Ness film](#) by Tim Dinsdale? His write-up is on the Legend of Nessie site. It is worth noting that Richard Carter is a Nessie-believer. The film simulation hopefully lays Dinsdale's film finally to rest, as it really does show that he merely filmed a boat under poor lighting conditions. Stills from the simulation (which involved filming a boat) very closely resemble stills from Dinsdale's film. I'm sure this comes as no surprise to you, but it is significant for two reasons: (1) It is surely the end for the one remaining piece of "evidence" the believers have been clinging onto for the last 39 years; and (2) This is the most important thing: It tells us a huge amount about false perceptions of objects on the loch.

Tim Dinsdale was a well-respected figure, with a scientific background. However, he filmed a boat, and subsequently recalled: "Unhurriedly I stopped the car and raising my binoculars, focused them carefully upon it. The object was perfectly clear and now quite large.....It lay motionless on the water, a long oval shape, a distinct mahogany colour and on the left flank a huge dark blotch could be seen, like the dapple on a cow. For some reason it reminded me of the back of an American buffalo - it had fullness of girth and stood well above the water...." [this is a quote from Dinsdale's book 'Loch Ness Monster' - the quote is featured in Witchell's 'The Loch Ness Story']

Dinsdale's experience when making this film in 1960, led him to dedicate much of his life to searching for the monster until he died in 1987. He inspired many other people to search too. For me, this is very significant. It shows the extent to which expecting to see a monster distorts perception when people visit the loch. It also says something about the reliability of recollections of events. The text in the above quote cannot be true in the light of the fact that it clearly was only a boat in the film, yet it is detailed and stated with absolute conviction - which no doubt strengthened over time [if he hadn't at first at least slightly doubted what he'd seen, it's unlikely he'd have sent out a boat and filmed it for comparison later on in the day].

The whole saga says so much about unsubstantiated eyewitness accounts. Here was an intelligent man, utterly convinced he'd seen a hump in great detail, with a film which he thought backed this belief up. However, due to the fact that we can see that he was wrong, we can discount his "sighting". If we hadn't seen the film, he would've been recorded as one of the very many convincing

eyewitnesses - who are very convincing because they have successfully and completely convinced themselves!

Mark Fox

8 Jan 1999

Your web site is wonderful! I had to write after recently viewing (and sleeping through parts) of the [Nova Loch Ness Monster gush-a-thon](#). Although Nova usually does a good job of not suffering fools lightly, they really missed the ball on this one. My wife and I (when I wasn't sleeping) were just rolling on the floor over some of the drivel they were trying to pass off as serious.

reply: I, too, thought the *Nova* piece was poorly done. I would have focused on how there is obviously no connection between intelligence and the ability to think critically. What a waste of brainpower on the part of the big brains featured as the centerpiece of the show: "Robert Rines, a lawyer trained in physics....Harold "Doc" Edgerton, the legendary MIT scientist who had invented side scan sonar and strobe photography; and Sir Peter Scott, one of Britain's most respected naturalists." The show reminded me of one of Francis Bacon's sayings: "the lame man who keeps the right road outstrips the runner who takes the wrong one. Nay it is obvious that when a man runs the wrong way, the more active and swift he is the further he will go astray."

Another thing I would have focused on is sense perception. *Nova* spent a good bit of time focusing on whether the Wilson fake photo was really a fake. Recreating the fake monster and trying to recreate the same background in a photo was insignificant, I think, compared to what might have been done by exploring the question as to how so many sightings could all be of a non-existent creature. *Nova* could have explored [pareidolia](#), misinterpretation of sense data, the power of suggestion, the role of desire in perception, etc.

Having been to Loch Ness myself, I observed a couple of phenomena that you might be interested in. My wife and I rode bicycles along the Caledonia Canal in 1984 from Inverness to Fort William. Because we were traveling at a much slower speed than most tourist we were able to observe the amount of optical equipment that people had set up in each pull-out along the Loch. Curiously from Inverness to Urqhart Castle every pull-out had several people with high power binoculars, telescopes, telephoto lenses, etc. all pointed out over the Loch.

However once you passed the Castle the amount of viewing dropped to zero. From the Castle to Fort William, we did not see anyone looking over the Loch. Another phenomenon we observed was at Urqhart Castle itself. While touring the castle ruins we both happened to notice a boat go by a few tens of meters

from the shore line, an event which was unremarkable except for what followed. Several minutes later after the boat had gone down the Loch and was no longer in sight, we observed a wave building to the northeast of the castle, about 30m to 40m off shore. The wave swirled around and around in a circle, drawing ever tighter and building up until it had reached a few centimeters in height (maybe as high as 30 cm) with a loud rushing sound until it abruptly disappeared, exactly like the description in the Nova piece from the head investigator.

I think that Urqhart Bay has a curious structure that allows waves to be reflected back on themselves. To the northeast of the castle is a curved bay which allows boat wakes to be reflected on focused to a certain spot long after the boat has passed. Along with the legend and an active imagination, anyone could build monsters out of these waves. In fact one of the famous Nessie pictures showing Urqhart Castle in the background and Nessie in the foreground has Nessie almost perfectly positioned in the focus of the bay.

Keep up the good work! Your site is a barrel of laughs!
Stuart Black

17 Nov 1996

I have just read your piece on the Loch ness monster in the Skeptic's Dictionary, and although I am a Ness investigator and on the "other side" as it were, I think your work was well-written and logically thought out.

However there is one piece of info you divulge that is a bit off the mark. You refer to the Nessie business as providing full employment to cryptozoologists like Alastair Boyd. I thought you ought to be aware that Mr Boyd does not profit from full employment in this field. I have spent many months this year in his company and can assure you he makes nothing out of cryptozoology. In fact he makes nothing out of anything, simply because he has been the victim for quite a few years of Myoencephalic Emeylitis or M.E. as it is more commonly known.

Alastair is unable to work and it is nothing short of superhuman that he found the strength in his condition to track down Spurling and obtain the story on the surgeon's photo hoax. It would be good of you if you were to alter the offending paragraph in the interests of complete accuracy in your otherwise splendid article.

As a skeptic you surely must believe that accuracy is the best policy.
John Kirk.

logical positivism (a.k.a. logical empiricism)

Logical positivism is a philosophical attitude which holds, among other things, that metaphysics, more or less, is bunk. According to the positivists' "verifiability principle," a statement is meaningful if and only if it can be proved true or false, at least in principle, by means of experience. Metaphysical statements cannot be proved by means of experience. Therefore, metaphysical statements are meaningless.

Critics of logical positivism have pointed out that since the verifiability principle itself cannot be proved true or false by means of experience, it is therefore meaningless.

See related entries on [naturalism](#) and [scientism](#).

SkepDic.com

scientism

Scientism, in the strong sense, is the self-annihilating view that only scientific claims are meaningful, which is not a scientific claim and hence, if true, not meaningful. Thus, scientism is either false or meaningless.

In the weak sense, scientism is the view that the methods of the natural sciences should be applied to any subject matter.

reader comments:

lucid dreaming

27 Oct 1999

If you can dream that you are seeing, hearing, feeling, etc. things that you really are not, isn't it possible that you could dream that you have control of your dream when really you do not? How would a person be able to tell the difference between lucid dreaming (if there is such a thing) and dreaming that they were lucid dreaming?

I'm not claiming that the above refutes lucid dreaming, but I do believe that someone claiming lucid dreaming exists would have to somehow demonstrate that they really have control, rather than merely the dream playing a trick on the mind making you believe that you had control.

Toff Philippo

12 Sep 1999

I am very glad to have found your Skeptic's Dictionary, and I look forward to perusing it at great length.

My views on lucid dreaming are similar to many other readers who responded. I have found lucid dreams to be very positive experiences, with no contradiction whatsoever with critical thinking and skepticism. Your entry seems to me to have an undeservedly negative tone.

I found the lucid dreaming entry because I was exploring the collection of links for junk science and pseudoscience. The article doesn't justify inclusion in this category. My understanding is that prior to LaBerge's experiments many people did not believe that conscious action in one's dreams was possible. LaBerge's original work where dreamers gave predetermined signals during REM seems to me to be good science, demonstrating that this belief was wrong (although I admit that I have not read the original paper).

You state in the reader comments section that LaBerge's devices "sound like snake oil" to you, and the tone of the entry suggests as much. But if there is no research to indicate the effectiveness of these devices, I would encourage you to put this in the article, rather than leaving it to implication. Because I respect LaBerge's original demonstration, I would not be surprised at all if there were

solid research showing that these devices increase the incidence of lucid dreaming.

You write "Why Dr. LaBerge doesn't just advocate daydreaming to do all this wonderful transcendent stuff is explained by Frederick van Eeden." This is just silly, and indicates that you are just making fun, rather than looking at lucid dreaming honestly and critically.

If you observe with any care at all, it is clear that the dream state is vastly different from daydreaming. Dreams seem real, while you are in them. Thus you can't have the same experience in a daydream as in a lucid dream, unless you can summon up full-fledged sensory hallucinations on demand, and act within those hallucinations while keeping your physical body essentially immobile and out of harm's way.

Despite this criticism, I want to thank you for providing the Skeptic's Dictionary online. I have enjoyed other entries that I have read and I look forward to reading more.

David Montgomery

21 Jul 1999

I have thoroughly enjoyed your Skeptic's Dictionary. I'd like to add a thought or two about lucid dreams. I've had this experience three or four times in my life, and I only wish it were more often! Usually, the trigger is a nightmare so severe that I become extremely frightened and agitated. Suddenly I realize that I am dreaming and that I can control events. In one instance I caused a lock to appear on a door that I had been unable to close -- I locked the door and then woke up. Another time I was being chased by threatening people when I realized it was a dream. I turned my back on them, decided that they were no longer there, and went flying over the city at night, then on an undersea adventure, "flying" through water. It was one of the most euphoric experiences in my life. I have tried to induce lucidity, but without success -- it happens independently of any efforts on my part.

Interestingly, many of the other commenting on lucid dreams also mentioned nightmares -- could the stress be a trigger? Or maybe that "nightmare" feeling is so distinctive that we recognize it, even in a dream, and it tips us off that we're not awake. The other trigger I have noticed is that I have had several lucid dreams while feverish. Once when running a fever and dozing, I became very distressed when I realized I was dreaming but was unable to wake up. It was a panicky feeling, quite unlike my other experiences.

The other thing I found interesting was your speculation that lucid dreams might be caused by a frontal lobe that isn't quite shut off. This would certainly be corroborated by my experiences, because even when not dreaming "lucidly,"

I will often become perplexed and agitated in the middle of a dream when I realize that the circumstances of my real life do not match the situation in the dream -- I can't remember committing the murder I am accused of, or my cat has kittens and I become very confused because I know that she has been spayed, that sort of thing. Even while dreaming, I question the premises and inconsistencies in the dream. Maybe those of prone to lucid dreams do have some kind of mild prefrontal lobe glitch? At any rate, I've always assumed it was a nice little bonus for those of us so inclined -- certainly not a spiritual message or anything of that sort.

Is there such a thing as lucid dreaming? It depends on how you define it. Anyone who has had a dream in which he realized he was asleep and could control events will tell you that it is a unique and unforgettable experience, quite unlike normal dreaming. In this sense, lucid dreaming unquestionably exists. If it is defined as somehow getting in touch with something outside of one's body -- I really doubt it.

Cathy Georges

05 Jul 1996

Dear Skeptic,

Since I have Lucid dreamed, I must tell all skeptics out there that they're being utter and complete rationalists and are probably afraid of their own power. That's why they're skeptics, I guess.

reply: There's nothing more nightmarish than an utter and complete rationalist who's afraid of his own power!

Lucid dreaming simply allows the subconscious realization of what the various faiths have been saying all along, the thought came before the deed, and "as within, so it is without".

reply: I thought it was something like that but I am glad you said it for me. This way I can't be accused of treating this subject lightly. (Actually, though, I think the proper aphorism is "as it is without, so it is within, unless you are within six paces of a Taco Bell.")

Nevertheless, there is a need for skeptics, those who are "faith-challenged". Just as there's a need for this computer, and my fingers, etc., etc..

reply: Is this the famous *argumentum ad needium* of the scholastics? There is a need for everything under the sun, except for the things that aren't needed?

I'm glad you're getting this out there! Any spur to thought is most welcome.

reply: It depends on whose horse is getting spurred, I think.

Oh, and Lucid dreaming scared the fuck out of me, so of late, I haven't done much of it. Pity.

reply: Well, it certainly has fouled your mouth! Maybe you should lay off the lucidity for awhile and wash your mouth out with soap!

Do you TRY anything before you skepticize it? Experience, finally, is the greatest truth.

reply: I try not to skepticize anything, actually. I have tried some of the things I've written about, but generally I do not try silly or immoral acts before I write about them, skeptically or otherwise. Experience is neither a small nor a great truth. Experience can lead one to the truth, but it can also lead one to falsehood and error. Any sentient creature can have experience. If it's truth you want, it's not experience that counts but who has the experience and how critically they can think about it.

29 Sep 1996

I just downloaded your Skeptic's Dictionary, at first being very happy to have found an internet resource which shows all those occult matters discussed and praised on a million webpages from a different light.

Having read through just a few of your articles I am disappointed to find that you do not try to engage in a critical discussion on the various issues, but merely dig up arguments to denounce the various topics. Your responses to the negative comments show that you do not seek the "truth". instead it seems to me, that you ridicule them and dismiss their thoughts and experiences right away.

reply: Glad you noticed. For a while there I was beginning to think I was a voice crying in the wilderness.

I myself am what you probably would call an open-minded seeker, not having experienced many of the occult phenomena. I have been gathering a lot of information on different subjects though and I am assured that those people who say they experience these really do experience them - they are not lying. the question is if they are tricking their own mind.

reply: You don't think anybody lies about this stuff?

Furthermore, I have experimenting with lucid dreaming and would like to

comment on your article about it in more detail. All of your claims you make are valid; I just get the feeling you have not investigated much in this subject. Instead it seems to me that you were just seeking to find arguments to disprove lucid dreaming.

reply: Aha. Now the truth as to why you wrote comes out (of course, the astute reader already figured this out, since your comments do appear after the lucid dreaming entry). Anyway, I don't try to disprove lucid dreaming, or any other kind of dreaming, for that matter.

The article starts with the prices for the induction devices, which labels lucid dreaming as an invention of LaBerge's institute to sell their devices. In fact, probably less than 1% of lucid dreamers buy any of these, simply because you can have lucid dreams without anything other than your mind.

reply: I am happy to hear that, although Mr. LaBerge might feel otherwise. But, you are right. His devices sound like snake oil to me. Glad to hear most lucid dreamers wouldn't fall for his pitch.

Furthermore, your article is stuffed with rhetorical questions like "where is the evidence that the more lucid dreams a person has the better off they are ?" Who claimed that ? Nobody said that having lucid dreams should be the goal of our lives. "What is the evidence that lucid dreaming has any significant effect on a person when they are awake ?" All of this sounds like you think people have lucid dreams because they want to improve their normal life ! That is not true for most of them. Lucid dreaming is an addition to their life, like going to a good concert, like spending a day in an amusement park, like trying out some of these new virtual reality machines. It is fun, nothing more and it is a lot of fun. But it is not meant to improve your waking life - simply because even experienced lucid dreamers do not have lucid dreams very often. Also, there are different degrees of control you can have, so it will never be like "okay, tonight I will do something I want to do but I do not dare to do in real life, then after the night I will be able to do it without fear. True, some people, like LaBerge, claim this to be one possibility, but I do not know of any that actually pursue lucid dreaming because they want to improve their normal life. I think you have been prejudiced after reading LaBerge's website. His website does look like a cult promoting lucid dreaming, promising a lot, offering the induction devices for a lot of money and so on. But there is a lot more to lucid dreaming.

Well, I can see that now.

I have had lucid dreams - not very many, but I enjoyed every one of them. I was skeptical about them before, but I tried to have them anyway and I am thankful I did. It has not changed my life but added some more sugar.

Markus

reply: So, if you want to add some spice to your life, you might join Markus

in a dream or two, but remember you don't need all those costly contraptions to fly away home.

09 Dec 1996

I have to respond to your comments regarding lucid dreaming, if for no other reason than you may be missing out on one of life's free treats. I have been doing this for years and it is wonderful. Does it give me any profound spiritual insights? No, I am still a devout atheist when I wake up. Did I spend lots of money to learn how to do that? No, I bought a skinny little book about 20 years ago, that instructed me to remember and write down all my dreams every morning until I began to have lucid dreams. That's all, and it worked. Took about three weeks. Now I can fly, breathe under water, have sex with movie stars and bedazzle villagers with my magical powers. Wheee! It doesn't change anything, it's just fun. Try it!

Leslie Steach

11 Jan 1997

Yes, I am a skeptic. So much so that my ex-husband's nickname for me was "linear, logical, literal-minded." There, that said, let me add that I am a lucid dreamer. There are two types of lucid dreams, those that are deliberately induced prior to falling asleep and those that simply occur while dreaming. I belong to the latter group and I have never made an attempt to belong to the former group. Do I believe that lucid dreaming is a good thing? Yup, it's saved me from more than a few nightmares (in fact, I don't have nightmares anymore).

Do I feel privileged? No, just grateful. What does it feel like? Well, it's kind of like observing yourself while you dream. If you believe that consciousness is a one-track tape then obviously lucid dreaming is a tough concept to grasp. Did I teach myself to dream lucidly? Nope, it just happened. BTW, Bob Dylan was wrong, you don't have to be asleep in order to dream...just ask any narcoleptic, they'll tell you all about it.

R.T.

7 Apr 1998

I started attempting to "guide" my dreams when I was a teenager. Why? Because it would help avoid recurring nightmares or bad dreams. This was not always successful, and I didn't even start out knowing what I was doing, but I would sometimes get to a point in the dream where I realized I was dreaming

and recognized the same pattern. Usually, I would wake up and then have to deal with trying to get back to sleep, and hopefully dream of something more pleasant. But sometimes if I could just change one little thing in the dream, the story would shift and not be so bad or scary.

Hey, it didn't always work, but sometimes it did. Later on, I realized that I could try it when a dream wasn't so bad, just to see what would happen. But usually you just wake up because you become too aware of what is going on. I can't imagine "controlling" a dream, because when you are that conscious it is pretty much impossible to stay asleep.

lycanthropy

The delusional belief that one has turned into an animal, especially a [werewolf](#). In Europe during the Middle Ages, lycanthropy was commonly believed to occur due to witchcraft or magic. One modern theory is that the rye bread of the poor was often contaminated with the fungus ergot, which caused hallucinations and delusions about werewolves.

Stories of humans turning into animals such as tigers, swans, monkeys, etc., are widespread and seem to occur in all cultures, indicating shared human fears (e.g., fear of the wildest local beast) or desires (e.g., wishing for powers such as great strength or the power of flight), or common brain disorders.

SkepDic.com

vampires

Vampires are mythical creatures who overcome death by sucking the blood from living humans. The most common variation of the myth portrays the vampire as a dead person who rises from the grave at night to seek his victim from the realm of the sleeping. The vampire is a popular theme of [film makers](#) who have started with Bram Stokers's novel (*Dracula*) and added a number of variations to the theme, e.g., the ability to fly (like the vampire bat); a lust for beautiful women as victims who then become vampires upon being bitten; fear of the symbol of the Christian cross; the repelling power of garlic or garlic flowers; and death by sunlight or by a special stake driven through the heart (a fitting death for a character based on the 15th century warrior, Vlad the Impaler).

Legends of bloodsucking creatures are found in many cultures throughout history. One of the more popular bloodsuckers of our age is the [chupacabra](#). The vampire is also a popular literary subject. Hence, there are numerous descriptions of the origin, nature, powers, etc. of vampires. What seems to be universal about vampire myths is their connection with the fear of death and the desire for immortality. The ritual drinking of blood to overcome death has been practiced by many peoples. The Aztecs and other Native Americans, for example, ate the hearts and drank the blood of captives in ritual ceremonies, most likely to satisfy the appetite of their gods and gain for themselves fertility and immortality. Also typical were the rites of Dionysus and Mithras, where the drinking of animal blood was required in the quest for immortality. Even today, some Christians believe that their priests perform a magical [transubstantiation](#) of bread and wine into the body and blood of Christ to be eaten and drunk in the quest to join God in eternal life.

We might say we've made progress in our ritualistic quest to overcome death. First, we sacrificed humans and drank their blood to keep the gods alive and happy, or to join them in overcoming death. We later came to substitute bulls or other animals for humans to achieve our goal. Finally, we progressed to a vegetarian menu of bread and wine. Even so, the basic truth is depressing: for anything to live, something or someone else must die. Whether this truth sets you free or not depends, I suppose, on your place at or on the dinner table. Since we are deep into metaphors, we may as well note here that the vampire has become a metaphor for those who define and create themselves by destroying others. People whose lives center on destroying other people's lives by disempowering them, who reduce their victims to dependent subjects to be lorded over, have been called [spiritual vampires](#). Some of the therapists, ministers and gurus I've written about elsewhere in the *Dictionary* could be called spiritual vampires, very aptly.

This cultural link between vampirism and the quest for immortality seems to have been subordinated in literature and film, where other themes, such as blood for blood's sake, fear for fear's sake, or entrance into the realm of the occult, seem to dominate. One sign of the cultural deterioration of our ancestor's noble quest for immortality can be seen in the modern secondary meaning of 'vampire': a woman who exploits and ruins her lover. Another example of deterioration can be seen in the numerous WWW sites on vampires which appeal to occult or New Age interests such as entering the so-called dark side of reality, gaining power, establishing a unique identity as a special person or selling commercial products and games.

Apparently, role playing and masquerading as vampires is not enough to satisfy the bloodlust of some people, and covens or cults of "vampires" have emerged among some occultists. They seek blood to give them power, a sexual rush, or to establish a unique and special fictional persona based on creating fear and mystery in others. Unlike our ancient ancestors, their power is not sought because of fear based on ignorance and misunderstanding of nature, but on ignorance and misunderstanding of themselves. Like other occult cults these vampire covens are attractive to the young and the weak.*
Just a few years ago, such "vampyres" would have been considered ill or evil. Today, they are said to have an "alternative lifestyle."

* "5 vampire cultists nabbed in killings," reads the headline of a story in the *Sacramento Bee* (November 29, 1996, p. A28). The five are all teenagers from a self-described "Vampire Clan" in Kentucky. They're wanted for the murders of Richard and Naomi Wendorf of Eustis, Florida. The 15-year-old daughter of the victims is one of the suspects, along with her boyfriend who was described by schoolmates as having boasted of immortality as a vampire.

reader comments:

19 Nov 2002 (full moon)

I recently read your article on the full moon. In your article, I see that nursing homes were mentioned, and that studies show there is no change in behavior in residents. As an RN of twelve years, and after working in a nursing home for seven, I assure you, you are wrong. Or rather, the study is wrong. I have given more Haldol, and anti-psychotics on the eves of full moons than at any other time. I have the charts. Also, the roaming, and noise is at its all time high during a full moon. I don't know what proof you have, but I have seen this with my own eyes, and I have medical charts to prove it.

Lauren

19 Nov 2002

Readers of this "phenomenon" can think what they want to but don't criticize those who believe until you have walked in my shoes. I work for a 911 office and also have a father with Alzheimer's disease. We get more crazy and terrible calls around the full moon each month at work than at any other time. My father has a "cycle" just like the moon that he has followed for the past 3-4 years since he was first realized with the disease. The week before the full moon is what I call "hell week" with him. He is much more confused, agitated, clumsy, rebellious, etc etc that week than at any other time of the month. So you can believe what you want, but I still think the full moon has an effect on human beings.

"Lee"

reply: Lauren and Lee raise an important point: What are we to make of the fact that our personal experience contradicts the results of scientifically designed and controlled studies? One response is that of the chiropractor who remarked to [Ray Hyman](#) after a chiropractic claim had been falsified in a [double-blind controlled study](#): "You see, that is why we never do double-blind testing anymore. It never works!" Personal experience can be overwhelmingly persuasive, especially if one is unaware of such things as [confirmation bias](#), [subjective validation](#), [wishful thinking](#), [the nocebo effect](#), and [self-deception](#). Lauren knows from personal experience that patients in her nursing home make more noise, roam about more, and require more antipsychotic drugs on full moon nights. Thus, studies that have found no significant correlation between the full moon and behavior in nursing homes must be wrong. She says she "has the charts" to prove it. But the only thing she is likely to have on the charts, I think, would be such things that have to be recorded such as administering Haldol. (How much noise people make is

subjective and unlikely to be recorded on any chart.) Lauren should give copies of the charts to an independent investigator to examine. Because it is easy and common to selectively perceive data that fits our preconceived notions, the data must be objectively analyzed to see if significantly more Haldol is given to patients on full moon nights. We shouldn't rely on our impressions and confidence that we've got the data "in the charts."

Lee should also provide copies of the 911 calls over a year's period to an independent investigator to examine. Perhaps her impressions are right, but to eliminate the possibility of bias and selectivity of memory, she should have the data evaluated by someone else.

As for her father with Alzheimer's becoming much more difficult in the week before a full moon, we should sympathize with her plight, but note one important thing. She says it is the week *before* a full moon that is "hell week." So, it can't be due to the full moon's influence, unless in this case the effect precedes the cause. Her father's behavior may well be cycling, but the *cause* of the cycling is not likely the moon.

Now, it is possible that all the studies are wrong and Lee and Lauren are right, but what are the odds? Lauren and Lee remind us of how powerful unexamined personal experience can be in persuading us to believe things contrary to evidence gathered much more objectively. They remind us of the power of suggestion and of how easy it is to find confirmation of our beliefs without even realizing that we are being selective in our perceptions and memories. If you believe the full moon makes people behave weirdly, you will have no trouble finding support for your belief. You will notice events that confirm it; you will mention it to others who will reinforce your belief by agreeing with you and providing examples of their own. You will find support for the view in the media every full moon. Police officers will verify it, as will nurses and many others who work in institutions. All the unexamined, unsystematically gathered data supports your view. The systematic and controlled examination of the data contradicts what "everybody knows." Who should you believe? Some unknown scientist or your own eyes? Neither is infallible, but perception without controls for self-deception is the less reliable of the two.

5 Jan 2001

I just read your essay on the full moon and the update at the end of it relates to a humorous story regarding the increase in alcohol consumption.

My first job at the phone company was as a Directory Assistance operator (411). It did not take long for me to believe the full moon effects completely. On a pretty regular basis the weirdo calls would increase to such an extent

that "it must be a full moon out there" was just accepted as a fact. Sometimes I would remember to check the sky on my drive home and sure enough: full moon. Of course sometimes I would forget to check. But I still dreaded a full moon if I knew one was coming and assumed a full moon was the cause at other times.

Jump ahead a few years. I get a job as a technician with regular 8-5 hours in a new location that has a bar around the corner that telephone employees hung out in. I got in the habit of stopping by pretty much every night after work for a couple of beers and to hang out with my coworkers. This was a real dive, the kind of joint that had customers at 7am. The bartender was an old soul and the kind of guy who would kick out any jerk dumb enough to ask for a drink that had milk in it. One night as I was reading the paper at the bar I couldn't help but notice the steady parade of one weirdo after another. The next time Bernie came down to get me another beer I said "jeez, Bern, lot's of weirdo's out tonight, huh?". Bernie said "yup". He was a man of few words. I said "must be a full moon". Bernie said "nah. Check day." And he walked away. I laughed my ass off for about 10 minutes. Now that made a lot more sense than my theory.

Lori

2 May 2000

In my business (wine), one hot topic is the practice of "biodynamic farming." This is a whole system of agriculture developed by [Rudolph Steiner](#) (!) which relies on a combination of homeopathy, astrology, and lunar correlations.

An example of the last is the requirement that pruning of the vines and racking of the wine (jargon for siphoning the wine off its lees into another barrel) take place only under specified phases of the moon. I've patiently explained to gullible winemakers and consumers, using simple math, that the notion of lunar gravitational influence is nonsense. But one often repeated claim in support of biodynamicism's plausibility is that the flow of sap in plants is "well-known" to follow the lunar cycle.

Since you're at a University with an agro department and you've got an updated section on Lunar Effects, perhaps you might know whom to ask to verify if this is true or not? The biodynamics guys have quite a following among some VERY prestigious producers and I'd like nothing better than to introduce more light and less "everybody knows that..." into these discussions.

Stuart Yaniger

reply: You must have me confused with someone else. I'm not at a university and Sacramento City College does not have an agricultural department. I do, however, live in a city (Davis, CA) which has a

university with an agricultural department. They also have viticulture and oenology departments. My experience in this area comes from frequent visits over the past twenty years to wineries in the Napa and Sonoma Valleys and the Sierra foothills. I've had my ear bent by a lot of winemakers and winemaker helpers but none have mentioned lunar cycles, much less the "flow of sap in plants." Of course, I may not have been listening very carefully due to the intensity of my concentration on their product.

Frankly, if they make good wine, I don't care if they use astrology or consult James Van Praagh for advice.

2 May 2000

First, comments that come to mind on the purported association of menstruation, fertility, and the lunar cycle:

In us human females, the menses are the period of lowest fertility - logically enough, as it is when the uterine lining that would sustain the developing embryo is shed. Ovulation, during which equally logically fertilization can occur, generally happens roughly mid-way in the menstrual cycle, or between periods of menses rather than concurrently. This isn't invariably the case, as some I've known who've tried to rely on various calendrical methods of birth control have found, but on average it is.

Ergo, whether or not onset of menses could occur synchronistically with the full moon (something that in roughly 33 years of experience I've somehow failed to notice), it would not usually be associated with peak fertility.

In some other mammals, blood-tinged vaginal discharges do occur just prior to peak fertility; these are not, however, menses (so far as I'm aware, menses do not occur in other mammals, the uterine lining digressing and being reabsorbed). At a guess, this may be more roughly analogous to the increase in vaginal discharges, which may or may contain minute quantities of blood, that usually occur when a woman ovulates.

As a side note, the article linked to the discussion on lunar effects describing the human menstrual cycle <<http://www.fwhc.org/moon.htm>> includes the highly questionable statement: "PMS and menstrual cramping are not diseases, but rather, symptoms of poor nutrition." So far as I'm aware - having looked into it periodically on PubMed and elsewhere - studies have yet to establish any clear link between nutritional factors and either of these phenomena of the menstrual cycle. To date the only nutritional supplementation that has shown consistent significant results in medical studies would seem to be calcium supplementation, which appears to reduce the symptoms of mild to moderate PMS. Other widely-touted nutritional

strategies, ranging from restriction of "stimulating" substances and foods to supplementation with Vitamin B-6 and evening primrose oil, have so far not panned out in double-blind studies, with results being conflicting and inconclusive.

Stacy Scott

reply: the above nutritional recommendations represent the views of the letter writer only.

28 Apr 2000

On reading your entry entitled "full moon and lunar effects", I recalled an article by Cecil Adams that appeared in his Straight Dope column some years ago. The article was entitled "What's the link between the moon and menstruation?"; an on-line transcription of the article is available on The Straight Dope 's website, at

<http://www.straightdope.com/columns/990924.html> .

One clause in Cecil Adams's article caught my attention; he said, "studies have found the average menstrual period is 29 days and change," not 28 days as is traditionally reported. Unfortunately, he doesn't say WHICH studies have found this, so it's not going to be easy for me to go back and verify this claim in the peer-reviewed literature.

I've also heard of a study (again without a name or journal reference!) in which volunteer women were placed in rooms that separated from each other (so that they wouldn't be exposed to one another's pheromones), and whose only light source was natural outdoor light (e.g. sunlight and moonlight). This study allegedly found that, after a while, all of the women's menstrual cycles were synchronized with the moonlight. The hypothesis is that ever since we humans learned to harness fire, our artificial light sources pretty much wash out any moonlight or lack-of-moonlight we might experience at night; but before we learned to create artificial light at night, moonlit nights were much safer from predators, and therefore a better choice for mating in than moonless nights. The popular notion that moonlight is "romantic" may be a vestige of this.

Roger M. Wilcox

reply: It is pretty romantic to think that our pre-hominid ancestors mated mainly at night under the light of the full moon. I wonder if they consulted their astrological charts before coupling?

19 Apr 2000

morphic resonance

Morphic resonance is a term coined by [Rupert Sheldrake](#) for what he thinks is "the basis of memory in nature....the idea of mysterious telepathy-type interconnections between organisms and of collective memories within species."

Sheldrake has been trained in 20th century scientific models--he has a Ph.D. in biochemistry from Cambridge University (1967)--but he prefers [Goethe](#) and 19th century [vitalism](#). Sheldrake prefers teleological to mechanistic models of reality. Rather than spend his life, say, trying to develop a way to increase crop yields, he prefers to study and think in terms outside of the paradigms of science, i.e., inside the paradigms of the occult and the paranormal. One of his books is entitled *Dogs That Know When Their Owners Are Coming Home: And Other Unexplained Powers of Animals*. One of his studies is on whether people can tell when someone is staring at them. (He says they can; others have been unable to duplicate his results.*)" He prefers a romantic vision of the past to the bleak picture of a world run by technocrats who want to control Nature and destroy much of the environment in the process. In short, he [prefers metaphysics](#) to science, though he seems to think he can do the former but call it the latter.

'Morphic resonance' (MR) is put forth as if it were an empirical term, but it is no more empirical than L. Ron Hubbard's '[engram](#)', the alleged source of all mental and physical illness. The term is more on par with the Stoic's notion of the [Logos](#) or Plato's notion of the *eidōs* [[εἶδος](#)] than it is with any scientific notion of the laws of nature. What the rest of the scientific world terms *lawfulness*--the tendency of things to follow patterns we call laws of nature--Sheldrake calls morphic resonance. He describes it as a kind of memory in things determined not by their inherent natures, but by repetition. He also describes MR as something which is transmitted via "morphogenic fields." This gives him a conceptual framework wherein information is transmitted mysteriously and miraculously through any amount of space and time without loss of energy, and presumably without loss or change of content through something like mutation in DNA replication. Thus, room is made for psychical as well as physical transmission of information. Thus,

it is not at all necessary for us to assume that the physical characteristics of organisms are contained inside the genes, which may in fact be analogous to transistors tuned in to the proper frequencies for translating invisible information into visible form. Thus, morphogenetic [sic] fields are located invisibly in and around organisms, and may account

for such hitherto unexplainable phenomena as the regeneration of severed limbs by worms and salamanders, phantom limbs, the holographic properties of memory, telepathy, and the increasing ease with which new skills are learned as greater quantities of a population acquire them.*

While this metaphysical proposition does seem to make room for telepathy, it does so at the expense of ignoring [Occam's razor](#). [Telepathy](#) and such things as [phantom limbs](#), for example, can be explained without adding the metaphysical baggage of morphic resonance. So can [memory](#), which does not require a holographic paradigm, by the way. The notion that new skills are learned with increasing ease as greater quantities of a population acquire them, known as the [hundredth monkey phenomenon](#), is bogus.

In short, although Sheldrake commands some respect as a scientist because of his education and degree, he has clearly abandoned science in favor of theology and philosophy. This is his right, of course. However, his continued pose as a scientist is unwarranted. He is one of a growing horde of "alternative" scientists whose resentment at the aspiritual nature of modern scientific [paradigms](#), as well as the obviously harmful and seemingly indifferent applications of modern science, have led them to create their own paradigms. These paradigms are not new, though the terminology is. These alternative paradigms allow for angels, telepathy, psychic dogs, and hope for a future world where we all live in harmony and love, surrounded by blissful neighbors who never heard of biological warfare, nuclear bombs, or genetically engineered corn on the cob.

werewolf

A werewolf is an animal from folklore believed to consume human flesh or blood, which can change from human to wolf and back again. (*Wer* is an Old English term for *man*.) While there are no documented cases of any human turning into a wolf and back, there are documented cases of humans who *believed* they were werewolves. To suffer from such a delusion is known as [lycanthropy](#).

Some have speculated that certain excessively hirsute individuals resemble wolves and that the legend of the werewolf may have a basis in the genetic disorder known as [hypertrichosis](#) or in some other endocrine disorder, such as adrenal virilism, basophilic adenoma of the pituitary, masculinizing ovarian tumors, or Stein-Leventhal syndrome. (See the [Merck Manual](#).)

Lysenkoism

27 Nov 1996

About Lysenkoism: First: no one in Russia knows Michur, his last name was Michurin. He was a good plant-breeder but not a good evolutionist. Trofim Denisovich Lysenko as a scientist was worse than you can imagine. One of his ideas: if you feed a calf from birth with bran, it will become a pig. I understand that it's nonsense but it's our history (I'm Russian).

Another side of Lysenko's activity was his struggle against geneticists in the USSR. Before WWII we had a good genetics school but Lysenko was a Stalin favorite and most of them (geneticists) were killed or died in prisons. And he so hated genetics that in Russian dictionaries after the War articles about the "gene" said that a "gene is mythical part of living structure which in reactionist theories as Mendelism-Veysmanism-Morganism determines heredity. Soviet scientists under rule of Lysenko proved scientifically that genes don't exist in the nature."

Sincerely yours, Vladislav Zarayskiy.

macrobiotics

30 Jan 2000

I try to follow a macrobiotic diet and believe that it has helped me enormously, but in spite of being macrobiotic, I am in sympathy with some of your criticisms. I do believe that macrobiotics has erred in placing too much emphasis on the metaphysical and not enough on the rational and scientific.

Macrobiotics works, in my opinion, because it is, in many ways closest to the diet that most human beings ate during most of human evolution (the Ice Ages are an exception). This diet emphasizes whole grains, beans, and vegetables -- incidentally, a diet very close to the one recommended by the new Food Pyramid-- and minimizes processed food, sweets, and animal products. It seems to me that eating a diet that our bodies are evolved to eat is sensible.

To me, Yin and Yang are somewhat analogous to the concept of homeostasis, but of course yin and yang are more primitive conceptions that were developed before the advent of the scientific method. If Yin and Yang are viewed in this light, it becomes somewhat more reasonable, although in my opinion, macrobiotics has erred in turning these concepts into dogma instead of using them as the quite useful tools they in fact are. It has also been my experience that balancing food in terms of yin and yang will usually produce a balanced diet, because the yin-yang theory of diet was based on observations, however informal, about what actually works.

But I also have a certain level of skepticism about science for two reasons. The first is that throughout most of human history, humans were able to eat in ways that sustained life without the benefit of biochemistry and modern nutrition. Presumably, they did this by observing the effects that certain foods had on the people that ate them. Humans can make sound decisions without the basis of laboratory techniques, although science can certainly increase the odds of making the right decisions and help to explain why certain choices are good or poor.

Secondly, science makes mistakes. The idea of the four basic food groups was supposed to be based on nutritional science --or so we were taught in school-- and yet those recommendations have turned out to be seriously flawed and have been replaced by the food pyramid. It does seem to me that people eating the broad macrobiotic diet, one that includes fish and plenty of vegetables, would be healthier than those eating a diet based on the four food groups, even though

macrobiotics has its theoretical basis in Asian philosophy and the four food groups was supposedly based on science. (Yes, I know--science is self-correcting, but a lot of people developed a lot of health problems while waiting for science to correct itself.) This is not an argument against or an attack on science. Rather it is an argument for understanding the fallibility of any human endeavor.

reply: Science, unlike metaphysics, not only makes mistakes, it uses methods of inquiry that make it possible to correct those mistakes. Positing yin and yang in foods is not the kind of thing that can be corrected because it cannot be proved or disproved. You might as well assign spiritual worth to different foods.

I think it is also true that the massive amounts of funding required to do really good science make it virtually impossible to do first-rate research on every question. This makes it imperative to rely on observation, traditions about food, and "common sense". Of course, these can be wrong also and should not be followed blindly. But it would also be wrong in my opinion to totally disregard them.

The fact that something stands outside of the Western scientific tradition does not necessarily make it wrong.

Maxine Boggy

reply: No amount of money or research can test the metaphysical claims of macrobiotics, which is a completely separate issue from whether the diet is healthy. It may well be, not because of yin and yang but because of vitamins and minerals and that kind of thing.

25 Sep 1999

A few minutes ago, I saw your webpage:

<http://skepdic.com/macrobiotics.html>

and I must say, I have never seen so much erroneous information, concerning macrobiotics, collected in one place, at one time.

reply: Thank you. Are you writing to tell me that I have won some sort of award?

1) Michio Kushi is misrepresented, in that drinking only "yang fluids" would not help one suffering from schizophrenia.

reply: Good. I am glad to hear that. But I refer to George Ohsawa as the one making the claims about yin and yang, and their relationship to

schizophrenia.

2) *Mr. Kushi's "claims" about cancer, among other diseases, have been studied and taken seriously, by many responsible professionals, including medical doctors, medical researchers, the United States Congress and medical journals, such as the Journal of the AMA and the Lancet. Some of his "claims" have resulted in landmark Medical Studies, such as the Framingham Heart Study and ongoing cancer tests. This summer, the Smithsonian Institute opened a permanent Macrobiotic exhibit, honoring his efforts.*

reply: Good for Mr. Kushi. This is great news that he is the brains behind the Framingham Heart Study, etc. The Smithsonian also recommends further research on the Loch Ness "monster."

3) *The comments on the "metaphysical" selection of foods is humorous. Many macrobiotic books and publications site the mineral and vitamin content of foods, in all food categories, in great detail. Macrobiotic people select foods that have been grown without pesticide residues and the main fare of the diet is whole grains & vegetables (that are high in fiber), while avoiding foods that are high in fat and cholesterol (quite the "metaphysical " coincidence).*

reply: I take it you are suggesting that it no coincidence that metaphysics and natural gardening are in harmony.

Most foods served in a macrobiotic household have been cited by the AMA to be chief contributors in preventing heart disease and cancer (e.g., broccoli and other cruciferous foods, oats and other whole grains).

reply: I've never denied it.

Macrobiotic foods contain Isothiocyanates, Lignans, genistein, daidzein and other Isoflavones; while avoiding Monosodium Glutamate, excess sodium and cholesterol. Macrobiotic people are aware of these facts and use a healthy diet as a preventative measure, trying not to overindulge in foods (like steak, hamburger and ice cream) that are obviously bad for our health.

reply: I've never denied it.

This is usually defined, by reasonable people, as being responsible. Metaphysical? Well, I suppose you read an article somewhere.....

reply: Yes, have you ever heard of George Ohsawa, the originator of macrobiotics?

SUMMARY: I would not be bothered or concerned by your cute webpage, with the exception that it could possibly turn away people who could really benefit from knowing about and realizing greater health and happiness.

If you decide that a particular issue deserves your skepticism, it may be wise to spend a little time collecting all of the facts. In the instance of macrobiotics, perhaps you could even try the diet for a few months. But, that would be taking on a lot of responsibility. Easier to type, type, type away.

Hope no one dies unnecessarily.

Wayne Weber

reply: Me, too.

12 Jun 1999

*I value your **Skeptic's Dictionary**. But I don't value the Macrobiotics description. Your negative view could kill people by turning them away from something which could heal their terminal cancer. The reason that macrobiotics is widely misunderstood, is that only very very few people really do it right. Now, if you had health problems and had them healed with macrobiotics you would look deeper into how that works. The understanding of macrobiotics needs a fusion of dualistic and monistic thinking. In order to think that way you have to eat that way. Otherwise your brain will not be able to understand it. That's the true problem. Brains need a clear nutrition in order to be able to connect to the universe, which contains intuition. No good nutrition - no good intuition - no macrobiotics understanding - no true healing. See www.macrobiotics.org and www.physicalsystems.com/macrobiotics/*

Rolf Bertram

reply: Testimonials from people who were diagnosed with terminal cancer, tried macrobiotics (or Tk47 or Tibetan bells or _____) and later had their disease go into remission are unscientific and based on [post hoc](#) reasoning. Of course, if you are the one whose disease disappears, you cannot help but think it is a miracle. You certainly are not going to give credit to the M.D.s who gave you chemotherapy and then told you that it was hopeless after putting you through months of agony.

A macrobiotic diet can be nutritious but there is no evidence that macrobiotics has healed anybody's cancer.

magnet therapy

27 Mar 2000

It appears that the alleged therapeutic value of magnets is gaining more mainstream acceptance, at least in Canada. In MacLean's magazine (March 27, 2000, Vol. 113, No. 13) on p. 60 is an advertisement for "Dr. Scholl's Magnet Therapy Insoles." The text is as follows:

"Introducing Dr. Scholl's(r) Magnet Therapy Insoles. See inside for details.

With our new Magna-Energy(tm) Insoles, it's what's inside that counts. And what's inside is magnets. Why? Well, many of you already know and swear by the therapeutic benefits of magnetic bracelets. Those who wear them say the magnets improve circulation leaving you with a general sense of well-being. So what happens when you take the same concept and apply it to a broader area? You get the same results, only better. Magna-Energy Insoles, with our exclusive bipolar magnet system, allow alternating waves of magnet therapy to penetrate your body through the soles of your feet. Add to that, Dr. Scholl's performance proven comfort technology, designed to absorb shock and enhance pain relief, and you have all the reasons you need to look into Dr. Scholl's new Magna-Energy Insoles for yourself. Available in the footcare section of your pharmacy."

Note how the advertiser carefully avoids directly claiming any benefit, using things like "...many of you already know and swear by..." and "Those who wear them say..." It is disappointing that a well-established and well-known company like Dr. Scholl's (at least, in Canada) would stoop to this. It says something about the widespread acceptance of such unfounded "technologies" that they are willing to market such a product.

Ian Ferguson
Montreal, Canada

St. Malachy (Bishop Malachy O'Morgair, 1094-1148)

"In the final persecution of the holy Roman Church there will reign Peter the Roman, who will feed his flock amongst many tribulations; after which the Seven-hilled City (Rome) will be destroyed and the dreadful Judge will judge the people." --so saith Malachy, prophet of doom

Malachy was born in Armagh (in what is now Northern Ireland) and is believed by many to have had the gift of prophecy. He predicted British oppression for the Irish (good call) and conversion of the English back to Catholicism (bad call, but hope springs eternal in the mystic's heart, so, maybe next year...). According to the Abbé Cucherat, Malachy had strange visions of the future, including a list of the popes until the end of time.*

Some Roman Catholics think Malachy has predicted that Armageddon is just around the corner and that after the current pope there will only be two more popes before the end of the world. Of course Malachy didn't name the popes by name--otherwise we'd all be believers in his prophetic skills. He gave them descriptive names. John Paul II, the current pope, is number 110 and he was christened "De Labore Solis," *from the labor of the sun*. Those who have the gift of interpretation tell us that this is an accurate prophecy because John Paul II's father was a laborer and he has traveled around the earth (like the sun? well, remember, the prediction was pre-Copernicus). Some think the name refers to the fact that there was a total eclipse of the sun when JP II was born.

Malachy's prophecies are said to have been locked away for four hundred years before they were allegedly discovered in 1590 in the Roman Archives. Arnold de Wyon first published them. The debate has raged ever since as to whether they are forgeries or genuine predictions of St. Malachy.*

[manifesting](#) 

[SkepDic.com](#)

Search the Skeptic's Dictionary

manifesting

Manifesting is allegedly a way for the average person, without need of [paranormal](#) or divine powers, to do [magick](#) and perform [miracles](#). All one needs is the will to exercise one's magic on the universe. "Manifesting is the art of creating what you want at the time that you want it," says [John Payne](#) (aka Omni, a "being of light" channeled by Mr. Payne).

Manifesting is an eclectic hodgepodge of CYOR (create your own reality), visualization techniques, positive thinking, goal-setting, self-analysis, [selective thinking](#), and [post hoc reasoning](#), supported by tons of [anecdotes](#). The purpose of manifesting is to get what you want by actively making your dreams come true, rather than passively waiting for someone to fulfill your dreams. For example, [Anne Marie Evers](#) recommends "affirmation" as the best way to manifest one's desires. She has written a book titled *Affirmations: Your Passport To Happiness*. Ms. Evers writes:

What Is An Affirmation: An Affirmation is a declaration of acceptance used to fill oneself with an abundance of freedom, prosperity and peace. An Affirmation is the vehicle of the manifestation of your desires. Affirmations are powerful, positive statements of belief recited consistently out loud and sent out into the Universe. The spoken word drives thoughts and images deep into both our conscious and subconscious minds. Slowly, firmly, concentrate on each word, phrase and the idea behind it. We know repetition is the Mother of Learning.

According to Ms. Evers, the first step to getting what you want is to "prepare the soil of your subconscious mind by forgiving everyone and everything that has EVER hurt you, then forgive yourself." This may seem to be a bit too dramatic if all one wants to do is, say, fix a broken garage door. [Jeannine](#), for example, didn't seem too concerned about forgiveness when her garage door was broken. She followed the advice of self-proclaimed expert manifesters [Fred Fengler and Todd Varnum](#), authors of *Manifesting Your Heart's Desire*.

I remembered reading your book and decided to manifest a fix. I started talking to the door and asking it to work. I . . . used to talk to plants and they tended to grow better so I talked to the door. After a few minutes of communicating with the door I pushed the button and the door worked perfectly.

Fengler and Varnum give other examples of successful manifesters. For example, an anonymous writer told them how he or she [sold a business](#).

I decided to manifest using my will power. As I went to sleep, I said out loud, "OK universe, this is what I want. I want an offer. I want a good offer. In fact I want TWO offers. In fact I want them TOMORROW!"

The next day was perfectly normal. I "reminded" the universe it was 4 PM and the office would close at 5:30. I felt confident that the universe would take care of me no matter what happened. Within ten minutes, I had a call from one prospect who said he had an offer and would be right over. Ten minutes after he left the offer off, I got a call from my business consultant. He told me that a second offer was being written and it would be on my desk in 24 hours, which it was.

I accepted the first offer, and we flawlessly closed the deal in less than two weeks.

That's all there is to it. You let the universe know what you want and you'll get it! This should be good news to those superstitious folks who try to sell real estate by burying a statue of St. Joseph on the property. There is an easier way: manifesting!

[Varnum explains](#) that by asserting yourself to the universe you express extra energy in your emotion. The universe listens to people with extra energy as long as one has no fear and is willing to accept whatever the universe hands out. Varnum's caveat reminds me of the warnings of faith healers who tell those who can't get rid of their cancer by faith that they don't really have faith. If the universe fails to give you what you demand, it is because your desire is not coming from the right place. If you get what you desire, then your desire came from the right place.

no coincidences

Manifesting is another New Age technique which denies there is any such thing as coincidence. For example, Fengler and Varnum, in recommending a book on manifesting write:

Some people call it luck or coincidence--or just plain magic. It is the gift of being in the right place at the right time, of having opportunity fall into your lap. But what if you could create your own luck, make "coincidences" happen, even bring a few miracles into your daily life? Drawing on over twenty years of teaching the art of manifestation, David

Spangler shows you how to do just that. Called a "strikingly new, spiritually aware approach to personal power and the fulfillment of your dreams," this new book [*Everyday Miracles: The Inner Art of Manifestation*] is a complete rewriting and updating of David's classic book, *Manifestation*.

Fengler and Varnum's own book, *Manifesting Your Heart's Desire*, is hailed by the authors as a three year "study," but it is little more than a collection of stories from a group of people who met regularly to learn a variety of manifesting techniques. One of the more popular techniques is visualization.

One of Fengler and Varnum's anecdotes involves a girl who was having trouble learning to ride a horse. She visualized riding the way her instructor told her to ride and at the next lesson she was riding well. Visualization seems quite different from talking to your garage door or vocalizing your wishes so the whole universe can hear them. Yet, the practices share much in common. Visualization is mental practice. It is a way to boost confidence. It requires clarifying goals. All of these can help a person who is trying to accomplish some physical feat, like riding a horse or hitting a golf ball. But no amount of visualization will create reality. A golfer can visualize hitting a hole-in-one from now until doomsday without it ever happening. There are some people who believe they can fight cancer by visualizing little cellular warriors killing off cancer cells. The likelihood of such visualization creating the reality desired is near zero. You might as well visualize yourself flying or being in six places at once. If anyone could fix a flat tire by visualization they would be collecting a million dollars from [James Randi](#). But, manifesters don't need Randi; they can get a million dollars just by visualizing it or letting the universe know that that's what they want.

Another manifestor is [John Payne of Omni World](#), who channels a being he calls Omni. According to Payne,

manifesting is the art of creating what you want at the time that you want it. Many of you are becoming aware that you create your own reality....Each and every object and event in your life has been created by you, whether or not you are conscious of the fact. Your reality, the Earth plane, is the result of the mass consciousness of all souls that are incarnate within your system of things. Each and every event in your life can be traced back to a belief and emotion that originated the impulse for it to manifest itself into reality as you experience it at present. In our realms, the realms of pure essence and light, we can create what we want at an instant. We the Beings of Light have mastered our emotions and thoughts and can therefore direct our energies with precision and clarity so that we may create

what we want. You are also learning this skill in this lifetime and you can choose to change what you experience in your reality at any moment you wish to.

If Payne and the other beings of light can create what they want in an instant, then they must not want very much, except maybe a few followers who might buy their books, tapes, crystals, etc. If these beings are so powerful, why don't they end the ethnic hatred in Bosnia, Northern Ireland, the Middle East, etc? Payne is telling us that he and the other beings of pure essence and light could make this world a better place but for some reason they choose not to. I think we all know the reason: they are powerless.

If Payne restricted himself to gibberish about Omni and the beings of light we might do well to ignore him, but it is because of the sensible advice he sprinkles in amongst the metaphysical gobbledygook, that Payne is worthy of consideration. For example, he offers the quite reasonable advice to write down a list of things that give you joy and things you desire to "create." (Let's give Payne the benefit of loose linguistics and call the desire to quit smoking, for example, the desire to create yourself as a non-smoker.) He also advises that you write up a list of fears you have regarding what you want to create, i.e., consider the obstacles to achieving your goal. Writing is a form of "thinking out loud." But the difference between *thinking* about quitting smoking and *writing* the words "I am going to quit smoking on November 17th" and *saying* those words to others is enormous. A silent thought or wish does not pack the wallop of a stated commitment, nor is it as likely to be acted upon.

Unfortunately, Payne clothes his good advice in bad metaphysics. He recommends that you write your goals down

making use of the non-dominant hand. If you are right handed then the non-dominant hand is the left hand and if you are left handed, the non-dominant hand is the right hand. By using your non-dominant hand to write out the answers when uncovering your hidden beliefs, you can tap into the deep inner wisdom of the inner child and your soul. This system of uncovering your inner self and it's [sic] truths can lead to unprecedented levels of healing and harmony.

Why using your non-dominant hand should be the gateway to deep anything is not mentioned.

Payne also recommends visualizing the achievement of your goals and keeping a diary or journal. This is sound advice for people who have trouble clearly identifying their goals and ways to achieve them, as well as for those who have so many goals that it difficult to keep track of them all, much less

develop plans to fulfill them. He also advises that you set aside some time each day where you will not be disturbed. Payne advises to use the time to pray, create sacred ceremonies or write a mantra. The time might be better spent thinking, planning, and writing in a journal.

Payne also recommends networking with friends. Create a group where you discuss your goals and plans for achieving them. This is not a bad idea if you have friends with the same goals you have. But it is unlikely to work if you all have different goals, unless the focus of the group is something very general such as "achieving your goals." But then Payne, not one to leave well enough alone, advises that we call out his name three times when we start our group so he can energize our goals.

Despite the obvious falsity of the main claims of manifesters, some of the techniques they recommend are quite good. For example, if you do not specify a goal, but merely express some vague wish like "someday I'm going to go to New Zealand," then you probably won't ever get your wish. But if you specify your desire, insist on having it satisfied, clarify the obstacles in the way of having it satisfied, determine what is needed to have your will be done, and create a plan for achieving your goal, then you have a very good chance of getting what you want. On the other hand, a lot of manifesting seems to be little more than refusing to accept co-incidence as a fact of life, peppered with a lot of [post hoc reasoning](#) and [selective thinking](#).

One good thing about manifesting is that it could take a person's attention away from the many bad things in life over which we have no control. By focusing on what you want, you may not dwell so much on the bad hand life has dealt you. By specifying your goals, you will be more likely to see troubles as obstacles to overcome rather than as hindrances blocking your chance of success.

On the other hand, it could also be very depressing to think that the only reason you are not getting what you want is because your desires are not coming from the right place.

manifesting

9 Dec 2000

We are all manifesting our lives according to our own beliefs. In reading your article on manifesting it is obvious that you have manifested a life based on straight-lined, logic based, I'll believe it when I see it beliefs. I lived in that world for most of my life. I also took the attack attitude as you have because it challenged my intellect. Open-mindedness came when I found myself in a terrible spot and asked, prayed, thought intently, meditated or whatever you may wish to call it, for help from unseen sources. Belief followed the results of this action. What used to seem paranormal has become part of everyday life. No, I don't understand it, but that doesn't mean it's not happening. Until I set my intellect aside, and became as a child <unbound by learned beliefs> I could not enter the the kingdom of heaven <magic, conscious creating> I am not religious in the least, but I do believe there are great insights into the nature of reality in many sacred writings. I personally never saw it until I was able to cut past the dogma that surrounds it. Have I created what I would call an ideal life? Absolutely not! The demons <doubt, fear> step up when I get bold. I will eventually succeed because I am committed.

I'm sure you will correct me if I'm wrong. I think you want to believe these things are possible. You just want proof up front. If I'm wrong, you'll just brand me as an idiot or, If I'm right, someday you'll be sending a similar message. Miracles occur in my life because I believe they do!

J. Gookin

reply: I won't brand you as anything. You can't help yourself any more than I can. I wish you well, but must insist that being open-minded is not the same as believing whatever makes you feel good. Nor is a person closed-minded simply because they won't cut you some slack on things like "manifesting." Some of us have come to our beliefs after some examination of the issues. We're not closed-minded simply because we won't validate your beliefs.

19 Nov 2000

Having read your views relating to Manifesting, I find it amusingly ironic that one of your final criticisms of this practice is that it involves "a lot of . . . selective thinking." Hmm, coincidence . . . I think not.

Granted, there are a few bad apples out there: the woman who speaks to her garage door is definitely not practicing manifestation and I have never, would never and wil

SkepDic.com

the Marfa lights

The Marfa lights are lights which are visible from a viewing area about 10 miles east of the town of [Marfa, Texas](#). They are the main tourist attraction in the area. The lights are said to appear to bounce around in the sky, vanish and re-appear, and thus are considered a mystery by some. To others, the lights are not a mystery. They are [ghosts](#) or swamp gas or radioactive bursts or [ball lightning](#) or navigational lights for space [aliens](#)

Skeptics who view the lights with strong binoculars claim that they are nothing more than the headlights and taillights of cars in the Chinati Mountains on U.S. highway 67.

occult statistics

Occult statistics are statistics used as the handmaiden of occult theorizing, in much the same way that philosophy was used by theology during medieval times, viz., to justify beliefs in supernatural beings and [occult](#) forces.

[Parapsychologists](#), [astrologers](#), theologians, and others who seek [anomalies](#) to guide them to transpersonal wisdom and insight into the true nature of the universe, are now able to use computers to do extremely complex statistical analyses of monumental masses of data. When they find a statistically significant correlation between or among variables, they are extremely impressed and consider the discovery to be proof of the occult or the supernatural. To the occult statistician there is no such thing as a [spurious correlation](#).

For example, [William Dembski's](#) *The Design Inference: Eliminating Chance through Small Probabilities* is said to "provide a mathematical foundation for the types of statistical inferences parapsychologists use to identify paranormal phenomena. In particular, the book shows how to deal with statistical experiments whose p-values are extremely small (like those that regularly come up in parapsychology experiments). This work is clearly relevant to Carl Jung's idea of [synchronicity](#). [It] promises to put synchronicity on a solid scientific footing" (Rabi Gupta, personal correspondence).

Likewise, [The Princeton Engineering Anomalies Research](#) program led by Robert Jahn, Dean of the School of Engineering and Applied Science, claims that in their experiments where human operators try to use their minds to influence a variety of mechanical, optical, acoustical, and fluid devices, they have gotten results that can't be due to chance and "can only be attributed to the influence of the human operators."

Legions of parapsychologists, led by such generals as [Charles Tart](#) and [Dean Radin](#), have also appealed to statistical anomalies as proof of [ESP](#). Statistician Jessica Utts of the University of California at Davis [gave her imprimatur](#) to U.S. government studies of ESP and [remote viewing](#). Many occultists have claimed that certain [dreams](#) must be [clairvoyant](#) and cannot be explained by coincidence because they defy the laws of probability.

It was not long ago that [astrologers](#) were claiming that Gauquelin had found the Holy Grail with his statistics showing the so-called "[Mars effect](#)." More recently, millionaire playboy Gunter Sachs published *Die Akte Astrologie*, which uses data analyzed by professors of statistics at the University of

Munich [to prove astrology is true.](#)

Obviously, this list could go on and on, and could include the [Bible Code](#) and various proofs of the existence of God on the grounds of improbability that chance could explain the nature of the universe or some complex aspect of it such as the genetic code.

skeptics unimpressed by occult stats

Skeptics are unimpressed with arguments that assert improbabilities for what has already happened. Whatever has already happened is obviously not an impossible event. Accurately calculating the odds of either the genetic code or the universe occurring by "chance," i.e., by natural laws alone without the [design](#) of a divine being, is impossible. Analogies to a monkey typing up *Hamlet* by chance, or to a *Mona Lisa* being "created" by nature, are irrelevant and notably without impact on skeptics.

Skeptics are not very impressed by statistical anomalies generated by those in quest of occult forces. Sometimes skeptics have discovered that the statistics were generated by incompetent or fraudulent means, e.g., the work of Walter J. Levy at Rhine's Institute of Parapsychology (Williams 191, 319). The history of ESP research is a paradigm of dishonesty and incompetence (Rawcliffe, Randi). Skeptics have noted many times while investigating the statistical claims of paranormal researchers that there are often significant problems with [subjective validation](#), [confirmation bias](#), [optional starting and stopping](#), [the clustering illusion](#), [the regressive fallacy](#), etc.

Sometimes the variables being correlated are ambiguous or vaguely defined, if defined at all, so that practically anything can count in support of the occult hypothesis. What is a ["great" athlete](#) or a ["rebel"](#)? Sometimes the methods of finding patterns are deceptive and inappropriate, e.g., finding hidden messages in texts. As John Ruscio notes, "If you look in a fantastic number of places, and count anything that you stumble upon as supportive evidence, you are guaranteed to discover meaning where none exists" (45).

Skeptics have noted that many times something seems to be statistically improbable when, in fact, it is not improbable at all. Some spurious correlations are due to lack of clarity regarding the variables; others are due to incorrect calculation of the odds. Both errors are common occurrences regarding so-called [clairvoyant dreams](#).

Finally, skeptics are unimpressed with artificially evoked statistical anomalies because such anomalies are expected to occur with some frequency given the vast number of trials that are made.

Correlating just a couple dozen variables with one another

will produce a matrix containing nearly 300 correlation coefficients. By convention, results that occur at a level expected by chance just 5 percent of the time are called "statistically significant." We can therefore expect about fifteen spuriously significant correlations within every matrix of 300 (Ruscio, 45).

Each of those spurious correlations is a temptation to see causal connections where there are none and to engage in [post hoc theorizing](#) to explain non-existent mysterious forces.

See related entries on [Bible Code](#), [the clustering illusion](#), [confirmation bias](#), [ESP](#), [the Forer effect](#), [law of really large numbers](#), ["Mars effect," numerology](#), [optional starting and stopping](#), [post hoc fallacy](#), [the regressive fallacy](#), [remote viewing](#) and [selective thinking](#).

reader comments:

massage therapy

21 Jul 2000

I found much of your site pleasing (and amusing), but I am disheartened by your description of massage therapy. Your current write-up on massage therapy is misleading, since the definition at its center is faulty.

I am a student of massage therapy at the [Center for Massage and Natural Health in Asheville, NC](#). We will graduate with a certification in massage therapy; we will be eligible to take the NCBTMB when we complete the course. And about half of the class members are nurses, physical therapists, and occupational therapists who are learning so that they may physically help, not psychically heal, their patients.

reply: Your curriculum indicates that you are being trained to do both physical and metaphysical healing.

Our studies center around anatomy, physiology, and Swedish massage. The emphasis is on the physical and scientific. Other modalities, including "mystical" modalities like energy work, are included in the curriculum, but they are not by any means the foundation of what we learn--or the foundation of massage therapy as a whole.

reply: Whether they are the foundation or not, they are part of the curriculum, along with 182 hours in anatomy, physiology, pathology and kinesiology. Your curriculum includes Swedish massage, [Cranio-Sacral Therapy](#), Lymphatic Drainage Therapy, [Reflexology](#), Relaxation Skills, [Energy Work](#), [Aromatherapy](#), Herbology, as well as an introduction to [Eastern Philosophy](#), [Chinese Medicine](#) and Shiatsu (Chinese Acupressure).

Your blanket statement that massage therapy is "a massage which includes a metaphysical explanation usually couched in terms of 'balancing' some sort of 'energy'" is blatantly inaccurate. Massage therapy is massage for a purpose--usually for wellness, recovery from injury, or relaxation.

reply: Your course of study tells a different story. Note that I don't claim that metaphysics is *all* you study, but it is part of the curriculum whether you choose to ignore it or not.

Your later statement that "Despite the emphasis on balancing energy, none of the practice questions provided by the NCBTMB involve metaphysics" is true--the board exams don't involve metaphysics because massage therapy isn't based on metaphysics.

reply: I don't say that massage therapy is based on metaphysics, only that the two are treated as inseparable in massage therapy.

Most books, journals, and articles on massage--at least those that I have read--center on the physical, the real, and, yes, sometimes the medically unproven. Specific articles on specific modalities like Reiki and Therapeutic Touch focus on the mystical, but they are not the core foundation of massage therapy.

I understand your efforts to educate the public on scams, quackery, and myths. But your basic definition of massage therapy is inaccurate. I agree with your statements that many massage therapy claims are unproven, and I have no problem with arguments built around that fact. It appears that you base your definitions on minimal contact with a few therapists, who are probably therapists who focus on the more metaphysical modalities. Just as cynics warn others to be careful who they choose as a source of information, you should be careful when selecting sources for your pages.

Tracy Wilson

reply: I agree that there is difference between massage therapy which is grounded in physiology and other physical sciences and experience, and therapy which is grounded in hocus-pocus metaphysical gibberish. In any case, it seems to me that you should be happy that I link your profession with Eastern philosophy, since the public seems to be seeking more and more for some philosophy and magic to take along with their traditional medicine.

25 May 1999

First, may I say I enjoy your site very much, although I have read only a portion of it so far.

Both my parents were medical doctors, and I was raised with an unusually high level of suspicion for alternative so-called medicines, but I was surprised to see Massage Therapy listed among the spookier alternative therapies. I understood better when I read the entry, which limited massage therapy by definition to massages which included metaphysical explanations.

Perhaps this is a national difference (I live in British Columbia, Canada) but massage therapy here is promoted as a primarily physical therapy for loosening muscles tightened by injury or overuse, for circulatory problems, that sort of thing - often as an adjunct to active therapies, such as stretching exercises. All

of that seems sensible enough to me, and consistent with what I understand to be the mechanisms of circulation and muscle contraction.

It does seem to be the case that massage therapists often support some of the "unblocking" and "balancing" theories, but I am inclined to put those in the category of private beliefs and sympathies, and in some cases, of communicating with their clients by way of metaphor.

At any rate, my suggestion would be that massage therapy which does not depend on or incorporate metaphysical theory be differentiated in your entry. The metaphysical theories, as far as I'm concerned, deserve all the scepticism you can apply.

By the way, since I think baseline biases are relevant in these things, I should mention that I am not a health care professional. Actually I am a lawyer whose practice includes a fair bit of personal injury defense, and I run across a lot of renegade therapies that people want insurance companies to fund (ever heard of Feldenkrais? thermography?) I am immensely grateful that relatively few of the ones you mention have found their way north of the border!

Thanks again for your provocative and endlessly interesting website.

Margaret Hollis

11 Sep 1996

Your definition of Ortho-Bionomy is not even close. It has almost nothing to do with contacting trigger points (we prefer to use the word "indicator points").

reply: I agree, "indicator points" is much preferable to "trigger points." It's much more precise and scientific and not as likely to be confused with Roy Rogers.

It has to do with facilitating self-correcting reflexes through positioning, facilitated movement, isometrics, and other methods.

Richard Valasek, Advanced Instructor, Honolulu

reply: Well, I am glad someone is facilitating those self-correcting reflexes or else they might stop self-correcting and begin rebelling or opening their own ortho-bionomy clinics. I will notify Karen Khamashta, our local massage therapist who is spreading these vicious lies about your field, that she is wrong, wrong, wrong. And I will print your letter so the world will know that ortho-bionomy has to do with positioning, facilitated movement and isometrics, not contacting trigger points.

8 Dec 1996

I am a registered massage therapist in Texas. I do a combination of Swedish massage (mainly for relaxation) and Neuromuscular Therapy (NMT - for pain relief). I agree with you (surprise!). Touch and soft tissue manipulation are soothing, relaxing, pleasurable, stress relieving, pain relieving, etc. It is physical, not magical. I think it does the massage profession a disservice when some practitioners go overboard on what I call voodoo. It scares away many average folks who could benefit from the positive effects of massage.

*Of course, I do have some clients who espouse their own New Age beliefs, and I do not try to dissuade them. My main concern in the area of New Age massage are techniques designed to evoke an emotional response which is supposed to be healing. This type of therapy **may** be useful with a highly trained psychotherapist in attendance to handle disturbing images that surface, but I personally know no massage therapists who have any training in this regard. My massage training focused on anatomy, physiology, and massage technique and I think we should stick with what we know. After all, massage is already a **wonderful** thing. Relax & enjoy!*

Mass Media Bunk

15

June 23, 2001. The Learning Channel's "Atlantis in the Andes" followed the vision of a former British military cartographer who reads Plato's myth of [Atlantis](#) as a literal depiction of a country (rather than as a story with a moral message) and who has found a place in the Andes that matches, more or less, the description. He was able to make things fit, more or less, by dividing Plato's unit of measurement in half and offering an explanation of this alteration in terms of different latitudes and longitudes justifying it. Things that didn't fit, he ignored. For instance, he made no effort to explain why philosophers and classicists understand the [Timaeus](#) and [Critias](#) as another of Plato's stories used to discuss the issue of the ideal society. He doesn't explain the nine thousand year gap during which nobody in Greece or Egypt (where the story allegedly originated) mentions the battle of Athens with Atlantis. He did hint at an explanation as to how Plato's source could have such detailed knowledge of a country across the Atlantic Ocean: he suggests the ancient South Americans sailed to Egypt in reed boats, similar to those used on lake [Titicaca](#) today. In fact, he claims that the ancient "Atlanteans" had an inland port and were masters of the high seas some nine-thousand years ago. The fact that there is little supportive evidence for this notion was ignored. (A native of the Titicaca region who believes his ancestors were masters of the high seas and who will one day build a reed boat and do a [Thor Heyerdahl](#) does not count as strong supportive evidence.) The show was a great study in [confirmation bias](#) and how, if you are clever enough, you can find evidence to support the literal truth of just about any story. Those who produced the show were no doubt influenced by the fact that speculative or "alternative" archaeology sells. It was mentioned, but little was made of it, that evidence of [cocaine](#) and [tobacco](#) have been found during exams of mummified pharaohs, yet those products did not originate in Egypt. No mention was made that these findings are controversial and could be due to contamination by earlier examiners or could represent chemicals from products available in Egypt or to Egypt via one of the trade routes, which most likely did not include sailing across the Pacific Ocean to South America.

If the Pharaohs or other Egyptians did use cocaine or tobacco, it is odd that no depiction is made of it in their tombs or on their papyrus sheets.

I look forward to the next program in this series: The Discovery of Plato's Cave in Aboriginal Australia.

reader comments

Thanks for your review of TLC's programs. I did see them in the TV listings, but declined the opportunity to view them. I have found many of TLC's programs touching on "paranormal" subjects to lack

almost any kind of skepticism. I wonder how many other viewers missed a good program because they've grown to mistrust TLC. The fact that they follow the good with the bad doesn't help inspire new confidence either.

Do you think that the market for good, honest, skeptical shows about "paranormal" subjects is really too small to merit the time and money spent on un-skeptical shows, or do you think it is cowardice on the part of the programming directors that prevents them from making less credulous programs the norm? Do you think that The Skeptic's Network (TSN) could be a viable channel someday if someone were brave enough to pitch it?

take care,

Karl

reply: TSN, The Skeptic's Network a viable channel? I doubt it, but we shouldn't be cynical as well as skeptical. Michael Shermer's ["Exploring the Unknown"](#) series has been picked up by Fox Family Channel (Friday 10 pm). Randi has had a few specials shown on public television, where he debunks psychics, paranormal researchers and fraudulent preachers. And [Scientific American Frontiers](#) (also on public television) debunked alien autopsies, dowsing and a few other items. If the programs are entertaining, skeptical programs can compete with unskeptical shows on paranormal or occult subjects. However, producers don't want to offend large numbers of viewers and any program which demonstrates that millions of people are irrational or idiots for believing in alien abductions, ESP, miracle cures from ancient China or ghosts talking to charlatans, is considered a bit offensive. I don't consider it offensive but some others do. Unfortunately, they're the ones who watch TV several hours a day.

March 14, 2001. The headline at CNN.com/health reads: **Experiment supports Freud's theory of [repression](#)**. The article is from the Associated Press and no author is listed. It begins:

An experiment found that people can push an unwanted memory out of their minds, lending credence to Sigmund Freud's theory of repression.

In the study, college students who had memorized pairs of words were later shown half of the pair and were asked to either say the corresponding word or try to forget the second word.

The more the participants were asked to put words out of their minds, the less likely they were to recall the word later, even when paid to remember the word.

[Freud's theory of repression](#) is *not* centered on the notion that people can and do *consciously* forget things. Freud's theory is that the mind *unconsciously* forgets unpleasant, traumatic events such as sexual abuse. These repressed memories, according to Freud, can unconsciously affect a person's thoughts, desires and actions, and lead to neuroses. I thought that the journalist didn't know Freud's theory and so this piece of bunk about finding experimental support for it was due to the ignorance of some journalist. Apparently not.

The CNN.com article is based on a study published in the March 16, 2001, issue of *Nature*: "Suppressing unwanted memories by executive control" by Michael C. Anderson and Collin Green. Their article begins

Freud proposed that unwanted memories can be forgotten by pushing them into the unconscious, a process called repression. The existence of repression has remained controversial for more than a century....*

I think these claims are misleading. Freud emphasized the *unconscious* repression of unpleasant memories. That theory is controversial because there is only weak empirical evidence for it. (See Daniel Schacter's [Searching for Memory](#), chapter 9, for a discussion of the research in this area. Most research supports the notion that the stronger the emotional experience, the more likely it is that one will remember it.) But there is a large amount of anecdotal and scientific evidence in support of the notion that we *consciously* repress unpleasant memories (as there is that we unconsciously forget *pleasant* things that unconsciously affect our thoughts and actions).

Another article in the same issue of *Nature* is called "Cognitive neuroscience: Repression revisited" by Martin A. Conway, a psychologist at the University of Bristol in England. According to CNN.com, Conway claims that

....the Oregon research supports Freud's theory about the mind's ability to repress thoughts, especially painful or disturbing ones.

Even more surprising is that this occurs for unrelated pairs of words. How much stronger must this inhibition be for objects central to our thoughts and emotions.

I'd say this is an empirical matter, not to be decided by projection. The ability to consciously forget words isn't even of the same type as *unconsciously* forgetting painful *emotional* experiences. The research doesn't support Freud's theory; it supports a minor and uncontroversial part of that theory. Anderson, at least, recognized this. He is quoted by CNN.com as saying "What we really need to do is see if the same effect occurs for emotionally more significant material....That's a very important step we have to take. I wouldn't really say we've solved the repression problem here. It's just a good start."

A third article in the same issue--"Neurobiology: New memories from new neurons" by Jeffrey D. Macklis--and a fourth--"Neurogenesis in the adult is involved in the formation of trace memories" by Tracey J. Shors et al.--seem to have been confused by the AP writer or a CNN.com editor. The CNN.com article credits Shors with the

Macklis study which dealt with rats who "were not as likely to remember the connection between two events separated by time if given a drug that cuts the production of neurons in the hippocampus, an area of the brain used in the formation of some types of memory."

For those who might not be aware of it, the AP story notes that "the brains of both rats and humans have a hippocampus" and claims that "the study is the first to show in mammals that new neurons are used in memory formation, though previous work has shown the connection in birds." What this has to do with supporting Freud's theory of repression is anybody's guess.

March 6, 2001. I wasted an hour tonight watching [Larry King Live](#), whose guests included three so-called [psychics](#) who claim they get messages from [spirits](#) of the dead. The most obnoxious guest was [Sylvia Browne](#), who claimed she solved the N.Y. Trade Center bombing and many other crimes. She's made the same claims several times on the Montel Williams show. Paul Kurtz of [CSICOP](#), also on the "panel" (as Larry referred to his guests), noted that whenever [Browne's](#) claims as a [psychic detective](#) have been checked out they don't check out. No mention was made, however, of the [Brill's Content investigation of Browne](#):

***Brill's Content* has examined ten recent Montel Williams programs that highlighted Browne's work as a psychic detective (as opposed to her ideas about "the afterlife," for example), spanning 35 cases. In 21, the details were too vague to be verified. Of the remaining 14, law-enforcement officials or family members involved in the investigations say that Browne had played no useful role.**

"These guys don't solve cases, and the media consistently gets it wrong," says Michael Corn, an investigative producer for Inside Edition who produced a story last May debunking psychic detectives. Moreover, the FBI and the National Center for Missing & Exploited Children maintain that to their knowledge, psychic detectives have never helped solve a single missing-person case.

"Zero. They go on TV and I see how things go and what they claim but no, zero," says FBI agent Chris Whitcomb. "They may be remarkable in other ways, but the FBI does not use them."

Of course, there is no way to test her other claims because they are about spirits or are too vague. For example, one caller wanted some info on her parents' parents. Her parents were both adopted. Browne said she was getting the message "B-U-R-G-E-S-S" and Memphis. Nobody could use such data to test anything meaningful.

My favorite line of the night came from [James Van Praagh](#), who does not take criticism well. Skeptics, including rabbi [Shmuley Boteach](#) who joined Kurtz and former *Time* magazine chief science writer Leon Jaroff, were out to destroy people, said Van Praagh, while psychics were bringing good things to life. Well, skeptics are certainly out to destroy frauds like those on Larry King's show, and with good reason. The rabbi--friend of and co-author with [Uri Geller](#)--noted that the information the psychics were claiming to get from spirits was trivial, banal and

demeaning. Van Praagh disagreed because such "messages" prove there is an afterlife, which he takes to be a good thing. To tell the truth, I wouldn't mind an afterlife if it did not include characters like Van Praagh or Sylvia Browne, but it would be hell to have to spend eternity in the presence of such uninspiring charlatans.

The least obnoxious of the charlatans was [John Edward](#), which is not to say that he was not obnoxious. He has reduced the debate between [true believers](#) and skeptics to one of choosing your belief system. He doesn't care what criticism you throw at him because he doesn't respond to criticism, which, he believes, is just part of your belief system, which isn't his or his fans' belief system. He says he isn't interested in proving his powers but he agreed to be tested by a scientist in Arizona who, as Jaroff put it, believes in the tooth fairy (clinical psychologist and professor of psychiatry [Dr. Gary Schwartz](#) of the University of Arizona in Tucson, director of something called [Human Energy Systems Laboratory](#)). None would agree to be tested by [James Randi](#) because, as Browne put it, it would be a set up. (She claims she was set up by Randi before who tested her psychic powers some ten years ago. She said the subjects whose minds she was supposed to read were "Germanic" and didn't speak English. Why should that matter to a psychic? Anyway, [Randi has posted a reply](#), denying that Browne was set up and claiming she lied about the Germans. According to Randi, "Only one member of that audience of 140 persons was German, and [Browne] spent a full one minute and seven seconds rattling off guesses for him, then found out he was German, only after he told [her].")

I don't see how these three stooges (Browne, Van Praagh and Edward) could be tested, since they all claimed that just because the message they get from the spirit doesn't make sense doesn't mean it doesn't make sense. The subject might figure it out later or it might be a message from a different spirit! There is no way in hell anyone could prove these messages didn't come from somebody in heaven!

Other than a bit of self-promotion and name-calling, the program provided nothing but a minimum of entertainment and even less enlightenment. For good measure, Larry brought in Clint Van Zandt, a former FBI agent and profiler, who stumbled his way around to say that psychics have never helped solve a case but he wouldn't rule out using them because you should pursue every avenue yada yada yada. Van Zandt said he'd use psychics even though they're useless:

....if you exhaust law enforcement investigation, if you exhaust psychological profiling, if the victim's family or the police say, "I would like to try a psychic," I would say, anything that can help, and anything that would help a victim's family, I would not stand in the way.

Van Zandt was the chief negotiator in the [Waco fiasco](#). He even admitted that he had someone say the word 'Beelzebub' to [Koresh](#) over the phone because some psychic advised him to do so.

King also brought in Dale Graff, a retired physicist who worked with the military on [Stargate](#), a program devoted to the investigation of [remote viewing](#).

The ostensible reason for having this show was to discuss Jaroff's recent article in *Time* magazine, "[Talking to the Dead](#)," an article inspired by James Randi's exposé of Edward in a recent issue of *Skeptic* magazine. Like Randi and Shermer, Jaroff has no kind words for frauds. The article mentions that Inside Edition is planning an exposé of Edward by James Randi to be aired later this week. There is no mention of such on the Randi [homepage](#). (Inside Edition's website is a major waste of bandwidth requiring Flash 4.)

In my opinion, the rabbi came off as being the most rational and thoughtful. Jaroff and Kurtz seemed cynical, the former calling the psychics names and the latter asking for the television equivalent of a strip search of his unscientific opponents. (There is something unbecoming about a person asking a psychic to be reasonable and scientific. Would Kurtz be baffled if the psychics required him to be spiritual in order to engage them in dialogue?) Browne and Van Praagh came off as bitter and arrogant, though the latter provided the best hoot of the evening when he claimed that [Michael Shermer](#) said on Oprah that Van Praagh has a computer hooked up to every home in America. Van Zandt waffled whilst Graff waxed poetic about the powers of remote viewing and forces out there that are unknown to modern physics. I'm surprised he didn't have to leave early to catch his UFO home. Larry remained calm throughout and to his credit did not appear to be favoring one side or the other. ([Not everyone](#) agrees with my assessment.) He gave the skeptics every opportunity to respond to the true believers. But it became clear about thirty seconds into the program that nothing very interesting or important was going to happen in the next hour. If the psychics truly are either suffering from delusions or are frauds, as I believe is most probably the case, how else could they respond to challenges from skeptics except with bitterness (Browne and Van Praagh) or indifference (Edward)? Any hope of a meaningful dialogue is as remote as the likelihood that the FBI knows who amongst them is spying for the enemy.

The rabbi simply noted that the psychics make pointless observation after pointless observation: if these psychics are truly getting messages from the dead then life truly is pointless because these messages prove life after death is for the terminally silly.

February 15, 2001. "If there's really a sucker born every minute, shouldn't Fox be America's No. 1 broadcaster by now?" I wish I had written that line, but I didn't. It comes from Ellen Gray of the [Philadelphia Daily News](#) in an article entitled "One false step for man? Fox dredges up 'conspiracy' that 1969 lunar landing was faked." This Fox program was much worse than the so-called Alien Autopsy film the network showed several years ago. Words like "shameless" and "despicable" come to mind to describe this latest panegyric to the cognitively challenged. The Fox show was little more than a soapbox for Bill Kaysing's moronic speculations ([We Never Went to the Moon](#), 1976). Kaysing thinks NASA intentionally burned to death astronauts Gus Grissom, Ed White and Roger Chaffee. He says NASA won't come clean about the deaths because the astronauts were killed because "they knew too much." About what? About how the whole space program was a fake. Right! If I were NASA and wanted my government to continue funding my fake program I'd burn three astronauts to death on the launching pad, too. What else would build more confidence in the program?

Kaysing's main "evidence" for believing the moon landings were faked prove only the man's ignorance. There are no stars in the NASA photos, notes Kaysing. Of

course there aren't, and if Kaysing had any knowledge at all about photography, he'd know why. There are no stars in the moon photos for the same reason you can't photograph stars in the daylight here on earth. For those who care about the truth, see [Jim Scotti's page](#) or [Phil Plait's](#) or [NASA's](#) or even the work of the [LunarAnomalies.com](#) people.

Fox is [shameless in its promotion of hoaxes](#) and its encouraging people to take seriously slanderous claptrap and ignorant drivel. They even brought in Mrs. Grissom and her son to insinuate that NASA was hiding something sinister from them regarding the fire that killed Gus Grissom and the other two astronauts. [thanks to Joe Littrell]

January 2, 2001. Acupuncture got a big boost from a couple of football announcers last night who noted during the Oregon State rout of Notre Dame that one of the OSU players had had back or leg pains that went away after acupuncture treatment that had been recommended by his coach. The announcers said that the player said that he never felt better and that he went back for more treatments, he thought so highly of them.

This kind of anecdote is powerful. I don't know how many people watched OSU thump ND, but some of them are probably calling an acupuncturist right now.

Of course, no one will ever hear a coach or an announcer say: *Johnny Winwon was treated for pain by an acupuncturist and there was no long-term improvement of his condition.*

Before consulting an acupuncturist based on a favorable anecdote, I would advise doing some reading on [regression](#), [confirmation bias](#) and the [post hoc fallacy](#).

December 26, 2000. Bob Salsberg of the Associated Press concluded his story about yesterday's partial solar eclipse with a quote from Lauren Likkell, an assistant professor of physics and astronomy at the University of Wisconsin-Eau Claire: "What are the odds of having a partial eclipse on the last Christmas Day of the millennium?"

I don't know, but they are probably about the same as the odds of 300 Chinese dying in a fire on Christmas and of President-elect Bush's daughter having an appendectomy, both of which happened yesterday.

One might ask *what are the odds of having a baby during a partial eclipse on the last Christmas Day of the millennium?* I have no idea, but I'll bet it happened.

Just about anything looks odd if you look through the wrong end of the telescope.

In Mass Media Funk, you will find articles about news stories, magazine articles or TV programs of interest to skeptics, which do not pander to the public's appetite for the occult and supernatural.

Note: because many of the sites linked to here are newspapers or magazines, it is impossible to maintain the links.

Mass Media Funk

4

October 13, 1998. [Art Bell quits broadcasting.](#) In his farewell address, Bell said: "You may recall about a year ago... I told you that there was an event, a threatening terrible event occurred to my family, which I could not tell you about. Because of that event, and a succession of other events, what you're listening to right now, is my final broadcast on the air. This is it folks, I'm going off the air and will not return." Promises, promises.

[Art Bell](#) was a very popular overnight radio show host (locally, his show is on from 1 to 4 a.m.). His specialty was the guest who had been abducted by aliens or claimed to be the victim of some government conspiracy. Those who claim that they can't get a fair hearing for their grand ideas about [reverse speech](#) or how the CIA has planted microphones in our cereal, could count on Bell giving them a soapbox. If you claimed there was a conspiracy to silence you by the FBI, the CIA or the local girl scouts, you were assured a spot on Bell's show.

Bell is the one who, more than anyone else in the mass media, promoted a variety of rumors culminating in the idea that comet Hale-Bopp was being trailed by a spaceship. During Easter Week 1997, [39 members of the Heaven's Gate cult committed suicide](#) in the belief that the spaceship was coming to pick them up and take them "to a higher level."

By the way, Bell is not the only broadcaster who quit on October 13. The Virgin Mary has announced to Her chosen channeler Nancy Fowler that She has sent her last message to the homemaker from Conyers, Georgia. According to the Associated Press, more than 100,000 faithful devotees gasped and fell to their knees upon hearing "The future holds no concern to those who truly seek God and truly love and remain in His favor." Nothing could be more true.

This is not the first time the BVM has quit broadcasting to Earth on October 13. In 1917, she made her last appearance at [Fatima](#) on this day. The BVM apparently likes the number 13, for that was the favored date for each of her announcements to Ms. Fowler. Coincidence?

(July 8, 2002. [Update.](#) Nancy Fowler sues former associates for millions.)

(October 23, 1998. Update: Art Bell announced he will be back to work beginning Wednesday night, October 28th. He says the crisis still remains but it is a private, family matter.

Note: According to [NYPost.com](http://nypost.com), Bell quit the show to care for his suicidal son who had been sexually molested when he was 16 by a male teacher. The teacher is now serving a life sentence for sex and drug offenses.)

October 6, 1998. The Power of Belief, an ABC news special with John Stossel.

This was a very good survey of popular culture's fascination with many of the topics taken up in the *Skeptic's Dictionary*, such as "alternative" medicine, firewalking, psychic detectives, astrology, levitation, channeling, psychics, therapeutic touch, OBEs and NDEs, voodoo, and more. Stossel took a skeptical approach and gave ample time to James Randi and Michael Shermer to argue that true believers are fideists, i.e, they don't care what the evidence is, they believe because they want to believe.

To illustrate this point, Stossel gave ample coverage to Randi's "[Carlos](#)" hoax. In 1988, Randi trained 19-year-old José Alvarez, a young artist, to impersonate a mystical channeler for "Carlos," a 2000-year-old spirit from Venezuela. With the assistance of an Australian television station, Alvarez toured Australia and developed a large following. The hoax was done by Randi to demonstrate how easy it is to deceive people and how gullible and uncritical the mass media are when confronted with extraordinary claims.

Unfortunately, nobody on Stossel's show asked why these gullible believers do not believe in each other's delusions or why they limit themselves to just these, rather than other equally pleasant, delusions? [Wishful thinking](#), [cold reading](#), [communal reinforcement](#), [confirmation bias](#), [subjective validation](#) and [the placebo effect](#) go a long way towards explaining these cases of self-deception. But more emphasis might have been placed on why we use methods like little [Emily Rosa's](#) (who was also featured) to test claims. We use [double-blind, controlled, randomized studies](#) because we know it is easy to deceive ourselves and we must force ourselves to test our claims. Otherwise, we run the risk of deceiving ourselves into believing things that seem true but are just not so.

In short, the program was atypical in that it presented the skeptics in a strong light and the true believers in the dark, but the show would have been perfect simply by having a scientist like Ray Hyman explain not why people believe weird things but why we devise controlled tests for our beliefs and why having satisfied customers is not sufficient to justify a belief. A philosopher like Shermer might have been asked about [ad hoc hypotheses](#), [Occam's razor](#), [the post hoc fallacy](#), and why [testimonials](#) are of little scientific importance.

Nevertheless, the show was very good and if you want to encourage ABC to do more such shows contact them at <http://www.abcnews.com/onair/emailshows.html>

August 27, 1998. [BBC News reports](#) a story released earlier this month about researchers who think they have the answer to [spontaneous human combustion](#): the "wick-effect." Some bodies are devoured by flames fueled by their own body fat. The researchers tested their theory on an animal closely resembling a human's fat content, the pig. "Using a dead pig wrapped in cloth, they simulated a human body being burned over a long period and the charred effect was the same as in so-called

spontaneous human combustion." The researchers were even able to incinerate the bones of the pig by letting the fire smolder for several hours.

August 21, 1998. A dog with a reputation for being psychic is tested under controlled conditions and is found not to be psychic, according to Glenda Cooper of the Independent (UK). The British Journal of Psychology published a report by [Dr Richard Wiseman](#) and [Matthew Smith](#) of the University of Hertfordshire who tested "Jaytee," known as a clairvoyant terrier. The dog had become somewhat of celebrity after appearing on several television programs going to a window at home at the precise moment her owner, Pam Smart, decided to return home from some miles away. Under controlled conditions, Jaytee did not perform as expected. In one experiment, the dog did go to the window about the time Ms. Smart was deciding to return home. However, the investigators believe that the dog's behavior was more likely to a car pulling up in front of the house than to clairvoyance. Other experiments found that the dog would often go to the window and stay put for minutes at a time, but not when Ms. Smart was deciding to come home. It even went outside to the garden one time at the precise moment her owner was deciding to return home; however, it was determined the dog went out to vomit, not to greet her mistress. Skeptics are not surprised that under controlled conditions the psychic explanation appears to have been driven by [selective](#) and [wishful thinking](#). Parapsychologists are not surprised, either, because psychic powers always fail under controlled conditions. (See ["The Telepathic Terrier"](#) by D. Trull)

August 19, 1998. An Associated Press story out of Concord, New Hampshire, today reports that Bill Morse has sued teacher Lucille Corriveau on charges "she caused him and his wife great emotional distress and invaded their privacy when she handed them a letter purporting to contain a message from their dead son." The Morse's son Sam was 10-years old when he drowned two years ago. Mr. Morse has also sued the Dunbarton School District for failing to fire Corriveau. Corriveau has countersued. She says she was defamed by the Morses when they passed out a flier saying "This woman RAPED my son." The teacher apparently gave the Morses a letter purportedly containing a message dictated to her by Sam. The message said that Sam and two other children who had died wanted Corriveau to know that she was "their idol."

Charles Douglas, the Morses' lawyer, claims the school district knew that Corriveau engaged in [channeling](#), [séances](#), and other [paranormal](#) activities in attempts to communicate with dead students. He asked the school district for any psychological evaluations of Corriveau and wanted to know if she was being treated for mental problems.

The teacher's lawyer, Fred Desmarais, says that his client can't explain how she got the message, nor should her client's doctor-patient confidentiality be broached.

August 13, 1998. [An Associated Press story](#) today reports on the disciplining of a prominent psychiatrist by the State of Illinois. Dr. Bennett Braun is accused of convincing a patient that she had 300 personalities, among them a child molester, a high priestess of a satanic cult, and a cannibal. Braun is the founder of the International Society for the Study of Disassociation. The patient claims that she was incorrectly diagnosed with [multiple personality disorder](#) and spent more than two

years in a psychiatric ward. She said her treatment included sedatives and other drugs, as well as [hypnosis](#). She claims she was sometimes restrained with leather straps to stimulate [abuse memories](#). Braun and another psychiatrist at Rush-Presbyterian-St. Luke's Hospital, Elva Poznanski, also persuaded the patient to hospitalize her two healthy children, then ages 4 and 5, for almost three years. The patient told the *Chicago Tribune*: "I began to add a few things up and realized there was no way I could come from a little town in Iowa, be eating 2,000 people a year, and nobody said anything about it."

In November, the patient won \$10.6 million in a lawsuit against Braun, Rush-Presbyterian-St. Luke's Hospital, and Poznanski. The patient apparently was suffering from depression after the birth of her second child.

July 12, 1998. Good summer reading: Richard Ellis, [Imagining Atlantis](#) (New York: Knopf, 1998) and now in paperback, Timothy Ferris, [The Whole Shebang : A State-Of-The-Universe's Report](#) (Touchstone, 1998).

June 30, 1998. [Science wrecks a good ghost story](#) By ROBERT MATTHEWS.

May 3, 1998. [Sandia Labs published the results of a double-blind test done on the DKL LifeGuard](#), an item featured in [Too Good To Be True](#) a few months ago. The results confirmed our suspicions of the uselessness of this device which its manufacturers claim can detect a human heartbeat through concrete walls, steel bulkheads, heavy foliage, earthworks, or up to 10 feet of water. Test results demonstrated beyond any reasonable doubt that the device only "works" if the operator has prior knowledge of where his target is. Without prior knowledge, the operator could do no better than expected by chance. There is hope, however, for the manufacturers. Scientists believe that such a device would work if only DKL would change the direction of its antenna and lengthen it to three times the diameter of the earth. I wonder if the *Washington Post* will consider doing a follow-up story to [the promotional piece written by Beth Berselli last January](#).

April 30, 1998. Praying over a child, rather than seeking medical care, can be lethal. A study published in *Pediatrics* (April 6, 1998), the journal of the American Academy of Pediatrics, found that 140 of 172 child deaths were due to conditions which have a treatment survival rate of greater than 90 percent. In other words, more than 80 percent of the deaths probably could have been avoided had the parents of the dead children sought traditional medical care. The study examined 172 child deaths in faith healing families from 1975 to 1995. It was done jointly by the University of California at San Diego and Children's Healthcare Is a Legal Duty, a group out of Sioux City, Iowa.

The study concluded that eighteen other children would have had better than a 50 percent chance of survival with treatment, and all but three of the children would likely have benefited from medical help. (submitted by Don Rush)

April 14, 1998. The Associated Press reported today that [Rama](#) now sleeps with the fishes or is snowboarding in nirvana. Frederick P. Lenz III was found dead in the water near his Long Island home. Police said he drowned or died of a drug overdose. (reported by Aaron R. White)

April 3, 1998. *20/20* on ABC. [Michael Shermer](#), author of [Why People Believe Weird Things](#) and founder of [Skeptic](#) magazine, got another chance to debunk author/mentalist [James Van Praagh](#). The latter specializes in talking to the dead and claims he is a contact for just about anyone's dead relative. On *20/20* Van Praagh extended his service to all dead pets. Shermer did as good a job as anyone could do in pointing out the tricks Van Praagh uses. (1) He fishes for information by asking question after question until he eventually gets a response he can pursue further. The audience quickly forgets or ignores all the questions that went nowhere and easily remember the "hits". (2) Many of his questions are very general and relate to obvious things like heirlooms. [[See Mass Media Bunk](#)] (3) Many of the "hits" aren't really hits at all. For example, when he was fishing with the name "Charlie" he began the questioning with a man in the front row of a very small group of people assembled by *20/20*. The man was blank on the word "Charlie" so he extended the name to the group at large. Finally, a woman in the second row said she had once had a dog named Charlie. The dog was dead, so the interviewer considered it a "hit" until Shermer had him show the tape again and pointed out that the question had been aimed at a man but a woman in the group finally bit that piece of bait. Wasn't it odd, noted Shermer, that this great psychic couldn't tell the difference between a canine and a human spirit. When asked about this, Van Praagh announced that animals have souls, too, and they continue to exist after death. He explained that hearing the spirits is like having a conversation under water, which is a perfect segue to the third point. (4) Van Praagh has many more "misses" than he has "hits", but only a skeptic would notice. (5) Some of his "special hits", like telling Barbara Walters that her father had a glass eye--a fact which impressed Walters--are likely due to having done his homework. The reporter told Barbara that it had taken him only a few minutes to discover that information from sources available to anyone. Another "special hit"--seeing a young woman's dead grandmother behind her, was shown to have been information he got by asking questions during a break in the programming an hour earlier. (6) He plays on the emotions. Many of the people who appreciate van Praagh are very emotional and have a very strong desire to communicate with the dead. He seems to fulfill their wish and they are very grateful.

When asked what harm their could be in helping people work through the grieving process, Shermer noted that the people who are devoted to Van Praagh are not going through the normal grieving process. He isn't helping them with anything. He is defrauding them, lying to them. Van Praagh denies he is a fraud and claims that he is doing God's work. He says he is helping people, while his critics are "negative" and "not open to the spirit world." He even accused *20/20* of a set-up because he didn't have great success with the small audience they had assembled for him to work. Van Praagh was assured that those selected had a genuine desire to talk to the dead. He was asked, however, why it would matter whether the audience consisted of believers or skeptics. Van Praagh claimed that skeptics by their very skepticism block the spirits from communicating. This [ad hoc hypothesis](#) is one we've heard before from psychics and psychic researchers.

20/20 was fair and did an excellent job of letting Van Praagh perform to the best of his ability, letting a skilled skeptic criticize the performance, and allowing both to respond to the other's claims. When the segment was finished, Barbara Walters asked Hugh Downs what he thought about Van Praagh. Downs put it very succinctly: "I don't believe him."

March 31, 1998. [Associated Press article by Brenda Coleman](#). Emily Rosa, a nine-year old, has published an article in the *The Journal of the American Medical Association* which debunks one of the main claims of therapeutic touch. "Those who practice the technique say an energy field emanates from every person and is detectable above the skin. The healer moves his or her hands over the patient's body to modify the field. Touching the patient isn't necessary....Emily set up a cardboard screen through which practitioners put their hands. With their sight blocked, she asked them to identify which of their hands was near one of hers." [\[Coleman\]](#) "The practitioners correctly located Emily's hand only 122 (44%) out of 280 trials, which is no better than would be expected by guessing. A score of 50% would be expected through chance alone." [\[Stephen Barrett\]](#)

March 31, 1998. *Sacramento Bee*. The United States Supreme Court upheld the ban on the use of polygraph results in military courts. Justice Thomas, speaking for the court said: "There is simply no consensus that polygraph evidence is reliable....the scientific community remains extremely polarized about the reliability of polygraph techniques....There is simply no way to know in a particular case whether a polygraph examiner's conclusion is accurate." The case involved an airman who wanted to introduce in his defense his so-called "lie detector" test results. He was charged with using drugs and writing bad checks. The Air Force, by the way, conducted over 35,000 polygraph tests in one year, according to the airman's attorney. He rightly asked, if the tests are so unreliable, why does the Air Force use them? Good question, but it should be directed at the Air Force, not the Supreme Court. [\[read about it\]](#)

Jan. 7, 1998. *Sacramento Bee*, Hundreds of psychics were proved to be of no use in another crime investigation. In 1992 a 6-year old boy vanished from his home in rural Butte County, California. After an intensive search for the boy had turned up nothing, the family and sheriff's officials had examined the theories of more than 100 self-proclaimed psychics who had volunteered to assist in the case. The investigators should have spent the time combing the nearby hills instead of chasing after the "visions" of so-called "psychics". Three boys recently found a skull of a young boy while hiking on a trail within two miles of the missing boy's home. A search of the area led to the discovery of some more bones and some clothing. Nothing that was discovered gave any clues as to the cause of death. In fact, investigators have sent the skull to an FBI lab for a positive identification. Though the skull is consistent with it being that of the missing boy, it is possible it is not. Yet, the mother of the missing child declared: "It wasn't no mountain lion. The person who did this is going to pay for it." In fact, if the skull and other items turn out to be that of the missing boy, the evidence would be consistent with the child falling down a canyon and dying of natural causes, his body being dragged away and devoured by animals, including the mountain lion. There is no evidence that there was any foul play. How much influence did the psychics and mass media play in conjuring up the worst-case scenario of kidnapping, molestation, mutilation and murder which apparently still haunts the child's mother?

January 8, 1998. The *New England Journal of Medicine* reports that when calcium channel blockers (for high blood pressure) were linked to higher risk of heart attack, 96% of the doctors who authored defenses of the use of calcium channel blockers

had financial interests in the medication. Of those doctors who wrote neutral pieces on the medication, only 60% had financial ties to manufacturers. Only 37% of those who wrote critical articles on the use of calcium channel blockers also had a financial interest in the product. Is this a coincidence that one's thinking correlates with one's financial interest?

December 31, 1997. The terms of the 1993 closure agreement between the IRS and Scientology were revealed by Mark Rathbun, director of Scientology's "Religious Technology Center". For over twenty years, the IRS had tried to deny Scientology tax-exempt status as a religion. Scientologists responded with over 2,000 lawsuits against the IRS before it caved in and granted Scientology the same status as granted the Catholic Church and other religious organizations. Rathbun revealed that Scientology paid the IRS \$12.5 million for past taxes. In exchange, the IRS not only granted Scientology tax-exempt status, but also agreed to drop any and all audits it was doing on the Church

memories, like [London cabbies](#) who must know something like 25,000 streets and 1,400 landmarks of London. Their brains are larger than the average person. What's more, they may not have been born that way. Their brains may have grown after they reached adulthood and began developing their memories. Neuroscientists have discovered that the adult brain is very malleable, even to the point of [growing new brain cells](#). [Dr. Alvaro Pascual-Leone](#) and other neuroscientists have shown that the visual cortex processes the sense of touch in people born blind. In this program a young woman was blindfolded for five days and it was discovered that her [visual cortex started to take over tasks related to touch](#).

The most dramatic example of how malleable the brain is involved a young woman who was born with half a brain, the right half. Tasks usually taken on by the left hemisphere such as language and object recognition have been taken up by her right hemisphere. There has been a price, however, as her visual-spatial abilities are compromised. "It's as if the two abilities, linguistic and visual-spatial, had to duke it out for space in Michelle's brain- and language won."*

The final segment profiled [Gerry Edelman](#), Director of the Neurosciences Institute in San Diego, winner of the Nobel prize for his work in immunology, and now working on understanding the brain and consciousness.

The next program will be shown November 28th (8 pm EST) and will feature Super People. One segment will feature [memory training](#) and [Frank Felberbaum](#), president of Memory Training Systems, one of the world's leading [memory experts](#). We'll also learn about the 2000 [Memoriad](#), a national memory championship contest held each year in New York City, and meet two-time champion Tatiana Cooley.

The December 19th program is titled ["Life's Really Big Questions"](#) and will explore our origins, our planet's history, life on other planets, robots, and a conversation with [Daniel Dennett](#) on the nature of consciousness.

There are at least seven more [Scientific American programs](#) scheduled for early next year, seven more candles in the dark wasteland known as television. [Steve Allen](#) would be proud.

November 21, 2000. The December 2000 issue of *Consumer Reports* (CR) says that tests on St. John's wort were "reassuring." They tested 13 brands and all "contained a reasonably standardized dose of dianthrones." St. John's wort is a mood modifier popular among self-medicators who are looking for a pick-me-up with minimum side-effects. There is "fairly solid" evidence, says CR, that St. John's wort "can help people with clinically significant mood disorders." And the only major side effect is increased sensitivity to sunlight. CR does note that "self-treatment can be dangerous, particularly with depression, which causes some 20,000 reported suicides a year in the U.S." CR also notes that St. John's wort "decreases the effectiveness of a host of medications, including oral contraceptives, cholesterol-lowering statin drugs, beta-blockers, and calcium-channel blockers for high blood pressure and coronary heart disease, protease inhibitors for HIV infection, and many other prescription drugs."

CR also tested 12 brands of SAM-e (s-adenosyl-methionine) and found that

"manufacturers are generally producing a reasonably stable standardized product," though they found four examples of misleading labeling. SAM-e "helps cells regulate the brain chemicals dopamine and serotonin" and is also used by self-medicators as a mood elevator. CR notes that the side effects of SAM-e can include upset stomach, insomnia and mania. And it is not cheap, costing \$55-\$260/month for 400-mg daily dose.

Finally, CR reports that 13 of 15 brands of kava pills contained approximately the amount of kavalactones that their label said. Extract of the root of the kava plant has long been used by Pacific islanders. It allegedly relieves anxiety and elevates mood. "Kava can magnify the potency of other antianxiety medicines and reduce the effectiveness of several other drugs, notably Parkinson's drugs containing levodopa." Side effects include blurred vision and impaired coordination.

CR does warn those taking prescription drugs to consult with your doctor or pharmacist before self-medicating with herbs. There may be drug interactions and some of these could be [serious, even life-threatening](#).

November 17, 2000. [Dateline \(NBC\)](#) featured "Waking the Dead" with [John Edward](#), a [James Van Praagh](#) clone. In an attempt to be fair and complete in their open-minded evaluation of Edward's ability to channel "symbols" from the dead, correspondent John Hockenberry interviewed a "Harvard-trained" professor who is doing "scientific" studies of psychics, and Joe Nickell, CSICOP point man for all things supernatural and occult. Nickell was clear and concise, as usual, as he went through a brief litany of cold reading techniques used by Edward. Talk fast, ask a lot of questions (i.e., go fishing for details), be vague and suggestive ("I'm getting 'July' here. Anything significant about July? What about 8, the number 8, the 8th of the month, August, something."), know that most people die of heart disease or cancer and that jewelry is likely to be significant for most people ("I'm getting a ring here, anything important about a ring? I sense a watch, a bracelet, something on the wrist or arm."). In short, let the subjects reveal information and let them be the ones to fix something significant to your questions, phrases, words, etc. Watching Edward or Van Praagh is like watching someone throw feed to starving animals. These people are so desperate to make contact with their deceased loved ones that they'll bite at almost anything the "medium" throws at them. The misses, the questions and remarks that don't resonate with anyone, are quickly forgotten as the rapid fire continues without missing a beat even though the medium couldn't tell a male from a female or a dog from a person.

The "scientist" in this feature did a controlled study where he compared the abilities of alleged psychics, including Edward, and students from his university in Arizona. The "psychics" in the test did their routine with subjects trying to make contact with the dead, while the students were given a set list of questions to ask the subjects. The psychics performed significantly better than the students in getting "accurate" information. What did the "scientist" prove? He proved that the "psychics" were very good at [cold reading](#), while the students weren't. When asked what he thought, the "scientist" said something to the effect that *the data are not inconsistent with the hypothesis that the psychics were making contact with the dead*. Brilliant!

Hockenberry tried to be fair and open-minded. He gave Edward every opportunity to

demonstrate his stuff, but he also raised some serious doubts. For example, everybody in the group of subjects trying to make contact through Edward was blown away when Edward apparently started getting messages from the father of one of the NBC camera operators. Edward named the father and got the cameraman to cry when he asked about "a ring." The cameraman had put his ring in his dad's coffin. The surprise element was overwhelming for the subjects. What the subjects didn't know, and what the cameraman apparently didn't even remember, was that earlier that day he had been shooting footage of Edward doing ballroom dancing and had talked with the cameraman. Under questioning, Edward admitted that the cameraman had told him about his father's death. Rather than be embarrassed, Edward acted nonplussed and seemed to wonder what the big deal was. So he gathers information for his "readings". What's the big deal? He did get the ring part didn't he? Well, not exactly. He went fishing with the jewelry symbol, in this case the word 'ring', but the cameraman filled in all the details.

I have to admit that I was more impressed with Edward's cold reading abilities than with Van Praagh whom I've seen perform on television several times. And like Van Praagh, Edwards leaves many [satisfied customers](#), which raises the question asked on the program: what's the harm in this charade, if so many people are grateful and have their grief alleviated? Edward says he is not a grief counselor, but he is. He knows he couldn't keep his audience nor his paying customers if he started hearing bad things and left people more uncomfortable than when they came in. True, he is not as blatantly mushy as Van Praagh, but he obviously provided a great deal of comfort to some of the subjects in the program. So, where's the harm and why should skeptics criticize such work?

It is hard to convince the beneficiaries of a benevolent fraud that despite their satisfaction something wrong has gone on. Just because everybody leaves satisfied with few or no complaints does not make the activity proper. I think we can all probably justify lying once in a while to avoid hurting someone's feelings or to give them a lift. But systematic fraud for the benefit of people who can't accept that death is final or that the guilt they feel may be deserved is quite different. The idea that truth may be bent when it is unpleasant, or when a lie will have a less detrimental effect than the truth, is not a healthy one. The notion that truth is subjective and that there is no harm in letting some things be true for some people while they are false for others is not a healthy one.

I have written a lot in these pages about bad [psychotherapy](#), [bad medicine](#) and [pious frauds](#). Many of the therapies and "alternative" treatments I have attacked have been based on the premise that objective truth does not matter or that there is no such thing as objective truth. These therapists and "alternative healers" make no effort to separate fact from fiction, history from delusion, in their patients' stories. Some of the therapists even encourage fantasy and delusion as part of their treatment! They encourage their patients to dig for memories of events that may never have happened. The patients "remember" things that didn't occur. The patients are often satisfied customers when they are told that they have discovered the source of their problem. The therapists don't care whether the memories are accurate. These are the patients' truths even if they are false! And the "alternative healers" don't care if the testimonials of their happy clients are based upon scientific evidence that the "alternative" treatment was a real causal factor in their relief. What matters is that the

client *believes*. Such thinking seems behind the pious frauds who claim to be [stigmatic](#) or have [statues that weep blood](#), etc. *The end justifies the means* is a principle for a world with little or no respect for reason and careful thought. It is a principle for people who don't care about the truth unless it makes them feel good. I get a good amount of mail from such people. They rage at me because I won't validate their belief in an afterlife where they will be rejoined with mommy, daddy and their beloved dog or cat. The skeptic is the ultimate party pooper. If I lied to these people, they'd love me.

By encouraging "psychics" and belief in their extraordinary powers we encourage delusion for the sake of its benefits. That is quite different from acknowledging that delusions can sometimes have benefits. To encourage delusion is to increase the probability for more delusion, more fraud, more self-deception. It is to chip away at what little rationality is left in the world.

November 14, 2000. [ABC.News](#) reports that scientists, not [cryptozoologists](#), in Madagascar have discovered three previously unknown species of mouse lemurs, the world's smallest primate. Meanwhile, cryptozoologists were busy hunting down Bigfoot and Nessie, both last spotted traveling through the Bermuda Triangle, heading for Atlantis.

reader comments

19 Nov 2000

You seemed too proud of the fact that three new species of lemurs had been discovered, despite the fact it goes against previous skeptic statements that no new animals are left to be discovered. (If you find that statement false, remember it was uninformed skeptics who said it) You didn't hear a thing about a species of thought to be extinct horse recently found in Asia? Those 2 new species of antelope found in Vietnam? Why is it that the most heavily populated continent can have all these new animals and its such a blatant cryptozoologist lie that Yeti can still be running around Nepal?

This selective reporting that actually weakens the skeptics status quo cause more than defending it, and it is especially spotlighted in the bigfoot section. A number of letter writers including myself have told you exactly when and where John Chambers denied any Hoaxing, yet your response refers readers back to outdated speculation from years back. You have yet to address the Chambers denial directly, probably trying to save desperate face when you've been obviously beaten hands down and hope nobody will notice. Stop being a sore loser. Chambers denied the hoax in a direct quote. Now was he lying or kidding? And are you going to hide this under the rug again or admit you were wrong?

Bern Finnigan

reply: If you read my entry on [Bigfoot](#) you would see that I report Chambers' denial of hoaxing on the Patterson film. I also report who (Landis and Berger) made the claim that Chambers denies

and what that claim was. Who's the sore loser? You want me to report only one side--your side.

Who typically discovers new species of plants and animals, Bern? People like yourself out hunting for Yeti? I don't think so. But, if I'm wrong, send me a list of the plants and animals you have discovered and I will post them with an apology.

Bern replies

I can always tell when someone gets under your skin when you dump the pretext of honest debate and dive into personal attacks. Not very professional, if I may say so. Some of us are above that sort of thing.

reply: I admit. Being falsely accused does get under my skin.

But seriously, I don't look for yeti, I merely point out the numerous flaws in the arguments of the cynics. Such as this letter of yours, where you infer no cryptozoologist has ever accomplished anything of use. Since I'm acting in proxy of the cryptozoologists, once I post a list of what they have done (a lengthy list, but I'll keep it to the point; [Dr. Krantz](#) has reconstructed the skull of the Asian gigantipithicus, [Dr. Meldrum](#) is breaking ground in the origin of human bipedalism, etc.) will you apologize to them, or sweep your bigotry under the rug again?

When they find Yeti, I'll apologize profusely.

November 7, 2000. Crop circle prankster Matthew Williams, a 29-year old pagan, was fined £100 and ordered to pay £40 costs for damaging a corn crop which he decorated with a seven-point star. He said he did it "to prove wrong an academic who said only aliens could make such elaborate designs."

Williams accused "academics" of trying to cash in on people's gullibility by claiming that aliens are making the circles. However, Williams is cashing in on the craze himself. "Williams set up his own magazine, *Truthseekers Review*, devoted to crop circles and has now opened a sister website. He has also appeared on television to talk about the subject and is suspected of being responsible for the creation of several circles."

"The general public are being conned," said Williams. "The majority of crop circles are man-made, although I do believe some are the work of the paranormal." Right. [thanks to J. Gravelle]

November 2, 2000. A Cook County judge warned an 8-year old girl and her 12-year old sister that they would go to Hell if they lied. He didn't do this at Sunday school, but from the bench in a secular, not an ecclesiastical, courtroom. Judge James T. Ryan was no doubt referring to the secular, rather than the religious, Hell. The girl's mother, Diane Tuzzolino, lost a wrongful death suit involving her poodle but she

seemed more upset with the judge scaring her children. "Never in my life," she said, "have I heard a judge say that, even to an adult."
[thanks to J. Gravelle and the *Chicago Sun-Times*]

November 2, 2000. Italian scientists studying the effects of exposure to extremely low frequency electromagnetic fields (ELF-EMF) have found that ovarian follicles in mice fail to develop properly in many cases. The results of their study are published in the November issue of [Human Reproduction](#):

Pre-antral follicles were cultured for 5 days and exposed to ELF-EMF at the frequencies of 33 or 50 Hz. ELF-EMF application did not affect follicular growth over a 3 day culture period, but on day 5 the growth of 33 Hz-exposed follicles was significantly reduced when compared with controls, while the 50 Hz-exposed follicles were not significantly affected. However, ELF-EMF severely impaired antrum formation at both frequencies, as $79 \pm 3\%$ of control follicles developed antral cavities compared with $30 \pm 6\%$ and $51.6 \pm 4\%$ of 33 or 50 Hz-exposed follicles respectively. The follicles with failed antrum formation showed lower oestradiol release and granulosa cell DNA synthesis, but these effects were not related to granulosa cell apoptosis. Furthermore, a high percentage of the in-vitro grown oocytes obtained from exposed follicles had a reduced ability to resume meiotic maturation when compared with controls.

The authors concluded

These results suggest that ELF-EMF exposure might impair mammalian female reproductive potentiality by reducing the capacity of the follicles to reach a developmental stage that is an essential pre-requisite for reproductive success.

In America, electronic devices and circuits commonly run at 60Hz.
[thanks to Florin Clapa]

October 31, 2000. A federal judge upheld [Virginia's "minute of silence" law](#), ruling that it does not violate the First Amendment. The American Civil Liberties Union argued unsuccessfully that the law, which requires a minute of silence of public school students at the beginning of the school day, was an attempt to introduce religion into the public schools. Judge Claude Hilton said the law has a secular purpose. Apparently, the students are free to worship the devil or to think about murdering their teacher, raping a nun, or molesting their neighbors during the mandatory minute of silence. The law does not provide that any guidance be given in how to use the mandatory minute. It is up to the student. The ruling will be appealed and is likely to go to the U.S. Supreme Court, which lately has not looked favorably upon sneaky attempts to inject religion into public school activities.
[thanks to Jon Henrik Gilhuus]

October 30, 2000. [CNN.com](#) has an article in their "career" section on occult occupations. The article features a "psychic" and a skeptic. The psychic tells her

story and how she's had this "gift" since she was a child, yada yada yada. The skeptic, Louis Manza, is a tenured faculty member with Lebanon Valley College (LVC) in Annville, Pennsylvania. He has a Ph.D. from City University of New York (CUNY) and a master's degree from CUNY's Brooklyn College, both in experimental psychology. Manza teaches a course at LVC called "Paranormal Phenomena -- A Critical Examination." In the course, he explains [cold reading](#) and [mentalism](#). He dismisses many psychics as frauds and explains the psychological mechanisms that motivate people to seek out such frauds. Dr. Manza also discusses the potential for harm from occultists:

Other than psychological damage -- that runs from fairly innocuous to fairly severe -- people might also spend lots of money on these things, money they could be spending on other things. You have potential medical problems, people going to alternative medicine or not taking their medicine or going to faith healers.

The danger is the public doesn't understand the science behind this. That's one of the reasons I decided to teach this class. I was so frustrated with the way people are.

I'm not going to change the world, but I might change one little corner. I don't want to convert every single person to skepticism, but if I can get 20 people per class to leave with a better appreciation for the science behind this, they might not be as likely to do what I consider to be dumb things later in life.

Sounds like the course should be a requirement.

Mass Media Funk

23

October 25, 2001. This was a good week for skepticism in the media. Last Saturday the *Sacramento Bee's* [Jennifer Garza](#) did a piece on [firewalking](#) that noted the severe burns several participants walked away with, comforted perhaps by inane comments such as "I'm a Leo and I love fire" or "I love the idea of defying logic." Saturday evening, firewalking and other physical feats were discussed on "Science Mysteries: Physical Feats" shown on the Discovery Channel. This was in part a rehash of the film "Guru Busters," which followed members of the Indian Rationalist Association (IRA) as they go from village to village pretending to be [godmen](#) or fakirs. The IRA considers the godmen to be frauds who use trickery, legerdemain, conjuring, deceit, and other unfair means of convincing ignorant villagers that they possess miraculous powers. Some of the godmen gain international reputations like [Sai Baba](#), but most make a living from the offerings of villagers. The IRA firewalk and explain anyone can do it without a need for supernatural intervention. They walk on glass, lay on nails, pull cars with hooks poked through the flesh on their backs, jab long needles through their cheeks and tongues, etc. The goal of the IRA is to debunk the godmen and reduce superstition among their countrymen and women. They are obviously having some notable success, for the Indian media consult them regularly.

Another part of the "Physical Feats" program dealt with Tibetan Buddhist monks who can raise the temperature of their hands and feet by 15 degrees through "tummo", a kind of meditation, thereby enabling them to spend the night meditating outside in subzero weather. Martial arts masters also demonstrated amazing physical powers at smashing pieces of wood or concrete with their hands, feet, or shins. Some of these feats are truly difficult and require years of training and discipline, but they do not seem to be necessarily connected to anything spiritual.

Finally, NOVA's program on "Secrets of the Mind" was excellent. V. S. [Ramachandran's](#) work on the brain, based on patients with blindsight, phantom limb pain, anosognosia, and temporal lobe epilepsy. The latter case was the most interesting for skeptics, since it involved a young man who was having religious ecstasies because of his epilepsy. Ramachandran thinks that the part of the brain that identifies objects of experience as significant goes haywire in the religious experience so that *everything* from a grain of sand to a spider's web to spindrift blowing on the surface of the ocean become imbued with significance. Ramachandran's [Phantoms in the Brain : Probing the Mysteries of the Human Mind](#) (with Sandra Blakeslee) (Quill, 1999) discusses these fascinating cases and offers a glimpse into the nature of consciousness. The NOVA program also brought home the dilemma of treating someone whose disorder has the pleasant side effect of making him feel omnipotent and omniscient.

October 17, 2001. Eileen McNamara of the *Boston Globe* reports on the latest anthrax terrorist attacks in the United States, only she notes that the attacks have

been going on for three years with no arrests having been made and no public furor over the attacks. Why? Because the anthrax scares have been made against abortion providers. According to McNamara, "110 letters claiming to be laced with deadly bacteria....arrived at abortion clinics in 13 states this week....Since 1998, mail purporting to be laced with anthrax has been delivered to clinics in 16 states." The campaign of terror against the abortion clinics has gone virtually unnoticed by the press and the government. It certainly hasn't received the attention that attacks on the press and the government have received.

Gloria Feldt, the president of Planned Parenthood, notes that dealing with the terrorist threat of anthrax contamination has been a way of life at abortion clinics for several years. They have developed several protocols for dealing with the threat. She called Tom Ridge, our new director of Homeland Security, to offer him some tips. I wonder if he'll call her back? Probably right after [John Ashcroft](#) expresses his disgust at the terrorism.

McNamara's article is a reminder that America has its own religious fanatics who believe terror and murder are justified if done in the name of God. In its trademark blasphemous way, the [Onion](#) has jackhammered home the same message: the American Taliban's effort to rid the world of "evildoers" by terror and murder is wrong. Jesus is depicted as a pro-life terrorist who opens fire in an abortion clinic. The image is so startling that it may stifle the obvious message: Jesus wouldn't approve such evil.

Neither would Mohammed and neither should our government. Perhaps now is the time to deal with these evildoers at home. Make no mistake about it. We need to smoke them out and bring them to justice.

October 3, 2001. There was a full moon last night and nothing much happened out of the ordinary. In fact, the week has been fairly typical on the lunacy front. [Amway lost a court appeal](#) with Proctor and Gamble over rumors spread by several [Amway](#) agents that their competitor is run by a group of [devil worshippers](#). The Amway people claimed they were just exercising their First Amendment free speech rights when they spread false rumors about [P & G's logo](#) being a sign of Satan, who is worshipped at P & G. A lower court had ruled that lying to hurt the competition isn't protected speech and the [U.S. Supreme Court](#) agreed by refusing to hear and making no comment on Amway's appeal. The 5th U.S. Circuit Court of Appeals had ruled that speech is not protected by the First Amendment if the "speakers' motives in spreading the Satanism rumor were economic."

Some twenty years ago, several of Amway's devoted distributors began spreading the lie that the man in the moon used by P & G in their logo is actually Satan. The rumors included a claim that the president of P & G had gone public by announcing on a television show that he worshipped Satan. The absurdity of such a claim was matched by the zeal with which Amway evangelists spread the good news. In the beginning, [Amway Corporation](#) maintained that the rumors were the work of [a few bad apples](#), but in the end the corporation was the one making the appeal to the U.S. Supreme Court. Amway claims it has spent over \$30 million in legal fees on the matter. Several lawsuits were filed against Amway (now called [Alticor](#)) in the 1980s

and the last one was settled in 1991, but apparently several more bad apples revived the rumors in 1995 after a zealous distributor used the company voice mail system to revive them.

Amway must have been especially disappointed that the Supreme Court would not hear their appeal. They had hired [Ken Starr](#) to defend them.

The Scientologists have their own coven of lawyers, so they don't need Ken Starr, but they too were turned away by the [Supreme Court](#) this week. Ten years ago they sued *Time* magazine for libel because of an article entitled "Scientology: The Cult of Greed," which called Scientology a "ruthless global scam." A lower court had ruled that the article wasn't written with malice, so it wasn't libelous under the law. The Supreme Court must have agreed for they refused to hear Scientology's appeal.

On another equally loony front, the [Maharishi Mahesh Yogi](#) was [back in the news](#) with a plea for wealthy Americans to send him one billion dollars so he can build facilities for a gathering of 40,000 yogic flyers who will bring world peace by bouncing around together in his compound in India. He believes that if enough people hop while seated in the lotus position, they will create a force field that can repel hatred and spread happiness in the world's collective consciousness. His belief is based upon many years of sitting on his butt and thinking about this in his hut.

The Maharishi is the one who turned on the Beatles to the good life after introducing them to [transcendental meditation](#). Reciting a mantra he has been using for many years, the Yogi was quoted as saying: "If I had the support of money, I have all that is needed to ... completely stop all this violence." It is rumored that the Beatles originally planned to call their hit tune "All you need is money," but their guru convinced them that love would be easier to sell.

The absurdity is that the Maharishi has already collected \$40 million from benefactors according to Mario Orsatti, a spokesman for the Maharishi University of Management in Fairfax, [Iowa](#).

Finally, there was some news about religion and how many people were turning to God after September 11th. In addition to the Scientological vultures mentioned [below](#), [ABC.news reports](#) that "Within two hours of the attacks, the American Tract Society had begun designing a new pamphlet advertising their faith in light of the tragedy. Robert Briggs of the American Bible Society said his privately funded group had published a booklet of tragedy-relevant scriptures and hymns within two days of the attacks and has since distributed more than 600,000 copies of the booklet." Where others see obstacles, some see opportunities. "This is a ripe opportunity for hope," said Reverend Trevon Gross of the American Bible Society in his Manhattan office. "We are not trying to capitalize on this tragedy, we just want to share in the strength of hope." Right. In any case, the horror of September 11th has given America's Taliban an excuse to pray at [public school football games](#), [post the Ten Commandments in courthouses](#), and [rant and rail about our secular ways](#). It is amazing that these moral busybodies and their minions can't see that the America they want to create already exists in places like Afghanistan. "I think you're going to see more Americans not putting up with those secularists trying to make the public

square a religion-free zone," said Richard D. Land, president of the Ethics and Religious Liberty Commission. I think Mr. Land's prophecy is a safe one. It is going to be a rough road ahead for atheists and agnostics, and for organizations such as [Americans United for Separation of Church and State](#), the [American Civil Liberties Union](#), and the [Red River Freethinkers](#). The utter emptiness of [theism](#) has been exposed as mass murderers claim they are serving God by their actions, preachers claim God is punishing people by acts of terror, and the hope peddlers swoop in to claim terror is God's way of bringing out the good in those who survive. How anyone can worship a God that they think had anything at all to do with September 11th is something I will never fathom.

To be fair, it is not just the militant Christian fundamentalists that are the card-carrying members of the American Taliban: the deluded patriots who are attacking anyone who doesn't look "American" enough to them are also in this clan. It is not just American Muslims who are in danger of being attacked by these self-anointed ethnic cleansers. Locally, these militant foot-soldiers for America's *jihad* have attacked and terrorized not only Arab-Americans but Hindu-Americans, Sikh-Americans and Mexican-Americans. [President Bush has condemned these attacks](#), but some people ignore anyone who disagrees with them. They follow their own law. Or worse, they think they are entitled to do what they do because they have been chosen to enforce what they think is God's law.

[thanks to Joe Littrell]

September 19, 2001. [Scientology](#), based on [Lafayette Ronald Hubbard's *Dianetics: The Modern Science of Mental Health*](#) (1950) has been waging a war against psychiatry for years. Several years ago I received in the mail a magazine called "Psychiatry - Destroying Religion" with a sidebar in large red capitals that read "Creating Evil." A menacing, fanged snake with forked tongue protruding and body coiled around a cross stares out from the cover, which has a notice claiming the magazine was "published as a public service by the Citizens Commission on Human Rights (CCHR)." There is even a seal for this organization printed above the notice. The truth is that the magazine and the CCHR are the work of Scientology. The only religion Scientology cares about is Scientology. Unlike other religions, Scientology claims it knows the cause and cure of all mental and physical disorders. Mental Health professionals, therefore, are seen as competitors. Like many other religions, unfortunately, Scientology would like to rid the world of its competitors. Hence, the war against psychiatry.

Deception is one of their tactics in this and all their other wars. For example, they managed to harass through lawsuits and then buy in bankruptcy court an organization ([Cult Awareness Network](#)) that tried to help people whose loved ones had joined cults. They not only then got access to all the records of this organization, they now work the phones and manage and direct all incoming calls.

After the mass murders on September 11th, Scientologist somehow got the [Fox](#) network to post a phone number to their organization, only the phone number was said to be that of National Mental Health Assistance. People were apparently encouraged to call the number for psychological counseling. The number? 800-FOR-TRUTH. I wish this were false, but it isn't.

For more information on other devious tactics used by Scientology to recruit new members during this time of crisis see [Rod Keller's page on Scientology](#).

August 10, 2001. James Taranto's columns ("Best of the Web," *The Wall Street Journal*) for [July 23, 2001](#), [July 24, 2001](#) and [August 6, 2001](#) took the mass media, particularly Fox News, to task for their junk journalism concerning the [Chandra Levy missing person case](#). No, he didn't criticize Hannity of [Hannity and Colmes](#) or Geraldo Rivera for smooching up to some pseudojournalist from the *National Enquirer* because that beacon of investigative fiction was able to find Darrell Wayne Condit. The hype was that that the *Enquirer* did what the FBI couldn't do: find a fugitive. This so-called fugitive had an outstanding warrant for violating his probation for a drunken driving conviction, not a very high priority item. Only the stars of cable news and the *Enquirer* would think it important to locate Gary Condit's younger brother because only they would assume the congressman must be involved in the young woman's disappearance and may have hired his "criminal" brother to eliminate her. (Hannity and Rivera reminded me of Dan Rather's fulsome praise of Larry King's interrogation methods while being interviewed by a fawning, softball-lobbing King.)

No, Taranto didn't mess with this side of trash journalism. He was upset because Fox News was interviewing [psychics Sylvia Browne](#) and [James Van Praagh](#) in their quest to discover what happened to Levy. They both say she's dead. Van Praagh claims she was strangled and all but implicated the congressman as the strangler, which Taranto found to be "the most outrageous example of journalistic irresponsibility we've seen in a long time." Taranto was especially displeased with [Judith Regan](#) who gave Van Praagh the forum for his "occult claptrap." Says Taranto: "Regan acted as if it's a

matter of dispute whether the proclamations of the charlatans who call themselves 'psychics' are legitimate news. She began her show by reading four letters from readers cheering Fox on for putting 'psychics' on the air, and two letters from critics." The old "majority of satisfied customers" test is well-established in alternative medicine, so why not in alternative journalism?! Then she brought on another "psychic," [John Monti](#), "who offered his own crackpot theories about what happened to Chandra."

Taranto also criticized [Paula Zahn](#) for consulting "spiritual medium [Rosemary Altea](#)" and "world-renowned psychic Sylvia Browne" for her news shows on July 12th and 17th, respectively. Zahn did a follow-up, asking whether she went too far in consulting psychics (as if there should be any doubt in the mind of a "real" journalist).

The last of the Fox News stalwarts denigrated by Taranto was [Bill O'Reilly](#) who interviewed "handwriting expert and psychic [Paula Roberts](#)." Comments Taranto: "O'Reilly--normally a swaggering skeptic who calls his program "the no-spin zone"--was so ovine in his credulity that we expected him to sprout wool."

The *New York Times*, which recently ([July 22, 2001](#)) ran feature articles on "psychic consultants" who claim to communicate with animals telepathically and on [John Edward](#) ("the Oprah of the other side"), had the chutzpah to criticize Fox News ([July 30, 2001](#)) for its psychic endeavors. The *NYT* also took to task Larry King for his panel of experts who evaluated Congressman Condit's facial expressions. King, of course, regularly schedules psychics for his "panels" of experts on the topic *du jour*. I'm surprised he hasn't yet featured [Miss Cleo](#) on one of his expert panels. Maybe she could use the money since her company's psychic hotline was recently fined \$75,000 for violating Missouri's no-call law.

It is comforting to know that not everyone in the mass media has gone mad. [James Taranto](#) is a refreshing [voice](#) in the wasteland of what passes for journalism these days.

Another light in the dark is [Howard Kurtz](#) of the *Washington Post*, who writes: "Bill Shine, executive producer of prime-time programming, says psychics are 'part of the story' because the Levy family has consulted some. 'We've just put them on to get another opinion, another side of the story,' he says, adding that other guests have criticized psychics as not credible. Shine concedes he's worried about Fox's image and 'that's why we don't go overboard with it.' What a relief."

I can understand reporting that the Levy family has consulted psychics, but I don't understand how you get from there to the conclusion that therefore psychics are part of the story and can legitimately be consulted for their opinions. Must be some sort of *alternative logic* at work here.

Mass Media Bunk

4

January 19, 1998. *Washington Post*. Today the *Post* ran an article singing the praises of the DKL Lifeguard from [DielectroKinetic Laboratories \(DKL\)](#). The device is supposed to be able to detect a human heartbeat up to 500 yards away. It is touted as a great thing to have when searching for a lost person in, say, the rubble of an exploded building. Personally, I'd rather have a good dog in such a circumstance. [I've expressed my skepticism of this device elsewhere](#), so I won't repeat my concerns about the device here. Rather, my concern is about Beth Berselli, who wrote the article, and the *Washington Post*, which printed "A Real Find for Rescuers - In a Search, LifeGuard Detects Heartbeats; Now DKL Has to Locate Buyers."

Almost all of the information about this magical device came from Howard Sidman, one of the founders of DKL, and Michael G. Charapp, the company's attorney. Sidman's explanation as to how the device works, as well as his assurance that it works, went unquestioned by Ms. Berselli. She even bought Sidman's pitch that the only way the Lifeguard can be proved to work is if there is testimony from satisfied customers, but without customers there can't be any testimonies. I guess neither Sidman nor Berselli ever heard of a [controlled experiment](#). "How can DKL sell the LifeGuard," Berselli writes, "until it has a track record? But how can it develop a track record until a lot of customers are using it?" Easy. Demonstrate the thing works under controlled conditions.

The closest Ms. Bereselli gets to showing she is not totally gullible is to note that "Though the technology is unproved, the concept behind it has supporters." For example, Joe Dougherty, a researcher at Pennsylvania State University's Center for Dielectric Studies, says "It's doable." That's some support! Tony Daniels is a more enthusiastic supporter. There is no evidence given that Daniels knows anything about the LifeGuard units, which sell from between \$6,000 and \$14,000, but he seems sure that "this will definitely give law enforcement officials an edge." Yes, if it works! Daniels is a former head of the Washington field office of the FBI and now runs his own consulting firm. He recommends it to his clients. "It will save lives and it'll save serious injuries." How he knows this is not mentioned.

Sidman claims that he and his investors have put half a million dollars into DKL. He is on the road trying to sell it to police departments, who never seem reluctant to spend the taxpayers money on unproved and questionable devices, such as the [Quadro Tracker](#). DKL seems to have put most of its money into marketing and very little into research. We are told near the end of the article that "DKL officials say they understand the hesitancy of potential customers but are confident that testing, marketing and a public education campaign will attract customers."

Did it not occur to Ms. Berselli that [testing of such a device should be relatively simple](#) and that the fact that there is any doubt at all that the thing works as claimed is a tip-off that something is amiss?

November 25, 1997. "At his first American press conference in 15 years, British futurist Benjamin Creme stated that [Maitreya - World Teacher](#) for the coming age-will be interviewed on a major American network before the end of the year. This will be followed by appearances on other networks around the world and, within months, will lead to a global satellite hook-up where Maitreya can speak to all people simultaneously-in their own language." You can read all about it and be prepared for the Great One. [\[click here\]](#)

December 10, 1997. *Larry King Live*. Just when I thought Larry was doing some good! (He had a very fine show on *depression* last week, featuring Art Buchwald, Margo Kidder, Marianne Hartmann (?) and [Dr. Kay Jamison](#).) Tonight Larry featured an alleged psychic named James van Praagh. This guy was special. All the billions and billions and billions of dead people are just waiting for someone to give James their names. That's all it takes. Give him the name and presto! the dead contact him in words, fragments of sentences or feelings of appearances. He could "feel" Larry's dead parents and even pointed out where in the room these feelings were coming from. James took phone calls on the air and, once given a name, he started telling the audience what he was "hearing" or "feeling". He fished for positive feedback and got it, indicating that he really was being contacted by spirits who wanted to tell their loved ones that being dead ain't so bad when you've got a guy like James to talk to on Larry King Live.

Of course, James has a book out with a can't-miss title: *Talking to Heaven*. (*Talking to God* and *Talking to Angels* have already been taken.) And he has a great fan who has put up a [WWW site](#) to keep us informed of James' books, tapes, upcoming products, tours and appearances. I predict continued success for James, as long as he never gets a bad message from any of the billions and billions of dead people who never get a busy signal when they call Mr. van Praagh.

November 30, 1997. "Acupuncture goes mainstream" by Brenda Biondo in *USA Weekend* (Nov. 30, 1997) contained very little skepticism about this controversial medical method. (The AMA is highly skeptical of acupuncture, it said.) The author passed on a few anecdotes and testimonials about how after acupuncture "the pain was gone." Little concern was shown either by the author or those giving the testimonials for such things as the possibility that the end of the pain had little or nothing to do with the acupuncture. It was enough to find support from "a federal panel of experts," i.e., the quacks who stack the National Institutes of Health Alternative Medicine division. They're claiming that there is "clear evidence" (whatever that means) that acupuncture is "effective" (whatever that means) for treating nausea caused by anesthesia, chemotherapy or pregnancy. (Why it wouldn't work for nausea from other causes remains a mystery.) Acupuncture is also said to be "effective" "for pain after dental surgery."

In addition to the self-interested testimony of the NIH alternative medicine panel, Biondo quoted another self-interested party, Janet Konefal of the University of Miami's Center for Complementary Medicine, as saying that physicians are

"definitely warming up to acupuncture." Now that is a scientific statement based, no doubt, on at least two conversations with her fellow researchers. If, as the Medical Acupuncture Association says, there are only about 4,000 American doctors using acupuncture, then I would say that not too many are warming up to it.

Throughout her article, the author implied that acupuncture may be effective in treating such diseases as cystic fibrosis, cancer, drug addiction and Parkinson's disease. In a strange twist as to what ought to drive medical research, it is claimed that "public interest" in acupuncture is what is motivating hospitals, research centers and insurance companies to take acupuncture seriously. What next? Psychic surgery because the public demands it?

A sidebar to the panegyric for acupuncture stated that there are two main theories as to how it works, but it did not seem concerned to note that one of the theories is [a metaphysical theory which can never be tested scientifically](#), while the other is an empirical theory and falsifiable. It is doubtful the author knows the difference between an empirical and a metaphysical theory, or what "falsifiability" means. In any case, the empirical theory noted speculates that the needle pricks stimulate the release of endorphins and other "chemicals and hormones" but the likelihood that these chemicals and hormones will cure cystic fibrosis or cancer seems near zero.

Finally, in other sidebars several WWW sties were listed where one could "learn more about acupuncture," but of course none of the sites are skeptical, such as the following sites: [the National Council Against Health Fraud](#), [Stephen Barrett, M.D.'s site](#), or *The Skeptic's Dictionary* entry on [acupuncture](#) or [pathological science](#).

July 5, 1997. On the front page of the "Family, Religion & Ethics" section of the *Sacramento Bee*, [past life regression therapy](#) for children was featured. "Can echoes of past lives haunt kids? Reincarnation is topic of book for parents," reads the headline. The article is by Edward Colimore of Knight-Ridder Newspapers and pretends to be a review of Carol Bowman's book, *Children's Past Lives: How Past Life Memories Affect Your Child*. Colimore's article is actually an uncritical presentation of a metaphysical belief in reincarnation and its application by hypnotherapists.

Nowhere in the article is it mentioned that many hypnotherapists have no formal training in psychology or medicine and that often attendance at a weekend training seminar is all one needs to become a certificated hypnotherapist. According to Margaret Singer and Janja Lalich,

There are no licensing requirements, no prerequisites for training, and no professional organization to which those who hypnotize others are accountable. You can be a real estate agent, a graphic artist, an English teacher, or a hairdresser and also call yourself a hypnotherapist by hanging a certificate on your wall that states you took as few as eighteen hours of courses in hypnosis.

This lack of oversight leads to all sorts of abuses and malpractice. (["Crazy" Therapies](#), p. 53)

The only voice of opposition to Bowman's thesis that the behavioral problems of children are due to past life memories was a short paragraph noting that the Catholic Church does not accept the doctrine of reincarnation. In another context, this matter-of-fact juxtaposition of opposing metaphysical views would be acceptable. In the context of an article aimed at encouraging parents of children with problems to seek out a hypnotherapist to find out what past life is harming their child, the comment about Catholic disbelief appears out-of-place at best, and at worst could be taken as an attempt to portray Catholics as hopelessly out-of-touch with New Age ideas.

No mention is made in the article that there is absolutely no scientific evidence that past life regression therapy works. There is ample evidence that many people can "recall" past lives, whether hypnotized or not. Fantasizing about having lived before is not difficult. There is ample evidence that some people have very vivid and detailed "recollections." And there are numerous anecdotes about people "feeling better" after having fantasized about a past life. But there is no evidence that (1) the memories are of previous incarnations or that (2) any improvement in health has been caused by remembering anything from this or a previous life, except perhaps remembering to take one's medications.

No mention was made that past-life regression therapy is considered "pure quackery" by the American Psychiatric Association. No mention of critics of regression techniques, such as Singer and Lalich, was mentioned. In their evaluation of several New Age therapies, Singer and Lalich write:

Because objective research on regression techniques is limited, the assumptions about regression remain merely myths based on anecdotal reports from enthusiastic proponents. (*"Crazy" Therapies*, p. 26)

Colimore's article provides several of Bowman's anecdotes. She claims she was healed of a severe lung ailment after learning that she had died of consumption in the 19th century and then died again in a Nazi gas chamber. A year after her "healing," her 5-year old son, Chase, was cured of his fear of loud noises by discovering that he had been a black soldier during the Civil War. Bowman offers as evidence of the wondrous nature of past-life regression therapy the fact that her son, now 14, is a drummer. Finally, Bowman's daughter, Sarah, was cured of her fear of house fires when she discovered she had previously died in one.

A skeptic would say that all of these remembered events are from this life, not a past one. Their source is probably television, movies, stories heard or books read. A critic might reply: *Who cares?* As long as her lungs got better, the boy overcame his fear of noise and the girl overcame her fear of fire, *what difference does it make whether their memories are of past lives or not?* They got better. Isn't that all that matters? What harm is there in a little fiction if it helps?

The harm is in the method and the claim that it has broader application. The method makes a mockery out of science and the quest for knowledge. Science is not built on anecdotes and metaphysical notions of the soul. It is built upon observation and controlled studies. The claim that these anecdotes have broader application is likely to have the effect of harming children whose parents will be convinced that their

children's behavior, which is caused by a brain disorder or hyperthyroidism, etc., is actually due to a past life experience. Such gullible parents will take their children to a hypnotherapist instead of to a physician. As a result, some children may very well die because they did not receive proper treatment early enough.

Instead of comparing the claims of Bowman to the work of a real scientist and psychologist (such as [Aaron Beck](#)) or psychiatrist [Ivan Goldberg](#), Colimore reinforces Bowman's claims by quoting Barbara Lane, another past-life regressionist. Lane is even cited for her theory that "regression experiences...could be genetic memories. The life experiences of ancestors imprinted on genes and passed down." No genetic scientist and no [neurobiologist](#) would admit such a possibility for the workings of [memory](#). Yet, Colimore leaves the reader without mentioning the absurdity of this theory of memory, much less without describing how memories are created by neural connections in complex ways unfathomable by the likes of Bowman and Lane. He simply notes that Lane says that "some people" believe the stories are based on memories of things read, etc., but whose source is forgotten and "others" think that past life memories are the result of imagination and knowledge of the past. No attempt is made to evaluate these different explanations, giving the impression they are of equal value and weight.

In any case, Colimore simply counterbalances the notions of skeptics and Catholics with Bowman's assertion that nothing but reincarnation adequately explains the anecdotes of children's past life regressions she recounts in her book. Bowman demonstrates her ignorance of children when she claims that some of her cases involve children who are "too young to read or watch serious TV documentaries." They may be too young to read, but if their hearing is not impaired, they can hear stories and listen to TV. If their vision is not impaired they can watch TV at a very early age. Bowman also seems unfamiliar with the vividness and pliability of children's capacity to perceive, imagine, [confabulate](#) and remember.

Bowman's claim that some of her subjects have birthmarks or birth defects which correspond to fatal wounds received in an earlier life is especially unconvincing. Colimore cites the research of professor Ian Stevenson of the University of Virginia as supporting this hypothesis. A similar claim is made by those who claim they've been [abducted by aliens](#): unaccounted for marks on their bodies are taken as proof they've been abducted and experimented on. Maybe alien abductees should consider the possibility that their marks come from previous lifetimes!

In all fairness, it should be noted that Bowman does indicate that it would be scientifically useful to extract from her anecdotes some general principles. She provides the following four signs as evidence that a child's past life story has "substance."

1. Whenever the past-life memories had substance, the children often talked about them in a matter-of-fact tone.

And if they did not talk about them in a matter-of-fact tone, I guess that was proof that the memories did not have "substance." This claim says little more than "I believe the stories are true when the kids use a certain tone." Very scientific.

2. Whenever the past-life memories had substance, the children told the stories with consistent details.

This says little more than "I believe stories which are consistent and detailed." (A reasonable person might consider a few other qualities as being essential to a believable story, such as whether the story is likely to be true or not.)

3. Whenever the past-life memories had substance, the children had knowledge beyond their experience.

This says little more than "I believe a child's past life story is true if I also believe the child could not have gotten this information from any other source. Logicians call this *begging the question*.

4. Whenever the past-life memories had substance, the children exhibited corresponding behavior and traits, such as phobias, birth marks or chronic physical conditions.

This says little more than "I believe a child's past life story is true if I can find some behavior, trait, phobia, birth mark or physical condition to relate to the story. In other words, the limits of my credulity are the limits of my imagination.

The main appeal of such notions is to the desire to live forever. If you know the four signs, says Bowman, "you can catch the magic moment." For, "when a child speaks so innocently and knowingly about living before....it is firsthand testimony to the truth that our souls never die." Perhaps. On the other hand, [Children's Past Lives](#) may also be firsthand testimony to ignorance of science, to gullibility and, above all, to wishful thinking.

I guess I should be grateful, however, for the small relief from the barrage of articles and television "documentaries" on this "[Roswell](#) Anniversary Weekend."

June 29, 2000. [CBS "48 Hours"](#) claims that tonight it "puts the paranormal world to the test." Instead what CBS actually does doesn't even qualify as "soft" news. They do a paranormal promotional piece, without much serious investigation of anything. The show features a psychiatrist who swears by [past life regression therapy](#) and the show does nothing to dispel his delusion. (Brian Weiss is one of many weird therapists treated in [Crazy Therapies](#), reviewed here.) Another segment features an up-and-coming [James Van Praagh](#) type named [George Anderson](#) who can hear the dead talking to him. He doesn't perform very well, however, but he doesn't give up his claim to paranormal powers. A third segment features Russell Targ and Joe McMoneagle on [remote viewing](#). No skepticism here; just a promo for these quacks. Another segment supported the notion of [ghosts](#) and [haunted houses](#). The final segment dealt with [psychics who help cops](#). At least here Joe Nickell was brought in to cast doubt upon alleged psychic Annette Martin. However the segment ends with Martin saying that as a result of the original 48 Hours broadcast in August 1999, another dozen police departments called for her help. Whether she was lying or not was not investigated by CBS.

[thanks to Matt McNaney]

June 22, 2000. [CNN.com](#) promotes the wonders of dowsing in an unsigned article from the Associated Press. The article is mostly a gullible presentation of the views of three dowsers, Tommy Hanson, LeRoy Bull, and Craig Elliot. Hanson seems a bit confused since he admits he doesn't know how [dowsing](#) works and yet he says: "People are negative about what they don't understand." Yes, and sometimes people are positive about what they don't understand.

Bull is a law unto himself. He says about 496 out of 500 people can get at least a little dowsing reaction. His attitude makes it sound unlikely that he keeps records. He scoffs at the idea of scientific study. Elliot says dowsing works as long as you don't have "monkey thoughts." Bull not only dowses for water, he uses a pendulum to tell him such things as whether vegetable are fresh. Clockwise means yes. Counterclockwise, means no. "We've been standing around with our hands on our hips waiting for the scientific community to come stumbling along," according to Bull, who gets the last word in the article: "For those who don't believe, no amount of evidence is enough. And for those who do believe, no evidence is necessary."

To be fair, the author gives one line to James Randi, who is described as "a prominent debunker of claims of paranormal phenomena." Robert Park is described more neutrally as a physics professor and is given several lines to offer some skeptical comments.

[thanks to Anthony Dillingham]

June 21, 2000. [WebMD.com](#)'s Denise Mann gives some lip service to skeptics and uses cautious language, but overall her article slants in favor of [therapeutic touch](#). "Non-Contact 'Therapeutic Touch' May Indeed Have the Right Touch Forms of Healing Based on Energy Fields, Spiritual Methods Reviewed" is the title of her article. She seems to think highly of John Astin's study (see below, June 5). She notes that skeptics disagree with the claims of TT, but presents her material as if both proponents and opponents had equal evidence on their sides.

June 7, 2000. [Excite.News](#) promotes Joshua Shapiro's claim that "Crystal Skulls are among of the most mysterious artifacts that have been discovered on our Earth." [Crystal skulls](#) are mysterious only if you don't know anything about them.
[thanks to Joe Littrell]

June 5, 2000. [According to the University of Maryland](#), John A. Astin, Ph.D., assistant professor in the School of Medicine's Complementary Medicine Program, analyzed 23 clinical studies involving prayer, [therapeutic touch](#), and some other "unconventional forms of spiritual intervention" and found that 57 percent of the studies showed a positive impact on the patients. "Statistically speaking, the figure of 57 percent is highly significant," says Astin. "This is far more than one would expect to see by chance alone."

Astin claims that the studies "were chosen for the scientific quality of the research." The University's press release does not mention how scientific quality was measured, but he does mention "one study of nearly 1,000 heart patients...who were being prayed for without their knowledge [and who] suffered 10 percent fewer complications. That study was published last year in the Archives of Internal Medicine." That study has been [reviewed here](#) and if it is an example of what Dr. Astin thinks is quality science, then we can take his conclusions with a grain of salt. He might consider looking for an explanation of the statistically significant positive results in the desires of the researchers rather than in the effectiveness of the unconventional interventions. Or, perhaps he is too generous in his designation "showed positive impact on the patients." For example, he notes that "of the 11 studies involving therapeutic touch, seven showed at least one positive treatment effect." At least one positive treatment effect? Dr. Astin's assessment sounds more like charity than science.

The University of Maryland [prides itself](#) on being one of nine research centers in the U.S.A. to receive the "prestigious NIH designation as a Specialized Center for Complementary and Alternative Medicine."
[thanks to Craig Levin]

June 2, 2000. [CNN.com](#) reports on how a veteran journalist used [feng shui](#) to get a job as book editor at *USA Today*. Carol Memmott thinks she got the job because she moved her trash can from the "wealth corner" of her office, painted the room yellow (to inspire "creativity and good feelings") and put in "a bubbling water fountain to make the [chi](#) (energy) move through the room." One hopes she is not the *science* book editor of *USA Today*. If so, she might want to read up on the [post hoc fallacy](#) and why [controlled studies](#) are done to overcome the human tendency to [self-deception](#).

The article doesn't mention which of the 250 feng shui titles listed on Amazon.com Memmott used, but it does mention two authors, one of whom has appeared on the Oprah Winfrey show. No surprise there. The other, Nancilee Wydra, is the author of *Feng Shui Goes to the Office*. Wydra says she practices *pyramid school* feng shui, an interesting creation in that it claims that its principles work differently on different people. This unique feature, of course, makes it impossible to test. Nevertheless, Wydra claims that "feng shui can help cure the ills that the high-tech culture places on workers." What these ills might be is not mentioned in the article, but I'm sure they are formidable and have to do with bad energy flow.

The author of the article is Patty Rhule of WomenConnect.com. She concludes with a hee-haw [anecdote](#) about an acupuncturist who got advice from Nancy Tartt, who practices "black hat and compass feng shui." On Tartt's advice, Beatty painted the steps to her office black and the entryway white. She then did a cleansing ritual that included burning dried sage to help "shift the energy." Did it "work"? Of course. After the changes, Beatty claims that she felt like she had more energy at work and she didn't "feel so resentful going to work" where she has to share space with another acupuncturist and a massage therapist. "I felt happier," said Beatty, "and I feel like the quality of my work improved." That's what it's all about, isn't it? If the customer is satisfied, the [pseudoscience](#) is validated.

For a more scientific view of feng shui read [Dave Barry's column on how to build a deck](#).

[thanks to Jon Henrik Gilhuus]

May 23, 2000. A writer for [Reuters](#), apparently completely ignorant of skeptical writings about the [shroud of Turin](#), writes

no one has been able to get to the bottom of how the three-dimensional, heat-resistant and apparently indelible image of a man with long hair and wounds consistent with Gospel descriptions came to be imprinted on the ancient linen cloth.

It was done with paint.

The writer also claims

The sheet also bears traces of ancient male type AB blood, which some scientists say is consistent with traumatic injuries.

Not true. No blood has been found on the shroud.

The writer also calls the carbon dating of the shroud "controversial." It is controversial only because a number of faithful believers refuse to accept the work of three independent research teams.

[thanks to Erik Alldredge]

May 18, 2000. According to *USAToday's* A.S. Berman, Einstein said "Science without religion is lame....Religion without science is blind." Never mind that the sentiment does not sound like anything the mature Einstein would say. (Einstein's

views on religion were closer to [Spinoza's](#) than to any orthodox religious thinker.) The quote is a hook to a story about [Charles Tart](#) and his unsubstantiated claim that scientists are afraid of being fired if they reveal they are religious or have had anything like a religious experience. To accommodate all those pitiable scientists who are cowering because of their fear of being exposed as morons or idiots, Tart has set up a web site where the scientists can pour out their sacred secrets. He calls it [TASTE](#), The Archives of Scientists' Transcendent Experiences.
[Thanks to Joe Littrell]

May 14, 2000. *UsaWeekend* (May 12-14) features an article by Ann Japenga in its health section entitled "Does your doctor use intuition?" It seems Harvard Medical School has a third stooge to join [Deepak Chopra](#) and [Andrew Weil](#). Jerome Groopman, M.D., is the author of *Second Opinions: Stories of Intuition and Choice in the Changing World of Medicine*. He says he's "a rationalist and a scientist" but finds that in many instances his best bet is to use his "gut sense." This reminds me of the cartoon about the doctor who is asked by his assistant what they should do now that the patient is dead. The doctor replies, "give him an enema." "But he's dead," says the assistant. "Right," says the doctor. "It can't hurt him."

Japenga also notes that [Judith Orloff](#), a "[psychic](#)" psychiatrist who claims she can diagnose intuitively and has several books to prove it, will be addressing the American Psychiatric Association's annual meeting this coming Wednesday. She's also an assistant professor at UCLA.

Maybe the government ought to investigate how many [deadly medical mistakes](#) are due to intuitive medicine.

Japenga contrasts intuitive medicine with evidence-based or outcomes-based medicine, which use tests and treatments established through research. This contrast, I suppose, is meant to give balance to her essay. She concludes with a quote from David Slawson, M.D., an associate professor at the University of Virginia: "A physician needs to be grounded in science but also must have the ability to improvise."

So, if your doctor suddenly starts [sucking on your leg and spitting nails into a dish](#), he or she may just be using intuition. Frankly, I'd feel better if my physician consulted a [computer](#) rather than his or her intuition.

What's wrong with using intuition to make medical diagnoses? What's wrong with it is that it is too easy [to deceive ourselves](#) into thinking we have some sort of extraordinary ability to understand things when we don't. Intuitionists don't keep proper records. They have no real idea as to how often they are right or wrong. They rely on memory to verify their power. It is easy to remember when one is right, but it is even easier to forget when one is wrong. Also, with no specified method or clearly testable claim to begin with, it is easy to massage the data to fit the intuition after the fact.

When I think of professionals using intuition I think of the police and their [blue sense](#). I think of the FBI and their intuitions about [Cary Stayner](#). I think of deluded people who think they are psychic. I think of inmates taking over the asylum.

May 13, 2000. The Vatican revealed today that in 1917 it was revealed to three children at Fatima that in 1987 an assassination attempt would be made on the Pope. The prophetic vision was of a "bishop clothed in white" who "falls to the ground, apparently dead, under a burst of gunfire." With such a clear message, it is a wonder that it took the Vatican more than eighty years to figure out the meaning, even though it has been 13 years since the Pope was shot by a Turkish tool of God. [thanks to Joe Littrell]

May 11, 2000. Fox outdid itself with "Powers of the Paranormal." The show was billed as real paranormalists and psychics performing before a live audience, but it was mostly parlor tricks and standard stage magic and mentalism. The show was too trashy to review. The host Jim Lampley, whom I remember as a fairly decent sideline commentator for college football games a few years ago, seems to have been put out to pasture. For a review, see Joe Nickell's comments on the [CSICOP page](#).

May 8, 2000. "The substance some Neapolitans believe is the dried blood of their patron, St Gennaro, liquefied on cue for a twice-yearly event the faithful believe is a miracle." So begins a Reuters' story published on [Yahoo!.News](#).

The powder mysteriously turns to liquid twice a year -- on the saint's feast day on September 19 and on the first Saturday in May.

The event has been recorded on the two days almost without fail for the past 600 years....

Italian scientists have confirmed that the substance inside the closed vial is blood but cannot explain why it liquefies regularly.

To its credit, the article does note that historians have no record of this alleged blood relic before 1389, more than a thousand years after Gennaro's alleged death. I say alleged death because there is no record he even existed (Nickell, 79). Also, the Italian scientists who examined the vial of blood in 1902 and in recent years were not allowed to take a sample of the stuff to the lab. They were allowed to shine a light through the vial and on the basis of a spectroscopic analysis concluded the substance is blood (Nickell, 78). It is not true, however, to say that scientists can't explain why the stuff in the vial liquefies regularly. A professor of organic chemistry at the University of Pavia, Luigi Garlaschelli, and two colleagues from Milan offered [thixotropy](#) as an explanation. They made their own "blood" that liquefied and congealed, using chalk, hydrated iron chloride and salt water. Joe Nickell did the same with oil, wax and dragon's blood [a resinous dark-red plant product].

The article does mention that the Neapolitans are a superstitious people, but it does not mention that there are about 20 allegedly miraculous vials of various saints' blood and nearly all of them are in the Naples region, "indicative of some regional secret" (Nickell, 79). The article also suggests that their superstitions may be justified. The number Neapolitans associate with miracles--66--came up in the national lottery on May 6th. The article also notes that the Neapolitans believe that if the blood fails to liquefy, disaster is around the corner.

Disaster has struck on at least five occasions after the blood failed to liquefy, including in 1527 when tens of thousands of people died from the plague and in 1980 when 3,000 people died after a earthquake that devastated southern Italy.

What isn't mentioned is how many times disaster *didn't* happen after the blood failed to liquefy and how many times disaster did happen after the blood *did* liquefy. A bit of [selective thinking](#) seems to be going on here.

The article also suggests that the 'miracle' is a con. It is noted that Cardinal Michele Giordano, who carried the vial in this year's May procession, is "under investigation on suspicion of complicity in loansharking, extortion and criminal association following the arrest of his brother in 1998." But the article doesn't mention that the ritual used to also be performed on December 16, "but the liquefaction occurred relatively rarely on those occasions--apparently due to the colder temperature--and those observances have been discontinued" (Nickell, 81). Most skeptics are convinced that whatever is in the vial is reacting to some natural phenomenon, such as temperature change or motion. Even some religious thinkers consider such 'miracles' frivolous and unworthy of God.

[thanks to Joe Littrell]

May 5, 2000. Larry King's guests tonight were [James Van Praagh](#), [Char Margolis](#) and [Sylvia Browne](#). Larry was very excited about the movie "[Frequency](#)." Actually, none of them seem to care whether there is any difference between reality, a film, a delusion, or a fairy tale for a ship of fools. [CNN.com](#) has the complete transcript, if you can bear to read the dialogue of four imbeciles tripping over each other to say something trite about life and death. An hour with this crew and most people would probably wish they were dead. Larry should have called the show: *Death Wish IV*. The dialogue reminds me of a line in a Bob Dylan song ("Foot of Pride"): *say one more stupid thing to me before the final nail is driven in*.

[thanks to Tim Boettcher]

May 5, 2000. *USAWeekend* (May 5-7) featured an interview with [James Van Praagh](#), whom they call a "medium-to-the-masses", though after reading the interview they might well call him the medium-of-the-asses. He actually claims that dead dogs talk to him and one of these dead dogs told him that he (the dead dog) was very upset that his owners gave his old food dish to the new dog they bought. How the interviewer, Jennifer Mendelsohn, could ignore commenting on such inane claptrap is incomprehensible to me. She followed up his dead dog tale with serious journalistic aplomb. She asked him: "Can anyone, with proper training, do what you do?"

For the answer, see the *Skeptic's Dictionary* entry on [cold reading](#).

Mass Media Bunk

14

December 16, 2000. According to Discovery.com writer Jennifer Viegas, dogs "may be able to read our minds, knowing what we're thinking even before we move or say a word." She bases this claim on an experiment some German researchers at the Max Planck Institute for Evolutionary Anthropology in Leipzig did with some dogs. Claire Ainsworth of [New Scientist](http://NewScientist), the source for Viegas' article, put it a bit differently: "Although dogs can't quite read our minds, they seem to know what we can see." According to Ainsworth, the researchers

placed treats on the floor in front of a number of dogs in turn, and forbade each animal to eat the food. As long as the person remained in the room, the dog rarely went for the food. But if the person left the room, the dog scooped the treat within five seconds.

They tested the dogs' behaviour in greater detail: once with someone looking directly at the dog, once with a person playing a computer game, once with a person with their eyes shut, and once with someone sitting with their back to the dog. In tests on six dogs, they found that the dogs stole twice as much food when the person was not looking directly at them.

The scientists did not conclude that the dogs might be psychic, but rather that dogs don't simply respond to a stimulus. "This may mean that dogs are able to figure out what humans can see," said one of the researchers.

On the other hand, Viegas spiced up her article by quoting Jean Donaldson, director of behavior and training at the San Francisco SPCA. "This might explain dog telepathy and why dogs can predict things like cancer occurrences and epileptic seizures," she said. Indeed, that's what my friend's Doberman, KC, said it was in his latest e-mail.

[thanks to Laddie Chapman]

reader comments

17 Dec 2000

I read with interest Laddie Chapman's item on Jennifer Viegas's article at Discovery.com. However, when I went to the site and read the actual article I was dismayed to find that Chapman had selectively edited the material in order to present a particular point of view. To wit: 'According to Discovery.com writer Jennifer Viegas, dogs "may be able to read our minds, knowing what we're thinking even before we move or say a word." ' The next sentence is omitted in Chapman's item.

The full quote should read : "Man's best friend may be able to read our minds, knowing what we're thinking even before we move or say a word. By closely watching the direction of our gazes dogs appear to be able to tell what we're looking at or more importantly, whether we're looking at them, according to a team of German researchers. " This changes the tone of Viegas's statement from ridiculous to sensible.

reply: First, Laddie Chapman referred me to the article in question. I do all the writing for the Skeptic's Dictionary. So, if you have a quarrel, it is with me, not Mr. Chapman.

Secondly, it is a judgment call as to whether Viegas' second sentence changes the tone from ridiculous to sensible. I don't think it does, especially in light of the title of her article--"Can Dogs Read Our Minds?"--and her concluding quotation. Viegas has clearly distorted the work of the scientists, which had absolutely nothing to do with testing psychic abilities in dogs.

In addition, Chapman says: 'On the other hand, Viegas spiced up her article by quoting Jean Donaldson, director of behavior and training at the San Francisco SPCA. "This might explain dog telepathy and why dogs can predict things like cancer occurrences and epileptic seizures," ' Again, this is a very selective quote. In reality the quote from the Viegas article reads: "Jean Donaldson, director of behavior and training at the San Francisco SPCA, said dogs could also be sensing small changes in our body chemistry.

"This might explain dog telepathy and why dogs can predict things like cancer occurrences and epileptic seizures," she said. " Again this is a far more reasonable argument and grounded in science.

reply: Again, this is a judgment call. I fail to see how Donaldson's reference to "sensing small changes in our body chemistry" makes her *more* reasonable. In my view, it makes her *less* reasonable. Where did she come up with such a notion? And what possible connection could it have to claiming that dogs can predict cancer by telepathic means?

In fact, I read the Viegas article and found nothing in it that suggests that she was doing anything more than reporting the facts of the study. I realize that you cannot personally check every submission, but in this case I would ask that you modify or remove this incorrect item. And no, I am not a lawyer.

Glen Hutton

reply: I suggest you read it again and compare it to the article in *New Scientist*, where there is absolutely no hint of anything paranormal. I cannot see how you can think that this article is just "reporting the facts" when it is entitled "Can Dogs Read Our Minds?", states in its opening line that "man's best friend may be able to read our minds" and concludes with a quote from someone

who thinks dogs can predict cancer by telepathy.

Glen Hutton replies:

First, my apologies to Mr. Chapman. Second, as the item was yours, and the website is yours, you are of course entitled to your interpretation of the Viegas article. I apologize for being pedantic but I wish to clarify two points with regard to my interpretation. 1) I took the reference to the psychic abilities of dogs, as referring to the seeming ability dogs have to read our minds. I did not assume the writer meant you to believe that dogs actually can read minds. What she was saying was "You know when your dog seems to be reading your mind? Well here is what may actually be happening. Your dog may be focusing on real and measurable motions and smells that you are not aware you are producing". Therefore the second sentence is vital. She is saying that the dog may be guessing at your intentions long before you are even aware that you are signaling them. This is clearly an example of dog "telepathy" being a version of the "Clever Hans" phenomenon of the last century.

reply: You are a very generous soul, Glen. I have re-read Viegas' first paragraph again, trying to see it your way, but I can't. I don't think she was using the headline and her opening sentence as teasers or hooks. If she wanted us to read her as you do, she should have opened with a different sentence (like the one you suggest), making it clear that dogs *seem* to be able to read our minds. As it is, she seems to me to identify reading our minds with knowing when they are being watched.

2) As to the ASPCA director's comment. I give it the same interpretation. Dogs reacting to small changes in body chemistry may explain why they seem to be able to anticipate our actions ("telepathy"), and why they seem able to "predict" seizures. Of course they are doing nothing of the sort. They are merely reacting to scents that we are unable to perceive. These small changes in body chemistry MAY precede a seizure. The dog's nose MAY also be sensitive enough to detect changes associated with cancer (particularly skin cancer), before the cancer is noticed by it's owner. This does not seem to me to be an unreasonable theory.

reply: I might agree with you if the article didn't end with the Donaldson quote and if that quote did not explicitly say "this might explain dog telepathy." The body of the article does not stray from what the scientists actually did, but it was sandwiched by irrelevant and misleading references to paranormal canines.

Finally, I agree that both the title and the first paragraph of Viegas's article were at best an unfortunate choice and at worst confusing. However, even after reading the New Scientist item, I do not find the Discovery.com article as egregious as you do.

Anyway we are both entitled to our opinions. Thank you for listening to mine.

Glen

reply: I may be more sensitive than most readers of Discovery.com since a) that site seems to have more than its share of paranormal and pseudoscientific "sightings"; and b) there is already enough non-sense about [psychic pets](#) being spread by Rupert Sheldrake and others.

Then again, you just may be a very charitable chap.

19 Dec 2000

The article about "can dogs read out minds?" in discovery.com is completely ridiculous, but not for the obvious reason of interjecting telepathy into the equation. The fact that a study was done on if dogs know what humans are looking at, and that discovery commented on it are silly beyond words. Anyone who has ever had a dog knows 2 things: 1. dogs make eye contact with people. 2. maintaining eye contact with a strange or agitated dog can make it more hostile.

If a dog is happy to see you, it makes and maintains eye contact. When they want something from you, they make eye contact. In fact, just about the only thing that can make a happy dog break eye contact from someone it likes, is if that someone waves a treat or toy off to the side. So in that light, it comes as no surprise that dogs know when people aren't looking.

The real question is if the concept of eyes as "seeing devices" is instinctual, or learned. Given that dogs make eye contact with other dogs, and knowing if a rival dog is looking at you is conducive to canine survival, it doesn't seem like that much of a stretch for dogs to extrapolate that the shiny round things above the human noise flap serves the same purpose as the shiny round things above the doggie noise flap.

-Devon

December 14, 2000. Sheila King, an exercise physiologist at UCLA, sees herself in the tradition of Aristotle and Plato because she, like them, "combined science, philosophy and metaphysics in a unified approach to life." In an article for [MSN.com](#), she claims just about any exercise activity can be a spiritual experience. I suppose for spiritual people just about anything can be a spiritual experience, but they don't usually claim that they are doing anything scientific when they are being spiritual. King does:

The integration of action, thought and emotion creates a vital life force that enhances our workouts along with our quality of life. The new age of science and medicine is beginning to draw on spirituality to help people cope with illness and enhance health,

with good reason: This inner source is a cost-effective therapy with virtually no negative side effects!

She doesn't clarify the scientific notions of a "vital life force" or "inner force", but I'm sure her readers know what she means.

Exercise such as running or cycling produces a natural tendency to focus inward, and requires you to draw on your vital inner force to transcend perceived barriers of intensity, distance or duration.

She doesn't say if this is true for people with gout or tendonitis. But she does claim that

Only a handful of controlled research studies in the United States have explored the mind-body connection, but already these practices have proved helpful in the treatment of conditions such as cardiovascular disease and asthma.

She doesn't mention any specific studies, however, nor does she specify what mind-body practices were "helpful" nor exactly how they were "helpful" in treating cardiovascular disease and asthma.

King does seem to have some useful common-sense and non-controversial advice for relaxing after exercise, however, such as listening to relaxing music and doing some controlled breathing. Her advice to examine our goals and do some thinking while exercising would no doubt meet with Aristotle's approval.

[thanks to Devon]

December 7, 2000. Sometimes stories about alternative "medicine" make me sick, like [this one](#) about a traditionally trained immuno-geneticist who dresses up in a bear suit and treats his patients with feathers and totems. According to Dr. Michael Samuels:

What you know is a good doctor has moments where they look into your eyes, where you can feel the interconnection with you — a merger — their heart opening. When that's missing there's a coldness that the patient feels and the healing is incomplete.

I've never had such a moment and, if I prayed, I'd pray that I never do. I don't want a soul mate when I go to a physician, but I am getting the feeling that I'm unusual in this respect.

[thanks to Jon Henrik Gilhuus]

reader comments

08 Dec 2000

In regards to your comment "I don't want a soul mate when I go to a physician, but I am getting the feeling that I'm unusual in this respect."

Well, think about the role Doctors play. They save lives. They provide salvation from suffering and death. They provide what many religions

promise. We demand perfection from doctors. We have essentially elevated them to demi-god status. It should come as no surprise that in a species that seems bent on seeking and creating gods and divinity, that when presented with a physical, tangible facsimile of that which is sought, we would project our expectations of the divine onto it. In the western, Christian areas, we've been taught that the furious angry god of the old testament is now a loving, tender, caring father who will provide our every need. It should therefore come as no surprise that such expectations are projected onto doctors too.

This begs the question as to why this is a recent phenomenon? Considering that up until recently, "healers" have not been terribly successful, and the image of god as a cuddly loving father is a relatively recent phenomenon due to increased literacy in the past 300-500 years, thus revoking the ability of the literate priests from emphasizing the blind obedience to a mighty, jealous deity. So both living gods, and the expectation of nurturing and caring from a god have overlapped. When our living gods fail, or aren't able to make us feel loved and special while performing their miracles on us, we feel cheated, and turn to traditions that make us feel good about ourselves. Traditions that come from cultures that were blessed with vastly shorter lifespans.

Devon

reply: You might want to invest a few \$ in a book on world religions.

October 31, 2000. Perhaps it is the obligatory stupid haunting story for Halloween, but Jaymi Freiden of the [Savannah Morning News](#) has a feature article about ghosts haunting the local Harley-Davidson Motorcycle shop. The story focuses on the work of Al Cobb and his little band of amateur paranormal investigators who call themselves the Searchers. They use scientific equipment because "People believe you more when you have scientific data."

They have an infrared thermal scanner that sends out a beam of red light that picks up on temperature changes. A change in temperature can mean a ghost is using the energy in that area, either increasing or decreasing the temperature, Thomas said. It can also affect magnetic fields, which is why some members carry a compass. Then there are the cameras - both still and video - used to record anything unusual that might be lurking.

How they know that ghosts use energy and change the air's temperature is not mentioned. Nor are we told what evidence there is that ghosts affect magnetic fields. But at least the *equipment* is scientific, even if the people using it are not.

Freiden reports that "it's been said that Savannah is the second most haunted city in America, behind Charleston and ahead of New Orleans." I'm sure it has, but how would one go about testing this claim with all that scientific equipment?

August 21, 2000. "The icecap at the North Pole has melted for the first time in 50

million years, reinforcing fears about global warming," writes Severin Carrell of the [Independent News \(UK\)](#). No doubt Mr. Carrell did an investigation after reading *The New York Times* (see next entry).

August 19, 2000. *The New York Times* reported today that "An ice-free patch of ocean about a mile wide has opened at the very top of the world, something that has presumably never before been seen by humans and is more evidence that global warming may be real and already affecting climate." The front page story had the headline: North Pole is Melting. Actually, about 10 percent of the Arctic Ocean is ice-free in any given summer, many people have seen an ice-free pole, and this is not necessarily related to global warming. This doesn't mean that Arctic ice is not [declining](#), however.

August 14, 2000. [CNN.com](#) and the [NandoTimes](#) published an Associated Press report which glowingly and uncritically says that some researchers have established that acupuncture is "an effective treatment for cocaine addiction." The study by some Yale scientists was published in the [Archives of Internal Medicine](#). The actual study only claims that "acupuncture shows promise for the treatment of cocaine dependence" and that further research "appears to be warranted." This was based upon the following results:

Examination of urine data for patients who completed the 8-week trial showed that acupuncture completers provided significantly more consecutive cocaine-negative urine samples than did either the relaxation control group (P = .002) or the needle-insertion control group (P = .02) (acupuncture, 7.23 6.77; needle-insertion control, 3.35 3.55; relaxation control, 2.14 3.37; F_{2,49} = 5.37; P = .008). Acupuncture completers were also significantly more likely to provide 3 consecutive cocaine-free urine samples in the final week of the study (acupuncture, 54% [7/13]; needle-insertion control, 24% [4/17]; relaxation control, 9% [2/22]; F_{2,22} = 8.76; P = .01).

The Associated Press article fails to note that of the 82 participants in the study, 30 dropped out before the study was completed. The AP also failed to note that the study only followed the addicts for eight weeks and that the greatest dropout rate was in the group getting acupuncture (64%). Those getting fake acupuncture had a dropout rate of 37% and those in the relaxation group had a dropout rate of only 19%.

Based on these results, if I had a vote on funding further research, I'd vote no. The Associated Press article quotes Arthur Margolin, Ph.D., one of the Yale researchers, as saying "the results suggest the need for increased study of acupuncture *and other forms of alternative medicine* [emphasis added]." If he said this, he was hyping the study beyond tolerable puffery. Neither science nor journalism, much less the public, is served well by exaggerating the significance of research results.

Arthur Margolin responds:

16 Aug 2000

The "quote" of mine you cite from CNN (which, incidentally, I have been unable to find on their web-site -- your direction to it would be appreciated) is in fact a misquote.

reply: That doesn't surprise me. Actually, the quote is from an Associated Press story which is posted by [CNN](#) and by [Nando Times](#).

What I have said is that our study suggests that complementary and alternative (CAM) therapies can be fairly investigated in rigorously controlled randomized clinical trials.

reply: Unfortunately, this point is not made either in the Associated Press story or in your article in the *Journal of Internal Medicine*.

I understand that the degree to which our study satisfies that description is open to interpretation; however, my statement was directed to individuals, particularly advocates of CAM, who may feel that the investigation of CAM therapies within a biomedical framework, without extreme prejudice to those therapies, is simply not possible. Whether or not CAM therapies should be further studied is another matter. The findings of our study could not of course supply the foundations for inferring that proposition; I think many have run afoul of the logical incoherence of attempting to derive "an ought from an is". It is interesting to me that you may have fallen into this trap by seeming to suggest that CAM therapies should not be further investigated, and furthermore, the tone, and curtness, of your message seems to be such as could only emerge from one who holds what seems to be the result of an unstated, and I fear unstateable, set of "inferences" leading to the belief in question with all of the certainty of a logically demonstrable truth!

Is this a new form of skeptical logic?

reply: Many, indeed, have run afoul trying to derive an ought from an is, but I fail to see the relevance of that point here. A logical point that does seem pertinent here, though, is the non sequitur. I don't see how it follows that I seem "to suggest that CAM therapies should not be further investigated" from my statement: "Based on these results, if I had a vote on funding further research, I'd vote no." I don't think your results were significant enough to warrant spending my money on further investigation. I have no problem with you finding some private party who is willing to fund further research of auricular acupuncture to treat cocaine addiction. And I certainly do not have a general objection to scientifically investigating CAM therapies. Even if I did, such is certainly not implied by my statement.

If you read our paper in the Archives of Internal Medicine, you will

find that in the Discussion section we point out a number of limitations of our study which decrease the generalizability of our findings.

Sincerely,

Art Margolin

reply: I did read your paper and I did note that the Associated Press article makes a stronger claim than you do for acupuncture as an effective therapy for cocaine addicts. I wrote to you to find out if you were quoted accurately (actually, you were paraphrased) because I know that the media often hypes up scientific stories and exaggerates their significance. Scientists do this also and I checked with you to find out if the AP had got it right. Apparently, they didn't. The AP story gives no hint that you think your study is a model for other CAM studies and shows that rigorous science can be done in that area.

August 4, 2000. [Shirley MacLaine](#) has her own website where she promises to spiritualize the Web. In case you don't know who she is, she is the author of *Out on a Limb*, a book serialized for television by ABC, in which she describes, among other things, her channeling guru. Her credentials? [She once was a Moor who had an affair with Charlemagne and bore him three children](#), but that was long ago.

[thanks to Joe Littrell]

July 10, 2000. The Sci Fi Channel has begun a nightly show called "Crossing Over With John Edward." Edward will do a [James Van Praagh](#) routine, claiming to speak to dead people of interest to those in the audience. [Salon.com](#) says the show starts at 8 pm; the [SciFi program guide](#) says it starts at 11 p.m. and that the first episode was July 9th. Check your local television guide for this exciting new program. By being on the Sci Fi channel, is Edward admitting that this stuff is fiction?

[thanks to Joe Littrell]

July 7, 2000. [The Washington Times](#), owned by the Rev. Sun Myong Moon's Unification Church, features an article by Valerie Richardson on a vote taken by the Colorado Board of Education to urge schools to display the motto "In God We Trust." In a deliberate example of the religionization of journalism, Richardson writes that the vote was "a deliberate challenge to the growing secularization of public education." Isn't *public* education secular by nature in this country?

ontology

Ontology is a branch of metaphysics which is concerned with being, including theories of the nature and kinds of being. Monistic ontologies hold that there is only one being, such as Spinoza's theory that God or Nature is the only substance. Pluralistic ontologies hold that there is no unity to Being and that there are numerous kinds of being. Dualism is a kind of pluralistic ontology, maintaining that there are two fundamental kinds of being: mind and body.

[The Alternative Science Pages of Richard Milton](#)

Richard Milton's defense of "alternative" science is a textbook case of **Why Intelligent People Believe Dumb Things**. Nearly every logical fallacy and psychological foible that hinders us from being fair and accurate in our assessment of claims and arguments regarding [science](#) and the paranormal is exemplified by Milton.

selective thinking

Let's begin with his version of the "they laughed at Galileo, so I must be right" fallacy, a *non sequitur* variation of [selective thinking](#).

In his book *Alternative Science*, and on his website under what he calls **Skeptics who declared discoveries and inventions impossible**, Milton lists a number of inventors and scientists who struggled to get their ideas accepted. Many were ridiculed along the way. But, like many others who commit this fallacy, Milton omits some important, relevant data. He does not mention that there are also a great number of inventors, scientists and thinkers who were laughed at and whose ideas have never been accepted. Many people accused of being crackpots turned out to be crackpots. Some did not. Thus, being ridiculed and rejected for one's ideas is not a sign that one is correct. It is not a sign of anything important about the idea which is being rejected. Thus, finding large numbers of skeptics who reject ideas as being "crackpot ideas" does not strengthen the likelihood of those ideas being correct. The number of skeptics who reject an idea is *completely irrelevant* to the truth of the idea. Ideas such as [alien abduction](#), [homeopathy](#), [psychokinesis](#), [orgone energy](#), [ESP](#), [free energy](#), [spontaneous human combustion](#), and the [rejection of evolution](#)--all favored by Milton--are not supported in the least by the fact that these ideas are trashed by thousands of skeptics.

anomalies and coincidences

Like many believers in the paranormal, Milton is quite impressed with the statistical data of people defending claims that they have scientific evidence for such things as [telepathy](#) or [psychokinesis](#).

Humans have an innate tendency to attribute significance to anomalies and coincidences. ---[John Allen Paulos](#)

He cites Dean [Radin](#) who defends the [ganzfeld](#) experiments and [The Princeton Engineering Anomalies Research](#). In both cases, impressive [statistics](#) are used to support the belief in paranormal phenomena. It does not seem to occur to Milton that there might be alternative explanations for the statistics. Nor does it seem to occur to him that the defenders of these claims have not done a very good job of providing compelling evidence of anything significant. Milton seems to think that the parapsychologists are rejected because they pose some sort of threat to mainstream science. There is no threat. If a reasonable explanation of paranormal phenomena is ever made and compelling evidence is produced to support belief in [ESP](#), etc., mainstream scientists will jump on the bandwagon as they have in the past (see below, the examples of continental drift and pre-Clovis Americans).

ad hominen

Another common fallacy committed by Milton is to attack the motives of those who criticize and reject "crackpot ideas." Milton claims

Some areas of scientific research are so sensitive and so jealously guarded by conventional science that anyone who dares to dabble in them -- or even to debate them in public -- is likely to bring down condemnation from the scientific establishment on their head, and risk being derided, ridiculed or even called insane.*

These allegations may be true, but they are also irrelevant to whether the "sensitive" ideas are true or not. The charges are not true in at least two areas where Milton claims it is forbidden to do research: [cold fusion](#) and Darwinism. [Research continues](#) at several labs into [cold fusion](#), although it is apparently the case that the [Department of Energy](#) considers cold fusion to be forbidden territory. Darwinism (natural selection), on the other hand, has been attacked from within the ranks of scientists almost from its inception. Even Darwin didn't think natural selection could completely explain evolution (See [The Descent of Man, and Selection in Relation to Sex](#)). Like many critics of evolution, Milton does not understand Darwinism. But that is another fallacy.

the straw man

Milton's attack on Darwinism is an attack on a position quite distinct from the theory of natural selection. Milton attacks an idea few, if any, hold today. He attacks an ideology he characterizes as a godless philosophy of materialism, embracing the meaningless of life in a dog-eat-dog world of brute aggression. Darwinism implies nothing about the existence of God or a spiritual realm. It implies nothing about a Creator who does or does not meddle in evolution. It implies nothing about the kind of social world we have or should have. An evolutionary biologist is certainly free to believe that God designed evolution.

more selective thinking

Milton ignores the fact that science has nothing to gain by believing what is false. Unlike Milton, who sees scientific beliefs as essentially ideological, scientists as a group have nothing at stake should the facts of nature turn out to be otherwise than currently believed. Of course, individual scientists from time to time get stuck in ideological and idiosyncratic corners, but science as a whole is an enterprise that is self-correcting. He attacks scientists for not accepting the criticisms of thinkers and writers who criticize Darwinism. But he does not see that these ideas are rejected either because their authors are barking up the wrong tree (attacking straw men) or they have not made their case convincingly. Milton should review the Alfred Wegner case for an example of how science really works, because it is quite different from his notion of conspirators guarding the gates of error and rejecting such things as homeopathy or [iridology](#) "because they threaten to violate the accepted canons of scientific rationalism."* Milton seems to have little appreciation for the fact that it is easy to find confirmation for just about any hypothesis and that one must constantly be on guard against [confirmation bias](#), [self-deception](#), [wishful thinking](#), and other psychological hindrances that can lead to [pathological science](#). Examples abound in his pages, but one of the weakest arguments he has is given in favor of a Russian astrophysicist, Mark Zilberman, who has found a [correlation](#) between the 11-year cycle of solar activity and winners of the lottery in Russia and France. Milton seems to think this is an amazing feat and indicative of ESP "modulated by external geophysical factors." He can't understand why scientists are not beating a path to Zilberman's door.

Alfred Wegener and continental drift

In *The Origin of Continents and Oceans* Wegener proposed the theory of continental drift against the prevailing theory that the earth was formed by cooling from a molten state and contractions. "Wegener's mode of reasoning lent itself to criticisms and counter-arguments. Wegener made assertions that could be checked and refuted as further evidence came in. He left room for his speculations to be superseded" (Radner & Radner, 92). Wegener did not have disciples, but sympathizers who "acted like scientists." Yet, Wegener's idea that continents move was rejected by most scientists when it was first proposed.

Stephen Jay Gould notes that when the only American paleontologist defending the new theory spoke at Antioch college (where Gould was an undergraduate at the time), most of the audience dismissed the speaker's views as "just this side of sane" (Gould, 1979, 160). A few years later, all the early critics of the new theory would accept it as true. Why? Was it simply a matter of Wegener and a few others jumping the gun by accepting a new theory before the evidence was sufficient to warrant assent? Were the latecomers 'good' scientists, waiting for more facts to confirm the theory? Gould's view is that dogmatic adherence to the view that the ocean floor is solid and unchanging was the main stumbling block to acceptance of the new theory. Most scientists rejected continental drift because it did not fit with their preconceived ideas about the nature of the earth's crust. They assumed that if continents did drift they would leave gaping holes in the earth. Since there were no gaping holes in the earth, it seemed unreasonable to believe that continents move. The theory of continental drift, says Gould, "was dismissed because no one had devised a physical mechanism that would permit continents to plow through an apparently solid oceanic

floor." Yet, "during the period of nearly universal rejection, direct evidence for continental drift--that is, the data gathered from rocks exposed on our continents--was every bit as good as it is today." Continental drift was considered *theoretically* impossible by some, even if it were *physically* possible for continents to move. The new theory could not be made to fit the theoretical model of the earth then universally accepted.

The theory of plate tectonics was then proposed--the idea that the continents ride on plates which are bounded by areas where new crust is being created from within the planet and old crust is falling into trenches. This provided *a mechanism which explains how continents drift*. Continental drift, according to Gould, came to be accepted not because more facts had been piled up, but because it was a necessary consequence of the new theory of plate tectonics. More facts were piled up, though--facts for the new theory of plate tectonics, of which the theory of continental drift is an essential element. Today, it is taken as a fact that continents move. Yet, the exact mechanism by which plates move is still incompletely understood. This area of science will no doubt generate much debate and theorizing, testing of hypotheses, rejection and/or refinement of ideas.

The continental drift episode is a good example of how science works. To someone who does not understand the nature of science, the early rejection of the idea of continental drift might appear to show how dogmatic scientists are about their pet theories. If scientists had not been so devoted to their belief that the earth's crust is solid and immovable, they would have seen that continents can move. That is true. However, the fact that Wegener's theory turned out to be correct does not mean that he and his few early followers were more reasonable than the rest of the scientific community. After all, *Wegener did not know about plate tectonics and he did not provide an acceptable explanation as to how continents might move*. Wegener argued that gravity alone could move the continents. Gould notes: "Physicists responded with derision and showed mathematically that gravitational forces are far too weak to power such monumental peregrination." Alexis du Toit, a defender of Wegener's theory, argued for radioactive melting of the ocean floor at continental borders as the mechanism by which continents might move. "This [ad hoc hypothesis](#) added no increment of plausibility to Wegener's speculation," according to Gould (1979, 163).

It is true that the idea that the earth's crust is solid and immovable has been proved wrong, but Wegener didn't prove that. What his theory could explain (about rocks and fossils, etc.) other theories could explain equally well. However, in the end, the idea of continental drift prevails. It prevails because the dogmatism of science--the tendency to interpret facts in light of theories--is not absolute but relative. Gould notes with obvious admiration that a distinguished stratigraphy professor at Columbia University (where Gould did graduate work), who had initially ridiculed the theory of drifting continents, "spent his last years joyously redoing his life's work" (Gould, 1979, 160). It is hard to imagine a comparable scene involving any of the scientists admired by Milton.

ad hoc hypotheses

One characteristic of Milton's "alternative" sciences that distinguishes them from real science is their reliance on [ad hoc hypotheses](#) to explain the mysterious mechanisms behind homeopathy, psychokinesis, ESP, perpetual motion machines, spontaneous

human combustion, etc. How *homeopathy* is explained will serve to demonstrate this point.

[Homeopathy](#) is a system of medical treatment based on the use of minute quantities of remedies that in massive doses produce effects similar to those of the disease being treated. Advocates of homeopathy think that concoctions with as little as one molecule per million can stimulate the "body's healing mechanism." They even believe that the potency of a remedy increases as the drug becomes more and more dilute. Some drugs are diluted so many times that they don't contain any molecules of the substance that was initially diluted, yet homeopaths claim that these are their most potent medications! Critics maintain that such minute doses are unlikely to have any significant effect on the body. The critics base their belief on what they know about the body and how it works. Homeopaths base their belief on [anecdotes](#) and the metaphysical notion that like heals like. They have resorted to various ad hoc hypotheses to explain how a negligible or non-existent amount of a substance could have any effect on the body. They have appealed to various healing "energies" of "vital forces" bringing this, that, or the other into "harmony." The explanation that seems to have the most favor among "alternative" scientists is, however, the theory of water memory, the notion that "that during serial dilution the complex interactions between the solvent (water) molecules are permanently altered to retain a "memory" of the original solute material."*

Not only is there no evidence that such memory occurs, there is no explanation as to *how* such an event could occur. Current chemical knowledge cannot explain how water could "remember" a molecule that is no longer present. Thus, the expected and reasonable response of the scientific community when presented with homeopathic studies that support the notion that a homeopathic potion is effective is to assume that something else besides efficacy of the potion explains the results. Usually, that something else is [the placebo effect](#), bias in experimental design, methodological or calculative errors, or even fraud. Until homeopaths can provide a reasonable explanation for how such diluted potions can affect anything, it would be unreasonable for the scientific community to respond otherwise. Do "alternative" scientists really think that it would be reasonable to abandon hundreds of years of knowledge and experience, to give up all the established principles of chemistry, on the chance that someday someone might find a mechanism which explains how nothing affects something?

If and when the "alternative" scientist finds a plausible explanation for how actual or virtual non-existent molecules have an effect on the human body, the scientific community will have to alter its basic beliefs about chemistry. Until then, however, given the accomplishments of chemistry, it would be egregiously unreasonable to throw it all away in the hopes that there really is a mysterious force in the universe by which homeopathy and all chemical processes work.

the conspiracy theory and the bias of science red herrings

Because scientists almost instinctively reject studies, no matter how well-designed they seem to be, that provide supportive evidence for "alternative" scientific notions, people like Milton argue that there is a conspiracy in the scientific community to stifle the truth. They also argue that the scientific community is so blind and biased

that they refuse to consider evidence that upsets their pet beliefs. These two approaches seem to me contradictory rather than complementary. Either scientists know the "alternative" scientists are on to something, so they conspire to stifle them, or the scientists are just biased and bigoted. In any case, Milton reverts to attempts at "censorship" by defenders of science as the evidence for both claims.

Much of what Milton considers to be attempts at censorship have nothing to do with censorship at all. He raises issues that are red herrings, e.g., legitimate criticism of the media for promoting junk science in programs such as the [Mysterious Origins of Man](#) and [cases of scientists](#) who are paranoid about their research or who have been ostracized by colleagues for their weird ideas.

Milton seems to have a naive view of open-mindedness. He calls [CSICOP](#) the Paradigm Police and takes a dim view of anyone who criticizes, boycotts, protests, etc. the promotion of junk science. He seems to think that what is true in politics ought to be true in science. We should have laissez faire science and let the most popular view win out. Milton seems to think that we should determine scientific truth by public vote. He sees no harm in letting pass egregious abuses of science (such as [Mysterious Origins of Man](#)) and monstrous falsehoods (such as, there is no proof for evolution, which is just a theory) in the name of "free speech." To rebel against the bunk promulgated by the mass media, school boards, etc., is, in Milton's view, a type of oppression.

Even if some scientists call for banning a network from the airwaves for promoting pseudoscience, there is no systematic attempt to censor weird ideas by any scientific organization. There is no persecution of pseudoscientists, no burning at the stake, no secret cabal blackballing those with new notions about the nature of reality. There is a requirement that ideas that challenge fundamental ideas in any science prove their worth. When they do, they will bump out the old ideas. Witness what has happened recently in American archaeology with regard to [Clovis and pre-Clovis](#) human settlements. Scientists who were on the outside, ridiculed by their peers, ostracized, etc., for their ideas about [pre-Clovis inhabitants](#) are gradually getting a strong hearing. Why? Because they are delivering the goods, i.e., piling up the evidence. The scientists Milton weeps for are not delivering the goods. If and when they do, like Wegener, like [Albert Goodyear](#), they will prevail.

arguments from ignorance

Another common error Milton makes is to argue that something is true (such as clairvoyance) because a bad argument was given to show that it is false. The [argumentum ad ignorantiam](#) can be found at several places on Milton's pages, but I will focus on just one. Milton defends the significance of unrelated coincidences such as dreaming of an airplane crash in a foreign country and waking to find that the news is reporting that there was an airplane crash in a foreign country. His defense is built on showing that a parapsychologist, Dr. Richard Wiseman, gave [a false but persuasive explanation](#) of such coincidences as being expected by the laws of probability.

First, Wiseman's argument is not very persuasive and I wonder if Milton is being disingenuous here. Second, no matter how many bad arguments against clairvoyance Milton can produce, they are irrelevant to whether there is any good positive

evidence for such a thing. Wiseman's argument, as presented by Milton, claims that there are so many air crashes every day that dreaming of one would be very likely to coincide with an actual air disaster. A better explanation would be that fear of airplane crashes is widespread and the number of people who dream of such things every night is probably very great, so on any given night it is highly probable that there is at least one person of the six billion on the planet who dreams of an air disaster in a foreign country.

false labeling

Another common error Milton makes is to mislabel things. For example, he labels as pseudoscience Richard Dawkins analogy of the 'evolution' of [biomorphs](#) with the 'evolution' of living creatures. This misclassification exposes Milton's malevolence (if it is intentional and he knows this example has nothing to do with pseudoscience but he thinks it will help his anti-evolution cause) or his ignorance regarding pseudoscience. Milton may truly believe that Dawkin's analogy is a false analogy, but you might as well call nuclear physics a pseudoscience for having made an analogy between planets revolving around the sun and electrons revolving around the nucleus of an atom. A [pseudoscience](#) claims it is science when it is not. The distinguishing characteristic of pseudoscience is not logical error, nor is it empirical error. What distinguishes pseudoscience from science is that the former proposes theories which cannot be tested in any meaningful way, or if the theory can be tested, its adherents refuse to accept refuting evidence as valid. The pseudoscientist would rather reject hundreds of years of investigation, argument, theorizing, testing, revising, etc., than ever give up his or her belief, regardless of the evidence. So-called [creation science](#) is the paradigm of a pseudoscience. Pseudoscience is static and leads nowhere. It generates no fruitful discussion about the nature of things and produces nothing but dogmatists who will retain their views until the end of time. Science is dynamic and leads to all kinds of interesting discussions about the nature of things and produces a seemingly endless array of ideas and techniques, many of which supercede and supplant earlier ideas and techniques.

false dilemmas

Milton seems driven by a need to propose false dilemmas. The basic form of his argument goes like this:

Either we believe my side or we believe these liars, cheats, deceivers, frauds, pseudoscientists, false historians, conspirators, and dogmatists. Clearly, the second choice is unacceptable. Therefore, we should believe my side.

Milton's approach reminds me of Arlen Specter's proposal to his colleagues during the Clarence Thomas hearings: Who do you believe? The distinguished gentleman or the slut? (Apologies to Dave Barry, whose created this caricature question that captures the essence of Specter's line of questioning.)

There are always third or fourth alternatives to Milton's proposals because he is so selective in his presentation of evidence and because he mixes legitimate criticism (e.g. of CSICOP and the Gauquelin affair, even though CSICOP turned out in the long run to be right about Gauquelin's data) with misunderstanding. He doesn't seem

to have a clue as to what Carl Sagan meant by the following

We've arranged a global civilization in which the most crucial elements profoundly depend on science and technology. We have also arranged things so that almost no one understands science and technology. This is a prescription for disaster. (from [*The Demon-Haunted World: Science as a Candle in the Dark*](#))

Sagan was lamenting, as he had done many times before, the lack of communication between scientists and the public; the poor use of the mass media to convey what science is, does and has yet to do; and the inadequate job we are doing in educating our young people about the beauty and wonder of science. Milton thinks Sagan was claiming that science is an elitist affair, a claim Milton uses as a springboard to launch into his defense of eccentrics, crackpots and loners as the real heroes of science, the point of which is difficult to ascertain. It seems that he thinks that since some great scientists were crackpots, all crackpots are great scientists. Or, perhaps he means to argue that since some crackpots did good science, we should never close the door on any crackpot. However, if science opened the door and took seriously every crackpot idea that is proposed, nothing of worth would ever get done. The burden of proof is always on the crackpot, the new kid on the block, the one who wants to knock off hundreds of years of research, argument, theorizing, testing, etc., with a single dream. "I have a dream" might be a wonderful line in politics, but it has no intrinsic value in science.

It has been said that "Today's mighty oak is just yesterday's nut that held its ground." That's one way to look at it.

If you smash a nut with a hammer, nobody will give it any attention tomorrow. That's another way to look at it.

9 Feb 2002

I've finished half of Milton's Alternative Science and on page 120 I came across a list that involves military incompetence. After reading the list I realized that they described Milton exactly. I can only agree that true to his own rationalization that he his scientifically incompetent.

us/

- [Richard Milton responds](#) (A piece of disingenuous word juggling, distortion and evasiveness with so little substance it is not worth responding to in detail. Either the man can't read or he has intentionally twisted nearly every criticism I've made of his work, save one (he's right about the DOE's stifling of research on cold fusion). He doesn't seem to see the difference between "exemplifies" or "seems to believe" with "says." He says he doesn't "favor ideas" and that "I present empirical evidence for consideration by my readers. (As I make abundantly clear, I am a reporter)." Since he does not say "I believe" this or that, his website should not be treated as if he were an advocate of the ideas he presents. When he labels something "Scientists and inventors who were ridiculed by science" we are supposed to read this as just a report by a reporter, noting a fact. We are not supposed to think that he

might have some reason for the label or the selection of scientists he makes. Another label: "Taboo subjects. Investigate these and you're a crackpot." This label and these subjects are selected for no reason? What Milton does might be called "alternative" journalism.)

miracles

30 Jun 1999

I too, am a skeptic.....be that as it may, my firm stance was shaken a few years ago. Scouting the area around our new home in Texas, we discovered a monastery. Nondescript place, high on secluded hilltop....hours of driving to get to it.

The black and white brochure simply said it housed a 'weeping icon'....no fanfare, no expensive admission (free). What we saw, smelled and tasted defied my clinical and non-religious attitudes. In a tiny mobile home, plastic flowers in plastic vases, propped up on an easel...was an icon. Silence prevailed in the room, there were only three of us present...in no way could a tiny motor have been operating. The back was in full sight, no wires observed either. The icon was inches from my nose as I asked for a closer look...no pinholes , but oil saturated it.

Explainable by wishful thinking, by group hallucination, by greed on the part of the presenter...none of these criteria fit. I cannot say I had a 'religious conversion' afterward, although the very nice monk did use a cotton ball and blessed our feet and hands, however my normal cynicism was shaken to its core.

I am telling you all of this to remind you that , not often, but 'occasionally' there are things we cannot understand in our present containers as humans. I still question and most often find logic and scientific basis for things...however, in the back of my mind's eye...remains the image of that weeping icon.

Barbara Johnston

reply: As Joe Nickell so aptly put it, you are one of many who are [Looking for a Miracle](#).

Non-drying oils, such as olive oil, have been used in the past to saturate statues that later appear to be bleeding or weeping. The monks count on your belief in their honesty and integrity, as well as your desire to see a miracle. Perhaps they justify their pious fraud because they think they are helping bring people to a belief in God. They might ask themselves, what kind of God wants admirers who must be tricked into admiration?

For more on the oil trick see [Joe Nickell](#).

mokele-mbembe

The mokele-mbembe is an alleged living sauropod dinosaur now living in the Likouala swamp region of the [Republic of Congo \(Zaire\)](#). The animal has allegedly been encountered by local pygmies who have given the creature its name. *Mokele-mbembe* means, depending on your source, "rainbow", "one that stops the flow of rivers", or "monstrous animal." The mokele-mbembe is allegedly the size of an elephant (the favorite prey of the local pygmies) with a very long reptilian neck. The creature is said to be hairless and reddish-brown, brown, or gray, with a tail five to ten feet long. The creature apparently spends most of its time in the water, but the pygmies claim they've seen prints left on land of a three-clawed foot.

Reports of this creature have been circulating for the past two hundred years, yet no one has photographed the creature or produced any physical evidence of its existence. Enthusiastic cryptozoologists like Roy Mackal (*A Living Dinosaur? In Search of Mokele-Mbembe*, 1987) think we should give as much credence to the mokele-mbembe as to the [Loch Ness monster](#). True, and it seems unlikely the creature exists, since there would have to be a significant number of the huge creatures to continue to produce descendents after all other dinosaurs were extinguished some 70 million years ago. Yet, they seem to have flourished without leaving a single carcass, bone fragment, or fossil.

[Cryptozoologists](#) argue that since a coelacanth was caught off the coast of South Africa, it is reasonable to think that a dinosaur might also have avoided detection for a few million years. However, there is a big difference between finding a fish thought to be extinct and finding a dinosaur. The fish is small and lives in the ocean. Oceans cover two-thirds of the earth and have depths of up to 35,000 feet. That is a lot of space to hide specimens and fragments of specimens. Dinosaurs are large, occupied the third of the earth mostly visible to its other inhabitants, and thus would be much more likely to be detected than the coelacanth.

See **related entries** on [cryptozoology](#) and the [Loch Ness monster](#).

[The Godless](#)

[Constitution : The](#)

[Case Against](#)

[Religious Correctness](#)

[\(W.W. Norton & Co.,
1997\).](#)

moment of silence

"A moment of silence" (a.k.a. "moment of silent meditation") is a code expression for [prayer time](#). The United States Constitution forbids any religion, including Christianity, from being the state religion. It forbids forcing every American to kowtow to the beliefs of any sect. The U.S. Supreme Court has ruled that requiring prayer in government institutions is unconstitutional, so Christians who want to have a public display of religious worship in places such as public schools, high school football fields, or government offices have created the ruse of the moment of silence. Even though judges and justices know that the moment of silence is code for prayer time, they have encouraged the ruse to flourish by publicly advising that laws requiring moments of silence are constitutional as long as they don't specify what is to be done during the moment of silence. Christian judges have rationalized their rulings by pretending that they don't know for sure that the reason for the law is to have a public display of people praying while pretending to be observing a moment of silence. Encouraging hypocritical behavior has become a pastime among certain Christian evangelists and judges, and the moment of silence marks one of their proudest achievements.

One thing the courts have not requested is proof that these moments of silence, which deprive people of their liberty, are necessary to accomplish some legitimate civic purpose. The moment of silence is a way to shut up those who loudly proclaim their fear of oppression in the name of religion. Those who think that prayer is the answer to our problems should consider that if this were a Christian nation, [the Bill of Rights would be gone](#). The history of Christianity is not the history of liberty, but of repression, oppression, and censorship. The Europeans who first displaced the natives of this country came here because Christian sects controlled governments and oppressed those who didn't share their religious views. Unfortunately, it turned out that most of the pilgrims who arrived here were just as intolerant as those who had oppressed them in Europe. Freedom of religion meant not just freedom to practice your own religion but power to enforce that religion on anyone in your political community. The fruit doesn't fall far from the tree, as they say. Those who stand around in silence while religion is publicly united to our schools, our patriotic songs, our civic meetings, and our sporting events will regret it when they realize that the only silence truly desired by the Christian lawmakers and judges pushing these moments of silent meditation is the silence of the opposition.

In Mass Media Funk, you will find articles about news stories, magazine articles or TV programs of interest to skeptics, which do not pander to the public's appetite for the occult and supernatural.

Note: because many of the sites linked to here are newspapers or magazines, it is impossible to maintain the links.

Mass Media Funk

24

January 13, 2002. Proving that wisdom does not necessarily accompany aging, 75-year old [Fr. Gabriele Amorth](#) confidently boasts of his superstitious notion that the Devil is behind all evil, including Harry Potter. Amorth is proud that he performs countless [exorcisms](#), despite the fact that these days the Catholic Church hardly recognizes Satan as a force to reckon with. "An unnecessary exorcism never hurt anybody," says the good priest who considers the movie "[The Exorcist](#)" to be a documentary of his kind of work. Raised in Italy, where it is common to believe in such things as [the evil eye](#) and the casting of [spells](#), Fr. Amorth has never outgrown his early training in superstition.

Amorth realizes that many people who think they are possessed by the Devil are mentally ill. He requires his victims to first see a doctor, but he doesn't seem to think the mentally ill can't also be possessed. He says he's treated some victims for 16 years. It is ironic that he thinks his victims have sometimes been dabbling in [magick](#).

Amorth has not led any burnings of Harry Potter books, but he believes Satan is behind the books, luring children into supernatural activities. Another irony. The good father preaches a comforting, though diabolical, sermon to evildoers: it's not your fault, the Devil made you do it. He relieves his victims of responsibility and offers his powerful magic to help purify them. If Fr. Amorth is right, we ought to shut down all our criminal courts immediately. Criminals need exorcisms, not punishment. Even the [temple priest in India who recently killed an 8-year old boy](#) to appease some god should have been exorcised, not arrested.

Fr. Amorth is the author of *An Exorcist Tells His Story* in which he expands his victims to include those who are not only *possessed* by the devil but those who are *oppressed* by Satan. Someone should do a book on people like Fr. Amorth who are *obsessed* by the devil. But he does fill a niche. He says he has ten customers a day. You would think a dude as powerful as Satan would be embarrassed by the quality of the opposition.

December 24, 2001. [Pope John Paul II](#) has added the names of three more [saints](#) to his record book. Apparently, John Paul is aiming at naming 500 saints during his reign, which began in 1978. He has already set the record for saint-naming among modern day popes, a record as impressive as Barry Bonds 73 home runs in a season or Hank Aaron's 755 home runs in a career. This latest trinity of halo wearers, however, is likely to raise some sepulchres. Entry into the elite club of pope-named saints requires several [miracles](#). The miracle is that the Catholic Church can find anybody to believe this is happening. These are the new role models for the faithful: [Juan Diego](#), [Josemaria Escriva de Balaguer](#), and [Padre Pio](#).

Juan Diego is the name behind [Our Lady of Guadalupe](#), patron saint of Mexico. His cape of cactus fibers with a [painting](#) of the Virgin, allegedly emblazoned there miraculously in 1531, is an icon on display in Mexico City's Basilica de Guadalupe. The abbot of the basilica in 1996, Guillermo Schulenburg, once proclaimed that Juan Diego is a symbol, not a reality. He also called the pope's beatification of Juan Diego in 1990 the "recognition of a cult." He resigned under pressure ("Vatican elevates Mexico's Juan Diego to sainthood," by Traci Carl, Associated Press, *Sacramento Bee*, December 21, 2001, A20.) Even though it is doubtful whether Juan Diego even existed and probable that the story of his miraculous cloak is apocryphal, the pope proclaimed that Juan Diego performed a miracle by answering a mother's prayers. Her son had jumped from a building and cracked his skull. She [prayed](#) he would not die and he didn't. When you are on a saint hunt, as John Paul is, you don't worry about minor details like the strength of the evidence.

The second person in this blessed trinity certainly existed. Josemaria Escriva de Balaguer was a Spanish priest who founded "[Opus Dei](#)" in 1928. He claimed God told him to do it. "Ascetism, anticommunism, a rigid hierarchicalism, religious militancy and secrecy have become the distinguishing marks of the organization."* [Opus Dei](#), according to Fr. Angel de la Parte Paris, "professes a fundamentalist theology, condemns Liberation Theology, has no concern for social problems, leaves little freedom to an individual's conscience, and is associated with secular power structures." Pope John Paul II loves the organization because it is against lax morals and communism. So did [Robert Hanssen](#), the spy who sold secrets to the communists, went to Church regularly, supported a [stripper](#), and made [sex videos of himself and his wife](#), unbeknownst to her.

Finally, the capuchin monk and self-proclaimed [stigmatic Padre Pio](#) (Francesco Forgione, born in Pietrelcina, Italy in 1887) has been made a saint. He was most likely a [pious fraud](#) with a brain disorder, but he had quite a following amongst women. Padre Pio hallucinated regularly and enjoyed self-flagellation. The Church told him to say mass in private after his cult followers started behaving like shoppers on bargain day, physically struggling for the best pew. The ladies also liked to tear at his vestments, hoping to take home a souvenir relic. Despite Padre Pio's questionable pedigree, he was a made man and there was never any question of his being named a saint. The pope believed in his miraculous powers. In 1962, while still a priest in Poland named Karol Wojtyla, the pope asked Padre Pio to pray for some woman who was thought to be dying of cancer. The woman was given a medical exam and no cancer was found. That's the kind of evidence this pope requires.

December 17, 2001. Yesterday's news was bad as usual. First, we find out that all the anthrax used to terrorize our U.S. Senators originated in a U.S. Army lab. That news was on page 19 of the *Sacramento Bee*. Second, the Chicago police have been accused of abandoning [pseudoscientific](#) crime fighting techniques such as the [polygraph](#) and [voice stress analyzer](#) in favor of the tried-and-true method of torture to get a confession. But what really caught my eye was a story on page 9 about how the U.S. Department of Justice has been lying for years about its efforts to combat terrorism. The authors of the article--Mark Fazlollah and Peter Nicholas of Knight Ridder--didn't accuse Justice of lying, of course. That wouldn't be prudent. Justice has "overstated its record of arresting and convicting terrorists." How? By counting

drunks who cause disturbances on commercial flights as "terrorists." Justice also counts prison riots as terrorism. Shove a judge, you're a terrorist. Threaten to kill *President* Bill Clinton even though he isn't the president anymore and you're a terrorist, according to the FBI. Last year, the FBI claims it had 236 "terrorist" convictions. Congress gave Justice \$22 billion to fight crime, including terrorists. John Ashcroft says that the U.S. government defines terrorists as "those who perpetrate premeditated, politically motivated violence against noncombatant targets." Someone from the Department of Justice should ask him for a clarification because it is obvious that words like 'premeditated', 'politically motivated', and 'noncombatant' are being ignored by some of our finest law enforcement officers.

We should see a substantial increase in FBI arrests for "terrorism" under Robert S. Mueller, who is now the director of the FBI. But I wouldn't feel any safer. Mueller ran the San Francisco U.S. attorney's office for the past three years. That office led the nation in "domestic terrorism" cases filed. My guess is that most Americans don't consider the mentally ill, prisoners and drunks to be in the same class as Mohammed Atta or Osama bin Laden.

December 6, 2001. The FBI has finally done something right. They've captured Clayton Lee Waagner, who is suspected of mailing hundreds of terrorist anthrax threats to abortion clinics. Waagner was a fugitive awaiting sentencing on federal firearms and auto theft convictions. He is also wanted for bank robberies, carjackings and firearms violations in various states. Attorney General Ashcroft says he will prosecute vigorously. The FBI had sent posters of the alleged terrorist to Kinko's copy centers around the country and employees of a Kinko's in Springdale, Ohio, recognized Mr. Waagner when he came in to check his e-mail.

November 11, 2001. *The Sunday Times (UK)* reports that the FBI is seeking out [psychics](#) again, this time to help fight the "war on terrorism." According to the article, Prudence Calabrese, head of [Transdimensional Systems](#), an outfit that trains [remote viewers](#), claims that "the FBI had asked the company to predict likely targets of future terrorist attacks." Angela Thompson-Smith and Lyn Buchanan, former members of the infamous government remote viewing project called [Stargate](#), also claimed that the FBI has sought their advice. Thompson-Smith is Executive Director of [Inner Vision](#) Las Vegas, which offers courses in remote viewing. Lyn Buchanan is part of a group called [Controlled Remote Viewing](#) and claims to have been teaching our military how to remote view for some fifteen years.

This does not come as a surprise. The FBI and CIA are the two most avid promoters of the use of the [pseudoscientific](#) device known as the [polygraph](#). That they would continue to dabble in the [occult](#) long after all reasonable people have abandoned such non-sense should alarm us even if it fails to shock. It is becoming more and more apparent that the quality of investigation done by these two agencies suffers from being done by people who are superstitious and uneducated. If I wanted to gather intelligence about Iraq, Iran, Afghanistan, etc. the first thing I would do is make sure I have plenty of agents who know the languages and histories of those peoples. Such obvious qualifications are not required, however. (See [Peter Beinart's article on the CIA](#) in *New Republic*.) The last thing I would do is hire alleged [psychics](#). But our agencies are more concerned that its agents pass so-called "lie detector" test than it is

that the people they hire be able to gather useful information based upon their having the proper education and training.

The FBI has released [a profile of the anthrax terrorist](#). Does anyone take these people seriously? Remember their [profile of the unabomber](#)? It wasn't even [close](#) (neat dresser and meticulously tidy, an ideal neighbor!). Yet, [Lou Bertram](#), a retired FBI agent who took part in the investigation of the unabomber claims "Absolutely, he fits the profile." Sound like a bit of [shoehorning](#) to me. The fact is that had not newspapers published the unabomber's "Manifesto" his own brother might not have ever suspected him. And had not his brother turned him in, it is unlikely that the FBI would have caught him. After all, they had 17 years to look for him and kept coming up empty.

The FBI profile of the anthrax terrorist is based upon the way he [prints his letters](#). He is not from the Middle East, but an American male. They said some other things so obvious as to sound stupid when mentioned: "He is apparently comfortable working with an extremely hazardous material. He probably has a scientific background to some extent, or at least a strong interest in science...He lacks the personal skills necessary to confront others. He chooses to confront his problems "long distance" and not face-to-face."

Finally, here is the FBI list of "post-offense behavior." Tell me this doesn't describe half the American population after 9-11?

1. Altered physical appearance. 2. Pronounced anxiety. 3. Atypical media interest. 4. Noticeable mood swings. 5. More withdrawn. 6. Unusual level of preoccupation. 7. Unusual absenteeism. 8. Altered sleeping and/or eating habits.

Maybe the remote viewers can tell us whether he wears a moustache or dabbles in the occult. I'd be more interested if they could tell us whether the FBI and CIA will [abuse their power](#) in the coming years now that they have the authority to wiretap and arrest just about anybody as a suspected terrorist and then wiretap your conversations with your lawyer. I wonder if the FBI will use remote viewers to go through our e-mail?

[What is 'terrorism', anyway?](#) The so-called "Patriot Act" signed by President Bush last week doesn't even define 'terrorism.' It refers everybody to section 140(d)(2) of the Foreign Relations Authorization Act, Fiscal Years 1988 and 1989. I have yet to hear the President or any of his minions [define terrorism](#). Was there even any [discussion](#) of the definition issue before unanimously approving it? There was debate about whether to include such things as computer hacking in the definition, but was there any discussion of the definition itself? We all know terrorism is bad and we're all against it, but will we know it when we are arrested for it? How broad is the definition? Is it as broad as the definition proposed for South Africa where there is fear that under the new anti-terrorism law "young pranksters or ordinary trade union members could be convicted of terrorism and jailed for life."* If it's defined broadly enough, participating in a public demonstration against government policies where someone throws a rock may be prosecuted under the terrorism bill. Maybe terrorism

includes criticizing the government as it takes more liberties from the people and moves forward with policies identical to disastrous past policies. For all we know, the government may consider it a terrorist act for the television mass media to do their news without the American flag waving in the foreground. Not that the television mass media would complain, since they seem to have assumed the role of government agents since 9-11. They see their role as one of support for the government in the war effort. They've finally completely lost touch with the ancient role of watchdog and protector of the people from government abuse. For all intents and purposes, the television media are part of the government itself. The print media still provides a voice for critics, but how long before they are shut down in the name of national security?

Maybe its time for Larry King to convene another panel of psychics to predict the future of freedom in America. While they're at it they could locate Osama bin Laden. The FBI and CIA could help pick the panel.

update: [January 15, 2002](#). Prudence Calabrese now says she and her team of Rviewers see that the next terrorist attack will be in a subway and the words SNOW BANK are prominent.

October 29, 2001. Yesterday's *Sacramento Bee* had an interesting article by Samuel H. Pillsbury, a professor of law at Loyola Law School, Los Angeles, and the author of [Judging Evil: Rethinking the Law of Murder and Manslaughter](#). The point of the article is pretty simple: "Evil is something humans do, not something they are." Dividing the world up into the good and the evil "dulls our understanding of the world" and has a very wicked consequence.

Consider what happens when we declare someone evil. We judge that person to be without value. The individual has no rights we must respect; there are no restrictions on what we can do to him or what we can feel about him.

Pillsbury believes that the "division of humankind into the worthy and the unworthy is the evil that drove the terror of Sept. 11, and perhaps the anthrax attacks as well. And such evil is contagious." His conclusion is that we should condemn acts not persons.

There is much to quibble with in Pillsbury's claims, but I think he is right about black-and-white thinking. This demonizing of the enemy and sanctifying of America is likely to result in "another eye for another eye till everyone is blind ([Tommy Sands](#))."

Elie Wiesel also had an article in yesterday's paper--in *Parade*--and demonstrated just how attractive this black-and-white thinking can be. "The terrorists have chosen shame," writes Wiesel. "We choose honor." We want to believe that we are good and honorable and the enemy is evil and shameful. Unfortunately, so does the enemy.

Terrorists do not discriminate between civilians and soldiers. They kill indiscriminately and some even willingly die while killing people in a restaurant, marketplace, or public building. But they are human beings and need to justify their atrocities. Those they murder have been dehumanized as evil beings who have no

right to be treated with any dignity. The terrorists who wish to kill every American have made the mistake of assuming we are all evil. They believe they are good and that good always prevails, so they believe they will prevail no matter what the odds. The odds are greatly against them. It is not likely they will prevail and turn the world into a fanatical fundamentalist medieval Islamic community, if that is their goal. But when they fail it will not be because they are evil and we are good.

While there are some Americans who will demonize all Muslims, Arabs, or dark-skinned people because of the evil acts of some dark-skinned Muslim Arabs on September 11th, most of us will follow President Bush's example and not use these events as an excuse to express racist hatred. But it does America no good to demonize Osama bin Laden and his millions of admirers the way we demonized Sadaam Hussein. Only if we distinguish the act from the person can we even ask the question, why is this man so admired by so many people? Why are millions willing to kill Americans or die trying because he tells them it is God's will? As long as we think of bin Laden and his followers as pure evil, we will make no effort to understand them. We will be driven by the same kind of blind hatred that drives our enemies; our goal will be to kill them all or die trying.

Bin Laden's followers admire him because they think he is good and his cause just. What is his cause? He says it is to rid sacred Muslim land of infidels and to punish those who cause suffering to Muslims. This religious intolerance is not unique to bin Laden, but is common in many Islamic countries. In fact, it is [common throughout the world](#), even in atheist countries. If Americans did not catch bin Laden's wrath, he would be persecuting somebody else, most likely the Jews. The extremist [Palestinian desire to exterminate all Jews in Israel](#) is one bin Laden's kind knows well. These Palestinian extremists have been terrorizing civilians for decades and have incorporated [suicide bombing](#) into their religion. In part, these ethnic/religious wars of annihilation are due to too many people and too little land. But much of the hatred has to do with the notion of "sacred" sites. There is a lesson here for America's Taliban. Our survival as a nation does not depend on us all saying [prayers](#) together to start the school or work day, or before sporting contests. We will not be made stronger or more moral by posting the Ten Commandments in all public buildings. We will not become invincible by forcing God on everyone at every opportunity. We will not become good or better by hiding intolerance behind the mask of prayerful, patriotic unity. The real enemy is within and it is not godlessness. We should not be wasting our time debating whether the pledge of allegiance should be required or not, or whether public schools should proclaim on their message boards "God Bless America." Our Supreme Court should not be wasting its time deciding the constitutionality of laws that require students to start each day with a "moment of silence" which everyone knows is supposed to be a religious exercise and which everyone knows can be done by anyone at any time in any place and so does not require a law to force it on anyone. (FYI: The U.S. Supreme Court has refused to hear the ACLU's appeal of a [federal court's upholding](#) of the Virginia statute which requires the moment of silence.)

The way to maintain our freedom and prosperity is through diversity and toleration. These are not the traditional values of Christianity, but they are the traditional values of America. The more we strive to impose uniformity of thought and trample upon diversity and freedom, the more we become like our enemy. It does not matter that

our intentions are good, that we believe we are doing God's will, that we *know* the Bible has all the answers to all the questions. That is what our enemy believes, though their book is the *Koran*. Most people who believe in the divinity of the Bible or the Koran are peaceful, loving people, who do not try to impose their understanding of religion on the rest of the world. But the minority who are intolerant of opposition and who think they have been given a divine mission to impose the will of God (as they understand it) on the rest of us are dangerous to peace and stability, to freedom and joy. We have seen what has happened in the world of Islam when moderates have not opposed fundamentalist fanatics. The same thing could happen here should the Jerry Falwells and Pat Robertsons take over.

The terrorists sending anthrax and anthrax hoaxes through the mails may think of themselves as good people attacking evil people. Whether they are trying to kill civilians or government agents, or frighten those who provide abortion information and services to women, these terrorists are not that different from each other. They think they are serving God by their terror. Where are the voices of the clergy or the moderate theists regarding anti-abortion terrorism, some of which has included terrorist bombings that have killed or injured innocent civilians? Does their silence mean they approve? What will happen to America if the religious moderates do not speak up against the religious fanatics and terrorists? Why doesn't law enforcement pursue these terrorists with the same vigor they are pursuing the September 11th criminals?

It would be foolish to try to predict how this will all play out. We are not going to wake up one day to headlines that read: *Osama says he was wrong - jihad halted*. Nor will we see: *America surrenders! Bush asks forgiveness of Allah*. The headline somewhere may read **Good Triumphs Over Evil!** but it shouldn't. Not when we have leaders of Islamic communities elsewhere and various Christian communities here in America declaring that those who do not share their moral values are evil.

August 27, 2000. [The South rebels again](#). Throughout the South yesterday high school football games centered on "voluntary" and "spontaneous" Christian prayer ("The Lord's Prayer" a.k.a. "The Our Father") in defiance of the law. The teachers and administrators who are leading and teaching the young are turning the other cheek on this one, claiming it's a free speech and freedom of religion issue. That's how the issue has been framed by the disc jockey ([Paul Ott](#)) who seems to be the leader of this movement to defy the U.S. Supreme Court ruling that organized prayer before public high school football games is an attempt to bring a particular religion into the public schools. The leaders and followers in this football prayer movement seem to really believe that the issue is freedom of speech (theirs) and freedom of religion (theirs). I can understand why the students don't grasp the significance of keeping private religious groups from co-opting public school programs. They're young, inexperienced, and ignorant of our history and its institutions. But the adults should be teaching their children about the "tyranny of the majority" and the function of the Constitution to protect individuals from bullies who would trample their rights in an instant while waving the flag in one hand and the Bill of Rights in the other.

In this country, the Constitution protects us against such things as requiring us to belong to a particular religion *even if the majority of citizens wanted us to*. The majority can't have its way in matters of religion unless an amendment to the Constitution is passed that would impose the majority's will on all citizens. The majority might want us to say a Christian prayer at public school functions, in our public courtrooms, at NFL games, etc., but the Constitution protects us against such an imposition. The teachers and administrators who are encouraging their students to defy the law or find phony loopholes in the law (*planned spontaneity!*) ought to be teaching their children that our democracy does not allow majorities to tyrannize minorities in matters of religion.

There is a good reason for not allowing organized religious services during public school functions. There is a good reason for not letting majorities tyrannize minorities. No one would ever think it reasonable to play football in a synagogue, mosque or church. And anyone can pray at any time anywhere in the world. The right to pray does not include the right to pray wherever you want in any fashion you want. Today, the ruse is prayer at high school football games. Tomorrow will they be demanding the right to pray with loudspeakers at the shopping mall? Even if it's voluntary and spontaneous?

The leaders should be teaching their children that by joining with their fellow Christians in a public display of prayer at a public high school football game they are creating an atmosphere of hostility and fear among non-Christians, and even among some Christians who don't say Protestant prayers. And, if they had any sense at all, the leaders would be teaching their children that the Eternal Almighty Creator of the

Infinite Universe doesn't give a fiddler's fart about high school football in America or any other country in the universe. They ought to be taught that to ask God to intervene in their football game is the height of moronic behavior and bound to irritate the Lord to no end. They should be teaching their children that this is not a free speech issue, for they can pray in their churches if they like organized prayer or silently if that suits them. No one is hindering their right to pray, for the right to pray does not include the right to pray wherever you want in whatever way you want. The adults should be teaching the children that this *is* a freedom of religion issue. Every student in a public school should be able to go to school and participate in school activities without having anyone impose their religious practices on him or her involuntarily. Religious freedom means the right to be protected from religious people or groups imposing their beliefs and practices on others in public institutions.

To behave the way these children and their leaders are behaving is disgraceful. It's unpatriotic, un-American and an offense to any self-respecting Infinite Being. These "leaders" are teaching their children to defy the law when it suits them. They're breeding a new generation of religious fanatics who think they are above the law when it comes to matters of conscience. Worse, they are being taught to masquerade their attempt to impose their religious practices on others as a matter of conscience. The whole issue is phony. Nobody is persecuting these people; nobody is forcing them to do anything immoral. No religion requires its adherents to engage in organized prayer at public school games. Even if it did, we'd rightly restrict such a cult for the benefit of true freedom of religion, which, if it means anything else, means the freedom from being subjected to other people's forms of worship in public places. I know, [Joe Lieberman disagrees](#).

reader comments

30 Aug 2000

Being an agnostic for a number of years, I do not think a high school football game prayer objectionable. Though it seems to breach the separation of church and state, does it really? No one is forcing the members of the audience to say the prayer. They need not sit down and listen, even. They can get up and stretch, or say their own prayers, or mumble to themselves, or go to the bathroom. More to the point, however, when we nonbelievers start objecting to basically innocuous expressions of religiosity, we seem insecure, defensive, and uncertain to believers. It makes us look afraid. Our pursuit of the truth will, in the end, speak for itself.

PS: If a president wanted us all to say the "Our Father," then I'd have a problem, I assure you.

J. Negrete

reply: I have no problem with the president *wanting* us to say the "Our Father" or any other prayer. I wouldn't even have a problem if the president, while speaking at a public school graduation, asked everybody to join him in the Lord's Prayer, unless he had been told not to use the podium as a pulpit. If you tell him he can't use the podium as a pulpit, he can refuse to speak to your school if he cannot accept that restriction. But if you invite him to speak to the school and you put no restrictions on what he can say, then, if he asks people to pray, it's his prerogative. The people can walk out or stand mute or otherwise refuse to participate. They could even boo if they felt strongly enough about it. They can join him in prayer if they feel like it.

Letting a student lead a prayer over the public address system at a public school function is in a different category. The issue isn't whether those present are forced to pray or not, since of course they are not forced to participate. But those who belong to minority religions or who are agnostics or atheists are made to feel inferior and alienated by the fact that their teachers and most of the other students are joining together in solidarity. It may be true, as you say, that *"They need not sit down and listen.... They can get up and stretch, or say their own prayers, or mumble to themselves, or go to the bathroom."* But what they can't do is avoid being identified as non-participants. Furthermore, even though the minorities might respect the right of the majority to worship in whatever way they see fit, by virtue of not participating the minorities appear to be rejecting the religious practice of the majority. The minority is forced into being in *opposition* to the majority. If you don't think being labeled an outsider is a big deal, you've probably never been an outsider.

Witness what happened to 16-year-old Jordan Kupersmith of Potomac Falls High School in Loudoun County, Virginia, [when he walk out of class to protest the state's new minute-of-silence law.](#) He was summoned to the principal's office and given detention and told he would face further disciplinary action if he continues to leave class during the daily minute of silence.

To characterize this kind of bullying as "innocuous" is wrong. It's pernicious. I have no understanding of your belief that objecting to these pray-in-your face bullies makes us *"seem insecure, defensive, and uncertain to believers. It makes us look afraid. Our pursuit of the truth will, in the end, speak for itself."* The truth never speaks for itself. Somebody has to hammer it home and keep reminding us of the obvious. The Republic cannot tolerate self-righteous bullies who think they only have to obey the laws they agree with, who can isolate people and create an aura of intolerance against those

who don't join them, and who can make even their leaders afraid to admonish them for their indecency. If I seem to be afraid to you that may be because I *am* afraid. I am afraid that the Yahoos are taking over the asylum.

[thanks to Jon Henrik Gilhuus and Joe Littrell]

August 20, 2000. In today's [New York Times](#), Natalie Angier reviews what has been learned from [the genome project](#) about the [Race/IQ issue](#). She concludes that "the more closely that researchers examine the human genome -- the complement of genetic material encased in the heart of almost every cell of the body -- the more most of them are convinced that the standard labels used to distinguish people by "race" have little or no biological meaning."

"Race is a social concept, not a scientific one," said Dr. J. Craig Venter, head of the Celera Genomics Corporation in Rockville, Md. "We all evolved in the last 100,000 years from the same small number of tribes that migrated out of Africa and colonized the world."
